27 factories

Twentyseven Factories in twentyseven Countries. Twentyseven Productive enterprises in which experience is gained. Twentyseven observation posts that watch each technical advance, investigate, develop and apply the same.

The fruit of all this immense amount of knowledge and experience is contained in just a small piece of carbon paper, in just one inked ribbon, and in that sheet of Stencil Paper, all products of the House of Kores.

If you buy equipment that is going to cost you a great deal of money, then the knowledge that you are buying from a firm with a world-wide reputation gives you that very comfortable feeling of safety. For just the same reason, it is preferable to choose 'KORES' when you need Carbon Paper, Ribbons and Stencils.

In this way, you will preserve and add to the distinction of your organization by sending out letters that are clear and legible and which leave behind them as a fitting memorial copies which are clean and clear.

On behalf of twentysix Kores Companies.

KORES (INDIA) LTD.

Dag Hammarskjöld: Journey's End

THE death on Sunday in a fateful flight over Katanga of Dag Hammarskjöld has shocked the conscience of the world in a manner which provides a great, if belated, tribute to one of the current world's most remarkable men. At the hour of his passing, indeed, it seems that the man has risen superior to his institution which, over the last seven years he had appeared to dominate with a seemingly relentless will and an incredible dedication to work. Anyone who hazarded the opinion in 1953 that Dag Hammarskjöld would have invested the office of the Secretary-General of the United Nations with the amazing capacity and power that he came to exercise in the councils of the world would have been accused of fantasy. But, by a process, which is far more personal than historic, the Secretary-General gave life and deep meaning to the functions of his office and today at the hour of his death it has become one of the great seats of the international balance of power. Less fortunately, since it is certain that no one can occupy the seat with the same tremendous capacity, the office has at one full blow lost almost all the power of his creation. Today, the United Nations is an orphan by the fact that the physical embodiment of its new vigour, which was Dag Hammarskjöld, has ceased to live and have a being in any other form. It is a small tribute to a man such as this that he should be judged fit to receive in his own country a State funeral, accorded only to kings, and that the world as a whole should be hushed in silence by the tremendous sacrifice which its own terrible tensions had forced upon a great international civil servant and a magnificent servant of peace.

ruary which gave authority to the United Nations to take action for the unity of the Congo and the avoidance of civil war. Whether, in point of fact, his every move was justified in terms of the United Nations Charter on this resolution or not is a point on which agreement is impossible. What is also relevant is the expediency of the matter which has currently left the recalcitrant authorities in Katanga in military possession of practically all the heights which the United Nations wished to wring from them by the launching of the ill-fated attack last week. The surrender of the Irish garrison at Elizabethville and the retreat of Indian relief reinforcement are sad blows to the United Nations' prestige. One wonders whether military intelligence—a condition of successful military operations—has been as good as the grand strategy which the Secretary-General himself seems to have initiated. All Indian opinion is united on the point that the unity of the Congo must be maintained and President Tshombe brought to heel. But there is hardly any one in India who wishes this undertaken at the expense of Indian lives without adequate military preparation and full assurance of success. It is not the time for expression of anger and hate. It is the time for firm cold-blooded calculation to forge the instruments of military success, if necessary to preserve the unity of the Congo and prevent the secession of Katanga which would be a fatal blow to the Congo's unity.

At the same time, as the situation in Katanga is thus in jeopardy as a result of inadequate military preparedness to meet the major objectives of the United Nations policy, there is even more disturbing issue as to the manner in which the office of the Secretary-General will change under the pressures of the Cold War operating at its full intensity in the corridors of the United Nations' New York office. The Troika has again been advanced as a Soviet solution. It is being strongly op-

To pay this ungrudging tribute to Dag Hammarskjöld is not necessarily to approve of any future course of action which his single mind deemed essential for the performance of his duty. A great debate has arisen in regard to the context of the Security Council Resolution of Feb-

posed by other nations. And a deep chasm divides the United Nations today without the semblance of unity which the great figure of Dag Hammarskjöld, from time to time, gave to the institution bedevilled for over a decade by all the rivalries of the Cold War.

To us in India the events of the last week have even exacting long-term consequences. Hasty and intemperate statements have been made on both sides so that Indo-British relations have entered into one of their most difficult periods since the Suez crisis. It is in the interest of the Indian Union to restore these good relations and, on both sides, there should be recognition that those who have helped to widen the gulf by unnecessarily harsh judgments of one another have done no service to either country. It is a pity that the Prime Minister is thought to have joined in this unfortunate episode at a level somewhat below that of statemanship and expectations thereof. The British Press has erred greatly in magnifying these small aberrations. It is time that one recognised that, in the difficulties that the United Nations faces in Katanga, there is

no room for petty skirmishes on details of conditions under which the Indian troops have had to operate in Katanga. Their responsibility is to the United Nations and not to us, but they are entitled to fair judgment of the world no less than that of the officers under whom they are currently serving. We cannot in the foolish controversies which have been raised bring back Dag Hammarskjöld to life. But we would be paying him no tribute if his absence were made further reason for a course of acrimonious recriminations which would ill serve the cause of peace in general and of the United Nations in particular. This is the time when, if we cannot find unity in principles, we might find it in a person. It would be no small triumph of Dag Hammarskjöld in death if his memory kept some of the leading nations of the world from exploiting his absence to exacerbate the differences which he spent the last seven years in trying helplessly, as it seems, to bridge. His last journey will also be his proudest if Dag Hammarskjöld in death could provide a beaconlight for smaller men to pursue the path of bigness of mind on which alone greatness can endure.

The New Fertilizer Policy

OF late — as though with a blinding light — some new pragmatism has been discernible in the Union Government's industrial policy. The first indication of this came when the Government signed an agreement in May last with the Burmah Oil Company for oil exploration in an 1600-mile area in the vicinity of Nahorkatiya and Moran oilfields. A second concrete instance was available when the private sector was allowed to participate in the manufacture of heavy electrical goods, a field hitherto reserved for the public sector. Close on the heels of this decision has come the Government's resolve, disclosed by Mr. K. C. Reddy, the Union Commerce and Industry Minister, in his address to the sixth annual general meeting of the Fertilizer Association of India, held in New Delhi last week, to increase the share of private sector in fertilizer manufacture not only from 2,00,000 tons nitrogen to 3,00,000 tons nitrogen, as contained in the Third Plan documents, but to "something more". This trend is obviously to be warmly welcomed.

The decision of the Government to allow greater scope for the private sector in the fertilizer manufacturing industry is, perhaps, an offshoot of another decision of the Government, also announced by Mr. Reddy at the Fertilizer Association's meeting, under which fertilizer manufacturing capacity is to be allowed to be installed in excess of the target of one million tons nitrogen fixed under the Third Plan. It does not imply that demand for nitrogenous fertilizers, in the counsels of the Government, is expected to go up beyond the estimates given in the Third Plan documents. The primary objective with which the Government has taken this decision is to provide a cushion against possible shortfall in output resulting from the teething troubles of new units. That inordinate delay is effected in planning, erection and commissioning into production of a fertilizer factory in India is evident from the U.N. Fertilizer Mission's report which has assessed this delay at anything from 17 to 24 months. While every effort is to be made to cut short unnecessary delays in the planning and execution of new ferti-

lizer projects, to go in for higher installed capacity with a view to warding off shortfalls in production is only prudent, especially when, consequent upon the agonising disclosure in the preliminary estimates of 1961 census about the rate of growth of our population and the growing shortage of foreign exchange, a new urgency has been imparted to the fulfilment of the various agricultural output targets fixed for 1965-66.

Apart from the above consideration, there is case for licensing fertilizer manufacturing capacity in excess of one million tons nitrogen during the Third Plan period. In the opinion of this journal, demand estimates of nitrogenous fertilizers contained in the Third Plan documents are on the low side by two to three lakh tons. The progressive farmers of the country, according to a survey conducted by the *Indian Institute of Public Opinion* at the agricultural exhibition held here last year, have displayed remarkable consciousness about the utility of chemical fertilizers. Moreover, the package programme of agriculture is now envisaged to be extended to a larger area than was taken into account while framing the targets for the Plan. The demand for chemical fertilizers, therefore, can be expected to increase during the current decade in a geometrical progression. That has been the experience of the countries whose agricultural economies have passed through the "Fertilizer Revolution". India today is just on the threshold of this Revolution.

To foster the "Fertilizer Revolution" in Indian agriculture and to achieve the targets of agricultural production fixed in the Third Plan, it is not only necessary to provide inorganic manures in adequate quantities but also at reasonable prices. Simultaneously with stepping up of fertilizers production, therefore, it is imperative to improve and strengthen the distribution machinery. As long as there is acute imbalance in the supply and demand of fertilizers — as has been the case for the past two years — their distribution through agricultural co-operatives is justified. But efforts need to be made to enlist progressively the assistance of normal trade channels for this task. The explo-

sion in demand for fertilizers in the next few years is bound to put tremendous strain on the existing distribution channels.

In view of the heavy investment involved in making the country self-sufficient in chemical manures, there is also need to reduce capital investment for setting up new fertilizer manufacturing plants. This can be done through standardisation of the fertilizer manufacturing units to be set up in future and by going in for

liquid fertilizers instead of granular varieties as is being done in some of the Western countries. Standardisation in setting up of new fertilizer plants, so forcefully advocated by the U.N. Fertilizer Mission, will expedite indigenous manufacture of equipment as well as spares, besides resulting in considerable saving in construction time and training of technical personnel. Going in for liquid fertilizers, of course, will entail difficulties of storage and transport in the initial stages. But they are not insurmountable.

Guest Editorial

Strength Through Gloom

By WILLIAM REES-MOGG

THE economic situation in Britain varies much less than the view that is taken of it. In 1960 there was a very serious balance of payments deficit, but money was flowing into London and sterling had a higher international standing than the dollar. As a result most people assumed that the British economy was sound, and even the professional economists expressed only moderate anxiety.

This year the situation has changed. The balance of payments has improved and in the second half of the year it could well prove to be in balance. The improvement has been gradual and disappointingly flabby, but the trend had undeniably been favourable.

Yet this has been accompanied by a flight of money from London, by a general panic about the state of the economy, and by sharp disinflationary measures for which the economic arguments were at least as strong in July 1960 as in July 1961. Yet the main cause of this turn-round in confidence has nothing to do with Britain at all — it was simply President Kennedy's success in persuading the world that the dollar was a sound currency to hold.

Britain and the United States have indeed found themselves sitting on opposite ends of a see-saw. When the dollar is weak sterling is strong and when the dollar is strong sterling is weak. To use another metaphor they are like people sharing too small a blanket in a double-bed: one or the other is always catching cold and yanking the blanket back across to his own side.

For this reason alone one should always tend to lean against the wind of public opinion in making any judgment of the economy. At present there are all the signs that the economy is in fact going through the least cheerful, but not the least hopeful, part of the business cycle. A mild recession is developing in the domestic economy of Britain, and as a result the external balance is beginning to improve.

The mechanism by which these two trends are related is fairly simple. In periods of boom there is a strong tendency for British industry to build up stocks, and for marginal purchases to be made from abroad of goods which would normally be bought from home suppliers. In periods of recession there is a tendency to run down stocks, including, of course, stocks of imported goods. There is also bound to be spare capacity in British industry, and a strong commercial counter-attack is mounted on foreign sales in the British market.

In 1958, the last recession year, the British balance of payments surplus was £400 million. This is most unlikely to be repeated, if only because invisible earnings have declined so seriously, but the present mild improvement in the balance of payments is likely to be accelerated.

At the same time there is plenty of evidence that Britain is moving into a recession probably very similar to that of 1958. The recession will to some extent be the result of the Government's policy, but it is also partly cyclical. The British economy, like that of the United States, seems now to be moving in a four-year cycle; the similarities between the pattern of boom — surfeit — crisis in 1955-56-57 and 1959-60-61 is quite remarkable. The stock exchange boom was in retrospect quite extraordinarily similar to that of July 1957, and the 7 per cent Bank Rate of 1961 was of course very similar to that of 1957.

The Bank Rate and the credit measures may have been superimposed on a natural cyclical recession. Whether they were or not they are certainly proving very effective. There is now a serious stringency of credit throughout the British economy. Speculative operations have practically been brought to a halt, and there are many city houses which are finding themselves unable to borrow.

At the same time there are signs of recession throughout industry. The latest figures for the steel industry make very depressing reading, and most of the consumer durable industries are still depressed. The extreme labour shortage has already begun to ease, and one can expect the unemployment figures to rise in the coming months. If the recession follows previous form the low point is likely to be reached quite quickly, perhaps by the Spring of 1962, with a recovery developing into a boom in 1962-63.

All this time-table may be upset, or changed one way or the other, by British entry into Europe, if Britain does in fact go into Europe. The combination of increased opportunity and increased competition is exactly what the British economy now most requires but no one can be sure in advance how it will respond to the initial impact.

It can also be argued that the British economy should not run in this way — that it ought to pursue a course of steady expansion. Certainly it pays a heavy price for failing to do so. The trouble is that the British have not yet found a way of combining rapid expansion with a strong balance of payments. Nor for that matter has the United States.

Your credit is better than a millionaire's...

When you Become a Member of The Diners' Club.

Exaggeration? Not at all! How many millionaires can get unquestioned and instant credit all over India? Very few. But you can! And so simply too—join the Diners' Club! With a Diners' Club Credit Card you can *sign* for just about *anything*—from a bouquet of flowers to an airline ticket around the world!

For a small membership fee of just Rs. 30 a year, every member gets

- instant and unquestioned credit in over 600 leading hotels, restaurants and shops throughout the country.
- an accurate, permanent record of monthly expenses invaluable for tax purposes
- the facility of paying for all monthly expenses by just one cheque
- a copy of the Diners' Club magazine every month.

THE WEEK'S NOTES

West Germany

COALITION: ON WHICH BASIS?

LAST SUNDAY's election results were in no sense a spectacular defeat for Dr. Adenauer's Christian Democratic Union. His party lost its absolute majority in the Bundestag, but this could be explained in the light of certain apparent circumstances. It suffered from the handicap of the apathy which the electorate develops for a party long in the saddle. It retained a total of 191 seats after losing 24. The Christian Social Union which is in alliance with the Christian Democrats lost 5 seats but retained 50. The Social Democrats have emerged as a balancing force against Dr. Adenauer's Christian Democrats, raising their strength by 21 to 190. But it was the Free Democrats who made the largest gains of 25 seats, raising their strength to 66. The existing alliance between the Christian Democrats and the Christian Social Union cannot obviously hold against the combined strength of the Social Democrats and the Free Democrats.

A coalition is absolutely inescapable and it is too obvious that the Free Democrats hold the key to the solution of the problem. But certain differences would need to be ironed out. Dr. Mende, Chairman of the Free Democratic Party, has made it clear that he would participate in a coalition if it is led by Dr. Ludwig Erhard. This involves considerable delicacy. Age commands veneration in Germany and the public would like to see Dr. Adenauer's exit with grace. There is again the vital consideration of the most crucial period ahead, demanding momentous decisions on Berlin and East Germany. Dr. Adenauer would be preferred to head the government at this juncture and Dr. Erhard, too, would hardly like to get off to a start with imponderable risks to his entire political future. The likelihood, therefore, is that Dr. Mende may be persuaded to accept Dr. Adenauer with an understanding that Dr. Erhard will be the eventual Chancellor. But there is yet another serious consideration to be taken carefully into account. The Social Democrats are a powerful force to reckon with and the future of Germany will need to be decided with their full consent. Another likelihood, therefore, is that there may be an all-party coalition. But this depends on the magnitude of the emergency which the Berlin crisis may create.

Accra

ACCORD ON APPREHENSIONS

AT THE ACCRA SESSION of the Commonwealth Economic Council, the Finance Ministers showed considerable preoccupation with Britain's decision to negotiate for the membership of the European Common Market. Perhaps this was inevitable in view of the burning importance of this issue to the export trade of each of the twelve members of the Commonwealth with Britain and also in view of the fact that the negotiations are scheduled to start in October. Commonwealth consultations normally seek the largest possible area of accord and eschew conflicts as well as controversies. The Accra session marked a departure from this convention. If at all, there was accord on apprehensions about the consequences of Britain's participation in the Common Market and also about the political repercussions on the Commonwealth link in view of Britain's identification with the political institutions of the European Economic Community. The apprehensions on the latter score were apparently exaggerated and Mr. Donald Fleming expressed Canada's misgivings in this behalf in strong words. What must have come as a complete surprise to Mr. Selwyn Lloyd was the hard-

hitting opposition of some members to the very proposal of Britain joining the Common Market. The duty-free or preferential tariff pattern of the intra-Commonwealth trade cannot be disrupted all of a sudden, nor is there any ground for such a fear. It is implicit in the process of negotiations that Britain will make every effort to see that some of these preferences, on which the export economy of certain member-countries hinges, will be retained substantially in not in toto.

Elimination of the system of preferences will be spread over a period of transition. The Accra communique demands a transition of 12 to 15 years. Other negotiating points which were urged upon Mr. Lloyd included acceptance of preferential rates ruling in Britain (including duty-free entry) as a major factor in revising the Common Market's tariffs after her admission and abolition of the quotas imposed on specific goods entering the Common Market from the Commonwealth countries. Whether this is a tall order of demands depends obviously on the angle from which they are viewed. The strength of feeling and vehemence of expression displayed at Accra will not have gone in vain if they strengthen Mr. Selwyn Lloyd's hands.

This preoccupation is understandable to the extent it shows concern about the effects of the change in the short-term context. But basically the Common Market must be viewed in the longer perspective as a bold experiment in economic integration between sovereign States and total demolition of barriers to intra-regional trade, as a preliminary step to multilateral world trade on a liberal basis. It will be a severe obligation cast on Britain to keep vigilance to ensure that the Market adopts outward-looking policies. A dynamic market which will accelerate economic growth by stepping up substantially the levels of production, employment, trade and investment will need to share these benefits with outside countries. There can be no one-way traffic in economic prosperity.

U.P. Congress

THE BATTLE FOR CANDIDATES

UNITY IN the Uttar Pradesh Congress Party is as remote as it was when Mr. C. B. Gupta was installed in power in strange circumstances. The State Congress Chief Mr. A. P. Jain's repeated protestations of reassuring success in the progressive elimination of groupism raised suspicions by the very fact of repetition. It now transpires that his denial of the need to prepare two lists of candidates for the next general elections for final determination by the Central Congress Election Committee was an unsuccessful attempt to mark time. The State Election Committee is having a hard time with the arduous task of selection of candidates inasmuch as there is a battle being waged for every single candidate by the Gupta group and the dissident group of the former Ministers. So far candidates have been "approved" by the State Election Committee for five districts and there too about 15 names only are reported to have been agreed upon unanimously, while parallel lists are stated to have been prepared for the remaining majority of names.

Mr. Kamalapati Tripathi, spokesman of the ministerialist group, is putting up a stiff fight for every single candidate. His hands are strengthened, significantly enough, by a principle which Mr. C. B. Gupta advocated successfully when Dr. Sampurnanand's Ministry was in power, namely, that the members of the Congress Legislature Party must be allowed freedom of vote (conscience would be a misnomer where groupism reigns supreme) in issues concerning the Party's

organizational wing. This advocacy (not objectionable, strictly speaking) is coming as a boomerang. Some of Mr. Gupta's Cabinet colleagues are exercising this freedom and voting against his candidates. Still some other members of the State Election Committee, who are not inside the Cabinet, are exhibiting independence of judgment and refusing to oblige Mr. Gupta. It would appear that the selection affair has been stalemated, but respite has been provided by the forthcoming session of the AICC next month. With a fight for every inch of ground, the prospect seems to be that two lists may be submitted for the decision of the Central Election Committee. Responsibility would then shift to it. If the Central Committee discharges it judiciously, the composition of candidates, as it may emerge groupwise, may persuade Mr. Gupta to take to the path of a generous compromise in the interest of party solidarity. But if he receives the boost he has enjoyed so far, the Congress election campaign may get lukewarm support in the constituencies where his voice is weak and the interest of the Party may suffer.

Turkey

THE EXECUTIONS

THE WILD enthusiasm with which the Turkish public rejoiced in the overthrow of the Menderes Government and hailed the seizure of power by the army in May 1960 was justified for two reasons. Mr. Menderes and his colleagues not only overstrained the patience of the public with the sickening corruption in the administration at every level but threw to the winds the elementary rules and practices of democratic government. Secondly, the army group which staged the coup prevailed upon General Gursel, due to retire in a matter of only a few days, to stay on and accept the heavy mantle of responsibility. His was an influence for moderation which prevented the extreme elements from jumping into power. No government, military or of other variety, could have remained in the saddle without bringing the political offenders, howsoever high placed in public life before, to book.

Among the major counts on which the former President Celal Bayar, Prime Minister Adnan Menderes, his colleagues and others adding up to an imposing total of 592 stood the trial, were violations of the constitution (an offence punishable with death under the Turkish criminal law even before the military coup) and misappropriation of public funds. The trial which was held under the auspices of the Special Court can be described neither as unfair nor as farcical. By and large it was fair and conducted under the normal law. The presiding judge refused to accommodate army pressure brought to bear on the Special Court from time to time. Nevertheless, the trial could not be free from the element of vengeance.

So far, there was not much to which serious exception could be taken, although mention must be made of the fact that the retrospective effect which was given to the law of treason as amended in July 1960 was totally indefensible. But the convictions were awarded also on other counts under the normal penal law. Having proved the guilt of the political leaders at all levels, General Gursel ought to have tempered justice with humanity. The ends of this historic trial would have been served with abiding effect if clemency had been shown. The sentence of death on President Bayar alone was commuted. But Mr. Menderes and two other ministers were sent to the gallows swiftly—the former after a little delay caused by his unsuccessful attempt to commit suicide. General Gursel was in a position to feel the pulse of the people. Already there were sharp, if uncomfortable, pointers. In the referendum held on the new constitution in July this year nearly 40 per cent voted against it. They are

believed to be sympathisers of Mr. Menderes' Democratic Party. Then there is a section of neutrals. Mr. Ismet Inonu's Republican People's Party is weakened by internal divisions. The Justice Party, a post-revolution product, is known for its leanings towards the Democratic Party, now outlawed. Whether the elections will be held on October 15, as scheduled, for the restoration of civil rule, seems problematic. The supporters of the Democratic Party can make capital out of the executions while not a few may shudder at them. The prospect of a stable civil government cannot be taken for granted and if, perchance, the army intervenes again, the extreme elements may get the upper hand. The consequences of the executions and other drastic sentences are imponderable at the moment.

Jan Sangh

PROMISES IN PROFUSION

A POLITICAL party usually contests the general elections to capture office. The Jan Sangh election manifesto, however, is modest. Its spokesman highlights the fact that the Party expects to emerge as the second biggest, meaning the biggest in Opposition. Those who wish to vote Jan Sangh need not feel downhearted, since this is the correct strategy to qualify for an absolute majority in the general elections after the next, entitling it to assume office. But there is some good hope here and now. In States "like" Uttar Pradesh and Madhya Pradesh it will gain maximum strength and may form governments. "Like" connotes flexibility and a similar victory in the Punjab, for instance, may not be ruled out. Cherishing the aspiration to rise as the largest in Opposition, it is in the privileged position to present a manifesto replete with profuse promises, which it will not be called upon to translate into performance.

Every inch of the Indian soil now under foreign occupation—that of China and Pakistan—will be liberated. Since there was no war when China forcibly occupied our territory, there is no apprehension of war when China's aggression is pushed out. By implication (if inferential interpretation is allowed), Pakistan-occupied part of Kashmir may need a war of emancipation. Goa seems to be a relatively low priority, perhaps deserving the pride of place in the election manifesto of 1967. The Constitution is to be amended to convert India into a unitary State (the division of powers between the Union and the federal units is a menace to unity) and once this transformation is achieved the administration will be decentralised widely. In the unitary State, the Preventive Detention Act and the Public Safety Acts will be expunged from the statute book. The Penal Code and the Criminal Procedure Code will be amended suitably to make them inoffensive against civil liberties. The doctrinaire distinction between the public sector and the private sector will be abolished. A new blend will be produced—the national sector. Defence industries and basic industries will then be nationalised (as if the former are not already), but urgent preference will be given to outlay on defence without disturbing price stability. The Planning Commission will be reconstituted as a truly expert body free from political influence. But the National Development Council will be reorganized and considerably enlarged to accommodate many more ministers (Central and State—in a unitary constitution) and a wide cross-section of M.P.s. and State legislators (also in a unitary set-up). Foreign exchange will be no headache in the Jan Sangh's image of economic development. Much less of it will be needed than now. Foreign capital will be welcome without strings. If it is not forthcoming adequately, the programmes of industrial expansion will be so re-aligned that they will not suffer. Under the umbrella of the Jan Sangh, there will be a guarantee of a minimum standard of living and a minimum monthly income of Rs. 125.

Vintage 1900

One of the first typewriters ever sold in India the old Remington Standard No. 7 is now virtually a museum piece. Although a good efficient machine in its day, progress and 'Old Father Time' have passed it by.

Today at the Remington Rand factory at Howrah, (the largest in Asia), new sleek typewriters are rolling off the production line. Already over 1,00,000 machines have been manufactured in India by the Indian Company.

85% of the components of Remington typewriters are manufactured at this factory—with Indian raw

materials—by Indian Staff.

Each part of each machine is made to exact universal specifications so that every part is interchangeable no matter where the machine was manufactured.

40 years ago the Remington organisation pioneered the adaptation of Indian languages to their typewriters and today Remington Rand produce typewriter keyboards in 8 regional languages. The blue prints for further languages are under preparation and these typewriters will go into production soon.

Steam...

Industry's greatest power

SINCE 1782, when the first Rotative Steam Engine enabled the use of steam power to motivate machinery, steam has played an ever increasing part in industry throughout the world.

Not only is steam today's most important source of power for the civilised world, but it must remain so for many years to come. Even atomic power is yet in its infancy and can only be applied as an alternative source of heat. Steam is indeed the real power of industry.

While this is but an outline of the extensive and continually growing part that steam plays in power generation and industry throughout the world, it indicates quite clearly the unparalleled importance of steam power in the industrial growth of India...and, therefore, the urgent need to manufacture vital steam-raising plant in this country to meet the demands of expanding industry.

This is one of the needs which has led to the formation of a new and powerful industrial group, ACC-Vickers-Babcock Limited (AVB). The vast technical knowledge and extensive practical experience available to it will enable the new company to make an important contribution to Indian industry—and help Indian engineers overcome some of the difficulties which have faced them for so long.

The new AVB plant is nearing completion on a 700-acre site at Durgapur. The workshops, designed on modern lines, will have built into the structure electric overhead travelling cranes with 70 tons lifting capacity. All workshops have been designed to allow for progressive expansion so that it will be possible to lift 200 tons without making structural alterations. Up-to-date machine tools are being installed. When completed, they will include a 3000 ton hydraulic press capable of bending steel plates up to 5" thick for use in the manufacture of high pressure boiler drums, and pressure vessels required for the fertiliser, chemicals and oil refining industries. The new plant will make it possible to manufacture steam-raising equipment in the high pressure range—for the first time in India.

ACC-VICKERS-BABCOCK LTD. offers the industrialist his best chance to ensure a fully integrated installation comprising the boiler plant itself and a wide range of equipment from the fuel handling and preparation plant to the ash plant and dust disposal installation.

Besides, the industrialist has the confidence that he will get after-sales service of the highest quality from AVB!

...a Powerful Partnership for Progress

The World Abroad

SELECT COMMITTEE ON NATIONALISED INDUSTRIES

By
ODYSSEUS

THE BRITISH ATTEMPT to keep the administration of the nationalised industries "out of politics" by entrusting their management to public corporations, whose boards were to be subject to broad policy directives from a Minister, who could be questioned in Parliament about them but not about matters of "day-to-day executive decision", has never worked in practice.

That Ministers evaded questions in Parliament by asserting that they concerned day-to-day matters, which were the responsibility of the public corporation and not of the Minister, meant first that the nationalised industries were free to enjoy their monopolistic power without being accountable to anyone and, secondly, that the public, unable to extract information or to secure remedial action, became more and more convinced that the public corporations were riddled with abuses which the government were trying to conceal. This led to much wholly unjustified criticism of the nationalised industries, and struck at the morale of executives and workers who felt that they would be unfairly blamed no matter what they did.

The dissatisfaction of both Conservative and Socialists with this frustrating situation led the government to agree in 1956 to set up a Select Committee of the House of Commons to examine the reports and accounts of the nationalised industries. This is in accord with the increasing tendency to use Select Committees.

As Mr. A. H. Hanson says in his closely documented "Parliament and Public Ownership" (Cassel, London, 1961. Price 30sh.), Select Committees to investigate the behaviour of government departments are not exactly popular with Ministers or civil servants, but they have acquired some of the prestige already won by the formidable Public Accounts Committee, and have achieved something of that body's "non-political" atmosphere. The process of hearing and sifting evidence by a small number of Members in a private committee room, to which the press are not admitted, makes for "responsibility", and the need to produce a Report which if it is to carry weight must be unanimous, means that party arguments are not pushed to a division. These factors (1) encourage the Committee to stick to considering practical ways and means of increasing efficiency and prevent them from undermining Ministerial responsibility by getting too deeply involved in matters of principle and policy; (2) encourage M.P.'s, the press, and the public, to treat Select Committee Reports as weighty documents, whose criticisms and proposals merit serious consideration. Many therefore regard Select Committees as a way out of the deadlock caused by the growing size and complexity of the administrative apparatus; they believe that the House ought to set up many specialised committees, each attached as advisers and critics to a Ministry or group of Ministries.

A CHANCE TO STATE THEIR CASE

The Old Guard of Socialists, headed by Herbert Morrison, whose perfectly responsible aim was to keep the administration of the nationalised industries "out of politics", resisted the proposal for a Select Committee; they argued that if at all a nationalised industry's files were thrown open to inspection and question, executives would be fearful of taking decisions. Against

this, Lord Hurcombe, then Chairman of the Transport Commission, said that one of the greatest handicaps from which the public corporations suffered was the lack of opportunities to state their cases, or explain their difficulties, to M.P.'s and public opinion. Mr. Ernest Davies, a Labour M.P., dismissed Mr. Morrison's fear of interference with day-to-day matters as a bogey. He urged, on the contrary, that if Parliament were better informed, it would be far less anxious to interfere. "It would not harbour suspicions and doubts, but would realise that it would be more helpful to assist the nationalised industries...."

The new Select Committee's first report, issued in 1957, justified the government's decision to set it up. Wisely, it confined itself to two subjects of manageable size: (1) Ministerial control over nationalised industries, with special reference to the extent to which the Treasury is able to make its influence felt, and (2) the Report and Accounts of the North of Scotland Hydro-Electric Board. The Committee's recommendations revealed that it had judiciously weighed the evidence submitted to it, and it did not hesitate to say where it felt that the evidence had been insufficient or ambiguous. Thus it felt unable to decide whether the Treasury had unduly hampered the initiative of the Boards. It also carefully avoided a carping critical tone in its recommendations and showed itself commendably ready to praise where praise was due. The Committee recognised, in fact, that to be complemented by an all-party Select Committee is one of the best defences that a public corporation can have against unjustified, or politically inspired, attack. Thus it recorded that the achievements of the North of Scotland Board "themselves rebut the criticism of the Board's present personnel made by one witness."

On the Board's policy and administration, the Committee recorded the following opinions and recommendations: (a) that there was some uncertainty whether the Board was concentrating too much on hydro-electric as distinct from thermal-electric stations; (b) that, as a matter of general practice, it should submit contracts to competitive tender; (c) that its accounts should specify the basis adopted for the calculation of depreciation costs; (d) that it should take steps to rectify considerable inaccuracies in its estimates of the costs of its schemes; (e) that it ought to use more fully the services of its Consultative Council, which were insufficiently publicised; and (f) that its policy of subsidising rural electrification was justified.

In the ensuing Commons debate, the Committee was congratulated by all parties. The informed content of the debate suggested that M.P.'s had digested the Report. That their general tone was moderate and constructive was doubtless in part because the North of Scotland Board had not been the subject of bitter controversy. So, encouraged by its first experiment, the Select Committee next tackled the National Coal Board, which had.

Recognising the vast scope of the subject the Committee wisely decided that it could best serve the House by concentrating on a number of major topics — investment, manpower, prices, and the problem of the balance

between the amounts of large and small coal produced. One of the Committee's more important recommendations was that the Ministry of Power should check more carefully the Board's investment schemes, particularly the marginal ones. On the whole, the debate was sensible and constructive, rambled less widely and aimlessly than most previous debates on coal, and kept fairly close to the issues raised by the Select Committee. This suggests that the copious and carefully sifted information provided by the Committee had compelled M.P.'s to be more careful in their statements than they would otherwise have been, and that the quality of the debate had been improved because the House had before it what the Socialist, Mr. Robens, justly described as the best evidence that he had ever seen about the coal industry.

B.O.A.C. PULLS ITS SOCKS UP

The next Select Committee Report, on the U.K.'s nationalised Air Corporations, broke new ground in that (1) it offered a comprehensive survey of the industry, and (2) in assessing performance, it used comparative statistics extensively. The 59 page Report contains a mass of succinct information, never before gathered together, about the conditions under which B.E.A. and B.O.A.C. had been operating. It enabled M.P.'s to compare their preconceived ideas with sifted facts. It seems "obvious", for instance, that B.E.A. and B.O.A.C. could effect substantial economies by increased co-operation in providing common coach services, joint advertising, a joint medical service, a joint organisation to sell surplus aircraft, and a common organisation to repair aircraft. Perhaps some of these points were "obvious" to M.P.'s before they started their enquiry. If so, neither they, nor public opinion, would have accepted a Ministerial assurance in the House that these ideas are impractical. The Select Committee's enquiry revealed, however, that most of them are, in fact, impractical. As a result, any M.P. or interested member of the public, who reads the Report, can get a clear idea, supported by factual evidence and expert opinion, as

to which paths are still worth exploring. Critics need no longer rely on hearsay and they have had their attention directed away from useless points to questions on which there is still room for reasonable differences of opinion.

The figures comparing the performances of B.E.A. and B.O.A.C. with their foreign competitors were striking. The Select Committee found, for example, that whereas the capacity per ton mile per employee of two foreign air lines was 37,700 and 44,100, B.O.A.C.'s was only 16,400. Even allowing that B.O.A.C.'s ratio was less because it did more things directly for itself and less by outside contract than its competitors, the Committee found that B.O.A.C. was over-staffed, particularly in its workshops. Until this was remedied, the Select Committee said "B.O.A.C. cannot expect to compete on even terms with the other airlines of the world."

Such an adverse verdict on B.O.A.C. could have emerged with difficulty from an ordinary Commons debate, because either opponents of nationalisation would have caused the Socialists to muddy the issues in order to defend the principle of nationalisation at all costs, or opponents of the government would have induced the utmost possible evasiveness on the part of the Minister to avoid a most damaging admission. Whatever remedial action might have followed would have been carried out in the midst of a political storm. But the government can accept the findings of an all-party Committee with a good grace, and the ensuing remedial action can be carried out calmly, as giving effect to an all-party decision.

And the Select Committee's bluntness with B.O.A.C. caused that great Corporation to get cracking. In 1956-57, B.O.A.C. employed 8,000 engineers at a cost per capacity ton mile of 10.3 pence; today there are only 6,702 engineers and their cost per c.t.m. is 6.05 pence. By 1962, B.O.A.C. aim to reduce this to 5.25 pence, which, they believe, will compare favourably with the best that their competitors achieve.

Are you in need of a loan for your industry?

The problem of finance faces a small industrialist like any other entrepreneur. To help solve this problem, a scheme for the co-ordinated provision of finance has been evolved by the various financing agencies with the assistance of the Central and State Governments.

The State Bank is ready to assist small industrialists with advances against raw materials, manufactured articles and ready stocks etc., as well as with advice as to any other source from where credit can be obtained.

There may be a branch of the Bank in your town. Why not take your problem to the Agent who will be glad to be of assistance?

The European Scene

THE DECLINE OF IMPERIAL TRADE—I

From Our Special West European Correspondent

PARIS, September 18.

IMPERIAL trade—essentially commerce between Britain and France, on the one hand, and the countries formerly belonging to their empires, on the other—is gradually but inexorably declining in importance. In some cases it is diminishing in absolute terms, and in others it is being maintained or even growing slowly while, however, accounting for a diminishing percentage of the trade both of the European power and of the ex-colonies. Apparently unaware that this is going on, some sentimental imperialists imagine that they are threatening us with something in the future when they say that it "will be the result" of European trade groupings, e.g. of Britain's entry into the Common Market. Far from being a possible future result, it is a real present cause of such trade groupings: trade treaties in Europe simply consecrate the fact that imperial trade is declining, that imperial "preserves" are becoming less useful for European exports. By abandoning imperial preferences abroad while creating regional preferences in West Europe, former imperial governments are simply following the drift that trade has taken, by itself, and would take whether or not there were such things as the Common Market.

Naturally, by so acting they might also hasten the decline of imperial trade for a time: British exports to the Commonwealth, already on the downgrade, might fall more quickly for a while if Britain officially drew the conclusions from this and joined the Common Market, surrendering Commonwealth preference. Similarly, French exports to French-speaking Africa have dipped fairly sharply since France admitted her Common Market partners' goods to the once-protected franc zone and since French industry began concentrating on the more promising European market. But two observations must be made about this accelerated decline of a secular downward trend. Firstly, nothing proves that it is more extensive than would have occurred in any event, even if the imperial nations had not agreed to surrender their colonial preferences. One cannot help pointing out that several of the Commonwealth capitals and trade associations that have just lately become ardent defenders of Commonwealth preference are precisely those that have been whittling down Commonwealth preference for years past. They were bound, for perfectly good reasons, to go on doing so in the future, and they would surely do so more enthusiastically if the isolated British economy stagnated while the Common Market became more attractive each year both as a market for their exports and as a source of capital equipment. Similarly, the losses French trade has suffered in Africa as an apparent consequence of the Common Market would have been suffered in any case as independent Negro States turned to Germany, Britain and (to a smaller extent) Russia and America. French unwillingness to accept this situation could only have proceeded from a fear that French goods could not compete with those countries' exports—but if they could not compete, i.e. if they were dearer or inferior, the clamour for an end to franc-zone preference would have become intense.

That brings up the second observation: the accelerated decline of imperial trade that follows the breaking up of old trade empires need not be permanent or irreversible. It is not that the former imperialist power decides to concentrate on Europe and loses interest in

trade with its former possessions, once and for all. Rather, by paying the price of losing imperial preference, it gains access to a unified European market, and that enables it (indeed obliges it) to re-organise its industry in ways that soon make it a more efficient exporter to its former colonial possessions. There is one reservation here, however. The ex-colony which, at this later stage, becomes a good market again for British or French exports must be demanding the goods that those nations are then equipped to produce thanks to the modernisation of their industry. This means, briefly, that the ex-colony should have begun its own industrialisation, so that it is seeking capital equipment, and not the simple consumer goods that used to be the staple of the "colonial trade" of European powers. Both the principal assertion of this paragraph and the reservation can be illustrated in the case of French trade with territories south of the Sahara. The surrender of preferential access to those markets (when they were opened to Germany and the other Common Market exporters) was accompanied by the vast revitalisation of French industry, required to stand up to German competition in Europe itself. This was carried out so successfully that French industry is now competitive with German in such departments as machinery and machine tools, and is thus a better purveyor of capital equipment than in the days of the protected franc zone—yet French industry does not yet reap the benefits of this because the Africans have not set on foot their industrialisation programmes.

The decline of imperial trade that we are witnessing does not imply any reduction in world trade, nor even any reduction in the trade of Britain and France with the under-developed world in general. The figures that will be given below show that Britain's trade with her own ex-colonies and the dominions is falling, and that French trade with former French possessions is falling. Yet, obviously, this is compatible with Britain exporting more to former French possessions and France exporting more to former British possessions as each gives up its vestigial imperial advantages. It is not as simple as that; third parties are often the gainers, notably West Germany, Italy and the USA. But we shall see something of this exchange of imperial commerce between France and Britain if the latter joins the Common Market and if the harmonisation of Commonwealth preference and "associate status" in the Common Market is achieved. Nevertheless, this exchange will not compensate for present losses in imperial trade, if only because there is another and more general factor at work: the tendency of trade between industrialised nations to increase much more rapidly than trade between them and developing countries. The reasons for this are primarily technological: economies in the use of, or substitutes for, traditional raw materials; plus the fact that as Western living standards rise less is spent on food and clothing, which require imported materials, in relation to the amount spent on durable consumer goods made of steel, aluminium and plastics.

This tendency has often been referred to in articles on this page, and invoked as one of the causes of the involution of European trade, expressed in the trade groupings such as the Common Market. It might explain some part of the decline in imperial trade shown in the figures. That is to say, the fall in British and French

trade with their former empires is, to some extent, an aspect of the general decline in Western reliance on imported raw materials and of the consequent inability of developing nations to import more from the West. Yet this factor does not seem to be very important, because we can show that in many cases while British exports to an ex-colony are falling, other industrialised nations are increasing their exports to that country. Thus the decline of imperial trade is a separate question. In so far as the general decline in trade between the West and the developing world is involved, it suffices to notice that no arrangements such as Commonwealth preference would serve to arrest it and no surrender of imperial preferences is going to hasten it, for its causes, as has been said, are primarily technological.

The following table reveals the fall in British shares of the main markets of the sterling area:

	Percentage of U.K. goods in total imports of manufactures	
	1954	1960
Rhodesia	87.2	70.2
New Zealand	84.9	71.7
Australia	71.7	50.7
Ghana	63.3	54.4
Nigeria	60.5	54.1
Malaya	54.7	39.4
South Africa	52.8	41.2
India	46.3	38.6
Pakistan	45.2	30.3

(To be concluded)

Between 1954-55 and 1959-60 Britain's exports of manufactures to the sterling area rose by only 5.2 per cent (from \$3,116 million to \$3,278 million), whereas eight other Western nations and Japan increased their exports to those same markets by 61.3 per cent (from \$2,160 million to \$3,485 million). The result was that Britain's share of this total market fell by 14.4 per cent, while the Common Market's share rose by 5.4 per cent, Japan's by 5 per cent and the USA's by 4 per cent.

These figures show the trend, which is plainly general throughout all the region of British influence, but they probably exaggerate its speed. British trade with the sterling area was at a peak after the war, and in 1954 Britain held a more dominant position in the Indian, Pakistani and Australasian markets than she did in 1937. At that time (in 1954) dollars were scarce, sterling area discipline was high, West Europe's recovery had not gone far enough to compete with Britain, and the overseas Commonwealth had not properly launched the ambitious development programmes that have since increased and varied its import requirements. This excessive British domination was temporary and these positions were bound to be lost as the overseas sterling area countries reduced the extent of imperial tariff preference and liberalised their quota system. Still, comparing the 1937 figures with those of 1960, one sees the same general decline, which may thus be taken for a long-term process, the decay of imperial trade.

FALL-OUT FROM BELGRADE

By ANDREW BOYD

RADIO-ACTIVE "fall-out" from Russia's new series of nuclear weapon tests hit London two weeks after the blasts in Central Asia and the Arctic began. Political fall-out from the Belgrade "summit" conference of non-aligned countries had spread through the world's atmosphere faster and farther. The long-term effects of the Soviet explosions on the human organism may be the more harmful; but it was the atmospheric after-effects of Belgrade that made me, soon after returning from the conference there, begin to rub my eyes and feel somewhat dizzy.

Belgrade, it seems, had one unlooked-for result. It united the great powers in at least one respect. The American, Russian and Chinese press appeared virtually unanimous in judging the conference to have been a triumph for the communist cause. ("Communist", in this context, firmly excludes the Yugoslav brand—of which more later) "Time" magazine's judgment on the uncommitted leaders assembled at Belgrade was that "big, bad Russia had in fact cowed them into appeasement". The Peking "People's Daily" warmly congratulated them on the fact that "the keynote of the principal speeches was directed against the West".

After ploughing through a whole lot more of this kind of stuff, culled from the newspapers of New York and Washington, Moscow and Peking, I almost began to wonder if I had been attending the wrong conference. Could there have been two simultaneous and separate meetings, both at places called Belgrade? I very nearly began to think so when I found that both the West German and the East German governments had expressed their satisfaction with the results of the conference. Again, surely there must be two quite different Marshal Titos (or Marshals Tito) abroad in the world? One Tito was in bad with the Americans for his Belgrade performance, for being beastly to the West Germans and soapy to the Russians. The other, according to the Chinese press, had played the part of "spokesman for US imperialism" at the Belgrade conference, "peddling his so-called non-bloc positive co-existence... The Tito clique's activities were painstakingly made to oppose the socialist camp, to undermine the Afro-Asian peoples' struggles for liberation... The Tito clique passes itself off as anti-colonialist; but in fact it serves imperialism".

To all of that I can only say that, equipped with the only pair of eyes I possess, I had sat close enough to Tito to watch him twiddling his thumbs throughout most of the five days that my Belgrade conference lasted. I had daily observed President Sukarno casting down his field-marshal's baton on the conference table—surely there could not be two such splendidly bemedalled uniforms in the world?—and I had thought I detected Mr. Nehru gently wincing each time this military symbol thudded on to the round table almost at his elbow.

Two conferences, and two different Nehrus? (Two Pandijis, I mean; of course, R.K. was there too.) It seems hard to credit. Yet, at my Belgrade, I had met an affable correspondent from Peking, Mr. Peng Ti. When asked what kind of reports he was sending home, Mr. Peng replied, with a singularly sweet smile: "Objective reports". I have just read one of these objective reports. It says that India was completely defeated at the Belgrade conference. According to Mr. Peng and his colleagues of the Peking press, India found itself completely "isolated" at Belgrade when it tried to bring

up "the so-called questions of war and peace". The conference, says Peking, would have none of this; instead, the delegates all gave enthusiastic backing to Dr. Sukarno, who told them that there was no other source of conflict except colonialism, and that they need not worry about conflict between the great powers in Europe.

Well, Mr. Peng and I were at the same conference. But the Belgrade meeting which I, and therefore presumably he, attended concluded by unanimously adopting a peace appeal to the great powers drafted by Mr. Nehru and the Indian delegation; and this appeal was solemnly carried to Washington by two heads of State, one of whom, unless I have been grossly deceived by the world's press, was President Sukarno of Indonesia.

In fairness to Mr. Peng, it seems possible that he and his colleagues from Peking found it difficult to concentrate properly on what was actually happening at the Belgrade conference. Ringed round as they must have been by sinister Yugoslav agents of American imperialism, they may have found it hard to keep their minds on the story. That could account for the leading article in the Peking "People's Daily" of September 9th, which complained bitterly that "Somebody at the conference advanced the argument that the era of classical colonialism is gone and dead".

Now, I saw and heard Mr. Nehru utter these words—qualified immediately by another phrase, "though it survives and gives a lot of trouble yet". I checked these words in the transcript of Mr. Nehru's speech, which I have before me now as I write, and a copy of which was certainly available to Mr. Peng and his colleagues. Yet here is the poor "People's Daily" so badly informed that it can only attribute these words to "somebody at the conference". With a strong Chinese press team at Belgrade, you would think they could have done better than that. But one must never forget how things can slip up in the course of the transmission of news across the world. Perhaps that is all that is needed to explain the curious transformation of the record of the Belgrade conference by the time it saw the light in the newspapers of China, Russia, and, it would also seem, America.

Personally I did not observe, as "Time" observed, the Belgrade governments "running for cover" in terror at the sound of Soviet nuclear blasts. What I saw was a series of delegates reading out the texts of long prepared speeches—and very dull this reading was, broken only by Mr. Nehru's lively, extempore speech, made virtually without notes; he was almost alone in addressing himself to his fellow heads of Government in a direct, parliamentary manner. For the rest, U Nu, Archbishop Makarios, and Mr. Ben Khedda of Algeria were admirably brief and to the point; Mrs. Bandaranaike was moving as well as sensible; and of course we all hung upon the words of the Congolese spokesmen, Mr. Adoula and Mr. Gizenga, with fascinated expectation. But much of the rest was so dull that I could not blame a distinguished but slightly eccentric editor who, sitting beside me in the press gallery, burst out in a loud voice at the end of the first hour of the speech of a president who had better be nameless: "Oh my dear man, do please sit down!" (Simultaneous translation through headphones has its blessings; a few delegates looked up, puzzled, but nobody seemed to have heard the cry clearly or to be sure from whose heart it had come, and scandal was averted).

PROUD ACHIEVEMENT

The J. K. Organisation can legitimately be proud of the fact that it has been the first in various fields of industrial activity in India.

- FIRST to manufacture Calico Prints in India—J. K. Cotton Spinning & Weaving Mills Co. Ltd., Kanpur.
- FIRST to install Electric Furnace for manufacturing steel in Northern India—J. K. Iron & Steel Co. Ltd., Kanpur.
- FIRST to produce Ballooning Hoops for use by the Jute and Cotton Textile Industries in India—J. K. Iron & Steel Co. Ltd., Kanpur.
- FIRST to manufacture hydraulically operated modern cane crushing mill for small-scale Khandari sugar units—J. K. Iron & Steel Co. Ltd., Kanpur.
- FIRST to produce Aluminium virgin metal from Indian Bauxite in India—Aluminium Corporation of India Ltd., Jaykaynagar.
- FIRST to produce Engineers' Files in India—J. K. Engineers' Files, Bombay.
- FIRST to establish Plastic Industry in Northern India—Plastic Products Ltd., Kanpur.
- FIRST to produce Heavy Chemicals in Western India—Eastern Chemical Co. (India) Bombay.
- FIRST in the world to produce on a commercial scale Hydrosulphite of Soda by Sodium Amalgam Process—J. K. Chemicals Ltd., Thana.
- FIRST Continuous process Rayon Plant in India to produce Viscose Rayon and the first such factory in India to be built up in record time—J. K. Rayon, Kanpur.
- FIRST Nylon Plant in India—Jaykaynagar (under construction) near Kanpur.
- FIRST to manufacture Portable Typewriters in India—Blackwoods India Ltd., Calcutta.
- FIRST Woollen mill in India to export woollen goods to Norway and Sweden—The Raymond Woollen Mills Ltd., Thana.
- LARGEST Jute Mill in Northern India—J. K. Jute Mills Co. Ltd., Kanpur.

J. K. ORGANISATION KANPUR • CALCUTTA • BOMBAY

India's Great Industrial & Commercial Combine

Russia's test explosions seemed to me to have little impact on the conference. Uncowed and, for the most part, unangered, the statesmen taking part made the same speeches as they had prepared before the Soviet bangs were announced. Most of what they said could have been predicted well in advance. The positions of these governments on Algeria, Angola and other colonial questions have long been familiar to anybody who takes notice of United Nations debates. So have their positions on, say, the Chinese UN seat; on disarmament; on the needs of under-developed countries for aid without strings and for stable commodity markets; on foreign military bases; on racialism. If the repetition of these policies at Belgrade really gave the communist powers a pleasant surprise and the American press a nasty surprise, well, it simply means that the rather charming capacity of human beings for being surprised is even more extensive than one had supposed.

Apart from India's success in getting the peace appeal to the super-powers adopted, I should not have thought that anybody in particular "won" at Belgrade. Dr. Nkrumah's formula for Germany, evolved during his long ramble through China and Russia, was turned down by President Nasser as well as by Mr. Nehru and others. The Arabs failed to get a condemnation of Israel into the conference declaration. The Cubans were tossed a couple of anti-American bones, but had to give way, grudgingly, on the wording of the peace appeal, which they had criticised because it equated Russia with America. Marshal Tito's strictures on Western Germany found no echo in the declaration; nor did President Makarios's plea for self-determination

and unity for Germans. Mr. Adoula's dramatic appearance with Mr. Gizenga in tow (and with a public benediction from Moscow) left the "Casablanca" group and other countries that had tied themselves to Mr. Gizenga's chariot scrabbling back into line. As for President Sukarno, who by Peking's account was victorious all along, he was prevented by Dr. Nkrumah from getting a mention of West Irian into the declaration; he lost his points on Israel, on Germany, on the peace appeal; he failed to carry his project for a second Bandung conference.

By the time these words are in print, the Belgrade countries' representatives will be once again in session—together with those of other countries, in the United Nations Assembly at New York. Whatever else they may do there as a group, I hope they will follow through with the resolve, generally expressed at Belgrade, to work for the strengthening of the machinery of the United Nations itself. Despite some half-hearted dissent from Cuba, Mali and Guinea, the Belgrade conference speeches clearly indicated opposition to Mr. Khrushchev's demand that the UN should be completely shackled by the multiple vetoes involved in his "troika" system. An increasingly effective UN peace-keeping capacity is vital to the non-aligned countries' hopes of restraining the jarring conflicts of the great powers, and of achieving the speedy end of colonialism without opening the door to still more conflicts. Here is a worthy task for these countries. Are they prepared to take it on? Belgrade did not seem to me to give a very definite answer to the question.

Economic Report from the U.S.

REPORT OF THE N.I.C.B.

By GUY SIMS FITCH

WASHINGTON, Sept. 12.

THE ability of American manufactured products to compete in world markets is reaffirmed in a new report prepared by the National Industrial Conference Board (N.I.C.B.), a leading private business research organization in the United States. In general, the N.I.C.B. has found, its higher productivity enables the U.S. economy to offset advantages other countries may have in the form of lower wages and lower labour costs. Contributing to this productivity are the size and nature of the U.S. economy — its high volume of operations and its generally advanced technology.

The report thus indicates that the United States retains the capacity to sell large quantities of its goods on world markets. This is a matter of some importance, since the United States is counting on a continued large trade surplus — an excess of exports over imports — to help counteract its capital outflows abroad and sustain this year's substantial improvement in its international balance of payments. Will U.S. imports now show signs of rising sharply in response to the strong upsurge in domestic economic activity? A serious lag in U.S. exports could cut markedly into the desired trade surplus. One of the principal forms of U.S. capital outflow, along with Government economic assistance, is direct investment abroad by private American companies. According to the latest survey by the McGraw-Hill Company, a leading publisher of business journals, these investments are expected to rise some 22 per cent this year to a record-breaking \$3,400 million, and to run nearly that high next year. The effect on the U.S. balance of payments may not be that large, however. The survey discloses that more than 40 per cent of the money scheduled for investment in facilities abroad is likely to be spent in the United States on buying equipment for installation in foreign plants. The survey also indicates that the U.S.

balance of payments will continue to be aided by high level of direct exports from the United States. Exports of U.S. manufactured goods are expected to rise 3 per cent next year — about the same rise the survey sees taking place this year. These trends tend to support the N.I.C.B. finding that American products can compete successfully in world markets.

The vast U.S. export potential, combined with the substantial improvement in the U.S. balance of payments, seems to have contributed to the further reinforcement of international confidence in the U.S. dollar. As one result, the outflow of U.S. gold has subsided to a trickle, as foreign holders of dollars have shown little tendency to change them for gold. As a matter of fact, any loss of U.S. gold in recent weeks seems to have stemmed largely from the advance of \$1,500 million to the United Kingdom by the International Monetary Fund (IMF). This advance enabled the Bank of England to repay some of the credit it had received from European Central Banks, which use the repayments to buy gold from the United States. This timely action, coupled with the U.K. Government's measures to correct its balance of payments, has helped shore up the position of the British pound and has helped stabilize the price of gold on the London market.

Nevertheless, these latest U.K. developments, coming on the heels of last year's flow of speculative funds out of the United States, have helped bring to the fore proposals to strengthen the international monetary mechanism and moderate short-term currency strains. Per Jacobsson, head of the IMF, has supported the idea of increasing the lending power of the IMF. The thought is that if the IMF is strengthened, and countries running deficits in their balance of payments are able to get the credits to tide them over in their dealings with surplus countries, the cause of international financial stability can be advanced.

Special Article**CONCENTRATION OF WEALTH ?**

By

S. K. GUHA

DOUBTS have often been expressed in public discussions and in private conversation, whether despite Independence and completion of the two Five-Year Plans and the commencement of the Third Plan, the rich are becoming richer and the poor poorer and whether there is now a greater concentration of wealth in fewer hands.

The outlays during the two Plans both in the public and the private sectors have no doubt generated an increasing volume of production and consequently of national income, which in turn has been distributed over the different sectors: agricultural, industrial, commerce, transport and communications and other services. The distribution of national income by various sectors and the percentage shares of the different sectors may be seen from Table I below:

While the volume of agricultural output has increased between 1950-51 and 1959-60 by about 33 per cent, the value of the output has increased by only 26.4 per cent. The percentage increase in the value of the output in the agricultural sector vis-a-vis the

mining and manufacturing sector at current and constant prices has, further, been as follows:

Percentage increase in 1959-60 over 1950-51

	Constant Prices	Current Prices
Agricultural	24.2	26.4
Mining, manufacturing and small enterprises	33.1	50.3

In other words, the agricultural sector has not benefited by the increase in prices to the same extent as the mining and manufacturing sector.

So far as the relative share as between the different sectors is concerned, the share of agriculture in the total national income declined from 51.3 per cent in 1950-51 to 48.1 per cent in 1959-60 at current prices.

TABLE I

DISTRIBUTION OF NATIONAL INCOME BY DIFFERENT SECTORS

	National income at current prices (crores of Rs.)		Percentage increase	Percentage distribution of national income at current prices	
	1950-51	1959-60		1950-51	1959-60
Agriculture, animal husbandry and ancillary activities	4,780	6,030	26.2	50.2	48.9
Forestry	70	100	42.9	0.7	0.8
Fishery	40	50	25.0	0.4	0.4
Total of agriculture	4,890	6,180	26.4	51.3	48.1
Mining	70	140	100.0	0.7	1.1
Factory establishments	550	1,120	103.6	5.8	8.7
Small enterprises	910	1,040	14.3	9.6	8.1
Total of mining, manufacturing and small enterprises	1,530	2,300	50.3	16.1	17.9
Communication (Posts, telegraphs & telephone)	40	60	50.0	0.4	0.5
Railways	180	330	83.3	1.9	2.6
Organised banking and insurance	70	140	100.0	0.7	1.1
Other commerce and transport	1,400	1,650	17.9	14.7	12.8
Total of Commerce, transport and communication	1,690	2,180	29.0	17.7	17.0
Professions and liberal arts	470	690	46.8	4.9	5.4
Government services (administration)	430	810	88.4	4.5	6.3
Domestic service	130	180	38.5	1.4	1.4
House property	410	520	26.8	4.3	4.1
Total of other services	1,440	2,200	52.8	15.1	17.1
TOTAL NATIONAL OUTPUT (after taking into account net income from abroad)	9,530	12,840	34.7	100.0	100.0

**LET YOUR APPLICATION DECIDE
WHICH HONEYWELL INSTRUMENT
FITS YOUR NEEDS**

Do you have a temperature or control job to handle?

There is no need to "shop around." From one source—

Honeywell—you can be sure of getting exactly the

right instrument to fit your needs and budget.

Honeywell is the recognized world's leader in the design and manufacture of automatic control equipment. An organization of more than 30,000 persons, with factories in the United States, Canada, France, Germany, Holland, Japan and the United Kingdom, Honeywell products are used in scores of widely diversified fields.

Honeywell products—more than 13,000 of them—fall into these three principal categories:

Heating and air conditioning controls and control systems for residences and industrial, commercial, public and educational buildings.

Instruments and instrumentation systems, process controls and control systems, valves, precision switches and data processing systems for business and industry. Precision electronic instruments and control systems for aircraft and missiles.

Head Office: Kapasia Bazar, Ahmedabad.

The share of the 'mining, manufacturing and small enterprises' group registered a small increase from 18.1 per cent to 17.9 per cent. The share of 'commerce, transport and communications' recorded marginal decrease from 17.7 per cent to 17.0 per cent. The share of the group 'other services' increased from 15.1 per cent in 1950-51 to 17.2 per cent in 1959-60.

The decline in the share of the 'agricultural' sector in the total national output is but natural in view of the greater emphasis on industrialisation and the development of the heavy and basic industries in the country in the Second Plan period, which process would continue in the Third Plan as well.

PER CAPITA NATIONAL INCOME

The provisional census figures for 1961 show an increase of 21.5 per cent over the previous census. This rate of increase works out to approximately 2 per cent per annum compounded. The national output by the different sectors for the years 1950-51 and 1959-60 may be divided by the relevant population to arrive at the per capita output for the various groups. The per capita income thus worked out for the various sectors are as follows:

TABLE II
PER CAPITA OUTPUT BY SECTORS
(Rs. per annum)

	At current prices		Percentage increase
	1950-51	1959-60	
Agriculture	196.3	208.5	6.2
Mining, manufacturing etc.	406.1	513.1	26.3
Commerce, transport etc.	627.5	680.2	8.4
Other services	306.7	393.8	28.4
TOTAL	264.3	299.2	13.2

Source: Worked out on the basis of National Income Estimates prepared by CSO and population estimated as explained above.

It will be seen that the per capita income in the 'agricultural sector' is the lowest and so is the rate of growth. This would support the inference drawn earlier that the 'agricultural' classes have not benefited much in the increase in the national income. On the other hand, those engaged in 'mining, manufacturing and small enterprises' and 'other services' would seem to have enjoyed a larger share of the benefit.

Table III below gives the available information extracted from the relevant portion of the two Reports on agricultural labour in India, viz., (i) Agricultural Labour Enquiry, Report on Intensive Survey of Agricultural Labour conducted during the year 1950-51; and (ii) Agricultural Labour in India, Report on the Second Enquiry, 1956-57:

TABLE III
DISTRIBUTION OF INCOME FROM AGRICULTURE BETWEEN LABOUR AND OTHER PARTICIPANTS

	1950-51 1956-57		Percentage variation
	(Rs. crores)	(Rs. crores)	
1. Output from agriculture, animal husbandry and ancillary activities as given in the National Income Estimates prepared by CSO	4,780	5,380	+12.6

1950-51 1956-57 Percentage variation

2. Total income of agricultural labour households as given in the Agricultural Labour Enquiry Reports (Rs. crores)	790	712	- 9.9
3. Share of participants other than labour (item 1 minus item 2)	3,990	4,668	+17
4. Total income of agricultural labour households as percentage of National Income	8.3	6.7	
5. Number of agricultural labour households—million	17.9	16.3	- 3.94
6. Number of wage-earners per agricultural labour household	2.0	2.2	+10.0
7. Average annual income per agricultural labour household — Rs.	447	437	- 2.2
8. Per capita income of agricultural labour — Rs.	104	99.4	- 4.42

It will be seen that the income of agricultural labour households has come down both in monetary and real terms and that other participants have benefited (Items 2 and 3 of the Table). It will also be seen that although the number of wage-earners per agricultural labour households has increased, the average annual income per agricultural households as also the per capita income of agricultural labour class have declined (see items 6, 7 and 8).

The position in regard to the second group, viz., 'mining, manufacturing and small enterprises', is that the total output has increased from Rs. 1,530 crores in 1950-51 to Rs. 2,300 crores in 1959-60 or by 50.3 per cent (see Table I). The per capita output has increased by 26.3 per cent from Rs. 406.1 in 1950-51 to Rs. 513.1 in 1959-60 (see Table II). Of this group, the value of output under 'mining' has increased two-fold, from Rs. 70 crores to Rs. 140 crores (see Table I).

A similar analysis in respect of the mining industries as done for the agricultural sector as between labour and other participants indicates that coal mine workers have shared equally with other participants in the increase in the value of output although in the case of the labour in other than coal mining, the indications are to the contrary.

SMALL ENTERPRISES

Hardly any data are available in respect of 'small enterprises'. As regards factory establishments, the total output increased from Rs. 550 crores in 1950-51 to Rs. 1,120 crores in 1959-60 (See Table I). The shares of workers and other participants in the net contribution of factory establishments for 28 selected industries covered by the Fifth and Twelfth census of Indian Manufactures during 1950 and 1957 have been as follows:

	1950 1957		Percentage increase
	(Crores of Rs.)	(Crores of Rs.)	
Value added by manufacture	283.93	467.92	64.8
Wages of workers	136.47	199.34	46.1
Salaries of other employees	32.05	54.87	71.2
Total wages and salaries, including other benefits	172.17	269.80	56.7
Residual share of profits, dividends, taxation, etc	111.76	198.12	77.3

It is apparent that the managing agents, the receivers of interest on equity capital and the ordinary shareholders have all derived a greater share in the increase in the factory output vis-a-vis the working classes. The extent to which the share-holders have participated in the profits may also be seen from the index of industrial profits which has increased from 100 in 1950 to 133.7 in 1957 and further to 151.7 in 1958*. The particulars of the eleven selected industries where the value added by manufacture is over Rs. 4 crores in 1950, detailed in the two censuses referred to, point to clear indications of some concentration of profits etc. in factory establishments. Participants other than workers in general and electrical engineering, iron and steel, chemicals, paper and paper board, vegetable oils and aluminium, copper and brass industries have derived greater advantage.

PLURALITY OF DIRECTORS

The Department of Company Law Administration have recently made a sample survey of the pattern of company directorships in the Western Region. Some evidence about the concentration of control may be obtained from the number of directorships held by a single individual on the basis of this survey. The study conducted by two officers of the Company Law Department covering some 117 big-sized companies in the Western Region revealed that the total number of directorships held by 546 persons belonging to these 117 companies having registered offices in the Western Region amounted to 4,174 on the boards of 1,905 companies on an all-India basis. The average number of directorships held by a person thus came to 7.6 or in rounded terms to eight. The frequency distribution of the directorships held by the 546 persons was as under:

No. of directorships	No. of persons holding directorships	Total No. of directorships held
1	113	113
2-10	294	1,541
11-20	95	1,421
21 and more	44	1,099
TOTAL	546	4,174

This table throws some light on the extent of plurality of directorships in the country in as much as about 80 per cent of the persons holding directorships are doing so on more than one company.

A recent study conducted under the auspices of the Research Committee confined to five selected industrial houses in the country appears interesting. The working of 496 companies for which balance sheets, etc., were available for 1958 were studied. These 496 companies had a net worth, i.e. paid up capital plus free reserves, of Rs. 314 crores during 1958 and the total assets amounted to Rs. 821 crores. The Fourth Annual Report on the Working and Administration of the Companies Act, 1956 gives the total number of joint stock companies at work as on 31st March, 1958, at 28,280 representing a total paid-up capital of Rs. 1,306.3 crores. Of this, 91 Government companies accounted for a paid-up capital of Rs. 256.8 crores. Thus, the number of companies managed by these five selected industrial houses referred to in Mr. Hazari's studies represented only about 1.8 per cent of the total number of non-government companies but the share capital of these companies represented about 19.4 per cent of the total paid-up capital of the non-government companies.

No data exist for the corporate sector as a whole giving the number of share holders and the average value of shares held by them in 1950-51 and now, from which one could judge whether there has been any broadening of investment in shares. The Reserve Bank conducted a limited survey in 1960 from the income tax returns of assesseees receiving dividend income. The analysis carried out by the Reserve Bank reveals that between 1955-56 and 1958-59 there has been a

noticeable expansion in the number of shareholders, which points to the fact that the habit of investing in shares is spreading.

In spite of this broadening, some concentration of control is inevitable in a developing economy. In fact, there is widespread feeling that the contractor class, the exporter/importer class and the very big capitalists have gained disproportionately from the increase in the national income. In view of the large scale construction work all over the country, the contractor class will, no doubt, have gained. Bitter complaints are often heard also from smaller capitalists operating on a capital of, say, Rs. 50 lakhs to Rs. 3 crores or so that the big capitalists have been deriving all the benefits in the corporate sector, reaping unduly large profits "vis-a-vis" the former class. Comparable data on the earnings of these classes as such in 1950 and in 1960 do not exist and it is possible that the Mahalanobis Committee on 'Income distribution and levels of living' will consider the question of suggesting specific sample surveys. The carrying out of such surveys will take time and involve considerable amount of labour and expenditure; and yet the chances of being able to go back to 1950 are slender. Be that as it may, it has to be remembered that in the process of development it is only natural that the larger and more organised units already in the field will grow further and faster in view of their experience and entrepreneur ability and derive the advantages of economies of large-scale and group management. This tendency is, however, checked by the development of the public sector and the growth of credit institutions and such developments are already taking place in the country. The number of Government companies which was only 61 in 1955-56 accounting for a paid-up capital of Rs. 66 crores has increased to 125 companies on 31st March, 1960, representing a paid-up capital of Rs. 468.4 crores. Thus, although the number has increased only two-fold, the capital has gone up more than seven times. The percentage share of the capital of Government companies to that of the total capital of joint stock companies has risen from 6.45 in 1955-56 to 29.4 in 1959-60. These figures do not take into account the capital-at-charge of the Railways and the Posts and Telegraphs.

PUBLIC SECTOR'S CONTRIBUTION

The increasing expansion of the public sector and its larger contribution to the national income is a noteworthy development. This would be evident from the figures quoted in Table 3 of the "Estimates of National Income, 1948-49 to 1959-60" issued by C.S.O., of the new output of 'Government enterprises, such as, the Railways, the Posts and Telegraphs, State Road Transport concerns, Electricity Undertakings and Government Services (Administration)'. While the net output of 'government enterprises' has increased from Rs. 290 crores in 1950-51 to Rs. 530 crores in 1959-60, the contribution of 'Government Services (Administration)' has gone up from Rs. 430 crores in 1950-51 to Rs. 810 crores in 1959-60. On the Railways, for which some detailed statistics are available, the pattern of pay distribution indicates a trend towards lesser inequality during the last decade or so. In the 'other services' sector also, although there is inequality in the pattern of distribution of earnings of Central Government employees, there has been some reduction in disparity between 1951 and 1959.

In short, the examination of the National Income Estimates throws some light only on one aspect of the question, namely, on the rate of growth of national income as between the different sectors and the variation in the per capita income as between the participants, such as the labour class and others, in the same sector. So far as the other aspect, namely, concentration of control and power in a few hands is concerned, there is little authentic information available at present.

THE BUSINESS WORLD

Sir Homi Mody is Eighty

By CROESUS

SIR HOMI MODY will be eighty on Saturday. I feel it is only proper for me on this occasion to recall to the readers of "The Eastern Economist" the signal services of this eminent and extra-ordinarily cheerful individual not only to the business world in various capacities but to the country generally. So many and so varied have been the spheres of his activity that I know I shall not be able to do full justice to Sir Homi's contribution to the social, economic, and political life of this country, but I daresay, there will be many others, both individuals and institutions, that would be writing about or honouring this 80-year young man to make up for what I may fail or forget to record.

Born on September 23, 1881, and educated in the St. Xavier's College, as he was, in Bombay, this 'urbs prima' has naturally claimed a lion's share of Sir Homi's services. It was the Bombay Municipal Corporation, which provided him his first and perhaps the longest (he was a Corporator for over 30 years) platform for public service, that revealed to the people of Bombay and outside his great talents as an impressive speaker. Thanks to his ever present wit and ability for ready repartee, he found no difficulty in throwing his opponents off their feet and overwhelm them. It was not surprising, therefore, that the people of Bombay wanted him to represent them in the Central Legislature. Entering in 1929 what was then the Indian Legislative Assembly, he continued there till 1943. During this long period, he also served, among others, as a member of the First Round Table Conference (1929), the Reserve Bank Committee (1934), Employers' Delegate to the International Labour Conference, Geneva (1937), and Member for Supply, Viceroy's Executive Council (1941-43). The year of his entry as well as the year of his exit from the Legislature represent important stages in the political evolution of this country. At the time he entered the legislature, far-reaching changes were impending in the constitutional structure of India, and when he resigned his membership of the Viceroy's Executive Council, it was as a protest against the refusal of the Viceroy to release Mahatma Gandhi who had gone on a fast in the jail. As a member of the Central Legislature, Sir Homi had to hold his own—which he did admirably—against such stalwart Parliamentarians as Satyamurthi, Bhulabhai Desai, and others.

The Indian Cotton Mill Industry has particular reasons to be grateful for what Sir Homi did to it as a legislator, and it is common knowledge that no other industry with which he has been connected has benefited to the same extent. The explanation probably is to be found in his close association with this industry for several years. Indeed, he first became the Chairman of the Millowners' Association in 1927 and, but for an interruption of one year in the following year, he continued in this capacity right up to 1934, a record broken by only three other chairmen in the annals of this Association.

But this should not mislead one into assuming that Sir Homi's contribution to the other industries or industry generally was any the less significant. Not only

was he closely associated with a number of other industries as a Director of Messrs. Tata Sons Ltd. but he was the prime mover and the President of the Employers' Federation of India for well over a generation. It may not be known to many that the Millowners' Association, Bombay, was responsible for sponsoring the idea of the formation of a Federation of Employers in India and that, like Addison, it conceived the idea thrice but brought forth nothing. It was only the fourth attempt, that in 1933—and then too not without some stiff opposition—that succeeded, and it is not without significance that the appeal on this occasion was signed by Sir Homi jointly with Sir Edward Bennell of Calcutta. It was in the fitness of things that Sir Homi, Chairman of the Millowners' Association, Bombay, which had so closely identified itself with the initiation of the proposal for the Federation, as well as the developments leading to its formation, should have been voted as the first President of the Federation.

Almost twenty seven years ago, Sir Homi joined the Tatas and his connection with that leading industrial house was interrupted only on two occasions, once between 1941 and 1943, when he joined the Viceroy's Executive Council as Supply Member, and a second time from 1949 to 1953 when he was called upon to fill the high office of the Governor of Uttar Pradesh. Incidentally, to Sir Homi also fell the unique distinction of being the Governor of Bombay in his own Home State for a time in 1947. As senior Director and Chairman of the several Tata Trusts, he rendered yeoman service to the House of Tatas, and when he retired in May, 1959, Mr. J. R. D. Tata, Chairman of the Board of Directors of Messrs. Tata Sons Ltd., is stated to have praised him in these words, which are indicative of the very high esteem in which he was—and continues to be—held by the Tatas: "For as long as he likes or thinks us worthy of his advice, Sir Homi is the Chief Adviser to Tatas on any and every subject under the sun." No one can wish for a more handsome tribute from one's chief.

Even half a century or more of his hard and intelligent work has not affected Sir Homi's scintillating wit or his amiable disposition. His relations with those who work with him or for him have been most cordial. There is something uniquely remarkable about the good sense and easy cheerfulness that he brings to bear in his relations with other people. The House of Tatas could not have had a better ambassador than Sir Homi for its relations with the public at large and the Government.

Besides his association with Tatas, Sir Homi was also closely connected with a number of other business concerns, such as the Central Bank of India, the New India Insurance Co., the Associated Cement Companies, and was the President or Chairman, at different times, of the Indian Merchants' Chamber, the Indian Bankers' Association, and the Indian Institute of Art-in-Industry, among others.

INDIAN TUBE

THE INDIAN TUBE COMPANY
(1953) LIMITED
A TATA-STEWARTS AND LLOYDS ENTERPRISE

Sir Homi had a way of his own of conducting company meetings. The leavening effect of his witty remarks left no scope for acrimonious controversies. At one of the annual general meetings of the A.C.C. over which he presided—I think it was the first year after the company had moved into its own commodious office on the Queen's Road — he found that the meeting was dragging on for too long, thanks to the tenacity of some shareholders who seem to be so fond of hearing their own voices, whether they have something worthwhile to say or not. No sooner than one of such marathon speakers sat down, Sir Homi stood up and told the shareholders half seriously and half jocularly: "I promise you some good tea and refreshments on the beautiful terrace of our new building, if you gentlemen cut short your speeches and help me close the meeting early". This remark had the desired effect. When many resolutions, most of them of a routine nature, have to be passed at a company meeting, I have no doubt that many companies would love to have a chairman of Sir Homi's type. For, after such a resolution was once proposed and seconded, I have known him say: "Those for, those against, motion passed unanimously". For the sheer fun of it, perhaps, an indulgent body of shareholders would submit to it. I wonder if, at the meetings of shareholders these days, such strategy would prove equally effective.

M. P. Goes All Out to Industrialise

By CROESUS

IT was not long ago that the Kerala Government held in Bombay a largely attended conference of leading industrialists, business men and financiers with a view to persuading them to interest themselves in the industrialisation of that State. The Governor of Kerala, Mr. V. V. Giri, came all the way from Trivandrum to Bombay to inaugurate the Conference and the concerned Ministers of the State Government, as also the Director of Industries of Kerala, were present to provide whatever information was needed by entrepreneurs with proposals for starting new industries in Kerala. A well-documented souvenir specially prepared was freely distributed on the occasion. What results followed the Conference is still not clear, but, from reports in the daily press, there would appear to be considerable public dissatisfaction in that Southern State at the slow rate of industrial progress not only since the Conference but ever since the First Plan period. Indeed, according to the recent assessment by an ex-Chief Minister of Kerala, Kerala's is an unfortunate case of "almost a barren record" during the first two Plan periods, especially from the point of view of location of Central sector, that is the Government of India, enterprises, as contrasted to the benefits of several crores of rupees derived by other States on this account over the same period. The percentage of Central share to the State's total outlay in the Second Plan period was only 0.45. (It must be added, so as not to mislead the reader, that in the case of no State was this percentage more than 0.90).

These thoughts forced themselves on me when I received from Mr. N. Swami, the energetic Director of Industries, Madhya Pradesh, the other day, a detailed note on what the M.P. Government proposes to do to bring about rapid industrialisation of that State. It is just like Mr. Swami not to make any fuss or fanfare about his State Government's plans, policies and procedures in this behalf, although I know this has been suggested to him more than once and by more than one party. But I have no doubt that most people who ought to know already know almost everything about them. M.P.'s Director of Industries evidently believes

Outside the business world too, Sir Homi's activities have been quite varied. He has thus been associated with several institutions, such as the Indo-American Society and the Indian Council of World Affairs, not to speak of his connection with important social organisations such as the Royal Western India Turf Club, the Cricket Club of India, the Rotary Club and the Wellingdon Sports Club, to mention only the more important of them.

After so brilliant a scoring spread over a half-century of exciting and eventful innings, any one could regard himself as entitled to rest and retirement, but not so the ever ebullient Sir Homi. Like Pheroze Sethna, he apparently believes in the saying "to rest is to rust". No wonder then that, responding readily to the call of Rajaji, he has been taking an active part in the working of the Swatantra Party. For its part, the Swatantra Party has not been slow to draw liberally as much on his political acumen as on his ability to collect funds for the Party in his capacity as the Hon. Treasurer of the Central Party.

A delightful conversationalist, a connoisseur of the liberal arts and, above all, a perfect gentleman, Sir Homi has to his credit a record of service to his country and countrymen who, I am sure, will unreservedly join me in wishing him many happy returns of the day.

in bearding the lion in its own den, as it were. And so he misses no opportunity of meeting enterprising entrepreneurs who may be expected to start industries in M.P., wherever they may be, in Bombay or elsewhere. This doubtless explains his frequent trips to Bombay on such missions. Ere long, we should be hearing about the successful results stemming from this personal approach.

I do not know whether there is any connection between the press note as above and the Businessmen's Conference that was held towards the close of last year. On that occasion, I note Mr. D. P. Mandelia made the following observation in the course of his presidential address:

"I am happy to note that Dr. Katju Sahib has assured us to give all encouragement to industrial progress and to provide an impetus to them, for which we are all very grateful to him indeed. We can attend to a number of things ourselves, but there are certain matters like means of communications and availability of power which are necessarily to be managed by the Government. Don't you remember when Nagda factory was put into commission in the year 1954, there was great hue and cry from political leaders? We were greeted with black flags and many approached the Prime Minister even, putting a plea that the gas of the factory would make the atmosphere unhealthy. But I would like to tell you that, at the time of the purchasing of land, it was a place inhabited hardly by 200 people; it has now a population of 16000 and it consists of 600 radio sets. When we are faced with these man-made difficulties, we are naturally compelled to lag behind. What to say of meeting our demands and giving us proper encouragement, when, sometimes, talks are in the air to impose tax on Chambal water as well! We have incurred heavy expenditure in the construction of the dam to make use of Chambal water, but, instead of giving us felicitations for this act, we are delat with otherwise. This type of feeling is ingenuine."

Connection or no connection, the M.P. Press Note of last month seems to have not only taken note of the misgivings of leaders of business like Mr. Mandelia, but also allays these misgivings by means of appropriate assurances. In fact, according to my understanding of this Press Note, it goes a very long way, so much so that it has anticipated practically every need or difficulty of those wanting to start new industries and has tried to meet it. Thus, the M.P. Government has undertaken to acquire and allot whatever land is required by a prospective industrialist, after developing it for industrial purposes, once his scheme is approved, on a long lease at nominal rates of premium and ground rent. The relevant lease deeds need not await the long laborious routine of acquisition by the Revenue Department; this responsibility now rests with the Director of Industries himself. It has promised suitable all-weather road connection from a suitable central point to the nearest pucca road. Similarly, power transmission lines and water mains are to be provided at suitable central points. Power is to be supplied to small-scale industries at nine naye paise per unit for five years from the starting of production and at concessional rates varying from six naye paise to nine naye paise per unit to other industries, also for five years from the starting of production. If, in certain places, industrialists have to set up their own generating sets, the M.P. Government has undertaken to subsidise the generation cost at 10 naye paise per unit for three years from the starting of production or until the M.P. Electricity Board supplies power. What is perhaps even more important, in the case of those industries where the cost of power may constitute a substantial part of the overall cost of production, the State Government proposes to offer partial or even total exemption from Electricity Duty for a specified period. In the case of industries generating their own power, this period is specified as five years from the date of the plant going into production. Yet other inducements relate to sales tax and octroi. For example, only one per cent ad valorem sales tax is to be charged on all new items

of machinery, equipment and raw materials required by industries; attractive and uniform rates of octroi are to be levied on these items, and, in certain cases as, for instance, basic raw materials, such as coal, cement, and furnace oils, the M.P. Government even contemplates to fix a ceiling beyond which octroi cannot be levied by local bodies.

In addition to all these inducements, it is noteworthy, the M.P. Government offers to use its good offices to facilitate and expedite supplies of controlled raw materials by the Union Government. Presumably it is for this purpose that the State Government wants to station a Liaison Officer in New Delhi. The M.P. Government is also prepared to participate in the share capital of certain new industrial undertakings or to grant loans where capital participation may not be feasible. And, above all, to implement all these and to deal promptly with applications for new ventures, a separate agency, which can give undivided attention to all industrial development matters, has been created.

It should be clear from what has preceded that the M.P. Government has gone as far as any State Government can go in order to attract new industries. The State has vast industrial potentialities. There are impressive deposits of some basic minerals, plenty of power generation resources (this is what very few States in India can claim), large forests and a network of river systems. From the point of view of marketing, M.P. is ideally located, thanks to its central situation. Following a techno-economic survey of the State a couple of years ago, the M.P. Government set up a State Board of Industries and Mineral Resources which has made valuable recommendations for the industrial development of the State, and it is on the basis of these recommendations that the Government of M.P. has since offered the inducements I have indicated above. It is for enterprising entrepreneurs to avail themselves of these really attractive inducements and make their contribution to the economic development of the State, nay of India.

Business Notes

Third Plan Projects

DISPERSAL ON REGIONAL BASIS

THE UNION GOVERNMENT has announced the location of seven major heavy industrial projects to be taken up in the public sector during the Third Plan period. Among these are included two precision instruments projects, two heavy electrical equipment plants, one machine tools project, one heavy plate and vessels project and one high-pressure boilers plant. The announcement contains no surprise except in one case i.e. the establishment of a precision instruments project in Kerala.

Both the precision instruments projects will be set up with Soviet Union's assistance. One plant is to be located at Kotah, in Rajasthan, and the other in Kerala State; the exact site for the Kerala plant is yet to be decided upon. The Kotah plant will manufacture electro-magnetic instruments, while the Kerala unit will turn out hydraulic, pneumatic and mechanical instruments. The total cost of setting up either of these two plants is estimated at Rs. 8 crores. When in full production, each of them will be turning out precision instruments valued at Rs. 10 to 15 crores per annum. The two projects will be amongst the biggest of their kind in the world and would produce precision instruments for a wide range of industrial needs under one roof, contrary to the present practice elsewhere of these instruments being produced in several factories.

Of the two heavy electrical equipment projects, one will be located at Ramachandrapuram, a village about 6 miles from Hyderabad, in Andhra Pradesh, and the other at Ranipur, in Saharanpur District of Uttar Pradesh. The Ramachandrapuram plant will be set up with technical collaboration from Czechoslovakia and the Ranipur project with assistance from the Soviet Union. The total cost of setting up of either of these projects is estimated at about Rs. 30 crores. The Ramachandrapuram plant will undertake the manufacture of steam turbines, alternators and other heavy electrical equipment. The Ranipur plant will be manufacturing turbines, AC/DC motors, alternators, generators and a wide range of other heavy electrical equipment. Both these projects will be under the control of the Heavy Electricals Ltd., which is also managing the first heavy electricals manufacturing plant set up under the Second Plan at Bhopal with British collaboration. Since the gestation period in the case of an electrical equipment manufacturing unit is seven to eight years, the two new plants, along with the Bhopal unit, will be meeting about 70 to 75 per cent of India's requirements of heavy electrical equipment only by the end of the Fourth Plan period. The total output of these three units by 1970-71 is estimated at Rs. 80-100 crores. The programme of manufacture of the two new units has been so framed as to have a completely integrated pattern of production at all the three units, avoiding overlapping.

The high-pressure boilers plant is to be established in the Tiruchi area of Madras State with technical collaboration and financial assistance from Czechoslovakia. It will be one of the biggest of its kind in the world, manufacturing high-pressure boilers, boiler equipment and high-pressure vessels. The total investment on this project will be about Rs. 15 to 20 crores. Its annual production will be of a similar order. This plant will be turning out boilers to suit the major requirements of the thermal power plants to be established in the country during the successive Plan periods. High-pressure chemical and other equipment will also be manufactured at this unit.

The heavy plate and vessel works and heavy structural works, to be set up with British collaboration, will be established in the Wardha area of Maharashtra State. The plate and vessel shops of this works are expected to have an annual output of 12,500 tons of high quality plates and vessels required for chemical, fertiliser, petro-chemical and other allied industries. The annual production of the heavy structural shops will be approximately 25,000 tons. This project is expected to cost Rs. 15 crores.

The machine tools project is to be located at Pinjore, near Kalka, in Punjab. It will have capacity to produce 2,000 machines per annum, valued at Rs. 6 crores. Capital cost of this project is estimated at Rs. 8 crores. This will be the third machine tools project to be undertaken in the public sector. It will be financed by the Hindustan Machine Tools Ltd., Bangalore, in collaboration with the German Democratic Republic.

The foreign exchange expenditure on all these seven projects is estimated at between Rs. 50 crores and Rs. 60 crores. All this has already been underwritten by the collaborating countries. Preliminary project reports for all of them are at an advanced stage of preparation.

The final decisions on the locations of these projects have been taken in conformity with the recommendations of the Technical Committees which had been specifically directed to keep in mind, while suggesting positive sites for these projects, the objective of regional dispersion of heavy industrial projects. As such, no significant economic consideration has been sacrificed in locating these projects at the proposed sites.

The two heavy electrical equipment plants and the high-pressure boilers plant will take about five years for completion. The other four projects will be ready in about three years' time. All the heavy industrial projects, including the heavy machine building project of Ranchi, will have designing units attached to them. This will facilitate the training and emergence of Indian designers of heavy machinery.

State Loans

BETTER RESPONSE

THE OVERALL response to the State Governments loans this year has been very much better than that to the Central Government loans issued earlier this year. The total subscriptions for the 13 State Loans amounted to Rs. 91.84 crores, as against the aggregate loan amount of Rs. 80 crores. As expected, a major portion of the total subscriptions, it would appear, was subscribed by the Life Insurance Corporation and a few big banks and, at least in the case of the latter, it is believed, mild pressure was employed by more than one State Government to ensure full subscription. As compared to the response to the State loans in 1959, however, even this year's response cannot be said to be quite satisfactory. Thus, as against a total loan amount of Rs. 63.50 crores called for in 1959, the total subscription amounted to as much as Rs. 102.38 crores, the percentage of oversubscription working out to a little over 61, as against only about 15 per cent this year. In 1960 also, the percentage of oversubscription was more or less around this year's level.

A feature of the current year's State loans is that the total cash subscription of Rs. 86 crores was the highest for the last four years; so also was the total loan amount invited the highest for any year over the same period. Among individual State loans, there was rather overwhelming support to the Uttar Pradesh loan, which was oversubscribed by more than 1½ times on the first day itself. This explains why the percentage allotment in the case of this loan has been the lowest at 63, compared with the cent per cent allotment in respect of the loans of Gujarat, Kerala, Madhya Pradesh, Madras, Maharashtra, Mysore, the Punjab and West Bengal. Further, the loans this year were oversubscribed in the case of five States (Bihar, Orissa, Andhra, U.P., and Rajasthan) while, in respect of the remaining eight States, they were just "fully subscribed."

Of the 13 Loans, subscription lists for five State Loans were oversubscribed. Of this, the lists of Bihar, Orissa and U.P. loans were oversubscribed and closed on the first day itself, while the Andhra and the Rajasthan Loans, which were also oversubscribed, had to be kept open till the third day. Of the other loans, the Maharashtra and the West Bengal Loans were closed on the first day, the Gujarat Loan on the second day, and the other State loans, namely Kerala, M.P., Madras, Mysore, and the Punjab, on the third day.

The following is a comparative table of the loan operations of State Governments in 1961 and 1960:

1961			1960			(Rs. in crores)
Amount of loan	Amount subscribed	Remarks	Name of the State	Amount of loan	Amount subscribed	Remarks
10.00	12.13	Over subscribed	Andhra Pradesh	9.00	13.23	Over subscribed

'ENGLISH ELECTRIC'

HIGH RUPTURING CAPACITY HEAVY DUTY FUSEGEAR

H. R. C. CARTRIDGE FUSE-LINKS

Hermetically sealed construction—Non-deteriorating—ASTA certified for 35 MVA rupturing capacity—Visible indication of operation—Ratings up to 300 amps.

COMBINATION FUSE-SWITCHES

Ratings from 30 to 750 amps—Rugged construction, fully shrouded and interlocked—Type tested for 35 MVA rupturing capacity.

COMBINATION FUSE-SWITCHBOARDS

Incorporating Combination Fuse-Switches upto 750 amps—Robust and compact construction—Readily modified and extended—Type tested for 35 MVA rupturing capacity.

DISTRIBUTION FUSE-BOARDS

Robust, dust and moisture proof construction—Type tested for 35 MVA rupturing capacity—Ratings from 15 to 100 amps.

Flexibility of power distribution—Can be installed without disturbing existing layout or production—Avoids chasing of floors for ducting—Approved by Fire Insurance Authorities.

OVERHEAD BUSBAR EQUIPMENT

A complete range of distribution equipment manufactured at the Madras Works of The English Electric Company of India (Private) Ltd.

G. D. BIRLA
CHAIRMAN

S. T. SADASIVAN
GENERAL MANAGER

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LTD.

[Incorporated in England]

NOTICE is hereby given that the Board of Directors of this Company have decided to recommend to stockholders at the forthcoming Annual General Meeting that a Final Dividend for the year ended 31st March, 1961 on the Company's Ordinary Stock at the rate of £4 per cent net (Tax applicable at 7s. 9d. in the £) be paid on the 11th November, 1961 to those stockholders whose names are registered in the Company's Stock Register on the 24th October, 1961.

Applications for transfers received in this office before 12 O'clock noon on Tuesday, the 24th October, 1961, will, if otherwise satisfactory, be registered at that date for the purpose of participation in the above Dividend.

BY ORDER OF THE BOARD
H. C. BOWKER
AGENT

VICTORIA HOUSE

Calcutta, 19th September, 1961.

ANNOUNCEMENT

The following Annual Numbers of THE EASTERN ECONOMIST are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Re. 50/-.

- | | |
|--|----------|
| 1. India & the World and India in 1950 | Rs. 5/- |
| 2. A Social History of the Indian People & India in 1951 | Rs. 5/- |
| 3. India & the Free World and India in 1952 | Rs. 5/- |
| 4. India in Asia & India in 1953 | Rs. 5/- |
| 5. India in South East Asia and India in 1954 | Rs. 5/- |
| 6. India & the Communist World and India in 1955 | Rs. 5/- |
| 7. India in 1975, A Study of the next Twenty Years & India in 1956 | Rs. 7.50 |
| 8. India & the Middle East and India in 1958 | Rs. 7.50 |
| 9. India and Europe & India in 1959 | Rs. 10/- |
| 10. India & North America and India in 1960 | Rs. 10/- |

Gram: "Research"

It is seen from the foregoing table that Orissa, Uttar Pradesh and Andhra Pradesh loans were over-subscribed both last year and this year, while Maharashtra and Mysore loans which had been oversubscribed last year were only just fully subscribed this time. On the other hand, the Bihar loan which was just fully subscribed last year has been oversubscribed this year.

I.D.A.

FIRST YEAR'S PERFORMANCE

INTERNATIONAL DEVELOPMENT ASSOCIATION, designed to aid economic development with credits bearing less heavily than conventional loans on the balance of payments of under-developed countries, came into existence on September 24, 1960. During its first year's performance it has carried out transactions to the extent of \$101 million in the form of 50 interest-free development credits to four countries. By the end of the fiscal year IDA had 51 Member Governments whose subscriptions total the equivalent of nearly 906 million dollars.

Mr. Eugene R. Black, President of IDA, commenting on the necessity of loans pointed out that "the problem is compounded by the circumstances of many newly independent countries: they are not able to rely to the same extent as before on the financial support of the metropolitan powers, including guarantees on loans floated abroad; but they have not yet developed a credit standing of their own sufficient to enable them to borrow on the scale they require". The first year's report reveals the significance of IDA's formation at a very crucial moment. It has a large list of proposals under investigation all over the world. They include projects for the development of electric power, transportation, agriculture and other activities of the type traditionally financed by the World Bank. They also include projects of a type not hitherto financed by the Bank — Municipal Water-Supply and Technical Training.

India got a credit of 60 million dollars signed on June 21, 1961. It is to cover half the cost of improvements to the National Highways of India during the first 3½ years of the Third Five-Year Plan. The funds are to be utilised for the construction of nearly 660 miles of highways including 19 major bridges, which are likely to open up some of the less developed parts of the country, improving connections between important agricultural and industrial centres and relieving traffic congestion in the vicinities of two principal cities and ports — Bombay and Calcutta. This credit is likely to go a long way to eliminate some of the major deficiencies in the national highways system and relieve to a considerable extent pressure on the railways. More recently, on September 6, 1961, IDA extended a development credit to the extent of 6 million dollars for the expansion of tube-well irrigation in Uttar Pradesh, one of the most important agricultural regions in the country. A four member delegation recently visited the U.S. to negotiate another loan for 3 power and drainage projects from IDA. The role of IDA in the Indian economy is, it seems, on the increase.

I.F.C.

PROBLEMS OF DEVELOPMENT

MR. R. L. GARNER, President of the International Finance Corporation has, in his annual report, outlined some important problems posed by industrial operations in developing countries. For instance, as far as the market is concerned, he believes that a careful assessment has to be made. "In our experience", he says, "it has been the rule rather than the exception

that both local and foreign business men tend to over-estimate potential markets, or at least to under-estimate the time required for the markets to materialize". In respect of financial set-up, he believes that an ample margin of error has to be provided to enable the enterprise to survive a slow build up of demand before the volume develops to a profitable level. Another factor that has to be kept in mind is "the uncertainty and error in calculating costs and especially the provision for working capital". Advising against the dependence on the commercial banks for working capital, he warns that a tightening in the general economic and financial situation may well force the banks to restrict rather than extend credits. "Inflation and the consequent decrease of purchasing power make the problem of maintaining adequate working capital even more acute." This problem is a "constant one and demands careful attention in establishing and maintaining a sound financial structure."

While outlining the significance of joint ventures in the underdeveloped regions, Mr. Garner pointed out that if industrialisation is to proceed to any substantial extent, there must be a considerable adjustment between the use of the machines and the habits of the people. Towards this end, joint enterprises involving national and foreign business men by sharing capital and management can prove of considerable help.

The working of the Corporation for the year from July 1, 1960, to June 30, 1961, reveals that the year's new investment commitments total 6.2 million dollars and brought the cumulative total of IFC investments net of cancellations of expirations to 44 million dollars. During this year a company in India, KSB Pumps Ltd., got a loan to the extent of \$210,000. This new enterprise is building a plant near Poona to manufacture pumps designed for a variety of local needs. Principal shareholder in the Company is KSB of Germany, leading manufacturers of pumps and compressors etc. The loan was at the rate of 7 per cent interest. Another loan received last year was for Assam Sillimanite Ltd., a company manufacturing refractory bricks, at the rate of 6½ per cent.

Textiles

EXPORTS TO AFRICA

DESPITE THE all-out effort that is being made supposedly, our foreign exchange position has continued to remain the same, which only establishes that all is not too well on our export front as yet. What is distressing to find is that exports of even some of our traditional items have not made headway; in fact, they have either remained stagnant or declined to a considerable extent. For instance, the average exports of cotton textiles during the past five years are only 750 million yards, as against the target of 1,000 million yards set at the Buxton Conference in 1952. The export figure for 1960 stood more or less at only 600 million yards. It is known that higher cost of production, poor quality, and the ever-growing competition in world markets are instrumental for the decline in our cotton textile exports. These are factors which apply as much to other items of our exports. However, according to the Report of the Cotton Textile Delegation to West Africa, sponsored by the Cotton Textile Export Promotion Council, there are other factors, besides, that have been primarily responsible for the decline in our exports to North and West African countries, viz. Tunisia, Libya, Nigeria, Ghana, Ivory Coast, Senegal and Morocco — a region covering a total population of as many as 60 million. These countries, which have won independence only in recent years, are primarily agricultural and nearly all of them are

endeavouring their utmost rapidly to industrialise themselves. Evidently the fruition of these efforts will take some more time, but the unfortunate fact, as the Report observes, is that, even before this has come to happen, a traditional exporter like India is slowly being pushed out from those countries by comparatively new entrants like East Germany, Poland, China, Bulgaria and Czechoslovakia. The reasons are stated to be the stiff competition India has been facing in these markets, especially from the U.K. and Japan. Besides these, the Report has noted that India is not manufacturing prints which have been very popular in African continent. In countries like Nigeria, Ghana, Ivory Coast and Senegal, the consumption of African Prints is of the order of 80 to 90 per cent, while, in Tunisia and Libya, prints on spun rayon, viscose rayon and cotton satin fabrics dominate. These African prints are classified into (a) wax prints, (b) imitation prints and (c) over prints with "large and loud" designs. At present, it is estimated that more than half the share of the total exports is being supplied by Japan, while the U.K. and Holland have followed in that order.

An important development is that new textile mills are coming up in some of these markets, and to protect them, while the usual tariff barriers are being raised by the concerned governments, in some countries, the Governments are banning all imports of greys. Notwithstanding all these limitations, it is noteworthy that the Report has observed that "this is an area which offers excellent opportunities to develop a market for our processed textiles," but, then, Indian industry must make "a definite effort to specialise in the production of quality required in North and West Africa" to exploit it to our advantage.

Coal

BREAKING THE TRANSPORT BOTTLENECK

AT MOST of the conferences it generally happens that there is a stating of each other's viewpoints and hardly a meeting of minds. The two-day coal conference of consumers and producers held recently to discuss the change in the pattern of coal movement in this way was no exception. While the Minister for Steel, Mines and Fuel was vociferous in stating that the railways would not be able to move all the coal needed by industry and that the coal dumps was a must, the representatives of all important chambers of commerce and associations of coal merchants were against moving the coal by road from the dumps.

The Government's scheme implies that those consumers who can receive and unload full wagon loads will get their coal directly; others will have to go to the coal dumps which the Government is establishing at selected sites in every State and where all coal will be unloaded. From the dumps to the point of consumption, the transportation of coal will be by road. The advantages of the coal dumps scheme put forward are that the railways will be able to move coal even in the slack season when the industries normally do not indent for coal supplies and that the bulk movement of selected dumps will make for efficient use of haulage capacity.

Whatever may be the advantages of the coal dumps scheme, it is apparent that the price of coal would go up. The scheme would shift the burden of transport to small industries and they would have to bear an enormous capital cost to arrange transport by road. Although railways have made available quite a large number of wagons in recent months and the turn round of wagons has also improved, it is still felt that the improvement has been only marginal. The increase on the whole has lagged behind the industry's growing wagon requirements. No doubt resort to road transport might improve matters to some extent, but the road

system has also its limitations. Since it is admitted that the coal dumps scheme will push up the handling charges of coal and thus the price the consumer has to pay, it is obvious that the game is not worth the candle. As it involves a costly waste to the economy, would it not be better to modify the provisions of the scheme? The transport bottleneck has been a great hindrance in the development of the economy. No time should be lost to set the house in order.

Cement

THE PROBLEM OF COSTS

THE INSTALLED capacity of cement industry in India is at present around 8.93 million tons and this has to be raised to 15 million tons by the end of Third Five-Year Plan. It is true that there is going to be a ready market for this output by 1965-66, but it cannot be forgotten that costs of production form a major element in the marketing of such commodities. This fact was highlighted by Mr. P. Suryanarayana, Chairman of the India Cements Ltd., in his address at the Annual General Meeting of the Company held recently, (report published in "The Eastern Economist" dated September 15, 1961). The Company recorded a 27 per cent increase in the production of clinker while there was practically no proportionate increase in the profits earned. This was because the cost of production has been going up rapidly. The Company could not procure coal in required quantities and it had to arrange coal supplies by sea-cum-rail route which increased the cost of coal delivered at the factory. It had to switch on to the use of furnace oil for one of the kilns due to coal shortage; the costs of furnace oil though were fairly prohibitive.

Wages and salaries for the staff of the Company too were revised in conformity with the recommendations of the Central Wage Board for Cement Industry. The cost of gunnies required for packing cement increased in the later half of 1960 and the Government did not choose to effect an upward revision in the quarterly packing charges till very late, when it permitted the use of old gunnies so as to off-set the increase in the prices of new bags. It is quite likely that the Tariff Commission, which has now taken up the question of revision of cement prices, will take all these factors into consideration so that the output of the cement companies does not suffer on account of rising costs.

THE INDIAN TOOL MANUFACTURERS LIMITED

Notice under Sec. 154 of the Companies Act, 1956.

NOTICE IS HEREBY GIVEN that the SHARE TRANSFER BOOKS of the Company shall remain CLOSED from Monday, the 9th October, 1961 to Monday, the 16th October, 1961 (both days inclusive) in connection with the issue of Bonus Shares.

By Order of The Board,
R. H. TOPRANI
Secretary.

BHILAI STEEL PLANT'S EXPANSION

LAST week we published some details of the expansion programme of the Rourkela Steel Plant. Some details are now available of the expansion programme of the Bhilai Steelworks from one million tons ingots output to 2.5 million tons. The equipment for the expansion programme of this Steelworks would be supplied by the Soviet Union which has already made available the necessary foreign exchange for the purpose.

The general plan of the expansion programme provides for the development of the existing plants and shops of the Steelworks and construction of new plants and structures. The Steelworks at present has 3 coke oven batteries of 65 chambers each, capable of producing 11,45,000 tons of plus 25 mm metallurgical coke, two 50 sq. m. sintering machines, capable of producing 10,00,000 tons of fluxed sinter, 3 blast furnaces with a useful volume of 1,033 cu. m. each, capable of turning out 11,10,000 tons of pig iron (8,00,000 tons of open-

neath pig iron and 3,10,000 tons of foundry iron), 6 stationary 250-ton open hearth furnaces with Dinas roofs having a capacity of 10,00,000 tons of steel ingots, and a rolling mill plant comprising 4 sections — a blooming mill, a continuous billet mill, one rail-structural mill and one merchant mill, having capacities to roll 8,59,000 tons, 4,27,000 tons, 3,65,000 tons and 2,55,000 tons respectively. The expansion programme envisages addition of 3 coke oven batteries of 65 chambers each, one 50 sq. m. sintering machine, 2 blast furnaces, four 500-ton open hearth furnaces, certain new facilities for the rolling mill plant, one 250 mm wire mill and a new unit to process slag. This will raise the capacities of the various sections of the Works to 22,90,000 tons plus 25 mm metallurgical coke, 18,70,000 tons fluxed sinter, 23,61,000 tons pig iron (20,90,000 tons open-hearth iron and 2,71,000 tons foundry iron), 25,00,000 tons steel ingots, 21,42,000 tons blooms, 12,63,000 tons billets, 7,50,000 tons rail structurals, 5,00,000 tons merchant structurals, 4,00,000 tons steel wire and 7,00,000 tons by-products from slag.

STRUCTURE AND OUTPUT OF THE PRINCIPAL PLANTS OF BHILAI STEELWORKS AS AT PRESENT AND AFTER THE COMPLETION OF THE EXPANSION PROGRAMME

Plant	Product	Expansion project	Annual Output (Thousand tons)	
			Project of First stage of the works total	Works expan- sion project total
Coke	Metallurgical coke + 25 mm	Six 65-oven 21.7 cu.m. coke batteries ..	1,145	2,290
Sintering	Fluxed sinter	Three 50 sq. m. sintering machines ..	1,000	1,870
Blast furnace	Iron (natural) including open-hearth foundry iron	Three 1,033 cu. m. and two 1,719 cu. m. blast furnaces ..	1,110	2,361
Open-hearth	Ingots	10 stationery open hearth furnaces, including five 250 tons and five 500 tons furnaces ..	1,000	2,500
Rolling mill	Blooms	1,150 mm blooming mill with 5 groups of soaking pits ..	859	2,142
	Billets	850/700/500 mm. 12 stand continuous billet mill ..	427	1,243
	Finished rolled stock	950/800 mm rail-structural mill ..	365	750
Slag processing	-do-	350 mm merchant mill ..	255	500
	-do-	250 mm wire mill ..	—	400
	granulated slag	Hydro chute granulation unit ..	—	250
	Slag wool	Department for production of mineral wool and products ..	—	38
	Cast slag gravel	Crushing-screening unit for production of cast slag gravel ..	—	412

As at present, the Works after the completion of the expansion programme, will continue to be connected with the Calcutta-Bombay railway trunk-line via Bhilai station. All freight (except ore and limestone) incoming to the Works from the external railway network will be received and all saleable products of the Works out-going to the external network will be shipped via the existing works station. Coal trains

arriving at the Works will be unloaded with the aid of car-tippers; a third car-tippler is to be installed to handle the increased requirements of coal. Iron ore trains arriving by the ore transportation branch line from the Rajara-Pahar mines would be received at Maroda station, which is scheduled to be built in the State railway network. From the Maroda station, ore trains will be driven to the Works by a newly built

track. Limestone will be delivered from the railway branch line running from the Nandini quarry to the raw materials stations by a new connecting line. Ore and limestone will be transported to the Works by cars of Hopper type. All products of the slag processing plant, to be set up under the expansion programme, are to be shipped by motor vehicles. Internal transportation will continue to be serviced by the existing open-hearth steel and blast furnace stations where additional tracks will be laid to handle the increasing freight flows. 37.3 km of new railway tracks and 5.6 km of new motor roads are to be built additionally. The rolling stock of the Works after the completion of the expansion programme, will consist of 36 diesel locomotives and 314 cars. The existing diesel locomotives and car depot is to be expanded to handle the maintenance of the additional diesel locomotives and cars. The motor fleet of the Works is to be increased to 80 cars. After the completion of the expansion plan, the more vital railway tracks will be provided with centralisation, automatic blocking and signalling systems. Architectural and constructional design of buildings and structures of the Works is to be maintained.

COMPLETION IN FOUR YEARS

The expansion programme is scheduled for completion within 4 years. In the course of the first two years, it is planned to build blast furnace No. 4 with a capacity of 1,719 cu. m., coke oven batteries Nos. 4 and 5, open hearth furnaces Nos. 7 and 8 with a capacity of 500 tons each, the slag processing plant, 4 additional groups of blooming soaking pits and instal additional equipment for the rail-structural and merchant mills. In the third year, it is planned to put into operation blast furnace No. 5, coke oven battery No. 6, open hearth furnace No. 9 and two more groups of blooming soaking pits. During this year there are also plans to complete the reconstruction of the continuous oillet mill. In the course of the fourth year, there will be put into operation the third sintering machine, the open hearth furnace No. 10, the last two groups of soaking pits and the new wire mill. The present open hearth furnace No. 6 is to be reconstructed for a double charge. The commissioning of the basic components will be accompanied by putting in operation the respective auxiliary and service facilities.

The total amount of equipment to be installed at the Works in the course of its expansion is estimated in round figures at 71,545 tons. Of this, 56,722 tons of equipment will be installed in the principal plants. The construction site will be supplied with power from the functioning plants of the Works. The maximum number of workers engaged in the construction work is estimated at 32,000 men.

TECHNICAL STANDARDS

The expansion programme envisages a further rise in the technical standard and economic indices of the Works' operation. It provides for the introduction of advanced technological processes, equipment and construction methods verified by the operational experience of the Soviet Union during recent years. The rise in technical standard of the Works ensures the following:

(a) Construction of larger (as compared with the project of the first stage of the Works) metallurgical units, i.e. blast furnaces with a useful volume of 1,719 cu.m. and open hearth furnaces with a capacity of 500 tons.

(b) Improvement of technological processes and units design such as oxygen utilisation in open hearth furnaces not only for enrichment of combustion air, but also for blowing through the furnace bath; the applica-

tion of magnesite-chromite crowns in open hearth furnaces, mould casting directly from molten iron coming from the blast furnace plant; the increase in the weight of ingots for heavy rail rolling and the increase in the size of blooms for the continuous billet mill, etc.

(c) Better utilisation of equipment and floor spaces, in particular, increased utilisation of rolling mills, repair shops, power and transport facilities.

(d) Fuller utilisation of industrial waste (for instance, the arrangements for the conversion of blast furnace slag into building materials) as also of excess coke oven and blast furnace gases, etc.

(e) Wider mechanisation and automation of production processes and transport operations; for instance, in the dispatcher's control of the Works gas facilities more extensive use will be made of telemechanical aids for control and signalling purposes, the transportation network is to employ electric centralisation of switches and signals, semi-automatic blocking and automatic signalling at crossings, etc.

(f) More efficient and cheaper construction methods — wider application of reinforced concrete structures, including fabricated members, etc.

The improvement envisaged in the technical standard of the Works will find its reflection in increased labour efficiency. The total number of men employed at the Works at the completion of the expansion programme will be nearly 12,000, as against 7,300 employed at present—an increase of 65 per cent for 2½-fold increase in production. Under the expansion plan, the annual steel output per man is estimated at 208 tons, as compared with 137 tons at present—an increase of 52 per cent.

COAL CONSUMPTION AND BY-PRODUCTS

According to the composition of coals which are to be delivered to the Works for coking, metallurgical coke will contain 23 per cent ash, 0.6 per cent sulphur and 0.8 per cent volatiles. The programme envisages a corresponding expansion of the by-products output. The yield of the principal coking by-products under the expansion plan is rated as follows:

	Per cent of dry blend
Tar, anhydrous	2.70
Ammonium sulphate (the ammonium yield is adopted at 0.25 per cent) ..	0.99
Crude benzol distilling at 180° ..	0.60
Coke oven gas with a caloric value of 4,300 Cal./cu.m. per ton of dry blend ..	305 cu.m.

The total amount of chemical products from the by-product plants will run into 138,000 tons annually, including: 32,600 tons of ammonium sulphate; 2,980 tons of toluene; 12,480 tons of pure benzol; 3,000 tons of various oils; 3,400 tons of naphthalene; 1,900 tons of crude phenols; 42,850 tons of road tar; 32,500 tons of combustible mixture for gas carburation in open-hearth furnaces, etc. The amount of chemical products for sale, less internal utilisation at the Works, will be about 105,000 tons per year.

The plan provides for the expansion of plants for the recovery and processing of coking products, which will require the installation of additional equipment and apparatus. The gas cooling, benzol recovery and distillation systems in the chemical product recovery plant remain unchanged.

Owing to the small ammonia content in the tar supernate, no lime is to be used when processing it in

150 YEARS

KRUPP

For 150 years, the name of Krupp has been identified with superb workmanship and enduring quality.

The name of Krupp is also linked with outstanding pioneer work, past and present, in many fields of industrial research, planning and manufacture.

The results achieved have caused the name of Krupp to be permanently associated with progress in engineering throughout the world. Illustrated on this page is one of the more than 3,000 items contained in our Catalogue "KRUPP PRODUCTS AND SERVICES": Full-portal level-luffing wharf cranes.

Products and Services:

Exploration of mineral deposits · Engineering of mining schemes · Design, layout, and supply of plant for the production and processing of ferrous and non-ferrous metals · Preparation and dressing plant for ore, coal, and other minerals · Chemical-process plant · Cement, lime, and gypsum plant · Bridges, hydraulic structures, and reinforced-concrete structures · Materials, pressure vessels, and tanks for nuclear reactors · Castings and forgings · Rolls · WIDIA-sintered carbide · Magnetic materials · Cable-making and stranding machines · Hydraulic extruders · Machinery for the rubber and plastics industries · Edible oil extraction plant · Sheet-metal working and can-making machinery · Mobile water purifiers · Plate and sheet-metal fabrications · Pneumatic tools · Motor trucks, buses, and special-purpose vehicles · Diesel and electric locomotives · Special-purpose freight cars · Ocean-going vessels and river craft · Diesel engines · Giant excavators and bulk-handling plant · Power shovels and cranes.

Branch Offices at Delhi, Calcutta and Madras

the sulphate department. In connection with the increase in the amount of processed crude benzol in the benzol rectification plant, continuous removal of toluene is envisaged, and a new process of evaporation of the washed fraction-benzol-toluene-xylene is to be introduced and the functions of rectification units redistributed. The tar distillation and fraction processing systems in the tar distillation plant remain as they are. A second tubular apparatus will be installed in connection with the increase in the plant output. The sulphuric acid plant is to be expanded. The projected additional units are a new oven, a heat exchange for the catalyst chamber and a new sprinkling cooler for the monohydrate absorber. The output of the sulphuric acid plant will amount to 27,000 tons annually in terms of monohydrate, which will fully meet the requirements of the chemical plants.

The details of the expansion of the major sections of the Works are as follows:

(1) **Blast Furnace Iron Production:** The open-hearth plant requirements for pig iron have been estimated at 1,962,000 tons. The total Works requirements including the foundry (72,000 tons) will amount to 2,034,000 tons per year. The blast furnace plant is to be expanded by the erection of two blast furnaces with a useful capacity of 1,719 cu.m. each. These blast furnaces exhibit a higher output and technical and economic efficiency in construction and operation than the 1,033 cu.m. furnaces which have been set up up till now. (In the U.S.S.R., large blast furnaces are mostly built with a capacity of 1,719 cu.m. and over, which show high performance). 1,719 cu.m. blast furnaces are to have an increased gas pressure of about 1 atm. gauge at the furnace top. The coke combustion intensity in these furnaces is to be 0.90 ton per cu.m. of furnace volume per day. Their output is rated at 1,738 tons per day or 608,000 tons per year.

The project envisages that two 1,033 cu.m. furnaces and two 1,719 cu.m. furnaces will produce only open-hearth iron, while one 1,033 cu.m. furnace will produce foundry and open-hearth iron. With 350 blast furnace operating days per annum in the average furnace campaign, the annual output of pig iron in the plant will be 2,090,000 tons of open-hearth iron and 271,000 tons of foundry iron, making a total of 2,361,000 tons. Liquid open-hearth iron will be delivered to the open-hearth plant (1,962,000 tons) and to the foundry for mould casting (69,000 tons). The remaining open-hearth pig iron (59,000 tons) and foundry iron (271,000 tons) will proceed to the casting machines. Of the 330,000 tons of solid pig iron, 3,000 tons will be used in the foundry, while 327,000 tons will go for sale, including 268,000 tons of foundry iron and 59,000 tons of open-hearth pig iron which can be utilised by other works for the production of ingots or steel castings.

(2) **Blast Furnace Slag Processing:** A plant has been designed for processing about 780,000 tons of molten slags per annum, which corresponds to the slag output by three 1,033 cu.m. blast furnaces. The annual output of the slag processing plant amounts to 700,000 tons of slag products. The output of slag building materials and their assortment have been determined with a view to utilising these materials, essentially, in the Bhilai area.

The following materials are scheduled for production by agreement with the Indian Government: granulated slag, mineral wool, mineral wool mats and cast slag gravel. Granulated slag produced in the amount of 250,000 tons per year is to be utilised in the cement industry of the Works area as an admixture in the production of slag portland cement and as a partial substitute for sand in the preparation of concrete and reinforced concrete at the construction sites of the

Works and the town. Mineral wool and products of the same are intended to be used as insulation material (ceiling and wall panels, etc.) in industrial and housing construction in the Bhilai area and partly in other areas. 32,400 cu.m. of mineral wool and 183,600 cu.m. of mats are to be produced, including 112,000 cu.m. of synthetic tar bound mats and 71,600 cu.m. of stitched mats with paper lining. It is planned to produce about 4,00,000 tons of cast slag gravel and to use it in the production of concrete and reinforced concrete in the construction of the Works and the town in place of crushed stone. The slag processing plant is to include: a hydro-cyclone granulation unit, a section for the production of mineral wool and products by horizontal glowing with subsequent processing of slag fibres, and a crushing-screening unit for the preparation of cast slag gravel.

The project provides for a possible expansion of the plant to handle all the slag produced by the five blast furnaces (1,662,000 tons).

(3) **Steel Production and Open Hearth Furnaces:** The total amount of steel to be produced is rated at 2.5 million tons of ingots annually. The production of carbon rail and merchant steel has been provided; a possibility of producing low-alloy metal is also envisaged. The increase of steel production is to be achieved by the expansion of the functioning open-hearth plant, involving the installation of 500 tons open hearth furnaces with steel tapping into two 270-ton ladles, and the reconstruction of one of the existing furnaces to handle 500 tons. This will provide for the expansion of the plant foreseen when building its first stage, and for the necessary increase of steel production with relatively low capital outlays.

The new open hearth furnaces are to have magnesite-chromite crowns. The existing 250 ton furnaces are to be reconstructed to operate with magnesite-chromite crowns. The advantages of basic crowns are particularly pronounced when oxygen is used, as implied in the expansion project. In this case, the temperature of the crown is raised above 1,700°C at which the strength of Dinas crown is insufficient. Basic crown ensure a considerable rise in the furnace output.

In contrast to the project of the first stage of the plant, whereby oxygen was to be used only for the enrichment of the combustion air, the expansion of the plant involves combined utilisation of oxygen, both for enrichment of combustion air and for blowing through the furnace bath. Oxygen consumption in the open-hearth furnaces is rated at 35 cu.m. per ton of ingots. Along with the application of oxygen, it is planned to intensify the melting process by delivering of atmospheric air injected by compressor air to the end of the gas span.

The output of the open hearth furnaces is rated at: 250 tons furnaces — 200,000 tons of ingots per year; 500 tons furnaces — 300,000 tons of ingots per year. Based on the output estimates of the furnaces, the open-hearth plant is to comprise five 250-ton and five 500-ton furnaces. Four 500-ton furnaces are to be built anew; besides, the existing furnace No. 6 with a capacity of 250 tons is to be reconstructed during its overhaul, to bring its capacity to 500 tons. The construction of the new furnaces will involve the extension of the main building of the plant. Added to the existing equipment will be three floor-type charging machines, two overhead travelling casting cranes with a lifting capacity of 125-130 tons each and four ladle cranes with a capacity of 350-75/15 tons each. A second mixer department with a 1,300-ton mixer is to be added. Buildings connected with the open hearth furnaces are to be extended suitably.

The open hearth furnaces are to operate on burden consisting of molten pig iron and reprocessing Works scrap. The content of molten pig iron in the burden is determined by the balance of the Works scrap and will amount to 0.785 ton per ton of usable ingots. The rolling mill and open-hearth plants as well as the repair shops are the principal sources of scrap at the Works. Besides, the project takes into account the wear scrap accumulating in all plants and shops (worn parts of equipment, production stock, metal structures, etc.) and metal recovered from the open-hearth slag. The total ingress of steel scrap at the Works is estimated at 522,000 tons per annum. A small part of the steel scrap is used in the foundry. Most of the pig iron scrap is due to the breakage of moulds and bottom plates. Besides, pig iron scrap is supplied by the blast furnace plant and the foundry. The total resources of pig iron scrap are estimated at 105,000 tons per year. The pig iron scrap is consumed by the blast furnace and open-hearth plants and the foundry.

(4) **Rolled Stock Production:** The following programme of rolled stock production has been adopted in connection with the expansion of the Works:

Rolled Product	Annual Output (Thousand Tons)
Heavy railway rails, 60-90 lbs/yd.	500
including 90 lbs./yd.	370
Light rails	20
Railway sleeper bars	82.5
Structural shapes (ordinary beams 3 to 24 in. high, broad-flange beams, girders, T-beams, angles)	386.5
Merchant rolled stock (rounds, 7/8-8 in. dia; squares, 7/8-3 in; flats, 2-5 in.)	261
Rolled wire, 5.3-10 mm dia.	400
Total finished rolled products	1,650
Blanks for re-rolling at other works, cross section 2 x 2 to 3 x 3 in.	315
Grand Total:	1,965

The total rolled products output provided by the project is based on the reduction of 2.5 million tons of ingots. Steel consumption per ton of finished products will average 1.27 ton. Compared with the project of the first stage of the Works, the output of wide-gauge rails will increase five-fold, that of structural shapes by about 35 per cent and that of merchant rolled products almost two-fold.

To ensure the required assortment of rolled products, supplementary equipment is to be added to the existing mills. Besides, a new 250-mm wire mill is to be installed.

The project has determined the possible annual output of the 250 mm wire mill at 400,000 tons of rolled wire. To ensure full utilisation of the wire mill putting out finished products, the billet output by the continuous billet mill for re-rolling at other Works has been planned at 315,000 tons.

The assortment of the rolled wire produced by the wire mill has been altered as against the contract which provided only for 6.5-10 mm dia. rolled wire. Since the Indian party subsequently stated they wished to obtain rolled wire of a small diameter, an annual output of 200,000 tons of 5.3 mm wire is provided, which makes fifty per cent of the total rolled wire output.

(5) **Blooming Mill:** In order to increase the output of the blooming mill, it is planned to roll part of the blooms for the rail-structural mill from heavier ingots (9.5 tons as against 7.45 tons provided by the project for the first stage) and to increase the cross section of blooms for the rail-structural mill and for the continuous billet mill (300 x 300 mm instead of 200 x 200 mm envisaged by the project of the first stage). The average hourly output of the blooming mill will be 350 tons.

In connection with the increase in the blooming mill output, it is planned to build eight groups of soaking pits in addition to the five existing ones. The existing one-piece ingots car is replaced by a two-piece car; an additional section of the receiving table is installed to receive two ingots. Simultaneously additional crane equipment is installed.

(6) **Billets Mill:** Two additional working stands with 850 mm rolls and a 1,200 kW drive for each are to be installed on the continuous billet mill, for rolling 300 x 300 mm blooms, before the first group of working stands with 700 mm rolls. Two additional coolers will be installed and the bloom storage expanded. The billet mill will roll billets for the merchant mill with cross-sections from 100 x 100 mm to 150 x 150 mm (532,000 tons), billets for the wire mill with a cross section of 80 x 80 mm (416,000 tons), as well as billets for sale (315,000 tons). The hourly output of the continuous billet mill is determined by the output of the blooming mill and will amount to about 300 tons of billets.

(7) **Rail-Structural Mill:** To increase the output of the rail-structural mill, it is planned to extend the length of strip rolling and hence to lengthen the roll pockets on the front and rear sides of the mill. As has been stated above, the weight of the blooms to be rolled will be increased. 20 pits for delayed rail cooling, four continuous lines for rail finishing and six shelves for their inspection are to be added in order to ensure the necessary throughput of the thermal treatment and finishing equipment considering the increasing hourly output of the mill. It is also planned to add an open storage for finished products. The annual programme of the rail-structural mill output includes: 500,000 tons of rails; 82,500 tons of sleeper bars; 161,500 tons of large structural shapes and 6,000 tons of 3 1/4 to 8 in. rounds. The average hourly output of the rail-structural mill will vary widely depending on the shape to be rolled: from 50 tons for 4 x 4 in. angles to 180 tons for 90 lbs. rails and 200 tons for 8 in. rounds. The annual output of the mill, including the rolling of a great number of heavy shapes, will amount to 750,000 tons. To meet the annual production goal the mill should operate 5,500 hours per year, on a three-shift basis, with holidays.

(8) **Merchant Mill:** A third continuous furnace is to be added to the 350 mm merchant mill and the finished product storage expanded. The annual output programme of the mill includes 185,000 tons of 7/8-3 in. rounds, 40,000 tons of 7/8-3 in. squares, 30,000 tons of 2-5 in. flats, 225,000 tons of small structural shapes and 20,000 tons of light rails. The average hourly output of this mill will vary from 50 to 170 tons, depending on the kind and size of the shape to be rolled. To meet the annual goal of 500,000 tons of merchant stock, the mill should operate 5,500 hours per year, on a three-shift basis, with holidays.

(9) **Wire Mill:** The 250 mm wire mill is designed to comprise 37 working stands including 29 stands with horizontal rolls and 8 with vertical rolls, the total driving power being 22,000 kW. Strip rolling in the roughing and the first middle groups of stands will be done simultaneously in four threads, in two second middle groups—in two threads in each group, in four finishing groups—in one thread in each group. The maximum rated speed of the strip emerging from the final stands will be 30 m/sec. The whole output of the mill will be produced in coils. The average hourly output of the wire mill will vary from 55 to 105 tons depending on the rolled wire diameter. To meet the annual production goal, the mill should operate 5,800 hours per year on a three-shift basis, with holidays.

The project for the expansion of the Works provides for the production of railway rails and part of the merchant rolled stock from killed steel big-end-up ingots with feeder heads, totalling 950,000 tons. The practice of rail production in the Soviet Union shows that killed steel ingots yield better quality rails which meet the high requirements of consumers.

Taking into consideration the Indian practice of producing railway rails from semi-killed steel big-end-down ingots without feeder heads, it seems expedient to carry out at the Works some experimental meltings of killed and semi-killed steel and thorough investigations of finished rails made from them, as regards their quality and production cost, with the aim of comparing the quality of rails rolled from killed and semi-killed steel ingots. If these experiments point to the expediency of producing rails from semi-killed steel at the Bhilai Works, the production of such rails can be ensured without any changes in the range and characteristics of the rolling mill plant equipment. It would also be advisable to stage an experimental check-up of the technical and economic efficiency of production of different types of merchant steel from semi-killed metal as compared with killed metal.

If rails and the merchant rolled stock which is to be produced from killed metal, are rolled from semi-killed steel ingots, the yield of usable blooms will increase, and this will bring about a corresponding decrease in the amount of trimmings by approximately 75,000 tons per annum.

The additional blooms can be used for rolling annually another 70,000 tons of billets on the continuous billet mill to be sold to other works. The open-hearth plant will be able to melt semi-killed steel in place of killed metal. In connection with the decreased amount of normal size trimmings in the rolling mill plant, the Works will have to bring in annually 75,000 tons of scrap from other sources.

The storage of a monthly reserve of scrap brought in from outside and its processing will require the expansion of the projected department of scrap flame cutting and the installation of a fagoting press for the preparation of light scrap.

NEGOTIATIONS WITH I.D.A.

A 4-member delegation, headed by Mr. M. R. Sachdev, Secretary, Union Ministry of Irrigation and Power, has left for the United States for negotiating assistance from the International Development Association for three irrigation and drainage schemes—(1) the Shetrunji Irrigation Project of Gujarat, (2) the Salandi Irrigation Project of Orissa and (3) the Drainage Project of Punjab.

The Shetrunji Irrigation Project envisages construction of a dam across the river Shetrunji in Gujarat State, to provide irrigation facilities for an area of 86,000 acres. A provision of Rs. 7.3 crores has been suggested for this scheme in the Third Plan. On completion, this project will be yielding nearly 27,000 tons of foodgrains

and cash crops every year. The construction of the dam will also help in the flood control work in the area.

The Salandi Project envisages construction of an earthen dam across the Salandi river, in Orissa State. On completion, this project will irrigate an area of 3,27,000 acres from which 40,000 tons of foodgrains and other cash crops would be raised every year. The Third Plan contains a provision to the tune of Rs. 3.46 crores for this scheme.

The Drainage Project of Punjab is aimed at improving surface as well as sub-surface drainage in an area of 39 lakh acres which was heavily inundated during the 1958 floods. The total cost on this project is estimated at Rs. 68.81 crores. It is a long-term project and the Third Plan envisages only an expenditure to the tune of Rs. 10.12 crores on it.

The International Development Association is an affiliate of the World Bank. Early this month it extended a development credit equivalent to \$6 million for the expansion of tube-well irrigation in Uttar Pradesh. This was the second credit granted by this Association to this country.

WEST GERMAN AID

An agreement has been signed between the Government of India and the Government of the Federal Republic of Germany under which the latter would be providing a credit of DM 170 million (Rs. 20.24 crores) for the development programmes included in India's Third Plan. The entire credit is untied. The bulk of the amount will be paid into Government of India's account in the next few days. The credit carries interest at the rate of 3 per cent per annum and is repayable in 20 years, including a period of seven years during which no payments are required to be made.

This credit is a part of the German assistance totalling DM 1700 million (Rs. 202.38 crores) indicated by West Germany at the last meeting of the Consortium of Governments and Institutions interested in providing development assistance to India. Together with a sum of DM 330 million for which credit agreements were signed in April last, the total assistance received from West Germany this year comes to DM 500 million (Rs. 59.52 crores).

DEFENCE PRODUCTION

The need for further stepping up indigenous production in the Defence Sector in view of the tight foreign exchange position of the country has been emphasised by Mr. V. K. Krishna Menon, the Union Defence Minister. Addressing the third Defence Production Conference held here last week, Mr. Menon said that production should be doubled in the course of three years and expenditure on foreign exchange reduced to the barest minimum, being limited only to such items of equipment as it was absolutely essential to import. He added that all impediments that caused delay in the completion of the projects must be removed as they only involved additional expenditure. Mr. Menon appealed to scientists in the Research and Development Organisation and officers in the Production Organisation of his Ministry to put their heads together in a spirit of close co-operation and co-ordination to ensure that the maximum production was achieved. He was emphatic that there should be no let-up in defence production and that the tempo should be maintained; no foreign exchange would be available for anything that could be done in India.

According to present indications, the manufacture in the ordnance factories and other defence industries in the country is estimated to increase by 27 per cent during the current financial year, as compared to 1960-61.

UNION CARBIDE INDIA NOW MANUFACTURES AT TROMBAY

Ethyl Acetate

"Union Carbide" Ethyl Acetate is an excellent fast evaporating solvent for making lacquers, thinners, varnishes, dopes, coated paper, inks and photographic films. It is also widely employed in

the manufacture of dyes, drugs and antibiotics, perfumes and synthetic flavours. For your requirements of Ethyl Acetate or for further information write to your nearest Union Carbide India Office.

JNTUC 247A

COMPANY AFFAIRS

ROHTAS INDUSTRIES

Mr. S. P. Jain, Chairman of the Rohtas Industries Ltd., in the annual report of the company for 1960-61 has made a pointed reference to the fact that inadequate and interrupted supply of power affected considerably the output of the company. He said that the power supplied from D.V.C. was interrupted 64 times on account of tripping of their equipment. In continuous process industries like paper and cement, each such interruption caused great dislocation and loss of production. The company's own power generation was also lower due to lack of adequate supply of suitable quality of coal, stocks of which were marginal and sufficient for consumption for two to three days only over a long period of time. The position in regard to transport material also remained acute and the chairman pointed out that there were no signs of any improvement at present; particular hardship was experienced in respect of movement of coal for power and steam generation and dispatches of paper and paper board. As can be observed from the table below, the company's output increased in respect of cement, clinker, asbestos cement, and vanaspati while it declined in the case of paper and paper board, sugar and caustic soda as compared to the previous year.

OUTPUT IN 1959-60 AND 1960-61

		(Tons)
	1959-60	1960-61
Paper & Boards	52,021	50,936
Cement	3,05,456	3,14,945
Clinker	2,68,658	2,86,981
Asbestos Cement	9,937	15,510
Sugar (Season)	16,166	14,898
Vanaspati	10,424	10,655
Caustic Soda	5,671	5,984

This accounting period was the first full year in which the impact of Tariff Commission's recommendations was felt on realisation from paper and boards. Besides glass, on account of the general price reduction, the company suffered particularly reduction in the differentials in respect of special variety of paper and boards manufactured by it. The Chairman pointed out that there has been a substantial increase in the cost of production on account of increase in the cost of chemicals, stores and spares, power and coal and enhanced railway freight. Production cost further increased by the imposition of excise duty of Rs. 40 per ton of caustic soda manufactured even for the consumption in the company's paper factory. Representations have been made to the Government by the industry for adequate increase in the price of paper and boards to compensate increase in cost and to provide a reasonable margin of profit.

One adverse aspect of the company's working was that the capacity of paper machines could not be utilised for want of pulp because the import licences were not received by the company for requisite quantities of pulp. The company has taken steps to expand its pulp production capacity and bleaching capacity in the pulp plant.

The profit of the company for the year was recorded at Rs. 66 lakhs. After providing Rs. 5.05 lakhs for development rebate reserves, the Directors have recommended the payment of a dividend on Ordinary shares subject to tax at the rate of Re. 1 per share of Rs. 10 each, which will absorb nearly Rs. 50 lakhs.

DEVANGIRI COTTON

The Directors of the Devangiri Cotton Mills Ltd. have pointed out that in response to the Government's plea and their own desire for holding the price line, the industry agreed to bring down the prices for its products to the August 1959 level making only such additions as were wanted by the increase in the cost

of production. The Directors of the company have reported that no material change in the cloth prices have been made because the company had taken care to maintain the rates at fair levels. All the same the sales of the company increased and reached a new record figure of Rs. 1.68 crores, being 19 per cent higher as compared to the previous year.

The company executed expansion and rehabilitation programme and one step was the purchase in court auction of the erstwhile Narayandas Chunilal Mills Gadag, costing in all Rs. 7 lakhs. It comprises 12,000 spindles and 218 looms. The company has applied and is awaiting the licence from the Central Government. The waste spinning plant which was received during the year was commissioned from July 1961. The company has placed orders to convert all the ring frames of the 1938 type to the modern types.

The Directors have said that scarcity conditions in cotton continued, though to a lesser degree, during the year under review. The Government retained the distribution control. Thus the cotton prices were ruling high. There was a general increase in cost of manufacture particularly in salaries and wages as a result of the implementation of the award of Textile Wage Board.

During the year to March 31, 1961, the company made a profit of Rs. 23.38 lakhs, after separating Rs. 10.78 lakhs for depreciation. The Directors have recommended a provision of Rs. 12.50 lakhs for taxation and Rs. 2.50 lakhs as reserve for payment of Mortgage loans and Rs. 2.15 lakhs as general reserve. They have recommended the payment of a dividend for the year at the rate of 12 per cent per annum, which will absorb Rs. 3.58 lakhs. The company is also paying Silver Jubilee Cash Bonus to the shareholders at 5 per cent, which will absorb Rs. 1.50 lakhs.

Company Meeting

BENGAL CHEMICAL AND PHARMACEUTICAL WORKS LTD.

Encouraging Results Despite Production Handicaps

Dr. B. N. Ghose, M.B., F.R.F.P.S. (Glas), Chairman, Board of Directors, Bengal Chemical & Pharmaceutical Works Ltd., at the Annual General Meeting of the Company held on August 10, 1961, said:

I may assure you that the results of the year under review are quite encouraging, and your Directors hope to report better results next year provided other conditions remain as before. The increase in sales by nearly Rs. 12 lakhs over the previous year's figure could not bring in proportionate profits as compared to last year for various reasons. The rate of dividend on all classes of Ordinary Shares has been maintained, but the dividends on Tax-free Cumulative Preference Shares have been grossed up in accordance with the provisions of Preference Shares (Regulation of Dividends) Act, 1960, which have resulted in the payment of dividends on Income Tax-free Preference Shares at rates less than those stipulated in the Company's Articles of Association. Your Directors are, however, considering to give the Preference Shareholders the additional dividends to make up the deficiency for deduction of tax at source as aforesaid after all necessary formalities in this connexion are duly complied with and after getting the approval of the shareholders in an Extraordinary General Meeting at a later date.

Gentlemen, as you all know this year is the centennial birth anniversary of Acharya P. C. Ray, the founder of your Company. To perpetuate the memory of our revered Acharya Prafulla Chandra Ray it has been decided at the initiative of Indian Chemical Manufacturers Association of which Acharya P. C. Ray was the Founder President to establish Sir P. C. Ray Memorial Research-cum-Testing Laboratory in Calcutta at a capital cost of Rs. 20 lakhs. Your Directors propose to contribute a sum of Rs. 50,000 to this institution. I hope you would gladly accord your sanction to it. Besides this, your Board of Directors has also recommended payment of half month's basic salary as bonus to all the permanent employees of the Company who have served the Company for at least one year and are still on the rolls of this Company. This bonus is being given as a gesture of good-will on this happy occasion. Of course, this is in addition to any other Bonus that the Directors of your Company may be pleased to sanction after the Annual General Meeting.

The acute shortage of wagons for moving coal in our area is known to all and so far the problem has baffled us. In the matter of Import Licences, we have not yet succeeded in getting licences for the import of some replacement items of machinery which is impeding production in some plants including the Plant for the manufacture of Surgical Dressings and the one for the manufacture of Printing, Rotary and Offset Inks. Despite a good export potentiality and consequential Foreign Exchange earnings thereby, the manufacture of Surgical Cotton has been considerably suffering in the competitive market for the non-availability of Import Licence for certain items for replacement and other component parts. The Licensing authorities are further unwilling to grant us licences in sufficient quantities for the import of Carbon Black, an essential ingredient for the manufacture of Printing Inks.

We can at this point strike a more cheerful note regarding the future of some of our productive units.

After long and sustained efforts we have been able to secure import licences covering the requirements of plants and equipment to be obtained from abroad in connexion with our projects for doubling the existing capacity of our Alum Plant and the installation of an additional Sulphuric Acid Plant producing 50 tons per day.

There has been a setback in our business in Singapore in the year (1960-61) as the Chinese products, specially Absorbent Cotton Wool, are being sold there at competitive rates. Our exports to Kuala Lumpur have however improved to a certain extent. Business in Burma is not up to our expectation. Since 1959 we have been experiencing difficulties in shipping our products to Colombo and there has not been any improvement in this regard as yet.

N.B.: These are only extracts from the speech. This does not purport to be a record of the proceedings of the Annual General Meeting.

Established 1865

Regd. Office: 14, India Exchange Place, Calcutta-1
Affiliated to The Chartered Bank.

At the following Offices in Punjab and Delhi.
Ambala Cantt.; Chandigarh; Jullundur Civil Lines and New Delhi, Karolbagh.

M. J. MACLAREN,

General Manager

A.B.-1;

"Here are five ways

BOAC Air Cargo can help your business!"

- ★ Fast BOAC jetliners slash transit time by hours.
- ★ Direct BOAC city-to-city freighting cuts out time-wasting journeys to and from docks.
- ★ Simple (cheap) packaging is all that's needed with careful BOAC handling.
- ★ Safe, efficient BOAC freighting means lower insurance costs, wider coverage.
- ★ Experienced BOAC staff give all goods individual attention all the way.

We deliver your goods in hours, instead of days or weeks! And that's only one of the things you gain. Speed alone may not be enough for you—but BOAC Air Cargo gives more and more successful businessmen these extra advantages...advantages that can help and benefit your business!

Ask for details now—from your Forwarding Agent or BOAC offices as:

BOOK REVIEWS

THE TWO SECTORS

The Public Sector in India: By Dr. Nabagopal Das:
Published by Asia Publishing House, Ballard
Estate, Bombay: Pp. 180: Price Rs. 11.25.

Industrial Enterprise in India: By Dr. Nabagopal Das:
Published by Orient Longmans, Ltd., 17, Chittaran-
jan Avenue, Calcutta: Pp. 225: Price Rs. 10.

DURING the last decade, the public sector in the industrial field has grown at a very fast rate in India. Of the total investment envisaged in industries and minerals in the Third Five-Year Plan, nearly two-thirds are expected to be in this sector. As a matter of fact, there is no longer any controversy about the comparative merits and defects of the public and private sectors. Even in countries with so-called free enterprise economies, the public sector forms an important section thereof. It is, therefore, but proper that this sector should engage the increasing attention of economists and administrators.

"The Public Sector in India" by Dr. N. Das is a welcome addition to the rather inadequate literature on the subject. Coming as it does from a former member of the Indian Civil Service who is now associated with the private sector, it bears the stamp of experience and authority. Yet, the author has not permitted his loyalties, whether old or new, to cloud his objectivity as an economist: he has been pragmatic in his approach through the entire length of the book.

Dr. Das fills in the background to the development of the public sector by describing the historical processes which led to its emergence on the Indian economic scene. In three subsequent chapters, he traces the evolution, successes and failures of the public sector, not merely in developed countries like the U.K., France, Scandinavia, U.S.A. and U.S.S.R., but also in the developing areas of Asia. He then outlines and classifies the specific projects and enterprises that have been initiated in this sector in India since 1947. After having presented the framework, as it were, he deals with the problems it faces and will continue to face in the years to come. These are the problems of organisation and management, of financing and accountability to Parliament and of industrial relations. In analysing these problems, the author sorts out the various issues involved with great skill and pleads for a balanced approach in a most effective manner. His final words are worth quoting: "It is time that people realised that there is no magic in the words 'public enterprise' and that mere extension of the public sector does not provide an answer to the problems of entrepreneurship, production and a fair deal for consumers".

It would, however, be wrong to conclude that Dr. Das has argued against the public ownership of industries. He says that, with the need for accelerated economic development and the equally important need to secure rising living standards, the expansion of the public sector in certain fields and directions is not only justified, but inescapable. He, however, points out that this does not preclude further discussion: as a matter of fact, it makes such discussion all the more necessary. "The extent to which the public sector should expand and the manner in which it should function are matters on which honest differences of opinion are still possible". One may not share his apprehension that a kind of "managerial empire" is likely to grow in India's public sector under the protecting umbrella of the State, but one can hardly find fault with his thesis, that "in the

ultimate analysis, the same economic laws apply to the private as well as the public sector, and the same mental, and almost the same physical, instruments have to be used in both the cases".

The second book by Dr. Das, "Industrial Enterprise in India", needs no introduction to the reading public, as it has already run into several editions. In a sense, it presents the other side of the picture, viz., the framework within which the private sector operates. In the revised edition just issued, the author has not merely brought all his facts and data up-to-date (he has carried the story forward to the beginning of the Third Five-Year Plan), but completely re-written some of the chapters in the context of changed conditions. It is virtually a new book.

Most interesting are the three new chapters which have been added to the present edition, viz., those relating to concentration of Economic Power, Problems of Management and Company Finances and Profits. He makes a dispassionate analysis of the factors which both militate against, and help, concentration of economic power and concludes that the State having stepped in as the "countervailing power", there is not much scope for such concentration in a few groups or individuals. On the other hand, while discussing the problems of management, he sounds a note of warning that there is a tendency to treat the management profession as something like the sacred preserve of an elite. "An aura of mystery seems to surround some of the top business executives. They speak pedantically of the intricacies of the problems of management, giving the outsider the impression that it is a difficult art which can be acquired only by a select few". As regards the future of profits in the private sector, while not denying that, for industry as a whole, profits are falling, he notes with characteristic candour that profits are constant or even rising in certain specified industries, and total profits are still substantial, mainly because sales have risen and continue to rise. Most pertinent are his remarks that, despite restrictions and regulations, both entrepreneurs and managements still manage to secure for themselves various kinds of "fringe benefits" of which the ordinary shareholder is blissfully unaware and that entrepreneurs and managements do not always think in terms of the money they earn: more than money, they value the prestige and power that go with the direction and management of industry.

In the concluding chapter, Dr. Das exhorts the private sector to think in terms of the interest of the consumers and the common people and not in terms of themselves only, and urges them to make genuine efforts to diffuse economic power. This, he says, can be done in two ways, viz., by securing a very wide dispersal of the ownership of equity capital and by managements being imbued with a social purpose — "the countervailing power from within". Some die-hard private entrepreneurs may not like Dr. Das' exhortations, but they would find it difficult to refute his arguments which have been presented with scholarly objectivity and scientific detachment.

These two companion volumes cover almost the entire industrial canvas in the India of today (the only omission is the field of small and cottage industries) and should find a place in the library of every person interested in the economic development of our country.

An Asian Economic Community?

THE Conference of Asian Economic Planners now in session in New Delhi has raised the ambitious hope that, under the sponsorship of ECAFE, there will somehow come into being, in the fullness of time, an Asian Economic Community. The direct purposes of the Conference are, however, much smaller and its largest proposal is merely the establishment of an Asian Institute of Economic Development with a related proposal for the establishment of a Regional Advisory Group on Economic Development Planning. The proceedings of the Conference have unfortunately failed to illuminate the great theme of Asian Economic Co-operation with concrete discussion of how a beginning can be made here and now in the planning of South-East Asian model. Thus it would seem that a great opportunity has been lost and it is necessary to explain why, to those who see the obvious economic advantages of co-operation, hopes of unity are still so dim and hesitant.

The approach of all those in authority has been verbal and almost verbose. Much the most useful contribution to the deliberations of the Conference has been a paper produced by the Secretariat of ECAFE on the scope for Regional Economic Co-operation in Asia and the Far East. This is a substantial study running into 84 pages of cyclostyled foolscap with a remarkably able presentation of what might be the immediate range of co-operation in the area. Unfortunately, this central paper has received very inadequate attention and, it would appear, its constructive contribution has been largely missed. Not least of the points of interest high-lighted is the Chapter on Economies of Scale and Competition, indicating the absurd costs which each country in the area is imposing on itself by units of far less than an adequate capacity, and the obstinate reluctance to depend on larger units in other countries which could operate at greatly reduced costs. The Secretariat paper gives a table of costs of steel in which it points out that the difference between a unit producing a million tons of steel and one producing 50,000 tons would be of the order of 40 per cent. More precisely, it is stated:

"Except for mainland China, India and Japan, the annual steel consumption in each of even the more advanced countries in the region has been reported to be in the range of 100,000—400,000 tons crude steel equivalent in 1957. If, however, each of these countries were to attempt to establish an integrated steel plant in its own territory separately, perhaps, with an annual capacity of 250,000 tons, costs per unit of finished steel would be at least 25 per cent higher than those of the plant's of the minimum efficient scale. The combined demand of a number of countries may justify the development of an efficient steel plant within the region, but such a plant can only be organised on the basis of some kind of co-operative effort among the countries. Even then, there will remain steel products which require relatively advanced techniques and involve economies of scale of their own. It might be that the total quantity of each finished steel product item consumed in the entire region is only a small fraction of the minimum efficient-scale output." In respect of cement it adds the comparable observation that "at an annual capacity of 100,000 tons, production costs per unit of output are estimated at almost

double the level of costs for an efficient plant with a capacity output of 1.8 million tons. Yet it is reported that the capacity of cement plants built recently in Ceylon and India, for example, has ranged from 100,000 to 150,000 tons."

These are sufficient indications of classic errors in development taking place in almost all the areas of ECAFE, including India. It does not, by any means, tell the full story of our common failure to exploit the principle of Increasing Returns where capacity has already been built and where, for one reason or another, often less than half is utilised. This has been the subject of a fuller study by Mr. Morris J. Solomon, who has contributed to these pages previously on plant utilisation, and *The Eastern Economist* will separately present next month a whole Blue Supplement incorporating his studies in India. It is hardly necessary, however, to stress the point, which should be obvious, that the limitation of markets in each one of these countries—and all of them are far less advantageously placed than India—will generate an extremely high-cost structure unless the original plant is rightly conceived and fully worked with the most modern technological efficiency.

The current difficulties are not entirely technological nor managerial. Nor, in their larger sense, are they strictly economic. What has held back co-operation in South-East Asia is failure to attempt political agreement covering the whole area whether on payments, on trade or on the dovetailing of plans of all countries. Proposals to have a Development Board, or to have a Payments Union have, from time to time been made, but been as hastily dropped, each country being fearful that any surrender of foreign exchange might limit its capacity to buy at the cheapest price in a global market. The idea that a somewhat restricted marketing or purchasing opportunity within might be compensated by a much larger regional volume of trade does not seem to have been driven home with anything like the power that it obviously bears. The truth is that the element of trust between the nations of South-East Asia is by no means large enough for an edifice yet to be built. This is not attributed to underdevelopment or for that matter to the markets being limited and the scales of operations being small. In somewhat different terms Europe, for over a hundred years, resisted economic unity because of the political obstacles which such unity seemed to suggest. The last decade has brought to fruition the European Economic Community and its toping stone, the Treaty of Rome, has been the result of the great integration following the rise of the Soviet Union—as much an element in self-defence as of ordered economic planning. Unless South-East Asia feels the crisis of its own survival much more keenly, it is extremely unlikely to take the plunge in anything like the direction which the ECAFE working paper has coherently suggested. The Conference has thus still a purely academic ring. Nevertheless, the contribution has been significant. Some imperfect seed has been sown: one must rest with that until political imagination runs to the dimensions required by our responsibilities to our peoples. This week the trumpets have given forth only a very uncertain sound.

Sugar: Belated Wisdom

THE decision announced this Wednesday after, it is believed, a rush Cabinet meeting the same day, to decontrol sugar, brings to a climax a sad story in official prevarication. Mr. S. K. Patil for many months has been arguing that there was in fact no serious sugar crisis; that over-production, consequent on large incentives given to sugarcane growers by a bonus on cane and to factories by rebate on excise, had the effect of building up stocks, but this was not "critical" calling for drastic modification of policy. For months the country had been led to believe that minor adjustments, including exports, would solve the problem. In fact, it has not even helped the supposed beneficiaries of this policy; the mills have carried stocks with a big token value based on the controlled price, which has been shown in the event to be impossible to maintain. In the meanwhile, the attempt to support the paper prices of sugar and cane has involved accommodation in the banking system far beyond what was either proper or necessary in the inflationary conditions prevailing. In the net result, notwithstanding "support" prices and large banking accommodation, the policy has proved a dismal failure. At long last, the Minister of Food and Agriculture has had to recognise that the policy he initiated has been greatly overdone, and a full retreat is now in operation.

The essential factors in the retreat are three. Firstly, prices have been completely dismantled. Secondly, while releases are in Government hands, there will be pressure to release as soon as large sales take place in the market and, therefore, it is extremely unlikely that a low rate of releases will maintain current prices. In fact, even with full control on sales, market prices well below the controlled price have been in operation. Thirdly, but most important of all, the assurances given to the cultivator for an indefinite volume of sale, and to the producer for an indefinite volume of relief from excise duty, have disappeared. The most interesting development

in this respect is contained in a clause which provides that a target for production for each factory is to be set at 10 per cent below the quantity produced in 1960-61. If a factory produces sugar in excess of the fixed target, it will have to pay an additional excise duty. But meanwhile it carries no obligation to buy cane in excess of the quantity required for its reduced target. Thus, with the prices of sugar decontrolled, in effect there will be decontrol of sugarcane prices; for an element of competition will now operate to prevent any indefinite quantity of cane being sold at the controlled prices and the balance in the free market will fetch a much reduced price. Perhaps the notorious price-linking formula will also disappear at the same time. Cane-growers are not unnaturally averse to sharing losses.

The decision to restore economic forces and to nullify ineffective Government control is not necessarily a pleasant one. One balance, all the vested interests involved, namely, the Government, producers and sugarcane growers, are likely to lose out with only one beneficiary, the consumer. But at least the possibility of reaching equilibrium in the industry without an absurd facade of make-believe prices unrelated to the demand-supply position and unrelated to the true value of cane will no longer be allowed to impose fantastically on the Indian people. In the last analysis, hard economic facts have their way of enforcing their ruthless decision even on politicians. Sugar has been the plaything of the politicians ever since Uttar Pradesh and Bihar committed themselves to large-scale dependence on the "sugar" vote. It is something that in an election year, and within a few months of the dates of election, the economic factors have been able to overrule the dogma of politicians in which political advantage seems to rise superior to all economic commonsense. At long last, perhaps the Minister of Food and Agriculture will confess that his procrastination has really been, in this case, the thief, but not the victor, of Time.

The Congress Manifesto

THE Congress election manifesto is two things in miniature—the history of the freedom movement after 1919 and the Third Five-Year Plan. This first impression does not yield place to second thoughts, but endures as an integral part of the final assessment. The invocation to the glorious part which the Congress undoubtedly played in the heroic struggle for freedom would have been quite appropriate in the manifesto for the first general elections after the inauguration of the Constitution, but it looks odd in the third manifesto. The narration of the objectives and strategy of the Third Plan does not perhaps lack in propriety, but it has overshot the mark by the repetition of elaborate detail to which the public was treated only a few weeks back when the Plan was released in its final form. Shorn of this substantial element of superfluity, the manifesto could be reduced to a third of its tiresome length.

The electorate to which the appeal of the manifesto is addressed will judge the claim of the Congress for an extended lease in office for the third term by the simple test of its record of performance in the second. The slogan of national integration is nothing new, it is being

dinned into the ears of the masses with amazing frequency and the voter is likely to pose the question why at all the need should be felt to launch a campaign for it after fourteen years of Congress rule. It serves little purpose to denounce communalism, casteism and various other forms of groupism as reactionary. At the hustings the organizers of the Congress campaign may have to face the blunt query whether the Congress Party can vouchsafe that it has not tacitly encouraged these forces for temporary political gains. An evasive no will not bear the scrutiny of actual facts.

On the economic front which is manifestly the major concern of the manifesto, the party in power will have several acts of omission and commission to answer for. The failure to contain price inflation and halt the spiralling cost of living will easily be a target of point blank attack. The influence of external factors not susceptible to the Government's control apart, a satisfactory defence can hardly be put in behalf of the monetary and fiscal policies pursued without adequate effect. The election manifesto is curiously silent on both. The strategy to hold inflation and prevent the

erosion of economic advance in real terms is apparently overlooked in the preoccupation with the catalogue of high-sounding promises to accelerate economic march in every direction. If the promises are alluring, a little scratching of the surface reveals how hollow they are at vital points. The manifesto talks about rural electrification to modernise the techniques employed in small and medium industries in the countryside. But the repeated failures of power supply to industry in the urban centres proclaim the limitations on the available as well as potential loads in the next five years.

The appeal to the electorate is designed to catch the ear of the voter in the countryside where the real strength of the ballot box resides. The manifesto contains a hollow if imposing array of assured benefits to the rural sector. But not all belong to this variety. To pick up an important illustration. The promise of a wide diffusion of the benefits of the community development programme will bear verification from recent experience. The Panchayati Raj is the very pivot of decentralisation of democratic power down to the village level. Its laudable success in the Punjab

and Rajasthan, for instance, will speak for the validity of the assurance contained in the manifesto.

It is a saving grace that the manifesto is practically free from dizzy flights into ideology. A promise of the early arrival of the socialist pattern of society is not trumpeted this time. The constructive and valuable role of the private sector in the mixed economy is given due recognition. But its value has been detracted by new threats which may not necessarily be dismissed as stunts. Monopolies and concentration of economic power in the private corporate sector are to be broken. These evils, if they exist, at all, are in evidence in the State sector. They are to be assailed by licensing of new entrants and an emphasis on small and medium enterprises. Is the pattern of large-scale production and economy of costs that goes with it to be reversed? Finally, as a counter-part of ceilings on land holdings, urban incomes may be, at least for political effect, subjected to ceilings. That no serious handicap is intended was shown by the fact that the Stock Exchanges reacted bullishly to the manifesto.

Oil: the Golden Mean?

AT long last, the perplexing issue of fixation of "reasonable" prices for petroleum products, payable to the oil companies for their imports and indigenous production, has been resolved. The first hurdle in the way was crossed on Wednesday when the Union Government decided to accept the Damle Committee's recommendations. The oil companies are expected to follow suit by Saturday when the ad hoc agreement now in force expires. Oil is often called black gold: this may be called the Golden Mean.

It is gratifying that the Government has accepted the recommendations of the Damle Committee practically in toto, although it had been given out in the Press that they did not come up to its expectations. Reason appears to have triumphed over the mistaken belief held by the Oil Ministry that oil companies were making unduly large profits and there was scope for drastic downward cut in prices currently being charged by them for their products. That there was some scope for lowering of these prices, however, was well known; the oil companies themselves had given an indication of this recently in view of the growing glut of petroleum products in the world market today. Government's acceptance of the "modest" recommendations of the Damle Committee has, thus, been all for the good since this Committee had been appointed by it in preference to referring the question to the Tariff Commission.

The acceptance of the Damle Committee's Report entails, on the basis of estimated sales in 1962, a reduction of nearly Rs. 15 crores annually in the present selling prices of petroleum products — Rs. 5 crores in landed costs, Rs. 7 crores on account of discounts in posted prices of refined products and Rs. 3 crores in distribution charges and profit margins of the oil companies. The foreign exchange saving is expected to be of the order of Rs. 12 crores. The benefit of this reduction in prices, however, is not to be passed on to the consumer; all this amount is envisaged to be appropriated to the Central Exchequer through increases in ad hoc levies under the Mineral Oils (Additional Duties of Excise and Customs) Act, 1958. The mopping up all this sum by the Central Exchequer at the expense of the consumer,

who at least is entitled to share these concessions partly, is not understandable, especially when they have been wrung in his name and when the provisions of the Essential Commodities Act are proposed to be invoked in case the oil companies prefer to disagree with the Government's decision. As already pointed out earlier in this Journal, there could not have been any objection to appropriation of the savings resulting from these concessions for the benefit of the Union Exchequer had they been only such that they could not have brought down petroleum products prices by more than a couple of naye paise. The cumulative effect of the concessions given so far by the companies under the ad hoc agreements and those resulting from the Damle Committee's recommendations can, however, be quite appreciable if concentrated on one or two items such as gasoline and furnace oil whose prices need to be lowered. The provisions of the Essential Commodities Act can also be invoked only to protect the interest of the consumer and not for the benefit of the Central Exchequer. The Oil Ministry will do well to look into this matter further.

As far as one can judge at present, the Government has departed from the recommendations of the Damle Committee only at one place, i.e., in regard to the period during which the prices now fixed will be operative. The Committee, it is understood, had recommended this period to extend to 1965 end with the provision that the Government could review the position at the expiry of about two years of the coming into force of the new prices. The Government has decided to restrict the period of operation to a "reasonable" term up to two years. But one can find little fault with this in view of the growing surplus of petroleum products in the world market, leading to gradual but persistent decline in prices. The decision should suit the oil companies as it does not rule out any upward revision of prices at the end of the two-year period, should the circumstances then so warrant.

It is earnestly hoped the new price pattern will be given effect to in the same spirit in which

(Continued at the bottom of page 586)

A DELHI DIARY

ARGUS IN WONDERLAND

THE world gets curiousest and curiousest. It seems to make no difference as to whether you look at it from Delhi or from Amritsar. These are, I suppose, the poles of the new axis round which the Punjab revolves. I must confess I myself have been quite unequal to the endurance tests required to interview the Prime Minister and the Home Minister or the mediators at the Delhi end or the leading actors in the Akali Dal at Amritsar at the other. I have, therefore, been misguided enough to take my information from secondary or tertiary sources — copies of copies, in Plato's phrase, twice removed from the truth — with results which have been disastrous to my expectations and to my peace of mind. On Sunday it seemed that an agreement was round the corner. On Monday Mr. H. S. Malik, leaving for Bombay, talked about the sudden appearance of more goodwill on both sides and everyone thought by the evening an announcement would be made and Master Tara Singh would be breaking his fast. On Tuesday, we suddenly discovered that there was no basis whatever for this optimism, and that the aforesaid mediators' formula was merely a nice turn of phrase which carried no substance either way. In any case, the Akali Dal has now made its position more than clear and the Government of India — as if to distract itself — is involved in Planners' Conference, National Integration and, of course, the United Nations, all of which suggest that the Punjab is a marginal question. Everyone seems to be perfectly calm in spite of the fact that everyone knows that feeling in the Punjab is running extremely high; is it not? Perhaps this calm does not presage a storm.

DELHI AND AMRITSAR

I have been trying to understand the focal points of the current Punjabi polarisation. As far as I can see the Prime Minister's statement in the Lok Sabha, from which he has declined to move at all in substance, although he will permit a roundabout reference to the Punjabi Suba, was bound to fail. My friends tell me that this is the proper policy because, in fact, the Government of India has made up its mind not to concede to Punjabi Suba and, therefore, there is no sense in raising hopes by reference of this demand to a high power commission. But if the dispute is about a particular problem — however foolish and irrational — surely a solution cannot be found by appointing a commission which treats of everything but the grievance. I doubt if the Akalis, any more than other people, love commissions — high or low powered — for themselves. Thus it seems to me that the Prime Minister and the Home Minister will inevitably be accused of cleverly avoiding the substance of the current controversy. On the other hand, I cannot see, assuming as is evident that the Government of India is not amenable to any formula which provides for Punjabi Suba, how the extremists in Amritsar can hope to win any non-violent campaign for the Punjabi Suba. I fail to distinguish between the Congress fasts, which somehow or another are always justified, and non-Congress fasts, which somehow or another are always disapproved by Congressmen. But I do see that in this particular case the fast is likely, if it leads to a disaster, to engender hate and not understanding. It seems to me that the fast unto death has been overdone; the useful fast is one of persuasion for a limited period. At present it looks as though neither is likely to be crowned with success, but at least one would have recorded as a truly Gandhian effort against Gandhians. The other looks to me a prelude to some violence which makes it both non-Gandhian and unpredictable. All in all, therefore, I find myself strongly disapproving of both sides. Thus I am learning the highest principles of Indian dynamic neutrality! I therefore, without approving of Delhi in

any way, consider that Amritsar has not been conspicuously wise in pressing a demand to its ultimate irrevocably violent conclusion.

BLESSED ARE THE MEDIATORS?

Having struck out my neck thus far, I must pay a belated tribute to the mediators of whom there have been three prominent over the last two weeks. These are: the Maharaja of Patiala, whose indefatigable activity passes all praise; Mr. Mauli Chandra Sharma seems to have done a considerable amount of foot work with him and Mr. H. S. Malik has supplied soft words in season. "Blessed are the peacemakers for they shall have peace". Far be it from me to criticise a Biblical pronouncement of acknowledged high wisdom, but it does seem to me that none of the mediators has yet inherited the earth. Indeed, the Maharaja of Patiala has been disowned by everybody except by Master Tara Singh himself, and we are hearing less and less of the other mediators. It does look as if those who have gone between suffer the worst of both the worlds.

Is mediation, or a middle course, always more rational because it looks more moderate? I recall, with something like nostalgia, meetings thirty years ago with the Rt. Hon'ble Srinivasa Sastri, Sir Tej Bahadur Sapru and Mr. M. R. Jayakar in London when the famous Round Table Conferences were on. As an impressionable student I thought how remarkable it was that these eminent people were taking up an unpopular middle course under the circumstances which it looked to me, would inevitably come down in the middle. In the event, however, I discovered that moderation was not a politically good course. None of the three eminent mediators, if I might so describe them, in the Round Table Conferences, left any long impression on the shape of things to come. In the end it was the Congress Party's extreme view — temporarily rebuffed in the Quit India movement — which secured Indian Independence. What in the present case is the moral? That the extremists in Delhi or in Amritsar are to win? I dare not venture beyond this innocent question.

NATIONAL INTEGRATION: HOW?

A momentous conference pursuing national integration with 150 national leaders in session is supposed to forge new instruments of integrating the country politically, economically, socially and, above all, emotionally. With Master Tara Singh in a critical state in Amritsar, I dare to say the conference will not get off to an auspicious start. I dare not express any disrespectful opinion, but I may, under the provisions of the Constitution providing for free speech—triumphantly vindicated by the Supreme Court's decision on the Price Page Schedule this week!—question the national integration conference as a means of securing the ends in view. The conference itself is not a deliberating but a ventilating body. I wonder whether more ventilation is what we require!

ARGUS.

(Continued from page 585)

it has been adjudicated upon. The Government by accepting the Damle Committee's Report has given further proof of its anxiety to cultivate goodwill with the private oil interests. Reciprocation on the part of the latter would help in fostering a rapid development of the oil industry in this country on which depends, to no small extent, the development of other industries. If the resolution of the issue of fixation of prices is followed up by some relaxation of restriction on expansion of the private sector oil refining capacity, the development of the oil industry can be accelerated further.

THE WEEK'S NOTES

Price-Page Regulation

ACT ULTRA-VIRES

THE VEXATIOUS controversy over the newspaper price and page schedule has been set at rest. The Supreme Court, delivering its anxiously awaited judgment in the case involving this issue, has ruled that the Newspaper (Price and Page) Act, 1956, was ultra vires the Constitution and as a consequential decision it has declared the Daily Newspaper (Price and Page) Order, 1960, void. In sum, the effect of the Act was to authorise the regulation of the number of pages in relation to the price charged, to regulate the number of supplements which a daily newspaper could publish in a year barring the two supplements on January 26 and August 15, as well as to regulate the size and space devoted to advertisement matter in relation to other matter. The Act and the Order were challenged on the ground that they abridged the fundamental right of freedom of expression as guaranteed by Article 19(1) (a) of the Constitution, and as such they were ultra vires the Constitution.

On behalf of the respondent, the Union of India, it was contended that the primary objects of the Act and the Order promulgated under it were two—to extend protection to the medium and small newspapers and to prevent the growth of monopolistic combines. Both the contentions were rejected by the Court as unsustainable under Article 19, Clause (1)(a) and Clause (2). Clause (1)(a) guarantees to every citizen the right of freedom of speech and expression. (In parenthesis it may be mentioned that the freedom of expression only was involved in this case). The right of freedom of speech and expression, however, is not absolute. It can be abridged under Clause (2) of the same Article, but on no other grounds. Under Clause (2) The State is empowered to enact a law, in curtailment of this freedom, if it relates to libel, slander, defamation, contempt of court or any matter which offends against decency or morality or which undermines the security of the State or which tends to overthrow the State. The provision of law under the Constitution is thus crystal clear.

Views were expressed before the Press Commission for as well as against the price-page regulation and on each side were ranged big as well as small papers. Eventually, the Press Commission recommended the regulation. It is worth noting that the "Sakal" daily of Poona, which moved the Supreme Court, publishes its edition running into a total of 34 pages in six days of the week (excluding the Sunday edition) and it cannot be classed as a big newspaper by any stretch of reasoning. The mischief wrought by the impugned Order was thus far-reaching. Apart from this fact, the existence of monopolistic combines of newspapers is no more than an assumption and it was unreal to act on the basis of an assumption. The idea that the regulation of price would conserve readership and regulation of advertisement space would conserve advertisement business for newspapers which are not big is inherently fallacious. The reader or the advertiser cannot be compelled to turn to the small newspaper. He may prefer to go without it. As literacy spreads more rapidly and as that distinctive category of the daily Press which serves local or regional requirements of

readership comes into its own in this country, there will be ample scope for the medium and small sized Press to entrench itself in the newspaper world. The most important gain conferred by the Supreme Court's judgment is that it has protected from the Executive's onslaught the right to disseminate news and views—a right which is an essential adjunct to a democracy.

ECAFE

A DECADE OF PLANNING

AT THE first session of the conference of Asian Economic Planners held at New Delhi this week an interesting paper prepared by the ECAFE Secretariat was presented. It related to a decade of development planning and implementation in the ECAFE region and made an objective appraisal of the rates of economic growth, actual as well as planned. It was indicated that the performance of the development plans in most of the countries during the last decade was encouraging because the rates of growth in national income as well as per capita income exceeded the targets though there were cases of shortfall as well. The table on p. 626 compares the planned rate of growth and actual performance in almost all countries in this region.

It will be seen that India acquitted herself quite creditably in the First Plan but she did not do so well in the Second Plan. The rate of growth in national income is shown to be the highest in the case of the mainland China subject to the serious reservation that the estimates are based on highly questionable figures. If mainland China is excluded Japan occupies the foremost place in this list with a rise of 8.5 per cent per annum rise in national income and 7.3 per cent in per capita income. The achievement in Japan was double that of the planned target. Pakistan had a poor showing in her First Plan which ended in 1959-60. The rate of rise in national income was only 1 per cent as compared to the target of 2.8 per cent while the per capita income was 0.6 per cent as compared to the target of 1.4 per cent. Burma, however, recorded remarkable achievement with a growth rate in national income of 5 per cent per annum. Despite the limitations from which these statistics suffer, these broad indications are enough to highlight the uneven character of the growth rates in the various countries in this region.

Nagaland

PROBLEMS OF TRANSITION

THE SECOND SESSION of the Interim Consultative Council of Nagaland which was held last week at Kohima has brought a further measure of reassurance that Dr. Phizo's following is losing ground and the moderate element is gaining greater mass support. Dr. Inkongliba Ao's assassination has had no adverse effect on the morale of the majority which is determined to make a success of the agreement signed at Delhi to elevate Nagaland to statehood and make the Nagas masters of their domestic affairs. Mr. T. N. Anga has been elected chairman of the Interim Consultative Council of Nagaland in succession to Dr. Ao and in his person the Interim Council has acquired considerable accession of strength. This one-time lieutenant of Dr.

Phizo has long since denounced the cult of violence and secession and has ranged himself as a staunch supporter of the moderate section which believes in the real destiny of Nagaland as an integral part of India. At last week's session, the Governor of Assam, Gen. Srinagesh, exhorted the members of the Interim Council to pull their weight with the administration in its function to preserve law and order. It would appear that misgivings about the support to the rebels from villages in certain areas of Nagaland are misplaced and such support as may be visible is more the result of duress than of voluntary action.

The hands of the Interim Consultative Council can be strengthened and firm conviction can be carried to the masses in Nagaland in regard to the final transfer of power if an effective beginning is made now during the period of transition. On this question it would appear that the members of the Interim Consultative Council are not quite so happy as they ought to be and at the last session they expressed themselves rather frankly that the transitional regulations were interpreted by the officials on the spot in too narrow a spirit which hampered the exercise of larger power by them. It was their plea that if there is tangible evidence to the people that the process of transfer has been initiated right now, although on a modest scale, the journey to statehood would be eased with the full and unreserved support from the people. This issue is likely to be taken up in the reported visit of a delegation of the Naga leaders to Delhi next month to meet the Prime Minister. Meantime, the Interim Council is busy making arrangements for drawing up the constitution of the local self-government councils at the tribal, range and village levels.

Ceylon

RESERVATION OF JOBS

RECENT REPORTS indicate that the Government of Ceylon is contemplating fresh legislation for the reservation of jobs in the plantation industry for Ceylon nationals. The reservation is to take the form of prescribed quotas for the nationals who would be entitled to preference in the recruitment of labour force in the plantations. It would appear that already a policy of reservation has been initiated by the Ceylon Government and the limit prescribed for priority for Ceylon nationals is about 50 per cent. If fresh legislative revision of this previous quota is proposed to be made, it would imply that it was not functioning properly or it was found to be inadequate. There is much to be argued in favour of such a kind of reservation where the problem of joblessness is by no means a minor one. But a vital and integral part of this policy is to come to a clear decision as to who are Ceylon nationals.

This problem of the definition of Ceylon nationals has become complicated in our neighbouring island because of the settlement in that country of people of Indian origin, who have now for generations adopted Ceylon as their homeland and have no intention whatsoever of returning to their land of origin. In the normal course, a great majority of them should be entitled to be recognized as Ceylon nationals and possibly a marginal section among them may not be eligible for that status. But out of about 9 lakh Ceylon Indians—persons of Indian origin settled for several decades in Ceylon—as many as 7 lakhs have been declared as stateless. For very understandable reasons, the Government of India is not eager to take greater interest in the determination of this question than it

has done hitherto. It is only right that it should not do anything which even remotely might create any reactions of interference in the domestic affairs of Ceylon. But it would be a great mistake to oversimplify this issue. This is as much a problem of the constitutional status of these "stateless" people as it is a humanitarian problem. In 1954, the agreement signed between the Governments of India and Ceylon stipulated that there would be no discrimination against the Ceylon Indians in the matter of employment, but if their status of statelessness is left pending, apparently they would not be entitled to the benefits of the system of employment priorities which are being offered by the Ceylon Government. It would be a great tragedy if they are uprooted from the homeland of their adoption and left with no choice but to be repatriated to India. Talks were recently started between the officials of the two countries to prepare the preliminaries for higher level talks on this question. It is to be regretted that the proposed revision of job reservations is synchronizing with the official talks.

Hindustan Antibiotics

THE FLY: FUSS OR FURY?

IT IS not in dispute that a dead house-fly was discovered in a vial of streptodocin by a doctor who was about to administer the contents to his patient. A prompt protest was entered with the Hindustan Antibiotics where it was manufactured. With equal promptitude action was taken to freeze the whole batch of 10,000 vials which had been put in the market. A doubt, however, may be raised whether it was by a miraculous chance that the fly was detected in the very first vial to be opened, while the whole batch minus this one remained on the druggists' shelves awaiting custom between delivery from Pimpri and the alarming discovery. But this is a minor point. Apparently the freezing of the 9,999 vials is to be taken in a figurative sense. Since no more complaints have been recorded, it is to be presumed that any other vials used were quite safe. But a point of dispute has been raised gratuitously (some might be tempted to say, foolishly,) by the Hindustan Antibiotics in its Press Note. The Press Note goes on to explain the meticulous procedure of sampling and testing to check up the purity and quality of the products and launches a counter-attack that interested quarters are playing up the incident. Who are these interested quarters and how have they managed to exploit the incident? Is it a case of a fuss over a trifling thing or fury over a grave lapse? The angry authors of the Press Note should find a dispassionate answer for their own benefit as also for the community's benefit.

It is true that a single lapse must not be magnified into a generalisation. It would be malicious and highly dangerous to do so. Nor is there any indication that such an attempt has been made by anybody in this case. But it is equally true that the magnitude of this single lapse is grave enough. Considerable expenditure has been incurred by the Hindustan Antibiotics in the training of a senior officer in Britain and America in the most up-to-date techniques of sampling and testing of antibiotics and much more on the construction of a modern and most well-equipped building to house its quality control department. But a tiny fly has given this public sector enterprise a rude jolt lest it slips into complacency. A thorough probe ought to be carried out into this incident and responsibility located to make quality control as fool-proof as humanly possible.

HOW TO SECURE EFFICIENCY IN STATE ENTERPRISES

By ODYSSEUS

BECAUSE the attempt in the UK to keep the nationalised industries "out of politics," by trying to insist that the Minister is responsible for broad policy and the public corporation for day-to-day administration, has broken down, there is a growing feeling that this should be constitutionally recognised and that direct Ministerial administration, on the lines of the post office, should be substituted.

But in his thoughtful and readable study, "Parliament and Public Ownership" (Cassel. London. 1961. Price 30sh.), Mr. A. H. Hanson, of Leeds University, points out that the basic difficulties of nationalised industries, such as coal or transport, arise because they are simultaneously (a) commercial enterprises, which ought to be managed in terms of costs and returns, and (b) public services, to which the community thinks that it is entitled whether they can be made to pay or not. The electors do not argue that if the railways cannot be made to pay they should be closed down, but that the "state" (which they usually fail to recognise is only another description of themselves as taxpayers) should subsidise the losses.

Nobody disputes, however, that state enterprises should be managed so as to pay their way to the greatest extent possible. This means that the business man's attitude of mind should predominate in their actual management. This, in turn, is a strong argument for maintaining their separate corporate existence and not making them an ordinary government department, in which ideas about business efficiency, costs, selling prices, and returns, are inevitably submerged in the ordinary departmental routine of detailed estimating and accounting procedures, Treasury control of establishments, government rules concerning contracts, etc., all of which were devised for the totally different purposes of enforcing uniform control in a purely administrative machine.

AN EFFICIENCY CONTROL CENTRE

Mr. Hanson proposes that the existing corporations should be preserved, that ministerial responsibility for all the corporation's activities should be fully admitted (thus solving the problem of evasion of accountability outlined here last week), but that, in addition, a new government agency should be created which would act as an efficiency control centre, to collect and sift information, to compare statistically achievements with foreign state, or other, enterprises, and to act generally as business consultants to the corporations.

This agency should be independent of the Ministry, public corporation, Parliament, the Select Committee of the House, and the Consumers Councils, but would be at the disposal of all these bodies to investigate definite problems referred to it. It should not undertake a continuous and complete investigation of all nationalised industries throughout the year, for this would mean that it would tend to usurp the functions of management of the corporations and would undermine their self-confidence and sense of responsibility by peering over their shoulders all the time. It would only examine problems, either specific to one industry, or

common to all, referred to it, or which it had decided to take up on its own initiative. This would, of course, involve some looking over of shoulders, but not everyone's all the time. Moreover, the agency's object would not be that of the Parliamentary Opposition, i.e. to catch people out, but that of the management consultant, i.e. to help them to improve. Plenty of looking over shoulders goes on already in the UK today, especially in controversial state enterprises, like the railways, so that it would be better not to try to stop it but to make it objective in intention and more informed.

Mr. Hanson suggests instances in which it would be desirable to insist that a problem be referred to the agency, and its advice received, before action is taken. Most UK public corporations have a Consumers' Council attached to them, which is supposed to be consulted on any proposal affecting consumers' interests. In fact, these councils have been wholly ineffective because they have been restricted to questions of hardships, are in no position to challenge the figures presented by a corporation, and because, in general, the Minister always supports the "commercial judgment" of the Corporation.

This procedure leaves everyone dissatisfied (except the Minister and the Corporation!). It would be more sensible if a specialised agency were to conduct an impartial expert investigation of the facts, the costs and the basis on which they were calculated, to ascertain what action would be in the best interests not merely of the corporation concerned, but of the locality and the nation. The principle might be adopted that no facility should be withdrawn until evidence was available that the cost of producing it outweighed the benefits conferred. Information and advice on this would be the responsibility of agency experts, skilled in "costs-and-benefits" calculations. Other functions that the agency could undertake would be to examine unremunerative public services demanded by consumers, and, above all, price policies. Although it has long been agreed in the UK that an industry providing a basic service cannot be left entirely free to decide its prices, especially if it is a monopoly, this was forgotten when coal, electricity, and gas were nationalised. How far the Minister has intervened to influence gas and electricity prices is not known. Mr. Hanson urges that what the Minister needs is the advice of an agency which has the facilities and the time to engage in continuous study of pricing policies, and which could therefore present the facts without delay and indicate the probable results of alternative decisions.

HOPES FOR THE FUTURE

Mr. Hanson is not optimistic about the chances of adoption of his proposal for an independent fact-finding and management consultancy government agency. He foresees strong opposition from the nationalised industries, which would fear and resent it, and from civil servants who would regard it as implying criticism of their own abilities. He thinks that the most likely hope for the emergence of such an agency would be to develop the information and advice functions within existing corporations to the point at which it would be reasonable or necessary to hive them off into a special institution. He thinks that the best hope lies in the

development of the activities of (1) the House of Commons Select Committee on Nationalised Industries and (2) the acknowledgment of responsibilities in the Ministries concerned with state enterprises. The "silent persuasiveness of ascertained fact" should remove from the sphere of partisan debate many subjects which are only controversial because they are not properly understood.

The House of Commons is seen at its best in (a) the broad discussion of important issues of public policy and (b) in ventilation of individual grievances. The best results are obtained when the debate or the question has been preceded by some kind of preparatory process, like that of a Select Committee, so that attention can be focussed on outstanding points. At present, the House's broad discussions of the nationalised industries take place mainly on the annual Reports and Accounts, periodically supplemented by a Report from the Select Committee. If these debates are unsatisfactory it is because (except when from time to time a Select Committee Report has been made) no point of concentration has been provided, partly because information is deficient, partly because many M.P.'s seize the occasion to expatiate on constituency grievances which they find difficulty in raising at Question time. M.P.'s cannot, of course, be prevented from using such occasions as grievance sessions, but if, either by means of the Select Committee, or of Mr. Hanson's suggested investigating agency, it could be ensured that documents summarising relevant information should be previously supplied

to M.P.'s, the more productive of parliamentary and public enlightenment will the debate be, and the better will genuine requirements of supervision of state enterprises be satisfied.

The ideas outlined here today, and in the previous two articles, for the more rational control of state enterprises may, I hope, provide food for reflection in India, since according to Mr. Paul Appleby (in his "Re-examination of India's Administrative System with Special Reference to Government's Industrial and Commercial Enterprises", published by the New Delhi Cabinet Secretariat), India's Parliament "is the chief citadel of opposition to delegation of powers, the need for which is the worst short-coming in Indian administration". It is Mr. Hanson's contention that the more you attempt to suppress Parliamentary interference the more are you likely to stimulate it. His support for a Select Committee on Nationalised Industries, and his suggestion for an investigatory agency, is not intended to perpetuate a regime in which Ministers and M.P.'s are constantly interfering. The value of Select Committee reports, and of an agency, is not that they would enable Ministers to do more, and M.P.'s to talk more, but that they would direct action and talk to points on which they were really needed.

[This is the final article in a set of three on the problems of parliamentary control over state owned enterprises.—Ed.]

India today is caught up in the feverish activity of industrial advancement. Projects are planned...dams are being built...all through the night we hear the ceaseless hum of men and machines at work. In the world of today, the economic development of a nation is gauged by her machines...and the STEEL consumed by them. In dams and bridges, in the railway and automobile industry, in the manufacture of the thousands of consumer goods, STEEL is necessary—absolutely necessary! And so steel has come to be indicative of the economic development of a country...indicative of what a country is worth in cold hard cash.

150 YEARS

1811 - 1961

**KRUPP**

For 150 years, the name of Krupp has been identified with superb workmanship and enduring quality.

The name of Krupp is also linked with outstanding pioneer work, past and present, in many fields of industrial research, planning and manufacture.

The results achieved have caused the name of Krupp to be permanently associated with progress in engineering throughout the world. Illustrated on this page is one of the more than 3,000 items contained in our Catalogue "KRUPP PRODUCTS AND SERVICES": Full-portal level-luffing wharf cranes.

Products and Services:

Exploration of mineral deposits • Engineering of mining schemes • Design, layout, and supply of plant for the production and processing of ferrous and non-ferrous metals • Preparation and dressing plant for ore, coal, and other minerals • Chemical-process plant • Cement, lime, and gypsum plant • Bridges, hydraulic structures, and reinforced-concrete structures • Materials, pressure vessels, and tanks for nuclear reactors • Castings and forgings • Rolls • WIDIA-sintered carbide • Magnetic materials • Cable-making and stranding machines • Hydraulic extruders • Machinery for the rubber and plastics industries • Edible oil extraction plant • Sheet-metal working and can-making machinery • Mobile water purifiers • Plate and sheet-metal fabrications • Pneumatic tools • Motor trucks, buses, and special-purpose vehicles • Diesel and electric locomotives • Special-purpose freight cars • Ocean-going vessels and river craft • Diesel engines • Giant excavators and bulk-handling plant • Power shovels and cranes.

THE DECLINE OF IMPERIAL TRADE—II

From Our Special West European Correspondent

PARIS, September 25.

FIGURES were given here last week to illustrate the erosion of British commercial positions in the countries of the Commonwealth. This decline of imperial trade is due: to the reduction of imperial preferences and the granting of quotas valid for more sources of supply; to the fact which both these changes express, namely the loosening of political ties between Britain and the independent nations of her former empire; to intensified competition from the USA, the Soviet bloc and above all from the rehabilitated Continental countries; and finally to the diversification and multiplication of import requirements in the Commonwealth countries, notably those that undertook planned development. In these circumstances, the decline of British trade is not surprising and some British observers express surprise that it has not gone further. But then, it is going further; long before any question of Britain joining the Common Market was raised, it was clear that the decline that has been going on since 1937, and with special rapidity since 1954, would continue as far ahead as one can see, though maybe at a slower rate. After all, for all the losses of recent years Britain still holds a dominating situation in several sterling area markets, and her position in all of them is stronger than in markets outside the sterling area. As the bonds of empire weaken, these vestiges of imperial advantage will be diminished further, especially now that we know that any viable arrangement Britain makes with the Common Market must entail a sharp reduction of imperial preference, if not its abolition. It is too early to speculate on the consequences of any reform of the international payments system (e.g. the Triffin plan) that would lead to Britain's abdication from the role of the sterling area's banker.

This decay of imperial trade is not, by itself, disastrous for Britain—provided she draws the appropriate conclusions, by ensuring that she is not shut out of a united Europe just when she is losing trade in the Commonwealth markets. While her share of Commonwealth markets has been declining, her share in non-sterling markets has been maintained, and it happens that the rate of growth in these latter is often higher than in the Commonwealth. If, with the aid of what remains of imperial preference, Britain cannot even manage to hold her own in Commonwealth markets which are expanding slowly; and if, even in spite of the beginnings of discrimination, she can hold her own or better in Continental markets which are growing rapidly, then obviously it is wisdom to reconcile oneself to the decline of imperial trade and to seek compensation elsewhere.

Having briefly surveyed the decay of imperial commerce in Britain's case, turn to the same process that is going on in French overseas trade. In July of this year, for the first time in her history, France's principal client was not Algeria but West Germany. Over the previous twelve months the Germans had increased their purchases of French goods by 30 per cent while Algeria reduced hers by 20 per cent. The former increase was due to the new competitiveness of French industry, notably in machinery, and (to a much smaller extent than is thought) to the mutual preferences of the Common Market. The latter decrease was due (not by any means to the Algerian war, which in the past six years has been consistent with considerable prosper-

ity in North Africa) to the prospect of a final break between France and her last colony. The extent of the decrease is no doubt to be ascribed to the sudden stagnation that has overtaken Algeria as the Europeans begin to consider quitting; only those sanguine enough to think that France can recover her positions in North Africa will regard this as an exceptional or temporary development. The contrast between the 30 per cent increase and the 20 per cent decrease illustrates, while perhaps exaggerating, the long-term trend: the decline of imperial trade and the intensification of European economic unity.

The same trend may be seen in France's trade with all the 33 countries or territories of the franc zone. This has been declining irregularly, for several years; it fell by 6 per cent in 1956 and it has fallen by 7 per cent again in the first seven months of this year. French exports to the franc zone were running at about 950 million New Francs a month at the end of 1959; they had fallen to under 900 million NF a year later; they were just over 800 million NF this spring and are under that figure for the average of seven months so far this year. Sharp declines have occurred not only in exports to Algeria, but to Guinea, Cambodia, South Viet Nam, Laos, Madagascar, Senegal and Togoland. The rate of fall in recent months might be exceptional, having to do with the American recession and a weakening of raw material prices, but there is no doubt about the long-term downward trend.

Were it not for the persistence of commercial preferences inherited from the colonial system, the decline of French imperial trade would have begun before this. French decolonisation began later than British, but its effects on trade have been felt more quickly because, by making her ex-colonies "associates" of the Common Market, France surrendered her commercial privileges even before the colonies were liberated. That is to say, she surrendered them to the extent of sharing them with her Common Market partners, whereas Britain alone continued to benefit from Commonwealth preference, even though its value shrank, when her colonies were freed. Since this sharing involves opening up the franc zone to the aggressive exporters of West Germany and Italy, the impact on French imperial trade was considerable, it will be even more marked if Britain, by joining the Common Market, gains similar access to French-speaking Africa.

As could have been pointed out in the British case, the effect on individual French industries varies widely. It is the manufacturers and exporters of finished consumer goods who are most affected; they have lost 12 per cent of their colonial trade so far this year. For the manufacturers of capital equipment there is the prospect of longer-term gain when the independent ex-colonies begin to industrialise, whereupon community of language and technical training will tend to favour purchases of producer-material in France. The British case, however, seems to show that this only serves to maintain the absolute value of trade, without preventing the relative decline of imports from the former mother-country, as foreign techniques are increasingly appealed to.

So far we have looked at the decline of imperial trade from the point of view of the European powers. How does it look from the other side, from the ex-colonies? Of course, it constitutes the substance of the

economic independence they agitated for when they were being governed from Europe. The steady fall in their purchases from the mother-country, at least relative to their total trade with the rest of the West, with Russia and Japan, expresses the freedom they now have to buy where they will. (Years ago they used to imagine that this would mean buying in the cheapest market, but in reality they find their purchases being directed by considerations of currency shortages, credit terms, tied loans, the requirements of political neutrality and other factors as remote from mere cheapness as were the obligations of colonial subservience.) This assertion of independence does not imply that, after a more or less long period of declining imperial trade, the former imperialist power is quite evinced from the ex-colonial market, or even that after surrendering traditional commercial domination it loses its position as the biggest single trading partner. It implies only that, after the disappearance of preferences that no longer have a political justification and after a weakening of traditional bonds, the ex-imperialist should be offering its exports on strictly competitive terms. Yet the only guarantee that the European power can do that is that it should be competing freely with other European economies in Europe itself, and with the Americans in a Western trading world from which dollar-import restrictions have abolished. We have seen that this has already happened to a large extent with French industry in its relations with Africa: it is because French industry has to meet German and Italian industry on an equal footing inside the Common Market that it can contemplate trading with Africa without any benefit from the remains of imperial advantage. British industry will have to face the same test if it enters the Common Market.

It is curious in these circumstances to see the reluctance with which certain interests in former colonies accept the other side of the medal: the loss of preferential access to one European country. This is re-

quired by that decline of imperial trade that constitutes, as we have said, their economic independence. There are African leaders who want to continue selling their coffee and fibres in France at special prices (i.e. to retain the benefits of economic subjugation) while they trade more freely with other European countries. Some of the alarm expressed in India in private quarters, but not in Mr. Morarji Desai's statesmanlike utterances on the subject, about possible loss of sheltered British custom belongs in the same class: a refusal to see the implications of India's right to buy more from Russia, the USA and West Germany. There is even something of this in the Australian attitude to Britain's entry into the Common Market; the drift of Australian taste to American goods is well known, but Canberra wants to combine this with integral preservation of her preferential access to the British market.

However, when developing countries who welcome the liberating aspect of the decline of imperial trade complain of the loss they suffer by being deprived of privileged access to one European market, they cannot simply be told that they are refusing to pay the price for what they want. It is rather that, faced with the immensity of their development tasks, they realise that economic independence is not enough, as they fondly thought, before attaining independence, it would be. The right to sell preferentially in Britain or France was matched by the obligation to buy preferentially from Britain or France. Now that they have the right to buy anywhere in the industrial world, their development needs impel them to assert the obligation on all the industrial world to provide them with favourable conditions for their exports. Obviously, this general obligation cannot be deduced from the corresponding right as clearly as the obligations of imperialism could be deduced from its rights. Fortunately, the Western community that is emerging around the node of the Common Market is capable of other deductions besides those of commercial logic.

Economic Report from the U.S.

I.B.R.D. AND I.M.F. MEET

By GUY SIMS FITCH

WASHINGTON, Sept. 20.

THOSE twin United Nations instruments of international economic growth and financial stability — the International Bank for Reconstruction and Development (IBRD) and the International Monetary Fund (IMF) — have now chalked up some 15 years of successful operation. This is a milestone not lightly to be dismissed, as the governors of the two organizations meet this week for their annual meeting, being held this year in Vienna. This milestone takes on added significance when one recalls some of the scepticism which greeted the two institutions. Yet time seems to have vindicated the judgment of those who saw in them new opportunities to achieve the kind of economic and financial co-operation from which all nations could benefit. As a matter of fact, the passing years have seen the continued growth of the two bodies, not merely in membership but also in structure and function.

To the IBRD, which has become known familiarly as the World Bank, have been added two new affiliates. These are the International Finance Corporation (IFC), with the function of spurring economic development around the world through the constructive use of private funds and investment, and the International Development Association (IDA), which has added to the normal World Bank operations the concept of long-term development loans on easier terms than might otherwise be available. Since it began its operation 15 years ago, the Bank has made available some \$5,700 million in loans to countries throughout the world — a notable sum, indeed, when one considers the broad need for development capital. Much of its lending in the beginning went for the rehabilitation of war-shattered economies, particularly in Europe. But for more than a decade now, with that initial task fulfilled, development has taken precedence over reconstruction. The bulk of its loans has been going to aid in the economic advancement of what have been called the developing nations, with such basic needs as electric power and transportation accounting for the major shares.

During the year ended this past June 30, Bank loans or credits came to \$711 million for development projects in 21 countries. Of this sum, IDA was responsible for \$101 million in the form of 50-year interest-free credits to four countries. This represents more than a little progress for IDA, which did not come into existence until September 1960, and by the end of June 1961 had 51 member governments with subscriptions totalling almost \$906 million. IDA now has a lengthening list of development proposals under investigation all over the world. Yet it is not the World Bank, which has expanded and liberalized its lending powers in response to new and growing needs, but the Monetary Fund that occupies the centre of the stage this year at Vienna. Actually, the focus at the annual meetings has been shifting toward the IMF for the past several years, ever since the nations of Western Europe moved to make their currencies convertible. This shift has been underscored by the increased use of the resources of the IMF, which makes funds available to ease balance of payments difficulties and currency strains. Drawings by member-nations have been running at a record rate this year, reaching \$2,300 million by the end of August. This compares with \$977 million for all of 1957, the previous peak year of IMF operations.

It comes as no surprise, then, to find the Fund, with the support of many of its members, proposing an enlargement of its lending powers. It should be emphasized that the advantages accruing from this added guarantee of financial stability would not be confined to just one or two nations. The additional resources would be available on a stand-by basis to help any major nation out of a temporary difficulty, with benefits to the entire world economy. While there may be a temptation to view the proposed IMF expansion as a sign of international financial weakness, in reality the reverse seems to be the case. As IMF Director Per Jacobsson has pointed out, the economies of the free nations have been expanding, world trade has been growing, and there is general confidence in the U.S. dollar and other leading currencies. The IMF, with its support of international financial stability, has made a significant contribution to these developments. Thus, there appears to be a growing realization that further strengthening of the Fund's resources may well be advisable, to enable this international organization of free nations to carry on with even greater assurance of success, the work in which it has been so notably engaged.

REGULATING STOCK EXCHANGES

By J. HAROLD TARBELL, Ph.D.

J. Harold Tarbell is Professor of Finance in the Department of Economics and Business Administration, Lafayette College, Easton, Pennsylvania. During the period of the Congressional Investigation and Hearings relative to the regulation of the stock exchanges he served as personal adviser to Ferdinand Pecora who directed the investigation committee. The specific task of Professor Tarbell was to analyse the evidence and suggest legislation for regulation to prevent abuses and malpractices in the orderly operation of the security markets. With one minor exception the recommendations were incorporated in the Securities Exchange Act of 1934.

ARE there evils and/or undesirable practices involved in the operation of the stock exchanges of India? Apparently there are men in high places feeling that this might be the case as evidenced by a discussion on this matter between the Minister of Finance and the Presidents of the Stock Exchanges.

Stock exchanges are useful for they provide a market place for securities, and give liquidity to shares and bonds at fair and reasonable prices. Without this liquidity corporations would have a much more difficult time in floating original issues to enable them to raise vast amounts of capital for large-scale operations. While stock exchanges attract persons who wish to speculate as well as invest, speculation in itself is not bad. In fact intelligent speculation is good for it tends to stabilize prices. The word "speculate" is derived from the Latin "speculari" which means "to see ahead". We need persons of vision, foresight, and wisdom who will support those enterprises which are capably managed and serve an economic need and withdraw their support from those firms which are not qualified.

Unfortunately the stock markets attract persons who are not qualified to speculate in that they are not equipped with adequate economic intelligence or with the financial strength to accept the risks involved. They feel that the stock market is a place to make money quickly and buy on tips, rumours, and without adequate information. Larger and more sophisticated operators have been known to use shady and unfair practices to the detriment of society in general and to the uninitiated investor in particular.

The purpose of this article is to point out some of the problems of stock exchanges in the U.S.A. and state what was done to overcome them with the hope that some food for thought, at least, might be provided here.

In the earlier days the buying and selling of shares on the stock exchanges in America was dominated by wealthy individuals or families that held substantial interests in corporations, the professional speculator or trader, and to a minor extent the "little fellow" who somehow thought that the stock market might be an easy path to riches. It was not until after World War I that public participation of persons in the middle class became extensive. By the middle and towards the end of the 1920's this participation reached a fantastic degree with persons buying shares merely because they were increasing in price and without regard for sound value. Finally, towards the end of 1929 the bubble broke in a mighty crash leaving financial ruin in its wake. In the purchase of equities, particularly on credit, persons threw all caution to the wind and few were willing to admit that they had engaged in a dangerous game excessively and with folly and stupidity. They screamed to the high heavens and demanded that that "Evil Den of Iniquity—Wall Street" should be cleansed. A Congressional Committee was appointed and after extensive hearings the Securities and Exchange Act was passed by 1934, with the Securities and Exchange Commission

as the administrative agency. The question involved was: what were the evils and unfair practices that should be outlawed or regulated? For purposes of convenience it can be said that the committee concentrated on three major items. First, the need for adequate information concerning the corporations and the securities issued, second, the regulation of credit used in the security markets, and third, manipulation of price restrictions.

No corporation (with minor exceptions) was permitted to issue and sell to the public any securities unless a detailed prospectus giving complete information was filed with the S.E.C. Heavy penalties are levied if a prospectus is found to be inaccurate or omits material facts. Even before this provision in the S.E.C. Act, the stock exchanges themselves had crusaded for full reporting of earnings and outlooks of the firms whose securities were listed thereon. Their attitude was that they did not want people buying and selling on the floor of the exchanges "pigs in a bag" and adopted the attitude of wanting to know every detail concerning the pig. For many years the New York Stock Exchange had insisted that its listed corporations should provide detailed annual reports as well as less exhaustive details every quarter. No uniform accounting practices are prescribed. A corporation is free to select any accounting methods which it might wish. However, once selected the same system must be followed unless one gets the approval of tax officials who are inclined to be suspicious that such a change is being made in order to show less taxable income. Therefore, this consistency in accounting methods and practices makes it the easier to interpret financial reports.

As for the second point, credit, let it be said that it has played an important role in connection with security speculation. One could purchase shares on 10 per cent margin. This involved a down payment of merely the 10 per cent. The seller of the shares would be paid in full with the additional 90 per cent being provided by the broker who would hold the shares until his customer had paid for them in full. The broker would use the shares, however, as collateral in borrowing money for he never had adequate funds of his own. These "brokers' loans" would be obtained from banks and large corporations which had idle funds. While the rate of interest paid for the use of money was generally low, the lender was in a safe position for the collateral was of known value and of high liquidity. Furthermore these loans were payable on demand. Thus if the value of the collateral fell in value, the lender could and did demand repayment in full or in part. In order to repay the loan the broker would demand that his customer retire the loan. If he was not in a position to reduce his loan with the broker then the stock would be sold to acquire funds to enable the broker to settle with the lender. With a sag in market prices of any extent those trading on margin would have to sell (therefore the term "forced liquidation") and this dumping of securities on a falling market obviously pushed prices even lower.

While the officials of the various stock exchanges realized that this distress selling could and did occur their attitude was to make the margin requirements merely large enough to protect themselves and their members. In order to control margin trading to avoid distress selling the SEC Act stated that brokers may now borrow only from a bank which is a member of the Federal Reserve System. Under this regulation the amount that a buyer must put up has ranged between 40 and 100 per cent. For example, during world War II, a time when it was felt unwise to permit credit to be used for speculative purposes, the margin requirement was 100 per cent. In general it can be said that the policy followed is to raise the margin requirements in periods of prosperity when over-optimism and speculative fever is high, and to lower the margin requirements in periods of recession and depression. Under this type of regulation there has been very little or no distress selling. It might be added here that at the moment the margin requirement is 70 per cent.

Our third point—eliminating manipulation. Several remedial steps were taken to this end.

One practice used by corporate officials was painting a rosy picture at a time when they were selling shares, then later give announcements of doom to depress prices so that they could acquire shares at the lower levels. To remedy this situation the law provides that all corporate officials must file, monthly, any changes of ownership directly or indirectly, i.e. shares in which they might have an interest even though the shares are registered in the names of friends or relatives. Furthermore, if they speculate in the shares of their firm any profit made must be turned over to the corporation, while any losses sustained must be borne by them personally. If shares are held over six months, then this holding is regarded as a permanent investment and dividends and profits may be retained by the corporate officials. Pools have also been outlawed. Under this manipulative device an individual would acquire vast sums from friends with the hope that the funds would be large enough to influence prices. Frequently the pool manager would hire well-known financial writers to tout the stock.

Short selling if carried on in excessive volume can be vicious. In fact some felt that had there been no short selling during the crash of '29 the market would not have sunk to the depth that it did. It has been argued further that as a result of the crash with thousands losing their fortunes in full or in part purchasing power was lost to such a degree that sales (particularly in the field of the durable goods industries) fell off and started the downward spiral that resulted in the Great Depression. In other words some felt that excesses in short selling was the cause of it all. This was obviously not entirely correct. There had been excessive speculation, particularly on margin, with the result that prices were not in keeping with value. Excesses in either direction—up or down, are not good for a stable economy. However, many do not understand the economic usefulness of short selling as a stabilising influence. The short seller sells when he feels that the market is too high and, while it is true that he is a potential buyer when prices sag, some have argued that this buying merely partially corrects the damage that he has done. The Act does not prohibit short selling, but it does limit the practice. Short selling is permissive when the market price of a particular stock increases, however, one may not sell short when prices are falling. Thus it is no longer possible to continuously hammer down prices in a falling market. However, when prices are falling, should there be an increase in price of only the smallest fraction, one may again sell short at that increased price. On this basis bear raiding is curbed.

Without question short selling during the crash did push prices down. Some of the larger short sellers were known (such as Joseph P. Kennedy, the father of the present President and who served as the first chairman of the Securities and Exchange Commission) and, while the matter of forbidding short selling on the part of individuals was discussed at the hearings, no regulation against them was made. However, investment companies may not sell short. These companies now hold, in their portfolios, securities with a market value of approximately eighteen billions of dollars so it is clear that should some of these larger companies sell short, prices might be depressed too much and too rapidly.

Initially a majority of the investment fraternity felt the Act too severe and that it would result in a lack in the flow of funds to finance industry and commerce. There is some evidence that this was true and minor amendments have been made. With the passage of time even the severest critics admit the advantages of regulation. Major abusive practices involved in the issuance and continuing sales of securities have been eliminated or curbed with the result that the investing public has the confidence that his interest is protected. Even though there is additional red-tape and record keeping those in the field of investment conclude that, while regulation may have been a nuisance in the short run, it has given all a greater measure of confidence, that all is well, thus the business of the stock exchanges has been booming with increased commissions and profits to the brokerage fraternity.

These remarks are not intended to imply that the usages and practices of trading on the stock exchanges of India do not properly and adequately serve the existing needs of its economy. It does no harm to take stock and to make inquiries from time to time as well as to study the pattern of experiences of other countries, which pattern and experience may or may not be applicable.

"For every shortcoming under the sun,
There is a remedy or there is none.
If there is one, try to find it,
If there is none, never mind it."

India's (and Asia's) LARGEST DAIRY ...air conditioned by BLUE STAR

The gigantic dairy plant of the Delhi Milk Scheme—the pride of the nation's Capital—will be handling over half a million pounds of milk per day when in full production. A major Second Plan project of the Union Government, it will help solve the Capital's milk supply problem.

Hygienic handling of such vast quantities of fresh milk and other dairy products daily has been made possible by WORTHINGTON air conditioning. Throughout the processing, bottling and storage of milk, a 350-ton WORTHINGTON air conditioning system helps provide absolutely sanitary conditions by eliminating dirt, dust and temperature variations which could cause adverse bacterial action in milk... it also provides cool comfort in offices, recreation rooms, auditorium.

Engineered and installed by BLUE STAR,
the plant comprises

- Two Centrifugals, 175 TR each, with their respective induced draft cooling towers
- Six chilled-water Air Handling Units
- Two giant Air Washer Systems which cool and ventilate the engineering workshops and stores, machine rooms, bulk can and bottle washing areas, milk reception and despatch, dry storage, etc.

This is yet another instance where high performance and economy in operation led logically to a BLUE STAR engineered WORTHINGTON installation. Whether your requirements are large or small—you will find that BLUE STAR can serve you best in 'climate control'.

THE BUSINESS WORLD

The Stand of the Seven Sages

By CROESUS

THE FIRST MEETING of the Presidents of the seven stock exchanges in India who have formed themselves into a committee, as suggested by the Union Finance Minister when he met them during mid-September, may be expected to provide an indication of the steps they are likely to take in order to ensure a healthy functioning of the stock markets in this country. As a contemporary observed recently, this is one more chance for the stock exchange authorities to set their house in order on their own. How they should go about it is entirely their business as they are expected to know how best to achieve it, and it is just as well that the Government of India has assured them that it would not interfere with the day-to-day working of stock exchanges. This is a great gain to the stock exchanges, in that it means that the Government has accepted the position that they (the stock exchanges) are autonomous bodies. This is what Mr. Morarji Desai, the Union Finance Minister, stated categorically in the course of his address to the meeting of the Presidents of the stock exchanges in the middle of this month. What Mr. Desai said at this meeting is well worth recalling, if only because it is indicative of how and what the Government has been thinking on this important subject.

Among other points that the Union Finance Minister made on the above occasion, the following are significant:

- (1) The share markets in India are an important link in the economic structure of the country and have a useful role to play.
- (2) The Government wants more and more people to invest in old as well as new shares, and this is possible only in a healthy climate.
- (3) This [that is (2) as above] demands that there should be no unhealthy speculation in the market leading to wide fluctuations in share prices, brought about by certain forces.
- (4) There are difficulties caused by kerb trading which is illegal.
- (5) The Government will advise the stock exchanges whenever its help is necessary and is sought.
- (6) The Government will not interfere with the day-to-day working of stock exchanges.
- (7) There will be no regulation, unless it becomes necessary.
- (8) If any Government action becomes necessary, the Government would like to have prior consultations with the stock exchange authorities.

(9) The stock exchange authorities should meet periodically to consider problems relating to unhealthy speculation in share markets and evolve suitable solutions for the development of sound share market operations (an idea of what these "sound practices" mean was indicated such as the need to go into the problems of Kerb trading, adequate margins and greater co-ordination among different stock exchanges).

Although several suggestions have ere now been made for the reform of stock exchanges in this country, two of them stand out prominently, namely a workable system of margins and the enforcement of a minimum brokerage. A third suggestion which has also been insistently made relates to deposits by brokers. The other suggestions include, 'inte alia', the establishment of a permanent Stock Exchange Security Commission on the U.S. model, surprise inspection of brokers' books periodically, and a careful watch on abnormal dealings in cash counters.

Any one who has carefully gone through all that has been written on this subject in the past few months, if not years, will not find it difficult to agree with those who insist that the minimum reforms which the Stock Exchange Division of the Union Ministry of Finance has been pressing for are in the best interests of everybody concerned, including the stock markets. Many in the stock markets too would welcome these minimum reforms. How then is one to explain why there has been such seemingly persistent unwillingness on the part of the stock exchange authorities to implement these reforms? Perhaps they apprehend that, if they were to do this, they would be accepting 'ipso facto' the allegations against them of unhealthy speculation. This presumption is permissible especially in the context of the several attempts on the part of market authorities to maintain that the market has been quite normal and well under control by reason of the several regulatory measures they have already taken on their own. Whether this is justified or not is beside the point if the desideratum of a healthy stock market is to be ensured. That can only be done, without, at the same time, any loss of face for the stock market authorities, by the Committee of the Presidents of the stock exchanges resolving at their forthcoming meeting to introduce margins and enforce minimum brokerages on all the stock exchanges. This meeting may also be availed of by the presidents of the stock exchanges to express an unequivocal appreciation of the Government's stand as adumbrated by the Union Finance Minister. It is hoped that this would be the stand of the seven sages.

Fund-Bank Meeting

AT the annual joint meeting at Vienna recently of the four international financial institutions—International Monetary Fund, International Bank for Reconstruction and Development, International Development Association and International Finance Corpora-

tion—it was an obvious realisation that the financial resources at the disposal of these institutions were quite inadequate as compared to their increasing commitments in various different ways. If the International Monetary Fund required more money to

attempt a control over international monetary stability, the International Development Association needed more funds to assist effectively the underdeveloped countries in their development efforts. The inadequacy of funds at the disposal of International Monetary Fund was stressed in the opening session by Mr. Per Jacobsson, the Managing Director, who warned that the Fund might not be able to adequately support a healthy world financial structure. He went to the extent of suggesting that the Fund should seek credits; something the Fund has never done during the last sixteen years of its existence.

Mr. Eugene Black went a step further and pointed out that the increasing requirements of funds at the present critical moment should be met by the industrialized nations. They should offer, he added, larger proportions of development finance for the lending institutions at minimum rates of interest. While his point was supported by the representatives of the underdeveloped nations, it was Mr. George W. Ball, the United States representative, who strongly pleaded for a liberal release of development funds by the industrially advanced nations. Thus at Vienna an atmosphere was created where the advanced nations were made to realize the urgency of financial assistance to developing economies.

There were indications that the World Bank, through larger borrowings from European markets, would siphon off investment funds for use in developing countries. This is significant because many developing nations would otherwise be unable to have direct access to tap the European prosperity.

Perhaps the most significant point made by Mr. Black at the meeting was in respect of the changing debt structure of underdeveloped countries where a persistent tendency had developed in too many cases for debt repayments to pile up. There were signs since 1959 that the ratio between conventional credits and what might be termed as unconventional credits was changing and as Mr. Black added, "changing for the worse." It was quite logical that for the assistance to be effective it had to be at terms that created a minimum burden for the borrowing country. The safest way of minimizing this unhealthy trend in the rising debt structure was to maximize the amount of official capital which was supplied on a long-term basis with

a token interest burden. Mr. Black added that it was going to be "harder and harder to keep development projects and programmes moving ahead in any orderly fashion and orderly pace unless the aid mixture had a larger component of funds on a grant basis." There was, however, an overwhelmingly strong view among the delegates of developing countries that unless the funds made available were in sufficiently large quantities they could not be really effective in raising their economies.

Mr. Black was critical of the recent Aid-India Club meetings on the grounds that too much capital subscribed would be provided on terms which bore too heavily on India's balance of payments. He emphasized that unless the aid was given on easy terms comparable with the IDA, economic development activity would be overloaded with foreign debt. While it was true that India would have liked to receive assistance on the terms of the credits given by IDA, which matured in 50 years and carried no interest rate or commitment charges and amortization began after a ten-year period of grace, it has to be kept in mind that such assistance would not be available in magnitudes necessary for Indian requirements. Financial assistance received from various sources on various terms has been effective in raising the tempo of India's economic development. As was pointed out by Mr. Morarji Desai at Vienna, India has made the development of its economy the central piece of all its policy. "The access to the funds and resources so readily obtained last July is of great and timely help to us." He added, though, that we have been operating on a very slender margin as far as our foreign exchange resources are concerned.

A well-conceived development programme is as necessary as the financial resources to accomplish it. This fact was highlighted by Mr. Black, who pointed out that it was not possible for any lending agency to realistically determine the quantity of aid required for any country. Against this background, the World Bank has recently decided to set aside a group of highly qualified development advisers who will be available to member countries on request for extended periods of time. In this respect, it may be added, India had been rather fortunate; her projects have been, by and large, considered financially and economically sound.

formed the main theme of the address of Mr. Vallabh-dass V. Mariwala, the President of the Indian Merchants' Chamber, to the second quarterly meeting of the Indian Merchants' Chamber a few days ago.

According to Mr. Mariwala, this rate of investment "contains an element of considerable sacrifice on the part of the community, being subject to a high and persisting inflationary rise in prices, cost of living and a level of taxation which has exceeded the capacity of the savings sector to bear." And so, he submitted, the Plan should be so tailored as to fit in with the resources that India could mobilise.

Referring to the problem of taxation, the IMC Chief pointed out that, compared to the actual realisation of Rs. 1,052 crores through additional taxation in the Second Plan, the expected amount of Rs. 1,710 crores of additional taxation in the Third Plan indicated the enormous extent of reliance the planners have placed on this front—and this at a time when it is recognised that, with the levels of taxation on persons and companies being what they are, there is hardly any scope left for further taxation. Even the present level of taxation, according to Mr. Mariwala

has adversely affected prospects for personal and corporate savings. As regards indirect taxes also, it was pointed out that any increase in the present levels would only serve to curb the enthusiasm and sap the stimulus for high rate of productivity in the different sectors. High costs as a result of indirect taxation, the IMC Chief felt, would affect the impetus for growth. In short, Mr. Mariwala summed up the position regarding taxation by saying that the whole approach to taxation policy and the high targets fixed for additional taxation have failed to take into account the present structure and levels of taxation, both direct and indirect, and their impact on prices.

Mr. Pravinchandra V. Gandhi, the Vice-President of the IMC, confined his remarks to banking, a field in which he has specialised. The proposed changes the Reserve Bank intends to introduce in the banking system, he opined, could only be brought in gradually and progressively. Although he conceded that, in view of the present economic development, there was imperative need to strengthen the banking system, he sounded a note of caution against any far reaching changes. Such changes, said he, would have to be carried out without rudely disturbing the spontaneous efforts of banks and their economic functioning. Instead of confining the banking system in a statutory strait-jacket, Mr. Gandhi preferred to ensure, as in the U.K., that the lending policies of banks are sound and the disposition of funds is made in a manner which combines safety of funds and a fair return on advances.

Exports

MERCHANTS' MEMORANDUM

DURING THE last decade, while India's imports have increased substantially from an annual average of Rs. 724 crores (in the First Plan) to Rs. 1,072 crores (in the Second Plan), exports have remained stagnant at an annual average of Rs. 614 crores and Rs. 609 crores in the First and the Second Plan periods, respectively. In view of the rapid development of industries, on the one hand, and the maintenance of the already existing industries, on the other, during the Third Plan, it is envisaged that the country's aggregate import bill will rise to about Rs. 1,270 crores annually. The magnitude of the task that this calls for—that is to make up the leeway between the existing level of our exports and that demanded by the sharp rise in our imports—must impress anyone that India has yet to evolve a dynamic export policy such as is required to tow the Third Plan out of the docks. In this connection, a reference may be made to the deliberations of the Export Promotion Advisory Council, recently held at New Delhi, in the course of which whereas all the participants agreed on the imperative need to step up our exports, quite a few of them were not agreeable to the Government's proposal for introducing an element of compulsion—say, by fixing a certain percentage of the production of each industry for export—in order to maximise exports.

In a memorandum submitted to the Import and Export Policy Committee headed by Dr. Ramaswami Mudaliar, it is noteworthy the Committee of the Indian Merchants Chamber (IMC) has not only stressed the need to boost up our exports but has gone one step further, to insist that "export promotion must be considered as an integral and vital feature of the plan for economic development". In this memorandum the IMC Committee has also observed that a reorientation of the country's export policy is an urgent necessity in the present circumstances and has called for a policy that would meet the demands of the overseas market not merely in respect of commodities which India can

offer them conveniently but those in respect of which the importing countries are in need of. The Committee also appreciates the imperative need for a degree of sacrifice in domestic consumption in order to leave an adequate surplus for export. But, then, it does not subscribe to the policy of compulsory exports, as envisaged by the Government. According to the IMC memorandum, the introduction of compulsion would mean that the exporters will have to effect distress sales and incur losses. It has, therefore, suggested other measures for the promotion of exports, such as taking the commercial community into confidence and persuading them to set aside a portion of production of different items of export on a voluntary basis, and offering suitable incentives, including retention of a part of their export earnings to import their own requirements, and so on. There is force in the contention of those who oppose any compulsion in these matters on principle. But what is more important and more often apt to be forgotten is the fact that, in matters as exports, where one of the parties (foreign buyers) is not amenable to our laws and discipline, compulsion cannot have any place. Nor will it yield results.

Automobiles

U.S. TEAM'S RECOMMENDATIONS ON STRENGTHENING ANCILLARIES

SOME VALUABLE suggestions have been made by the U.S. Team, sponsored some time ago by the Technical Co-operation Mission to study the working of the Indian automobile industry, on strengthening the automobile ancillary industry in this country.

The Team, in its report, says that the automobile ancillary industry in India has developed along lines unlike those in other countries and it does not appear, despite more foreign technical collaboration and coming up of new ancillaries, that the industry is moving in the direction of strength. A major restrictive and limiting factor in this respect, the Team opines, is that both the large and small-scale Indian businesses are seeking maximum independence from each other and from ancillary suppliers to a degree inconsistent with objectives of low cost, maximum production and conservation of foreign exchange. The Team recommends that this situation should receive objective thinking on the part of Indian business management as well as the Government of India.

Purchasing practices and sub-contracting techniques, the Team says, are vital to the growth and strength of an industry. The practice in the Indian automobile industry to make the components in the unit of assembly itself rather than buying them from ancillary units is not justifiable on economic grounds or even on grounds of survival. In this regard, the Team senses an underlying and almost universal mistrust between buyers and sellers; "Sanctity of a contract or a business agreement of any kind, not on moral grounds but on the basis of long-term self interest, seems to be almost completely lacking". To remedy the situation, the Team suggests that purchasing representatives of the business community should go abroad to investigate material procurement practices and techniques.

To put the ancillary industries on a sound footing, the Team has further suggested that ancillaries which desire to grow and sell their products to vehicle manufacturers should start developing a Product Design Engineering Department of their own regardless of the type of foreign collaboration which they may enjoy. Unless and until the Indian ancillary producers recognise their obligation to make product design changes and improvement, thereby becoming more and more valuable to their customers, no strong ancillary group can develop, says the Team. The ancillaries' technical

Business Notes

Taxation

FRESH TAX TARGET TOO HIGH AND UNREALISTIC

IT HAS been estimated that, in order to meet the total investment of Rs. 10,400 crores in the Third Plan, the rate of investment has to be stepped up from the current level of about 11 per cent of national income to about 14 per cent and the rate of domestic savings from about 8.5 per cent to about 11.5 per cent by 1965-66. The question that is exercising the minds of most people today is whether this is at all feasible, notwithstanding the optimistic findings of the National Council of Applied Economic Research. It is true that, during the past decade, the rate of investment has risen appreciably. Thus, at the commencement of the First Plan, the investment in the public sector alone stood at Rs. 200 crores, which rose to Rs. 800 crores by the end of the Second Plan. This is now proposed to be raised further to Rs. 1,700 crores. In view of the past sacrifices, the question that is now being posed is whether the country can afford the further sacrifices that this proposal entails, and it is just as well that this subject

objective should be to know more about the end use of their products.

The Team has also found lack of automotive standards in the automobile ancillary industry in India. To rectify this lacuna, it recommends the establishment of standardization committees similar to the Society of Automotive Engineers. These committees, it further suggests, should be made up of engineers from the automotive industry. The Chairman of the committee should probably be chosen from an engineering school, since no professional automotive engineering society now exists in India. The various committees should agree on tentative standards for lights, instruments, splines, gears, materials, heat treatment, etc. These standards should not be binding on any company, but should be published and distributed to the industry.

To improve the technical know-how in the industry, the Team suggests that ancillaries, through their own Ancillary Industries Association, should create a technical assistance group, composed of Indian engineers, to give technical assistance to all members on their production and quality problems. This Technical Assistance Group should be able to draw on the vehical manufacturers and T.C.M. for information that it might not be able to get otherwise.

Throughout the survey the Team has observed duplication of facilities within the vehical manufacturers and the ancillaries. The Team has recommended that fewer new manufacturing licences be issued that duplicate facilities not now being utilized to capacity.

To serve the public better, the Team has recommended that all ancillaries be allowed to sell in the replacement market without restriction. The vehical manufacturers should distribute replacement parts more widely than is currently being done through a limited number of car dealers. Another pertinent observation in this regard made by the Team is that contractual agreements between the manufacturers and the ancillary industry are usually qualified with the stipulation that the ancillary industry would refrain from using its own trade mark or name and not establish its own image in the replacement market. Should this practice continue, the Team thinks the possibility of establishing high grade ancillaries, with a brand name, comparable to the O.E.M., will never materialise.

On the question of profit margin on replacement parts, the Team has come to the conclusion that the profits made by the Indian manufacturers are not excessive compared to the United States, considering the discounts allowed on prices in the U.S.A. Similarly, published profit margins to the Indian dealers are lower than those in the United States. When acute shortages of replacement parts occur, the public has, however, to pay excessive prices.

Banking

CO-OPERATIVE BANKS AND THE STATE

IN HIS annual address to the Maharashtra State Co-operative Bank Ltd., Chairman, Prof. D. R. Gadgil, raised an important point regarding the role played by the Government in various ways in the furtherance of co-operative institutions, especially the banks. At a time when the Maharashtra State Co-operative Bank found its commitments to co-operative sugar factories increasing and the demand for loans for agricultural purposes appreciating, it was the Government of Maharashtra, he said, that rendered timely help by advancing to this Bank a temporary loan of Rs. 1 crore. The deposits of the Bank increased further and it was able to repay the Government loan on the due date. He, emphasised, however, that the Government could do more than that. For instance, the surplus funds with local bodies and some public corporations could find

their way to the Co-operative Banks, in view of the increased responsibility devolving on them for providing adequate agricultural credit under the development programmes. Considering the fact that these funds would otherwise lie idle, it appears that this move could be of considerable assistance to the banks. In fact, as Prof. Gadgil pointed out, the Maharashtra State Co-operative Bank did receive a generous response from some of these bodies. In line with the approach outlined by Prof. Gadgil, the Bank with its affiliates and their branches has decided to provide necessary banking facilities to the State Road Transport Corporation throughout the State. This step again indicated the establishment of closer contacts with local bodies and public corporations.

A notable development of the year in the working of the Bank was the decision of the Refinance Corporation for Industries to extend facilities of reimbursement for the medium term loans advanced by the Bank. In view of the expanding activities of the Bank, Dr. Gadgil added that the Bank will have to rely on the Reserve Bank of India to a substantial extent and this assistance, it appears, was already available in some degree. Prof. Gadgil has, however, raised an important point that it was not very proper for the Reserve Bank to determine the credit-worthiness and the needs of the Co-operative Banks from their paid-up share capital and resources. The quantum of the Government capital made available, he said, should depend not merely on the performance of a bank in the past but on the development envisaged in the future. These views have been supported by the recommendations of Vaikunthbhai Mehta Committee regarding the provision of agricultural credit by the Reserve Bank on a more liberal scale. The Reserve Bank, it has to be remembered, accepted these recommendations in principle.

C & I Chambers

ROLE IN A DEVELOPING ECONOMY

IDEAS REGARDING the role of Chambers of Commerce and Industry in a developing economy have been so far foggy. Various do's and don'ts, of course, have often been put across by spokesmen of these Chambers, but there had not been any clear line of thinking. The whole issue was put in the right perspective by Mr. Barker, Secretary of the Bombay Chamber of Commerce and Industry, at the Chamber's 125th anniversary, when he pointed out that apart from acting as the Public Relations-cum-Information Offices of the Government, these Chambers should be the mouthpiece of commerce and industry, as far as public are concerned. It is also right and inevitable that the prime task of the larger Chambers of Commerce and Industry in India should be to act as a liaison between the Government and the private sector industry. In addition to the relations of the Commerce and Industry with Government and the public, the Chambers are generally of considerable assistance to other trade associations.

Pertaining to the work of the Bombay Chamber of Commerce and Industry, Mr. Barker underlined that the Chamber did not reckon to take up the difficulties of the individual companies on any subject. It is only where the difficulties are generally experienced by all or a considerable number of members that the Chamber feels to take action. Generally speaking, the Chamber deals with issues of general application, that is, those which concern at least a wide section of members. It is the special services, namely, the Labour Advisory Service, the Statistical Service, the Docks Department and others that are available for the use of member-individually.

...Just enough for Tips and Taxis!

It can be done on a Diners' Club Credit Card! As a member of the Diners' Club you can travel anywhere in India, on business or pleasure, and get *instant and unquestioned credit wherever you need it*. You can sign for just about anything from stalking a rhino to furnishing an office!

Membership to the Diners' Club is only Rs. 30 per year and entitles you to

- *unquestioned credit in over 600 leading hotels, restaurants and shops throughout the country.*
- *an accurate, permanent record of monthly expenses, invaluable for tax purposes.*
- *a copy of the Diners' Club magazine every month.*
- *the facility of paying for all monthly expenses by just one cheque*

To Delhi* and back on
a handful of change

FIT

Firestone

BE SAFER FOR LONGER

There is no economy in driving on worn-down tyres. There is only DANGER—from skids, from blow-outs and from the lack of braking control.

You and your family are no safer than the tyres on your car!

Buy Firestone and you get—

- The still exclusive Firestone Safety Tread with its thousands of non-skid angles to ensure the utmost in braking control.
- Long-service, wear-resistant Firestone rubber formulated to keep you safer—for longer.
- The same engineering skill in tyre construction that World Motor Racing Champions depend on for their lives.

Fit **Firestone** New DeLuxe Champion Tyres
BEST TODAY—STILL BETTER TOMORROW!

There is a great demand in the Chamber for the issue of certificates of origin and analysis in respect of a variety of goods exported. In order to meet the demands of overseas buyers of Indian produce and manufacture, the Chamber issues certificate of weight and quality in respect of larger number of commodities especially oils and oilseeds, spices, drugs and medicines, Indian herbs, etc.

The Bombay Chamber has sixteen special sub-committees on every subject affecting commerce and industry from labour affairs to exports and from railways to company law. All said and done from a review made by Mr. Barker, it appears that the role which the Chambers will have to play will be to guide, advise and, if necessary, to direct stipendary experts.

Chemicals

VITAL ROLE OF CAUSTIC SODA

THE VITAL role of caustic soda as a basic raw material to several important industries, such as soap, textiles, paper, vanaspati, rayon and aluminium, is well known, but not so the heavy responsibility of manufacturers to ensure the development of the industry to its full stature, observed Mr. K. R. P. Aiyangar, Chairman, Tariff Commission, while opening the public enquiry into the question of continuance of protection to the caustic soda industry beyond December 31, 1961. There were 12 units engaged in the production of caustic soda when the protection was first granted to the industry in 1955. This number rose to 15 in 1958 and to 18 by 1961. Of these 18 units, 11 units produce caustic soda for sale and seven for their own consumption. The three units established since 1958 are Saurashtra Chemicals, Porbunder, Dhrangadhra Chemical Works Ltd., Sahapuram, and J.K. Chemicals, Ltd., Bombay. The rated capacity, which stood at 39,940 tonnes in 1956, increased to 68,270 tonnes in 1958 and has risen further to 131,630 tonnes this year. On the other hand, actual production during 1958, 1959, 1960 and the first six months of 1961 aggregated 58,311 tonnes, 70,487 tonnes, 97,402 tonnes, and 57,873 tonnes, respectively. Production during the current year is expected to cross the one-lakh-tonne level, which compares with a production of less than 30,000 tonnes only seven years ago, that is in 1954, before the industry got protection. While ten of the existing units were permitted to expand their capacities substantially, fourteen new units have been given licences to establish caustic soda plants in various parts of the country. When all these are commissioned, the total capacity of the industry would increase to about 3,66,500 tonnes, that is within a very close range of the target capacity of 4,00,000 tonnes as laid down in the Third Five-Year Plan.

On the demand side, whereas the annual domestic demand was estimated by the Tariff Commission at 1,24,000 tonnes in 1958, the actual consumption of caustic soda, according to the Development Wing of the Commerce and Industry Ministry, amounted to 1,35,000 tonnes. This figure increased to 155,000 tonnes in 1959 and 170,000 tonnes in 1960. According to the estimate of the Development Wing, the current year's consumption has been put down at 1,95,000 tonnes. By 1964, the demand is expected to rise up to as much as 3,00,000 tonnes.

It is noteworthy that, by and large, the quality of the domestic product has been considered to be satisfactory. According to Mr. Aiyangar, the industry has fared well due to the strict regulation of imports, thereby completely eliminating foreign competition. In its turn, the industry too may be said to have made good this gesture by saving for the country a large volume of foreign exchange on imports at a time when every rupee of foreign exchange is of consequence. With the vast scope that lies ahead by reason of the increasing dependence of caustic soda-consuming industries on the home product — undoubtedly a favourable factor — there are great opportunities for service for the

industry, provided, of course, the Government adopts a helpful attitude and does not give shocks so often as it has been doing of late by allowing the State Trading Corporation to import large quantities of caustic soda (even if they be from Rupee Payment countries) and unload them on the market at psychologically wrong moments.

METTUR'S EXPANSION PROGRAMME

DR. P. S. LOKANATHAN, Chairman of the Mettur Chemical and Industrial Corporation Ltd. at the annual general meeting of the company held recently referred to the company's expansion programme which, he said, was progressing smoothly. The second stage of expansion of caustic soda plant from 20 to 40 tons per day capacity was under way. Equipment was already received at site, and was being installed gradually. The next step would be the raising of production capacity of caustic soda from 40 to 100 tons per day which would be accomplished during the Third Plan period. Incidentally, this expansion programme would be in line with the overall tempo in the country; India's caustic soda production was expected to reach 3.5 lakh tons by the end of the Third Plan as against 1.35 lakh tons at the end of the Second Plan.

Dr. Lokanathan added that one important feature of this company would be that it would have a fully integrated plant utilising co-product chlorine beneficially, thus achieving in one measure higher efficiency. Another special feature of this expansion programme was that the stepping up of investment was not likely to affect dividend distribution, which was a considerable achievement in itself. This would nevertheless involve raising of funds through loans and share capital. Dr. Lokanathan mentioned another development which sounded a note of optimism for the company: the location in the vicinity of this company of two big consumers—the Madras Aluminium Company and India Cements Ltd.—which would solve, though partly, the problem of marketing for the Company.

Paper

MYSORE PAPER'S EXPANSION PLAN

MR. M. D. SHIVANANJAPPA, Chairman of the Mysore Paper Mills Ltd., outlined the proposed expansion scheme of the Company at the Annual General Meeting held recently. From the present installed capacity of 8,000 tons to 18,000 tons of marketable paper by the end of Third Five-Year Plan is going to be a major landmark in the Company's history. At present, as the Chairman pointed out, the paper making capacity of the Company exceeded the pulp making capacity so that there was an imbalance between the two sections. Moreover, the present output did not permit the Company to instal a modern Soda Recovery Plant which alone could secure for the Company certain economies which in turn could reduce considerably the cost of production.

The Chairman pointed out that soon the Company would go in for the expansion scheme and the Mysore Government had already agreed to supply 50,000 tons of bamboo annually required for the plant. The pulp plant which was to be installed after expansion would have a capacity to produce sufficient quantity of pulp to feed the existing two paper machines of 15 tons each and also the new paper machine of 30-35 tons capacity. Thus after the installation of the pulp plant and a modern Soda Recovery Plant, the Mysore Paper would produce 18,000 tons of marketable paper at a considerably reduced cost. As the demand for paper was likely to continue in the present rate of progression, marketing of the additional output would not be a problem for the Company.

The Chairman has estimated that the expansion scheme would cost nearly Rs. 3.5 crores which, he believed, could be raised through share capital by Rights Issue (Rs. one crore), rupee loan from Indus-

trial Finance Corporation (Rs. 60 lakhs), foreign exchange loan from Commonwealth Development Finance Corporation and Industrial Credit and Investment Corporation of India (Rs. 70 lakhs each) and bank borrowings and other reserves (Rs. 50 lakhs). The authorised capital of the Company had already been increased from Rs. 25 lakhs to Rs. 150 lakhs and the Company had obtained consent of the Controller of Capital Issues to raise Rs. one crore by issue of shares. The Company would not find it difficult to raise finance through new issues as well as through loans. As the Chairman pointed out, the agreement with Commonwealth Development Finance Corporation had been signed recently and an agreement with Industrial Credit and Investment Corporation of India too had been reached. He added that these two loans would finance the purchase of equipment in the U.K. and certain European countries for the expansion programme. Thus the Company was proceeding with its expansion schemes on a sound basis and soon the Mysore Paper Mills would be producing more than double its present output, profitably.

Woolens

PROBLEMS OF WOOLLEN INDUSTRY

MR. L. P. PITTIE, Chairman, All-India Woollen Mills Association Ltd., at the first annual general meeting of the Association held in Bombay highlighted some of the problems facing the woollen industry. He brought to the fore the question of Indian raw wool and the extent to which its use could help in saving foreign exchange. The Chairman opined that while the Association was in full agreement with the views that the possibilities of using Indian wool and thus conserving out limited resources of foreign exchange should be fully explored, it has also got to be examined carefully as to whether use of Indian wool in fact would serve and further the real purpose of saving foreign exchange. The current thinking in the Government circles appears to be in favour of using Indian wool to the extent of 20 per cent. On all counts, it appears that the foreign exchange earned in exporting Indian wool is more than the foreign exchange spent in importing foreign wool. The cost of wool tops manufactured out of the imported wool would be lower than the tops manufactured out of Indian wool because of the higher yield of the imported wool. The Chairman underlined that it would be appreciated if superior imported wool is mixed with Indian Bikaner carpet wool, which is of an inferior quality, the full advantages of the superior wool are eliminated. Further, if increasing quantities of Indian wool are used in the country, the export markets for the same would naturally be adversely affected, if not lost, and it would become very difficult in the normal time to recapture them. The points made by Mr. Pittie are of basic importance and should set a new thinking on the subject.

Among other points, the Chairman pleaded that the export incentives should be increased in the case of woollen goods from 75 per cent to 85 per cent of the export value. So far as the pattern of production is concerned it is submitted that the Government should, after assessing the situation, so re-adjust the mills' individual pattern of production that the aggregate production of hosiery yarn is reduced to 30 per cent of the total production. On the question of determining the fair rate of return on the employed capital, the Chairman submitted that the return should be such that should encourage greater production. Bearing in mind the peculiar circumstances of the woollen industry, where the prices of raw materials are subject to wide fluctuations, it is clear that a return of 20 per cent on the employed capital will be fair. With a view now to export more of woollen goods, it is imperative that an up-to-date machinery be installed so that the quality of Indian goods may conform to the foreign standards.

Economy

INDUSTRY IN KASHMIR

IT SHOULD be a comforting thought for the Kashmir Government that the Central Government has decided to set up a newsprint and a pulp plant with a capacity to manufacture 30,000 tons yearly. Besides, another paper and pulp plant of the same capacity and a plywood plant would also be established in the private sector. These three projects would be quite big and are expected to solve the unemployment problem at present rampant in the mountain-locked area. It is also gathered that a National Drug Farm will be established by the Union Drug and Pharmaceutical Corporation. An Indian firm has also agreed to set up a development corporation for Kashmir bauxite which could result in the starting of an aluminium industry in Jammu area. There are also possibilities of setting up several medium-sized cement plants in Jammu and Kashmir. The foundation stone of a cement factory was laid recently by Bakhshi Ghulam Mohammed, Prime Minister of Kashmir. The scope for fruit-preservation industries is, of course, tremendous. Although large-scale industries cannot be set up in the State because of its difficult terrain and absence of rail link, the scope for medium and small-scale industries to raise the standard of living of people could be exploited fully. There is enough hidden mineral wealth in the State and it can be utilised effectively.

While it is a heartening factor that industrialisation is under way in the Kashmir State, the fear is that until and unless power, trained labour and effective transport system is provided, all the plans in the State may go awry. So what the State needs today is to start a labour training programme which could ultimately increase productivity. Power on a large scale would certainly be required as the existing power plants would not be sufficient to meet the exigencies of the situation. So in the first instance, power potential in Kashmir will have to be developed rapidly and extensively. Last but not the least, transport system will have to be organised in such a way that the needs of industry are met properly. Mere tinkering with the problem would not provide the right answer. Besides, special facilities and concessions will have to be provided to the industrialists so that they might have full confidence and go ahead with the schemes.

Lead

SALE OF SURPLUS AUSTRALIAN STOCKS

NOW THAT an Agreement has been arrived at with the Commodity Project Corporation, an Agency of the United States, it will help Australia to dispose of 45,000 short tons of surplus Australian stocks of lead metal. The Agreement provides for delivery over a period not exceeding twelve months. The agreed price is related to the current world price for lead, (about £A80 a long ton) and represents about £A3,600,000 from the sale. The sale has been announced by Broken Hill Associated Smelters Pty. Ltd., which is owned jointly by North Broken Hill Ltd., Broken Hill South Limited and the Consolidated Zinc Group. B.H.A.S. refines lead concentrates for the Group at Port Pirie, South Australia, where it operates the largest lead refinery in the world. The B.H.A.S. statement said that the sale represented part of a programme announced by the United States Government representatives at the International Lead and Zinc Study Group meeting held in Mexico city last April to discuss barter of surplus agricultural commodities for surplus lead under certain conditions. One condition of the sale is that B.H.A.S. and Broken Hill Mining Companies undertake not to sell or produce during the present calendar year in excess of figures provisionally agreed on at the Mexico city meeting. The surplus lead stocks to be bartered by the Broken Hill group had accumulated as the result of restrictions the Group had imposed on itself at various meetings of the Lead and Zinc Study Group.

FROM THE CAPITAL'S CORRIDORS

DURGAPUR STEEL PLANT

IN the last two weeks have been published in this column the expansion programmes of the Rourkela and Bhilai Steel Plants. Some details are now available of the expansion programme of the Durgapur Steelworks. The Project Report for the expansion of this steel plant will be shortly examined by Messrs. Atkins and Partners, a British firm of consultants. On the basis of this examination, the Government of India will invite tenders for the supply of machinery and equipment for the expansion programme. The present contractors of this plant—Indian Steelworks Construction Limited (ISCON), are expected to participate in these tenders. It is just likely that their valuable experience will be fully made use of.

The expansion programme of the Durgapur Steelworks envisages raising of its annual output of steel to 1.6 million tons ingots from the present capacity of approximately 8 lakh tons of finished products from one million tons ingots together with some three lakh tons of pig iron for sale and for internal use at the Works Foundry when all the existing blast furnaces are in operation.

To raise the capacity from one million tons ingots to 1.6 million tons ingots per annum, it will be necessary to instal at the Works a further battery of coke ovens together with its attendant By-products Plant, an additional blast furnace and another open hearth furnace of 240-ton capacity, besides effecting some improvements and extensions in the Works such as remodelling of the existing seven 200-ton open hearth furnaces into 240-ton furnaces and the existing 100-ton furnace producing wheel quality steel into 120-ton furnace.

To make the blast furnaces fully efficient, a fully prepared burden will have to be charged into them together with sinter created from the natural fines from the ore mines. It is intended that the screening of the natural fines and subsequent beneficiation, if necessary, should be done at the mines and supplied as two separate materials into the Works.

The remodelling of the existing open hearth furnaces to their increased capacity of 240 tons each, will be done in rotation as they come up for major repairs. The remodelled furnaces will be supplied with basic roofs and full oxygen equipment. The existing open hearth furnace, which produces wheel quality steel, after its remodelling will be able to produce 1,10,000 tons per annum of this quality steel. Any additional requirements of this quality steel required for the Wheel and Axle Plant is envisaged to be secured by the use of the larger capacity furnaces with a reduced charge. To maximise production at the open hearth furnaces, resort will be had to 8-hour tapping. It will be essential to have an efficient organisation to make certain that scrap, hot metal and ancillary materials are available as and when required for any particular furnace.

The additional unit intended to be installed at the coke oven plant will ensure that coke making facilities are well in excess of the extended requirements under good conditions. Similarly, the additional blast furnace with a fully prepared burden and with the use of sinter in the burden will ensure that blast furnaces on basic iron will be capable of producing more hot metal than is required. The additional open hearth furnace and the remodelling of the existing furnaces will be capable of providing all the ingots required. In case the alterations to the existing furnaces and training of operators in modern technique take more time to obtain full output efficiency, provision has been made in the layout of this section of the Works to instal another 240-ton open hearth furnace.

The Primary Mill System already installed at the Works is fully capable, when working 6,000 hours per annum, of breaking down 1.5 million ingots into blooms. Only minor extensions are envisaged to be made in this unit in the form of having additional coking pits and a cold ingot stockyard together with a cold ingot pre-heating furnace system. The remaining one lakh tons breakdown of ingots will be had in the Wheel and Plant.

The Central Engineering Maintenance Department is also competent to deal with the requirements of the additional plant. The foundry, similarly, is capable, with small additions, of providing the additional ingot moulds, baseplates and trumpets that will be required for the increased output and also approximately 2,500 tons per year of ingot moulds and stools required for the Alloy and Special Steels Plant to be set up near this Steelworks.

In the Finishing Plant section, it is proposed to have a new skelp mill and some additions to the Wheel and Axle Plant to raise its capacity from 45,000 to 75,000 wheel sets of various types and dimensions. The output of the Wheel and Axle Plant at the completion of the expansion programme will be some 1,30,000 tons per annum. It is proposed to effect some other small adjustments in this section, for instance the material for the skelp mill and the slabs and billets for sale will be transferred from the existing stock bay into two new bays—one located for the stocking of material for sale and the other for the stocking of material for the skelp mill. Additional rolls and attendant facilities will also be required at the medium section mill to enable this mill to produce 60 lbs. per yard rails.

SUPPLY OF ELECTRICITY

An additional gas-fired boiler and blower will be installed as an extension to the existing power plant to meet the requirements of the fourth blast furnace.

The maximum demand of electric power after the completion of the expansion programme is estimated to be approximately 60,000 kW. The existing power station can give a firm power-load of 10,000 kW. The balance of 50,000 kW. power has to be arranged.

As the demand for power in the Durgapur area is increasing rapidly and the Damodar Valley Corporation is not likely to be in a position to meet the demand of the Steel Plant in time, it is recommended to construct a new power station in the Steelworks to generate its power demand with the Steelworks' surplus fuel.

The new power station can be equipped with either one 50,000 kW unit or two 30,000 kW units. If only one 50,000 kW unit is installed, there will be no standby capacity and when the only unit is down for normal maintenance, steel production will be severely limited. If two 30,000 kW sets are installed, only one set need be taken down at a time for maintenance and during this time the second set, together with the 15,000 kW possible from the existing power station, will give a total power of 45,000 kW. With this power and with suitable staggering of mill operations, the steel production can be reasonably maintained. It is, therefore, recommended to install two 30,000 kW generating sets.

The existing power station cannot be enlarged to accommodate the two new 30,000 kW sets. It is, therefore, proposed to erect the 30,000 kW units in a new power station.

A second primary sub-station will be built at Sajara, located between the two approach ramps to the Blast Furnace Plant and the Steel Plant. This sub-station will be laid out to receive two 30 MW feeders at 33 kV from the new power station.

All new load centres in the iron and steel making plants will be fed from the Sajara sub-station. Existing load centres in these areas now fed from Punabad sub-station will be transferred to Sajara sub-station, thereby leaving Punabad sub-station entirely free for the rolling mill loads.

The existing feeder cables of the loads transferred to Sajara will be reconnected to form two ties between the two primary sub-stations. These ties will be strengthened by an additional feeder so that a total of 40 MW could be transmitted either way.

The two 30 MW generating sets in the new power station will be in operation for most of the year. Under this condition the entire power requirement of the Steelworks can be met from the power generated in the Steelworks itself. At times, it would be possible for the Steelworks to export power after meeting the works demand. Therefore, the Steelworks will not require the 40 MW of power already reserved from the Damodar Valley Corporation's Waria power station under the one million-ton programme.

Since the Alloy and Special Steels Plant, under the management of Hindustan Steel Limited, is being installed adjacent to the Steelworks at Durgapur, it would be possible to divert this power already reserved for the steelworks to this new plant whose requirements also are approximately 40 MW. This can be most economically done by feeding the purchased power through Punabad sub-station, utilising the feeders already laid between Waria power station and Punabad sub-station.

With above arrangement it is possible to run the Steelworks' power station at its optimum capacity and supply the surplus power, as available, to the Alloy and Special Steels Plant, thereby reducing the actual amount of power to be purchased from the Public Utility System. Also, this inter-connection of the power supply systems of the two plants will ensure practically all the power required for the Steelworks, even when one of the two 30 MW sets is down for normal maintenance, as the small additional power that may be required at this time by the Steelworks would be available out of the 40 MW reserved for the Alloy and Special Steels Plant since integration of both systems will allow greater diversity of loads.

The above proposal of integrating the power supply systems of the Steelworks and the Alloy and Special

Steels Plant will need careful investigation by Hindustan Steel Limited jointly with the consultants for the Alloy and Special Steels Plant and the Public Utility Authorities.

All extensions to the existing services will be provided. It is intended to install a 100-ton capacity Oxygen Plant to meet the additional requirements of the Steel Plant and the blast furnaces. This will be installed in the existing building together with the necessary auxiliary equipment.

Additional railways, roadways, rolling stock and mobile stock will be provided to handle the increased output of the works.

Necessary new, or extensions to existing, administrative buildings will be provided.

COST ESTIMATE

The total estimated cost of the expansion programme is approximately Rs. 590,000,000, of which an equivalent of approximately Rs. 334,000,000 will be the expenditure in foreign exchange.

The present 1.6 million ton extensions are so arranged that they allow for the continual expansion of the Works upto its ultimate capacity of approximately 3 million tons and will form an integral part of the ultimate plant arrangement.

BHILAI, ROURKELA AND BOKARO STEEL PLANTS

Meanwhile, negotiations have started at Ranchi between Hindustan Steel Limited and some Russian experts for the finalisation of the agreement for the expansion of the Bhilai Steel Plant on the basis of the Project Report prepared by Soviet experts.

The Government of India has also accepted the Project Report on the expansion of the Rourkela Steel Plant. Some tenders for the expansion programme of this plant have already been invited.

So far as the Bokaro Steel Plant is concerned, negotiations are said to be still in progress between the Government of India and the U.S. Ambassador, Prof. J. K. Galbraith.

UTILIZATION OF YEN CREDIT FOR THIRD PLAN

The following manufacturing programmes have been approved by the Government for being financed through the credit made available by Japan for the Third Plan period.

Name of Party	Industry and Manufacturing Programme	Amount Approved (Rs. lakhs)
Century Rayon, Bombay	Viscose Rayon	60.00
New Era Paper Mills, Ludhiana	Paper	3.80
Rajaramka Paper Mills Limited, Tumsar	Paper	3.60
McLeod & Company Ltd., Calcutta	Wire Ropes	45.40
Jagdish Lal & Bros, Delhi	Four Denier Wire Cloth	10.00
Chandansinha Vijaysingh Bharkatya, Indore	Insulated Power Cables	80.00
The National Foundry & Rolling Mills Ltd., Cuttack	Steel re-rolled products	2.67
R. M. Karkaria & Co.	Textile Auxiliaries	2.48
East India Rubber Works (Private) Ltd., Calcutta	Conveyor Belting	4.00
Harbans Lal Malhotra & Sons, Calcutta	Hand Sewing needles	1.04
Shri Katta Nagabhushanam, Anantpur	Bolts and Nuts	1.29
Shanker Bulb Industries Private Ltd., Dehradun	Miniature Head Lamps	0.54
Jagkumar & Company, Bombay	Hypodermic syringes	2.12
Hakim Rai Jai Chand, Bombay	Railway Electrical Signalling Equipment	1.07
Sri S. Balasubramaniam, Sri Shakthi Kumaran Enterprises, Madurai	Fluorescent tubes and fittings	2.11
Shah Electrical Enterprise, Bombay	H.T. Porcelain insulators, etc.	3.89
Das Hitachi (Private) Limited, New Delhi	Manufacturing programme not available	1.21
Eastend Paper Industries (Private) Limited, Calcutta	Paper	2.60
	TOTAL	227.82

PUBLIC SECTOR OIL REFINERIES

A firm date for the commissioning into production of the first public sector oil refinery, being set up at Nunmati, in Assam, has been set in the beginning of January next year, according to the Chairman of the Indian Refineries Ltd., Mr. D. K. Barua. Addressing a press conference here last Saturday, Mr. Barua stated that despite heavier monsoons this year and the recent riots in Assam, the work on the refinery was going on satisfactorily; these two delaying factors, he said, had only added to the zest of the workers and the management to complete the refinery according to the original schedule.

To begin with, the refinery will be going on stream with about 50 per cent capacity. It is expected to achieve its full rated capacity of 0.75 million tons per annum output by April end or middle of May next year. A stock of about 22,000 tons of crude has already been built up at the refinery. By the end of December, the crude stock would have been built up to the tune of about 45,000 tons. In the initial stages, the consumption requirements of the refinery will be nearly 500 tons of crude per day. Since construction of the pipeline has been delayed somewhat, the railways have been approached to continue to transport about 500 tons of crude a day till the time the pipeline is completed. This, along with the stock being built up, will make it possible for the refinery to start production. Trial production at the refinery is expected to start on or about November 20.

Replying to a question on the distribution of the products of the Nunmati refinery, Mr. Barua said that since there is another refinery in existence in Assam, the market for petroleum products in the Assam State will be divided into three parts. The Nunmati refinery will have two districts of Assam—the Kamrup district and the Khasi and Jaintia Hills district—reserved for its products. The Upper Assam area will continue to receive its supplies of petroleum products from the Digboi refinery of the Assam Oil Company. In the rest of the State, products from both the refineries will be marketed. The Nunmati refinery will be marketing nearly 75 per cent of its products outside Assam State. As a sequel to the marketing of the Nunmati refinery products in certain parts of Assam, the Assam Oil Company will have to divert some of its supplies from the area at present being served by it to its reserve area of Upper Assam or to outside the State.

Replying to several questions regarding the possibility of the products of the public sector refineries being available at cheaper prices to the consumers, Mr. P. R. Naik, Managing Director of Indian Refineries Ltd., stated that the price policy was a matter for the Government to decide. The Nunmati Refinery would be getting an ex-refinery price for its products and at what price these products would be sold to the consumers was a question for the Government to consider. The Government, he added, was expected to determine from time to time the ex-refinery prices and sale prices of various petroleum products of both the public and private sector refineries.

Referring to the schemes to be based on the by-products of the Nunmati Refinery, Mr. Naik stated that among these were included calcination of 39,000 tons of petroleum coke to manufacture graphite and carbon electrodes, production of liquid petroleum gas (a domestic and industrial fuel) and aromax (base for carbon black).

The Assam Government is likely to acquire a share in the equity capital of the Nunmati refinery to the extent of the value of the land—both for the refinery and the township sites—provided by it and the improvements effected on this land. This, it is understood, will

come to about 4 per cent of the share capital of the refinery.

Referring to the schedule for the completion of 2-million-ton Barauni Refinery, Mr. Naik said that the first stage of this refinery was expected to be completed by the end of 1962. During this stage, this refinery will be able to achieve refining capacity to the tune of one million tons of crude. The second stage of refining another one million tons of crude will be achieved by June, 1963. The third stage, which includes setting up of the lubricating plant, is likely to be achieved by the first quarter of 1964. The lubricating plant will have a capacity of 50,000 tons. The Bihar Government is likely to be allotted a share in the equity capital of this refinery on the same principles as have been laid down for Assam Government's participation in the share capital of Nunmati refinery.

The schedule for the setting up of the third public sector refinery in Gujarat is expected to be finalised in about six months' time. Tentatively, this refinery is expected to go on stream during the second half of 1964 or early in 1965. This refinery will be under the control of the Oil and Natural Gas Commission and will have a refining capacity of two million tons per annum. The Gujarat Government is likely to participate in its share capital.

WOOLLEN GOODS EXPORT PROMOTION

It has been decided that mills or factories exporting woollen textiles (including hosiery and yarn) and exporters of woollen shawls, woollen garments and carpets, rugs and druggets will be entitled to import raw materials, viz., raw wool, wool tops, shoddy wool, etc., and permissible types of dyes and chemicals etc., in accordance with the Export Promotion Scheme for Woollen Goods, 1961-62, provided that they are registered under this Scheme with the Textile Commissioner, Bombay. The Scheme covers only those woollen goods which contain at least 90 per cent wool by weight.

Only those manufacturers of woollen textiles, hosiery and yarn and exporters of shawls, garments and woollen carpets, rugs and druggets who fulfill the following qualifications will be registered by the Textile Commissioner:

(a) He should have been enrolled as an exporter under the scheme of enrolment of exporters announced by the Government of India. (This condition will not be insisted upon during the period July-September 1961. Registrations granted during the period July-September 1961 would be deemed to be provisional and would be confirmed only after enrolment under the Scheme. The provisional nature of the registration during July-September 1961 will not in any way affect entitlements under this Scheme. However, after September 30, 1961, no further benefits would be granted unless Enrolment Certificates are produced to the Textile Commissioner.)

(b) He should have past exports or internal turnover during any of the last three calendar years of such a magnitude as to indicate his capacity to export.

(c) He should produce evidence to the satisfaction of the Textile Commissioner that he is interested in export (either by past performance or by showing proof of action taken to conduct market surveys, appoint agents abroad, etc.).

(d) He should undertake to adhere to any code of conduct, as and when evolved.

(e) He should undertake to adopt the standard Contract Form with suitable clauses for arbitration and settlement of disputes as and when evolved.

(f) He should undertake to abide by such quality control and pre-shipment inspection procedure as may be evolved.

(g) He should undertake to abide by the decision of the Textile Commissioner in the matter of dispute between him and his foreign customers in the export of the commodities in question.

(h) He should undertake to forward figures of exports of woollen goods made by him every month to the Textile Commissioner, Bombay with effect from July 1, 1961, onwards.

Licence will be granted once a month or a quarter against payments, received on or after July 1, 1961, in respect of exports made on or after July 1, 1961. Applications for licences shall be made in the month or quarter following the month or quarter of receipt of payment for export. The licences will be subject to the conditions applicable to Actual User Licences, except in the case of merchant exporters who will be required to sell the imported raw materials to actual users of the materials imported. Any specific conditions/restrictions applicable to items allowed to be imported under the scheme as are detailed in Sections II and III of the Red Book, will also be applicable to Licences that may be issued under this scheme.

IMPORT ENTITLEMENT

The following will be the materials permitted to be imported under this scheme:

(a) **Raw Materials:** Raw wool, wool tops or shoddy wool, as the case may be, depending upon the raw material used in the particular item exported.

(b) **Dyes and Chemicals:** The permissible types allowed to be imported in the case of exports of woollen textiles, hosiery yarn and carpets.

(c) **Embellishments:** Zip fasteners, buttons, and sewing thread, in the case of exports of hosiery and garments, provided that the goods exported contained such embellishments, and provided further that there is no objection to import of any such embellishment from the point of view of indigenous availability.

(d) **Permissible items of machinery, consumable stores, spare parts and accessories:** For replacement purposes not involving expansion of the plant, in the case of exports of woollen textiles, hosiery and yarn only.

(e) **Industrial Sewing Machines:** Of the type and specifications approved by the Development Wing, against exports of woollen garments only.

The total import entitlements under the scheme for all the above mentioned items will be 85 per cent of the F.O.B. value of goods exported in the case of woollen textiles, yarn and hosiery, and 50 per cent of F.O.B. value in case of export of woollen garments and woollen shawls.

The entitlement for machinery may be accumulated for a period of three years. The entitlement for machinery should be claimed at the time of each application, and request made for carry-over of the entitlement. The Textile Commissioner shall issue a separate entitlement certificate for such carried-over entitlements. At the end of the year, when the application for the month or quarter ending June 30, 1962, is made, all these entitlement certificates should be submitted to the Textile Commissioner who would issue a consolidated entitlement certificate for machinery for the year 1961-62. The applicant may obtain an import licence against this entitlement certificate, or carry over the entitlement to the next two years, i.e. 1962-63 or 1963-64.

The rates of import entitlements against woollen goods exports are given in the table below.

Manufacturers-cum-exporters of woollen textiles and yarn belonging to the 'Organised Mills Sector' who are at present being given import licences for raw wool and wool tops as Actual Users would be eligible to get advance licences under the scheme up to a maximum of 20 per cent of the value of their current actual users licences, for import of raw wool or wool tops as the case may be, with a stipulation that if they so choose, they can utilise 10 per cent of the face value of such licences for import of dyes and chemicals.

Manufacturers-cum-exporters of hosiery, and exporters of garments, shawls and woollen carpets, rugs and druggets, even if they are not at present in receipt of actual user licences, will be entitled to receive advance licences for the import of admissible raw materials under this scheme on production of proof of firm export contracts. Whether any particular document produced for this purpose shall be accepted or not as proof of an export contract shall be decided by the Textile Commissioner whose decision shall be final. The value of such advance licences would, however, be limited to two-thirds of the entitlement specified in this scheme based on the exports undertaken.

In the case of licences against hosiery export the licence will be permitted, if he so chooses, to utilise 10 per cent of the face value of the licences for import of dyes and chemicals.

IMPORT ENTITLEMENTS AGAINST WOOLLEN GOODS EXPORTS

Exports	Import Entitlements
(A) Entitlements against export of woollen garments:	
(a) Raw material	50 per cent of FOB value of export, less what is utilised under (B) below.
(b) Embellishments	Half per cent of FOB value of garments exported, containing such embellishments.
(c) Industrial Sewing Machines	10 per cent of FOB value of export.
(B) Entitlements against export of woollen shawls:	
Raw material	50 per cent of FOB value of export.
(C) Entitlements against export of woollen carpets, rugs and druggets:	
(a) Dyes and chemicals	5 per cent of FOB value of export.
(b) Raw materials (only in the case of carpets the FOB value of which is not less than Rs. 20 per sq. yd.)	(i) 10 per cent of FOB value of export if the carpets contain 60 per cent or less knots per square inch. (ii) 20 per cent of FOB value of export if the carpets contain 61 or more knots per square inch.

COMPANY AFFAIRS

IMPERIAL TOBACCO

The performance of the Imperial Tobacco Company of India Ltd., during the year ended March 31, 1961 records an improvement over the previous year, thus establishing the fact that certain commercial organisations continue to achieve higher standards of efficiency. During the year the sales recorded were at Rs. 42.18 crores, nearly 14 per cent higher than the previous year's sales of Rs. 36.88 crores. These improved results enabled the board of directors to recommend a higher dividend distribution and also to appropriate the enhanced amount of fixed assets and stock replacements reserve for financing the increasing cost of replacing fixed assets and stocks. After providing taxation to the extent of Rs. 19.70 crores and paying salaries and wages to the tune of Rs. 4.34 crores, the Company had a profit of Rs. 1.88 crores. Out of this figure a sum of Rs. 52 lakhs was retained in the business against Rs. 21 lakh retained last year. An interim dividend on ordinary shares was paid at the rate of 2½ per cent subject to taxation on September 25, 1960 and another interim dividend of 2½ per cent subject to taxation on ordinary shares was paid on April 12, 1961. Now the directors have proposed the payment of a final dividend on ordinary shares at the rate of 4 per cent subject to taxation. Thus a sum of Rs. 1.36 crores is likely to be appropriated towards dividends as against Rs. 1.21 crores appropriated last year.

BATALA ENGINEERING

The directors of the Batala Engineering Company Ltd. in their annual report have pointed out that despite shortage of power, the output of the rolling mills showed an improvement though the billet supply position deteriorated sharply. Production in machine tool department improved and the directors decided to further expand the machine tool capacity. Their expansion programme has been approved by the Government and they have entered into technical collaboration with M/s. Gatti and Company and Officina Maccanico Favretto, Torino, Italy. The plan for modernisation of the rolling mill is expected to be completed by the middle of 1962. During the year under review the company recorded a gross profit of Rs. 5.25 lakhs. After making provisions for depreciation, development rebate and taxation, there is a balance at the disposal of the directors to the tune of Rs. 2.39 lakhs. A sum of Rs. 77,558 is transferred to general reserves. The directors have recommended the payment of 6.66 per cent dividend on preference shares and 11.50 per cent on equity shares.

CAPITAL ISSUES

Consents have been granted to 10 companies to raise fresh capital to the tune of Rs. 3.51 crores. The Bengal Paper Mills, Calcutta was granted consent to issue a fresh capital of Rs. 57 lakhs consisting of Rs. 9 lakhs as bonus shares, Rs. 18 lakhs as rights issue and Rs. 30 lakhs as loans stock. The new capital is to be utilised for expansion and modernisation programme of the company. The bonus shares divided into 1.80 lakh equity shares of Rs. 5 each will be issued to the existing shareholders in the ratio of 1 for 5. The rights issue to be made at a premium of Rs. 12 per share will be offered to the existing shareholders in the ratio of one equity share of Rs. 10 for three equity shares held already. The rest of the new capital will be issued in the form of 6½ per cent taxable loan stock of Rs. 250 repayable after 10 years, with a right of conversion into equity shares at specified rates. The existing equity shares of Rs. 25 each and the bonus shares would be consolidated and divided into equity shares of Rs. 10 each.

The Hind Rectifiers Ltd., of Bombay, having a paid-up capital of Rs. 5 lakhs in equity shares of Rs. 100 each, was granted consent to issue capital of Rs. 20 lakhs in equity shares of Rs. 100 for cash at par. The proceeds of the issue would be utilised for the manufacture of rectified apparatus. Menora Hosiery, Bombay, having a paid up capital of Rs. 1.60 lakhs, was granted consent to issue bonus shares of Rs. 40,000 divided into 40 equity shares of Rs. 1,000 each. Escorts Ltd., will issue Rs. 5.60 lakhs equity shares of Rs. 10 each at a premium of Rs. 4 a share and 8,000 nine per cent redeemable cumulative preference shares of Rs. 100 each at par. The allotment will be one for one in the case of equity shares; preference shares will be issued fully paid at par.

Of the six other companies which are new floatations, Sakthi Pipes Limited, Madras, was granted consent to the issue of Rs. 70 lakhs divided into 56,000 equity shares of Rs. 100 each and 14,000 cumulative preference shares of Rs. 100 each carrying a dividend of 8.57 per cent for cash at par. Sodepur Engineering Co. Ltd., proposed to be incorporated in West Bengal has been granted consent to the issue capital of Rs. 35 lakhs divided into equity capital of Rs. 25 lakhs and cumulative redeemable preference shares of Rs. 5 lakhs. Kota Strawboards Private Ltd., was granted consent to the issue of a capital of Rs. 25 lakhs for cash at par divided into 18,000 equity shares of Rs. 100 each and 700 cumulative redeemable preference shares of Rs. 1,000 each, carrying a dividend of 7½ per cent. Zenith Lamps and Electricals Ltd., Madras was granted consent to issue capital of Rs. 25 lakhs consisting of equity shares worth Rs. 20 lakhs and 9.286 per cent cumulative redeemable preference shares of the value of Rs. 5 lakhs. Trichy Steel Rolling Mills (P) Ltd., Madras was granted consent to the issue of capital of Rs. 80 lakhs in the form of equity shares of Rs. 100 each for cash at par privately. Sturdia Chemicals Ltd., Bombay was granted consent to issue capital of the nominal value of Rs. 30 lakhs in equity shares of Rs. 10 each for cash at par.

AUSTRALIA'S LARGEST COMMERCIAL BANK CAN HELP YOU TO PROMOTE TWO-WAY TRADE WITH AUSTRALIA, NEW ZEALAND, AND FIJI

Want to sell? Want to buy? Want market information? The international Division of the Bank of New South Wales can tell you about the opportunities for trade offering with these countries. The Bank's complete banking service includes such specialized facilities as trade introductions to buyers and sellers, industrial enquiries, economic and market information, and a complete travel service. The Bank is closely and constantly in touch with industry, business, and agriculture in the areas it serves through more than 1,100 branches and agencies.

Company Meetings

THE MYSORE PAPER MILLS, LIMITED, Bangalore-9.

Speech delivered by Sri M. D. SHIVANANJAPPA, I.A.S., Chairman and Managing Director, The Mysore Paper Mills, Limited, at the Twenty-sixth Ordinary General Meeting of the Company held at Bangalore on Friday the 29th September, 1961.

Ladies and Gentlemen,

It gives me very great pleasure to welcome you to this the 26th Ordinary General Meeting of the Shareholders and to place before you the Report of the Directors and the Audited Balance Sheet for the year ended 31st March, 1961. These have been circulated already and with your permission, I shall take them as read and would proceed to review the main features of the year's operations.

Production during the year under review is quite satisfactory. Sales realisation during the year amounted to Rs. 123.22 lakhs as against Rs. 141.31 lakhs in the previous year. The reduction in turnover is largely due to the revised prices fixed by the Government of India in accordance with the recommendations of the Tariff Commission from 1-1-1960, the effects of which were felt for the full year under review as against only one quarter during the previous year. The efforts of the Paper Industry to move the Government of India for a suitable revision of prices in the interest of existing units, particularly to minimise the adverse effects on smaller units like ours and in the interest of expansion of existing units and starting of new ones have not borne fruit and repeated requests are being made to Government of India by the Industry for a suitable revision and I hope that the Government of India would view this question with sympathy.

In regard to despatch of papers, I would like to keep you informed that during some months in the year, there were continuous railway booking restrictions and this led to accumulation of stocks which caused strain on our liquid resources — common to Companies which finance capital projects by current resources — which necessitated drawals from the Cash Credit Account. This year, we had also to meet tax liability to the extent of Rs. 9,32,700 and also to deposit advance tax under Section 18A of the Income-tax Act to the extent of Rs. 7,44,775. To provide for adequate working capital, your Directors have taken steps to raise the limit of cash credit account with the State Bank of Mysore to Rs. 25 lakhs. I should hasten to state that conditions have improved now and our products are moving quickly and there is no cause for anxiety.

I must bring to your notice that manufacturing costs are mounting on account of increase in prices of raw materials, power, coal and chemicals and there are no signs of decline. Recently, Government of India have levied an excise duty of Rs. 40 per tonne on Caustic Soda. Having regard to the rates of excise duty for writing and printing, it must be said that the rates of excise duty levied on packing and wrapping paper are disproportionately high and in addition there has also been an increase in Railway freight and all these have added considerably to our expenses. The only hope, as it appears to my mind, lies in increasing production and improving efficiency and securing maximum economies calculated to reduce costs. It is with this view — pending implementation of the expansion scheme — action was taken to secure Dorr Oliver's Recausticising Unit, and I am glad to inform you that the equipments have been installed and taken to service and it is expected that appreciable economies would be secured which would go to reduce production costs.

Coming to the consideration of the Balance Sheet, I have to mention that provision has been made for depreciation on fixed assets calculated in accordance

with the rates allowed for normal depreciation and extra shift allowances as per Income-tax Act, amounting to Rs. 6.69 lakhs; Rs. 1,69,700 towards Development Rebate and a further sum of Rs. 55,000 towards Retirement Gratuity. A provision of Rs. 6.5 lakhs has been made towards taxation. I am glad to inform you that the only one instalment of Rs. 4 lakhs that was due to the Industrial Finance Corporation of India has been paid during the year under review and the loan of Rs. 50 lakhs obtained from them for financing the First Expansion Scheme has now been fully repaid, about a decade ahead of due date. A sum of Rs. 12,50,000 remaining in the Industrial Finance Corporation of India Loan Redemption Fund has been transferred to General Reserves. As the loan has been completely repaid, the Industrial Finance Corporation of India have withdrawn their nominee, Sri T. Bhaskara Rao, from our Board of Directors. I am glad to acknowledge that the Board received valuable assistance and advice from Sri T. Bhaskara Rao and your Board have placed on record their appreciation of his services to the Company.

In regard to disposal of surplus namely Rs. 6,61,663 including carry over of last year, which stood at Rs. 51,968 your Directors have decided to transfer Rs. 2,50,000 to Dividend Equalisation Fund, which fund now stands at Rs. 3,12,500 a sum of 62,500 having been provided for in 1954. Further your Directors, having regard to the satisfactory working during the year under review have proposed to maintain the rate of dividend at the level of previous year and to recommend declaration of a dividend of 15 per cent, subject to tax, absorbing Rs. 3,75,000; the balance being carried forward, and I am confident that these proposals will meet with your approval.

I am happy to inform you that the labour-management relations continue to be very cordial. Your Directors have been pleased to sanction a bonus of four months' salary or wages to the employees for the year ended 31-3-1961 and the same has been disbursed.

In regard to the celebrations of the Silver Jubilee of our Mills you will remember that I had said on the last occasion that your Directors would fix a suitable date and I am glad to announce that it has been proposed to celebrate the Silver Jubilee in a befitting manner during the last week of March or 1st week of April 1962, and invitations will be sent to the Shareholders and I do hope that a very good number of shareholders will participate in the Function.

I now come to the important subject of the Developmental activities of our Mills in which you are deeply interested. When I had the privilege of addressing you for the first time in August 1959, having regard to the tightness of the foreign exchange position obtaining two years preceding, I cautiously expressed the hope that our application for increasing the production capacity of our Mills from the present level of 8,000 tons to 18,000 tons would receive sympathetic consideration at the hands of the Government of India and that I would be able to formulate specific proposals for expansion. Last year about this time I informed you that the necessary Industrial Licence had been received from the Government of India and that discussions with the Commonwealth Development Finance Co., Ltd., and Industrial Credit and Investment Corporation of India for exchange loans had been encouraging, the only difficulty that had delayed implementation of our

scheme of expansion. I should also like to recall that I informed you that having availed myself of the opportunity of studying at close range the conditions and trends obtaining in Capital Goods Market in foreign countries I was confident of formulating a scheme of expansion which would be both sound and economical. It is indeed a matter of gratification to me, and I have no doubt it will be to you that we have been able to secure loans to cover the value of Plant and Machinery to be imported from abroad and I shall come to the details presently.

Though I do not wish to burden you with technical details relative to the scheme of expansion, yet I should like to state a few details of fundamental importance. You are aware that our existing unit is an integrated pulp and paper unit with a capacity to manufacture 8,000 tons, the primary raw material being bamboo, supplemented by Rags, waste paper and wood pulp. The Paper making capacity exceeds the pulp making capacity, if only the primary raw material, bamboo is used. It has been explained in previous years that it is this imbalance between pulp making and paper making capacity that stood in the way of achieving the target production earlier.

The current capacity of the Mills does not permit installation of a Modern Soda Recovery Plant, which alone secures higher percentage of chemical recoveries, procuring considerable economies. The present scheme of expansion contemplates use of only bamboo for manufacture of pulp, discarding rags and waste paper used at present. In this connection, I am glad to inform you that the Government of Mysore have agreed to supply annually 50,000 tons of bamboo required for the expanded plant. The Pulp Plant after expansion will have a capacity to produce sufficient quantity of pulp to feed the existing two Paper Machines of 15 tons each and also the New Paper Machine of 30 to 35 tons capacity. This increased capacity will enable us to instal a Modern Soda Recovery Plant which secures considerable economies and reduce cost of production to a great extent and the production of 18,000 tons of marketable paper will greatly help to reduce costs by way of overheads, labour charges etc., and also help to serve the needs of the community better. I have heard it said that with the going into production of new units and additional units of the existing units production may exceed demand by 1965, yet I feel that with the progress of educational and developmental activities of the Government of India and State Governments under the five year plans, entailing expenditure of crores of rupees, there will be created a demand for paper in the ensuing years which will be positively favourable to the indigenous paper manufacturers. Speaking of ourselves, I should like to say that production of 18,000 tons of marketable paper will undoubtedly increase the earnings of our Company and will place the Company on a firm and sound basis ensuring a fair return on capital and in so far as marketability is concerned, I wish to add that our steady and sustained supplies during good years and bad have established for our products a regular and an assured market.

The scheme of expansion is estimated to entail a total expenditure of about Rs. 350 lakhs which is proposed to be financed as under:

	Rs. in lakhs
Share Capital by Rights Issue	100
Rupee Loan from I.F.C.I.	60
Foreign exchange loans from CDFC and ICICI	140
Bank Borrowings and other resource	50
TOTAL	350

As you are aware, the Shareholders at their meeting held on 7-10-1960 accorded approval to the increase of authorised capital from Rs. 25 lakhs to Rs. 150 lakhs. In pursuance of that resolution, application had been made to the Controller of Capital Issues and his sanction obtained to raise Rs. 100 lakhs by issue of 10 lakhs of Equity Shares of Rs. 10 per Share attaching a premium of Rs. 2 per Share. I do not wish to go into great details regarding the issue as you have all been in possession of the Letters of Offer issued in terms of the Controller of Capital Issues sanction order. I am glad to inform you that the Government of Mysore have agreed to take 10 per cent of the Shares which are their quota of Right Shares and the balance of 90 per cent has been under-written in compliance with the condition laid down by lending Institutions, under-writing commission being 1½ per cent without brokerage.

I am happy to inform you that the response from our Shareholders has been encouraging and there have been numerous enquiries from non-members regarding the availability of the Shares and I am hopeful that the issue would be a success.

Reverting to the question of loans, I am very happy to inform you that I signed the Subscription Agreement with Commonwealth Development Finance Co., Ltd., on 18th August, 1961, when I happened to be in London in connection with the expansion scheme of the Mysore Iron and Steel Works. According to the agreement, the Commonwealth Development Finance Co., Ltd., would give us a loan of £5,25,000 or Rs. 70 lakhs carrying an interest of 7½ per cent repayable in 7 equal annual instalments, the 1st instalment to be paid on 31st March, 1970. This amount will suffice to finance 50 per cent of our purchases of equipment in U.K. and Europe. Further, I am glad to inform you that the agreement between Industrial Credit and Investment Corporation of India Ltd., and ourselves has also been signed on 1-9-1961 and according to the terms and conditions the Industrial Credit and Investment Corporation of India Ltd., will give us a loan of United States \$ 1,470,000 or Rs. 70 lakhs carrying interest at the rate of 7½ per cent repayable in 13 half-yearly instalments, the first instalment to be paid on 1st May, 1965. This loan will finance the purchases abroad to the extent of 50 per cent and the two loans referred to above will fully cover our foreign exchange requirements. I am very happy to keep you informed that all the necessary permissions, consents and licences have been received from the Government of India. The terms and the conditions governing the loan from Industrial Finance Corporation of India have been settled, and the agreement is being signed. According to the terms and conditions the Industrial Finance Corporation of India have agreed to give us a loan of Rs. 60 lakhs carrying an interest at the rate of 7 per cent repayable in 15 instalments, the first instalment to be paid on 1st July, 1965. I should like to add that the Industrial Finance Corporation of India and Industrial Credit and Investment Corporation of India Ltd., have each sought representation on our Board of Directors and we have agreed to it. In compliance of a Statutory requirement, the Industrial Finance Corporation of India have stipulated a condition that the repayment of their loan should be guaranteed by a scheduled Bank and I am glad to inform you that the Canara Banking Corporation Ltd., one of our Bankers has agreed to stand guarantee on a nominal guaranteeing commission of ½ per cent on the day to day balances due to the Industrial Finance Corporation of India.

As you know, certain legal formalities have to be observed for execution of loan documents referred to above. To simplify the procedure and to avoid somewhat heavy expenditure it has been agreed to appoint a common trustee and to execute a common Trust Deed

for the purpose, and I am happy to inform you that the State Bank of Mysore has accepted our offer to be appointed trustee, who will look after the interests of the three lending Institutions and on a nominal commission of 6 nP. per cent on the amount of the loans. You have before you resolution No. 5 relating to the borrowing powers of the Directors and as stated in the explanatory note you are requested to pass the resolution to comply with the Statutory requirement.

Having dealt with the question of finances you will naturally expect me to say a word or two regarding the Plant and Machinery to be imported from abroad. We have had full discussions and consultations with well known manufacturers and suppliers of Plant and Machinery in U.K. and Europe and it is important to bear in mind that we are free to select and buy equipment from well known firms in U.K. or the Continent as ours is not a package deal, and funds are available for the necessary purchases in U.K. and Europe. As a result of extensive survey and study, we have formulated a scheme and a schedule of purchases and in accordance with it arrangements have been made to secure best equipments at economic prices. We have concluded arrangements to secure Pulp Plant and Paper Machine from Germany and Boilers and Modern Soda Recovery Plant and Cross Cutters from U.K. I should mention here that agreeably with the policy of the Government of India provision has been made in our scheme for the purchase of balance of equipment necessary from indigenous sources.

I feel it a pleasant duty particularly to bring to your notice that the chief merit of our scheme lies in the fact that the work of erection assisted by two or three foreign erectors, installation, supervision and co-ordination of several units of the scheme is being undertaken by a devoted team of our own technical and administrative officers and operatives, who have the requisite knowledge, experience and skill, acquired and accumulated over years and I am glad to acknowledge that it is these human resources that embolden me to launch this scheme of expansion and I am quite hopeful that the scheme will be implemented successfully and expeditiously.

I have now to refer to Resolution No. 6 regarding amendments to our Articles of Association. As has been stated in the explanatory note that our Articles of Association were framed and incorporated in 1936 at the time of inception of the Company. The Indian Companies Act, 1956 and the subsequent Amendment Act, 1960 have introduced considerable changes. As you are aware, our Shares are quoted in the Stock Exchanges of Bombay, Calcutta and Madras and certain amendments to our Articles are called for to be in conformity with their regulations and all these amendments have been made and I seek your approval to the same.

I am happy to say that as mentioned in your Directors' Report, your Directors have contributed a sum of Rs. 5000 towards the Centenary Celebrations of Bharata Ratna Dr. Sir M. Visvesvaraya, Engineer—Statesman of Mysore who has rendered meritorious services to the State and I hope you will appreciate and approve of contribution made.

I am obliged to you all for the whole-hearted support you have been extending and look forward with confidence for a full measure of support and encouragement in the implementation of the scheme of expansion.

On behalf of the Company, I should express my grateful thanks to the Government of India and the Government of Mysore for their abiding interest in the

progress of the Company and for having granted the necessary permissions and consents and concessions in connection with our scheme of expansion. On behalf of the Company, I should also express my grateful thanks to the Board of Directors of the Commonwealth Development Finance Co., Ltd., London; Industrial Credit and Investment Corporation of India Ltd., Bombay; and the Industrial Finance Corporation of India, New Delhi; the State Bank of Mysore and the Canara Banking Corporation Ltd., for their valued assistance in securing funds for the expansion scheme.

I am grateful to my colleagues on the Board for the uniform courtesy, consideration and valuable guidance I have been receiving. I wish also to express on behalf of the Directors and myself our warm appreciation of the willing and efficient co-operation of all our employees.

Ladies and Gentlemen, I now move that the Directors' Report and the Audited Balance Sheet and the Profit and Loss Account for the year ended 31st March, 1961 be "APPROVED AND ADOPTED."

Note: This does not purport to be a report of the proceedings of the shareholders' meeting, a copy of which shall be sent to the shareholders separately.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

UBP-1-3-61

THE METTUR CHEMICAL & INDUSTRIAL CORPORATION LTD.,

Registered Office: METTUR DAM R. S.

Addressing the 24th Annual General Meeting of the Company held at the registered office of the Company at Mettur Dam R. S. on Saturday, the 9th September, 1961, Dr. P. S. Lokanathan, Chairman, said:

Ladies & Gentlemen:

It is again my pleasant privilege to welcome you all here for the Annual Meeting and to place before you the salient aspects of the Company's present working and future potentialities. The Directors' Report has been in your hands for sometime, from a perusal of which, I should say that the Company has had a satisfactory year of working. On the whole the results have been better than last year and the turnover in volume and in value has been the highest in the Company's history.

The second stage of expansion for increasing our production of caustic soda from 20 to 40 tons per day, is making satisfactory progress though the plant has not yet started production, consequent on delays in the delivery of electrical and Rectifier plants. However all the equipment has been either received at site or is in transit. Such equipment as has been received is being installed and tuned up. When this plant starts production, we will have installed a more economic unit which will be eight times the original capacity with which the Company started operations.

I have to invite your special attention to the further expansion scheme referred to in the Report, which your Directors consider, will place the Company in a competitive position and keep us abreast of developments elsewhere in the years ahead. The stepping up of production of caustic soda from 40 to 100 tons per day, the entire increase in production being of Rayon grade quality, is a necessary development for us during the Third Plan period, in which caustic production in the country is expected to reach 3,50,000 tons as against the Second Plan target of 1,35,000 tons. One important feature of our expansion will be that ours will be a fully integrated plant utilising all the co-product chlorine, quite beneficially contributing to the high profitability of our expanded plant.

Your Directors are actively exploring ways and means of financing this third stage expansion in such a way that the dividend percentage is not materially affected during the period of our stepping up production. This would therefore involve our procuring both loan and share capital in suitably staggered stages depending on the progress of erection and construction. We shall place before you definite proposals with regard to the financing of this expansion scheme as soon as exact estimates are worked out for the project, which it is hoped will be in the course of the current year.

In this context, I am happy to mention two salient features. The first important development is that we shall shortly have two big consumers of our products in our immediate vicinity at Mettur Dam. First is The Madras Aluminium Company, who are putting up their plant at Mettur and who will be substantial consumers

of the caustic soda produced by us. The second interesting development is the proposal by India Cements Limited to put up a plant for the manufacture of 6000 tons of PVC in collaboration with the well-known American firm M/s. B. F. Goodrich & Co. The PVC project will be a big consumer of the chlorine produced by this Company. As you are aware, the Company has now received a licence for manufacture of a number of important organic chemicals based on chlorine. Mr. S. Ramaswamy, our General Superintendent, who was recently in the United States has been assured of technical and financial collaboration by leading American Chemical firms in the precaution of these chemicals. We are therefore on quite concrete ground in our future programme and we look forward to your fullest co-operation in the task lying ahead of the Company in the coming two years.

As you are aware, the Industrial Finance Corporation of India have been of continuous assistance to this Company in all its expansion projects from the very inception. In our recent discussion in connection with the present expansion, we have been broadly assured of full financial co-operation in the implementation of the new project.

Since the close of the financial year, this Company has had its share of electricity cuts resulting in slightly reduced production. Now that all our hydel dams are full and the Electricity Board has assured us that there is no likelihood of power cuts in the rest of the year, I have reason to anticipate that there will be no disturbance to our production for the remaining period of the year. With the commissioning of the Neiveli Thermal Unit, it is my hope that we shall have seen the last of the power cuts in the State.

You would have seen from the appropriation account that we have had to draw on our Deferred Taxation Reserve to maintain the same dividend as in the previous year. This is because, capital equipment of the value of Rs. 55 lakhs for which payment has already been made, which is now under erection, has not yet been brought into commission which would increase our caustic soda production from 20 to 40 tons per day. It is my hope that the additional plant and equipment would be in commercial production in the last quarter of the current financial year. I am glad to say, nevertheless, that the accounts reveal a very satisfactory state of affairs.

In conclusion, I must place on record our appreciation of the valuable and devoted services rendered by the Managing Agents and by all ranks of staff and workers during the year.

Note: This does not purport to be a report of the proceedings of the Annual General Meeting.

SUMMARY OF CURRENCIES REPAYABLE ON EFFECTIVE LOANS HELD BY BANK

Currency	Amount	(1) Loans are made (a) to the member or (b) to a political sub-division or a public or a private enterprise in the territories of the member with the member's guarantee.
Australian pounds	\$ 32,807,007	
Austrian schillings	10,340,425	
Belgian francs	56,746,047	(2) This does not include \$17,054,527 of effective loans which the Bank has agreed to sell. Of the undisbursed balance, the Bank has entered into irrevocable commitments to disburse \$12,772,207.
Burmese kyats	916,765	
Canadian dollars	101,737,689	
Ceylon rupees	540,000	
Danish kroner	11,078,888	
Deutsche marks	286,508,705	(3) Original principal amount of loans signed \$ 5,790,527.893
Finnish Markkas	3,493,805	
New French francs	77,558,957	
Ghanian pounds	1,120,000	
Indian rupees	22,894,273	
Iranian rials	6,111,147	
Iraqi dinars	851,864	
Irish pounds	2,998,851	(a) Cancellation, terminations and re-fundings \$ 121,735,253
Israel pounds	1,794,552	
Italian lire	38,339,547	
Japanese yen	60,951,386	
Luxembourg francs	1,951,656	(b) Principal repayments to the Bank 438,435,370
Malayan dollars	2,834,845	
Mexican pesos	16,059,631	
Netherlands guilders	76,598,964	
Norwegian kroner	8,792,757	(c) Loans sold or agreed to be sold of which \$17,054,527 has not yet been disbursed 997,789,516
Pakistan rupees	174,552	
Pounds sterling	277,940,740	(d) Loans not yet effective 236,450,000 1,794,410,139
South African rands	19,160,840	
Sudanese pounds	1,844,279	
Swedish kronor	21,480,524	
Swiss francs	184,911,594	
United States dollars	1,567,914,229	
Venezuelan bolivares	2,211,902	
Yugoslav dinars	1,878,355	
		\$ 3,996,117,754
Disbursed portion of effective loans held by Bank	\$ 2,900,544,576	ADD: Exchange adjustments 19,972
ADD: Undisbursed portion of effective loans held by Bank	1,095,573,178	Effective loans held by Bank \$ 3,996,137,726
	\$ 3,996,117,754	
ADD: Exchange adjustments	19,972	
Effective loans held by Bank	\$ 3,996,137,726	(4) Agreements providing for these loans have been signed, but the loans do not become effective and disbursements thereunder do not start until the borrower and guarantor, if any, take certain action and furnish certain documents to the Bank. The Bank has agreed to sell \$15,396,456 of loan not yet effective and thus the total of both effective and non-effective loans sold or agreed to be sold is the equivalent of \$1,013,185,972.

**POTENTIALITIES OF SOME OF THE MINERAL RESERVES EXPLORED
BY THE END OF SECOND PLAN PERIOD**

(Million tons)

Mineral	Place of exploration	As at the beginning of the First Plan	As Revised now	Remarks
Coal		37300	50000	In addition there are inferred reserves of 80,000 million tons.
Manganese Ore		20 (high grade)	180	About 40% being of marketable grade.
Copper Ore	Khetri	No estimate	28	With an average copper content of 0.8 per cent.
	Sikkim	No estimate	0.35	With an average combined copper lead and zinc content of 8.24 per cent.
Pyrites	Amjor	No estimate	384	Of which 8 million tons represents proved reserves and 68 million tons probable reserves. Average sulphur content of the proved reserves is 40 per cent.
	Ingaldal	No estimate	2.0	
Gypsum	Nagaur	No estimate	1000	
	(Rajasthan)			
	Ramban	No estimate	50	
	(Jammu & Kashmir)			
Limestone	Shahabad District	No estimate	About 44 million tons of flux grade and 268 million tons of furnace grade.	
Chromite	Byrapur (Mysore)	No estimate	0.7	
Iron Ore	Kiriburu (Orissa)	No estimate	173	
Bauxite	Jamnagar District (Gujarat)	No estimate	6	
Magnesite	Almora (Uttar Pradesh)	No estimate	12	
Apatite	Singhbhum Copper belt (Bihar)	0.7	1.8	
Lead & Zinc	Zawar (Rajasthan)	No estimate	10.7	With an average combined lead and zinc content of 3 per cent.
Bentonite	Barmer (Rajasthan)	No estimate	10.0

The Punjab: Wisdom is Strength

THERE has been, except for a few irrational people, rejoicing that the major gulf between Master Tara Singh and the Government of India has suddenly disappeared. Master Tara Singh broke his fast on Sunday and, immediately thereafter, the Government of India in a communique announced that a neutral commission would be appointed to go into the grievances which led to Master Tara Singh's fast. That there is some difference between the Government of India's current position and the somewhat inflexible position taken up a month ago is shown by the fact that Master Tara Singh, while breaking his fast, has stated: "As the only grievance that led to my fast is the non-application of the linguistic principle to the Punjabi-speaking area, resulting in discrimination on a social plane, the said commission is going to examine this question, that is, the question regarding the formation of a Punjabi-speaking State". The Government of India has, it seems, shown a live sense of responsibility and has agreed to allow the Punjabi Suba issue to be raised albeit in a qualified form. This in no way involves the grant of the Punjabi Suba demand, since the Commission is not authorised to concede or even recommend Punjabi Suba. This cannot be a matter for a judicial enquiry; it is a high political issue on which the rest of the country must have an equal say with those discontented. But since no final commitment was involved, why was consideration so long delayed?

All in all, one can look upon the events of the last fifty days with some regret, but, on the whole, with some satisfaction. It is a pity that an issue which could have been resolved with the solution now obtained, needed a serious crisis in Master Tara Singh's state of health on the one hand, and a long period of hard selling in Delhi on the other, before it could be accepted. This is a measure of the rigid postures which lie behind instruments of authority and of popular representation. Governments are notoriously bound by prestige as well as by their representative character. The Akali Dal had a greater degree of freedom, but, unfortunately, until the end this was not used for accommodation, but almost always for coercion. The mediators in this case have performed a great service in bridging a gulf even

though, in retrospect, it looks small enough. It would also be foolish to ignore the point that what has been achieved is only a temporary bridge, and that many acts of goodwill will be necessary on both sides till the distrust which has been sown is dispersed and finally dissipated.

At this hour of victory, we need to be grateful for many gifts in personality and approach which too often are left unnoticed. Mr. Lal Bahadur Shastri, the Home Minister, has greatly strained his health by dedication which passes all praise. The Prime Minister has been available at all hours of the day and night and has again demonstrated this week an unbelievable capacity to deal with momentous issues with calm of mind and almost all passion spent. His stature after the National Integration Conference and the current agreement on the Punjab has again reached the great height from which his somewhat hesitant approaches to a solution previously threatened to cast him down. India should be grateful for leaders such as these, who have shown that the Gandhian message under some different circumstances and indeed, with the additional handicap of being placed in Government hands, is still alive and powerful to work in a framework so largely conceived by its first and grandest preceptor.

Perhaps it is not an accident that the news of the breaking of the fast appeared one day before October 2. Can it be the spirit of Mahatma Gandhi still hovers over the country and expresses itself on this day of dedication in a manner different from at other times? It is certainly true that as October 2 approached the angry denunciations of one another ceased and a great tranquillity seems to have descended on both sides in the current dispute. It may be that the weapons of the spirit are far more powerful than we in our material age currently believe. But the greatest materialists of all will admit that Sarvodaya Day has been given new meaning by the fact that on this day the spirit of Mahatma Gandhi was felt in areas over the country far wider than Rajghat, the symbol of the greatness of this giant visionary who is dead, but whose spirit speaks continuously to the people in whose memory he is eternally enshrined.

Syria Breaks Away

AS we go to Press, President Nasser has made the decisive pronouncement that he would oppose neither the admission of Syria to the United Nations nor her entry in the Arab League in her own right as a sovereign member. This declaration sets at rest all the doubts about the status of Syria and makes the break with Egypt complete. It must have been a painful decision for President Nasser to bear with fortitude the set-back to Arab unity and not least to his personal prestige. In showing restraint, moderation and political prudence to reconcile himself with the inevitable, he has saved his own country, Syria and perhaps part of the Middle East from an imponderable crisis which would have been to the benefit of none. It ought to be recalled as a historical fact that the initiative to form the Union emanated from Syria and although President Nasser responded to it as offering a welcome opportunity, it was not without some hesitation in conviction whether the time was quite ripe for it. This experiment in Arab unity for about three and

a half years has ended in disintegration and it may very likely lead to an agonising reappraisal of the concept of Arab nationalism in more realistic terms. This would be no small gain.

Now that the initial shock of the secession has been absorbed there is to be no more breaking off of diplomatic relations with other powers by Egypt on the score of their recognizing the reborn state as in the case of Jordan and Turkey. It means that the judgment of America and Britain in according recognition, only after President Nasser made the unequivocal decision that he would in no case resort to civil war, has been acknowledged to be correct. It may be tempting and convenient to find a scape-goat and blame the Syrian military junta's adventurous bid on external inspiration. But any such theory will hardly bear scrutiny.

It is probably true that the army leaders must have been surprised at their own experience that nothing succeeds like success. They succeeded

not only in seceding but in getting Egypt's acquiescence to it. But this discovery does not disprove the existence of a deep undercurrent of discontent and resentment which emboldened them to take the risk. A majority of the Syrians no doubt keenly felt the emotional pull of the concept of Arab unity and many regretted its break after the coup. But the discontent arose from the fact that, despite the fact of union, the Syrians could not regard the Egyptians as one with them and overcome the feeling that they were aliens. The manner in which the union was worked accentuated this feeling and President Nasser's dictatorial attitude was no less galling. In retrospect he has owned his blunders.

After the first flush of enthusiasm over the union subsided and as the Syrians started taking an objective view of governmental affairs, there emerged on the surface the realisation that a status of subordinate partnership was being accorded to them in matters of common interest. Even in the domain of internal autonomy, the Syrians felt that the right to full self-governance was being denied to them. The Syrian sense of dignity and self-respect was deeply hurt and only a plausible occasion was enough for eruption. The exit of Colonel Serraj from the Union Cabinet provided that occasion. But it is interesting to remember that if Colonel Serraj's ardent advocacy of Arab unity found powerful popular support, after the formation of the union he invited upon himself country-wide contempt for directing the oppressive machinery for spying. His arrest by the military junta, howsoever explained later, shows where he stands.

It would, however, be a distortion of facts to overlook the economic causes of the discontent.

Public Sector Shipping

OCTOBER 2, 1961, is a major landmark in the history of India's overseas shipping. That day marks the amalgamation of the two public sector enterprises — the Eastern Shipping Corporation and the Western Shipping Corporation. The formation of the amalgamated Shipping Corporation of India was an over-due reform for quite a long time and the Estimates Committee which argued a strong case for it was not the first advocate of amalgamation. There was little point in maintaining the operation of two enterprises under State auspices for the overseas trade and the ends of extended shipping services could have been served by the expansion of the Eastern Shipping Corporation. Duplication of overheads could have been avoided, bringing to the Exchequer the benefit of larger net revenue. The error of policy then committed is now being rectified.

The emergence of the amalgamated Corporation is to be hailed as a measure of rationalisation which holds the promise of financial economies that are possible as a consequence of large-scale operation. In Dr. Nagendra Singh the amalgamated Corporation has acquired an able Chairman to lead the Board of Directors, but one of the criteria by which the successful management on the part of the Board will be judged is the increasing ratio of net earnings. The increase of 50 per cent even in gross earnings in 1960-61, which was a year full of difficulties and a depressing outlook in the freight market, is a worthy achievement for which the official Press Note rightly claims credit. It is to be trusted that no decline will be allowed in this rate of increase in earnings assuming, as it is fair to do, that no further deterioration will occur in the freight rates.

Three successive years of drought, coinciding virtually with the phase of union since February 1958, converted Syria from an exporter of foodgrains into a net importer and this phenomenon, coupled with the introduction of unconventional economic policies, created a feeling of drain on the country's resources. More recently, President Nasser's hasty and drastic decrees on the nationalisation of banks, foreign firms, social policies and extreme land reforms generated a deeper feeling of the threat of disruption of the economy.

The choice of Dr. Kuzbari as Prime Minister indicates that the army leaders have taken the precaution to select one who has a proved political standing dating back to the period before the merger and who at the same time represents the elements to the right. The new regime appears conscious of the fact that it will have to proceed warily in reversing President Nasser's extreme policies. Its assurances to grant freedom for trade unionism and introduction of profit-sharing for workers and their participation in industrial management are pointers to the adoption of a shrewd policy, calculated to placate an important section of the community. Military regimes have an incorrigible tendency to prolong their own tenures and the Syrian junta's announcement to hold early elections for the restoration of the normal civilian rule may not be taken at face value. Syria's serious problems will rear their head when the normal authority will be installed. Ever since her inception as an independent state, party dissensions and instability have been the bane of Syrian politics. Will Syria, reborn as a separate sovereign state, gather strength to overcome this cardinal weakness?

The expansion of world trade is one hopeful factor.

Details of the scheme of amalgamation and the existing fleet as well as the programme for its expansion, together with the services to be operated by the amalgamated Corporation, will be found elsewhere in this issue on page 656. Two things need to be emphasized about the projected plan of plying the overseas trade. The "possibility" of the Corporation entering the tramp trade, it is said, is "being considered". The scheme should not be shelved in the indefinite process of official consideration. A leap into the tramp trade is now imperative for Indian shipping, even if it may involve some loss to the tax-payer. It is a potential instrument to capture a larger share of the cargo, albeit at the risk of cut-throat competition. Because of its potentiality in this respect its acquisition will enable us to speak in a language which the entrenched Conference lines of the advanced maritime countries properly appreciate and are willing to listen to. The amalgamated Corporation has a programme of acquiring 5 fast cargo vessels in 1962-63 and 6 more before the end of the Third Plan. This programme should not be modified and it ought to be strictly adhered to. It will help the entry in the tramp trade and increase our bargaining strength with the conference lines.

The new Corporation is making a debut on the continental route at a time when the edge of competition will be less sharp than heretofore. The Pool System of earnings on the India-U.K./Continent Conference came into operation on January 1 this year. In the immediate future there

will be no conflict of interest and ruinous competition by reason of the parallel operation on the Continental route by the India Steamship and Scindias, on the one hand, and the State-owned Corporation, on the other. As a successor to the former Western Shipping Corporation, the amalgamated Corporation acquires the right to ply this route for the specified period in respect of the prescribed number of ships in terms of the agreement with the India-U.K./Continental Conference.

I F C : Another Good Year

THE Industrial Finance Corporation of India made satisfactory progress during the year 1960-61. The net profit earned — Rs. 84.75 lakhs — shows an increase of nearly 42 per cent over the previous year; the gross income has been an all-time record at Rs. 2.99 crores. Loans sanctioned during the year aggregated Rs. 21.21 crores, bringing the total loans sanctioned since the inception of the Corporation to Rs. 105.82 crores. Loans sanctioned during the Second Plan period alone have been quite impressive around Rs. 63 crores, reflecting the improving tempo of industrial activity in the country. The total amount of loans disbursed, however, still lags far behind; upto June 30, 1961, only Rs. 57.35 crores were disbursed out of the sanctioned amount of Rs. 105.82 crores. The effective utility of the Corporation is to be judged by disbursements and on this score its performance could have been much better. The percentage of default in the payment of interest and repayment of principal has gone down appreciably from 1.2 and 4.3 in 1959-60 to 0.25 and 2.34 in 1960-61.

Consequent upon the increase in net profit, the general reserve fund has been strengthened to Rs. 1.33 crores, from Rs. 69.4 lakhs. There is also a reserve for bad debts; the credit of Rs. 14.61 lakhs in this reserve is considered to be more than adequate. The subvention given by the Government in the early years of the Corporation's operation to enable it to pay the 2½ per cent guaranteed minimum dividend on its share capital has been brought down by Rs. 10 lakhs to Rs. 18 lakhs. This the Corporation hopes to liquidate in the next two years.

Particularly gratifying is the fact that the Corporation, clothed with new powers by the amendment of its statute in December last, has achieved some measure of diversification in its activities. Though interest on loans still forms the major portion of its income, the income from its new activities — underwriting of shares and guaranteeing of deferred payments — is picking up. In 1960-61, while the income from interest charges went up by 13.3 per cent from Rs. 2.25 crores to Rs. 2.60 crores, the income from new activities went up by over 120 per cent from Rs. 4.60 lakhs to Rs. 10 lakhs. The venturing by the Corporation on joint financing with some foreign and domestic financing institutions is also a step in the right direction.

The Third Plan will obviously put great demands on the Corporation's financial resources. It is strengthening its capital structure by raising the share capital by Rs. 2 crores, which would enable it to raise market loans to the tune of Rs. 20 crores. But equally essential for the Corporation to make it more useful is the strengthening of its foreign exchange resources. The avail-

The two Indian private companies are parties to the agreement as members of the Conference. But any further extension of the distant overseas services of the Corporation must eschew parallel operation, involving, in the last analysis, a division of virtually the same freight earnings of foreign exchange or their economy. Such future plans of expansion must be on the basis of allocation of services to the two sectors to ensure maximisation of freight earnings.

ability of the first loan of \$10 million from the U.S. Development Loan Fund has been of value to the Corporation in extending its operation during 1960-61. This loan having been exhausted, the Corporation has entered into negotiations for a further loan of \$20 million from this source. The success of these negotiations need not be held in doubt. The Corporation's plans to arrange credits in several foreign currencies other than the dollar may also not meet with difficulty. These credits have a vital role to play in fostering the development of various industries dependent on imports from some of the Continental countries and Japan. But the Corporation's role here cannot but be modest.

Two other measures which can go some way in improving the financial resources of the Corporation and its income are participation in the equity capital of the loanee companies and charging of a surcharge over the interest on its loans in case the loanee concerns make profits over a prescribed limit. Participation in profits and equity capital of the borrowers is a practice not unknown to finance corporations abroad. When the Corporation is receiving an increasing number of applications for underwriting of capital issues, the implication is that the loanee companies would not have much objection to participation by the Corporation in their equity capital. Profit-sharing without participation in the share capital of the borrowing concerns, will enable the Corporation in the long run to get some additional income. These two proposals are under the consideration of the Corporation. An early decision would be desirable.

Can the Corporation turn to the financing of heavy industry as a new activity? Uptil now, the real beneficiaries from its activities have been some consumer goods industries such as sugar, textiles, paper. The profit margin in the machine-building industry in the initial stages being invariably small because of heavier capital investment, there is a case for the Corporation charging concessional rates of interest on its loans to this industry and to some other similar ones. If India is to really "arrive" as an industrial power in the world, the growth of heavy and basic industries has obviously to be fostered. The Corporation would do well to bestow some thought on this issue. If the principle of concessional rates of interest is also followed in the case of loans to industries capable of being set up in the backward areas of the country, regional development can be assisted. It is otherwise difficult to find fault with the Corporation's current rate of interest, especially when interest rates in the country have, in the recent past, shown a tendency to go up. The Corporation's decision not to step up its rates despite the growing volume of its business is in keeping with its purpose.

A DELHI DIARY

EXPECTING THE UNEXPECTED

IN this week the unexpected has happened and some of my very wise friends tell me that in their wisdom they expected the unexpected. I remember about thirty years ago that great apostle of paradoxes, Mr. G. K. Chesterton, evolved a peculiar theory that we were always expecting the unexpected. I forget the argument which contained only a small vulgar fraction of the truth, but it was something to the effect that if we were expecting the expected, then expectation ran very low. When you expected the unexpected you were tense and excited. Conversely, if you are tense and excited, then you must be expecting the unexpected. Quod Erat Demonstrandum. As my Delhi Diary last week showed, I was not in the class of the privileged and, of course, I was not tense and excited. Therefore, I suppose I was quite unready in mind to face the whirligig of time and explore the curious events which followed one another with unexpected and breathtaking speed. On Friday night it looked as though the Government was standing hard by its view that the Punjabi Suba issue would not be referred as such or even as a direct grievance to the high-powered neutral commission. On Saturday night all this was changed. On Sunday Mr. H. S. Malik was on his way to Amritsar and on Sunday evening everything was as in the best of all possible worlds. Master Tara Singh had broken his fast; the Prime Minister was happy and the whole world was singing the praises of everyone, particularly the Home Minister, the Maharaja of Patiala and Mr. Malik. May I add my feeble praises to this distinguished galaxy of peace-makers?

NATIONAL INTEGRATION AND ALL THAT

I do not have to hang my head in shame on the Punjab problem. Indeed, I have argued before and will continue to argue again that a journalist placed in the position of one arguing for mediation should be a critic of both sides when they resolve to take rigid postures which prevent an agreement being reached. Last week, I expressed my strong disapproval of the attitudes of both the sides. I do not apologise for this because at that time, I contend, the postures were rigid. To the invitations of my friends to eat my words and my hat I respond the conditions have changed a lot since then; the accommodation has come about where there was rigidity before. It is they who have changed, and, therefore, I do not see the necessity for eating my hat or my words. But I might explain that if eating my words is a punishment which I must endure to bring about a becoming sense of humility, I will gladly do it every time if it is as good as this. It is not generally realised how near a point of no return we were in Hindu-Sikh feelings in the Punjab. The fact that we have pulled back in time is cause for congratulations, not for proof that similar escapades are good for the country or for ourselves.

However, I was talking about national integration and here I will certainly eat my words because I have made a genuine mistake. I thought the National Integration Conference would be a pure talking shop which, in fact, it has not been. Opinions may well differ on the value of some of the speeches and even on the official resolutions. I think in a four-day conference, with such a glorious diversity of people, the results could not have been very much more constructive than, in fact, they turned out to be. Therefore, I for one would argue that the mere fact that we have got a full-fledged policy emerging out of the Conference is not the end. We have to have several things: firstly, a better sense of communication between parties and between people; secondly, some balance on the subject of English and Hindi in Devnagri script; thirdly, not a little understanding of the sense of sin which pervades political parties who exploit caste and local tensions

for their own purposes. They have all faithfully promised to eschew these methods in future. The test is in February, 1962 — or, indeed, all the way till then.

One of the most interesting facets of the Conference was its display of humour. The Prime Minister in the Chair for all the four days kept the sense of humour alive, although he was obviously under severe pressure — both inside and outside the meeting hall. He made a splendid chairman, and Mr. Jaipal Singh's vote of thanks reflected some inadequacy for the tremendous task that he accomplished. But I am inclined to think that a few speakers will be remembered not so much for forcefully stating their views as for the general rebuke. As a conspicuous example of technical skill I refer to Mr. J.R.D. Tata's observation that the country had been led to believe that resources belonged to the people. When, however, people, in the mistaken belief that they inherited the resources, laid claim to property which belonged to others, we soon discovered that what we really meant was something quite different. Did we, in fact, mean that the people belonged to the resources? I think this is an interesting way of showing to socialist members of society how difficult are their prescriptions in practice. I think the laughter in this particular case proved that Mr. Tata's point, apart from having strictly local application, had a significant shaft for the socialist opposition.

THE GRATUITOUS JET CONTROVERSY

I am one of those who feel very much intrigued by the Defence Ministry's strange handling of the manufacture of the supersonic jet fighter at the Hindustan Aircraft Factory. A prudent decision to obtain the technical know-how is of the very essence of this key defence project, which has become a matter of urgency for us in view of the security of our frontier. Britain is our traditional supplier of aircraft of varied descriptions, we are Britain's largest overseas customers and friendly relations in defence as in political affairs have been fostered by the Commonwealth bond. All these argue for our choice of Britain as the collaborator in the supersonic project. In fact, the choice is narrowed down practically to Britain and Russia as no other country worth collaboration has shown partiality for supersonic jets powered by two engines. But while the Defence Ministry opted for the British aircraft manufacturer—the Bristol Siddeley Group—in the first instance, it later turned to Russia for the engine equipment. This seems to be the root of the present trouble between the Hindustan Aircraft and the British firm.

When the Hindustan Aircraft called upon the firm to furnish further technical information about the supersonic jet engines capable of the verticle take-off for its programme of defence manufacture, the British firm declined to disclose it. The allegation against the firm of backing out of the original deal can hardly be borne out, since this is not an unmixed commercial deal, but considerations of security are deeply involved. Security classification, whether it relates to manufacture or research in aircraft, is under the control of the Air Ministry in Britain which would not have withheld the information in this case from us in the normal course. But if after the first successful test of our supersonic HF-94, our Defence Ministry turns to Russia for the engine equipment, the UK Air Ministry can quite reasonably apprehend leakage of strategic information and direct the firm not to supply the classified information in this situation. Freedom to buy from any source can hardly be treated as absolute in defence equipment and consistency in the choice of the supplier is the better part of discretion. Even neutrality needs to recognise obvious limitations lest the instruments of national defence may be neutralised. The diplomatic channel can be utilised fruitfully to resolve this impasse.

ARGUS

THE WEEK'S NOTES

National Unity

THE INTEGRATION COUNCIL

THE INITIAL reaction that the National Integration Conference might be caught in the cobweb of platitudes, hollow talk and a heroic display of idealism and end up in adopting pompous resolutions proved to be completely wrong. As the deliberations at the conference gained momentum, a keen sense of earnestness to evolve ways and means to arrest the dangerous fissiparous trends and to set the tone for a determined effort to foster national integration asserted itself. The Prime Minister's convincing appeal in a memorable speech, unanimously acclaimed as the decisive factor in turning the entire tenor of the proceedings, radically changed the outcome of the conference. A real meaning and purpose were imparted to the projected drive for national integration which otherwise may have degenerated into an empty slogan.

Most of the speeches at the conference struck the right note of urging a supreme effort to restore in public life the attributes of tolerance, mutual understanding and accommodation for a rational balance between the diverse elements in the community. The emphasis on minority grievances, if over-done, is sure to create a sense of frustration in some and apathy in others. The conference gave the correct lead in stressing that the accent must be placed on integration. The speeches delivered and the well-reasoned arguments advanced at the conference brought the realisation that what was needed to narrow down the differences was not the negative attitude of harping on the impediments to national integration but a positive attitude to work for its consummation. A dispassionate assessment of the work of the conference brings a sense that something solid has been achieved.

The National Integration Council, which is to be formed to give life and substance to the resolutions adopted at the conference, is confronted with a heavy task. Short-sighted opportunism on the part of all the parties and groups in the country without any exception has gone on feeding the forces of disintegration — communalism, casteism, linguism and regionalism. It would be the task of the National Integration Council to use its moral influence to put an end to this disruptive trend. The Council, consisting as it does of the representatives of the seven political parties or groups in Parliament and other diverse interests, may appear, on a superficial view, to be too heterogeneous in composition to secure identity of effort. But precisely a contrary view could be taken that in its composition it is all-inclusive and therefore comprehensive. That the diverse interests will refrain from mutual fault-finding or apportioning responsibility for the sins of omission and commission, if any, and, on the other hand, work with a community of purpose to achieve genuine integration, is a presumption on which rests the faith in the efficacy of the Council. There was ample assurance at the conference that a deep urge existed to work in this spirit. The Council has to make a success of its mission on the strength of the only sanction that stands behind it — the moral sanction. Indeed, there can be no other abiding sanction for its work.

The U.N.

INTERIM SUCCESSOR

THE LONGER the delay in filling the vacuum created by the tragic death of Mr. Dag Hammarskjöld the more difficult will it be for the effective functioning of the United Nations. In fact, for lack of the top executive

the United Nations is sure to be paralysed in its functioning. The original apprehensions that Russia would utilise this occasion for enforcing her proposal of "troika" have proved to be somewhat misplaced and she has softened her attitude, although for the purpose of an interim solution. The Russian proposal was for filling the vacancy with an interim successor till April 1963, when Mr. Hammarskjöld's term was to expire. A provisional Secretary-General, assisted by three deputies, was the hard core of the Russian proposal. She also explained that the deputies should not exercise the power of veto in the discharge of their functions and should work in a spirit of concert. This proposal has been opposed by America and it would be erroneous to treat the American reaction as hasty or rigid. In this proposal America smelt a definite attempt to plant the principle of "troika" in the constitution of the United Nations and the phraseology used by Russia also indicated that, although the three deputies would not utilise the power of veto, by implication there would be a commitment to the fact that the power of veto would be vested in them. Such a precedent would make the solution of finding a permanent successor still more difficult.

The ball has been set rolling and it would be too much to presume that Russia would maintain inflexibility in her attitude. The very fact that an interim solution until April 1963 is acceptable to her raises hope for manoeuvring for compromise. The latest development in this regard gives still greater hope that a solution might be within sight at an early date, provided the determination to accommodate the two divergent view-points of the two blocs is there. The non-aligned nations have proposed that the interim executive be selected in a manner that will bring full representation of the varied membership of the United Nations. One representative is to be selected from America, one from Russia and three from the non-aligned nations, but the power of veto is not to rest with them. It seems hardly likely that there can be any escape from making a variation in the rule of one-man supreme executive as stipulated in the Charter of the United Nations. The alignment of the membership of the United Nations into the two major blocs, accompanied by the neutral states, is a stark reality and it is not easy to ignore it. If Russia agrees to the absence of the veto and the Western nations agree to the two deputies (to be nominated by the interim Secretary-General), the vacuum can be filled immediately and negotiations for a permanent solution of this delicate question could be taken in hand.

F.A.O.

THE STATE OF FOOD AND AGRICULTURE

THE LATEST annual report released by the Food and Agriculture Organisation of the United Nations for the year 1961 draws a dismal picture of the race between agricultural production and population. The preliminary estimates for the year 1960-61 indicate that agricultural production in the world (excluding Mainland China) showed a rise of about 1 per cent over the previous year, while population rose by 1.6 per cent. Thus, the population of the world is marching much ahead of agricultural output. Since agriculture all the world over is dominated by the vagaries of climate, the performance in a particular year cannot be taken as representative. If the last two seasons are taken together, production seems to have increased slightly faster than population. If, however, Mainland China is also included in the world index of agricultural production, the index would indicate a decline in 1960-61 over 1959-60.

The disconcerting story of agricultural production in the world including Mainland China, however, conceals certain bright spots. In the Far East, Western Europe and Oceania considerable progress was recorded. Food production in the Far East (excluding Mainland China) recorded a rise of about 3 per cent with the result that per capita production of food in this particular area regained the average level of the immediate pre-war year.

The per capita output of food in the world has changed very little from the level attained in 1958-59, the year when record global production was noted. This level represents a rise of 14 per cent over the immediate pre-war year. But in the meantime living standards are improved and a revolution of rising expectations has been generated with the result that this modest rise fails to make much impression. Africa is, however, one of the unfortunate continents where per capita food production has been declining for some time past and the present level is slightly lower than what prevailed before the last World War.

Aligarh

AGONISING APPRAISAL

THE COMMUNAL riot which spread with the rapidity of a wild fire in Aligarh this week stands in a special category and discloses a sinister trend which it is the primary duty of the custodians of the Aligarh University to eradicate by a sustained effort. The need for such an effort is in no sense less pressing in other educational institutions which carry a communal label. The District Magistrate has minced no words when he put it categorically that it was the failure of the university authorities to take prompt action against delinquent students that was responsible for the development of tension in the university area as well as the city. The Vice-Chancellor, Colonel B. H. Zaidi is quite candid in making the admission that last Sunday's elections to the University Students' Union were held on communal lines. This fact is patent on the face of the results. The belabouring of students of one community by those of another in a hostel in the university and their removal to a hospital for treatment speak for the tempo to which tension was worked up. The election campaign that preceded this ugly development ought to have put the university authorities on their guard and the least they ought to have done was to postpone the election until the normal atmosphere was restored. The Vice-Chancellor has stated that he had no time to act swiftly which only shows that he did not properly grasp the undercurrent of the forces that were coming into play.

The toll of the fatal casualties in the city as a result of the spread of rioting there has now risen to eleven. The damage to life and property would have been larger if the district authorities had not acted as swiftly and energetically as they did. Students from the university hostels, who left for their home towns under apprehensions of insecurity, gave currency to coloured reports about the happenings in the university campus and this inflamed communal passions in other places. In Chandausi in particular the magnitude of rioting and casualties was great. The situation in some districts of Western U.P. has become tense, but the State Government has left no doubt that firm action would be taken to put down violence, while at the same time composite committees drawn from all the communities and parties are being organized to maintain peace. All these developments are proof of the explosive potential of communal passions in U.P.

That this virus is entering the student community deeper is a most dangerous development. One should have expected the new generation of students to inculcate a healthy national outlook. But the failure of this expectation to materialise should awaken responsible leadership in all the communities and those entrusted with the custody of the educational institutions to

make an agonising appraisal of the latent forces and in particular make a determined effort to foster a real spirit of integration in the rising generation. Coming close on the heels of the National Integration Conference, this development draws attention to an aspect which received insufficient attention at its hands. A probe into the Aligarh University episode is essential, but it will not be enough. The policy in respect of universities and other educational institutions, based on a communal basis historically or otherwise, requires a complete overhaul.

ECAFE

PLANNING IN ASIA

THE FIRST SESSION of the United Nations Conference of Asian Economic Planners which was held at New Delhi last week discussed a number of important problems in planning. The broad conclusions reached at this conference were:

- (a) Recognition that planning is essential for Asia's economic development;
- (b) Emphasis on the value of regional co-operation as a means to help economic progress in the individual countries as well as the region as a whole;
- (c) Formulation of a number of concrete steps that the members of ECAFE and its Secretariat can take to promote effective regional co-operation, basing themselves on a long-term concept of dynamic growth in the countries of Asia;
- (d) Recommendations, based on a survey of ten years' experience of development planning and implementation, for improving planning techniques, administrative procedures and the execution of development plans;
- (e) Approval of proposals to establish (i) an Asian Institute for Economic Development to provide practical and theoretical training for government personnel in economic and social planning; (2) a Regional Advisory Group on Economic Development Planning consisting of experts who would be available on the request of governments to assist them in drawing up their plans.

A majority of the delegates emphasised the apparent fact that industrialisation was a basic and long-term solution to the problem of poverty in these countries. It was conceded, however, that most of the countries in this region were predominantly dependent on agriculture and it was essential that agricultural productivity should also be increased through new technological changes in farming.

The problem of resources in these countries, it was agreed, was ticklish as domestic resources in almost each case needed to be supplemented by external resources for accelerating the rate of economic growth. International agencies, individual countries as well as private investment could all participate in this operation of assisting the backward economies of these countries to pull them out of poverty and stagnation. The economic aid, when promised by the advanced countries, should preferably be on a long-term basis so as to assist these countries in planning on a continuous basis, in accordance with the national perspective plans. An appeal was made to the advanced countries of the world to liberalise their trading policies in relation to the developing countries. In the recent past, the export earnings of all these countries had declined while the cost of importing machinery and manufacturing goods had increased. This unfavourable turn in the terms of trade had far-reaching repercussions and had retarded the process of economic growth in these countries. In the final analysis, chronic disequilibria in the balance of payments of the developing countries cannot fail to retard the growth of world trade.

SMARTNESS THAT MATTERS...

"Clothes make the man" says the age-old Proverb. They not only impart smartness but also give that air of self-confidence to a man which is so necessary in all walks of life.

STEEL IN THE U.K.: LESSONS FOR INDIA

By
ODYSSEUS

IF A LARGE ENTERPRISE, such as a steel plant, is to be launched, should it be sited where raw material, transport, power, and other costs are cheapest, or should these considerations be ignored in favour of a high cost site in an area of persistently heavy unemployment? Should the new plant be allowed to import cheap foreign coal, or oil, or compelled to use more expensive nationally produced coal? Should a plant using cheap nationally mined ore be compelled to pay a levy into a central fund to keep alive other existing high cost plants, which, if closed, would create unemployment and "social dislocation"? Should a key industry, like steel, be compelled to keep its selling prices (and therefore its profits) as low as possible in order to "prevent inflation" and to give steel-using export industries a price advantage in world markets? If low cost steel plants are, "in the national interest" to subsidise high cost plants, how do you discourage waste and ensure efficiency in the high cost plants? If, as a result of a variety of tariffs, levies, subsidies, and high cost locations, all adopted in the "national interest", your steel (or other) industry becomes a high cost industry, unable to compete in world markets, is that still "in the national interest"? Last, but not least, how do you keep a state controlled industry "out of politics"?

These are a few of the problems analysed in "The Steel Industry 1939—1959" (Camb. Univ. Press, London, 1961. Price 80 sh.), by Mr. Duncan Burn.

EXPERIENCE IN EUROPE AND THE U.S.A.

Mr. Burn's first hand knowledge of the steel industries, not only of Britain, but of France, Germany, Belgium, and the U.S.A., is encyclopaedic. I do not hesitate to say that his exhaustive 700 page book, with its 105 statistical tables, and maps covering the world's main steel producing centres, should be compulsory reading for any one concerned with steel, and for any government official concerned with central planning. Mr. Burn gives, for example, the only complete description of the working of the European Coal and Steel Community and of the U.S. antitrust control of steel, written from the viewpoint of a detached, outside observer, that I have seen under one cover. The trouble with steel in most countries is that it is so tangled up with politics that most discussions are written either to uphold or to attack the existing set up. Mr. Burn's bias is towards free enterprise, but before giving his conclusions he is careful to take awkward facts into account and meticulous in setting forth the opposing viewpoint.

Since India, with its mixture of state and private enterprise in steel, and other industries, seems to be following the pattern set in the U.K., an outline of British experience to date may be helpful.

Britain pioneered steel making, but already by 1900, the industry was being criticised for alleged inefficiency and was being outdistanced by the U.S.A. and

Germany. Its relative decline, as reflected in comparative costs, arose from several causes, not wholly of its own creation. As an industry supplying capital goods, it suffered from the growing severity of recurring slumps. As one with expensive and durable plant, it paid to continue to use obsolescent plant as long as selling prices covered operating costs. Moreover, there are heavy costs in closing down and restarting blast-furnaces, so owners, hoping that demand will revive, usually continue to work them, even when receipts do not cover operating costs. It followed that the old established U.K. plants (which had often accumulated strong reserves) kept going even when suffering acutely from competitive price cutting.

The U.K. industry was particularly vulnerable because a substantial part of its capacity had been built to supply export markets, but newly industrialising countries were growing and progressively occupying protected home markets hitherto supplied by the U.K. The European industries could often keep up their home prices by cartels behind tariffs. They cut prices competitively to get exports, not only in third countries, but inside free trade Britain. This slowed the expansion of U.K. steel, and made it difficult to modernise. Further, because the U.K. industry had grown up on top of the iron industry, it had started off with a variety of smallish, scattered firms, in which it was difficult to achieve economies of scale. These factors made for lack of competitive flexibility and encouraged price-fixing agreements.

World War I led to piecemeal expansions (rather than radical reconstruction), which imposed heavy financial burdens when the fall in post-war demand was followed by deflation, and when war-devastated Europe stepped up production in newly constructed modern plants.

TARIFFS OR FREE TRADE?

When the big interwar depression came, the whole world thought that the solution lay in tariff protection. This naturally contracted the total volume of trade available to all, and put prices up in all countries, thus deepening the depression. Had the U.K. remained a free trade island in a protected world, doubtless many of her industries, including steel, would have been killed. Without giving oneself the benefit of hindsight, it is difficult to be dogmatic as to what the U.K. should have done in the 1930's. So protectionist and restrictionist was the climate of world opinion then that today's return to expansionist, free trade, policies over wide areas of the West is a miracle beyond the dreams of the wildest pre-war optimist.

Probably the path of wisdom would have been to recognise that protection was essentially a defensive, restrictive policy, handicapping aggressive expansionist firms, fostering indolent practitioners of the high cost status quo, and to institute a flexible tariff, kept under constant review with instructions to lower the

margin of protection on all possible occasions. What happened, in fact, was that the Import Duties Advisory Committee was set up in 1932, which paid lip service to the need for the industry to reorganise itself. The steelmakers formed the British Iron and Steel Federation, which evolved a system to "secure planning", to eliminate "unrestricted" competition at home or from abroad, and to foster "efficiency". The tariff imposed was theoretically flexible to keep producers on their toes. In practice, it was very high. It led to some investment and modernisation. But mostly it buttressed high cost location, and impeded radical changes. Planning revealed an over-riding pre-occupation to avoid disturbing existing sites and to help distressed areas. A central fund, fed by levies, led to "price stability". The export of scrap was stopped, to keep the home price low and stable. The excess costs of imported scrap and pig-iron above home prices were met out of the central fund, so that the whole industry bore the burden of high cost firms which relied on imported scrap and pig-iron.

Thus was the "national interest" preserved. Nobody suggested that the tariff and the central fund should be used to close down high cost firms, to build modern plant on low cost sites, and to pay for the movement of workers to low cost sites, and for the building of modern housing for them there.

During the war, the steel industry was naturally controlled as part of the war effort. War-time problems and experience were little guide towards those of peace. Germany's control of the European coastline denied the U.K. access to Swedish and North African ores, Belgian and French semi-products, and Scandinavian ferro-alloys etc. Wolfram from Burma was cut off; pig-iron from India was drastically reduced; shipping was everywhere in short supply. Imports of U.S.

steel, especially in semi-products, became all important. In these circumstances, the expansion of capacity witnessed in World War I was not repeated. Mr. Burn considers that the Control met the requirements of war, but he points out that this very fact meant that it was not ideally suited for the wholly different conditions of competitive production for world markets in peace.

Broadly, the war Control consolidated the position of the older high cost areas. The war naturally brought rising costs in steel-making. The Control achieved its aim to "stabilise" prices, and a complicated mechanism, incomprehensible to the outside observer, was erected, the effect of which was to prevent any rational distribution of profits to individual firms in accordance with their efficiency and to conceal their real costs. Because 1936-37 was used as a profit ceiling on old investments, old plants and old regions were favoured.

At the end of the war, the existence of these controls, depressing profit margins and distorting costs, made forecasting by individual firms hazardous. But these hazards were compensated by the levy system whereby the efficient bore the burden for the less efficient.

The real issue at stake in the political warfare that broke out for and against nationalisation — namely, would efficiency be better ensured under private or state enterprise? — was lost to sight because nobody wanted decontrol and a return to real competition. The battle was fought not on the question of efficiency but of ownership. The Conservative party, and the individual steel firms, wanted war-time planning and price controls to continue under private ownership, the Labour party under state ownership.

Next week, we will see what came of this.

The European Scene

BUSINESS IN WEST EUROPE

From Our Special West European Correspondent

PARIS, September 30.

THERE is no longer a sharp contrast between business activity inside the Common Market and business activity in surrounding states in West Europe. Inside Euromarket as outside, there are various trends at work, causing wide differences between national economies and between industrial sectors. For example, there are four countries that continue to make rapid progress: Italy, France, Norway and Austria; two that show feeble growth rates: West Germany and the United Kingdom; one that is stuck on a plateau: Belgium; and two that give signs of slight contraction: Holland and Sweden. So it would be artificial to treat the Common Market Six separately in reporting on current business activity, seeking to strike an average between their different situations. Although it makes generalisation more difficult, this diversity is important as suggesting that the Common Market has lost, for a time, that élan that made the Six a compact bunch of sprinters well ahead of the rest of the field. There is nothing in the air to indicate a recession or even a notable stagnation, but the appearance of discordant notes shows that West Europe—both the Six and their neighbours—is entering a more difficult period. Naturally, the theory has been revived that West Europe follows American ups and downs with a delay of six months, so that this region is now suffering the backwash of the recent U.S. slowdown. If that is all there is in it, the present situation need cause no anxiety, for the U.S. recession was mild and European echoes of trans-Atlantic downturns have become very muted in recent years.

Certain things are true of all West European economies at the beginning of this autumn. In all of them, there is virtually full employment (even in Italy, if one sets aside manpower that is so unqualified as not to be immediately employable); and in countries or in industries where there has been contraction this has not caused any laying off of labour but simply a fall in productivity per person employed. Secondly, wages and prices are rising almost everywhere, at different rates it is true but everywhere faster than increases in productivity. This is most notable perhaps in Britain; although we have classed her with nations showing moderate expansion, one must remember that this is just a recovery after a previous slowdown, so that activity in the U.K. today is back where it was 15 months ago—with a 4 per cent increase in wages in the meantime. Thirdly, investors seem everywhere to be hesitant, both in the creating of new productive assets and in the support of the stock markets, which argues a universal reserve about the prospects of resumed general expansion in the next six months.

Any other generalisations would be hazardous, as covering situations that differ too widely to be averaged. Thus one could say that West European production has grown by 5 per cent this year over 1960 (most of the advance being realised by February, after which the curve flattened out), but I am not sure that it is helpful to average out Britain's 1 per cent and Italy's 15 per cent. The safest generality is that progress this year will be modest compared to last year. It is better to turn to the various industrial sectors, where one sees in most of West Europe that there has been a decline in mining and in the food industries, stagnation in textiles, and expansion at a slower rate in metals, metal-working and chemicals. Industries that are growing faster than the general index number for industrial production are oil and petrol, chemicals and heavy

electrical equipment. There is irregular growth in machines, mechanical construction and building material. Expansion in electricity generation and rubber production coincides with the index number for all industries. Slower than this weighted average are steel, paper and automobiles. Those on a plateau are textiles, furnishing, wood. There is regression in coal, ship-building, leather. Perhaps the most interesting aspect of this hierarchy is that automobiles, steel and paper have lost their leading position as pilots of the West economies.

None of this amounts to recession but because the fall in the tempo of expansion coincides with the maturing of the substantial investments in new machinery over the last three years, there is the dual result that delivery dates have everywhere shortened considerably and there is less pressure on manpower resources. Labour is still too short in Germany and Holland for employers to be able to resist demands for higher wages, but the situation is no longer critical; there may have been some increase in unemployment in Britain very lately; while Italy and Belgium continue to absorb idle hands into industry. The first measures to promote free movement of labour inside the Common Market have just come into effect and it is too early to say what effect they will have. A general feature is keen competition for skilled labour; the closure of the frontier between free Germany and Herr Ulbricht's concentration camp will worsen this, while no influx of southern Italian or North African labour will do anything to alleviate it. Though the manpower position is nowhere desperate, the certainty that labour will remain the scarcest factor in the European economy is helping to maintain investments in modernisation, rationalisation and automation. Investments in extension of plant are another matter; here the tendency is to greater caution everywhere except in France. It is not that investments are being cut back; major plans for expansion, especially in today's capital-intensive industries, take time to formulate and implement, and do not respond to the short-term factors being described in this article. Investment outlays in the second half of this year will continue to show a bigger rise than gross national product, but a deceleration is evident in Germany and Italy. In France and Belgium, the situation is different; France has to create now the machinery that will employ her growing population in a few years' time, while Belgium has to carry through the modernisation of her no-longer-imperial economy, and neither of these tasks can be held up because of temporary fluctuations.

Building has been an important stimulant to the European economies in recent years and (given the poor housing conditions of most Continental countries) it is a healthy thing that it remains so when automobiles and steel lose that role. In most European countries, the number of dwellings completed this year will exceed the 1960 total. In France, further increase in building activity is assured, but there is a decline in the issue of building permits in Holland and Belgium. Construction of industrial and commercial buildings continues to expand in phase with the above-noted buoyancy of industrial investment.

Despite the tendency for industrial production to slow down, consumer outlays are increasing. This is because stocks are being run down at every point between the factory and the ultimate purchaser, and because outlays on services are rising faster than outlays on goods (this latter is a secular trend and has nothing to do with the short-term position). revenues have risen notably: the labour shortage has enabled wage-earners to secure increases and the intense envy that now rules between all classes and occupations in Europe ensures that similar increases are sought by groups (such as peasants and civil servants) whose hands are not in such keen demand. Industry has paid shareholders the excellent returns on last year's profitable working, but investors (as the state of the stock markets shows) prefer to hold on to their cash. The ratio between saving and spending has remained the same, so the larger volume of revenues means larger absolute amounts laid out on goods and services. The rise in wages in the first half of the year was 7 per cent in West Germany and France, 5 per cent in Holland, 4 per cent in Britain and 3 per cent in Italy. In this situation, a rise in the cost of living is inevitable and will continue into next year: industry's costs are rising under the influence of higher wages and lower productivity per person employed, competition for services is raising their price, and finally increases in rents and transport charges are being decreed by governments on general grounds.

The external trading position of the European countries varies widely; there is no common measure between Britain's recent deficits, Holland's export decline following the revaluation, and the excellent response of French and Italian exporters to the opportunities of the Common Market. Yet if we consider the trade between these countries and the outside world, we see a universal fall in imports and a stagnation of exports. Europe is buying less from overseas and is not succeeding in selling more. This is in part an aspect of that "decline of imperial trade" described here in the last two weeks, and in part the result of European trade

losses in the U.S. market combined with the vigorous American export-drive. The fall in European car sales in the USA is familiar; Detroit expects that imports of foreign cars will be only 400,000 next year against 700,000 in 1959. To be sure, the latest U.S. figures say that the recovery from the recession has caused an unexpectedly large increase in imports, but these must be of goods drawn from countries other than West Europe; this region has to date felt no stimulation from the better level of activity on the other side of the Atlantic.

Despite this deterioration in West Europe's trade balance, exchange reserves remain abundant; they total over \$8,000 million in West Germany and around \$3,000 million in France and Italy; they have improved in Britain. With the exception of the latter country, the money supply is exceedingly easy, interest rates are uniformly low and in general liquidity has increased faster than the national product. If governments decide that this circumstance—read with the increases in wages and prices already mentioned—calls for closer control over the inflationary danger, then all the symptoms of a slowdown mentioned in this article could be intensified in the months ahead. If—as would be wiser, and as their plentiful exchange reserves would allow—they choose to liberate imports further (by faster tariff disarmament inside the Common Market, by acceding to U.S. demands for removal of the last dollar discriminations, by opening their frontiers to more Japanese goods as Tokyo is urgently requesting), they could perhaps manage to stem the rise in prices, admittedly at the cost of further embarrassing certain industries already affected by the slowdown in European activity.

4½ Per Cent Madras State Electricity Board Bonds, 1971. For Rs. 200 lakhs.

(Payment of Interest and Repayment of Principal, Guaranteed by the
Government of Madras)

The bonds will be trustee securities under the Indian Trusts Act and also approved securities for the purposes of the Insurance Act and the Banking Companies Act.

Issue Price Rs. 90.50 Per Cent.

REDEEMABLE AT PAR ON THE 16TH OCTOBER, 1971

Subscription will be received in cash or cheques from the 16th October, 1961. But the lists will be closed without notice as soon as the total subscriptions amount to approximately Rs. 200 lakhs and in any case not later than the close of business on the 23rd October, 1961.

Applications will be received at all branches of the State Bank of India within the State of Madras and at the State Bank of India at Madras, Bombay, Calcutta, Delhi, Bangalore and Bangalore city.

Copies of the Notification announcing the terms of issue and application forms are available at all the receiving offices mentioned above, at all treasuries and sub-treasuries in the State of Madras and at all offices of the State Electricity Board and its undertakings.

Economic Report from the U.S.

CONFIDENCE IN U.S. FINANCIAL POSITION

By GUY SIMS FIATCH

WASHINGTON, Sept. 26.

U.S. OFFICIALS appear pleased with the results of the recently concluded meeting in Vienna of the World Bank and the International Monetary Fund (IMF). Of particular importance at the meeting was the agreement in the IMF on a system whereby standby credits could be drawn by major industrial nations in serious short-term balance of payments difficulties. This agreement may not have met with the complete approval of all the governments concerned. The belief is general, however, that if properly implemented it will be a distinct step forward in meeting and overcoming serious international financial dislocations, especially exchange difficulties created by large movements of capital. Difficulties of this sort have affected a number of major countries in the past, and could strike again anywhere in the future.

The agreement has another advantage. While it still must be approved by the legislative bodies of the interested nations, including the Congress of the U.S., it can be carried out within the existing framework of the IMF. This means that it can be put into effect with a minimum of delay, perhaps by next spring or summer. A more ambitious plan involving basic changes in the IMF structure, on the other hand, might have proved more controversial, and even if agreed on in principle, would probably take as long as two or three years to consummate. Of course, one cannot expect an agreement of the sort reached at Vienna to solve all the world's financial problems. Much still will depend on the circumstances faced and the policies followed by individual governments. The U.S. with all its influence, financial reserves and economic strength, is no exception. It is significant, therefore, that U.S. officials appear to have come from Vienna with the distinct impression that foreign governments have a good deal of confidence in the financial position of the U.S. and in the policies of the U.S. Government. There seems to be relatively little fear abroad of any serious or imminent inflation in the U.S., despite the strong upsurge in the U.S. economy. According to reports, this confidence is not affected by the deficit anticipated in the U.S. budget for the current fiscal year that began last July 1. It is particularly heartening that the Budget deficit promises to be rather moderate in this year of business recovery, and that President Kennedy has made clear his intention to submit a balanced Budget to Congress for the 1963 fiscal year, when the nation's resources will be more fully employed.

Another source of possible concern is the deficit in the U.S. balance of payments. But here, too, there

seems to be more confidence abroad than is sometimes supposed. The large U.S. favourable trade balance may well be declining through this year as the American economy continues its strong rebound and imports rise, but this promises to be more offset by a reduced flow of short-term capital. Moreover, U.S. exports give every sign of remaining strong, and foreign governments are further reassured by the U.S. Government's continuing efforts to expand the nation's export trade. The general expectation here is that at worst, the balance of payments deficit still will not reach the \$2,100 million mark, and at best will be as low as \$1,000 million. This is a remarkable improvement for a country that ran deficits in the \$3,500 million—\$4,000 million range in the three previous years. A number of domestic developments in the U.S., meanwhile, are lending support to the appraisal of U.S. financial strength. For one thing, the latest report places the consumer price index for August at 128 per cent of the 1947-48 average. This represents a slight dip from July, and reinforces the view that the current business upswing is largely non-inflationary in character. It might be noted that since the beginning of this year, the price index has fluctuated within the very narrow range of 127.4 to 128.1.

There are, additionally, specific industrial trends that indicate price lines generally will be held. Several automobile manufacturers, for instance, have said they will not be raising their prices on their new 1962 models, and aluminium companies have announced plans to reduce their prices. These developments place additional pressure on steel makers to hold their price lines, what with the automobile industry the largest single user of steel, and aluminium a ready substitute for steel in many industrial applications. Furthermore, the publically stated opposition of President Kennedy to steel price boosts has confronted that industry with a moral suasion and a public interest it cannot help but take into account. Yet it is in the world's money markets that the most telling vote of confidence in the U.S. financial position may be found. All evidence points to the conclusion that the U.S. dollar is becoming increasingly valuable in foreign markets. With the advance in dollar exchange rates have come signs of a flow of short-term capital to the U.S. From this, one can conclude that financial leaders around the world are reasonably convinced that the U.S. is not likely to experience the kind of inflation which could weaken its ability to compete in world markets, that it can control adequately its budget and its balance of payments position, and that its economy will continue the sound expansion of the past six months.

THE BUSINESS WORLD

The Two Omissions in our Plans

By CROESUS

MR. P. A. GOPALAKRISHNAN has certainly put to good use his term of office as Chairman of the Life Insurance Corporation of India. But he has been making a better use still of his experience and knowledge of the working of the Corporation in thinking aloud about what the Corporation has achieved and what it has yet to achieve, especially if it is to subserve the socialistic pattern goal of the Government of the day. "Although the three Five-Year Plans of the country have built-in devices, e.g. the increasing number and variety of public sector undertakings, the active encouragement provided to co-operatives and the fiscal and monetary policies and control on industry, finance and commerce—which are calculated to advance us towards this goal", he is of the opinion that there are certain serious omissions in them and that unless these are taken care of, the goal in view cannot be reached. What these omissions are and what needs to be done formed the theme of a dinner meeting of the Bombay Suburban (West) Rotary Club. These dinner meetings, I must add, are taken quite seriously by the local Rotarians.

I do not find myself in agreement with Mr. Gopalakrishnan about the effectiveness of the so-called built-in devices he referred to, but I have no hesitation in endorsing his views about the two omissions in our Plans. These are: (1) failure to use all the employable potential and (2) absence of a national plan of social insurance. On the first of these, what the L.I.C. Chairman has to say bears reproduction. "While the Plans provide for increased outlays from year to year, they do not seek to provide employment to all those in the country who are employable. In result, unemployment has been increasing in spite of heavy investments and progress in many directions. According to the Planning Commission, the backlog of unemployment at the end of the Second Plan period was 9 million and the number of under-employed was 15-18 million. During the period of the Third Plan, the additional employment created would only be of the order of 14 million, while the addition to the labour force is estimated at 17 million. At the end of this Plan, therefore, we will be still left with 12 million unemployed and a much larger number of under-employed persons. The loss to the nation caused by this widespread unemployment is a negative force not only corroding the Five-Year Plans but eating into the socialist objective."

In the considered opinion of Mr. Gopalakrishnan, the Plans require to be reorientated "to provide full employment to those who are under-employed as well as to those who are unemployed. It is only thus that the present colossal waste of human resources could be avoided and foundations laid for realising the objectives of social security". Both the diagnosis of the problem and the stress on the need to solve it are precisely stated here. But have we got a precise and effective solution? In any one of his further talks on this subject, perhaps, Mr. Gopalakrishnan may choose to dwell on this aspect at some length for the benefit

of the students of this most trying socio-economic problem.

The second serious omission in our Plans, according to the L.I.C. Chairman, is the absence of a national plan of social insurance. But "this is understandable", he went on to say, "because when the Plans leave so many million unemployed and under-employed persons, it is impracticable to think of any comprehensive scheme of social insurance. Moreover, there is such a lot of poverty, even among those who are employed that the saving capacity is almost nil".

After posing the problems, Mr. Gopalakrishnan also offered suggestions to solve them. The Planning Commission should, he pointed out, appoint a committee to survey the nature and volume of unemployment and under-employment in different parts of the country and suggest schemes for providing employment. The latter task is bound to baffle anybody because of the sheer enormity of it. The L.I.C. Chief also wants another committee, to be appointed simultaneously, to make enquiries, collect necessary data, and draw up a national plan of social insurance. While saying this, Mr. Gopalakrishnan has taken care to note that the Planning Commission is not unaware of the need for social security and insurance and has even quoted the relevant passage from the Third Five-Year Plan. He believes, nevertheless, that what has been done so far does not "provide an effective answer to the formidable challenge of unemployment or general absence of social security". He is convinced that, in spite of all its valient efforts, the L.I.C. has been able to tackle only a fraction of the problem. Hence the need for a national plan of social insurance.

This national plan of social insurance, the Chairman adds, "will not only cover the entire working population, but also cater to the different needs of the different categories of workers". It need not necessarily be similar to those which are working in foreign countries, some of which (as in West Germany & Sweden) are even compulsory. Obviously, as he has himself said, "we have to suit our schemes to the conditions prevailing here and even the nature of the benefits under different schemes will have to be decided in accordance with the different needs of our working population".

Outlining the scheme, Mr. Gopalakrishnan said: "This population (working population) may be conveniently divided into four categories for the purpose of social insurance, workers in the organised industrial sector and in Government departments, farmers engaged in agriculture, workers organised into co-operative societies and all other workers either self-employed or working for others. An income of Rs. 500 per month may be fixed as the upper limit for social insurance."

"With regard to the first category of workers, I would like to refer to a scheme of issuing mass insurance policies. What I mean is that instead of issuing individual policies with different rates of premium de-

pending upon the age at entry and the duration of the policy, mass policies should be issued to industrial and commercial establishments, army personnel and workers in Government departments insuring them up to a standard amount. There will be no medical examination and no requirement of age proof. Not even the names of the policyholders need be known to the insurer. The mass policy will merely mention the number of workers in the establishment, the policy amount to be paid on the death or retirement of each worker and the premium to be paid by the establishment. The insurer will in short deal with each establishment as a single holder of a mass policy. If a claim arises, the establishment has only to certify that a worker has retired or died and the policy amount will then be paid to the establishment.

"Adoption of these mass policies will considerably simplify life insurance administration. The insurer will directly contact the head of each establishment and issue a mass policy. There will be no payment of first year's or renewal commission, no administrative work dealing with field officers and agents and no payment of medical fees. For millions of policies the number of premium notices and receipts to be issued will be only a few thousands. The renewal expense ratio for this mass business will be reduced to one or two per cent and premium rates can be reduced to astonishingly low levels. This will make the scheme highly attractive and industrial and other establishments will find it worth their while to take out this mass policy.

"With regard to the second category of workers, viz. farmers who cultivate their own holdings, a slightly different form of social insurance is called for. A farmer has his land, which is the best security, and when he becomes too old to work on his land one or more of his sons take up the work. There is, therefore, a continuity of occupation and economic security is provided by the land in the possession of the farmer. As the majority of farmers have the joint family system, a farmer who becomes too old to work is looked after by his joint family. An ordinary life insurance policy or a guaranteed pension in old age is not necessarily the answer to the farmer's problems. A farmer really needs financial assistance when his crops fail and he is unable to pay off his monetary obligations and provide seed etc., for his next crop. Similarly, he needs funds when he has to replace old and unserviceable cattle. Any social insurance scheme for farmers has, therefore, to provide for these two of their needs. It is estimated that heavy failure of crops occurs, on the average, every five years. This means that, in the course of twenty years, a farmer may need financial assistance four times in respect of failure of crops. His need for replacing unserviceable cattle may arise, on the average, twice in twenty years. If a farmer's insurance policy could be devised, which would enable

lump sum payments to be made to him for replacing his cattle or for providing against failure of crops, six times during the currency of the policy, such an insurance scheme should not only prove most attractive to our farmers but provision of assistance at the time that it is needed would help in maintaining and increasing our agricultural production.

"Coming now to the third category of workers, who are organised into co-operative societies, it might be possible to lump similar types of co-operative societies actuarially and evolve standard plans of social insurance for them on a mass basis. Co-operative societies of handloom weavers, fishermen, milkmen, etc., and societies engaged in tanning, toy-making or marketing of consumer goods can each be taken up separately and mass policy with appropriate benefits issued to each society.

"Workers in the unorganised sector, whether in the urban or rural area, present a more formidable problem. They will have to be dealt with on an individual basis as the L.I.C. is doing at present. It should be possible, however, to devise a simple form of social insurance card on which will be entered the details of the policy and the premiums paid. Payment of premium will have to be made through post offices so that every insured person has an office nearby at which he can pay his premium."

Although I admire the broad sweep of Mr. Gopalakrishnan's imagination in adumbrating so comprehensive a scheme of national social insurance such as this, I cannot help remarking that the scheme impinges on spheres that do not strictly fall within the ambit of activities of the L.I.C., as he has himself impliedly admitted in suggesting that the State governments might operate some of these schemes. Even otherwise, it is a matter for serious consideration whether the L.I.C. can be saddled with more responsibilities (of the nature indicated by Mr. Gopalakrishnan) which would make it too unwieldy an organisation to prove effective. While I am not opposed to a scheme of national social insurance being taken up early, I strongly feel that it should be entrusted to agencies other than the L.I.C., although the benefit of the L.I.C.'s experience and advice may be liberally extended to those agencies. As it is, many insured (life insurance policy-holders) have been feeling that they have yet to taste the promised fruits of nationalised life insurance in the form of lower premium rates and higher bonuses, probably because it has become difficult to keep an effective check on rising expenses in this growing organisation which fully answers the definition of Parkinson's law. If more activities are added to the L.I.C., there will be no knowing how much longer policy-holders would have to wait to say that the nationalised life insurance has in fact benefitted them.

The Import Policy

THE import policy for the next half year, October 1961-March 1962, announced on September 30, 1961 revealed a more restrictive attitude adopted by the makers of the policy than that prevailed in the current licensing period that ended on the same day. The only notable relaxation announced was in respect of the import of capital goods required by export-oriented industries.

In formulating the policy, the official announcement stated, the views expressed at the meeting of the last Import & Export Promotion Advisory Council held

on September 11 and 12, 1961 were taken into account. It was stated that this policy had also been guided by the fact that the country had now embarked on its Third Five-Year Plan and an attempt was necessary to regulate the policy and procedures of import control in a manner that it could serve as an instrument of industrial development, a conservator of foreign exchange and a vehicle of export promotion. It cannot be denied that need to conserve foreign exchange resources persists, but the import policy, it may be pointed out, has not been very helpful in the industrial development. **She thought
she was
a thrifty housewife**

Like every good housewife, she worked on a budget making her husband's pay go a long way. But she grew careless one day, and did not bother to see that the cotton cloth she bought was stamped with the label 'Sanforized'.

Now look at her lovely new choli—shrunk after the first wash!

*Don't take anybody's word for it.
Make certain you get the full measure of
value of the material you buy—*

Look for

•SANFORIZED•
MADE TO ME

on the label

and your clothes will never shrink out of fit!

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

MAR. SAN.277

measure of indication of the helpfulness, the number exceeds the record during the last five years. While for the period October 1960-March 1961 the number of pending applications was 1,161, it is now 12,105. This, in a way, is a grim reminder that more than the policy, the execution is of greater significance. The new policy, however, lays down the continuation of the scheme of 'Repeat Licensing' introduced previously. Moreover, the licensing of certain items like brass, bronze and similar alloys, brass rods, strips and tubes, essential basic drugs and special apparatus, instruments, equipments required by the pharmaceutical industry, have been decentralised.

One indication of the Government's desire to sustain industrial activity was indicated by the decision to liberalize import of capital goods though only for export-oriented industries. In a way, it is a recognition of the Government's anxiety to maximise export earnings. An attempt has been made to differentiate between 'maintenance' and 'developmental' imports, and to ensure adequate utilization of the country's industrial potential within the limitation of the available foreign exchange.

The new policy completely bans the import of three items and imposes sizeable cuts in the quotas in respect of nearly 117 items over a wide range of products. The three banned items are cycle parts and accessories, butyl acetate and butyl alcohol. The new curbs are not intended to save more than Rs. 1 crores on import bill. It is stated that the cuts applied on the import of finished products would be off-set to a considerable extent by the import of essential raw materials and capital goods.

It was indicated that in view of the progress made by the indigenous industry and stock position, quotas have been reduced for items like Bright M.S. and free cutting quality (high sulphur and/or landloy) bars, rounds etc., iron and steel valves, strainers etc., Mechanical tubing (seamless), Machine screws, set screws etc., Bifurcated rivets, iron or steel wire ropes, Boot and shoe grindery, steel balls of sizes above 9/16" diameter, Machine worked saws, Tube expanders, hand saws, etc., Graphite crucibles, V. Belts, Rubber covered conveyor belting and other beltings, Fractional horse power motors, Compressors Air or gas etc., Electric insulations, Flexible metallic tubes, High tension insulators, Electric carbons, Condensers, Heating elements, Rectifiers and battery chargers, Chemicals like Hydro-

sulphite of Soda, Cation active finishing agents, Carboxy Methyl Cellulose and its salts Argon gas, Sodium Bicarbonate, Potassium permanganate etc., Car clothing and car accessories etc., Farinaceous and patent foods, cutch, gableir, gums, resins, all sorts, certain items of drugs and medicines such as Tetracycline, Oxytetracycline, Acid Calicylic excluding preparations thereof, Caffeine and its salts, Sera vaccines etc., Sheet and Plate glass, Prefocussed types of bulbs, Metal lamps and parts, Radio parts such as Electronic valves, condensers, loud-speakers etc., Motor vehicle parts such as electric horns, shock absorbers, piston rings etc., slide rules, Theodolites etc., Phenol formaldehyde resinous sheets tubes etc., Synthetic resins, all sorts, and vulcanised fibre in sheets, rods and tubes. Quotas for raw films, photographic sensitised materials and carbon black have been slightly reduced.

A few items have been added to the list of licensables to actual users. These are wire cloth, sieve cloth, shuttlecock cork bottoms for sports goods industries and hosiery needles. For a number of items, the basic period has been extended. These are: Ball roller and taper bearings, pipes or tubes flexible, circular saws, dental surgical instruments, apparatus, appliances etc., Leader films, parts of earth-moving machinery, laboratory-ware made of Silica, parts of power-driven agricultural machinery, machinery required for other industries and undertakings etc. The validity period in respect of a few items such as Milling cutters, Gear cutters etc., sealed beam units all types, Taper roller bearings and their components, miscellaneous hardware, cinema machinery etc. has been extended.

Explaining the new policy, the official spokesmen indicated that the differentiation between 'maintenance' and 'developmental' imports was essentially to ensure adequate utilization of the country's industrial potential within the limits of available foreign exchange. It was suggested that paucity of imported raw materials had not slowed the rate of increase in industrial production. This denial in a way indicates the inability of those in power to appreciate the evidence provided by various industries that unutilized installed capacity exists even now and this capacity in a number of cases can be brought under profitable utilization. It is one thing to express inability to face the problem, but it is quite another to deny its existence.

Business Notes

Rayon

PROBLEM OF WORKING

IT IS understood that one of the items tabled for discussion by the Indian Labour Conference in Bangalore is the question of shorter working hours in the Rayon Industry. It is a moot point whether the present is at all the time to think in terms of shorter working hours for any industry, let alone the Rayon Industry, for even if every industry in the country works overtime, it will not be possible for us to produce enough to export to other countries and earn sufficient foreign exchange to cover the yawning gap between our swelling import bill and static export earnings. Accordingly, the plea for shorter working hours in the Rayon Industry by certain quarters with intent to force the issue willy-nilly is, to say the least, as unfortunate as it is misguided. It is indeed both unfortunate and misguided to attempt to give a bad name to the Rayon Industry, especially when it is hardly justified, with a view to hanging the industry for it. No other explanation can be found for the reported active lobbying of certain interests who have been maintaining that the Rayon

Industry, especially the Viscose Rayon Industry, is a hazardous industry and, therefore, there should be shorter working hours in that industry than in other industries. This is a serious allegation to make even to gain a scoring point in discussions across the table, and it can certainly not be made so light-heartedly as it is believed to have been made. Nor is shortening working hours the only known or the most effective way of dealing with a hazardous industry.

When the spokesmen of the Viscose Rayon Industry were contacted to throw light on this allegation, they were naturally taken aback. They categorically repudiate the view that the Viscose Rayon Industry is more hazardous than any other industry. It is not known on what basis those who hold this view have proceeded, they say, but, as the leaders of the Viscose Rayon Industry point out, detailed studies should be made before pronouncing so damaging a view in respect of any industry in this cavalier fashion.

Now, what is the easiest or, rather, a rough and ready way to determine whether working in any industry is more hazardous or less hazardous than working in another industry? A comparative record of

absenteeism due to sickness or accident in a number of industries is admittedly the easiest and, at the same time, most dependable. From one such chart made available to the writer, showing absenteeism in various industries, including the Viscose Rayon Industry, (1) due to sickness and accident, (2) due to other causes, and (3) total absenteeism due to all causes, it was clear that absenteeism in the Viscose Rayon Industry was not, on an average, higher than that in other textile industries or the Iron and Steel Industry. The percentage of absenteeism due to sickness or accident in these industries in May, 1961 varied from 3 (the lowest) to 6.5 in the cotton mill industry and from 3.3 (the lowest) to 6.5 in the Iron and Steel Industry, while, in the case of only one unit of the Viscose Rayon Industry, for which figures were available, the incidence was no more than 4.2. Absenteeism due to all causes was the second lowest at 12.9 per cent in the case of this unit, as against 16.1 per cent in the case of the Iron and Steel Industry in Bihar. If these figures convey anything at all, it is that the Viscose Rayon Industry is no more hazardous than any other industry.

If the Rayon Industry were hazardous, surely the authorities as well as the public in other countries would have taken adequate precautionary measures, including, perhaps, shorter working hours. But, from information available from authentic sources, hours of work in the Rayon Industry in other countries (the U.K., the USA and Japan) do not appear to be any the shorter than in other industries in those countries. This apart, by and large, the managements of the rayon factories in India are all known to be progressive and broad-minded and may be expected to take prompt and suitable anti-hazard action, whenever needed, if the conditions of work warrant it. Undoubtedly, the small one gets in a rayon factory is not at all pleasing, but this is neither so unbearable nor so injurious to one's health as has been made out in certain quarters. Protective measures, such as supply of free milk and vitamin tablets to workers who have to spend some hours at a stretch are adopted by these enlightened employers. So what is misunderstood as a health hazard is really a psychological discomfort occasioned by the strong and none-too-pleasant odours one experiences at times in rayon factories. But this happens in the case of quite a few other industries, such as, for example, the fertiliser industry. It would be worthwhile knowing if those who advocate shorter working hours in the Rayon Industry would make a similar plea in the case of our Fertilizer Industry also. Let the official spokesmen who may be only too ready to concede to any such vociferous demand bear in mind that the largest units of the Fertilizer Industry are in the public sector and producing a commodity vital to the successful implementation of the high agricultural targets in the Third Plan.

"EXPORT TO EXIST" SAYS SASMA CHIEF

THE TARGETS set for the rayon industry in the Third Plan period are more than double the existing capacity and to achieve it the actual capacity of 100.3 million lbs. of rayon filament and staple fibre has to be stepped up to nearly 215 million lbs. (140 million lbs of rayon filament and 75 million lbs. of staple fibre). This expansion, it is estimated, would provide for an increase in the per capita consumption of rayon fabrics from 1.3 yards in 1960-61 to 1.8 yards by the end of the Third Plan. Even after this, the Indian consumption would amount to only 1/10 of the present world per capita consumption of 18 yards. In view of this wide disparity, as also the increasing demand for apparel in this country, Mr. D. N. Shroff, Chairman, the Silk and Art Silk Mills' Association Ltd. (SASMA), told the twenty-second annual general meeting in Bombay, that

the man-made textile fibre industry had to expand its production to meet not only the present demand but also the prospective requirements based on the rate of growth over the past few years. The rayon industry has admittedly made remarkable progress in recent years. The production of man-made fibre fabrics in 1960 aggregated 413.67 million yards which is 3 per cent more than the previous year's production, but more than as much as 70 per cent, compared with the output of 1955. On the other hand, the production of man-made fibres in 1960 reached the total of 93.70 million lbs, consisting of 45.08 million lbs of continuous rayon filament yarn and 48.02 million lbs of staple yarn. Incidentally, in spite of the increase in output, Mr. Shroff complained that the range of varieties had remained stagnant.

Referring to the question of exports, the SASMA, Chairman pointed out that the industry should be prepared to export at least a minimum of 20 per cent of its production. The exports of man-made fibre fabrics during 1960 had touched an all time high at 33.96 million yards which was higher by nearly 80 per cent than the previous year's exports and 31 per cent higher than those of 1958. However, this had been achieved when the Government was incurring a vast expenditure which, it had indicated, it will not be prepared to bear in future. Instead, the industry has been urged to make sacrifices. In view of this the industry has to pass through difficult time, cautioned Mr. Shroff. All the same, he insisted that the industry needed "unflinching zeal to export for the sake of the existence of the industry, for the sake of the economy of the industry, and for the sake of the country."

FICCI Memorandum

TRADE WITH RUPEE PAYMENT COUNTRIES

THE FEDERATION of Indian Chambers of Commerce and Industry's memorandum submitted to the Import and Export Policy Committee is comprehensive, logical and to the point. Amongst the many points made, it has drawn attention that trade with rupee payment countries is beneficial only in the short run. Rupee payment agreements have been concluded not only with East European countries, but also with countries like United Arab Republic, Burma, Tunisia, etc. These agreements were entered into to ease the pressure on our scarce foreign exchange resources, and to bring about an automatic balancing of imports and exports between India and the countries concerned. To what extend these bilateral agreements have been beneficial, the answer to it is provided in the FICCI memorandum. Although such agreements may seem to effect immediately a saving in foreign exchange as no payments are required to be made out of our foreign exchange resources, the position in the long run is not so simple, because the balance amount is brought forward from year to year either to the credit of one country or the other. Thus, the funds accumulated in India by the rupee payment countries must eventually be utilized, and these arrangements, therefore, represent only a postponement of India's liability. In other words, though import from the rupee payment countries will no doubt obviate an immediate drain on India's foreign exchange resources, the payment in rupees will mean payment of Indian goods of equivalent value. While the imports from these countries serve to avoid expenditure of foreign exchange, exports to these countries will mean no addition to our foreign exchange earnings.

It has also been brought to the notice of the Committee in the FICCI memorandum that the conventional goods like tea, coffee, jute and textiles, exported to these countries are re-exported at a lower price. These

malpractices on the part of some of these countries are of a high order. The Federation has, therefore, rightly urged that rupee payment agreements must clearly provide that the additional goods exported from India should be used only for internal consumption and not for re-export or resale to a third party. In case India is to benefit by the rupee-payment agreements the procedure outlined by the FICCI needs immediate implementation.

Other points made by the Federation relate to import policy and the licensing procedure. The FICCI memorandum urges that import policy must provide for the expansion and diversification of capacity not only of the heavy engineering and machine building industry but also in the increased production of major basic raw materials. In regard to the licensing procedure, the FICCI feels that as far as capital goods are concerned the entrepreneur should not be required to argue the economics of the project 'de novo' once he has obtained an industrial licence. FICCI has also criticized the policy of ad hoc licensing. On diversification of exports, the Federation is of the view that the West European countries should be requested to allow India to export more traditional goods to those developing nations which are receiving economic aid from them. Such exports could help in setting off repayment of loans by India. All these points are of far-reaching significance and deserve to be looked into carefully.

Woollen Industry

PROBLEMS OF THE INDUSTRY

DURING THE past fifteen years, the woollen industry has achieved notable progress. The number of woollen spindles rose from 50,000 in 1946 to 60,000 in 1961 and that of worsted spindles from a negligible number of 27,500 to as much as 1,29,681. Over the same period, powerlooms also increased from nearly 2,300 to about 3,000. This bright performance, however, has been overshadowed by the unfortunate fact that the industry was not able fully to utilise its installed capacity. Highlighting this fact, Mr. P. L. Pittie, Chairman, All India Woollen Mills' Association Ltd. (AIWMA), told the last annual general meeting of the body in Bombay a few days ago, that the under-utilization of the installed capacity to an extent of more than fifty per cent was to be attributed to the inadequacy of raw material. While Indian raw wool was unsuited to the mills, the quantity of imports permitted by the authorities had been sufficient to meet only half the requirements of the industry, he said. In contrast, Mr. Pittie went on to note, the demand for woollen and worsted yarns had increased, what with the increase in income, rising standards of living, and increasing population. With the increase in demand, the prices also naturally soared high.

Referring to the quantity of wool permitted to be imported this year, Mr. Pittie observed that it was more or less the same as that permitted a year ago. He unreservedly disagreed with the belief in certain Government circles that the industry could make use of Indian raw wool to the extent of 20 per cent. For the experiments conducted by the industry in this respect have revealed that the cost of wool manufactured out of Indian raw wool is much higher than that of wool tops made out of imported wool, while the mixing of both types of wool has only resulted in diminishing the superior quality of the imported wool. In pressing the case for larger imports of wool, Mr. Pittie contended that, inasmuch as the foreign exchange earned by exporting Indian wool was higher than that spent on importing foreign wool, there was scope for increasing the imports of wool which, in turn, would help increase

the export of woollen goods. In view of the repeated demand of the Indian Woollen Industry for higher import of wool from abroad, the entire question requires, as Mr. Pittie pointed out, to be very carefully examined, in consultation with the various interests.

Referring to the problem of Indian woollen goods, the AIWMA Chief pointed out that the woollen industry had suffered considerably due to its cost of production disadvantage and that if this were further aggravated by the low quality of woollen products, there might soon be no export outlet. It is the very old and obsolete nature of the machinery that is really to blame for this, as the leaders of the industry have complained time and again. While the question of rehabilitation and modernisation of the industry has been recognised by the Government, which may, therefore, be expected to take suitable action, what the industry needs immediately, according to Mr. Pittie, is sufficient export incentive in order to cover the losses sustained by it in exporting at competitive prices. In other words, like quite a few other Indian industries, to be able to export, the Indian woollen industry also needs to be subsidised. But, even so, if the subsidy involved is not much and the gain in the form of foreign exchange earnings by export of woollen goods is considerable, it would perhaps be worthwhile.

Jay Engineering

FROM STRENGTH TO STRENGTH

IT IS evident from the speech of L. Charat Ram, Chairman of Jay Engineering Works Ltd., made at its 24th annual general meeting, that the company is growing from strength to strength. Against Rs. 52 lakhs in the previous year, company's profit after providing employees' share of profit amounted to Rs. 58.4 lakhs in the year 1960-61. It will be interesting to observe that while All-India index number of industrial production for all manufacturing industries with 1956 as base went up to 126 in 1960, the corresponding figures of the company are 207 for sewing machines and 440 for fans. This no doubt is a tremendous progress. By reducing the price of ceiling and table fans the company has been able to cater to a greater number of consumers. On the export front the company could export fans worth more than Rs. 1 crore. It is in fact a matter of gratification that the company is now in the fore-front in the export of engineering items like sewing machines and fans and has been able to get a foothold even in industrially advanced countries like U.K., U.S.A., West Germany, France, Australia etc. This speaks of the high standard of goods manufactured by the company.

With a view to develop exports in the markets abroad, the company now proposes to start assembly and progressive manufacture of the products in those markets which are seeking to establish industries of their own. A licence for putting up a unit in Ceylon has already been obtained. It is proposed to have similar arrangements in other countries like Burma, Pakistan, Thailand etc. It is also being proposed to help the industrial concerns in other countries to set up assemblies with a phased programme of progressive manufacture by giving them technical know-how, equipment, personnel and the supply of component parts. Arrangement of this type has already been made with South Vietnam, and negotiations are now afoot with Iraq, Egypt and Yugoslavia.

So that full benefit of export incentives may be obtained, the Chairman urged that a high power committee should be appointed to look into this matter of export incentives. Perhaps it may be able to devise

ways of weeding out causes which defeat or delay the inducements available to exporters. Since the mechanics of obtaining the reliefs is far from simple and speedy, it is imperative that a high powered committee asked for by the Chairman be appointed soon.

Prago Tools

SATISFACTORY PROGRESS

IT IS a matter of gratification that the Prago Tools Corporation Ltd. has now reached a stage when it can well claim to be in a sound financial position. Although the final carry-over of profit on March 31, 1961 is only Rs. 23,631 it is a great consoling factor that the Prago Tools Corporation has succeeded in writing off past losses, value of intangible assets and unsaleable finished goods and development expenses etc. Between the period July 1, 1958 to March 31, 1961, the company earned a gross profit of Rs. 17.36 lakhs after providing for full depreciation. Most of this profit was utilised for meeting past losses.

Progress in fact is discernible all-round and the Corporation has now substantial plans for its expansion. The Corporation has signed technical collaboration agreement with three firms for the manufacture of drill chucks, lathe chucks and tool and cutter grinders respectively. Negotiations are also underway with a fourth British firm for the manufacture of milling machine under licence. In fact a place of importance has been assigned to the Prago Tools Corporation Ltd. by the Government of India in the machine tool industry. Three hundred acres of land on the outskirts of Hyderabad near Maula Ali Railway Station are being acquired. When the expansion schemes are completed, it is expected that machine tools and accessories worth Rs. 2 crores annually would be produced.

A significant development that deserves notice is the signing of an agreement with Cekop of Poland for the preparation and supply of a Project Report for a unit manufacturing machine tools of various types. This project report is expected to reach in a month or two. Already Rs. 1 crore have been earmarked by the Government of India for the use of the Corporation out of the Polish credit. A second agreement with Cekop for the supply of machinery under this credit arrangement is under negotiations. So far as future of the Corporation is concerned, it is quite bright if it maintains the quality of its goods.

Aluminium

ALIND'S EXPANSION PROGRAMME

MR. S. NARAYANASWAMY, Chairman of the Aluminium Industries Ltd. outlined the proposed expansion programme of the company at the 15th annual general meeting held recently. The high tensile steel core wire factory was in the final stages of erection at Kundara, and would be commissioned before the end of the calendar year. This plant, it was hoped, would be completed three months ahead of schedule which is a considerable achievement. The factory received sufficient assistance from their Japanese associates Messrs. Kokoku and Ataka. The Chairman added that with the production of core wire in the factory the unit would, to a large extent, be self-sufficient in bare conductor manufacture. The company had also received industrial licence for the manufacture of underground cable — trade marked 'Solidal' — but was awaiting

import licence to procure the necessary equipment. Although the Government had been paying sufficient attention towards granting of licences to the importers of raw materials for most of the industries, the instance of this company provided ample evidence that in some cases the time lost in the imports of raw materials caused delays in the manufacture of final products. In this case such an important item as underground cables had to be imported at heavy costs.

The Chairman was of the opinion that considerable expansion of the cable industry had materialised during the last two years. In the light of this expansion, apart from other aluminium using industries, the supply position of aluminium metal had become increasingly difficult. The indigenous production of metal had to be supplemented copiously by imports. This was in spite of the fact that metal producing units had been doubling their installed capacity. Till the additional capacity in the newly installed units did not materialise, it would be advisable on the part of the Government to allow the import of metal for the consumers so that their output did not suffer.

Tobacco

FROM MARKETING TO MANUFACTURE

AT THE 50th annual general meeting of the Imperial Tobacco Co. of India Limited, Mr. F. A. Collett, the Chairman made a reference proudly that this Company which started 50 years ago only as a selling organisation and for a limited scope of business with a capital of only Rs. 25 lakhs had expanded its activities and now owns 5 cigarette making factories and two printing factories and its capital exceeds Rs. 15 crores. This expansion in turnover as well as the fields of activities has been very gradual. During the year to March 31, 1961 also the company progressed as compared to the year before. While reviewing year's accounts, Mr. Collett told the shareholders that both the volume and the value of sales had recorded a marked increase and the sales value has increased from nearly Rs. 37 crores last year to a figure of over 42 crores in the year under review. The Chairman added that the net profits increased from Rs. 142 lakhs to Rs. 188 lakhs and the Board recommended the raising of dividend from 8 per cent to 9 per cent. This improvement, he attributed to 'no change' in excise duties on the company's products in the budget presented on February 1960.

The Company's record shows an efficient working of the marketing machinery which is being run every year on an improved pattern. The company has made marketing its speciality in the light that their consumers are dispersed over a very large area. "Marketing", the Chairman pointed out, "may roughly be divided into two functions, the distribution function and the creative side; both of these functions are highly technical". This process of distribution of a consumer product of a perishable nature such as cigarettes has to be so organised as to make supplies available to people who want to buy them at all times and in the freshest possible condition. At one hand there are the distributors, merchants of high standing who have association with the company of many years and on the other are a chain of tens of thousands of retailers who are the final contact with the consumers. The company's distribution system is geared to service this existing channel, and their efficient staff has been contributing to a large extent. Thus, the company's system of marketing in this respect provides an instance from which many other organisations can learn.

FROM THE CAPITAL'S CORRIDORS

OIL PRICES ENQUIRY COMMITTEE

THE Damle Committee on Oil Prices, whose recommendations were accepted by the Union Government practically in toto last week and enforced on October 1, 1961, has emphasised that the oil companies should recognise the advent of a new set of circumstances in a long-term commitment of the nature of their Refinery Agreements and not insist on import of crude oil from sources of their choice only so long as the profitability of their refineries is not affected. The oil companies, the Committee says, should press on their suppliers for equivalent discounts as available to this country on a long-term continuous basis on imports of the same quality of crude oil from sources other than traditional.

The Committee finds fault with the oil refineries for not disclosing the names of their overseas original suppliers. "We fail to see", it says, "why the companies could not deal with the original producers/suppliers of crude oil or furnish information regarding the names of such original producers/suppliers. The oil companies with their world-wide connections should normally be capable of dealing directly with the consortium operating in Iran, in which their principals have interest in respect of supplies through that source and also with the original producers/suppliers at other places."

In regard to discount on crude oil supplies, the Committee has particularly recommended that the Caltex Refinery should ask from its suppliers 8 per cent discount, which the Burmah Shell and the Standard Vacuum Oil Companies have been obtaining from their suppliers, on 'Minas' crude oil obtained from Indonesia. Alternatively, it should consider the discontinuance of the use of this oil in favour of a discounted crude oil from the Persian Gulf, unless the Government is satisfied that the continued use of 'Minas' crude is advantageous to the overall economy and conducive to saving in foreign exchange in regard to finished products. The Standard Vacuum Oil Company also, the Committee urges, should endeavour to reduce (and eventually eliminate altogether) the payment of charges to its London and New York offices.

DISCOUNTS WRUNG LATE

The Committee's report implies that the discounts wrung by the oil companies operating in India from their crude oil suppliers came too late. "It should normally have been possible for the oil companies to successfully bargain for discounts on posted prices for their requirements of crude oil, long before discounts were conceded at the current rates." The companies, the Committee opines, should not only press on their suppliers for the continuance of discounts in future but also for increase in the quantum thereof, consistent with the market trends prevailing from time to time.

In regard to prices of petroleum products, the Committee says, "the discounts on posted prices of crude oil should, in more or less equivalent measure, be reflected in the pricing of end-products." The recent discounts on crude oil, the Committee adds, are not reflected in the prices of end-products and the benefit thereof is absorbed by the refineries or consignors. To this extent their margin has been enhanced above the expectation envisaged at the time of the conclusion of the Refinery Agreements. The availability of discounts on crude oil should be taken into account for allocation of foreign exchange, the Committee recommends.

DISCOUNTS ON END-PRODUCTS

As discounts are admittedly available on crude oil, the Committee believes that discounts should also be available on refined products. Two oil companies, in fact,

have admitted that they obtained their imports of petroleum products at discounted prices. As the products imported by these two companies are not identical and the rates of discount vary for the different products, the Committee has inferred that availability of discounts depends upon the bargaining capacity of the individual marketing company. The major oil companies, with their world-wide connections and long experience in oil business, the Committee opines, should be able to exert sufficient pressure on the suppliers of bulk refined products in obtaining discounts on their supplies.

The stipulation in the Refinery Agreements for determination of prices of products on 'import parity', the Committee says, is not intended to preclude the availability of supplies in the Indian market of products from sources other than those of the major oil companies. It would be quite appropriate, therefore, it suggests, to base the landed cost of products on imports at cheaper rates, if available from sources other than those which have been normally utilised by the major oil companies, provided continuous supply of equivalent quality is guaranteed.

The inability of the oil companies to obtain discounts for the import of products from their suppliers, the Committee thinks, is no proof of the position sought to be established that discounts are not available in the Middle East. The Committee draws attention in this respect to the fact that the major oil companies have been quoting for supplies, particularly H.S.D., rates lower than the landed cost of imports from Russia. Such under-cutting, it opines, would only be possible if substantial discounts were available to them on F.O.B. postings.

The Committee has not believed the statement of the oil companies that the suppliers of bulk refined products do not charge any fee or commission for the services rendered, apart from charging out-of-pocket expenses. This statement, it says, does not stand to reason particularly when the services rendered include even arrangements for financing.

GENESIS OF PRICING FORMULA

The Committee, after considerable deliberations and elaborate analysis, has produced a formula for the pricing of petroleum products which would result in a reduction to the tune of Rs. 15 crores annually in the prices of major petroleum products and bitumen based on an estimated demand for them in 1962. The break-up of this reduction is as follows: Rs. 5 crores due to drop in landed cost; Rs. 7 crores on account of discounts in the posted prices of bulk refined products and Rs. 3 crores in regard to distribution and profit margin.

In evolving the pricing formula, the Committee has grouped lubricants, greases and 'specialities' for the purpose of control of distribution costs and profits. Hot heavy stock, low sulphur fuel oil, liquidified petroleum gas, boiler fuel and chemicals have been excluded from the purview of the proposed formula.

In determining parity prices it has taken into consideration the following rates of discount in F.O.B. prices: Kerosene (superior and inferior) 10 per cent; Aviation turbine fuel 10 per cent; H.S.D. 10 per cent; Motor spirit 5 per cent; Light Diesel oil 9.3 per cent and Furnace oil 3 per cent. The F.O.B. cost of bulk refined products is to be determined at the lowest posted prices of any company regularly posted in Abadan, as reported by Platt's Oilgram Daily Reporting Service. In the prices evolved, F.O.B. quotations as applicable on May 24, 1961 (and reported in Platt's

Oilgrain Price Service No. 102 dated May 25, 1961) have been adopted, subject to certain discounts.

Ocean freight has been calculated at the AFRA rate ex-Abadan as applicable in the second quarter of 1961. Bombay has been taken on a single port discharge, Madras/Vishakhapatnam/Calcutta on a double port discharge at the Calcutta rate and Kandla/Okha/Cochin on a double port discharge at the Cochin rate.

Marine insurance, excluding War Risk Insurance, has been included. War Risk Insurance will be added separately in case of emergency. The Committee recommends that the Union Ministry of Finance (Department of Economic Affairs) should take up with the Indian Insurance Companies Association the question of undertaking marine insurance of petroleum products at the rates available to the oil companies from other sources. The risks covered should also be comparable to the risks covered under the agreement at present followed by the oil companies.

Ocean loss has been included in the pricing formula as a percent on c.i.f. cost on the basis of the past experience of the oil companies. The factors adopted for the conversion of F.O.B. prices have also been indicated. Rate of exchange has been adopted at U.S. Dollars 2.80 per Pound-Sterling (within a range of Dollar/Sterling of \$2.78 to \$2.82). The current rate of exchange of Pound-Sterling at Rs. 13.3565 has been adopted.

Basic duties and surcharges have been included in the prices as applicable for the imported counterpart, adjusted to normal temperature of the landing port on an all-India basis taken at 29.4°C or 85°F at the standard conversion factors. In the event of variations in the level of customs duty and surcharges resulting from discussions by the Oil Industry Metric Committee with the Ministry of Commerce and Industry, suitable adjustments have been recommended to be made.

Rates of wharfrage included in the prices are as applicable during January 1961. Other compulsory landing charges are based on the past experience of the oil companies.

FIXATION OF BITUMEN PRICES

In the absence of posted prices for bitumen, F.O.B. cost is determined on the basis of the suppliers' invoices. For this, Bombay port landed cost is based on bulk parity, while for other ports, it is determined on packed parity. Marine freight for bulk bitumen is included at the rates for premium rated vessels as applicable on the second quarter of 1961. Marine freight for packed supplies has been included at the rates indicated by the London Freight Brokers Association on January 12, 1961. Insurance and ocean loss have been provided on the same lines as for bulk refined products. Customs duty has been calculated at the rate of 27 per cent on a provisional tariff value of Rs. 231 per metric ton for straight grades and Rs. 280 per metric ton for cutbacks, both packed in drums. In case bitumen straight grade is supplied in bulk, the relevant customs duty at 27 per cent on a provision tariff value of Rs. 138 per metric ton will have to be substituted. In the case of bitumen ex-A.O.C., the custom duty at 27 per cent on the respective tariff value will be substituted. In the event of the tariff valuation being different, it has been suggested that suitable adjustment should be made in customs duty.

MOTOR SPIRIT AND H.S.D.

To rationalise the distribution system for motor spirit and H.S.D., free delivery zone has been created for H.S.D., as for motor spirit. The oil companies, it is suggested, should issue specific instructions, under advice to Government, that the dealers should not make

a further charge on account of delivery of H.S.D., within the free delivery zone.

The expenses against which specific recoveries are made at present have been included in the prices. Delivery ex-airfield pump will, therefore, no longer involve payment of extra charges. The oil companies, it is further suggested, should bring this fact prominently to notice at the airfields.

The charges for delivery beyond the companies' storage points of kerosene, vaporising oil, furnace oil, light diesel oil and bitumen have been excluded from the basic ceiling selling prices.

A differential between the selling prices at international airfields and other internal airfields has been maintained.

For 'lubricants and greases' and 'specialties', control is recommended to be imposed by fixing an overall ceiling limits for marketing charges and profit margin, on an average for all the products coming under these groups. The ceiling limit will be Rs. 123.02 per kilolitre for lubricants and greases and Rs. 31.28 per kilolitre for specialties.

The oil companies shall be permitted to recover the cost of materials, blending charges and the packaging and filling-in charges at actual rates. In case recovery towards marketing and distribution charges and profit margins per unit during a financial period exceeds the ceilings proposed, the oil companies should suitably revise the price structure of the various products within the respective group.

The prices for the A.O.C. products have been determined on parity with the prices ex-F.O.R. Calcutta, subject to differential being maintained for lower diesel index for H.S.D.

GROWTH IN DEMAND

There has been a progressive increase over the past years in the consumption of petroleum products and the demand will continue to increase considerably during the Third Plan period. The average increase in volume for each of the three years 1962-64 is estimated at about 25 per cent for the three major oil companies.

The overall unit incidence in 1959 showed a decrease specially in regard to bulk refined products as a group in respect of all the companies. This is largely attributable to increase in the volume of sales in 1959 over 1958.

Burmah Shell and Standard Vacuum handle about 80 per cent of the total sales of petroleum products and would, therefore, represent the cross-section of the industry. In each of the three years 1962-64, the estimate of sales will be about 22 per cent over 1959 for Burmah Shell and about 25 per cent over 1959 for Standard Vacuum.

In estimating the future marketing and distribution charges, suitable provision has been made for (i) increase in expenditure for the higher anticipated volume of sales, (ii) for effecting free deliveries of aviation spirit/gasoline and aviation turbine fuel from the companies' storage points to the airfield outlets. Aircraft and motor spirit gasoline and H.S.D. at the retail pump outlets within the free delivery zone in port and municipal towns and (iii) for unrecovered freight and bridging costs.

The weighted average of the marketing and distribution charges of Burmah Shell and Standard Vacuum has been adopted as the fair incidence for the industry.

The packed-bulk differential for 18.18 litre tins is assessed at Rs. 1.88 per container, based on the price of Rs. 1,407.4 per metric ton of tin-plate.

Introduction of uniform port charges in the price structure is not considered advisable. Introduction of a railway freight pooling system is also not considered advisable and the maintenance of the status quo is recommended. B.O.C. (L.T.) Ltd., which has been operating a freight pool system in its area, may, however, continue to do so.

The present classification of products into dangerous and non-dangerous categories in regard to railway freight should continue.

12 PER CENT RETURN

Based on the capital employed in 1959 of Burmah Shell and Standard Vacuum, the requirements of capital employed for both the companies for their future sales have been estimated. A return of 12 per cent on capital employed has been allowed.

The basic ceiling selling prices for bulk refined products as evolved should be applicable for delivery as under:

Aviation spirit/ aviation gasoline and aviation turbine fuel.	Ex-oil company's storage points and ex-airfields/ aircraft.
Motor spirit and H.S.D.	Ex-oil company's storage points and retail pump outlets within free delivery zone.
Kerosene, vaporising oil, light diesel oil, furnace oil and bitumen.	Ex-oil company's storage points.

Further charges will be payable, whenever applicable, on account of railway freight, local duties/taxes, specific delivery and supplies in returnable packages. Railway freight from companies' storage points to up-country points will apply at the bulk rate for bulk despatches and at the packed rate for supplies in packages.

The prices evolved, the Committee recommended, should come into effect from September 1, 1961, and remain in force till March 31, 1965, subject to fluctuations as suggested. The control on lubricants and greases and specialties should be valid for the same period. (The Government has deviated from this recommendation and has fixed the period of operation of the new prices to a "reasonable" term extending upto two years).

The employment of price mechanism for the correction of imbalance in the supply of end-products has not been favoured by the Committee. The solution thereof, it says, should be sought in technological adjustments in production pattern and in finding alternative uses for surplus products.

The Committee has not considered the rate payable by the oil companies to contractors for loading/unloading unreasonable as the contractors are appointed as a result of tenders or by negotiations. The Committee, however, recommends that if service co-operatives are capable of undertaking distribution of kerosene and other petroleum products, preference should be given to them.

OIL PROSPECTING IN SOUTH INDIA

Oil prospecting in the Cauvery Basin, in South India, is expected to start before the General Elections. Negotiations are currently being held between the Union Ministry of Oil and the ESSO Standard Oil Company in this regard. The U.S. company, it is learnt,

is now veering round the Government's proposal of 50:50 partnership in this venture. A definite decision on this exploration programme is likely to be arrived at in the next few days.

The Union Minister for Oil and Fuel, Mr. K. D. Malaviya, it is understood, has also ordered the examination of the proposal to set up a refinery in South India. If the marketing survey to be conducted as part of this examination warrants, the refinery would be set up whether oil is found in the Cauvery Basic or not. The Oil Ministry would welcome proposals for setting up this refinery from all quarters.

Negotiations in regard to the setting up of a lubricating oil plant by ESSO Standard Oil Company are expected to fructify in the near future. The company is said to be agreeable to have the Government of India as an equal partner in this venture.

The ESSO Standard's proposal to set up a naphtha cracker plant at its Bombay refinery is also understood to be under consideration of the Oil Ministry. The Government, it is learnt, has asked for equal partnership in this project also. The company at present is said to be opposed to it.

UTILISATION OF SWISS CREDIT

The Rs. 11 crores credit made available by the Swiss Government for India's Third Five-Year Plan is proposed to be utilised for financing the following imports:

1. **Equipment for Upper Sileru Project:** Two 95,000 H.P. water turbines; two 60,000 KW. alternators; hydraulic butter fly valves; generator transformers and some sub-station transformers; 132 KV switchgears, switch-boards, switchgear cables, circuit breakers, carrier equipment etc. All this equipment is needed for the utilization of the power potential of Machkund power station and of a weir to be built at Guntavada (Andhra Pradesh). The scheme envisages installing of two units of 60,000 KW. each, laying of 135 miles of double circuit and 80 miles of single circuit 132 KV transmission lines. The power developed will be transmitted to the coastal districts of Andhra Pradesh and fed into the existing grid to supply a variety of industrial loads such as ferro-manganese, ship-building, oil refining, fertilizer and cement manufacturing.

2. **Circuit Breakers and Switchgears for Power Transmission:** Fifty 220 KV blast circuit breakers. The rupturing capacity of the circuit breakers will vary from 7,500 MVA to 10,000 MVA. The exact number of each rupturing capacity would be estimated in course of time when tenders are invited.

3. **Machinery for Expansion and Modernisation of Textile Industry:** Part of the credit is envisaged to be utilised for import of blow-room machinery, combers and pirn winders, components for automatic looms and finished automatic looms required for replacement purposes in the modernisation programme of the textile industry. Import of components is necessitated by the fact that the National Machinery Manufacturers Limited is collaborating with Messrs. Ruti of Switzerland for the manufacture of automatic looms.

4. **Printing Machinery:** The items intended to be imported from Switzerland under this credit include stop cylinder machines, two revolution machines, lithographic machines, book-binding, stitching and sewing machines etc.

5. **Equipment for Sugar Factories:** Turbo-alternators for power generation, capacity 1,250 KW, 400/440 volts, A.C., 3-phase, 50 cycles, 0.8 power factor, Back Pressure type exhausting at 0.7 kg. to 1.0 kg./cm. 2. Turbines are to be multi-staged, complete with all accessories coupled to an enclosed high speed reduction

gear box with coupling and accessories. Alternators will be the enclosed type-exciter mounted on alternator shaft-coupled to high speed gear box outlet side. Steam ratings will be provided separately in individual cases. Turbo-alternator sets will be used in the development of the sugar industry. There are two concerns manufacturing this equipment in Switzerland. They are M/s. Brown Boveri and Messrs. Escherwyss.

6. Capital Goods and Equipment for Private Sector Industries: Some capital goods and equipment are envisaged to be imported for the following private sector industry: caustic soda, drugs and pharmaceuticals, dyestuffs, miscellaneous chemical industries like optical bleaching agents, industrial machinery, machine tools and other processing industries.

The spinning machinery to be imported under this credit will be brought by Voltas who will be distributing it to various units in the country. An order based on the expansion and modernisation of 8 spinning mills has already been placed. Among the other orders either placed or to be placed are included: (i) an order for one complete plant for the manufacture of sodium sulphate, (ii) an order for the import of equipment for dyestuff and optical bleaching agents, drugs and pharmaceuticals, (iii) an order for complete electrical cell plant and ancillary equipment (for Konoria Chemicals and Industries Ltd.), (iv) three turbo-alternator sets, and (v) an order for equipment required for the expansion of the ammonium chloride plant of Fertilizers and Chemicals Ltd.

SUGAR ORDINANCE

The Government of India has issued an Ordinance vesting it with powers to fix the quantity of sugar which a factory would be allowed to produce during the next crushing season. In case a factory produces sugar in excess of the ceiling prescribed by the Government, it will have to pay a special excise duty equal in amount to the one chargeable on the commodity under the Central Excise Act in force. The ordinance comes into force on November 1.

The issuance of the ordinance has been necessitated by the recasting by the Government of its sugar policy under which output by factories is to be cut by 10 per cent from the 1960-61 level. The new policy also envisages removal of all control on distribution, movement and price of sugar, except control on releases. The 50 per cent rebate on sugar output in excess of the production in the previous year has also been withdrawn.

With a view to lighten the burden of an unprecedented carry-over of 12 lakh tons of sugar from the current season, the Government has approached the International Sugar Agreement for increasing India's quota for exports to international markets from 1.5 lakh tons to about 5 lakh tons. Expectations are that this quota will be raised to about 2.5 lakh tons. An approach has also been made to the United States for getting the quota for sugar exports to that country raised to nearly 5 lakh tons. The present quota granted by the U.S. Government to India is 1.87 lakh long tons. Contracts for the supply of sugar to this extent have already been concluded with the U.S. importers. Shipments are expected to be completed by December. There is every likelihood of India getting a supplementary quota from the U.S.A.

AMALGAMATION OF SHIPPING CORPORATIONS

The two State-owned shipping corporations —The Eastern Shipping Corporation and the Western Shipping Corporation — have been amalgamated into one unit, named as the Shipping Corporation of India. The new Corporation has an authorised capital of Rs. 35 crores, of which Rs. 23 crores is paid-up. It has taken over from the amalgamating corporations 19 ships with a total tonnage of 1,38,593 GRT. Five fast cargo vessels, ordered by the Eastern and the Western Shipping Corporations and

now at advanced stages of construction at the Hindustan Shipyard, Visakhapatnam, will be acquired by it during 1962-63. Each of these vessels (when closed shelter) will be about 9,200 GRT. In addition to these, orders have also been placed with the Hindustan Shipyard for six fast cargo liners of Mitsubishi type. Each of these vessels would be about 9,200 GRT as closed shelters dockers and would be delivered to the Corporation within the Third Plan period. There are also plans to purchase at least one ocean-going super-tanker for transportation of crude oil. Additional tonnage of this type might be considered for acquisition later.

During 1960, the two corporations now amalgamated ran their cargo services on India-Australia, India-Japan, India-Black Sea, India-Poland and India-Persian Gulf routes and passenger-cum-cargo services from Bombay to East Africa, from Madras to Singapore and between the East Coast and the Andamans. Two more routes—West Coast India-West Pakistan/Far East-Japan and India-Pakistan/U.K.-Continent Service—were added to these early this year. The new Corporation will soon be entering the Tuticorin-Colombo Service for which plans have already been approved. It is intended to purchase one small ship for this run. The possibility of the Corporation entering the tramp-trade field is also being considered.

Since one of the two amalgamating corporations was a member of the U.K.-Continent Shipping Conference, the new Corporation has become a member of this Conference.

Dr. Nagendra Singh, Joint Secretary, Union Ministry of Transport, will be the Chairman of the Board of Directors of the Corporation. Mr. C.P. Srivastava is its Managing Director.

DUTY CONCESSION ON MATCHES

As a measure of further encouragement to the cottage match factories for using bamboo, the Government of India has decided to further reduce the rates of duty applicable to them by 25 nP. per gross of boxes of 50s. and 20 nP. per gross of boxes of 40s. The new concessional rates came into effect from October 1, 1961, and are applicable to only such factories the annual output of which does not exceed 50 million matches.

NEW MEMBER OF I.R.E.A.C.

Mr. Shriram C. Chokhani, representative of the Engineering Association of India, has been nominated as a member of the Indian Railway Equipment Advisory Committee, by the Bombay Regional Railway Equipment Advisory Committee.

CAPITAL ISSUES

Five Companies have been granted consent by the Controller of Capital Issues for the issue of capital totalling Rs. 43.5 lakhs. The consent granted to the Upper Doab Sugar Mills Limited, Shamli, is valid up to April 28, 1962, and in other cases it is valid for 12 months. The following are the details.

The Upper Doab Sugar Mills Ltd., Shamli (U.P.), having a paid-up capital of Rs. 63,76,200 has been accorded consent to issue a capital of Rs. 25 lakhs divided into equity shares of Rs. 100 each for cash at a premium of Rs. 25 per share to the shareholders.

Dehri-Rohtas Light Railway Company Ltd., Dalmianagar, Bihar, running a narrow-gauge railway line for movement of public traffic and having a paid-up capital of Rs. 30,02,800 has been accorded consent to issue 100,000 equity shares of Rs. 10 each as bonus shares to their existing shareholders on capitalization of the company's reserves to a like extent.

The Victoria Mills Ltd., Bombay, has a paid-up capital of Rs. 25,60,000 (Rs. 8 lakhs in preference shares and Rs. 17,60,000 in equity). It has been granted consent to issue bonus shares of the value of Rs. 4,40,000 to be made in the ratio of one bonus share for every four equity shares held. The company is engaged in the business of spinning, weaving, manufacturing and processing of cotton and piecegoods.

The Kalasa Tea and Produce Company Ltd., Mangalore, has been granted consent to the issue of capital of Rs. 3 lakhs divided into 1,50,000 equity shares of Rs. 2 each to be issued as bonus shares on capitalization of reserves to a like extent. The present paid-up capital is Rs. 6,00,000 in ordinary shares of Rs. 2 each.

Ghaziabad Engineering Company Private Ltd., engaged in the manufacture of coolers, diesel engines etc., and dealing in Bosch parts and Tractors, have a paid-up capital of Rs. 4,50,000. The company has been accorded consent to the capitalization and issue of bonus shares of the value of Rs. 1,12,500 to its existing shareholders in the ratio of one for four shares held.

BISRA STONE LIME

The Directors of the Bisra Stone Lime Co. Ltd., have decided to issue bonus shares in the proportion of three fully paid up equity shares of Rs. 10 each for every share held by capitalization to General Reserves to the extent of Rs. 30 lakhs. Necessary application has been made by the Directors to the Controller of Capital Issues and steps are being taken to implement the above proposal when the approval is obtained.

STANDARD PENCIL FACTORY

The Standard Pencil Factory Madras was licensed to make pencils and refills. Only important machines were fabricated from indigenous sources. The factory went into production in March 1960 and within a short time built up its capacity to over 75,000 numbers per day. The company manufactures a variety of lead pencils and colour pencils. The company has a programme for export and have, therefore decided to raise their production to about 1.25 lakh pencils a day. The company has also been licensed to manufacture ball-point pens and refills, for which they have acquired the technical co-laboration of Messrs. Axel C. Jensen Inc. of U.S.A.

TRACTORS AND FARM EQUIPMENT

The Madras Chief Minister recently performed the inauguration of production plant of Tractors & Farm

Equipment Ltd., at Madras. This is a venture of the well-known industrial group of Simpsons in collaboration with the Massey Ferguson group of Farm Equipment Manufacturers and costs nearly Rs. 2 crores. It has an annual licensed capacity of 7000 tractors on a two-shift basis employing 3000 workers. Trailers and Tiller Seeding attachments and a number of important accessories are already being manufactured at the Madras factory. One feature of this Company is that from the very initial stages, the quantum of indigenous component is nearly 50 per cent which will reach nearly 85 per cent by 1964.

HINDUSTAN ANTIBIOTICS

The Directors of Hindustan Antibiotics Ltd., indicate in their annual report that 42.76 million mega units of finished penicillin was tested and passed during 1960-61 as against a target of 35 million mega units for the year. During the previous year the output was nearly 33.15 mega units. Out of the total output of this year, a production of 2.52 m.m.u. was obtained from the imported first crystals. Even then the target of the Plan was exceeded by nearly 14 per cent. The gross earnings were Rs. 342.57 lakhs as against a target of Rs. 315 lakhs. This was in spite of the fact that there was a substantial reduction of prices. The company derived a surplus of Rs. 142.24 lakhs after providing for depreciation development rebate etc. A provision of Rs. 65 lakhs has been made for taxation. Out of the remaining sum, Rs. 75.75 lakhs were transferred to the General Reserve.

ANNOUNCEMENT

The following Annual Numbers of **THE EASTERN ECONOMIST** are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Re. 50/-.

Company Meetings

INDIA STEAMSHIP COMPANY LTD.,

Address of the Chairman. Sir A. Ramaswami Mudaliar,
K.C.S.I., D.C.L. (oxon)

Delivered at the Annual General Meeting of the Shareholders of the Company on the 26th September, 1961

GENTLEMEN,

The Audited Accounts and Directors' Report for the period ending March, 1961, has been in your possession for sometime and with your permission I shall take them as read.

The Directors' Report shows that the freight earned during the year was Rs. 8,63,00,835 as against Rs. 8,38,59,427 in the previous year. The total number of Liner voyages during the year was 49 compared to 47.5 in the previous year. Though the freight earned was higher than last year, owing to a variety of reasons, I regret to state that the result is a substantial loss to the Company.

NAVAL DISASTERS:

At the beginning of the year, the Company suffered a serious loss by the sinking of the s.s. 'Indian Navigator' after an explosion on board. All the crew except one seaman were rescued. A more serious and sadder calamity was the loss of the lives of some Officers and Crew of a sister ship s.s. 'Indian Success' in their effort to salvage the abandoned vessel, the s.s. 'Indian Navigator'. As both the disasters are subject of a formal enquiry, it would not be proper for me to comment on them, except to the extent that I share, and I am sure you also do, the tribute that has been paid in the Directors' Report to the gallant Officers and Crew.

OVERSEAS TRADE AND FREIGHT RATES:

During the last two years, I referred to the decline in International trade and to its effect on international shipping. During the year under review the position was not any better than it was last year. In an effort to chase cargo and to keep up with the severe competition both of other shipping lines in the liner trade, and of the tramps, your ships have had to call at an even greater number of ports to secure the cargo, resulting in heavy expenses.

The rates of freight were generally at an uneconomic level—most of the rates remaining the same as they were in 1957. Meanwhile, in the intervening period, costs in every direction have gone up. Wages of staff, both floating and on the land, have had to be increased. Concessions had to be made by way of longer leave periods for the floating staff, necessitating additional personnel for the purpose. Stevedoring charges in most ports had to be revised in accordance with the rules and regulations in these ports. Any freight increase required very careful consideration and could not be readily equated to the increased cost of running the service. Some of the countries in the trade were anxious to promote export of commodities and manufactured goods in a desire to earn foreign exchange and to preserve the balance of payment position of their Governments. Conflicting considerations such as these have to a large extent prevented the easier course which would otherwise have been adopted, of increasing freight rates to meet extra and heavy expenditure. The position is now being studied both objectively and scientifically and an effort is being made to see whether freights may be increased on commodities which can bear the increase and still maintain their competitive positions in world markets.

I referred to the keen competition that prevailed last year and the unhealthy and unfair means by which

a few of the companies or their agents tried to obtain the cargo by undercutting freight rates and giving larger rates of rebate to the Shippers. These and other practices such as the manner in which some of the forwarding agents, particularly on the Continent of Europe, tried to corner the cargoes, were referred to by me in my last address and these practices continued during the greater part of the year under review.

A PARTIAL SOLUTION:

In my speech last year I referred to a possible solution that was being attempted at by the two Indian Lines in the Conference, along with other Conference Lines, who faced the same problems and were equally anxious to find a solution to put an end to unhealthy competition and to the malpractices. I stated that the solution suggested was that the allocation of freight earnings of the Conference, in certain proportions over a term of years, providing at the same time, for the growth and development of the fleets of under-developed countries, through a defined and reasonable escalation of the rate of allocation during the period. Negotiations for this purpose were started as early as 1959 at a Conference in Delhi, between the representatives of British and foreign lines and the representatives of Indian Lines, and they were continued in London and Hamburg in the early part of 1960. The result, however, was not promising at that stage. Meanwhile the evils enumerated above were on the increase. At last, at a meeting of the Representatives of these Lines and the two Indian Lines in Delhi, in November, 1960, an agreement was arrived at, defining the percentages of earnings which the lines under different flags would be allocated at the end of each year. It is a matter of some satisfaction that this arrangement has been arrived at and is considered beneficial by all the Lines concerned, particularly as it removes unhealthy competition, various kinds of malpractices and ensures the better working of the Conference system, as much in the interests of Shippers as of the shipping lines. The Pool system in the India-U.K./North Continent Trade, has come into effect from 1st January, 1961, and in two other Conferences of the Continent, viz. the French Conference, and the Western Italy Conference, came into effect from 1st April, 1961. It has to be emphasised that by this arrangement Shippers will not be inconvenienced to the slightest extent and in fact that the movement of cargo to and from Continental ports will be better facilitated. It is also hoped, provided that the international trade does not deteriorate, and there is no reason to expect it will, the earnings of the various companies will improve by this arrangement. I would only like to add that the results of this Pool System, owing to the date at which it came into effect, are not reflected in the Balance Sheet for the year under review.

PORT DELAYS:

But all attempts at improving the financial position of the companies will prove infructuous if the delays that are occurring at the ports both in India and abroad are not seriously checked and curtailed. One of the main reasons for the serious loss which your Company along with others sustained, is the extraordinarily long hold up of the vessels at various ports during the year. The Directors' Report refers to the fact that 332 days

were lost in the ports in the year under report as against 85 days in the previous year when vessels were idle without loading or unloading operations. The unofficial strikes in the U.K. and the delays in some of the Indian Ports have largely contributed to this unfortunate result. When it is remembered that on the Company's new vessels, and they are in a majority in the composition of our fleet, Rs. 10,000 is lost every day the vessel is idle in port, it requires little calculation to assess the loss to the Company on this account alone. The tugmen's strike at Bombay which held up the port working for many days, is only an instance in point. The unofficial strikes in the U.K., particularly in London and Liverpool, which manifested themselves all too frequently during the year, contributed substantially to the loss incurred by companies.

SHIPPING—PUBLIC AND PRIVATE:

While the position is as I have stated, there has arisen recently a doubt as to the part that Shipping in the Public Sector, the Shipping Corporation of India, can or should play in relation to the Private Sector. Is it proper for the Public Sector to come in competition on routes which the Private Sector has been handling so far and if so to what extent is this desirable or justifiable? The question has come into prominence in connection with the recent entry of the Western Shipping and I should like to take this opportunity of clarifying the position. The Western Shipping Corporation applied for a limited number of ships being allowed to ply in the Conference route as ships of a member of the Conference. The Corporation with the full approval of Government agreed on the number of ships that would ply in this route and the period during which that fixed number of ships will operate. With the agreement and approval of the two Indian Lines on this route, the Conference admitted the Shipping Corporation to its membership. In this connection there has been some criticism that the Government owned Corporation should not have entered into competition with the Private shipping concerns, and the statement of Hon'ble Shri Lal Bahadur Shastri, when he was Minister of Transport, has been quoted which was as follows: "I must state it very clearly that it is not our intention that shipping in the Public Sector should run in competition on routes which private shipping companies have established themselves". I believe that this will still be the basic policy in the expansion of shipping, whether in the Public Sector or in the Private Sector. The vessels of the Indian Flag whatever route they may be engaged in, are facing worldwide competition in many ways. They do not have the protection of tariffs as inland industries have and it is therefore essential that no Line or Lines engaged in a particular route should have over competition from the same flag vessels, to the ultimate detriment of all the Lines of the Flag, whether it be the vessels of the Public Sector or of the Private Sector. They only principle on which either kind of vessels can enter a route which has been established by other Lines of the same Flag, should be as stated by the Chairman of the National Shipping Board "The new Line must be supplementary to and not in displacement of the existing shipping Lines".

DEVELOPMENT REBATE:

The question of expanding shipping tonnage whether for shipping companies already in operation or for new companies, presents a problem in view of the legislation regarding development rebate, which was passed some time back. The development rebate has been allowed generously at 40 per cent of the cost of the ship. But the onerous character of this allowance arises out of the fact that 75 per cent of this allowance has to be provided out of the profits before any dividend can be declared. Shipping companies have repeatedly represented to the Government that the provision of this amount out of the profits of the company may be extended over

a period of years so that the prospect of payment of dividend to Shareholders may not be seriously affected. The National Shipping Board has considered this problem on more than one occasion and has unanimously adopted the recommendation that the development rebate to be provided for by the companies, may be spread over a period of years. These representations and recommendations have not so far helped in modifying the provisions regarding development rebate. I would only like to reiterate our request for the Government giving further consideration to this question.

LOOKING AHEAD:

I do not desire to strike an unduly pessimistic note as to the future of your Company. I have reiterated often that shipping is a peculiar industry, where the boom periods are few and the lean periods are many. While we are going through a lean period, I do venture to express the hope that we may turn the corner before long. There has been in many quarters a very reasonable and legitimate demand that Indian shipping should expand fast and that during the Third Plan Period, a larger amount of tonnage should be added than is provided for at present. While I myself have advocated the expansion of tonnage and your Company has established its belief in such expansion, I would like to enter a caveat against hasty and illtimed expansion under the circumstances in which shipping, all over the world is today. Such expansion requires very deep thinking. The question how and on what routes such expanded tonnage should be used, whether the expansion in tonnage should take the form of tramps or liner cargo vessels, or tanker or passenger vessels—all these aspects of expansion require careful consideration. The National Shipping Board has paid some attention to these factors and its recommendations will, I hope, engage the serious attention of shipping companies and of Government. I am certain that the Ministry of Transport is giving careful thought to these questions. In Dr. P. Subbarayan, the Minister of Transport and Shri Raj Bahadur, the Minister of Shipping, we have gentlemen, enthusiastic and eager for the promotion of Indian Shipping, but who are also at the same time, realists and cautious in approaching these problems. To them, Indian shipping owes a deep debt of gratitude for the encouragement they have given and the support they have extended, particularly in the Pool negotiations. The Ministry of Transport, the Secretary to the Ministry of Transport, the Director General of Shipping, his deputies and assistants, have shown their concern in and anxiety to help Indian shipping, and to them we owe our thanks. They have helped us with advice and assistance at all times. The Shipping Co-ordination Committee has been reorganised and promises to be of real help to Indian shipping whatever the routes may be. I was rather critical of the Chartering activities of the State Trading Corporation in my speech last year and I am glad to note that this Charter Committee has now been reconstituted and my hope that it will be on a better, broader and firmer basis with more clear policies adopted is likely to be fulfilled.

TRIBUTE:

The financial results of the Company does not reflect the hard work and the devoted attention which officers, both ashore and afloat, and the staff of the Company have rendered during the year. In fact, owing to the conditions mentioned earlier, their responsibilities have been greater and their work heavier and I should like to express the Board's appreciation of their services. I should also like to convey the thanks of the Company to the Shippers who have extended their continued and firm support to us, and to the brokers and forwarding agents who have shown confidence in us and in the quality of our shipping service.

CENTRAL WAREHOUSING CORPORATION

Speech of the Chairman, Shri B. B. Ghosh, at the Fourth Annual General Meeting

Gentlemen,

I have great pleasure in welcoming you to this Fourth Annual General Meeting of this Corporation. The report of the Directors and the annual accounts, which have been supplied to you, give an account of the working of the Corporation for the year 1960-61. Both the types of audit prescribed under the Act, namely one conducted by the Auditors appointed by the Government of India and the other by the Director of Commercial Audit on behalf of the Comptroller and Auditor-General have been completed, though the report of the latter is yet to be received.

2. The year under report marked the end of the Second Five-Year Plan. As you are aware, the Central Warehousing Corporation started its activities midway through the Second Plan and it could not be expected to achieve in two or three years what it could have achieved if it were able to function for the entire period of the Second Plan. How many warehouses should be set up during the Second Plan was the subject matter of numerous discussions and the target was ultimately set at 40 warehouses. It is a matter of some satisfaction that the Corporation was able to achieve this target. This is a modest number, considering the size of the country, but if we take into account the warehouses set up by the State Warehousing Corporations, of which we hold 50 per cent shares, the total number is over 300. We have thus, at the beginning of the Third Plan, a fairly good number of warehouses spread throughout the country. It is expected that this number will probably be doubled before the end of the Third Plan.

3. While the number is important, we have come to a stage where we ought to think more about the size and capacity of each warehouse, the volume of business and in general the services which the warehouses may claim to be rendering to the community. Speaking about the Central Warehouses alone, the storage capacity has been increased by about 80 per cent during 1960-61. As an indication of the increase in business, I may mention that the outstanding advances against warehouse receipts at the end of the year under report exceeded Rs. 5 crores as against Rs. 2.86 crores at the end of the previous year. There is little doubt that the warehousing scheme is becoming more and more popular.

4. You are aware that in order to avoid delay, we had to set up warehouses generally in hired accommodation and the volume of business has been limited by the capacity of the hired accommodation available. The policy, however, has been to start construction of warehouses of economic size as soon as possible. We have already got new warehouses in certain places and construction work is now going on at many centres. It has recently been agreed that the Engineering Organisation functioning under the Department of Food will also undertake and look after the construction programme of the Central Warehousing Corporation. This is expected to expedite the works. As new warehouses become available, our storage capacity will increase. In fact, during the Third Plan, our main emphasis will have to be on building up warehouses of proper size, at least at the centres where we have already set up warehouses and to take up construction also increasingly

at the new centres. We may, therefore, except that while the number of Central Warehouses will increase there would be a proportionately larger increase in storage capacity and hence of the volume of business. In designing the Corporation's own warehouses, the need for specialised types of storage for certain commodities is always kept in view. The question whether cold storages for perishable commodities can be set up is also under consideration.

5. I understand that deposits from producers have also been showing a gradual increase. This is a welcome trend. We should be able to attract them more as, between the Central Corporation and the State Corporations, we succeed in covering the country more intensively. I would request you all to convey to the agriculturists, in your respective spheres, the genuine benefits which they will derive by coming to the warehouses direct.

6. The Corporation will constantly keep in view the increasing warehousing needs of our developing economy. The Central Corporation is concerned not only with the establishment of some big Central Warehouses and making them a success, but is responsible for ensuring, through constant help and advice, that each of the fourteen State Warehousing Corporations fulfils its role. It took some time to set up these State Corporations and many of them were set up rather recently. Even so, the State Corporations are, I am happy to say, making on the whole good progress. As many as 266 warehouses were set up by the end of the year under report, with total storage capacity of 2.78 lakh tons. During 1960-61 the Central Corporation contributed about Rs. 35 lakhs to the share capital of the State Corporations and by the end of 1960-61 the total contribution of the Central Corporation to the share capital of the State Corporations amounted to about Rs. 132 lakhs. Some of the State Corporations have also started their construction work and I hope that they will be able to show better performance in this regard soon.

7. You will see from the profit and loss account that the net loss in 1960-61 was less than in 1959-60. This is so in spite of the fact that we are still not earning any return on our investments in the State Corporations. We are by and large recovering our direct expenses on the Central Warehouses.

8. In spite of difficulties and occasional differences of opinion about the respective roles of different organisations, I am glad to say that the warehousing scheme has been making steady, though not spectacular, progress. It has created a general consciousness of the need for good storage and this is bound to result in widespread benefits.

9. Before I conclude, I would like to express on your behalf and on behalf of the Board of Directors our appreciation of the work of the officers and staff of the Corporation.

10. I now invite you to consider the annual accounts and the report of the Directors which have been supplied to you.

THE IMPERIAL TOBACCO COMPANY OF INDIA LTD.

Speech of the Chairman, Mr. F. A. Collett, at the Fiftieth Annual General Meeting of the Company on 26th September 1961

BOARD OF DIRECTORS

On the 31st of May this year Mr. N. Shiva Rao retired from the Board after serving as a Director of the Company since the 1st of April 1956. Mr. Shiva Rao has had a very long association with the Company, having first joined in February 1935, and I am sure I am expressing the sentiments of all of us when I say that we wish him very much happiness and all success in the future.

In October 1960, Mr. S. D. Gupta was appointed to the Board. Since he joined the Company in 1940, Mr. Gupta has concentrated on the production side of the business and he brings to his increased responsibilities an extensive experience and expert knowledge which has already made, and I am sure will continue to make, a substantial contribution to the progress of your Company.

ACCOUNTS

When I addressed you a year ago, I told you that during the first five months of the financial year Sales showed a welcome improvement over the previous year. I am happy to be able to tell you that the improvement then referred to was maintained throughout the year and both the volume and the value of Sales showed a very marked increase over the previous year. The measure of this increase is reflected in the Profit & Loss Account, from which you will see that Sales values have increased from just under Rs. 37 crores last year to a figure of more than Rs. 42 crores in the current year.

In a large measure I attribute this improvement to the fact that in the Central Budget presented to the Lok Sabha in February 1960 no changes were made in Excise Duties on your Company's products. This was a very welcome respite from the frequent changes which had occurred in earlier years and because selling prices in the various categories remained undisturbed the consumer knew exactly where he stood. You will see from the Accounts that, nevertheless, Customs and Excise Duties have increased from Rs. 15½ crores to Rs. 18 crores.

As a result of the increased business the Accounts show an increase in net profits from Rs. 142 lakhs to Rs. 188 lakhs, with the result that your Board has recommended raising the total dividend from 8 per cent to 9 per cent. Your Board believes that there is still considerable scope for expansion and has considered it necessary to make a larger than usual transfer to Fixed Asset and Stock Replacement Reserve, for the purpose not only of making good past deficiencies in providing for the increasing cost of replacing fixed assets in due course, but also of financing the larger stocks of leaf and other material at prices which show a constant tendency to rise.

GOLDEN JUBILEE

You will have seen from the Notice convening this meeting that this is our Fiftieth Annual General Meeting and on an occasion such as this I think you will agree that I am justified in indulging in a little reminiscence.

Fifty years ago your Company was only a selling organisation and for the limited scope of its business it

required a capital of only Rs. 25 lakhs; today your Company owns five cigarette making factories and two printing factories, and its capital is now in excess of Rs. 15 crores. In 1911 your Company's turnover was just over Rs. 40 lakhs; in the current year it is well over Rs. 40 crores, and even though Rs. 18 crores of the present turnover represents a collection of revenue on behalf of the Government in the form of Customs and Excise Duties, I think you will agree with me that the expansion of the business is no mean achievement.

At the time of our First Annual General Meeting, the management staff was recruited entirely from overseas; of the present staff only about one-fifth was so recruited, the remainder being Indian Nationals.

Over the same period there has been an even more comprehensive change in the source of our raw materials. Apart from one or two specialised items, all our raw materials are now produced in India. This fact, of course, reflects the rapid development of industry in this country but I can safely say that your Company has always extended a welcome, and often a helping hand, to potential suppliers, both of raw materials and, more recently, of machinery.

However, we certainly have no intention of resting on our past achievements. The per-capita consumption of cigarettes in India is still very low and, with the successful implementation of the Five-Year Plans and the resultant increase in the standard of living of the population, one must expect further increases in the consumption of tobacco goods in the years to come. I believe that your Company will not be found wanting in the task of supplying this anticipated demand.

MARKETING

Although a most valuable contribution has been made by the Company's employees this year on all sides of the business, not least on the production side, it is perhaps in the field of marketing that most progress has been made. Marketing may be roughly divided into two functions, the distributive function and the creative side; both of these functions are highly technical.

The basic requirement of distribution of a consumer product of a perishable nature such as cigarettes is to make supplies available to people who want to buy them, at all times and in the freshest possible condition. This task, in a country the size of India, is of exceptional complexity. Apart from the constant activities of the Company's field staff, a most important part is played by all the links in the distributory chain. At one end we have the distributors, merchants of high standing in all the main cities and towns, most of whom have been associated with the Company for many years and have a profound knowledge both of our business and of conditions in their distributory areas. Their contribution to the Company's increased business has been most valuable. At the other end of the chain we have the tens of thousands of retailers, who are the final contact with the consumer. I am confident that your Company's distributory system is now geared to service our existing volume and indeed to meet the expanding demand of the future; incidentally it is worth noting that the cigarette business provides a livelihood to a great multitude of people.

On what I have referred to as the creative function, our marketing staff are constantly investigating and endeavouring to anticipate the changing needs and preferences of the consumer and endeavouring to meet his wishes. They have had some success this year but there is more to be done and there is no feeling of complacency.

LEAF TOBACCO

In my speech last year I drew attention to the very serious problem of the growing of flue-cured tobaccos on unsuitable soil. I am sorry to say that I have seen nothing in the current year to relieve my apprehensions, and we have been much concerned about the quality of some of the tobacco which has been offered to this Company for sale. I might take this opportunity of remarking that the problem is a wider one than the immediate interests of this Company in as much as while Indian tobacco is deteriorating, tobacco grown in other countries of the world continues to improve, and this situation cannot long continue without jeopardising India's extremely valuable export trade in this commodity.

LABOUR RELATIONS

In the majority of our branches and in our Head Office relations with the Trade Unions and with our employees have been generally good. During the past year we have been successful in concluding mutually negotiated long-term settlements with most of our branches and this has had the desirable effect of stabilising the employment contract with a large percentage of our work people for a three-year period. It has also had the effect of further cementing the mutual trust and confidence between management and labour which is so necessary for productive efficiency.

At one time there was a threat of large scale redundancy at our branch in Monghyr, but with requirements of increased production the economic operation of our factory there continues to improve, to the extent that redundancy has now been replaced by recruitment of new labour — an indication of what might well be expected elsewhere with increased business.

In its relations with its work people it is your Company's policy to provide emoluments and other

benefits fully comparable with those of similar industries, while at the same time making further financial improvement in the terms of service dependent upon greater productivity both of men and machines. In this we are working in conformity with the labour policy announced for the Third Five-Year Plan, with which we are in full agreement.

CENTRAL EXCISE

In presenting the Central Budget for 1961-62, the Finance Minister announced that tobacco had been one of Government's stable revenue earners, but said that experience had shown the need for some simplification and rationalisation. In practice, however, he anticipated with his changes in the tax structure an increased revenue of something over Rs. 2 crores from unmanufactured tobacco. At the same time, the Finance Minister announced large increases in the Import Duty on unmanufactured tobacco, which he expected would realise Rs. 89 lakhs.

This increase in Import Duty made an increase in the prices of the higher categories of cigarettes inevitable. The upward adjustment in Excise Duty was relatively small, and did not fully justify an increase in the unit price of a packet of cigarettes in the more popular price classes, so your Board decided, on this occasion, to absorb most of the additional duty.

PROSPECTS

In addition to absorbing most of the increased Excise Duties, your Company is having to meet steadily increasing costs of labour, raw materials and freight, but it will be obvious to you that we cannot continue to do this if the increases in various items of cost outstrip the gain we are able to make from increased productivity.

Nevertheless, as I have said earlier, I am confident that given freedom from further increases in tobacco duties there is considerable potential for additional business accruing to your Company and, provided rising costs do not outpace increase in turnover, we can look forward to the future with moderate optimism.

THE PRAGA TOOLS CORPORATION LTD.

Speech of Shri S. Ranganathan, Secretary, Ministry of Commerce and Industry, Government of India and Chairman of the Board of Directors at the Seventeenth Annual General Meeting of the Shareholders held on September 28, 1961.

Gentlemen,

We met last on March 27, 1961 for the Sixteenth Annual General Meeting of the Company and I am happy to welcome you to the Seventeenth Meeting in six months' time. This is possible because we have been able to close the accounts for the year ended March 31, 1961, and present the same to you within the period of six months stipulated in the Companies Act.

2. The audited statement of accounts and the Directors' Report thereon have already been sent to all shareholders. You would have also received, as on the last occasion, a simplified Balance Sheet and Profit and Loss Account. These would give at a glance the working results of the Company. With your permission, I shall take them as read.

3. As you are aware, the Government of India started taking an interest in the affairs of our Company in 1956 and appointed some of their officers to serve on the Board, even when the Industrial Trust Fund of the erstwhile Hyderabad Government acted as the Managing Agents. Later, the Managing Agents resigned as from July 1, 1958, from which date the management of the affairs of the Company has been the direct responsibility of your Board of Directors assisted by a General Manager.

4. I propose, with your permission, to review briefly the progress achieved by the Company since your Board assumed direct charge of its affairs. At the outset I am glad to report that during the period of 2 years 9 months from July 1, 1958 to March 31, 1961 the Company earned a gross profit of Rs. 17.36 lacs, after providing for full depreciation. Almost all this profit, however, has had to be utilised in writing off past losses, value of intangible assets and unsaleable finished goods, developmental expenses, etc. so that the final carry over of profit on March 31, 1961, is only Rs. 23,631. Your Directors can take justifiable pride in the fact that today the Company has been placed on a comparatively sound footing and its financial position is such that a reasonable share of the surpluses accruing in succeeding years could go to the payment of dividends, and the balance ploughed back for expansion programmes.

5. The capital of the Company was reconstituted in 1958 by writing down the share value from Rs. 50 to Rs. 35 per share. Even so the loss carried forward was Rs. 9.99 lacs. Another important step was the decision of the Central Government to invest Rs. 70 lacs in the Company. At the same time the Andhra Pradesh Government agreed that the loan granted by them to the Company of Rs. 17.75 lacs could be converted into share capital. They also agreed to forgo the outstanding interest of Rs. 5.29 lacs due to them. These steps put the Company in ready funds to meet its various commitments and its business could thereafter be conducted without the nightmare of constant financial difficulties to which it had been subject in the preceding years.

6. One of the handicaps this Company suffered from was the lack of adequately experienced person-

nel at the middle management levels. This deficiency has been remedied by the appointment as heads of departments of persons with considerable experience in their respective lines. The post of Works Manager, however, continues to be vacant since November, 1959, and attempts to recruit a suitable person have not yet succeeded owing to the paucity of persons with requisite technical experience.

7. In the factory itself, considerable improvements have been effected. The drainage was improved to prevent storm water entering the machine shop and causing damage to machinery as has happened in past years. The machines were re-laid out to form product-wise sections to the maximum extent. Considerable re-wiring of the plant was undertaken in order to minimise electrical losses and breakdowns which were occurring frequently. Over sixty machines have been reconditioned. In order to minimise running repairs and sudden breakdowns a preventive Maintenance Unit has been formed. A systematic lubrication procedure has been introduced. A new and hygienic canteen has been built. All these steps have already yielded results in the greater utilisation of machines.

8. With the available plant and machinery the factory had reached a production level of Rs. 60 lacs per annum in 1959 itself, but during 1960, due to unsettled labour conditions, production came down to Rs. 48 lacs in 1960-61. In the current year 1961-62 we have every hope of reaching the Rs. 70 lacs target provided labour continues to co-operate, and if this figure is reached the shareholders could not reasonably complain.

9. As at the time of my last report to you, labour situation has been continuing to cause us concern; but I am glad to report that on the 1st July, 1961, the management and the Employees' Union signed a settlement which gave the workers an additional dearness allowance of Rs. 10 per month and certain other benefits in the form of a night shift allowance and supply of uniforms. In its turn the Union has entered into a truce agreement for three years and has also agreed to the revision of work-norms and work standards by mutual negotiation. This settlement if implemented in the spirit, will be a landmark in the labour-management relations in this Company, and we may look forward to peace in the industry and to a climate for better working and productivity in the coming years. The General Manager who has conducted these delicate negotiations deserves our congratulations.

10. Thus, we have so far, with some measure of success, consolidated the position of the Company and ordinarily there should be no fear of its sliding back. With this assurance, we have now taken in hand a substantial expansion. As you are all aware our Company has signed technical collaboration agreements with three British firms for the manufacture of drill chucks, lathe chucks and tool and cutter grinders respectively. Negotiations are currently under way with a fourth British firm for the manufacture of milling machines under licence. The Government of India

GRINDWELL ABRASIVES LTD.

Army & Navy Building, Bombay-1

Branches & Representatives: New Delhi, Calcutta, Jamshedpur, Poona, Madras, Bangalore and Secunderabad.

have already assigned to this Company a definite role in the machine tool industry. Three hundred acres of land on the outskirts of Hyderabad near Maula Ali Railway Station are being acquired. When these expansion schemes are completed the factory would produce about Rs. 2 crores worth of machine tools and accessories annually besides the other products the Company is currently manufacturing.

11. Since we last met here, there has been another significant development. The Company has negotiated and signed an agreement with CEKOP of Poland for the preparation and supply of a Project Report for a unit manufacturing machine tools of various types. This Project Report is expected to reach us in a month or two. The Government of India have already earmarked Rs. 1 crore for the use of our Company out of the Polish Credit. A second agreement with CEKOP for the supply of machinery under this credit arrangement is under negotiations.

12. You will expect me to say something about the future. All I would say is that I am optimistic, even though some of our products are in the competitive field. Already there is keen competition from other entrepreneurs in some lines; this competition could be expected to increase rather than decrease. But quality is our hall mark and if we maintain our standards, I

am not unduly pessimistic about sales. There may however be need to reduce prices. Greater productivity is the answer and our management is fully alive to this need.

13. Our General Manager, Shri B. Venkataraman, who has been with us since July 1958 is due to retire shortly from the Company on October 18 next. I am sure you will wish to express our sincere appreciation of his services to the Company and to wish him a happy retirement. Shri A. M. Kelkar, an Officer of the Industrial Management Pool who joined the Company as Officer on Special Duty on July 21, 1961 will be taking over from him and we propose, with your permission, to designate him as Managing Director.

14. This will be the last occasion I shall attend your meeting as Chairman of the Board of Directors. The President has decided to appoint Shri P. S. Rau as Chairman and I am confident that the Company's affairs will register under his able and experienced stewardship greater and greater success.

N.B.: The above does not purport to be the report of the proceedings of the Seventeenth Annual General Meeting of the Company held on September 28, 1961.

THE ALUMINIUM INDUSTRIES LTD

Chairman's Speech

Addressing the Fifteenth Annual General Meeting of The Aluminium Industries Limited, held at the Registered Office, Kundara, on September 30, 1961, Mr. S. Narayanaswamy, Chairman, said:

The past year has been one of all-round increase in production of bare conductors, covered conductors and rod, as you have no doubt observed from a glance at the production graph published in the Report. Bare conductor production touched 66,300 kilometres and covered conductor 9 million core metres. There has been an interesting revival in the demand for tools and accessories. Our total sales reached Rs. 435.73 lakhs against Rs. 340.72 lakhs in the preceding year. This was to be expected with our Hirakud Unit being in fuller commercial production than in the previous year. However, our nett profit figure is slightly lower than in the previous year, with no very significant variation under the conventional appropriation heads. This is, perhaps, a correct reflection of the competition your Company has had to contend with in the bare conductor market, despite its patriarchal position in the aluminium conductor industry. Our production and sales testify to the acceptability of Alind cables in the bare conductor market. We have had in a measure to depend on our large turnover for profits and thus gain horizontally what has been lost vertically.

MOUNTING DEMAND

I am happy to report that the demand for the Alind covered conductor has been steadily on the increase and we have seen a heartening degree of consumer preference of our product. This has encouraged us to increase our installed capacity at Kundara for covered conductors. This also provided us the incentive to establish one more Unit for covered conductor production in Hyderabad -- which will be in commission before the end of the current financial year. We are grateful to the Government of Andhra Pradesh for their kind assistance in helping us to establish this Unit.

It is a matter of no small gratification to your Board, that it was possible to keep both our Kundara and Hirakud factories occupied to capacity. This was largely due to the Central Government's assistance in making aluminium metal available. It is correct to say, however, that with larger supplies, it would have been possible for us to make more rolled rod available to other manufacturers of bare conductor in the country, having regard to our current rolling capacity.

EXPANSION PROGRAMME

I would like to take this opportunity of briefly touching on our expansion plans. As you know already, our high tensile steel core wire factory in the installation of which we have received considerable assistance from our Japanese friends Messrs Kokoku and Ataka, is in the final stages of erection at Kundara and will be commissioned well before the end of the calendar year, that is to say, about three months ahead of schedule. With the production of core wire in our Kundara compound, we shall achieve a very satisfactory degree of self-sufficiency in bare conductor manufacture.

The Company holds the industrial licence for the manufacture of "solidal" underground cable, but the import licence for the equipment has not yet been received and there has been an amazing time lag between the two. While your Board appreciates the pressure on the country's foreign exchange reserves, it is time for Government to assess the balance of advantage as between importing underground cable costing crores of rupees annually on the one hand and issuing the import licence for equipment costing a very modest amount that would

help the cause of substituting expensive cable imports from hard currency areas on the other. It is our hope that this will not be delayed too long.

No management worth its salt today can merely complete an industrial installation, energise and commission it to the prescribed capacity of efficient working, sit back and declare complacently that the time table having been satisfactorily implemented, there is nothing more to be done. The modern concept of industrialisation is that it is a continuous race against obsolescence, by reason of what competitors do at home and abroad to reduce costs, improve quality, diversify production and refashion goods to suit both the changed consumer tastes and the newer uses to which the articles are put. This is also the process by which earning power is maximized. Thus stagnation or non-development has become the nightmare of industry and what may be called the Battle against Back-numberism has to be kept up. Such a battle cannot obviously be fought without resources. Your Company has been ploughing back earnings into the industry, by practising restraints on dividend distribution all these years -- to the point of making even normally contented sections of shareholders feel that dividends could have been more generous. Looking back, I cannot help feeling that your Board was never on stronger ground than when they resisted the temptation to increase distributions.

The enlarged production of bare conductors since our Hirakud Unit went into production, the stepping up in rod-rolling and covered conductor capacity and the erection of our high tensile wire plant at Kundara have cumulatively begun to impose on the Company's finances considerable strain. The capital cost of all the newer units and the tremendous physical increase in what are compendiously described as "inventories", which have a disconcerting knack of costing more and more every year, have kept our bank borrowings at a high level. When we get import licences for a third rod rolling unit and the "Solidal" project, which may be coming in any time, your Directors will be confronting a ways-and-means problem, the solution of which should enable the Company to function in reasonable comfort. Today inventories are no less formidable a problem than capital costs and it would be unwise to make frugal estimates of project requirements that might ultimately prove self-defeating. Your Directors hope in tackling the resource problem of the coming year, to keep in mind the interests of shareholders no less than the exigencies of Company finance. In the process, it is only fair to mention that a fresh capital issue may prove inevitable.

The Tariff Commission have recommended continuance of protection for a further three-year period from 1st January, 1961. There is reason to expect that on the expiry of this period, increased production of cheaper aluminium metal in India will facilitate a gradual reduction in prices of conductors and render protection unnecessary to the aluminium industry.

METAL POSITION

I would like to dwell however briefly on the technical position of aluminium metal as it obtains currently in India. There has been considerable expansion of the cable industry in the country, apart from other aluminium-using industries in the last few years. The

supply position has been getting increasingly difficult. The indigenous production of metal has had to be copiously supplemented by imports from the sterling and dollar areas and rupee-payment accepting countries. Yet the position is not free from anxiety.

One existing metal producing unit has been doubting its installed capacity at Hirakud, another has been completing erection of its factory at Rihand and a third Company nearer home, will shortly be commencing construction at Mettur. It would be unwise, all the same, to expect that we shall be freed from dependence on external supply sources for some years to come. Aluminium is both a massive and complex industry depending in large measure on steady and unfailing supply of electric energy, apart from being beset by problems peculiar to metallurgical industries. Meanwhile, indications are that the metal using industries will be making larger demands on the suppliers. It would be comforting to know that in the coming four years our metal-producing units would be able to meet in overwhelming measure, the processing industries' demands within the country. With the Government of India's declared desire that the copper-using cable-makers of India should switch over to aluminium in the next few years, this question of metal supply within the country assumes special importance. The transition phase during which supplies would be partly indigenous and partly drawn from external sources, in one of some anxiety. It seems important during this period to keep the supply line from abroad in good repair.

I cannot omit to say a word about our transport difficulties. Owing to short supply of railway wagons, we have not been able to move our manufactured goods

to consumer ends, within a reasonable period and this has seriously affected our delivery time tables — particularly at Hirakud, which is not to say that at Kundara the wagon position is comfortable. This has led to congestion and stockpiling of finished goods in our yards, while at the consuming end there has been shortage of supplies. There is the inevitable chain reaction, in that the Company's inventories swell in the shape of undelivered manufactured articles and there is need for larger working capital. Financing charges tend to swell the final bill of costs. I sincerely hope this unhappy transport deficiency will be remedied in the near future.

Our relations with labour have been very cordial indeed. Our incentive schemes have been fully vindicated in the larger production and larger earnings of our workers. We have concluded an agreement with our workers at Hirakud which must be considered a very fair deal to our workers, in that the opportunities for higher earning based on production are handsome, and if our Kundara experience is any indication, this should result in larger production for the Company and higher earnings for the workers.

I must place on record the Board's appreciation of the continued and lively interest the Managing Agents have taken in the working of the Company and their constant efforts to secure the expansion of its activities, the excellent work put in by the supervisory and engineering staff and all ranks of workers in our diverse Units at Kundara and Hirakud.

N.B.: This does not purport to be a record of the proceedings of the Annual General Meeting.

JAY ENGINEERING WORKS LTD.

CHAIRMAN'S SPEECH

NEW EXPORT RECORD CREATED

TECHNICAL KNOW-HOW GIVEN ABROAD

Lala Charat Ram Stresses the need for Early Decision and Smooth Machinery for Export Incentives

Speech delivered by Lala Charat Ram, as Chairman of 24th Annual General Meeting of Shareholders of The Jay Engineering Works Ltd., Calcutta, on 28th September, 1961.

Ladies and Gentlemen,

It is a matter of pleasure for me to welcome you at the 24th Annual General Meeting of Shareholders of the Company. I am, however, saddened by the fact that, due to illness, our Chairman, Sir Shri Ramji, has been unable to preside personally at this Year's meeting. Sir Shri Ramji is now well on the way to recovery, and all of us fervently hope that he will soon be in a position to resume his active interest in the Company.

I am very much touched by the feeling reference of Lala Kishenlall Poddar to Sir Shri Ramji, and though, as a son, it is somewhat embarrassing for me, I must say that he has echoed the feelings of all those who have watched with interest and appreciation the progress of Jay Engineering Works Ltd. I shall convey these sentiments to Sir Shri Ramji who will be greatly cheered by the expression of affection by the Directors and Shareholders of the Company, for him.

The Directors' Report and the Balance Sheet and Profit and Loss Account for the year 1960-61, have been with you for some time, and with your permission, I shall take them as read.

HIGHER EXPORTS AND REDUCTION IN FAN PRICES

As you will have seen, the Company's profit, after providing Employees' share of profit amounted to Rs. 58.4 lakhs in the year under review against Rs. 52 lakhs in the previous year. The increase in profit is comparatively lower because of higher exports and reduction in Fan prices to the consumer. Due to higher provision for Income Tax, the disposable profit is only slightly more than last year, and the Directors have therefore recommended to maintain the dividend at last year's level.

An idea of the progress made by the Company during the last 5-year period can be had from the following figures:

	Unit	1955-56	1959-60	1960-61
Net Sale Value	Crore Rs.	3.1	7.2	8.9
Profit (after providing employees' share of profit)	Lakh Rs.	28.4	52.0	58.4
Production				
— Sewing Machines	Lakh Nos.	1.1	2.4	2.6
— Electric Fans	"	0.8	3.5	5.1
No. of Retail Points	Number	1,115	1,800	2,000
" " Schools	"	150	700	800
" " Students	"	11,000	50,000	55,000
Value of Exports	Lakhs Rs.	21.0	82.5	113.0

PRODUCTION INDEX IS MUCH HIGHER

It is interesting to see that while the All-India index number of industrial production for all manufacturing industries, with 1956 as base, has gone up to 126 in 1960, the corresponding figures of our Company are, 207 for Sewing Machines and 440 for Fans.

Working results for the year are quite gratifying, and you will no doubt join with me in congratulating the officers, staff, and workers of the Company for putting in hard work which has produced these results. Our special thanks are due to Shri Bishan Sarup Agarwal and Shri T. R. Gupta for the fine performance of our splendid team of personnel at all levels.

CONSUMERS ARE BENEFITED BY REDUCTION OF PRICES

During the year, we reduced the prices of ceiling fans by Rs. 5 and of table fans by Rs. 2.50 each. This

step was in keeping with the Company's policy of continuously sharing the fruits of economy of operations with the consumers. We have found that Indian society is financially so stratified that demand for durable consumer goods tends to be highly elastic, and with every reduction in price, a larger and more numerous class of consumers opens up to the manufacturer. Voluntary price reductions therefore enable the Company to move further towards economies of large scale operation, with consequential benefit to consumers, employees, shareholders and to the national economy.

OPENING A NEW UNIT AT HYDERABAD

The Chairman mentioned in his speech last year that we had applied for Industrial Licence for setting up a new unit for producing 3 lakh Sewing Machines per year. Government of India has since then granted the Licence, and plans for establishing the new unit — at Hyderabad — are in hand.

As I mentioned earlier, our exports during the year under review exceeded Rs. 1 crore. This has been possible because of vigorous selling effort put in by the Company and its Selling Agents, at considerable sacrifice of immediate profits. It is a matter of pride for us that we have been in the fore-front of export promotion of engineering items like Sewing Machines and Fans, and have been able to get foothold even in industrially advanced countries like U.K., U.S.A., West Germany, France, Australia, etc. However, the bulk of our exports is still to under-developed countries, and, as is natural, these countries, like our own, are anxious to build up indigenous manufacturing industries. Again, just like us, they have the foreign exchange problem. These factors put a limitation on the size of foreign markets, and the severe international competition for them makes the promotion — or even maintenance — of exports, a function of the efficiency and quality standards that we can command.

Our country's need for foreign exchange for developmental purposes makes exports a matter of vital importance. The achievement of highest standards of productivity, efficiency, and quality thus calls for dedicated effort on the part of managers as well as workers, and no consideration of doctrinaire regard for vested 'rights' of employers or employees, should be permitted to interfere with this national effort.

PLANNING TO PUT UP MANUFACTURING AND ASSEMBLY PLANTS IN FOREIGN COUNTRIES

We have proposed to meet the challenge of exports by re-orientation of our policy in three respects. Firstly, we plan to develop further our exports to developed countries by making our products continuously more attractive to them on the basis of quality and prices; this will release us somewhat from dependence on under-developed markets which, by their very nature, will shrink as they develop. Secondly, we propose to start assembly and progressive manufacture of our products in those of our present export markets which are seeking to establish industries of their own. We have already got a Licence for putting up a unit in Ceylon, and are registering a Company under the name 'Usha Industries Ltd.' as a subsidiary of our Company. It is proposed to have similar arrangements in other countries like Burma, Pakistan, Thailand, etc. Thirdly, we plan to help the industrial concerns in other countries to set up assemblies with a phased programme of progressive manufacture by giving them technical know-how, equipment, personnel and the supply of component parts. Such an arrangement has come in operation in South Vietnam and negotiations are going on in Iraq, Egypt and Yugoslavia.

You are probably aware that Government of India is proposing a programme of compulsory exports. A pre-requisite for the success of such a programme is an efficient system of rigid quality control so that sub-standard goods do not get exported. Otherwise there is the danger of export markets being spoiled for Indian goods, and good-will built over long periods will be lost. Means must, therefore, be devised for checking such a situation.

We believe that in the existing circumstances there is no alternative to a programme of enforced exports. At the same time it is necessary to create favourable conditions for those who are themselves willing to export. Our economy is tending to be a high-cost economy; for this reason, the need for matching the incentives which exporters of other competing countries enjoy, becomes all the more emphasised. Amongst export promotion measures awaiting Government action are, reduction of steel prices for Engineering goods,

and the availability of long term credit at low rates of interest. Early decision on these will considerably stimulate exports.

It is a matter of gratification that Government has realised the need for offering Income-tax relief to exporting industries. While we are happy that the proposition has been accepted in principle, I would like to submit to Government that the mechanics of granting the relief should be designed to avoid self-defeating delays and complications. I am moved to make this observation by our experience of existing incentives, with which it has unfortunately been the rule, rather than the exception, that mechanics of obtaining the promised reliefs have been far from simple and speedy.

I would reiterate the suggestion made by our Chairman last year that a High Power Committee should go into the matter of export incentives and should devise ways of weeding out causes which defeat or delay the inducements available to exporters.

USHA DISPLACES THE FOREIGN RIVALS

In internal market, USHA has become a by-word for the highest value in manufactured goods, and to a very large extent, consumer preference for foreign Sewing Machines and Fans has been displaced. It appears clear from the progress of our Company and from that of other large and small-scale manufacturers, that in our field there is absolutely no need for foreign know-how or capital, and indigenous resources are adequate for meeting the country's requirement of Sewing Machines and Fans.

MALPRACTICES IN THE TRADE

In this connection I refer with some distress to what our Company considers to be a situation not conforming with rules of fair trade practices. My reference is to the exploitation of internationally established trade-names by applying them to goods which are produced neither by the owner of those names, nor in conditions under which it is customary to permit such use. To the extent that such a practice conveys to the consumer an assurance which is not founded on facts, it needs to be discouraged in the interest of business ethics. There appear to have been only isolated instances of this type so far, particularly one in Sewing Machine industry, but the industry and Government have to safeguard against the continuance and spreading of this practice.

PROGRESSIVE EMPLOYMENT POLICY

This leads us to the need for building up the intransigent strength of our industry. I referred a little while back to the pressing demand for high standards of productivity, efficiency and quality. Our Company is committed to a policy of 'High wages — low unit costs', and has been practising it for the past many years. By and large our experience with this concept has been encouraging, but the realization that the monetary impact of this policy must be reciprocated in ever-increasing measure by higher performance standards, requires more to be driven home. Employee relations in our Company are a worthy example to industries anywhere. I am, therefore, mentioning this not in a spirit of dis-satisfaction, but as a live fact which must be increasingly realised and translated into practice if progressive employment policies are to survive the forces of competition in internal and foreign markets.

Ladies and Gentlemen, I am very proud of this opportunity of addressing you today, and I hope that operations of the Company in the year have been a matter of satisfaction to you. Thank you.

INDUSTRIAL IBCON CONSULTANTS

The industrial consultancy services offered by the group fall under the following headings:-

IN THE PLANT—

PLANT CAPACITY AND LAY-OUTS • PRODUCTION PLANNING AND CONTROL
STORES ORGANISATION • CONSUMABLE STORES CONTROL
RAW MATERIALS CONTROL • FUEL AND STEAM UTILISATION
TRANSPORTATION METHODS • MECHANICAL HANDLING
PRODUCT QUALITY CONTROL • OPERATIONAL RESEARCH
WORK STUDY • BUDGETARY CONTROLS
VALUATION OF PLANT & BUILDINGS
DESIGN AND ESTIMATES OF EXTENSIONS

ON LABOUR—

METHOD AND WORK STUDY • PRODUCTIVITY INDICES
TIMEKEEPING SYSTEMS • WAGE PAYMENT SYSTEMS
JOB EVALUATION • WAGE STRUCTURES
PERSONNEL RECORDS • LABOUR POLICIES
HUMAN RELATIONS • COMMUNICATION
REORIENTATION LECTURES • FOR LABOUR AND SUPERVISION

IN OFFICES—

MANAGEMENT ORGANISATION • EXECUTIVE LEVEL WORK
CLERICAL PROCEDURE • MANAGEMENT CONTROLS
WORK MEASUREMENT • BUDGET FORECASTS
LAYOUT, COMMUNICATIONS AND EQUIPMENT

AND

THE SETTING UP AND TRAINING OF THE
CLIENT'S OWN INDUSTRIAL
ENGINEERING DEPARTMENT

MARKET RESEARCH

PLANNING FOR MODERNISATION AND EXPANSION OF INDUSTRIES
TECHNOLOGICAL STUDIES IN RAW MATERIALS, PROCESS AND PLANT PERFORMANCE

India : A House Divided?

EVENTS this week in Uttar Pradesh have given point to an old accusation that India is a house divided against itself. The National Integration Conference, voted as a great success just a week ago, is now being criticised for quick complacency. Were these eminent people blind to realities or are they basically, in their passion for reason and intellect, removed from the masses in which these powerful political currents are at work? If they are, in fact, blind, can the blind lead the blind, with both possibly falling in the ditch? If on the other hand they are only removed from the masses—but have a power of understanding the passionate currents below—cannot the National Integration Council rise above paper resolutions and formulate a policy for breaking down the barriers between man and man at those levels which have resulted in terrible antagonisms in the last unhappy week? This is not to argue, as the Vice-President had done, that something must be extremely wrong with our educational system. The fact that the trouble started in a University campus does not prove that its source is there and there only. Indeed, the Aligarh incident seems to have displayed passions drawn from soil far away and particularly in many non-university cities of the State. Basically we are coming to the hard conclusion that the communal problem is something far deeper than we, in our national pride, often claimed it to be, namely, an off-shoot of British 'Divide and Rule' Imperial policy. All these are major issues which Indians must ask of themselves. It is to be recognised that a major diagnosis and some deep surgery is required to deal with a deeply distressing malady in our body politic.

To say this is essentially a social and political question is by no means to absolve those in authority in Aligarh and elsewhere who have erred. Administration of the University of Aligarh has been grossly inadequate and, irrespective of any other factor previously under enquiry, it would seem that the University authorities had no grip of the situation when it was rapidly moving out of hand. It is right that changes should be made without delay in the University's administration. Secondly, and without question, the communal universities, obviously have no purpose. Secularism must be imposed since there is always a danger with current passions that communal approaches will encourage or protect communal approach. But why should one stop short of universities? The Muslim Convention and the Hindu Convention were both misguided, and the fact that the eminent people have sat on both sides is no reason to judge their action wise. *The Eastern Economist* does not propose the banning of such conventions because, in a democratic country, it is vital that groups of people of whatever community should be able to state their views subject

to the overriding conditions of law and order and the essentials of political stability. But it is not wisdom for the individuals concerned to exercise their right of free speech in this manner. As a matter of convention it should now be recognised that these conferences should not normally be held particularly in an atmosphere unfavourable to dispassionate thought.

Hitherto, the prescription is largely negative — no communal universities, no communal conventions and, indeed, no communal approaches of any kind. But who will carry out a dispassionate policy, when, as often happens, the pursuit of communal or caste advantages achieves not merely popular approval but also secures political power? The Congress Party cannot pretend that it has ignored the advantages of putting up a candidate who would be backed by the religion or the caste of large groups of the electorate. It is, therefore, in no position to point to the mote in its political neighbour's eye, since it has a large beam in its own. Similarly, the moral righteousness often exhibited by leaders in the Congress, and by the Prime Minister in particular, in regard to an all-India approach when deep grievances do reside in the minds of the people in certain areas, is not a solution. Indeed, it might provide a new irritant. In the last analysis, there are deep regional political overtones of the current malaise. In Uttar Pradesh, the Punjab and Madras we have seen within the last month a display of regionalism as well as of communalism or casteism. It was in the face of these known facts that the National Integration Conference decided that the situation was by no means grave, and the national unity of India was superior to the forces of dissension. Surely, this view was not reflecting the facts. The National Integration Conference has appointed the National Integration Council with comprehensive membership, representing a cross-section of interests to implement its resolutions, but there is a pressing need to frame a policy for emotional integration. The country waits now for quick action. This is a testing time for those who participated in the Conference even more than for those who are in sympathy with its ideals without understanding how that sympathy can be translated into deeds. And for the Congress Party the ordeal will be greater than ever for, if the salt shall lose its savour, wherewith will it be salted? Will it apply balm to the wounds, real or imagined, of those discontented or will it only proclaim as it keeps on doing that all States belong to all people? If it cannot meet the disease at its source, its remedy will fail. For the minds of those affected are not yet ready for exhortation; they are sick, but it is the sick who need the physician not those that are whole.

The Berlin Deadlock

MR. GROMYKO'S statement at London on Tuesday this week about the possibility of resolving the deadlock over Berlin by negotiations must be interpreted in the context of the prolonged discussions between Mr. Rusk, Mr. Gromyko and Lord Home, followed by his talks with President Kennedy on the eve of his departure

from America. The conference of the three Foreign Ministers gave ample proof of the tough attitude adopted by Russia which does not appear to have been softened so far. In maintaining this rigid posture and at the same time holding out a hope of a negotiated settlement, Russia obviously wants to emphasize that the two sides should

lose no time in making up their minds as to what precisely should be the form of give and take that would be indispensable for a settlement on the basis of a compromise. But while every possibility for negotiating an agreement will need to be explored, the Western allies have to come to unanimity on the extent of accommodation. This means that the time would be ripe for negotiations once France and West Germany are persuaded to join America and Britain in evolving an agreed strategy.

The limits of compromise imply that on certain basic issues a sacrifice of rights will not be countenanced, since what would emerge in the end would be not a compromise but capitulation. Mr. Khrushchev's proposal to confer the status of a free city on Berlin is nothing short of reducing it to a state of defencelessness and eventually neutralising its very freedom, since in the state of vacuum which would be created, East Germany can easily dominate the city by virtue of her commanding position over the normal surface access routes. The Western allies are placed under a relentless obligation to keep their armed forces in West Berlin for its defence and any vacillation on their part in discharging it would not only undermine German faith in the alliance but produce repercussions transcending far beyond. The capacity to defend West Berlin's security is entirely conditioned by the command over the line of communications and in an emergency (or even in its absence) it depends on the unfettered right of air access. These are the minimum rights or obligations which cannot be made the subject of bargaining for peace, unless it is to be bargaining for peace at any price.

The Berlin crisis was raised to the highest pitch by Herr Ulbricht's precipitate and calculated action in sealing off the East Berlin border on August 13. That this was in compliance with Russia's major tactical move hardly needs to be underlined. Berlin is not an isolated and separate issue in itself. It is an integral part of the larger

issue of the separation of West and East Germany which has been strategically manoeuvred by Russia. The route for intercourse between West and East Berlin has been blocked and a complete barrier has been raised between the two halves of the country. This is with the apparent object of forcing the question of recognizing the status of East Germany. Russia has held in abeyance the threat of concluding a unilateral treaty with the Ulbricht regime as tactics of the last resort.

The longer the Berlin crisis is allowed to be prolonged, the more explosive will the situation become involving an increasingly grave threat to peace. Between the blockade of Berlin thirteen years ago and the Berlin crisis of today lies a vast difference. Russia was not a nuclear power then, but now she has achieved parity. It would be naive to presume that a war on this issue will be restricted to the use of the conventional weapons, much less that it will be localised. The two leading nuclear powers are fully alive to this possibility. Mr. Gromyko's reference to the possibility of a negotiated settlement is not unrelated, in the last analysis, to this risk which may be forced by a chance miscalculation. America on her part is far from sticking to an inflexible posture. In his address to the United Nations General Assembly, President Kennedy made two significant observations—that America would not transfer the control of nuclear weapons to a non-nuclear power (implying in this context West Germany) and she would not insist on a rigid formula for Berlin.

The real task, but at the same time an extremely delicate task, that is ahead is to persuade West Germany not to ignore the fact of a separate regime in East Germany. Even a de facto recognition of East Germany would clear the way for a settlement. Hard as this decision may be, it is the acceptable solution to the deadlock. It does not slam the door permanently against the reunification of Germany. It is this conviction which America and Britain have to bring home to West Germany.

Jute Turns the Corner

THE decision of the Indian Jute Mills Association to step up the working hours in the industry to 48 a week from October 16 would be widely welcomed. The decision has come not a day too soon and marks the end of the crisis the industry has been passing through for over a year. During this protracted crisis, which arose out of the failure of the jute crop last year, the industry has had to resort to two block closures of mills and reduction of working hours to 42 per week. In the past six months it is estimated to have suffered a loss of nearly Rs. 6 crores to recoup which it will take at least a couple of years. Though foreign buyers had become hesitant to go in for purchases at the prevailing high prices and restricted them to their immediate needs only, production of jute goods had suffered to the extent that at the end of September the industry had stocks only to the tune of 51,600 tons—the lowest during the past ten years.

With the current year's jute and mesta crop considered to be "excellent"—the first estimates put the output between 6.5 million and 7 million bales—and liberalisation of imports from Pakistan and Siam (in the latter case the import duty has been abolished), the outlook for the industry indeed appears to be promising for the next year.

Raw jute prices during the past three weeks have receded well to around Rs. 33 per maund, basis Assam Bottoms. But care has to be taken that they do not fall precipitately to uneconomic levels below Rs. 30. Had the recent decline in raw jute prices been only due to rush of supplies on Puja-eve when the agriculturist is in dire need of money, it would not have been a matter of much concern. With the abatement of supplies to normal quantities, prices would have stabilised. A disconcerting factor, however, is that the downturn displays some element of manipulation. The reminder by the Government to the Indian Jute Mills Association to fulfil the understanding the latter had given during the recent talks on fixation of floor prices for raw jute, suggests that certain sections of the industry have not refrained from indulging in activities prejudicial to its long-term interest.

There may not be any danger of raw jute prices falling below uneconomic levels in the near future, firstly because the pre-Puja rush of supplies would abate and next, because the industry has to step up its purchases consequent upon the increase in working hours. But to be complacent about the issue obviously amounts to shutting

one's eyes to the grave situation that may develop in the beginning of the next year. The heavy discount at which the distant deliveries of raw jute are quoted is a clear pointer that a slump in jute prices in another two or three months may not be ruled out. To ward off this danger, it is imperative that the Buffer Stock Scheme is finalised as early as possible and the mills step up their purchases to replenish their heavily depleted holdings.

While the fall in raw jute prices will soon be reflected in lower jute goods prices, leading to a stimulation of the dormant demand abroad for jute manufactures, it is time that the industry and the Government took up in right earnest the question of reducing costs so as to bring them somewhat in line with the expectations of our foreign buyers, who are the ultimate masters so far as this industry is concerned. Pakistan with her advantages of superior quality jute and mo-

dern equipment of her industry is fast becoming a keen competitor to India. The competitive capacity of the Indian jute industry, therefore, has to be improved. This calls for various measures of which the most important are modernisation and rationalisation of the industry, cutting down of middleman's profit and fixation of minimum prices of raw jute at a level which, while giving an adequate return to the agriculturist, should not unduly push up the industry's costs. Though no floor prices are envisaged for the current year, it is gratifying that there does not remain now any difference of opinion on the issue and that there is a growing realisation of the fact that the interest of the jute grower does not clash with that of the manufacturer. What the jute industry primarily requires is assured supplies of raw jute in adequate quantities. The jute grower can respond when he is guaranteed a minimum return for his produce.

Company Finances in 1959

THE Reserve Bank of India's bulletin for the month of September sets out an analysis of the financial results of 1001 large and medium sized non-Government public limited companies for the period July 1959 to June 1960 spotlighting with special reference to certain contradictory movements within the corporate sector. Whereas sales and profits recorded an increase in 1959 over 1958, the volume of gross capital formation (assets plus inventories) showed a fall. In 1959, the total gross assets formation amounted to Rs. 157.4 crores. This compared unfavourably with Rs. 166.6 crores in 1958, Rs. 237.3 crores in 1957 and Rs. 263.8 crores in 1956 indicating a decline by about 40 per cent between 1956 and 1959. A further probe needs to be undertaken for locating the reasons for this downtrend because the expansion of this vital sector of the economy depends very much on the ploughing back of assets. If in a year of encouraging rise in sales and profits, capital formation cannot be hastened, then in years of poor performance the picture may be much more disconcerting.

The study has estimated for the first time the entire volume of assets formation for the corporate sector and has come to the conclusion that the gross capital formation in 1959 was not more than Rs. 159 crores, out of which gross fixed assets amounted to Rs. 139 crores and inventories to Rs. 20 crores. For the first four years of the Second Plan, it is estimated the gross capital formation for the entire corporate sector was around Rs. 952 crores, out of which the gross fixed assets accounted for Rs. 739 crores. Thus it is patent that the inventories played only a secondary role in the process of capital formation as they contributed not more than Rs. 213 crores.

Another significant feature of the financing operations of the corporate sector as revealed by this analysis is that it is dependent for expansion mostly on its internal resources. In 1958, the internal resources constituted 48 per cent of the total resources while earlier in 1956 their percentage was only 28. It was assumed that more reliance would in future be placed on external resources because it was cheaper to borrow from the banks. All those earlier anticipations have been belied by the working results which show that as much as 63 per cent of the assets forma-

tion in 1959 came from the internal resources of the companies which consisted of free reserves and surplus, depreciation and taxation reserves. The depreciation reserves alone constituted about one-third of the total internal resources.

Fresh capital from the market in the case of the external resources constituted nearly one-half of the total external finances. Earlier in 1958, its share was one-third of the external resources. Borrowings from the banks shrank probably because of the rise in the interest rates necessitating a shift to internal resources and fresh capital from the market.

The rise in the price of manufactures and the recovery in production were both responsible in increasing the volume of sales by as much as Rs. 170.5 crores in 1959. The total sales of 1001 companies were estimated to be a little more than Rs. 2,000 crores. The industries mainly responsible for this buoyancy in sales were iron and steel, cotton textiles and engineering. The rise in prices was due to an increase in the manufacturing cost, but not in toto, with the result that profits also increased by a substantial margin. The profits before taxation of 1,001 companies increased by as much as Rs. 40 crores from Rs. 120.9 crores in 1958 to Rs. 161.5 crores in the year under study. This is a heartening trend because 1958 also had registered a similar rise in profits while the earlier two years i.e. 1956 and 1957 had presented a very depressing picture of profits. A major contribution to the increase in the volume of profits was made by the cotton textile industry. The total volume of profits in 1959 in the case of this industry was Rs. 19.3 crores — nearly three times the profits in 1958 at Rs. 7 crores.

The findings of the Reserve Bank in regard to the corporate sector confirm the impressions gathered earlier through various other economic indicators such as the index of industrial production and the index of wholesale prices. During the last year, it has been pointed out repeatedly that while production has continued to increase, prices also have increased both in the case of raw materials and the manufactured goods. What is discouraging is that despite the faster rise in profits, the rate of capital formation has lagged behind, indicating a probable adverse repercussion on the tempo of industrial production.

THE WEEK'S NOTES

Communalism

THE HINDU CONVENTION

IF THE question is bluntly posed why at all the convenors of the Hindu Convention felt the need at this time for their action in calling the convention, no honest and convincing explanation can be offered except that the Muslim Convention held in the capital city provided the provocation. The plain truth is that this is a case of a counter-convention pure and simple. More specifically it seems to have been intended as a counter-blast to the action of Muslim communalists. In retrospect it should be quite clear that the holding of the Muslim Convention was a most harmful move and its sponsors should have pondered over the potential injury which their action was likely to inflict on the cause of communal harmony. The counter-convention held last week cannot be justified since one wrong does not justify the other. Both the conventions have made an ugly demonstration of the forces of disruption that are still lying dormant in the Indian society and bring home the agonising realisation that, despite the philosophy, professions and some practice of secularism, the virus of religious animosity has not disappeared during the fourteen years since we became the master of our own affairs.

Mahant Digvijayanath, Chairman of the Reception Committee, and Dr. S. N. Bannerji, President of the Convention, were at great pains trying to establish the incredible thesis that there was nothing sectarian about the Hindu Convention, that the term Hindu connoted nothing more and nothing less than the national way of life and, above all, they equated the Hindu society with the Indian nation itself. Hindu consolidation, the audience was told in the most passionate terms, was not different from national consolidation. This bubble of the non-communal interpretation of the activities of a blatantly communal association could easily be pricked by a plain query: Where lies the place for those who do not profess the Hindu way of life as they have the full freedom to do under the Constitution? If there was anything which characterised the deliberations at this convention, it was the total and most conspicuous absence of logic. Dr. Bannerji denounced the Muslim Convention as violating the very spirit of the Constitution, but apparently this reasoning did not apply to the convening of the Hindu Convention — it was a convention for national consolidation, for the integration of a way of life! The agenda before the Convention contained an imposing — but merely plausible — array of subjects ranging from foreign policy, internal and external threat, defence to protection of the Hindu minority in Pakistan. The entire tenor of the discussion showed that the agenda was conveniently ignored and other issues usurped its place. While the Muslim convention was castigated for maligning the Government, the Hindu convention appealed to the electorate not to vote it into power again.

Laos

THE END OF STALEMATE

AT LONG last an agreement has been reached on the formation of a neutralist government for Laos. Such a government could only be on the basis of a coalition of the three groups, obviously with a preponderance of the neutralist element. The prolonged stalemate was a pointer to the necessity of coming to an early settlement, lest the internal situation in Laos might deteriorate with the infiltration of military aid. While the stalemate lasted, the International Control Commission also found itself in a condition of stagnation. The major barrier to the formation of the neutralist government was the difficulty of an agreed settlement between

the three princes themselves. It is possible to argue that the alignment of the power blocs assisted the process of stiffening the attitude of the princes at times, but the degree of this external influence ought not to be exaggerated. What was obvious emerged in the end. Prince Souvanna Phouma now becomes the Premier and, although a final decision has not been reached, it is likely that Prince Boun Oum would be the choice for the office of Vice-Premier. There has been an acceptable division of potential authority between Prince Souvanna Phouma and Prince Boun Oum by the allocation of the portfolios of the Interior to the former and of Defence to the latter. The provisional rules stipulate that the Premier and Vice-Premier should act concurrently in policy matters, which means that there would be an obligation to find harmonious working based on consent. Whether this arrangement works smoothly or becomes a source of friction should not be a matter for real worry, as there seems an earnest desire on the part of the three groups that a neutral government should govern the country.

The 14-nation conference at Geneva stands committed to the principle of neutrality for Laos since the independence of the country can be ensured only by safeguarding non-alignment. The main question that now remains to be settled is how soon the International Control Commission should be put in a functional position to discharge its assignment. Whether the Commission will be free from the possible recurrence of obstructions by a rigid rule of unanimity or whether the rule of simple majority will enable it to operate freely is another hurdle to be crossed. Now that Laos would be represented by an undoubted plenipotentiary at Geneva, his voice ought to be respected as the united voice of Laos and recognised as a vital factor in the deliberations. All in all, the prospect in Laos has brightened up.

A.I.C.C.

ACCENT ON UNITY

AN IMPORTANT event at the two-day session of the All-India Congress Committee at Madurai last week was the forthright declaration of the Party to give a fight to all the reactionary forces which were determined "to preach separatism as a confirmed political creed." The Prime Minister made one of the most forceful and effective speeches against the separatist forces. He did not name the Dravida Munetra Kazhgam, but his reference was too obvious to be missed. Who else is making the advocacy of secession? In the heat of passion the Prime Minister went so far as to state in naked words: "Let the whole of India be destroyed in the process of defending its integrity and there should be no separation." This forthright pronouncement immediately after the National Integration Conference at Delhi, sets in perspective the political philosophy that guides the nation. But those who can be credited with statesmanship have questioned the wisdom of the strongly worded denouncement of the DMK which is likely to stiffen its attitude.

But it needs to be pointed out that the party in power has suffered in recent years from the disease of disintegration more from within than from without. The Congress factions at the State level, the unseemly squabbles over the party tickets for the next elections and the virus of casteism have weakened the organisation and the talk of effective national integration may become more of a slogan than a reality. The Congress Party had better imposed the same discipline on its own members to achieve the eluding ideal of national unity. It is heartening that a decision has already been taken to disclaim the Congress alliance with the Muslim League in Kerala.

The World Abroad

PRICE CONTROLS AND COMPETITION IN U.K. STEEL

By
ODYSSEUS

WHEN WORLD WAR II ended, the UK steel industry sought to retain private ownership, and ward off nationalisation by showing that the war-time system of price control avoided the evils caused by pre-war alternate booms and slumps, ensured efficiency and cheap steel, and avoided profiteering. Conservatives and Socialists accepted the industry's view that the war control system was sound. The difference between them was whether it should be exercised over privately or state-owned enterprises. So the real issue—Is efficiency ensured better under private or state enterprise?—was never debated. In the event, steel was nationalised for a short period and then denationalised. But the system of control remained broadly the same, before and after. What was it?

A magisterial analysis is given in "The Steel Industry: 1939—1959: A Study In Competition and Planning" (Camb. Univ. Press. London. 1961. Price 80 sh.) by Mr. Duncan Burn, who is all the more enlightening in that he draws on his encyclopaedic knowledge of the steel industries of Europe and the U.S.A.

After the war, the British Iron and Steel Federation, representing the steel-makers, claimed (with a straight face) that price control provided competition in a form which was better than if there were price competition. Since theirs was a variation of the classic argument used by cartels and state enterprises, it is worth examining.

AN INGENIOUS THEORY

The Federation said that the upholders of price competition maintained that it induced firms to lower costs and raise efficiency. In fact, however, they asserted, inefficient firms were not quickly eliminated and efficient firms were impoverished. Price competition could not work with alternate booms and slumps. Firms which lowered prices could not get much more business, because demand was inelastic in the short run. In the long run, the finances of the inefficient were restored by the return of a boom.

The Federation argued that sponsored competition, within prices fixed on the average costs of efficient firms, would induce the inefficient to lower costs, would lead to their quicker elimination and to the quicker adoption of large-scale methods. If a firm had to make a specified article for a fixed price it had an incentive to lower costs and thus raise profits (within the authorised price). If, in addition, the price is fixed in relation to average costs with a narrow profit margin, then every successful effort to reduce costs by one firm affects the calculation of average costs and so squeezes further the profit margin of all, and those which fail to improve will fare progressively worse and eventually be eliminated by their losses.

Indeed, the Federation argued, besides this automatic reduction in average costs, once firms had responded as the price-fixing authority thought sufficient to meet a scarcity by increasing capacity, the margin itself could be lowered. They claimed that this had been done. Where rapid expansion of output was needed, the Steel Board fixed prices above this margin cost level. In other cases, where modernisation of capacity seemed less desirable, because the saving in operational costs at a new plant would not be enough to offset the high capital cost, they did not fix a price even as high as the marginal cost at a new plant. Provided prices are not raised when demand is keen in booms, or lowered when it falls in slumps, pressure towards efficiency will

be continuous, and inefficient firms will not be able to keep their heads above water by using as reserves in times of slump the profits made by charging high prices in booms. There was no question of giving profits to all producers however high their costs. On the other hand, there were no quotas or restrictions on any firm's output.

In support of this ingenious theory, the Federation published charts showing the margins earned during three quarters on sales of heavy products by all the 42 firms which made them. Six of the 42 sold between 60,000 and 80,000 tons each in a quarter, and together provided 41 per cent of total sales; five selling from 30,000 to 60,000 provided 20 per cent; six selling from 20,000 to 30,000 provided 11 per cent; twenty-four selling less than 20,000 tons provided 28 per cent. The charts showed that some firms made large losses in all three quarters. Margins rose from a loss of £2/12/6 a ton for the least successful firm to an equal profit for the most successful. Out of total production of some 1,100,000 tons, losses were made in the first quarter on some 140,000 tons, on over 200,000 tons in the second, and on 300,000 tons in the third. Eight firms made losses in each quarter; seven had losses in two quarters, and four in one quarter.

These, says Mr. Burn, are not the only remarkable features of these figures. There were, for example, striking fluctuations of fortune from one quarter to another. One firm appears to have increased its margin from 12/- per ton to 38/- at a time when the average margin fell. Another, selling 50,000 tons a month, had a fall from 25/- to 2/6. One turned a loss of £2/12/6 into a profit of 5/-. It is obvious that sponsored competition had confusingly erratic results.

At first glance these charts were inexplicable. Here, it seemed, was an industry in which not less than 42 firms competed against each other, and yet accepted, without a murmur, fixed prices which left many of them with a loss at a time of strong demand and gave no producer a high margin of profit.

THE TRUTH!

The truth was that the famous 42 were not all competing against each other. Not all made the types of heavy product subject to price fixing, and few made the whole range of sizes and qualities in any one type of product. Within each heavy trade there was some specialisation. Colvilles, for example, made the widest and thickest heavy plates. Cargo Fleet made only wide flange beams. There were some patent piling sections, special high tensile structural steels, and free-cutting steel billets. Thus, in specific products, there was little or no competition. Nor did the firms make only heavy products. With few exceptions, they also made some of the more highly finished products—sheets, tin-plate, re-rolled bars, rods and sections, wire, hoops and strip, tubes, forgings, tyres, wheels and Axles. In addition, many were linked with engineering and other manufacturers. So the truth was that although some firms were losing on some products, none were losing on all.

All this sheds new light on the sponsored competition charts. Heavy product sales accounted for 40 per cent of the steel ingot output. Most of the steel industry's output was sold in the uncontrolled higher profit categories. Sales of heavy products, even "at a loss", might, in fact, be making useful contributions to overheads. Some production "at a loss" was doubtless the result of "coupled bargains", whereby firms under-

took an order which would involve them in a loss, or small profit margin, only if accompanied by another order on a product enabling them to compensate for the loss. Scandalous, anti-social capitalism? But if you create a system in which profit margins, based on averages, are distributed erratically, regardless of enterprise, do you expect the ordinary human being's instinct for survival not to lead him to some solution? Competition compels the survival of the fittest to compete. But having eliminated that, you get instead the survival of the fittest to wangle. Because you insist on creating impossible conditions for the business man, you must not expect him obligingly to commit suicide.

By charging higher prices on a mass of infinitely varied products, and by offsetting losses with coupled bargains, firms making heavy products avoided the losses that would have put them out of business. So the narrow profit margin authorised, far from offering incentives to reduce costs, merely discouraged investment in unremunerative (although may be from the view point of the economy as a whole, important) lines.

So much for controls on selling prices. I refrain from attempting to outline the controls on raw material prices — imported ore, scrap, and coal for fueling the blast furnaces — because they are of nightmare complexity. Broadly, the policy has been to keep prices of scrap and of coal artificially low, and to charge a levy on the users of cheap home ores to help importers of foreign ores. The doctrine is that the various price controls counteract some currently abnormal cost factor, which unfairly affects firms, irrespective of their efficiency or inefficiency. The doctrine disregards the industry's short term costs in order to promote its best long term cost interests, "in order to allow steel makers to plan on a proper assessment of real costs and users to gauge the future prospects of the steel market accurately".

The doctrine is seductively simple. But to say that it affects firms irrespective of their efficiency does not mean that it leaves the positions of the efficient and inefficient unchanged. Did the system have a regular

bias? Could this bias be altered? What constitutes "efficiency" in a situation where neither raw material nor selling prices are realistic? Is a firm to be praised for "efficiency" if it sites itself well to get cheap raw materials, or is this dastardly profiteering? What is an "abnormal" cost factor? If it lasts long enough, does it become "normal"? How can long-term costs be defined? How forecast? Does any fool-proof method of forecasting exist? To what scale of output would forecasts be related, to what scale of imports of steel? Could oil be substituted for coal as a fuel, at what prices?

Take ore. The subsidy assumed that post-war freights would settle at 50 per cent above pre-war. They disobligingly rose to 255 per cent by 1949. In 1948, the system benefitted scrap users at the expense of pig iron users in order to mitigate the steep rise in pig iron costs. This spread the pig iron burden over the whole industry. The controllers therefore had to decide the right ratio between pig iron and scrap. Was the ratio right historically? What was the range within which the pig iron-scrap ratio moved in competition? Had the average relation in a free market any relevance? If it had what validity did it give the whole scheme, including the artificially low price of scrap and the use of the ingot levy to cover the cost of imported scrap or special collections of home scrap? In these years of inflation, the pegged scrap prices helped steel makers in competition with makers of other (uncontrolled) raw materials as well as in competition with foreign steelmakers. In other words, the steel makers' true costs were masked: they made profits irrespective of efficiency. This, it seems, was what Conservatives and Socialists wanted "in the national interest." The trouble is that the steel makers of the world do not owe U.K. steel makers a living.

In a final article next week I will outline bright spots on the horizon which suggest that the U.K. industry has seen the red light in time.

Meanwhile, does India enjoy high cost steel "in the national interest"?

4½ Per Cent Madras State Electricity Board Bonds, 1971. For Rs. 200 lakhs.

(Payment of Interest and Repayment of Principal, Guaranteed by the
Government of Madras)

The bonds will be trustee securities under the Indian Trusts Act and also approved securities for the purposes of the Insurance Act and the Banking Companies Act.

Issue Price Rs. 90.50 Per Cent.

REDEEMABLE AT PAR ON THE 16TH OCTOBER, 1971

Subscription will be received in cash or cheques from the 16th October, 1961. But the lists will be closed without notice as soon as the total subscriptions amount to approximately Rs. 200 lakhs and in any case not later than the close of business on the 23rd October, 1961.

Applications will be received at all branches of the State Bank of India within the State of Madras and at the State Bank of India at Madras, Bombay, Calcutta, Delhi, Bangalore and Bangalore city.

Copies of the Notification announcing the terms of issue and application forms are available at all the receiving offices mentioned above, at all treasuries and sub-treasuries in the State of Madras and at all offices of the State Electricity Board and its undertakings.

The European Scene

B.S.T. AND T.O.P.

From Our Special West European Correspondent

PARIS, October 9.

A PROBLEM that presents itself in very much the same way both in India's expanding economy and in the dynamic economy of the Common Market is the place of "small enterprises" in an industrial system that inevitably tends to reward bigness. Mr. S. K. Guha wrote in "The Eastern Economist" on September 22, "Bitter complaints are often heard also from smaller capitalists operating on a capital of, say, Rs. 50 lakhs to Rs. 3 crores or so that the big capitalists have been deriving all the benefits in the corporate sector, reaping unduly large profits vis-a-vis the former class.... Be that as it may, it has to be remembered that in the process of development it is only natural that the larger and more organised units already in the field will grow further and faster, in view of their experience and entrepreneur ability, and derive the advantages of economies of large-scale and group management". The same complaints are very frequently heard over here on the Continent. Of course, this is nothing new; the history of "small business" legislation in the United States shows that this is a perpetual problem in a progressive economy. (That same history also shows that this is a fertile field for demagoguery; crusades in favour of small enterprises are electorally paying and Congress has enacted much unwise and merely useless legislation on the subject.) Yet it has become much more urgent since the introduction of the Common Market. Small businesses in the individual countries had learned, more or less, how to rub along in the shadow of the giants, with the protection of their national parliaments, but the opening up of a six-nation market upset this precarious balance.

The bigger market naturally favours the bigger firms. Economies of scale become more important in a market of 170 million consumers than in a market of 50 million. Foreign markets are more easily approached by an enterprise that has a well-known name, is used to advertising, can afford to employ specialists and build up a new sales network, and, if necessary, make market-splitting pacts with its foreign peers. The small business can do none of these things alone, so it gets little benefit from the widening of the market while it sees big foreign firms encroaching on its home market. A typical result is that this year in France the giant corporations are increasing their investments by 30 per cent while small firms are diminishing theirs by 5 per cent, while the number of bankruptcies recorded this summer was 25 per cent greater than a year ago. In general, this is a process that no one wants to stop, for it is realised that it is a necessary aspect of the modernisation and enlargement of European industry, and of a more rational division of labour. The best way to ease the pain for the small family concern that is forced to the wall is, not to restrict the big firms or to pour cheap credit into a doomed business, but to maintain the economy's expansion and full employment, so that alternative uses for capital and labour are immediately available.

At the same time, for perfectly sound economic, political and humane reasons, no one is resigned to seeing small enterprises and family businesses wiped out just because they are not big enough to indulge in monopolistic practices. Unless we are Marxists, we know that it is not the fate of a free economy to become endlessly bigger and more concentrated. Not only is there plenty of room in an efficient economy for a host of small enterprises, but their existence is necessary to the biggest firms, which become uneconomic if they try to do everything "under the one roof". For want of skill and knowledge small firms may fail to adjust to a new situation, when their disappearance will be sorely missed a little later. Without seeking

to prop up outdated concerns or to delay inevitable absorptions and amalgamations, it can be in everyone's interest — government, local authorities, consumers and big firms themselves — to assist certain small enterprises across a difficult passage, to reveal to them the new opportunities that economic progress creates for them and, even, to help establish new small firms. Just as in India, much has been attempted in Europe and America by governments through specialised finance corporations that seek to provide capital on favoured terms to small entrepreneurs, yet I think that this is the least important and least fruitful approach. Small business, of course, lacks cheap long-term finance, but then so does everyone in an expanding economy, by definition. But that is not what it lacks most. Mr. Guha, as quoted above, judiciously mentions first the relative lack of "experience and entrepreneur ability" and the benefits of group management.

To say summarily that the big corporation wins out because of its superior financial resources misses the fact that, very often, these resources are used to buy intellectual and organisational advantages which, if they were made available to small firms cheaply (by hiring, renting or pooling) would enable them to hold their own. Only the biggest corporation can afford to buy its own electronic computers, but if small firms can hire them or, even more economical, can submit problems to a computer-firm that works for a fee, they can secure whatever benefits this device brings without an increase in their capital; and in the last three years, such practices have become common in Europe. So it might be interesting to draw attention to several ways of helping small firms that involve no appeal to government generosity or to the money market, and which are being used today in Europe to assist family concerns through what is for them the Common Market crisis. I emphasise that, apart from a benevolent interest taken in some cases by the French plan authorities, these techniques are entirely the work of the private sector and would require, for their imitation in India, no legislation or official intervention. They are examples of self-help by small firms or of co-operation between big and small firms.

The first are called "bourses de sous-traitance", or sub-contract exchange-markets, which seek to provide for small firms what the big firms get by market-studies, advertising and a staff of representatives. That is, they make known what the firm can do, find out what others want done, and centralise this supply and demand of services. A small house that has a wood-working machine or a metal-finishing apparatus or a gadget for sealing plastic which lies idle one day of the week or for one season of the year cannot afford to prospect the market, and yet another firm (it may be another small business or even a giant corporation) may require just those services in the same town. The "bourse" tries to operate like a labour-exchange, by marrying these offers and enquiries; if it gets enough support and learns to respond quickly, it can hope to make industrialists think of it whenever they need a job done, just as employers gradually learned to apply first to a labour exchange when they needed hands. It may specialise in work of a particular sort, handling only enquiries for metal-working, or it may cover many or all industries over a smaller region. Of very recent origin, the idea is quickly catching on. I take as example the "bourse de sous-traitance" (the initials BST are rapidly passing into commercial jargon) of the metallurgical and mechanical industries of the West-Centre of France. Set up last July, it has compiled a complete inventory of all the material, intellectual and human resources in that line in its region, and keeps up to date a file on the available capacity of all its mem-

October 13, 1961.

bers. It already undertakes to reply instantly to any enquiry, though it cannot promise that the reply will be positive; resources of the sort needed may not be locally available, whereupon the applicant will perhaps enquire at the BST of a neighbouring region. The West-Centre BST calculates that it needs to have 100 members to operate efficiently and so far it has not quite got them, so it is extending its geographical cover to take in nearby departments. Its annual budget is Rs. 1 lakh, subscribed by members in proportion to their number of workers; when it has 100 members, then the average subscription will be Rs. 1,000 a year. The utility of this scheme in India, where there exists much idle capacity in machinery installed quite recently, is evident.

More ambitious though so far limited to the region of the Ardennes is an association called TOP ("technique, organisation, productivity"), which is a club formed by the seven biggest firms of that region (mainly steelmakers and mechanical construction firms) and 42 medium and small businesses. The idea is to make available to the small firms the services of the productivity experts of the big firms, for several days each month when they organise seminars and visits to plant and offices. The big firms simply detach their experts free of charge, the small firms put up the travelling expenses (each one might have to find Rs. 800 for a complete "course") and the Plan authorities, who were not slow to see the possibilities of the scheme, lend some of their experts and give a subsidy that goes to buying a small library. Why did the big firms have this idea? Just because they realised the dangers of "prosperity in solitude". In the Ardennes, there are 12 firms employing more than 500 men, and 4,100 employing less than 50 each; the big 12 were branches of large national or international corporations, which benefitted from the latest knowledge in business methods, work organisation, etc., while the small houses were feeling the draught of the Common Market. A natural solidarity inclined the big firms to lend a hand; and anyhow, men who spend their whole working life in quest of greater efficiency in their own firm find it hard to resist offering advice to a struggling little neighbour who has a good business but does not know how to run it.

It was the president of Arthur Martin, one of Europe's biggest stove manufacturers, who persuaded six equally big firms to invite the small entrepreneurs

to open their doors to their technicians, productivity experts, accountants, and, in turn, to show the small fry around their plant to see modern methods in operation. Usually, a group of a dozen or so small entrepreneurs interested in a problem attend lectures by the big firm's specialist, then visit its plant or office to see his ideas at work on a large scale and then visit a small business to see how those ideas could be adapted on a smaller canvas. It soon emerged that the specialist found this as profitable intellectually as the little men; it was by no means a waste of his employer's time to have him studying organisational problems "in a test tube". Besides, in this club one big firm's experts, for the first time, were invited to see how another big firm handled similar questions; two steel mills, which for no good reason had always been jealous of their "private affairs", discovered that they had nothing to lose by learning from each other in the candid and enthusiastic atmosphere created by a dozen little men eager to learn. But of course the most impressive results were achieved in the small firms themselves. Examples (of which the authenticity is attested by the fact that M. Pierre Masse, the French Plan's commissioner-general, inaugurated the latest session of TOP) include a family business that found that it could reduce its manpower by 40 per cent for an investment in small equipment costing Rs. 3,000, and another that learnt how to reduce its production time by 50 per cent without investing a centime.

TOP has been so successful in its career of 20 months that the promoters are getting worried: there are thousands of small businesses in the Ardennes, and what will happen if they all want to join in? The big seven who founded it hope to get the five other mammoths of the region to take part. The assistance of the Plan authorities and of the national Productivity Association can be drawn on. Moreover, the experts on loan from the big corporations found that there was no scarcity of talent among entrepreneurs employing less than 500 men; their experience was narrower but they had useful contributions to make on particular points. Finally, the small businesses that have benefitted from assistance and have achieved notable economies are becoming showpieces that are capable of passing on the lesson. TOP's success has aroused the interest of the Belgian authorities, who have sent people to watch it work. Maybe it will find imitators further afield.

PROUD ACHIEVEMENT

The J. K. Organisation can legitimately be proud of the fact that it has been the first in various fields of industrial activity in India.

- FIRST to manufacture Calico Prints in India—J. K. Cotton Spinning & Weaving Mills Co. Ltd., Kanpur.
- FIRST to install Electric Furnace for manufacturing steel in Northern India—J. K. Iron & Steel Co. Ltd., Kanpur.
- FIRST to produce Baling Hoops for use by the Jute and Cotton Textile Industries in India—J. K. Iron & Steel Co. Ltd., Kanpur.
- FIRST to manufacture hydraulically operated modern cane crushing mill for small-scale Khandsari sugar units—J. K. Iron & Steel Co. Ltd., Kanpur.
- FIRST to produce Aluminium virgin metal from Indian Bauxite in India—Aluminium Corporation of India Ltd., Jaykaynagar.
- FIRST to produce Engineers' Files in India—J. K. Engineers' Files, Bombay.
- FIRST to establish Plastic Industry in Northern India—Plastic Products Ltd., Kanpur.
- FIRST to produce Heavy Chemicals in Western India—Eastern Chemical Co., (India) Bombay.
- FIRST in the world to produce on a commercial scale Hydrosulphite of Soda by Sodium Amalgam Process—J. K. Chemicals Ltd., Thane.
- FIRST Continuous process Rayon Plant in India to produce Viscose Rayon and the first such factory in India to be built up in record time—J. K. Rayon, Kanpur.
- FIRST Nylon Plant in India—Jaykaylon (under construction), Kara.
- FIRST to manufacture Portable Typewriters in India—Blackwood India Ltd., Calcutta.
- FIRST Woollen mill in India to export woollen goods to Norway and Sweden—The Raymond Woollen Mills Ltd., Thane.
- LARGEST Jute Mill in Northern India—J. K. Jute Mills Co. Ltd., Kanpur.

India's Great Industrial & Commercial Combine

POLITICIANS AND JUDGES

By P. KODANDA RAO

RECENT events connected with the High Courts in Madras, Mysore and Maharashtra have caused deep concern, as they tend to undermine public confidence in the independence of the Judiciary due to the decisive influence of the Chief Ministers, who are politicians and party-politicians at that. Currently the Madras and Mysore High Courts have Officiating Chief Justices. It was known years ago when the last permanent incumbents were due to retire, and yet their permanent successors were not named before they were due to retire. There are two vacancies in the Mysore High Court which have not been filled for nearly two years! The Government of Maharashtra openly avowed in their official publication, "Guiding Principles of Maharashtra" that it would ensure regional representation on the High Court! In the "bad old" days of British rule, successors to fill vacancies were announced well before the vacancies occurred, reducing, if not eliminating, canvassing by aspirants to the offices. In the "good new" days of Swaraj, there have often been unconscionable delays, with highly demoralising consequences. The instances mentioned above are not exceptional. Delays seem to have become chronic and general.

The judiciary is the sole protection to the citizen against invasion by the executive and therefore, it is axiomatic that it should be beyond the reach of political influence. If the judiciary also comes under the control of the politicians, then good-bye to justice. It is for this reason that the Constitution of India excluded the Chief Ministers and the Home Minister of the Government from having any say in making judicial appointments, and included only the Chief Justice of India and the Chief Justices of the States who are non-political at all times, and the President and the Governors who are non-political during their office. According to the Constitution, the President of India is the sole authority to make the appointment of the Judges and Chief Justices of the High Courts. He has to consult the Chief Justice of India and the Governor of the State in appointing the Chief Justice of a High Court, and the Chief Justice of the High Court also in appointing psuine judges of the High Court.

It is a moot question whether the President and the Governor should act in their own 'individual discretion' or on the advice of their Cabinets. It is also a moot question whether the Chief Justices also should act in their own individual discretion or in accordance with the majority opinion of the Bench. Mr. Justice A. R. Somnatha Iyer and Mr. Justice Mir Iqbal Husain of the Mysore High Court were reported to have held that the judicial service was selected for special treatment under Article 234 of the Indian Constitution as against other appointments contemplated in Article 309, and that the power under the former Article was the special responsibility of the Governor, to be exercised by him in his discretion. This interpretation would rule out the Chief Minister altogether. On the other hand, if the President and the Governors are obliged to act on the advice, amounting to commands, of the Home Mi-

nister at the Centre and the Chief Ministers in the States, the decisive power in making judicial appointments will vest in the politicians, and the Chief Justices of India and of the High Courts would be reduced to mere advisers.

The Constitution is silent as to who should take the initiative in the appointment of judges of High Courts. The Press Communique issued by the Government of India on May 10, 1961, stated that the initiative for such appointments came mostly from the Chief Justices concerned. It is obvious that in some cases it came from what the communique euphemistically called the "State authorities", meaning thereby the Chief Ministers. The Law Commission revealed that the Chief Justice made his recommendation, not to the Governor, but to the Chief Minister! The latter consulted the Governor, which must necessarily be an empty formality, and then forwarded it to the Home Minister of the Government of India, and not the Chief Justice of India! The Home Minister consulted the Chief Justice of India and made his recommendation to the President, who formally made the appointment. The Law Commission stated further that if the Chief Minister did not approve of the recommendation of the Chief Justice, he forwarded his own rival proposal to the Home Minister, with or without the knowledge of the Chief Justice! And the Home Minister sometimes preferred the nominee of the Chief Minister to the nominee of the Chief Justice! The undermining of the prestige of the judiciary at the hands of politicians could hardly go further.

The Commission condemned in the strongest possible terms the decisive voice given to party-politicians in making judicial appointments, and anticipated that if the present practice continued, independence of the judiciary would disappear, as the High Courts would be filled with judges who owed their appointments to politicians. It was a "dismal" and "grave" prospect. It recommended that the Chief Justice should take the initiative and forward his recommendation both to the Chief Minister and the Chief Justice of India. The Chief Minister might comment on the recommendation, but should not make a rival one. At the Centre, the Chief Justice should not merely be consulted by the Home Minister but his concurrence obtained. To give effect to its proposal, the Commission furnished a draft amendment to the Constitution. But the party-politicians would have none of it. It is a grave scandal.

It seems desirable that, instead of the Chief Minister, the retiring Chief Justice of the High Court should recommend his successor and forward it to the Chief Justice of India, who, in consultation with the Chief Justices of other High Courts, should make the final recommendation, which, with the comments of the Home Minister, if any, should be forwarded to the President, who should automatically accept it. This system may not be perfect, but it is any day better than judges be appointed by judges than by party-politicians.

PEOPLE ARE TALKING ABOUT LIC

Every year, about Rs 30 crores is received by people who own life insurance policies (or by their dependents). And it is interesting that more than 70% of this money is paid to policyholders on maturity of their policies.

This fact clearly demonstrates that the benefits of Life Insurance are being largely enjoyed during the life-time of the policyholder himself.

Millions of people are today realizing that Life Insurance is a unique investment of security — both for themselves and for their families. And millions of people are placing their trust in the soundness of the LIC to safeguard their interests.

Life Insurance Corporation of India

If you can say so about all the purchases you make, you will be saying good-bye to the uncertainty of material, quality, durability of product etc.

Unfortunately, there are many articles produced in India which do not conform to any standard—although they should. For, standards ensure quality products, fair competition, consumer goodwill, increased profits. To manufacturers producing goods according to Indian standards, the Indian Standards Institution grants licences for applying on their goods the ISI mark which is a third-party guarantee of quality.

Write to ISI for a list of products which are manufactured to prescribed standards and carry the ISI mark. Make sure that the next time you buy anything, it is a quality product carrying the ISI mark.

INDIAN ADMINISTRATION: MYTHS OF THE LEGACY

By C. S. VENKATACHAR, I.C.S. (Retd.)

THE fifteenth year of Independence is an opportune time to have a close look at the Indian administration. For, the old British Indian administration was one of those very impressive but curiously unsubstantial human institutions—almost a phenomenon, till it faded away in 1947. In many ways it resembled one of the Isles of Laputa in Gulliver's travels which contained many admirable things but which remained suspended from above the ordinary world.

It was neither an integral part of India nor of Britain. Guy Wint noted that the English Civil Servants in India—solidly English to the core—sat in fact on the Moghul throne and the empire of those Civil Servants was not integral to British political life.

To many Indians, it was a strange, inscrutable instrument of power of a distant, alien people. When the Awakening came in the 1920's the administration became an irritant which soon developed into one of bitter hostility and contempt towards it. Indian nationalism remained aloof from the machinery of the Government, barring a brief interlude of contact for two years in the field of provincial administration. The ruling party has, since independence, exhibited an inexplicable and perplexing attitude of ambivalence towards public administration and the Civil Servants, almost a feeling of revulsion somewhat akin to that against Western culture of which K. M. Panikkar wrote in the early 1920's as "Hating it with all our heart we may not get away from it." It is against such a background there stand out some myths of the pre-1947 administration.

An oft repeated, one thought of the I.C.S. as the steel frame of the administration. Lloyd George, whom Lord Keynes once described as "a prism which collects light and distorts it, a vampire and medium in one", coined the phrase to please the Tory Imperialists. Indians naturally resented the epithet but curiously believed in it. Because it was a good phrase, it stuck. No one cared to examine its inaccuracy.

Even if there was a frame, it had broken down under the impact of the first world war. The administration always retained its character of a vast Civil and Military bureaucracy—a well-devised system of administrative absolutism. The army, as in the case of the Hapsburg Empire, enforced a latent despotism. Till the first world war, the British ruled effectively at the district level and at the higher regions of the administration they skilfully manipulated power by a combination of authority, prestige and a nimbus round about that vague but glamorous entity known as the Raj.

Some foreign observers, while praising the remarkable stability of India in the 1960's, stress that a contributory cause was the handing over of the torch to the Indians as the British were making efforts generously to get out. This is a fiction as there was no conscious effort either to hand over or take over. Edwin Mon-

tagu was told as early as 1917 that the "Indian Servants were very sorry their day was done, recognised that it was inevitable and were willing to go ahead". Another thirty years had to elapse before independence came. During this period, the administration was changing in its composition and cohesion. The British were unable to restore the prestige of the Civil Service to the pre-war conditions. They had to carry out a series of manipulations to maintain the racial strength and composition of the I.C.S.

The administration ceased to have any dynamism. It could not go backward; it refused to move forward. It was trapped in a mental cul-de-sac. It lacked confidence and possessed no sense of purpose. One of the Englishmen who entered the I.C.S. in the 1930's found that the English had become strangers in India.

The administration which nicely confused, except to the initiated, the relation between the machinery and the men behind it, alternated between the Rule of Law and the Rule of men, with a bias, on the whole, in favour of the latter. Indians, with their background of literary tradition, thought the strength and merit of the service lay in the competitive examination in the erroneous belief that the ruling class was a meritocracy. The opposite was the case. A governing class, adapted to the needs of a growing empire was moulded in the last century in the English public schools and expatriated to India through the doors of competitive examination and in the far-flung outposts of the Empire, the public school 'chaps', in the words of Kipling, 'lived or died as gentlemen and officers.' "As a device for training the guardians of the British empire, the public schools deserve respect. They seem a good deal more ingenious, if only less painful, than the Chinese communes." Based on the English public school tradition, the civil services remained stubbornly English to the core till its very end. Lord Radcliffe in his lecture on the 'Problem of Power' referring to the Indian Services says:

"What was their secret? Power of Race? Sense of duty? Sound Schooling? All these things were present and yet the quality that strikes one most is a certain unaffected readiness to be themselves. Goethe noted in our countrymen: 'It lies' he said, 'in the courage they have to be that which nature made them'."

With all its English characteristics, a startling attribute of the administrative structure was that it had been neatly fitted into India's age-long caste system. The nineteenth century British bureaucracy during their residence in India, revelled in being members of a super-caste. They came from the governing classes and aristocratic society of the Victorian age and their social differentiation from the rest of the British population was tremendous. This aristocratic character of the British society was well stamped on the Indian administration. Competition based on a more democratic system of recruitment did not eliminate the caste spirit

in the Indian administration. The bureaucracy invented many ritualistic forms to keep it alive.

When Indians were inducted into the machinery, they felt quite at home with its caste spirit, if not with its racial exclusiveness. The higher Indian official became a 'predatory' status seeker partly because of the bar sinister. He also developed exaggerated notions of his personal status in relation to society which in reality meant his caste or social group. At the lower echelons of the administration, castes which had hereditary traditions for Government service, found a haven for the exercise of their caste spirit, in a bee-hive like activity in the hierarchical structure of the administration. Here is a *damnosa hereditas* bequeathed to the Indian Republic; within the bosom of a most up-to-date modern constitution functions an administration, well-saturated with caste spirit—alas considerably strengthened and rejuvenated by linguistic parochialism and caste patriotism of the new elites.

When the westernized Indian invaded the top echelons of the administration, it lost its organic character. It became mechanistic. The British refused to accept the standards of their competitive society. So, when it is said that Indians inherited the administration of the pre-independence period, it should be borne in mind that they became heirs to a skilfully constructed and carefully tended machine but devoid of any intellectual or

philosophical ideas. Many departing Britons thought that the machinery would go into a scrap heap in the sincere, if a mistaken, belief that in the Indian administration it is the men behind the machine who count. Withdraw them and the machinery, a clever piece of human invention, manipulated by an alien authority, with no roots in national life, would inevitably collapse. At best, the I.C.S. was "the mechanical expression of a legacy".

Administrative unity and the use of the English language created the illusory image that an all-India service under freedom is automatically transformed into a national bureaucracy. India equipped herself with a kind of *mandarinate* but not with a mandarin who had his psychological roots in India's culture. There is a wide gap between the elites and the masses; the Government and the administration are still disconnected from the people, despite the progress achieved since independence. The new intelligentsia is hostile to the idea of maintaining the unity of India through the English language. This is understandable as political power is passing into the hands of the elites of the regional languages. The English civil servants will have the status of hired technicians, possibly segregated into a separate and inferior social group. There appears to be a dim prospect for the emergence of a truly national bureaucracy, though the fiction is sedulously fostered that a pan-Indian Service creates national unity.

A proud achievement

Established in the record time of five months. The Company is equipped with the latest continuous process plant to produce filament yarn of all deniers. Also producer of Sulphuric acid, Sodium sulphide, & Carbon bi-sulphide.

BINNY's fabrics are shipped to this exciting land of New Guinea to help the people discover the wonderful new world of modern clothes.

BINNY's fabrics are exported to 49 other countries, too. Superb materials made only from cotton of the best quality and dyed with the fastest colours or so carefully bleached that the full strength of the cloth is preserved. Rigid Quality Control* ensures maximum durability and perfect finish.

Quality Control:
Modern machines process yarn and cloth so fast that often defects, invisible to the naked eye, creep into the cloth. Quality Control is laboratory testing to eliminate defects at every stage of production. That's why BINNY'S fabrics stay smart so long.

From palm leaves to TUSSORES

BINNY's manufacture nearly 90 million yards of cloth every year. Here are some of the varieties they make:
Shirting . Khaki Drills . Bleached & Dyed Drills
Towels . Anticrease Suitings . Tussore
Union Fabrics . Silk Saris etc. etc.

BIRDS are stepping up it

To sustain its expanding output, India's steel industry needs increased quantities of essential raw materials like iron and manganese ore, coal, limestone and refractories. By meeting a large part of this demand, Bird & Company (Private) Limited have been making significant contributions to the progress of the steel industry.

Birds have now launched on a programme of expansion, which when completed will step up considerably the annual output of these raw materials.

	PRESENT PRODUCTION	EXPECTED INCREASED PRODUCTION
Iron and manganese ore	2,000,000 tons	3,000,000 tons
Coal	2,250,000 tons	3,000,000 tons
Limestone	2,000,000 tons	2,500,000 tons
Refractories	100,000 tons	120,000 tons

This expansion will assure the steel industry of increased supplies of these vital raw materials.

THE BUSINESS WORLD

The Defences Behind Sterling

By PAUL BAREAU, Editor of 'The Statist'

THE reduction in the Bank of England rate from 7 to 6½ per cent, modest as it is, provides a significant sign of the turn of the tide. The stern measures called into being to meet the sterling crisis that developed with such dramatic rapidity earlier this year, have been making themselves felt both on the external and domestic fronts. The time has come for a slight easing of these restrictive measures and, in particular, for a reduction in the very high rates of interest which were again threatening to pull into Britain a dangerous and unwanted volume of foreign money.

The sturdy recovery in sterling which has made this possible, followed what looked like a near knock-out blow. The power of that blow has been fully revealed in the latest Quarterly Bulletin of the Bank of England. The attack on sterling began in early March when the German mark and the Dutch guilder were revalued. These exchange moves set off a wave of uncertainty and doubts about the permanence of the existing structure of all exchange rates. Sterling was the main victim of the resulting panic, partly because the balance of payments position of the United Kingdom was anything but satisfactory, partly because a large amount of foreign money had been attracted to the London market by relatively high rates of interest in the preceding months, and finally because sterling as a currency so widely used in international trade was inevitably vulnerable.

The extent of the run on sterling is to be gauged not merely by the fall in the gold and convertible currency reserve which over the first seven months of the year amounted to £278 million, but even more by the extent to which European central banks came to the rescue of sterling by extending short term banking accommodation to the Bank of England. The Bank of England itself has announced that at their peaks these short term credit facilities, arranged under what has become known as the "Basle Agreement" reached £325 million. Adding to this the loss of gold and convertible currencies in the reserve, a total of just over £600 million is reached — a figure which approximately corresponds to the net inflow of foreign balances during 1960. What came in then, went out during the first seven months of 1961. The Bank of England rightly describes this exodus and the speculative movements of funds that accompanied it as being "of a magnitude which had not been seen in the post-war years".

It was in those grim circumstances that the Government decided to introduce what was virtually a supplementary budget in July and allied this to restrictive credit measures, including a rise in Bank rate to 7 per cent. These may themselves have done little to produce any solution to the long-term problem of the British economy; but there can be no doubt as to their effectiveness in the short run and in removing the sense of panic and uncertainty which had for so long hung round sterling's neck.

In this respect, perhaps the most effective of these short term measures was the massive assistance which

was obtained from the International Monetary Fund from which Britain drew the equivalent of \$1,500 million in the form of nine different currencies. In addition it obtained a standby credit equivalent to \$500 million. The amount withdrawn from the International Monetary Fund has been used in part to rebuild the gold and convertible currency reserves which, by the end of September, had been strengthened to £1,260 million, a recovery of £393 million from the low point reached at the end of July. In addition the large bulk of the £325 million which had been borrowed from the European central banks has now been repaid.

The sterling scare is thus well and truly over. Behind sterling there is a solid phalanx of reserves. Apart from the gold and convertible currency reserve of £1,260 million, its highest level for more than ten years, there is the I.M.F. standby credit equivalent to \$500 million. The facilities that can be made available through inter-central banking credits under the "Basle Agreement" have been repaid and are, therefore, intact. If sterling or the dollar come under pressure, the International Monetary Fund will soon have at its disposal the additional resources promised under the Jacobson plan at the recent Vienna meetings of the Bank and Fund. These additional facilities may have certain strings tied to them by the French, the Dutch and the other creditor countries that may have to provide them but there is little doubt that if they were needed they would be forthcoming to the tune of the promised \$ billion.

This by no means exhausts the reserves that lie behind sterling. The British Government still owns dollar securities that were taken over from British investors during the war but never marketed. These at the latest count were valued at nearly \$1,000 million. In a real emergency the Government could also count on mobilising the privately owned dollar securities in Great Britain. These portfolio investments are now estimated at about \$3,000 million.

There should, therefore, be no qualms about the availability of adequate ammunition with which to defend the sterling and to repel any speculative attack that may be made on it. These reassurances, however, only apply to the short term. Looking beyond the next few months certain forbidding tasks loom on the horizon. The International Monetary Fund will have to be repaid and this can only be done by restoring to the British balance of payments the surplus which it has lost over the past three years. Here lies the most fundamental problem facing Britain. The competitive position of British industry must be strengthened, some attempt must be made to restore the surplus Britain used to earn in its "invisible" transactions with the rest of the world.

One of the main factors in the reduction and virtual disappearance of that surplus has been the growth in overseas Government expenditure. At the recent Lord Mayor's dinner to the Bankers and Merchants of the City of London, Lord Cromer, the recently elected

Governor of the Bank of England, asked whether the high level of Government expenditure overseas was not perhaps "based more on our Imperial past than tailored to our changing position in the world?"

There are, however, signs that events are moving,

albeit slowly, in the right direction. Exports are picking up, merchandise balance of payments is improving. The reduction in Bank rate would not have been made had the authorities not been fairly reassured about the direction in which economic developments in Britain are moving.

A Look at L. I. C.'s Investments

By CROESUS

WITH its annual rate of net investment of all kinds crossing Rs. 60-crores mark—it was Rs. 63.62 crores, to be precise—the Life Insurance Corporation of India has come to invest more than Rs. 5 crores every month, and the indications are that the rate will further rise in size with the steady growth of Life Insurance in the coming years. By reason of being such a large investor, the L.I.C.'s investment operations are naturally watched with considerable public interest. The discriminating public, especially that section which has a stake in investments, is always on the alert to ensure that the investment of the policy-holders' moneys continues to be done on the lines of the promises made at the time of nationalisation of life insurance in this country. In particular, they remember the assurances given by the Union Finance Minister, Mr. Morarji Desai, in Parliament that there would be no change in the respective shares of the public sector and the private sector as regards the investment of the moneys of the Life Insurance Corporation.

It is against this background that one has to study the following table showing the trend of stock exchange investment during the period 1957-60:

(Figures in crores of rupees)

Year	In stock exchange securities in India	In public sector in India	Per cent	In private sector in India	Per cent
1957	329.75	255.13	77.37	74.62	22.63
1958	368.93	288.12	78.1	80.81	21.9
1959	398.28	311.60	78.2	86.68	21.8
1960	457.43	360.06	78.7	97.37	21.3

It will be seen from the foregoing table that, although there has not been a material change in the respective proportions of investments in the public and private sectors, there is no gainsaying the fact that, from the point of view of the total value of investments and percentage-wise, there has been a steady increase in respect of investment in the public sector. In the private sector too, there has been a steady increase in the total amount of investment, but percentage-wise, it is significant that there has been a steady decline. If this trend were to continue, the respective proportions are bound to vary. Even otherwise, it seems difficult for the L.I.C., even if it wants to, after a given period, to maintain the present proportions, unless the scope for investment in the private sector increases commensurately with the rate of increase in the investible funds of the L.I.C. (which does not seem likely) or the permissible percentage of investment in individual companies is raised by the authorities (which may not be welcome to these companies). In other words, a situation may well be visualised when, even if the L.I.C. wants, it may not be able to maintain these proportions and also keep on investing its funds in stock exchange securities. Perhaps this is one of the reasons, suggest certain

quarters, which has prompted the L.I.C. to be more solicitous of investments in buildings. It is well-known that, both in England and in the United States of America, where, although insurance has not been nationalised, insurance companies undertake building operations on a vast scale. This is considered by them not only a good investment but as a contribution to the welfare of society. As a matter of fact, after visiting Poona in the wake of the devastating floods, recently, our Prime Minister drew the pointed attention of the Corporation to this fact and suggested that the L.I.C. could certainly help solve the problem of housing in a big way. That there is great scope for doing so is obvious from the percentage of investment in the total of all the three items that may be taken to represent this category, viz. loans to Co-operative Housing Finance Societies, (Rs. 2.50 crores), loans on house property (Rs. 25.66 crores) and loans to State Governments for their housing schemes (Rs. 11.31 crores) or a total of Rs. 39.27 crores out of a total investment of Rs. 512.76 crores in India, as the following table showing the breakdown of the L.I.C.'s investments in India on December 31, 1960 shows:

(In lakhs of Rs.)

Central & State Govt. and other Approved Securities	364,72.33
Municipal Securities not included above	65.98
Share and Debentures	92,04.91
Loans to State Govts. for Housing Schemes	11,30.84
Amounts due from State Govts. in respect of their controlled business taken over	6,02.78
Loans to Co-operative Housing Finance Societies	2,50.00
Other loans guaranteed by Govt.	50.25
Loans on mortgage of property	9,05.19
House Property	25,66.23
Other investments	27.88
TOTAL	512,76.39

The first four items of the above table are really the items that will attract the utmost attention, and it must be said to the credit of the Corporation that complete details of its stock exchange investments have been provided in its Fourth Annual Report. The total of these items comes to Rs. 470.72 crores, of which Rs. 457.43 crores represents the value of the Corporation's investment in India and the balance of Rs. 13.29 crores the value of investments outside India. Out of the former, investments in the public sector amounted to Rs. 360.06 crores or 78.7 per cent of the total while the investments in the private sector were no more than Rs. 97.37 crores or 21.3 per cent of the total investments in India. The investments in the public sector include Central Government securities (Rs. 228.25 crores, State Government securities Rs. 94.90 crores, municipal loans Rs. 65.98 lakhs and debentures, preference and ordinary shares Rs. 30.98 lakhs). Similarly, investments in the private sector include investments in approved securities of Rs. 5.64 crores and in debentures, preference and ordinary shares of Rs. 91.73 crores. It

is interesting to note that, out of the total of Rs. 360.06 crores investments in the public sector, investments aggregating Rs. 30.98 lakhs in debentures, preference and ordinary shares as well as Rs. 65.98 lakhs in Municipal loans do not come under "approved securities." Although a glance at the list of these investments must impress anyone, the fact that they are not "approved securities" may occasion adverse comment. For this reason, either securities in question must be added to the "approved" list or the L.I.C. specially and specifically permitted to invest in these "not approved" items. In the private sector investments, however, the entire amount of Rs. 5.64 crores are under "approved securities" and it is significant that they represent debentures of co-operatives or credit institutions.

Out of the total investments of Rs. 97.37 crores in the private sector, as already noted, Rs. 5.64 crores constitute the so-called "approved securities", leaving a balance of Rs. 91.74 crores as representing the Corporation's investments in other debentures, preference shares and ordinary shares. The Corporation has provided the following interesting table giving an industry-wise breakdown of the L.I.C.'s major investments (i.e. those investments that are in excess of Rs. 2 crores):

(Rs. in crores)	
Industries	1960
Electricity	9.55
Engineering	9.10
Cotton textiles	8.57
Iron & Steel	7.67
Mineral Oil	7.49
Cement	5.34
Jute	4.31
Paper and Boards	4.09
Electrical goods	3.06
Banks	2.97
Sugar & Breweries	2.90
Aluminium	2.65
Insurance	2.60
Coal	2.36
Plantations	2.00
Rubber products	2.16
Other industries	15.23
TOTAL	92.05

It will be seen from the foregoing table that the largest individual investments have been made in the electricity and the engineering industries, followed by cotton textiles, iron and steel, mineral oil and cement, in that order. In all these cases, the total value of the investment has exceeded Rs. 5 crores. The total number of industries in which the L.I.C. had investments at the end of 1960 amounted to 28, as against only 22 at the end of 1957, and many of them are new industrial ventures. This is an indication of the refreshingly welcome attitude of the L.I.C. towards investments in new industries and industrial undertakings.

A few words now about the L.I.C.'s investments in one form or another, in house building schemes. The L.I.C. has been helping the house building operation in a number of ways. Thus, the Corporation has given loans to State Governments for housing schemes, and, at the end of 1960, the total of such loans aggregated Rs. 11.31 crores. Secondly, the L.I.C. has been giving loans to co-operative Housing Finance Societies. The total of such loans at the end of 1960 stood at Rs. 2.50 crores. The L.I.C. has also invested in house property to the tune of Rs. 25.66 crores as on December 31, 1960. Thirteen States have benefitted from the L.I.C.'s loans to State Governments for housing schemes and it is the MP Government that has taken the maximum advantage, accounting for the largest amount among the 13 States, namely Rs. 1.74 crores. The entire Rs. 2.50 crores under loans to Co-operative Housing Finance Societies has gone to the Bombay Co-operative Housing Finance Society, no other State Co-operative Housing Finance Society having as yet availed itself of this facility. Obviously, the investment of Rs. 25.66 crores in house property represents the investment of Life Office buildings in different parts of the country, including those owned by private insurers in the past, which had been, and still continue to be, rented out. Perhaps the investment of Rs. 9.05 crores on loans on mortgage of properties also includes loans to policy-holders who may have mortgaged their property and taken loans against that security, and, in one sense, even this can be considered as an aid to building operations. But, even so, the total extent of aid by the L.I.C. to house building operations cannot be considered to come anywhere near the expectations of our Prime Minister and, to quote his own words "a state corporation like the L.I.C. of India should be presumed to have a greater social outlook."

Business Notes

Rubber

STATE OF THE INDUSTRY

AT THE 40th meeting of the Rubber Board, Dr. Rama Varma, the Chairman, surveyed the present conditions prevailing in the industry and discussed certain important problems that face the industry today. Commenting on the target fixed for rubber (1 lakh tons constituting 45,000 tons of natural rubber, 50,000 tons of synthetic rubber and 10 to 15,000 tons of reclaimed rubber) by the end of the Third Five-Year Plan, he stressed that the industry will have to equip itself with a production programme to achieve it. At present the area under rubber is nearly 3.21 lakh acres, of which 1.74 lakh acres or nearly 54 per cent is mature for tapping. By the end of 1965, it is expected the tapable area would increase to nearly 2.64 lakh acres. This shows nearly 52 per cent increase in the effective area. On this basis, the output may increase to nearly 38,000 tons, taking into consideration the present output of 26,000 tons. He is of the opinion that it may reach even 40,000 tons if due weight was given to the pro-

duction from clonal seedlings and budded trees that would be tapable by that time. It is clear, therefore, that to attain a target of 45,000 tons, greater effort would be necessary. Some of the methods suggested by him to increase output are improved manuring practices, adequate plant protection, new methods of tapping, application of yield stimulants and better employer-employee relations.

Commenting on the structure of the industry, he said that the size of holding has an important bearing on any measure for increased production. At present the total number of registered holders is 57,731, of which only 547 have estates of above 50 acres in size (covering an area of 1.32 lakh acres). The number of holdings of 50 acres and below is nearly 57,174 covering an area of 1.89 lakh acres. This includes 49,636 holdings of 5 acres and below, the average size of which is less than 2 acres. The small size of average holdings raises an important point in respect of productivity. Mr. Varma pointed out that to give full employment to a tapper, a minimum of five acres are required. If a 'task' is to include instead of only 250 trees, 300 to 400 trees as in

Malaya and in other rubber producing countries, the size of the holding has to be raised further. It is these considerations which induced the Board to recommend to the Government to advance loans on easy terms to small holders to enable them to increase their holdings to blocks of 5 to 15 acres. This seems to be a wise suggestion and it is hoped the Government would give sufficient attention to its implementation.

The state of finances of the producers is also a major factor. The main handicap is the lack of working capital. It is true that a small holder gets some credit facility from the Co-operatives, but the fact remains that the existing arrangements for short-term credit to small holders of rubber are totally inadequate. In view of the fact that small holders have increased by 324 per cent between 1950 and 1960 and the area covered by them has also gone up by 250 per cent, special attention has to be paid and wherever necessary the Government should come forward. The Board's replanting subsidy scheme and new planting scheme, it appears, must be helpful, though for long-term capital requirements only. Dr. Varma made it clear that the Board has yet to evolve a plan, precise and complete in details, to meet the short-term credit requirements of small holders. It is hoped some solution would be forthcoming.

Foreign Trade

NEED FOR PLANNING

TOTAL WORLD trade in 1960 showed a considerable rise over the previous years. While the annual average of imports and exports aggregated \$112.5 billion and \$119.3 billion, respectively, the actual imports and exports in 1960 amounted to \$113.4 billion and \$118.9 billion, respectively. However, over the same period, the performance of India lagged behind her performance in previous years. The total worth of India's exports were valued at only Rs. 6.3 billion, while her imports amounted to Rs. 10.1 billion, so that the gap between our exports and imports has widened further. It was only Rs. 2.9 billion in 1958, which increased to Rs. 3.2 billions in 1959 and further increased to Rs. 3.8 billion in 1960. Even in the current year (1961), according to available figures (for the first five months), exports and imports have reached Rs. 6.6 billion and Rs. 9.8 billion, respectively, disclosing, again, a gap of Rs. 3.2 billion for only a part of the year. If this rate of rise in our trade gap were to continue, despite the observance of strict import controls, the resulting effect on our balance of payments position would be disastrous. The problem is serious in all conscience and cannot be tinkered with; it must be solved on a long-term basis, as Mr. Morarji J. Vaidya, President of the Indian Council of Foreign Trade (I.C.F.T.), rightly observed, while addressing the central committee of that body at Bombay recently. Mr. Vaidya pointed out that the present exchange crisis was the outcome of wishful thinking and miscalculation of the Government in having laid unduly excessive dependence on short-term credit. As a result, the commissioning of many industrial plants could not be carried out according to schedule and the anticipated quick returns have been delayed longer than anticipated. In consequence, savings from the industry also have not materialised as expected. On the other hand, repayment of the debts by us has become overdue.

One of the causes for the present predicament, according to Mr. Vaidya, has been the keen interest of both the Government and the industrialists to industrialise the country willy-nilly. The rate at which imports of capital goods have been taking place in view of this all out industrialisation has been faster than the resources of the country can permit in terms of

the foreign exchange available. Even the long-term credit secured by the Government for the purpose could not be availed of at the right time, thanks to delays in the allocation of these funds among the various and numerous claimants, as, for example, the small car project, the aluminium projects, the rayon projects, and the steel projects, all of which have had to suffer in the event.

In Mr. Vaidya's view, the position as it has now developed calls for immediate attention to two problems: first, that the process of translating planning into action requires efficient co-ordination between the Government and the private sector; "undue obsession about the integrity of one section or the other does not prevent us from implementing practical policies which would yield desired results" to quote his words and, secondly, the schemes for export promotion should be so devised as to cover all the interests who are connected with exports directly or indirectly.

The ICFT Chief also noted three factors which would benefit all the interests and also activate exports. For one thing, he wanted the incentives which are presently being provided for exports by manufacturers to be made available to exporters who are traders also; secondly, the Government should, instead of specifying incentives in terms of import licences for specific raw materials, components, etc., introduce a system of incentives based on the retention of a part of the foreign exchange earned by the exporter; and, thirdly, the export activities of the STC should be minimised. In this connection, Mr. Vaidya cautioned that it is not a matter which can be achieved through the disposal of files on a politician's or a bureaucrat's desk, however, clever and able the person concerned may be in his own sphere of administration, as some of these seem to believe. The export trade of any country can only be built on the sure basis of years of experience of those engaged specifically and specially in the field and whatever we may do to reorientate our export policy without regard to this basic fact is doomed to certain failure.

INDO-MALAYAN TRADE

IT SEEMS a little strange that a foreign trade delegation should tell us what we should do in regard to our export trade. Could not the authorities in this country ever think of installing a permanent exhibition emporium in Malaya and a permanent trade commission over there? The suggestion coming from the Malayan trade delegation, however, has substance in it and needs to be pursued in right earnest.

That there exist vast possibilities of trade between the two countries, of course, goes without saying. The Malayan Trade Delegation which is in this country to explore possibilities of increasing her exports to India and to find out the reasons for the decline in Indo-Malayan trade, has pointed out that India can capture the market in Malaya provided it maintains the quality of its goods. There exist vast possibilities in the Malayan market, particularly when Malaya has now embarked on a Five-Year Plan of economic development which would open up the Malayan countryside. The extension of economic frontiers and rural development would naturally create a matching increase in demand for manufactured and consumer goods, which Indian industry could meet.

Our goods are quite popular in Malaya. An instance of Usha electric fans was given by the Malayan delegation to prove this point. India can export machine tools, machinery and durable consumer goods such as electric fans, bicycles and wireless sets, a variety of other goods like razor blades and pharmaceuticals and a wide range of plastic and chemical manufactures. It is now for Indian business men to come forward and explore the possibilities. Perhaps

a trade agreement between the two countries could extend facilities both to Malayan and Indian traders and thereby improve the trade relations between the two countries further. India's adverse balance of trade with Malaya in 1959 was to the tune of 58 million dollars. With a publicity campaign of high order and making its goods more competitive, India can certainly bring about improvement in her balance of trade. The opening of trade centres in Malaya at strategic places might also be helpful.

EXPORT PROMOTION

VARIOUS TRADE bodies have of late been stressing their viewpoints in regard to export promotion. The latest to come out have been the Federation of Indian Chambers of Commerce and Industry, Bharat Chamber of Commerce and the AIMO Export Promotion Seminar, jointly organized by the All-India Manufacturers Organisation, Association of Indian Industries and the Indian Council of Foreign Trade. Of the notable suggestions made at the Seminar was that of Mrs. Sinha, India's Deputy Finance Minister, that the pattern of production must move in step with the requirements of foreign trade and the structure of India's foreign trade must, in turn, reflect the changes in the economic structure. It is clear that in spite of external aid, there is likely to be a serious shortfall in the Plan, if exports during this period do not increase significantly beyond the present level. And to bring about this increase in exports, it needs to be emphasised that production costs must be reduced.

As to what the manufacturers could do for export promotion, Mr. Prabhu V. Mehta, the Chairman of the AIMO special committee for industrial finance and development, said that India as a whole and particularly Indian business men should have a slogan "sell Indian goods" to meet the needs of time and replace the pre-Independence slogan "buy India" or "buy Swadeshi". Discussing the need for export promotion, Mr. Mehta said that a proper determination of export prices would pave the way for larger exports with greater certainty. Mr. Mehta pleaded for the adoption of modern methods of sales promotion such as prestige publication for each product, employment of audio-visual publicity campaign and the training of multi-lingual marketing men. Business ethics and the adoption of fair trade practices have become an article of faith in international business. It is, therefore, important that Indian exporters should strictly adhere to all contractual obligations so widely necessary to build good customer relations. All said and done, it needs to be emphasised that a time has come when all thinking men should realize that without an active, vigorous and efficient campaign to sell our goods abroad, there is no solution to the country's foreign exchange problem.

Stock Exchanges

BETTER ORGANISATION

IN PURSUANCE of the decision taken by the presidents of the seven stock exchanges in India, last month, to meet periodically to review the working of stock exchanges, as also to take such measures as are necessary for their proper functioning, the committee of the presidents of the seven stock exchanges in India (Ahmedabad, Bombay, Calcutta, Madras, Delhi, Hyderabad, and Indore) met in Bombay last week. The main outcome of this first meeting of the committee was the proposal to introduce a uniform scheme of automatic margins on carry-over ('badla') business. According to Mr. P. S. Nadkarny of the Stock Exchange Division of the Finance Ministry, Convenor of the committee, the graded scale of carry-over margins would range from 2 to

50 per cent, depending upon the load of carried forward business in all the cleared shares from one settlement to another.

In view of the great disparities existing in different stock exchanges as regards the price of a membership card and the security deposit (in Bombay, for example, the value of a membership card and the security deposit are Rs. 20,000 and Rs. 25,000 respectively, while in Ahmedabad, it is Rs. 5,000 for both membership and security deposit), the committee decided to consult their respective Boards of Directors, before formulating details of the necessary forms, statements, returns, etc.

Referring to the problem of kerb trading and option business, there was unanimous agreement for a check on these but, the committee left it to the discretion of the respective stock exchanges to deal with the problem as best as possible.

The question of listing shares is not without its share of difficulties. It is noteworthy that the committee accepted the suggestion that the bigger exchanges be asked to help the smaller ones who have got very little business, by persuading the companies having their registered offices in the jurisdiction of the smaller stock exchanges to have their shares first listed on these exchanges.

Two problems have come into the limelight as a result of the meeting. First, though the market mechanism is left to be controlled by stock brokers, their behaviour has to be so readjusted as to serve the interests of the investing public better. Secondly, the periodical meetings will undoubtedly keep the stock exchanges abreast of happenings, and public opinion is bound to have its impact upon every meeting. There is no gainsaying the fact, therefore, that the first meeting has begun well and has ushered in a new epoch in the history of stock exchanges in India.

LIC

A YEAR OF PROGRESS

THE ANNUAL REPORT of the LIC released last week shows a steady progress attained during the recent years. During 1960, for instance, life funds increased by nearly 56 crores to Rs. 560 crores, and total assets increased from Rs. 554 crores in 1959 to Rs. 662 crores in 1960. The total business in force at the end of the year shows that it covers 77.13 lakh policies amounting to Rs. 2,285 crores — an increase of Rs. 327 crores over 1959. During the year 1960, the Corporation wrote a total business of Rs. 495.72 crores and issued 12.34 lakh policies. As against this the performance during 1959 was total business of Rs. 427.16 crores, and 11.23 lakh policies. The new business during 1960, therefore, increased by nearly 16.1 per cent over the previous year's level. The performance of the Corporation can be seen in another way: the average sum of insured policies. In India it increased from Rs. 3,671 in 1959 to Rs. 3,903 in 1960, while in its business abroad the average sum increased from Rs. 11,969 in 1959 to Rs. 12,539 in 1960. Moreover during the year 1960, the Corporation paid an amount of Rs. 30.69 crores towards settlement schemes: Rs. 7.68 crores were claimed by death and Rs. 23.01 crores by maturity.

Another measure of Corporation's continued progress is that it has opened one regional office, three branch offices, and 39 sub-offices and upgraded 24 sub-offices as branch offices. Besides the Corporation opened 74 centres in 1960. These centres when fully developed will be upgraded as sub-offices. The Corporation also opened a branch office in London. With this the Corporation now transacts new business in Eden,

Fiji, Hong Kong, Kenya, Malaya, Mauritius, Singapore, Tanganaika, Uganda, United Kingdom and Zanzibar.

Under a TCM project a team of three senior officers of the Corporation visited U.S.A. to make a study of American life insurance practices. The team is to report on the ways on which American methods can be adapted in India. The recommendations made by this team are under consideration of the Corporation at the moment. Apart from this report, an interesting controversy was raised regarding the insurance rates which were recommended to be lowered. It appears the Corporation may sooner or later consider to reduce its rates and the insurance business, in that case, will show an added progress.

Steel

STEEL PLANTS IN SOUTH

THE POSSIBLE location of pig iron plants in the South is being considered by the Government of India in pursuance of its policy to avoid concentration of industries in any particular area and devote special attention to under-developed regions, the Union Minister for Steel, Mines and Fuel, Sardar Swaran Singh, revealed in Madras recently. The Minister pointed out that the possibility of smelting iron ore with lignite briquettes would open up opportunities of producing pig iron in Madras which could be converted into steel. In line with this policy, the Mysore Iron and Steel Works at Badravathi, the Minister said, had been encouraged to expand, although it involves haulage of larger quantities of coal from Bengal and Bihar regions.

A scheme for a Steel Plant has already been drawn up and included in the Third Plan, pending the success of the pilot tests of Neyveli lignite. Commending the progress made so far in Neyveli Project, the Minister said, the integrated lignite project is estimated to cost about Rs. 100 crores which has been broken up under different heads as follows: (1) Rs. 20 crores for the mining operations; (2) Rs. 22 crores for processing and utilizing lignite for the generation of 250 mega-watts of electric power using one and a half-million tons of lignite; (3) Rs. 26 crores for the urea and fertilizer plant designed to produce 1.52 lakh tons of urea per annum using about 6 lakh tons lignite annually; (4) Rs. 20 crores for the briquetting and carbonisation plant, and (5) Rs. 11 crores for other works.

The briquetting and carbonisation plant is designed to produce smokeless fuel, particularly suitable for domestic purposes, and also valuable bye-products. All the schemes are closely integrated, the products of one or the other of the schemes constituting the raw materials of essential utility for one or more of the others.

Tobacco

SURPLUS U.S. AND PHILIPPINES STOCKS POSE SERIOUS PROBLEM

THE MOUNTING stocks of tobacco in the United States and the Philippines since 1955 pose a serious problem for big tobacco-producing countries like Rhodesia and India. This is the opinion expressed by Mr. E. R. Campbell, Chairman of the Tobacco Export Promotion Council of Rhodesia and Nyasaland. The U.S.A., Mr. Campbell pointed out in Bombay last week, had by now accumulated a total stock of 500 million lbs. of flue-cured tobacco. Philippines had supplies to suffice for her requirements for the next five years. These stocks, he said, were unsaleable today due to their high prices and also, in some cases, due to the quality. "But a day must come when these countries will have to dispose of their stocks even at a serious loss." When large quantities came to be dumped in the world market, orderly marketing that Rhodesia and India have, would be obviously disrupted, opined Mr. Campbell.

Another serious problem that the tobacco-producing countries in the Commonwealth will have to face is U.K.'s possible membership of the European Economic Community. The extent of the damage to the tobacco-growers caused by this factor, Mr. Campbell said, could not be ascertained as long as the conditions under which Britain would join the ECM and the concessions she would be able to wring for the Commonwealth countries were not known.

The World Tobacco Congress which is scheduled to meet in Salisbury in 1963, Mr. Campbell hoped, would discuss the problem. He also called for an understanding to be reached between the tobacco-growing countries and those which were building up huge stocks, on the orderly liquidation of surpluses so as not to upset the export markets of countries like India and Rhodesia. This is possible in view of the rising demand for cigarettes in the world, consequent upon the increase in population and improving standard of living. Mr. Campbell urged the need for Indian and Rhodesian tobacco industries coming closer.

Soap

MEETING THE TARGET

DURING THE last few years soap industry in India did not fare very well because various raw materials were not available; but this problem was solved to some extent in 1960 and the organized units produced nearly 1.40 lakh tons. Mr. S.P. Godrej, President of the Indian Soap and Toiletries Makers' Association, pointed out at the annual general meeting held recently at Calcutta that the output could have been more if sufficient capacity were available with certain producers and adequate supplies of suitable raw materials were made available to certain others. This is a known fact that a number of units have been going with idle production capacity due to inadequate supply of suitable indigenous as well as imported raw materials. In view of the 1965-66 target of 500,000 tons laid down by the Planning Commission (organized sector: 2.2 lakh tons, and unorganized sector 2.78 lakh tons), special efforts will have to be made by the industry.

Mr. Godrej pointed out that due to the acute stringency of foreign exchange, Government found it impossible to grant adequate licences for modern plant and machinery as well as for raw materials to meet the industry's needs. It cannot be forgotten that soap consumption is a symbol of the country's progress. It would not be very proper to minimise the needs of foreign exchange for this industry. The Government must take steps to encourage the output of modern soap making machinery in India. The Chairman pointed out that there is hardly any producer who is engaged in this line. In order to adopt latest production techniques, it is necessary that the producers of soap machinery are encouraged. The production of caustic soda in the country too is to be stepped up considerably and the gap, if any, has to be met by adequate imports.

Another important point raised by the Chairman was in respect of small-scale producers, who should make the commodity available in the villages. He was of the opinion that many of the small producing units are situated in urban areas and in some cases, they maintained their units at a smaller level just to get the benefit of excise exemption. The Chairman was of the opinion that Government should bring down the exemption level to a low minimum of 30 to 40 tons per year, which will benefit the really small units and the units producing 50 to 200 tons be made to pay a moderate cess of Rs. 50. This seems to be a sound proposal.

150 YEARS

1811-1961

KRUPP

4 man-trolley bridges, each capable of lifting 16 tons at a speed of 90 m/minute. Span 65 m. Apron 48 m. These bridges were built by Krupp-Ardelt, Wilhelmshaven.

For 150 years, the name of Krupp has been identified with superb workmanship and enduring quality.

The name of Krupp is also linked with outstanding pioneer work, past and present, in many fields of industrial research, planning and manufacture.

The results achieved have caused the name of Krupp to be permanently associated with progress in engineering throughout the world.

Products and Services:

Exploration of mineral deposits · Engineering of mining schemes · Design, layout, and supply of plant for the production and processing of ferrous and non-ferrous metals · Preparation and dressing plant for ore, coal, and other minerals · Chemical-process plant · Cement, lime, and gypsum plant · Bridges, hydraulic structures, and reinforced-concrete structures · Materials, pressure vessels, and tanks for nuclear reactors · Castings and forgings · Rolls · WIDIA-sintered carbide · Magnetic materials · Cable-making and stranding machines · Hydraulic extruders · Machinery for the rubber and plastics industries · Edible oil extraction plant · Sheet-metal working and can-making machinery · Mobile water purifiers · Plate and sheet-metal fabrications · Pneumatic tools · Motor trucks, buses, and special-purpose vehicles · Diesel and electric locomotives · Special-purpose freight cars · Ocean-going vessels and river craft · Diesel engines · Giant excavators and bulk-handling plant · Power shovels and cranes.

See us on our Stand at the
Indian Industries Fair, New Delhi

His costs will go up this month...

Because he has had a machine breakdown and has had to replace costly parts which were ruined by faulty lubrication. This didn't have to happen — a Caltex Lubrication Survey could have spotted the trouble — solved the problem.

Machinery shutdown means loss in production, time and money. Correct lubrication is therefore essential to ensure the protection and efficient operation of costly machinery. Planned lubrication is vital for increased production at lower costs.

This service is yours for the asking — call in your Caltex Lubrication Engineer — arrange for a correct lubrication programme for your plant. Let us help you in conserving parts and money.

PLANNED LUBRICATION — A VITAL FACTOR IN COST CONTROL

FROM THE CAPITAL'S CORRIDORS

SMALL CAR CONTROVERSY

THE 'Small Car' Project is still in a state of confusion. While the Planning Commission did not include it in the Third Five-Year Plan, the Finance Minister, before he left India, gave his "conditional" approval to the Project. The Defence Ministry also came in with its project to manufacture "Economy Car" with Japanese collaboration. The Government has, however, not still reached any decision. The Federation of Indian Chambers has, meanwhile, come out with its bold proposition, which is likely to be read with interest.

The Committee of the Federation of Indian Chambers of Commerce and Industry recalls the record and potentialities of the automobile manufacturing units which are currently in operation in the country. It says: "These units have been set up in collaboration with foreign enterprises and in consultation with and approval of the Government of India. The industry had to pass through difficult times in its early years. Volume of demand particularly at that time was very low. The future was uncertain. The inadequate foreign exchange allocation to the industry added to its difficulties and has been primarily responsible for curbing the further growth of industry. Nevertheless, the industry gradually consolidated its position. The indigenous content of the cars has steadily increased. Some of the manufacturers have indicated their willingness and capacity to undertake the production of the type of car as envisaged by the authorities".

In view of these factors and also in terms of Government's declared policy that it will not enter lines of manufacture which the private enterprise is capable of handling, the Committee seems to be disturbed at the reported decision of the Government to go ahead with the project. In this connection, the Committee frankly brings it to the notice of Government that if it proceeds to implement this decision, it will have far-reaching repercussions on business sentiment, especially in the minds of foreign collaborators.

Another point that has been raised by the Committee is in respect of foreign exchange required for the project. If the proposed project has not been provided for in the Third Five-Year Plan, it has not been made clear as to how the Government proposed to secure foreign exchange. "It is said that foreign exchange will be taken out of what has been earmarked for the Automobile Industry. If this report is correct, it is a serious matter in that, as already explained, inadequate foreign exchange allocation has already had an adverse impact on the growth of automobile industry." If the necessary exchange is to be made out of the total foreign exchange pool, the Committee is doubtful if the extra foreign exchange will be made available by the World Bank or members of the Aid-India Club to finance this specific project. "On this analysis, foreign exchange will be spent on the project at the expense of other projects which have already been included in the Third Five-Year Plan. And, obviously, those that have been included must be deemed to be of greater urgency". The Committee, therefore, trusts that the Government will not proceed with the project as it is not in keeping with the principles of Industrial Policy.

The above observations may be read with interest in the light of the recommendations of the People's Car Committee. This Committee has said:

"It is possible, at present levels of material costs, labour rates, and various taxes, to produce a car at an ex-factory price of Rs. 5,100 on an annual production rate of 50,000 cars, exclusive of excise duty.

When the production rate is 20,000 cars per annum, the ex-factory price is estimated to be around Rs. 6,150, exclusive of excise duty.

Car production, with an initial indigenous content of fifty per cent, can be commenced in 24 months from the date on which land is made available to the project authorities and an agreement with the collaborator signed.

It is possible to build up production with a more or less wholly indigenous content within a period of three years from the start of production.

Of all the proposals received, that of Regie Nationale des Usines Renault of France, for the production of the Renault 'Dauphine' car is the most acceptable on the basis of technical suitability, satisfactory collaboration terms and experience and background of this State-owned firm.

The offer made by Regie Nationale des Usines Renault of France for the production of the Renault 'Dauphine' car furnishes a promising basis for further negotiations.

In the limited time available, it has not been possible to undertake the detailed studies of prospective sites. However, on broad technical considerations the most appropriate location for the proposed Plant should be found within the area bounded by Agra in the North, Rajpur in the East, Hyderabad in the South and Nasik in the West."

Certain other recommendations relating to production, build-up training, sales, etc., detailed in the Report include:

(i) The car should be marketed in two versions — standard and deluxe — of the model. The latter to have additional fittings — particularly for export.

(ii) Production of other types of vehicles such as pick-ups, station wagons and delivery vans using the same power equipment and other fittings as the car should be taken up as demand develops.

(iii) The same engine as in the car can be used for small generating and pumping sets required in an increasing scale in Community Development areas.

(iv) Land and factory buildings should be constructed as required for the final rate of production even though the requirements in the earlier stages may be somewhat less.

(v) The Plant should be located in an area where the cost of construction would be within the figures estimated.

(vi) Surplus capacities likely to be available in other factories in the country for various processes such as body pressings, forgings and castings should be taken advantage of to reduce capital cost of production machinery.

(vii) Consideration should be given to the possibility of procuring machinery and plant from U.S. Defence Surpluses.

(viii) Expenditure on the residential colony to be provided should be limited to Rs. 150 lakhs for an annual production rate of 20,000 cars and Rs. 250 lakhs for an annual production rate of 50,000 cars.

(ix) Every endeavour should be made to obtain experienced management and supervisory personnel from existing Government plants.

(x) Training facilities available on the Indian Railways and in other Public Sector Plants should be made use of for speedy training of staff.

(xi) If Renault are appointed as the collaborators, advantage should be taken of the Indo-French Technical Aid Agreement for the training of Indian personnel abroad.

(xii) Plant erection and staff strength must be accurately matched to production build-up to keep costs down to the minimum in the initial stages.

(xii) It will be expeditious and advantageous for the Plant Authorities to work abroad in the close liaison with the collaborators for the early procurement of plant and machinery.

(xiv) It may be possible to obtain some parts from alternative sources such as Railway Workshops, automobile manufacturers and other Engineering Plants. This will help reduce capital expenditure and also to increase the indigenous content in the initial stages.

(xv) The range of manufacture in the main plant should be reduced to the minimum and the ancillary industry encouraged to produce a larger range of components.

(xvi) Proprietary ancillary fittings already being produced in India should be used in the proposed car to the maximum extent permissible by design.

(xvii) It should be possible to procure ancillary components manufactured in India at a level of around fifty per cent above the foreign prices and, in fact, to further reduce the costs of production in the country.

(xviii) Long-term contracts should be arranged with ancillary equipment manufacturers to ensure satisfactory prices.

(xix) A Development Suspense Fund should be operated to absorb the differential between cost of production and ex-factory price in the initial stages.

(xx) Dealer's commission should be fixed at 7½ per cent of ex-factory price or Rs. 400 whichever is less.

(xxi) An equated transport charge should be levied on all cars sold within the country, irrespective of distances of haulage.

(xxii) Consideration should be given to the possibility of reviewing and revising the present rates of excise duty and to correlate these either to horsepower or cost of production.

(xxiii) Profits from the sale of spare parts and over-hauling of power packs — which have been left out of the estimates of cost of production — will have a material effect on the ex-factory price as sales build up.

(xxiv) Regional distribution of cars should be arranged by the Plant Organisation itself.

(xxv) Sales of cars to individual customers should be through private agencies.

(xxvi) Export of cars should be undertaken by the Sales Organisation of the Plant itself.

COMPULSORY EXPORTS

The Union Government, it is learnt, has not abandoned the idea of going in for legislation to secure compulsory exports. The measure is still under consideration of Government and only last week the Economic Secretaries Committee on export promotion dwelt upon the issue in all its ramifications in the light of the comments made at the Export Promotion Advisory Council meeting last month. A final decision on the question is likely to be taken in the near future.

EXPORT OF SUGAR

The Government of India has approached the British Government for allocation of a quota for export of sugar from this country to the United Kingdom under the Commonwealth Sugar Agreement. The Indian Government has also requested the U.K. Government to use its good offices in getting an increased quota for Indian sugar for export to the international market.

There does not seem to be any difficulty in India being allotted a quota under the Commonwealth Sugar Agreement. Thirty per cent of the sugar requirements of the United Kingdom are reserved for being supplied by the local producers, 60 per cent from the Commonwealth countries and the remaining 10 per cent from

the members of the International Sugar Agreement. Among the countries which have got a quota for sugar exports to the United Kingdom under the Commonwealth Sugar Agreement are included Australia, South Africa, West Indies, Fiji and Mauritius. As South Africa has voluntarily withdrawn from the Commonwealth, her quota can conveniently be diverted to India.

The real difficulty, apart from the price factor, which will arise in respect of export of Indian sugar to the United Kingdom is that the U.K., like the United States of America, is used to specially refined sugar. The intake into the United Kingdom of the kind of sugar India produces is practically nil. Great Britain imports raw sugar from abroad and refines it itself. Apart from meeting her own consumption, she exports refined sugar to East Africa, Singapore, Malaya and even to the United States. If India wishes to enter the Commonwealth Sugar Agreement on a permanent basis, she will obviously have to change her pattern of production.

INDO - U.S. ACCORD ON TEXTILE EXPORTS

India and the United States have agreed to work towards increased access to world markets for cotton textile exports on a constructive and orderly basis. The agreement, it is learnt, has been reached at the informal discussions held last week in Washington between the officials of the Indian and United States Governments. These officials were assisted by the representatives of the textile industries from both the countries.

A joint communique issued in Washington and New Delhi simultaneously at the end of the discussions, said that the desire of the two Governments to facilitate economic expansion and in particular to promote the development of less-developed countries by providing increasing access for their exports of manufactured product was reaffirmed.

HIGHER PROFIT FOR N.C.D.C.

The National Coal Development Corporation has earned a net profit of over Rs. 1 crore during the year 1960-61, as against about Rs. 20 lakhs in the previous year. The higher profits earned by the Corporation in 1960-61, according to its Chairman, Sardar Ujjal Singh, is accounted primarily by a substantial increase in production compared to the previous year and to some extent to better supervision.

Addressing the recent annual general meeting of the Corporation, Sardar Ujjal Singh contended that the Corporation had achieved the coal output target set for it under the Second Five-Year Plan. During the last three months of the Second Plan period, the Corporation, he said, had attained an annual rate of production of 13.7 million tons approximately, as against the target of 13.5 million tons.

The Chairman dwelt at length on the facilities arranged by the Corporation for training technical personnel which have been in short supply for its purposes. The Corporation has set up five mining training schools in different areas with an intake capacity of 552 a year. These schools provide for four separate courses of training for periods varying from 13 months to 3½ years in subjects like fitters, supervisors, surveyors and assistant surveyors. In 1960-61 as many as 188 trainees completed their courses at these schools.

The Corporation has also a scheme for training of mining engineers and graduate electrical and mechanical engineers. During the Second Plan period, 66 graduate mining engineers underwent apprenticeship training under this scheme. Of these, fifteen obtained their second class Colliery Managers' Certificate of Competency and another 16 their first class Competency Certificates. The Corporation has also been deputing graduate mining engineers and electrical and mechanical engineers for training abroad in some specialised subjects.

SKF offer the
widest selection of bearings

Illustrated here is the **SKF** DOUBLE-ROW SELF-ALIGNING BALL BEARING with its two rows of balls having a common sphered track in the outer ring, is completely self-aligning, and permits automatic adjustment to minor angular displacements of the shaft. Bearings of this type are particularly suited to applications where the speed is high and extra true running is required.

The Corporation has set up for the purpose of maintenance and repairs of heavy earth-moving equipment a central workshop in its eastern India coalfields. This workshop will also be manufacturing spare parts to an approximate value of Rs. 35 lakhs per annum and undertake fabrication of steel structures. During the Third Plan period, the Corporation intends to set up a central workshop with Russian assistance in Central India coalfields at Korba for undertaking heavy maintenance work.

Sardar Ujjal Singh expressed his confidence that the Corporation would be in a position to fulfil the target of coal production set for it under the Third Plan, although the task was a stupendous one. The Corporation has been assigned a target of raising an additional 20 million tons of coal per annum by the end of the Third Plan period. Of this, Singareni coalfields would be required to contribute three million tons and the N.C.D.C.'s other collieries 17 million tons.

THIRD PLAN COAL, TRANSPORT TARGETS

Opinion is hardening here that the Planning Commission has underestimated the demand for coal at the end of the Third Plan period. In order to achieve even the present target of 97 million tons of coal output by 1965-66, it is pointed that planning will have to be made on the basis of about 120 million tons production.

A reappraisal of the planning for transport is also considered essential. The present targets fixed in regard to transport are thought to be rather on the low side. The Union Ministry of Mines and Fuel has undertaken a series of studies which it is felt will prove useful in appraising the correct demand for coal, oil and power.

D.V.C. EARNINGS IN 1960-61

Over Rs. 7.83 crores were earned by the Damodar Valley Corporation from the sale of power produced by its chain of hydel and thermal stations in 1960-61—an increase of about Rs. 167 lakhs compared to the revenue earned by it in 1959-60.

The total power generated by the D.V.C. power system in 1960-61 was 163.73 million kWh., against 145.82 million kWh. in the previous year. The rises in revenue and power generated by the D.V.C. were, thus, about 27 per cent and 12 per cent respectively in 1960-61, as compared to the previous year.

The hydel stations of the D.V.C., namely Maithon, Panchet and Talaiya, produced 13.6, 13.4 and 0.9 million kWh. in 1960-61. The two thermal stations, Bokaro and Durgapur, generated 12.9 and 0.59 kWh. this year.

The main consumers of D.V.C. power in 1960-61 were the West Bengal and Bihar State Electricity Boards and the Calcutta Electric Supply Corporation. In addition, the Eastern Railway, Chittaranjan Locomotive Works, Hindustan Cables, Durgapur Steelworks, the Indian Copper Corporation, the Indian Iron and Steel Company and the Tata Iron and Steel Company received power from this source in these years.

AID - INDIA CLUB MEETING PUT OFF

The Aid-India Club meeting, which was scheduled to be held in Washington on October 25, has been put off till early next year, it is learnt here. This is the second postponement of this meeting; it was earlier to be held in September.

The precise reasons for the present postponement are not clear. But it is indicated that certain members of the Consortium have not yet been able to complete the formalities concerning aid programme and arrangements. India, it is understood, would like all the aid coming from the Consortium to be on a long-term basis and at low rate of interest. The assistance promised

by Japan and France, it is said, falls short of these expectations. An approach has been made to both these countries to liberalize their credit terms.

BOKARO STEEL PLANT

Some developments are expected to take place by the end of the current month in regard to the setting up of the fourth steel plant in the public sector at Bokaro. Negotiations, it may be recalled, have been going on in this respect for some time between India and the United States. The finalization of these negotiations, it is understood, has been delayed due to United States' anxiety that if they at all assist India in setting up the Bokaro steel plant, that should be most modern.

Meanwhile, the Union Government has licensed an additional capacity of 1,20,000 tons for the manufacture of alloy and special steels in the private sector. This brings the total capacity sanctioned so far for such steels in the private sector to 1,30,000 tons. The country's requirements of these steels by the end of the Third Five-Year Plan are estimated around 2 lakh tons. The ordnance factories and the alloy steels plant envisaged to be set up in the public sector are expected to supply nearly 85,000 tons of such steels per annum.

Preliminary work on setting up the alloy and special steels plant in the public sector has already been taken on hand. Tender enquiries for the supply of plant and equipment are understood to be under preparation.

WEST GERMAN TECHNICAL EXPERTS FOR ROURKELA

The first group of 34 West German engineers, it is learnt, has reached the Rourkela Steelworks to assist in its operation. During the next few weeks, upto a total of approximately 200 experts from several leading firms will be released by the West German industry to take up work in India.

Top members of the team who have arrived so far include Dr. Fritz Peter, Chief Superintendent, Iron and Steel; Hans Niess, Chief Superintendent, Engineering Services; Guenther Vogt, Manager, Production Planning; Klaus Voss, Assistant Traffic Manager and Gerhard Schuermann, Manager, Repair Shop. They are all headed by Dr. Robert Mintrop, General Superintendent, who arrived last month.

FOUR - POINT PLAN FOR STABILISING LAC PRICES

The Union Government has formulated a four-point programme for stabilising the purchase and export prices of lac. The main features of the scheme are the fixation of minimum purchase prices, operation of the buffer stock programme by the State Trading Corporation and levy of an export duty. The minimum export prices are proposed to be reduced from Rs. 64 per maund for B-II quality seedlac with corresponding changes for other grades. The minimum price at which the STC will purchase B-II quality seedlac from growers and manufacturers has been fixed at Rs. 56 per maund. Differentials over this price have also been fixed for certain other types of lac. The export duty will be Rs. 160 per 1,000 kg. of seedlac and shellac (including button lac and garnet lac) and Rs. 125 per 1,000 kg. of other types of lac.

The scheme takes effect immediately and has been drawn up with the twin objects of encouraging overseas traders to purchase lac in preference to synthetic substitutes and to ensure fair prices to the growers and manufacturers. The low prices at which lac purchases were being made recently, it was apprehended, would have led to curtailment of lac production in future.

COMPANY AFFAIRS

USHA SPINNING

The Usha Spinning and Weaving Mills Ltd., incorporated recently at Delhi, is to carry on the business of wool combers and cotton spinners, and proposes to erect a cotton spinning mill in Gurgaon District with an installed capacity of 12,000 spindles. It proposes to produce nearly 40 lakh lbs. of yarn per annum. The annual requirements of raw cotton are estimated at 4.68 million lbs. and the entire quantity is likely to be available to the Company from indigenous sources. The Punjab is one of the largest cotton growing areas in India producing nearly 17 per cent of India's cotton. The quality of Punjab cotton is considered quite good. Apart from this, the produce will feed the vast handloom, power loom and hosiery industry, which is developing rapidly in the Punjab.

The Company has already procured the necessary land. The promoters, Messrs. Ram Kishan Kulwant Rai, have agreed to transfer 40,000 sq. yards of land to the Company, which will be sufficient for the purpose. Orders for the entire machinery have been placed. The Company is importing plant and machinery of the value of Rs. 15.27 lakhs out of which Rs. 8.76 lakhs will be in deferred instalments. The factory is already under construction. It is expected that its building will be completed by the next month and major parts of the machinery will arrive at site towards the end of this year, so that the mill would go into production by May 1962. The promoters and directors plan to put up additional spindleage of 13,000 together with 600 looms, subject to receipt of necessary approval.

The Company, it seems, is well set for a profitable beginning.

NEW ISSUES

Two new companies and three existing companies have been granted consent by the Controller of Capital Issues for the issue of a total capital of Rs. 5 crores. The consent is valid for 12 months in each case. Following are the details:

Lucas-TVS: Lucas-TVS Private Limited, a company proposed to be incorporated in the State of Madras for the manufacture of automobile electrical equipment in collaboration with Messrs. Joseph Lucas (Industries) Limited, United Kingdom, have been accorded consent to issue capital of Rs. 2 crores divided into 200,000 equity shares of Rs. 100 each, for cash at par. Of the said capital, 60 per cent will be subscribed by the foreign collaborators.

India Refrigeration Industries: India Refrigeration Industries Limited, Delhi, has been granted consent to the issue of capital of Rs. 50 lakhs consisting of equity shares of Rs. 10 each of the value of Rs. 36 lakhs and the balance in 9 per cent free of company's tax but subject to deduction of taxes at source, cumulative, redeemable preference shares of Rs. 100 each. The new company will manufacture sealed units for refrigerators and air conditioners.

Dunlop Rubber Company: The Dunlop Rubber Company (India) Limited, has been granted consent to the issue of 15,00,000 equity shares of Rs. 10 each credited as fully paid-up bonus shares on capitalisation of the company reserves to the extent of Rs. 1½ crores. The company's existing paid-up capital is Rs. 3 crores

and the bonus shares will be issued at the rate of one bonus share for every two shares held.

Kerala State Industrial Development Corporation: Kerala State Industrial Development Corporation Limited, Trivandrum, has been granted consent to the issue of capital of Rs. 100 lakhs, for cash at par, divided into 10,000 equity shares of Rs. 1,000 each. The entire capital will be subscribed by the Government of Kerala and the proceeds will be utilised for promoting, establishing and executing industries for the manufacture of various types of plant and machinery, etc.

Oldham & Son: Oldham & Son (India) Limited, Madras, an existing public company has been accorded consent to issue bonus shares of the value of Rs. 2.5 lakhs on capitalisation of the company's reserves to a like extent. The company's paid-up capital is Rs. 7.5 lakhs.

PRIZE FOR PHILIPS INDIA

The Minister for Commerce and Industry, Mr. K. C. Reddy, handed over to the Chairman, and Managing Director of Philips India Limited, a shield representing the first prize for the best presented accounts for the year 1959-60 at the recent annual meeting of the Council of the Institute of Chartered Accountants of India.

The scheme introducing the award of the shield and certificate has succeeded in setting up of a high standard in the presentation of accounts.

Company Meeting

INDUSTRIAL FINANCE CORPORATION OF INDIA

Chairman's Speech

AT THE

Thirteenth Annual General Meeting Held on Thursday, the 28th September, 1961

Speech delivered by Shri K. P. Mathrani, I.C.S., Chairman, Industrial Finance Corporation of India, at the Thirteenth Annual General Meeting of the Corporation held on the 28th September, 1961.

Gentlemen,

Owing to the fortuitous circumstance that I assumed my duties immediately on the expiry of the year 1960-61, it is my pleasure and privilege, soon after my taking over, to present to you the Annual Accounts of the Corporation and the Report of the Board of Directors for the year ending the 30th June, 1961. The printed copies of the Accounts and of the Report have been circulated to all the shareholders and I shall, with your permission, take them as read.

2. The year under report marks another stage in the economic development of the country — the completion of the Second Five-Year Plan and the beginning of the Third. Your Corporation has played not an insignificant role in the achievement of one of the major objectives of the Plan, namely the establishment of a sound and progressive industrial economy. During this five year period, we sanctioned loans of the value of Rs. 62 crores and 61 lakhs and disbursed funds to the extent of Rs. 40 crores and 62 lakhs. Over the thirteen years of the existence of the Corporation loans aggregating Rs. 105 crores and 82 lakhs have been approved, a sum of Rs. 57 crores and 35 lakhs having been disbursed during the period. It shall be our aim to ensure that the Corporation makes a further useful contribution to the economic growth of India with the specific object of reducing our dependence on the import of manufactured goods as well as plant and machinery.

3. The year under review has been a particularly successful one for the Corporation. Our gross income reached the record figure of Rs. 2 crores and 99 lakhs as against Rs. 2 crores and 50 lakhs during the preceding year and our net profits, after making provision for income tax and corporation tax, came to Rs. 84.75 lakhs, showing an increase of nearly 42 per cent over the previous year. It has, therefore, been possible for us to add substantially to our reserves which now stand at Rs. 1 crore and 69 lakhs, an increase of 69 per cent on the balance at the end of the last year. We have, in addition, as a reserve for doubtful debts a sum of Rs. 14.61 lakhs, which is considered to be more than adequate. In fact, a review of the reserve has shown a distinct improvement in the position of our bad and doubtful debts. As in the previous two years, we have provided a sum of Rs. 10 lakhs towards progressive liquidation of the subvention of Rs. 53.45 lakhs received by us from the Central Government for the purpose of paying the guaranteed minimum dividend on our share capital in the early stages of the establishment of the Corporation. This leaves a balance of Rs. 18 lakhs only which we plan to repay in the course of the next two years. In view of the statutory restriction contained in the second proviso to Section 31(2) of the I.F.C. Act the dividend for the year is being limited to the minimum guaranteed by the Central Government, nearly 24 per cent.

4. As will be evident from the Statement of Profit & Loss Account, there has been an appreciable diversi-

fication of our activities during the year, even though the interest on loans continues to be the major source of our income. While the income from this source has gone up by 13.3 per cent, from Rs. 2 crores and 25 lakhs during the previous year to Rs. 2 crores and 60 lakhs, that from commission on underwriting of shares and on guarantee of deferred payments has increased by over 120 per cent, from Rs. 4.60 lakhs to Rs. 10 lakhs; in addition, we have earned a handsome profit by sale of some of our investments. Moreover, during the year we also received, for the first time, a dividend on the shares held by us.

5. The total amount of loans approved by your Board of Directors during the year aggregated Rs. 21.21 crores, which is an all time record for the last 13 years of the Corporation's activities, and shows an advance of Rs. 3 crores and 29 lakhs over the figures for the last year of Rs. 17 crores and 92 lakhs. The Corporation received 76 loan applications during the year under review for an aggregate amount of Rs. 36.86 crores as compared to 38 applications for an aggregate amount of Rs. 17.54 crores received during the year 1959-60, indicating an increase in the volume of business handled by the Corporation of almost 100 per cent over the previous year. The aggregate amount of loans sanctioned by the Corporation has now exceeded rupees one hundred crores, which may be considered as a land mark in the life of the Corporation. These noteworthy achievements have been facilitated by the fact that the Corporation has widened the scope of its activities by granting loans in foreign currency, guaranteeing deferred payments, underwriting equity and preference issues, and financing industrial projects jointly with other institutions, etc.

6. It may not be out of place to refer briefly here to some of the joint ventures with other financing institutions in which the Corporation has participated in recent months. The Corporation has for the first time sanctioned a loan of Rs. 60 lakhs to a concern engaged in the manufacture of paper jointly with the Commonwealth Development Finance Company Ltd., of the United Kingdom (CDFC) and the Industrial Credit and Investment Corporation of India Ltd. (ICICI). These two institutions have agreed to grant loans of £ 525,000 (approximately Rs. 70 lakhs) and 1.47 million dollars (approximately Rs. 70 lakhs) respectively to meet the cost of the imported plant and machinery while the loan of the Corporation is to be utilised for the rupee expenditure. In another case, the Corporation has agreed to grant a loan of Rs. 18 lakhs to a concern engaged in the manufacture of camphor and its allied products jointly with the ICICI which has granted to it a loan of Rs. 30 lakhs in foreign currency. In two other cases the Corporation has agreed to finance industrial projects jointly with two State Financial Corporations. I am sure you will agree with me that these are steps in the right direction. It is our intention progressively to broaden the fields of co-operation between ourselves and other financial institutions, both at home and

abroad. This policy would also help to diversify the risks of investment and thereby render it possible to finance large requirements with a view to making a further contribution to the rapid industrialisation of the country.

7. At the last Annual General Meeting, mention was made of the efforts of the Corporation in obtaining credits in foreign currency and of the sanction by the Development Loan Fund of the United States Government of a loan of 10 million U.S. dollars to the Corporation for giving sub-loans to industrial concerns in the private sector in the country. How useful this facility has proved can be gauged from the fact that during the few months of the year after signing of the agreement the Corporation approved dollar sub-loans aggregating 9.023 million dollars (Rs. 4.23 crores) along with rupee loans of the order of Rs. 1.37 crores to 14 concerns engaged in the manufacture of a variety of products such as glass, paper, chemicals including fertilisers and electrical machinery, etc. Shareholders will be glad to note that our relations with D.L.F. in the matter of these loan operations have been very satisfactory and the Fund have agreed to raise the limit up to which the Corporation can grant sub-loans without their prior approval from \$250,000 to \$500,000. The Corporation had, at the close of the year, pending with it application for the dollar sub-loans equivalent to Rs. 5.62 crores. As we stand almost fully committed in respect of this first loan, negotiations for an additional loan of U.S. \$20 million from the D.L.F. are in progress and it is hoped that a further tranche of dollar loan will soon be available to us. Apart from the credit in dollars, possibilities of securing loans in other foreign currencies are also being explored.

8. In regard to our loan operations, the sugar industry continues to lead the list of loans approved by the Corporation for the last three years consecutively. This is mainly due to the high priority given by the Corporation to the establishment of sugar factories in the Co-operative sector. The Corporation has so far sanctioned loans aggregating over Rs. 23.20 crores to 37 sugar co-operatives distributed all over the country and I am glad to say that the working of most of the factories which have gone into production, has been satisfactory. The success achieved in the establishment of sugar co-operatives has led to the promotion by the Corporation of co-operative projects in other lines of production as well. The Corporation has sanctioned loans amounting to Rs. 49.70 lakhs for the establishment of two co-operative spinning units. The loans approved by the Corporation for co-operative societies represent 22.4 per cent of the total loans approved by it, which is indicative of the important role played by the Corporation in the promotion of this sector of the economy.

9. Next to sugar, paper and textiles occupied the second and third places in the quantum of loans approved by us during the year. For the first time since its inception, the Corporation has sanctioned a loan of Rs. 20 lakhs to a concern engaged in coal mining. It is also a matter for satisfaction that concerns from the less developed parts of the country are now utilising the facilities offered by the Corporation on an increasing scale. In this context you may be interested to note that 17 loans aggregating in amount to Rs. 5 crores and 93 lakhs were sanctioned to concerns located in the States of Andhra Pradesh, Assam, Kerala, Orissa, Rajasthan and Uttar Pradesh.

10. In the field of underwriting too, we have made much progress, though our approach in this line has been somewhat cautious. The Corporation approved twelve proposals for underwriting of preference and equity issues of Rs. 2.32 crores (as compared to five proposals for Rs. 1.87 crores in the previous year), thereby bringing the total amount of underwriting approved by the Corporation to Rs. 4.30 crores. The ap-

plications for underwriting came from a variety of industries such as cement, glass, pottery, basic metals, basic industrial chemicals, fertilisers, textiles, rubber, etc.

11. As in the case of applications for underwriting, requests for guaranteeing deferred payments to the suppliers of foreign machinery also showed a significant increase over the figures for the previous year. The Corporation received 14 applications for an aggregate amount of Rs. 18.61 crores against 5 applications for Rs. 3.72 crores in the year 1959-60 and approved 9 such proposals to the extent of Rs. 13.29 crores. This brings the total number of proposals approved to 20 and the total amount to Rs. 25.47 crores.

12. It has been our practice to carry out regular inspections of the concerns financed by us and to obtain periodical progress reports from them. These inspections and reports, I am glad to say, show that most of the concerns have done well in the quantum of production as well as sales during the year. Many of them earned sizable profits and were, with our prior approval, able to declare dividends in excess of 8 per cent (subject to tax), which is our standard limit. An overwhelming majority of our borrower concerns met their obligations to us promptly in the course of the year. There has been a further improvement in the position regarding defaults in the repayment of principal and in the payment of interest. The percentage of defaults in the repayment of principal has declined from 4.3 per cent in 1960 to 2.34 per cent in 1961, while that in regard to interest has come down from 1.2 per cent to 0.25 per cent. The industrial review which we have given in an appendix to our Annual Report will give an idea of the progress made by the various industries to which we have advanced loans and it is a matter of satisfaction to us that they have contributed significantly in the rapid industrial progress made by the country.

13. The resources position of the Corporation during the year in regard to rupee finance was quite comfortable and we were able to meet the commitments for disbursement of sanctioned loans largely from our own resources supplemented by a net additional loan of Rs. 2 crores from the Central Government. In view of this we did not have to enter the market during the year for fresh issue of Bonds; but, as and when money market conditions justify our doing so, we shall go in for fresh issues of Bonds in order that we may be able to meet the demands likely to be made on us during the Third Five-Year Plan period. We are also assured of further loans from the Central Government for meeting a part of our requirements during this period. In addition your Board of Directors have under their active consideration the issue of further share capital of Rs. 2 crores by the Corporation, carrying a minimum guaranteed dividend of 4 per cent per annum for which the approval of the Central Government has been obtained. This will enable the Corporation to broaden its capital structure and increase its borrowing powers in terms of Section 21 of the Industrial Finance Corporation Act, in order to meet the growing demands of industry for capital. Having regard to the progress achieved by the Corporation during the last 13 years of its working, I have no doubt that we can count upon your generous support when the issue comes in the market. While we have tried to ensure that the shareholders get an adequate return by way of dividend on the new issue, the question of enhancing the existing rate of dividend on the present paid-up capital will need an amendment to the I.F.C. Act. The Corporation is in correspondence on this subject with the Central Government.

14. In December last, Parliament enacted a bill incorporating certain amendments to the Industrial Finance Corporation Act, for which there was a pressing need in view of the changed conditions including the

growing activities of the Corporation. These amendments now enable the Corporation to guarantee (a) deferred payments to machinery suppliers both within and outside India, (b) loans raised by industrial concerns from scheduled banks or State Co-operative Banks, and (c) loans raised and credit arrangements made in foreign currency by industrial concerns with any bank or financial institution outside India. The Corporation has also been empowered to subscribe directly to the stocks and shares of industrial concerns as also to convert at its option the loans granted or debentures subscribed to by it into stocks or shares. These are useful facilities which have been eagerly sought for by industrial concerns and we have already, in one case, agreed to guarantee a loan of Rs. 1.47 crores in foreign currency. Another amendment of which I might make a specific mention is the deletion of the provision in Section 24 of the Act which required a guarantee of the Central Government in respect of accommodation by the Corporation exceeding rupees one crore to an individual concern. Since in all such cases the Corporation carefully examines the profitability of the project and the security available, the guarantee of the Central Government was hardly necessary. After the amendment, the Corporation is, however, required to obtain the 'prior' approval of the Central Government before sanctioning the accommodation. This gives adequate opportunity to Government to scrutinise the merits of the proposal before any commitment is entered into by the Corporation.

15. As you are probably aware the Finance Bill introduced in the last Budget included an amendment to the Income Tax Act which gives us a welcome relief. The new clause (xiva) of Section 10(2) of the Indian Income Tax Act provides that financial corporations which are engaged in providing long-term finance for industrial development and have been approved by the Central Government can claim rebate in Income-tax in respect of amounts not exceeding 10 per cent of the total income of each year which are transferred to a special reserve fund, so long as the aggregate of the amounts so transferred does not exceed the paid-up share capital of the institutions concerned. I am glad to say that this Corporation has been approved by the Central Government for the purpose of this concession, and we have been permitted this rebate in respect of our accounting year ended the 30th June, 1960, the

assessment in regard to which has been very recently completed. We have, as a result, got a relief of nearly Rs. 5 lakhs in our assessment and we expect to be able to get a somewhat larger relief in respect of the assessment for the accounting year 1960-61.

16. Our relations with the various Chambers of Commerce and with our loanee concerns continue to be cordial. We have, during the year, nominated more non-officials on the Boards of our loanee concerns and I wish to thank them on behalf of our Board of Directors for the keen interest they have taken in the work.

17. Shri K. R. K. Menon who held the office of the Chairman of the Corporation since 18th September, 1955 with distinction and was largely responsible for the great strides made by the Corporation in the last six years proceeded on leave with effect from the 1st July, 1961 preparatory to the expiry of his tenure of office. On behalf of the Board of Directors, I should like to express our high appreciation of the valuable services rendered by him to the Corporation.

18. It is with profound regret that I have to report to you the sad demise of Shri H. V. Venkatasubbiah, who was the General Manager of the Corporation for about five and half years and who rendered valuable service to the Corporation. He has been succeeded by Shri D. R. Madhok, Secretary of the Corporation.

19. Before I conclude, you will, I am sure, wish to join me in expressing our warm appreciation of the co-operation and assistance made available to us by the Development Loan Fund and its officials. You would also like me to convey our sincere thanks to the members of our five Advisory Committees—non-officials and officials—for the very able and effective assistance they have rendered to the Corporation. I should also like to thank my colleagues on the Board for their very valuable co-operation and wise counsels, and their generous response to the many calls made on their time. In this connection I should like to make a special reference to our two directors, Shri S. V. Ramamurthy and Shri S. C. Roy, who have been on the Board of Directors for two full consecutive terms and are due to retire this year. Finally, I have great pleasure in conveying the thanks of the Board of Directors, as well as my own, to the General Manager and the entire staff of the Corporation for another year of loyal and devoted work on their part.

Awakening India's Conscience

FOR long years it has been a standing rebuke against the conscience of the Indian people that they are blind to the inhumanities practised by themselves upon their fellows. The intelligentsia of India have always reacted angrily to such a reproach, believing sincerely that the revolt against poverty and destitution has been great, but that rectification of the terrible inhumanity of widespread destitution which has been imposed on millions of our people was largely out of our power. No such flattering unctious can easily be laid to ourselves at a time when we are constantly impugning the richer for not sharing their wealth with the poorer, implying that wealth shared is itself a potent solution. The report of the Study Group on the Welfare of the Weaker Sections of the Village Community of which Volume I has just emerged, albeit in somewhat unfinished form, must raise a question as to whether our sensitiveness to our national poverty is reflected equally by the sensitiveness of many Indian people to the condition of the weak and destitute of India's own population. Again, after all our resolutions on national integration, are we truly alive to the shocking disparities in the conditions of living in India's countryside?

The current report of the Study Group—over which Mr. Jaya Prakash Narayan presided and which contained several officials and three Members of Parliament—cannot be dismissed as a Utopian exercise associated with the Bhoodan movement. The report itself is a closely argued document, and, while it is possible to differ on assessments here and there, it presents a constructive approach to a problem objectively analysed and, in fact, framed with reference to nationally accepted goals. It is not merely a description of the nation's poverty with a passion for righteousness unbacked by deep and calm analysis of concrete solutions. The report will need to be considered in detail by the country as a whole. If it takes a long time to be published, *The Eastern Economist* will arrange for a Blue Supplement to be published containing its important elements. It is not, therefore, necessary here to go into detail; but it is vital that the country should recognise that it presents a major step forward in assigning to the Indian people their responsibilities and at least an adventurous approach to their solution. The removal of abject poverty and the protection of what the Committee described "the weaker sections" in the rural population cannot be a matter for a decade or two decades only; it is certainly a much longer journey. But at least there is now held before the eyes of the Indian people the long road that it is necessary to travel in order that ordinary human values should be restored by fighting, and not acquiescing in the degradation which rural destitution implies.

The "weakest" sections of the population have been variously defined, but, they are here present-

ed by two tests—those of limitation by land and secondly, by limitation of income. It is stated that 20 per cent of the rural households own no land and 25 per cent hold lands of less than one acre. This is probably reflected in income, because it is stated that 35 to 50 per cent of Indian rural households have an annual income of less than Rs. 500 and about 80 per cent less than Rs. 1,000. The "weaker" sections of the population are defined as those below an income of Rs. 1,000 per annum with three large groups; those below Rs. 250 per annum, who are destitute, need immediate grants from the State to avoid their immediate destitution. A large campaign for employment and all the elements which should go with welfare, such as literacy, rural housing, industrial co-operatives and so on, are laid out with detail and precision which provide their own recommendation. But the central point is the recognition of the need of a State grant by "a means test" to assist the weaker sections. For this purpose the Committee states: "We would suggest a general formula, that families whose income is less than, say, Rs. 1,000 a year would cover cases of chronic economic backwardness. Next, we would suggest, following Gandhiji's concept of 'Antyodaya', that within this low income classification, priority of assistance should be given to those families whose income is less than Rs. 500 a year. We are convinced that a beginning should be made from the lowest rung of the ladder. Lastly, we would regard that families whose income is less than Rs. 250 per annum should be regarded as destitutes. They should be taken care of in the first instance by suitable welfare measures which should be the responsibility of or routed through the Panchayat Raj institutions. These institutions should be assisted by suitable grants-in-aid by the State."

It is possible to resile from the tremendous challenge contained in these proposals. It has always been assumed that the burdens on the Exchequer are so great that it is unthinkable that they should, in the short period, be greatly enhanced. It is also supposed that any grants of this nature will be violently inflationary. These aspects of the matter have to be examined in some detail, but meanwhile a suggestion could easily be made that the Finance Commission in framing its recommendations for grants-in-aid under Article 275 of the Constitution, should bear in mind the respective claims of the States on the basis of this destitution defined within the sense of the Jaya Prakash Narayan Committee. It is not possible for poverty and degradation to be removed by one great stroke of fiscal policy, but a gradual movement in that direction will surely both engender hope and create faith amongst the weaker sections of the population that the socialist pattern of society is contrived for their protection and not merely for the enlargement of the power of those that have the gifts of education and influence.

The World Bank Loan for the Railways

THE World Bank's initial loan of \$50 million (approximately equivalent to Rs. 24 crores) for financing part of the expansion programmes of the railways in the Third Five-Year Plan is not

only in keeping with the tradition of the Bank to assign priority to accommodation for social capital but it is also in keeping with the tradition of eligibility of a high order which the Indian Railways

have established for the Bank's supply of credit. In this loan is to be found further corroboration of the soundness of the case of the railways for credit. Five commercial banks from America have participated in this credit without the guarantee of the World Bank to the extent of the first full half-yearly maturity falling due in February 1965 and part of the second maturity. The terms of the loan are fair. The period of maturity is spread over 20 years, while the rate of interest is fixed at $5\frac{1}{2}$ per cent per annum, inclusive of the surcharge of 1 per cent for the Bank's reserves. The question of strain on the balance of payments hardly arises in this case at all.

The debate is bound to remain inconclusive as to what should be the magnitude of change in the relative positions to be allocated to rail and road transport in development from now onwards. This is an internal issue of the overall transport system of the country. But confining it to the period of the Third Plan, there is no gainsaying the claim that the railways have to play the dominant role in providing transport capacity. In the opinion of *The Eastern Economist*, there has been an error in not casting a heavier responsibility on road transport and making a larger allocation of finance for it. Avoidance of this error would have made the outlook for provision of transport in the Third Plan less precarious than what it threatens to be. But this criticism does not alter the fundamental fact that the provision of outlay on railway development has been inadequate for the purposes of the present Plan. In plain terms, it means that the rupee expenditure as well as the foreign exchange expenditure now estimated for it represent the irreducible minimum.

It is astonishing how the ratios of rupee and foreign exchange outlays on railway development are being radically changed. Here is to be found a vindication of the policy of assigning priority to capital goods producing industries. In this context, the First Five-Year Plan can be conveniently left out of consideration, since the railway component of the Plan did not represent expansion but rehabilitation of the rail system. Development as such was taken in hand in the Second Five-Year Plan. But out of the total outlay of Rs. 1,100 crores in the Second Plan, the rupee component was of the order of Rs. 768 crores and

the foreign exchange component Rs. 332 crores. This gave a ratio of 70:30. In the Third Plan the outlay is fixed at Rs. 1,325 crores, divided into Rs. 1,139 crores for the rupee component and Rs. 186 crores for the foreign exchange component. The ratio has been changed radically to 86:14. No other segment of India's economy has made such remarkable strides towards self-sufficiency. Today India is not only self-sufficient in steam locomotives but she turns out a small exportable surplus. Passenger coaches are supplied domestically. Freight wagons were a chronic headache, but capacity has been expanded at a high rate, particularly in the private sector, to build all the wagons that the Indian railways require in increasing numbers. Only the special type bogie wagons with a high carrying capacity are imported. In a wide range of equipment the need for imports has been eliminated.

The race for cutting down the expenditure of foreign exchange and relieving the strain on the balance of payments has been underscored by a significant synchronism. The agreement for the World Bank's loan was signed on October 13 and immediately the next day the Prime Minister inaugurated the commissioning of the first Indian made electric locomotive. True, the electrical equipment of this loco was imported. But it will not be long before the Bhopal Heavy Electricals will supply it. This is the first in a batch of 21 electric locos to be produced initially at Chittaranjan. Electric and diesel locos, some types of track equipment, electrical signalling apparatus, equipment for railway electrification and special types of steel are the chief items of imports needed in the Third Plan. In their absence, high speed transport, on which accent is now being placed, can hardly be made available.

The World Bank has been generous, but not without technical justification, to the Indian railways. Its loans to them to date (excluding the latest one) add up to about Rs. 160 crores — the largest granted by it to a single enterprise. This aid is roughly equivalent to the balance required to finance imports in the Third Plan. Not all of it ought necessarily to come from the Bank, but the bulk is expected from it. The railways have made out a cogent case for eligibility for assistance of this order.

L. I. C. Valuation : A Mixed Bag

THE with-profit policyholders of the Life Insurance Corporation of India will heave a sigh of relief that the agonising period of suspense about the quantum of bonuses receivable by them is at last over. Not that the results of the latest valuation i.e. the second valuation in respect of the biennial ended 31st December, 1959, are such as to gloat about; what they have got is certainly less than what they were hoping to get. However, they may derive some satisfaction from the fact that the basis of valuation is much more satisfactory, devoid as it is of some of the shortcomings of the provisional valuation. Notwithstanding the lively debate that has been going on, on the merits and demerits of the with-profit policies, the finalization of the scheme of the differential bonus by the LIC and its approval by the Government of India will be welcomed by the with-profit policy holders especially those who were discriminating and prudent enough to have had their lives insured with financially sound and

long established insurers. Whatever may be said about the experience of the with-profit policy holders — and this has been none-too-happy and certainly not as attractive in the event as was indicated to them when they took out their policies — there is no gainsaying the fact that these policies still hold out a charm to a majority of the insuring public. This is obvious from the fact that out of the total number of the policies at the end of 1959 at 69.29 lakhs as many as 52.30 lakhs were with-profit policies. Recent indications, however, are that in view of the past experience in respect of bonus payments many people are seriously to consider whether, after all, they should continue to go in for with-profit policies when in fact they are tending to prove less profitable commensurately with the extra moneys payable by them by way of bonus loading. Unless, therefore, the LIC takes note of this growing concern among the with-profit policy holders and does something to make these policies at least as

attractive as they are purported to be, the demand for abolition of these policies may become too overwhelming for even the LIC to resist. And there is no dearth of advocates of uniformity in everything under the guise of socialism who will add their support to this plea. It is to be hoped that the LIC will strive its utmost to retain the with-profit policies as also to make them sufficiently attractive, of course with its own limitations. This is precisely the interpretation that should be put on this concluding sentence of the second Valuation Report, "The policy holders will be glad to know that further investigations made by us go to show that the Corporation is not only in a position to maintain the present bonuses in the future but also to improve thereon in due course if the present favourable conditions continue". True, this future outlook though promising has been hedged in with qualifications but it is undoubtedly a pointer to the way in which the mind of the LIC — at least the actuarial mind of the LIC — seems to be working.

Before commenting on the valuation results as such it is necessary to record (1) that the second valuation provides the basis for all future valuations and (2) that the scheme of differential bonuses which had only been provisionally accepted following the first valuation has now been definitely accepted. The latter is particularly significant in the context of the assurances given at the time of nationalisation and subsequently that notwithstanding the enabling clause in the Life Insurance Corporation Act, 1956, the with-profit policy holders will not be denied the benefits of bonus as per their contracts with the erstwhile insurers.

A word about the plan of the latest valuation. All the policy holders both of the old companies and the Corporation have been classified under 24 groups and allotted index numbers. It is not clear why when there are only 25 groups one company has been placed in the group index 49 leading one to look for group index numbers 26 to 48 without profit. It would have been better if the serial order of the group index numbers had not been broken thus. Similarly, while one can understand the term "miscellaneous group", one is at a loss to find the term "group index nil" when any one of the numbers 26 to 48 might well have been given to it. But the actuaries might apparently have their own justifications, not excluding that of avoidably confusing the layman!

Strictly speaking it would not be proper to compare the results of the first valuation and the

second valuation. For one thing, the first valuation results when they were released in 1959 were still provisional and have only been finalised now. Secondly, the assets and liabilities of the insurers covered by the first valuation do not pertain to the biennial period; strictly speaking, they range over a period extending from three to seven years, except in the case of a few foreign insurers and the LIC itself. Subject to these qualifications comparison of the two valuation results shows that as against 56.83 lakh policies assuring the sum of Rs. 1,472.81 crores (including bonus and annuity policies) the latest valuation covers 69.29 lakhs policies assuring a sum of Rs. 1,997.15 crores (including bonus and annuity policies). The disclosed profit of the first valuation was Rs. 30.24 crores gross which left an amount of Rs. 27.56 crores net for participating policy holders. As per the second valuation, the disclosed profit was Rs. 26.08 crores gross, leaving a net amount of Rs. 24.47 crores for distribution among the participating policy holders.

The breakdown of the 245 insurers including the LIC from the point of view of their bonus experience is something like this: 23 of these were insolvent insurers; 6 were insurers with only non-participating policies; 26 insurers could not declare any bonus because of absence of surplus. In the second category fall 42 insurers who had no bonuses to offer under the provisional valuation but are giving some bonus now; 119 insurers have raised their rates of bonus under the second valuation as compared to the first. It is only in the case of 26 companies that the latest bonus is less than the provisional one. However, if the total number of policies involved is considered, whereas 31 per cent have got a higher bonus, as many as 69 per cent stand to get a lower bonus. This is more or less the same picture that one gets by comparing the bonus rates during the pre-nationalisation year with those now offered. Even the LIC cannot dispute that the bonus paid by the better managed companies in the pre-nationalisation period were certainly higher. Therefore the LIC has yet to establish that nationalisation of life insurance has benefitted the policy holder. There is no use saying that the LIC has to subserve an ideology that was not there during the pre-nationalisation days. The insured is concerned with the benefits that he gets and it is only from this point of view that he will compare the working of LIC with that of his old insurer. In other words, a commercial undertaking whether in the public or the private sector will be judged and has to be judged only from the point of view of profitability.

A DELHI DIARY

MAGIC IN 101?

TODAY is Vijaydashmi. I am sorely tempted to indulge in the general gaiety, but a high sense of duty — combined with a bad conscience over my absence last week — compels me to attempt hard work, when everyone is playing. It is hard going. There is nothing of interest, and my eager eye scanning the newspapers has had to fall back — or is it a fall forward? — on Moscow and the United Nations. I notice one extraordinarily important new development abroad. This is that the figure of 101 — which I thought was an exclusively Indian lucky number — has been invading the highest councils of the world. The 22nd Soviet Communist Party Congress has chosen 101 slogans in which to surround its general exhortations to its people and the world. At the same time, I notice that the Political Committee of the United Nations, addressed

by Mr. V. K. Krishna Menon on Tuesday, in his first appearance after his operation, has 101 members. We have thus lost our magical monopoly to the auspicious use of the number 101. Or have we, like so much else, given our best to international affairs? In any case, "ek-sau-ek" is now an international symbol just like, in less happy times, our Swastika became in years to be forgotten. May I express the hope that "ek-sau-ek" now adopted in Moscow and in New York will have more peaceful effects on world affairs?

"The Eastern Economist" — largely, I expect, because it has been invaded by the spirit of the Vijaydashmi Day — has no Editorial on the 22nd Soviet Communist Party Congress. I have, therefore, been promoted to the official spokespersonship of the paper on the subject of Mr. Khrushchev's latest proposals on Berlin. I will take no note of the fact that he pre-

faced these proposals with the interesting, but somewhat terrifying, announcement that before the end of the month Russia will have exploded a 50-megaton H-Bomb, equal to 50 million tons of TNT, and that the only reason for not exploding a 100-megaton bomb would be that it would break his own windows. The major interest in Delhi, I expect, is not in either the 100- or 50-megaton bombs, but the sweet reasonableness of the Prime Minister in regard to the signing of a treaty with East Germany. "If", said Mr. Khrushchev, "the Western Powers show readiness to settle the (Berlin) problem, the question of a deadline for the signing of a German peace treaty will not be of such importance". It would be enough if it could be "settled as quickly as possible". Naturally we take this to mean that negotiations have now got no deadline — or D-day — and all that is required is that elusive thing called "goodwill", or, when goodwill is lost, "a change of heart". Apart from General de Gaulle, and possibly Dr. Adenauer, for somewhat different reasons, "the change of heart" can be assumed. I am, therefore, drawing the happy conclusion that the Berlin crisis is thawing, or whatever metaphor describes the relaxation of rigid postures in international cold war affairs.

The Prime Minister has reiterated this week his objection to all nuclear tests. Everyone in India will endorse the appeal made to Mr. Khrushchev not to explode his 50-megaton bomb ever, or at least for some considerable time to come. Nobody doubts that he has a 100-megaton bomb and probably several of the 50-megaton. But the explosion is a wholly unnecessary operation considering that it cannot even be looked at. We have a large fire ball in the sun, if fire ball watching is a worthwhile occupation!

MR. V. K. KRISHNA MENON

In Delhi what has attracted most attention on the U.N. Political Committee meeting addressed by Mr.

Krishna Menon, is 'the picture of Mr. Krishna Menon after his operation. It was, in many ways, a sad picture, partly because the Defence Minister was without his magnificent hair. Was it absolutely necessary for the operation that his impressive mane should all be removed in one fell sweep? Secondly, there is some feeling of sadness at the ordeal which the Defence Minister has had to undertake, facing not merely the difficult problems of the United Nations, but also considerable ill-health at a time of strain. I have sometimes, in these pages, criticised the Defence Minister in the pursuit of what I like to think is the national interest and the inalienable right of free speech. Let me say here that I am full of admiration for the courage which the Defence Minister shows in the face of repeated obstacles. It is now known that his doctors had advised him not to make the trip to the United States on account of his very high blood pressure, but he insisted on doing it out of a high sense of duty. There are many who will wish — even if they do not desire him as a Defence Minister — that his health should not cause him the current anxiety. There is a further ordeal for him ahead.

THE NORTH BOMBAY ELECTION

During the week Acharya Kripalani announced his candidature for North Bombay and reports from Bombay indicate that an election fever has settled on that distinguished city and a stirring political battle has been joined. I will not, at this moment, suggest any particular course of action, except to say that I am glad that at least in one constituency of the Indian Union a true, and not a sham, battle will be fought. I reproduce, without comment, a cartoon, which is disrespectful to both contestants. This might be described as true (dynamic?) neutrality!

THE WEEK'S NOTES

Kerala

UNEASY COALITION

ONE AND a half years' partnership between the Congress Party and the Praja Socialist Party has not succeeded in bringing home to both of them the supreme need to sink their differences and to hold fast together to offer a powerful front against the Communist Party, which still appears to command the largest influence in the State as a single party. The rift between the PSP Ministers, on the one hand, and the Congress Ministers, on the other, has been a matter of considerable concern to the State and particularly to the Congress High Command. It was obvious that there was great resentment against the manner in which Pattom Thanu Pillai, Chief Minister of Kerala, handled important issues without taking into consultation his Congress colleagues. Mr. Sankar, the Deputy Chief Minister, naturally could not go on tolerating this sort of treatment. The question of filling the vacancy of the Chief Secretary to the Government, caused by the acceptance by the former incumbent of an assignment in the ECAFE, and grave allegations of corruption against Mr. Thanu Pillai's personal secretary brought matters to a head. It would appear that the Congress President, Mr. Sanjiva Reddy, made indiscreet remarks at a public meeting in Trivandrum which alienated the PSP still further. It is true that in a legislature of 126 members (not counting the Speaker) the Congress commands 64 seats as against the PSP's 17. But in a multi-party House, where no single party commands a clear majority to run a stable government, it is the minority party willing to enter into an alliance which holds the balance of power. If the PSP exploited this situation to its own advantage, there is very little which the Congress could do about it.

Two recent developments deserve to be interpreted in the context of the forthcoming elections and of preventing the Communist Party from capturing power in the State again. At a Cabinet meeting specially convened on October 14, all the differences between the two partners were patched up and it was announced that the coalition would run a smooth course. Patching up is only a temporary device, devoid of the virtue of eliminating the causes of discontent and disruption. The fact that the Press was not taken into confidence about the manner in which the outstanding issues were settled is an unfortunate pointer that the so-called compromise is no more than a stop-gap device. Another development of crucial importance is that the negotiations between the two parties for forming an election alliance have broken down—let us hope, for the time being. The hurdles in the way of an alliance are the PSP's dogged attitude to maintain its election alliance with the Muslim League and its demand for the allocation of 5 candidatures for the PSP out of a total 18 for the Lok Sabha as against 3 which the Congress Party is willing to offer. The months that lie ahead will occupy both the parties in the election campaign rather than in running the administration of the State. Both the parties being in office, they will try to use that position of strength for election purposes. But since no election alliance has been forged between the two, they will offer a sorry spectacle of pulling in opposite directions. If a compromise is not arrived at on the question of the election front, it is only the Com-

munist Party which stands to gain by their differences. Here lies a stern warning to both.

Sino-Nepalese Treaty

BORDER SETTLEMENT

THE TREATY signed between China and Nepal at Peking on October 5 for the settlement of the border between the two countries and released on the Peking Radio on October 12, did not involve any vital issues of controversy. But an element of some divergence appears to have been introduced over the interpretations of the treaty in Khatmandu and Peking. The Khatmandu version claimed that Mount Everest was included inside the border of Nepal and as such Nepal's sovereign right over it was acknowledged by China. Subsequent details showed that the situation was different from this version. One of the two basic principles applied in defining the frontier was the principle of accepting the range of mountain ridges as the line of demarcation, defining the territory to the north as belonging to China and the territory to the south as belonging to Nepal. This principle has been applied to the three peaks, namely, Mount Everest, Cho Oyu Lhotse and Makalu. Its meaning is that the sovereignty over the three peaks, among which world interest centres round Mount Everest, rests with China to the north and Nepal to the south. Another principle applied in the settlement of the border was that of the watershed. The watershed was recognized wherever it cut across the rivers flowing over the territories of the two countries. Both these principles are vital for the reason that India has been advocating their application to her own case. There is natural jubilation in Nepal over the conclusion of the treaty and India, too, is glad that Nepal has settled her border question with her giant neighbour.

The protocol defining the details of the border settlement between China and Burma was also signed at Peking. It has been one of the strongest and oft-repeated comments on the Chinese strategy in concluding the border treaties with Burma and Nepal that she wanted to isolate India, hold her out as intransigent in insisting upon her claims and thereby to score the propaganda point that China has no territorial ambitions against her neighbours. This criticism does not hold water. Only 100 square miles were in dispute between China and Nepal, while in the case of Burma, China completely abandoned her "claim" over 25,000 square miles of Burmese territory. In the case of India, China's initial claim was in respect of 12,000 square miles of territory, which, by a stroke of after-thought, was magnified into 50,000 square miles. If China recognizes the reality and abandons her pretence of claim over the Indian territory, as she has done in the case of Burma, the settlement will be quick.

There are two important points which emerge from the Sino-Nepalese Treaty as of great relevance to the dispute between China and India. They justify the stand taken by India. The first and the lesser one is that the two points of tri-junction of the frontiers of China, Nepal and India have been settled in the treaty with Nepal in accordance with the claim put forward by India. But the more important point is that all along the Peking Radio had been carrying on the propaganda that the boundary between China and Nepal had never

been delimited and, therefore, it required thorough delimitation. But as the treaty shows, it has been settled on the basis of custom, usage and the reality of geography, besides other historical evidence. These precisely are the criteria which India is insisting upon as the factors in settling her own border question. There can be no question of India conceding China's fantastic claim of delimitation of the entire boundary running over thousands of miles.

Mysore Congress

THE DEEPENING RIFT

THE RIFT between the organizational and legislative wings of the Mysore Pradesh Congress Committee is unfortunately deepening. This development has been brought above the surface as a result of the initial selection of the Party's candidates for the forthcoming general elections at the Mandal and District Congress Committee levels. An unseemly wrangle is openly being indulged in. Mr. B. D. Jatti, the Chief Minister of Mysore, and his sympathisers have protested vehemently against what they consider the elimination of the supporters of the ministerialist group from the initial selection. They have alleged discrimination in this process and have asked for a drastic revision of the recommendations of the Mandal and District Congress Committees by the Pradesh Election Committee. The Pradesh Congress Chief, Mr. Nijalingappa, has deprecated this practice of washing of the dirty linen in the public and he has expressed his displeasure at the tendency to jump to the Press. The very fact that Mr. Jatti has a grouse against the elimination of the ministerialist group is proof positive of the fact that the differences between the ministerialist and organizational groups are widening and deepening.

Mr. Nijalingappa was perfectly right in maintaining that proper weight must be given to the views of the Mandal and District Congress Committees in the matter of the choice of the candidates and that the Pradesh Election Committee should interfere with them only where there is a strong case for such a course of action. The very fact that the ministerialist group has not received support in the Mandal and District Congress Committees shows that it has lost live contact with the electorate and it does not truly represent the Party members. This precisely is a challenge to which Mr. Jatti and his co-complainants should direct their attention and do a good deal of searching introspection. The truth of the matter is that since Mr. K. C. Reddy was made to shift the venue of his political career from the State to the Centre, aspirants to ministerialist power have been busy aggrandizing their position. There have been several reshuffles in the group alignments inside the Party and, while power might shift from one to the other, the wrangles weaken the Party. It is problematic how far Mr. Nijalingappa's appeal to banish groupism from the Pradesh Congress Committee will be heeded. But the ministerialist group in Mysore would do well to try to emulate the examples of the neighbouring States of Madras and Maharashtra, where the Party's interests are upheld as supreme.

Election Manifestos

CPI AND PSP

IT IS an outstanding characteristic of the election manifestos of the Opposition Parties so far released that they confess to a feeling of utter helplessness in displacing the Congress Party from office and all that they aspire to do is to capture the position as the prin-

cipal Opposition in the Legislatures. This applies to the Jan Sangh as well as the Communist Party of India and the Praja Socialist Party. Another feature of the CPI manifesto is that it has succumbed to the temptation to play up the feelings of the minorities and woo them apparently for their vote. The CPI speaks blatantly of disabilities and discriminations to which the Muslims are subjected and which they are said to bear silently in a mood of resignation. In the class of minorities, scheduled castes, scheduled tribes and linguistic minorities are clubbed together. The Party gives its tacit support to the Akali demand for a Punjabi Suba.

The CPI is fully conscious that it cannot face the electorate with a clear conscience on the issue of the Chinese aggression and illegal occupation of Indian territory. It refrains from calling a spade a spade and, although internal conflicts in the Party still lie dormant on this question, a facade of unanimity has been raised for public consumption. The CPI comes very near to endorsing the nation's stand on the border dispute with China, but it does not do so in words beyond absolute equivocation. The MacMahon Line is declared as the eastern frontier, but in so far as the western frontier is concerned, the Party refers to tradition and usage as factors determining it. This is vague as China insists upon a delimitation of the entire frontier and it is anybody's guess what constitute tradition, usage and the reality of geography according to the Chinese conception.

The nuclear war is declared to be the greatest threat to world peace, rather to its existence, but the manifesto is silent on Russia's resumption of nuclear tests. As usual, America has been named as the imperialistic war-monger. The manifesto utters a warning against the shift in the Congress Party to the right and makes a fervent appeal to all democratic forces to rally round the banner of a "united front" to safeguard democracy. This trick can now no longer deceive anybody. The "united front" is a ladder by which the Communist Party intends to climb and, having once climbed to the desired point, to kick the ladder at its convenience.

The PSP also speaks of a feeling of deep frustration which has seized the minorities, when, in fact, the Government should inspire faith, trust and hope in them. The implication is that the minorities would receive special care at its hands. It has, in fact, very little economic programme of its own which can be distinguished from that of the Congress Party. There is a promise of work for the employable in the scheduled castes and scheduled tribes in the backward areas and free education for women at all levels through out the country. But when it comes to State revenues it pleads for a more aggressive policy of taxation of the upper income groups, little caring to estimate how far a policy of soaking the rich can sustain an extensive outlay on welfare in a country where the number of high income assesseees as well as the size of their incomes are modest. In fact, there is very little in its manifesto which it can claim as its distinctive promise to the electorate.

It has made the pompous claim that the Party's organisation was never before more trim and its policies more clearly defined than at the present moment. This claim rings quite hollow. The reality of the situation is that during these five years, the PSP has gone on losing heavily in strength and cohesion. If Mr. Asoka Mehta's assertion, that in case the Party does not emerge as the principal Opposition in Parliament, it has no justification to exist, is to be honoured, will it be prepared to impose upon itself the penalty of self-effacement?

Iron Making at Durgapur

THE BEST OF BRITAIN FOR DURGAPUR

The best of British Engineering has been brought together by ISCON to design and construct the Durgapur Steelworks.

The combined efforts of British and Indian engineers who built Durgapur will serve as a unique example of Indo-British collaboration which can meet the future needs of the Indian Steel Industry.

BRITISH COMPANIES WORKING FOR INDIA

DIFFERENTIAL BONUS SCHEME ANNOUNCEMENT

The Differential Bonus Scheme has now been finalised and in exercise of the powers conferred by Section 49 of the Life Insurance Corporation Act, 1956, the Corporation has made Regulations classifying the policies issued by the Corporation, and by the various insurers, whose controlled business has been transferred to and vested in the Corporation, for the purpose of declaring Differential Bonuses. The Regulations have been drawn up in consultation with and approved by the Central Government and notified in the Gazette of India.

2. The Scheme is being implemented under instructions from the Government of India and supersedes the Provisional Scheme framed by the Corporation and published in June 1959. The participating Policies of the erstwhile insurers and of the Corporation are now classified in 25 groups instead of the 6 groups under the superseded Scheme.

3. The rates of bonus now declared are as a result of the valuation as at 31st December, 1957. The business valued included all the policies which were issued by the Life Insurance Corporation or by the erstwhile insurers and were in force as on 31st December, 1957. Out of the gross profits disclosed by the valuation an amount of Rs. 27.56 crores was reserved for distribution to participating policyholders, after providing for the estimated income-tax liability and the Government's share of surplus.

4. The rates of bonus in respect of participating policies issued by the Life Insurance Corporation of India are:

Whole Life—Rs. 16.00 per Rs. thousand sum assured per annum.
Endowment—Rs. 12.80 per Rs. thousand sum assured per annum.

5. As stated earlier the policies of the erstwhile insurers are now classified in 25 different groups.

The policies of the Life Insurance Corporation as well as of certain

insurers included in the same group have been allotted key index No. 10. Each of the other 24 groups has been given an index number and the ratio thereof to 10 indicates the proportion which the bonus rates applicable to the group bear to the bonus rates of the group which has the key index No. 10. The bonus vests immediately.

6. For the purposes of illustration, the bonus rates applicable to policies of some of the erstwhile insurers are shown below:

Name of the Unit	Index No.	Rate of bonus per thousand per annum	Whole Life Rs.	Endowment Rs.
Bombay Mutual	11	17.60	14.08	
Hindusthan Co-op.	10	16.00	12.80	
National Insurance	10	16.00	12.80	
New India	11	17.60	14.08	
Oriental Govt. Sec.	12	19.20	15.36	

7. The classification adopted in the new scheme will also apply to bonus allocations at future valuations. The new scheme will not apply to policies which have resulted into claims by death or maturity after 31st Dec. 1957 but before 15th Oct. 1961. For these policies bonuses are payable on the basis of the Provisional Scheme.

Full details of the L.I.C. Differential Bonus Scheme and names of Units in various groups are being published in the following papers:

Life Insurance Corporation of India

The European Scene

BRITAIN'S CHANCES IN EUROPE

From Our Special West European Correspondent

PARIS, October 14.

DESPITE some exaggerated apprehensions, it is quite unlikely (on political grounds alone) that the terms Britain negotiates for her entry into the Common Market will result in any net, uncompensated loss for India. The Dominions producing temperate-zone foodstuffs have more to worry about, but there is little chance that the British and the Continentals will strike a bargain at India's expense, not because they love her particularly but because her vital interests are not at the centre of the debate. Being subsidiary, from the European point of view, they can give rise to compromises that take account of India's development needs—which, it is to be remembered, all the parties to the negotiations are actively supporting in the Aid India Club and elsewhere. If this is correct, India's principal concern remains (as British emissaries to Delhi have said many times) the prospect for expansion that membership of the ECM opens up to India's main trading partner in this region, Great Britain. Now that London has agreed to accept all the rules of the Common Market, that prospect can be tentatively evaluated.

Tentatively only, because much remains to be settled. The competitiveness of individual British industries in the Common Market will depend, for example, on how far any such industry continues to enjoy privileged supplies of raw materials, drawn from cheap Commonwealth producers, or how far it continues to benefit from preferential access to Commonwealth markets denied to its Continental competitors. Yet, all in all, it is clear that British industry as a whole will not enjoy any such benefits; that was the idea of the free-trade zone and by rejecting it and forcing London to seek full membership of the Common Market, the Continentals have ensured that British industry will not be able to win on both tables at once. Either Commonwealth preference on raw materials is shared out between all the West Europeans, whereupon Continental industries will gain from cheaper supplies; or else it is abolished, whereupon Britain loses the advantage. Either way, British industry will pay for entry into the ECM by admitting equality of competition, both as to raw material supplies and preferential export markets. The precise terms of this equality have to be negotiated, but that does not stop us estimating British chances in Europe.

A more serious unknown factor is the value of the pound sterling when Britain joins the ECM. Rightly or wrongly, many Continentals, particularly in West Germany and Holland, are convinced that the pound will be devalued on the eve of Britain's entry, just as the French franc was in December 1958 as the Rome Treaty came into effect. There is no wishful thinking in this, for it is what Continental industrialists fear most; a cheaper pound would revolutionise British chances in Europe, and any estimate of those chances we might make today would be as out of date as gloomy forecasts about France's hopes were in 1958. What follows, then, is written under this reservation.

We need not dwell on the benefits British industry will derive from the bracing atmosphere of freer competition, for this has been stressed by the British Government in making its decision. Less advertised is the hope that membership will restore the pre-eminence of the City as a world financial centre over the new challengers on the Continent. The City indeed could become once again the monetary heart of an economic unit as impressive as its former empire, to the great financial profit of the UK. This point is not lost on the Conti-

nentalists, who regard the admission of the City and of sterling as being just as formidable as the admission of Sheffield, Manchester and their manufactures. That is why they will probably insist on a greater degree of monetary co-operation within the enlarged Common Market. Connected with this, but also with matters of industrial competition, is the prospect of London becoming the Mecca of foreign capital, especially of American investments. Britain's gains could be substantial, and Continental capitals will seek to limit them or to ensure that they are shared. The question of joint monetary policy will become more important than it was in the six-nation association.

Coming to trade, there is first the matter of foodstuffs. Britain imports three-quarters of her food and Paris and The Hague would be willing to see British manufactures gain much wider markets in Europe in return for the right to supply much of these imports. Tempered to suit the agricultural protectionism that rules in Britain and West Germany, this solution would be acceptable to all Europeans, but it would seriously indispose the Australasians and North Americans. What concerns us is that it would suit India perfectly well; she supplies no temperate-zone food to Britain and would benefit from more intense industrial activity in West Europe, and especially in Britain, which called upon her to provide more raw materials and semi-manufactures.

As for the outlook for British industrial goods, one turns first to capital equipment, which constitutes 25 per cent of British exports and is the largest entry in her commercial accounts (\$3,000 million yearly). A substantial amount is already exported to the Continent (most of the rest to the Commonwealth) and this amount could easily be increased when tariff barriers fall, for British prices are competitive thanks to the larger size of British manufactures. The outlook is especially bright for machine tools, and electric and electronic equipment. However, the use of the Anglo-Saxon system of measures and standards is a hurdle that is not suppressed by simply joining the Common Market. The metric system would have to be adopted and standards made uniform throughout the enlarged Common Market (trick specifications are a simple means of evading free trade in this department, and can be practised by trade associations as well as by governments). As import duties on British capital goods fall from 16 per cent to zero, British industry will find immense opportunities on the Continent, but competition will be rough and there will be no easy victories. The West German capital goods industry can, of course, look after itself and the French firms after their recent spectacular progress will provide stiffer opposition than three years ago.

British mechanical industries (automobiles and the like) have most to gain. They have invested very heavily in recent years, they are fully modernised, are considerably bigger than the equivalent French and Italian industries, and their productive capacity is at present in excess. Faced with import tariffs of 29 per cent on the Continent, they have cut their export prices in order to keep their plant as fully employed as possible. Moreover, and this is what the Continentals are most afraid of, these industries are in fact largely in American hands and American investment will perhaps increase further once Britain is in the Common Market. The Continentals realise that they are being asked to take on Detroit "by proxy". In this sector, Britain is regarded as an American colony, whose introduction into the Common Market is sometimes seen as a Trojan

horse operation, designed to carry American competition into the home-ground of the Continental mechanical industries, whose rapid progress has caused some alarm on the other side of the Atlantic. This might be exaggerated, but it is true that the struggle will be between American methods, as represented by the British, and the Continental reliance on cheaper labour and more inventive engineers.

The struggle will be no less keen in the electrical industries and aeronautics. Some Continental manufacturers in this field would like to impose conditions on free competition with the British; specifically, equal access to Commonwealth raw materials and to Commonwealth markets, a controlled share-out of American licences and capital between Britain and the Six, and harmonisation of tax and labour laws. In general, these conditions are thought necessary by many Continental industries but the demand is quite formal in this department because it is felt that Britain's advantage is most marked here. This attitude suggests that the people best informed give Britain an excellent chance of making serious inroads into the Continental market for these goods.

In chemicals (8 per cent of British exports), the outlook is more obscure because the amount of protection varies widely from product to product and no one will really know how the British, German and French industries will fare until the gloves are off. All of the national industries are solidly established in basic lines (sulphuric acid, fertilisers, plastics) and competition will centre on several products where the economies of producing for a really big, mass market are greatest: synthetic rubber (hence tyres), moulded plastics and derivatives of natural gas. Summarily, the question is how big an impact ICI will make when import duties of 18 and 20 per cent are removed on both sides. After watching the reorganisation of the Continental chemicals industries inside the Common Market, one has the impression that this is a field where specialisation agreements, exchange of licences, market-splitting pacts, formation of common subsidiaries, etc. are readily resorted to, in preference to prolonged competition. The West German and Italian chemicals industries were already heavily concentrated and the French industry

has become so since 1958, so ICI will find boys its own size when it crosses the Channel.

In textiles, Britain is more protectionist than the Continentals and she has been buying more from them than she can sell them, which would suggest that her mills will find it rough going in a unified market. But many types of British cloth benefit from considerable prestige on the Continent, and when import duties fall from the present level of 9 to 15 per cent to zero an expansion of sales of woollen goods is probable. Finally, in basic industries (coal and steel) import duties are small and their abolition might not seem to make much difference. Yet certain types of English coal find a wider market on the Continent, especially to Channel ports where they benefit from the lower cost of sea carriage. However, this problem concerns Britain's entry into the CECA (Coal and Steel Pool) rather than the Common Market, which will be negotiated separately if the current talks succeed. The prospect of an equal encounter with the more warmly protected British steel industry does not perturb the industries of the Pool, it being understood that Britain would have to conform to the rules of that association after an initial period of transition.

This survey cannot be neatly summed up because balance of advantage does not tilt markedly one way or the other. There are spheres where British industry will have vast opportunities, and others where they will find the competition quite hot. It is clear that Britain would have been very much better off if she had joined the Common Market from the start. The lost years were spent in sterile opposition and half-baked adventures like EFTA, while British industry made little progress and the Continentals reorganised themselves to face a unified market, thereby increasing their capacity to stand up to bigger British industry. ICI, for example, will find things quite different in the concentrated and specialised French chemicals industry to the fragmented opposition it would have encountered in 1957. Nevertheless, the scope that remains for British conquests on the Continent is impressive especially if, in spite of promises now being given, Britain eventually sacrifices some of the interests of the food-producing Dominions in order to draw more of her food from her partners of tomorrow.

VIENNA: THE COCKPIT OF POWER

By WILLIAM REES-MOGG

VIENNA is a strange, beautiful, consciously neutral City, scattered with palaces. Apart from Berlin it is the capital City of Europe which is closest to the frontier of the cold war. In Vienna one cannot fail to be conscious of the frontier posts of the Red Army only 25 miles away. Inevitably the Russians are for the moment relieved to have contracted out of the conflict; yet at the same time they are in another sense the most anti-Communist people in Europe. "There are no Communists in Austria," they say, "we have been occupied by the Russians".

This atmosphere was particularly appropriate for this year's meeting of the International Monetary Fund which seemed itself to be a cockpit of power. The theme round which the discussions turned was the enlargement of the Fund itself: the real issue was the Challenge to American economic power which was made by France, acting as a kind of representative of Europe.

Certainly the French, very ably led by M. Baumgartner set out to cut everyone else down to size—and they very largely succeeded. They established first of all the simple but important rule that no alteration to the Fund's organisation can be made which is not acceptable to the powers which are in fact going to make the loans.

This for the present knocks out the more ambitious plans for a radical solution to the world exchange problem. At Bretton Woods, as at any time up to a couple of years ago, the I.M.F. powers would have passed a Bernstein or a Triffin plan on the nod if the Americans had wanted it. They would have done so because it would have been the United States which would have had to put up the cash to finance either plan.

Now the situation is quite different. Any reform of the International Monetary Fund must now depend on the willingness of the European powers to put up more money. Indeed the problem of world exchange rates is now the problem of the reserve currencies, sterling and the dollar. The question that was discussed at Vienna was how far the European powers, with their big surpluses, would be willing to support these two widely held currencies, which many European bankers believe to be overvalued.

The weakness of both currencies has now reached the point at which it seems to be virtually impossible for both to be strong at the same time. In 1960 the pressure was on the dollar and, despite an unfavourable balance of payments, sterling was strong. In 1961 sterling came under pressure and the dollar enjoyed a momentary revival of confidence. Now sterling is again recuperating and already the outflow of dollars has begun. It seems that there is little real world confidence in either currency, but that each is supported by people getting out of the other.

In these circumstances it is inevitable that the powers with strong currencies should be in a very strong bargaining position. America is of course still the country with the big reserve of economic capacity. It is still American aid on which the world depends, and it would be disastrous if balance of payments difficulties forced her to reduce it. Nevertheless, as Vienna showed, it is the marginal balance on which the bargain-

ing position depends. A man worth £100,000 can make his terms with a man worth £1,000,000 if the millionaire has to come to him to borrow cash.

The improvement in Europe's bargaining position comes at the point when Europe is in any case beginning to reassert its political and economic power. Before 1939 Europe had three of the six effective world powers. The effect of the war was to reduce the number of world powers effectively to two. In 1939 however it would have been taken for granted that the combination of Germany, France and Britain would outweigh either Russia or the United States.

It is again becoming obvious, not that Europe can outweigh the other world powers, but that Europe is claiming the position of a world power and will claim it successfully. In defence and international affairs the Berlin crisis shows that Europe is not yet powerful enough to speak for herself, but in exchange and financial matters Europe has successfully reasserted her independence already.

Inevitably this process will lead to strain between Europe and the United States. The Americans have behaved with remarkable restraint and generosity towards the Common Market, but they will have to be trained out of the habit of unquestioned leadership. Here the vigour of General de Gaulle's independence, which has so often seemed to be a weakness of Europe does in fact serve a useful purpose.

On the other hand, as Vienna also showed, Europe is insisting upon being independent, but not on being unreasonable. The I.M.F. is not being given all the new funds it would like, but it will be given very substantial sums all the same—Europe is claiming independence and is also accepting responsibility.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

Economic Report from the U.S.

FOREIGN AID PROGRAMMES

By GUY SIMS FITCH

WASHINGTON, Oct. 11.

FOREIGN aid programmes, both national and international, are being re-examined, re-defined and re-oriented as never before. It is apparent that the experts who are taking a close look at this subject see a clear need for new approaches to the economic advancement and modernization of developing lands. These new approaches can be summarized briefly as increasing emphasis on long-term, easy-payment loans geared to realistic and soundly based programmes, combined with a determined effort on the part of developing nations to mobilize their own resources, public and private, and to effect necessary reforms in their own economies. Implicit in this is the recognition that government-to-government capital, no matter how large the flow, cannot of itself engender the kind of progress required to set developing nations squarely on the road to self-sustaining growth and effective economic and social modernization. As put by World Bank chief Eugene Black, there must be stress on quality as well as quantity in aid programmes.

It is especially heartening, then, that the U.S. foreign aid programme finally voted by Congress and signed into law by President Kennedy goes far toward meeting both these criteria—quality and quantity. One can safely make this statement despite the fact that the Kennedy Administration did not receive from Congress all it wanted, either in new authority or new funds. The act places primary emphasis—where, according to current thinking, it properly belongs—on long-range assistance programmes to support the self-help efforts of the developing countries and to promote their economic and social advancement. It establishes a new organization—the Agency for International Development (A.I.D.)—to administer the programme, with authority stretching over five years to make long-term loans, of as much as 50 years' maturity, generally repayable in dollars but at little or no interest. It is true that Congress reserved to itself its time-honoured prerogative of voting annual appropriations for these

loans, instead of giving the administration the right to withdraw the funds from the Treasury as requested. But the important point is that Congress appropriated more than \$1,000 million for these development loans this year, compared with \$550 million last year, and authorized another \$1,500 million a year for the succeeding four years.

In addition to the more than \$1,100 million for long-term development loans, Congress this year has appropriated \$296 million for "Point Four" technical co-operation grants, \$275 million for the President's fund to meet special emergencies, and \$425 million economic aid to free nations whose economies may be exceedingly strained by the need to maintain large defence establishments. Including all these, the total foreign aid appropriation for the current fiscal year that began July 1 comes to slightly more than \$4,000 million. Much is being made of the fact that this sum falls about \$800 million short of President's Kennedy's original request. It is, nevertheless, the largest annual foreign aid appropriation voted in a number of years. Also to be borne in mind is the fact that this \$4,000 million does not include the \$600 million voted earlier this year in special economic and social development assistance for Latin America under President Kennedy's Alliance for Progress programme. All in all, then, the total voted this year for economic and social assistance to other countries emerges as far more generous than it is sometimes supposed.

It is obvious that detailed organization of a new agency for as large and as complex an aid is a time-consuming task. Significant progress is being made, however, and aid should be reaching the operative stage within a matter of weeks. Fowler Hamilton, who has been appointed by President Kennedy to head the new agency, firmly believes that aid has been given the authority and the tools with which to lay the basis for a sound and successful "decade of development"—the term which President Kennedy often has applied to these years of the 1960's.

INDIAN ADMINISTRATION: THE INVENTORY

By C. S. VENKATACHAR

[This is the second of a series of three articles by Mr. C. S. Venkatachar, a distinguished member of the Indian Civil Service. Mr. Venkatachar has been Secretary to the Government of India and Secretary to the President. He was recently a member of the Expert Committee to recommend changes in the Secretariat of the United Nations.]

WHAT happened to the prophets of doom when the British withdrew? Why did not the machinery of administration collapse? The British forgot for once their own historic contribution. Prof. Stewart's scholarly study on the part played by Bentham and the Mills — father and son — on the shaping of the Indian Administration, has established its solid Victorian foundations. That through legislation many ills and defects of society could be remedied was one of the earliest of the administrative philosophies advocated by the Benthamites. The habit of detailed study of social, administrative and legislative problems through investigation and public enquiry, objective reporting, official rectitude, and so on were moulded by their rationalism. Hence "the importance of inductive evidence, of statistics, blue books and regional reports." Laws were codified, rules and regulations framed and a panoply of law courts instituted. Thus foundations were laid for the concept of an Indian State, administrative efficiency and unity in diversity. It was through an administrative state, with all its failures and shortcomings and with no claim for democracy as its handiworks, did India emerge into freedom.

A signal contribution, which continues to give strength and stability to our administration was made by injecting a strong dose of centralisation and by providing a hierarchy of officialdom to which a substantial underpinning was given at different levels. Without such a structural design, the machinery would have been weak, as the Indonesians experienced when the Dutch withdrew, or would have vanished into thin air as the Congolese found it to their cost. Further, a chain of responsibility was run through the staff line with freedom to act and take initiative. A corollary to this arrangement was the supervisory nature of the administration and a system of checks and of reporting backwards and forwards.

The alarming concentration of political and economic power in the Central Government inhibits the delegation of power in a more democratic society which, consequently, tends to become more bureaucratic. Professor Wheare's description of the Government in England as a parliamentary bureaucracy draws attention to this changing aspect. The civil administration in India was long accustomed to delegation of authority, particularly at the district level. This delegated authority was habitually combined with the ability to assume responsibility, a feature which was markedly absent in French or Dutch colonialism. The Frenchman, Victor Jacquemont, travelling in India in 1830's noticed with amazement, there was only one Englishman where there would have been twenty Frenchmen to perform the same job.

As elsewhere, in India too, the concept of the State is changing but the mechanism of the State has not changed. The Indian administration maintains its two original component parts — one the district administration and the other the Secretariat. The problem of interlocking the functions of a Welfare State with the district executive machinery was haphazardly attempted. That task awaits accomplishment. The Secretariat,

once thoroughly British in character — the citadel of the Imperialists' imperious Will and Power as well as of 'Imperial bumbledom' — is now fully democratised, though politicians still complain that governmental technocrats cunningly manipulate power behind the ministers. Politics must be weak somewhere, not that the Secretariat has managed to retain or acquire power.

An oddity of the administration was that it was functionally equipped to serve the requirement of what is now termed as State Socialism. In spite of the notions of liberalism and attachment to the philosophy of laissez-faire and governmental non-interference, even John Stuart Mill had to admit that Government must necessarily do many things in India which in the West would be left to private enterprise. Such activities related to what the present day economists term the infra-structure of the Government machinery, the overheads necessary for industrialisation and economic growth. Curiously enough, Lord Lawrence complained that private enterprise in India meant looting the Government. The public sector presented no novelty to the Indian administrator when innovated in 1950's.

The Indian administration possesses remarkable uniformity of procedure, forms, technique and thought. Over this is superimposed a tradition, of what may be conveniently termed as the 'Rule of rule'. This has standardised the norms specially applicable to the complexities of a vast administration and has induced a habit of work and many small traditions which are not easily discarded even under the impact of democratic forces at the top. Lift any corner of an 'administrative blanket': "the things we know are the things that work; the things that work are the things we know."

Constancy of methods and reliance on precedents were the other aspects of the same tradition. These in a way gave rise to the double reproach of the administration, of exorbitant writing and of unpardonable delay. The Indian system went beyond the nature of work of bureaucrats — their fussiness for details and the habit imposed by tradition on the Civil Service of recording every detail. These together with a chronic disinclination to take decisions except under stress of grave emergency, and the habit of making every question from the smallest to the highest, the subject matter of written memorandum by officials of every grade — resulted in the asphyxiation of initiative and more currently the shirking of responsibility. These older reproaches have, since Independence, not only been accentuated but carried forward by the bureaucracy, reinforced by Parkinson's law. Case files continue their leisurely journey once they are launched on their way. "Round and round, like the diurnal revolution of the earth went the file, stately, solemn, sure and slow; and now in due season it has completed its orbit". So wrote Curzon at the beginning of this century. They still orbit in this space age, but with the same ancient tempo, except when they choose to disappear underground in the rabbit-warrens of the under secretaries. The system has hardened into an ossified shell of the administration's soul.

The norm of the I.C.S. was that of a general purposes man, never an expert in any branch of the administration. This type conformed to the national traits of the British who dislike expertise, preferring it to common sense and pragmatism; to the class origin of the British Civil Servants and the educational system through which they emerged. One is left to wonder what purpose it served in perpetrating this kind of a general purposes type in the I.A.S., at a time when the Scientist, the Technician and the managerial man are becoming as indispensable as an administrator. The old tradition, retained by India, undoubtedly at its best, attains a notability for honesty, industry and competency, but has little capacity to generate the right type of leadership for a democratic scientific, welfare world. Since we adhere to the British type, it is interesting that Mr. C. A. R. Crossland has recently charged the British Civil Services of failing to "adapt to a world which requires the long rather than short view, active planning rather than passive administration, novel rather than traditional ideas. The typical Whitehall attitude of mind — thorough and precise, but pedantic and unadventurous — is in part a reflection of the Oxford and Cambridge background from which most Civil Servants come".

The vast apparatus of officialdom was contained within it, an impressive manpower in some depth, more so at the provincial-state level. Transfer of power left the State Civil Services and the State Secretariats practically intact. In the Central Government, the Indian element in the ranks of the Higher Civil Service con-

siderably thinned out. In 1947, about 450 I.C.S. Officers remained to serve the Indian Government, of whom just about half the number were available to the Centre. At present there are perhaps 200 of them. This small, progressively dwindling group has proved to be an extremely valuable key element, at the apex of an organisation of nearly seven hundred thousand officials at the national level.

This agglomeration of vast numbers has undoubtedly maintained the continuity of administration but mere numbers do not mean everything. The body of the Civil Service is not homogeneous, is not broad-based and has no common binding ethos. Instead of functional differentiation arising out of work and responsibility there is in it a distinctive class division.

This lack of cohesion is part of the wider problem of national integration. Government servants in India are essentially an economic and not a social and cultural category. They are a self-isolating group because of their mechanistic attachment to governmental work. They tend to be a class apart though they are a segment of the elite which includes the politician, the journalist and the professional classes. An interesting question for the future is whether the ethos of the Indian upper stratum, will extend to the ruling elite component no less than to the managerial and the bureaucratic, now that it is certain that there will neither be an aristocratic class of any kind nor the Indian version of an Establishment.

Vietnam Economy: Recent Trends

VIETNAM'S economy, like the economies of many other Asian countries, is showing signs of rapid growth. The recent trends in the industrial output as well as foreign trade reveal clearly the fact that new vistas are being explored to raise the country's productive capacity.

In the first four months of 1961 alone, 12 large industrial projects received approval of the Government for import of equipment under the commercial import programme. The most important development was in respect of textile industry. The cotton spinning and weaving mill belonging to Vietnam Textile Company (VINTEXCO), which has 20,000 spindles and 400 looms already installed and which began three shift production in September 1960, received approval for imports of machinery to double its capacity by adding 20,000 spindles and 400 looms. Another important company, the Vietnam Textile Finishing Company, designed for dyeing and finishing, is likely to be operative in October 1961. The cotton mill of Vietnam American Textile Company (VIMTYEX) having 17,200 spindles began operation in January 1961 and by April reached 3 shift capacity. It has American equity participation and is planning to expand its plant further. VIMTYEX and VINATEXCO were able to sell their entire yarn output advantageously which was partly due to the imposition in December of restrictions on yarn imports. Financing of equipment was also approved for International Textile Company, a new cotton weaving mill with an annual planned capacity of 2.8 million linear meters.

Another important section of the industry which received special attention during the recent months was bicycle tyre industry. Construction began of a new French-owned bicycle tyre and tube plant. Although certain delays were reported in the delivery of equipment, the operations are likely to start in about 1962. Production of this company together with that of another company which was scheduled to begin production this July, were likely to meet all Vietnam's bicycle tyre requirements. Construction of paper mill controlled by the Government-owned Credit Commercial of Vietnam, which includes minority Italian interests, was also reported to be progressing and the production was expected by the middle of September. With its present capacity rated at about 8,400 tons a year, the mill initially will produce brown kraft wrapping paper, although it is designed for a flexible production of several kinds of standard paper. A long delayed paper mill project promoted by American interests also appears to be on its way. All equipment is expected to be delivered by February 1962 and production may begin by October.

Other industrial projects which are to move ahead include three tea processing plants, a synthetic fibre fabrics weaving mill, an iron pipe foundry and an asbestos cement sheet factory. Above all, the negotiations continued for construction of a multi-million dollar petroleum refinery of Standard Oil Company and Shell Petroleum Company. This industrial dynamism during the recent months complements the commencement of production at the glass plant in October 1960 and the ordering of equipment for expansion of a plant

producing gunny bags. All this leads us to the conclusion that Vietnamese industry is entering into a new phase.

In the field of foreign trade too this dynamism is observed. Two major items of export — rubber and rice — have been well received in the foreign market; which is a sign of expansion in the internal economy. The exports of rubber were higher during the recent months in spite of the fact that there was a sharp fall in rubber prices which wiped out to some extent the gains arising from substantial increases in the first quarter of 1961 to 21,774 metric tons as against 13,320 metric tons in the same period last year. The fall in rubber prices which occurred in the later part of the 1960 and continued till the first part of 1961 reflects in a way that demand has declined partly on account of the increased use of synthetic rubber.

Rice shipments increased considerably in the early part of the year, over the same period of 1960. Despite the precarious situation in the countryside as on April 30, exports for the four months totalled 116,900 tons compared with 88,705 tons during the same period of previous year. It was reported that there was considerable uncertainty about the volume of exports in the remaining part of the year. The estimated production of 5.4 million tons of paddy in the 1960-61 crop year matched output in 1959-60, and normally would permit exports of between 450,000 and 500,000 tons of rice. Nonetheless, the Government has suspended the licensing of rice exports in order to maintain an emergency stock in Saigon to guard against further price rises.

Although rubber and rice still make up the bulk of the country's exports, shift in the relative mass of some secondary exports reflects the growth of the economy. Shipments of live hogs to Hong Kong which began in June 1960 ranked third as export earner in 1960 and maintained that position in the first quarter of this year too. Development of new commodities for exports was further evidenced in Vietnam's first commercial export of keanaf yarn during this quarter. Fish exports which have gone to Singapore for some time were resumed to Thailand in 1961.

The imports also reflect the rising trend of the economy. One very important development has been that the stress under the new programme of imports is more on producers goods and there has been a consequent reduction in the imports of consumer goods. Total imports amounted to \$41.3 million in the first two months of 1961, which is at the rate of \$61.8 million for the quarter. It compares well with \$59.8 million in the same period of 1961. Thus there is not much change in the total imports, while change is witnessed as far as the composition is concerned. Principle commodities imported were textile fabrics yarn and thread, machinery, petroleum products, motor cars and accessories and tobacco. Japan retained its position as the principal supplier and the United States ranked second followed by France, West Germany and Indonesia. The rising trend of industrialisation is likely to affect the composition and direction of the country's imports further.

Business Notes

Industry

IDLE CAPACITY: A BOGEY?

DURING THE First and the Second Plan periods, the increase in national income has been considerable, having gone up by 18.4 per cent and 19.5 per cent, respectively. And it is estimated that the national income would further go up considerably as a result of the total investment envisaged in the current Plan, which is twice as much as the investment on the first two Plans put together. Even so, the rate of economic progress during the last decade does not compare favourably even with that in less-developed countries in Asia, let alone the industrially advanced countries, such as Japan and West Germany, observed Mr. G. V. Puranik, Chairman of the All-India Manufacturers' Organisation at the second quarterly meeting of the central committee of the Organisation. In support of this observation, he referred to a recent economic survey brought out by the United Nations according to which many under-developed countries have recorded greater economic progress than India not only in the rate of investment but also in the rate of increase in national income.

Mr. Manubhai Shah, Union Minister for Industries, who was the chief guest on the occasion, however, disputed the correctness of this finding and observed that his own study had shown him that the findings of this survey were not in accordance with the actual progress and, at times, even grossly miscalculated. On the contrary, he maintained: "I can say that our rate of growth is the highest without any fear of contradiction from any quarter." This is indeed a challenging challenge, but, even if one grants it, for argument's sake, if only to salve our conscience, the incontrovertible fact remains that we could certainly have fared very much better, had our rate of productivity been better and had there been enough drive and proper co-ordination of efforts in the implementation of all our developmental programmes, whether in the public sector or in the private sector. The absence of these is glaringly reflected in the inordinate delays in the execution of many an urgent project. In this connection, Mr. Puranik did well to recall the pertinent and impartial observation of none other than Mr. V. T. Krishnamachari, ex-Deputy Chairman of the Planning Commission, that "our administrative personnel have not proved themselves equal to the responsibilities entailed by plans of such vast magnitude."

Mr. Manubhai Shah was also not prepared to accept the generally universal complaint about idle capacity in our industries. To the complaint of the A.I.M.O. Chief that this unfortunate situation had not only been causing constant national loss but also greater pressure on fresh capital investment, — incidentally, this view is shared by many others, including Dr. P. S. Lokanathan, at the last meeting of the Import Advisory Council—Mr. Shah's reaction was: "The sooner this bogey of under-utilization of industrial capacity is buried, the better it will be for the rapid industrialization of the country". He went so far as to declare that the complaint was divorced from realities, though he was prepared to concede that it applied to but one per cent of the entire industrial sector. Important industries like cement and chemicals and 63 per cent of the 498 mills, he added, had been operating round the clock. Notwithstanding this categorical assertion of the Minister, the feeling persists, even in most responsible busi-

ness circles, that the problem is there and certainly in a greater degree than Mr. Shah is prepared to concede. Not only is there considerable idle capacity in our industries still, but it bids fair to be with us for several years to come. In any case, if only because of the existence of a genuine difference of opinion on the subject, it seems to us that the suggestion of Mr. Puranik that the concerned Development Councils should be entrusted with the task of ascertaining the extent of, and reasons for, the idle capacity, as also of recommending appropriate remedial measures, deserves to be more carefully considered.

C.A.I. Seminar

CONSUMER'S PROBLEMS

IT NEEDS to be emphasized that the interests of the consumer must be protected for he has all along suffered from rising prices. Happily their case was taken up at the All-India Seminar on consumers problems. The Consumers Association of India urged upon the Government that a high-power commission headed by a non-official to enquire thoroughly into all factors affecting the consumer interests should be appointed. The other suggestions made by the CAI are that accredited representatives of the CAI should be associated with Government agencies in helping to detect and report malpractices; the CAI should be given adequate representation on various committees and boards formulating rules, regulations and standards for consumer products; home science colleges should provide leadership on consumer education work and instruction in consumer education be given more emphasis in the curricula of schools and colleges. The CAI also recommended that shopkeepers should be obliged to display price lists and that the Government should impose some kind of price control. Consumer co-operatives should be opened to act as buffers against rising prices and suitable steps should be taken against spurious advertisements. The role of women was stressed for resisting malpractices.

The suggestions made by the CAI are thought-provoking and, if implemented, can go a long way in setting the state of affairs right. So far as consumers co-operatives are concerned, they can, of course, be an effective means to protect the consumers if only properly organized and co-ordinated. They have proved to be of great value in the West and there is no reason why they should not be a success here. Time is ripe for their experiment; just possible, as the CAI has stressed, they might act as buffer and help in holding the price line.

Small-Scale Industries

MECHANISATION OF SMALL UNITS

IF THE small-scale industry is to play an effective role in the changing economic set up, it is essential that the small units should be mechanised. And for speedy mechanisation, it is imperative that inducements such as easy credit, tax concessions and consultative services should be offered to the small-scale industries. Happily, due note of it was taken at a recent meeting of the Technical Committee of the International Labour Office which came out frankly in support of these points. The meeting recommended that measures be taken to modify and adapt existing machinery to meet new needs

and consideration should be given to the utilisation of second-hand machines provided these were suitable. Pilot projects should be started initially in geographical areas with a favourable environment in regard to capital, skill, power supply, market etc., as an effective means of promoting mechanisation.

On the organization and management of small industries, the Technical Meeting of the International Labour Office was of the view that the co-operative method was one of the most effective means. But this, of course, has got to be recognized that the scope for co-operative organization is limited in the case of small undertakings engaged in complex production. It, therefore, recommended that in such cases, joint action should be taken to a limited extent in operations like processing, finishing and provision of other common facilities.

As regards technical services to the small industry, the meeting suggested the provision of services in respect of finance, raw materials, marketing, production, labour, management, organization, economic and social research, information services and designs and teaching of packaging techniques. Since the experience of other countries can be a valuable guide, it was emphasized that tours be organized for small entrepreneurs to go abroad to give them an opportunity to visit small units. The suggestions are of far-reaching importance and need to be looked into carefully.

Trade

GUJARAT CHAMBER'S MEMORANDUM

IN A lengthy memorandum submitted to the Import Export Policy Committee, the Gujarat Chamber of Commerce has raised a number of pertinent points in regard to the export import policies. The Chamber is of the view that import policy should not be changed during the currency of a licensing period because the change in between can cause uncertainty and result in gluts or shortages of some of the goods. The Chamber favours the repeat licensing scheme and has suggested that repeat licensing should be extended to cover as many items as possible. There is much scope for the decentralisation of licensing of imports and it is, therefore, urged that licensing authorities at the ports should be delegated with the licensing work to the maximum possible extent.

As regards exports, the Chamber calls for a dynamic approach with a view to achieve the desired results. So that exports may have a quicker tempo, a review of the activities of the export promotion councils is called for and it is suggested that their recommendations should be implemented to the maximum extent.

Encouraged by the success of some of the export promotion councils, the Chamber has requested the Committee to examine the feasibility of establishing export promotion councils to cover commodities like oils, oil-seeds, oil-cakes, raw wool, minerals, sugar, salt etc. The establishment of an organization on the lines of the British Export Research Organization and the Japan Export Trade Recovery Organization is suggested from the point of view of developing exports of other commodities for which there is fairly good scope in the foreign markets, and for which export promotion councils are not yet formed. In all, the approach is that export policy as such must move with the changing trends. Since our trade missions can be an effective means in the export drive, there is a logical feeling that trade commissioners' offices abroad must be better

staffed and well equipped. In view of the paramount need to stimulate exports, the Chamber considers that export duty should either be reduced or completely removed, wherever feasible.

New Issues

TRIVENI ENGINEERING WORKS LTD.

THE TRIVENI ENGINEERING WORKS LTD. is offering at par for public subscription 1,04,125 equity shares of Rs. 10 each. The entire issue of 87,500 preference shares has been under-written by the Life Insurance Corporation and M/s. Harbans Singh Mehta & Co., New Delhi.

The authorized capital of the Company is Rs. 1 crore divided into 800,000 equity shares and 200,000, 9.3 per cent cumulative redeemable preference shares of Rs. 10 each. The issued capital is of Rs. 60,00,000 divided into 4,25,000 equity shares and 1,75,000, 9.3 per cent cumulative redeemable preference shares. Out of the above issue, 1,08,375 equity shares at par are reserved for issue to the Indian promoters, the Directors, the companies with which they are associated and the employees of the Company and 2,12,500 equity shares and 87,500 9.3 per cent cumulative redeemable preference shares have been issued and subscribed for cash at par by the collaborator concern to be utilized for import of plant and machinery required for the project. The subscription list of the new issue will open on 30th October, 1961, and will close on 5th November, 1961, or earlier at the discretion of the Directors, but not before November 1, 1961.

The Company was incorporated in January 1961 for the purposes of manufacture and production of sugar machinery, steam turbines and other heavy industrial plant and machinery. So far as technical collaboration is concerned, Bookers Sugar Machinery Group Ltd., George Fletcher & Co. Ltd., and Duncan Stewart & Co. Ltd., have agreed to act as the technical consultants to the Triveni Engineering Works Ltd. For the manufacture of turbines and air compressors, Peter Brotherhood & Co. Ltd. of Peterborough, England, has entered into an agreement to give full and continued technical collaboration. The site chosen by the Company is ideal. Raw materials can be found in plenty nearby and the Government of U.P. have promised the utmost help for the early supply of Government hydro-electric power.

Since the Triveni Engineering Works Ltd. is a sound concern, the favourable response of the public to the new issue is a foregone conclusion.

INDIAN CAMPHOR TO RAISE RS. 70 LAKHS

INDIAN CAMPHOR LIMITED, a new Company sponsored by Mr. Popatlal N. Shah, Mr. Pravin P. Shah, Mr. Hasmukh J. Amin and some others, to undertake the manufacture of camphor and turpentine derivatives, is expected to enter the capital market in December to raise Rs. 70 lakhs, out of the Rs. one crore authorised capital of the Company, divided into 1,00,000 equity shares of Rs. 100 each. The Company was registered in Maharashtra State recently.

Technical collaboration for the project has been secured from an American firm, Glidden International C.A., manufacturers of turpentine. Its production will be of the order of 1,000 tons per annum. The plant will be located at Kalyan, near Bombay. Production is expected to start towards the end of the next year.

This is the second company going in for manufacture of camphor and turpentine derivatives in the country, the first being Camphor and Allied Products Limited, which was floated a few months ago, to undertake the manufacture of synthetic camphor to the tune of 900 tons per annum. At present, all the requirements of camphor are being met through imports. The demand for the commodity is increasing because of its use in the production of drugs and pharmaceuticals.

Mysore

STATE'S THIRD PLAN OUTLAY

THE THIRD PLAN outlay for Mysore State has been fixed at Rs. 250 crores, out of which Rs. 110 crores are expected to be provided by the State Government from its own resources. This has been described by the State's Chief Minister, Mr. B. D. Jatti, as "the most comprehensive programme of development" for the new State of Mysore. Per capita outlay is estimated to be Rs. 98.89 crores, recording an increase of 54 per cent over the Second Plan. In regard to the creation of employment opportunities, it is envisaged that overall additional employment might be found for about 567,000 people.

The Plan outlay is distributed as follows: Power Rs. 70 crores; Social Services Rs. 48 crores; Agriculture, Minor Irrigation, etc., Rs. 41 crores; Major and Medium Irrigation Rs. 41 crores; Community Development and Co-operation Rs. 21 crores; Transport and Communications Rs. 13 crores; Village and Small Industries Rs. 8 crores; Major and Medium Industries and Minerals Rs. 8 crores. The area that benefitted from the additional irrigational facilities provided during the first two Plans had been of the order of 18.5 million acres. A target of 12.8 million acres to be brought under additional irrigation has been set during the Third Plan.

The overall foreign exchange component of the expenditure envisaged under the Plan is only about 9.4 per cent. An investment of the order of Rs. 57.11 crores by the Central Government has been anticipated.

The Plan expects a tremendous progress in the electric power sector, stepping up of the installed capacity from 208 MW to 977 MW, or a net increase of 370 cent.

The participation by the State in the share capital of private sector industries has been set at Rs. 2 crores. A fertilizer unit and an aluminium factory are proposed to be established. The other industrial development schemes include the stepping up of the Kolar and Hatti gold mines, expansion of the Bhadravati Steelworks, manufacture of stainless steel, setting up of an electric pig iron furnace, development of Mangalore port, etc.

Social services account for about Rs. 48 crores in the Plan. The provision of free and compulsory education for the age-group 6 to 11 is the highlight of the General Education Programme. Under technical education, the establishment of a polytechnic for women, two junior technical schools and an arts and crafts school is planned.

Economy

TECHNO-ECONOMIC SURVEY OF KERALA

LIKE MANY other techno-economic surveys conducted by the National Council of Applied Economic Research, the survey of Kerala also follows the same pattern.

The survey covers as usual every aspect of the economy. Agriculture, plantations, animal husbandry, forests, fisheries, minerals, power, transport and industry are dealt with exhaustively.

Investment suggested by the Council in its preliminary economic report in various spheres in the State is to the tune of Rs. 1,001.7 crores during the ten-year period from 1961 to 1971. On the industrial front, the suggestion of the Council is that there should be established a large number of engineering industries and for establishing industries the loan policy of the Government should be made more flexible and the procedure of granting loans should be made quicker than it is at present. An Investment Trust and a Corporation for State industries is suggested with a view to reducing the risk of industrial investment by spreading it out over a number of concerns. The function of the corporation will be to make day to day running of the State Government concerns independent of the Industries Department.

As far as financial resources are concerned, the report says that there is not much scope for the introduction of new taxes. However, encouragement be provided to the tourist traffic in order to earn more revenue. The rates of the existing taxes may also be raised.

Since the cost of generation of electricity in Kerala is much lower than in the neighbouring States, it has suggested that the price at which electricity is exported to the neighbouring States should be such as to yield a net profit to the Kerala State. To achieve this, it is underlined that the installed capacity be raised from the present level of 120 MW to 400 MW and 800 MW by 1966 and 1971 respectively. The investment required for the purpose over the next decade is expected to be Rs. 105 crores. Among the many other recommendations made, extension of the area under sea island cotton, tobacco, sugarcane, ginger, oilseeds, lemon-grass, bananas and pine-apple is quite prominent.

The main problem confronting the State at the present moment is that of unemployment. The report has estimated that 24.3 lakhs of persons would be looking for jobs during 1961 and 1971, including the backlog of unemployment and the growth of labour force during the period. Although the investment programme in the report would help in mitigating the unemployment problem, it is feared that there will still be a backlog of 9 lakhs unemployed by 1971.

Madras

DISTRICT INDUSTRIAL ESTATES

THE INTENTION of the Government of Madras to have an industrial estate unit in every district was disclosed by the State's Minister for Finance and Education, Mr. C. Subramaniam, while inaugurating the Small Industries Management Association at Madras recently. In addition to the district units, the Minister added, it was the intention of the Government to have smaller units in various semi-urban areas like taluk headquarters, which had already been registered. It was necessary, therefore, that small-scale industrialists should know the methods of industrialisation for making speedy progress.

Emphasizing the importance of small industries the Minister said that a large number of small ancillary industries in the U.S.A. were feeding the big industry,

which often functioned only as an assembling unit. The high standard of quality was imperative in order to market them to a wide region of large units.

In Japan, Mr. Subramaniam pointed out, highly specialized metallic parts and instruments of high standard were produced by the small-scale industry. About 30 per cent of the condenser requirements of Japanese industry, he said, was turned out by a single unit in the small-scale sector.

Presiding over the inaugural ceremony, Mr. Easwaran, Director of the Easun Engineering Co. Ltd., said that problems of management were the same in small and big industries except that their fact of ownership was different.

Explaining the objects of the Association, Mr. S. Ramalingam, President of the Association, said the Association intended to help the small industries by providing them all assistance in the matter of their management needs and problems.

Labour Conference

CODE OF EFFICIENCY AND WELFARE

OF THE many problems discussed at the Indian Labour Conference at Bangalore last week, Code of Industrial Welfare and Efficiency figured prominently. And rightly too since productivity on which hinges the success of planning, must of necessity be given the highest possible priority, incentive for which should be sought through an equitable guarantee of welfare. The new code is designed to maintain a cordial atmosphere so that production can progress unimpeded and thereby bring about conditions for the maximum utilisation of the installed capacity of the industrial units. According to a study made by a work study expert, Mr. Solomon, utilised licensed capacity in our best private enterprise factories in Calcutta area is only 50 per cent of the capacity. In other words, the average is less than 50 per cent in respect of all the factories in respect of every single group of machine.

The Code has been committed to scrutiny by a tripartite committee for it is considered that any commitment in the implementation of the code should not be made until the fullest thought is given to all its implications. The case for caution is valid as undue haste can lead to disastrous consequences. It is by now well known that very often vested interests try to spoil the game in between.

Now that the Code is before the Committee, it is to be hoped that a thorough probe in every aspect would be carried out. More than anything else would be required a specific machinery to work it. Works Committees and Joint Management Councils would just not be sufficient to implement it.

Carbon Black

NEW PROJECT

ANOTHER PLANT to manufacture furnace type carbon black is to be set up near Bombay in the near future. The project is being sponsored by Mr. C. H. Bhabha, the noted Bombay banker and a former Commerce Minister of the Government of India, in collaboration with Messrs. United Carbon Company of U.S.A. A formal agreement on the collaboration arrangements is expected to be signed when Mr. Bhabha returns from his European tour.

The issued capital of the Company to be formed to undertake the project will be of the order of Rs. 162.50

lakhs. The foreign collaborators will be subscribing to shares worth Rs. 50 lakhs, mainly to meet the cost of import of machinery and equipment for the project. In addition to these Rs. 50 lakhs worth shares, the U.S. company will get shares worth Rs. 15 lakhs for its patent rights, technical know-how and for collaboration in the marketing of the Company's products. In all, thus, 40 per cent of the capital of the new Company will be held by the foreign collaborators. The balance will come from the shareholders resident in India. The capacity of the plant is envisaged to be 13,600 tons per annum.

The petroleum feed stock, the principal raw material to be used at the plant, will be obtained from within the country itself. The foreign collaborators are said to have indicated to the Government of India that after the plant goes into full production, efforts will be made to build a sizeable export market for the Company's products in the neighbouring countries.

Coffee

ACCUMULATION OF STOCKS

IT HAS been voiced in recent months that there is need for a change in the methods of marketing by the Coffee Board and also a different system is required in exporting, particularly the better qualities of Arabica coffee. In the year 1960-61 when the industry witnessed a peak crop, there were accumulated stocks of about 30,000 tons which, however, were of inferior varieties of coffee. Some of the planters believe that if they had the freedom to sell the output in the overseas market, they could fetch higher prices for their better grades of coffee. They believe that in bulking the coffee, it is difficult for the companies to secure better price for superior grades. They add that so long as the industry was experiencing easy markets, certain handicaps did not influence the sales, but the recent fall in prices is being felt by the growers and the demand for freedom to the individual estates to sell at least a part of their output directly both in the internal and overseas markets is growing. It is pointed out that at times a situation comes when the average price realized is much below the cost of production for a good number of estates and naturally the profits at the previous levels are not maintained even with larger crops. In fact, the present conditions will only be reflected in the company results when they are published next year. Several company chairmen have also voiced that a new procedure should be devised so that periods of waiting between the actual realisation of returns are reduced, which in turn will reduce their interest charges.

Village Industries

RURAL INDUSTRIALISATION COMMISSION

AT A recent meeting of the Co-ordination Committee of the representatives of Khadi and Village Industries Commission, State Boards and of the Khadi Samiti of the Sarva Seva Sangh held at Ahmedabad, it was decided to accord general approval to the proposal put forward at the Sarvodaya Sammelan for the formation of a rural industrialisation commission. The Committee believed that it was mainly through the expansion of all forms of non-agricultural production in rural areas that an improvement could be brought about in the rural economy. Thus far it seems to be a sound proposition because in the rural regions, unless we generate a sense of industrialisation, real progressive attitude cannot develop among our villages. But the attitude taken by the Co-ordination Committee to disavow the State Governments' granting of more capa-

city for spinning mills seems to be quite baseless. The Committee pointed out that the existing spinning capacity was enough to meet needs of an expanding handloom weaving industry during the next few years. The Committee also expressed its disapproval of the approval granted by the State Governments to expand the sphere of powerlooms. This view again is not very correct because the Government's attitude has never been to replace handlooms but allow expansion of powerloom sector which is certainly going to provide more weaving capacity which is very necessary in view of the rising demand of cloth as a sequel to the rising standards in the rural areas.

NAPE

NAPE IN THE NEWS

THE NATIONAL ASSOCIATION OF PURCHASING EXECUTIVES, started in October last year and formally inaugurated by Dr. C. D. Deshmukh in July, 1961, sponsored a six-day instructional course in conjunction with the "Eastern Purchasing Journal", New Delhi. The course was conducted in Bombay from September 25 to September 30, 1961, and covered modern methods of Purchasing, Store-keeping and Materials Management. Not only Purchase and Stores Officers but also those connected with Purchasing and Materials Management in one way or another participated in the course.

Inaugurating the course, Mr. G. V. Puranik, President of the All-India Manufacturers' Organisation, congratulated the NAPE for its valuable contribution to the important field of Management by extending opportunities of training for Purchasing Personnel in the country.

The course was conducted by Mr. A. R. Palit, Editor, "Eastern Purchasing Journal", which is the official organ of the Association, and certificates for the course were distributed to the participants by Dr. K. S. Basu, President, Bombay Management Association.

The NAPE hopes to organise another advanced Instructional Course, consisting of 20 lectures, some time during the first quarter of 1962.

Warehousing

ALL ROUND PROGRESS

THAT WAREHOUSING is making steady, though not spectacular, progress and has created a general con-

sciousness of the need for good storage, is evident from the annual report and accounts of the Central Warehousing Corporation adopted at the fourth annual general meeting of the Corporation held in New Delhi recently. It may, for instance, be noted that the number of Central Warehouses rose from 27 to 40 fulfilling thereby the Second Plan target. The number of warehouses opened by the State Corporations increased to 266 as against 148 at the end of 1959-60. The storage capacity of Central Warehouses rose from 44,040 tons at the end of 1959-60 to 79,020 tons at the end of 1960-61. The revenue collected from storage charge increased from Rs. 3,81,198 during 1959-60 to Rs. 7,87,505 during the year under report.

It is also encouraging to find that the Corporation has approved project reports for the construction of warehouses at 34 centres with a total storage capacity of 1,63,400 tons at an estimated cost of Rs. 231.27 lakhs. Warehouse buildings with a storage capacity of nearly 27,00 tons have been completed so far at Amravat and Sangli (Maharashtra), Warangal (Andhra Pradesh), Davangere (Mysore), Srirangapatna and Kotah (Rajasthan) and Morena (Madhya Pradesh). The Corporation has taken steps to accelerate its construction programme so that warehouses at present located in hired accommodation may be shifted to new buildings constructed on modern and scientific lines. The State Corporations have also undertaken the construction of their own buildings at more than 20 centres in the country so far.

The warehouses of the Central and State Warehousing Corporations have a storage capacity of about 3,50,000 tons; this is to be increased to over 1.6 million tons in the Third Five-Year Plan. In the Third Plan Rs. 8 crores have been allotted for warehousing programmes. Since the provision of storage capacity is a vital step in the implementation of price policies, every step is being taken to execute the programme successfully. It is now to be hoped that in designing new warehouses, the need for specialised types of storages for certain commodities would be kept in view.

AN OMISSION

The statistical tables appearing on pages 576 to 578 of our journal dated September 22, 1961, were taken from the August Bulletin of the Reserve Bank of India. The omission to acknowledge the source is regretted.—Ed.

FROM THE CAPITAL'S CORRIDORS

U.S. BUSINESS MEN IN DELHI

ABOUT 50 top U.S. business executives, representing over 35 companies, will meet in New Delhi from October 22 to 27 to discuss with the representatives of Indian Government and industry the possibilities of greater collaboration between them in the field of industrial development in India. The meeting, which has been organised by Business International of the U.S.A., is an annual event. The last meeting was held at Brussels. The Prime Minister, Mr. Nehru, and the Central Ministers in charge of Finance, Commerce and Industry, Planning, Steel, Mines and Fuel, and Irrigation and Power, are among those who are expected to speak to the U.S. business men about the scope and possibilities of American investment in India.

The Vice-President and Editor of Business International, Mr. E. Haynes, indicated recently that the fact that they had decided to hold the conference in New Delhi did not mean that the U.S. business executives were coming with specific proposals for investment in India. He added, they were coming "to learn", exchange views with representatives of the Government and industry and to see for themselves the possibilities of "direct private investment". He explained that they were interested in putting in their own capital and imparting skills and technical know-how in productive enterprises rather than in giving loans for developments. Mr. Haynes added that many of the U.S. business men, who will be attending the New Delhi meeting, represent "blue chip" companies, that is those with stature and reputation. Mr. Haynes disclosed that some of these companies already had "involvements" in India.

COAL IN THE PUBLIC SECTOR

The National Coal Development Corporation has succeeded in persuading the British Coal Board and the Technical Co-operation Mission of America to step up the quantum of their aid for the implementation of the public sector programme of coal raising during the Third Plan. The T.C.M. has agreed to undertake the development of Singrauli coalfields in addition to Ramgarh for which an American team of experts visited India sometime back.

As a result of the discussion between the British team of experts, which recently came to India, and the N.C.D.C., it has been decided that not only Jarandih deep pit but also Kathara and Swang deep pits should be entrusted to them. The British experts are to develop these mines up to the stage of full production after which they will be handed over to the N.C.D.C. as running mines. Since no production can be expected from deep shaft mines at either of these sites before the next 7 or 8 years, it is proposed to develop open cast mines at Jarandih and Swang for an initial production of about one million tons a year which would subsequently be replaced by deep shaft mines. The British Coal Board is likely to send out a specialist open-cast engineer to co-ordinate the open cast mines to fit in with the deep shaft mines at both Jarandih and Swang.

The programme for developing the steeply inclined thick seam of Karanpura mines has also been chalked out in consultation with French experts. A team of French experts is expected to visit India to prepare

the project report for the "depillaring" of the mines in Karanpura.

WORLD BANK LOAN FOR RAILWAYS

The International Bank for Reconstruction and Development has granted a loan of \$50 million (Rs. 23.9 crores) for the development programme of Indian railways during the current and the coming year. The loan is repayable in 20 years and carries interest at the rate of 5½ per cent, including the one per cent commission which is allocated by the Bank to its Special Reserve.

Five U.S. commercial banks are participating in the loan, without the World Bank's guarantee, for a total of \$10,75,000, covering the entire first maturity due in February, 1965, and a part of the second maturity due in August, 1965. The participating banks are: the Bank of America, N.T. & S.A., San Francisco; First National City Bank, New York; Manufacturers Hanover Trust Company, New York; Fidelity Philadelphia Trust Company, Philadelphia; and the First Pennsylvania Banking and Trust Company, Philadelphia.

The foreign exchange component of the Railways' Rs. 1,325 crores Third Plan is estimated at Rs. 186 crores. Further loans from the World Bank for this development programme are, therefore, expected to be available in course of time. The World Bank has been assisting the Indian Railways with loans for a number of years now. Up to the end of the Second Plan period, the Indian Railways received from the World Bank loans totalling \$329 million.

The development programme of the Railways has a very important place in the Third Five-Year Plan of the country which was launched in April last. Railways in India are today the largest carriers of long-distance freight and passenger traffic. Large investments, therefore, are required if they are to keep pace with the requirements of the Third Plan, whose production targets imply a 75 per cent increase in freight traffic (mostly bulk commodities, such as coal, iron ore, steel and cement) and a 15 per cent increase in passenger traffic.

Emphasis over the next few years will be placed on increasing traffic capacity by equipping the existing Railway System to run heavier trains at higher speeds. To this end, more diesel locomotives will be bought, about 1,300 route-miles of track will be electrified, large capacity freight cars will be acquired, and heavier track will be laid. Over the next five years, a total of over 1,800 new locomotives (steam, diesel and electric), nearly 7,900 passenger cars and 117,000 freight cars are to be brought into service. At the same time, large sums will be spent on workshops, track, bridges, traffic and signalling works and equipment, electrification and the addition of about 1,200 miles of new lines to the Railway System.

COLLABORATION WITH MONTECATINI

Indo-Italian collaboration for the industrial development of this country is envisaged to be taken a step further by the Italian firm Montecatini which is prepared to collaborate with Indian industrialists for the manufacture of various goods, such as polypropylene plastics, industrial and mining explosives, methanol

and formaldehyde and polystyrene resin. The four projects will involve a total capital outlay of about Rs. 30 crores. Applications for securing industrial licences for the first three projects have already been made to the Government of India. The sanction for the fourth one is to be sought shortly.

The Italian firm will participate in the equity capital of the new companies to be formed to undertake these project. Its participation will range from 25 to 50 per cent of the share capital of these companies. Montecatini will provide technical know-how and also supply the necessary machinery and equipment. It will as well arrange loans from Italian banks, if necessary.

The polypropylene plastics plant is likely to be located in Bombay, where the required raw material propylene would be available in sufficient quantities. The project will involve capital investment to the tune of Rs. 10 crores in the first stage which would be stepped up to Rs. 15 crores in the final stage. To begin with, the plant will have a capacity of 7,000 tons per annum. The capacity would be raised in the final stage to 15,000 tons per year.

The industrial and mining explosives project is proposed to be undertaken somewhere in Madhya Pradesh. It will also involve an investment of Rs. 10 crores.

The methanol project is proposed to be undertaken in Gujarat where it would be linked up with the new oil refinery to be set up there. It will involve an outlay of Rs. 6 crores. The capacity of the plant would be 10 tons of methanol per day, which would yield 40 tons of urea formaldehyde.

The polystyrene resin plant is envisaged to be set up either in Maharashtra or in Gujarat and will involve an outlay of about Rs. 5 crores. Its capacity is proposed to be 5 tons a day.

Montecatini is already collaborating with India Dye-stuff Industries and Amar Dye Chemicals for the manufacture of dyestuffs and with Madras Aluminium Company for the manufacture of aluminium. It has also designed the urea plant to be set up at Neyveli. The current capital investments of this Italian firm in India are placed round Rs. 3 crores.

INDO-GERMAN COLLABORATION

The Government of India, it is understood, has under consideration a scheme for the manufacture of pharmaceuticals in collaboration with Messrs. Farbenfabriken Bayer, Leverkusen, Germany. The German firm will be providing technical know-how and also the necessary foreign exchange required for the import of plant and equipment. Its holdings in the Indian company will amount to 56.25 per cent. The imported plant and equipment will cost Rs. 37.80 lakhs. Some raw materials will also have to be imported, their cost being Rs. 3.85 lakhs. The equipment to be procured indigenously is estimated to cost Rs. 28.70 lakhs.

The official circles are said to be of the view that the scheme should be subject to the condition that it would be based on the intermediates metachloro Aniline and Diamine and that the programme would be so phased as to replace Diamine with Diethylamine when the latter becomes available from the Synthetic Drugs Plant in three or four years' time. As regards the formulation activity, the firm should base them on basic drugs produced in its undertaking and/or utilising other indigenous raw materials.

The choice of raw material for the manufacture of Parathion has also been discussed. It is expected that the manufacture of Parathion from Thiophosphoryl Chloride will be taken up in the shortest possible time.

The question of permitting manufacture of synthetic anti-malarials was considered at the meeting convened by the Ministry of Health in Delhi on May 23, 1961, when representatives of the State Governments of Madras, West Bengal, the Development Wing (Drugs and Pharmaceuticals Directorate), Malaria Institute of India, etc., were present. The consensus of opinion on this point was that there need not be a total ban on production of synthetic anti-malarials which were quite useful for treatment of diseases other than malaria, provided the production was gradual and adequate to meet the requirements of the country.

The scheme of Messrs. Bayer Agrochem envisages manufacture of chloroquin diphosphate with a capacity of 4,000 kgs. per annum. This drug is used for the treatment of malaria, amoebosis, rheumatoid arthritis, tapeworm infestations etc. For some time, the shortage of this drug has been keenly felt in the country in view of the restrictions imposed on the import of synthetic anti-malarials to protect the local quinine industry. It has, however, now been recognised that this is superior to quinine in certain respects even in the treatment of malaria, and the cost of treatment is also lower as compared to quinine. It is now being increasingly used for the treatment of other diseases also.

RE-ROLLING MILLS FOR ANDHRA

The Government of India, it is understood, is giving its most favourable consideration to the recommendations of the Andhra Pradesh Government for setting up three re-rolling mills in the State. The Andhra Pradesh Government had written to the Central Government that since there was very little re-rolling capacity in the State at present, sufficient capacity should be set up in its various industrially backward regions. It had named Telengana, Rayalaseema and the Circars as the possible sites for establishment of re-rolling units. The State Government had further

recommended that it would be advantageous if the capacity to be set up in these regions were to be a minimum of 5,000 tons per unit, working on two shift basis. Along with this recommendation, the State Government had forwarded the applications of the following three parties to set up 5,000 tons capacity re-rolling units in the State: (1) The Andhra Re-rolling Works, Hyderabad, (2) The Rayalaseema Steel Re-rolling Mills, Guntak, and (3) The Venketeswara Steel Products Ltd., Anaparthi.

All these three applications, it is expected, will be accepted by the Union Government. The Union Government's decision will be in line with the Re-rolling Mills Committee's recommendations which have already been accepted by it.

BRICK-MAKING

A beginning will shortly be made in the manufacture of some common materials, such as bricks, through mechanical methods. The Government of India recently had made a study in this regard, which showed that supplies of bricks from the existing sources were inadequate and, consequently, the prices were very high. The existing small-scale brick kilns, the study revealed, employed migratory labour and changed their working sites after depletion of clay deposits at a particular place. Further, the manufacture of bricks was being carried on only for 5 months in a year when rains did not come. The study reiterated the need for setting up mechanised brick-making plants for meeting the growing demands of cities like Delhi, Bombay, Calcutta and Madras.

The first application considered for setting up a mechanised brick-making plant has been that of Messrs. K.T. Kosalam. Messrs Kosalam's plans envisage manufacture of three crores bricks per year, which will meet the requirements of the Madras Government for implementation of its Third Plan projects. The Madras Government, it is understood, proposes to participate in the share capital of this company. The entire equipment and plant will be imported from Czechoslovakia against rupee payment. It will cost nearly Rs. 7.2 lakhs.

L.I.C.'S FINAL BONUS FOR 1958-59

The Life Insurance Corporation has announced, for the two-year period ending December 1959, a bonus of Rs. 16 per Rs. 1,000 per annum on whole life policies and Rs. 12.89 on endowment policies issued after the nationalisation of Insurance. Bonuses ranging from Rs. 78.40 to Rs. 1.60 for whole life and Rs. 32 to Rs. 1.28 for endowment have been declared on policies of 185 companies taken over by the Corporation. No bonus has been declared in respect of 53 companies. The total number of with-profit policies entitled to bonus is 52.30 lakhs. The Corporation has announced this in its second valuation report on the differential bonus scheme. This scheme supersedes the provisional one framed by the Corporation and announced in June 1959.

As regards the second valuation as at December 31, 1959, the allocation of profit to the Central Government was Rs. 1.28 crores, Rs. 33 lakhs were paid as interim bonus to policy holders and Rs. 24.47 crores were reserved for the participating policy-holders. The profit totalled Rs. 28.08 crores for the inter-valuation period of two years.

It was revealed by the Managing Director of the Life Insurance Corporation, Mr. S. D. Srinivasan, that the final bonus in respect of 119 insurers was greater than the provisional bonus. In the case of 26 insurers, the final bonus was less than the provisional one. The break-up of the other insurers was as follows: Insolvent 23, purely non-participating 6, no provisional and

final bonus 26, and no provisional bonus and some final bonus 42.

The Managing Director pointed out that the next valuation covering the two-year period ending December 1961 was hoped to be completed by October 1962. Regulations with regard to the classifications of policies for differential bonus which come into effect from October 15, 1961, will not apply to policies which have resulted in claims by death or maturity before that date.

EXPORT DRIVE

The Government of India, it is understood, will be finalising various incentive schemes for export promotion, including a wide range of tax concessions and legislation to set aside a part of industrial production for exports, before the Lok Sabha's next session starts on November 20. A final announcement in this regard is expected to be made during the Parliament Session.

A Committee of Finance Ministry officials, headed by Mr. K. S. Sundara Rajan, Joint Secretary, Department of Economic Affairs, which has been studying the implications of income-tax and other concessions demanded by the export trade, is expected to finalise its proposals in the near future. Its recommendations, it is envisaged, will include concessions in income-tax and excise and custom duties as also in respect of evolving a simple formula for determining on a rough and ready basis the quantum of drawback of duties paid on the manufacture of export products.

While the proposed enabling legislation for compulsory exports might take more time to be finalised in consultation with affected industrial and trade interests, the scheme for short-term credits for exports as also other forms of export credit assistance recommended by an official Committee, are in the process of being finalised by the Union Commerce and Industry Ministry.

The suggestion for setting up a Refinance Corporation for exports on the lines of the Refinance Corporation for assisting industrial development, it is understood, has not found favour with official circles mainly due to practical difficulties. It is said that the suggestion made by the Federation of Indian Chambers of Commerce and Industry could be seriously examined only if there was an assurance that the huge funds that would be required to finance exports would be forthcoming.

INDIA TO PARTICIPATE IN LEIPZIG FAIR

India will be participating in the forthcoming Leipzig Spring Fair in East Germany, scheduled to be held from March 4 to 13, 1962. The object of the participation is to publicise India-made goods and merchandise, both traditional and non-traditional, and thus expand the market for Indian goods in East Germany and the adjoining countries. The last date for sending lists of articles for exhibition at this fair to the Union Ministry of Commerce and Industry has been fixed as November 25, 1961.

INDO-CEYLONESE TRADE

Talks have started here between an 8-member delegation from Ceylon and the Government of India for fostering trade between the two countries. India today has a favourable balance of trade with Ceylon of about Rs. 14 crores per year (exports Rs. 18 crores, imports Rs. 3.9 crores) and imports from there mainly copra and coconut oil. Ceylon desires fewer restrictions on the entry of these items into India. She would also like to export rubber to this country. India on her

Bank vaults are always made of steel...
because steel is so dependable!

symbol of security!

Through the years Steel has come to be considered the symbol of security... not merely physical security, but economic security as well! The larger the amount of steel a country produces, the higher the rung she occupies on the ladder of economically stable countries... the greater her credit in the international market. And that is why India today is striving so hard to raise her output of steel — Steel that will endorse her claim to economic stability... Steel that she can hold up to the world as a symbol of her security.

MR. CURRAN IN DELHI

Mr. George Curran, vice-president in-charge of Bank of America's Far East division, is arriving in New Delhi on Saturday, October 21, on an extended tour of several Asian cities and countries where the bank has branches and representative offices. During two months of his tour, Mr. Curran will study the economies of the region and will meet business and industrial leaders, government and central bank officials, correspondent bankers, and resident Bank of America officers. Included in the bank executive's itinerary are India, Pakistan, Thailand, Hong Kong, Formosa, Okinawa and Japan. Mr. Curran will return to San Francisco from Tokyo on December 21.

CENTRAL REVENUE

The revenue realised from items on which duties are levied and collected by the Central Government in the first five months of the current financial year amounted to Rs. 338.86 crores. Of this, Rs. 68.37 crores were collected during August. The corresponding figures for the first five months of the last financial year and for the month of August, 1960, were Rs. 291.93 crores and Rs. 60.39 crores respectively.

Alongside are details for the revenue realised under various heads:

BOOK REVIEWS

NOT WITHOUT BLOSSOMS

Blossoms in the Dust: By Kusum Nair: Published by Duckworth: Pp. 201: Price 21s.

"Blossoms in the Dust" by Kusum Nair deals with rural India. As described in its introduction by Gunnar Myrdal, "It is primarily a literary work." Its substance has not got the glamour of its style. The book proves that a good writer can articulate life into fiction and give the fiction a stir and tremble of life. That is what Pasternak did with a greater finesse in Dr. Zhivago. The ailing doctor of the novel did not see one streak of nobility in the whole Russian Revolution which in less than 40 years turned Russia into a big power. Dr. Zhivago only saw the ugly spots on the face of the Revolution and spat it. On a smaller scale, Kusum Nair tried the same technique but with lesser success. Her book is replete with half-truths which are more dangerous than blatant lies when told in a fascinating style. This technique, however, can turn out a good seller.

For over a year and a half, Kusum Nair toured the countryside and all that met her eyes is a saga of a people sunk in apathy. With a few exceptions, the country bore no signs of change or colour. It is all dull, drab, arid and dry, with dust blowing all over.

She is horror struck by the circumscribed limits of people's aspirations and their psychological unwillingness to work. She laments on the limitation of man's desire for land and goods forgetting that a starving man asks for a loaf of bread and not for the whole bakery. The author is sad to recall Ballapa one among her numerous apathetic characters who refused to work in the afternoon since he has to get grass for his cow. In Ballapa's life, cow is indeed an economic factor and for her sustenance he has to get grass. Maintenance of the cow is, economically and psychologically as important a job for Ballapa as to earn through physical labour. It is difficult to concede to the author's insinuation that Ballapa is disinterested in earning more. Her sweeping generalisations based on casual impressions reveal that her observations are the outcome of a hypothesis already formed than of facts. Perhaps with a little deeper probe, Kusum Nair could have easily appreciated that men would not labour unless the fruit of their labour is assured to them.

Economic growth is the cumulative result of numerous factors and each has its own set of theories. No one factor is the key to its realisation. Confusion is inevitable when one single factor is exaggerated out of context. Kusum Nair has tried to dismember a part from the whole.

In finding faults with individuals and groups of individuals, Kusum Nair completely fails to see that the people she has interviewed are socially conditioned and are working in a social context. Their relative efficiency or lack of it is conditioned by the levels of social conditions in which they operate. The suggestion that rural India has no future without streamlining of value system, is nothing but naivety.

Differences in human beliefs and behaviour do, partially, influence economic growth. But should not we enquire as to what causes a people to have one set of beliefs rather than another? Are these differences accidental or is there a socio-economic reason behind them? How do beliefs and institutions change? Why do they affect growth or stagnation? How does growth

itself react upon them? Is growth not cumulative in the sense that beliefs and institutions get fashioned to facilitate further growth. In not facing the implications of any of these posers, she has consciously or otherwise deviated from reality.

Many changes have taken place in rural India and many more will follow. It is true that the lines of the past are still too deep to be easily erased. In a society like ours where classes and castes exist, obstacles are not removed overnight. Phantoms of traditions still haunt the environments. Impatience in this regard is never rewarded. India today is not a national park from where blossoms could be picked at random. It is a barricaded race course of human development which is full of pitfalls and obstacles. Yet it is not without blossoms.

H. U. SAIN.

MONETARY POLICY

The Problems of Monetary Policy in an Under-developed Country with Special Reference to India: By Dr. J. D. Sethi: Published by Asia Publishing House, Bombay: Pp. 336: Price Rs. 15.

The monetary history of the Indian Union for the last two decades is full of interest because it has passed through new phases of economic expansion, sometimes under severe strains. The debate has been carried on between the fiscal and monetary policy experts regarding the relative importance of the two in keeping certain harmful effects of expansion under control. The Governor of the Reserve Bank of India, Mr. H. V. R. Iengar, has more than once openly criticised the fiscal policy of the Government of India which has resulted in price inflation and has repeatedly expressed the central banking authority's inability to regulate prices with monetary measures in the absence of appropriate co-ordination between the two policies. He is of the opinion that the monetary policy can only be of marginal efficacy and unless both the fiscal and the monetary measures are made to supplement each other, the harmful effects of inflation now witnessed may never be eliminated.

Dr. J. D. Sethi has made an attempt in the present volume to study this problem from every angle and he has in fact X-rayed all the developments during the last two decades. Every Finance Minister of the Union Government and every Governor of the Reserve Bank has been closely studied in this volume to throw light on the historical experiences of the past two decades, so as to seek guidance for formulating a policy for the Third and Fourth Five-Year Plans. Instead of jumping headlong into the application of monetary principles to the Indian economy, Dr. Sethi has rightly devoted about 100 pages to setting out the theoretical frame-work, for practice without theory is like an edifice without a foundation. After setting out in broad outline modern thinking on monetary policy, he has traced the history of monetary policy in an objective and analytical manner to piece together all the available evidence on the relative merits of all measures so far taken for shaping the Indian economy.

Dr. Sethi goes all out in praise of Mr. T. T. Krishnamachari's aggressive fiscal policy for expanding the Indian economy. He believes that it was Mr. Krishnamachari who really laid the fiscal foundation for economic development in India while his predecessor, Mr. C. D. Deshmukh only tinkered with the problem. Dr.

HINDUSTAN SHIPYARD AT VISAKHAPATNAM

LIGHTING BY PHILIPS

An area covering more than 67,000 sq. ft. in India's only shipbuilding yard at Visakhapatnam, a project of national importance, has been installed with Philips lighting to ensure round-the-clock, working efficiently and speedily. And, this has been found so satisfactory that Philips fluorescent lighting will shortly be introduced in the rest of the establishment.

Philips' exclusive lighting consisting of lamps, fittings and accessories ensures ultimate economy by providing the maximum illumination level at lowest running cost and gives longer, trouble-free performance. Philips' scientifically designed equipment is the result of experience as well as research and development aimed to meet the ever-growing demands of better lighting. And hand-in-hand with Philips' unrivalled quality goes the invisible plus of Philips' international experience and know-how.

FREE: For planned lighting, designed economically to suit your specific need—whether it is industrial, commercial or any other specialised application—consult Philips Lighting Service Bureau.

NEWFIELD 117/21

THE LARGEST INDUSTRY AND TRADE FAIR OF ASIA

COMPANY AFFAIRS

NEW CAPITAL ISSUES

The Controller of Capital Issues has granted consent to six companies for the issue of a total capital of Rs. 3.14 crores. The consent is valid for 12 months in each case.

Messrs. India Carbon Limited, a new company registered in Assam, has been granted consent to the issue of capital of Rs. 50 lakhs divided into 10,000 cumulative redeemable preference shares of Rs. 100 each and 4 lakh equity shares of Rs. 10 each. The company will manufacture calcined petroleum coke and graphite paste etc. for which a licence has been obtained under the Industries (Development and Regulation) Act. The factory will be established at Gauhati. Foreign collaboration will be supplied by Great Lakes Carbon Corporation of the U.S., which will also invest in the equity capital of the company to the extent of about Rs. 16 lakhs. The Assam Government will subscribe to the preference shares; 49 per cent of the equity capital to be issued in India will be offered for public subscription.

Messrs. Kirloskar-Asea Ltd., Bangalore, has been granted consent to the issue of capital of Rs. 25 lakhs in equity shares of Rs. 10 each for cash at par. Out of this, shares worth Rs. 7.5 lakhs will be issued to the foreign collaborator — Messrs. Asea of Sweden. The proceeds will be utilized for the manufacture of switch-gear and motor starters.

Jayanti Shipping Company Private Ltd., New Delhi, engaged in the business as shipowners has been granted consent to issue capital of Rs. 1.5 crores divided into equity shares of Rs. 100 each for cash at par. The proceeds would be utilised for the purpose of acquisition of ships.

The Mandya National Paper Mills Limited, Bangalore, have been granted consent to the issue of capital of Rs. 80 lakhs in equity shares of Rs. 10 each for cash at par. Out of this, shares of the value of Rs. 10 lakhs will be issued to the existing non-resident shareholders — M/s. Parsons and Whittemore. The proceeds will be utilized for financing the expansion in the company's existing business of manufacturing paper. The present subscribed capital of the Company is Rs. 2 crores.

National Buildings Construction Corporation Limited, a Government undertaking having a paid-up capital of Rs. 13,00,000, have been accorded consent to issue further capital of Rs. 6,00,000 divided into equity shares of Rs. 1,000/- each for cash at par.

Canara Bank Limited, Bangalore, has been granted consent to the issue of further capital of Rs. 25 lakhs divided into 50,000 equity shares of Rs. 50 each to be fully paid-up for cash at a premium of Rs. 15 per share. The proceeds will be utilized for strengthening the banking company's capital base.

AIR-INDIA: NEW HORIZONS

In the annual report of Air-India International, Mr. J. R. D. Tata, Chairman, indicates that the year 1960-61 marks the beginning of a new chapter in the history of the airline characterised by the introduction

of Boeing 707 jet aircraft in April 1960 and Corporation's entry into the North Atlantic market on the extension of the Bombay-London service to New York in May 1960. Air-India thus became the first ocean carrier to operate across the North Atlantic. Boeing services were also introduced on the India-Japan route in 1961 and on the India-East Africa route in May 1961.

The financial results for the year 1960-61 show an increase of operating revenue of Rs. 6.59 crores — from Rs. 12.58 crores in 1959-60 to Rs. 19.17 crores — or by 52 per cent over those of the previous year. Operating profit for the year came to Rs. 117.41 lakhs, considerably higher than the previous year when the figure was Rs. 18.26 lakhs. After making provisions for various expenses, the Board decided to set apart Rs. 32.8 lakhs towards writing off development expenditure, Rs. 32.90 lakhs towards insurance fund, Rs. 4.25 lakhs towards equipment renewal reserve, Rs. 6.50 lakhs towards reserve fund and the remaining sums of Rs. 6.55 lakhs was to be carried forward.

The total capacity offered during the year recorded an increase of 72.7 per cent over the capacity offered in the previous year. The traffic actually carried, however, could not keep pace with this increase, and increased by only 41.2 per cent. One of the more important events for Air-India was its entry into pool partnership with Aeroflot on the Delhi-Moscow sector and with the Czech airlines on Bombay-Prague sector. More recently a major partnership agreement was arrived at with BOAC and Quantas on all the routes of the Corporation from New York to Tokyo and Sydney. The basic principle of revenue pools is sharing of common traffic rights between two points.

HASTINGS MILL

The Hastings Mill Ltd. during its operations for the year to March 31, 1961 recorded a profit of Rs. 29.20 lakhs which was higher as compared to the previous year. This improvement was partly because some purchases of jute were made by the Company prior to the steep rise in prices. The trading conditions otherwise remained difficult during the year. The jute crop of 1959-60 was not sufficient to meet the requirements of industry and the situation was further aggravated by the disappointing jute crop of 1960-61 with the result that the prices of raw jute became exorbitant and due to wide disparity between the prices of raw materials and finished products the work of the most of the jute mills was adversely affected. After making provisions for depreciation and taxation, a sum of Rs. 2.71 lakhs were transferred to development rebate reserve, and Rs. 6 lakhs towards general reserve. The directors have made the payment of a dividend on 25,000, 6 per cent cumulative preference shares at the rate of Rs. 1.80 per share for the year to March 31, 1960. For the present year dividend at the rate of 6 per cent on cumulative preference shares (at the rate of 7.80 per share) will absorb Rs. 1.95 lakhs. Dividend on 40,000 ordinary shares at the rate of Rs. 6 per share will absorb Rs. 2.40 lakhs.

BOOK REVIEWS—Contd. from page 760

Sethi has particularly analysed the problem of raising resources for India's Five-Year Plans and has categorically asserted that "if more than one half of the resources for development are to come from deficit financing and from foreign aid, then our future planning become precarious. These are crutches, and no foundation on which the growing system is made to stand." While there can be no disagreement on the warning he has uttered in regard to deficit financing, he is far less convincing on foreign aid, the more so because he does not demonstrate a fully effective alternative to it.

Dr. Sethi has made a detailed study of the limita-

tions under which the Reserve Bank is obliged to operate. He has also deprecated the selective credit control policy and the blanket restrictions on the volume of credit by the Reserve Bank. These are all harmful techniques which may show some results in the short period, but are likely to harm the economy in the long run. The likely flight from equity capital will certainly distort and damage the capital structure of the companies.

The present volume is based on the author's thesis for his doctorate and was prepared at the London School of Economics under the guidance of Mr. Ralph Turvey and Dr. Vera Anstey.

THIS IS ONLY AN ANNOUNCEMENT — NOT A PROSPECTUS

Consent of the Government of India has been obtained to this issue by an order of which a complete copy is open to public inspection at the registered office of the Company. It must be distinctly understood that in giving this consent the Government of India do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinions expressed with regard to them.

A copy of this Prospectus having attached thereto the documents specified in Section 60 of the Companies Act, 1956, has been delivered to the Registrar of Companies, Delhi, for registration.

A licence under the Industries (Development & Regulation) Act, 1951, has been obtained from the Government of India for the establishment of this new industrial undertaking at Naini, District Allahabad, of which a copy is open to public inspection at the registered office of the Company. It must be distinctly understood that in granting this licence the Government of India do not undertake any responsibility for the financial soundness of this undertaking or for the correctness of any of the statements made or opinions expressed in regard to it.

Applications have been made to the Delhi, Bombay and Calcutta Stock Exchanges for permission to deal in and for an official quotation of the shares of the Company.

The subscription list will open at the commencement of banking hours on 30th October, 1961 and will close at the close of banking hours on 5th November, 1961, or earlier at the discretion of the Directors, but not before the close of banking hours on 1st November, 1961.

THE TRIVENI ENGINEERING WORKS LTD.

(Incorporated under the Companies Act, 1956, on 7th January, 1961)

Out of the above issue of Rs. 42,50,000/- worth Equity Shares and Rs. 17,50,000/- worth 9.3% Cumulative Redeemable Preference Shares of Rs. 10/- each at par amounting to Rs. 60,00,000/- :—

- 1,08,375 Equity Shares of Rs. 10/- each at par are reserved for issue to the Indian Promoters, the Directors, the companies with which they are associated, and the employees of the company Rs. 10,83,750
- 2,12,500 Equity Shares and 87,500—9.3% Cumulative Redeemable Preference shares of Rs. 10/- each have been issued and subscribed for cash at par by the collaborator concern to be utilized for import of plant and machinery required for the Project Rs. 30,00,000

The balance 1,04,125 Equity Shares and 87,500 — 9.3% Cumulative Redeemable Preference Shares of Rs. 10/- each will be issued to the public at par.

RIGHTS OF PREFERENCE SHARES

The Preference Shareholders will be entitled to a fixed dividend of 9.3% per annum, payable in priority to the Equity Shares, free of company's income-tax but subject to deduction of tax at source at the prescribed rates. In the event of winding up Preference Shareholders will be entitled, in priority to Equity Shareholders, to repayment of the capital paid-up at par

plus all accrued dividends—whether earned, declared or not declared and also declared but not paid.

The Preference Shares are redeemable at par on expiry of seven years at the option of the Company on giving three months' notice but shall definitely be redeemed on or before expiry of ten years from the date of issue.

The voting rights of the Preference Shares will be as per Section 87 of the Companies Act.

VOTING RIGHTS

On a show of hands every member present in person has one vote and every person present either as a general proxy, as defined in the Articles of Association, or as a duly authorised representative of a body corporate has one vote. On a poll the voting rights of a member are in proportion to his share of the paid-up equity capital of the Company. A member holding Preference Shares is entitled to vote in respect of such shares only when the dividend due on such shares or any part thereof is two years in arrear or on a resolution which directly affects the rights attached to the Preference Shares.

PRESENT ISSUE

The balance capital will be issued at par to the public as follows :—

- 1,04,125 Equity Shares of Rs. 10 each:
- 87,500 9.3% Cumulative Redeemable Preference Shares of Rs. 10 each.

The entire issue of 87,500 Preference Shares has been underwritten by (1) Life Insurance Corporation of India, 60,000 shares (subject to firm allotment of 40,000 shares to them) and (2) M/s. Harbans Singh Mehta & Co., New Delhi 27,500 shares.

PROSPECTUS, APPLICATION FORM AND ALLOTMENT OF SHARES

Copies of the Prospectus, on the basis of which alone applications will be considered, and Application Forms may be obtained from the Registered Office of the Company or offices of the Company's Bankers and their branches mentioned in the Application Form, or Brokers and Underwriters.

Applications have to be made for a minimum of 50 shares, or multiple thereof in the case of Equity Shares and 100 shares or multiple thereof in the case of Preference Shares, and in all cases these must be accompanied by remittance of the amount payable on application.

Applications must be completed in accordance with the directions contained therein and delivered before

October 20, 1961.

THE EASTERN ECONOMIST

765

the closing of the subscription list to the bankers or brokers, but not to the registered office of the Company.

If no allotment will be made, the application money will be returned in full, and where the number of shares allotted is less than the number applied for then the balance amount, if any, left after adjustment of allotment money on the shares allotted will be returned to the applicants by cheques either through the post or otherwise within two months from the date of allotment.

The Share Certificates will be ready for issue by the Company within four months from the date of allotment of shares.

LOAN CAPITAL

The Company has no Loan Capital at present but intends to raise at an early date Rs. 22½ lakhs by means of a debenture loan.

FINANCIAL REQUIREMENTS

The financial requirements of the Company are comprised of :

Cost of land and factory and office buildings	Rs. 12,00,000
Cost of imported plant and machinery	Rs. 39,75,000
Cost of indigenous machinery and Drawing Office equipment etc.	Rs. 13,00,000
Freight, insurance, custom duty, transport charges, erection and technical service etc.	Rs. 8,60,000
Motor Cars, furniture, Administrative contingent and miscellaneous expenses	Rs. 7,50,000
Preliminary Expenses	Rs. 1,65,000
TOTAL	Rs. 82,50,000

FINANCIAL RESOURCES

By capital subscription from Equity Shares	Rs. 42,50,000
By capital subscription from Preference Shares	Rs. 17,50,000
By Debentures Loan	Rs. 22,50,000
TOTAL	Rs. 82,50,000

CONSENTS

The consents in writing of the directors, auditors, managing brokers, brokers, bankers, and solicitors to the Company to act in their respective capacities have been obtained and filed with the Registrar of Companies, New Delhi, and none of them has withdrawn the consent so given.

MINIMUM SUBSCRIPTION

The directors will not proceed to allotment until the whole of the present issue has been subscribed.

HISTORY AND OBJECTS

The Company was incorporated on 7th January, 1961, for the purposes stated in its Memorandum of Association. The immediate object in particular is to carry on the business of Engineering and to that end to erect and establish at Naini, District Allahabad, U.P., a plant for the purposes of manufacture and production of sugar machinery, steam turbines, and other heavy industrial plant and machinery.

Amongst the main objects of the Company, as contained in its Memorandum of Association, are:—

1. To carry on the business of general manufacturing engineers, manufacturers and repairers of heavy machinery of all kinds and component parts thereof as well as complete factories and plants and in particular for the following industries:—
Sugar, paper, ice-making, flour, steel rolling, rubber processing textiles, power plants.
2. To carry on the business of iron-founders, millwrights, boiler makers, electricians, machinists, coppersmiths, makers of motors, accumulators, generators, builders of all kinds of property, shippers, shipowners, brokers and general merchants in all the branches thereof, and
3. To carry on the business or businesses of manufacture of agricultural and other implements of all kinds and other machinery, bridge builders, brass founders, metal works, iron and steel converters, smiths, wood workers, builders, metallurgists, etc. etc. and water work engineers, tool makers, water supply engineers, gas makers, farmers, printers, carriers, and to buy, sell, manufacture, repair, convert, alter, let on hire and deal in machinery, implements, rolling stock and hardware of all kinds and to carry on any other business (manufacturing or otherwise) which may seem to the Company capable of being conveniently carried on in connection with the above or otherwise calculated directly or indirectly to enhance the value of the Company's property and rights for the time being.

SCOPE AND PROSPECTS

As the Second Five-Year Plan could be called a Steel Plan, so might the Third Five-Year Plan, which operates from early 1961, well be called India's Machinery Plan, since under it the production of machinery in the country is designed to rise nearly three-fold.

The Sugar Industry is the second largest and one of the first to be established in the country. With a rapidly rising population and with the improvement of living standards, this industry has expanded from a production of 10 lakh tons in 1953-54 to 29.8 lakh tons for the season 1960-61 and this production is scheduled to rise to 35 lakh tons at the end of the Third Five-Year Plan.

To take full advantage of the experience and knowledge in the Sugar Industry of the Indian and United Kingdom promoters, the production programme of the Triveni Engineering Works Ltd. will be based on the manufacture of sugar machinery. However, to avoid possible seasonal declines in demand and to be able to select the most profitable business available, the Works are being designed for general manufacture of heavy engineering lines, including industrial process turbines for which the Company is the first to be licensed in the Private Sector.

SITE FOR THE WORKS

The site for the Works has been chosen at Naini, on the outskirts of Allahabad, near the physical centre of India. Its location is in the middle of Uttar Pradesh-Bihar Sugar belt and six railway systems meet at or converge on Allahabad. Moreover, it is well placed for the supply of raw materials from India's Steel Industry and the Government Foundry Forge Development at Ranchi.

Approximately 26 Acres of almost level land for the Company's Works has been acquired by the Uttar Pradesh Government and possession given to the Com-

pany. This is near the Naini Station, adjacent to the proposed Rihand Power Sub-station and bordered by two roads, one of which is the Grand Trunk Road.

POWER, MACHINERY AND EQUIPMENT

Government of U.P. have promised the utmost help for the early supply of Government "Hydro Electric Power." In the meantime arrangements have been made for generation by the company of electricity by Diesel Engines at site.

Major portion of the plant and machinery—both imported and indigenous, has reached the site and is under installation. It is hoped that the production will commence early in 1962.

TECHNICAL COLLABORATION

As may as one-quarter of the sugar plants in operation in India today have been manufactured either by George Fletcher and Co., Ltd., of Derby, England, and/or by Duncan Stewart & Co., Ltd. of Glasgow, Scotland, and there is hardly a sugar factory in India which does not contain some items of equipment supplied by one or other of these companies. Both companies are subsidiaries of Booker Brothers McConnell & Co., Ltd. which company has taken up for cash 50% of the Equity and Preference Shares to be issued by the Triveni Engineering Works Ltd.

COLLABORATION FEE

Under an agreement Bookers Sugar Machinery Group Ltd., George Fletcher & Co. Ltd., and Duncan Stewart & Co. Ltd. agreed to act as the Technical Consultants and sell outright in London to the Company at a consideration of £50,000 sterling the technical know-how to be in the exclusive use of the Company in India and they have also agreed to advance to the Company a loan of £50,000/- sterling free of interest and repayable by the Company within a period of ten years and tax liability thereon, if any, would be borne by the Company.

For Turbines and Air Compressors, Peter Brotherhood & Co. Ltd. of Peterborough, England, whose products are well-known throughout the world, has entered into an agreement to give full and continuing technical collaboration and have agreed to sell in London for a consideration of £40,000 sterling the technical know-how to be in the exclusive use of the Company in India. They have also similarly agreed to advance to the Company a loan of £40,000 sterling free of interest and repayable by the Company within a period of ten years and tax liability thereon, if any, would be borne by the Company.

IMPORT LICENCES

Import Licences No. 997663/60/HQ/CE/I dated 1-2-61 and 997664/60/HQ/CE/II dated 1-2-61 have been received from Government of India for import of nearly Rs. 30 lakhs worth of capital equipment from the U.K. and Italy, against the foreign investment. In addition, Rs. 12 lakhs worth of capital equipment will be imported from U.S.A. against a D.L.F. Loan, sanctioned vide Government of India Letter No. 41(43)/61-DLF dated 21st February, 1961.

PROFITABILITY

Annual production on one shift working is estimated at about Rs. 1 crore. This is expected to rise to between Rs. 2 and 2.5 crores on three shift working, which, it is hoped to attain in two to three years. The

experience of similar engineering concerns in India, catering to specialised markets for industrial plant, shows that the Company's estimated rates of production could return a satisfactory profit.

SPECIAL BENEFITS

The Company will enjoy the special benefits under the "Indian Income-Tax Act" inasmuch as:—

1. Development Rebate equal to 20% of the cost of machinery installed will be allowed.
2. Under Sec. 15C the profits upto 6% of the employed capital will be exempt from tax for the first five years of production. The shareholders will also enjoy relief on the dividends received by them in accordance with this section of the Income-Tax Act in respect of any dividend paid as is attributable to that part of the profits of the Company, which obtained the foregoing exemption, and
3. Under Sec. 56A of the Income-Tax Act, Super-Tax will not be payable on dividends received by the Company holding shares in this company.

BROKERAGE

Brokerage will be paid to the brokers, banks and underwriters at 10 nP. per Equity and Preference Share of Rs. 10 each offered to the public in respect of shares allotted on applications bearing their stamps. In addition, brokerage at 7 nP. per share will be paid to the Managing Brokers only in respect of 1,04,125 Equity Shares being offered to the public.

UNDERWRITING COMMISSION

Underwriting Commission of 2½% will be paid to the Life Insurance Corporation of India and M/s. Harbans Singh Mehta & Co.—the underwriters in respect of Cumulative Redeemable Preference Shares of Rs. 8,75,000 underwritten by them.

PRELIMINARY EXPENSES

The Preliminary Expenses and the expenses of the Issue including Underwriting Commission and Brokerage are estimated at Rs. 1,85,000/- and are payable by the Company.

INTEREST OF PROMOTERS

The Promoters of the Company are Booker Brothers McConnell & Co. Ltd. and R. B. L. Tirath Ram Shah (India) Ltd. The Promoters are receiving no remuneration for their services as such but the latter company is entitled to be reimbursed for expenses borne by them. Bookers Sugar Machinery Group Ltd., George Fletcher & Co. Ltd., and Duncan Stewart & Co. Ltd., are subsidiaries of Booker Brothers McConnell Co. Ltd. The Promoters are interested to the extent of the shares allotted to them.

DIRECTORS' INTEREST

All the Directors will be interested in the remuneration payable to them as fee for the meetings attended and travelling expenses, if any, for the purpose.

Shri Balmokand Shah Sawhney, Shri Kanhaya Lal Sawhney, Shri Puran Chand Sawhney and Shri Devi Chand Sawhney are Directors or Members of R. B. L. Tirath Ram Shah (India) Ltd., promoters of the Company. Each of them is also a director or member of The Ganga Sugar Corporation Ltd. The Upper India Sugar Mills Ltd., The Mahalakshmi Sugar Mills Co. Ltd., and The Ramkola Sugar Mills Co. Ltd., and are in-

terested to the extent of the shares to be allotted to each of these companies and to themselves.

Shri C. W. Tyrrell is a director and member and Shri C. W. Murray is a member of Booker Brothers McConnell & Co. Ltd., one of the promoters of the Company. Shri C. W. Murray is Chairman and Shri T. P. Houghton a Director of Bookers Sugar Machinery Group Ltd. and Shri Murray is also Chairman of George Fletcher & Co. Ltd. and of Duncan Stewart & Co. Ltd.

BORROWING POWERS

The Directors may from time to time raise or borrow and secure the payment of any sums of money for the purposes of the Company provided that the amount borrowed and outstanding (apart from temporary Bank Loans obtained in the ordinary course of trading) shall not at any time exceed the aggregate of the paid-up capital of the Company and its free reserves, except with the consent of the Company in general meeting.

POWERS OF THE DIRECTORS

No restrictions are imposed by the Articles of Association on the Board's powers of the management and the control of the Company's affairs is vested in the Board and save in so far as provided by the Companies Act, 1956.

AUDITORS' REPORT

In accordance with Clause 24 of Para II of Schedule II of the Companies Act, 1956, we report that the Triveni Engineering Works Ltd., have not made up accounts for the period from the incorporation of the Company (7th January, 1961) to three months before the issue of the Prospectus.

INDUSTRIAL IBCON CONSULTANTS

The industrial consultancy services offered by the group fall under the following headings:-

IN THE PLANT—

PLANT CAPACITY AND LAY-OUTS • PRODUCTION PLANNING AND CONTROL
STORES ORGANISATION • CONSUMABLE STORES CONTROL
RAW MATERIALS CONTROL • FUEL AND STEAM UTILISATION
TRANSPORTATION METHODS • MECHANICAL HANDLING
PRODUCT QUALITY CONTROL • OPERATIONAL RESEARCH
WORK STUDY • BUDGETARY CONTROLS
VALUATION OF PLANT & BUILDINGS
DESIGN AND ESTIMATES OF EXTENSIONS

ON LABOUR—

METHOD AND WORK STUDY • PRODUCTIVITY INDICES
TIMEKEEPING SYSTEMS • WAGE PAYMENT SYSTEMS
JOB EVALUATION • WAGE STRUCTURES
PERSONNEL RECORDS • LABOUR POLICIES
HUMAN RELATIONS • COMMUNICATION
REORIENTATION LECTURES • FOR LABOUR AND SUPERVISION

IN OFFICES—

MANAGEMENT ORGANISATION • EXECUTIVE LEVEL WORK
CLERICAL PROCEDURE • MANAGEMENT CONTROLS
WORK MEASUREMENT • BUDGET FORECASTS
LAYOUT, COMMUNICATIONS AND EQUIPMENT

AND

THE SETTING UP AND TRAINING OF THE
CLIENT'S OWN INDUSTRIAL
ENGINEERING DEPARTMENT

MARKET RESEARCH

PLANNING FOR MODERNISATION AND EXPANSION OF INDUSTRIES
TECHNOLOGICAL STUDIES IN RAW MATERIALS, PROCESS AND PLANT PERFORMANCE

Portuguese Colonies: The Boomerang

THERE can be few conferences, seemingly routine in character, which have created so tense an atmosphere and so embarrassing a challenge to the hosts as has the Delhi-Bombay Conference on Portuguese Colonies. The Council for Africa, whose new-found enthusiasm has certainly been rewarded by the passionate interest in every hour of the Conference both in its Delhi and Bombay sessions, has unfortunately brought to India not peace but a sword. Whether this is a good or a bad thing, history alone can say. The immediate difficulty of resisting a call for military action on Goa was bitterly revealed by the ambivalent statements of the Prime Minister that India was never committed to a non-military approach, and had certainly not ruled out military action on Goa. The Finance Minister, in his "personal" capacity, attempted on the succeeding day to argue the case for a Gandhian approach, only to be heavily and agrily outvoted in every speech that followed. The Prime Minister himself at the concluding session denied Gandhian teaching and indicated, at least so it seemed, a willingness to employ military force. In the end, Goa was made by our visitors the acid test of the Indian Government's protestations on Colonialism in general.

Rarely, if ever, have we thus been hoist with our own petard. It would be foolish to deny that the results of the Conference, satisfying as they have been in the enthusiasm aroused amongst all the delegates against the cruelties practised by the Portuguese administration, particularly in the African colonies, have left the Government of India with a very difficult decision. Our visitors from Africa left us in doubt whether they expected India to give a lead. In private, they did not conceal their feeling that India's passion against Colonialism had undergone a substantial watering down in the years of freedom, and that, in the wide spectrum of dislike of Colonialism, India was the most passive hater in the Conference. Undoubtedly it was this atmosphere of criticism, unspoken but real, which prompted the Prime Minister to proceed somewhat beyond the immediate purpose of the Conference to argue that India was never committed to the non-use of military methods.

What this implies is, presumably, that Satyagraha belongs only to conditions where its success is likely; that, in other matters, pragmatism is the only real test; moral or soul force has serious limitations. If this is true, surely Mahatma Gandhi's doctrine has suffered a grievous blow at the hands of his disciples.

Although his was a lone voice in a Conference which was eager for military action and not moral indignation, Mr. Morarji Desai proved a much better Gandhian than the Prime Minister on this occasion. It would be foolish, however, to deny that Indian opinion on the conflict would be much more on the Prime Minister's side than on that of the Finance Minister. If this were sufficient to prove to our friends in Africa that we are not necessarily acquiescing supinely in the wrongs being perpetrated upon them, it might be salutary. Again, there is something to be said for a threat of military force against Goa, Daman and Diu, if it would impound Portuguese military forces on Indian territory and thereby release pressure on the gallant men and women fighting for their freedom in Africa. In the last analysis, however, action means action, and not a threat of action. More than one delegate privately pointed out that time was running out, and it would not be possible for the whole of Africa to wait on India's judgment as to what time was appropriate for military action to be employed. In other words, the urgency of taking action on military lines cannot be regulated by India's convenience alone.

While Indian public opinion is excited, and rightly so, at the wrongs perpetrated on our subject friends in Africa, it would be difficult to say that a military adventure of this kind would not greatly affect our capacity to argue a case for peace and non-violence elsewhere. And thus the seminar on Portuguese colonies has left us on the horns of an acute dilemma. All eyes will now be on the Prime Minister. How will he face the dual choice which he himself has raised and the dread consequences of any decision which he can make? He will almost certainly have the support of the Indian people in military action; but will he and India not lose stature in the world as a whole?

Industrial Performance of the Public Sector : 1960-61

IN a Special Article in *The Eastern Economist* dated March 17, 1961 it was shown that the working results of the public sector undertakings for the year 1959-60 exhibited a very bleak picture. The return on "capital employed" in these undertakings was not equal to even the bank rate. Preliminary financial results have now been made available for ten leading public sector undertakings such as Hindustan Machine Tools, Hindustan Cables, Nahan Foundry, Praga Tools, Hindustan Salt Company, Sindri, National Instruments, Hindustan Antibiotics, National Newsprint, and Hindustan Insecticides. The combined paid-up capital for all these ten units works out to only Rs. 34.16 crores as against the total paid-up capital of all public sector industrial undertakings of

Rs. 604.66 crores. This works out to nearly 6 per cent of the total public sector paid-up capital. The results of this analysis must be read against this background. On the basis of these preliminary results, it is revealed that the net profits for these 10 units, after providing for depreciation, taxation and interest for loans, were Rs. 4.52 crores or 13.23 per cent of the total paid-up capital. In order to get a comparison with the performance of the private sector units, it is necessary to find out the total net worth or the total capital employed in these units. Unfortunately, it is not possible to do so on the basis of the information made available so far. A rough estimate based on 1001 companies shows that the ratio of paid-up capital to net worth is about 60 per cent. On the

assumption that the same ratio might prevail in the case of these undertakings, it has been computed that the yield on net worth is not more than 7.97 per cent. This compares very unfavourably with the private sector performance as revealed by the recent analysis of the Reserve Bank of India for 1001 companies. The analysis shows that the private sector had a rate of return of 10.5 per cent in relation to net worth.

The performance of these ten units is also of an extremely unrepresentative character. The Hindustan Salt Company is the only unit showing a loss, after providing for depreciation and taxation. Except for Sindri Fertilizers, Hindustan Machine Tools and Hindustan Antibiotics, the profits are of a marginal nature. The total profit from these three units alone add up to Rs. 3.71 crores—nearly 80 per cent of the total profits of all these ten units. In all these three cases production has shown a steep rise. In the case of Hindustan Machine Tools the total value of production rose by 39.1 per cent from Rs. 237.27 lakhs in 1959-60 to Rs. 330.04 lakhs in 1960-61. Similarly in the case of Hindustan Antibiotics, the production of finished penicillin during 1960-61 was 42.76 million Mega Units as against the target of 35 million M. Units for the year and against actual production of 33.15 million M. Units in 1959-60. Sindri also showed a small rise of 5.4 per cent in 1959-60.

The Third Five-Year Plan has envisaged ploughing back from public sector undertakings of Rs. 450 crores as financial resources during the Third Plan period. Even though the units under discussion form a very small portion of the public industrial sector, yet it is clear that except for a few units, such as Hindustan Antibiotics, Sindri,

Hindustan Machine Tools and Hindustan Cables, the working results are not so encouraging as to warrant great enthusiasm. On the other hand, 1960-61 is clearly better than the previous year. And it may be that, as the opportunities of the Third Plan are exploited, all these companies will show steadily better performance in the years to come. It is necessary to remember that private sector units have had a much longer time to improve this working. It is premature to underestimate the public sector; it is unwise, however, to make excessive claims for its current performance. What is good for both sectors is that there is greater competition; let the crown rest each year where it should, on merit, not ideology, lie.

WORKING RESULTS OF TEN PUBLIC SECTOR UNDERTAKINGS

(For the year ended 1960-61)

	(Rs. Crores)	
	Paid-Up Capital	Net Profits
Hindustan Machine Tools	5.31	0.74

Hindustan Insecticides	0.97	0.17
TOTAL	34.16	4.52

† Relates to 1959-60.

** Gross Profits.

The Coalition in Turkey

NINE days after the indecisive general elections of October 15, came the announcement from Ankara on Tuesday this week that the stalemate had been broken and a coalition government composed of all the four parties had been formed. This was precisely what was demanded by General Gursel and the military junta on whose support his power hangs. The National Front Government which is now announced consists of heterogeneous political parties and the two numerically strong parties—the Republican People's Party and the Justice Party—will find it hard to reconcile their political philosophies. It was no more than a matter of formality that, after acceding to the army junta's proposal for an all-party government, their leaders announced that complete agreement was reached between them.

How the sharp differences between the parties were eliminated and what was the common ground of the political programme on which the policies of the coalition were to be based has not been disclosed. The fact of the situation appears to be that such a disclosure could not be made for obvious reasons. A National Front Government inclusive of all the parties is indispensable to tide over a national emergency and the implication is that it is to be co-extensive with the emergency. But it looks odd when constituted for the duration of a newly elected legislature. The saving grace in the Turkish expedient, however, is that General Gursel who assumes the supreme office of President in the new set-up is the best available choice among the army officers. And no civilian could have been acceptable to the military junta.

Nearly one and a half year of the military regime has not succeeded either in purifying political life (which was probably the major justification for the overthrow of the Democratic Government of Mr. Menderes) or in unifying the country. It must be said to the credit of General Gursel that he resisted the army pressure to resort to extreme measures in running the government during the interregnum. The referendum on the constitution held in July this year was free and fair or else a forty per cent vote against it under the organized influence of the Justice Party could not have been recorded. The elections were held without any change in the schedule on October 15, and, while there was great hesitation for over a week after the electorate's verdict was known, the civil rule has been restored, although it is arguable that it can hardly maintain complete freedom from the influence of the army officers.

When this is said, the fundamental fact cannot be denied that General Gursel took it almost as an absolute certainty that the Republican People's Party and Mr. Ismet Inonu, political heir to Kemal Ataturk, would be securely installed in power. Although the Republican People's Party bore no responsibility for the doings of the army junta, its association with it turned to be a heavy liability for it at the elections. But of basic importance is the fact that this party is now a house sharply divided against itself and the halo around Mr. Inonu has worn out. If the Republican People's Party has been unable to command a clear majority, it is primarily due to its internal weaknesses.

In retrospect it would appear that the enthusiastic demonstrations of May last year in the city streets, demanding a take-over by the army, represented the mood of the urban population and in particular of the intelligentsia. The Justice Party, which to all intents and purposes is a successor to Mr. Menderes' Democratic Party, draws its strength and sustenance essentially from the country-side. And this is not without a powerful socio-religious impetus. Kemal Ataturk's Europeanisation of Turkey and his philosophy of secularism did not succeed over the past four decades in taking root in the rural soil. The urge for the revival of the Islamic way of life was a powerful motive force behind the Justice Party and the all-party election pledge under the inspiration of the junta not to make an issue of Ataturk's reforms was hardly observed in spirit. Mr. Menderes had already provided a stimulus to revivalism by his religious concessions in Anatolia.

The second unanimous election pledge was not to allow the Yasslada trial and the executions and sentences of long-term imprisonment to pre-

judice the voter. This was observed in open breach for the propaganda literature of the successor party bore the emblem of the gallows. The execution of Mr. Menderes and his two colleagues was an act of the greatest political unwisdom committed by the junta. It became the strongest asset to the Justice Party. General Gumushpala who leads this party had to resign his office as Chief of Army Staff on the occasion of the military purge of August last year and many of the 2,000 personnel who were relieved of their army posts have swelled its ranks. The composite revivalist and army element in the Justice Party is a factor that can hardly be ignored.

None of the four members of the National Front Government—the minority ones are the New Turkish Party and the Peasants and Nation Party—has a distinct political programme of its own, but their sharp differences threaten to prevent full accord. The best that the Front can do to obviate a relapse into a military regime is to address itself to the problems of economic reform—land tenures and industrialisation.

Sugar: A Rude Awakening

THE U.S. Agriculture Department's decision to reduce the ad hoc quota of sugar imports from India from 2,25,000 short tons to 1,75,000 short tons for the current year has virtually come as a bolt from the blue. The sugar mill industry in this country has hardly got some respite from excessive production this year through restoration of trade channels for the distribution of the commodity which has helped to some extent in lightening the burden of unprecedented stocks. The industry had been taking special pains to ship the entire U.S. quota well before December-end in the hope that it would be allotted a supplementary quota. Not only these expectations have been dashed to the ground but the cut has posed a special problem in as much as bulk of exports under the original quota have either already been shipped or contracts have been signed for their shipment.

Some consolation, however, might be derived from the other news which has reached Delhi almost simultaneously with the advice of cut in the U.S. quota—though seemingly accidental. The International Sugar Council has authorised India to export 20,000 metric tonnes of sugar to the world market in addition to the quota already granted. The Council's decision, which has been prompted by taking cognizance of the recent floods in Bihar, would offset partly the difficulties that the industry would encounter on account of the cut in U.S. quota. But this solace can only be meagre since India has to export to the international market sugar at a loss of about Rs. 350 to Rs. 400 per ton. India has been keen to step up sugar export to the United States for the latter pays a premium to the tune of 60 per cent over the international price. One result of the cut in sugar exports to the United States will obviously be the increase in loss to the industry, which might again start clamouring for some device to be evolved to meet the increased loss on exports.

The Government of India's recent approach to the British Government for allocation of a quota for export of sugar from this country under the Commonwealth Sugar Agreement in the circumstances assumes added significance. The Commonwealth market also pays a price about 35 per cent higher than the international price and

if India is successful in obtaining a quota from Britain, it would help in ironing out the difficulties here. There should be little difficulty in the British Government's acceding to India's request since South Africa, which was one of the countries exporting sugar to Britain under this agreement, has already withdrawn from the Commonwealth. Its continuing to receive preference in the British sugar market obviously cannot be justified. The South African quota can be conveniently diverted to India which at present has got huge surplus of sugar to export.

Along with the efforts to secure a quota for sugar exports to Britain, attempts must be continued to secure a permanent quota from the United States. Only then will India be in a position to successfully embark upon sugar exports on a permanent basis. It is heartening that the various interests concerned with import of sugar in the United States are favourably inclined to include India amongst the U.S. quota countries. This interest can be capitalised for our benefit if the Government of India refrains from display of anger in its proposed representation to the U.S. Government on the issue of cut in the ad hoc quota. The U.S. authorities' step has apparently been prompted by their anxiety to safeguard the interest of sugar producers in that country. And that is their legitimate right. The indication that special efforts will be made by the U.S. Government to restore the cut in the Indian quota, as also in the quotas of Brazil and Formosa—their quotas have been cut by 30,000 tons and 20,000 tons respectively—during the first half of 1962, points to the fact that Tuesday's measure is only a temporary expedient. An appreciation of the U.S. Government's difficulties will undoubtedly lead to good results at a later date.

In the meantime, the Government of India will do well to bestow some thought on the confectionary industry's plea to make available to it sugar at a concession price by reducing the excise duty. Indian confectionary can have a good market in the neighbouring countries provided its cost is reduced. The one sure way to do so is to lower the price of its basic raw material, that is sugar.

A DELHI DIARY

AN EXPLOSIVE WEEK

THIS has been an explosive week; I refer not only to the explosion of the U.S.S.R. 50-megaton nuclear bomb in the Arctic, but also the explosive character of the seminar on Portuguese Colonies conducted in Delhi and Bombay. I have no doubt that I shall be considered perverse by equating the explosive character of the two events as though any conference can produce the equivalent of million tons of T.N.T. I would, however, ask my indignant friends who will question my equating great intangibles with something extremely accurately measured, what the explosive character of the October 1917 Revolution was. Was it greater than or less than that of Mr. Khrushchev's 50-megaton bomb? If less, how much less was Lenin's non-nuclear explosion? My scientist friends tell me that the fallout from Mr. Khrushchev's effort will probably be finished within a year. Most of the danger apparently is next spring, but there is no serious danger likely to result to life or limb even after twelve months, and currently there has not been a single life lost. Can the October 1917 Revolution not claim that, at any rate, it was much more violent in its first impact on humanity; of its second and third round, discretion requires me to be moderate. But from the evidence adduced in the 22nd Congress on the Leningrad affair, may I say that the continued explosion of Marxism-Leninism was seen as late as 1950? Thus it is that explosions within the mind are as powerful as "controlled" nuclear explosions. I make no predictions on nuclear explosions of the uncontrolled kind or an all-out nuclear war. I am assuming, from what my experts tell me, that there will be no human race left to enjoy the spectacle of victory.

FALLOUT WITH INDIA?

The immediate consequence of the 50-megaton bomb has been greatly to shock the Indian mind. The grand canvas which Mr. Khrushchev unrolled on the future achievements of the U.S.S.R. socialist paradise with all the wonders that are to come (with full employment in a thirty-hour week and no taxes!) has been completely offset by this display of nuclear might which, in my view, was totally unnecessary. The Prime Minister and the Defence Minister have both expressed themselves violently against Soviet policy. So far as the Defence Minister is concerned, it is the first occasion on which there has been strong criticism of a major Soviet policy decision. Wicked friends of mine are saying that such are the beneficial consequences of the North Bombay elections!

Meanwhile, it seems a just judgment of Providence that most of the immediate fallout is over the U.S.S.R., but it would seem that some of flying geese visiting other portions of the world have already acquired a high degree of radioactivity. Will we have a campaign for eradication of radioactive geese as we have a campaign for the extermination of locusts? To what Ministry should one appeal for protection against radioactive geese? I fear, the distribution of portfolios in the Indian Union has not made it clear whether it is the Ministry of Defence or the Ministry of Food and Agriculture which we have to approach. I, therefore, (with my continued dynamic neutrality) make my petition to both.

THE COUNCIL FOR AFRICA: LEAP TO FAME

The Council for Africa, of whose existence very few people in Delhi were aware three months ago, has shot itself into prominence by a powerful, though somewhat embarrassing, shot at Portuguese colonialism. No one can deny that the shot was immensely powerful; how else could the recoil have been so great?

The Conference was well organised both at Bombay and at Delhi; only the Government of India was unprepared for the recoil, with our distinguished visitors demanding immediate action on Goa, which the Executive Committee of the Council for Africa had apparently not expected with such force. In the end a nice debate has arisen: Is India Gandhian or non Gandhian on Colonialism?

The Prime Minister wishes to have the best of both the worlds and argues that the Congress Party is by no means committed to the abandonment of military methods. He has certainly given a suggestion that our Goa policy is being reconsidered with the object of employing the aforesaid military methods which, for a decade have somehow or another, laid in cold storage. Many inconvenient questions are now being asked. If the Government of India wishes to employ these military methods in Goa, what becomes of the great Gandhian heritage? Again, if military methods are employed in Goa, cannot they be employed in Ladakh to free our own territories from an aggressor? The Portuguese are aggressors in a far more technical sense than are the Chinese who are, in fact, in possession of soil which is, according to the Constitution, a portion of India. Goa, Daman, Diu are not currently Indian territories in the same sense. Can the Prime Minister be strong on Goa and weak on China, or are we to prevaricate on both? The current position in which we are "ready" to invoke military methods, but never in fact do, seems to be a little disappointing to those who want action and is probably helping Acharya Kripalani not a little in his election campaign.

WHAT IS NON-VIOLENCE?

I will not enter into a philosophical discussion about non-violence. But I have had discussions with some of the distinguished delegates at the Seminar and it is difficult to believe that our somewhat ambivalent view has any admirers. In regard to the nice debate about violence and non-violence I may perhaps quote a view presented by Dr. Clovis Maksoud the distinguished representative of the Council for Arab States, who holds that the pattern of Colonialism is violent and the exercise of self-defence, even if it should take military form, is really not a departure from non-violence as such. Even Gandhians would admit that one is justified in defending oneself by the use of force. Mahatma Gandhi was against the use of force aggressively in the pursuit of political objects. But apparently, according to Dr. Maksoud the colonial peoples are practising only self-defence and are not bound by the doctrine of Satyagraha since the original imposition on them is a violent exercise of military power. Every nation militarily attacked can defend itself militarily. So far as other delegates are concerned, I fear the African delegates from Angola and Mozambique are extremely dubious about India's willingness to take up arms in order to liberate Goa, Daman, and Diu. In this they are probably as good judges as the temper of Indian feeling at the present time. The Indian Government is far too cagey about its commitments on military operations on Goa. It can advertise the export of soldiers and aircraft to the Congo to maintain independence there. Does it dare to put a date on the liberation of Goa? That was one of the inconvenient questions which two delegates from the Portuguese colonies in Africa addressed to me. I pointed out, with not a little happiness, that I enjoyed no responsibility in this matter. Their questions should be addressed to the Prime Minister!

ARGUS.

THE WEEK'S NOTES

General de Gaulle

TENSION OVER ALGERIA

THE ALGERIAN problem is getting more and more complicated as acts of violence are being resorted to on an increasing scale. As the Algerian insurgents intensified their activities in Paris and chose policemen as one of their principal targets of attack, as a measure of safety, an effective curfew was imposed upon the Algerian Muslim population in Paris and the suburbs. Obviously, incensed by this curtailment of their freedom of movement, the Algerians took to mass activity and spectacular demonstrations, regardless of the curfew. The demonstrations in which not less than 1,500 Algerians were arrested, could not remain peaceful and in the police action three persons were killed, while, as a result of the combined action of the police and the counter-action of the demonstrators, 77 persons were injured, among them 64 being Algerians and 13 policemen. The arrested ones are to be deported from France. As if this was not sufficient to add to the conflagration over Algeria, the European mob in Oran took to the lynching of Algerian Muslims. This bout of violence, which, so far, had not entered the precincts of Paris, has given a critical turn to the developments in this thorny issue.

But it is not merely overt acts of violence that are adding to the mounting tension over Algeria. President de Gaulle's emphatic declaration that he would consider the end of 1961 as the deadline for settling the Algerian issue on the basis of independence for the colony has aroused bitter hostility on the part of practically all the opposition parties in France and there are whispers going round of effective action before the President abides by his deadline. Shadow cabinets are said to have been set up in the hope that an emergency may have to be faced—emergency arising from any cause, ranging from President de Gaulle's overthrow to an off-chance of an assassin's successful attack in a desperate and fanatic mood.

The Press

PARLIAMENTARY PRIVILEGE

IN THE light of the proceedings instituted against "Blitz" and "Madras Mail" recently in respect of breach of the privilege of the legislature and the decisions taken thereon, it was but inevitable that this question should be one of those uppermost in the mind of the Standing Committee of the All-India Newspaper Editors' Conference which met at Nainital the other day. Experience has brought home to the Press the bitter truth that the present undefined position of the privileges, immunities and powers of the legislature has created problems and upsets for which a genuine cause cannot necessarily be found in every single case. The Standing Committee adopted a resolution asking for a clear definition by law of these powers, privileges and immunities and in this context it emphasized that this definition should take full note of democratic practices and the Code of Ethics passed by the AINEC. This was necessary in order to obviate conflicts between the two sides and to pave the way for healthy and fruitful co-operation. In particular, the Press in India earnestly desires the recognition of the position that in case of any likely conflict between the privilege of the legislature and the right of the Press to the freedom of expression, the privilege should yield ground to the extent that it affects this right. This is particularly sought after in order to secure recognition of the position that no privilege of the House should stifle press comment based on faithful and correct reporting of the proceedings of the legislature.

The Chief Minister of Uttar Pradesh, in effect, vigorously argued the case for maintaining the present fluid position by emphasizing that the parliamentary privileges in India were the same as those of the House of Commons. He dilated on the virtues of not committing this issue to precise definition under the law and posed the question: What guarantee is there that more privileges than those enjoyed by the House of Commons cannot be added once they are codified? This question in fact does not arise. Mr. C. B. Gupta also placed accent on the fact that the freedom of the Press cannot be more or less than the freedom of expression granted to the citizen as a fundamental right under the Constitution, subject, of course, to the rational limitations incorporated in it. This precisely is the view insisted upon in the resolution of the Standing Committee. It says that the privilege should not subtract from the right of freedom of expression which the Press possesses. Although it is arguable that an undefined position is in several ways conducive to the benefit of both the parties, there has been considerable display of sensitiveness—a few might be tempted to observe, supersensitiveness—by some legislatures on occasions and the Press has found itself in a difficult position. Sooner rather than later the question of codification of parliamentary privilege ought to be taken in hand.

Rajasthan

PRINCES AND POLITICS

WHILE CONSIDERABLE latitude in the criticism of the opposition party candidates is quite a common feature at the hustings, it would appear that in running down the candidatures of Maharani Gayatri Devi and the Maharawal of Dungarpur, particularly the former, Mr. Sukhadia, Chief Minister of Rajasthan, revealed some perturbation of mind. He was right in reminding the two candidates that the rapid economic and social revolution which has been overtaking this country since Independence and the concrete results of the development programmes, especially through the medium of community development, have brought home to the people of the State the realisation of what a government run on the principles of democracy means and what a world of difference it makes with conditions under the former princely regimes. The average voter in India, as in many other countries with a low percentage of literacy, has shown a robust common-sense and maturity of judgment in deciding who would be his representative in the legislature and who is wooing merely for his vote.

In criticising the candidature of Maharani Gayatri Devi, Mr. Sukhadia appears to have lost the full sense of perspective. In particular, her election appeal to her former subjects ought not to have been construed as a calculated attempt to hold up the march towards progress and modernisation. In going a step further and imputing motives of reviving the old princely and feudatory order, Mr. Sukhadia has given reason to believe that he has strong misgivings that the Maharani may come out victorious in the Jaipur constituency inflicting heavy defeat on her Congress opponent. Does the inference legitimately arise that the candidatures of the former princely rulers are tantamount to a bid at revivalism? An inconvenient question may be posed whether the Congress Party itself has not awarded tickets to members of the bygone order to contest elections? The correct view to take is that those who belong to this class should not be estranged and alienated by being excluded from policies. Rather, as the Congress Party seems purposefully to have chosen to do, the best elements among them should be en-

couraged to participate in the legislatures and wipe out the gulf which they might feel between their way of life before and now. On the whole, their entry in the legislatures and other fields of politics will facilitate their assimilation in the new democratic order.

Apartheid

THE RENEWED "MANDATE"

THE RESULT of the premature general election fixed by Dr. Verwoerd for October 18 was never in doubt. It was taken as an immutable fact that the Nationalist Party would be returned to power. What was in doubt were the relative changes in the strengths of the opposition parties. But the wide gap between the Nationalist Party and even the United Party which is the main opposition has taken away any real interest in the accession or loss of strength of the opposition parties in Parliament.

In due course, after the last general election of 1958, the next one ought to have been held in 1963. Dr. Verwoerd's rising influence among the white population was carried to another climax by South Africa's withdrawal from the Commonwealth. Fears of a flight of capital from South Africa turned to be exaggerated and the drastic exchange controls imposed by the Nationalist Government proved effective in preventing the emergence of a crisis. Since then the foreign reserves position of South Africa has improved. Why then was it that Dr. Verwoerd found it necessary to hold a mid-term election? Emboldened by victory after victory, Dr. Verwoerd wants a clear fresh term of five years to "consolidate" the gains achieved by apartheid. In fact the Nationalist Party is not the only one that subscribes to the philosophy of apartheid and a renewed mandate was superfluous. But Dr. Verwoerd's ambitions are now soaring higher. Apartheid is to be entrenched more strongly than ever before by the contemplated partition of South Africa into the white areas, where the non-whites will have no rights whatsoever, and the "Bantu" states, where the Africans will be totally segregated and given crumbs of local autonomy with the sight of the mirage of independence. This, in effect, is the meaning of "consolidation" for which the mandate was sought. But it has been criticised by the opposition supporters of apartheid as a dream and an impracticable policy as millions of Africans have settled in the cities and to uproot them from the projected white areas would be to invite a catastrophe of an impendable magnitude. Apparently, Dr. Verwoerd is unmindful of the tide of freedom for the Africans that has begun to surge forcefully everywhere else in Africa.

Police Centenary

TRADITION AND TRANSITION

IT WAS under the Police Act of 1861 that the Indian Police force took its birth. The centenary which was celebrated on October 21 is important for two reasons. Apart from the fact that it is an important landmark in the onward march of this wing of the executive, there comes also the reminder that exactly two years back, on October 21, 1959, the Indian police showed their spirit of heroism and dedication in far away Ladakh when a party of 19 fought against the Chinese aggressors and 10 of them laid down their lives. This indeed is a supreme and shining example of the spirit of dedication to duty. But the Police Martyrs Memorial which was unveiled by Mr. Lal Bahadur Shastri in the capital city on October 21 commemorates the immortal example of still another heroic 24 members of the force, who, after Independence, sacrificed their lives in the discharge of their duty. The police force,

constituted four years after the Mutiny, has built tradition after tradition of service in maintaining law and order. But maintenance of law and order had been its almost exclusive task until Independence. Today this remains no doubt an integral and basic part of its functions, but the tradition of holding it supreme above any other duties must fade away in the post-independence set-up.

The police force thus is called upon to face the new challenge of the transition in the character of its service and of the problems of adaptation it raises. This period of transition is no doubt one of trial and difficulty, but it has been rendered still more so by certain evils which have crept into the police force. Lack of integrity, efficiency and the temptation to succumb to practices of corruption are evils which are so rampant in the police force today. To mention this is not to run down the force as a national asset nor to minimise the importance of the valuable services it continues to render and shall always continue to render to society. But in this hour of joy and pride, the police force needs to do a good deal of introspection. Corruption is by no means a vice peculiar to the police force, but in different degrees it is to be found in the various branches of administration. The Bihar Police Commission's report, published the other day, lays emphasis on the prevalence of malpractices whether in the investigation of crime or otherwise and the same condition obtains more or less in the other States too. An increase in the police staff, rationalisation of their methods of recruitment and promotion, improvement in their working conditions and liberalisation of their pay scales have been recommended by this Commission. They are undoubtedly badly needed. But the police has to adapt itself to the transition towards democratic methods of operation. The persisting tradition in which the police is looked upon with awe, rather than as a guide, must disappear and it is for the police to hasten its disappearance.

AUSTRALIA'S LARGEST COMMERCIAL BANK CAN HELP YOU TO PROMOTE TWO-WAY TRADE WITH AUSTRALIA, NEW ZEALAND, AND FIJI

Want to sell? Want to buy? Want market information? The international Division of the Bank of New South Wales can tell you about the opportunities for trade offering with these countries. The Bank's complete banking service includes such specialized facilities as trade introductions to buyers and sellers, industrial enquiries, economic and market information, and a complete travel service. The Bank is closely and constantly in touch with industry, business, and agriculture in the areas it serves through more than 1,100 branches and agencies.

Enquiries may be made through your own bankers or direct to

Accurate cost accounting begins with HONEYWELL FLOW METERS

HONEYWELL FLOW METERS
HANDLE THESE AND
MANY OTHER FLUIDS

Chemicals
Steam
Fuel oil
Air
Water
Fluid materials

Brown Recording-Integrating Flow Receiver

What is the cost of process flows for the various production departments of your plant? You must have accurate records of the quantities of steam, water, air, chemicals, fuel oil and other fluids supplied to each department to know where your money goes and why. Honeywell Flow Meters aid cost accounting by providing the information you need.

Honeywell is the recognized world's leader in the design and manufacture of automatic control equipment. An organization of more than 30,000 persons, with factories in the United States, Canada, France, Germany, Holland, Japan and the United Kingdom, Honeywell products are used in scores of widely diversified fields.

Honeywell products—more than 13,000 of them—fall into these three principal categories:

Heating and air conditioning controls and control systems for residences and industrial, commercial, public and educational buildings.
Instruments and instrumentation systems, process controls and control systems, valves, precision switches and data processing systems for business and industry.
Precision electronic instruments and control systems for aircraft and missiles.

For information on any control or instrumentation problem, contact

C.I. PRESSURE PIPES BY IISCO

IISCO-STANTON Cast Iron Spun Pipes
Made to BSS 1211 of 1958
and Vertically Cast Pipes
to BSS 78 of 1938

Our pipes are being utilised all over the country from Kashmir to Kerala and from Assam to Gujarat. A few of the largest schemes being supplied today from Kulti at the present moment are —

Ernakulam — Mattanchery and other Schemes under the Third Five-Year Plan, Kerala		
3" dia. to 24" dia. Spun Pipes	—	8,62,000 Rft.
Trivandrum Water Supply Augmentation Scheme		
48" dia. Vertically Cast Pipes	—	42,240 Rft.
Madras State Third Five-Year Plan		
Water Supply and Drainage Scheme, Madras		
3" dia. to 24" dia. Spun Pipes	—	48,02,000 Rft.
Thippegonanahalli Water Supply Scheme, Bangalore		
36" dia. Vertically Cast Pipes	—	89,760 Rft.
Ajmer Water Supply Scheme, Rajasthan		
21" dia. Spun Pipes	—	3,69,000 Rft.
Manjira Water Supply Scheme, Hyderabad		
16" dia. to 24" dia. Spun Pipes	—	8,760 Rft.
36", 40", 42" & 45" dia. Vertically Cast Pipes	—	53,585 Rft.

The European Scene

PLANNING AFFLUENCE

From Our Special West European Correspondent

PARIS, October 22.

WHATEVER the virtues and shortcomings of voluntary, "indicative" planning in a free economy, the mere collaboration of capitalists, trade unionists and officials in the writing of a national plan provides the occasion for philosophical reflection on the meaning and purpose of economic progress. Even if many of the predictions of such a plan fail to be realised, the confrontation of various views about the sort of economy that is desirable will have been salutary. Admittedly, in a free society there are always moralists and a few (rare) academic economists who worry about such questions and who seek to correct public engrossment with the standard of life by pointing out that an economy also determines a way of life. Yet their conclusions generally find little echo; most economic agents continue to conceive progress in terms of producing more of no matter what or (on the Left) of employing more and better-paid men to do no matter what. This can lead to the gadget-society where men work hard to get high wages in order to buy the latest annual model refrigerator for a wife who is mortified because she is still using last year's model electric mixer. A democratic attempt to plan affluence, in a society that is already fully employed, provides an opportunity to decide whether one really wants that sort of economy. Since most people find it ridiculous, there is then the chance of re-directing investment toward activities that will produce a more acceptable way of living and perhaps no lower a standard of living.

This has been done in the fourth French Four-Year Plan, which is being finalised this month. The introductory expose sets out the "philosophy" of the plan; I recall that this is not decreed by an oligarchy of planners but is the joint work of various talents drawn from the producers' associations, the workers' movement, the university and the administration. It bears the mark of the thinking of one of those economic moralists I have mentioned, Ambassador Galbraith, for it argues that Western industrial society tends to support production by creating more and more artificial needs for private enterprise to satisfy, while public wants are neglected. It adds, "The consumption-economy, which is foreshadowed in certain aspects of American life and which has found its most penetrating critics in the United States themselves, eventually leads to futile satisfactions which simply generate discontent. No doubt it would be better to place the increasing abundance that is promised us to the service of a less restricted conception of Man." M. Pierre Masse, Commissioner-General of the French plan, thinks that to the consumption-economy should be preferred the "solidarity-economy," which seeks to eliminate inequalities produced by economic progress itself. This is not the familiar Leftist notion of levelling up incomes between classes because the inequalities between the traditional classes are not especially shocking today in prosperous West Europe, and could only be reduced at the price of hampering further production of wealth. The inequalities that now cause concern affect age-groups (the growing number of inactive old people, of whatever "class," inspire more solicitude than the lowest-paid wage-earners) and regions. The polarisation between active industrial centres and backward or retrogressing regions sets up more tensions in European societies than the class-struggle which now exists mainly in communist rhetoric only. The new plan, more earnestly than its predecessors, sets out to remedy some of these inequalities. It is realised, of course, that there can be no once-for-all equality such

as was imagined by the socialist egalitarians; any progressive industrial economy is forever generating new imbalances.

However, beyond the solidarity-economy, says M. Masse, is the "creation-economy," and it is the outlines of this that appear in the new French plan. Here the aim is no longer to improve living standards, whether of the average of all citizens or of certain under-privileged sections, but to supply the materials for a way of life whose attractions cannot be measured in index numbers or monetary terms. Granted that the market-mechanism will ensure that, as effective demand increases, private enterprise will manufacture the personal instruments for many satisfactions (in the shape of durable consumer goods for individual use), what requires public planning is the social equipment for a better way of life. That is why the outstanding feature of the new French plan is an increase of 50 per cent between 1962 and 1965 of investments by the State and local authorities in town-planning, slum-clearance, the beautification of resorts, schools, universities, scientific research, hospitals, and sports facilities. A 50 per cent increase in outlays of this sort is substantial (the concurrent rise in productive investments will be 28 per cent), but it must be remembered that in France, as in most other industrialised countries, the point of comparison is pretty low; social investments have been long neglected in favour of the restoration and expansion of industry.

Nevertheless, the rise is significant for it will mean that expenditure on social equipment will be 3.5 per cent of gross national product in 1965, against only 2.5 per cent in 1961. Thus it marks a sharp change of direction, toward that creation-economy which, says M. Masse, "bears the same relation to the consumption-economy as the civilization of cathedrals does to the civilization of gadgets." Europeans have an irritating habit of contrasting "their" cathedrals with the Americans' gadgets, forgetting to add that no cathedrals have been built in Europe these many centuries. If at last Europeans set out to build community amenities, at the expense of less chromium on their motor cars, they will have more right to point out the contrast. Some people will think that the French are beginning to worry about this too soon; their living standards are still very far below American and many of them lack decent housing (which presumably is not a mere gadget) whereas in the USA today, according to the Census Bureau, 7.6 per cent of all rented accommodation is vacant—that is, there are two million vacancies. A number of Frenchmen will think that the switch from the solidarity-economy to the creation-economy is premature, for they are keenly aware of their limited share in current prosperity; and a very large number that are intent on Americanising their way of life as fast as possible will feel that they are being cheated. But, on present indications, France will attain 1961 American income per head before the next decade is out, and if forward planning means anything it must look ahead to situations within that range.

Already, at the degree of prosperity attained in West Europe, there are examples of wasteful expenditure and superfluous consumption which no one dares reduce because so much industry and employment depend on them. The private automobile is an evident example. Continental cars have not become the hideous and stupid waste of metal seen in the "insolent chariots of Detroit" and their production has not been financed at the expense of public transport—the French have more motor cars per thousand of population than any

country except the USA, but they also have the best railways bar none. Yet they have chosen to motorise themselves before housing themselves, with the absurd result that they are more comfortable on wheels than at the fireside. Worse, they have so many cars on the road that a growing proportion of public expenditure risks going to the construction of dual-carriage motorways, road tunnels and parking lots, leaving less State funds for other community amenities. This is the sort of vicious circle that voluntary democratic planning could try to avoid: the consumer chooses a car at the expense of other necessities and thus obliges the State to build the expensive infra-structure for his car, again at the expense of other social necessities, more roads allow more cars to circulate, and so on. The problem of wasteful consumption is indeed a rich nation's problem but it appears well before American standards are attained and it has to be tackled well in advance if it is to be solved. If they look ahead, free men will voluntarily agree to re-direct investment in order to avoid a certain situation, but by the time that situation has arisen there are too many interests involved for it to be remedied otherwise than by the undemocratic method of prohibitions and penal taxation.

The preference for community amenities over individual consumer goods can readily be exaggerated into the demagogic flourish that covers up the fact that personal freedom is being limited: the State undertakes to provide, perhaps free of cost, various services whether or not you want them, while the range of goods on offer to the multitude of personal tastes is consequently restricted. There is much of this in the Russian plan now approved; everyone, including bald men, will have the right to a free socialist haircut but combs will be of one colour and on the ration. Mr. Khrushchev assures us that Russians prefer public transport to the bourgeois pleasures of a private car, but one would need to have their own opinion on this. Seeing that you have to wait up to 24 hours on a railway station to make a connection in Russia today, no doubt any reasonable Russian would like to see public transport improved before an automobile industry is created, supposing that one can only be done at the expense of the other. But the arbitrary decree that community assets are to be preferred to individual equipment produces situation infinitely more absurd and unsatisfying than sole reliance on the expression of effective demand in a "free" market dominated by advertising men. The change in emphasis in French plans toward social assets takes place, it must be remembered, in an economy where consumers' choice in the free market still determines the main lines of economic development, while the social correctives are voluntarily agreed upon by the representatives of all classes and activities.

This new concern with qualitative investment comes after a long period of production-at-any-price obsession in West Europe, a period in which the industrial production index number was thought to tell the whole story of economic advance. The new attitude shows up not only in plans for public expenditures but in the private manufacturing sector too, in the form of a greater concentration on quality. It is well known that the gadget civilization depends, not simply on a fascination for superfluous luxuries, but on the phenomenon of artificial obsolescence—which is a big name for the production of shoddy goods. It is not only to acquire a yearly model in electrical household equipment; it is necessary, because the machine is so poorly made that it probably will not last beyond a year. (Until some months ago, U.S. cars were being sold with a warranty of only six months.) The consumption-economy sees the marketing of an incredible quantity of gimcrack produce, and the maker of sound, durable goods could come to be regarded as an uneconomic force, holding back the rise of the sacred production index number.

There was a good deal of this in West Europe after the war, but the change that began to take place two years ago is striking. I expect that it was in part due to the increased competition brought about by the Common Market, less because it reduced tariffs than because it opened quotas: even token imports of high-priced foreign goods suffice to show the consumer what quality is possible in a given line, while, conversely, the exporter of high-quality goods has an earlier chance of getting across tariff barriers than the ordinary manufacturer.

However, there are more general causes. It just seems to be a characteristic reaction of the Continental to use higher personal revenues by buying better quality goods of the same type as he has always bought, and buying no more of them, rather than buying new products. This is an aspect of his greater conservatism, as compared with the more open and restless temperaments of the USA. The fourth French Plan allows for this, in foreseeing a shift toward quality production rather than as big a rise in the volume of production as one might expect as personal revenues approach American levels. The point is to be borne in mind, incidentally, by Indian exporters to Europe, especially if current pressure secures bigger quotas for textiles. Hard-won custom in more particular European markets might be seriously damaged by allegations of defective exports such as have been made lately.

A PASSENGER FROM CALCUTTA WRITES:

... Just a line to thank you and KLM for looking after us so well prior to our departure from Dum Dum, and during the flight to London. The service on the plane was excellent and the hostesses charming...

This extract is from an unsolicited letter; a photocopy can be obtained from KLM, Calcutta.

For that extra personalised service, there's nothing like flying "the Golden Circle" to EUROPE by KLM DC-8 JET

Departure: New Delhi Thursday 22.20 hrs.
Excellent connections from Amsterdam to the U.K.
Arrival: London Friday 13.10 hrs.

Sincerely yours

THE WILD ONES

By ANDREW BOYD

I HAPPENED, this week, to run into one of the involuntary lords who now form one of the stranger features of the British political scene. On inheriting a peerage, he had found himself dragged, kicking and screaming into the fifteenth century, deprived not only of any prospect of making an honest political career for himself but even of his right to vote, and installed as a reluctant baron in the Upper House of the Parliament of the United Kingdom. Over lunch, we talked of the debate on world affairs which was about to occupy both Houses for two days, and in which he duly took a modest but intelligent part. As a result of our talk, I paid more attention than usual to the Lords' share of the proceedings, reading the verbatim record of the debate instead of being content with summarised versions in the press. And the effect was, frankly, horrifying.

There are "wild men" in all parliaments—except for parliaments that have been "tamed" to the point of absurdity, like those in Moscow and Lisbon. But a sprinkling of wild men is not enough to reduce a major debate in the House of Commons to near-insanity; and the Lords, according to the theory of the British constitution, is supposed to be a body of grave elders, detached from partisan emotion and qualified to pass calm judgment on the great issues of the day. Sometimes it does so. But the debate to which chance had drawn my particular attention was of a very different kind.

This debate had arisen from anxiety about two principal matters: the crisis over Berlin, and the clash between the United Nations and Katanga forces in September. The Lords' discussion of the Berlin crisis had its moments of distinction, with the former Anthony Eden making his first appearance in his new incarnation as Lord Avon, and a bravura performance by Field Marshal Montgomery, fresh from his much publicised and doubtless enjoyable swimming picnic with Mao Tse-tung. But the second day of the debate was mainly devoted to the Congo problem; and a hair-raising affair it proved.

Apart from the Ministers who opened and closed the day's debate, and two speakers from the Labour Opposition benches, there were only six speeches on the Congo: from Lords Salisbury, Clitheroe, Astor, Winterton, and Milverton, and the Duke of Montrose. A single chord vibrated through all their orations. The Marquess of Salisbury started them off with a comparatively quiet twang on the tuning fork; but by the time the others had finished, the pitch had risen to a shriek.

In the "state of Katanga", according to Lord Salisbury (this Congolese province was repeatedly named as a "state"), Mr. Tshombe had been successfully applying the principle of "partnership" between races. "One might have expected the United Nations to give a vote of thanks to President Tshombe on the success of his multi-racial experiment". Instead, "peaceful" Katanga had become a battleground because the UN had itself carried out "a military coup" there. In Lord Clitheroe's eyes, this was an "act of aggression". In Lord Milverton's, it was "a cynical and unscrupulous armed attack", and a "sudden experiment in international thuggery".

Lord Salisbury deplored the use of the term "mercenaries" to describe the collection of white soldiers of fortune who have been leading Mr. Tshombe's private army (and who led it into battle against the UN force in Katanga even after Tshombe himself had ordered a cease-fire). His lordship equally deplored the efforts made by the United Nations—in accordance with resolutions passed by the General Assembly and Security Council, resolutions which the British government had supported—to get these men out of the Congo. To Lord Salisbury, they were "the white partners in this multi-racial state", and they ought to be allowed to carry on with their good work.

Lord Milverton thought that in the Congo the United Nations had been "a disastrous liability", and that "if the United Nations were determined to force a political solution on an unwilling group of tribal areas, it would have been far more sensible to base it on Elisabethville, not on Leopoldville". Lord Astor pooh-poohed the idea of any real armed clash between the forces of the Congo government and Mr. Tshombe's. "War can take place between the central government and Katanga only if the United Nations facilitates it".

Earl Winterton described the chief United Nations official in Katanga as "the almost unbelievable Mr. O'Brien, who is the worst type of filibustering braggard"—a remark which revealed a total lack of acquaintance with the scholarly, modest and humorous character of that highly intelligent diplomat, Dr. Conor Cruise O'Brien, as well as a shrewd ability to take advantage of parliamentary privilege in showering personal abuse upon people who are unable to reply in kind. But then the earl moves in a world of his own. "There is in this country", he said, "what I would describe as a Negrophile press and a Negrophile element in the population... The Negrophile press and the Negrophile elements have done their best to blanket the truth about the atrocities committed in the name of the United Nations and by UN troops and officials". Lord Winterton was baffled by a report that his own Prime Minister had described these "outrages" as "unsubstantiated". He was doubtless equally baffled when Lord Lansdowne, the Joint Parliamentary Under-Secretary in the Foreign Office, said in this same debate that he had concluded that "many of the apparently more outrageous aspects of the United Nations' action as we had seen them in London were inaccurate or exaggerated".

Their lordships, once their blood was up, easily strayed across the Congo border into Angola. Lord Astor called for sympathy for the Portuguese "rather than criticism". The Angola rising had been "a carefully laid plot" organised from outside. Lord Milverton spoke of "the invading forces" as having behaved with "bestial savagery", and, after assuring his fellow peers that tribal Africans in Portuguese territories "have voting rights", went on to ask: "What is the alternative to Portuguese control in Angola? Is it handing over the territory to murderous thugs?"

Borders were less than nothing to the Duke of Montrose. As befits a man who has lived in Africa for thirty years, he saw Africa, if not steadily, at any rate whole, and generalised fervently about its entire (non-

white) population. "If you permit this policy to spread", he warned his peers, "and these big amalgamations of African nations take place, and there is an African army, officered perhaps by Russians or Chinese, fighting their way down through Africa, trying to go perhaps from Cairo to the Cape, what is going to happen?"

Should one read too much unconscious revelation into the duke's statement that "the final thing the African feels that the white man has held back from him has been the white woman"? The sexual undertones in this remarkable debate were ominously strong. Their lordships kept reverting to tales of rape. A good doctrinaire Marxist would presumably insist that the reasons for the attitudes adopted by British die-hards to African issues are explainable in strictly economic terms. It is true that on this occasion several of their lordships carefully declared their financial interest—taking warning from the way Lord Salisbury had been chastised for not doing so in another recent African debate. But one cannot help wondering whether there is not something deeper here.

Bernard Shaw once remarked that the Lords are much more representative of the country than the Commons, because they are not professional politicians but ordinary men. Happily, I do not think the Lords' performance this time was anything like as representative as all that. But it did reflect, in the same way as much that was said at the time of the Suez conflict,

the emergence of a recognisable Freudian "id" under the strain of "disimperialism". There may be a case for deliberately using the House of Lords as a kind of safety-valve, a device through which the wild ones can be permitted to blow off steam without doing any serious damage (nobody normally takes much account of the utterances of its die-hard backbenchers). If so, there are quite a few people about whom I should like to see have peerages thrust upon them; and, as other countries have a very similar problem with their wild men, a systematic British development of this idea might attract worldwide attention.

The difficulty, of course, is to give these men a satisfactory feeling that they have given vent properly, without letting their extravagances actually affect matters at all. Under the present British system, they must get considerable satisfaction from the fact that Ministers duly sit and listen to what they say, and at the end of the day contradict them with the utmost courtesy and respect. And, of course, when the Commons is in simultaneous debate, there is little risk of the peerage getting more publicity than its utterances deserve. All the same, reading the record of this particular debate, and reflecting on the alarming possibility of these particular voices being heard in any part of the world and taken to represent British opinion and the standard of British parliamentary life, I gave thanks to Mr. Khrushchev for perpetrating another marathon speech on the same day, and thereby helping to drown them out.

Economic Report from the U.S.

O.E.C.D. MEETING

By GUY SIMS FITCH

WASHINGTON, October 17.

THE international conference now under way here provides ample evidence of the extent to which concepts of economic developments have broadened. The conference is sponsored by the Organization for Economic Co-operation and Development (OECD), which is composed of Western European nations, Canada and the United States, and which has as one of its principal endeavours the effective extension of economic aid to developing areas by its member nations. Interestingly enough, however, this OECD meeting is not devoted to an assessment of capital assistance as such, but rather to the role that investment in education can play in helping to advance economic growth. Here is a frank recognition that ample modernization efforts apply to the whole of society, and are not confined to the narrow proliferation of industrial projects which in the long run may or may not add to the essential well-being of a nation or its citizens.

Modernization in this sense must in the final analysis embrace a broad spectrum of social as well as economic programmes. It requires the development of human as well as material resources. It rests not only on the infusion of external capital assistance, but also on the intelligent and determined efforts of the developing nations to help themselves—to mobilize their own resources, to institute needed internal reforms, to preserve their national integrity. These are not idle preachments, and should not be so taken. They are rather, in the words of Mr. Adlai Stevenson, "new truths" which have been learned—laboriously and painfully, at time—in the 15 years or so since the United States became the world's pioneer in the extension of large-scale economic assistance to other countries. What we have learned, according to Mr. Stevenson, is that "it was impossible to build a modern economy on the foundations of massive poverty, illiteracy, feudalism, tax avoidance and social injustice." The U.S. Ambassador to the United Nations was speaking at the opening in New York of the General Assembly of the Inter-American Press Association. What he had to say, therefore, was applied particularly to President Kennedy's Alliance for Progress, that joint Western hemisphere venture under which the United States in little more than six months already has made available more than \$700 million to 16 Latin American countries for social and economic development. But his words are equally applicable to all countries in all parts of the world that are dedicated to modernizing their societies and raising the living standards of their people.

None of this is desired to minimize the essential role of capital. In supporting sound development programmes, if anything, this kind of an ambitious appraisal of modernization requirements underscores the need to mobilize capital from all fruitful sources—from within as well as from without, from private industry and investments as well as from governments. Some cogent thoughts on this subject were offered recently by Mr. Philip Klutznick, U.S. representative to the UN's Economic Committee, now meeting in New York. In calling for strengthening and expanding U.S. programmes in the field of economic development, he emphasized not only the amount of capital to be provided, but also the need for careful development planning, for sound national programmes, for the training of skilled personnel, and for the exchange of useful knowledge and ideas.

Nor did Mr. Klutznick overlook the importance of bilateral aid, which he held to be as necessary as UN assistance in providing resources needed to promote economic growth.

He also cited "the exciting possibilities of private capital" as without foreseeable limit and as embracing the largest aggregate pool of skills available. While there has been a tendency to talk about those contributions which governments rather than private enterprise can make to economic development, Mr. Klutznick took the occasion to point to the other side of the coin—to the "customary capacity of private enterprise to indulge in imaginative business adventures which involve risks that governments are reluctant or unable to take." In all this one can detect a shift of emphasis from the quantity of money available to the quality of the use to which it will be put. Capital, after all, is in great demand everywhere, and its supply is not unlimited. No matter how much money may be available for specific development purposes, there always seem to be others for which it might also have been used. The idea, then, is to ascertain those uses which will best contribute to economic and social development—which will best fit in with soundly drawn long-range programmes to speed the modernization of developing societies.

The new Director of the U.S. Foreign Assistance Programme apparently has these thoughts very much in mind. In taking over his new post as head of the U.S. agency for international development, Mr. Fowler Hamilton observed that "in the administration of this programme we will regard it as our first duty to help those of the less-developed friendly countries that make efforts to help themselves." He went on to characterize the \$4,000 million in foreign aid voted by the U.S. Congress this year as "seed money"—money that may be small in quantity when compared with the potential demand, but "effective in consequences."

ANNOUNCEMENT

The following Annual Numbers of THE EASTERN ECONOMIST are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Rs. 50/-.

- | | |
|--|----------|
| 1. India & the World and India in 1950 | Rs. 5/- |
| 2. A Social History of the Indian People & India in 1951 | Rs. 5/- |
| 3. India & the Free World and India in 1952 | Rs. 5/- |
| 4. India in Asia & India in 1953 | Rs. 5/- |
| 5. India in South East Asia and India in 1954 | Rs. 5/- |
| 6. India & the Communist World and India in 1955 | Rs. 5/- |
| 7. India in 1975, A Study of the next Twenty Years & India in 1956 | Rs. 7.50 |
| 8. India & the Middle East and India in 1958 | Rs. 7.50 |
| 9. India and Europe & India in 1959 | Rs. 10/- |
| 10. India & North America and India in 1960 | Rs. 10/- |

L.I.C. BONUS ANNOUNCEMENT 1959 VALUATION RESULTS

WHOLE LIFE ASSURANCES	ENDOWMENT ASSURANCES
Rs. 16.00	Rs. 12.80
per thousand per annum	per thousand per annum

The Life Insurance Corporation has pleasure in declaring the above rates of bonus as a result of the second Valuation of its liabilities and assets as at 31st December 1959. These bonus rates are applicable to with-profits policies issued by the Corporation and in force as at the date of Valuation.

As regards the bonuses on with-profits policies issued by former insurers, these have been declared proportionately in accordance with the Scheme of Differential Bonuses approved by the Central Government and published in the Gazette of India dated 14th October, 1961.

The bonus rates applicable to all the policies are the same as those declared on the basis of the preceding Valuation as at 31st December 1957.

As at the date of the present Valuation the total sum assured under the policies was Rs 1,997 crores, including bonuses, and Rs. 105 lakhs per annum under Annuities. Out of the gross profits disclosed by the Valuation, a sum of Rs. 24.47 crores has been utilised for allotting bonuses at the above rates to policy-holders, after providing for income-tax liability amounting to Rs. 4.58 crores and Government's share of Surplus amounting to Rs. 1.28 crores.

As already announced, bonus intimations in respect of both the first and second Valuations will be sent out to the policy-holders as soon as possible.

Special Article

INDIAN ADMINISTRATION: WHAT IS THE NEW LOOK?

By C. S. VENKATACHAR

WOODROW WILSON, as a professor at Princeton, wrote that the French Revolution had removed all the foundations of French politics but scarcely any of the foundations of French administration. Something similar has occurred in India. The conjunction of a democratic government with the foundations of bureaucratic administration presently marks the political system of India.

At the district level and below very far-reaching democratisation of the administration has yet to be carried out. The administration here is only modern in external appearances; its spirit and outlook is traditional and in that sense reactionary. The essence of re-organization is to infuse a democratic spirit into the machinery, change its entire outlook, completely modernize the obscurantist traditionalism, exorcise the banal mentality of the functionaries at the lowest echelons and cut down the diseased and the dead roots. Let there be a distinction between two types of administration in the districts. One will be the power of active administration exercised individually; the other the power of deliberative administration belonging to democratic bodies, such as panchayats, co-operative societies and developmental councils. In the case of deliberative administration there may be a further subdivision; one may relate to the action to be taken and other advice to be given. Deliberative administration comes in wherever it is necessary, to secure the active co-operation of the people. On the other hand, where, for example, law and order is concerned, the question of deliberative administration does not arise. The officer responsible of the State government will exercise this power according to law. There should be no gap between the government official and the society in which he functions, socially and culturally. Only the fullest measure of democratisation will remove the psychological barrier between the rural society and the local administrative machinery.

Till the second World War, the Secretariat was a small compact body, authoritarian, nimble with pen and worked in a blissful state of 'aloofness, conscious rectitude and confidence in itself'. It has on the whole, been successfully integrated into the parliamentary system of government. On the organizational side, efforts are being made to secure maximum of effectiveness of work and the rational use of available resources. A working adjustment has been achieved but long-term developments will be conditioned by national politics.

In a parliamentary democracy, a question often posed is how to attain efficiency in a system which is a joint enterprise between the political chief and the trained civil servant. Much depends on the working relationship between the Minister and his senior officers. More attention should be paid to the transaction of work by oral or personal discussions; in other words transact business by conversation. The old familiar style of business on files, fitted as it is into the interstices of the day, is not the substantial work of the Minister or even of the higher staff. This kind of work requires a high degree of mutual confidence between the Minister and the Civil Servant.

Should there be a creed for Civil Servants? The answer would be in the affirmative but it would be difficult to lay down any positive creed. The substance of a creed may be compressed into five propositions none of which may be novel.

First, the Civil Servants form a composite body which includes scientists, technocrats and managerial men; second, they shall not be status-seekers and in order to safeguard their prestige, which in fact does not exist, they shall not isolate themselves from the generality of the people; third, they should think and act as belonging to a corporate body of national civil servants; fourth, there is much to be said for both sides on any complicated question and in the modern world, nearly all serious questions are complicated. There is, therefore, limit to the application of pure reason. Action, even imperfect at times, is always preferable to endless examination and reasoning; fifth, in an expanding society, grave social, economic and political changes cannot be made without arousing opposition, much of it natural and reasonable. A Civil Servant should not have a neutral attitude towards the executive and legislative programmes of the government of the day.

The inter-relation between the ruling elite and government officials is not one of a conventional formality. It is deeper than any conventionality. What is involved is the role of the intelligentsia, consisting of persons of professional and special skills, needed to run a modern government. So far no positive thought has been bestowed on this crucial question. No doubt the intelligentsia is needed in the stage of economic growth as specialists and sometimes as scapegoats. The old order continues with some obvious and necessary changes. The Civil Servants have been comparatively well paid and worked in decent material conditions. On occasions they are openly distrusted and often contemptuously tolerated. At the district level and below, the subordinate officialdom, if not strictly supervised, is disconcertingly shadowed by partymen of orthodox ideological quality. There are distinct signs of antagonism growing in all political parties against the English speaking 'Neo-Brahmins'.

The issue really concerns the nature of the upper stratum of Indian society which may be a spectrum of the old and new, but it has to have some blending. Or to use a more current phrase, there should be a national emotional integration. At least three obstructions towards this consummation may be readily recognized. They are the absence of a common bourgeoisie 'ethos', the conundrum of the language question and the spirit of casteism.

The last of these is capable of being attacked vigorously. The entire system comprising the lowest grade of menial and clerical workers is outmoded, anachronistic, feudal, positively disgraceful. Mechanisation is the principal answer for the elimination of this reproach on all government establishments. Casteism should be systematically attacked at all levels from the grass roots upwards. "No perceptive foreigner can help being struck by the ironic contrast between the socialistic opinion voiced by many Indian leaders and the fact they seem to find it quite natural to be surrounded by under-fed servants, sweepers, bearers and low-caste men", is the acid comment of a recent western observer. The ruling elite should practise that which they preach to the toad beneath the administrative harrow.

A cleansing process will not mean much, unless there is a clear evolution of a common bourgeoisie ethos. The intelligentsia has to merge itself with other groups like skilled working classes and the new middle-

classes to form an upper class with 'a unifying ethos of its own'. This means a process of absorption of the greatest political importance, marking the transition from a static agrarian society to a modern urban industrial society.

But indications are that the dichotomy between the elites and the masses will continue to exist in the absence of an all inclusive Indian culture acting as a dissolvent of separatist cultural and social trends. One sees Bengali, Hindi or Tamil, culture emphasized. Linguism accentuates this separatism. The controversy over the language raises the doubt whether there would at all be an Indian culture spreading commonness and a oneness. Religion and culture bind social groups, but they seem hardly germane to the State which in fact is faced with the threat of disruption by them.

What is to be done? It is outside the purpose of this article to provide a blue-print of reform and changes. Let us at any rate be clear on one point. Let us not look for scapegoats. There is no earthly use in blaming the rules and procedures left behind by the British. They are quite irrelevant. You can have any rules and procedures you like. Why blame the men behind the administrative mechanism for being incompetent and corrupt? If so, eliminate them and open up the dazzling prospects to the young, even to the very young. Then there is a demand to overhaul the administrative machinery as though this will be enough to put things right. Here, the ruling party is showing blindness to its own shortcomings. It is smugly content to assume the role of the critic as if it is still engaged in criticising the shortcomings of an alien rule. Its relation with the administration is as tenuous

as its contact with the rural masses. Then it puts a pathetic faith in the idea that pan-Indian services forge national unity. How can a piece of mechanism—that is all a service cadre is—achieve it, when the men in the cadre have no unity of common culture and language?

It is the function of democracy to apply self-introspection, to examine at intervals its own defects and to remedy the deficiencies by objective examination. A commission may be a long-term remedy but it is inevitable. As a first step to get over the disinclination of the idea of a parliamentary commission, Parliament should have a representative standing committee and come to close grips with the realities of the administrative problems in the 1960's and not with past iniquities, omissions and shortcomings and all those horrid memories of a vanishing past.

As a short-term policy, the Planning Commission should have a unit of its own, reinforced if necessary by foreign expertise, to enforce administrative procedures, methods and practice in relation to the wide range of planning activities. In other words, have a Five-Year Plan, at each stage of the successive plans for the re-vamping of the administrative machinery. Then dovetail the short-term plans into long-term national objectives. The changes call for daring adventure in ideas, purposeful thinking on the objectives and the search for a broad-base on which future developments could be anchored. Of one thing it is certain. There are no heroic measures, no easy remedies for India's so-called administrative ills.

(Concluded)

THE BUSINESS WORLD

The Progress of Alkali Industries

It appears from the annual report of the Development Council for Alkali and Allied Industries that the production of calcium carbide, soda ash, caustic soda and chlorine had all increased substantially during 1960 and were expected to increase still further in 1961. This encouraging progress was achieved, it is pointed out, by the commissioning of additional units and substantial expansion of the existing factories. At the end of the Second Plan period, a production level of 1½ lakh tons of soda ash, one lakh tons of caustic soda, 32,000 tons of liquid chlorine and 10,000 tons of calcium carbide has been reached. Though this was less than the target visualised at the beginning of the Second Plan, the Council noted that 1961 level of production was likely to increase to 2 lakh tons of soda ash, 1.25 lakh tons of caustic soda and 20,000 tons of calcium carbide. The shortfall, it was indicated, was essentially due to foreign exchange shortage for obtaining the capital goods for the industry.

The Council outlined the schemes that commenced trial runs during the year 1960-61 and some of which went into regular production in addition. These are given in Table I below:

TABLE I.

1. Soda Ash	Tata Chemicals Ltd.—expansion partly completed.
2. Caustic Soda	(i) Alkali Chemical Corporation of India Ltd.—completed. (ii) Travancore-Cochin Chemicals Ltd.—completed. (iii) Mettur Chemicals & Industrial Corporation Ltd.—not yet completed.
3. Hydrogen peroxide	National Peroxide Ltd.—expansion completed.
4. Calcium Carbide	(i) Industrial Chemicals Ltd.—completed. (ii) Calico Mills (Chemicals Div.)—trial run commenced.
5. Potassium Chlorate	Mettur Chemicals & Industrial Corporation Ltd.—completed.
6. Bleaching Powder (Stable)	Mettur Chemicals & Industrial Corporation Ltd.—completed.
7. Calcium Carbonate (precipitated)	Tribeni Tissues Ltd.—completed.

The following schemes are under construction or machinery have been ordered:

1. Soda Ash	Tata Chemicals Ltd.—balance of expansion.
-------------	---

2. Caustic Soda	(i) Atul Products Ltd. (ii) Andhra Sugars Ltd. (iii) Mettur Chemicals Ltd.—expansion. (iv) Sirpur Paper Mills Ltd.—expansion. (v) Hindustan Heavy Chemicals Ltd.—expansion. (vi) Tata Chemicals Ltd.—expansion. (vii) D.C.M. Chemical Works—balance expansion—machinery ordered. (viii) Calico Mills (Chemical Div.)—expansion—machinery ordered. (ix) Dharangdhara Chemicals Works—expansion—machinery ordered.
3. Caustic Potash	(i) Atul Products Ltd. (ii) Tata Chemicals Ltd.
4. Sodium Sulphide (Iron Free)	(i) Atul Products Ltd. (ii) Travancore-Cochin Chemicals Ltd.
5. Sodium Hydro-sulphite	Indian Electro-Chemical Ltd.
6. Calcium Carbide	Travancore Electro-Chemicals Ltd.—machinery ordered.

Further licensing for expansion was in progress with a view to meeting the target laid down in the Third Plan. The Council, however, expressed its desire that along with licensing of further capacity, active steps had to be taken to issue capital goods licences for the machinery progressively, so that the increase in annual demand would be regularly met by increase in the installed capacity. It was pointed out that installed capacity for soda ash at present was satisfactory to meet internal demand but active steps had to be taken to see that the expansion and new schemes were implemented soon. It was noted that beginning was being made to produce heavy soda ash. Regarding caustic soda, the Council noted that the capacity installed was not yet enough to meet the internal demand. The annual installed capacity on April 1, 1961 was a little below 1.2½ lakh tons against a demand of 1.50 lakh tons. It was added that 61,170 tons annual capacity was expected to be added when schemes under construction were completed by 1962. Thus the demand was likely to be around 1.80 lakh tons as against the probable installed capacity of 1.86 lakh tons. At this rate, it was likely that the present shortages would be wiped out. But naturally licensing authorities had to take special measures to eliminate any possible delays.

The Council further pointed out that enough production capacity for calcium carbide, potassium chlorate

and calcium carbonate had been built up and capacity for new items such as caustic potash, iron-free sodium sulphide were being created for the first time. The Council desired speedy production of sodium hydrosulphite at rated capacity from the factories installed for achieving targets under the Third Plan. It was noted that already development licences have been given for

substantial additions to almost all the commodities as indicated in Table II. It appears from the report that by the end of the Third Plan, this important section of Indian industry would be producing enough for the expanding home market. But enough care has to be taken to eliminate any hurdles in the way of achieving these targets.

TABLE II.

(All data in tons per year)

Sr. No.	Name of the Chemical	II Plan Target	Existing Installed Capacity	Additional Licensed Capacity	III Plan Target	Percentage of Total Capacity Against III Plan Target
1.	Soda Ash	2,53,000	2,68,000	2,08,000	5,30,000	90
2.	Caustic Soda	1,50,400	1,24,500	2,05,800	4,00,000	83
3.	Calcium Carbide	26,200	34,500	24,000	67,000	87
4.	Potassium Chlorate	4,000	4,250	600	9,500	51
5.	Hydro-sulphite and Rangolite	5,000	3,900	10,000	12,000	116
6.	Hydrogen Peroxide (35%)	3,000	3,000	10,300	9,500	140

Business Notes

Gujarat

NEED FOR A MAJOR HEAVY INDUSTRY

WHEN COMPARED with many other States in India, Gujarat may be said to have relatively more organised industries, such as textiles, chemicals, pharmaceuticals, cement, etc. Even so, when the industrial structure of the region as a whole is considered, it will be seen that the development has been lopsided and lacks diversification. Highlighting this fact, Mr. Jayakrishna Hari-vallabhdas, President of the Gujarat Chamber of Commerce (G.C.C.), observed at that body's last annual general meeting at Ahmedabad, a few days ago, that the solution for this anomalous situation would be to have a major industrial plant set up in the State. In his view, this will ensure a proper nucleus for integrated development and generation of a suitable climate. In this connection, he referred to the State-wise distribution of the seven major heavy industrial projects—the Heavy Electric Plant, the Heavy Electrical Equipment Plant, the High Pressure Boiler Plant, the two Precision Instrument Plants, the Machine Tool Plant and the Heavy Plate and Vessel Works—none of which, he said, had been given to Gujarat. This, Mr. Hari-vallabhdas observed, was unfortunate and complained that, in taking a decision on this subject, the legitimate claims of Gujarat had not been given due consideration. He appealed to the Union Government to lose no time in locating a major industrial plant in the State.

Speaking at the same meeting, the Vice-President of the Chamber, Mr. Sarabhai Chhotalal Kashiparekh, observed that, in view of the backwardness of agriculture in the State, it was imperative to have the sanctioned Ukai and Narmada projects implemented speedily so as to bring prosperity to Gujarat. He also made an appeal to the Union Government to establish in the State petro-chemical industries by reason of the successful exploration of oil in Cambay and Ankleshwar. At the same time, he urged the Gujarat University to introduce degree courses in petroleum engineering, as also to establish a Petroleum Research Institute in the State.

The subject that attracted the undivided attention of all those present was the deteriorating coal situation in Gujarat. Mr. Kashiparekh attributed this to the

absence of a realistic and imaginative policy on the part of both the Ministries of Steel, Mines and Fuel, and the Railways. A more realistic policy in respect of coal transportation as much as of coal production, according to him, is the supreme need of the hour.

Plastics

NEEDED MODERNISATION

IT IS gratifying to note that during the short span of fifteen years, the plastics industry has become an established one, well able to achieve the Second Plan target of 11,500 tons. During the Third Plan period, its further expansion involving a total production of 74,000 tons is envisaged. The Plastics Panel of the Development Council has planned to enlarge the production capacity of the industry to 133,000 tons by the end of the current Plan period, which, in its view, would be sufficient to meet the estimated requirements of 125,000 tons. The industry also feels confident of reaching the set target of the Third Plan, but to achieve this, it was made clear that some of the hardships facing this industry needed to be removed. As Mr. Pratap Bhogilal, who presided over the 14th All-India Plastics Manufacturers' Conference (AIPMC), held last week in Bombay, noted, it is not only the availability of raw materials in abundance that can achieve the set targets but also the installed machinery and its efficiency. With its old and worn out machinery, the industry was not able to compete profitably with the other advanced countries. But to renovate and modernise the plants, it is imperative, Mr. Bhogilal observed, to import the necessary machinery which would, in turn, call for lifting of some of the import restrictions.

Earlier the Chairman of the Reception Committee, Mr. Shantilal I. Parekh, expressing a similar view said that, while it was necessary, in the present circumstances, to import the needed machinery, this problem could only be solved permanently by resorting to our own manufacture. It is gratifying to note that India at present has been manufacturing some of the badly needed machines like small capacity injection machines, extruders and compression processes. But this should not veneer the fact that, when compared to some of the advanced countries, we still lag very much behind.

150 YEARS

1811-1961

KRUPP

Charging an LD-converter with pig iron. Krupp built the first oxygen steel plant to be erected in Germany, which produces steel by the low-cost LD top-blowing process.

For 150 years, the name of Krupp has been identified with superb workmanship and enduring quality.

The name of Krupp is also linked with outstanding pioneer work, past and present, in many fields of industrial research, planning and manufacture.

The results achieved have caused the name of Krupp to be permanently associated with progress in engineering throughout the world.

AIR-INDIA

IN ASSOCIATION WITH S.O.A.C. AND QANTAS

It is common knowledge that the Government has been levying an excise duty, since March 1, 1961, of as much as 20 per cent 'ad velorem' which the industry considers to be out of all proportion vis-a-vis its capacity to bear. All the deputations by the Association to the Finance Minister to remedy the situation have borne no fruit. To realise a revenue of Rs. 40 lakhs, as estimated in the Budget, Mr. Parikh reiterated, an excise duty of 5 per cent would have sufficed; the present taxation, however, is estimated by the industry to deprive it of as much as Rs. 150 lakhs. Accordingly, he pleaded for the reduction of the present 20 per cent duty to 5 per cent.

Referring to exports, Mr. Parikh pointed out that with its old and worn out machines, the non-availability of essential raw materials at international prices and the excessive taxation, the export performance of the industry failed to come up to expectations. Although exports in 1960 had improved to Rs. 72.84 lakhs from Rs. 67.45 lakhs in 1959, the figures available for the first half year of this year have been disappointing, the total exports for this period amounting to only Rs. 34.85 lakhs, as against Rs. 35.34 lakhs for the corresponding period of last year. Attributing this squarely to the present export policy of the Government, Mr. Parikh said, "It is hardly necessary for me to state that the present export policy of the Government is deficient in various respects and many export promotion measures are required to push the export trade."

Automobiles

RECENT TRENDS

IN THE light of the recent controversy about the manufacture of small car in the public sector, the report of the Development Council for the Automobile Ancillary Industries and Transport Vehicle Industries for the year 1960-61 could be read with sufficient interest. There are certain important observations about the factor that influences the further expansion of automobile industry—the requirement of foreign exchange—after considering the recommendations of the ad hoc Committee which went into the details of demand and capacity for the production of important and special components for the automobile industry. The ad hoc Committee indicated that "foreign" exchange requirements of any new production programme of automobiles must rank in priority below the requirements of the maintenance of existing production programmes. For new capacity expenditure of foreign exchange should be limited to capital goods for the project and imports of components as a recurring feature should be virtually eliminated." Thus the foreign exchange requirements and the setting up of new units of automobiles have to rank in priority below the needs of maintenance of the existing vehicles. The establishment of small car presupposes a drain on extra foreign exchange which will influence indirectly the programme of development and expansion of the existing units. The Council's endorsement of these views is of significance. It seems the automobile industry established at the moment has the capacity to produce more and it can expand its production capacity with comparatively minor changes.

The ad hoc Committee also recommended that Government should inspect the industry to introduce an adequate system of cost accounting. The Tariff Commission, too, made a similar recommendation. There should be no two opinions on the existence of proper cost accounting system. It has pointed out that the manufacturers have technical tie up with different foreign manufacturers and data were being maintained on the advice of the respective foreign collaborators consistent with their requirements. It was proposed that the Government's cost accountants may have dis-

cussions with manufacturers' cost accountants so that the best manners of cost accounting could be evolved.

Another important point that the ad hoc Committee considered was in respect of price control under different classes of vehicles. It recommended that control on cars, diesel engines supply to the vehicle manufacturers should continue while it recommended decontrol on commercial vehicles. One would agree with the Council that time was not opportune for another period of two years for decontrol, after which sufficient competitive capacity would have developed and volume of production should have increased.

Raw Film

RAW FILM FACTORY IN MADRAS

ON AN area of 250 acres near Ootacamund in Madras State, India's first raw film factory is fast coming up to its final shape. It is expected to be commissioned by the end of 1962 and will produce a large variety of photographic sensitized material, including cinematograph film, roll and sheet film, photographic paper, materials for graphic arts etc. The total investment on the project will be of the order of Rs. 7 crores — Rs. 4 crores in foreign exchange and Rs. 3 crores in Indian currency. The project will meet bulk of the requirements of photographic materials and help in saving annually nearly Rs. 5 crores in foreign exchange by 1965-66.

The factory will also manufacture X-Ray films. Their output will not only meet the entire requirements of the domestic market but will leave some surplus as well for exports. Considering the complex processes of production and the necessity of ensuring high quality of the products, the Government of India has secured technical collaboration from the well-known French firm Messrs. Baughet. The designs for the different sections of the factory have been completed, and while a large part of the equipment will be fabricated in France, certain specialised items will be supplied from the U.S.A., West Germany, Switzerland and Austria. Shipments will be made as each item is completed and tested. It is expected that the first consignment will reach India by March, 1962. Import of the necessary equipment for the factory will be financed under the French Government's Export Credit Scheme. Payments for the equipment are due to start only after the factory has gone to production, and will be spread over five years. The factory will, thus, be able to save the foreign exchange needed to pay for the imported equipment.

A special feature of this project is that from the very outset it will be manned and operated by Indian personnel. A number of scientists and engineers have already been recruited from all parts of India and sent to France to get training in the factories of the Technical Consultants.

Arrangements have been made for production of necessary raw materials within the country. For a number of these materials such as cellulose, triacetate, plasticisers, solvents and photographic gelatine, the Government has already granted manufacturing licences to units in private sector. Some of the materials like silver nitrate, will be manufactured in the film factory itself. It is planned that from the beginning the value of raw materials to be imported will be only a small fraction of the price of the finished product and that by the end of the Plan period practically 99 per cent out of the raw materials will be produced in this country.

The project is being executed by the recently formed Hindustan Photo Film Manufacturing Company Limited.

New Issue

USHA SPINNING AND WEAVING

THE USHA SPINNING AND WEAVING MILLS LTD. will enter the market to raise capital by the issue of equity shares to the extent of Rs. 25 lakhs and preference shares to the extent of Rs. 10 lakhs. Out of the present issue, the promoters, directors and their friends have subscribed for in cash at par 1,27,500 equity shares of Rs. 10 each and the remaining 1,22,500 equity shares are being offered to the public for subscription in cash along with 10,000 9.3 per cent, free of company tax, cumulative redeemable preference shares of Rs. 10 each valued at Rs. 10 lakhs. The subscription list will open on October 30, 1961 and will close on November 6, 1961 or earlier, but not before November 1, 1961.

The estimated total cost of the undertaking will be nearly Rs. 97 lakhs, made up of nearly Rs. 2 lakhs for land, Rs. 11 lakhs for buildings, Rs. 47 lakhs for plant and machinery and the remaining for working capital. This amount is to be raised to the extent of Rs. 35 lakhs by the issue of shares, Rs. 30 lakhs through loans from the Industrial Finance Corporation and Rs. 24 lakhs from banks against securities. The Industrial Finance Corporation has agreed to grant the loan. Major part of the equipment is to be supplied by M/s. Tweedele & Smalley Ltd. and various other important equipment producers of England. Some Indian firms like Machinery Manufacturers Corporation of Calcutta, are also supplying a considerable part of the machinery. The proposed project is economically quite sound and naturally the new issues are bound to receive a ready response in the market.

The Company was incorporated last April to carry on the business of cotton spinners and manufacturers. A cotton spinning mill at Badarpur near Delhi is to be installed with a capacity of 1200 spindles to produce 40 lakh tons of yarn per year. The medium yarn which the company will produce has considerable demand in the adjoining areas of Delhi, Punjab, Rajasthan etc. It will be suitable to feed the vast handloom, powerloom and hosiery industries which are developing rapidly in these areas. The company, it seems, will have the advantage of raw material and its requirement of nearly 4.68 million lbs. of cotton will be available in Punjab.

Assam Sillimanite Ltd.

INCREASED SALES AND PRODUCTION

IT WAS revealed by Mr. S. M. Wahi, the Chairman of the Assam Sillimanite Ltd., at the annual general meeting of the company that in spite of the stresses and strains, Assam Sillimanite was able to achieve increased production during 1960-61. While the production in 1959-60 was 6957.80 tons in 1960-61 it was 7540.01 tons. And the expectations are that in 1962 the company may be able to reach a production of 9,000 tons.

Progress on the sales side has been equally satisfactory and in 1960-61 sales increased to Rs. 25,26,344.09. Presently, orders in hand are for 9,374 tons valued at Rs. 33.75 lakhs. This does not include the 4,368 tons already supplied up to August, 1961.

Emphasis is now being placed on increasing production of sawn blocks and additional capital expenditure has been incurred for developing the facilities for Diamond Saw Plant at Pahrpur in Calcutta to meet the growing demand of sillimanite blocks and shapes for glass and ceramic industries. It has also been decided to double the capacity of the existing plant so that the orders in hand can be completely executed by the end of 1962 or early 1963, and the company may

be in a position to satisfy the growing demand of the industry by accepting fresh orders for sawn blocks, cut to shape and size, from the individual clients. In regard to progress of the refractory plant at Ramgarh, it was stated that the plant has gone into production and is producing sillimanite blocks and shapes, fireclay bricks and shapes. Crucibles and some quantities of thermocouple sheaths have also been successfully experimented. The interesting feature about this plant is that it has been entirely constructed from machinery indigenously procured. It has an installed capacity of 5,500 tons.

Development of mines of fireclays, both plastic and non-plastic is taking a proper shape and with their development it is hoped the refractory plant would be able to have largely its own sources of raw material supplies. Efforts are being directed to develop production of these mines at a rapid pace so that some of the existing plant and other refractory works could get supplies and avail themselves of the company's services.

Shipping

BOMBAY-KONKAN STEAMER SERVICE CLOSURE

IT IS unfortunate that the Bombay-Konkan Steamer Service, operated by the Bombay Steam Navigation Company (BSN), which has subserved the travel needs of the population of this region for more than 100 years is to be closed from December 1, 1961. Disclosing this news as also the impelling reasons for such an action, Mr. Dharmsey M. Khatau, The Scindia Chairman, and Mr. Jahengir P. Patel, the B. S. N. Chairman, told a Press Conference at Bombay last week, that it has become practically impossible to run the service as the loss that has accrued to the company since 1950 has by far wiped off the share capital of Rs. 30 lakhs of the B.N.S. While it is inevitable to raise the fares to keep the service running, the persistent refusal of the Maharashtra State Government to do so has left no other choice but to close it down, Mr. Khatau observed. Further, he said, in spite of the fact that the Rau Committee's recommendations were unsatisfactory and unfavourable to the company, yet the B.S.N. was prepared to continue the service. The Rau Committee, headed by Mr. P. S. Rau, which was appointed in 1959, had gone fully into the working of the company and had recommended:-

1. An 8 per cent increase in fares with immediate effect.
2. The scrapping of the old ships and acquisition of three new ships.
3. An interest free loan by the Central Government yielding an annual concessions of Rs. 1.89 lakhs on an average.
4. An annual subsidy from the Maharashtra Government equivalent to the concession amount.
5. A further increase of 7 per cent in fares after the acquisition of the new ships.

However, the Central Government accepted only the recommendations insofar as it agreed to give the company an interest-free loan of Rs. 1.20 crores to meet the cost of construction of three ships, while the State Government agreed in principle to grant a matching subsidy equivalent to the interest foregone by the Centre on its loan subject to a maximum of Rs. 1.89 lakhs per annum. But, Mr. Khatau stated that the Maharashtra Government was not in favour of any immediate increase in fares.

Besides the loss of more than Rs. 30 lakhs, Mr. Khatau noted that three out of five steamers and two launches have gone out of order. They can be recommissioned

We like to carry the load...

...the responsibility of air conditioning your office. Modesty forbids or we'd tell you all about us. About the buildings we've air conditioned. Like Stanvac in Bombay. And many climate control and refrigeration jobs all over the country. Our morale is as fine as our service. Thanks to the nice things our clients say: "Carrier equipment is so reliable. Voltas service, first-rate. When we install Carrier air conditioning, staff efficiency improves, turnover shows a welcome increase."

As we said: We like to carry the load.
May we carry yours too?

sioned into service after repairs only at a cost of about Rs. 15.50 lakhs. Under these changed circumstances, after the Committee's Report, Mr. Khatau observed, that even the 8 per cent increase in fares was insufficient to cover fully the increased cost of operation, not to speak of yielding a return of 4½ per cent on the subscribed capital as estimated by the Committee. Similarly, the construction cost of the new ships has swelled since that time to Rs. 1.62 crores or Rs. 42 lakhs more than was estimated by the Rau Committee. However, it has to be kept in mind that more than a million passengers who utilize the service round the year would be put to inconvenience for no fault of theirs.

Foreign Trade

TRADE BETWEEN INDIA AND INDONESIA

WITH ONLY a few days left for the Indonesian economic fact-finding mission to arrive in this country, it is time to have a look at the trade between the two countries and to probe further in what fields economic co-operation can be brought about. Ostensibly, the purpose of this mission will be to study the planning structure of India and how she has developed under the two Plans. Indonesia has an eight-year development plan in mind and the feeling is that the experience of India could be of valuable assistance to Indonesia. The economic mission will also be discussing the revision of the trade agreement.

While the favourable balance of trade for India in 1955 was to the tune of Rs. 9.68 crores, it became negative in 1958. In 1959 imports and exports balanced each other and in 1960, there was again a small rise and the favourable trade balance was Rs. 0.35 crores. The fall in exports can be attributed to many causes. The main one appears to be that Indonesia has started importing from countries like China and Russia who are offering deferred payment facilities to that country. It is gathered that the Soviet Union is prepared to supply Indonesia 60 million yards and China about 90 million yards of textile fabrics against payment at a later date. Indonesia is also prepared to buy textile fabrics from India provided she is given deferred payment facilities as have been meted out to her by Russia and China.

During the first 8 months of the current year, India exported to that country about 8.5 million yards of textile fabrics, the items being shirting, bleached long cloth and drills and grey sheetings. India's main exports to Indonesia constitute jute goods, cotton yarn, cotton piecegoods, linseed oil, paper, paper-board and stationery, animal and vegetable oils, fats, greases and derivatives and machinery other than electric. Imports on the other hand consist of palm oil, essential oil, textile yarn, fabrics, make-up articles and related products, mineral fuels, lubricants and related materials.

As exports at the present moment are very essential for the economic development of this country, it is imperative that an all out drive be launched to capture markets abroad. Possibilities ought to be borne in mind for extending deferred payment facilities to a country which is prepared to buy textile fabrics to the extent of about 30 to 50 million yards. For India any amount of foreign exchange earned could be of help in easing her balance of payments difficulties.

EXPORT OF DIESEL ENGINES

WITH INCREASED production of diesel engines in the Third Five-Year Plan, there is every likelihood that its exports may also increase. The production target for diesel engines in the Third Plan is 100,000, against the Second Plan target of 20,500. During the last year

of the Second Plan, production was over 42,000 diesel engines. Keeping in view the progress maintained, it seems that the production targets of the Third Plan could well be achieved. Expectations are that the exports of diesel engines during the Third Plan might be round about 1,000, but that, of course, would depend on the inducements that are provided to the manufacturers to overcome many of their difficulties in the export market.

The firms that are likely to figure in this export plan will be Kirloskar Oil Engines, Rustons and Hornsby and Cooper Engineering Company. A fact, however, to be borne in mind is that the earlier proposal to form an export pool may not materialise because the number of manufacturers who can export and sustain the exports rendering the necessary after-sale service is very few. Some of the foreign collaborators have also not been in favour of such a pool. Then there is the difference of quality of diesel engines manufactured by various firms.

The demand of the manufacturers is that they should be permitted to import more capital goods and there should not be any restrictions on the use of the 30 per cent import entitlement. They like to be left free to utilise it in any manner they think fit. Under the existing scheme of concession, 30 per cent of the foreign exchange earned by way of exports is given to the manufacturers, of which they can import replacement machinery up to 10 per cent only, the rest being used for the import of raw materials.

The heartening feature is that there has been a steady increase in the value of exports of diesel engines. In 1960, diesel engines worth Rs. 30 lakhs were exported. If encouragement is given to the manufacturers, it is just possible that the country might be able to export even more than 1,000 engines during the Third Plan period.

SISTA'S-PAL. 382

FROM THE CAPITAL'S CORRIDORS

CENTRAL ADVISORY COUNCIL OF INDUSTRIES

The Central Advisory Council of Industries is meeting here on October 28. It will consider primarily the problems relating to industrial development of the country and export promotion.

Devising of measures to step up exports has assumed special significance at the present juncture in view of the rapidly deteriorating foreign exchange reserves of the country. In 1960-61 the foreign exchange reserves were drawn down by Rs. 59 crores, apart from the utilization of various loans and grants provided by friendly countries and world financial institutions. The rate of decline in our foreign assets has gone up during the current financial year. In spite of borrowing a sum of Rs. 58 crores from the International Monetary Fund, foreign assets of the Reserve Bank of India on September 29, 1961, stood at Rs. 129.73 crores, which sum is less than the value of imports for two months.

Under the circumstances, it has been found necessary to adopt a cautious policy with regard to allocation of foreign exchange for imports even of some of the essential items. The broad policy that is being followed at present is that imports of capital goods for setting up new units or for effecting substantial improvements in the existing units are approved only against suitable methods of financing such as foreign private investment, loans from foreign governments or world financial institutions to the Government of India, long-term foreign exchange loans secured by private parties from financing institutions abroad etc. Special priority is being accorded to imports of plant and equipment for industries which are of special importance from the point of view of exports. Imports of raw materials, components and spare parts are being primarily financed from export earnings and through some untied credits being supplied by the Aid-India Club members. Part of the imports of components and raw materials, popularly known as maintenance imports, are envisaged to be effected from these loans.

Since this mode of financing the maintenance imports can have only a limited scope, India has to step up her exports if the tempo of industrial activity is to be maintained. The deliberations of the Central Advisory Council of Industries this week-end will, therefore, be watched with interest.

PUBLIC SECTOR ENTERPRISES

According to the statistics now available, ten public sector industrial enterprises recorded further rise in production in 1960-61. Net profits in most cases were also higher as compared with the previous year.

The HMT at Bangalore manufactured 1,002 machines worth Rs. 3.3 crores in 1960-61, as compared with 702 machines valued at Rs. 2.37 crores in the previous year. The Hindustan Cable Factory at Roopnainpur achieved an output of over Rs. 1.6 crores, as against Rs. 1.1 crores. In the case of the National Instruments Factory at Calcutta, the rise in production was from Rs. 53.7 lakhs to Rs. 59.3 lakhs.

The Nahan Foundry turned out over 3,172 tons of equipment valued at Rs. 25 lakhs, as against 3,067 tons of the value of Rs. 22.05 lakhs. The Praga Tools Corporation recorded a rise of Rs. 8 lakhs to Rs. 48.32 lakhs of machine tools' output in 1960-61.

Both the factories under the Hindustan Insecticides improved on their past year's performance and together produced over 2800 tons of DDT. Comparatively, the rise in the case of Hindustan Antibiotic Factory was much higher and amounted to 42.76 million mega units of finished penicillin, as against 33.15 mmu in the previous year.

The National Newsprint and Paper Mills at Nepalnagar, the only one of its kind so far in the country; manufactured 23,029 tons of newsprint in 1960-61, showing a small rise over the previous year.

In the case of Sindri Fertiliser Factory, the rise in production in 1960-61 was of the order of about 15,000 tons of ammonium sulphate, the output in 1960-61 being 3,00,411 metric tons. The Nangal Fertiliser Factory went into production in February, 1961, and from a monthly production of 1,185 tons in that month, production had risen to nearly 19,000 tons by August.

The Heavy Electrical Factory at Bhopal also commenced production during 1960-61.

The net profit in 1960-61, after allowing depreciation, taxation, interest on loans, etc., was also substantially higher in the case of almost all these public sector enterprises. The HMT nearly doubled its net profits to Rs. 74 lakhs. For the first time, a dividend of 10 per cent was also declared during this year. The Hindustan Cable Factory also doubled its profits to Rs. 16 lakhs.

The net profit in 1960-61 in the case of the National Instruments Factory is expected to be about Rs. 8 lakhs, as against Rs. 6.7 lakhs in the previous year. While the figures relating to net profits of the Nahan Foundry are not available, the gross profits in 1960-61 were higher at Rs. 5.23 lakhs than in the previous year (Rs. 4.5 lakhs). The Praga Tools Corporation, however, is estimated to have made a slightly lower net profit, Rs. 3.2 lakhs, as against Rs. 3.5 lakh in 1959-60.

The financial results of Hindustan Insecticides show that the net profits amounting Rs. 17 lakhs were made by the DDT factories in 1960-61. The Penicillin Factory at Pimpri made a net profit of Rs. 79 lakhs, and the Nepa Newsprint Factory Rs. 37.8 lakhs, slightly higher than in the previous year.

The working of the Fertiliser Factory at Sindri, showed a profit of Rs. 1.51 crores for 1959-60; the accounts for 1960-61 have not been finalised so far. In the case of the Nangal Fertiliser Factory and the Heavy Electrical Factory at Bhopal, production being in the early stages, it is not time as yet to compute the profitability of these enterprises.

EXPANSION PROGRAMMES

Nearly all these enterprises have taken up in hand programmes of expansion and diversification of their output. The HMT, for example, has entered into two technical collaboration agreements with M/s. Renaults for production of special purpose machines and M/s. Limex of East Germany for setting up a new machine tool unit at Pinjaur in Punjab. The HMT has also put up a second unit adjacent to the present factory much ahead of schedule. A unique feature of this venture was that this was built entirely from the internal resources of the HMT.

The expansion programme of the Hindustan Cable Factory centres round the manufacture of 2,250 miles of dry core cables annually, plastic insulated telecommunication cables valued at Rs. 48 lakhs per annum and the installation of a wire drawing plant with a capacity of 1500 tons annually. The total expenditure on these expansion projects will be Rs. 3.6 crores. In addition to these expansion schemes, the factory also plans to take up the manufacture of small tube co-axial, paper insulated power cables etc.

The National Instruments Factory at Calcutta proposes to manufacture in collaboration with a Hungarian firm of micro-optic theodolite. It has also entered into arrangements with two Japanese firms for manufacturing clinical thermometers and cameras. Recently, the ophthalmic glass project, to be built with Russian collaboration at Durgapur, has also been transferred to this company from the Heavy Engineering Corporation.

The Nahan Foundry, which is mainly engaged in the manufacture of sugarcane crushers, has now taken up manufacture of integral electric motors up to 10 H.P., centrifugal pumps, etc. In order to meet the demand for metric weights, the factory has completed arrangements for mass production of various denominations of cast iron metric weights. The factory also proposes to take up the manufacture of agricultural implements during the Third Plan period.

The Praga Tools Corporation at Hyderabad has undertaken a big expansion programme for the manufacture of drill chucks, tool and cutter grinders and lathe chucks. The factory also proposes to manufacture Polish type of machine tools of light and medium variety. It is expected that the value of production in the factory, expected to be Rs. 80 lakhs in 1961-62, will be doubled by 1964-65.

The production of DDT is to be doubled at both the units of the Hindustan Insecticides. The Hindustan Antibiotics has undertaken a programme for the production of streptomycin and tetracyclines. The streptomycin project, costing about Rs. 2 crores, is expected to commence production before the end of the current financial year. Trial production in respect of the latter has already started. The Pimpri Factory also proposes to take up another project for the manufacture of 50 tons of vitamin C annually. All these expansion programmes will altogether cost Rs. 3.4 crores, which will be entirely found from out of its own resources.

The Newsprint Factory at Nepanagar proposes to double its output during the Third Plan period. In order to overcome the difficulty in the procurement of chlorine, an essential ingredient, the factory has decided to instal its own plant for this purpose. In the case of Sindri Fertiliser Factory, a scheme to expand production by about 60 per cent at a cost of about Rs. 15 crores has been completed. The Sindri Factory has now developed into an important training centre for engineers and technicians, a factor of considerable importance in the context of our development programme for fertilizer production, during the Third Plan period.

MANUFACTURE OF PHOSPHORUS

A phosphorus manufacturing plant is proposed to be set up at Mangalore in Mysore State. It will have a capacity of 6,000 tons per annum, and will cost, apart from the rupee expenditure, Rs. 1.05 crores in foreign exchange. On a conservative estimate, demand for phosphorus will be of the order of 1,200 tons per year by 1965-66. The net foreign exchange saving, after the plant goes into production, will thus be to the tune of Rs. 42.8 lakhs per annum.

The plant is proposed to be set up in the public sector, within the financial ceiling of Rs. 1,528 crores

fixed for industries and minerals, out of which Rs. 20 crores are likely to be provided for the activities of the National Industrial Development Corporation. While a greater portion of the allocation earmarked for the N.I.D.C. will be devoted to the modernisation of the cotton and jute textiles industries, the Corporation, it is suggested, should spend a part of its allocation on projects considered essential for the country's economy. The proposed phosphorus project is one of these.

The tentative decision to locate the project at Mangalore follows the offer of the Mysore Government to supply power from the Sharavati project at Rs. 125 per kWYr. If adequate power supply is not available from the Sharavati project, alternative sites for locating the plant will be explored. Among these are included the Koyana area, Trombay and Alwaye.

Meanwhile, three private sector companies have applied to the Government of India for grant of permission to set up phosphorus manufacturing plants of varying capacities. One application is from Messrs. Star Chemicals, Bombay, for putting up a plant to manufacture 1,500 tons of yellow phosphorus a year. The second applicant is Bharat Phosphorus Works, Calcutta, who wants to go in for manufacture of yellow phosphorus to the extent of 3,000 tons per annum. The third party which has applied for a license is Konoria General Dealers (Private) Ltd., Calcutta, who desires to set up a plant to manufacture 1,500 tons of yellow phosphorus per year. All these three applications, informed sources suggest, are likely to be rejected in view of the Estimates Committee's opinion expressed recently that the private sector companies put up schemes for production of some essential materials just at the time when a public sector project for the same becomes ripe for consideration.

The phosphorus project has been under active consideration of the Government since the early stages of the Second Plan. Due to complicated nature of the project and the difficulty in obtaining technical collaboration, it could not take a concrete shape until recently when a Technical Team was sent abroad to explore the prospects of setting up this project in the public sector.

The requirements of phosphorus at present are mainly met by imports in the shape of yellow phosphorus, red phosphorus and some phosphorus chemicals. The indigenous production is only small. In 1960, the total demand based on actual imports and indigenous production amounted to an equivalent of 500.5 tons of yellow phosphorus, made up of 214 tons red phosphorus (equivalent to 235.4 tons yellow phosphorus), 431 tons phosphorus pentoxide (equal to 187.5 tons yellow phosphorus) and 250 tons phosphorus trichloride, phosphorus oxychloride and phosphorus pentachloride (77.6 tons yellow phosphorus). The Third Plan estimate of yellow phosphorus consumption is considered to be rather on the lower side, taking into consideration the rapidly increasing habit of smoking and greater use of town gas and LPG gas as domestic fuel. During the ten years to 1960, production of match boxes (of 60 sticks each) went up from 3,100 million to 5,400 million boxes. Another factor that is likely to lead to a spurt in demand for phosphorus and phosphorus compounds is the availability of steel for engineering industries which will raise the demand for phosphates used in bonderizing compounds. Some consumers who use phosphorus compounds derived from wet process phosphoric acid have indicated their preference for similar compounds derived from electro-thermal phosphoric acid because of its greater purity.

MANUFACTURE OF SULPHURIC ACID

To produce sulphuric acid at a cost comparable to international prices, the minimum size of a sulphuric acid manufacturing unit, it is suggested, should be 50

tons per day capacity. Licences for the new units to be installed during the Third Plan period, therefore, may not be for less than this minimum economic size, except under special circumstances.

The requirements of sulphuric acid at the end of the Third Plan period are estimated to be around 1.25 million tons per annum. The present requirements are estimated at 6 lakh tons a year. The following table gives the requirement of sulphuric acid industry-wise.

('000 tons)

Industry	Estimated Sulphuric Acid Requirements in 1960-61	Estimated Requirement of Sulphuric Acid in 1965-66
1. Superphosphate / Amm. Phosphate (in terms of P ₂ O ₅)	180.0	580.0
2. Amm. Sulphate (acid process)	115.0	147.0
3. Pickling of Iron & finished steel	47.0	83.0
4. Rayon Yarn & Staple Fibre	93.0	190.0
5. Aluminium Sulphate	20.0	40.0
6. Petroleum Refining	8.0	20.0
7. Titanium Dioxide	9.0	27.0
8. Bichromates	3.2	6.5
9. Phosphoric Acid	2.0	8.0
10. Alum	2.5	8.5
11. Hydrochloric Acid / Sodium Sulphate	2.0	4.0
12. Nitric Acid	2.1	4.2
13. Magnesium Sulphate	1.7	2.0
14. Copper Sulphate & Ferrous Sulphate	2.0	4.0
15. Miscellaneous (Tanning, Dye-stuffs & Intermediates, Dyeing, Chromic, Acid, Drying of Chlorine, Industrial Explosives	110.0	120.0
TOTAL	597.5	1243.2
Say	600.0	1250.0

In order to achieve a production of 1.25 million tons of sulphuric acid, installed capacity of 1.5 million tons is envisaged to be set up. This will necessitate setting up an additional capacity to the tune of 7.2 lakh tons. The additional capacity is proposed to be achieved by expansion of the existing units by 2.25 lakh tons and setting up of new units with a total capacity of nearly 4.95 lakh tons.

The investment requirements of setting up the additional capacity are envisaged as under:

(Rs. million)

	Total Investment	Machinery Component	Foreign Exchange Component
30 new units (each of 50 tons/day)	54.4	39.6	19.8
Expansions	18.0	13.5	6.8
TOTAL	72.4	53.1	26.6

Current consumption of sulphur is about 2 lakh tons. This is expected to go up to a little more than 5 lakh tons by 1965-66. If the sulphuric acid production target is raised to 1.65 million tons, the requirements of sulphur will amount to 677,500 tons.

HEAVY ELECTRICALS

In its annual review, the Development Council for Heavy Electrical Industries has expressed the view that the difficulties mostly experienced by the heavy electrical industries are in respect of foreign exchange for the import of necessary capital goods, replacement plant and machinery. Shortage of essential raw materials, it says, also continues to handicap these industries. Particularly in short supply is steel, certain sections of which are not freely available. For instance, the supply position of electric sheet steel and high tensile galvanised steel wire continues to be tight despite issuing of licences for their import somewhat freely under the Development Loan Fund Scheme. The high prices of these two materials under the present arrangement of imports, it is feared, will add considerably to the cost of the finished products. The Council has, therefore, recommended that licences for the import of these two items may be granted for import from sources other than those allowed under the Development Loan Fund Scheme.

To relieve the situation in regard to supply of non-ferrous and extruded sections, consequent upon the indigenous capacity not being adequate, the Council has recommended that licences should be granted for import of such of those sections which are not available in the country itself.

For other raw materials, such as ball bearings, insulating materials, small and semi-finished components etc., it has been recommended by the Council that these basic ancillary industries should be developed quickly in order that the electrical industries may become self-sufficient in regard to these and that imports may be substantially reduced. Insofar as ball bearings are concerned, the Council thinks that early efforts should be made to establish more capacity.

The Council reiterates its earlier recommendation that the duty anomaly on the import of aluminium ingots/bars and rods for the manufacture of ACSR conductors and for the manufacture of all-aluminium conductors should be removed early. Also lower rates of duty should be made applicable to the aluminium used in the manufacture of various types of cables and wires under the scheme of 'substitution of aluminium for copper'.

The Council feels that there is not enough tool-making capacity in the country. It therefore recommends:

(a) Adequate supply of tool steel in large quantity should be made available and steps should be taken for proper distribution at reasonable prices;

(b) It is necessary to train a very large number of tool-makers. A special and intensive course in tool-making at Technical High School level is required to be encouraged with adequate facilities and scholarships;

(c) Present tool-making establishments should be encouraged to expand and further steps should be taken to encourage formation of new tool making shops;

(d) Import of equipment required for tool making should be liberalised. Special machine tools, Heat treatment plants, Testing equipment etc. should be licensed freely.

(e) Various training schemes in different countries abroad are formulated for training of Indian engineers. In all such schemes, special arrangements should be made for training engineers in tool-making techniques.

MANUFACTURE OF GLASS WOOL AND GLASS FIBRE

Messrs. Fibreglass Pilkington Limited propose to set up a plant in Bombay for the manufacture of 2,500 tons of insulated wool, 600 tons of glass textiles and 75 tons of staple tissue per annum. The programme is to be spread over three stages. In the first stage, the company will go in for the production of 833 tons of insulated wool and 200 tons of glass textiles. The second stage envisages stepping up of production of these two items to 1,666 tons and 400 tons respectively. The third stage will see the completion of the project.

Technical collaboration is being secured from two foreign companies: (1) Owen-Corning of USA and (2) Fibreglass Limited of UK, which will also be participating in the equity capital of the venture to the extent of 27.5 per cent each. Both the collaborating companies enjoy a world-wide reputation in the field and are in turn tied up with a French firm, S.O.D.E.F.I.V.E., for making use of the latter's centrifugal process of manufacture of glass wool. The foreign exchange component of the project is estimated around Rs. 32 lakhs.

The company has given an assurance to the Government that it would participate in the country's export drive as soon as production is started.

MANUFACTURE OF RADIO COMPONENTS

Messrs. P. A. Bhatt and Company of Bombay propose to set up a new undertaking in Maharashtra State for manufacturing 12 million pieces of crack carbon resistors and 7.2 million pieces of styroflex capacitors used in radio assembling. The foreign exchange requirements of the scheme are placed at Rs. 6 lakhs.

It is proposed to import machinery, equipment and technical know-how from Poland on rupee payment basis. Some raw materials are also envisaged to be imported from Poland in the initial stages. After one year of commencement of production, it is proposed to undertake the manufacture of ceramic bodies required for resistors.

MANUFACTURE OF SALT

After careful review of the existing capacity in the country and requirements of salt for industrial and edible purposes during the Third Plan period, the Government has decided to permit setting up of new units for the manufacture of salt. The target fixed for production of salt during the Second Plan period having been exceeded, the Government had decided in November, 1958, not to issue new licences so as to avoid any difficulties in marketing the surplus output. The latest estimates of demand reveal that an additional production of about 25 lakh tons, mostly of industrial quality, salt would be necessary. The licences for setting up the new units will be issued by the Salt Commissioner on the recommendation of the State Governments.

CEMENT INDUSTRY

The Government of India has set up a nine-member Panel under the Chairmanship of Dr. G. P. Kane, Senior Industrial Adviser in the Ministry of Commerce and Industry, to examine the various matters relating to the cement industry and make suitable recommendations.

The Panel will consider 'inter alia' the availability of limestone and other calcareous minerals suitable for making cement, possible utilisation of alternate raw materials, availability of suitable quantities and quality

of fuels like coal and furnace oil, requirements of spares, balancing equipment and capital machinery for industry, diversification of production to manufacture special cements like slag cement, pozzolan cement, low heat and high early strength cements etc., bulk transport of cement, training programme for the industry and research and development.

Besides Dr. Kane, the members of the Panel are: Mr. K. N. Sinha, of the State Trading Corporation of India; Dr. R. R. Hattiangadi, Technical Director, Associated Cement Companies Limited, Bombay; Mr. V. Ramakrishna, Chairman, Messrs. K.C.P. Limited, Madras; Mr. T. S. Narayanaswami, Director, India Cement Limited, Madras; Mr. N. C. Roy, Director, Messrs. Orissa Cement Limited, Calcutta, Seth V. Podder, Works Director, Messrs. Rohtas Industries Limited, Dalmianagar; Mr. G. R. Tongonkar, Deputy Managing Director, ACC-Vickers-Babcock Limited, Bombay and Dr. S. P. Verma, Development Officer, Ministry of Commerce and Industry, New Delhi.

TRADE PACTS

A number of trade delegations from foreign countries are expected here in the near future to negotiate new trade agreements or trade plans for the current year. One such delegation from Ceylon is already here and is having discussions with the Union Government. A delegation from Indonesia is expected during the current week, so also a trade mission from Poland. Four delegations are scheduled to arrive in November, one from East Germany (November 4), another from Uganda (November 11), the third one from Nigeria (November 15) and the fourth one from Czechoslovakia (November 20). A delegation from Yugoslavia is due on December 4 and another from Rumania on December 15. A trade mission from Bulgaria is expected to arrive on January 4 next year.

An Indian trade mission is due to leave for Burma on October 23 and another for Pakistan on November 26. Trade plan for the current year in regard to imports to Hungary is also scheduled for discussion in the next few weeks. The protocol in this regard will be signed in Budapest.

METALLURGICAL COAL — NEW FIND

Rich deposits of metallurgical coal have been recently discovered by the Indian Bureau of Mines in the vicinity of North Karanpura coalfields, in Bihar. Exposed in a Nala cutting in Chano-Rikha area, the seams occurring are said to be of 10 to 12 feet thickness. They have been proved to extend over a large area in the Chano-Rikha and contiguous areas.

The present estimates of these reserves are placed at 50 million tons of coking coal, but with a high ash content. The ash content, however, is likely to decrease with the depth of the seam.

BRIEFS

Messrs. Devidayal Metal Industries Private Limited have started exporting copper and brass semis in the form of sheets, strips, circles and sheathings on a fairly large scale to most of the South-East Asian countries.

The United States has made a gift to India of 2.5 million lbs. of dried milk for distribution in the flood-affected areas.

The question of including India in the list of countries from where the United States imports sugar is likely to be taken up in June next, when the U.S. Congress would review the country's sugar policy.

BOOK REVIEWS

RIISING EXPECTATIONS

The Rich and the Poor: By Robert Theobald: Published by the New American Library of World Literature, Inc., 501, Madison Avenue, New York 22, New York: Pages 160: Price 50 cents.

The developing countries of the world are currently undergoing a revolution — popularly described as the revolution of rising expectations — which has created a desire among the masses in these countries for more goods and better education. Mr. Theobald has illustrated this rising desire by citing the example of a popular Ghanese song which says — ideal man to marry is one with "car-ful, fridge-ful and been-to" — that is, one who has a car and a refrigerator and has also been abroad.

The Governments in these countries are giving new purchasing power in the hands of the people as a result of the vast developmental expenditure. The objective is to accelerate the pace of economic growth with the simultaneous purpose of keeping price inflation under check — an objective which has not been realised in any marked degree in any one of these countries. It has now become obvious that economic growth 'must' lead to price inflation in the developing countries because people living below the poverty line tend to "consume" new increments in income instead of "saving" them.

It is a mistaken belief that the problems of all the developing countries are similar. In the words of Mr. Robert Theobald, "problems of each country are unique and must be tailored to the real size in each country". Under-developed countries will have to charter new paths which will not be based upon any precedents.

These are some of the basic ideas expounded in this paperback which makes a forceful plea for generous aid by the rich countries to the poor countries so as to provide higher standard of living and a better world — for one and all.

INDIAN INCOME TAX LAWS FOR FOREIGNERS

Indian Tax Laws & Foreigners Having Investment in India or Having Business Connections in or With India: Prepared by the Editorial Board consisting of G. Basu (Chairman), S. K. Ganguli, A. K. Basu and B. Mitra: Published by Oxford Book and Stationery Co., 17 Park Street, Calcutta-16: Pp. 40.

Income-tax laws all the world over are complicated and the Indian Income-tax laws are no exception. The foreigners in particular have in recent years been very much intrigued about the frequent changes which have taken place in our income-tax laws and have always been anxious to know the essential details about the laws which are particularly applicable to them. This small pamphlet of 40 pages only, prepared by able chartered accountants and income-tax law experts under the chairmanship of Mr. G. Basu, who was until recently Chairman of the Institute of Cost Accountants, sets out the essential details for the foreign executives. For intricate details a reference, of course, will have to be made to comprehensive publications but any one who wants to have a rapid look at the income-tax laws as applicable to foreigners will find all his questions answered in this pamphlet. It deals not only with the taxation laws applicable to individuals but also to corporate bodies with copious notes on capital gains tax, company bonus shares, wealth tax and ex-

penditure tax. The authors have taken great pains to explain the incentives provided for foreign investments in India with a passing reference to the tax convention with other countries for avoidance of double taxation. The chief merit of the pamphlet lies in its brevity.

THE SUGAR INDUSTRY

The Indian Sugar Industry (1959-60 Annual): By M. P. Gandhi: Published by M. P. Gandhi & Co., Publishers, Nanabhay Mansion, Sir Phirozeshah Mehta Road, Bombay-1: Price Rs. 6/-.

The Indian sugar industry is very much in the news these days. The surplus in production recorded in the last two seasons has created acute problems. Whereas the Second Plan had set the target of production of refined sugar at 2.25 million tons the actual production is estimated around 3.25 million tons which is almost the target for the Third Five-Year Plan. Recently measures have been taken by the Central Government to reduce the output of sugar and all controls on prices have been removed. In order to understand completely the pressures which have operated in this important industry in the Indian Union since 1931-32, the Annual under review will be found of considerable use. Even though it is called the annual for the year 1959-60, the statistical section has been revised upto July 15, 1961.

The annuals published by Mr. M. P. Gandhi have carved out a unique place for themselves in this country and the present volume will be found of immense use to all those administrators, planners, students, industrialists, retailers, wholesalers, and other distributors, who are associated with this industry in one way or the other or who want to make a thorough study of this industry.

INVESTOR'S GUIDE

C.J.D. Investor's Guide, 1961: Edited and compiled by Waman P. Kabadi: Pp. 1150: Price Rs. 15: Bombay: Chimanlal J. Dalal & Company, 2nd Floor, Agakhan Building, 9, Dalal Street, Bombay 1.

Messrs. Chimanlal J. Dalal & Company, the well-known firm of share-brokers of Bombay, deserve to be complimented on the second edition of their Investor's Guide, which they have just brought out. That their primary purpose in bringing out an enlarged and up-to-date edition of their already popular publication is to serve their clientele in particular and the investing public generally is amply borne out by the fact that, despite the inclusion of particulars of more than 100 companies and the increase in the number of pages by about 400, they have not raised the price even in these years of rising prices. They have certainly enhanced the value of the latest edition by adding a number of new features, such as transfer details, year's working, and activities and objects, among others, of every company. The thoughtful inclusion of the quotations of some important scrips on all the stock exchanges in the country as on certain dates which the income-tax authorities insist upon at the time of assessment is bound to be appreciated by the investors; so also the articles relating to Company Law and Taxation by well-known authorities on the subject. There are other articles, besides, of general interest, on not a few of the outstanding economic issues of the day. All in all,

the C.J.D. Investor's Guide is well worth investing on by all those interested in investing in stocks and shares.

ECONOMIC THEORY

Modern Economic Theory (2nd Edition) Vol. I and Vol. II: By Prof. J. D. Khatri, M.A.: Publishers Kitab Mahal, Allahabad: Pages 612: Price for Vol I — Rs. 10 and for Vol. II — Rs. 7.

It is only once a while that one comes across a really good text book for university students; this book falls in the category of such few books. Volume I deals with theories of consumer's behaviour, production, partial equilibrium and distribution. Volume II covers money, banking, income and employment, inter-regional trade, foreign exchange, and economic activities of the state.

The author has rightly stressed the significance of the laws of returns in the attainment of the objective of maximum production. Eight chapters devoted to the analysis of partial equilibrium cover the important market forms and welfare implications of each of them are brought out. The integrated approach which characterises these chapters as well as chapters on production distinguishes this book from other books available on the subject. It is gratifying to note that a special endeavour has been made to bring home to the

readers some basic economic truths — e.g. that national output, national income and national expenditure are equal, or that capital formation is the key to economic progress, or that knowledge of elasticity of demand is essential for so many economic decisions etc. etc.

Discussion of the problems of money and banking in the early chapters of Volume II lays due stress on the importance of liquidity ratio. Comparison of banking practice in India and England is interesting. The discussion of weapons of credit control is as illuminating as it is comprehensive, but questions of inflation and I.M.F. have been rather summarily disposed of. Keynesian theory of income and employment has been well summarised. The theoretical discussion of inter-regional and international trade is followed by relevant conclusions for policy regarding balance of payments. The chapter on planning, though elementary, is clear and emphasises the special need for planning in under-developed areas.

Though the book purports to deal with economic theory, yet it is highly illuminating from the point of view of practical policy. The author's claim that "the discussion of various doctrines and generalisations is policy-oriented so that the reader will feel throughout that his feet are on the ground and that he is not soaring in ethereal regions" seems to be justified.

COMPANY AFFAIRS

CAPITAL ISSUES

The Asiatic Oxygen, a new company formed recently, has been authorised to raise capital to the extent of Rs. 160 lakhs by the Controller of Capital Issues. Four existing companies have also been given consent by the Controller for the issue of new capital to finance their expansion programmes. The consent in all the five cases is valid for a year.

The Asiatic Oxygen, issue will consist of 12,50,000 equity shares of Rs. 10 each and 35,000 cumulative redeemable preference shares of Rs. 100 each. Of these 9,84,000 equity shares and the preference shares will be issued for cash at par and 2,66,000 equity shares for consideration other than cash to be allotted as fully paid-up to shareholders of the Asiatic Oxygen and Acetylene Co. Ltd. Messrs. Air Products Inc., USA will subscribe to the equity share capital of the company to the extent of Rs. 25 lakhs. The Company has been formed to undertake the manufacture of oxygen, acetylene, electrodes, oxy-acetylene welding and cutting machines, arc welding transformers and generators for which six factories will be established at Bombay, Madras, Rourkela, Durgapur, Patna and Gauhati.

West India Chemicals Private Limited, Bombay has been granted consent to issue capital of Rs. 40 lakhs—after the conversion of the company into a public company—divided into 40,000 equity shares of Rs. 100 each for cash at par. The proceeds of the issue will be utilised for financing the expansion programme for the manufacture of sulphuric acid and superphosphate. The Company's present paid-up capital is Rs. 10 lakhs.

Messrs. Kores (India) Ltd., Bombay has been granted consent to issue bonus shares of Rs. 5,00,000 in ordinary shares of Re. 1 each to be made in the ratio of one bonus share for every equity share held. The company is engaged in the manufacture of duplicating stencils, ink-tablets, stamp pads, inks, duplicating accessories etc. The present paid-up capital of the company is Rs. 5,00,000.

The Sirpur Paper Mills Ltd. has been granted consent to the issue of capital of Rs. 1,09,27,620 divided into 10,92,762 equity shares of Rs. 10 each for cash at par. Of this, shares of the value of Rs. 54,63,810 will be offered to M/s. Mimerley-Clark Corporation of the U.S. The proceeds will be utilised for effecting substantial expansion to the company's existing business of manufacturing different varieties of paper. The present paid-up capital of Rs. 2,89,47,840 consists of 21,85,524 ordinary shares of Rs. 10 each and 70,926 six per cent (tax-free) preference shares of Rs. 100 each.

The Bisra Stone Lime Company Limited, Calcutta has been granted consent to the issue of three lakh equity shares of Rs. 10 each as fully paid-up bonus shares on capitalisation of its reserves to the extent of Rs. 30 lakhs. The company which was established in 1910 is engaged in business in the raising of limestone and dolomite. The company's existing paid-up capital is Rs. 10 lakhs.

PANYAM CEMENTS

There was an improvement in the clinker production of Panyam Cements and Mineral Industries Ltd. during the year to August 31, 1961 which is evident from the figures of two years:

	Year 1960-61 (Metric Tonnes)	Year 1959-60 (Metric Tonnes)
Production of Clinker ..	65,297	60,808
Production of Cement ..	71,385	78,242

The chairman reported that the backlog of clinker available for cement grinding at the beginning of the

year was less than available at the commencement of the previous year which was on account of lower output of cement during the 1960-61. This shortage was due to the coal shortage which resulted in a loss of production for about 30 days in all. The demand for cement, however, continues to be encouraging.

During the year under review there was a net profit of Rs. 11.79 lakhs after meeting the expenses of operation and administration and after providing for depreciation of Rs. 10.20 lakhs. After setting off a loss of Rs. 7.51 lakh brought forward from the previous years, the Directors have recommended payment of arrears of dividend of 6 per cent tax-free cumulative preference shares up to August 31, 1960 which will absorb Rs. 3.73 lakhs.

The company made steady progress with regard to its expansion programme. Orders were placed for the supply of mechanical equipment for a 300 ton per day cement plant which is expected to go into regular commercial production during the second part of 1963. The total capital outlay estimated for the project is about Rs. 120 lakhs which will be financed by the issue of further share capital, long-term borrowings and internal resources. The Company has obtained the consent of Controller of Capital Issues for the further issue of share capital to the tune of Rs. 46.46 lakhs and will be approaching the shareholders in the near future.

MORARJI GOKULDAS

During the year to June 30, 1961, the Morarji Gokuldas Spinning and Weaving Company Limited recorded a profit of Rs. 61.35 lakhs. After making a provision for depreciation to the extent of Rs. 15.91 lakhs, the directors have proposed to transfer Rs. 4.50 lakhs to development rebate, Rs. 5.50 lakhs to general reserve and Rs. 16.50 lakhs to taxation. Dividend at the rate of Rs. 5.85 per cent per 4½ per cent free of income-tax, cumulative preference share will absorb Rs. 1.01 lakhs. Dividend at the rate of Rs. 24 per equity share of Rs. 100 will absorb Rs. 12.42 lakh.

The sales of the company were higher at Rs. 4.98 lakhs against Rs. 3.94 lakhs during the previous year. This improvement is naturally reflected in the profits. Additions to the plant and machinery, too, were made to the extent of Rs. 22 lakhs under the expansion and modernisation programme undertaken by the company. Further orders for the new machinery to the extent of Rs. 27.50 lakhs were placed during the year under review.

ORIENTAL'S YEAR OF PROGRESS

The 1960 accounts of the Oriental Fire and General Insurance Co. Ltd., which have been just published, disclose a remarkable progress. The net premiums rose by as much as 73.7 per cent from Rs. 108.66 lakhs in 1959 to Rs. 188.74 lakhs in 1960 and the funds registered a further accretion of Rs. 39.31 lakhs, rising from Rs. 158.31 lakhs in 1959 to Rs. 198.22 lakhs in 1960. In line with the present trends, claims also have recorded an increase of 3.5 per cent at 51.4 per cent in 1960, against 47.9 per cent in 1959. On the other hand, the net commission cost has been only 6 per cent while the management expenses have dropped by 4.1 per cent being 23.9 per cent of the net premium in 1960, as against 28.0 per cent in 1959.

Departmentwise, the growth has been most marked in the Miscellaneous Department, with a premium increase of 109.7 per cent over the previous year. The increases in the other departments were 34.5 per cent in Fire and 36.50 per cent in Marine. Consequently, the reserve strain has been the severest in the case of Miscellaneous Department at 20.2 per cent, as against 13.2 per cent and 14.9 per cent in the Fire and Marine Departments, respectively. The dividend has been

Company Meeting

ASSAM SILLIMANITE LTD. GROWING INTERNAL DEMAND: STEPS TO DIVERSIFY ACTIVITY

Mr. S. M. Wahi's Statement

The Tenth Annual General Meeting of Assam Sillimanite Ltd., was held on October 14, 1961, at the Registered Office at Gauhati, Assam. Mr. S. M. Wahi, the Chairman, in the course of his statement said:

Gentlemen,

This year has been a period of great stress and strain—stress, because, while our production, even though increased from the previous years, was not found to be enough to meet the growing demand for sillimanite the world over as also the increased requirement from within the country; and strain, since our valued clients in Europe—most of the large refractory works—got a shock to find the Government of India's policy announced early in 1961 restricting exports to one third of the best year's export. These works had switched over their production to sillimanite products on account of the good quality as well as continuity of supplies being maintained by your Company during the last couple of years. Thanks to the efforts of your Managing Agents, export market for sillimanite had been well established in Europe, Japan and several other countries.

With certain adjustments we had to make for meeting the immediate but reasonable needs of the indigenous industries, the Government of India was good enough to approve of the export of the quantities, for which we had entered into a firm commitment for export during 1961. So, while some of our customers abroad had some difficulties in receiving supplies expected by them, the position of meeting their orders for 1961 has been resolved. To frame the programme for 1962, the Ministry of Commerce and Industry, Government of India, has issued circulars to all indigenous refractory works to submit to us their requirements for 1962. We had also asked our overseas buyers to place their firm requirements in our hands at an early date so that we may be able to finalise arrangements for 1962. As in 1961, we expect some sort of satisfactory formula for export would be worked out on the basis of firm commitments after keeping a reasonable quantity for indigenous industries. It would be a pity to lose the world market and the foreign exchange so earned out of the export of sillimanite. To restrict indiscriminate buying we had to ask for one third advance with orders, so that our old and genuine buyers continue to get their genuine needs met.

ISING PRODUCTION

The gradual increase in production as anticipated is working out despite heavy odds under which the mine has to be operated. Larger sums of money had to be expended in the maintenance and improvement of the Company's 22 miles of hill section road. New approach roads and bridges had to be made to reach new deposits. The transport and excavation machinery has had rough beating, resulting in heavy depreciation.

The production, however, was 7,540.01 tons in 1960-61 as against 6,957.80 tons in 1959-60. In 1962 we expect to reach a production of 9,000 tons. The sales had also increased to Rs. 25,26,344.09 in the year under review. Presently orders in hand are for 9,374 tons

valued at Rs. 33.75 lakhs. This does not include the 4,366 tons already supplied up to August 1961.

Emphasis has been laid on increasing production of sawn blocks and additional capital expenditure was incurred for developing the facilities for Diamond Saw Plant at Paharpur in Calcutta to meet the growing demand of sillimanite blocks and shapes for the glass and ceramic industries. While quite a number of backlog orders have been completed during the year, we have received fresh orders valuing Rs. 7.04 lakhs which, with the present installed capacity could only be completed by 1964. It has, therefore, been decided to double capacity of the existing plant so that the orders in hand could be completely executed by the end of 1962 or early 1963 and we may be in a position to satisfy the growing demand of the industry by accepting fresh orders for sawn blocks, but to size and shape, from the individual clients. It is expected that the import licence, which has been recommended by the Industry Ministry for this additional plant, would be in our hands and additional capacity set up early in 1962.

RAMGARH PLANT

I am glad to report that the progress of work on the initial Refractory Plant at Ramgarh has been quite satisfactory. The Plant has gone into production and is producing sillimanite blocks and shapes, fireclay bricks and shapes, crucibles and some quantities of thermocouple sheaths have also been successfully experimented. The present Plant has been erected entirely from machinery indigenously procured and has an installed capacity of 5,500 tons. We have in hand firm inquiries awaiting confirmation by us for 3,076 tons valuing Rs. 22.00 lakhs. It is proposed to concentrate on the production of sillimanite shapes and tank blocks to meet the requirement of our existing customers, by adding a couple more of machines. In the meantime the legal and other technical obstacles to International Finance Corporation's investment of Rs. 65.00 lakhs in the Company for the import of the 46,000 tons main plant have been resolved. According to the Companies Act, certain resolutions have to be passed by the shareholders to implement the Investment Agreement. There are being placed before you at the Extraordinary General Meeting for approval.

Last year I had mentioned to you about the development of the mines of fireclays, both plastic and non-plastic, near Ramgarh. For the manufacture of refractories, both plastic and non-plastic fireclays, kyanite, chrome and magnesite are essential raw materials. Excellent deposits of fireclays have been located near about our Ramgarh Refractory Plant. Lease and other formalities for some of these deposits have been completed with the Government of Bihar, while for certain others the formalities are still to be completed. Operations on one of these plastic fireclay deposits have commenced. A prospecting licence and

the relative lease agreement have also been signed with the Bihar Government for some kyanite deposits in Chybassa District. Work on these mines would be started soon after the rains are over. With the mines of some of these raw materials gradually developed, the refractory plant would have largely its own sources of raw material supplies. It is intended to develop sufficient production of these mines so that some of the existing plants and other refractory works could also get supplies and avail themselves of our services.

CONTINUOUS EXPANSION

It may be of interest to the shareholders to know that it has been your Company's general policy to continually expand and invest in developing the properties and assets of the Company. This continuous process during the past few years has taken away some of your liquid resources, which otherwise could have built general reserves. This has resulted in greatly increasing the value of your property and assets. Furthermore, this diversification of the activity to cover the refractory field, from out of the existing resources of the Company, has opened the vast potential for your mining Company to serve the refractory needs of the country and obtain its fair share of business.

Once again, this year, I would like to thank our workers for the devotion to duty and service rendered especially at the mines in Assam, where working conditions have been extremely difficult and, during the rains, even hazardous. Major MacLeod has kept up the team spirit of the personnel and maintained good relations with the people of the area, which is an important aspect of any business operation in the present day. The Company has also to recognize the endeavours of Mr. N. C. Whiter, Project Manager, who along with Mr. K. G. R. Nayar, our Refractory Engineer, have been responsible for erecting and putting the present Ramgarh Plant in operation. A good team of technicians and workers at Ramgarh is being built up and trained and their experience would greatly assist in the successful and economical operation of the main plant. This promises an excellent future for the Company in its service to the refractory industry in India, which is the basis of the industrial and the relative economic development of a country.

Note: The above statement is not a report of the proceedings of the Annual General Meeting referred to.

Rebuilding this
ancient land
of ours

RAZA BULAND SUGAR CO. LTD. Rampur (U.P.)

Where we make the finest quality white crystal sugar made anywhere in India.

ORISSA CEMENT LTD. Rajgangpur (Orissa)

Where the most up-to-date equipment and the latest production methods make possible a large output of highgrade refractories, to meet the needs of all types of furnaces in the Steel, Cement, Glass and large number of other industries.

DALMIA CEMENT (BHARAT) LTD. Dalmiapuram (Madras State)

Where we are busy steadily producing increasing quantities of cement, one of the essential industrial products for all development projects, for helping build the brighter tomorrow of our dreams.

DALMIA ENTERPRISES IN THE NATION'S SERVICE

COSY COMFORT !

LINOLEUM for better living!
THE VERSATILE FLOORCOVERING

14 Radhabazar Lane, Calcutta-1 INDIA LINOLEUMS LTD.

27 factories

Twentyseven Factories in twentyseven Countries. Twentyseven Productive enterprises in which experience is gained. Twentyseven observation posts that watch each technical advance, investigate, develop and apply the same.

The fruit of all this immense amount of knowledge and experience is contained in just a small piece of carbon paper, in just one inked ribbon, and in that sheet of Stencil Paper, all products of the House of Kores.

If you buy equipment that is going to cost you a great deal of money, then the knowledge that you are buying from a firm with a world-wide reputation gives you that very comfortable feeling of safety. For just the same reason, it is preferable to choose 'KORES' when you need Carbon Paper, Ribbons and Stencils.

In this way, you will preserve and add to the distinction of your organization by sending out letters that are clear and legible and which leave behind them as a fitting memorial copies which are clean and clear.

On behalf of twentysix Kores Companies.

KORES (INDIA) LTD.

THE EASTERN ECONOMIST

NOVEMBER 3, 1961.

After the Megaton Mania

IS the world, in the classic manner of Greek Tragedy, moving relentlessly to its doom? Can it be that the gods, having decided on destruction, are making mad those whom they wish to destroy? No reason—or, indeed, military expediency without reason—can justify the wholesale orgy of nuclear explosions to which the USSR has committed itself in the last two weeks. It has made light—as though there were humour in the point—that the last scheduled 50-megaton test has turned out to be substantially larger. If this were in the region of 70-megatons, it is impossible to be sure that the fallout is within the limits of safety so far as radioactivity is concerned. It is to be remembered that the last has followed other explosions and is bound, in the natural course of events, to be followed by United States explosions in rapid succession, perhaps smaller individually, but cumulatively as large in radioactive fallout. Thus on both sides, risks being run are as great as at any time in the world's history—the greater, because their power of joint destruction is now to some extent unknown, and the consequences global in every way. Perhaps this is not the time for politicians, but for philosophers. It is difficult to be anything but cynical about *homo sapiens*, preparing for a war to end wars, by the process of self-destruction.

While one can be critical of all those who explode bombs, surely special responsibility must lie on the USSR that has initiated this series. Delhi has been much taken aback by the criticism in the United States of our seemingly neutral resolution on the banning of all nuclear explosions. But Mr. V. K. Krishna Menon, who initiated the Indian resolution, seems totally to have missed the point that, once the Russian explosions were taking place, the placing of limitations on the Free World is placing military advantage in the hands of the Communist Bloc. It is impossible to be neutral in a situation in which one side determines to press its military advantage. We may hate military containment and all it implies, but, both psychologically and militarily, military containment is the only answer to aggression.

The world will never be made safe by pious platitudes. In the light of the supreme display of military might of the Soviet Union—which may or may not be simple blackmail—the Free World needs to stand prepared. Preparedness is not necessarily aggressive; indeed, it might be the only means of being potent in defence. For these reasons *The Eastern Economist* considers that the Indian resolution, whatever its original justification, cannot be considered practical politics. It would be wise for comment to wait until the Prime Minister, who is leaving today for London and Washington, has completed fuller consultations with the authorities there. It is not to be expected that India will depart very radically from her present position, but it is becoming increasingly clear that what was sound a month ago has been now rendered by the Russians hollow. In the event, our current position will now be considered universally an attempt to grant military advantage to the Communist Bloc. This impression must not be allowed to be created at any price.

In the current terrible crisis it may be that India has a special place to fill. It is the more necessary that we should not, until the time comes for the exercise of our influence, jeopardise it by foolish pronouncements designed to favour one of the parties with whom we will need to negotiate. In the meanwhile, one thing is quite sure that the display of military might, like gun-boat diplomacy of old, does not produce fear but anger. Nothing has done so much to destroy confidence in the peaceful intentions of the Soviet Union in India than the savage display of her power. The Soviet Union will have few friends in India if she does not retrace her steps. The Prime Minister failed at the Kremlin last month. That is no reason for India to give up her constant urge that the Soviet Union should recognize how deeply it has angered world opinion and all that is involved therein. If the die is cast there may be only a short time between now and a fatal disaster for mankind. It is something that India can still play a part in moderation and in possible success in postponing the day of doom.

Reallocation for Industrial Growth

IT was not in the least in a spirit of carping criticism but in an earnest desire to focus attention on the reality of genuine handicaps to industry that spokesman after spokesman at the last week's meeting of the Central Advisory Council of Industries felt constrained to point to the danger spots that hold up the progress of the industrial programmes and threaten to do so during the Plan period. There was no intention whatsoever to enumerate a catalogue of grievances or harp upon any discrimination in treatment as meted out to the public sector and the private sector. Rather the reverse. Sir Ramaswamy Mudaliar came forward with the vigorous exposition that the controversy between the two sectors was now a dead issue. He gave a new and deeper interpretation to the complementary nature of the two sectors when he reminded the Council to take a proper note of the catalytic effect of the growth of the public sector on its private counterpart.

The central purpose of the constructive tone of the criticism was to drive home the basic point that there had been a maldistribution of financial resources resulting from a misdirection of priorities. Another important point was also stressed in this context—the undue acceleration of the pace of development in certain industries, exerting a severe strain on the limited resources, of which impatience to set up additional capacity, when the present installed capacity cannot be fully used for lack of imports, is a telling example. Though the point was not reiterated at the meeting, it is obvious that redistribution of funds would be made easier if this glaring mistake was first rectified. Power, transport, coal and foreign exchange held the spotlight during the Council's deliberations. It would be a serious error to dismiss the criticism as a stock criticism. These resources are so fundamental to industrial development that, unless their allocation is reviewed

and changed from time to time, progress in several sectors will be halted.

Constant power shortages leading to intermittent stoppages of the existing plants have become such an alarming feature that serious thought must be given now to the magnitude of the expansion in capacity and the volume of power that will be needed to keep it in production. There was a frank admission on behalf of the Planning Commission that the prospect of additional power generation does not obviate a tight supply position. Such a cold statement can neither bring any consolation nor stimulate any energetic search for revising the power target. Some relief to industry is certainly possible if a little determination is displayed to adopt a pragmatic attitude. Nothing will be lost if permission is granted on a liberal scale to private undertakings to install their own generating capacity. Readiness to pour investment in this vital direction will be induced if the statutory ceiling on the rate of reasonable return is raised upwards of the existing 6 per cent.

The handicaps of coal and transport are intermingled and it is a recurring experience that even when coal raisings keep to the schedule, stocks cannot be moved to the consuming industrial centres for sheer shortage of wagon capacity. There was once again the sorry spectacle of the rail transport top executives taking the dogmatic position that they had maximised their performance under the present conditions of available resources, it could not be improved upon and, whatever the inconveniences and risks, industry must reconcile itself to the inevitability of ordering coal during the slack season and creating stock-piles in the dumps. What was worse, the

Planning Commission and the Railway Board were ranged against each other in this controversy. While the Chairman of the Railway Board stuck to his position of no feasibility of improvement, Mr. T. N. Singh went on contending that the Planning Commission had urged upon the Board to step up the annual outlay under the Plan by any thing up to 40 per cent. Mr. Singh apparently overlooked the time-lag necessary for such a step-up and his predicament was that he held both the portfolios of industry and transport in the Planning Commission.

The handicap of coal does not stop with the quantitative aspect. It has a qualitative aspect too. The spokesman of the Department of Steel pleaded guilty to the charge of the public sector steel plants producing sub-standard steel (and undermining the competitive efficiency of the engineering goods industry), but blamed it on inadequate supplies of metallurgical coal. Railway locomotives are big consumers of this high grade coal and the balance of advantage dictates a greater shift to diesel locos.

The reallocation of finances is indicated mainly in the foreign exchange component, but it cannot be shirked for this reason. There is the inevitable need for a periodical reshuffle in priorities at the cost of some projects. But a few of them can be saved this fate. Sir Ramaswamy Mudaliar's exposure of some State Governments frittering away foreign exchange on non-Plan projects points to an important loophole which must be plugged. For a positive approach to a better and more fruitful utilisation of foreign exchange, the report of the Committee which he is so ably piloting must be awaited.

Accord in Kerala?

OVER a decade of ministerial instability and the maximum record of the imposition of the Governor's rule do not appear to have brought home with sufficient force either to the Congress Party or to the Praja Socialist Party the painful truth that Kerala constitutes the Achilles heel of the Indian Union. This is the one State which has betrayed vulnerability to Communist dominance and the solitary instance where the Communist Party captured office and maintained power, albeit with the solid support of a tiny but reliable group of independents. To dislodge it from that position required an abnormal effort based on a combination of circumstances and it is open to question whether this result could have been achieved by means of a puristic constitutional warfare. The moral of the developments, which enabled the Congress and the PSP to set up the coalition, has not been fully assimilated by them even after about eighteen months of partnership in office. That and no other is the inference that may be reasonably drawn from the wrangles which recently assumed a dimension sufficient to threaten a sharp cleavage in the coalition likely to precipitate its break.

The election-eve logic which justifies subordinating all other considerations to the fight for victory has no application to Kerala on the present occasion. The mid-term election to the State legislature has put off the next general election to early 1965. Kerala's interest centres round the election to the Lok Sabha alone and obviously its results can produce no repercussions on the coalition. It is surprising, therefore, that a minor agreement over the allocation of candidatures from the eighteen Lok Sabha constituencies was allowed to assume the proportion of a crisis in the

coalition. Whether the PSP was allocated six constituencies as it demanded or three as the Congress was ready to offer would have actually made little difference to the prospective position of either party in Parliament. But partly inflexibility of attitudes and partly considerations of prestige were responsible for overstraining the relations between the partners in the coalition on this trivial question.

It would have been absurd to sacrifice the partnership and worsen the matters by a bitter parting. But when the organisational and legislative wings of the Congress Party buried their internal differences, it produced a wholesome effect on the PSP leadership, making it responsive to accommodation. And a word of advice from Mr. Nehru to the State Congress Party to preserve the electoral alliance with the PSP had the desired effect. The compromise was negotiated with the allocation of four seats to the PSP and fourteen to the Congress. Another hitch was the PSP's electoral alliance with the Muslim League and the High Command's stern directive to the State Congress Party not to have any truck with it. But the four constituencies allocated to the PSP are outside the sphere of the Muslim League's influence. Their alliance is in effect put in cold storage.

Can it be assumed that the coalition will have a smooth sailing as was made out by the leaders of the legislative wings of the two parties after the compromise on sharing cabinet authority was reached on October 14? It is plain that divergence over this issue was at the bottom of the widening rift between the coalition partners. The position stated in simple terms was that the

choice of Mr. Thanu Pillai as Chief Minister was determined largely by virtue of his personal status in the political life of the State. But the PSP got a weightage in the cabinet out of proportion to its strength in the legislature, while the Congress, although numerically strong, was awarded a subordinate position. To add to that, Mr. Thanu Pillai assumed extensive powers as Chief Minister that automatically go with this office in a single-party cabinet, but not in a coalition. He did not show the consideration that was due to the Deputy Chief Minister, Mr. Sankar, as the spokesman of the Congress Party and normally

even policy decisions were taken without his or the cabinet's consultation. This, of course, was to impose an intolerable position. Mr. Thanu Pillai has been persuaded to see the error in his methods.

The cabinet business rules are now being amended as a result of the successful mediation of the Governor, Mr. Giri. The proposals are to be finally discussed and adopted at a cabinet meeting this week-end. Will the accord, reached after stresses and strains, be sustained and the uncertainty hanging over the cabinet dispelled? The stake is too big to allow the accord to slip.

Guest Editorial

A World Surplus of Steel?

By WILLIAM REES-MOGG

THE steel industry has always been subject to the effects of the trade cycle and is even more vulnerable to the effects of post-war depressions. It took the British iron industry a generation to recover from the ending of the Napoleonic War, and it never recovered between 1918 and 1939 from the surplus capacity which had been created to fight the First World War.

After the Second War things were different. For the first ten years after the war there was a world-wide shortage of steel, and all the estimates of demand proved to be too low. Since 1955 there has been a surplus of steel capacity, but except for brief periods it has been concentrated in the United States. In 1960, for instance, there were periods when the American steel industry was working below 50 per cent of capacity, while the rest of the world's steel industry was operating at 90 per cent of capacity or better. This did in fact represent a very large surplus of world capacity since the United States has much the largest steel industry in the world.

The present situation is that most countries are operating their steel plants well below capacity. The latest figure in Britain is 77 per cent, while the American steel industry is so depressed that it has given up publishing figures expressed in terms of its hypothetical capacity to produce. Actual output in the first three quarters of the current year in the United States totalled 76.7 million tons, which is 9 per cent down on the depressed levels of the previous year.

As a result steel shares have become a depressed investment in all the world's stock markets. The main German steel shares yield over 5 per cent compared with the yields of 0.8 per cent on Daimler and 1.5 per cent on Volkswagen. Bethlehem Steel, bought in London, yields 5.9 per cent, while United Steel, the leader of the London market, yields over 6 per cent.

This suggests that stock markets are taking a somewhat gloomier view than would be justified by a cyclical depression alone. Certainly, however, there is a cyclical depression in the British steel industry. Customers of the industry are running down their stocks in order to reduce the burden of high interest rates. The motor car and consumer durable industries are passing through their own period of recession, partly caused by restrictions on credit and partly by over-optimistic views of the prospects of expansion. This recession will certainly not last for ever.

On the other hand, the steady development of surplus capacity in the world as a whole suggests that the situation may well be more serious than it appears. If steel, like copper coil, or alumi-

nium, is a commodity which has changed fundamentally from a scarcity position to a surplus position, then this is a change which could take years to right itself.

The parallel with oil is disturbingly close. Both have become symbols of political prestige as well as ordinary articles of commerce. In simple economic terms it would almost certainly pay a developing country better to buy its refined oil products and its steel from abroad. In a buyer's market both can be bought cheaply, and the early stages of an oil refining or steel industry must involve a heavy burden of extra cost.

However, both oil and steel have become symbols of economic power and almost even of national independence. As a result, steel industries have been developed in countries where there was only the slenderest economic justification, and they have probably been overemphasised for political reasons even in countries like India where a long-term justification does exist. The international competition to build steel-mills in India did not necessarily represent the most sensible use of such large development funds.

This process inevitably tends to add to the surplus capacity in the world. It has created a number of protected relatively high-cost steel industries, and has reduced the size of the free world export market.

Another trend which affects the demand for steel is the reduced importance of steel in the highly industrialised countries which have the most rapid rates of economic growth. The more complex a piece of machinery is the lower the proportion of the steel cost will be to the value of the end product. In the earliest stages of industrialisation iron and steel are used in vast lumps — for heavy girders, for bridges, for heavy machinery, for railway tracks and so on. In the latest stages of industrialisation steel is used in tiny quantities of special alloys, machined to very fine tolerances. For the steel industry the Forth Bridge is worth a very large number of sputniks. This development away from heavy steel does not deprive the steel industry of opportunities — special alloys will become more important, but it could result in a different type of industry, smaller in tonnages, but larger in terms of value of its output.

In Britain there is also still the possibility that the Labour Party will try to re-nationalise the steel industry at the next election, though nobody yet seems sure what precisely the policy on steel will be. But whether nationalised or not, the steel industry probably faces a serious problem of readaptation.

A DELHI DIARY

THE PERILS OF BOMBOSITY

BOMBS, more bombs and still more bombs. Our heads keep reeling with a surfeit of bombosity. I cannot quite understand why we should have been visited with this terrible anachronism, in a seemingly meaningless form, all in one week. At the present time, while our newspapers carry a great deal of general information, my friends and I are almost exclusively concerned with—bombosity. Is preparedness, or to use Mr. Khrushchev's phrase, "the warning to the adventurers of the West", likely to imply a tournament, in which weapons will not be lances and shields as of old, but missiles carrying atomic spearheads, getting larger and larger everyday? If this is the prospect, there are many people—of whom I feel I should count myself one—who would say that we were much happier twenty years ago, whatever the miseries which surrounded us at that time. It is a melancholy thought that progress is now to be measured in terms so ridiculous that one feels that the greatest progress of all is the capacity to wipe out all progress that man has achieved. We are all, in some measure, ridiculous, but today one cannot help feeling that the leaders of the Soviet Union who have brought about the present result are more ridiculous than the scientists who invented fission or fusion or whatever is responsible for bombosity.

THE NEW BRINKMANSHIP

The old brinkmanship belonged to John Foster Dulles and was appropriately notorious, particularly because it looked as though it was one man's individual whim. The new brinkmanship which belongs to Mr. Khrushchev is, at least measured in megatons, some millions of times worse. The question arises whether it is as much personal as the Dulles variety. Can it be that the Prime Minister of the USSR is taking on this Mephistophelean role because pressures inside the Soviet Union are driving him to extreme measures? Can it be that there is, in fact, a crisis in the Kremlin, the solution of which is sought to be a demonstration of determination to go on with a change of the status of Berlin, whatever happens? Can it be that the same pressures have induced Mr. Khrushchev to distract attention at home by the unkindly removal of the mortal remains of Stalin to some unknown quarter near the Kremlin walls? All in all, the 22nd Session of the Congress, with both brinkmanship and backmanship, has not added to the prestige of the Soviet Union in India, nor to the reputation of Mr. Khrushchev as a man of moderation and good sense. Why, I keep on asking, was all this necessary? Incidentally, the movement against Stalin is the more inexplicable as China resents the demotion of a legendary hero. There at least legends will live for ever; but who would have thought they would fight a battle for them as Chou En-lai did?

THE COMMONWEALTH PRESS UNION

While these earth-moving—both literally and metaphorically—events have taken place, I must confess that I have been absorbed in engagements far more enter-

taining and, indeed, satisfying. The meetings of the Commonwealth Press Union in Karachi and Delhi are, unfortunately, not open to the public, though they are open to the Press which, in Pakistan, in particular, has accorded to them a place which, vain as we are, we feel we do not deserve. I am not in a position to talk about all the arrangements made in North Pakistan, during the grand tour of the north as well as in Karachi, but a Gallup (?) Poll conducted by me in Karachi amongst the delegates to the Conference has pronounced them perfect in every way. Or, perhaps, I should have avoided the word 'perfect' in dealing with degrees. Did not Hillare Belloc (when recommending degrees for women in the University of Oxford), say, "where all are perfect, there is no question of degree"?

However, to return to the Commonwealth Press Union's meetings, held every five years, the general consensus of opinion is that neither India nor Pakistan has ever had so full a galaxy of Press Stars as it has on this occasion. All the great newspapers of the United Kingdom—"The Times", "The Daily Telegraph", "The Manchester Guardian", "The Daily Mail" and, last but not the least, "The Daily Mirror"—are represented by high dignitaries. A very large number of the leading Australian, New Zealand and Canadian papers are also represented. Some one said that if the chartered plane from Karachi to Delhi fell out of the sky it would cause some terrific headlines. So it would! The impression one got was that India and Pakistan have aroused so great an interest in the highest circles of the Press in these countries that they were ready to enjoin on themselves a hard course of instruction by prolonged tours in both areas and by a round of entertainment at Karachi and Delhi, which, surely, has not recognised that the weekly intake of men and women can only be increased to these dimensions if two days of fast and abstinence can be rigorously enforced. This was one omission in both Karachi and Delhi; no day has passed without round of excessive entertainment. Perhaps this has to be; is it not true that there is no rose but has a thorn?

Of special interest at the Delhi session was the discussion on the economics of newspapers in which two giants of the Press, Mr. Roy Thomson, on the one hand and Lord Burnham of the "The Daily Telegraph", crossed metaphorical swords. Mr. Thomson, who now has control of a hundred newspapers, would put business considerations first and accept concentration because he believes that they are conditions of survival. Lord Burnham, while recognising the pressures of economic costs, disagrees that concentration is good and much is lost by the absence of small newspapers or by concentration under one single person. Lord Burnham said (amidst applause!) that no man should have the authority to sack one hundred Editors. Mr. Roy Thomson who made concentration look so amiable was a great danger in that he held a dagger below his very ample toga and the power to stab behind his genial smile. There was an answering chord in all our hearts.

ARGUS.

THE WEEK'S NOTES

Nagaland

THE DE FACTO SET-UP

SINCE THE last meeting of the Interim Body for Nagaland was addressed by General Shreenagesh, Governor of Assam, much water has flowed under the bridge. In fact, at the time of the meeting itself, Mr. P. Shilu Ao and his colleagues gave open vent to their grievance that the position in which all the effective authority was exercised by the Adviser and they enjoyed the plausible status of members either of the Interim Body or the Executive Council, created great embarrassment for them and prevented eliciting full respect for their authority from the people. Even at that time they made a decision that a representation should be made to the Prime Minister for a discussion of this issue and for asking for potential authority to be placed in their hands in progressive stages during the transitional period. Such a course would be greatly conducive to weaning away the minority that still persisted in lending support to Dr. Phizo and the rebels.

The delegation of the Naga leaders led by Mr. Ao recently came to Delhi to conduct these talks with the Prime Minister. On Monday this week came the report that a very sympathetic view of the grievances of the Naga leaders had been taken by the Prime Minister and the decision was made that the Interim Body of Nagaland should function as the 'de facto' legislature and the Executive Council should function as the 'de facto' cabinet of Nagaland during the transition until the elections would be held after three years as contemplated. This arrangement goes the farthest limit of accommodation during the transition and it is clear that the Naga leaders have returned satisfied.

Mr. Ao has expressed the optimism that the disrupting activities of the separatist group would disappear very soon. It would be an error to suppose that wherever any support is available to them it is voluntary, because from the very nature of the terrain it is quite obvious that much of it has been obtained by intimidation. The village, the range area and the tribal councils must now be enabled to function effectively so that the people may feel the glow of autonomy. Nevertheless, responsibility for the maintenance of law and order would remain very heavy and the assistance of the army, if necessary, would always be ready at hand. But now that the 'de facto' set-up is to be launched, the primary responsibility for accepting all the functions would devolve upon Mr. Ao and his colleagues.

School Text-books

THE NATIONALISATION CURE-ALL

IT IS somewhat amazing that minds which have a reputation for receptiveness tend to revert to nationalisation as a cure-all in spite of the fact that rationalised socialism has found its faith in nationalisation considerably shaken. At the Conference of the Vice-Chancellors of Indian Universities the Prime Minister emphatically asserted that the proper remedy for doing away with the poor quality text-books for primary schools was their nationalisation. He described the writers of these books as hacks and announced that the State should draw upon the best talent available in the country to write the correct type of books and their

overall get-up should also be attractive for the class of readers for whom they are intended. Emphasis was also placed on the fact that the idea of national unity should permeate the text-books. There is nothing wrong in this suggestion, but it would appear that a fetish is being made of this goal of national integration and in every field it seems to eclipse most other important considerations.

The moot question is whether nationalisation of text-books is the correct remedy and it is going to mend the present unsatisfactory state of affairs. Experience in Rajasthan and the Punjab, where the State has dabbled with text-books by nationalising them, is anything but satisfactory. It is a basic mistake just to assume that writers can bring out the best in their literary products under State auspices. The very fact that the patronage emanates from the State casts its shadow in different degrees on the work of the writer. It is not the writer who is responsible for the selection of his book as a text-book, but that function belongs to the selection committee. The truth of the matter is that, as is the case with many other spheres of administration and public life, corruption has corroded these committees too. The selection of text-books is determined in several cases by considerations other than those of strict merit. Many of the selection committees have gone to the extent of absorbing a technique which should be the monopoly of rackets. It is to be trusted that the idea of nationalisation of text-books will not only be discarded but its adoption will be revoked in the States which have inadvisedly resorted to it.

The Governors

A ROUTINE CONFERENCE

THIS TIME the Conference of the Governors was convened in an atmosphere which was certainly quite unusual. The country had received different varieties of shocks ranging from the recrudescence of communal riots, violent student disturbances to calamities like devastating floods. In particular, the ominous revival of communalism threw up a challenge not only to law and order but to some of the basic tenets of our political faith. In this situation the general tone at the deliberations of the Governors' Conference was expected to be not only critical but of a sufficiently introspective nature. Some at least of the Governors in whose States the law and order situation was disrupted, were expected to speak out their minds frankly by way of caution and a warning for the exercise of preventive as well as curative measures for the future. But beyond harping upon the urgency of inculcating the idea of national integration and suggesting the stock remedy of rationalisation of the contents of history and other text-books, there was little in the reported proceedings of the Conference.

Nevertheless, it was some satisfaction that a new accent was placed on making the role of the Zonal Councils more effective and purposeful than hitherto. In the reorganised set-up based predominantly on the linguistic principle, the Zonal Councils provide a hopeful machinery for re-establishing the ideal of regional affinity on a multi-lingual basis. It was rightly pointed out that the recommendations of the States Reorganisation Commission to accept a good proportion of top level officials from other States and also to select High Court judges from outside the States should be translated into practice. If the potential danger of parochialism, revealed by the linguistic emphasis, is properly grasped, this accent on the role of the Zonal Councils should be given a concrete shape.

The World Abroad

NEW POLICIES IN U.K. STEEL

By ODYSSEUS

THE UK IRON AND STEEL BOARD is often held up as an example of the British genius for compromise, so that the UK is said to get the best of both worlds—national planning and free enterprise. The Board fixes selling prices (as described here in the previous article) and plans the expansion of the industry. All the individual development plans have to be approved by the Board which can withhold consent, or insist on new proposals of its own.

In "The Steel Industry: 1939-1959" (Camb. Univ. Press, London, 1961, Price 80 sh.) Duncan Burn, a world authority on steel, shows that the Board revealed no disturbing unconventionality in their approach to planning. They did not suggest that the UK industry should be open to free international competition. They shrank from joining the European Coal and Steel Community, which would have meant dismantling tariffs and the Board's power to control prices, lifting the ban on scrap exports, and on coal imports. They did not suggest that the size of the UK market was small for an industry capable of big economies by large scale operations. They cheerfully assumed that UK costs would always be competitive in exports, that the UK would import a little steel but would cut imports when home demand fell, and cut exports when home demand rose. These quantities would, moreover, be planned in accordance with "the national interest"—full employment, the relief of distressed areas, and the prosperity of the UK coal industry.

Conservatives and Socialists accepted these ideas. The planners, the Conservatives, and the Socialists, were all united against any re-appraisals that might be agonising.

The only criticism came from the Socialists, who, obsessed by the idea of expansion, apparently for its own sake, and indifferent to costs and quality, complained that the steel makers would not expand fast enough.

The planners thought that world markets would continue to grow fast. They admitted that other naturally cheaper producers might take a large share of the world market "in the remote future". From their ivory planning tower, they confidently declared that "to a limited extent" the UK's share in export markets could be varied without harming her long-term export prospects. They did not ask whether Stop and Go in exports would endear UK steel to overseas buyers. Apparently they planned an indefinite continuance of a scarcity of steel in world export markets and that Belgian, French, and German steel makers would accept UK sales without a murmur.

Within the Board's first year, home consumption almost reached the total planned for the fifth year. Encouraged by the Korean boom, the second plan foresaw a vast increase in demand, whereupon ship building prospects worsened, railway wagon programmes were modified, electrification schemes were curtailed, defence programmes streamlined, the coal shortage changed to a surplus and upset investment plans, oil supplies and tanker capacities exceeded needs, and those competitive Japanese, Belgians, and French began exporting madly. One would have thought that planners with their statistical apparatus, which, as one of them pointed out, did away with competition's "irrational guess work", would have foreseen all these events and have planned accordingly. Otherwise what is planning for?

QUANTITY VERSUS QUALITY

Because the planners put increased production before economic locations and costs, most expansion consisted of adding to existing plants rather than radical reconstruction and modern methods. The result perpetuated the UK industry's scattered nature and comparatively small units. By 1958, experience was showing forcibly what the ordinarily competitive-minded, non-planner would regard as elementary, i.e., that quality as well as quantity of investment counted. Thus, Europe's oxygen steel processes saved capital, labour, and fuel.

A notorious example of the fog that obscures the real issues when planning brings politics into an economic problem (i.e., whether a nation wishes to grow richer nor not) was that of the plans for Richard Thomas & Baldwin's new mill. Richard Thomas & Baldwin wanted to site it at Newport, which had many advantages over existing sites. Iron ore could reach it in much larger ships. It would avoid expensive inland rail transport. It was nearer to home ores. It was a good export harbour. It was well sited for domestic sales of its products. It was near home industries which bought its products. Immediately pressure groups worked for rival sites in Wales and Scotland. Controversy raged throughout the land. The Cabinet was divided by Ministers fighting for their local interests. The Scotch site could import Swedish ores cheaply, but lacked access to cheap home ore. Coking coal reserves were small in Scotland and coal dearer than anywhere else. The site was remote from all major domestic steel using markets.

The Scots were undaunted. Their solution was simple: import coal from South Wales. Eventually the government disclosed "the national interest". Not one strip mill but two should be set up, one in Wales, one in Scotland. The Prime Minister stated that this was a matter of judgment like that of King Solomon. No one pointed out that Solomon decided knowing well that if his judgment were carried out, the baby would die, and that his award in fact saved the baby's life. The Richard Thomas & Baldwin decision was the exact opposite. The UK is to have two half-mills of uneconomic size, at double the capital cost. The division of work will raise operating costs and limit the scope for reducing costs and raising quality by long runs. The greatest economic advantage was sacrificed to social comfort.

What was done fitted no industrial strategy. The government were soon trying to persuade motor car manufacturers not to expand in their natural low cost production areas but to go to Scotland to create a market for steel sheets. Such a policy conspicuously differs from that of the European Coal and Steel Community, whose basic premise is that ultimate cost reduction should never be lost to sight. The ECSC's policy should help the transition towards an economic distribution of industry in Europe. The UK policy lessened the increase of productivity, the ECSC's aimed to maximise it.

Ignoring the capital cost in building two mills instead of one, the Richard Thomas & Baldwin decision will result in costs 5 to 10 percent higher than on a low cost site. The full benefits of low cost production would, of course, only have been secured if uncontrolled market prices had been allowed, which would have attracted steel users to the low cost areas, whereas

the 1959 policy seemed designed specially to encourage users to settle where it would cost most to make steel sheets. This story typifies UK steel planning at the end of the 1950's. Welfare doctrines clamped down on the dynamic forces in the economy in order to reduce social dislocation.

NEW IDEAS

Nobody suggested that the expansion of high cost industries would render it increasingly difficult to compete in world markets, and thus, by way of recurring balance payments difficulties, end not in social dislocations but in social upheavals.

Socialists often argue that the government should retain Richard Thomas & Baldwin, which is not yet denationalised, to do jobs which private firms might not wish to undertake, or to stimulate private enterprise by state competition. That an existing state enterprise would always have the necessary experience and judgment and freshness for new ideas in steel market is unrealistic—except in a world in which quantity of production is put before quality of investment. As for stimulating private enterprise, the conditions on which capital could be obtained by a state enterprise would differ from those open to private enterprise. If, as might happen, the state enterprise fared badly because its plant was partly idle (as is currently reported of several Indian state enterprises), this would not embarrass the state—with all the nation's taxpayers, plus the currency note printers, behind it—as it might a private company.

With all its weaknesses, the UK system of privately managed and financed companies is better than complete nationalisation. The individual companies are not all managed by sheep. There are many keen and able

men, chafing under the Board's policies, who have increasingly made themselves heard. The emphasis today is moving away from making more steel to making cheaper and better steel. In a nationalised industry this change of emphasis would have been almost impossible to bring about. For example, although the Steel Company of Wales's recent application to import low cost US coal was refused, it could not have been made by the directors of a nationalised unit, beholden to a Ministry for their appointment and promotion. The application is a shot in the struggle towards production for profit. The very fact that it was made at all reveals the change in the trend of UK opinion. The extraordinary success of the free market economy in Germany, the flying start to which the European Common Market has got off, the flourishing state of the French and Italian economies under impact of neo-liberal ideas, and the persistent teaching of a handful of respected UK economists, like Lionel Robbins, Roy Harrod, F. W. Paish, and Paul Bareau, have created a new tone in public debate, and modified the outlook even of Socialists. Ten years ago the problems of coal, electricity, and steel were discussed solely in terms of quantity and employment. Nobody worried about costs. Ten years ago only a few specialists would have bothered with Mr Burn's new book. Today, reviewed at length by all the serious press, it has created a profound impression and it is likely to be an appreciable factor (a) in modifying the UK's future steel policy and (b) in facilitating the integration of the UK industry into the European Coal and Steel Community, if the UK joins the Common Market.

[This is the third and final article on the UK steel industry.—Ed.]

DISCORD: THE PRICE OF DEVELOPMENT

By ODYSSEUS

A RECENT CONFERENCE at Oxford on "Tensions in World Development," sponsored by the US Council of World Tensions (304 East 42nd St., New York) and the UK Overseas Development Institute (160 Piccadilly, London) attracted less attention than its importance deserved. The galaxy of authorities who attended included Dr. C. D. Deshmukh, Dr. G. L. Mehta, Mr. B. K. Nehru, Shri Asoka Mehta of India, Mr. Carlos Romulo of the Philippines, Mr. Lester B. Pearson of Canada, Miss Barbara Ward, Miss Margery Perham, of the UK, and others of equal calibre from Africa, Asia, and South America, all of whom are in a position to help in translating into policy and practice the recommendations which emerged from the conference.

One of the papers read to the conference by Dr. W. A. Lewis, of the University College of the West Indies, was outstanding for its tough common sense. Dr. Lewis pointed out that, although the past fifteen years had, on the whole, been a good period for most developing countries, mass discontent is greater than ever before. Nearly all Latin America, the Caribbean, and the Middle East, and parts of Asia and Africa, share this mass discontent. Why?

It would be easy, although in Dr. Lewis's view insufficient, to attribute this discontent to the disillusionment following excessive promises by politicians. Nationalist agitation led some people to expect that political independence would be followed by ease and affluence. Although I believe such promises have had greater influence than Dr. Lewis concedes, he is right to draw attention to other causes, particularly the changes in the relative positions of internal groups, which have generated frictions.

The basic problem is that the fruits of economic development are not easy to spread throughout the population. The process of development may be described by saying that in each country there is a small modern sector, which is in those parts of the economy in which rapid development is occurring, surrounded by a large backward sector, which usually includes peasants, handicraft workers, servants, and casual workers. Ultimately, the modern sector will expand to cover the whole economy, but in the meantime the modern sector can become increasingly prosperous with relatively small effect on the backward sector.

The backward sector suffers if the modern sector competes with it, for example, if factories put handicraft workers out of business (as in textiles in India), or if construction equipment dispenses with casual workers. On the other hand, the backward sector gains to the extent that the growth of the modern sector offers expanding markets for food, raw materials, or services. Inside the growing sector, profits, salaries, and wages naturally tend to be high. Elaborate social services are provided and the benefits of urbanisation—piped water, schools, buses, cinemas, hospitals, subsidised houses—are enjoyed. Outside the modern sector, disturbance of old established ways may well exceed benefits.

CAUSES OF UNREST

Dr. Lewis pinpoints the causes of unrest thus:

1. Development creates unemployment as well as employment. Normally, it creates more employment than unemployment, but if investment is concentrated more on introducing labour saving devices into old

industries than on introducing new industries, the net effect may be to add to unemployment. This is an acute problem in some West Indian islands. Those who have jobs are better paid than ever before, but there are fewer jobs. Even where the net effect adds to the number of jobs, some people suffer for shorter or longer periods.

2. The high incomes earned in the more productive industries (e.g. oil) create tensions elsewhere. Civil servants, bus conductors, plantation farmers, and persons in other industries of slowly rising productivity, keep trying to catch up, through trade unions, farmers' associations, or other political activity. Although Dr. Lewis does not mention it, friction from this cause is also wide-spread in those industrial countries of the West where Welfare doctrines have spread the idea that all incomes should be equal and that a railway porter is entitled to earn as much as a skilled factory worker. The more rapidly that some industries develop, the greater the industrial and political unrest in other industries (in both developed Welfare states and developing countries). Paradoxically, there is least mass unrest in those countries where economic development is slowest. Unrest is also greater where development occurs in pockets scattered throughout the country than where it is all in one place, because more people are excited by the disparity between their incomes and those of the lucky few who get jobs in modernised industries.

3. Sooner or later the high earnings in the modern sector pull up wages in the backward sector, whether through trade union or other activity. This can have disastrous effects on employment in over-populated countries. In a country like Egypt or India, says Dr. Lewis, starvation is rare until the trade unions arrive, because society creates innumerable surplus jobs as a means of distributing the national output. Offices have twice as many clerks as they need; enterprises have innumerable chaprassis; even lower class families are expected to keep their quota of servants; and no "respectable" person does manual labour. This is feasible as long as wages run at, say, Rs. 1 per day. Everyone knows that such a wage barely provides food, so that no employer expects any serious quantity of work for it. The system amounts to unorganised but necessary poor relief. When the trade unions and the efficiency experts get to work, the picture changes. Wages shoot up to, say, Rs. 10 a day; the surplus clerks, chaprassis, and domestic servants, can no longer be afforded by their former employers. They are dumped on the labour market or, as in Jamaica, forced to emigrate.

4. The prosperity where development is greatest attracts people from the backward areas and creates a serious unemployment problem in the developed areas. In Jamaica, for example, the more jobs that you create in Kingston, the more unemployment you have in Kingston. There is little observable unemployment in the backward areas because, in the absence of social services, everyone has to attach himself to some customary means of subsistence. Excessive population, if it exists, reveals itself not in open unemployment but in the small size of family farms, or in excessive numbers in domestic service, or in petty trading. So, paradoxically again, it is those parts of the economy which are developing most rapidly which also show the most stubborn unemployment figures.

5. In the modern sector, the profit ratio is high—this, indeed, is why this sector attracts so much investment. Tax exemptions to new industries make net profits still higher, to the exasperation of established entrepreneurs who receive no tax exemptions. If, in addition, the modern sector is being developed largely by foreign entrepreneurs, who export part of their profits, then nationalism, or racialism, may be added to other discords.

PALLIATIVES FOR DISCORDS

Dr. Lewis asserts that there is no "solution" to these problems. It is too often forgotten that discord has always been part of the cost of economic development everywhere. Although, again he does not mention it, this is true of developed economies. A large part of the UK's present economic difficulties arise from the (natural) resistance of established industries, like railway transport, or coal mining, to displacement by newer and cheaper methods of transport and power. One can suggest palliatives, continues Dr. Lewis, such as better machinery for preventing or settling industrial disputes, a more determined effort by governments to transfer (through taxation and expenditure) some of the benefits of development from the modern to the backward sector. In an industrialised country, such efforts should include encouraging the movement of workers from old to new industries and the rehabilitation of displaced workers. In both developed and developing countries, educationists should be encouraged to spread a better understanding of economic processes.

But some discord is inevitable (in both developed and undeveloped countries). Once an undeveloped country seeks development, nostalgia for the good old days of social stability is useless. In an industrialised country, it needs to be recognised that if growth is desired, it cannot be achieved without discordant changes. All one can do is to try to minimise the discord. Dr. Lewis says that possibly the surest way to diminish the discords of development is to have still more rapid development. That this is just as true of the industrialised countries suggests that the basic principles are the same. In the undeveloped, the discords spring from the contrasts between the modern and the backward; in the developed from the contrast between the obsolescent and the progressive. If, in both, the most up-to-date sectors expanded faster, and the backward sector (agriculture in Asia, coal mining in the UK) diminished more rapidly, the fruits of economic progress would be spread more widely, and there might be less unrest.

I should make it clear that Dr. Lewis confined his observations to the problems of the developing countries, and that it is I who have ventured to point out their application, by and large, to developed economies.

NATIONAL INTEGRATION

From Our Special West European Correspondent

PARIS, October 30.

THE problem of "national integration" does not exist only at the stage of economic and political development reached in India; it can continue to be posed in acute form in highly industrialised and cultivated nations for centuries and centuries. The persistence of violent and often sanguinary provincialism in countries like Italy and Spain (where, incidentally, religious persecution of the Protestant minority is still officially tolerated) discourages optimism about an early disappearance of the malady in India; and the periodic recrudescence of provincial animosity during temporary economic setbacks in Britain and France (e.g. Scot and Breton "nationalism") points the same lesson. However, it is in Belgium that one can study, in a test tube as it were, the persistence of "communal", religious, provincial and linguistic strife in forms quite familiar in India—with the added parallel of a dual-language capital in Brussels. A visitor from Bombay or Gauhati dropped down in the Belgian metropolis (which aspires to be the capital of Europe!) last weekend would, if he understood both Dutch and French, have felt quite at home: one lakh of Flemings paraded aggressively through the streets singing "The Flemish Lion", waving not only Flemish flags but Dutch ones too, shouting slogans hostile to their French-speaking compatriots and meanwhile beating up a few dozen policemen. The French-speaking majority replied with the Walloon flag (and the French tricolour, too), sang the "Marseillaise" or the "International", cried "Down with Flemish imperialism!" and beat up their quota of policemen. If our Indian visitor were informed that the linguistic frontier in what is now Belgium has not varied significantly for 1,500 years (I repeat, for 15 centuries), he would return dispirited to read of the national integration conference in Delhi.

One could develop with some precision the parallel between the Belgian "communal" problem and the situation in certain parts of India, but it will be more instructive (though at the risk of some hasty generalisations) to connect the developments of the Belgian strife with the country's economic and demographic evolution. It appears that a slow rate of economic expansion brings communal antagonism to the boil, to the point where it threatens national unity, as in Belgium today; this is especially so if there is a discrepancy between the birth rates in the two opposed communities. So much is not surprising; the contrary case is more so: rapid economic expansion does not eradicate communal antagonism but "sublimates" it, i.e. diverts it away from head-on clashes between communities toward keen, and sometimes bitter, party-political struggles about such matters as education. Moreover, in so far as economic progress is accompanied (as it mostly is) by increased urbanisation and the centralisation of economic power (whether private or socialist) in a metropolis, it creates one of the deepest of communal dissensions, the struggle for dominance in the city. Communal opposition is ancient, but in centres like Bombay or Brussels economic progress adds a new dimension to it.

The Flemings who inhabit the northern parts of Belgium speak Dutch, are mainly agriculturists (though in Antwerp they have Europe's busiest port),

are Catholic to the point of clericalism and support the Social Catholic Party. The Walloons in the south speak French, are of secular temper, are more industrialised, have strong trade unions (some showing Communist influence) and support the Belgian Socialist Party. The two communities used to be about equal in number but the Flemings have become the more prolific and are now about three for every two Walloons; 51 per cent of Belgians are Flemish, 34 per cent are Walloons and the rest are resident in the half-caste, bilingual capital of Brussels. For long the Walloons ruled the roost; Belgian industrialisation and the management of the colonies were almost entirely their work. In 1932, the oppressed Flemish managed to stop the invasion of French culture into their part of the country by getting a sort of standstill agreement that gave Dutch the monopoly over half the national territory. Having secured their home-base and confident in their rising numerical superiority, they set out to conquer the State from the Walloons.

The struggle was masked during the postwar boom, when Belgium was the first European country to regain prosperity. The gross national product grew by 3.9 per cent annually from 1948 to 1957, the few industries of Flanders (coal and textiles) were fully employed, Antwerp held its own against nearby Rotterdam in Holland, and there was a vast building boom: 61 per cent of the houses in Flanders have been built since the war. Communal rivalry was still keen in the fat years from 1950 to 1958 but it took the shape of acute political cock-fighting between the Socialist and Catholic parties about such relatively frivolous problems as the abdication of King Leopold. The curious thing is that during this period the Flemish made very little progress in wresting power from the Walloons: 97 per cent of Belgian diplomats are still French-speaking, there is not a single Flemish general in the Army, only one-third of university students are Flemings, and many industries in Flanders continue to be managed by Walloons. Above all, despite the inequality of numbers between the communities, the language of one of them, French, continued to extend its domination.

The instrument of this domination, and the cause of exacerbation of communal tension, was the growth of Brussels, due both to the familiar process of urbanisation and centralisation in a progressing industrial economy and to the city's new international status as de facto capital of the Common Market. Situated in Flanders and originally a Flemish town, Brussels is officially bi-lingual but this equality of status for the two languages in fact permitted the increasing dominance of the more vital of the two: Brussels is rapidly becoming a French city. The Walloons therefore are migrating to it faster than the Flemings, accelerating its francisation. The city is sprawling out into endless (and incidentally quite attractive) suburbs and these of course invade Flemish territory. The Flemings are furious to see their cultural reserves being invaded by a French capital, and the Walloons are aggravated to find that if they send their children to local, suburban schools they have to learn Dutch. One has the usual problem of "dormitory suburbs" seen around all big cities—people sleep at their address but work, amuse themselves and spend their money in the city and thus pay so little local taxes that the suburban municipality

cannot provide the costly amenities the new population clamours for—but in this case it is complicated by communal differences between the city and its suburbs.

Faced with the Flemish onslaught but confident in the spread of the French language, the Walloons demand a new census in which folk will be asked to declare their customary language, knowing that the wider use of French will compensate for the greater vitality of the Flemish population. The Flemings, by one ruse after another, have succeeded in avoiding a linguistic census for the same reason; territory proclaimed Dutch in culture in 1932 must remain so forever, while the Flemings continue their attack on the Walloon citadels. Bad faith, as one can see, is common on both sides and the depth of passion with which Belgians discuss these issues has to be seen to be believed. Last week the Government ventured to make some adjustments along the linguistic frontier, making a carefully balanced transfer of "enclaves" from one side to the other; though no one seems to have gained, Flemish demonstrators in the streets of Brussels last weekend attacked these measures as Walloon imperialism.

This rivalry could have gone on for decades without really jeopardising national unity if it had not been for the economic disaster that overtook Belgium in the past few years. The rate of growth of the national product fell to 1.7 per cent annually, the Borinage coalfields in the Walloon part of the country had to be subsidised and then closed, the loss of the Congo discredited Belgian imperialism and its French-speaking agents and left thousands of them unemployed or much the poorer, and finally the long general strike of last winter did grave damage to the economy (or, more accurately, reflected the grave damage that had already been done). The question of Belgium's economic renovation, its adjustment to the no-Congo situation and its integration into the Common Market is, of course, a national question, not a communal one; but once communal dissensions exist they are grafted on to every other problem the country encounters. The Congo fiasco was a national humiliation, but the Flemings contended that it discredited the French-dominated colonial administration in particular; the Walloons returned the compliment, saying that the Flemish minority in the colonial service had made the Belgians hated (this was why the first U.N. Swedish troops were attacked by the Congolese, who mistook tall blond men speaking a weird language for the detested Flemings). The strike of last winter was a labour-capital clash, but when the Flemish unions defected first, it soon became a communal question. The challenge of the Common Market was addressed to the Belgian nation, but when foreign investors moved into Flanders to take advantage of cheap labour and docile trade unions, that too became a communal issue.

The upshot is that the country's present urgent effort at economic renovation is being complicated by communal passion. New industries have to be founded to reduce Belgium's traditional reliance on coal, crude steel and low-grade textiles, but the location of every new plant gives rise, as in India, to provincialist competition. Last weekend in Brussels, the rival groups exchanged slogans such as "Flanders first, the Borinage can wait!", "Flemings go back to your farms!", "No more French bosses in Flemish factories!" and so on. The biggest project in the coming national plan (Belgium's first) promises a big provincialist row: the building of a new steel mill in Flanders, which is defensible from the point of view of regional development but rather less so in the context of the Common Market's excess steel capacity.

Antagonism has reached the stage where the integrity of the kingdom is in jeopardy. There has always been a Flemish federalist movement, which aimed to defeat French-dominated centralisation by giving the Flemings local autonomy; this was a right-wing movement, with Catholic and clerical overtones. Now there is a Walloon federalist movement, which aims at separating off a sort of Belgian Katanga which will keep the industrial wealth of the French-speaking parts out of the common pool; this is a socialist movement, led by trade union leader Renard who came to prominence in the general strike of 1960-61. Both are agreed on one thing, to fight the central power in Brussels. The success of these movements would mark the end of the Belgian nation as it has existed since 1830. To meet this threat, the Government is placing its hopes in the national plan which will seek to give Belgium a growth rate of 4.4 per cent a year, creating enough new wealth for a share-out without communal squabbling and bringing the country into line with the rate of expansion of the rest of the Common Market. More generally, the wider horizons of the Common Market are expected to reduce communal differences to unimportance. But is this not a way of saying that the deliquescence of the Belgian nation will be disguised in the rise of a new European nation? Communal antagonism in Belgium has gone so far that the disappearance of the Belgian nation as distinct unity is a possibility to be considered.

Ease out of that profit squeeze...

Decentralisation and lower profit margins make the profit-and-loss statement the real measure of each plant's efficiency. That's why it is increasingly important for management to study methods to ease out of the profit squeeze. Planned Lubrication gives management such an opportunity for savings.

Machinery shutdown means loss in production, time and money. Correct lubrication is therefore essential to ensure the protection and efficient operation of costly machinery. Planned lubrication is vital for increased production at lower costs.

The service is yours for the asking—call in your Caltex Lubrication Engineer—arrange for a correct lubrication programme for your plant. Let us help you in conserving parts and money.

PLANNED LUBRICATION—A VITAL FACTOR IN COST CONTROL

Visit

BASF and **CASSELLA**at the
Indian
Industries
Fair

BASF and CASSELLA, who bring to India a wide range of chemicals, dyestuffs and raw materials, are participating in the Indian Industries Fair at New Delhi from November 14, 1961 to January 1, 1962. Their display will consist of a large number of products of special interest to the Indian Industries.

BADISCHE ANILIN- & SODA-FABRIK AG, Ludwigshafen am Rhein, West Germany, is the largest individual complex of chemical industry on the European Continent.

They manufacture more than 5,300 products, from Dyestuffs to Fertilizers to Magnetic Recording Tapes. There are BASF products for almost every branch of industry.

CASSELLA FARBWERKE MAINKUR AG, Frankfurt/Main-Fechenheim, West Germany, make a famous range of textile dyestuffs—and specialised products for the paper, leather, and paint industries. Come and see the BASF and CASSELLA stand in the West German Pavilion.

*Our West German Letter***THE VICTORY OF THE POCKET BOOK**

From Our West German Correspondent

BONN, October 26.

THAT the "Book Fair" in Frankfurt is not an ordinary and purely business affair is proved by the fact that the "Borsenverein des Deutschen Buchhandels" (Association of the German Book Trade), in which publishers and booksellers are united, had ten years ago created the "Peace Prize of the German Book Trade". The presentation of this award marks every year the climax of the fair and takes place in the historic "Paulskirche" where the first German parliament assembled in 1848. This year's recipient, Dr. S. Radhakrishnan, succeeded men like Albert Schweitzer, Thornton Wilder, Victor Gollancz and Theodor Heuss which shows that the prize is given to people of international reputation who by their writings have contributed to peace in the world. The prize is a modest one of 10,000 DM and cannot, therefore, be compared with the Nobel peace prize. It should be considered as a gesture of goodwill. In the presence of the President of the Federal Republic of Germany, Dr. Heinrich Lübke, the former President Prof. Heuss, the Lord Mayor of Frankfurt, the Indian Ambassador P. A. Menon, members of the diplomatic corps and of members of Parliament who had come over from Bonn, Dr. Radhakrishnan received the prize from the President of the Book Trade, Werner Dodeshoner. While Prof. Ernst Benz in his "laudatory oration" quoted the Upanishads, the Bhagavad Gita and Mahatma Gandhi, Dr. Radhakrishnan quoted in his speech when expressing his gratitude, Goethe and Schopenhauer. (The two very remarkable speeches or, better, lectures will shortly be published.)

After the ceremony the Indian guest of honour visited the Fair with its 1132 stalls where 32 nations, amongst them India, showed their book production. It is here not the place to go into details but one fact is outstanding: the victory of the pocket book! In the "Pocket Book of the Pocket Books", the just published encyclopaedia of pocket books, are already 700 German titles registered. The Frankfurt Book Fair does not know the conception of the "Iron Curtain" and is guided by the maxim that the human spirit emanating from writers does not recognize political frontiers. Therefore, one found exhibitors from the East European countries, including East Germany. But there was a fly in this outwardly peaceful ointment. Writers of East Germany had not only approved but also supported the horrible events of the 13th August when the East German satellite Government hermetically closed the border between the Communist and the free part of Berlin by erecting concrete walls and barbed wire fences to stop the exodus of people fed up with the Communist regime. The West German writers now protested vehemently that works of these contemporaries of wavering characters on the other side of the fences were exhibited in Frankfurt.

FOREIGN FIRMS GO TO BERLIN

Apropos Berlin and apropos exhibitions, we have also to report on the "German Industry Exhibition, Berlin, 1961" which was opened by the Minister of Economics, Prof. Erhard. This is also an annual event which till last year brought thousands and thousands of visitors from East Germany to West Berlin. Apart

from breathing in a free country (without timidly looking to the right and left whether somebody was eavesdropping) here they could convince themselves of the industrial progress of the free world. The number of foreign participants rose from 96 in 1960 to 162 this year out of which were 54 American firms. West Germany is represented by 419 and West Berlin itself by 274 firms. All these undertakings had booked halls and stalls before the 13th August but none of them cancelled the arrangements afterwards. The main theme of this year's exhibition was traffic by road, rail, air and on water-ways. Not only firms are here exhibitors but also state-owned enterprises. The German railways (Deutsche Bundesbahn) show working models of most modern lines with remote-controlled switches and signals, with junction signal boxes in full working order on an area of about 100 square meters. The Hanseatic towns Hamburg and Bremen prove also in models the importance of the two largest ports of the Federal Republic. In the American Hall, called "Marshall House" after the initiator of the Marshall Plan, we find models of all kinds of types of ships. Of special interest for Berlin is a transverse section of a freight barge as almost all goods to and from Berlin are transported on water-ways. In 1960 about 3 million tons arrived on freight barges in Berlin. Other exhibition objects are original aircraft of various types, a motor car repair shop with "super testers", a special truck which can carry a complete week-end bungalow, a noiseless electromotor for fishing boats, etc.

We part from Berlin by mentioning that there is at present a lack of skilled workers since the Communist government closed the border. Many of them had their residence in East Berlin and came daily to the West sector. As West Berlin's industry is participating since years in the boom of the Federal Republic this lack of workers will be overcome first of all by increased automation. Secondly, workers from West Germany will be transferred to Berlin in spite of the fact that in the Federal Republic there is no unemployment. As is well known, lakhs of foreign workers from Italy, Spain, Greece and Turkey are already employed in the Federal Republic. But West Germany's industry has asked their young and unmarried workers to go to Berlin on a voluntary basis. They will get the guarantee that they will be taken back if they so desire. Moreover, the West German Government intends to pay the rail or air fare for them, also when they go on leave.

A SQUIRREL AS SYMBOL

We have to report about a new scheme in Germany by the peculiar name of "Squirrel", called after the little and charming animal which nature has wisely taught to collect food for winter time. One finds now-a-days advertisements in German dailies showing a squirrel and the slogan: "Denke dran — schaff Vorrat an" ("Consider it more — keep food in store"). And the reader is reminded that the continuous basic stock of a household should consist of rice, paste foods, sugar, lard and tinned food. The basic stock has to be replaced, the ad says, in the course of time by new stuff. A speaker of the Food Ministry explained that the "Squirrel" scheme which has been started in co-opera-

tion with consumer-organisations should not cause any panic. Storing of a food reserve must not necessarily be brought in relation to the possibility of a war in Europe but could prove useful also in case of calamities by force majeure, by an economic crisis or disturbances in food producing countries. But still the scheme has not been welcomed everywhere. Nevertheless, out of 1300 press commentaries only 65 were opposed to it. Critics were then asked whether in our present world situation there is a single moment when people could live without any anxiety in complete peacefulness. At any rate, since this scheme had been discussed for the first time last year and the pros and contras have frequently been published without causing any panic, this seems to be the best proof that the Germans are not losing their head. Quite on the contrary, they are working hard as usual without forgetting that man does not live from bread alone. Theatres and concerts are crowded, books — as one could see at the above mentioned show in Frankfurt — are being published in thousands (to be exact, 22,524 titles in West Germany within the last year) and sold in lakhs, pocket books even in millions.

In a pamphlet, giving details of the Squirrel scheme, it is pointed out that the expenses for a three persons household of the suggested food reserve amount only to about 33 to 44 DM. The public relations firm commissioned with the propaganda for the scheme, recommends to keep the reserve in a small cupboard with a coloured curtain or in a book shelf with sliding doors,

so camouflaging the food stock — which seems to be, to say the least, a strange idea.

To turn from food to drinks: are the Germans still the typical beer drinkers? Obviously not, milk has beaten beer. Let us see what statistics have to say. The "balance sheet of drinks" has been published and for the first time announced at the annual meeting of the "Association of German Spas". In 1960, per head of the population 111 litre milk, 96 litre coffee, 94 litre beer, 53 litre imitation (Ersatz) coffee, 22 litre tea, 13 litre mineral water, 10.8 litre wine and 6.9 litre grapejuice have been consumed. Eight million litre mineral water was exported in 1960 to 35 countries. The production of the mineral water industry came last year to 1.214 million bottles, an almost oceanic figure. During the first three quarters of 1961 an increase of 10 p.c. has already been achieved.

The "Bundesverband der Deutschen Industrie" (BDI — the Association of German Industries) is not exclusively concerned with the professional interests of its members. Its cultural section has arranged the "Ars Viva 1961", an art exhibition of young painters. This exhibition, first shown in Cologne where the BDI has its headquarters, will now go to Nuremberg, Wiesbaden, Brunswick and Dortmund. In Cologne paintings were already sold for 18,860 DM. Even the New York Museum of Modern Art appeared as buyer. Some of these painters had received scholarships from the cultural section of the BDI.

*Economic Report from the U.S.***INVESTMENT IN EDUCATION**

By GUY SIMS FITCH

WASHINGTON, October 25.

THE realization is growing that the achievement of economic goals rests to a large extent on the knowledge and skills of a nation's citizenry. This is especially the case with regard to the technical and scientific manpower, the managerial talent and the administrative leadership required in a modern economic society. All of this can best be summarized, perhaps, under the single heading of education. It should come as no surprise, then, that an international meeting was held in Washington about a week ago on this very subject. Titled the Policy Conference of Economic Growth and Investment in Education, it brought together educational and economic experts from the United States, Canada and the Western European nations under the auspices of the Organization for Economic Co-operation and Development (O.E.C.D.). From the discussions there emerged the conclusion that there must be both quality and quantity in education if a nation is to fulfil its national goals effectively.

As noted by Philip H. Coombs, U.S. Assistant Secretary of State for Educational and Cultural Affairs, "there is no serious danger of over-educating the population; the greatest risks lie in the opposite direction." Effective educational systems also must embrace a broad spectrum of knowledge and achievement. The building of a better world requires people adequately trained in the sciences, in technology, in industrial management, as well as in the more traditional social studies and humanities. All of this implies that investments in human resources are at least as important as investments in physical facilities. As a matter of fact, it is an observable phenomenon that the United States and many other economically advanced countries are distinguished to varying degrees, by widely diffused and high levels of educational opportunity and achievement. The noted U.S. economist Theodore W. Schultz, who has headed the American Economic Association, has pointed to "the growth in human capital" as "the most distinctive feature of our economic system." Without it, he observes, "there would be only hard, manual work and poverty except for those who have income from property." Dr. Schultz, who has devoted much time and study to the development of human resources, estimates that since the turn of the century educational costs in the United States have risen more than three times as rapidly as has the gross formation of physical capital in dollars. Yet, there is a real awareness that educational standards must be constantly

improved if the challenges of the future are to be met adequately. If this is the case with a relatively developed country such as the United States, how much more important it becomes for developing lands to expand their opportunities and raise their standards in the broad and vital area of education.

Steel mills and factories seem to have become symbols of industrialization and economic progress, yet too often too little thought has been given to the knowledge and the skills required to plan and use the advanced techniques of production. Some economic growth can be achieved in this fashion, but its rate is inevitably limited. In the words of Dr. Schultz, "it simply is not possible to have the fruits of a modern agriculture and the abundance of modern industry without making large investments in human beings." Underlined at OECD's education meeting here was the inescapable fact that education must develop even more rapidly in new countries than it has in the United States and Western Europe — or in the Soviet Union, for that matter. According to estimates presented at the conference, the developing areas of Latin America, Asia and Africa had just over two million students in institutions of higher learning in 1958, and they will have to have at least 4.5 million in those institutions by 1970. It is small wonder, then, that the United States and the other OECD nations, who have given of their bounty to help developing lands build up their resources, are beginning to turn more of their attention to the social side of the modernization effort.

Mr. M. Hechinger, Education Editor of the "New York Times", has put it this way: "It is relatively easy . . . to provide under-developed countries with medical supplies and even hospitals, but it is much harder to furnish or train doctors, laboratory technicians and nurses" — without whom, one may add, the physical facilities in the form of hospitals and equipment would to all practical purposes mean relatively little. Formal education, while it is basic, still is but one aspect of the total effort to develop a society's human resources. Attention also must be paid to correlative efforts in this general educational area. There are, for instance, health and safety services which contribute to the vitality of a people; there is on-the-job training; there are study programmes for adults; there is the adjustment of individuals and families to changing employment opportunities. All of these are bound up with the effort to raise social and educational levels throughout the world.

at
a
place
called
sahaganj

Residents of a town some thirty miles north of Calcutta, coming to work at the Dunlop factory—a typical, week-day, morning scene. Indeed, there is scarcely a household in Sahaganj today where the main breadwinner does not work at the Dunlop factory.

The Sahaganj of 25 years ago, however, was a different story; having achieved a brief eminence in the later Moghul period, it lapsed into obscurity and remained unknown to the world outside.

It was here that Dunlop bought a derelict jute mill and set up in 1936, India's first large-scale tyre factory which is today Asia's largest rubber manufacturing enterprise.

To the community at Sahaganj the Dunlop factory has meant, among other things, better health conditions such as the control of malaria. Above all, it has meant a rapid absorption of modern values which come in the wake of a progressive industry.

en route to NEW YORK

Effective October 29, TWA offers you direct service to CAIRO, ATHENS, ROME, PARIS and NEW YORK.

TWA's Royal Ambassador Service is unmatched and as regal as its name implies. Gourmet dinners, in-flight movies and a standard of personalized service you'll never forget.

See the European panorama by daylight! Same-day service to the U.S.A.

Use TWA's 17-day excursion fares across the Atlantic. Take advantage of the Pay Later Plan.

Consult your favourite travel agent or
call TWA at Bombay 211041-2-3 • Calcutta 235967 • Delhi 42620-42626 • Madras 84166 • Karachi 51245.

TWA. G. 237.

Special Article

THE TERMS OF TRADE OF PRIMARY PRODUCING COUNTRIES, 1958-60

THE primary producing countries had to face a serious situation in 1960 because of the relative passivity of the commodity prices. Whereas the domestic demand of imports had risen, the exports refused to move in line, resulting in large trade deficits. It was in the third quarter of 1959 that the gap between the exports and imports showed signs of narrowing, but early in 1960 the gap started widening again, mostly because of the upsurge in imports and the failure of exports to look up.

Even though export earnings also increased, they were far outpaced by the import expenditure. The gap in the balance of payments of these countries in 1960 was filled by commercial credit, further credits from the International Monetary Fund and also by the higher inflow of investment capital both from the public and the private sources. It is the purpose of this article to study the behaviour of the foreign trade of the primary producing countries in order to assess the part played by the terms of trade which, it is generally assumed, have continuously worked against them.

Table I alongside gives the details for the period 1958-60 in regard to the major exports of 87 primary exporting countries in terms of quantum as well as unit value of exports. It will be seen that the quantum of exports for the under-developed areas rose by 8 per cent in 1959 over 1958 but only by 4 per cent in 1960 over 1959. The effect of this increase in exports was partly nullified by a fall of 4 per cent in unit value realised in 1959 over 1958 and a nominal rise of 1 per cent in 1960 over 1959.

The year 1960 indicated some improvement over 1959 in the value of export earnings. The volume of exports of the various countries showed wide fluctuations. In the case of the coffee producing countries the volume of exports showed a rise of 19 per cent in 1959 over 1958, but was, at the same time, accompanied by a fall of 15 per cent in the prices realised. Again in 1960, the volume of exports rose over 1959 by 2 per cent but the prices realised showed only a marginal fall of 1 per cent. In the case of the tea exporting countries (India and Ceylon) the volume of exports rose by 6 per cent in 1959 over 1958, though prices remained stabilised at the 1958 level. A fall by 5 per cent in volume in 1960 over 1959 was accompanied by a rise of 8 per cent in prices, with the result that the overall earnings recorded a rise. It is thus clear that the year 1960 was a year of recovery for most of the primary producing countries as compared to the depressing state of affairs prevalent in 1958 and 1959.

Table II overleaf highlights the pressure of imports on the primary producing countries in 1960. There was a rise of 15 per cent in the imports of manufactured goods in 1960 over 1959. The Southern and South-Eastern Asian countries had to bear an import bill for manufactured goods which was 22 per cent above the level in 1959. A much higher percentage rise was recorded in other groups. In the case of fuels, the increase was by 33 per cent, raw materials by 54 per cent and food stuffs by 23 per cent but the value of all these three items taken together did not add up to a significant figure as compared to the value of manufactured goods. The major pressure was caused by machinery and vehicles which constituted nearly 50

* Metals are included with "other manufactures".

** Including dependencies of western European countries in the Caribbean and South-East Asia. The coverage in 1960 differs slightly from that of 1959.

In the case of 33 primary exporting countries, balance of trade rose in 1960 over 1959 entirely because of the increase in imports. In the case of the Indian Union which belongs to this group the adverse balance of trade which was around \$671 million in 1959 rose to \$791 million in 1960. India was not the only country with such a large deficit. Algeria with an adverse balance of \$774 million in 1959 and \$874 million in 1960 was the country with the heaviest deficit in the list of 33 countries given in Table III alongside.

The problem of the primary exporting countries may be looked at from another angle. An analysis of the exports of the industrially advanced countries shows that the pressure was not caused by higher prices of their exports but by the increased volume of exports. This significant fact is brought out in Table IV. It shows that the quantum of exports of the industrially advanced countries rose by 24 per cent in 1960 over the level prevalent in 1958 or as much as 14 per cent over the level in 1959. The sizable increase in the value of exports seems to have been attained by an increase in the volume of exports but not in prices. Thus, it is conclusively proved, that the pressure on the balance of

payments of the primary producing countries in 1960 was mainly caused by a significant rise in the value of their imports and not by any sharp movement of the terms of trade against them.

THE BUSINESS WORLD

Report on Calcutta Tramways Strike

THE outstanding feature of the tripartite committee report under the chairmanship of Mr. R. L. Mehta, Joint Secretary, Ministry of Labour and Employment, which presents a lucid picture of the Calcutta Tramways strike is that five out of the six members agree on all the points. First of its kind, this committee was appointed to study the strike from the point of view of the Code of Discipline whose main object is to create public opinion against unfair labour practices and unwarranted work stoppages. The previous enquiries under the Code, like the one in the strike in the Premier Automobiles Limited, were by officials only.

Written in an easy and simple style the report makes an interesting reading. Not only does one get a fair assessment of the entire situation that prevailed during the strike period in 1958 in the Calcutta Tramways Ltd. but one is also impressed by the painstaking efforts of the Committee. The credit should go to the chairman and the members of the Committee for their penetrating analysis who with their deep insight into labour matters have put into right perspective all the points pertaining to the strike.

The note of dissent given by Dr. Ranen Sen does not appear to be convincing. Throughout he has supported the workers view-point and has tried to put the entire blame on the company. Their is no doubt that the company is also to blame for breach of the Code of Discipline, but the entire blame cannot be put on one body. The demand for increasing the fares by the Calcutta Tramways Ltd. was fair and justified. Both the Government and the Dey Commission recognised the stand of the company, but the pity is that Dr. Sen fails to see the light of the day and persists in maintaining his recalcitrant attitude. His mixing up of the issue of increasing fares along with the demands of the workers is totally untenable. The company at no stage had wanted that the wrath of the public should be let loose on the workers. The company had no desire to make the settlement of the dispute dependent on an increase in fares but circumstances forced it to take a decision which perhaps could be interpreted that way. That the demands of the workers involved large financial commitments can not be gainsaid. Similarly, it cannot be controverted that the cost of maintenance and improvement of the service had risen steeply since the fares were last fixed. And finally, it must not be forgotten that fares are the main source of the company's revenues. In the circumstances, the rise in fares was inevitable, if more financial commitments were to be undertaken. The report after sifting evidence amply makes that clear.

The fault of the unions was that they kept up the spirit of agitation amongst the workers on issues already settled by tribunals. They resorted to force, intimidation and coercion which cannot but be condemned. Their refusal to make use of the efforts of help made by the State Labour Minister and the Union Deputy Labour Minister was simply to have things in their own way. It needs to be pointed out that the

company had not rejected the demand of the workers for gratuity. Since the matter required consideration by the company's Board of Directors in London, there was no other course left but to refer the issue there. The surprising thing is that the workers did not wait even for a few days and instead went on strike on August 12. Thus, everything by way of advice, warning or appeals was thrown to the high winds. Not only did they go on strike but insisted all the time that the settlement of their demands should not involve any rise in fares, logic of which is simply beyond comprehension. What baffles most is that they made this the most crucial issue. Generally labour does not worry how a management adds to its income particularly when the benefit is also to be passed on to them. And what did they gain out of this 42 day strike? Simply nothing. Rather they lost about Rs. 10 lakhs in wages and the company about Rs. 30 lakhs in revenue. The travelling public was inconvenienced about a month and a half as they lost during this period their cheapest means of transport.

While a greater blame may be put on the workers, the management by no means can be spared. Its infringement of the Code lies in the fact that it had not provided an adequate machinery for collective bargaining. Nor was the formal recognition conferred on the majority union. In the case of medical benefits there was a deliberate delay in implementing the award. So it naturally led to industrial unrest. It is also difficult to understand why copies of service books were not issued to the workers particularly when it is claimed that the service records maintained were absolutely correct. Had the copies of the service records been issued to the workers, perhaps it might have helped to remove their suspicions to a certain degree. And then again why the copies of the Code of Discipline were not displayed in the company's office. These are things which cannot be defended on any score.

Matters might have improved if the State Government had taken action against the unions for their sudden strikes particularly when they were against the Code of Discipline and constituted violations of the Industrial Disputes Act. But it is a pity that no action was taken. In all fairness the report makes no secret of that and rightly levels allegations against the State Government.

With a view to settling disputes without work stoppages in future, the Committee rightly contends that the company must provide the means for collective bargaining and establish an authoritative organ for joint consultation. The organising of Works Committees at each depot with a view to setting up eventually a Joint Management Council, of course, is a must, for it is only through these means that a speedy betterment of relations between management and workers can be brought about. The Committee has done a singular service in bringing every aspect to light and now it is only to be hoped that its findings would help set the house in order.

Business Notes

Cement

THE PRICE INCREASE

THE RISE in the cement price from the existing rate of Rs. 122.60 per ton to Rs. 135.60 is to be welcomed by the industry as it would not only provide incentive for greater production, but would also help the industry to meet its needs for expansion. The full increase recommended by the Tariff Commission could not be brought about as it was thought that it might impinge heavily on the construction programme. Of prices now announced, rupees two per ton will be earmarked by each unit for research, development, modernisation, rehabilitation and other improvements needed to put them on a more efficient basis.

The Government has differed from the Tariff Commission in two main respects. Firstly, the Government has not accepted the full increase of Rs. 16 recommended by the Commission. Secondly, the Government has fixed a uniform ex-works price, and at the same time, allowed an additional price for a short period for uneconomic units instead of the differential retention prices for the various cement units recommended by the Tariff Commission. The price that has come into force will continue to remain for the entire Third Plan period. The Commission's recommendation was that the new prices remain in force only for three years.

So far as distribution of cement by the S.T.C. is concerned, there is to be no change in the system. The Government somehow or the other seems to be convinced that the S.T.C. has acquitted itself very well and there is no necessity to change the horse in the middle of the stream. The Tariff Commission had also recommended that the existing arrangements be continued. This obviously would not be to the liking of the private sector as it had been demanding all along that the monopoly enjoyed by the S.T.C. in the distribution of cement should be put an end to. The revised price, according to official sources, will leave to the S.T.C. only a reasonable remuneration for the task of equalization of prices, procurement, transport and distribution, which the S.T.C. has to perform.

As a result of the increase the cost of building operations is likely to go up. Since more than half of consumption is accounted for by Government agencies and public sector works, it is clear that most of the brunt of rise in price will have to be borne by the public sector.

Foreign Trade

TRADE BETWEEN INDIA AND POLAND

TRADE BETWEEN India and Poland during the last few years has been increasing at a rapid pace. While imports from Poland in 1952 were of the order of Rs. 26 lakhs, in 1960 they were of the order of Rs. 299 lakhs. Exports to Poland in 1952 were worth Rs. 24 lakhs and they jumped to Rs. 359 lakhs in 1959. A significant point noticeable in the trade between these countries is that India has been having an adverse balance of trade more or less continuously starting from 1952. It was only in 1960 that one comes across a favourable balance of trade, which was to the tune of Rs. 36 lakhs. The table in the next Column in this context is self-explanatory.

(In rupees lakhs)

Year	Imports from Poland	Exports to Poland	Balance of Trade
1952	26	24	— 2
1953	17	9	— 8
1954	2,60	27	—2,33
1955	2,05	44	—1,61
1956	2,17	1,09	—1,08
1957	4,88	1,15	—3,73
1958	2,26	92	—1,34
1959	4,14	3,59	— 55
1960	2,99	3,35	+ 36

It is possible for both sides to develop the trade in future particularly because of the fact that long range planning is the rule in both Poland and in India. The Polish Trade Team which has arrived to have discussions with the Indian Government for finalizing the trade arrangements for 1962 seems to be hopeful on all scores. A frank exchange of views has taken place and the trade talks are in a successful stage. At present trade between India and Poland is governed by the three-year Trade Agreement which came into force on January 1, 1960. Under the terms of the Agreement, trade will be on a balanced basis and payments will be regulated through non-convertible Indian rupees.

The principal imports from Poland consist of items such as mining and drilling machinery, metal and wood working machine tools, electrical instruments, equipment, and appliances, electric motors, pumps and compressors, electric meters, rolling stock, dye-stuffs, pharmaceuticals including anti-biotics, vaccines and serums, photo materials and photo chemicals, newsprint, etc. Exports to Poland constitute mostly of commodities like shellac, coir products, hides and skins, iron ore, manganese ore, mica, castor oil and de-oiled cakes.

Since India requires large capital goods for the successful execution of her Third Five-Year Plan, Poland can fill the gap in certain ways. It has, for instance, specialised in delivery of equipment and technical services for the coal industry co-operation in this field can certainly be extended effectively. Co-operation can also be sought in regard to deliveries of Polish equipment for India's ore mines, power installations, tube-well and irrigation purposes, and a number of other plants, specially machine building factories. All said and done, it appears that trade and economic ties between India and Poland are likely to grow in the years to come.

Minor Irrigation

SETTING UP OF ENGINEERING CELLS IN STATES

OF LATE, there has been a greater emphasis on minor irrigation works to increase agricultural production. This emphasis is to be welcomed as minor irrigation

INVEST WISELY AND WELL

You may be prudent enough to save a portion of your income, but perhaps you are hesitant to decide on a safe investment.

Let this not disturb you. The State Bank is in touch with the leading brokers and will make their expert advice available to you quickly and without charge.

The State Bank will also keep your investments in safe custody and collect and credit to your account interest and dividends as and when they fall due.

It does not matter where you reside—the State Bank has a net-work of offices through which it offers to place these and other services at your disposal.

Why not talk things over with our nearest Bank Agent or write for information?

The State Bank's branch at Delhi, one of more than nine hundred offices waiting to serve you throughout India.

STATE BANK OF INDIA
INDIA'S LEADING BANK

Now...from the Trombay Plant of UNION CARBIDE INDIA

"Union Carbide" glacial Acetic Acid will meet the needs of India's growing pharmaceutical, textiles and dyestuffs industries—to name only a few. Glacial Acetic Acid produced by Union Carbide India is free from metals and higher acids and is of

uniform strength because production is based on a carefully controlled, continuous process.

For your requirements of Acetic Acid or for further information write to your nearest Union Carbide India Office.

works are easier to execute and cost much less than the medium irrigation works do. In 1959-60 the irrigation potential available on account of these works was utilized only to the tune of 46 per cent during the khariff season and 69 per cent during the rabi season. Since there is a vast unutilized capacity, it is imperative that the irrigation potential available on account of minor irrigation works be fully harnessed. Under the Third Five-Year Plan, it is proposed to increase the area under minor irrigation works from 3.9 million acres to 47.5 million acres (net).

The two-day Northern Regional Conference on minor irrigation, which concluded its session recently, has come out with various suggestions to accelerate the minor irrigation programme. The setting up of special engineering cells in all States to deal with technical aspects of minor irrigation schemes in a unified and integrated manner is one of the main recommendations of the regional conference. Urgent steps have also been called for to remove procedural delays in matters like sanctioning estimates, entering into works agreements and granting financial assistance to cultivators. Taking due note of the rising cost of minor irrigation works, research and training in the technique of design and construction with a view to bringing down the costs have been rightly called for.

For satisfactory maintenance of works belonging to groups of cultivators like tanks, anicuts it has been suggested that responsibility for maintenance should be increasingly placed on the local organizations like panchayats and co-operatives. These organizations should be provided with necessary statutory powers and finance, as well as technical staff.

Another of the important recommendations is that any saving that might be effected out of funds allocated for agriculture should be diverted only to the minor irrigation programme. It has also been urged that a certain percentage of electric power potential available in the States should be set apart for use on agricultural pumping.

The recommendations pertain to many of the aspects of minor irrigation works and, if implemented, can go a long way to bring about greater co-ordination and technical competence in planning.

Transport

RURAL ROADS

WHILE IT is proclaimed that no village should remain more than four miles away from a metalled road by the end of the Third Plan, it is a pity that the necessary priority has not so far been given to road building in the rural areas. The attitude of the States is not co-operative as they feel that they will not be able to contribute the funds that have been asked for. The Centre's plan is to construct 80,000 miles of roads in the rural areas at a cost of Rs. 180 crores. The money asked for from the States is to the tune of Rs. 50 crores, contribution by the Central Government Rs. 50 crores and contribution of the people to the tune of Rs. 80 crores, largely through manual labour.

The demand that the States should set apart 10 per cent of their allocations for road building seems quite reasonable. Since development of roads in the rural areas can contribute to increased agricultural production, it seems fair and justified that the States should exert themselves to find out the required resources. The community development movement has done valuable work in the field of road construction. It has, for instance, been responsible for the construction of 80,000 miles of new roads and improvement of 1 lakh miles of old roads. All this goes to prove that the panchayats can pull their weight and if they are backed up with money and also given the legal power to levy

taxes for the purpose of road building, significant progress can be achieved.

It may be a worthwhile proposition to consider that a part of the levy on sugarcane should be used for improving road communication in the areas concerned. But what is actually happening is that much of it is being absorbed in the general revenues of the States. A beginning in this direction was made in one cane growing area in Mysore, but later on the cess money came to be regarded as part of the State's general revenue, as in the rest of the country.

Now that the creation of a fund for the development of rural roads in India has been accepted in principle by the Transport Development Council, it should strengthen the hands of the Union Transport Ministry, which has been sedulously and tenaciously fostering this idea and pressing the Planning Commission to reconcile itself to it. It is not difficult to raise the required amount for construction of rural roads under the present Plan if the States take courage in both hands and remain prepared to meet the exigencies of the situation.

Agricultural Labour

BRINGING ABOUT ECONOMIC BETTERMENT

WHILE A number of constructive steps are being taken to improve the lot of landless agricultural labourers in more or less every State, Maharashtra appears to have taken the lead. A number of measures to secure an increase in the per capita income of the landless agricultural labourers in Maharashtra to the extent of 33.34 per cent during the Third Plan in order to reduce the disparity in their economic conditions have been recommended by the Study Group on landless agricultural labourers set up by the State Consultative Committee on the Third Five-Year Plan. The disparity in the economic conditions of the landless agricultural labourers and that of the State's population is so wide that one is simply amazed at it. According to the survey on agricultural labourers, conducted under the National Sample Survey in the year 1956-57, the per capita income of the agricultural labourer was Rs. 91 as against the per capita State income of about Rs. 335.

The various recommendations of the Study Group for improving the economic condition of the landless agricultural labour are: grant of land to them by means of ceiling on land holdings; setting up of industries based on local resources; constructional activities and the programme of milk production and poultry farming.

Assuming that the increase in the per capita income for the State's population as a whole would be about 16 to 17 per cent during the Third Plan period, the Study Group has recommended that in order to reduce the disparity between the income of the landless agricultural labourers and that of the State's population as a whole, the target for the growth in per capita income of landless agricultural labour should be fixed at 33 to 34 per cent.

It cannot be denied that an immediate solution of the problem lies in the industrialisation of rural areas. A pilot scheme of a District Industrial Board on the pattern of Housing Board or the State Electricity Board, consisting of officials and non-officials has, therefore, been suggested for three districts—one each for Vidharbha, Marathwada and the rest of Maharashtra. The Study Group feels that there should be a board at the State level as recommended by the Planning Commission to keep a constant watch over and to make recommendations regarding the programme of economic betterment of landless agricultural labour. The recommendations of the Study Group touch the very root of the problem and if properly implemented, can go a long way in bringing about economic betterment of landless agricultural labour.

FROM THE CAPITAL'S CORRIDORS

U.S. BUSINESSMEN IN DELHI

THE Indian Round-table of the Business International which concluded its session this week in New Delhi was by and large a success. It helped to eliminate to a large extent the 'psychological barriers' which stood in the way of American investment in this country and created an atmosphere for more collaboration and joint ventures. The American businessmen and industrialists seemed to have been impressed by India's economic development since Independence, its political stability, its tremendous resources and its potentialities as a wide market.

The discussions took place at various levels and the members of the Business International had a very large number of questions to pose like the status of the Private Sector in the Indian economy, the economic significance of Socialist Pattern of Society, the possibilities of limits on the returns on foreign investment, and so on. It is gathered that generally they were satisfied with the replies they received.

A pertinent question they had for the Prime Minister was: "You defined a capitalist society the other day as an acquisitive society interested solely in 'grab'. Would you put enlightened industrial countries such as the U.S. and the U.K. in this category? In your view, does the profit motive make a private industrial corporation incapable of voluntarily acting with a social conscience in the national (or international) interest?" And along with this they tried to seek clarification on the nature of Socialist Pattern of Society. A spokesman for the Indian view point told them that the Government of India's policy was not rigidly ideological and was based on practical and economic considerations. There was neither totalitarian planning nor rationed consumption in this country. Thus it was made clear that the Government did not consider the private corporations incapable of acting with a social conscience in the national interest.

The Indian spokesmen also tried to clarify the U.S. investors' question regarding their difficulties in collaborating with Indian firms with a minority holding because of the U.S. anti-trust laws. The Indian spokesman indicated that but for such an arrangement it would be difficult, if not altogether impossible, for indigenous entrepreneurs to stand on their own legs. It was further noticed that Indian collaborators had never tried to take an undue advantage of their position in the majority holding undertakings.

Another important question was regarding the delays that take place in various ministries at various levels. The question was put to the Ministry of Commerce and Industry: "The most common complaint of businessmen in India is that practically everything needs to be approved by the Government of India, that because of the overload of work on key officials decisions are delayed and business planning suffers. What can be done to speed up decisions and to reduce the number of matters on which Government approval is required?" For instance they questioned the necessity of approval by three different groups before capital imports for new projects could be executed. These are Licensing Committee, the Capital Goods Committee and the Controller of Imports and Exports. Another triple check that was maintained on the foreign financing aspects of a new project, they indicated, was by the Licensing Committee, Controller of Capital Issues and the Reserve Bank. They very rightly suggested that the multiple controls could be eliminated.

BUSINESS INTERNATIONAL AND THE COMPANY LAW ADMINISTRATION

The Business International posed a question to the Company Law Department in respect of senior execu-

tives. It said, "The present Indian law allows for negotiation on the compensation of foreign senior executives. However, in view of the limitations on compensation established by Indian statutes, these negotiations can prove unsatisfactory. Is there any prospect for an improvement in this situation?"

The answer by the Company Law Administration was: "The reference to 'senior executives' in the question is apparently to executives acting as directors, managing directors, whole-time directors and managers. The relevant provisions of the Companies Act apply only to public companies and such private companies as are subsidiaries of public companies, and do not seek to regulate the remuneration of other categories of employees in the service of companies, except where such employees are associates of the managing agents or secretaries and treasurers of the said companies, in which case Government's approval is required to the contract between the Company and the employees for rendering of services by the latter. These powers of approval have been conferred on the Central Government, because Parliament was anxious to ensure that the management expenses of public companies and their subsidiaries, in which the public had a stake were not disproportionate to the resources and profit earning capacity of the companies, and that salaries of individual members of the top management were fixed at reasonable figures, in conformity with the prevailing levels obtaining in industry and the legitimate expectations of the top managerial personnel in this country. In the case of foreign managerial personnel employed in this country, their previous remuneration and legitimate expectations are duly taken into account. Action by the Government of India on individual application is taken on the recommendation of an independent body, the Company Law Advisory Commission, to consider what reasonable figures of remuneration in the light of the statutory maxima, should be fixed as remuneration for particular individuals or agencies concerned with the top management of trade and industry. The interposition of an Independent Advisory Commission, consisting wholly of eminent non-officials familiar with the working of the corporate sector, and presided over, as at present, by an entirely disinterested person, ensures that, in the exercise of the discretionary powers conferred on Government, they have the advantage of a careful assessment of the merits of individual cases by a body of competent people, who are generally familiar with company methods and practices and can be expected at the same time to take a broad view of the responsibilities of company management both to their stockholders and the general public. No serious practical difficulty has been experienced in exercising the discretionary powers vested in Government under the statutory rules."

\$20 MILLION U.S. LOAN TO INDIA

Under an agreement with the United States, the Government of India has now secured a loan of \$20 million, (Rs. 9.5 crores), which will be channelled through the U.S. Development Loan Fund and repayable in rupees for the import of non-ferrous metals. The agreement was signed by Mr. L. K. Jha, Secretary, Ministry of Finance, Department of Economic Affairs, and Mr. J. K. Galbraith, U.S. Ambassador in India. The loan will, it is stated, be utilised in the United States for the procurement of aluminium, copper and zinc to help make full use of the additional industrial capacities released in India in recent years. Much of the metal will be processed into final form at plants in India. The resulting products will be used mainly in products in the field of power, transportation and communication. The major part of the imports of non-ferrous metals will be used in the fabrication of electri-

cal equipment such as transformers, motors, generators, switch-gear and overhead lines for railway electrification and also in the manufacture of machinery components for chemical, sugar, tea, paper, automobile and storage battery industries.

TERMS OF REFERENCE OF BONUS PANEL

The terms of reference of the Bonus Panel to be constituted by the Government shortly were settled at a meeting held last week of the tripartite sub-committee on Bonus held under the chairmanship of Mr. Gulzari Lal Nanda, the Union Minister of Labour and Employment. The Commission will consist of Mr. M. R. Meher, Chairman, two independent members, two representatives of the employers, one from the private sector and another from the public sector, and two nominees of the workers' organisations. As soon as the names of the employers' and workers' representatives are communicated to the Government, an official notification setting up the Commission will be issued. The two independent members on the Commission, it is understood, will be Mr. M. Govinda Reddy and Dr. Ganguli, the Director of Delhi School of Economics.

Regarding the banking industry, the sub-committee is understood to have taken the view that though the question of bonus in the banking industry was before the Desai Tribunal, there could be no bar to the bank employees presenting their case before the Commission. The banking industry had earlier represented that they be excluded from the purview of the Bonus Commission as the tribunal presided over by Mr. Justice Desai was seized of the bonus question at present. The employees had, however, opposed such exclusion as the reference to tribunal in their view was of a limited nature.

The sub-committee did not make any major changes in the draft terms of reference which emerged out of the discussions at Bangalore earlier this month. The terms of reference include the following:

To define the concept of bonus and to consider in relation to industrial employment, the question of payment of bonus, based on profits and recommended principles for computation of bonus and methods of payments. The term "industrial employments" will include employment in private sector and in establishments in the public sector now departmentally run which compete directly with the establishments in the private sector.

To determine the extent to which the quantum of bonus should be influenced by the prevailing level of remuneration and the need for improving productivity; to determine what the prior charges should be and how they should be calculated under different circumstances; and to determine other conditions under which bonus payments should be made, unit-wise industry-wise or industry-cum-region wise.

MODE OF PAYMENT

The Commission will examine whether the bonus due to workers beyond a specified amount should be paid in the form of national savings certificates or in other form. It will also consider whether there should be lower limits irrespective of losses in a particular establishment and upper limits for distribution in one year and, if so, the manner of carrying forward profits and losses over a prescribed period. Further, it will suggest an appropriate machinery and method for the settlement of bonus disputes and will make such other recommendation on which employers' and workers' representatives are agreed.

L.I.C.'S MASS POLICY

A proposal for launching a "revolutionary" scheme of "mass" life insurance policy is being actively considered by the Life Insurance Corporation of India it is learnt. The Actuarial Department of the Corporation has been asked to work out a uniform premium rate for all age groups which a mass scheme will entail.

The mass insurance of the type envisaged by the Corporation is not known to exist anywhere in the world. The idea, it may be recalled, was first mooted by the Chairman of the Corporation, Mr. P. A. Gopalakrishnan. The essence of the scheme is that an institution will take a policy on behalf of all its employees who will be charged the same rate of premium, irrespective of their age. The consolidated amount for all the employees in the form will reach the LIC, which is thus relieved of the burden of maintaining individual accounts and keeping track of the "status" of each policy holder from time to time.

Apart from the laborious work of making individual entries in each policy, the maintenance of records of millions of policyholders for long periods is a stupendous task. The problem of finding space for keeping the records is said to be acute. In other countries this is overcome by resort to microfilms.

Another advantage of the "revolutionary" scheme is that a mass policy offers an easy, sure and automatic way of spreading insurance business quickly. The enormous labour and time taken in door to door canvassing for individual policies can also be saved.

HIGHER ALUMINIUM CAPACITY

The Planning Commission has approved a proposal for two new projects with aluminium output capacity of 35,000 tons and 25,000 tons respectively, which together will raise the total capacity from existing target of the Third Five-Year Plan of 87,500 tons to 142,500 tons. It is understood that even this is not considered to be the final target for the industry because the Government is considering to take up more schemes in the private sector. One of these is a unit to produce 30,000 metric tons aluminium ingot (60 per cent electrolytic grade) with 15,000 metric tons of aluminium fabrication plant. It will manufacture 60,000 metric tons of alumina. An Industrial Licence for this unit has been granted to Bharat Aluminium Corporation Limited, Mysore. The licence is subject to the condition that issue of industrial licence did not involve any commitment on the part of the Government in respect of electrical power, availability of bauxite, release of foreign exchange, import of capital goods and machinery etc., and that, before Government accorded their approval to the other important aspects of the project such as issue of capital, foreign exchange financing, terms of foreign collaboration, etc., the project should have been fully investigated and satisfaction given on all relevant matters, such as availability of power and raw materials in adequate quantities, availability of external finance, technical collaboration arrangements and a firm plan for export as proposed by the party in their application.

The other proposal is for a 25,000 tons smelter in the public sector. The Planning Commission has agreed to approve this capacity as and when the scheme takes shape.

The decision to increase aluminium capacity has been taken in view of the rising demand for electrolytic copper, and the relatively meagre possibility of increasing its domestic production during the Third Plan. Expansion is under way of the Indian Aluminium Company's plant at Hubli by 10,000 tons per annum and Alwaye by 5,000 tons; a smelter at Rihand of 20,000 tons capacity; a smelter at Koyna of 20,000 capacity; a smelter near Salem of 10,000 capacity; and expansion of the Aluminium Corporation of India by 5,000 tons. It is also gathered that a sub-committee appointed by the Development Council for non-ferrous metals recommended that the target be fixed at 150,000 tons. It has, however, been suggested that before raising the capacity, bauxite deposits in the country should be correctly assessed and the availability of power should be ensured.

BAUXITE EXPORTS

The Government of India have decided to allow the export of 3,50,000 tons of bauxite annually for the

next two years from now. Of this quantity, 1,50,000 tons of bauxite will be allowed for export from the ports of Saurashtra and one lakh tons each from Bombay and Calcutta. Exports will be allowed irrespective of the origin of the bauxite. For some time past, the Government have been reviewing the export policy of bauxite in view of the rapid development of the aluminium industry in India on a massive scale. Having regard to the export commitments already made by Indian exporters with the overseas buyers, the present policy of allowing exports up to 3,50,000 tons annually has been decided as a short-term policy for the next two years. Exporters are advised not to enter into any commitments beyond this period of two years.

PROMOTING REGIONAL TRADE: AFRO-ASIAN MOVE

At a Press Conference in New Delhi recently, Dr. Mohammed Ali Rifaat, Secretary General of the Afro-Asian Organization for Economic Co-operation, revealed that 38 Asian and African countries will meet in New Delhi in the middle of December in an unofficial conference to discuss what the Afro-Asian region can do to protect itself from the adverse impact of the economic groupings elsewhere. The main subjects that are likely to come up before the Conference are: possibilities of increasing regional trade in specified market commodities along with the world trade, impact of external groupings on the trade and the economic development of Afro-Asian countries through mutual aid and investment. The ultimate aim of the Afro-Asian Organization for Economic Co-operation, Dr. Rifaat mentioned, was to form an Afro-Asian common market. But, as has been realized by the members, this can only be achieved in stages, of which the formation of a Limited Payments Union would probably be one.

An important point made by the Secretary General was that the Conference would have much to say about the French attempt to weaken the economic solidarity of Africa by organizing a separate group of African countries formerly under French occupation.

The Conference will be sponsored by the Afro-Asian Organization for Economic Co-operation and will last from 11th December to 15th December, 1961.

The organization consists of the following organs: the Conference, the Council and the Centre. Its main objectives as laid down by its constitution are: to foster collaboration among the national chambers of commerce, industry and agriculture, their Federations and such other similar institutions; to promote better understanding and cordial relations among the peoples of Africa and Asia; and to achieve increased co-operation among the Afro-Asian countries in the economic field in order to realize higher standards of living among their peoples.

INDIA-CEYLON TRADE AGREEMENT

India-Ceylon Trade Agreement signed in New Delhi this week, comes into force with immediate effect and will remain in force until it is modified or terminated by either contracting party on giving three months' notice to the other party. The two Governments have undertaken on the basis of mutual advantage to maintain as far as practicable the traditional pattern of trade hitherto existing and to explore all possibilities, through consultation from time to time of expanding trade and of trading in new goods. They have further undertaken to give full consideration to the suggestion made by either party for facilitating the export and import of specific commodities. The agreement is expected to alleviate the difficulties currently encountered with regard to the exports of coconut oil, copra and rubber from Ceylon to India and the exports of dried-fish, bidis, jaggery, tamarind and handloom textiles from India to Ceylon.

RESTRICTED EXPORTS OF TETXILES TO U.K.

Hong Kong has undertaken to restrict the export of cotton textiles to the United Kingdom throughout 1962. Adjustments have been made to the current cotton textile agreement with the Indian and Pakistan cotton industries for 1962 to bring them in line with the new Hong Kong arrangements.

BASIC QUOTAS

Details of the 1962 arrangements for Hong Kong are: The total basic quota will be increased to 185 million square yards (annual rate) from the present 164 million. Of this 100 million square yards are for made-up goods. The remaining 20 million square yards will be allocated, at the Hong Kong Government's discretion, between these categories.

In the case of India the total basic quota will be increased to 195 million square yards from the present 175 million. For Pakistan the total basic quota will be increased to 42.4 million square yards from the present 38 million.

SUPPLEMENTARY QUOTAS

In addition to the increased basic quotas, reviews of the state of trade will be made every three months, starting in November 1961, with a view to the issue of supplementary quotas for the three Commonwealth countries. The supplementary quotas will be intended to enable the three Commonwealth countries to compete for their normal share of the market. The supplementary quotas will be related to the rate of imports from other countries and account will also be taken of conditions in the United Kingdom industry. The system provides that supplementary quotas calculated in accordance with an agreed formula will be issued in full if the average length of order books in the United Kingdom cotton weaving industry, according to the Cotton Board's return, is twenty weeks or more; when order books are less than twenty weeks, deductions will be made according to an agreed scale; when order books are fifteen weeks or less, no supplementary quota will be issued. The supplementary quotas so calculated will be divided between India, Pakistan and Hong Kong in proportion to their basic quotas.

Independently of the review arrangements described above, supplementary quotas are being issued forthwith in respect of the year 1961 as follows: 10 million square yards for Hong Kong, 11 million square yards for India and 2.5 million square yards for Pakistan.

A target share for imports from the three Commonwealth countries has been set at 85 per cent of retained imports into the United Kingdom from all sources of grey cloth and of the cloth equivalent of made-up goods, plus 20 per cent of the retained imports from all sources of cloth other than grey cloth. The import figures will be examined every three months, starting in November 1961, and if the 'target share' of the three Commonwealth countries for the latest three months for which figures are available exceeds the quarterly rate of the basic quotas for 1962, i.e. 106 million square yards per quarter, a supplementary quota equal to the difference will be issued, provided that the state of weavers' order books in the United Kingdom industry does not require a reduction in the supplement as so calculated. The rate of reduction of the supplement when order books are between 15 and 20 weeks is as follows:

Order Books	Abatement
20.0 weeks	0%
19.0 weeks	5%
18.0 weeks	15%
17.0 weeks	25%
16.0 weeks	50%
15.0 weeks	100%

MEET
THE
DEMAND**

Rising steel production requires more and more vital raw material, iron and manganese ore, limestone, coal, dolomite, and refractories... New plants need essential water treatment processes... Agriculture requires tubewells in greater volume... the country's growing markets demand more jute products, paper, electricity, steel structurals and castings. And the Birds/Heilgers group is always there to spur their production... to meet these demands. But expansion doesn't stifle achievement. Nearly a hundred years of experience and research continues as Birds strive harder to bring you better products and better materials to keep pace with India's fast expanding economy.

Company Meeting

MODI SPINNING & WEAVING MILLS COMPANY LIMITED, MODINAGAR

Speech of the Chairman, Rai Bahadur Seth Gujar Mal Modi

The following is the speech delivered by Rai Bahadur Seth Gujar Mal Modi, Chairman, Modi Spinning & Weaving Mills Co., Ltd., Modinagar, at the 15th Annual General Meeting of the Shareholders of the Company on 31st October, 1961.

Ladies & Gentlemen,

It is a matter of great pleasure for me to welcome you at this 15th Annual General Meeting of the Shareholders of the Company. The Directors' Report and the Audited Accounts have been with you for some time now and with your permission I shall take them as read.

I have to report with immense pleasure that the results of the Company for the year ended 30th April, 1961, have enabled your Board to recommend 17 per cent dividend (inclusive of 8 per cent interim dividend already paid) subject to tax. This compares most favourably with last year's results as only 13 per cent dividend, subject to tax, was declared. It is gratifying to note when we compare the results of production, earnings and turnover of the Company for this year with that of last year. The production during the year is worth Rs. 654.21 lakhs against last year's production of Rs. 543.96 lakhs, showing an increase of about 20 per cent. Similarly the sales have also increased to the extent of Rs. 647.12 lakhs against the last year's figures of Rs. 581.09 lakhs showing an increase of 11.4 per cent. The net revenue earnings have also increased from Rs. 584.39 lakhs to Rs. 651.35 lakhs this year, and the net surplus has increased from Rs. 16.01 to Rs. 21.73 lakhs showing a net increase in the profits to the extent of 35.7 per cent.

I am glad to record that on account of the additions, alterations and extensive renovation we have made during the year under review by installing one Hot Pin and Clip Stenter, one Mercerising machine and 2 Sets of High productive Combing equipments consisting of combers with requisite preparatory machine, on which we have spent about Rs. 20.55 lakhs, the quality of our yarn and cotton cloth has immensely improved. We are further adding one Sanforizing machine in cloth section and high drafting plant and 6,400 spindles in yarn section, which will further improve the quality and production.

The Cotton year of 1960 was a most difficult one and the production of cotton which was estimated at 48 lakh bales crop was reduced to 38 lakh bales resulting in a short production of 21 per cent in comparison to the estimates. Due to the acute scarcity of cotton it resulted in a sharp increase in prices and non-availability of good quality of cotton. Every year nearly Rs. 70 crores are drained out from the country by way of import of cotton after adjusting the export of short staple cotton to other countries. The cost of Indian cotton is very high and thus it hampers the export trade of cotton fabrics to the Eastern countries where it has an established trade. More attention is required to be given to produce improved quality of cotton in the country, otherwise the Indian cotton fabrics are bound to diminish gradually as the importing countries are becoming self-sufficient in the matter of cotton textiles.

Agricultural improvement in the country is not such a process which may bring immediate effective

results but it will be a matter of satisfaction if due attention is paid to it. Adequate drainage of the fields is as important as irrigation. I believe it has not yet been realised that immense loss has been caused by the floods due to the defective drainage system. In some cases irrigation facilities have caused floods even in such areas where there were deserts. Construction of canals, culverts and roads without providing drainage has affected the natural flow. Thus the attention should be paid to the drainage.

In olden days only natural fibres — cotton, wool and silk were available for making fabrics. The natural silk fibre has now become so costly that it is not within the reach of common man. Therefore, various new synthetic fibres have come within the living memory. Their coming has made a considerable difference to us not only Industrially and Economically but also Socially. The introduction of synthetic fibre along with the natural fibres were very popular in Twenties. It is one of the main reasons that the fabrics produced by foreign countries are more attractive than that of ours because they have got the facilities of having blended yarn.

Similarly, wool is also very expensive and is sometimes scarce. India spends Rs. 10 crores per year for the import of wool from the foreign countries. The blending of wool with the synthetic fibre enabled fabrics and garments look like all wool to enter the market at a lower price range. Further more, most of the natural fibres have defects of one kind or another and the man-made fibre when properly applied in blends helped to correct these deficiencies and increase the strength and durability. Another factor which is advantageous in blending of man-made fibres is that the price of man-made fibres is much more stable than that of natural fibres which varies from year to year according to the harvest and consequently the price of blend is more stable than that of the natural fibres alone. Low moisture regain, high strength, chemical resistance, biological resistance are few of these which have made it possible for synthetic fabrics to find quite new uses, such as, for productive clothing, out-door furnishing, industrial filters, etc.

Most of the man-made fibres are made from timbers and chemicals. To grow timber is much more easier than to grow cotton and our country is very well favourably placed to grow timber suitable for producing synthetic fibres. In the World man-made fibres are leading the way to cheaper products and forcing the natural fibres which are sold at soaring prices, down to a reasonable price. The production of man-made fibres is increasing in multiples throughout the World.

The total reported area of India is 72.10 crore acres out of which the cropped area is 36.85 crore acres and the non-agricultural land is 11.62 crore acres. Out of the cropped area 1.98 crore acres is already under the cotton sowing and every year near about Rs. 70 crores are spent by importing the foreign cotton. India's population is 44 crores and it is increasing at the rate of 2 per cent per annum. It imports

its food cereals to the value of Rs. 140 crores. Food always comes first. Thus it is desirable to supplement the need of fabrics. More attention be paid to its forestry. India's forests cover 2.69 lakh square miles, being about 21.3 per cent of the total geographical area of the country. The productivity per acre per annum is 3.0 cft. which is substantially below the yield of forests in other countries, such as, France 56.8 cft., Japan 37.0 cft. and the U.S.A. 18.0 cft. 5 acres of forests can give a ton of synthetic yarn per annum while to get one ton of cotton, it requires 11 acres of land. When we are already in short of cereals attention for growing more pine trees be given for producing synthetic fibres.

Another method of making synthetic fibre is to utilise cotton linters. In India it is not a practice to delint the cotton seed. Generally cotton seed is fed to cattle without removing such cotton linters. It is one of the major reasons that the feeding of cotton harms cattle and their milk is reduced. If the cotton lint is removed and cotton cakes are used for animal feeding then out of 18 lakh tons of cotton seed produced in India, it is expected that 90,000 tons of cotton lint, being 5 per cent of the total cotton seed, and 2,16,000 tons cotton seed oil being 12 per cent of the seed, may be obtained. Cotton seed oil is used throughout the world as best edible oil. A simple change in habit of using the cotton seed cake instead of cotton seed will bring a saving of Rs. 42 crores in the shape of oil and Rs. 4 crores in the shape of cotton lint for which already there is an acute shortage in the country.

It is not easy to change the minds of villagers who have been accustomed to use seed but the Government could take steps to educate them.

India is the biggest sugar producing country of the world and molasses is one of the important by-product of the sugar factories. By distillation of the same and with chemical treatment the alcohol produced is mixed with the cotton lint to produce the synthetic fibre

called Acetate Yarn which is much superior than any other synthetic fibre. Its use is increasing very rapidly throughout the world.

Two months back I alongwith your Managing Director went for World Tour to study the methods of production of various new fabrics in different parts of the world and we are fortunate to have succeeded in studying the various Textile and Synthetic factories there. In collaboration with some important foreign firm we propose to instal shortly one synthetic fibre producing Plant, which will involve about Rs. 10 crores, but it is expected that more than half of the total investment will be available to us from foreign collaboration.

I must mention herein that synthetic fibre commonly known as "Artificial Silk" does not command the support for its expansion which it should deserve. Though it has not got the remotest relation with silk, it is more near to cotton fabrics. It is, therefore, expected that the false prejudice against artificial silk would go.

You will be glad to know that various other expansion schemes are under Government consideration and we hope that we shall be able to achieve substantial expansion.

The relations between the labour and the Management in our Factory have been very cordial for which I congratulate all concerned.

I am glad to inform you that the results of 6 months current year working are encouraging and very satisfactory.

Before I conclude I sincerely thank all of you and record a high appreciation for the services rendered by the staff and workers of the Company who are mainly responsible for the results which are before you.

Note: This does not purport to be a record of the proceedings of the meeting.

A letter to the Editor

INDIAN ECONOMIC POLICY AND DEVELOPMENT

Dear Sir,

In reviewing Professor Bauer's new book, "Indian Economic Policy and Development", "Odysseus" writes: "Development expenditure on elementary education... is less than the corresponding figure in the First Plan despite the rise in prices, the increase in population and the doubling of total planned outlay." ("The Eastern Economist", June 16, 1961, p. 1381).

The facts are that development expenditure on elementary education rose from Rs. 85 crores in the First Plan to Rs. 209 crores in the Third Plan (see The Third Five-Year Plan, Draft Report, Part II, chapter on Education, Table 2). Even allowing for the price rise, this represents more than a doubling of Plan expenditure on elementary education.

Does the mistake lie with Professor Bauer, with the Third Plan or with "Odysseus"? In any event, someone appears to have been guilty of a very careless use of statistics.

Yours etc.,
Michael Lipton,
Apelbergsgatan 50, III, Stockholm, C.

Odysseus comments:

I have now been in touch with Professor P. T. Bauer, who replies to Mr. Lipton as follows:

"When quoting you, Mr. Lipton omits to mention that the passage in your review and in my book referred to the Second Plan — not the Third. This effectively disposes of the text of his letter.

In the statistics given in the final version of the Third Plan, p. 577, development expenditure on elementary education under the Second Plan is shown as practically identical with that under the First Plan in spite of the increase in population and the rise in prices which confirms the substance of my argument. My contention that the figure was actually less under the Second Plan than under the First Plan, was based on comparing the official figures given either in "Appraisal and Prospects" or the Second Plan itself with the corresponding figure under the First Plan.

Sd/- P. T. Baur.

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LIMITED

(Incorporated in England)

Notice is hereby given that the Board of Directors of this Company have declared payment of an Interim Dividend on the Company's Preference Stock for the year ending 31st March 1962 at the rate of £2-14-8.16/49d. per cent less Income Tax at 7s. 9d. in the pound equal to £1-13-6d. per cent. Payment will be made on 1st December, 1961 to those stockholders whose names are registered in the Company's Stock Register on 15th November, 1961.

Applications for transfers received in this office before 12 o'clock noon on Wednesday, the 15th November, 1961, will, if otherwise satisfactory, be registered at that date for the purpose of participation in the above dividend.

BY ORDER OF THE BOARD,

COMPANY AFFAIRS

CAPITAL ISSUES

The Controller of Capital Issues has granted consent to eight companies for the issue of a total capital of Rs. 7.23 crores. The consent is valid for a period of 12 months in each case.

Indian Refineries Ltd., Delhi, has been granted consent to issue further capital of the order of Rs. 600 lakhs in equity shares of Rs. 1,000 each for cash at par. The proceeds would be utilized for the completion of refineries at Gauhati and Barauni. The Company's present paid up capital is Rs. 8.89 crores.

United Malleable Co. Ltd., Bombay, has been granted consent to the issue of capital of Rs. 85 lakhs in equity shares of Rs. 100 each at par. Out of this issue, 23,900 shares will be offered to Union Manufacturing Co. of Ohio, USA, or their nominees in part payment for the supply of plant and machinery and the balance will be subscribed in India for cash. The proceeds will be utilized for the manufacture of malleable iron pipe fittings.

Shama Engine Valves Ltd., Delhi, has been granted consent to the issue of capital of Rs. 15 lakhs divided into Rs. 11.25 lakhs in equity shares and Rs. 3.75 lakhs in preference shares. The proceeds will be utilized for the manufacture of valves for heat engines and internal combustion engines.

Business Credit and Finance Corporation Ltd., Bombay, has been allowed to increase its capital by Rs. 15 lakhs for expansion of its activities.

Harbans Lal Malhotra and Sons Private Limited of Calcutta, manufacturers of steel blades etc., has been granted consent to the issue of 3,300 bonus shares of Rs. 100 each on capitalization of its reserves to the extent of Rs. 3,30,000. The present paid up capital of the Company is Rs. 5 lakhs.

Automotive Manufacturers Private Limited, Bombay, has a paid up capital of Rs. 10 lakhs all in equity. It has been granted consent to issue bonus shares of Rs. 2,50,000 in the ratio of one bonus share for every four equity shares held. The Company's main business is to work as assemblers of motor trucks, buses and other vehicles and also to work as main dealer of Leyland Jeep, Albion trucks, buses, vehicles and diesel engines.

Girdhardas Harivallavdas Mills Ltd., Ahmedabad, has been granted consent to the issue of bonus capital of Rs. 1.50 lakhs on capitalization of the Company's reserves to a like extent. The bonus shares will be of the value of Rs. 125 each and will be allotted to the holders of the existing 4,800 equity shares in the ratio of one bonus share for every four equity shares held.

DELHI CLOTH AND GENERAL MILLS

The Delhi Cloth and General Mills recorded the highest figure in profits before taxation for the working of 1960-61. The profits at Rs. 3.20 crores were nearly double the previous year's figure of Rs. 1.83 crores. These high profits are reflected in higher dividends paid at the rate of 13 per cent per ordinary share. This again is the highest figure in the Company's history for the last ten years. The profits for the year after deduction of all expenses, depreciation and taxes came to Rs. 1.49 crores. Dividends on ordinary shares would take away Rs. 44.12 lakhs and those on preference shares Rs. 4.27

lakhs. The Directors have decided to set aside Rs. 50 lakhs for development reserves, and another sum of Rs. 50 lakhs towards reserves called 'Fall in Prices'.

The Directors have reported that the textile units in India and Pakistan continue to show good results, and their renovation and modernisation are continuing. The Company has maintained its position with regard to the exports of cloth both from India and Pakistan. The silk section has turned the corner and future results are expected to be satisfactory. The working of the Chemical and Vanaspati divisions of the Company continued to be satisfactory and the Sugar division's results were normal. However, the Directors have reported that in view of the very large increase in production of sugar in the country, the future of the sugar industry is likely to cause anxious times in the coming years. The distillery working of the Company during the year was normal. The tent business of the Company was discontinued during the year.

Regarding diversification of manufacturing lines, the Directors have reported that the Company has undertaken installation of two new plants, viz., P.V.C. plant of 20 tons per day capacity together with ancillary units of calcium carbide and chlorine and caustic soda and a rayon tyre cord plant of 10 tons per day capacity for the manufacture of high tenacity rayon tyre cord yarn and fabrics. Agreements for the supply of know-how and machinery for these projects have been entered into with reputed firms of Japan and the United States of America. The plants will employ the latest technique and equipment in the field. The factories will be located at Kota, Rajasthan. The foreign exchange requirements of the proposed venture were to be met from deferred payments and long term loans from foreign financing institutions. The financial requirements in Indian currency were to be met partly from the issue of ordinary and preference shares and partly from loans and advances from banks and other sources and the issue of debentures.

KINNISON JUTE

During the year to March 31, 1961, the Kinnison Jute Mills Co. Ltd., worked with between 19 and 9 per cent looms sealed and the hours of work remained most of the time 48, but towards early February, they were reduced to 42½. The Company, however, continued its efforts to modernise the mills and various types of machinery were ordered. It is reported that in May 1960 there was a further rise in jute prices consequent on the adverse weather conditions, which affected the 1960-61 crop in the early stages of its growth. But the Indian Jute Mills Association tried to control the prices to some extent. However, towards October, the prices advanced further. The IJMA tried to work out a quota system. This, to some extent, had a restrictive effect on purchases of jute goods by foreign buyers. Nevertheless, the Company was able to make a profit of Rs. 29.55 lakhs. After making provision for depreciation and taxation to the extent of Rs. 9.09 lakhs and Rs. 9.82 lakhs respectively, the Directors transferred Rs. 1.51 lakhs to statutory development rebate reserve, Rs. 3 lakhs to machinery replacement reserve and Rs. 50,000 to general reserves. An interim dividend on ordinary shares was paid at the rate of Rs. 5 per share of Rs. 100 each. In the final payment, another sum of Rs. 2 per share has been provided making a total of Rs. 7 per share per annum.

Skilled hands working with the touch of steel—steel weaving in and out of fabric, making a pattern or sewing together, steel fashions the clothes we wear. Fine needle to giant machinery in modern cloth mills, much of the textile industry's equipment is shaped from steel—tons of steel are required to produce the fabrics which clothe our millions. Soon we shall know abundance in an even greater measure—the finest textile at a price all can afford. Soon all this will be ours as there is a little more steel for each of us. Towards this end, IISCO is working—for more steel to help you and you and you—in serving you we help the Nation and that is our privilege.

The Prime Minister in America

THE enthusiastic reception accorded to the Prime Minister in the United States has naturally given great satisfaction to the Indian people. The report that the first meeting between President Kennedy and the Prime Minister has been, in the President's words, "very fine", leads to the hope that there may be accord on Vietnam and Laos if not on the thorny question of nuclear tests. There is no doubt that the Prime Minister enjoys with the United States Administration a somewhat happier position than he does with the American public. It is openly argued that American public opinion will not give very much under the Prime Minister's persuasion, although he has made a very effective impact in his first television appearance. It is stated that there will be somewhat greater difficulty at the National Press Club where some inconsistencies in India's thinking might be chosen for attack. But it must be immediately apparent that the climate of public opinion in the United States has been somewhat muddled not by our policies, but by our personalities, notably that of Mr. Krishna Menon's handling of Indian affairs in the United Nations.

The argument being presented increasingly in the election campaign in the North-Bombay constituency that Mr. Krishna Menon is doing no more than representing the Prime Minister faithfully is obviously untrue in relation at least to the United States. Pointed comment was made on the television programme to Mr. Krishna Menon's speeches in respect of nuclear tests in which he placed the United States and the Soviet Union in the same camp. The Prime Minister has taken no such stand, and has fairly and squarely placed the blame on the Soviet Union in regard to the breaking of the moratorium on the current tests. Policies look different in different hands; in other words, personalities can vitiate policies. This implies, quite apart from the method of communication chosen, that it is possible for policies to appear different at the receiving end by the choice of spokesmen for this country. It is a fact not open to argument that Mr. Krishna Menon has built up an innate resistance in the majority of Americans, which makes the understanding of Indian policy difficult there by the aversion which he has often raised. The Prime Minister has, for a decade, refused to recognise the damage that is done when American public opinion is thus incensed. It will be a major success of the present

visit if the Prime Minister recognized, once and for all, that it cannot pay dividends deliberately to irritate and anger American public opinion. This is not a matter of political pressure by the United States requiring the Prime Minister to shed his Defence Minister. It is simply enlightened public relations in terms of the growing need of our countries for more understanding and goodwill.

At the present time, the chances of a larger agreement on nuclear testing have been promoted by the Prime Minister's tact in admitting that he could not advise the United States on its own policy in regard to its own security. It is true that this statement is somewhat ambivalent, since the Prime Minister himself has advised all those testing nuclear weapons to cease such tests. It is a fair implication from this general appeal that the Prime Minister wishes the United States to desist from such tests, and thus, in point of fact, on nuclear testing—as on Goa—we have a policy which in practical diplomacy we are unable to state without ambiguity under all conditions. This is an undoubted weakness in Indian thinking at the present time. The habit of making very forceful statements, and then subduing them to suit expediency, is likely to reduce both our sense of moral fervour and the respect we enjoy abroad.

While, therefore, there has been success in the capable and adroit manner in which the Prime Minister has avoided opinions likely to upset American opinion, one cannot help feeling that this has been obtained at the price of the clear definition of standards which, at one time or another, have been keystones of Indian policy. It may be that India has here a lesson for herself far greater than any lesson which she can teach. Politics remains the art of the possible, and not dogmatic opinions, however attractive as ideals, cannot often survive in the hard world of reality. Not the least advantage of the Prime Minister's present trip is that he has come face to face with basic realities—the intense dislike that Mr. Krishna Menon arouses in the United States, and the need for adjusting his sails on nuclear tests to the prevailing political wind. Can one dare to hope that the impression left on the Prime Minister might endure beyond his stay in the United States?

The Swatantra Manifesto

THE draft election manifesto of the Swatantra Party which carries the appropriate heading "To Prosperity Through Freedom" is a well argued and consistent piece of political presentation. The current abuse of the party as "reactionary" and "big business-dominated" is certainly unfair in the light of the presentation here of a wide area of "sharing of prosperity", particularly in terms of the small man, agricultural labour and, indeed, "progress-sharing" in general. Article 45 makes the fairly revolutionary proposal for precise provision for progress sharing through increased wages, alongside an increase in productivity without detriment to the overall aim of national prosperity through the reduction of costs. There is here no evidence of exploitation of the poor by the rich which is part of the stock-in-trade criticism by the Congress of this new party. It has its weaknesses, largely in terms of its failure to guarantee progress; but it is at least alive to the ravages that public sectorism can make on individual self-reliance.

The Swatantra Party can claim that it presents the discontented voters with a different ideology and, indeed, a different outlook. It borrows, however, from the fount of political power which is the Gandhian legend, making, perhaps, the undue claim that it stands by the principles of Mahatma Gandhi who pleaded that "that Government is best which governs the least, and diffusion of power provides the best climate for freedom so that people might grow into their full stature."

All in all, this is an attractive theoretical document. One's disappointment with it is that it has moved a little too much to the Right for the current appetite of the Indian people. It is probable that the Congress Party's excessive governance and, indeed, its serious failures in Power and Transport—which have been highlighted this week in the Planning Commission's "agonising reappraisal"—have erred severely at the other end. What the country needs at this moment is a via media between the Swatantra concept of

individual liberty and the Congress concept of growing interference and intervention of an inefficient State.

The voter will still be heavily on the Congress side, but this makes no difference to the value of the Swatantra approach as providing a brake. Economic development requires in India both an accelerator and a brake. The public sector in the last ten years has provided a substantial volume of economic development on its own and by its increase in purchasing power through deficit financing and full order books it has given the private sector a vital shot in the arm which was badly needed. The private sector in India cannot provide its own salvation, and, therefore, it is a mistake for the Swatantra Party to overdo the individual incentive approach. Nevertheless, just as an economy which has an accelerator needs a brake, the wise voter will recognise that the Swatantra Party in opposition is a necessary appendage to the State intervention of the Congress Party. This is a Manifesto for an Opposition and not for a Government. That is as it should be since, in fact, no reasonable person wishes the

Congress to be displaced from the Government in this country at this stage.

Whether other governments will provide less corruption, on which the Swatantra Party has not a little to say, may be a more debatable question. The apparatus of the Indian thinking is at the moment excessively obsessed by corruption. It would seem some of the supporters of the Swatantra Party are not free from the weaknesses which have shown themselves in the Congress machine. Who then should throw the first stone? Corruption is a potent weapon of attack against the party in power, but it is doubtful whether it permits of the same polarisation of policy which should be the base of an election programme.

All in all, however, one must congratulate those who have framed the Manifesto of the Swatantra Party in that they have concentrated in a concise form both a philosophy and a plan of action which is new in Indian political life. It is hoped that, for its prime function, which is to place a brake on the monolithic power of the Congress effectively to promote individual effort and freedom, it will have significant success at the polls.

The Commonwealth Press Union

THE meetings of the Ninth Quinquennial Commonwealth Press Union Conference in Karachi and Delhi last week have been rightly reckoned as the most successful that the Union has had in its half century's active existence. It is natural to connect much of the new interest in the meetings with the personality of the leading journalists of the Commonwealth who have, for the first time, received a mighty visual impact of the true importance in the Commonwealth of India and Pakistan. The receiving end, of what might be called the Western spectrum, was remarkably well prepared for this new appreciation. Apart from the size of the United Kingdom, Australian and Canadian delegations, greater than ever before, there has been a tremendous assembly of the top-most lights in the Press firmament. The United Kingdom delegation included, in addition to the Hon'ble Gavin Astor of *The Times*, Chairman of the CPU, Lord Burnham of the *Daily Telegraph*, Mr. Laurence Scott of the *Manchester Guardian*, Sir Linton Andrews, formerly of the *Yorkshire Post*, Mr. Thomas Atkins and Mr. Hugh Cudlipp of the *Daily Mirror Group*, Mr. Charles Eade of the *Daily Mail* and not least of all Mr. Roy Thomson, the new pattern of newspaper baron, who has awakened much romantic interest in his calling; at the Conference, however, he commanded no universal acclamation in his thesis that the business side must dominate editorial eminence.

In the last analysis, every conference is made up by the quality of its members. This Conference was treated, both in Pakistan and India, as the foremost conference of the Press ever held. Hospitality was extensive and even embarrassing; indeed, in India it is still continuing and, in East Pakistan, still to come. A vast organisation has been set up in both countries to show the numerous guests and their wives that they are not merely welcome but that we have, on both sides, great objects of world interest in men and projects, which should capture their attention, first, and that of their newspapers in appropriate time. Most of the delegates agreed that the space given to the Commonwealth Conference was inadequate, although a resolution more specifically phrased in these terms was lost.

Nevertheless, the resolutions passed showed an active reflection of the determination of the members of the Conference to do something more than debate their common interests. Important resolutions referred to a reduction in telecommunication rates and also of some postal rates to make the receiving of all papers in the Commonwealth easier. Other resolutions referred to the freedom of the Press, on which speeches spoke openly of the new despotism, both real and disguised. Ceylon was almost in everyone's mind where a terrible incursion into the freedom of the Press is contemplated as a bill in the Legislative Assembly, which the Commonwealth Press Union sincerely hopes will not be passed. Many United Kingdom speakers drew attention to more subtle influence at work, some within the judiciary itself where publication has been restrained by injunctions, sometimes even in chambers on an ex-parte application. We in India have no special plea to make on this particular point, but it is quite clear that both in India and Pakistan the freedom of the Press cannot be taken for granted: in Pakistan, of course, things are much more difficult than in India.

All in all, the meeting was of special value as indicating not merely a live new interest in the Commonwealth but in providing a new determination, clearly visible, of the intangible ties which are supposed to hold together a somewhat amorphous group. The Commonwealth Press Union thus emerged as a powerful instrument of common approach and discussions on the changing character of the Commonwealth showed that colour and race were no longer elements of difference in proceedings of this kind. More than ever the feeling has been created that members of the Commonwealth have lost their race prejudices; we have increasingly lost the chip upon our shoulders. This great increase of friendliness and trust is, in the long run, more important than the resolutions which were passed. In any case, there can be no doubt that the professional association of Commonwealth newspapermen has been brought appreciably closer as a result of the true meeting of minds which has taken place.

Guest Editorial

Virtues and Defects of Dear Money

By PAUL BAREAU, Editor of 'The Statist'

THE decision of the British authorities to reduce interest rates long before the task which dear money was intended to tackle has been completed, has unleashed a great debate on the virtues and defects of dear money. The authorities have moved slowly but it is the direction of their initiative which is significant. The Bank of England rate has begun to slide from the crisis level of 7 per cent to which it was raised last July and in two steps has now come down to 6 per cent.

Against this some purists, not to say masochists, have raised their voices in protest. They argue, quite rightly, that the basic reasons for which the July measures were introduced still apply. The balance of payments is still in deficit. The pressure on manpower resources, though a little less severe than it was three months ago, should still, by every standard of full employment, be regarded as high. The crucial battle against inflationary increases in wages has yet to be fought.

This is perhaps painting the picture in unduly dark colours. There are some hopeful signs in the situation. One of them is the speed with which bank advances are being reduced. Over the past three months they have fallen by an average of nearly £25 million a week. The boom in retail trade is not quite as buoyant as it was. Increased competitiveness in industry has led to a narrowing of profit margins and in some notable cases — as for example in the well-known companies of Cunard and Courtaulds — to sizable reductions in profits and cuts in dividend.

This in turn has led to what is probably the most powerful single deflationary factor in the present situation, namely a sharp decline in the value of Stock Exchange securities. Gone are the days when lavish expenditure was being met by quick profits on the Stock Exchange. The speculators today are nursing their wounds. They have also been warned by the Chancellor of the Exchequer that before long he will introduce further legislation to tax quick "in and out" profits, whether in Stock Exchange securities or in property.

Admitting all this, the orthodox school clings to its argument that interest rates do not begin to "bite" on an inflated economy such as Britain's until they are geared to a Bank rate of 7 per cent. They therefore deplore the reductions that have taken place even though these reductions have been accompanied by statements from the Bank and the Treasury that they betoken no real relaxation in credit policy.

While admitting that changes in Bank inevitably carry with them psychological implications which may be more powerful than the direct consequences of the changes themselves, the truth surely is that interest rates should be regarded as one of the many controls available to the monetary authorities. Anchored as they are in Britain to a Bank rate of 6 per cent, these rates still reflect relatively dear money. This is an important control — far more important in Britain than it is, say, in India, where I have often been assured by officials that interest rate policy is irrelevant to the problems of a country which is in the process of industrialising itself and is beset by a tremendous shortage of capital and a constant tendency for the balance of payments to be unbalanced.

In Britain the prophylactic of dear money is powerful because it acts at tens of thousands of

points of the economy, both in its private and public sectors. When, however, it affects a country whose currency is as widely used in international trade and capital payments as Britain, dear money also has side effects which cannot be disregarded. It is these side effects which probably bear the main responsibility for the decision to get interest rates back to a somewhat lower level.

The 7 per cent Bank rate has been a serious burden to the British balance of payments. It has increased the cost of British exports by raising the price of export credits. In some large capital goods operations this factor alone has meant the difference between securing and losing the order. This has been particularly true in the shipbuilding industry where orders for two large tankers have recently been lost to British yards by reason of the cost of the credit.

Far more direct and important, however, has been the burden to the balance of payments caused by the attraction to London of a large volume of foreign short term money pulled to this market by the highly attractive rates it has been able to earn. This is unwanted hot money and it has to be remunerated at a price which Britain is unable to afford.

The impact of this inflow of unwanted capital has been admirably and also ominously illustrated by the end-October gold and convertible currency reserve figures. These show that the reserve fell by £8 million during the month, but this was after special capital payments of at least £120 million. The biggest item in this was the repayment of £100 million to the International Monetary Fund. Other once-for-all transactions included, very significantly, a withdrawal of £11 million worth of dollars from the reserves by Nigeria.

It follows that during October the relatively high interest rates in Britain must have attracted well over £100 million of hot money. This, and this alone provided sufficient justification for the fall in Bank rate and for the decline in market rates which has followed. Indeed, it may be questioned whether the flow of hot money will be effectively checked by rates of interest anchored to a 6 per cent Bank rate and, therefore, still well above what can be earned in other international markets.

In this context it should be borne in mind that the European money market is becoming increasingly internationalised. The restoration of confidence in currencies which followed the July measures in Britain and the International Monetary Fund meeting in Vienna, has created a situation in which capital has again been tending to move from one centre to another without cover of the exchange risk by the appropriate forward exchange transaction. If the expense of this forward exchange transaction is avoided, the disparity in interest rates immediately becomes more potent than it would otherwise have been. The flood of hot money to London must without question be linked to this development in the European money market situation. In the circumstances, the two modest cuts in Bank rate would appear to have been wholly appropriate not only for the sake of sterling but for that of other currencies, including the dollar, which were being involved in the rush of hot money to London.

A DELHI DIARY

CRACKERS — AND CRACKERS!

I DO not know whether there have been many weeks which include both the explosive Mr. Guy Fawkes and Diwali. In any case, this week both the West and the East were very busy at using their crackers. Of course, there are crackers — and crackers. Mr. Nikita Khrushchev's crackers, it now transpires, are, in megaton value, about 50 per cent more than all those used by the United States and Britain combined; although, as he skilfully indicated for propaganda purposes, he is still short in terms of numbers. Thus it seems explosions have a somewhat variable element in quality. Our own Diwali explosions on Tuesday and Wednesday are happily, at the bottom of the list. But I must confess that even at a distance of five yards a Diwali cracker now frightens me almost out of my skin. I am quite clear that I shall not be able to take an explosion of greater magnitude at any time in the future. A learned medical friend tells me that I have been reading too much about radioactive fallout and Strontium-90. I have certainly viewed with great distaste the coloured fireworks ordinarily on display at Diwali time. Can it be that others, besides myself, are being infected by the peculiar literature which now paints Strontium-90 and Carbon-16 in a most disagreeable light? When we were young — many nuclear ages ago — Strontium was a wonderful and romantic chemical which gave colour to flasks as well as to fireworks. Today Strontium-90 has got the pallor of death. Thus it seems that the great megaton explosions have now succeeded in destroying some of the happiest days in Indian life.

THE DELHI-WASHINGTON AXIS

Interest in Delhi outside Diwali has concentrated almost entirely on the Prime Minister's movements in the United States. A very large number of people to my knowledge waited till 11.30 on Thursday night to hear the Prime Minister's address to the National Press Club at Washington, beamed over, I expect, by some special arrangement, which it seems can bear repetition so as to enable India to listen in to important happenings in Washington. The Prime Minister has

been the soul of discretion, but one wonders whether or not he has not yielded something to atmosphere. And a ghost still walks that land. It is called Krishna Menon. We were naturally intrigued on Wednesday when we were told that, this atmosphere notwithstanding, Mr. Krishna Menon had decided to return to New York so as to be present for the General Assembly's Special Session which is to be addressed by the Prime Minister. No one need accuse the Defence Minister of lack of courage or of an unwillingness to become again the cynosure of all eyes. But can it be argued that India's choice in personalities is also not subject to some of the exigencies of political necessity, which have shaken the Kremlin, and have moved a revered body as well as a ghost?

THE UNIVERSITY YOUTH FESTIVAL

I just have time to deal with an inspiring domestic event. This is the Seventh Inter-University Youth Festival which has been held in the Talkatora Gardens from October 25 to 31. This is the first occasion on which I have intimately connected myself with its activities and which have left me enthusiastic about its organisation and nostalgic for youth. No one present could have failed to have seen how extraordinarily vital the festival was in all respects but particularly in music, dancing, drama and debates. There were 36 participating universities and a new experiment in organisation was conducted by having a resourceful person attached to each so that a travelling encyclopaedia more or less accompanied the team, deprived of its library and the usual college facilities. In the result, the group discussions showed that the libraries were not a necessary adjunct to knowledge. Of particular interest was the standard maintained in debates of which I can bear witness in many cases. I doubt very much whether any fall of standards has taken place in the last thirty years, during which those of us who have lived in what we believe was the golden age of university education have developed calculated distrust of modern standards. Both in terms of language and quality the debates were up to the best of thirty years ago. It may be the teams were carefully chosen but since they were chosen from thirty-six universities, there is enough to suggest that there is widespread quality and significant volume even if the sample was not representative.

Apart from quality, may I add that the freedom of movement and the readiness with which boys and girls as well as teachers and students mixed was an inspiring example of how the States of the Indian Union can live and work as one? It was appropriate that in his welcome message to the participants, Mr. Prem Kirpal, Secretary to the Government of India, Ministry of Education, should have referred to what he called "the real grandeur of the festival and what it seeks to symbolise — the picture of a young India resurgent with idealism of the highest kind, pulsating with intellectual vigour and full of promise for providing leadership of the right type to the country in future". Our warmest congratulations should go to the Ministry of Education which has evolved a new pattern of Inter-University Education which, I dare say, is as good as anything anywhere in the world.

ARGUS.

What a Life!

Well, what should we talk about first — Krishna Menon or the rest of the world?

150 YEARS

1811-1961

KRUPP

For 150 years, the name of Krupp has been identified with superb workmanship and enduring quality.

The name of Krupp is also linked with outstanding pioneer work, past and present, in many fields of industrial research, planning and manufacture.

The results achieved have caused the name of Krupp to be permanently associated with progress in engineering throughout the world. Illustrated on this page is one of the more than 3,000 items contained in our Catalogue "KRUPP PRODUCTS AND SERVICES": Full-port level-luffing wharf cranes.

Products and Services:

Exploration of mineral deposits · Engineering of mining schemes · Design, layout, and supply of plant for the production and processing of ferrous and non-ferrous metals · Preparation and dressing plant for ore, coal, and other minerals · Chemical-process plant · Cement, lime, and gypsum plant · Bridges, hydraulic structures, and reinforced-concrete structures · Materials, pressure vessels, and tanks for nuclear reactors · Castings and forgings · Rolls · WIDIA-sintered carbide · Magnetic materials · Cable-making and stranding machines · Hydraulic extruders · Machinery for the rubber and plastics industries · Edible oil extraction plant · Sheet-metal working and can-making machinery · Mobile water purifiers · Plate and sheet-metal fabrications · Pneumatic tools · Motor trucks, buses, and special-purpose vehicles · Diesel and electric locomotives · Special-purpose freight cars · Ocean-going vessels and river craft · Diesel engines · Giant excavators and bulk-handling plant · Power shovels and cranes.

THE WEEK'S NOTES

The U.N.

DAG'S SUCCESSOR

THE GENERAL ASSEMBLY'S unanimous vote installing U. Thant as the interim Secretary-General of the United Nations for the period to April, 1963, when the term of office of late Dag Hammarskjöld was to expire, augurs well for this august body. Protracted negotiations, extending over nearly six weeks, had been carried on for the purpose on the crucial point raised by the Soviet Union on modification of the powers of the U.N. Secretary-General, divesting them into three persons—the Secretary-General and his two deputies to be selected from the two power blocs. The Western Powers, especially the United States, had been opposed to this Troika in which they saw the seeds of reduction of the office of the Secretary-General to a purile one. The Soviet Union, confronted with this firm stand of the U.S.A., has shown commendable resilience and flexibility in its approach.

U Thant as the acting Secretary-General will not be fettered by any conditions and limitations other than those stipulated in the U.N. Charter itself. He is not to be compelled to choose any specific number of deputies and on considerations of political divisions in the world. Of course, following his eminent predecessor, he is likely to have his principal aides from various regions of the world. But since these aides will not have any right of veto, the Secretary-General will have the ultimate authority to decide and execute his decisions. The U.N. today faces a critical period ahead not only in regard to the secession of Katanga from the Central Congo or on the question of Berlin, but also in respect of the all-important issue of disarmament. Only a firm handling by the Secretary-General of his office within the limitations of the U.N. Charter can help in solving these problems.

Though the Soviet Union has refrained from precipitating a crisis on the choice of the acting Secretary-General, it still does not appear to have abandoned its stand on the revision of the U.N. Charter in respect of the appointment of a permanent Secretary-General. It wants this office to be remodelled on the Troika principle. But since there is now ample time to negotiate on the issue, a solution satisfactory to both the power blocs and the other interests concerned at the U.N. will perhaps be found out in course of time.

Punjabi Suba

AKALIS' ANGER

THE IRE with which the Akali Dal has greeted the Union Government's announcement on setting up of a three-member Commission under the chairmanship of a former Chief Justice of India, Mr. S. R. Das, to go into the grievances of the Sikhs and their charge of being discriminated against, does little credit to the Akali leadership. The Commission has been constituted in fulfilment of Prime Minister Nehru's promise made during the recent fast of Master Tara Singh, the veteran Akali leader. The Akali Dal is said to be dissatisfied with the announcement due to four reasons: firstly, that the Dal was not consulted before the constitution of the Commission; secondly, two members of the Commission may have bias against the Sikhs' complaint; thirdly, the terms of reference of the Commission do not contain a specific reference to the Akali demand for Punjabi Suba; and fourthly, the time allowed to the Commission for submission of its report is too short.

These objections, however, are hardly tenable. The Prime Minister has stated, and rightly, that the appointment of the Commission is a prerogative of the Govern-

ment which it cannot forego under any circumstances. Moreover, the announcement is in line with the statements of the Government, particularly that of October 1, 1961, which paved the way for the breaking of the 48-day fast by Master Tara Singh. Perhaps the Dal had been nursing a mistaken belief that there would be a specific mention to the Punjabi Suba issue in the Commission's terms of reference. But at no stage the Prime Minister had agreed to this. Similarly, the three members of the Commission are men of high integrity and to suspect that they would not act independently because of the association of the Chairman with the Punjab High Court before he was elevated to the Supreme Court and the desire expressed by another member to contest election to the Lok Sabha on Congress ticket is unwarranted. Such misgivings can be expressed against any person howsoever he might have distinguished himself in his sphere of activity. The two months' time given to the Commission to make its report is also quite appropriate because the Government is anxious to avoid exploitation of this issue in the ensuing election. It is, indeed, surprising that the Akali Dal which has been fighting for a Punjabi Suba and levelling all sorts of charges of discrimination against the Sikhs should find itself unprepared with its case. The Akali Dal's threat to boycott the Commission if carried out will be unfortunate. It will do irreparable harm to its own cause.

Commonwealth

U.K.'S RESTRICTIONS ON IMMIGRANTS

THE RESTRICTIONS proposed to be imposed by the British Government on immigrants through a legislative act are likely to provide interest in most of the Commonwealth countries. There is no doubt that a large number of Commonwealth citizens have been having free entry into Britain and they now will find it slightly difficult, if not impossible, to do so. The British Government recently sent an 'aide-memoire' to India about the proposal for this legislative measure. It was indicated that the total number of immigrants from the Commonwealth countries in 1960 was nearly 58,000 out of which 50,000 were from Jamaica and the remaining 8,000 from the Indo-Pak sub-continent. Estimates for 1961 placed the number of immigrants at 100,000 out of which Indians and Pakistanis were expected to number 15,000. The mounting number seems to have provoked the legislation. By and large these restrictions might be interpreted as discrimination on the part of Britain because there were no restrictions whatsoever on British passport-holders regarding entry, period of stay and taking up of any type of employment in India. The international practice in this respect has been one of reciprocity. The contemplated restrictions might give a feeling that there was a tinge of discrimination against the coloured races. It might be pointed out, however, that the British Government had tried to make it very clear that that in no way was the intention. It has been contended that the pressure of immigration has been posing a serious social problem, mostly for reasons of employment. While it is appreciated that a great majority of immigrants from India were making a valuable contribution to the British economy, it is feared that immigrant labour may be a dead-weight in a period of slump. But this legislation is also to be viewed from another angle. As far as India is concerned the Government here has for some time past been discouraging emigration to U.K. of unskilled labour. The proposed legislation will, therefore, only substantiate the measures adopted to curb such emigration.

CLOSER CONTROL OF FLOW AND LIQUID LEVEL

...with Honeywell's Differential Converter

USE THIS mercuryless remote transmitter for practically any application requiring precise high-speed measurement of flow or liquid level.

Accurate to within 1%, it's equally fast in response up the scale or down. Range is continually adjustable in the field.

Honeywell is the recognized world's leader in the design and manufacture of automatic control equipment. An organization of more than 30,000 persons, with factories in the United States, Canada, France, Germany, Holland, Japan and the United Kingdom, Honeywell products are used in scores of widely diversified fields.

Honeywell products—more than 13,000 of them—fall into these three principal categories:

Heating and air conditioning controls and control systems for residences and industrial, commercial, public and educational buildings.
Instruments and instrumentation systems, process controls and control systems, valves, precision switches and data processing systems for business and industry.
Precision electronic instruments and control systems for aircraft and missiles.

The World Abroad

AN INTERNATIONAL CIVIL SERVICE FOR DEVELOPMENT

By
ODYSSEUS

BARBARA WARD made an outstanding contribution to the recent conference at Oxford, sponsored by the U.S. Council on World Tensions (304 East 42nd St. New York) and the UK Overseas Development Institute (160 Piccadilly, London W.1.)

Miss Ward believes that a new theme is emerging in world relations. In place of nation states, allied or hostile, she sees a new sense of the whole human race involved in thrusting back subsistence agriculture and marginal trade, and moving towards universal higher standards of living. I hope that she is right. She is certainly right in insisting that if the objective moves away from shoring up allies to promoting a world take-off, new attitudes are required not only in donors but also in recipients of aid.

Recipients must undertake nation-wide planning, avoid waste by ensuring competent execution and action against social bottlenecks to modernisation (some of which we looked at here last week). Donors must find not annual but long-term funds, lower or abolish their tariffs against the manufactures of developing countries, and create cadres of career technicians to administer and pass on skills.

Miss Ward points out that the West has no adequate plans for enlisting career technicians. She observes that some developing countries lack sufficient administrators, technicians, and experienced planners. These countries need technical help in making surveys, devising plans, and carrying them out. Such men exist in the West, but there is no common register where they can be found, no adequate system of recruiting them, or ensuring them stable careers. There is almost no liaison between governments, UN agencies, foundations and universities, to co-ordinate the dispatch overseas of technicians. Most aid and recruitment has hitherto been ad hoc, but if development is to be made internationally systematic, it must be administered by competent career men and women.

More trained planners are wanted. At present there is no agency to recruit, train, and pool their experience. Many bodies, governments, universities, the World Bank, the IMF, etc., provide them, but the general scarcity means that too many second-rate men, who are worse than none, are sent. Moreover, some governments hesitate to accept expert advice on their plans from agencies which are subsequently to advance the money. Should an independent Institute of Development be set up? It would work closely with existing bodies, and governments and international agencies would be influenced by its advice, which would give weight to its recommendations locally. But its professional and objective character would derive from its international status.

Many developing countries will need, for the next ten years or so, trained men to help them carry out their plans. Present methods of recruiting are unsatisfactory. A man obtainable on a limited contract is liable to be one who has failed to make good elsewhere. He may lack the esprit de corps that goes with belonging to a recognised profession or service, and if he takes on a job merely to add to his savings before retirement, he may have a stop-gap attitude rather than the dedication and flexibility required.

CONTINUITY OF CAREERS

Miss Ward urges the Western governments to create a cadre of officers seconded for a period of development service. Western governments can act themselves to create a new kind of professional service. Ex-colonial civil servants in Africa could offer much in the way of experience and a sense of service. The French Government has devised a system of secondment, which enables men to serve locally without forfeiting their long-term prospects in the French service. A similar scheme may be developed by the British Government for East Africa since one of its essential features—the acceptance of financial responsibility for the official's future by the home government—has been adopted. It remains to be seen whether the responsibility will be interpreted imaginatively enough to encourage the younger officials to stay.

In ex-British West Africa, the opportunity has largely been missed. It is too soon to say whether Britain's new Department of Technical Assistance will give priority to the recruitment of able ex-officials as a possible cadre of administrators on whom developing governments may call. The re-organisation of ICA under the State Department provides an opportunity for the United States to select some of its experienced people for possible secondment. But approval would need to be given to their employment inside the government machines of the emergent states. Advisers cannot be administrators, and it is administrators who will often be the weakest link in development.

Some overseas governments, fearful of laying themselves open to the charge of "neo-colonialist" control may prefer not to look to London, Paris, or Brussels for help. They might turn more readily to an international administrative service. Essential to the success of such a service would be the quality of recruits and the continuity of career which it would offer.

The developing world is strewn with diagnoses—World Bank reports, UN surveys, etc. Prescriptions are piling up. The need is to persuade the patients to take the medicines. This is the responsibility of the international official on the spot. Ideally, he should be able to work not as an outside adviser, but as part of, and inside, the local administration. He must gain the confidence of local Ministers and officials. He must be known both for his impartiality and for his loyalty to the local government that he serves. Any hint of divided loyalties, or Cold War hankerings, rules out his influence. He must be ready for defeats and must not carry his resignation in his pocket. None of this is possible when a man is an outside "expert" available for a couple of years. He must be able to serve as long as the job needs him. In short, without careers, prospects, and security, the kind of man on whom successful development depends will not be available.

To some extent, development planners and administrators are a new need. But other, long recognised, needs also require re-examination. We all know that the developing countries are short of every kind of technician, above all educational and agricultural experts. Ideally, the various international agencies could estimate needs, recruit men, and guarantee careers. But, unhappily, their apparent unwillingness to co-

ordinate their activities, as well as the difficulties imposed on them by their need to maintain a balance of nationalities in their cadres, are handicaps. Perhaps the growing sense of urgency in world development will encourage closer co-ordination, but the calibre of the technicians recruited would be higher if they were engaged in a recognised international civil service.

Education is one field with special opportunities for British, American, Canadian, and French professionals. The languages of education in most of Africa, and in parts of Asia, are English and French. The need for educational expansion is tremendous and one way of ensuring recruitment, without vast new expense or bureaucratic complications, would be for Western Universities, and schools, to agree that in awarding professorships, and in choosing heads of institutions, they would take favourably into account readiness to serve not less than three years in a developing country. Once it was known that an assignment abroad, far from injuring domestic prospects, would appreciably improve them, the numbers, eagerness, and quality of applicants would increase.

CHAOS REIGNS!

The local administration of aid as it is today is sometimes chaotic. Indonesia has even asked for technical assistance to assist in dealing with the number of assisting agencies! If the idea of the "country plan" gains ground, and development planners are available to help to guide it, would it be possible for the agencies interested in aid to allot themselves roles within it? And if this degree of fusion is too radical, could they agree to representation on a single aid mission under a single chairman? Or at least two missions—one Western, the other United Nations. (The possibility of an Eastern Mission should not be excluded). The formation of a

Western Aid Group should make the idea of a single Western mission acceptable. The UN agencies in theory work through a country mission—but it seems to lack authority. As long as this is so, chaos reigns.

No successful answer has been found to the problem of audit. The aiding agencies have a right to try to get value for their capital, but seeing that they do so is a delicate political issue, which donor governments would be well advised to hand over to an international agency. Then, if the kind of audit needed can be settled in the master agreement setting up the framework of co-operation between the local community and the aiding government, the work can perhaps be kept out of politics.

The truth is, surely, that massive long-term economic development is a new world-wide activity. Hitherto, the efforts have rather resembled the great variety of private schemes—provident schemes, health schemes, housing schemes—which preceded the establishment of social insurance and welfare on a national scale. The change could not have been made without far-reaching changes in administration, in the development of new services, in the recruiting of new types of official. Something of the same administrative imagination is needed now to underpin a new world-wide career service of development planners and technicians.

And this need is, in turn, part of a wider challenge—to remove the work of world development from the subsidiary attention of the wealthy nations and to make it the central theme of their diplomacy, their international relationships, their philosophy of world order, their hopes for a future, in which not only groups and nations but the human race itself can hope to make this small planet into a habitable home.

Huge tonnages of iron ores from India flow into steel mills of Japan every day to be made into quality steel and steel products. Japanese steel producers, now achieving the 4th largest output in the world, thus contribute to solidify the trade relations between India and Japan. Japan Iron & Steel Exporters' Association invites you to inspect quality steel and steel products from Japan at The Indian Industries Fair.

BASF and **CASSELLA**

at the
Indian
Industries
Fair

BASF and CASSELLA, who bring to India a wide range of chemicals, dyestuffs and raw materials, are participating in the Indian Industries Fair at New Delhi from November 14, 1961 to January 1, 1962. Their display will consist of a large number of products of special interest to the Indian Industries.

BADISCHE ANILIN- & SODA-FABRIK AG, Ludwigshafen am Rhein, West Germany, is the largest individual complex of chemical industry on the European Continent. They manufacture more than 5,300 products, from Dyestuffs to Fertilizers to Magnetic Recording Tapes. There are BASF products for almost every branch of industry.

CASSELLA FARBWERKE MAINKUR AG, Frankfurt/Main-Fechenheim, West Germany, make a famous range of textile dyestuffs—and specialised products for the paper, leather, and paint industries. Come and see the BASF and CASSELLA stand in the West German Pavilion.

*The European Scene***THE COMMON MARKET'S ASSOCIATES**

From Our Special West European Correspondent

PARIS, November 4.

THE idea that the "associated countries" (essentially the former French, Belgian and Italian colonies in Africa and, eventually perhaps, the British colonies in that continent) will benefit from the preference of the Common Market in receiving aid and in selling their exports, is one that naturally disturbs other developing countries. It came up for discussion at a conference of Common Market economists in Bari (Italy) lately; what was said there was unofficial, but given the quality and responsibility of the participants, their views may be taken as representing the European approach to the question. They debated and finally endorsed a long report on the subject prepared by Messrs. Emilio Colombo, Hermann Abs (president of the Deutsche Bank), Robert Marjolin (vice-president of the ECM Commission), Hans von den Groeben (a member of that Commission), Baron de Lettenhove (chief of Belgian planning), Pierre Moussa (author of "The Proletarian Nations"), Pasquale Saraceno (professor at Venice), Jan Tinbergen (professor at Amsterdam) and Pierre Uri (formerly secretary of OEEC and now director of Lehman Bros. Bank). Briefly, these luminaries argued that Europe had to concern itself with assistance for all the developing nations, but that this global approach was perfectly consistent with a co-ordinated regional action aimed at Africa. Trade and aid relations between the industrialised nations and the developing nations had to be put on a multilateral basis as far as possible, but this was possible only up to a point: bilateral relations would persist between one or other Western nation and one or other of its former colonies. Similarly, the regional relations between the Common Market group and the group of associates, which have been in force since 1958, will and should endure.

The associates in question have a total population of 52 millions, which is a 25th part of the non-communist, non-European world. Why should Europe show special solicitude for this fraction? Surprisingly in an age when written promises are not taken very seriously, the first reason given was that the Six had bound themselves to do so in the Rome Treaty. Accessory reasons included: the importance of continuity in any aid effort, which made it desirable to maintain the direction chosen four years ago; the special experience that Continentals have acquired, during the colonial era, in these parts of the world; the geographical nearness of Africa and the special historical connection between it and Europe for centuries past; and finally the appearance of Communist influence in some African associates (a reference to Guinea, Mali and the Congo). The last two reasons, it will be noticed, would argue for European aid to all Africa, rather than simply to the favoured associates. Indeed, elsewhere the experts envisaged the extension of the list of associates, by addition of Britain's African friends in the event of Britain joining the Common Market.

More important for developing countries outside Africa, the report claimed to show that aid to the associates would take only a part (maybe 15 to 20 per cent) of the assistance that the Common Market should consent to give to development abroad. M. Mbeka, Finance Secretary of the Congo (Leopoldville) Government, protested that this was so only because the sums envisaged in the report were "ridiculously low", but the authors seemed to doubt whether the African states could absorb capital, at this early stage in their

development, on a really lavish scale. Indeed, of the \$581 million that the ECM Development Fund set aside for investment in associate territories between 1958 and end-1962, only half has so far been placed. Some will have to be carried forward to the next phase, if the Africans agree to renew the link with the ECM when it expires at the end of next year. How much financial aid should the Six count on giving them after 1962? The report's calculations on this point may well become official Common Market doctrine, so they should be of interest to those who imagine that Africa will claim too much of Europe's capital surplus.

Assuming that one has to invest \$3 to get a \$1 increase in gross national product, and knowing that the total GNP of the associates is now around \$6,000 million, an investment of \$180 to \$200 million yearly would be required to raise the GNP by 1 per cent. In fact, the population of these regions is rising by 2 per cent yearly, so it would need an outlay of \$400 million just to maintain current revenues per head. To increase per capita revenues by 3 per cent would require \$900 to \$1,000 million yearly in fresh investments. Such a rate of increase would be lower than that currently attained in the Common Market itself, so the gap between African and European living standards would widen. In order to begin closing that gap, the rate of increase of GNP should be carried to 7.5 per cent, and of per capita revenues to 5 per cent, annually. That would call for investment of \$1,500 million a year. Of that sum, between two-thirds and a half could be found by local governments and local private saving, leaving \$500 million or more to be found abroad. This foreign aid would come from all available sources, including the USA, the World Bank and the Development Aid Group. The Common Market could claim that it was making a very special contribution to the progress of its associates if it put up \$300 million a year. Compared with the \$581 million put up for the five years 1958-62, this would be a notable rise. (Actually, allocations were divided equally between those five years but were scheduled to rise from \$58 million in 1958 to \$224 million in 1962; the figure of \$300 million would still be a big rise over the latter sum.)

Now the GNP of the Common Market is \$160,000 million. If it were to devote 1 per cent of that sum to aid for development (and more is already being given by France; it only requires West Germany to come into line for this object to be approached), there should be \$1,600 million a year available for investment in the developing countries. The sum envisaged for the associates, \$300 million, is less than 20 per cent of that. Admittedly, if the African associates are to keep their GNP expanding by 7.5 per cent a year, investments must increase in like proportion. But they should be able to find at home a growing percentage of the capital required as development progress, and it would be sufficient for the Common Market to increase its contribution by 4 per cent a year, this being the rate at which its own GNP is growing.

The eminent authors of the report are fully aware (and I even more so, for I have reduced their argument to the bare figures) of the suspicion with which one must regard these calculations, which all begin from the disputed proposition that \$3 invested leads to \$1 extra revenue. However, when recipients are clamouring to know how much aid they can expect, when Europeans are anxiously asking whether they can afford the effort

necessary and when other developing countries are wondering whether Africa will not monopolise Europe's capital surplus, then there is a definite advantage in trying to put down in figures, however approximate, the cost of the Common Market's doctrine that the African associates have a special claim on its assistance. These hazardous reckonings could be a fair way from the truth without affecting the conclusion that the Common Market will be able to play a dominant role in the provision of capital to its African associates while still being able to play a far from negligible role in assisting development elsewhere in the world.

The other aspect of association is the customs preference that certain African products enjoy in the Common Market and which is denounced as discriminatory by other producers. The authors assert, curiously, that this should be put on the same level as the protection that all developing countries allow to their infant industries; Africa is more backward than most of Asia and Latin America, and industries like coffee, tea and hard fibres are quite young industries there, so they are entitled to special solicitude. Moreover, the degree of customs preference is high only for coffee, cocoa and bananas, and in such cases the Common Market and its associates are merely imitating the system of Commonwealth preferences that Britain and her friends have long practised, without being denounced for discrimination. In fact, they claim, the preference granted by the Common Market to its favoured partners is less marked, for many products and notably for fats, than that allowed by Britain to her friends. (The common external tariff on peanut oil and several other tropical goods is zero, so there is no discrimination.) However, the experts at Bari freely confessed that the method of customs preferences was unsatisfactory: it seemed prejudicial to other producers and at the same time it did not protect African associates from violent fluctuations in their export earnings. (They might sell inside the Common Market at prices higher than the world level, but those prices inevitably moved up and down with the world level.) So it was suggested that this customs advantage be replaced, at least in some cases and gradually, by a mechanism designed to stabilise export earnings. For example, without enjoying privileged access to European markets the African associates (and they alone among Europe's suppliers) would receive

advances from a jointly administered fund when their sales declined in value, which they would repay when their sales proceeds were abnormally high.

A similar arrangement has been practised by the French "regularisation funds" in favour of the colonies; it is now urged (and it is no secret that the West Germans want this) that it be generalised to cover the main associate exports to the Common Market as a whole. It would be combined with various other sorts of financial aid designed to improve the industries in question, but it would partially and gradually replace the advantage of customs preference. The calculation evidently is that non-associates would object less to this sort of discriminatory assistance than they do to preferential tariffs. At all events, certain African associates react badly to the suggestion, which they take to be an attempt to buy their tariff advantage for money; they reply that they want both the tariff advantage and the money, but in no case will they part with preferential customs. Their attitude will depend, I believe, on what happens to Commonwealth preferences when Britain joins the Common Market; if those preferences are abandoned or slashed, the associates will probably agree to surrender or moderate theirs. As long as Commonwealth preference stands, the associates will cling to the equivalent arrangements with the Common Market.

Finally, it was agreed at Bari that if associate status was envied or resented by other developing countries, the only solution was to offer it to such as cared to accept it. The entry of Britain should imply the extension of the list of associates but the report envisaged offering similar facilities to countries in Latin America and the Middle East. The form of association need not duplicate that enjoyed by present African associates (this being what Mr. Morarji Desai has said he would not touch with a bargepole), but could approximate to the special trade arrangements negotiated with Greece and Turkey. In other words, the Common Market should be ready to negotiate commercial treaties with any developing country, covering one or more products, in an effort to expand its markets in West Europe. The notion of "association", it can be seen, is becoming more fluid and it is being hasty to declare in advance that one would not touch it with a bargepole.

No liveried footmen or blazing chandeliers remain to proclaim the grandeur and gaiety that once pervaded the large red brick mansion that still stands in Calcutta's Hastings Street and which Warren Hastings, India's first Governor-General, built for his charming wife as her town house. For many years this fine residence was the scene of glittering assemblies and balls, the entrée to which was considered a high social privilege.

In 1827, No. 7 was acquired for the purpose of its business by the old established engineering firm of Burn & Company which occupied it for almost a century. By reason of its expanding business, Burn & Company found this historic building with its cobbled carriage drive and spacious rooms too small, and in 1925, the Company was forced to sever its link with this house of memories and moved to larger premises in Clive Street, where it joined hands with Martin & Co.

Today, the activities of Martin Burn Ltd. cover a wide range of engineering interests including those brought to it by the renowned firm of Burn & Company all of which are vital to the rapid development of India's industrialisation.

Economic Report from the U.S.

FREE ENTERPRISE — KEY TO SOCIAL PROGRESS

By GUY SIMS FITCH

NEW YORK, November 1.

IT is not unusual that businessmen would hold a meeting dedicated to the proposition that private enterprise has much to contribute to economic progress and welfare. The National Foreign Trade Council is no exception. The theme of its 48th Convention, held here this week, is "Free enterprise — key to social progress and preservation of freedom." This private organization comprising some 700 companies is the leader in the trade field, and represents a cross-section of business opinion on foreign economic policies. The annual convention of this group is always an important event. This year, with more than 2,000 U.S. business executives in attendance plus 400 Government officials, diplomats, educators, students and other observers, the views expressed inevitably are many and varied.

Yes, while differences of opinion are quite normal among these defenders of freedom in enterprise, there is one underlying thesis that constantly comes to the fore: continued support for distinctly liberal positions on international aid, trade and investment. In his keynote address, Carl J. Gilbert, Chairman of the Gillette Company of Boston, Massachusetts, stood solidly behind the Government's foreign assistance programmes, and offered cogent comment on private investment: "While both (government and private) forms of flow of capital are necessary," he said, "to permit the rapid improvement in standards of living . . . , direct private investment by American business in suitable local enterprises, well operated and fully supported by American technology, is an essential ingredient of any such programme." He noted that American owned plants in other countries directly provide jobs and income for more than three million persons. Less than one

percent of the jobs in these U.S.-owned plants abroad are held by U.S. nationals. His own company has only 21 Americans among 6,000 overseas employees. Another company has only one American among hundreds of employees at one of its overseas installations, and he is scheduled for replacement by a local employee as soon as the current training programme ends.

Mr. Gilbert also called attention to the need for a propitious investment climate on the one hand, and for U.S. companies to be good citizens of the most countries, on the other hand. They have "the duty to refrain for unfair labour practices, to maintain a high standard of quality — and to scrupulously conform to the laws and customs of the host countries," he said. But there is also another side to the coin. Exporters in other countries must have a fair opportunity to expand in turn their sales on the U.S. market. This is a real test of enlightened international economic programmes. Mr. Gilbert therefore rejected protectionism in trade, and instead advocated a further liberalization of the Trade Agreements Act, under which the U.S. for the past 27 years has led the world's expansion of trade and commerce.

President Kennedy and his aides are deeply concerned today with this problem. The Trade Agreements Act expires next June 30, and new legislation must be enacted. Unquestionably, any attempt to liberalize the act will meet with opposition from protectionists. Mr. Gilbert's stand, therefore, comes at a most opportune time. Representing an important business group, he has in effect strengthened the Kennedy administration's position on trade liberalization and its chances for gaining the support of a sizable body of the U.S. business community.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

REFINEMENT IN NATIONAL INCOME ESTIMATES

THE Third Session of the Indian Conference on Research in National Income held last week in Bombay focussed attention on the difficulties which the national income experts have had to face during the last decade. Ever since the appointment of the National Income Committee in 1951 under the guidance of Prof. P. C. Mahalanobis, Dr. V. K. R. V. Rao and Dr. D. R. Gadgil, the statisticians have repeatedly pointed out the slender basis on which some estimates are made, especially in such sectors as trade and the professions. There is considerable disagreement even regarding the computations made for the primary sector because the method of collecting statistics in this particular field needs vast improvements. Not much reliance is placed on the estimates of tertiary income as well, and there is a practice in this country for calculating quick estimates of national income to impute the value of income originating in this sector on the basis of the income in the primary and secondary sectors, implying that the income generated in the tertiary sector is related to the income from primary and secondary sectors.

There is a big gap between the estimates of agricultural production as presented by the Central Ministry of Food and Agriculture and the data thrown up by the consumption surveys conducted by the National Sample Survey. For purposes of uniformity, the National Income Unit has hitherto stuck to the procedure of adopting only the statistics presented by the Ministry of Food and Agriculture. In other words, even on the volume of output in the primary sector, there is considerable disagreement. The only sector about which it can be said that the estimates are trustworthy, is that of the organised industry which however forms only one-tenth of the total economy. The high degree of accuracy presented in the organised industrial sector does not add to the accuracy of the overall all-India estimates.

The final report of the National Income Unit released in 1954 set out the broad margins of error which could be expected in its estimates of the various sectors. It was indicated that in such sectors as construction, small-scale industries etc. margin of error could be as high as 30 per cent of the figures presented. The overall average error was estimated to be plus/minus 10 per cent of the estimates presented by the National Income Unit. The very fact that the National Income Unit had fixed this wide margin of error in its own estimates had urged a number of national income experts to look deeper into these figures. In recent years, the National Income Unit took upon itself the task of revising its own conventional estimates. The fresh estimates, however, fall within the ambit of the margin of error already indicated (vide graph overleaf), though they indicate a definite improvement upon the procedure adopted in the earlier reports. It cannot be said even the new estimates are fool-proof, or not subject to the same margins of error as the earlier estimates. The present attempt, however, needs to be encouraged in so far as it leads to continual improvement.

Attention is invited to the table alongside which sets out the conventional estimates of the National Income Unit and the new estimates to show how they broadly lie within the margin of error indicated in the final report of the National Income Unit and how a few refinements here and there do not materially alter the conventional estimates. Moreover, the usual technique of constructing mathematical models to infer the

probable implications of the growth in the primary and secondary sectors on the tertiary sector are not likely to be fruitful in view of the high margins of error. Also the new estimates will need further revision when the new information collected by the 1961 census is made known.

NATIONAL INCOME: 1950-51 — 1960-61

(Billion=1,000,000,000)

(Rs. in Billions)

Year	Revised Series (At 1958-59 prices)	Conventional Series (at 1948-49 prices)		
		Actuals	Series I (+10%)	Series II (-10%)
1950-51	92.4	88.5	97.4	79.7
1951-52	—	91.0	100.1	81.9
1952-53	—	94.6	104.1	85.1
1953-54	—	100.3	110.3	90.3
1954-55	—	102.8	113.1	92.5
1955-56	109.0	104.8	115.3	94.3
1956-57	114.6	110.0	121.0	99.0
1957-58	112.8	108.9	119.8	98.0
1958-59	121.1	116.5	128.2	104.9
1959-60	122.5	117.6	129.4	105.8
1960-61	130.5	125.3	137.8	112.8

The difficulties of making reliable national income estimates originate from the data used which is collected mostly for administrative purposes, without any regard to the needs of the national income experts. It is obvious that certain modifications or revisions have to be made for feeding these statistics into the national income accounting technique. It is, however, a blessing in disguise that these figures are, in fact, being collected, for whatever purpose. What needs to be done is to continue to make concerted efforts for steadily improving this statistical information on the basis of the needs for the new research work which is being done at the Centre, the State level and in the universities.

In recent years, the estimation of State incomes has assumed great importance because of the necessity of ironing out regional disparities. A number of States have made their own estimates on whatever scanty data they possessed. These estimates do suffer almost from the same limitations as the overall Indian Union estimates prepared by the National Income Unit because in most of these cases the methodology adopted is the same as that of the all-India estimates. In any case, some of the States such as Uttar Pradesh and Madhya Pradesh have steadily improved their estimates from year to year. The difficulty lies, it seems, in the lack of resources for strengthening certain State

Directorates of Economics and Statistics. If during the next few years, it is not going to be possible for the State Governments to allocate substantially bigger funds for Economic and Statistical Research, it is necessary that the attention of the Heads of Department of Economics and Statistics in the Universities should be directed to the encouragement of research at the University level. Some universities have the happy practice of making it compulsory for the students to conduct small surveys and write out their findings before awarding the Master's Degree. This practice needs to be encouraged in all the Universities so that more primary data could be collected at the State level. Particular attention needs to be paid to the wage level in the States for which reliable information is not at all available. This is the only way to unearth new statistical data without much additional cost. The National Sample Survey took upon itself the task of filling in the gaps in statistical information but it seems these problems are too big for even this gigantic organisation to cope with.

Fears were expressed at this conference regarding the misuse by the politicians of State estimates produced by some statisticians. All estimates produced, either for the Indian Union or for the States, are subject to certain margins of error and this has got to be noted by all who make use of these figures, whether they are

politicians or not. Small differences in the estimates for the States do not have much significance to show that one State is better placed than the other. The pioneers in this particular branch who have dared to produce these estimates, however, need to be encouraged. All good and reliable estimates start with imperfect and provisional estimates. Efforts need to be continued at the State level as well as at the university level to compute not only the income generated within the States, but also income accruing to the States. A beginning has still to be made in regard to income "accruing to the State" approach since no worthwhile efforts have been made so far in this direction. The machinery for locating inter-State movements of funds will have to be evolved, sooner or later. The fact that this particular problem has not been taken up by a research worker will bring home the necessity of creating a machinery for this purpose.

Despite the repeated efforts made by the statisticians both at the official and non-official levels, the estimates of savings, investment, capital formation etc. need great refinement. The Planning Commission has, from time to time, made some rough "guesses" about these important variables. Unless these tools are sufficiently sharpened, much of the statistical research necessary for planned development in this country cannot be carried through successfully.

THE BUSINESS WORLD

Progress of Electrical Industries

THE report of the Development Council for Heavy and Light Electrical Industries issued recently records that there has been a significant increase in production in these industries. If targets have not been achieved in a few of them, it is because of the foreign exchange difficulties. The industries that faced a slight setback during the middle of the Second Five-Year Plan were transformers and electric motors. But production of cables, wires, switchgears and control-gears was quite upto the mark. In the case of light electrical industries shortages existed in respect of a few commodities only like low wattage general lighting service lamps, fluorescent tubes, etc. The overall progress made by the heavy and light electrical industries can be gauged from the tables below:

SOME LIGHT ELECTRICAL INDUSTRIES

Industry (Unit)	Production in 1960	Production in Jan.-June 1961	Capacity targets for 1965-66
Dry cells (Mil. Nos.)	207	106	..
Storage batteries ('000 Nos.)	510	279	..
Electric Lamps:			
(a) G.L.S. & others (Mil. Nos.)	40	22	..
(b) Fluorescent ('000 Nos.)	1,520	950	..
Electric fans ('000 Nos.)	991	562	2,800
House Service Meters ('000 Nos.)	475	273	2,500
Radio receivers ('000 Nos.)	287	151	..
Refrigerators (Nos.)	11,388	5,511	..

It is interesting to know that while there were only 12 units manufacturing electric motors in 1955, there were 27 such firms in 1960 producing motors having a capacity of 700,000 horse power. Transformers were being manufactured by 17 units in 1960, whereas in 1955 there number was only 10. So far as switchgear and control-gear industries are concerned their production in 1955 was of the order of Rs. 40 lakhs. In 1960, a total production of Rs. 410 lakhs from 23 units was recorded. Although production of bare copper conductors in 1960 was only 10,000 tons, as against the installed capacity of 20,000 tons, the shortfall was apparently due to the scarcity of copper caused by shortages of foreign exchange. But the production of aluminium conductors showed a notable increase and its production in 1960 from all the units was 22,000 tons.

The establishment of heavy electricals plant at Bhopal is of paramount importance. It will be manufacturing a wide range of specialised heavy electrical equipment such as turbo-alternators, hydraulic turbines and generators, large-size power transformers and electric motors, switchgear required for power transmission systems and industries and control gear, traction equipment for railway electrification etc. The establishment of the other two heavy electrical projects has also now been decided upon. These plants would ensure from indigenous sources a wide range of electrical equipments sufficient to enable power generation to be increased at an annual rate of 2 million KW per year from 1971 onwards. They will also produce heavy motors, rectifiers and control equipment. The new projects will be set up with Czechoslovak and Russian collaboration in Andhra (Hyderabad) and U.P. (Ranipur).

With a view to set things right in these industries, the Development Council has made a number of recom-

HEAVY ELECTRICAL INDUSTRIES

Industry (Unit)	Production in 1960		Production in Jan.-June 1961		Targeted production in 1965-66	
	Qty.	Value in Rs. crores	Quantity	Qty.	Value in Rs. crores	
Electric motors ('000 H.P.)	700	8.30	391	2,500	25.00	
Transformers ('000 K.V.A.)	1,200	6.60	791	3,500	20.00	
Switch gear and control gear	..	4.00	..	..	15.00	
Cables & Wires:						
(a) Bare copper conductors (Tons)	9,700	4.80	4,000	15,000	6.00	
(b) A.C.S.R. and all aluminium conductors (Tons)	22,000	8.90	11,000	30,000	12.00	
(c) V.I.R. & P.V.C. cables (Mil. yds.)	250	7.50	113	525	17.00	
(d) Paper insulated power cables (Miles)	575	1.80	..	3,750	13.00	
(e) Winding wires (Tons)	4,200	4.00	2,550	29,000	27.50	
Heavy electrical machinery and equipment	Nil	Nil	..	..	35.00	
TOTAL	..	45.90	..	..	170.50	

mentations. The Development Council is for instance of the opinion that as it would take a considerable time to build up capacities in respect of most of the heavy electrical equipment, it is desirable to licence additional capacities as early as possible, keeping in view the anticipated demand during the Third Five-Year Plan. Of the many recommendations, leaving the field open to the private sector in production has attracted the greatest attention. The Council's recommendation is that the manufacture of electrical equipments such as transformers and motors of higher rating which are so far reserved for development in the public sector should also be open to the units in the private sector and such of those units that have capacity to manufacture these. Since the prices of electrical sheet steel and high tensile galvanised steel available under the Development Loan Fund are very high compared to the prices from other sources, granting of licences, wherever possible, for the import of these from sources other than D.L.F. has been recommended very strongly. And as the supply position of non-ferrous sections and extruded sections etc. is still difficult, it has been vociferously put that Government might consider granting of licences for import of such of sections which are not available indigenously. In order that the electrical industry might become self-sufficient and reduce imports substantially, it is underlined that the manufacture of basic and ancillary industries such as ball bearings, insulating materials, small and semi-finished components etc. should be developed quickly. The earlier recommendation that the duty anomaly on the import of aluminium ingots bars and rods for the manufacture of ACSR conductors and for the manufacture of all aluminium conductors should be removed, has, of course, been rightly repeated.

In the field of export promotion, due note is taken of the various suggestions made by the Export Promotion Sub-Committee and requisite steps have been suggested to establish adequate tool making capacity. In fact the recommendations cover every aspect of the problems pertaining to the heavy and light electrical industries and if implemented can go a long way in fostering their growth.

Business Notes

Productivity

NEED FOR NEW THINKING

IF THE burden placed on the public sector in the Third Five-Year Plan is to be fully discharged, productivity in the public sector will have to be increased at a rapid pace. At a seminar on utilisation of human resources in industry, this point was made amply clear by various speakers. Mr. C. D. Deshmukh, former Union Finance Minister, pointed out that while public services have markedly deteriorated since the partition, private services have notably improved. The deterioration in the public services can be attributed to the fact that the public sector has tried to take upon itself much more than it can really chew. The poor quality of managerial personnel is also one of the factors responsible for prejudicing the success of the enterprises. It cannot be denied that there are very few experienced persons in managerial posts and often the jobs are held by persons without any requisite training and experience. The absence of delegation of authority within the enterprise is another common failure. Besides, there is a great reluctance to take responsibility. The result is that important decisions are often taken based on non-economic considerations.

Productivity is of great importance to a country like India particularly now that she is at the point of take off. And it is important that due importance be given to the consumer while deciding about the share of various participants. Mr. Silverstein, leader of the U.S. team which participated in the Seminar deprecated the tendency to agitate for sharing the gains from productivity before they were known and precisely measured. His thesis was that instead of fighting for it, it was better for management to grapple with the problems of marketing first because in the ultimate analysis, it was marketing which held the key to productivity. Resistance on the part of workers for productivity drive was quite natural because of fear of unemployment. It was, therefore, necessary that their interests be looked into carefully while giving a fillip to the productivity movement. The commonsense approach would appear to be that there should be efficient utilisation of capacity and skills with the minimum of waste. And this can be achieved through management-worker-technician collaboration. Since India has still a long way to travel in this direction, every effort must be directed to bring about a happy sense of partnership.

Industry

INDUSTRIALISATION OF RURAL AREAS

THE DEVELOPMENT of rural areas is gaining increased attention partly to relieve congestion in the urban areas and partly for balanced growth of the economy. Industries are being set up and facilities are being offered in the underdeveloped parts to promote the speedy growth of industrialisation. Industrial estates are being given due place in the economy. They are being encouraged because they not only serve as a stimulus to encourage potential enterprise to come out by using the facilities provided at subsidised rate in these estates but also because they are a generator of new employment. A fact to be borne in mind is that these estates can help the increasing employment only in so far as they attract new units as distinct from units functioning in other areas. But if the industrial estates are only prototypes of big industrial establishments producing what the latter produce no gainful purpose can be served for the economy. They will have to be supplementary units to big industries. And it is only in this way that a diversification of production and techniques to the advantage of industrial growth can be brought about.

Rural industrial estates will have to fit into the scheme of economic decentralisation and panchayati raj. Without it they would not be able to serve the purpose that is expected of them. To put it more plainly, they will have to fit into the rural industrialisation programme in general. Under the circumstances, those who are concerned with the problem will have to take into consideration all the fundamentals of industrial and economic growth relating to question of industrial estates. It may be hoped that the seminar on industrial estates being held in Madras will help to evolve ways and means to strengthen the structure of industrial estates which are earmarked to play an important role in the economy of the country.

NOTABLE ADVANCES IN ANDHRA

EVERY STATE is realizing that if it is to make a rapid advance, it must pay increased attention to the industrialisation aspect. In fact for the backward States this seems to be the only way out. Suitable steps are, therefore, being taken by some of these less developed States to mould their economies. It may be noted that

the States are behind in the field of industrialization not because they lack resources, but because the existing resources—including human—are not being utilized fully. The technico-economic surveys conducted by the National Council of Applied Economic Research would confirm this view-point.

Andhra is one of those States which have taken courage in both hands and have found out ways and means to put the State on the industrial map of India. Three corporations have been set up in Andhra State for small-scale industry, mineral development, handicrafts and leather. A new move for establishing private industrial estates is also gathering momentum. The estates will be set up as joint ventures between the Government and the prospective occupant industrialists. Government will provide developed lands, electric supply, water supply, drainage and roads etc. The occupant industrialist will be able to avail himself of loan assistance upto 70 per cent towards the cost of building and 75 per cent towards the cost of machinery.

The major undertakings that the Government of India has decided to establish in the State are: a synthetic drugs project at Sanathnagar at a cost of Rs. 8 to 10 crores covering the manufacture of sulphur drugs, vitamins, phenacelin and other intermediates. A heavy electrical plant with a capital of Rs. 40 crores is also to be set up with Czechoslovak collaboration.

To create conditions favourable for the development of small-scale industries and to actively assist the growth, the Government has initiated a number of programmes. These comprise not only those designed to assist private entrepreneurs in starting new industries such as the establishment of industrial estates but also establishment of tool room servicing workshops and raw material supply depots.

With a view to rehabilitating the village economy, schemes for a large number of Khadi and village industries have also been implemented by the State. Many of the schemes have been expanded and carried into the Third Plan to achieve greater production. Now that the ground for industrialisation has been sufficiently prepared, the State can look to the future with greater confidence.

SESHASAYEE'S MASSIVE EXPANSION

THE ELECTRICAL porcelain industry in India is now likely to move from its nascent stage to a stage of development. A large-scale expansion programme of about 250 per cent in the installed capacity of Seshasayee Industries Limited is in the offing. The Company has obtained a licence to raise its capacity from 1,200 tons to 3,000 tons of high and low tension porcelain insulators together with the associated metal parts and hardware.

An investment in the block to the tune of Rs. 60 lakhs for the expansion programme is proposed to be financed by an additional share issue of Rs. 40 lakhs, all in the form of equity shares, and the balance is to be met through a medium-term loan. The additional capital issue is to start in November this year.

The block outlay of about Rs. 70 lakhs in the factory at Vadalur (Madras) was financed by the issue of Rs. 40 lakhs of both Preference and Ordinary capital and by means of a long-term loan of Rs. 30 lakhs.

On the completion of the expansion programme, the Company's gross block will come up to Rs. 1.30 crores of which Rs. 80 lakhs would represent share capital and Rs. 50 lakhs long-term loan.

Soon after the Company's factory went into commercial production some three months ago, considerable

increase in the demand for electrical porcelain from various State Electricity Boards, electrical licensees, switchgear and electrical manufacturers and railways rendered it necessary for the Company to launch an expansion programme of its installed capacity. The overwhelming requirements of high tension insulators are being met by imports.

The Company's equity capital base will facilitate its sound working and satisfactory dividend distribution in the coming years. On the completion of its expansion programme, the Company will emerge as probably the largest electrical porcelain manufacturers in the country.

The Central Government has agreed to grant a cash licence of the value of Rs. 33 lakhs in Deutsche marks to enable the Company to secure its plant and machinery from West Germany. China-clay is expected to be obtained from Neyveli Lignite Corporation. At present it is being obtained from Kerala and other sources.

Delhi Cloth Mills

PROBLEM OF RISING COSTS

EXPRESSING SATISFACTION over the financial results of the Company this year compared to the last year, Mr. Bharat Ram, Chairman of the Delhi Cloth and General Mills Company Limited observed at the Annual General Meeting of shareholders that the problem of rising costs of raw material and labour has been hitting the cotton textile industry very hard.

With increased consumption of cotton in the existing industry and the addition of 4 million spindles in view during the Third Plan period, the Chairman said, the prospect of Cotton appears bleak in the years ahead. On the basis of 9,300 million yards of cloth production and 2,250 million lbs. of yarn, as visualized in the Third Plan, 14.50 lakh more bales would be required. The cotton production has stubbornly remained around 45/48 lakh bales and, in fact, in the year 1959-60 it went down to 37 lakh bales. The stringency in cotton situation, Mr. Ram said, is bound to increase the cotton prices in India which in turn will affect the cost of production and export trade. The exports in 1960-61 had already dropped by Rs. 7 crores over that of the preceding year.

In addition to the rising cost of raw materials, the Chairman said, wage costs in the textile industry have also moved up following the Wage Board award. In spite of the general setback, the Chairman added with evident satisfaction, the textile exports of the D.C.M. have not moved down.

The menace of the powerlooms is posing a serious problem. Apart from the fact that they pay a very small excise duty, thousands of unauthorised powerlooms have come into production. According to a recent government survey, these unauthorised looms are at least 66 per cent as numerous as the looms registered with the Government making a mockery of the statutory provisions for registration.

The overall position of the cotton textile industry in India is far from sound and on the export front the industry is becoming more and more vulnerable on account of rising costs. Unless the costs are kept down and wages are lowered, export outlook for the industry would continue to remain bleak. It is also time that active steps were taken to increase the cotton production, for without it desired results would not be obtained.

Modi Mills

STEADY PROGRESS

THE INCREASE in the profits this year over the last year by about 35.7 per cent has enabled Modi Spinning and Weaving Mills Limited, Modinagar, to come out with 17 per cent dividend to its shareholders (inclusive of 8 per cent interim dividend already paid) subject to tax, as against 13 per cent dividend in the previous year. In his speech at the 15th Annual General Meeting of the Company, Rai Bahadur Seth Gujar Mal Modi, expressing his satisfaction over the record of performance this year, said that on account of the additions, alterations and extensive renovations that had been made during the year under review, the quality of yarn and cotton cloth had immensely improved. To improve further the quality and production, one Sanforizing machine in cloth section, high drafting plant and 6,400 spindles in yarn section are being added. The production of cotton in 1960 having fallen short of estimates, a sharp increase in prices occurred. Nearly Rs. 70 crores were drained out of the country by way of import of cotton.

Touching upon the subject of man-made fibres, the Chairman pointed out that the fibres produced by the foreign countries were more attractive than that of ours. The blending of wool with the synthetic fibre enabled fabrics and garments look like all wool to enter the market at a lower price range. Properly blended, man-made fibres prove to be more durable than the natural fibre. Most of the man-made fibres are made from timbers and chemicals and India is favourably placed to grow timber suitable for producing synthetic fibres. A method of making synthetic fibre is to utilise cotton lint. By distillation of the molasses and with chemical treatment, the alcohol produced is mixed with the cotton lint to produce the synthetic fibre called acetate yarn. This is of much superior quality to any other synthetic fibre and, therefore, its use is increasing very rapidly throughout the world.

The expansion plans of the company are all well set. In collaboration with some important foreign firm, the company now proposes to install shortly one synthetic fibre producing plant, which will cost about Rs. 10 crores. It is expected that more than half of the total investment will be available to the company from foreign collaboration.

Bicycles

STEADY PROGRESS IN PRODUCTION

DURING THE period 1960-61 the bicycle industry recorded a steady progress. The target of production set at 11,00,000 numbers in the large scale sector and 2,50,000 numbers in the small scale sectors was more or less achieved. The target of production for 1961 has been fixed at 12,00,000 numbers in the large scale sector and 3,50,000 numbers in the small scale sector.

Having reviewed the pack-value of imported components required by cycle manufacturers for the year 1961, the Development Council for Bicycle Industry recommended to bring down the pack value of imported components during the licencing period April-September 1961 to 50 nP. in the case of those units which are producing chains and Rs. 2 in the case of other units on the large scale sector. The industry was expected to be completely self-sufficient in the production of components by the end of September this year, and it was, therefore, thought that there would be no need for import of components on the large scale sector towards the end of this year.

Despite the steps taken by the Bicycle Manufacturers' Association to promote export of bicycles, the in-

dustry has not hitherto made much headway in exports. To boost up exports it is imperative that publicity for Indian manufactured goods should be intensified in the foreign markets with the active co-operation of the industry. Because of the rising prices in the home market, manufacturers have not hitherto shown any distinct interest in selling their goods abroad.

World Bank

RISE IN RESERVES

THE FINANCIAL statement for the three months ending September 30, 1961 of the International Bank for Reconstruction and Development points out that there had been a rise of \$24.2 million in the first quarter of the current fiscal year. The additions to reserves in the three months' period ending September 30, 1961 are made up of net earnings of \$16.8 million which are placed in the supplemental reserve against losses on loans and guarantees, and loan commissions of \$7.4 million which were credited to the special reserve. On September 30, the supplemental reserve totalled \$424.9 million and the special reserve was \$201.1 million.

Gross income, exclusive of loan commissions was \$44.2 million. Expenses totalled \$127.4 million and included \$23.5 million for interest on the Bank's funded debt, for bond issuance and other financial expenses. The outstanding feature was that during this period the Bank made 8 loans totalling \$160.5 million in Colombia, Costa Rica, Finland, India (two loans), Israel, Philippines, Trinidad and Tobago. This brought the total number of loans to 300 in 58 countries and territories and raised the gross total of commitments to \$5,951 million. By September 30, as a result of cancellations, repayments and sales of loans, the portions of loans signed still retained by the Bank had been reduced to \$4,316 million.

The Dominican Republic was readmitted to membership in the Bank during the first quarter of the fiscal year with a capital subscription of \$8 million. Laos, New Zealand and Nepal became members of the Bank with capital subscriptions of \$10 million, \$166.7 million and \$10 million respectively. The subscribed capital of the Bank amounted to \$20,287.8 million on September 30, 1961.

FOREIGN EXCHANGE FOR CRUDE IMPORTS

THE Government of India has revised its policy regarding the allocation of foreign exchange for the import of crude for three refineries in the private sector. The Government of India had informed the three oil companies earlier that foreign exchange to import crude would be allocated on the basis of 1960 level. As the oil companies had, on the basis of an earlier directive, expanded their refining capacity, there had been very little crude available for them during the last three months. They had exhausted their import quota on the basis of 1960 production. The Government of India have, therefore, decided to allocate necessary foreign exchange to the three oil companies to enable them to import as much crude, as they imported during October-December 1960.

The Government of India has allocated Rs. 41 crores (\$861,000,000) for the import of petroleum products, including crude, during six months, October 1961 to March 1962. Of this Rs. 37.50 crores (\$787,500,000) will be in free foreign exchange and Rs. 3.50 crores (\$7,350,000) under D.L.F. In addition Rs. 3 crores (\$6,300,000) have been allocated for rupee payment imports. The Government has reached a tentative agreement with the U.S.A. to import certain petroleum products from the United States, to be financed from D.L.F. loan. These products will largely include lubricants. Broadly speaking 50 per cent of the allocation is earmarked for the import of crude.

The Government of India, in allocating foreign exchange, specified the quantities of crude and petroleum products, which are in short supplies in this country. This calculation is based on the pattern of demand and the pattern of production of the three Refineries.

KNOW-HOW FOR INDIAN COAL MINING

The Government of India and the British team of experts after a series of discussions, decided that apart from the Jarandih Deep Pit, Kathara and Swang Deep Pits should also be entrusted to the British team. The intention is that these deep mines should be developed by these experts upto the stage of full production after which they will be handed over to the National Coal Development Corporation as running mines.

No production could be expected from deep shaft mines either at Jarandih or at Swang or at Kathara before the next 7 years, as further geological data had to be collected and as in any case the commissioning of a deep shaft mine normally took about 7 years.

Open cast mines had to be developed at both Jarandih and Swang for initial production of about 1 million tons, which would subsequently be replaced by the deep-shaft mines, when these were commissioned some 7 to 8 years later. Additional drilling would be necessary; it should be possible to take up the planning of these mines within the next 6 months.

As the life of the Kathara mine was estimated at between 20 to 30 years on its present productive capacity of 1.5 million tons per year, the first priority for planning deep shaft mines would be for Jarandih, followed by Swang and Kathara.

Additional drilling would be undertaken immediately for further geological data required for the planning of the Jarandih deep shaft mine.

The British expert who was staying on here would mainly be concerned, initially, with completing the preliminary work necessary, including co-ordinating the collection of additional geological data for planning a deep-shaft mine in Jarandih.

As a result of discussions held with the French experts, the various stages for developing the steeply inclined thick seams of Karanpura were: (i) Some senior mining engineers of the National Coal Development Corporation would go to France to see for themselves the techniques of depillaring the steeply inclined thick seams being employed there; (ii) Deputation of three or four National Coal Development Corporation mining engineers would go to France to receive training for the sub-level caving work and pneumatic stowing; and (iii) A team of French experts would come over to India and undertake the preparation of the project report for the depillaring of the mines in Karanpura.

The Technical Co-operation Mission authorities have agreed to undertake the development of Singrauli coalfield, in addition to Ramgarh, provided a formal request was made to them, which has now been made.

It was now proposed to set up the following Coking Coal Washeries during the Third Five-Year Plan:

In million tons

i East Bokaro Field			
a. Kathara	..	..	2.0
b. Swang..	..	..	0.5
c. Jarandih	..	..	0.5
d. Kargali	..	..	0.5
ii. Ramgarh	..	..	1.5
iii. Jhilmili/Korba	..	..	1.0
iv. West Bokaro	..	..	0.5
v. Karanpur	..	..	2.8
TOTAL	..	..	9.3

A Washery at Sudamdih would go into production towards the end of the Third Five-Year Plan, contributing about 0.5 million tons of washed coal. Preliminary negotiations with other parties were in progress and a team of National Coal Development Corporation would be leaving shortly for Moscow to discuss the Kathara Washery Project.

FOREIGN COLLABORATION

Ninetytwo cases of foreign collaboration with Indian firms for setting up industrial undertakings were approved during the quarter July-September 1961. Out of this, twenty-nine are British, Nineteen Americans, fifteen West Germans, five each Dutch and

Japanese, four French, three each Austrians and Swiss, two Italians, one Canadian and one Australian.

A list of the British Collaborators and their lines of production is given below:

Name of the Foreign Firm	Items of manufacture
1. M/s. Parsons Engineering Co.,	Marine Gear Boxes.
2. M/s. Monsanto Chemicals Ltd.,	Salicylic acid and Aspirin.
3. M/s. Crosland and Pickstone Ltd.,	Aniline black dyeing process.
4. M/s. Geo Salter and Co. Ltd.,	Springs, Weighing Appliances and Machines etc.
5. M/s. Wadkin Ltd.,	Wood working machines and lathes.
6. M/s. Paterson Hughes Egg Co., Ltd.,	R.O.T. Cranes.
7. M/s. A. Reyrolle & Co.,	Switchgear.
8. M/s. Doulton & Co. Ltd.,	Sanitaryware.
9. M/s. William Gardner and Sons Ltd.,	Miners, Sifters, Grinders etc.
10. M/s. British Insulated Cables Ltd.,	Cables.
11. M/s. C.J. Hampton Ltd.,	Stillson wrenches.
12. M/s. Samuel Dracup & Sons Ltd.,	Jacquard machines.
13. M/s. Lifting Equipment Ltd.,	Cranes.
14. The Mond Nickel Co. Ltd.,	S.G. Iron castings and special steel castings.
15. M/s. Stone-Wallwork Ltd.,	PIV Gears.
16. M/s. James Howder and Co. Ltd.,	Boiler Auxiliary equipment.
17. M/s. Gilbert Gilkes and Gordan Ltd.,	Hydro-electric generating units.
18. M/s. W.A. Tysack & Co. Ltd.,	Chaff-cutter knives.
19. M/s. D. Leonardt and Co. (Highley Pens) Ltd.,	Steel Pens.
20. 1. Bryce Electric Construction Co. Ltd., 2. M/s. Wego Condensers Co. Ltd.	1. Power Factor capacitors. 2. Paper capacitors.
21. M/s. Hard Capsules Ltd.,	Hard Gelatine Capsules.
22. M/s. Temperature Ltd.,	Industrial & Commercial refrigeration equipment.
23. M/s. Ruston & Hornby Ltd.,	Ruston Diesel Engines.
24. The Mond Nickel Co. Ltd.,	S.G. Iron castings.
25. M/s. B. & S. Massey Ltd.,	Drop Forge Dies.
26. M/s. Ampins Ltd.,	Ampins.
27. M/s. P.Y.E. Ltd.,	Radio frequency, electric heaters & R.F. induction heaters.
28. M/s. Fractional H.P. Motors,	Fractional horse power motors.
29. M/s. McCalls Macalloy Ltd.,	Square twisted steel bars.

The American collaboration will be, among others, in the manufacturing fields of Dithane Fungicides and Plasticisers, Oxyacetylene cutting and welding equipment, Commercial graphite, Glass and mineral wool, Caterpillar, Bulldozer and tractor spare parts, Taps, Chemical machinery, Steel forgings, Cable insulating

paper, Industrial furnaces, Insulators and lightning arresters, Hypodermic needles, Stethoscopes and Medical meters and Sewing machine needles.

The Germans will help in the production of steel wire ropes, concrete agents, metal spectacle frames, automobile electrical components, bolts, paper capacitors, hard carbon resistors, spray guns, air-jet drying equipment, loudspeakers, paper cones and stinders, machine tools, platinum laboratory apparatus and power cables.

The items for the manufacture of which the Japanese have joined hands with the Indians are: spring and battery operated mechanical and educational toys, fibre glass reinforced safety products, spun pipes, rubber prophylactics and pulp and paper making machinery.

The remaining foreign firms, namely, the Dutch, the French, the Hungarians, the Austrians, the Italians, the Polish, the Swiss, the Danish and the Australians, will participate in the manufacture of cellulose and other adhesive types, electricity meters, steering wheels, shield glass for automobiles, polyphase meters, wired and figured glass, high precision presses, plastic products, milling cutters and twist drills, milk pumps and refrigeration equipments.

SCRUTINY OVER THE PUBLIC SECTOR

The Government of India in the Ministry of Finance, it was learnt, was creating a cell to watch the working of public sector undertakings and make its report to the Secretary for Expenditure. Public Sector Undertakings were, at present, required to make three-monthly reports to Ministry of Finance, and there was no effective machinery to scrutinise their working. The proposed cell, it was claimed, would observe their income and expenditure and would help to step up their profitability.

STATES' PLANS FOR 1962-63

Discussions between the Planning Commission and the representatives of State Governments on the annual plans of States for 1962-63 will start in New Delhi from November 15. They will be preceded by discussions on the annual plans of Union Territories.

The discussions which will last for three days will cover the progress of plan schemes made during the current year and an appraisal of the programmes and outlays for 1962-63 in the light of continuous and integrated development.

The importance of drawing up annual plans carefully and of keeping in view proper phasing and synchronisation with related sectors has been stressed by the Planning Commission both in respect of States' plans and Central plans. Since the realisation of important objectives as in agriculture, education, employment and other social services depends on the successful implementation of States' plans, programmes concerning accelerated progress in agricultural production, including intensification of minor irrigation, soil conservation and extension activities, fuller utilisation of irrigation and implementation of programmes of co-operative movement, speedy development of training programmes, power, primary education and employment-generating and labour-intensive programmes specially in areas suffering considerably from under-employment acquire special significance in the drawing up of the States' annual plans for 1962-63.

The discussions on the States' plans are intended to provide as concrete an idea as possible of States'

resources and programmes to arrive at a realistic estimate of the outlay for 1962-63 and to make suitable arrangements for implementation.

The discussions with each State will begin with an examination of the State's financial resources for the year. According to Third Five-Year Plan, the States' resources for the entire Plan period have been estimated at Rs. 1,462 crores, of which Rs. 610 crores will be by way of additional taxation including measures to increase the surpluses of public enterprises.

Eighteen Working Groups—each dealing with a major specific development aspect—will then study in detail the existing and the newly proposed programmes for the States for 1962-63. The annual plan of the States will be finalised in the light of these studies.

MORE FUNDS FOR POSTS AND TELEGRAPHS

The Director General of Posts and Telegraphs, Mr. V. Nanjappa stated in Delhi during the week that besides the resources made available by the Planning Commission, the Posts and Telegraphs Department might be able to raise about Rs. 50 crores from its own Renewals Reserve Fund and revenue sources. This would mean that the P and T Department would have to spend 70 to 80 per cent more than it did during the Second Plan. This was possible only if the shortage of equipment and stores was eliminated.

In this connection Mr. Nanjappa pointed out that the Planning Commission had agreed to the preparation of a project report for another unit for the production of cables and that the establishment of a second automatic switching equipment factory besides a proposal to set up a factory for manufacturing telegraph poles was being contemplated.

In the end, Mr. Nanjappa emphasizing the need for greater co-ordination between the users and the manufacturers of the equipment, said that the Government might consider the setting up of a Development Council for the Tele-communication industry.

NEW IRON AND STEEL ADVISORY COUNCIL

The Government of India has decided to reconstitute the Iron and Steel Advisory Council for a term of two years.

The Minister for Steel, Mines and Fuel will be the Chairman of the Council with the Presidents of the Federation of Indian Chambers of Commerce and Industry and the Associated Chambers of Commerce of India, or their nominees, as ex-officio members and 21 nominated members who, in the opinion of the Council are capable of representing the interests of producers, consumers, the trade and the mining and allied interests. The Secretary, Department of Iron and Steel of the Ministry of Steel, Mines and Fuel and 8 representatives of the concerned Ministries of the Government of India will also be members of the Council with the Iron and Steel Controller as the Member-Secretary.

The Chairman may also specially invite any other person or persons to represent the Iron and Steel Industry or trade or consumers to attend the meetings of the Council which will meet at least twice a year. The Iron and Steel Advisory Council was set up in November, 1959, to advise on all matters of a general

character relating to iron and steel and in particular to problems pertaining to production, distribution, transport, research, import and export.

SHIPPING RATES?

The U.K. Shipping Conference Lines proposed to station in New Delhi a representative to maintain liaison with the Government of India and also to regulate shipping freight rates by mutual consultations. The Shipping Conference Lines had already increased freight rates by ten per cent on India-ward cargo, with effect from October 1, 1961. A similar proposal in respect of the outward cargo was being strongly opposed by both India and Pakistan.

A German shipping company, which had offered to carry jute on much lower rates was being made a bargaining counter by Pakistan. India had threatened to charter tramp ships and undertake Legislation, on the U.S.A. pattern, in case rates were increased by ten per cent on the outward cargo. It was contended that such an increase in rates would adversely affect India's export trade, at a time when India was making special efforts to step up its exports.

If might be added that the U.K. Conference Lines have some Indian members too. The attitude they had adopted vis-a-vis the proposed increase in rates was not yet disclosed. Their assertion would have been more effective.

The long standing dispute between the Bombay Steam Navigation Company, a subsidiary of the Scindia Steam Company, and the Government could be cited as an illustration in this rate controversy. The Bombay Steam Navigation Company had recently decided to

pur-2, on 23rd October, 1961.

M. J. Maclaren,
General Manager.

MR. AL FOIL GIVES A LIGHT

Fifty seven years' experience as Manufacturers of Aluminium Foils for packaging goods in the Cigarette, Pharmaceutical, Confectionary, Tea and many other Industries.

"Delightfully fresh, my Lady Nicotine . . . just as I like her." "Naturally," replied Mr. Foil with a knowing smile, "these are the virtues of the lady in question. Think of the protection she enjoys. Snugly wrapped in aluminium foil from tip to toe, the flavour of her tobacco, the freshness and fragrance are sealed within. Her foil wrap, as decorative as mink, protects her from dirt too. Sufficient reasons you'll agree, sir," finished Mr. Foil, "for the lady to insist on a foil wrap, whether she comes to you as a pipe smoke or a slender cigarette!"

Selling Agents: Tea Chest Linings: WILLIAMSON, MAGOR & CO. LTD., Calcutta.

In what you do every day, you are taking many chances. For example, take the things that you buy in the market. Are you always sure of their quality? Do you get good value for the money you spend?

And yet, you can be sure if you know that the goods you buy have been made to a given standard. Standardization benefits not only you, the consumer, but also the producer, the distributor and indeed, the country as a whole.

The Indian Standards Institution has prescribed standards for industrial as well as consumer goods. To manufacturers producing to relevant standards, ISI grants licences to apply on their goods its certification mark which is the guarantee of quality. The next time you buy anything, don't take a chance: look for the ISI mark.

ISI INDIAN STANDARDS INSTITUTION

NEW DELHI * BOMBAY * CALCUTTA * MADRAS * KANPUR

discontinue its Bombay-Konkan Steamer Service with effect from December 1, 1961 unless it were allowed to increase its passenger fares. It was contended that the Company had been suffering losses since 1954. The question of Bombay-Konkan fares was examined by the P. S. Rau Committee, which made its report in 1959, recommending (1) an immediate increase in fares by eight per cent, (2) an interest free loan by the Central Government, yielding on the average an annual concession of Rs. 1.89 lakhs to purchase three new ships and (3) further increase of seven per cent in fares after the acquisition of new ships.

The Government had already decided to subsidise the movement of coal. It meant that consumers of coal would have to pay for an increase in the rates of coal. The Indian shipping companies, had refused to move rice from Calcutta to Kerala, unless their rates were stepped up. The Conference Lines, similarly hoped to convince the Government, by producing documents and books that they too had been incurring losses and that their demand for an increase in freight rates was justified.

MORE ON VISITING BUSINESSMEN

The members of the Business International addressed to the Planning Commission an important question which reveals some information about the Fourth Plan. They asked: "Assuming successful completion of all the targets of the Third Plan, how big will the Fourth Plan be and what will be its highest priority industries?" The reply was: "It is tentatively envisaged that the net investment in the Fourth Plan should be of the order of Rs. 17,000 crores, as against Rs. 10,500 crores postulated for the Third Plan. (ii) The matter is still under study. But tentatively it may be said that a high priority is likely to be given to the industries given in the next column.

	Actual 1960-61	Target 1965-66	Perspective 1970-71
Steel ingots (mil. tons)	6.0	10.2	18-19
Pig iron (mill. tons)	0.9	1.5	3-4
Aluminium ('000 tons)	18.2	87.5	230-250
Coal (million tons)	60.0	97.0	170-180
Dil refining (mill. tons of crude throughput)	6.02	10.77	18-20
Nitrogenous fertilisers (mill. tons of nitrogen)	0.248	1.0	20-22
Cement (mill. tons of nitrogen)	9.0	15.0	24-26
Machine building (Rs. crores of output)	160	500	1600
Electric Power (installed capacity) (Mn. KW)	5.7	12.7	21-23

BRIEFS

The Government of India has decided to invite global tenders for setting up its Alloy Steel Plant at Durgapur. A representative of a Japanese firm, Kishi Moto Shote, who came here to negotiate for a package deal to supply plant and equipment, has returned to his country.

The British Government has regretted its inability to the Government of India to allocate a quota under the Commonwealth Sugar Agreement. India had asked for a quota in anticipation of replacing South Africa, which had opted out from the Commonwealth.

An India-British Credit Agreement, it was expected, would be signed on November 10. It would be a £5 million united credit, which was being made available to India to finance its maintenance imports.

COMPANY AFFAIRS

NEW ISSUES

Of the five companies which have been authorised new capital issues, three will issue bonus shares and the other two equities. The consent of the Controller of Capital Issues for all the issues is valid for 12 months. The following are the details:

The Hindustan National Glass Manufacturing Company Limited, Calcutta, incorporated in 1946, has been granted consent to the issue of bonus shares of the value of Rs. 9 lakhs on capitalisation of its reserves to that extent. The Company's existing paid up capital is Rs. 25 lakhs divided equally in preference and equity shares. It is proposed to issue bonus shares in the proportion of two bonus shares for every five shares held.

The Britannia Biscuit Company Limited, Calcutta, registered in 1918, has been granted consent to the issue of 2,29,881 equity shares of Rs. 10 each as fully paid up bonus shares on capitalisation of its reserves to the extent of Rs. 22,98,510. The bonus shares will be issued in the proportion of one bonus share for every two equity shares held.

Firestone Tyre and Rubber Company of India (Private) Limited, Bombay, has its paid up capital held by the American Company M/s. Firestone and Rubber Company, Akron, Ohio, U.S.A. It has been granted consent to issue bonus shares of the value of Rs. 1,09,80,000.

Oriental Fire and General Insurance Company Limited, Bombay, has been granted consent to the issue of further capital of Rs. 35 lakhs in equity shares of Rs. 5 each for consideration other than cash. The shares will be offered to the shareholders of National Fire and General Insurance Company Limited and the Asiatic Government Security Fire and General Insurance Company Limited for the purpose of amalgamation of the two Companies, after the scheme of amalgamation has been sanctioned by the High Court.

Investa Machine Tools and Engineering Company Limited, Bombay, have been granted consent to the issue of further capital of Rs. 20 lakhs in equity shares of Rs. 100 each for cash at par. The proceeds will be used for financing the Company's expansion scheme.

FOREIGN ESTABLISHMENTS

Ten foreign companies have established business in India during the period April — September 1961, according to the information released by the Company Law Department of the Commerce and Industry Ministry. The names of these companies along with the States in which they are located are: Macmillan Co. of U.S. (Maharashtra); Bains International Travel Service of Canada (Delhi); Compagnie Industrielle de Travanux of France (Maharashtra); W. Canning & Co. of U.K. (Maharashtra); Fertel Engineering of U.K. (Madras); Downingtown-Parwhit of U.S. (Madras); Brightside Heating and Engineering Co. of U.K. (West Bengal); Japan Air Lines Co. of Japan (West Bengal); Western Machinery Co. of U.S. (Delhi); and Natural Rubber Bureau of U.K. (Maharashtra).

THE EASTERN SHIPPING CORPORATION

The Chairman of the Eastern Shipping Corporation in the annual report for 1960-61 has indicated the manner in which the two Corporations — the Eastern Shipping Corporation Ltd. and the Western Shipping Corporation Ltd. — have been amalgamated into one single body with effect from October 2, 1961. Accordingly the undertaking of the Western Shipping Corporation has been transferred to the Eastern Shipping Corporation and the latter is now called the Shipping Cor-

poration of India. The Company resulting from the proposed amalgamation is to allot to every person registered as a shareholder in the Western Shipping Corporation immediately before the amalgamation as many shares in the Company resulting from the amalgamation as are equivalent in number and value to the shares held by him in the Eastern Shipping Corporation. The Chairman pointed out that the question of amalgamation was under consideration for quite some time. From the next year there will be only one report instead of two separate as during the year 1960-61.

The overall earning of the Corporation increased from Rs. 4.08 crores in 1959-60 to Rs. 6.07 crores, which shows about 50 per cent increase. The two Corporations provided only Rs. 68.13 lakhs by way of normal depreciation during 1959-60. During the year under review this provision is significantly more at Rs. 1.07 crores. After the provision of depreciation and interest charges etc., the financial results of two Corporations together indicated a net loss of Rs. 32,671 for 1959-60 — the Western Corporation having made a profit of Rs. 4.73 lakhs and the Eastern Corporation having incurred a loss of Rs. 5.06 lakhs. During the year as a sharp contrast the overall result shows a net profit of Rs. 47.52 lakhs after covering all expenditure, which is gratifying. The Chairman has claimed that overall earnings are the highest so far since the inception of the Corporation and this has been achieved in a year which from the shipowners point of view has been one of difficulties, the freight not having looked up as expected. The combined authorised capital was increased in December 1960 and paid-up capital on September 26, 1961 was raised to Rs. 23 crores against Rs. 15.45 crores on March 31, 1960. Apart from this the number of ships, the gross tonnage of ships and gross investment on the fleet have shown a net increase. On March 31, 1960 the number of ships were 15 with 109,258 GRT capacity and an investment of Rs. 15.58 crores. On March 31, 1961, the number of ships owned was 17 with 126,725 GRT capacity and an investment of Rs. 20.38 crores. At present (September 26, 1961) there were 19 ships with 138,936 GRT capacity and Rs. 23.28 crores as investment.

The improvement in the Corporation's performance can also be visualized from the cargo lifted and the freight and passage earnings during financial year 1960-61. During 1959-60 cargo lifted in tons was 382,825 and freight and passage earnings were Rs. 3.87 crores. During 1961 cargo lifted was 517,619 tons and freight capacity earnings Rs. 5.63 crores.

TWENTY GIANT-SIZED FIRMS SET UP DURING JULY-SEPTEMBER

Twenty giant-sized companies, incorporated with an authorised capital of over Rs. 1 crore each were formed in the country during July-September this year, as against 24 during the preceding quarter.

The total authorised capital of these giant-sized companies accounts for nearly two-thirds of the total authorised capital of all new companies registered during the period.

In the preceding quarter, the proportion of such companies in the total authorised capital of all new companies worked out at 80 per cent. The number of big-sized companies, with an authorised capital of Rs. 50 lakhs and under Rs. 1 crore each, formed during the current quarter, is reported to be 17. The number of the companies having an authorised capital of Rs. 10 lakhs to Rs. 50 lakhs is 75 whereas 312 companies are formed with an authorised capital base of less than Rs. 10 lakhs.

Company Meeting

THE DELHI CLOTH & GENERAL MILLS COMPANY LTD., DELHI

Speech of the Chairman, Lala Bharat Ram

The following is the speech delivered by Lala Bharat Ram, Chairman, The Delhi Cloth and General Mills Co., Ltd., at the Annual General Meeting of shareholders held on 3-11-61 in the office of the Company at Bara Hindu Rao, Delhi:

Ladies & Gentlemen,

With your permission I will take the Accounts and Directors' Report as read.

As you will observe from the Balance Sheet, the financial results of the Company have been better than in the last year, which naturally is a matter of satisfaction for all of us.

The cotton mill industry this year also has had a good year as far as profits are concerned. However, I would like to mention certain aspects of the cotton textile industry.

Last year due to the heavy imports of American cotton, the cotton situation quantitatively was easier than in the year before last, but the industry had to use a much more expensive cotton than the local cotton for the same counts of yarn, which added to the cost of production. With the increased consumption of cotton in the existing industry and also in the Third Plan period when, it is visualised, nearly 4 million spindles would be added, I feel the cotton situation is going to be very difficult in the years to come. On the basis of 9,300 million yards of cloth production and 2,250 million lbs. of yarn, as visualised in the Third Plan, 14.50 lakh more bales of cotton would be required. The planners have, of course, expressed the hope that our cotton production will keep pace with the demand, but I cannot but feel rather pessimistic about our attaining this increased production of cotton. In the Second Plan period it was planned that cotton production would go up to 55 lakh bales. But it has remained stagnant around 45/48 lakh bales and, in fact, in the year 1959-60 production went down to as low as 37 lakh bales. We will, in case of shortfall, thus have to import large quantities of cotton. This stringency in cotton is bound to increase the cotton prices in India, which in turn will affect the cost of production and our export trade. One of the main advantages India had in the exports of textiles was its cheap cotton, but today this position does not hold good. Even today the exports of textiles from India are falling. The exports in 1959-60 were worth about 69 crores of rupees, and in 1960-61 had dropped to only 62 crores. The tendency even now for the exports of textiles is on the decline.

What I said earlier about the disquietening trend in raw material cost applies, with equal force, to labour cost, the other main element in textile costs. Labour costs in the textile industry are continuously moving up, sometimes because of increase in dearness allowances, which comprise between one-half to two-thirds of the total emoluments of the worker, and sometimes due to other wage increases as happened after the Wage Board recommendations in 1960. While according to the Wage Board recommendations the industry has given the wage increases, labour, on the other hand, has not played its part in helping rationalisation which was visualised by the Wage Board. The net result, of

course, is to add to the general upward pressure on wage cost.

Only if these two main items of costs, i.e., cotton and labour are kept down, we may be in a position to become competitive in the world markets. Nevertheless it is a matter of satisfaction to us that the textile exports of the D.C.M. have not been allowed to go down in spite of the general setback.

Another very serious problem, which is threatening the whole of the cotton textile industry, is the menace of the powerlooms. The powerlooms pay a very small excise duty. And apart from the fact that they pay a very small amount of excise duty, thousands of unauthorised powerlooms have come into production. This situation with regard to powerlooms is not only hurting the mills but also the handloom sector without increasing the employment potential, which is one of the basic arguments for keeping the handlooms as an important sector of our economy. Policies were designed by the Government to protect the handloom sector such as restrictions on new loomage in the mills and reservation of varieties of cloth. But the experience of the last few years has been that instead of helping the handlooms, the powerlooms are becoming a problem for both the handlooms and the mills. While the mill industry places the incidence of unauthorised looms at a much higher level, even a recent Government survey has shown that these unauthorised looms are at least 66 per cent as numerous as the looms registered with the Government, making a mockery of the statutory provisions for registration.

In the context of this unsatisfactory situation I feel that the Government must take active steps to see that the powerloom industry is not allowed to run counter to the Government's own policies.

Coming next to the sugar industry in which your Company is again interested, it is unfortunate that it continues to suffer from one problem after another. Today there is a great problem of very large surplus stocks of sugar for which there is no market. Although the Government is putting a restriction on output in the year 1961-62, and also imposing a stiff penal excise duty on production beyond the restricted level, I am still not sure that the sugar industry will not be facing a near crisis in the next year unless it is possible to export a sizable quantity from India or unless cane prices are so adjusted as to materially bring down the costs, and therefore prices of sugar whereby internal consumption would increase.

In fact, whether it is the question of the prices of sugarcane or cotton, the main point, to which I also made a reference last year, is that unless and until the productivity in agricultural fields is going to be increased, we shall continue to face high costs and high prices, which, in my view, would have an advance effect on the whole of our economy.

As you know, one of the major activities of your Company is the production of edible fats i.e. Vanaspati, and in this field, we are one of the largest manufacturers in the country. The prices of the finished product, and the profitability of the industry continue to be highly erratic on account of the increasing element of speculation in the oilseeds and oils trade. The fluctuation in prices of oils between one part of the year and another have been of an order exceeding 30 per cent at times. It will be appreciated that such violent fluctuations in raw material prices must inevitably lead to similar fluctuations in the prices of the end-product. This situation has been causing considerable worry to the edible fats industry, as these violent fluctuations are not in the interests of either the consumer, or the farmer, or even of the normal trader, but only of the speculator. There is definitely a need for the Government and the industry to take stock of this situation and to take such steps as are possible for minimising the impact of these unhealthy trends.

Before I close, I am sure, you would be pleased to know that in keeping with the past policy of diversification and expansion of the enterprises in your Company, it has been decided by your Board to put up a P.V.C. Plant with its ancillary products like chlorine, calcium carbide and caustic soda, as also a Plant for the manufacture of Rayon Tyre Cord, both yarn and fabric. Both these are large projects involving very large investment. In addition to these two large projects, renovation, modernisation and, in certain fields, expansion are continually going on.

Before I close, I am sure you will join me in conveying my thanks to all my colleagues who have been responsible for the satisfactory results and also express confidence in their ability to shoulder responsibilities in the future development of the Company.

With these words, Ladies and Gentlemen, I move that the Directors' Report and Accounts be adopted.

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting.

The New Controversy on Oil Prices

DISCUSSIONS on oil prices partake of all the exciting change that Alice found in Wonderland. Each day the ground seems to shift, new points of dispute arise between Mr. K. D. Malaviya's Ministry and the great oil companies. Perhaps differences are in the nature of things when Government deals with business using, as is inevitable, its political power in addition to its newly found knowledge of an industry as a participant thereof. Inevitably the hammer and the anvil, even when there is co-operation, have some different approaches to one another. In any case, the anvil cannot normally be expected to appreciate the superior role of the hammer. In essence, the differences with the oil companies have often been a matter of method, and the armoury of dictation which has marked the approach has been made in successive reduction of oil prices. It is, however, true that the Damle Committee report was the most moderate of the efforts made by Mr. Malaviya to press the oil companies into a lower price range.

It is difficult for those who are not conversant with the detailed elements in the oil picture to appreciate the force of the oil companies' contention in the current case. While the reductions in rupee receipts for marketing inside the country are deemed severe, the oil companies have accepted the rupee reduction of marketing costs implied in the Damle Committee Report. They have also accepted the reduction in prices of crude, where discounts are available on posted prices and can be proved to have been so granted. On the other hand, there has been some confusion in regard to other refined petroleum products. The Damle Report made the particular point on other products in some such terms as these.

As discounts are admittedly available on crude oil, the Committee believes that discounts should also be available on refined products. Two oil companies, in fact, have admitted that they obtained their imports of petroleum products at discounted prices. As the products imported by these two companies are not identical and the rates of discount vary for the different products, the Committee has inferred that availability of discounts depends upon the bargaining capacity of the individual marketing company. The major oil companies, with their world-wide connections and long experience in oil business, the Committee opines, should be able to exert sufficient pressure on the suppliers of bulk refined products in obtaining discounts on their supplies.

It would appear the Committee was on unstable ground so far as the factual basis of the discounts on refined products were concerned. They have relied on an observation which seems in the current context to be misleading. It now appears that, in regard to middle distillates the oil companies had no access to discounts on supplies. They, therefore, argue with justification, that they are unable to accept a loss on that portion of mid-

dle distillate supplies whose prevailing prices are higher than those stipulated in the Damle Committee Report.

Since the oil companies cannot be forced to make these supplies below cost, one of two alternatives is possible. Either they cease to supply these particular products or they supply them at a price based upon actuals on which the Damle Report had insufficient evidence. There is something to be said for both alternatives. The first alternative implies, however, that the Government of India can obtain adequate supplies from Russian or Eastern European sources; these being for rupee payments, the country might favour them, firstly because of ready supplies and, secondly, there is saving of foreign exchange. It cannot be presumed that they can be marketed in India in a short period without some very special arrangements. Inevitably they would involve some considerable disorganisation, and the other alternative which is to obtain a reasonable price reduction, but one consistent with Western oil company supplies might, on balance, be an advantageous course. The question is at what price and how the differences in foreign exchange can be met. It would be foolish to deny that timing is of the essence. Since the elections are shortly to arrive, the supply position of middle distillates will play some part in the bargaining process. Therefore, the oil companies might well be accused of choosing the wrong time for the rejection of the Report. On this, however, their justification is clear that they have put in a reply within a reasonable time from the date of the Government's order accepting the Damle Committee Report and six weeks is by no means unusually long time for considering a matter of this gravity. If, therefore, the time is favourable to them, it is largely the responsibility of the Ministry which delayed consideration of the Report for some considerable time.

It is difficult to see that an advantage is to be gained by either side by an open rupture and there is much to be said for reaching an agreement with the oil companies on a basis of which they seem to have given some indication, that no net foreign exchange commitment will be involved though prices will have to be higher than those included in the Damle Report. This is an intriguing suggestion and the public is entitled to details in order that it might know how reasonable the Ministry would be in pressing the acceptance of the Damle Report against the suggestions made by the oil companies.

The attempt has been made this week to paint the situation more gravely than in fact it should. It is true that neither of the negotiators is alarmed, and the conversations have hitherto taken place in an atmosphere of relative accommodation. The difference, however, is significant and it would be foolish to suppose that, having declined to accept the Damle Report in full, the oil companies

will now go back on their decision in total. In effect, therefore, there are rigid postures on both sides. Perhaps a cynic, observing the course of controversy between the Ministry of Fuel and the oil companies over the last few years, can shrug his shoulders in the manner of the Austrian who said, dealing with a severe political tangle, that the situation was hopeless but not serious. The constant atmosphere of crisis happily builds

humour among other things. The corresponding German comment was that it was grimly serious though not quite hopeless. The public is a little weary of these disputes, and whether one shrugs it away in the German or the Austrian fashion, one perhaps might recall that worse differences have been resolved. It is unlikely that a radical change in Indian oil supplies is on the point of taking place.

The New Congo Crisis

THE news that Mr. Antoine Gizenga, the Lumumbist Congo leader, is in revolt against the Central Government, has struck New Delhi with a rude shock. It will be some time before the Ministry of External Affairs recognises that all the Lumumbists were not worthy of the extreme faith that we have placed in them. There will, of course, be strong support for the action that the acting Secretary-General, U Thant, has already taken in regard to the "firm" authorisation to restore order in Albertville and Kindu. But who can say how far the writ of the United Nations runs, facing revolts both from the Right and the Left? It is difficult to estimate the political influence of Mr. Gizenga — which was obviously much lower than that of Mr. Patrice Lumumba — but the conclusion that the Central Government of the Congo, legally established in the eyes of the United Nations, is operating on a smaller and smaller base, is no longer in doubt.

The immediate problem of what India is to do in circumstances such as these cannot be settled in the absence of the Prime Minister. It is clear, however, that Indian troops are now committed to a role which every Indian citizen must view with alarm. It is easy enough to argue that India is not responsible for the decisions of the United Nations; it is not so easy to absolve ourselves of the responsibility of placing our troops in this position in which they seem to have no supporters in a country where they are supposed to maintain law and order. Thus they are thrown against Mr. Gizenga as well as Mr. Tshombe. Our ex-

perience of controlling Mr. Tshombe's activities has not been particularly encouraging. What might lie in store in respect of Mr. Gizenga this critical week, no doubt, will reveal. While we pause to consider into what dire dangers we have cast our troops, it is important to recognize that this is no longer a matter of dealing with a few "reactionaries" in the country. The word "reactionary" has been freely bandied about, and with some justification, in dealing with President Tshombe who has shown notorious willingness to endure colonialism in a somewhat different form rather than accept the Central Government. But the word "reactionary" has no meaning by itself. Much the most grievous portion of Mr. Tshombe's sin was his failure to recognise the new Congo nation. If Mr. Gizenga is acting likewise, the fact that he is on the Left does not entitle him to any greater sympathy. Indeed, we are now certainly convinced of having backed the wrong horse at least up to a point. It is time that India recognised that the situation in the Congo does not resolve itself into "progressives" and "reactionaries", but a large number of local leaders whose politics is as variable as their wills to power. In the result, a thorough review of Indian policy is required. It is hoped that no time will be lost on the Prime Minister's return in carrying through a deep probe into the current situation. The interests of the Indian Union cannot always be subordinated to vague international commitments, the significance of which is not fully known because we really do not know much about the persons with whom we are dealing.

The Akali Dal and the Das Commission

THE Union Home Minister, Mr. Lal Bahadur Shastri's forthright statement repudiating the charges of Master Tara Singh that the Government had gone back on the understanding it had given to the Akali Dal through the mediators during Masterji's fast unto death in regard to the personnel and the terms of reference of the high-powered commission to be set up to investigate the grievances of the Sikhs and their insinuation of being discriminated against, should set at rest all speculation about the issue. The Akali Dal obviously will find itself in a quandary after this statement for in its resolution of November 1, it had vehemently criticised the Government for not having fulfilled its assurances, which it now transpires were not beyond what was contained in the Prime Minister's oft-repeated utterances on the issue and the Union Home Ministry's Press Note of October 1.

The Akali Dal's resolution of November 1 otherwise too had carried little conviction with those who had closely followed the Government-Dal negotiations in August and September. It is possible that Master Tara Singh and the Akali Dal got the impression that the Commission would include one or two persons out of the four whose names it claims had been communicated to it by the Government. But Mr. Shastri has categorically denied having suggested any name on his own though he had agreed to consider the names put forth by the Akali Dal. The Government, no doubt, appears to have given serious thought to the problem of selecting members of the Commission and to satisfy the Dal, it even approached the Sarvodaya leader, Mr. Jaya Prakash Narayan, whom Master Tara Singh was so keen of having on this high-powered body. But if Mr. Narayan preferred to decline the invitation, the Govern-

ment surely cannot be blamed. One might, however, wonder whether all the names chosen to form the Commission are equally good. One member is believed to be greatly under the influence of the Prime Minister. Here there was possibly room for a better choice.

The Akali Dal's ire over the terms of reference of the Commission is, of course, unjustified, especially when it had been made clear by the Prime Minister not only in his statement on the issue made in Parliament in August but also at his press conference in September that the demand for Punjabi Suba was a political one which could not be adjudicated upon by any committee after the verdict of the States' Reorganisation Commission. The issue could be raised before the new Commission only in an indirect form. And the present terms of reference of the Das Commission apparently provide for this.

If the Akali Dal carries out its threat to boycott the Commission if the latter's personnel and

terms of reference are not changed to suit its rigid posture, it will undoubtedly do substantial harm to its own cause. The Commission has been set up in response to the Dal's own request and it will obviously serve no purpose if the Akali Dal itself fails to co-operate with it. The Commission, despite J. P's absence on it, is by and large a fair one and it is up to Master Tara Singh and the Akali Dal to put forth their grievances before it. Their non-co-operation with it will be construed to mean that they have no real grievance and that the fast and the Punjabi Suba agitation was an election stunt. Communal harmony in this border State has already been disturbed greatly by the activities and pronouncements of the extremist elements in the Akali Dal. It is time the tide is turned back. This can be done by adjudication of the Akali Dal's grievances and charges by the Das Commission. So far as the country is concerned, it will almost everywhere be disposed to accept without question the fairness of a Commission over which Mr. S. R. Das, India's most distinguished retired Chief Justice, presides.

The Ganatantra Parishad—Swatantra Merger

THE decision of the Ganatantra Parishad—the main opposition party in Orissa—to merge with the All-India Swatantra Party has been acclaimed as a wise decision by the rightist forces in Orissa worsted early this year in a straight fight with the Congress Party. The merger followed the recommendations of a four-member Subcommittee of the Parishad which analysed the pros and cons of this alignment after having heart to heart discussion with the leaders of the Swatantra Party last month. Something revolutionary was certainly required in the organisation of the opposition to the Congress Party in Orissa in view of the fact that the mid-term elections had brought about a fall in the strength of the Parishad from 51 to 37 seats in the State legislature. Simultaneously, the Congress Party emerged with a clear majority of 82 seats in a House of 140, while earlier, in the 1957 elections it could not secure more than 56 seats.

The Parishad is disturbed at the forceful policies being pursued by the present Chief Minister, Mr. Patnaik, who has not minced matters in regard to his future plans for entrenching the Congress Party in the State. He has openly declared that he would not make any distinction between the Government and the Congress Party and would see that both moved in unison. Alarmed over the monolithic character of his outlook regarding political affairs in the State, the Parishad was forced to look for support elsewhere. The merger with an all-India opposition party is expected to rejuvenate the Parishad and its election machinery. Presently the Parishad holds seven seats in the Lok Sabha covering a total electorate of 4.3 million, with some double counting due to the reserved seats. During the last general election only one-third of the electorate cast their votes with the result that the fate of these seven Lok Sabha constituencies was settled by 1.4 million voters only. In these seven constituencies of Dhenkana, Sambalpur, Sambalpur (R), Sundargarh (R), Kalahandi, Kalahandi (R) and Angul the Ganatantra Parishad won 59 per cent of the votes. In other words, if there has been no deviation from

the "hold" of the Parishad in these seven constituencies, it may be assumed that nearly 8,00,000 voters have aligned themselves with the Swatantra Party. Making correction for double counting, the strength of the voters may be reduced to 7,00,000. It is, however, believed that the mid-term election weakened the Parishad's "hold" in some of these constituencies. This fact is illustrated by the mid-term State election results wherein votes polled by the Parishad were 6.49 lakhs as against Congress Party's 12.69 lakhs. Unless the Parishad makes a concerted effort to intensify its election campaign in the coming months, it may lose one or two of these seats as well.

The underlying urge for merger was there because of the ideological affinity between the policies publicly proclaimed by the Parishad and the Swatantra Party. The election manifesto of the Swatantra Party which was released a few days ago runs very much parallel to the ideals of the Parishad. In view of this dominant fact, the well-informed sections in the Parishad believed that the party would gain considerably by associating itself with an all-India political party which had already excited the imagination of all opposition groups, especially in the rightist camp, throughout the country. The powerful election machinery of the Swatantra Party could be pressed into service so as to retrieve the position that had already been lost. Also, the enlightened sections of the Parishad felt that polarisation of political forces in the country was of paramount importance for the creation of a healthy two-party system. Without a strong Opposition, the machinery of democratic Government runs the risk of being converted into a dictatorial one.

It is natural that attempts are being made to mobilise some rightist parties in the country under one banner for organising a strong Opposition to the Congress Party. But this is not currently possible since many electoral alliances in particular constituencies can be and are being arranged. It is probable that this will bring the Swatantra Party in as the largest single Opposition party.

A DELHI DIARY

IS RAIN AUSPICIOUS?

THERE is a belief (or is it a superstition?) that rain at inauguration ceremonies is auspicious. I thought, therefore, that when a light drizzle started at about 2-00 p.m. just before the opening of the Indian Industries Fair by the Vice-President on the 14th November, there would be a general recognition that Providence was taking a kindly interest in the proceedings, and was blessing an ambitious, if somewhat unfinished, operation. I communicated this sentiment of good cheer to a very large number of people, including the active Secretary-General of the Federation, Mr. G. L. Bansal. To my surprise I was accused of being frivolous and unsympathetic. None of the dignitaries associated with the Fair thought that this rain was well-timed and short of saying that Providence was being somewhat unthoughtful, I saw every possible mark of annoyance. After some time the unfortunate guests who had come early discovered that there was only one place of refuge which was the dais gaily covered by a Shamiana with the colours of the Indian flag. We all rushed hastily for cover, and discovered that the dais was capable of embracing shoulder to shoulder, and if I might be so indiscreet, back to front, something like a thousand people. But for this gracious shelter I would not today be writing of the Indian Industries Fair. Its memory would be so unpleasant that I would not also make light of the annoyance caused. However, apart from the dripping which the unwise use of non-water-proof cloth entailed, we escaped fairly easily from the deluge, and the sun in due course arrived, and the proceedings went off a promising start with many apologies from the hosts and much goodwill from the audience. The Vice-President himself, praising scientific organisation, observed that there were still some important matters beyond the control of man. Thus even if the rains were not auspicious, they produced more than one genuine smile. All's well that ends well.

IS DELAY DAMAGING?

A more serious question has arisen in regard to the unfinished character of many of the pavilions and the somewhat disorderly state of some of the roads. I myself on this occasion did not share the views of the naughty cartoonist whose vindictive effort I append.

This Fair has been about twice as demanding as any other that I know and with the shortage of electri-

What a Life!

A simply wonderful idea—they're exhibiting actual construction work!

Courtesy: The Hindustan Times.

city and the difficulties of obtaining skilled workmen in the capital city, it was impossible to carry through the vast amount of work that was involved without some considerable disorganisation and, inevitably, some considerable passing of budget estimates. Certainly, this has involved what might be called a national waste in the sense that Peter, who commissions a job, has been robbed to pay Paul, who generally works overtime. But, all in all, one must remember that Peter and Paul are Indians and, therefore, all is well for the country as a whole. Where Peter is a foreigner perhaps there is even some net benefit in foreign exchange, but it would be uncharitable for us to press for overtime merely because the international pavilions are so ready on this occasion to meet almost every conceivable bill! The great international pavilions, including those of the large foreign firms that have participated, are enormously impressive. I protest here and now on the limited period of this Fair. It should be allowed to go on for at least three months. The process of education is, of course, a continuous one, but we will never have exactly these facilities to demonstrate how both the world and India are progressing — I believe, now at last, at almost the same rate. This is called looking the world in the face.

IS HAPPINESS THE END?

Appropriate tributes were paid in both the speeches of Mr. Madan Mohan Ruia, Chairman of the Fair Committee and of the Vice-President, to the strides that Indian industry had taken in the period of the Second Five-Year Plan. There is, of course, much visual evidence to show how great qualitatively this advance has been. But the Vice-President did well to remind us that, while prosperity and, of course, that powerful display of skills that prosperity implies, are important, there were much greater values written into welfare than material progress. He pointed out that the pursuit of happiness and pursuit of economic progress were by no means associated in the West. He might have added that they are by no means associated in the East. There is no doubt that the business community, great as its contribution has been, needs to recognise the large area of discontent in this country which is a source not only of unhappiness but a source of danger to the system of production which has worked these quite substantial feats.

That dismal prophet, Thomas Carlyle, once said that man could do without happiness and find in exchange blessedness. Perhaps if the business community as well as everyone else thought more about the problems of the body politic as a whole rather than of production in itself, we might have more blessedness and less happiness. I am inclined myself to think that the Vice-President would wish it this way. In any case there would be more welfare in a community so constituted than one in which we have an active business community and a passive onlooking but envious lower middle class. The spread of industry must be greater than it has been in the last five years in order to make the achievements of Indian industrial production a national, and not a sectional, subject for pride.

THE CLASSIC UNDERSTATEMENT

I leave on this point to refer to the classic understatement of the week which comes from no less a figure than His Holiness, Pope John the XXIII, who last week, meeting diplomats of 68 nations assembled to congratulate him on his 80th birthday, said: "Grounds for fear for the future of mankind are not lacking". He added, "Use well the time given to act in favour of peace, of civilization and of true progress." Someone or other described progress as a century-old disease. Surely the 20th century has this disease more than any other!

ARGUS.

up

BIRDS

are it

stepping

To sustain its expanding output, India's steel industry needs increased quantities of essential raw materials like iron and manganese ore, coal, limestone and refractories. By meeting a large part of this demand, Bird & Company (Private) Limited have been making significant contributions to the progress of the steel industry.

Birds have now launched on a programme of expansion, which when completed will step up considerably the annual output of these raw materials.

	PRESENT PRODUCTION	EXPECTED INCREASED PRODUCTION
Iron and manganese ore	2,000,000 tons	3,000,000 tons
Coal	2,250,000 tons	3,000,000 tons
Limestone	2,000,000 tons	2,500,000 tons
Refractories	100,000 tons	120,000 tons

This expansion will assure the steel industry of increased supplies of these vital raw materials.

THE WEEK'S NOTES

I.I.F.

A VISUAL PICTURE OF EMERGENT INDIA

THE 1960's are envisaged to be of crucial importance for the industrial development of India. The Third Five-Year Plan, though it lays great emphasis on making the country self-sufficient in food and some essential agricultural raw materials, accords top priority to industrial growth. The Fourth Plan will similarly lay great store by industrialisation. Against this background, it is, therefore, just appropriate that the Federation of Indian Chambers of Commerce and Industry has sponsored the second Industries Fair.

Declared open by the Vice-President, Dr. Radhakrishnan, on Prime Minister Nehru's birthday, November 14, the Fair spreads over the sprawling Exhibition Grounds on Mathura Road in New Delhi and provides "a visual picture of emergent India slowly and steadily treading its way towards a more advanced and progressive economy". Compared to the first such fair held in the capital some six years ago, it is tremendously more rich in content and wider in its scope. This is as it should be; during the last six years, the country has made rapid advance in some basic and heavy industries apart from expansion of consumer goods industries. The Fair not only provides a window on the development of private sector industries in the country, but also on the giant enterprises undertaken in the public sector. In a way, it depicts amiably the pattern of development in a mixed economy. Most of the leading industrial nations of the world are also participating in the Fair, prominent among them being the U.S.A., the U.S.S.R., the United Kingdom, West Germany, France and the industrially emerging countries like Poland and Yugoslavia. They have put on show the latest industrial techniques adopted by them, as also the great advance made by them in scientific and industrial research. The stress in Indian exhibits is obviously on export promotion.

The need for holding such fairs periodically can hardly be over-emphasized in a developing country like ours. They provide not only a window on the industrial strides made by the more advanced countries from which we can profit immensely, but also inculcate a feeling of confidence amongst the masses through affording to them an opportunity to know the mighty task which is being performed in the country to raise it from a level of poverty and squalor. The Federation of Indian Chambers of Commerce and Industry deserves compliments for the imaginative way it has arranged the Fair, though the work on it can be completed in all respects only in another week or ten days. On the inauguration day none of the eight sectors into which the Fair has been divided was in proper shape, despite round-the-clock work having been done by thousands of workers. Debris and rubble could be seen scattered at various places—an unseemly sight which could have been avoided through a little more energetic effort on the part of the exhibitors.

Kerala

MUSLIM LEAGUE'S BREAK FROM THE ALLIANCE
THE WITHDRAWAL of the Muslim League from the tripartite political alliance in Kerala will undoubtedly be welcomed by the secular forces in the country. This split by itself is not likely to have any adverse effect on the functioning of Congress-P.S.P. coalition Ministry in the State since the two parties together with their strength of 80 can still claim a comfortable majority in a House of 127 legislators. The real danger to the stability of the Kerala Government can come only if the recent bickerings between the Congress and the Praja Socialist Party come to a head.

The blame for the split in the alliance in Kerala can scarcely be placed on the Congress or the P.S.P., although the understanding reached between the two on putting up of candidates for the Lok Sabha in the ensuing General Election to the exclusion of the League has been interpreted by the latter as a great betrayal. The Muslim League apparently has nursed the mistaken belief that the limited alliance entered into between the three parties in the last mid-term election to the State Legislature with a view to defeat the Communist Party, could be turned into a permanent one. This could be done by the Congress and the P.S.P. only at their peril. The alliance had put the Congress in an embarrassing position on all-India basis and had resulted in causing setback to it in a number of by-elections in other States. The P.S.P. Central Executive too had been feeling not a little uncomfortable by this arrangement, though the State unit had acquired through it a little more manoeuvrability than it could otherwise do.

How far the withdrawal of the Muslim League from the alliance will effect the election of Kerala candidates to the Lok Sabha it is difficult to say. The Muslim League has decided to put up four candidates — two to contest the P.S.P. nominees and two to oppose those of the Congress. It is anybody's guess how far the Muslim electorate will follow the lead given by the League leaders. Any setback to the Congress and the P.S.P. in this State would, however, be more than offset by the resultant gains elsewhere where the opposition would not now be in a position to raise the bogey of their alliance with communal forces in Kerala.

Railways

ASIAN EXPERTS MEET

DELEGATES FROM fifteen Asian countries met here this week under the auspices of Asian Railways Conference. This organisation is supposed to afford an opportunity to the delegates to exchange ideas on problems of mutual interest. Naturally, therefore, it constitutes an important forum for the exchange of views. In these developing countries, where the economies face special hurdles, such an organisation is likely to prove fairly useful. This is all the more so when there is a tendency towards geographical unities like the Common Market in Europe.

The most important proposal made at this Conference was regarding the Standardisation of Rolling Stock. The speaker from Turkey believed that standardisation was essential at the national level, but the representative from Malaya stressed the need to extend standardisation on limited international scale at least on a regional basis. He pointed out that the Malaya Railways and the Thai Railways adhered to different specifications resulting in operational problems between the two systems. The idea of regional standardisation was naturally received with considerable enthusiasm by the UNESCO specialists because this would in a way unite the region and create some sort of inter-dependence which is helpful for every country. Ultimately a degree of standardisation is bound to be helpful in mass production even if the Asian countries at present are importing their rolling stock from most of the European countries. It is quite likely that some of the Asian countries like India and Japan may be in a position to export rolling stock in the years to come which would only be possible if there was a degree of standardisation. It is true that peculiar circumstances on account of geographical and climatic conditions determine certain special types of rolling stock, but by and large this measure should be welcomed by most of the Asian countries.

TELL US YOUR JOB—

AND WE'LL GIVE YOU THE TOOLS

The size, shape or complexity of a project doesn't overawe us. We have the tools to help build it with a minimum of time, labour and cost. For nearly 70 years, BATLIBOI have supplied Industry and Trade in India with goods ranging from complete power plants to hacksaw blades. We represent internationally known manufacturers from the United

Kingdom, U.S.A. Czechoslovakia, France, Germany, Japan and many other countries. BATLIBOI also represent some of India's leading manufacturers of Machine Tools, Diesel Engines and various other types of machinery. Industry and Trade are vitally connected with the economic growth of any country, and BATLIBOI are vitally connected with Industry and Trade in India.

DESIGN... for finest performance

Of all aspects of industrial endeavour the most intriguing is thermo-dynamics, for it is this medium that provides industry with its greatest power—steam. Therefore, wherever high pressure steam-raising plant is used, there is a story...a story of experience, analysis and design.

Varying Conditions

Wherever new steam-raising plant is to be installed, either for generating power or in industry, it is essential that skilled investigation and analysis be carried out to ensure that the plant is *tailor-made* to give optimum performance under varying local conditions and requirements.

Fuel

Having established the purpose for which the steam power created will be required, it is necessary for the design engineer to identify the type of fuel to be used, either oil, gas or coal. Coal is by far the most widely used fuel, but its thermal content varies and it is therefore necessary to make an analysis to establish the percentage of principal heat-producing elements present. The thermal content of fuel has an important bearing on the designing of the kind of plant to be installed. Generally low-grade coal is used with anything up to 50% ash content. It should be remembered that steam must be raised as economically as possible.

Waste fuel

Particular attention has to be given to industries that wish to use waste material as fuel. For instance, the sugar industry absorbs vast quantities

of waste material in the form of bagasse for fuel; again in the pulp and paper industry it is now the practice to combine the processes of chemical recovery and steam raising by burning the 'black liquor' from the digestors in a special type of boiler unit. Of course, these industries cannot keep their steam-raising plant functioning entirely on waste materials. So, in their designing and planning, the technicians and design engineers must allow for varying fuels to be used and at the same time achieve optimum performance.

Powerful Ally

The new and powerful industrial group of ACC-Vickers-Babcock Ltd., with its vast resources of technical knowledge and the rich, wide experience of its partners, will undoubtedly prove a powerful ally in achieving the high target set by the government for the installation of boiler and thermal power plant during the third Five-Year Plan. AVB will be able to draw on the finest engineering minds to study, design and draw up plans that will *tailor-make* not only vital steam-raising plant but also heavy mining and cement-making machinery which will help meet the exigencies of industrial expansion and, in addition, ultimately contribute towards the earning of foreign exchange through export.

The AVB industrial plant at Durgapur is in the final stages of erection. Here, in Durgapur, all the advanced technical knowledge of AVB will be utilised to the fullest extent to ensure that each project is designed for the finest possible performance.

...a Powerful Partnership for Progress

The World Abroad

STAGNANT SOCIETIES

By ODYSSEUS

MY BET (perhaps influenced by wishful thinking) is that the UK will join the European Economic Community. But whether she does or not, the possibility of joining has let loose avalanches of constructively agonising reappraisals of the UK's economy, of her industrial and agricultural production and techniques, of her foreign and Commonwealth relationships, even of her social structure, among politicians, economists, industrialists, farmers, trade union officials, and all manner of other fry, small and big, who are researching, arguing, conferring, debating on radio and television, and publishing articles and books. Never have so many socks been pulled up by so many people before.

Any busy Indian politician, industrialist, leader writer, or other earnest student of current affairs, anxious to put himself rapidly abreast of the ferment in ideas that has overtaken the UK, should get a copy of "The Stagnant Society", by Michael Shanks (Industrial Editor of the "Financial Times" of London), a paperback Penguin Books Special, just published at 3sh. 6d.

Mr. Shanks summarises virtually every leading British political, social, and economic headache of the day. He jumps on his horse and rides vigorously off in all directions at once, exploring every avenue, and leaving no important stone unturned. He begins with the Soviet economic challenge to the free world, noting that between 1953-60 industrial production in the USSR rose by 91 per cent, compared with 21 per cent in the UK, and 16 per cent in the USA, and he asks whether the UK and the West can stand idle while the USSR is adding to its productive capacity at a faster rate. The two systems—that of totalitarian Communism and that of the free countries—are on trial in the eyes of the whole world. Mr. Shanks believes that democracy is better designed to achieve the best use of resources to promote the spiritual happiness and economic welfare of the masses, providing that we bestir ourselves from our lethargy.

Mr. Shanks is, of course, concerned with the major problems of costs, productivity, and inflation, which slow the UK's rate of progress, but he digs deeper, and points to faults in the British social structure, to the class divisions which impede understanding between employers and workers, to the neglect of technological education, to the weakening of efficiency and the competitive spirit by excessive protection, and, above all, to the UK's primitive labour relations. Mr. Shanks is a man of the Left, a Fabian Socialist, but he does not hesitate constructively to castigate the archaic organisation and obsolete 19th century economic thinking of the British trade unions, which he sees as the greatest institutional barrier to the emergence of a dynamic society.

INDIA'S EXAMPLE

Although Mr. Shanks is concerned with the UK, many of his criticisms and suggestions apply, in varying degree, to other countries, not only in Europe, but in Asia. I noticed, for example, an article in "The Eastern Economist" of April 28, 1961, which showed statistically that increases in real wages in India have been higher than increases in productivity, which argued that if this continued the result would be higher prices all round and no gain in living standards, and which concluded that high prices would impede India from competing in

foreign markets. Mr. Shanks' effort to find a way out of this vicious circle occupies the greater part of his book.

Mr. Shanks seeks to extend the power of the unions, not to limit it. There has grown up (not only in the UK) a widespread idea that a trade union leader is a sort of ex-officio civil servant, responsible not to his workers but to the community. His job is regarded as "knocking sense" into the workers, to deter them from putting in big wage claims and from striking, to encourage them to work harder, and increase their productivity. This is exactly the role that a union leader plays in a Communist state. But any leader who acted thus in a democratic society would lose his job.

Mr. Shanks urges that if the trade unions are to moderate their demands to a level which the economy can afford, they must be given an inducement. The UK Trade Union Congress Executive Council should be put on an equal footing with British Employers Confederation to join with government representatives in a National Production Advisory Council for Industry (N.P.A.C.I.) under the chairmanship of the Chancellor of the Exchequer, which would keep the whole field of economic policy under review, establish wage planning and a national wages policy.

A prior reform would be necessary. The TUC is, by and large, staffed with a second rate bureaucracy because its officials are heavily overworked and grossly underpaid. Many earn less than their fellow members on the factory floors. The Unions can afford to pay more, but don't want to. For example, in 1912 union dues in the Amalgamated Engineers Union were 1sh. 9d. a week, when wages were 38sh. a week. In 1959, earnings averaged £14 a week but dues were only 2sh. 3d., i.e. they had fallen from over 4 per cent of earnings to less than 1 per cent. The result is that union officials are more and more recruited from mediocrities, while the ambitious and able go elsewhere.

The unions should adopt the US system of "Business Unionism", in which members pay dues commensurate to their earnings, which, in turn, enable salaries to be paid which attract union leaders of a calibre and status equal to the employers or government officials with whom they negotiate. An American union leader like Walter Reuther does not approach his task handicapped by any hangover of 19th century Marxism, or feelings of proletarian inferiority, but as a twentieth century business leader, whose job is to ensure that a company maximises its profits with the aid of the latest technologies, in order that he can secure maximum wages within the productivity available. American unions are not afraid of dismissals to promote greater productivity in a factory, providing those remaining in employment get bigger pay packets.

The UK Conservative government is by no means the only one to have appealed constantly for wage restraint without offering anything in return. Why should wages be the one planned element in an unplanned economy? True. But frightened employers should note that if we are to have a planned economy it is equally impossible to leave wages as the one unplanned element.

The first requirement is for an N.P.A.C.I. to draw up an annual forecast of the nation's economic prospects,

which would estimate how much extra purchasing power could be safely released, whether as higher wages or improved welfare services. The planners would also need to ensure that there was enough money going to industrial investment and that the balance of payments was not jeopardised.

HAS ODYSSEUS SOLD THE PASS?

At this point, some old hands, who have been struggling with this column for years, may rub their eyes and exclaim "Has Odysseus sold the pass and been converted to planning?" I continue to oppose the kind of planning in which a group of bureaucrats or party leaders lay down production targets in what they conceive to be the national interest, taking no account of the need to produce what consumers want, which can only be ascertained by a flexible system of voluntary co-operation between the government, industry, and the unions, in the French Planning manner, which allows the price mechanism to work and assumes that competition is essential to progress.

The recommendations of such a planning group are likely to be based on compromises worked out by men who feel themselves engaged in a common enterprise, and who also realise that the unforeseen may crop up which will modify their next lot of negotiations and plans.

I am not abreast of what goes on in France, and I don't imagine that the unions there function in the manner envisaged by Mr. Shanks, but under his scheme the basis of agreement would be a recognition by high calibre union leaders that, at some point, their interests would be better served by advances in, say, the expansion of an industry, the introduction of new techni-

ques, or improved welfare services, than by forcing up wages to a level at which they would be offset by higher prices or unemployment. Union leaders in many countries already understand how self-defeating are the demands for increased wages to which their members annually commit them, and would be glad to "give a sensible lead"—provided that they could demonstrate factually that their members would benefit from it.

Such an N.P.A.C.I. would calculate, and publish, how great an increase in wages could be afforded. There is no doubt that many companies would be glad to pay higher wages, if they could be certain that the unions and workers would co-operate to ensure that they were earned. A major task for the British TUC in this system would be to persuade the workers to agree to shift working (the lack of which seriously deters capital investment), the elimination of restrictive practices, and the use of work study methods.

It would be idle to suppose that Mr. Shanks' system could be evolved quickly, or that it would always work painlessly. Mutual trust could only come gradually from the habit of working together. It might be that in some years the N.P.A.C.I. would be unable to agree on recommendations. The government would then have to make its own allocations, and resolutely face the consequences, since it is clear that, in any country where full employment exists, no government can remain neutral in the wages struggle.

But if a government were to set up an N.P.A.C.I., and to give it full support when it produced agreed recommendations, persistence might well be rewarded. One of the greatest by-products would be to soften the rigours of the class struggle by demonstrating to the different groups in the community that each had gained more by co-operation than by conflict.

Huge tonnage of iron ores from India flow into steel mills of Japan every day to be made into quality steel and steel products. Japanese steel producers, now achieving the 4th largest output in the world, thus contribute to solidify the trade relations between India and Japan. Japan Iron & Steel Exporters' Association invites you to inspect quality steel and steel products from Japan at The Indian Industries Fair.

prestressed concrete for clear space construction

Durgapur Thermal Power Station

Prestressed Concrete Plank Roofing was adopted for the Durgapur Thermal Power Station because of its lightness thus reducing the cost of the foundation and superstructure. It also made rapid construction possible.

A conventional cast-in-situ roof was ruled

out because of the unusual height between roof and floor.

The roof area covered was 50,000 sq. ft. The job was completed in about twelve months.

An additional feature is thermal insulation with foam concrete blocks.

TRADE WITH DEVELOPING NATIONS

From Our Special West European Correspondent

PARIS, November 12.

AN article on this page last week showed how some of the Common Market's leading economists and officials thought this region could continue to give special help to its "associates" (essentially French-speaking Negro Africa) without damaging the interests of other developing nations—indeed, while implementing a "global" policy of aid for development. On the question of financial aid, the case seems clear; the Six could provide a very large part of all the capital these African nations can usefully absorb, while still leaving 80 to 85 per cent of their exportable capital surplus for investment in other developing regions—on the assumption that they set aside for development aid a proportion of their national income equal to that now being devoted to that purpose by France. The question of privileged trade facilities is more difficult. The range and size of the customs preferences enjoyed by the African associates is frequently exaggerated by outsiders, but many Africans want to hold on to them, if only to match the privileges enjoyed by Commonwealth members. The Common Market powers (outside certain quarters in France) would prefer to "buy the Africans off", giving them capital, technical aid, subsidies and guarantees for their export earnings, in place of outright customs preferences.

It is on the trade issue that there is patent contradiction between the Common Market's wish to assist all developing countries and its commitment to aid especially its associates. Investment capital, technical help and even funds to equalise export revenues may all be given fairly lavishly to a selected group of countries without arousing envy and resentment elsewhere to anything like the same extent as a differential import duty. Non-beneficiaries can shrug off the first sort of aid as "neo-colonialism" or some other sort of sour grapes, but a discriminatory import duty is another matter. How far can the Six succeed in moderating the tariff advantages they have promised their associates, and what is their policy on trade with the developing nations in general?

The first task is to persuade the Africans that their vision of a Common Market giving outright preference to their goods is an illusion, that comes from imagining that the special status they enjoyed in France can be extended to the other five countries. As the metropolis of a colonial empire, France could make all sorts of special arrangements with her colonies which it would be impossible to extend to West Germany and Italy. (Certain Commonwealth countries labour under the same illusion; they think that the preferences they had in Britain can be enlarged to cover the whole Common Market if Britain joins.) Other European countries have no interest in assuming the "white man's burden" that one imperialist nation took on for the benefit of its colonies (in exchange, of course, for reciprocal advantages). Those other European countries have their traditional trade arrangements with, say, Latin America which they see no reason to upset, for the benefit of someone else's ex-colonies, least of all if those ex-colonies are poorer customers for manufactures than the Latin Americans.

Many Africans have been reasoning from the following table, which shows how much of their "tropical

produce" the Six drew from the associated countries in 1959:

(In thousands of tons)			
		Total ECM Imports	Imports from Associates
Bananas		951	340
Cocoa		272	146
Coffee		576	169
Copra		322	39
Palm Oil		240	130
Peanuts		706	380
Groundnut Oil		146	117
Cotton		758	67
Tropical Woods		2290	1330

They concluded that the Common Market as a whole was now bound to treat them the way France did, and so there was reason to hope that the figures in the second column would approach those in the first. Instead of buying only half their cocoa, palm oil, wood and groundnuts, only a third of their bananas and coffee and a tenth of their copra and cotton, from the French-speaking Africans, the Continentals would buy virtually all their requirements of tropical produce from those sources. If this were true, of course, the associates would have every cause for satisfaction and other developing countries ample grounds for discontent, for the Common Market is the world's biggest importer of several of these commodities, and one whose import needs are growing rapidly. However, nothing of the sort was ever promised, or even looked possible. The Africans' monopoly of the French market was not due simply to tariff preferences, but to import quotas (which obliged Frenchmen to drink Robusta coffee when they would have been willing to pay more for Arabica), to the generally protectionist policy France practised toward all the world outside the franc zone, and to the numerous political and commercial links forged by imperialism. The franc zone was in fact a politically managed, closed-circuit market, and that alone made the figures in the second column above as high as they are.

The mere granting of tariff preferences by the Common Market, which was all that was ever promised, would not suffice to give French-African produce a monopoly of the wider Continental market. The Common Market began by taking a liberal line on imports, abolishing quotas and breaking up the old, inflationary closed circuits of Euro-African trade; even when most favourably disposed toward the associated states, the Six have shown no inclination to practise the socialist-style management of markets known to the franc zone. Moreover, it lowered all its duties and thus reduced the absolute value of the preference offered the Africans—to the point where it was inadequate to prevent consumers choosing the cheaper and often better quality commodities offered from outside. And even that amount of preference is criticised by the West Germans and Dutch, as giving offence (if not actually causing damage) to their overseas customers in Asia and Latin America.

Even if, in the end, the associates are left with some tariff preferences in the Common Market, their vision of prosperity and industrialisation founded on a monopoly for their exports in Euromarket is an illusion. The Six will never absorb all their coffee, cocoa,

etc., nor guarantee them a market regardless of price, quality and volume. The associates were mistaken (or were led into error from Paris) in thinking they could pin all their hopes on the Common Market and thus avoid all the trade and development difficulties known to other backward economies. They will have to seek new markets in the Communist bloc, try to meet Asian, Latin American and other African competition in the free world market, trade more among themselves and learn to use more of their agricultural produce at home (where fats and fruit are badly needed by an undernourished population). In that context, the Common Market's offer to replace tariff preferences with capital aid and technical help, while seeking to assure the Africans stability in their export earnings, promises more gains than clinging to the delusion that preferences will secure the whole Continental market to their produce.

If, as is hoped in Brussels, the Six can persuade the African associates to accept this point of view, it will be easier for the Common Market to practise a coherent trade policy with all developing nations. The few and moderate preferences that will remain in favour of the associates might well cause less trouble than competition between producers in Europe itself and overseas producers, in the cases of sugar and certain fats (beet and olives compete with the cane and groundnuts). What sort of trade policy is the Common Market inclined to? (I am leaving quite aside the problems of capital assistance and technical help.) It is as well to be clear on one point: the very Continentals who seek to whittle down French-speaking Africa's preferences in the name of other, equally deserving, developing countries are inclined to a bare (not to say ruthless) commercial policy with no fancy concessions in favour of raw-material producers. The real reason they opposed special benefits for African associates was that they want to buy in the cheapest market, and this is their attitude to trade in general with developing countries: the Common Market should be free to buy where it likes, leaving raw material prices (and hence export revenues for developing countries) fluctuate as the free market dictates, without getting entangled in expensive fantasies like international commodity pacts, stabilisation schemes, etc. Suggestions for special trade policies, aimed at making life easier for raw-material producers, will still come from the same quarters as wanted to advantage the backward nations of Africa, and for the same reason—a recognition of the importance of high and stable export earnings for an industrialising economy.

The purely commercial approach, which at present dominates, is tempered by a willingness to facilitate entry into Europe of certain industrial and semi-industrial exports from countries like India and Japan. The realisation is gaining ground that the Common Market will have to contract, if not sacrifice, several old industries in order to let the so-called cheap-labour countries expand their sales. The outlook on this question is improving every month—not because anyone is undergoing a change of heart, but because capital and labour are being re-directed out of those old industries to other uses, so that the cost of the sacrifice will be minimal when it comes. Nevertheless, New Delhi would quite over-estimate the generosity of Europeans if it expected these concessions to be made without bargaining; when the Common Market agrees to buy more Indian manufactures, it will ask its price. That price will certainly include the demand that Delhi abolish or greatly reduce export duties on raw materials and that it abandon most export subsidies (even indirect ones) in favour of Indian manufactures.

The predominant view among Common Market authorities concerned with trade with developing countries is that West Europe should promote world trade by keeping import duties low or nil on goods from those countries, by abolishing sumptuary excise duties on things like tea, removing quota obstacles to Indian and Japanese textiles and by widening the notion of "raw materials" to include semi-finished manufactures—but that the developing nations should reciprocate by ceasing to tax European importers (e.g. of jute goods) and by practising more honest export prices for their new manufactures. There has even been discussion in the Continental financial press about the level of protective duties in countries like India; almost no one (but only almost) questions the need for protective tariffs around infant industries, but it is thought that protection has run wild in some cases—e.g. when protection is given an Indian producer of materials supplied to the Indian manufacturer of finished goods which are already protected, so that the protection given this second industry has to be increased. It is alleged that irrational, and partly self-defeating pyramids of protection are being built up in some industrialising countries, thus unnecessarily damaging European exporters. In exchange for trade concessions, some Common Market authorities would ask for this system to be reviewed. This approach may cause surprise in India, but it is consistent with the purely commercial attitude that has led to the reduction of the African associates' preferential benefits in the Common Market.

a commonwealth of industry

The publications lying on this official's table at the Dunlop factory at Sahaganj are marked "PRIVATE & CONFIDENTIAL". Published by Dunlop, U.K., they represent a medium for the continuous exchange of technological ideas that goes on between Dunlop factories the world over.

Brought together on their pages are reports of important developments at various Dunlop factories. What has Kobe done to reduce tyre abrasion? How is Hanau strengthening tyre casings? Or an idea from Sahaganj to reduce cord friction in tyres.

Every item of information is given careful attention at Sahaganj, every suggestion is considered worth studying, for it is not known which will spark off a train of new ideas, start a new chain of developments that will result in a better Dunlop product.

There are also frequent training and refresher courses arranged by Dunlop companies in other parts of the world, where participating Sahaganj technicians come across fresh ideas which they can put into use in their own factory. It is this constant international exchange of ideas which makes the Dunlop organisation truly a "Commonwealth of Industry".

DUNLOP  **SAHAGANJ**

25 years of progress: 1936-1961

Burning the midnight oil

The light from the oil lamp burned low as A.P. Stockwell sat working into the middle of the night to complete his report of 1903 on the possibilities of a typewriter market in India. It was this report which prompted the opening of the first Remington office in Asia at Calcutta.

In 1952, after an extensive survey of India's industrial sites and prolonged discussions in Delhi with the Government, the Indian Company—Remington Rand of India Limited—was born. Its objectives, to manufacture and sell Remington Rand office equipment in India.

Now at the Howrah factory about 1,300 of Remington's staff of over 2,300 personnel still burn the

midnight oil as they work overtime to catch up with India's typewriter needs. Production of typewriters was doubled in the last few years and negotiations are now under way for further expansion which will again double production. This move will not only save valuable foreign exchange, but will offer employment to hundreds of skilled and unskilled workers throughout the country.

The policy of the Company is Indianisation and the task of recruiting and training Indian personnel at all levels is constantly under way. We are proud of the contribution we are making to the prosperity of this fast growing country.

Economic Report from the U.S.

A NEW TRADE PROGRAMME

By GUY SIMS FITCH

WASHINGTON, November 9.

A NEW trade programme is beginning to take shape in the United States, one that is in keeping with the momentous changes now evident in international economic needs and relationships. Involved is a sweeping liberalization of the old Trade Agreements Act, under which the United States for the past 27 years has negotiated the reciprocal reduction of tariffs and other trade barriers with nations all over the world. That Act is due to expire on June 30, 1962, and President can be expected in the near future to submit recommendations to Congress for its renewal and possible alteration. The specific recommendations the President will offer have yet to be announced. Some indication of the Kennedy administration's thinking, however, is contained in a speech delivered to the National Foreign Trade Convention in New York last week by George W. Ball, Under-Secretary of State for Economic Affairs. From Mr. Ball's statement, it is evident that the Kennedy administration has been giving careful consideration to several new features which would not only liberalize but in a sense revamp the existing U.S. trade programme. One would be new authority for the President to negotiate deep, across-the-board tariff cuts on groups of commodities. This would in effect replace the existing requirement that tariff negotiations be conducted on an item-by-item basis — a time-consuming and not always satisfying procedure.

In addition, Mr. Ball urged that less emphasis be placed on tariff or quota relief for American industries affected by foreign competition. He spoke instead of special Federal aid, ranging from retraining of workers to modernisation of machinery, to help American industry adjust to new trade situations. Moreover, he made it clear that even this type of Federal assistance should not spare American management and labour from living up to their own responsibilities in adjusting to competitive world changes. Behind this statement lies the widely shared conviction that the present Trade Act, with much of its negotiating authority already used up, is no longer adequate to meet the challenges of the future. These challenges are bound up with

the establishment of the European Economic Community (E.E.C.) — the so-called Common Market — as an operating body, and its emergence as a world trading entity of major importance. They are linked, also, to the needs of the less-developed nations for access to world markets as they seek to accelerate their economic advancement. The six Common Market nations — France, West Germany, Italy, Belgium, the Netherlands, and Luxembourg—are in the process of drastically reducing and eventually eliminating trade restrictions among themselves, and of drawing up a common external tariff schedule against outsiders. This makes it important for the United States to be in a position to negotiate broad and meaningful tariff concessions if American companies are to find a growing market for their products in the economically expanding E.E.C.

In seeking to ease any discriminatory impact of the Common Market, the United States also would be in a better position to see that tariff reductions are extended to other U.S. trading partners in the less-developed areas of Latin America, Asia and Africa. In this way, as Mr. Ball observed, progress would be made in the welding of "a close-knit trading system in the Free World." Whatever specific trade recommendations it may finally decide on to help bringing these ends about, the Kennedy administration is faced with important decisions on tactics. Some officials reportedly believe that the administration should put off asking for big changes in the Trade Act until 1963, to give the President a chance to educate the public and Congress on their virtues. Protectionist sentiment, they argue, could be particularly strong in 1962, which is a Congressional election year. On the other hand, there are many who believe that a bold new trade programme is bound to evoke protectionist opposition whenever it is presented, and the fight might just as well be made sooner rather than later. Whatever decision may be on this score, however, it is clear that the Kennedy administration is wedded to a trade policy aimed at the continued expansion of world commerce and the freeing of trade from stultifying influences of international restrictions.

all round service to the nation

Yoked to the country's economy and the National Five Year Plans the J. K. Organisation with a multitude of strings formed of Industrial, Commercial and Financial units is pulling its weight towards economic progress and straining towards the "take off stage." Before the III Plan is ended, several more strings of varied line not seen so far in the country would be welded and the Organisation's pulling power increase the pace of the PROGRESS.

THE BUSINESS WORLD

Reactions to Swatantra Manifesto

By CROESUS

WHILE the second annual convention of the Swatantra Party, shortly to be held in Agra, has, as its main agenda, the discussion of the Party's Draft Manifesto, released a few days ago, practically all sections of the Press have already subjected it to a detailed and critical examination and commented upon it. So also have the different sections of the public, including the business community, and I propose to devote my column this week to a brief round-up of these comments.

It would be too much to expect the election manifesto of any political party, whether an existing or a new one, to receive cent per cent approbation, but, judging from the reactions I have come across so far, the Draft Election Manifesto of the Swatantra Party may be said to have been generally well received. Even from the extremist quarters, the reaction has been unusually moderate. At the present juncture, it is believed by some, this is precisely what the Congress Election Manifesto should have been, which it is unfortunately not, albeit for a variety of reasons, the most important being the absence of a strong and vigilant opposition. If today a large section of the people of this country is discontented, despite independence and what it has brought in its wake, it is because there seems to be a feeling that the ruling party has deviated from the admittedly sound moorings established by the Father of the Nation. No political party which discounts the values and priorities prescribed by Mahatma Gandhi, it is felt, can hope to carry with it the Indian public for long. To put it differently, the genius of the Indian people will not accept from any political party an extremely leftist policy, divorced, as it must perforce be in that case, from all spiritual background. It is in discerning this in time and in forming a new party uncompromisingly opposed to such a policy that the genius of Mr. C. Rajagopalachari lies and, as is only to be expected, the Swatantra Party's Election Manifesto fully bears the impress of his genius.

In its Election Manifesto, the Swatantra Party has not only indicated what it will do and what it will not do, but also how it proposes to implement its promises. A contemporary has described that a striking feature of the Swatantra Manifesto is its "unequivocal enunciation of the means it would like to adopt to lead the country to prosperity through freedom." Not all may like these means or this approach. For instance, there has been criticism, even from some friendly sources, of the Swatantra Party's attitude towards planning and foreign aid. For inerrable reasons, in certain quarters, the relevant wording has been torn from the context to give the impression that the Swatantra Party is opposed to all planning and all foreign aid. Similarly, the Swatantra Party's criticism of statism has been interpreted as the Party's unqualified condemnation of public sector participation anywhere. Yet another point on which the Swatantra philosophy has been misunderstood — deliberately in certain quarters — is in regard to its opposition to heavy industries. But a careful study of the full text of the Manifesto, assure the Party leaders, ought not to leave such an impression. What the Party has made clear in its Election Manifesto, they say, is to endeavour to show to the public

the shortcomings of the approach of the Party in power on a number of issues and to suggest a workable alternative such as would not offend the known traditional and spiritual values that have always been prized by the people of this country.

The Swatantra Party's Election Manifesto, it is claimed, has gone a long way towards dispelling doubts in the minds of certain sections of the public, including labour and the middle classes. After going through the Manifesto, one cannot conscientiously hold that the Swatantra Party is out to exploit either the worker or the consumer. The Party, says the Manifesto categorically, stands for a fair deal to labour, both agricultural and industrial, and "for a good wage for a good day's work." Particularly impressive is the new concept of "Progress Sharing". The Party expects to achieve "progress sharing" through the increase in productivity without detriment to the overall aim of national prosperity through the reduction of costs. How imperative reduction of costs is in the context of the need to increase our exports does not require to be specially stressed. It is by reducing cost and improving quality that the Swatantra Party hopes to augment India's exports, not by compulsion. Those who commend compulsory exports conveniently forget that, while it may be possible to compel our exporters to export, we may not and, in fact, cannot compel importers of another country to accept our goods, unless they are competitive both qualitatively and price-wise. Hence, urged a spokesman of the Party, "it is difficult for me to see any contradiction between the Swatantra Party stand against exports by compulsion and its insistence on increased exports", as has been commented by some.

Many business men consider the references in the Swatantra Party's Election Manifesto to the question of safeguarding the Fundamental Rights as originally embodied in the Constitution as of the utmost importance. Considerable importance also seems to be attached by them to the promise made by the Party "to ensure the widest possible distribution of industrial ownership" through such measures as establishment of investment societies and trusts and provision of employee's shares to enable the small man to invest.

When all is said and done, however impressive the manifesto of a political party may be, its import and implications cannot be expected fully to percolate to the man in the street or people in the remotest village. The voting will not, therefore, necessarily reflect an appreciation or understanding of the manifesto, but it is bound to reflect, at least in part, in the public disapproval of certain policies and actions of the party in power, and if the section registering such disapproval is sufficiently large, the feeling in business circles is that it is probable that the political party benefitting largely by this will be the Swatantra Party. It would then be for the Swatantra Party to prove how effective as an opposition it will function. For it is not only the leaders and spokesmen of the Swatantra Party that want an effective opposition but all lovers of parliamentary democracy generally.

Efficiency in Engineering Enterprises

THE symposium organized by the Institution of Engineers this week on 'Economy and Efficiency of Engineering Enterprises in India' proved fruitful in the sense that the speakers were able to initiate a certain degree of controversy which is the very basis of provocative thinking. Not only the variety of subjects discussed was considerably wide, the standard of the papers read at the Seminar was also fairly high. The President of the Institution of Engineers in his welcome address outlined the urgency of holding the Seminar, when he said that although India had the lowest wages in various units, the cost of production of most of the articles was generally higher than the cost of production of similar articles elsewhere in the world. This could be explained, he added, by the overall inefficiency of engineering enterprises which, if allowed to continue, would have very serious effect on the implementation of the Five-Year Plans.

One major controversy that appeared to be brewing in the seminar was about the selection of the top management. There were certain contenders who stressed the need of having the highest management in the technical hands because the delays, wastages and the frustrations occurred on account of administrative and financial curbs placed on the engineers. There were other speakers who believed that administrators had to have a larger vision apart from the technical knowledge. The basic element of management comprised planning and designing of the project, the selection of men, materials and machines and the control of overall organisation. All these phases though associated with technical processes, are more varied in the sense that a technologist was not necessarily supposed to comprehend them. The civil service, with all its faults, had an admirable record in many fields and it could not be called non-creative and less imaginative when it was called upon to handle the top management of huge engineering enterprises in the public sector.

In the views of the members of Institution of Engineers, the approach of civil servants was to persist with old arrangements in preference to new innovations. "Bureaucracy in dictatorial control of the tech-

nical enterprise has only an infinitesimal knowledge of the circumstances of the ventures.... Technical understanding and judgment are indispensable qualities a man must possess for the successful administration of an engineering enterprise, public or private". In fact this controversy was not as severe as it appears to be because ultimately the qualities which made a good technical man could be helpful for top management too. But apart from this, it was essentially the imagination which made a successful top manager. It was rightly added, therefore, that incentives and opportunities should be offered to junior technical hands so that they could exercise initiative and prove their worth.

Another important point raised in one of the important papers was the significance of work study which included work measurement through organisational analysis. It may be pointed that this technique was being applied in most of the industries in the West with considerable utility. With the help of travel charts and flow diagrams of men and material, the spots of wastage, which ultimately lead to higher cost of operation and loss of efficiency, were spotted. In the under-developed countries, there was immense scope for the application of 'work study' techniques because in most of the industries inefficient and outmoded methods are applied and there was lack of planning at all levels. Applied economy and efficiency have to be a second habit in the working practices of the employees if real efficiency has to be attained. The work study specialists in most of the cases brought to light the wastages that prevailed in most of the enterprises and acted as catalysts in bringing about an effective "cross fertilization of ideas". It must be remembered that even these methods could not revolutionise the efficiency overnight. The improvement was a continuous task. It was rightly advised, therefore, that work study departments should be set up in all technical organisations which gradually would improve the efficiency in engineering enterprises.

Various controversies at the symposium are likely to ensure thinking at various levels and several suggestion if followed could definitely lead to greater productivity during the years to come.

Business Notes

Taxation

PREVALENT HIGH RATES

THAT HIGH taxation would deplete resources and discourage initiative, both so badly needed for the success of any series of development plans such as our country has undertaken, was the main theme of the Presidential address of Mr. Lalchand Hirachand at a meeting of the Maharashtra Chamber of Commerce held in Bombay last week. Stating that the incidence of taxation remained the highest in India, he pointed out that the maximum rate of tax on unearned income amounted to 84 per cent, while that on earned income was 77 per cent, which made the effective rate of taxation in India higher than either in the U.S.A. or France. Accordingly he apprehended that any additional taxes on the top of the already heavy burden now obtaining would not only be unwise and harmful but might even weaken the very source of growth. As it is, the present taxation policy, according to Mr. Hirachand, has not only resulted in taxing the income of the person concerned but his capital as well. With the imposition of wealth tax and expenditure tax, to boot, he argued, there was a case for accepting the principle of amorti-

sation of capital expenditure in suitable cases as relief. He also entered an emphatic plea for special and positive efforts to encourage investment and capital formation by way of tax concessions as has been done by Sweden and Pakistan.

Mr. Morarji Desai, Union Finance Minister, who was present at the meeting, however, did not share the president's view. While assuring the trade and industry that, in the sphere of taxation, the Government had no intention of pursuing a path which would set in operation the law of diminishing returns, he said that the taxation policy of the Government was not aimed at earning more revenue; it was solely guided by the criterion of subserving the general benefit with a view to affording a better deal to the masses. Mr. Desai also contended that the rate of direct taxation was the highest in the U.S.A. being 91 per cent while the corporation tax also was higher at 51 per cent as against only 45 per cent in India. Even the rates of development rebate given in countries like Sweden, he remarked, were equal or lower as compared to those in India. In view of this, the Union Finance Minister warned the business community not to raise false alarm about crippling taxes, as such would only serve to frighten away foreign enterprise and collaborations.

Foreign Trade

INDO-AFGHANISTAN TRADE

WHILE IMPORTS from Afghanistan have remained more or less stagnant, exports to Afghanistan during the last few years have started picking up. In 1960 they were of the value of Rs. 608 lakhs. As a result of this increase in exports India's adverse balance of trade has also declined. Whereas the adverse balance of trade was as high as Rs. 312 lakhs, in 1960 a favourable trend was visible. An idea of trade between the two countries can be had from the following table:

(Rs. lakhs)

Year	Imports from Afghanistan	Exports to Afghanistan	Balance of Trade
1952	5.07	5.35	+ 28
1953	4.85	4.17	- 68
1954	5.51	3.72	-1,79
1955	4.13	2.05	-2,08
1956	4.36	1.71	-2,65
1957	4.94	1.82	-3,12
1958	5.00	3.30	-1,70
1959	5.70	4.55	-1,15
1960	5.02	6.08	+1,06

Imports from Afghanistan consist mostly of fruits and vegetables, hides and skins and fur skins. Exports comprise mainly of commodities like cotton textiles, wearing apparel, tea, bidi and tobacco manufactures, spices, jute goods, leather and leather goods including footwear, chemicals, pharmaceuticals, paper and stationery, paints and varnishes, toilet requisites, bicycles and motor cycles.

Whether this trade will increase further or not will, of course, depend on the restoring of the transit facilities. At present several consignments sent to Afghanistan are locked up in Pakistan and the latter has been hinting at auctioning these goods unless they were cleared soon. The Government of India has been quick to take notice of that and have advised the Indian traders that immediate arrangements should be made to bring back such goods. Meanwhile a trade agreement has been signed between Afghanistan and India. The arrangement takes effect from October 1, 1961, and will remain in force for one year thereafter and unless either contracting party gives notice to the contrary, will automatically be extended by a further period of one year.

Engineering

WHEELS INDIA: A NEW VENTURE

MR. K. C. REDDY, Union Minister for Commerce and Industry, inaugurated last week the Wheels India Ltd., a new venture floated by Messrs. T. V. Sundaram Iyengar & Sons in collaboration with Dunlop Rubber Co. of the United Kingdom. This undertaking is likely to cost over Rs. 1.5 crores and will produce 2.10 lakh commercial vehicle wheels every year. The participation of the Indian firm will be to the extent of 55 per cent and the remaining 45 per cent will be the Dunlop's share, which will be contributed in the form of machinery and equipment.

This is one of the capital intensive industries and when the unit starts producing its full output, it will mean a considerable saving of foreign exchange. At the moment we are importing nearly 2.5 lakh wheels at a cost of nearly Rs. 1.6 crores. The initial saving would be to the extent of Rs. 90 lakhs though steel flats suitable for these wheels would have to be imported

for some more time. It is estimated that of the final product, initially imported component may be of the order of 40 per cent. But gradually these components will be manufactured by the company.

The company will produce wheels for Dodge, Bedford, Leyland and Tata Mercedes-Benz commercial vehicles. The wheels will be of fully welded design, which is the latest technique adopted in foreign countries. The company will be the first to adopt in India the carbon dioxide automatic welding process. It is estimated that 80 to 85 per cent of the offtake will be by vehicle manufacturers because the replacement market for wheels is negligible in India. One advantage the company will have is that there are only two sizes of truck wheels in India as against 132 sizes in the U.S.A.

Regular output may start by December 1961, and by March 1962 it may run to full capacity. It may be added that the factory can raise its output to 4 lakh wheels by duplicating only 20 per cent of the existing machinery. The products of this venture are likely to receive a ready response in the market.

New Issue

MADRAS MACHINE TOOL MANUFACTURERS LTD.

MADRAS MACHINE TOOL MANUFACTURERS LTD. is putting its expansion programme through. A license has been obtained from the Central Government for bringing about a substantial expansion to the existing industrial undertaking at Singanailur (Coimbatore). The present factory is situated in a highly industrialised area in Coimbatore. It has all facilities for the transport of raw materials and finished goods.

The present issue consists of 24,900 equity shares of Rs. 100 each. The capital offered for public subscription is of Rs. 22 lakhs consisting of 22,000 equity shares of Rs. 100 each. The company has agreed to make allotment of 3,000 equity shares of Rs. 100 each that is of the nominal value of Rs. 3,00,000 to the Life Insurance Corporation of India, Bombay, against underwriting arrangements with them. The entire issue now offered to the public is under-written.

The demand for machine tools has been increasing in this country. It is mostly because of the reason that machines provide the key to industrialisation. It is estimated that the requirements of machine tools by 1965-66 would be approximately three times, i.e. Rs. 60 crores per annum. Even on a conservative basis, the demand will not be lower than Rs. 50 crores per annum. It is therefore apparent that the present output of Rs. 6.4 crores will have to be increased manifold.

Since this factory has gone into production, it has its order books well-filled. Though the company started production as late as 1959 it had earned reasonable profits during the years ending 31st March, 1960 and 31st March, 1961 for which the company had declared a dividend of 5 per cent on the paid-up capital. Since the demand is likely to increase further, it is apparent that the new issue will have a ready response in the market. The subscription list for this issue will open on November 20 and will close on November 28, 1961, or earlier as soon as subscription approximating to the amount issued to the public have been received, but it will not close earlier than November 22, 1961.

British Loan

A VALUABLE HELP

IT IS a matter of gratification that in spite of Britain's own balance of payments difficulties there has been no cut in her programme of aid to under-developed

countries. In the case of India this assistance has been quite considerable. Of the many countries which have been helping us she is among the first to make untied loans. The recent credit of Rs. 6.67 crores (£5 million) is an instance in point. The significant feature of this loan is that it is not attached to any particular project and can be used with immediate effect by India to pay for a particular range of imports from the United Kingdom. It is the third in the British series of loans for the Third Plan towards which the British Government has so far promised Rs. 120 crores (£90 million) under the Aid-India consortium arrangements. The first loan was of £30 million for mixed projects and the second one was of £10 million for a general balance of payments support. During the Second Plan Britain gave assistance to the tune of Rs. 107 crores (£10.5 million). Taken together with the Third Plan commitment, total British aid committed to date amounts to Rs. 227 crores (£170.5 million).

The credit of £5 million is payable over 25 years with a grace period of 7 years — the first instalment will fall due in May 31, 1968. The rate of interest will be the same as that applied by the British Treasury to a loan for a comparable period from its domestic consolidated fund plus ½ per cent management charge. The loan was made under the authority of Section 3 of the Export Guarantees Act 1949 and 1957. Since the first repayment of this loan will not be made until May 31, 1968, it would be a matter of great relief to the economy. In fact by setting a repayment term of 25 years the British Government has confirmed its recognition of the need to avoid repayment arrangements which a developing country like India is likely to find burdensome in the short term. The idea of total disbursed and committed assistance to India can be had from the following table:

Grand total of disbursed and committed assistance to date:	£ 170.5 million
SECOND PLAN	
Project Aid for Durgapur 1958	£ 15 million
General balance of payments aid—1958	£ 28.5 million
" " " "	£ 19 million
Project aid for Assam Pipeline—1958	£ 3 million
General balance of payments aid—1960	£ 10 million
" " " "	£ 5 million
TOTAL	£ 80.5 million
THIRD PLAN	
Commitment to date:	£ 90 million
LOANS SIGNED	
Mixed project and development goods loan — May 1961	£ 30 million
General balance of payments loan — May 1961	£ 10 million
General balance of payments loan — November 1961	£ 5 million
TOTAL	£ 45 million

Calcutta Electric

INCREASED SALES

IN HIS speech at the 64th Annual General Meeting of the Calcutta Electric Supply Corporation Ltd. held in London on November 9 (the full text of the address appears elsewhere in this issue), the Chairman, Sir Harry Burn, said the sales of electrical energy to all classes of consumers during the year ended March 31, 1961, recorded an increase of 138 million units over the previous year. Rolling mills, engineering workshops, cotton mills, chemical works and paper mills were responsible for 80 per cent of the company's sales of high tension energy for industrial purposes. Demand

for low tension industrial power expanded further with sales increasing by 9 million units to 123 million units; the number of consumers rose by over 1,200 to more than 16,700.

The gross revenue of the company has exceeded for the first time £10 millions. Commensurate with higher revenues was heavier expenditure in respect of the cost of generation and distribution. Increases in wages, after adjustments of dearness allowances and overtime rates, were substantial. Cost increases in respect of materials were commensurate with the expansion of the company's system.

Referring to the question of future supply within the company's licensed area, Sir Burn said that on account of the failure of the Damodar Valley Corporation to honour its commitment to supply 95 MW to the company, the turbo-alternators at New Cossipore Station which were long overdue for overhaul could not be taken out of service for routine maintenance. As a result, all the three turbines failed by a breakdown of balding. Two of them were recommissioned by the end of May. The remaining machine required extensive overhaul which was not completed until August 21.

Since the demand in the area is already outstripping the maximum generating capacity augmented by the off-take available from the Damodar Valley Corporation, Sir Burn observed that shortage of power was bound to continue, though to a lesser extent, for the next few years. The company has been assured by the Government of a bulk supply of power through the West Bengal State Electricity Board, first some 60 MW (not expected to be available until January 1964) from the Government's Durgapur Station and thereafter increasing supplies from the station proposed to be built in Bandel near Calcutta. The Government has approved of the company's plan to increase the capacity of its new Cossipore Station by installing another unit of 50 MW. Finance in respect of expenditure to be incurred in India has been arranged on reasonable terms.

Plywood

PAUCITY OF RAW MATERIAL

APART FROM the absence of adequate consumer response, the paucity of raw material (timber) has inhibited the development of plywood industry in India. This was stated by Mr. Manubhai Shah, Union Minister for Industries, while inaugurating the Federation of Indian Plywood Industry at Calcutta recently. For its annual requirement of about 100,000 tons of timber, the industry has largely to depend upon the forests controlled by the Central and State Governments. The number of plywood factories has increased from 43 in 1947 to 72 now. These factories have an authorised capacity to manufacture tea-chest plywood over 200 million sq. ft. and commercial plywood of over 124 million sq. ft. The present production is estimated at about 167 million sq. ft.

The import of raw materials and other ingredients as well as machineries, the Minister said, can be allowed, in pursuance of the Government's accepted policy, to the extent of earnings made by the industry from its exports. For this purpose, the Minister said, it is imperative for the industry to set up an export promotion council of its own to draw up an effective export programme.

The performance of the industry in the years ahead will largely depend upon the extent to which the raw materials are made available and consumer response aroused in the home market.

100-4

Time brimful with
laughter and
tears, time gay
with romps on the
sea shore, time
of careless days that
must be left behind.
But what sort of
'times' will they
inherit, these
youngsters, what
world awaits
them? A good
world, we hope, a
better one than
we live in. More
food, more clothes,
better medicines
and greater oppor-
tunities to travel
and make friends.
It is towards this
end that industry
and commerce
are working and
we are glad to be
a part of it.

INDIAN OXYGEN LIMITED

sends greetings to all children

FROM THE CAPITAL'S CORRIDORS

FOREIGN COLLABORATION

SEVEN important applications of Indo-foreign collaboration were approved during October 1961, four with the U.S.A. and one each with British, German and Swiss firms.

Haven Steel Ball Corporation of Bombay has entered into an agreement with Miniature Precision Bearings of U.S.A. to set up a plant to manufacture ball and roller bearings. According to the collaboration agreement, the paid up capital of the company will be Rs. 17 lakhs, half of which will be contributed by the U.S. firm. No royalty will be paid but the U.S. collaborators will be paid five per cent commission on imported plant and machinery.

D.C.M. Chemical Works of New Delhi have a tie up with Phosphate Acidulating Corporation of the U.S.A. to set up a plant to manufacture Superphosphate plants. The foreign firm will be paid a licence fee of £1332 per 6/10 ton plant manufactured in India for the supply of drawings etc. for the plants. The duration of agreement is five years in which period exports will be permitted.

International General Electric Company of Bombay has entered into an agreement for a period of ten years with International General Electric Company of New York to manufacture lighting arresters, magnets, heating elements and X-Ray equipment. A new company will be formed with an equity capital of Rs. 2 crores, out of which Rs. 1 crore will be subscribed by the U.S. firm. The foreign investment will be utilised for plant and equipment to be imported and the balance, if any, will be invested in cash in foreign exchange. For technical services etc., the foreign firm will be paid 3 per cent on the net annual sales value of the products of the Indian company less the value of imported components. This payment will be subject to Indian taxes. Export will be freely permitted and the company will export 10 per cent for the first three years and later 20 per cent of their annual production.

Little and Company of Bombay has joined hands with Columbus McKinnon Corporation of U.S.A. to manufacture link chains. An Indian public company will be formed in which the foreign company will subscribe 50 per cent of the total equity capital. No royalty or any other remuneration for technical know-how is stipulated. Exports will be freely permitted and the duration of the agreement will be 10 years.

K. C. Maitra of New Delhi has sought collaboration with Joseph Sankey and Sons, Limited of the United Kingdom to manufacture automobile wheels. The United Kingdom firm will be given free shares to the extent of 10 per cent in the issued equity capital of the new company, which will be Rs. 85 lakhs. No other royalty payments are involved. The U.K. firm will have the option to subscribe up to 50 per cent to the equity capital of the new company of which Rs. 10 lakhs would be in cash and/or in the form of plant and equipment to be imported from the U.K. company and the balance in rupees equal to the agreed value of the present car and A.D.V. wheels plant of M/s. Guest Keen Williams to be transferred to the new company and cash investment by Sankey Electrical Stampings Ltd. The period of agreement will be 10 years.

Neiveli Ceramics and Refractories Limited of Tiruchirapalli have entered into a collaboration agreement

with the West German firm, Elemental Baukeramik Vertriebs GmbH and Dr. Franz Kirchfeld GmbH to manufacture sanitary-ware. The issued equity capital of the company will be Rs. 40 lakhs. M/s. Elemental Baukeramik and Dr. Franz Kirchfeld will invest sums equivalent to DM145,000 and DM200,000 respectively. Messrs. Elemental Baukeramik will supply the necessary technical assistance. In consideration of this assistance, the West German firm will be paid an amount of DM150,000 for know-how etc., and a sum not exceeding DM275,000 for out of pocket expenses in respect of actual services rendered. The expenditure of Indian trainees and the foreign experts will be borne by the Indian company. Exports will be freely permitted during the term of the agreement which will be 10 years.

T. Maneklal Manufacturing Company of Bombay has a tie up with Benuinger Engineering Company of Switzerland to manufacture Four Bowl pad dyeing machines. Fee for the supply of drawings etc. to the foreign firm will be SF20,000 and the royalty at the rate of 5 per cent subject to taxes. The purchase of component parts from abroad will be at competitive prices and subject to the import control policy. Exports will be allowed freely, and the duration of the agreement will be 10 years.

TWO NEW ISSUES

Two more companies have been granted consent for issue of capital by the Controller of Capital Issues valid for 12 months. The following are the details:

Glass Corporation:

The Glass Corporation Private Limited, Dholpur, Rajasthan, having a paid-up capital of Rs. 1,00,000 has been accorded consent to issue bonus shares of the total value of Rs. 35,000 in the ratio of 7 bonus shares for 20 shares held on capitalisation of the Company's reserves to a like extent.

Canara Industrial and Banking:

The Canara Industrial and Banking Syndicate L'd., Mysore, which has a paid-up capital of Rs. 47,21,419 has been granted consent to the issue of capital of Rs. 50,00,000 in 5,00,000 (B) class ordinary shares of Rs. 10 each for cash at a premium of Re. 1 per share to the existing shareholders on right basis. The proceeds will be utilised for strengthening the bank's capital structure.

PRIME MINISTER & BUSINESS INTERNATIONAL

Only a reiteration of India's basic policy of economic development emerged as a result of the discussions between the Prime Minister of India and the members of the Indian Roundtable Conference of the Business International, which held its Session in New Delhi last month and a report of which is now available.

In answer to a question asking the Prime Minister to share with the American businessmen his vision of India's future, Mr. Nehru, referring to the field of industry, said that he attached the greatest importance to its rapid development. Explaining the country's broad industrial policy, he said: "Our broad policy is that the basic and strategic industries should be controlled by the State. At the same time, we encourage the growth of medium and small scale industries and traditional and home industries are also given facilities for expansion. Still, there are vast numbers of people who remain without employment. There is not enough

My choice

of a truck?

DODGE

of course

Bhaiya, I have been a truck operator long enough to know that there can be no two opinions about the superiority of Dodge trucks. For instance take Axles. A Dodge vehicle is fitted with Timken axles now known as Rockwell-Standard which have a world-wide reputation. These axles have great load carrying capacity and are absolutely dependable—which means a great deal to us truck operators.

There are several other superior features, besides. Taken together they lead to only one conclusion, namely, that the Dodge is a great truck. It is great in hauling power, great in endurance, great in earning capacity. You'll make Dodge your truck, too, I am sure.

TWA G. 237.

room for absorbing them on land. We, therefore look forward to a technologically more mature society in which work would be done more efficiently. But this will have to be a gradual process. Even in agriculture, we would not mind having tractors and we do have them but we have to see that by employing labour saving devices, we do not create more unemployment, for it may upset our social balance."

Mr. Nehru further added in reply to another question that the field for development was so vast and the market in India was so great that he wanted every method to stimulate India's economic growth through planned development. Drawing attention to riches at one extreme end and poverty on the other, Mr. Nehru stated that in an independent society the gap between riches and poverty should be reduced and eliminated as quickly as possible. He expressed the fear that if the process took too long, the social balance might be upset.

On the question of foreign aid, the Prime Minister said that foreign aid was obviously necessary but the manner of assistance would depend upon various factors. Elucidating his policy, Mr. Nehru said: "In individual projects of industrial development private foreign capital was allowed to flow in and we do not distinguish between indigenous capital and foreign capital. We have followed the practice of keeping the majority control and ownership in Indian hands. Apart from the psychological reasons the historical background has created a strong resistance among people to any kind of economic domination and this resistance gives rise to a feeling that we must beware of this danger. This, however, is not really in the way of allowing foreign private capital to come in."

To another question, asking the Prime Minister whether he looked favourably on simplification and some relaxation of controls, on the speeding up of procedures and on a less rigid limitation of capacities — especially in those cases where no foreign exchange was involved or where foreign exchange savings could be achieved—Mr. Nehru answered that they had inherited a system of Government which was adequate for the then Government as it was not essentially a Government which interested itself in the social progress of the people. He, however, agreed that procedures should be simplified and declared that the Board of Directors of the public undertakings would now be given complete autonomy. Regarding controls, the Prime Minister stated that nobody fancied controls as such. "However, they come in when Government thinks that something will happen if controls are not enforced." He referred to the situation after the War when textile controls were removed in 1948 and had to be re-imposed after about 8 months because there was acute shortage of cloth and prices went up.

At the end, Mr. A. R. Gale of Amplex Corporation asked the Prime Minister's views on the role that Communism might play in South-East Asia. Mr. Nehru stated in his answer that there were many political problems which were put under the head 'Communism'. Referring to China he said that its aggressive nationalism was a historic fact and was not peculiar to the Chinese Communist regime. There was a tendency for simplification of complex questions. Communism was an upsetting force and it generally thrived in countries which were under-developed and backward. "If you, however, refer to a situation in any particular country, you should analyse the conditions in that country." He referred to Indo-China and stated that at Geneva in 1954 it was unanimously agreed that Indo-China must be kept out of ideological conflicts of

the major power blocs. There was a tendency, specially in America, to pick up people who had no influence on their own people and were not capable of delivering the goods. This led to all kinds of complications.

INDIAN INDUSTRIES FAIR

The 1961 Indian Industries Fair which was opened by Vice-President Dr. Radhakrishnan on the 14th is expected to present a vision of new Industrial life of India while mirroring the achievements made in the Second Five-Year Plan with or without foreign help. According to the Federation of Indian Chambers of Commerce and Industry who have organized the Fair for the second time, goods worth Rs. 30 crores will be exhibited by 400 participants. Among the participants are many foreign firms who are at present collaborating with indigenous firms in the various sectors of Indian economic life. Following is a brief description of some of the 'Foreign national' pavilions, a preview of which was given on Monday:

By far the most elegant pavilion at the Fair is the spacious American pavilion where on display are more than 1,000 tons of industrial and scientific equipment, ranging from a fully-equipped workshop rebuilding worn automobile engines, a modern production line assembling small but sturdy tractors, a foundry, a small print shop and giant turret lathes to highly sensitive precision testing devices and a model of the unmanned atomic power weather station reporting on conditions in polar regions. The "aeromobile", the car of the future riding without wheels on a cushion of air, displayed at this pavilion is likely to be one of the biggest draws of the Fair. The theme of the American pavilion is "Industry in the Service of Man".

True to the words of Lenin who said that "communism is Soviet Power plus electrification of the whole country", a pride of place has been given at the Soviet pavilion to the electrical exhibits such as working models of the hydro-generation of the Bratsk Hydrel Station of Siberia, a 3,00,000 kilowatt Turbo-Generator, high voltage transmission lines, atomic and solar energy accumulators and other implements.

The other sections display impressive exhibits of heavy machine-building, mining implements, metal cutting lathes, fuel and chemical industry, oil-well drilling machines "Zif-Zoom" and "GP-T", different types of tractors, harvester combines, tea and cotton plucking machines and such other agricultural machinery which might be used in the Indian agriculture and industry and the kinds of which are already being used in India in respect of the joint Indo-Soviet projects, such as Bhilai metal, Cambay and Ankleshwar oil, Korba coal, pharmaceuticals, Ranchi heavy machine-building plant, Durgapur mining equipment, coking batteries, blast furnaces, machinery for smelting steel and rolling metal.

The Soviet pavilion, occupying more than 10,000 sq. meters of space with an imported 12 ft. high statue of Lenin overlooking the entrance and a large-size photo of Khrushchev and Nehru sitting together, forming the background, has not ignored the consumer and utility goods side which includes exhibits of textiles, foods, knitted wear, watches, handicrafts, toys, glass, china, a mobile TV transmitter where one can see one's own picture, tape-recorders and cameras.

The British pavilion lays stress on Indo-British collaboration through charts, working models and photographs. British assistance has been forthcoming not only in industry but in finance, transport,

communications, power and knowledge as well. Exhibits illustrating the themes "partnership in road, rail, sea and air" include a picture of the first steamship to reach an Indian port (in 1825); a photograph of the dock extension and reconstruction work in Calcutta, carried out with the help of British consulting engineers. Another display shows at a glance the loans made to India in the last three years by the British Government for such projects as the Durgapur Steel Works and the Assam Oil pipeline, and for general imports. The "partners in communication" section has photographs and pieces of equipment to show the wide variety of means of communication Britain has brought to India. The "partners in promoting health" section shows a picture of the Tuberculosis Chemotherapy Centre in Madras, a model of Melrose heart-lung machine and an actual "radio pill", which when swallowed relays information on conditions within the human body. The other sections dealing with "partners in power", "partners in production" and "partners in knowledge" are equally impressive. Almost in the middle of the pavilion is a gleaming wide airhouse made of a water-proof chloride-coated nylon fabric and held up solely by air blown into it.

There are two major attractions at the French pavilion; the cars and the aeronautical machinery. There are on display two cars, a Renault and a Dauphine. Both these are small-size four-door cars and cost in France between 5 and 6 thousand rupees. These are among the best sellers in Europe and are owned by middle and upper-middle class people. They are, therefore, bound to attract the attention of many visitors.

The aeronautical industry machinery has been displayed in the major part of the pavilion which incidentally has been organized by the French aeronautical companies. The section may attract the attention of comparatively lesser number of visitors but those who understand the basic elements of engineering would find it considerably interesting. At present French aeronautical industry is supplying aircraft and other aeronautical equipment to various other foreign countries. "French planes were sold all through the world as early as 1918 when every month France produced 2,750 aeroplanes and 4,000 engines", the guide at the pavilion indicated proudly. At present the French factories are equipped with the latest techniques and their output includes all aspects of aviation from the sports plane to the twin-jet medium range transport liner including fighter planes which fly twice the speed of sound and missiles of all types.

The accent in the Polish pavilion is on exhibiting a wide range of machinery and machine tools which Poland is in a position to export today. As many as ten State enterprises of Poland are participating in the show where on view are models of a complete power plant and foundry, coal mining machinery, equipment for the manufacture of textiles and chemicals, engineering goods making machinery, precision instruments, metallurgical plants and equipment etc. On display also are some engineering goods of direct consumption such as motor cycles and cameras. The various exhibits obviously give an inkling into the rapid progress that Poland has made in the manufacture of heavy machinery and machine tools during the post-war period.

LOK SABHA'S FORTHCOMING SESSION

Twenty new bills will be introduced by the Government in the forthcoming session of the Lok Sabha commencing on November 20, 1961. The Reserve Bank

of India (Amendment) Bill seeks to amend the parent Act to permit the establishment of a Credit Information Bureau and for certain other purposes. The laws relating to Wealth Tax, Gift Tax and Expenditure Tax are also to be amended. One other bill defines the duties and powers of the Comptroller and Auditor-General of India.

The other bills to be introduced are: The Sugar (Regulation of Production) Bill; The Telegraph Wires (Unlawful Possession) Amendment Bill; the Indian Railways (Second Amendment) Bill; The Indian Succession (Amendment) Bill; The Indian Tariff (Amendment) Bill; The Iron Ore Labour Welfare Fund Bill; The Drug (Amendment) Bill; The Air Corporations (Amendment) Bill; The Atomic Energy Bill; The Vishvabharati University (Amendment) Bill; The State Financial Corporations (Amendment) Bill; a bill to facilitate introduction of correspondence courses under the aegis of the University of Delhi; a Criminal Law amendment to make the production, circulation, etc. of documents resembling currency notes an offence and the Indian School of Mines (Dhanbad) Bill.

The business before the Lok Sabha also includes discussion on international situation, Tenth Report of the Union Public Service Commission, Supplementary Demands for Grants (General) for 1961-62, Supplementary Demands for Grants (Railways) for 1961-62, and the Demands for Excess Grants (Railways) for 1961-62, and the Demand for Excess Grants (Railways) for 1959-60.

INDIA AND E.C.C.

As part of Britain's policy of keeping other Commonwealth Governments closely informed about the course of her negotiations with the Common Market, the Lord Privy Seal, Mr. Edward Heath, on November 10 met the Commonwealth High Commissioners in London and gave them a report of the first round of the talks between Britain and the countries of the European Economic Community (Common Market) which ended on November 9 in Brussels, Belgium.

Meanwhile, India's Minister-designate to the European Common Market, Mr. K. B. Lal, has returned to New Delhi for a seven weeks' consultations visit. Mr. Lal who expects to return to London en route Brussels by Christmas has dispelled a great deal of pessimism as a result of his study on the spot. In his view, with proper safeguards and genuine efforts, India's export trade should get a further stimulus after the United Kingdom joined the European Common Market. This seems to be in contrast to the general feeling that Britain was turning its back on the Commonwealth. This was, at any rate, the feeling after the Commonwealth Finance Ministers' Conference in Africa, where the Commonwealth countries had used strong language against Britain's entry into the Common Market. There appears to be now a much greater awareness of what is involved in the main issue, namely who would benefit, if Commonwealth trade suffered by Britain's entry into the "Common Market." The obvious answer is the Communist Bloc. There is, therefore, greater awareness in Britain and even in the Common Market countries to consider ways and means of fitting in the Commonwealth pattern of trade into the new United Kingdom-Common Market Treaty, which is now being negotiated.

PROJECTS FOR PUBLIC SECTOR

Five public sector projects are still under discussion here, some of which have sufficiently advanced towards agreements while others are still in talking stage. The

CUT AIR CONDITIONING COSTS CUT

with **BLUE STAR-WORTHINGTON**
Packaged Air Conditioners
5, 7½, 10 tons
Now made in India

Here's how **BLUE STAR-WORTHINGTON** Packaged Air Conditioners offer you a four-way saving in air conditioning costs.

CUT COSTS on tonnage. Single units range from 5 to 10 tons, operate independently.

CUT COSTS on installation. Units can operate without ductwork.

CUT COSTS on subsequent expansion. Single units connect up into multiple systems with minimum alterations.

CUT COSTS on operation and maintenance. Every unit is engineered, built and individually performance-tested in **BLUE STAR'S** own plant to **WORTHINGTON** specifications.

For a better air conditioning job, call in **BLUE STAR**

JWTC 250A

twin project of Heavy Structural and Heavy Plate and Vessel comes in the first category, an agreement in respect of which, it is expected, will shortly be signed with Davy Ashmore of the United Kingdom.

There are three parties in the field for setting up the Diesel Engine Project. They are B. N. M. of Denmark, Fiat of Italy and MAN of Germany. The Project will be located in the vicinity of a shipyard, either Vishakapatnam or near the proposed shipyard at Cochin.

The second precision instruments plant to be located at Kerala will be in collaboration with the Russians.

Data on the Heavy Compressors and Pumps Project is being prepared to enable the Russians to prepare a techno-economic report. This report will enable the Government to decide whether the requirements of this country could be met by the expansion of existing capacity or whether it would be more economical to set up a new plant for it.

The Russians, it is learned, have intimated to the Government that, for the time being, their hands were full to take up the Ball and Roller Bearing Project. They might take it up, say, a year later.

INDUSTRIAL CONSULTANTS

At least three consulting firms have been approved by the Government of India to operate in this country. They are Simon Carves (British), Koppers (German) and Hydrotherm (American). Another Indian Company, Industrial Consultants, ISCONS, hopes to operate by the end of March, 1962 when it will start bidding and executing projects. In the initial stages the Indian Company will undertake the supervision of construction of plants and heavy civil construction, but eventually it hopes to give an integrated service to its clients either by strengthening its construction division or by creating a separate subsidiary organisation.

MORE INDIA-MADE WATCHES

Permission has recently been given to Hindustan Equipment Suppliers of Bombay to set up a wrist watch factory at Baroda. The proposed factory will have an annual capacity, on single shift basis, of 300,000 watches a year as under:

First year	..	82,000 watches
Second year	..	130,000 watches
Third year and onward	..	300,000 watches

The c.i.f. value of imported components per watch in each phase will be as under:

First phase (one year)		Rs. 13.31
Second phase	Upto	Rs. 12.35
Third phase	Upto	Rs. 8.92
Fourth phase	Upto	Rs. 6.87
Fifth phase	Upto	Rs. 4.00

From the sixth year onwards, no imports of any parts will be permitted.

The foreign collaborations are the French Firm, L.I.P., which will have no participation in the capital of the company.

GOODYEAR'S BALLABHGARH FACTORY

On November 18 the Vice-President, Dr. Radhakrishnan, will be inaugurating the Goodyear's Ballabhgarh plant set up to manufacture 750 car and truck tyres a day on three-shift basis. Besides producing tyres, the factory will be turning out tubes, camelback and repair materials as well.

The total investment in the project is of the order of Rs. 6 crores, of which 80 per cent has been made available by the company from its own resources and the rest by the Indian public and some institutional lenders. The company, it may be recalled, had offered to the Indian public earlier this year 4,00,000 equity shares of Rs. 10 each at a premium of Rs. 7 per share. The issue was heavily over-subscribed. The company

has also secured a credit of Rs. 2.25 crores from the U.S. Export-Import Bank for this factory, 59th in the chain of Goodyear manufacturing units all over the world. The 70.5-acre site for the factory at Ballabhgarh provides for further expansion in all the manufacturing lines of the company.

The Goodyear Tyre and Rubber Company is engaged at present in conducting research in five synthetic fibres which may revolutionise tyre-making in future. This has been disclosed by Mr. Ted M. Kersker, Manager of the Fabric and Adhesives Development Department, of the company. He said here on Saturday last that "quest is for a tyre which will have exceptionally long life with smooth and good riding properties."

BRIEFS

Jayanti Shipping Company signed an agreement with the Japanese firm, Mitsubishi Shipbuilding and Engineering Company for the construction of eight 32,250 dwt bulk cargo carriers at a cost of over Rs. 17 crores. Jayanti Shipping Company already has a tanker and proposes to acquire five more second-hand vessels for the carriage of coal between Calcutta and Rangoon. The Company has purchased two more tankers of 40,000 tons each. Its present tanker is of 30,000 tons.

A German firm has shown interest in the Koyana Aluminium Project and is sending out a team to negotiate its terms of collaboration.

A PASSENGER FROM NEW ORLEANS WRITES:

COMPANY AFFAIRS

TATA CHEMICALS

Tata Chemicals Limited during the year to June 30, 1961, made a steady progress so that the output of soda ash increased by nearly 25 per cent and the total revenue of the Company by over 20 per cent. It exceeded the Rs. 4 crore mark. Gross profit rose by Rs. 8 lakhs to Rs. 57 lakhs showing an increase of 15 per cent over the last year. Though these gains over the previous year have not permitted the Company the full restoration of the dividends paid two years ago, they are fairly satisfactory in the sense that dividend proposed was to absorb Rs. 21.19 lakhs as against Rs. 18.86 lakhs during the previous year.

The progress achieved might have been greater but for a number of difficulties which either impeded production or raised costs during the year. The most unfortunate of them was the recurrence of the exceptionally heavy rains which have plagued the salt raisings almost every year. In the year under review, the loss of salt and the resulting purchases in the market to maintain production of soda ash and electrolytic caustic soda, cost the Company about Rs. 9 lakhs and so reduced the gross profits by that amount.

The long range programme for the expansion of the Company's production capacity in soda ash and other products made satisfactory progress during the year under report. Most of the remaining major units planned for the soda ash plant were commissioned. Barring the intervention of unforeseen incidents or misfortunes, the main project for the expansion of the Company's productive capacity in soda ash and sodium bicarbonate would be completed by June 1962.

The expansion programme includes in the final stages a provision for doubling the capacity of chemical caustic soda plant. A final decision on this proposal will be taken after the recommendations of the Tariff Commission and Government's orders thereon, are known. The prices hitherto fixed for caustic soda have not been remunerative when applied to caustic soda made by the chemical process. In this connection, the Company has made certain submissions to the Tariff Commission and if they are accepted by the Commission and by Government, the Company will go ahead with the expansion of this plant.

This expansion, along with a number of other schemes undertaken during the same period, will from its inception in 1957-58 eventually cost Rs. 6 crores, of which Rs. 4.15 crores have been spent upto 30th June, 1961. This expenditure was financed to the extent of Rs. 1.86 crores from borrowings, Rs. 1.17 crores from internal resources including allocations to depreciation, and Rs. 1.12 crores from additional share capital.

TUBE INVESTMENTS OF INDIA LIMITED

The operating results of the Company for the period under review have been satisfactory. After setting apart Rs. 9.46 lakhs as development rebate and after meeting all expenses and providing for depreciation and for income-tax, the net profit is Rs. 55.24 lakhs. The directors recommend the amount to be apportioned (a) Rs. 25 lakhs be provided as proposed dividend for the year ended 31st July, 1961, at the rate of Rs. 10 per share subject to deduction of tax; (b) Rs. 17.00 lakhs be transferred to general reserve; (c) Rs. 3.00 lakhs be transferred to dividend equalisation reserve; (d) Rs. 1.25 lakhs be transferred to development, replacement and research reserve; and (e) the balance of Rs. 12.03 lakhs be carried over to next year.

Despite the power cut and shortage of water for a short period, the production of cycles during the year has been satisfactory. The production of components has also increased during the year compared with that of the previous year. On the recommendation of the Tariff Commission the protection to the cycle industry has been extended by another three years.

There has been a delay in the production of saddles due to the late receipt of plant. Trial production runs were made and found satisfactory. Bicycle saddles are expected to be in the market soon.

The installation of the cold rolling mill had to be completed but owing to the delay in arrival of plant and machinery it remained incomplete. It is now anticipated that the mill will go into production by December, 1961. Tube mill could not work full capacity for some time on account of shortage of raw materials, power etc. It is anticipated that the addition of a cold roll mill will, to a large extent, safeguard the requirement of raw materials provided the supplies of steel strips from indigenous sources are in accordance with requirements of the Company.

The company has received an industrial licence for manufacture of Metal Sections. Necessary factory-space to house the plant for this project has been found and the building work has started. Application for licence to import machinery for this project has already been made and orders will be placed for the plant shortly. It is expected that sometime in the second half of 1962 this unit will go into production.

Both the subsidiary companies—T I Diamond Chain Limited and T I Miller Limited—have become public companies under Section 43-A of the Companies Act from 29th March, 1961. T I Diamond Chain Limited have already started production of bicycle chains at their temporary factory in Avadi. Their permanent factory at Ambattur is under construction and it is expected by early 1962 it will move into the new premises, when it should be possible to increase the production of bicycle chains and start manufacture of industrial chains. T I Miller Limited have already obtained the necessary import licences for the plant and machinery for which orders have been placed abroad. It is expected that the production of lamps will be started by the end of the current financial year.

Company Meeting

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LIMITED

Sir Harry Burn's Review

The Sixty-Fourth Annual General Meeting of The Calcutta Electric Supply Corporation Limited was held on November 9 in London.

Sir Harry Burn, K.B.E., F.C.A., the chairman, presided.

The following is his review which had been circulated with the report and accounts:—

There were increased sales to all classes of consumers during the year ended March 31, 1961. The total energy sold of 1,955 million units shows an increase of 138 million units over the previous year. Sales of energy have increased each year for the last 14 years and over that period sales have increased more than threefold, thus reflecting the ever-increasing need of electrical energy, particularly for industrial purposes. It is indicative of the great expansion that has been happening in India and our forecasts show that this expansion will continue. Later on in this Review I refer to the grave shortage of power in the industrial areas of West Bengal and Bihar and to the extensions to your Company's plant that are being put in hand.

Industrial demand accounts for 90 per cent of the energy sold for power purposes. The balance is divided equally between sales to public waterworks and for domestic power, the latter being used principally for air-conditioning and refrigeration. There was a small increase in sales to the jute industry, our largest consumer and responsible for 34 per cent of our total industrial demand. An acute shortage of raw jute made trading conditions very difficult for the jute mills. Once again rolling mills and engineering workshops showed a large increase; their consumption rose by 37 million units, equivalent to an increase of 15 per cent. Next in importance are cotton mills, chemical works and paper mills; in each case their consumption rose by 10 per cent. The five classes of industry mentioned above were responsible for 80 per cent of the Company's sales of high tension energy for industrial purposes.

Demand for low tension industrial power expanded further with sales increasing by 9 million units to 123 million units; the number of consumers rose by over 1,200 to more than 16,700. Consumption by public waterworks increased to the extent of 4 per cent and was solely due to larger demands from the Calcutta Corporation. Sales of domestic power again showed a substantial rise, mostly due to the growing popularity of small air-conditioning units suitable for residence and small offices.

Sales of energy for lights and fans increased by 16½ million units to 259 million units. Housing development continues, but is mostly confined to the outskirts of the Calcutta suburbs.

Public lighting sales have increased by approximately one million units in each of the last two years. Expansion of electric street lighting by the Calcutta Corporation has not been as extensive as hitherto.

The Calcutta Tramways Co. Ltd. is the sole consumer for traction purposes. Improvement in their operating conditions is reflected in the increase in consumption of 2½ million units.

Bulk supplies are given to some nine distributing undertakings, seven of which are owned by the State Electricity Board and the remaining two by the River-side (Bhatpara) Electricity Supply Co. Ltd. and the Chandernagore Electric Supply Co. Ltd. The State

Board was responsible for 94 per cent of the total sales of 89½ million units and for almost all of the increase of 23 million units over the previous year. The largest State undertaking is the North Calcutta Grid which distributes energy entirely outside the Company's licensed area.

Sales under special contracts increased by nearly 8 million units to more than 100 million units. The bulk of those sales, and of the increase in consumption, were at our special tariff to owners of large office and residential buildings, public institutions, cinemas, and hotels. That tariff is particularly designed to give relief to our low tension distribution. The remaining consumers under special contract are the Central and State Governments, the Calcutta Corporation and the Calcutta Port Commissioners; their consumption showed little change from that of the previous year.

REVENUE ACCOUNT

I have already referred to increased sales to all classes of consumers. Despite the restrictions I refer to below sales of energy for the current year continue to improve. The revenue account shows that the revenue from the sale of current rose by nearly £1 million to £9,800,000. The gross revenue exceeded for the first time £10 million. Interest received amounts to £88,305, an increase of £44,578 over the previous year and is attributable to the return on treasury bill investments and interest on bank deposits. Commensurate with higher revenues is heavier expenditure. The cost of generation and distribution rose by £530,000 to £5,088,000. Coal accounts for £414,000 of this increase. Expenditure on coal including handling and ash disposal charges amounted to £3,240,000 (consumption 1,293,000 tons) and accounts for 80 per cent of the total operating cost of generation. Power purchased from the Damodar Valley Corporation cost £288,000 more than the previous year. 390,406,000 units were imported, an increase of 87,850,000 over the previous year, but the power made available was insufficient to give the relief necessary to allow essential and urgent plant overhauls to be taken in hand. I will revert later to the present power position. Increases in wages include adjustments of dearness allowances and overtime rates. Cost increases in respect of materials call for no special comment and are commensurate with the expansion of the Company's system. By comparison with the previous year administration and general establishment charges show a considerable increase. This is mainly due to expenditure in the previous year having been reduced by the writing back of a provision created during other years and no longer required. Nevertheless there was a moderate increase in expenditure during the year under review and it was mainly due to higher salaries and wages costs. The wealth tax, for which there was a charge of £99,723 in the previous year, was abolished with effect from April 1, 1960. The depreciation charge has risen by £31,500 to the figure of £960,600. The balance on revenue after taking into account the depreciation charge has increased by £213,000.

I will now deal with the net revenue account. The Indian tax charge is £1,164,387 as compared with a charge of £595,923 for the previous year which was materially eased by the adjustment of provisions set free on settlement of appeals relating to assessments of previous years. It will be noted from the directors' report that the sum of £356,541 has been transferred to net revenue account in order to equate the Company's clear profits with its reasonable return. This transfer has been made from reserves created in the past specifically for this purpose, and leaves a balance at the end of the year of £187,816 all of which it is expected will be utilised during the current year. When these reserves are exhausted it is essential that the Company's tariff structure should be able by itself to earn the reasonable return and thus ensure the provision of the internal finance that will be required during the next three or four years in connexion with the major extensions at New Cossipore to which I refer below. Initial allowances for depreciation eased the burden of taxation during the period these were operative. This acceleration of the depreciation charge as permissible for tax purposes connoted higher assessments and therefore higher taxation in future years and as stated above the Company has now entered this period. Our rates have been held unaltered for the last 15 years, but now with the steadily rising costs of generation, distribution, repairs and maintenance and an increased tax charge it has become necessary to place the structure of the Company's tariffs under close examination with the object of ensuring that, when required, rates are so adjusted as to earn the reasonable return permitted by the Electricity (Supply) Act, 1948. An investigation into the Company's rate structure is, therefore, now being carried out.

The allocation for the contingency reserve fund has been made as required by the Act and it is proposed to make the customary contribution to the retiring gratuity fund. Provision has been made for the debenture interest and sinking fund charges. The continued expansion of the Company's operations makes it essential to conserve our finances to meet the consequent capital expenditure. The board have, therefore, deemed it advisable to appropriate a sum of £550,000 to special appropriations for plant expansion, replacements and contingencies. Dividends on the preference stock amounting to £63,650 have been paid and it is proposed to pay a final dividend of 4 per cent (actual) for the year. The balance left to be carried forward on net revenue account is £124,585.

BALANCE - SHEET

The balance-sheet shows an increased holding in Treasury bills, £979,300 as against £771,700 at March 31, 1960. Thus funds are available to meet current commitments in respect of plant and other payments falling to be made in the United Kingdom. Payments of Indian tax falling due during the concluding months of the year, to which reference was made in last year's review, have reduced the deposits with bankers to £55,000. At the end of the previous year these deposits stood at £531,000.

Capital expenditure during the year amounted to £1,332,000, and was almost entirely for our transmission and distribution system. By far the greater part of the expenditure was on mains and service connexions. As a provision for capital expenditure during the year there was available the sum set aside for depreciation of £980,000 and the allocation to special appropriations for plant expansion, replacements, and contingencies amounting to £550,000, thus making a total provision of £1,510,000. During the period January 1, 1951, to March 31, 1961, the outlay on capital expenditure was £13,400,000, which was met by the internal finance made available over that period from

depreciation reserves and appropriations for plant expansion and replacements.

In July of 1960 Mr. Macpherson and Mr. Hobson visited Calcutta and met the Chief Minister, officials of the Government and of the State Electricity Board and representatives of the Damodar Valley Corporation. The company's assessment of the supply position and the impending shortage of power it revealed was conveyed at a conference convened for the purpose and permission was requested to install a fourth set at the New Cossipore generating station as providing a further contribution to the generating capacity available in the state as a whole. Permission for this project, to which reference was made in last year's review, was not then forthcoming.

I was in Calcutta this year throughout the month of February and discussed the matter with the Chief Minister when he informed me that we were then at liberty to go ahead with the project. During my visit I also met the chairman of the State Electricity Board, the chairman and the general manager of the Damodar Valley Corporation and leaders of commerce and industry in Calcutta and West Bengal with whom I had talks on the power situation. I went over all sections of our organization and was afforded ample evidence of the care and attention which our staff devote to their work. Dr. Roy, the Chief Minister, and his officials take a keen interest in the Company's activities. They are fully aware of our problems and the service we render to the industrial and residential communities. I desire to say how much the board appreciate the assistance given by Dr. Roy over the issue of import licences and supplies of the necessary indigenous materials.

Our secretary, Mr. Colley, who was commercial manager in Calcutta for a number of years, accompanied me during my visit and carried out an inspection of the various sections with which he is concerned.

Special attention continues to be given to the training of Indian engineers. Quite a number of our permanent staff were originally appointed under our technical training scheme which was started in 1946 for young Indian graduates chosen by a selection committee in Calcutta for training in the United Kingdom. In addition, short refresher periods of training in the United Kingdom are given to selected members of our permanent staff. We are grateful to the Electricity Council, the Area Boards, and various manufacturing companies who provide facilities for this training.

POWER SITUATION

In last year's review I referred at length to the question of the future supply within the Company's licensed area and recounted the steps which had been taken over the decade and a half that had elapsed since the end of the war to meet the growth of demand on the system. I also related the circumstances which brought the Damodar Valley Corporation into the picture and how our expectations for an adequate supply of power from this source—as provided for by agreements entered into in April, 1954, and January, 1959, had not been fulfilled. We anticipated, however, that by the end of 1960 the Damodar Valley Corporation would have commissioned sufficient new generating plant to have enabled them to honour their commitment to us of 95 mw. for the year 1960-61. Unfortunately our hopes were not realized and despite our most persistent requests throughout 1960 and early 1961 to the Damodar Valley Corporation to afford us power up to their full contractual obligation they never found it possible to afford us a supply of more than 60 mw. at the time of our daily system peak. As a result we were unable to take out of service for routine maintenance the turbo-

alternators at our New Cossipore Station all of which were long overdue for overhaul. I regret to have to report that all three failed on load, the 50 mw. Machine on the 9th February this year followed by the two 30 mw. Machines on the 1st and the 11th April. All three turbines failed by a breakdown of blading and this can be directly attributed to the necessity to keep the machines in commission beyond the time when they were due for normal overhaul. The Company took the view that they would be failing in their duty to consumers had they not accepted the considered risk of keeping these machines in service at a time when they were entitled to expect an early augmentation of the import from the Damodar Valley Corporation. The 50 mw. Machine was recommissioned on the 7th May and the 30 mw. Machine No. 2 on the 25th May, thus restoring the Company's total effective generating capacity to about 275 mw. The remaining machine required extensive overhaul which was not completed until the 21st August on which date the machine was again on full load. I wish now to express the board's high appreciation of the work carried out by the agent, Dr. Bowker, and the chief engineer, Mr. Kanga, and the station engineers and those members of their staff concerned in getting the station on load again and in dealing with the allocation of power during this period of emergency—their hours were long and the work arduous. I also desire to pay a warm tribute to the turbine manufacturers and the craftsmen they so promptly sent out to remedy matters and get the machines into commission with the minimum of delay.

The maximum demand on the Company's system at the time of these failures was approximately 385 mw. sent out and although the Damodar Valley Corporation were able at times to increase their export to 85 mw. (and for a short period to 105 mw.) the outage of the New Cossipore plant totalling 110 mw. entitled load shedding on an extensive scale. In shedding this load the Company endeavoured at all times to maintain its low tension supplies, particularly to hospitals, pumping stations and other essential services, the restrictions falling mainly on high tension consumers, including unfortunately those taking high tension supply for domestic purposes. The board desire to express their very great appreciation of the voluntary acceptance by

its large industrial consumers particularly the constituents of the Indian Jute Mills Association and the Indian Engineering Association of restrictions on their demands on the Company at the time of its peak loads during this crisis. These restrictions which were devised to spread the burden on the most equitable basis over all sections of industry, mitigated to a very considerable degree the hardships imposed on other sections of the community.

Although the breakdowns to which I have referred greatly increased for the time being the impact on the public of a shortage of power in the city, a shortage is bound to continue to a lesser extent for the next few years, since the demand in the area is already outstripping the Company's maximum generating capacity augmented by the off-take available from the Damodar Valley Corporation. As I explained in my review of last year the Company has been assured by Government that they will provide the ultimate solution of the problem in the shape of a bulk supply through the West Bengal State Electricity Board, first some 60 mw. (not now expected to be available until January, 1964) from Government's Durgapore Station and thereafter increasing supplies from the station they intend to build in the Bandel area near Calcutta which will increase their supply to some 120 mw. by January, 1966. The Company now anxiously await these additional supplies and our best wishes are with the State Board in the speedy accomplishment of the various power projects they are now engaged on. We trust that the construction and commissioning of the plant will proceed smoothly as planned.

In the meantime I am glad to be able to report that Government, reversing the decision communicated to us a year ago, have now agreed that we should, with the utmost dispatch, proceed with our plan to increase the capacity of our New Cossipore Station by the installation of a further machine of 50 mw. Finance in respect of expenditure to be incurred in India has been arranged on reasonable terms and, advised by our consultants, Messrs. Merz & McLellan, we are now engaged in negotiating the necessary contracts. It is hoped to commission this machine, at an all-in cost of some £3,500,000, towards the end of 1963, some 12

months before the State Board anticipate having their new Bandel Station in operation.

Even before the recent crisis, it was apparent that the growing load on the Company's system was bound over the next few years to exceed the total power resources available and we accordingly requested Government to arrange for the control of the distribution and consumption of electricity under Section 22B of the Indian Electricity Act. Government accordingly appointed an Electricity Supply Control Advisory Committee on whose advice they issued orders that no new or additional supply of electrical energy for a connected load of 100 kw. or above shall be given to any impending or existing consumer as the case may be without the prior sanction of Government. Provided the full contractual supply of 100 mw. is available from the Damodar Valley Corporation this restriction, taken in conjunction with the continued voluntary agreement by certain large industrial units to restrict their demand at the time of the Company's evening peak loads, should, as far as can be seen, enable the Company without further substantial load shedding to carry out proper and regular maintenance of its plant and thus alleviate the position until our new plant is commissioned two years hence.

Following the recent breakdowns at New Cossipore to which I have referred, there has been a certain amount of ill-informed criticism in the press and in particular it has been suggested that the Company's generating plant is largely worn out. This is far from true, as in fact the plant at New Cossipore (now completely repaired) and that at Mulajore are in first class condition and capable of many years of useful service, while the Southern Station, though old and not so efficient, has been well maintained and will continue to provide a satisfactory source of power especially during peak load periods.

Mr. W. H. Thompson, C.S.I., has intimated his intention to retire from the board after the annual general meeting and I, therefore, take this opportunity of stating how much we appreciate his services to the

Company and the keen interest he has taken in its affairs. He was secretary from 1936 to 1945 and became a member of the board in the latter year. Mr. Thompson had a distinguished career in the Indian Civil Service and on retirement in 1922 he became general manager of the Bengal Telephone Corporation Ltd. He also represented the Bengal Chamber of Commerce on the Bengal Legislative Council until he returned to the United Kingdom in 1936. During the war he was assistant secretary, Ministry of Home Security in charge of the Air Raid Warning System. Mr. Thompson has our best wishes for pleasant years of retirement which he contemplates in the countryside of his choice.

TRIBUTE TO STAFF

It affords me much pleasure to express our thanks to the staff and employees in Calcutta. The expansion of the Company's operations and their devoted efforts in meeting the calls on their services bear witness to the interest and zeal they take in the affairs of the Company.

Mr. Henderson demitted his charge as agent on March 31, 1961, having carried out his responsible duties with care and competence. Mr. Canning, the acting chief engineer, also retired after many years of yeoman service particularly at the generating stations. We wish them both happy years of retirement.

Dr. Bowker, our chief engineer, took over the post of agent as from March 31, 1961. He has a wide experience of the Company's affairs, having been with us since 1936, is well qualified to carry out the duties of agent and has amply illustrated this during recent months. I also desire to record the board's appreciation of the able manner in which Mr. Colley has carried out his duties as secretary.

The report and accounts were adopted.

NOTE: The above statement is not a report of the proceedings of the Annual General Meeting referred to.

The Congo: Confusion Worse Confounded

THE news from the Congo this week is no better than before and, indeed, there has been a report from New York to say that the acting Secretary-General, U Thant, is already having second thoughts on the vigorous pursuit of United Nations policy there. Whether this latter report is authorised or not, the fact that it has appeared in the world's Press is in itself an indication that doubts have appeared at the centre of the citadel of action. It is even more natural that these doubts should exist at the periphery, and that many nations previously anxious to contribute to the support of the United Nations in the Congo should start furiously to think what is involved, now that the original agency is itself bogged down both in mental and military confusion. The original request from the Government of the Congo which emanated from Mr. Patrice Lumumba has undergone so many metamorphoses that it is now a completely different affair. Is it possible for all the personalities to change (and change sides) without the original request losing all its basic value? Surely, this is the time to ask what the United Nations is doing in the Congo, and exactly what India is doing on her own and on the United Nations' behalf.

The original theory which seemed to most of us in India to justify the United Nations intervention was the belief that there was a nationalist struggle in which mercenaries—from Belgium in particular, but from other countries also—were anxious to defeat the national current and to raise local revolts, particularly in Katanga, dominated, it was thought, by foreign capitalists. A secondary, though at that time unargued case, was that the refusal of the United Nations to shoulder responsibility would imply inevitably that either the USSR or the United States would enter and make the Congo a bloody creature of cold war rivalries. The suggestion that there are other areas of the world where cold war rivalries do not enter physically in spite of the fact that the United Nations is not present, and that even in Berlin, which is the centre of the cold war controversy, war has been avoided without the physical presence of the United Nations, was brushed aside as either interested or naive. The view that United Nations' intervention is all that keeps the United States and the USSR from rushing to war in the Congo seems now a serious error. If they do not go to war in Berlin, they are far less likely to try conclusions in the Congo. It would be very surprising if either the USSR or the United States considered the Congo worth a nuclear war.

It is, therefore, in terms of the first argument, namely, that a national movement is being thwarted in its fulfilment of popular aspirations, that one might plead that the United Nations' adventure must continue. On the other hand, it is now patently clear that this is not a straight colonial problem. If Mr. Tshombe is the creature of colonialism, at least on paper Mr. Gizenga is not. And these are not the only large elements which challenge the United Nations in the Congo. It is also clear that if the United Nations has been called in to unite the Congo, then the record has shown that it has signally failed in its purpose. It now seems clear that the 15,000 effective troops in the Congo are unable to defend themselves in every area when attacked, far less carry out aggressive operations in other areas. Hardly any country would now wish to add to its troop strength there. And our Defence Minister was certainly right in declining to add to India's responsibilities. The question is why he agreed to so great a commitment in the Congo whilst leaving the Chinese open to commit a new act of aggression in Ladakh.

Indian public opinion, so far as the Prime Minister is concerned, is extraordinarily temperate and subdued. It is not, however, to be taken as acquiescing meekly in the double disaster which has overtaken us in the last month. As our active protest to the Chinese Government dated October 31 makes plain, India is now unable even to maintain her frontiers of six months ago. To have exported troops and aircraft on a mission of doubtful value in the Congo makes the situation even more reprehensible. If the country is not able, because it suffers from a paralysis of adulation, to censure the Prime Minister for his failure to defend the country or to prevent further aggression in Ladakh, after all his proud talk, it will certainly wreak its vengeance on the Defence Minister. It is foolish to assume that the Government of India, having accepted one serious defeat at Chinese hands, can now go on with more verbal jugglery to justify its helplessness. There is a decisive note of anger creeping into the Indian mind. In our pursuit of idealistic international commitments we have neglected our own domestic responsibilities. How long can the Indian people be made to believe that we lie supinely helpless before China, but can be supremely effective in maintaining the security of the Congo? This, surely, is a Pickwickian situation. It may well raise a smile abroad. It can only fill us with anger and humiliation at home.

New Chinese Aggression

THE written answer to a question by Mr. Bhakt Darshan on the first day of the current session of the Lok Sabha has electrified Delhi and presumably in due course of time will enrage the whole country. This is that further aggression has been committed by the Chinese Government and that the Government of India has now protested against "numerous incursions into Indian territory,

building new military roads close to the frontier in the middle and eastern sectors and deep inside Indian territory under unlawful Chinese occupation in the western sector." In effect the fears expressed in the Indian Press that the Government of India's defence arrangements in Ladakh were inadequate to stop further advance by the Chinese have proved true. The Prime Minister returns

to a situation which is full of failure on both the defence and the foreign policy fronts. The question that is being asked angrily is whether, when India increased commitments to the United Nations and sent aircraft abroad, there was evidence that the Chinese were pursuing their aggressive policy. Indian opinion will never accept the view that the troops released for the Congo were not available for battle on our own frontiers. It may be that they were not troops trained for high altitudes; it may be that the aircraft were not suitable for this purpose, but the argument that India can spend her scarce military resources abroad while being unable to maintain her own territorial integrity will never be accepted by any section of the Indian people. It is a deep mark of humiliation that we have now come to a point of accepting every new act of aggression as though it were inevitable.

In the last analysis the question as to whether our defence arrangements were adequate or not, will be proved by the result not by clever pleading. The result proves that our defence arrangements were not adequate. Both the Minister of Defence and the military authorities responsible for maintaining Indian territorial integrity must be held liable by Parliament for this great failure to carry out an

Public Sector Undertakings

WITH the rapid expansion of the public sector in the industrial field that has taken place during the Second Five-Year Plan and is envisaged under the current one, it is only appropriate that the Government should have bestowed some thought on efficient management of these concerns; the current approximately 3½ per cent return on the capital invested in State enterprises is obviously not what is desired. The Government has done well in finalising its decisions on the Krishna Menon Committee's report before the Third Plan has gone into strides.

The most important decision that the Government has taken is the constitution of a Joint Committee of Parliament to supervise the working of State undertakings. A draft motion for constitution of this Committee is said to be under consideration. The step is obviously in the right direction for public sector enterprises had become a matter of everybody's interference in the sense that all sorts of questions were put in Parliament on their working which had necessitated more than necessary control by the Ministry concerned. The constitution of the Joint Committee of Parliament, along with the decision to avoid in future appointment of Secretaries of the Ministries or departments of the Government on the Board of Directors of State undertakings, would lead to relaxation of bureaucratic control on them, imparting thereby greater autonomy in their working.

The Government's decision to debar Members of Parliament from becoming directors of public sector enterprises, however, is likely to provoke a controversy. The Krishna Menon Committee has vehemently expressed itself against the appointment of Parliament Members to these offices; it considers this practice to be altogether an unhealthy one and difficult to justify. But since holding of the office of directorship of a State enterprise has been declared by the Government

elementary obligation of national policy. We have now come to the point where the Chinese all over our frontiers are capable of inflicting severe and bitter humiliations upon our troops as well as upon our politicians. Surely this is not a situation in which either the Prime Minister or the Defence Minister can be at ease before the elections.

It is unfortunate that China and thus defence and foreign policy have become major issues in the political battle which is to be decided in the general elections. There can be no doubt whatever that in certain sensitive electorates this will involve a substantial fall of Congress prestige. It is likely in the North Bombay constituency where it will be raised more than anywhere else, that there will be a major defeat inflicted on the Defence Minister whose conduct of India's defence affairs leaves us thus pitifully helpless and humiliated before our foes. It is of little consequence that he has been rebuked this week in the United States, where he has been compelled to appear in a somewhat subdued role before President Kennedy. He will need to answer to the Indian electorate for his acts of omission and commission. It is essential, even if the Indian people are unable to defend their frontiers, that they should censure those who have failed in the discharge of their high duties. ...

an office which should not stand in the way of a person from becoming a Member of Parliament, presumably because there is no such restriction on the election of directors of private sector companies to Parliament, it is difficult to reconcile with the proposition why this onerous restriction should be there on Members of Parliament being appointed to the Boards of Directors of State enterprises. The experience of the industrially advanced countries of the West in this respect is, of course, not a true guide for the practice there varies. This rule probably will be enforced not so strictly because the Government has only recently appointed a Member of Rajya Sabha as the chairman of an undertaking in which both the State and the private sectors are partners.

One can find little fault with the decision on the appointment of directors of State undertakings from amongst persons having business connections and from amongst the ranks of the workers and senior officers of the undertakings themselves. The Government has rightly decided that no whole-time director of a major public sector undertaking should have any connection with private business; that is an unhealthy practice. Part-time directors of small State enterprises, however, may be appointed from these ranks provided no question of conflict of interest, whether direct or indirect, arises between the operations of public sector undertakings to which they are appointed and their own business interests. This should help in bridging the yawning gap that exists in regard to availability of top men in industrial leadership. But utmost care has to be exercised in the selection of such directors.

The decision to have, as far as possible, only full-time directors for public sector undertakings is equally appropriate for that would impart greater efficiency to these enterprises by obviating diversion of attention on the part of the management from its main task. The Government has similarly done well in empowering the Chairman

of the Board of Directors of a State undertaking with the ultimate responsibility for the working of the enterprise, thereby giving him the power to overrule the Board or to exercise his discretion before prior consultation with it if it is thought to be essential in the interest of the company.

Guest Editorial

Stalin's Secret Speech on Khrushchev

By WILLIAM REES-MOGG

UNTIL recently the study of Soviet policy was very much like the study of archaeology—one had to reconstruct the history of an inherently unknowable society by assembling broken fragments of evidence. Now Mr. Khrushchev has changed all that. Even if the whole debate is not yet out in the open, a large part of it is. The Communist Party in Russia is probably now less successful than the Conservative Party in England at the important political skill of presenting a united image to the public mind.

We have now even reached the point at which the Italian Communist Conference openly discusses whether the flood-tide of anti-Stalinism which Mr. Khrushchev has been boating upon will not in the end engulf Mr. Khrushchev himself. "What were you doing in the great purges, Daddy?" has become an unavoidable question in Communist life.

The broad division that has occurred is clear enough—indeed it can readily be described in the orthodox terms of Leninist-Stalinist theory. One can imagine Stalin, in his own familiar prose style producing his latest revision to "The Problems of Leninism" or perhaps he would produce a new work entitled "The Problems of Stalinism". It would go something like this:

"Stalinism developed in the historical period of the early revolution, when the infant socialist state was still weak and beset by enemies. It grew up in the period of wars and war preparations by the imperialist states, when the contradictions of capitalism were at their most acute, when the first direct proletarian onslaught on capitalism had been made and revanchist groups were preparing to fight back.

"The tasks of Stalinism were to protect the progress of the proletarian revolution and to develop the strength of the infant socialist state. The task of Stalinism was to change from the muzhik horse of poverty to the horse of large-scale machine industry.

"In order to achieve these tasks it was necessary to repress all the enemies of the state, both those Trotskyite gangs of assassins and spies who wanted to risk the development of the infant socialist state by left-wing adventurism, and the right-wing deviationists and latter-day Mensheviks as well.

"It was necessary to smash those hyena-enemies of the people who wanted to weaken the will of the people by modernism, by revisionism, by Jewish cosmopolitanism and by premature emphasis on consumer goods. Both right-wing and left-wing deviations were unmasked and crushed. (All rise and cheer, 'hail to our great leader, Comrade Stalin'. Prolonged and tumultuous applause.)

"In the early stages of revolution it is historically and dialectically correct for any Communist party to pursue this path, the path of historic rigour. That now is the position of China, of Albania, of our comrades in the German People's Republic

Quick decisions can raise productivity and efficiency to a marked degree and can go a long way in making State enterprises contribute their mite for financing the Third Plan which takes into account as much as Rs. 450 crores being available from these concerns for this purpose.

"It is not the position of Russia.

"Then we did not have a heavy industry: now we have one.

"Then we did not have sufficient defence preparations: now we are a strong country, mighty in defence.

"Then we had to prepare ourselves for the economic crisis of capitalism and for the attack of Hitlerite Germany and her open and secret allies: now we have overcome those attacks

"It is therefore no longer historically correct to say that Soviet vigilance must be primitive vigilance: on the contrary, comrades, it must be vigilance of a higher order, related to the needs of a society in which the work of construction has reached a new stage.

"As a result of our past work we have already achieved the objectives which other Communist parties are fighting for. Is there really any need after this to urge and spur on the country? This is obviously no longer necessary.

"It is, however, necessary to understand that there are four stages in the development of communism. The first stage of exploiting the contradictions of capitalism, of creating the revolution, of establishing the dictatorship of the proletariat. That is the stage of Leninism. What after all is Leninism? Leninism is Marxism of the era of imperialism and of the proletarian revolution.

"The second stage is the stage of securing the revolution, of putting industry, transport and agriculture on a modern technical basis, of building mighty defence forces, of liquidating counter-revolutionaries, deviationists, all who could strangle the infant revolution in its birth. That is the stage of Stalinism.

"The third stage is the stage of developing the revolution, of creating a socialist state of rising standards of consumption, strong enough in defence not to fear the moribund capitalism of the outside world, strong enough at home to afford Communist democracy, including full individual responsibility, and self-criticism. That is the present stage of Russia.

"The fourth stage is the stage of full communism, of the transition to a complete Communist society.

"It is for each country to judge in which stage of this historic process it should be placed. In some countries, like Great Britain, the first stage is only beginning, though imperialism is in open retreat. In many countries the stage of Stalinism is still a necessary reality. In Russia alone is the stage of Stalinism completed.

"But what are we to think, comrades, of a man who from the fancied superiority of the third stage taunts those who are in the second, or perhaps even the first? What are we to think of a man who enjoys the advantage of having passed through the stage of Stalinism in order to embar-

A DELHI DIARY

THE SURPRISE 'LAME DUCK'

THE Prime Minister arrived on Monday morning and plunged straight into troubled waters. An answer to a tricky question in the Lok Sabha, which opened on Monday, showed that the Chinese have made an advance over the previous positions in the western sector and the eastern sector; the Opposition was immediately full to overflowing in its indignation. The Prime Minister's attempt to intervene was unhelpful, and in the end the Speaker agreed to a separate debate in view of the "seriousness" of the situation which he recognised. Thus it comes about that the 'lame duck' session of Parliament has started on an aggressive and even exciting note. There are other matters which are likely to cause heated debate, one such being the handling of Colonel Bhattacharya's trial in Pakistan. The view that the Indian Government has done everything possible is not entertained by the Opposition or by the great majority of the Indian people. It is to be remembered that when Colonel Bhattacharya was first taken into custody, a reply in Parliament did not even reveal that he was a serving officer. From that error most people have concluded that the Government of India was not interested in the facts and now, probably wrongly, the assumption has been made that it could have done more to extricate a gallant officer from a very trying situation. Certainly, the exact evidence on which he has been convicted will come in time to Delhi and then perhaps the Government of India will know whether or not an error of any kind has been made, or a scapegoat has been found by Pakistan for reasons unknown. All in all, one might say that China and Pakistan now present a sorry picture of our foreign relations; these countries represent the most serious dent in the Prime Minister's prestige as India's Foreign Minister.

Parliament though interesting, has not for the great majority of people provided the leading points of interest of the week. The Indian Industries Fair is a powerful contender for both working time and entertainment; it has made inroads into both — Ministers of high and low degree not being excluded. The West German Pavilion was formally inaugurated by Mr. Manubhai Shah with much éclat last Saturday. Each of the other pavilions is having a reception and liquid assets (in the form of duty-free fluids) have flown merrily to attract guests as well as, less happily, gentlemen of the Press. The members of our fraternity are now in much demand, thereby raising not merely their velocity of circulation but also, it would seem, their prestige in the eyes of the public as a whole. One good turn deserves another. Thus it comes about that large paragraphs appear each day describing this or that pavilion and in the whirligig of time (meaning six weeks) no doubt, we shall get round to do credit to every participant in an exacting galaxy of ingenious display. We are likely to lose all proportion in the process. It is a fact that events of far greater importance are in store, possibly for this country as well as for the world. What, people were asking agitatedly in the grounds of the Vigyan Bhavan, where the World Council of Churches is meeting, is the significance of the President of Finland's being called to Moscow urgently? Can it be that the U.S.S.R. under Comrade Khrushchev is pursuing the (down and out) Stalinist line of good neighbourly policy?

THE WORLD COUNCIL OF CHURCHES

For the rest I am giving myself over to one of the most extraordinary assemblies of dignitaries that has visited Delhi in recent years. These are concerned with the meetings of the World Council of Churches

to which, on Monday, were added, by a resolution supported by a two-thirds majority, some 23 new members, including the Orthodox Church of Russia. In an assembly which includes Churchmen, one should not make comparisons because obviously Churchmen must proclaim and believe that they are equal being all children of God and, therefore, brothers of one another. But, perhaps, here too some are more equal than others. I am making a plunge for the character I find most interesting in a distinguished team of delegates which includes the Archbishop of Canterbury, Dr. Arthur Ramsey, Mr. Henry Luce of "Time-Life", Dr. Nathan Pusey, Head of Harvard University, and not least of all, Dr. Billy Graham, the famous Evangelist. The figure I choose — represented somewhat unflatteringly by my naughty cartoonist below — is no other than the Archbishop Nikodim of the Russian Orthodox Church. He is a fascinating character, the more remarkable because

Courtesy "The Hindustan Times"

at the age of 32 he has reached Patriarchal eminence; also because he has an apparatus by which he deals skilfully with the most difficult questions, including the relations between Church and State in the Soviet Union. He speaks with humour, of many things, including his television appearances at London, where, it occurred to him, that his large beard occupied an unduly prominent place. But his interest today is in the application for membership which his Church has made, largely under his guidance, to the World Council. Asked why the Russian Church wanted the membership of the Council, he explained that it was because they wanted more "contacts" and because "they wished to work with fellow clergymen for unity among the various Churches". His differences with the Russian State seem to be confined to the point that atheism is practised and preached by 9 million Communists, while he still has 200 million Christians on his side. He does not seem at all abashed by the fact that power exercised by the State is disproportionately large in religious matters. He insists that 20,000 orthodox churches, 35,000 priests, 40 monasteries, 5,000 monks and nuns are allowed, notwithstanding the propaganda for atheism, to enjoy "free" practice of their religion. Apparently being free, he made the decision to join the World Council without the sanction of the Kremlin. Thus there has been fulfilment again of the Biblical precept: "Render unto Caesar the things that are Caesar's and to God the things that are God's". For Archbishop Nikodim things are made easier by the fact that his Caesar is so benevolent. It would seem that Megatonism and Christian goodwill can form a happy combination in the pursuit of peaceful co-existence.

ARGUS.

THE WEEK'S NOTES

Japan

MR. IKEDA IN NEW DELHI

THIS MONDAY, New Delhi extended a warm and cordial welcome to Mr. Hayato Ikeda, Prime Minister of Japan. Mr. Ikeda's visit obviously has much wider import than that of his predecessor Mr. Kishi in 1957. Japan during the past three or four years has emerged as a rejuvenated and important entity in East Asia, both in the political and economic fields. She has shed to a great extent the isolation that was enjoined upon her because of the devastation caused by World War II and the peculiar association she came to have in the post-war years with the United States. An eloquent testimony to this fact is available in the political pressures evidenced in Japan in the recent past and her emergence as an important partner in the Colombo Plan and the Aid-India Club.

The remarkable recovery that Japan has witnessed during the past few years—it has been more spectacular than even in some of the war-devastated countries of the European Continent—contains not a few lessons for India which has embarked upon planned development to raise her masses from a level of dire poverty and squalor. Precisely for this reason a number of study teams and delegations have been going to Japan from here. Their tours have been of not inconsiderable value. A number of experts from Japan have also visited India in the past few years to advise her on the development of small-scale industries which are so essential for opening up of new avenues of employment for the educated and the unemployed in the countryside. One can only hope that this co-operation between the two countries will grow in the future.

In the political field, India and Japan have not a few common goals and objectives. In both the countries great experiments are being carried out in democracy, the success of which will have immense impact on the whole of Asia. Then there is the menace of Communist China and the all-important question of disarmament and use of nuclear weapons. An exchange of views between Mr. Ikeda and Mr. Nehru on these issues can obviously lead to a better understanding between the two countries.

Japan's interest in the economic development of India, evident from the fact that she has promised to provide assistance to the tune of Rs. 38.5 crores for the latter's Third Five-Year Plan, it is earnestly hoped, will only be heightened by the visit of Mr. Ikeda who has brought with him some prominent financial experts from his country.

Oil

A STATESMANLIKE UTTERANCE

MR. K. D. MALAVIYA'S statement on oil prices at the opening session of Parliament on Monday has been regarded as a moderate and statesmanlike utterance, leaving the door open for further negotiations for the Oil Companies. The Oil Companies have, in fact, sought a clarification and their current approach is also constructive. It would appear that, while there are prestige considerations on both sides, it is not the intention of either side to rule out a change from the current, somewhat rigid, position. So far as Mr. Malaviya is concerned, he has agreed to allow the Oil Companies import licences up to March, 1962, on the previous allo-

cations, which, in effect, is a recognition that the Damle oil prices may not be enforced till then. He has, of course, been careful to indicate that this is not a final decision of the Government and that, while negotiations are proceeding, the Government itself is committed to the Damle Report. The basic issue in this case, however, is not in regard to what decision the Damle Committee has taken or what Government, acting ex-parte, deems appropriate. The basic issue is whether or not there was not some ambiguity in the Damle Report in regard to the discounts available on refined products, especially middle distillates. If it is true that the Damle Report postulated discounts which are not available, the Government should not stand on prestige and argue that its decision is final. There is some justification for the view that the Government assumed that the Damle Committee finding on this point was factual, whereas actually it was based on an opinion and not a fact. Therefore, the chances of an agreement can be deemed bright, if both sides look at it as an issue of equity. India is short of foreign exchange and the Oil Companies must make a contribution facing this hard fact. On the other hand, Oil Companies marketing in India have to pay certain prices in foreign exchange for their oil supplies. The Government of India must equally face this hard fact that the Oil Companies cannot sustain indefinite losses merely because the Government of India has made a decision of this kind. Provided, therefore, equity and reason are the aims of both sides, an agreement can be quickly reached.

ANNOUNCEMENT

The following Annual Numbers of THE EASTERN ECONOMIST are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Re. 50/-.

- | | |
|--|----------|
| 1. India & the World and India in 1950 | Rs. 5/- |
| 2. A Social History of the Indian People & India in 1951 | Rs. 5/- |
| 3. India & the Free World and India in 1952 | Rs. 5/- |
| 4. India in Asia & India in 1953 | Rs. 5/- |
| 5. India in South East Asia and India in 1954 | Rs. 5/- |
| 6. India & the Communist World and India in 1955 | Rs. 5/- |
| 7. India in 1975, A Study of the next Twenty Years & India in 1956 | Rs. 7.50 |
| 8. India & the Middle East and India in 1958 | Rs. 7.50 |
| 9. India and Europe & India in 1959 | Rs. 10/- |
| 10. India & North America and India in 1960 | Rs. 10/- |

Common Cadres

STEP TOWARDS NATIONAL INTEGRATION

AT LONG last the Union Home Ministry has taken a decision to constitute all-India cadres for engineering, medical and forest services. The question had been under consideration for a fairly long time, more precisely since the submission of the State Reorganisation Commission's report which had lent its powerful support to the idea. The Government's decision now obviously has been expedited by the anxiety to foster national integration by all possible means.

The role of common service cadres in fostering national integration can hardly be over-emphasized; it inculcates an idea of brotherhood amongst the people of various States. Apart from this, there is a case for having all-India cadres for such technical services. There is no denying the fact that the efficiency in these services in some States has been impaired not to an inconsiderable extent by dismantling of the common cadres for them in 1930's, particularly after the 1935 Act which brought in provincial autonomy. Some States even today might have reservations in lending their whole-hearted support to the measure, but the overriding considerations of national unity in the present times will perhaps prompt them to consent to the constitution of these services. Common cadres will enable recruitment of the best talent on a uniform standard for all the States.

To make these services a success, however, it is essential that the incumbents to these jobs should be caught young and on conditions of service attractive enough to enable them to serve in the remote corners of the country enthusiastically. The lure of the city today is very strong, especially amongst the educated. This can be overcome only if adequate safeguards are taken in matters of age and service conditions. With advance of age, it invariably becomes more difficult for one to uproot oneself from one's environments. There also arise difficulties in respect of language which hinder mobility from one State to another. In technical services such as engineering and health, this difficulty may not be so serious a handicap. But it has to be countenanced.

(Continued from page 965)

pass those parties of greater revolutionary ardour, who are still in that stage? (Voices, 'the swine'.)

"Does the completion of the Stalinist process mean that we should tread down those countries which are still in that necessary state of historic development? No, comrades, it does not.

"The party will know how to deal with this unhealthy tendency. We shall continue the fight against the Khrushchev deviation. We shall fight, and fight, and fight again.... (Prolonged and stormy applause. Cries of 'Long live Comrade Stalin', 'Death to the traitor Khrushchev', 'Hail our immortal victor Stalin'. All rise. Ovation.)"

This would be the new chapter that Stalin would write, this would have been the address he would have delivered to the last Communist Party Conference if he had been able to defend himself. The remarkable thing is surely that the people who would also have written the chapter this way—including Mr. Molotov—were in fact defeated. The social forces in Russia which pushed the Soviet Government, and Mr. Khrushchev, that brilliantly sensitive politician, to a policy which was bound to shatter the unity of Communist dogma, must have been extremely strong.

Khrushchev's willingness to do so can in fact only be explained in three ways. The first is that the Russian people were so hostile to Stalinism that an open denunciation of Stalinism was the only way to retain power. The second, related to the first, is that the personal intrigues at the top of the Communist party forced Khrushchev to attack Stalin in order to destroy the political power of his opponents. The third is that the hydrogen bomb, the threat of nuclear war, forced the Russians to the view that they could not afford Stalinist satellites who might involve them in such a war.

Whatever the reason, we may be sure that Stalin would not have approved. We may be equally sure that the de-Stalinisation of Russia, the promulgation of a doctrine of fallibility, has weakened communism throughout the world.

The World Abroad

THE STERLING AREA AND THE COMMON MARKET

By ODYSSEUS

MY BET (as I was saying here last week) is that the U.K. will join the European Economic Community. The possibility has made a number of Commonwealth countries nervous of losing their present export markets in the U.K. The pros and cons are admirably set out in Michael Shanks's little book, "The Stagnant Society" (Penguin. London. 3sh. 6d.), which I commend to your attention. Don't be misled by the simplicity of Mr. Shanks's language into thinking that he lacks depth or authority.

Mr. Shanks debates the view, sometimes heard, that to act as the sterling area's banker imposes too big a strain on the U.K., and that she should reduce her commitments by ceasing to do so. The minority, who uphold this view, suggest that too much U.K. capital gets invested abroad which could better be used to strengthen the U.K.'s own economy. They add that in the early post-war years, the sterling system worked because the former colonial territories earned large dollar surpluses which could be used to support expansion in Australia, India, and elsewhere. But as more and more of these colonial territories become independent, they naturally tend to want themselves to spend any surpluses that they earn. The whole sterling area is hungry for capital. This will put increasing strains on the U.K., because (a) the overseas sterling countries openly regard free access to London's capital market as perhaps the chief advantage of membership; (b) the area will become more and more vulnerable to payments difficulties if all its members are simultaneously spending up to the hilt. If this happens, the domestic expansion of the U.K., as ultimate holder of the area's reserves, will be retarded, and her own ability to export enough to maintain the necessary reserves will suffer. Can the U.K., in short, afford to hold down her own expansion to enable India, Australia, Nigeria, Ghana, etc., to go ahead faster?

THE STERLING AREA OMELETTE

Whatever the answer, it is not that the U.K. should try to cease to act as the sterling area's banker. Because, first, as soon as it was realised that the U.K. had decided on such a policy, a run on the £ of fantastic size would start. Secondly, even on the unrealistic assumption that this could be prevented by watertight exchange control, the cost to the U.K. of paying off her sterling area creditors would be enormous, even if spread over some years. The sterling balances recently stood at £4,347 million, of which £2,577 million were held by sterling countries, and £604 million by international organisations. Reserves available, without selling overseas assets (as the U.K. did during the war) stood at £1,110 million. To repay £4,000 million, even without interest, over twenty years would add £200 million a year to the debit side of the balance of payments, which would more than offset the saving in the interest now paid on these balances. The whole operation would, moreover, be fraught with the risk to overseas sterling holders that the U.K.'s difficulties would be such as to threaten a disastrous devaluation of the £, in which they would be heavy losers. The sterling area omelette therefore seems unscramblable.

Mr. Shanks suggests that the UK should propose that, in return for free access to London's capital market, the sterling area members should agree on some co-ordination of their policies, and planning, to avoid the risk that all will go on a simultaneous spending

spree. More and more developing countries are launching five-year plans, and it should be possible to agree to co-ordinate these plans, so that the heavy buying of foreign equipment, which occurs at one stage in every plan, should be phased, so that it occurs in different countries at different times. Members ought to get together to submit their plans to a sterling area joint secretariat. Without some co-ordination, it is difficult to see how the sterling area can survive. If it collapses, all will suffer.

One function of such a secretariat would be to ensure a better distribution of London's investible funds. It would, for example, be reasonable to ask Australia to restrain her borrowings in favour of the hard up Afro-Asian members.

If the UK is to have sufficient reserves to work the sterling system smoothly and to increase funds for overseas investment, she must obviously get her own production costs down and increase her competitive ability to export. As I said last week, whether she joins the EEC or not, the possibility, either way, has initiated a tremendous amount of hard thinking in UK industry. If she joins the EEC, this should open an expanding market for UK exports, increase her own economic strength, and so her ability to aid the Commonwealth.

One of the reasons why German firms have been more successful in exporting than the British is that, after the war, they had to fight their way back into world markets the hard way, without the easy protected markets that the UK enjoyed in the Commonwealth. But if the only economic benefit from joining the EEC was to create keener competition for the UK, it would seem an unprofitable exercise in masochism. However, Mr. Shanks makes the sound point that the real economic value of the Common Market lies in the glittering opportunities that it offers to the successful: the rewards for efficiency should be far greater than the penalties for inefficiency. Membership of the EEC would compel the UK to eliminate her cosy high cost producers and to concentrate on what she does best, and the very size of the new market would enable her best producers to be even more efficient, and therefore to earn more than ever before.

THE COMMONWEALTH OR EUROPE?

A dwindling minority in the UK argue that if the UK has to choose between the Commonwealth and Europe, she must choose the Commonwealth. I am among the majority who agree with Mr. Shanks in arguing that the Commonwealth, as an economic unit, is not a viable choice. Apart from the fact that no Commonwealth member would accept it, the idea of a self-sufficient Commonwealth economic bloc, drawing its capital and manufactures from the UK, and sending its food and raw materials to the UK in return, is unrealistic. The idea was, in fact, given a trial run in the immediate post-war years, and progressively abandoned, to the relief of all concerned, in the 1950's.

Even if any one wanted to put the clock back, it could not be done, because the UK alone is not a big enough market to absorb the Commonwealth's entire output. Nor, in such circumstances, could the UK generate enough capital to meet all Commonwealth needs. And UK industry cannot supply the full range of manufactures for Commonwealth requirements. The experiment of the 1950's was abandoned because the

UK found it advantageous to buy her food and raw materials from an area wider than the Commonwealth, and because the Commonwealth discovered the advantages of alternative sources of supply for their imports of capital goods and manufactures.

One reason for this is that Commonwealth Markets have been growing disappointingly slowly because of the low level of commodity prices, a trend which seems to persist, if only because of the ever-growing competition from synthetic processes, as well as the obstinate determination of so many industrial countries to maintain their agricultural producers at the taxpayers' expense. This means, of course, that the primary producers earn less money, so that not only do they import less, but they prefer cheap to high quality goods, which means buying in, e.g., Japan, rather than in the UK.

The weakness of commodity prices naturally stimulates the Commonwealth developing countries to hasten their industrialisation. This (a) increases the tendency towards inflation and balance of payments difficulties in the sterling area, and (b) means a growing range of manufactures made locally in these countries behind tariffs, and falling imports.

These difficulties could be eased by more co-ordination of Commonwealth policies, but Mr. Shanks rightly points out that they could not be eliminated.

However, from all one reads in the vast mass of reports on trends in EEC countries, the Six are increasingly conscious of the absurdity of aiding the developing countries with capital goods and then refusing to buy the resulting manufactures, and if they remain nervous about importing temperate agricultural products, they are, on the other hand, anxious to maintain, and even increase, the flow of tropical agricultural products and

raw materials. Trade between the Six and the overseas Commonwealth has in fact been growing faster than between the UK and the Commonwealth.

Mr. Shanks believes (with Our Special West European Correspondent, if I interpret his dispatches correctly) that sooner or later the EEC will evolve a common central bank and a common currency. If the UK joins, sterling would eventually be merged in this currency, and its assets and liabilities taken over by the EEC's central bank, so that sterling's special responsibilities would be internationalised.

I do not know what the solution of all the triangular relations between the UK, the Commonwealth, and the EEC will be, but I am convinced that for the overseas Commonwealth to argue the UK to stay out of the EEC is unrealistic. It would mean the erosion of the UK's economic strength at an unpredictable rate, and correspondingly diminish the UK's capacity to buy from the Commonwealth and to lend to it. I may be naive, but I cannot understand Canada's screams over the possible loss of the UK market for her manufactures coming up against an EEC tariff wall. The one hope for an expanding market in the UK, not only for Canada's exports but for those of all Commonwealth countries, is that the UK will be admitted to the Common Market. In the short run, some Commonwealth exports must suffer. In the long run, they should gain. The main ground for optimism that (a) the UK will be admitted and (b) that ad hoc solutions for particular Commonwealth exports to the UK and to Europe will be found, seems to me to be that the EEC itself would suffer if its external tariff wall were such as to set off a chain reaction of economic crises from country to country across the world.

CONSULT US ON YOUR FOREIGN BUSINESS PROBLEMS

Do you have any special problems connected with your trade or travel abroad?

Do you wish to know more about the currency or customs of foreign countries?

Do you require any specific information on trading opportunities in overseas markets?

Don't throw away parts and money...

It sounds like an impossibility, we know, but it is none the less true. Many hard-to-replace parts costing valuable money are literally thrown away because they have been ruined due to faulty lubrication.

Machinery shutdown means loss in production, time and money. Correct lubrication is therefore essential to ensure the protection and efficient operation of costly machinery. Planned lubrication is vital for increased production at lower costs.

The service is yours for the asking—call in your Caltex Lubrication Engineer—arrange for a correct lubrication programme for your plant. Let us help you in conserving parts and money.

The European Scene

A MORAL IN TRADE STATISTICS

From Our Special West European Correspondent

PARIS, November 20.

TWO recent reports emphasise the diminishing role of non-industrial countries in world trade: GATT's annual report, published this month in Geneva under the title "World Trade in 1960", and a review of "the recent evolution of European trade" published a few weeks before by the UN's Economic Commission for Europe. The facts that they report are extremely disquieting. The more so because, being devoted to recent developments only, neither report stresses that they are in fact dealing with a small phase in a long process, that has been going on for decades and may well continue for years to come. Before looking at the latest figures, it is as well to recall that between 1928 and 1956-57 world trade in manufactures grew three times as fast as trade in raw materials and food. This was due to two separate factors, both of them unfavourable to the raw material exports. Firstly, the countries that made and exported most of this swelling volume of manufactures became themselves producers of more food and raw materials, so that these articles entered less into international trade. Secondly, even within any one industrialised nation, the consumption of raw materials declined relative to the output of finished goods; for example in the past 30 years in the USA industrial production has grown twice as fast as the consumption of raw materials.

It follows inevitably that countries that rely on raw material exports will come to represent a smaller and smaller percentage of world trade. This decline has been hastened in the last few years by another factor that has quite different causes: the vast increase in trade between industrialised nations, because of the constitution of the Common Market, and of the liberalisation of several Continental countries' imports from industrialised nations not belonging to that association; also because of EFTA and of the removal of dollar-import restrictions throughout West Europe. The figures for 1960 reported by GATT and by the ECE have to be set in that context. They show that last year there occurred the most vigorous expansion in world trade since 1955, despite the slowdown of industrial production in the USA and Britain, and the slower rate of progress in some Common Market countries. The value of world exports rose by 11 per cent over 1959 and since there was a 1 per cent rise in prices this meant a 10 per cent increase in volume. However, both the rise in prices and the increase in the volume of trade were shared very unequally between manufactures and raw materials: prices of manufactures rose 3 per cent and the volume exported rose 12 per cent, whereas prices of raw materials were stable and the volume exported rose only 8 per cent. Worse, a good part of this increase in the volume of raw material and food exports actually reflects the better sales of farm produce by the USA and France; just over half the extra exports of raw materials of agricultural origin came from the USA. Thus the developing nations with only raw materials or food to sell lost on both counts: they earned little more, if at all, for their exports but had to pay more for their imports. Their exports brought them in \$27,000 million (+5 per cent) but their imports cost them \$28,600 million (+9 per cent). The deficit was in reality more than \$1,600 million (the difference between the two figures just quoted), because the export earnings given include the value of oil shipments from which are to be deducted the oil companies' profits. The real deficit of the raw material

exporting nations was about \$4,700 million, against \$3,300 million in 1959. This is to be compared with the total trade surplus achieved by the industrialised nations: \$2,200 million.

Perhaps last year was an especially unfavourable one for raw material exporters because of the recession in the USA, so we should look at the ECE figures for European trade, rather than GATT's global figures. We find that Europe's imports ("Europe" for the ECE means all the non-Communist economies of this region, not just the Common Market) from primary producers abroad increased last year by 8 per cent, against only 2 per cent in 1959. However this 8 per cent is the average of a 12 per cent jump in the first half and 4 per cent rise in the second half: imports, that is, slowed down as the growth rate declined in European industry. Moreover, the rise in imports from primary producers was extremely modest alongside the rise in European import from North America (+40 per cent) the rise in imports of Common Market countries from each other (+25 per cent) and the rise in imports of EFTA countries from each other (+15 per cent). These big increases are not due so much to discriminatory tariff preferences, which have so far played a small role, as to the high level of industrial activity. Trade has been increasing by leaps and bounds between the Common Market countries right from 1950; it simply gathered pace somewhat after 1958, when the Rome Treaty began to be implemented. Since that date, very notable increases in exports to the Common Market have been achieved by neighbouring industrialised countries like Switzerland, despite the beginnings of tariff discrimination. Thus the poor results achieved by primary produce exporters to Europe cannot be ascribed to the Common Market or EFTA, but reflect the fact that raw material suppliers nowadays get smaller benefits from boom conditions in the West.

The large expansion in European imports last year was due mostly to purchases of manufactures in other industrialised nations, especially North America. Imports of raw materials also increased, and substantially, but they were materials supplied by other industrialised nations, once again North America in particular. (The USA sent at least 2½ times as much non-ferrous metal to Europe last year as in 1959). The developing nations' share in European imports declined, even in traditional lines where tropical countries seemed to have assured markets. An example of this latter trend is fats and oils, of which industrialised countries are increasing their consumption only slowly whereas they are boosting their production rapidly as well as turning to other types of fats. Whale and fish oil are replacing tropical produce in margarine; the USA has boosted its domestic output of oilseeds (cotton, groundnut and soya) by 40 per cent in four years, the production of rape-seed is being perfected technically and has a great future, while the productivity of South Europe's olive trees is being multiplied rapidly.

Similarly there is intense competition for primary producers abroad from the farmers of the industrialised regions, especially North America and France where productivity has increased remarkably of late. This affects mainly semi-industrialised regions such as Australasia and South America, whose foodstuffs markets in West Europe are being threatened. Last year, for instance, there was a sharp fall in New Zealand butter

sales in Europe and a sharp rise in French sales. All of these producers accuse each other of dumping and no doubt they are all correct: farmers everywhere get more in their home market for their produce than they ask in the free world market. The interesting point to note is that this competitive dumping has two main beneficiaries: the United Kingdom and West Germany. These two highly industrialised nations, whose agriculture is just an expensive hobby, leave the subsidising of mass production farms to their industrial rivals, the USA, France, etc., then watch these rivals dump produce on the world market in competition with developing or semi-industrial nations—and collect the profits, in the shape of unrealistically low costs for their food, and some raw materials. Thus some industrial countries which also have a highly efficient farming community are not only stealing markets from less developed countries, they are virtually paying a subsidy to their main industrial rivals.

This is a curious situation, but my reason for drawing attention to it is that any attempt to change it will no doubt result in further loss of trade for countries that export largely or wholly raw materials. That is, if Continental farmers can oblige Britain and West Germany to buy their produce at or near cost prices (and that is what is meant by a "common agricultural policy" for Europe), markets will be lost by exporters of farm produce in Latin America and Australasia. The figures quoted above on the diminishing proportion in world trade held by primary exporters, and the growing proportion held by industrial nations, will then show an even greater disparity. However, the main reason for expecting this disparity to increase in the years to come is technological progress. This is already one of the main causes of the fall in exports of jute, sisal, natural rubber and wool reported last year by GATT, but for producers of those commodities "the worst is yet". Current expansion of capacity in polyethylene and other synthetic packaging materials, in synthetic rubber, man-made fibres, hard plastics and aluminium is little short of stupendous. In some of these products there is already over-production and dumping has begun from one industrial nation to another.

One is inclined to the mournful conclusion that all plans for stabilisation of natural commodity prices, for

guaranteed export earnings by developing countries, etc., are doomed to failure. None of these have yet been attempted on a large scale but even if resistances in Western countries were overcome and if some such plans were applied and succeeded in preventing the fluctuation or the deterioration of the terms of trade between manufactures and raw materials—still the developing nations would be left with a shrinking proportion of world trade. A smaller volume of the goods they produce is required by advancing industrial economies, and of that smaller volume a large part is being provided by agriculture and mining in the advanced countries themselves. So the mere maintenance of a high level of activity in those latter economies is no guarantee against falling revenues for overseas primary producers, and even the sharpest increase in activity in Western industry produces discouragingly small benefits for them.

If this is so, the only hope for the developing countries is to pursue their own industrialisation with renewed vigour. If the odds are moving ever further against primary production in favour of manufactures, and if notable increases in agricultural productivity can only be achieved in an industrialised economy, then the moral is clear. It is reinforced by a fact reported by ECE: the only type of goods from developing countries that have been imported in steadily rising volume into Europe over the past few years is industrial manufactures. Everywhere that developing countries rely on their farms, plantations and mines, they are losing; once their secondary industry has an export surplus, they begin to gain. Of course, there are considerable obstacles to an expansion of their industrial exports to Europe; the cries of "cheap labour", "unfair competition" and "annihilation of national industries" are familiar. However this should not discourage us. Opposition of that sort is probably easier to overcome than the opposition of European farmers, which is almost invincible; and Western industry can be persuaded more easily to contract some traditional branches (textiles, shoes, pottery, etc.) than to restrain progress in the dynamic synthetics industries. That is to say, relative loss of Western markets for food and raw materials seems ineluctable; expansion of Western markets for manufactures seems difficult but not impossible.

Economic Report from the U.S.

O. E. C. D. MEETING

By GUY SIMS FITCH

WASHINGTON, November 15.

ONE of the world's most ambitious and potentially rewarding undertakings advances another step as the Organization for Economic Co-operation and Development (O.E.C.D.) holds its first ministerial meeting in Paris this week. This meeting is devoted to the proposition that the highest sustainable rate of economic growth among the 20 O.E.C.D. nations — which include the United States, Canada and many West European countries — can and should be stimulated through the co-operative endeavour of all. This, indeed, is one of the three main objectives of the O.E.C.D. The others concern enlarged and co-ordinated economic assistance to developing lands, and the further expansion of world's trade. Actually, O.E.C.D. is an outgrowth of the old and now defunct Organization for European Economic Co-operation (O.E.E.C.), of which the United States and Canada were not full members. The O.E.E.C. was set up in 1947 in connection with the use of Marshall Plan aid, and later branched out into other matters of European economic concern. With the convertibility of European currencies, and the recovery of Western Europe to its present state of vibrant prosperity, O.E.E.C. during the past year was transformed into the O.E.C.D. In other words, a strictly regional and largely inward looking European body has now been replaced by an Atlantic body with world-wide interests. At this week's first ministerial meeting, the United States is supporting a resolution that sets forth a common goal for O.E.C.D. economic growth. Mentioned prominently in this connection is a 50 per cent rise in the combined gross national product (GNP) — total output of goods and services — of all O.E.C.D. members by 1970.

Whatever the figure finally agreed on, it is clear that the acceptance of a growth formula represents an important area of general agreement among the O.E.C.D. nations. It not only recognizes that national economies can and should be dynamic, but it also provides an incentive for continued economic progress and points to a significant degree of co-operation in the formulation of internal policies to achieve the desired end. A 50 per cent growth rate over the nine years would represent a somewhat more rapid annual rate of expansion than the United States has experienced in recent years. It is noteworthy, however, that President Kennedy has characterized an annual U.S. growth rate of 4.5 per cent, which would be just about the rate required to achieve a 50 per cent growth goal over nine years, as well within the capability of the U.S. economy. Despite its current upsurge, moreover, the U.S. economy still contains some slack in the way of unused or partly used capacity. Taking up this slack would give the United States a start toward achieving whatever combined growth rate the O.E.C. officials might deem appropriate and feasible. In addition, of course, the United States will be adding substantially to its productive potential. The Kennedy administration already has undertaken several actions and proposed others to accelerate U.S. economic growth.

These include moves to spur business investment in plant and equipment through such devices as tax and depreciation incentives, programmes for worker training to meet the needs of a changing and expanding economy, internal area redevelopment activities, and monetary policy aimed at encouraging demand and business spending. It is not expected that each O.E.C.

country would necessarily maintain growth rates of the same magnitude each year; there are bound to be fluctuations and differences over the course of nine years. But if the goal of a combined 50 per cent G.N.P. rise is attained — and there is no reason to doubt that it will be — it would mean an increment to the combined G.N.P. of the O.E.C.D. members almost equal to the present U.S. G.N.P., which accounts for some 60 per cent of the total.

For 1961, the U.S. G.N.P. is estimated at about \$500,000 million, and the combined G.N.P. of all O.E.C.D. members, including the United States, at about \$900,000 million, thus a 50 per cent rise would be in the neighbourhood of \$450,000 million — certainly a sizeable expansion, especially when it is considered that these estimates are in constant dollars. This consideration of a target growth rate for O.E.C.D. is not a new or spur-of-the-moment approach. The original suggestion was made early this year, and can be said to represent much of the thinking within the organization.

It is clear, therefore, that the O.E.C.D. already has behind it a notable record of co-operative achievement during the past year, even before it came into official being this past September 30. Its economic policy committee was doing a good deal of groundwork in discussing questions of mutual concern, including economic growth and balance of payments difficulties. These discussions have been marked by a notable degree of frankness in the disclosure of problems, policies and prospects. Much work also has been done in the realm of capital requirements of less-developed lands. This subject has been handled through its development assistance committee (D.A.C.), originally known as the development assistance group (D.A.G.), of which Japan also is a member. Its efforts have been directed at enlarging the total economic aid effort of the capital-supplying nations, and at bringing greater unity and co-ordination into their bilateral assistance programmes. If O.E.C.D. progress does not appear to have been as marked in the field of trade expansion, it is because many important trade problems are being worked out in the larger arena of the 39-nation General Agreement on Tariffs and Trade (GATT). Still, much can be accomplished through O.E.C.D. in the handling of special problems. Particularly those that may relate to the European Common Market and the projected accession to that six-nation group of the United Kingdom and other West European countries.

While O.E.C.D. is not directly concerned with the foreign trade programme of the United States, there is little doubt that a sustained high rate of U.S. economic growth would make it easier for American industry and labour to adjust to new trading situations around the world. It also would help make possible the maintenance of large programmes of economic assistance to less-developed countries. These are considerations that could apply to other O.E.C.D. members as well. Fundamentally, then, in its conception and operation, O.E.C.D. recognizes the need for substantial international co-operation. Through it, independence is giving way to a marked degree of interdependence among modern industrial societies, with domestic policies taking into account the well-being of the entire community of Atlantic nations, and indeed, of all free nations everywhere.

Special Article**AGRICULTURAL ECONOMICS AND AGRICULTURAL PRODUCTION**

By R. S. SRIVASTAVA

AGRICULTURE occupies a crucial place in the economy of India. Consequently, constant and persistent emphasis has been laid for long, specially since Independence, on the need to raise the level of agricultural production in the country. Considerable progress has been made in this respect through the last two Plans. But in the policies and programmes there has generally been much less emphasis on the economic aspects of agriculture, as distinguished from its natural ones, than is warranted by virtue of their potentiality for increasing agricultural production. Therefore, the rate of agricultural progress can go up considerably, if this lacuna is removed.

THE DETERMINANTS OF PRODUCTIVITY

The success of a plan depends on the soundness of its conception, i.e. an understanding of the factors which influence the production process and on the effectiveness of policies and methods adopted to implement the plan. Production is an economic activity, calling for an economic use of certain resources known as factors or means of production or inputs, viz., land, labour, capital and organization.

The level of agricultural production during a particular period of time is a function of the aggregate quantum of the resources or inputs used, their quality and their average economic productivity or yield per unit. In order to increase production it is necessary either to raise all these factors or one or more of these without a proportionate reduction in the remainder.

Economic productivity may be expressed in relation to the total resources, land, labour, capital, organization, the total farm economy or in relation to certain selected constituent items, e.g., per acre of land, per farm owner, per unit of capital etc. In areas where surplus land is available, it is possible to raise productivity per man by resorting to extensive cultivation, i.e., increasing the input of land.

On the other hand, in countries like India where the pressure of population on land is heavy, there is greater need for raising productivity per acre but less scope due to the limitations inherent in the small scale farming. A large proportion of population being engaged in agriculture and almost all the available land being under cultivation, it is not possible to add to the inputs of land or labour. In fact there is need to divert some of these to non-agricultural uses. Among capital inputs also the choice is very limited. Use of costly machines and implements is not generally practicable not only on operational grounds but also because of the low investment potential of small farmers. In such circumstances, their use must await the emergence of the requisite size of farms. Changing the size-pattern of farming is a relatively long-term and difficult process, requiring certain fundamental adjustments in the pattern of values etc. Consequently in the present phase of our economic and social development, reliance has to be placed on a more intensive application of inputs, such as, seeds, fertilizers, irrigation, better organization and cultural care or what may be termed as items of 'working capital'. Increasing the quantum and/or productivity of these inputs, thus, constitutes the main plank of a short-term programme of increasing agricultural production in densely populated countries like India.

RESEARCH, EXTENSION AND ORGANIZATION

This too is a difficult task involving, as it does, concerted and co-ordinated efforts in many directions,

specially, research, extension and organisation. Research is needed for the discovery of better varieties of inputs and improved methods. Extension plays a twin role: extending the results of research to the farms by demonstrating the advantages of better methods (discovered in the course of research) and by creating an urge for adopting them, and communicating field problems to the research centres. After an urge for a change resulting from knowledge has been created, certain facilities are needed for its fulfilment. Therefore, organization is essential for enabling the smooth fulfilment of the urge. For example, to fulfil the urge for certain seeds and fertilizers, arrangement for the procurement and distribution of seeds at the proper time, of satisfactory quality and in adequate quantity is necessary. Technical know-how is to be imparted in regard to matters, such as, appropriate rate or dosage of seeds and fertilizers, preservation of seed so as to protect its germinating power, frequency of fertilizer application, line-sowing, Japanese method. This may be provided by the Government agencies, Government sponsored or voluntary institutions or progressive individuals.

These functions are closely inter-related. Research provides the subject-matter to the extension arm. The latter can extend to the cultivator only what it gets from the former. The quality of the knowledge, which is the basic and most important element of the extension programme, depends on the quality of research. On the other hand, the extent to which the extension workers perform the function of registering local problems and transmitting them to the research workers, to that extent will the latter be in a position to attune their projects and results to the regional needs. Efficiency of extension in this respect thus reacts on the efficiency of research.

Extension and organization also react on each other. The more successful the work of extension, the stronger and more widely-felt will be the urge for development. The weaker the urge the more likely it is to peter out when faced with obstacles to fulfilment. When the cultivators are attracted to sponsored practices, due to persuasion or other consideration, without a rational conviction rooted in economic benefit, the urge created is not of a strong character. The existence of a strong-willed body of cultivators for the adoption of certain practices is bound to egg the agencies concerned on to prompt and more effective measures for its fulfilment and also result in the establishment of voluntary methods to supplement the Government efforts. As the old saying goes, where there is a will, there is a way. The creation of the will is, therefore, a more fundamental fact. Given that, some way or the other will be found for its fulfilment. Similarly, the organizational efficiency also tells on the intensity and extent of the urge. The quicker and smoother the fulfilment, the more the chance for the continuance of the urge. The greater the delay and the difficulties in fulfilment, the greater the likelihood that the urge will fizzle out.

INADEQUATE EMPHASIS ON ECONOMIC ASPECTS

The policy has been conceived on right lines as research, extension and organization have been the important functions of the Agricultural Departments in the States for long. But its implementation has suffered from certain drawbacks, chiefly, lack of adequate emphasis on economic aspects in the research and ex-

tension stages. To take research first, the discoveries and practices, which are recommended for propagation are not, generally speaking, tested for their economic benefit. The criterion of better varieties is mainly increase in yield without a reckoning of the economic repercussions.

It is wrongly supposed that technical superiority is enough. What matters with the cultivator is really the economic superiority. To assess this, one has to balance the economic effects at a number of stages, from the beginning of the tilling operations to the disposal of the crop, such as sowing, irrigation, harvesting, sale quality, appearance and taste of the main products and by-products, relationship between supply and demand of the produce in question and of competitive commodities. These require research in the field of agricultural economics. No doubt there has been a growing recognition of this need. But the existing facilities and provisions in Universities and Government organizations are far too inadequate compared with its potentialities and with its relative importance in other countries like the U.K. and the U.S.A.

Let us now turn to the extension arm. Extension is the twin process of aiding the flow of knowledge from the research centres to the farm as well as from the farm to the research centres. The lack of emphasis on economic aspects at the research stage tells on the quality of knowledge available to extension workers. Some actual illustrations of this drawback may be noted. An improved variety of seed sometimes requires a

longer period of maturity and thus stands in the way of the cultivator's raising a second or a third crop. Inferiority in the taste of grain or poor quality of fodder tells on the price.

The effectiveness of extension is further marred greatly because the role of agricultural economics is even less appreciated at this than at the research stage. Provision is being gradually made for research in the field of agricultural economics in Government, non-Government and educational institutions. In the extension stage, this aspect is as yet almost completely neglected. The battery of specialists provided at various levels, block, district, State, and Centre, is conspicuous by the absence of agricultural economists, though a statistical progress assistant has been considered necessary. Consequently, the block personnel are not able to put through their programmes on economic grounds, i.e., to demonstrate to the cultivators the economic worth of the programmes. It is not enough for the programmes suggested to be economically worth while. It is also essential that extension workers are able to effectively bring home this worthwhileness to those actually engaged in production. The creation of an urge for adoption is really a task of convincing the cultivator of the economic value of measures and methods being sponsored. This is the weakest link in the chain.

The lesson of our experience, according to the above analysis, is that the adoption of economic aims and the provision of means not proven for economic worth go ill together.

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LIMITED

(INCORPORATED IN ENGLAND)

5% RUPEE DEBENTURE STOCK, 1970**INTEREST FOR THE HALF-YEAR ENDING 31ST DECEMBER, 1961.**

Notice is hereby given that interest at the rate of Rs. 25/- (less Indian Income Tax) per Rs. 1,000/- of Stock will be paid on 1st January 1962 to Debenture Stockholders registered on the books of the Company on 19th December 1961. Applications for transfers received at the Company's Office at Victoria House, P.B. 304, Chowringhee Square, Calcutta-1, up to 19th December 1961, will, if otherwise satisfactory, be registered at that date for the purpose of participation in the above interest.

Debenture Stock Transfer Books will be closed from 20th December, 1961 to 31st December, 1961 both days inclusive.

THE BUSINESS WORLD

A Small Venture With a Big Achievement

By CROESUS

THESE are verily the days of small industries and if the same enthusiasts as are in charge of these industries today continue to shape policies after the coming General Elections, small industries even like Industrial Estates, are bound to have a field day. Whether or no one accepts the Union Minister for Industry Manubhai Shah's rather tall claims about the employment potentialities in the rural areas and the very small capital said to be required to start these industries, all must concede the generally useful role of the successful small industries in India. At any rate, after attending a function arranged by the Victory Flask Co. (Private) Ltd., and Kangan (Private) Ltd., to give a send-off to two of their technicians and listening to the few brief but to-the-point speeches made thereat, my respect both for small industries and for those who have started and made a success of them — more strength to their elbows — has increased considerably. It was a revelation to me, as much as to Maharashtra's Minister for Law and Labour, Mr. Shantilal Shah, who presided on the occasion, and to the several invitees to the function, that a modest industrial undertaking in a remote suburb of Bombay not only made its debut as early as 1942 when we had hardly begun to industrialise at the rate at which we are going ahead now, and that without any foreign collaboration, but is today in a position even to send its technical experts to foreign countries to teach know-how to them. For this is so much unlike what we see and hear daily. In fact, it is just the opposite of what we are accustomed to see and hear. Hardly any industrial venture, be it big or small, is started these days without some foreign collaboration or other. Even where such collaboration has been a virtual necessity by reason of our parlous foreign exchange resources there are as many instances — certainly more and not less — where the collaboration covers not only the cost of capital goods but of technical know-how as well. As Mr. Shantilal Shah observed, therefore, what the Victory Flask Co. (Private) Ltd., and Kangan (Private) Ltd., have done is singularly remarkable and there should be more and more of such instances if India has to hold her own as an industrial country in the comity of nations.

The two Indian technicians being deputed by Victory Flask (Private) Ltd. and Kangan (Private) Ltd., it is noteworthy, are Mr. Chakradeo, a chemist, and Mr. Landge, a worker, both having associations with the companies concerned almost right from the start. It speaks volumes for the farsightedness of Mr. Bhide, the painstaking Managing Director of the Company, and the Board of Directors that they should have afforded these opportunities to two of their technicians. In my opinion, acts like these go very far, much farther than any joint councils or labour participating schemes, about the suitability or adaptability of which to our country, where labour is still largely illiterate, the last word has yet to be said.

Now, let me say a few words about the vacuum

flask industry itself. Until the other day, may I confess, in so far as this industry went, my knowledge was verily a vacuum. Very few, I believe, know that it was in the year 1869 that one Andrews made the first experiments in the liquefaction of gases above the critical temperature of gases and that it was in 1881 that one Weinhold in Chemnitz (East Germany) — now known as Karl Marx Stadt — that made the first protection vessels against loss or gain of heat. But the well-known Dewar's Flask — which incorporated Dewar's great improvement of silvering the inside so as to reduce loss or gain of heat by radiation — took nine more years to come on the scene. It was a firm in East Germany (Thuringia) again that first put those flasks to commercial use by the popular trade name of 'Thermos'; the right to sell which was obtained later by Englishmen, French and Americans. Still, for the most part, thermos flasks were beyond the reach of the lower income groups, but Japan and Hong Kong started producing and selling these flasks on such a big scale that not only did the supply of these flasks become plentiful but their prices too were marked down to plebeian levels.

Although we have today four units —and more are to come—manufacturing vacuum flasks, it was not until 1942 that the first vacuum flask factory was started in India, and the credit for being the pioneers in the field thus goes the Victory Flask Co. That this company's products should successfully compete with the Japanese in variety and price alike is no mean tribute to this relatively less known unit of private enterprise, and I don't think it would be incorrect to venture the statement that there must be many more of such small venturesome enterprises dotting the length and breadth of this vast sub-continent making their own modest contribution to the economic development of our country.

The classical method of making vacuum flasks, I understand, is to blow two vessels separately, open and assemble them together by asbestos spacers and then silver and evacuate the air from the finished flask. But asbestos, though a good insulator, is not as efficient for vacuum purpose, in that it allows some heat to be lost. Victory Flask Co. have, since the past few years, developed a new technique by which the use of asbestos spacers is eliminated, which is a very big step forward, indeed, in the vacuum flask manufacturing industry. By adopting the new method, the Victory people are able to make their refills stronger and more efficient as far as thermal qualities go, and also free from the disagreeable black spots one notices practically on all refills generally. It is said that there are hardly two countries in the whole world today which have succeeded in eliminating this black spot on the refills and none of the other units manufacturing vacuum flasks in India, not even those with foreign collaboration, has succeeded in this, although their flasks are priced relatively higher, it is reported. No wonder then that Victory vacuum flasks have been used by even the

TREMENDOUS BOOST TO CEMENT AND ALLIED INDUSTRIES

ACC-VICKERS-BABCOCK LTD., the powerful new engineering enterprise, will 'tailor-make' for industry the very latest cement-making machinery.

The AVB Plant at Durgapur is in the final stages of construction. It is equipped with some of the world's most up-to-date machine tools and staffed by highly skilled technicians and experienced design engineers. AVB are now ready to accept orders for cement-making machinery which will be 'tailor-made' to specific requirements.

Now in a position to make a major contribution to the cement industry, AVB will help the nation achieve the Third Five Year Plan target of 15,000,000 tons of cement every year.

AVB will be able to draw on the vast technical knowledge and rich experience of three famous engineering concerns;

National Physical Laboratory for temperatures at 250 degrees C below zero and by practically every Himalayan expedition team to the Everest, as also by Prime Minister Nehru on his trip to Bhutan.

Wherever one sees the spirit of humility and the ambition to achieve great things manifest themselves, one can safely predict a bright future. Victory's Managing Director who regards that "a worker is a

student throughout" and feels that he is not satisfied with his company's "small achievement", has these qualities in an abundant measure, he can legitimately expect to realise his ambition not only to find lucrative export markets for his vacuum flasks but also to make a success of his company's project to manufacture fibre glass, toughened glass, and syringes. India has a place for, and needs any number of such small really enterprising and imaginative undertakings.

Coal Transport: Muddled Situation

THE insufficiency of transport still continues to be the most potent deterrent to the planned production of coal and industrial output. The imbalance between the availability of transport and the requirement of coal is so great that it is likely to affect the Plan itself by hindering output and raising production costs.

A clear picture of this transport insufficiency has been provided by Mr. Darab C. Driver in his address to the tenth annual general meeting of the Coal Consumers' Association of India. Whatever may be the reason for the failure of coal transport, it needs to be emphasised that a much greater effort will be required to solve the problem. Thinking in this sphere has so far been muddled and the setting up of coal dumps and other measures have by no means eased the situation. And from all evidence it appears that there is little hope of improvement in the Third Plan. According to Sir B. P. Singh Roy, Chairman, Coal Transport Advisory Committee, a stepping up of coal production from 60 million tons to 97 million tons under the Third Plan would require railway wagons in the following order:

Year	Wagon Requirements Per Day
1961-62	7,183
1962-63	8,561
1963-64	9,910
1964-65	11,502
1965-66	12,339

The question now is where these wagons are to come from since the railways can provide at present only about 5,865 wagons. It was admitted by high officials of the Planning Commission at a Press Conference recently that the railways' capacity to dispatch coal wagons above Moghulsarai would continue to be below requirements and the coal dump scheme was not the panacea for the coal muddle that it was once imagined to be. The fate of the scheme to transport two million tons of coal annually by the DVC navigational canal is, according to all indications, at its pathetic worst. The canal should have been completed by 1959, but

due to floods last year, it is now scheduled for commissioning into operation by the middle of next year. A Committee has been appointed by the Coal Controller to examine the possibilities and economy of carrying coal through this canal. But the way the matter has been handled so far would mean that the potentialities of this canal to move coal cannot be exploited for at least another two or three years. Then again the price of coal is likely to rise further in the Third Five-Year Plan; the tendency towards it is visible in clear terms. The Government's decision to levy 2½ per cent royalty on the f.o.r. price of coal raised from areas leased prior to October, 1949, large accumulation of coal stocks at pit-heads, necessitating greater finance to service them, rising prices of explosives, machinery and spare parts, increasing need for stowing, deeper mining and washing and washing of coal and better amenities for labour etc. are, for instance, some of the factors that are likely to bring about an increase in coal prices. From the middle of 1955 to January 1961, there has been an increase in the price of coal including cesses etc. of more than 45 per cent and it seems certain that similar factors will operate for an increase in the Third Plan.

Although heavy box type wagons have recently been put on the manufacturing list, they have their own disadvantages and are likely to add to the cost of industries receiving their coal in such wagons. There are no weighbridges to weigh these heavy wagons. So unscrupulous suppliers underload such wagons sometimes to the extent of 30 per cent and make the consumers pay according to the wagon capacity. Then again mechanical devices in large-sized works for unloading old type 4-wheelers cannot be used for this new type wagon and at times the extra cost of unloading comes to more than 30 per cent. It seems, therefore, that the situation is not going to be relieved for some time. Consolation, however, may be derived from the fact that a working group headed by the Planning Commission Adviser for Transport and Industry is engaged in the thorough examination of the coal problem. It is to be hoped that the findings of this working group will help in setting the house in order at least to some extent. In the meantime, as has been suggested by Mr. Driver, it would not be a bad idea, in view of the present shortage of transport and good quality coal, to ascertain how far oil can meet the deficiency and at what reduction in price.

Business Notes

Industrial Training

APPRENTICE BILL APPROVED

THE APPROVING of the Apprentice Bill by the Lok Sabha, which seeks to regulate the training of youngmen in the public and private sector industries is to be hailed as a step in the right direction. India needs a large number of trained technicians to execute its Third Plan. Happily, this has been visualised in time and it can be hoped that this measure would set right

the things that have so far been in jeopardy. The Ministry of Labour and Employment is particularly to be congratulated for coming out with this measure. It will not only remove the paucity of trained technicians to a great extent but may also put on right footing the training programme in general.

This measure is likely to come as a boon to those particularly who were unable to take advantage of technical schools, colleges and universities but were fit to be trained as skilled workers. The grievances of

the advanced countries should earmark one per cent of their national incomes for investment in these countries. There is a lot of logic and force in this argument because with the development of under-developed countries there can be brought about an expansion in world trade. The most comforting factor was that the U.S.A. and the U.K. were conscious of the vital importance of increasing export markets for countries in the Colombo Plan region and of the stabilisation of commodity prices. The task that lies ahead is indeed a colossal one and it is now for the Colombo Plan countries themselves to pull their weight together.

Industry

BASF TO START NEW VENTURE

IT IS likely that Basf, a West German concern, may start new ventures in India. The possibilities are being fully explored as was disclosed the other day at a Press Conference by Mr. F. Sinn, the company's export manager on the West German pavilion at the Indian Industries Fair. The goods that are displayed in the West German pavilion by Basf are of considerable interest. They are of the nature of Nitrophoska, known as complete fertilizer, dyestuffs, illustrated on dyed and printed fabrics, and other textile auxiliaries. Bases material for nylon production and polyester fibres like caproactam, AH salt, moulding compounds like polystyrol, lupolen, ultramid and styropor, plastic dispersion for the surface coating of paper and fabrics like acronal, diofan and lutofan, and synthetic adhesives for wood-working like eaurit and kauresin are also being exhibited.

This company is already collaborating with R. A. Cole Limited in setting up a factory for the manufacture of expandable polystyrene beads. To render technical assistance to Indian industries specially textiles, paints, printing inks and paper, it has also set up Chemicolour Private Ltd. Besides, a technical service station in India is being organized by Basf where qualified Indian and European technicians have been posted. A large number of Indian chemists and engineers are also being trained in its factories in West Germany. Its interest in the public sector industries is equally great. Hindustan Organic Chemicals Ltd. is a joint venture of several well-known German companies including Basf and the Government of India. If the plans of Basf go through, India is likely to have a splendid variety of goods which are useful both to industrialists and householders.

Food Processing

REGAINING LOST GROUND

TO HELP India's food processing industry regain foreign markets, a three pronged effort was considered essential at a two-day Convention held in New Delhi recently. This industry has lost a good deal to Australia on account of heavy freight charges and lack of modern equipment. This three-pronged effort implies arranging of cheaper and better raw materials, reduction of overhead costs and importing of modern equipment. Besides this, it was decided to set up an export promotion council to promote exports. Without the aid of proper equipment, it was stated, a workman in India turns out only 25 cans a day as against 1,000 cans per worker in modernised factories in Australia.

The unfortunate fact in this situation is that no foreign exchange can be spared for the import of equipment.

It was pointed out on behalf of the manufacturers that while the cost of bottles for keeping jams and

squashes was Rs. 16 a gross in Britain, it was Rs. 50 a gross in India. The freight charges from Bombay to London are 222 shillings per ton, as against 175 shilling from Australia to London. These comparisons showed that India's food processing industry, with all its potentialities, was losing a battle against Australia in foreign markets.

The supply of sugar to the industry for products meant for exports at the international price of Rs. 13 a maund, as was the practice in Australia, was urged upon by the convention. The Development Council having agreed in principle, the decision is now resting with the Government to act upon. It is expected that with the supply of cheaper sugar, the exports of the industry might become four-fold. It would not be inappropriate to mention in this context that following the recommendations of the Development Council for food processing industries, a subsidy of Rs. 500 per ton on tin plates used for open top cans for packing condensed milk, meat products and canned fish has been extended from the financial year 1961-62.

Agricultural Labour

WEST BENGAL ENQUIRY

THE SECOND VOLUME of Agricultural Labour Enquiry report pertaining to West Bengal has now been published. The enquiry in the State was conducted in 251 villages on the principle of stratified random sampling but staggered evenly over a period of 12 months. Data on employment, unemployment, wages and earnings, income, expenditure and indebtedness were collected from 2,094 agricultural labour households. One of the objects of the second enquiry was to assess the impact of developmental schemes undertaken during the First Plan on the condition of agricultural labourers as between 1950-51 and 1956-57.

The report reveals that the estimated number of agricultural labour households in West Bengal went up by about 8.9 per cent i.e. from 10,78,000 in 1950-51 to 11,63,100 in 1956-57. During this period the percentage of landless agricultural labour households went up from 53.71 to 63.49. According to the enquiry attached labour households in 1956-57 accounted for 21.31 per cent of the total for the State, the remainder being casual labour households. The average size of the agricultural labour household rose from 4.0 in 1950-51 to 4.30 in 1956-57. The average number of wage earners was 1.52 per household compared with 1.50 in 1950-51.

Regarding employment in West Bengal the report says that casual daily male workers were employed on an average, for wages for 232 days in 1950-51 and 227 days in 1956-57. They were self-employed for 40 days in 1950-51 and for about 25 days in 1956-57. They were unemployed for 113 days in 1956-57 as against 93 days in 1950-51. The average annual income of an agricultural labour household in 1950-51 was Rs. 608, while it was Rs. 657 in 1956-57. So far as indebtedness is concerned, about 69 per cent of agricultural labour households were indebted during 1956-57 as against 33 per cent in 1950-51. The enquiry provides an insight into the working of agricultural labour force and should be helpful in working out norms for the welfare of agricultural labourers.

Panyam Cements

SATISFACTORY PROGRESS

PRESIDING OVER the 6th Annual General Meeting of the Panyam Cements and Mineral Industries Ltd. held on August 31, 1961, at Kurnool, Andhra Pradesh, T. S. Sundaram, Chairman of the Board of Directors,

HIT THE BULL'S EYE

There is a surer way of getting your rightful share of the rich export market. If you exercise strict quality control in the manufacture of your goods, maintain regular supplies, produce according to the buyer's specifications, arrange for after sales service facilities, a tidy sum in foreign exchange is yours. In the Export markets you are competing face to face with the highly industrialised countries of the west. For the buyer to select your goods in preference to those of other countries you have to compete on quality.

told the shareholders that the company has earned a net profit of Rs. 11,78,934 during the year under report after providing Rs. 10,20,231 for depreciation including extra depreciation. This substantial profit has enabled the company to make provision for payment of the arrears of dividends on Preference Shares at 6 per cent tax-free.

The Government of India, after examining in detail the report of the Tariff Commission, has fixed for the Company highest price for portland cement. The high cost of production of the new units, Mr. Sundaram thinks, is mainly due to the steep increase in the capital costs.

The factory is now on its way to expansion with orders for a 300-ton Unit placed with the indigenous suppliers Messrs. ACC, Vickers, Babcock Ltd., Bombay. The budgeted outlay for the expansion project estimated at Rs. 120 lakhs will be met by the proposed issue of share capital of Rs. 46.36 lakhs and borrowings. The Company has secured a long-term loan of Rs. 40 lakhs from the Industrial Credit and Investment Corporation of India Limited and medium-term loan of Rs. 20 lakhs under the scheme of Refinance Corporation for Industry through the Company's bankers, The Bank of Baroda Ltd. The Authorised share capital is proposed to be enhanced by Rs. 1 crore.

Engineering

FORMATION OF TWO NEW COMPANIES

TWO NEW industrial plants are likely to be set up soon at Baddarpur, near Delhi. One of these plants would be for the production of drop forged tools and the other would be for the manufacture of semi-conductors and rectifiers, including selenium rectifier stocks cartridges and photovoltaic cells. For the production of drop forged tools, an agreement has been reached with Techno-Export of Czechoslovakia. The entire plant and machinery is to be supplied by this foreign concern. This concern will also provide the technical know-how and train Indian technicians in Czechoslovakia. The promoters of the new company, Usha Forgings and Stampings Ltd. are Messrs Rm Krishan Kulwant Rai of Delhi. Orders for Rs. 14 lakhs worth of machinery have already been placed for the first stage of manufacture. The plant will have the capacity to produce 300 tons a year of double ended spanners, combination pliers, rose nails, wrenches and other tools for machine shops.

The promoters of the company which is to manufacture rectifiers and semi-conductors are also Messrs. Ramkrishan Kulwant Rai. In this case technical collaboration has been obtained from International Rectifier Corporation, a U.S. firm of repute. The project will cost Rs. 25 lakhs and the U.S. firm's share in the capital of the new company would be to the extent of 50 per cent. Both these plants are expected to go into production by the middle of 1962.

New Issues

INDIA CARBON

TWO COMPANIES — India Carbon Limited and East-end Paper Industries — will be entering the market in the next few days for raising capital to start their manufacturing programme, the former in Assam and the latter in West Bengal.

India Carbon Limited is offering 1,18,000 equity shares of Rs. 10 each for public subscription at par. The subscription list opens on December 4 and will close on December 9, or earlier at the discretion of the directors but not before December 6. The proceeds of the issue will go to finance partly the Rs. 80-lakh project of the company to produce calcined petroleum

coke and calcined anthracite coal. The factory is to be set up at Gauhati near the public sector Nunmati refinery which, along with the Digboi refinery, would be providing the company with its primary raw material — raw petroleum coke. Anthracite coal of the required quality will be imported from Jammu and Kashmir mines which are said to have sufficient deposits of this type of coal. The plant is expected to go into production before the end of 1962.

Technical collaboration has been secured from Messrs. Great Lake Carbon Corporation of the United States who will also be participating in the equity capital of the company to the tune of Rs. 16 lakhs — Rs. 12 lakhs in the shape of subscription to equity capital against cash and Rs. 4 lakhs in lieu of "technical know-how and show-how" fees. The Government of Assam is as well participating in this venture by subscribing Rs. 10 lakhs in the form of redeemable cumulative preference shares. The authorised capital of the company is Rs. 1.50 crores. The issued capital is Rs. 50 lakhs.

Of the total cost of the project, estimated around Rs. 80 lakhs, Rs. 30 lakhs will be secured in the form of loans from the Industrial Credit and Investment Corporation of India and/or from the Export-Import Bank, Washington. The Export-Import Bank and the ICICI have already agreed in principle to grant these loans. The former will be making its loan available in U.S. dollars and the latter in Indian rupees on a long-term basis.

Calcined petroleum coke is one of the basic materials required in the manufacture of aluminium and other electro-chemical and electro-metallurgical products viz. Ferro-Alloy, Ferro-Manganese, Ferro-Silicon, Calcium Carbide etc. At present India is entirely dependent on imports of this type of coke, whose requirements will only grow with the rising tempo of industrial activity. India Carbon is the first company in this country to undertake the production of calcined petroleum coke and calcined anthracite coal. Its Gauhati plant is expected to result in a saving of foreign exchange to the tune of Rs. 1.2 crores annually. Besides this saving, some foreign exchange may also be earned by the export of calcined petroleum coke after meeting the home consumption in full.

EASTEND PAPER

EASTEND PAPER INDUSTRIES LIMITED is offering for public subscription 2,00,000 equity shares of Rs. 10 each. The subscription list opens on November 24 and shall close on November 28 or later at the discretion of the directors. The authorised capital of the company is Rs. 35 lakhs, all consisting of equity shares of Rs. 10 each. The issue capital is Rs. 30 lakhs, of which shares worth Rs. 5,11,250 have already been subscribed by the directors of the company and their friends. Another 48,875 shares are intended to be reserved for them.

The company proposes to set up a plant at Bansberia in the Hoogly district of West Bengal for the manufacture of paper and boards from rice straw which is available in abundance in the neighbourhood. It is also intended to use waste paper and at a later stage sabi grass as raw materials.

The capital outlay on the project is estimated around Rs. 60 lakhs. Since the share capital would provide only Rs. 30 lakhs, loans are being arranged from the Industrial Finance Corporation (Rs. 20 lakhs) and from the company's bankers (Rs. 10 lakhs). When in full production, the output of the company would amount to nearly 3,000 tons a year.

The plant is expected to be commissioned early in 1963. Contracts for the supply of plant and machinery have already been finalised with Nichimen and Co. Ltd., Tokyo

FROM THE CAPITAL'S CORRIDORS

CEMENT INDUSTRY

AS envisaged in the Third Five-Year Plan the Union Ministry of Commerce and Industry is planning to renew its efforts to step up the installed capacity for the manufacture of cement to 18 million tons a year from the present level of licensed capacity of 16.36 million tons, of which about 9 million tons is installed. There are three undertakings at present licensed to manufacture cement-making machinery, namely, A.C.C. in collaboration with the British Consortium, A.V.B. which is setting up its plant at Durgapur; K.C.D. in collaboration with the French firm, FIVES LILLE and Sahu-Jain in collaboration with the Danish firm, F. L. Smith. In addition, Skoda of Czechoslovakia and KRUPPS of West Germany have shown interest in cement machine making projects. It should be noted that by 1964, India will be manufacturing eight cement making plants.

The Tariff Commission on cement whose report has been published had anticipated in their first inquiry in 1958 that 16 factories then existing would have expanded their capacity and 16 new factories would be established by the end of 1960. They, therefore, estimated that as a result of these developments total annual rated capacity of the industry would rise from 6.43 million tonnes in 1957 to 12.52 million tonnes in 1960. Reviewing the actual position that obtained at the time of the present Commission they observed that only 10 old factories had increased their capacity, six new factories had come up and the total capacity of the industry had risen to 9.50 million tonnes only. The old factories which failed to expand their capacities as originally planned are Lakheri and Dwarka of A.C.C. group, Kalyanpur, Orissa Cement, Mysore Iron and U.P. Government factory.

Commenting on the future expansion of the industry and the target of 15 million tons fixed in the Third Five-Year Plan, the Commission observed that if all the new schemes materialised as scheduled, the additional capacity likely to be established by the middle of 1964 would be of the order of 2.06 million tonnes. This was to be achieved by expansion in nine of the existing factories and by the establishment of eight new factories, giving the following picture:

	Additional annual capa- city likely to be established	Total annual capa- city	No. of cement fac- tories
	(Million tonnes)	(Million tonnes)	
As at the end of April 1961	..	9.50	34
During July 1961 to June 1962	0.63	10.13	37
During July 1962 to June 1963	0.36	10.49	39
During July 1963 to June 1964	1.07	11.56	42
TOTAL	2.06	..	..

According to the data furnished by the industry and the Development Wing additional capacity of the order of 2.41 million tonnes is likely to be established after June 1964. Further, schemes for the manufacture of portland blast furnace slag cement by five of the existing factories (Sindri and Drug of A.C.C. group, Orissa Cement, Sone Valley and Rohtas) have been licensed

but progress thereon has been held up for want of details regarding composition and availability of slag from the steel plants.

The Planning Commission had estimated the demand for cement at 13 million tons (13.20 million tonnes) in 1965-66 and to meet this fixed a target of 15 million tons (15.24 million tonnes) of capacity to be achieved by the end of Third Plan period. Together with the estimates of the Planning Commission, the manufacturers of cement had also given their own estimates. For example, A.C.C. had estimated the demand at 9.13 million tonnes for 1961, 10.04 for 1962 and 11.05 for 1963. It had based its estimates on a consumption figure of 7.02 million tonnes in 1960 plus an unsatisfied demand of about 1.28 million tonnes and had assumed an annual increase of 10 per cent (cumulative) in the demand. Other manufacturers furnished divergent figures and their estimates ranged from 8 million to 11 million tons for 1961, 9.28 million to 13 million tons for 1962 and 10.57 million to 13 million tons for 1963. The State Trading Corporation also furnished data relating to actual dispatches of cement during 1958, 1959 and 1960, which are as follows:

	Million tonnes
1958	6.04
1959	6.70
1960	7.64

These divergent figures of estimates were discussed at a public inquiry and the consensus of opinion was that the unsatisfied demand in 1960 was less than 10 per cent of the despatches of cement during that year. According to this view, therefore, the potential demand for 1960 was about 8 million tonnes. "As regards the future, it was agreed that taking into consideration the increased tempo of industrial development and constructional activity in both the public and the private sectors for the Third Plan period it would not be wrong to assume a cumulative annual increase of 12½ per cent in future demand". The Tariff Commission forecast that the demand for 1961 would be of the order of 9 million tonnes and that it would rise by 12½ a year to 12.8 million tonnes in 1964.

Giving their views on the productive capacity that would be required for meeting the growing potential demand in the country, the Commission observes "that the aggregate annual capacity would be 11.56 million tons at the end of June 1964. As against this the demand during that year was estimated at 12.80 million tons." Considering the condition of the existing plants, difficulties regarding quality and transport of coal, etc. the maximum utilisation of capacity, the Commission opined could not be expected to go beyond 90 to 95 per cent, over all. On this basis, production in 1964 was, therefore, not likely to exceed 10.40 to 10.98 million tonnes. In other words, shortfall in supply of cement that year would be of the order of 1.8 million tons. The Commission, therefore, argues "that there was an urgent need for licensing additional capacity of cement manufacture and also for taking active steps to ensure that such capacity was actually installed and commissioned progressively by 1964."

Referring to the policy of the Union Government in regard to the granting of new licenses which was that "licenses would be granted as far as possible to new entrepreneurs, that is, persons or groups of persons who did not hold any licenses for a cement factory", the Tariff Commission suggested that in view of the time lag and considerable capital

150 YEARS

not be available to new entrants, the Government should adopt a flexible policy as regards licensing of additional capacity and that established producers having resources and know-how were not discouraged or prevented from implementing their schemes of establishing new cement units or adding to existing capacity. With regard to the present near-famine conditions for cement, the Commission warned that this situation might persist "unless vigorous steps were taken side by side urgently to step up the prevailing low percentage of utilisation of installed capacity in many units." They further observed that "current shortage of cement which was of the order of 1 million tonnes was partially due to physical shortages which actually exist and also to the psychology of scarcity which leads to inflation of demands." As indicated earlier that production which was running at the rate of 86.2 per cent of the rated capacity, the output could be stepped up quickly by another 5 per cent namely, by about 0.5 million tons a year, if adequate supplies of coal were ensured. The Commission also recommended that the economy in consumption might be obtained, if the government departments and projects which were consuming nearly 45 to 50 per cent of the indigenous production of cement should, as a temporary measure, make use of alternative building material such as lime-mortar in the construction of residential buildings.

STATE UNDERTAKINGS

The Minister of Industry, Shri Manubhai Shah, announced in the Lok Sabha on Monday the Government's decisions on the main recommendations made

in the Report of the Krishna Menon Committee on State Undertakings. The Government have accepted the Committee's recommendations that a Joint Committee of Parliament on State Undertakings should be appointed. A draft motion for constituting the committee was under consideration. The Government have also accepted the recommendations that Members of Parliament should not be appointed to Boards of Management. It has also been decided that the Secretary of any Ministry or Department should not be appointed as a Director on the Board of Directors of any Government companies and that no Officer assigned ordinary Secretariat duties would be appointed as a Director in more than three or four companies at the maximum.

Regarding the appointment of Directors with business connections to the Board of Directors of public sector undertakings, the policy would be that no whole-time director should have any connection with business. Part-time directors might be appointed provided no question of conflict of interest, whether direct or indirect, would arise between the operations of the public sector undertakings to which they were appointed and their own business interest. Care should be taken in judging the likely conflict of interest in appointment. As regards the reservation of all appointments on the Board to company employees, the Minister stated that it was likely to meet with practical difficulties. The proposal that an employee, when appointed to be a Director, should continue to hold his previous post in the company was not practical and might lead to friction in practice. Where an employee was considered to hold the post of a Director, he would be made a full-time Director.

54 YEARS OF **IB** SOUND SERVICE

The Minister added that it had now been decided that the Chairman and the Managing Director should be appointed by Government and, except in the case of very small concerns, should be full-time. On the powers of the Chairman of the Board of Directors of State Undertakings, the Krishna Menon Committee had recommended that the Chairman, who had ultimate responsibility, should have the power to over-rule the Board or to exercise his discretion without prior consultation of the Board, if he thought it essential in the interest of the Company. The Government have decided that the Chairman should be given the power to reserve for the President's decision any matter, which, in his opinion, should be so reserved. It had also been decided that the Article giving power to any Director to withhold action on any proposal or decision taken by the Board, until Central Government's approval was obtained, should be deleted from the Article of Association of other Companies.

U.S. GRANT TO INDIA

The United States Government has concluded four agreements with the Government of India providing for grants totalling Rs. 26.4 crores (\$55 million) for national highways, dairy development, soil and water conservation and groundwater exploration projects. This amount will come out of the money earmarked as grants to the Government of India from the sale proceeds of agricultural commodities supplied to India under U.S. Public Law 480. The grants will cover the anticipated expenditure on the projects during the first two years of the Third Five-Year Plan.

Bulk of the grant, Rs. 20 crores, will be utilised for the improvement of national highways whose mileage was 15,000 at the end of the Second Five-Year Plan. About 787 schemes have been carried over to the Third Plan and work has begun on a number of new schemes. A sum of Rs. 3.6 crores will be utilised for milk schemes in Amritsar, Bangalore, Barauni, Calcutta, Hyderabad, Jabalpur, Kanpur, Kozhikode, Madras, Madurai, Nagpur, Surat, Vijayawada and Worli and also for research projects undertaken by the National Dairy Research Institute in the Punjab and the Dairy Science College, Gujarat.

Rs. 2 crores have been earmarked for soil conservation projects in the catchment areas of Bhakra Nangal, Damodar Valley Corporation, Machkund, Hirakud, Chambal, Kosi, Mayurakshi, Kundah, Tungabhadra and Ramganga projects. Part of this development programme includes contour bunding and terracing, afforestation, pasture development and control of landslides. A sum of Rs. 80 lakhs is intended for the groundwater exploration programme. Under this programme, a hundred exploratory wells a year will be drilled in Andhra Pradesh, Assam, Bihar, Gujarat, Kerala, Madhya Pradesh, Madras, Maharashtra, Mysore, Orissa, Punjab, Rajasthan, Uttar Pradesh, West Bengal, Himachal Pradesh and Tripura. During the Second Plan, 287 tubewells were drilled with American assistance.

INDO-POLISH TRADE AGREEMENT

A trade agreement between India and Poland was concluded during the week with an exchange of letters.

Business Manager,

THE EASTERN PURCHASING JOURNAL,
76, Sunder Nagar, New Delhi-11.

It is anticipated that during 1962, trade between the two countries may increase appreciably. Commodities to be imported in India will include machinery items and capital goods, power generating equipment, industrial raw materials, non-ferrous metal, newsprint, etc. The exports from India to Poland, on the other hand, will be engineering items, textile machinery, steel products, collapsible tubes, asbestos yarn and fibres, semi-products of pharmaceutical production, sports goods, handicrafts, tinned tropical fruits and juices, tinned fish and prawns, coir goods, etc. apart from other traditional items like tea, coffee, spices, etc.

INDO-INDONESIAN TRADE TALKS

Talks for promoting trade and economic relations between India and Indonesia opened in Delhi last week. The Indonesian Mission, which arrived here during that week, is led by Mr. Haroon Al Rashid Saleh, Director, Division of Economic Affairs, Department of Foreign Affairs of Indonesia. Further talks will be held after the return of the Mission from its tour of important industrial and commercial centres in India.

INDO-SOVIET TRADE

The progress of trade between India and U.S.S.R. was reviewed during the discussion between Deputy Minister for Foreign Trade of the Government of the U.S.S.R. and the Government of India. Letters were exchanged between the two Governments expressing satisfaction on the increase of trade between the two countries. During the discussion the U.S.S.R. delegation was acquainted with new items like light engineering goods, chemicals, asbestos, textiles and coke oven bye-products and other manufactured goods which were available for export from India.

The fourth Agreement in the field of international commercial arbitration entered into by the Federation with the business organisations abroad is with the Soviet Union, the first three agreements being with Japan, U.S.A. and German Democratic Republic. The arbitration clause to be included in contracts between the Soviet foreign trade organisations, on one side, and the Indian parties, on the other side, runs as follows:

"Any dispute or claim which may arise out of the present contract or in connection with the same is to be referred, with exclusion of the jurisdiction of the ordinary courts, to decision by arbitration. If the defendant in such dispute or claim is a Soviet foreign trade organization, the arbitration will be conducted in the Foreign Trade Arbitration Commission under the U.S.S.R. Chamber of Commerce, Moscow, in accordance with Rules of Procedure of the said Commission. If the defendant in such dispute or claim is an Indian physical or juridical party, the arbitration will be conducted by the Arbitration Tribunal of the Federation of Indian Chambers of Commerce and Industry, New Delhi, in accordance with the Rules of Procedure of the said Tribunal. The award of the respective arbitration will be binding upon both parties."

The agreement also provides for periodical meetings between the competent representatives of the Foreign Trade Arbitration Commission of the U.S.S.R. Chamber of Commerce and the Arbitration Tribunal of the Federation to discuss general questions relating to the fulfilment of the present Agreement.

BUSINESS FOR LOK SABHA

Of the twenty sittings of the Lok Sabha, which

began its Winter Session on Monday, four half days are allotted for Private Members' business, including two half days for non-official resolutions. Two hundred and ten resolutions have so far been admitted, covering a wide field of governmental activities. There are resolutions demanding nationalisation of industries like Sugar, Film, Oil, Iron and Steel, Jute and Foreign Trade in general including export trade in jute, in particular. Another set of resolutions seek to canalise the entire foreign assistance to Indian industries through Government of India, to enquire into economic and political consequences of increased foreign private investment in various industries; and to enquire into the sources and utilization of the large funds received by various foreign and Indian missionary societies.

Two members from Uttar Pradesh and Bihar respectively would like the Government to fix the price of sugar cane at Rs. 2 and Rs. 2½ per maund. Communists and Socialist members, through joint resolutions have urged the re-instatement of Government employees dismissed for participation in July 1960 strike. The other resolutions ask for more wage boards, for banning the production of vanaspati, for starting a newspaper in the public sector, for postponing the establishment of fourth steel plant till the existing three steel plants in the public sector are completed, for stabilising prices of essential commodities, for an enquiry into the workings of the Community Development Projects, of Air India International, Indian Airlines Corporation.

As a result of ballot held on November 9, six resolutions were admitted for discussion on November 24, the first place having been drawn for a resolution asking Government to give a final ultimatum to the Portuguese Government to withdraw from Goa, Daman and Diu. This leaves another half a day for which another resolution should await the fortunes of the ballot box. In addition, notice has been tabled for sixty-three "No-Day yet named" motions.

Besides, three bills, as passed by the Rajya Sabha, one bill, as reported by the Select Committee, another bill in the Select Committee stage and eight other bills are pending before Lok Sabha for disposal. In addition, twenty bills as reported in the last issue of "The Eastern Economist" have so far been put down on the order paper.

TYRE MANUFACTURE

Two tyre manufacturing factories were formally inaugurated this week—one at Ballabgarh about 21 miles from Delhi and the other near Madras.

The Ballabgarh factory, owned by nearly 49,000 Indian shareholders and the Goodyear, U.S.A., was inaugurated by the Vice-President, Dr. S. Radhakrishnan, who described it as symbol of Indo-U.S. collaboration. Housed on a 71-acre plot with 1,80,000 square ft. built, the factory is the most modern in its equipment. When in full production, it will be turning out 750 tyres a day on three-shift basis besides tubes and camelback (equivalent to an annual output of 2,13,000 tyres). The present programme envisages manufacture of tyres and tubes for passenger cars, buses, trucks, tractors and animal drawn vehicles. Generous provision has, however, been made for further expansion to 1,000 tyres a day, equivalent to 5,10,000 tyres per annum. Under the expansion programme, tyres for all uses would be pro-

duced by this factory, including aeroplane tyres. Decision to go in for the manufacture of this special type tyres would, of course, depend on how far testing facilities are secured by the company.

The total cost of setting up this project is estimated at Rs. 6 crores. The company has an authorised and issued capital of Rs. 2,00,15,000. It issued to the Indian public 4 lakh equity shares of Rs. 10 each with a premium of Rs. 7 per share. Of the 89,000 applicants, nearly 49,000 were allotted shares, thus making this company the second largest in regard to Indian shareholding, the first being the Tata Iron and Steel Company. The company has received assistance, from the U.S. Export-Import Bank to the tune of Rs. 2.25 crores out of the PL 480 funds accumulated to the credit of the U.S. Government through sale of agricultural products.

One hinderance that the company is envisaged to face in reaching full capacity is the power shortage which has necessitated curtailment of the present output (the factory has been in operation since August last) to only 250 tyres a day on two-shift basis. The Punjab Government, however, has promised to extend all assistance in the matter and before long it is expected that the required amount of electricity would be made available to it.

Mr. E. J. Thomas, Chairman of Goodyear, U.S.A., the parent company of Goodyear India, welcoming the Vice-President at the inauguration ceremony, paid handsome tribute to the economic development this country has achieved under the first two Plans and to the Indian talent in manning giant enterprises. One of the main

considerations which prompted his company to go in for a manufacturing programme in this country, Mr. Thomas said, was the impression made by the strong Indian sales and loyal dealer organisations built up by Mr. R. E. O. Carey, the Goodyear representative in India, and his associates through the years. The political stability that is obtained in India today along with vast market which this country provides, Mr. Thomas opined, should help in attracting foreign private investment to this country.

The Ballabgarh factory is the 59th in the chain of Goodyear manufacturing units all over the world.

The second tyre manufacturing factory whose pilot plant has been inaugurated near Madras by the Madras Chief Minister, Mr. Kamaraja Nadar, has an installed capacity to produce 1,000 tyres and a similar number of tubes per day for use in road transport. This factory is scheduled for commissioning into production by June next year. Work on the main factory is going on round the clock since the ambition of the promoters and the collaborators is to commission the same in a record time of only 10 months of obtaining the Government's permission to set up the plant.

The pilot plant will be producing only 30 tyres a day. It will primarily be run for giving the requisite experience to the factory's workers, technicians and engineers.

This factory has been set up in collaboration with Mansfield Tyre and Rubber Company of the United States.

We reckon our production in 1960-61 to be 69,552 tonnes of rolled products and 5,624 tonnes of castings. In other words a rise of 48% over the previous year. In 1951-52 MUKAND employed 1,064; in April 1961—2,306. Over the past ten years production figures have soared—13,615 tonnes of rolled products and 704 tonnes of castings in 1951-52; and 425% more in 1960-61.

Dividend for the year	5	5	8	19

MUKAND manufactures high grade steel products—bars, rods and castings. Presently an expansion programme is under way. It will cope with the growing flux of big orders—like the one placed by the Railways with MUKAND in October 1961 for 4,862 sets of Centre Buffer Couplers valued at Rs. 1,14,00,000.

MUKAND provides India's new and growing industries with the quality components that they must have.

COMPANY AFFAIRS

CAPITAL ISSUES

Of the eight companies which have been authorised new capital issues, four will issue bonus shares and the other four equities. The consent of the Controller of Capital Issues for all the issues is valid for 12 months. The following are the details:

Glaxo Laboratories:

Glaxo Laboratories (India) Private Limited, Bombay, has been accorded permission to the issue of further capital of Rs. 1 crores in 10,00,000 equity shares of Rs. 10 each to be issued as bonus shares on capitalisation of reserves.

Gammon India:

Gammon India Private Limited, Bombay, incorporated in 1922 and engaged in business as Civil Engineers and Contractors, has been given consent to the issue of 2,50,000 equity shares of Rs. 10 each as fully paid up bonus shares on capitalisation of its reserves to the extent of Rs. 25 lakhs. The company's existing paid up capital is Rs. 30 lakhs. It will issue five bonus shares to the holders of six shares.

New Commercial Mills:

New Commercial Mills Company Limited, Ahmedabad, has been granted consent to the issue of bonus capital of Rs. 14,31,750 divided into 5,772 equity shares of Rs. 250 each. The bonus shares will be issued to the existing equity shareholders of the company in the ratio of one bonus share for every five equity shares held, on capitalisation of the Share Premium Account of the company.

Devashola (Nilgiri) Tea Estates:

The Devashola (Nilgiri) Tea Estates Company Ltd., Madras, has been granted consent to issue equity bonus shares of the value of Rs. 2,40,000 on capitalisation of the company's reserves to a like extent. The bonus shares will be issued in proportion of 2 bonus shares for every 5 shares held by the existing shareholders.

Seshasayee Industries:

Seshasayee Industries Limited, Madras, has been granted consent to issue further capital of Rs. 40 lakhs in the form of equity shares of Rs. 10 each for cash at par. The proceeds of the issue will be utilised for the manufacture of H.T. & L.T. porcelain insulators, transformer bushings etc.

Simco Meters:

Simco Meters Limited, Madras, has been granted consent to issue capital of Rs. 35 lakhs consisting of equity shares worth Rs. 32 lakhs and 9 per cent preference shares of Rs. 3 lakhs for cash at par. The proceeds will be utilised for the manufacture of house service electricity meters, in collaboration with Denis Ferranti Meters Limited, U.K.

Southern Brick Works:

Southern Brick Works (Private) Limited, Madras, has been granted consent to issue equity capital of Rs. 25 lakhs for cash at par privately. The proceeds of the issue will be utilised for starting a factory in Madras for the manufacture of bricks and tiles.

Perfect Pottery Company:

The Perfect Pottery Company Limited, Jabalpur, Madhya Pradesh, having a paid-up capital of Rs. 22,52,400 to-date has been accorded consent to the issue of further capital of Rs. 5,93,850 divided in 11,877 equity

shares of Rs. 50 each to the existing equity shareholders in the ratio of one new share for three shares held, for cash at par. The proceeds of the issue will be utilised for establishing a new works at Bharatpur for the manufacture of 7,200 tons of Stoneware Pipes and 7,200 tons of Refractory Firebricks annually.

THE PREMIER AUTOMOBILES

The Company's report for the year 1960-61 discloses a rise in the gross profit by Rs. 39.98 lakhs to Rs. 193.86 lakhs and net profit by about Rs. 18 lakhs after providing Rs. 56.44 lakhs for depreciation. This has been made possible as a result of an improvement in the sales from Rs. 20.94 crores to Rs. 22.73 crores. The directors have recommended that the dividend should be maintained at Rs. 9 per share subject to tax. After providing for the proposed dividend which will absorb Rs. 49.82 lakhs against Rs. 30.97 lakhs and making necessary adjustments, a sum of Rs. 4.75 lakhs is carried forward against Rs. 3.23 lakhs brought in.

The Directors have stated that all the components of the Fiat transmission including gears, sliding sleeves and hubs were now being produced at the Company's factory. The Company hopes to mount locally-made transmission and Fiat cars before long.

The Company has also sought the sanction of the Government for the issue of further equity capital of Rs. 2 crores in shares of Rs. 100 each. The proceeds of the issue are to be utilised for financing the Company's sheet metal project.

H.E.H. THE NIZAM'S CHARITABLE TRUST

The Nizam's Charitable Trust have shown a surplus of income over expenditure as at 31st March, 1961. The Trustees have reported that the market value of the assets of the Trust have increased to Rs. 6,21,00,000 as against Rs. 6,17,00,000 shown last year in spite of the fact that shares of the book value of Rs. 50 lakhs of three Companies were sold at a premium and the sale proceeds invested in Government securities. This investment in Government securities has, however, resulted in a decrease in income from Rs. 41,03,142 in 1959-60 to Rs. 33,64,936 in the year under review.

The Trustees have set apart a sum of Rs. 30 lakhs to construct an Orthopaedic Hospital in Hyderabad with 200 beds to be completed by the middle of 1963. During the year under review over Rs. 21 lakhs were spent on the various old and new beneficent activities of the Trust. The Trust Fund which opened at Rs. 4,90,00,000.00 closed at Rs. 5,83,50,784.62.

FRIED KRUPP

Fried Krupp, a German firm, which will complete its 150th year of existence this month, is at present building 52 large wharf cranes for the extension of harbour facilities at Calcutta and Madras. The firm will also deliver, in the first part 1962, 15 large tyre-curing presses to a tyre factory in India.

Krupp supplies to India in recent years include 90 locomotives, 3 cement factories, 5 weirs, a large 12 kilometer conveyor system for an open-cut lignite mine, as well as a low shaft furnace, a number of cranes, oil mills, cable-making and stranding machines, can-making machines, steel structures of various kinds and rolled steel products.

From 1957 to the present time alone, the firm's deliveries to India amounted to a value of 225 million DM, a considerable part of which went for supplies and equipment for the Rourkela Iron and Steel Works.

*Company Meeting***PANYAM CEMENTS & MINERAL INDUSTRIES LTD.****Cement Nagar, Kurnool Dt., A. P.**

Speech delivered by Sri T. S. Sundaram, Chairman, Board of Directors of Panyam Cements and Mineral Industries Ltd., at the Sixth Annual General Meeting held on Tuesday, 14th November, 1961, at Cement Nagar.

Gentlemen,

It gives me great pleasure to welcome you to the SIXTH ANNUAL GENERAL MEETING of the Company. The Audited Statements of Accounts for the year ended 31st August, 1961, along with your Directors' Report on the affairs of the Company have been circulated to you and with your permission, I shall take them as read.

It is a matter of gratification to one and all of us that the result of the working of the Company during the year under review has been exceedingly satisfactory. As you will have noted the Profit and Loss Account shows a net profit of Rs. 11,78,934 after providing Rs. 10,20,231 for depreciation including extra shift depreciation. This substantial profit has enabled us to completely write off the preliminary expenses, commission and brokerage of Rs. 40,469 and to make provision for payment of the arrears of dividends on Preference Shares of Rs. 3,72,000 from the date of allotment to 31st August, 1960, at 6 per cent tax-free, i.e. 8-4/7 per cent subject to deduction of tax.

The Managing Agents have waived their remuneration for the second year in succession. I have to place on record on your behalf our sincere gratitude to the Managing Agents for their generous gesture.

I am glad to inform you that the Government of India, after examining the report of the Tariff Commission on the Retention Price payable to the Cement Industry, have fixed for our Company the highest price fixed for Portland Cement. Underlining the importance of the industry, the Commission had proposed prices which will help its development to achieve the capacity target fixed by the Planning Commission. Whilst right and due emphasis has been laid by the Government of India and also the Tariff Commission on improvement of efficiency and reduction in the production costs of the industry, I hope it is appreciated that the high cost of production of the units of this capital intensive industry, especially of those which have come into being in recent years, is mainly due to the steep increase in the capital costs. With the cost of coal and purchased power and railway freight determined or influenced by Government's policies, Wages and salaries fixed by Wage Boards, prices of inventory stores steadily rising and the production targets getting adversely affected by unforeseen circumstances such as coal shortage or wagon shortage and power cuts, only little is left in the hands of the producers to reduce their production costs.

As you are aware, the size of the Cement Plant is one of the important factors influencing its productivity. I hope the Government, keeping in view the

overall, balanced and rational development of this industry to exploit the raw material deposits in all parts of the country, will ensure by their licensing and other policies that the new units are given preference, encouragement and facilities to expand to more economic sizes.

I welcome the Government's decision to allow the State Trading Corporation to continue in the field of cement distribution.

I am happy to inform you that work on the expansion of our Factory is progressing satisfactorily. Orders have been placed for a 300-ton Unit with the indigenous suppliers, Messrs. ACC, Vickers, Babcock Ltd., Bombay. The equipment is due to be delivered during the second half of 1962 by which time civil construction works are also scheduled to be completed. The plant is expected to be commissioned in the second quarter of 1963.

It is proposed to enhance the Authorised Share Capital of the Company from Rs. 1 crore to Rs. 2 crores. The appropriate resolution with regard to this and the present capital issue for Rs. 46.36 lakhs are being placed before you. I am sure we will have your enthusiastic co-operation in making this issue a success.

As mentioned in my last year's speech, the budgeted outlay for this expansion project is estimated at Rs. 120 lakhs. This will be met by the proposed issue of Share Capital of Rs. 46.36 lakhs and borrowings. You will be glad to hear that your Directors have been successful in securing a long-term loan of Rs. 40 lakhs from the Industrial Credit and Investment Corporation of India Ltd., Bombay, and a medium term loan of Rs. 20 lakhs under the Scheme of Refinance Corporation for Industry through our Bankers, The Bank of Baroda Ltd.

I come now to the pleasant part of my duty of expressing our thanks to our Managing Agents for the care and interest evinced by them in the management of the Company and officers, members of the staff and operatives of all categories for their sense of duty and hard work willingly rendered by them.

I now have pleasure in moving that the Directors' Report and the Audited Statements of Accounts for the year ended 31st August, 1961 with the Auditors' Report attached thereto, be adopted.

T. S. SUNDARAM.
Chairman.

Note: The above statement is not a report of the proceedings of the Annual General Meeting referred to.

a full meal, twice a day

Just a dream for the hungry millions amongst us, but the most vital target of all our national planning.

Great irrigation projects, new methods of cultivation and improved tools promise bumper harvests and fulfilment of this dream.

Mysore Kirloskar Lathes — machines which make other machines — play a key role in the factories producing tools for the tiller and in the project workshops. Mysore Kirloskar Lathes turn our dreams into reality.

BAR-56-141

H.E.H. THE NIZAM'S CHARITABLE TRUST

*Seventh Annual Report for the Year
Ended 31st March, 1961.*

1. The H.E.H. The Nizam's Charitable Trust was created by His Exalted Highness the Nizam of Hyderabad on June 14, 1954, with a corpus of the face value of Rs. 4,90,00,000 (Rupees four crores and ninety lacs) for relief of the poor, support of religious institutions, provision of medical aid, advancement of education and for any other objects of public utility in India in general and particularly for people in the former State of Hyderabad.

2. During the year, the Board of Trustees comprised of:

- | | |
|---|-----------|
| i) Prince Mukarram Jah Bahadur | Chairman |
| ii) Sir Said-ul-Mulk, Nawab of Chhatari | Member |
| iii) Nawab Zain Yar Jung Bahadur | Member |
| iv) Shri V. P. Menon | Member |
| v) Mr. Shavax Ardeshir Lal | Member |
| Khan Bahadur C. B. Taraporvala | Secretary |

The Trustees place on record their feeling of grief and loss on the death of their esteemed colleague, Nawab Zain Yar Jung Bahadur, on 16th May, 1961, and their profound appreciation of the services rendered by him. His Exalted Highness the Nizam of Hyderabad, by virtue of the powers reserved to him, under the Trust Deed, in respect of this Trust, appointed Nawab Shah Nawaz Jung Bahadur, as an additional Trustee of this Trust, from 12th June 1961, in the place of the deceased.

3. During the period under review, six meetings of the Board of Trustees were held to deal with the affairs of the Trust, including the consideration of applications received from various public institutions and individuals, for donations, lumpsum grants, medical aid, scholarships etc.

4. The Trustees received, during the year, a very large number of applications from poor and destitute persons, from unemployed people and poor students. The Trustees themselves caused proper investigations to be made before granting relief. The applications dealt with during the year under review are classified under the following broad categories, showing the relief or assistance granted: (1) 581 poor and destitute persons and widows, who are unable to work and have, therefore, no other means of income, were granted maintenance allowances ranging from 5 to Rs. 20 per mensem. (2) Special maintenance allowances ranging from Rs. 25 to Rs. 50 per mensem, were paid to 10 widows and poor and destitute persons who had no other source of income. (3) 917 poor and deserving students were granted scholarships ranging from Rs. 10 to Rs. 20 per mensem. (4) 66 students were awarded special scholarships ranging from Rs. 25 to Rs. 125 per mensem, for higher technical studies.

In all 5,378 beneficiaries (practically all of whom belong to Hyderabad), including those who were recipients of financial aid before, drew either maintenance

allowances or scholarships under the four categories referred to above, as on 31st March, 1961, and the total of such payments during the period under review amounted to Rs. 8,80,842.06. 1,088 patients (almost all of whom belonged to Andhra Pradesh) suffering from T.B., Cancer, Leprosy and other diseases, were granted lumpsum financial aid for medical relief. The total amount of medical aid granted to such patients, during the period under report, amounted to Rs. 1,00,950. 891 poor and deserving students (practically all of whom belonged to Hyderabad) were granted lumpsum financial aid, ranging from Rs. 50 to Rs. 200, towards payment of their admission fees, examination fees and for purchase of books, instruments etc. The total sum of such financial aid, during the year under review, amounted to Rs. 87,135. Special lumpsum educational aid amounting to Rs. 10,911 was granted to 3 scholars for Scientific Research and preparation of Thesis etc.

5. The Trustees, according to the rules framed by them for grant of Foreign Scholarships, invited applications, offering Foreign Scholarships in Mechanical Engineering, Metallurgy and Pharmacology. The applications received were submitted to Committees of experts formed in consultation with the Vice-Chancellor, Osmania University, and on the recommendations of the Committees, the Trustees granted four full and four part scholarships for studies abroad. In addition to these, lumpsum scholarships for higher education

AUSTRALIA'S LARGEST COMMERCIAL BANK
CAN HELP YOU TO PROMOTE TWO-WAY
TRADE WITH AUSTRALIA,
NEW ZEALAND, AND FIJI

Want to sell? Want to buy? Want market information? The international Division of the Bank of New South Wales can tell you about the opportunities for trade offering with these countries. The Bank's complete banking service includes such specialized facilities as trade introductions to buyers and sellers, industrial enquiries, economic and market information, and a complete travel service. The Bank is closely and constantly in touch with industry, business, and agriculture in the areas it serves through more than 1,100 branches and agencies.

Enquiries may be made through your own bankers or direct to

International Division: John W. McEwen, Chief Manager.

196101

abroad (including passage money) amounting in all to Rs. 2,24,850.83 were provided by the Trust.

6: Special lumpsum grants aggregating Rs. 8,22,600 were given to Schools, Colleges and other Institutions, Sanatoria and other beneficial objects of public utility.

7. During the year under review, recurring grants for periods ranging from 1 to 3 years were granted to (21) educational and technical institutions.

8. During the year under review M/s. A. F. Ferguson & Co., Chartered Accountants, who were appointed by the Auditor-General of India to audit the accounts of the Trust from its inception and to enquire into "the truth, the legality and the propriety of the various transactions and investments of the Trustees", completed their work and submitted their report to the Supreme Court of India through the Auditor-General of India. The Trustees, as decided by them last year, invested Rs. 2 lacs in Government Small Savings Schemes and Rupees one crore in 4 per cent Andhra Pradesh State Development Loan and 4½ per cent Andhra Pradesh State Electricity Board Bonds. They have further invested Rs. 10 lacs in sound Preference Shares yielding 8 per cent per annum, to make good, to an extent, the short-fall in the income of the Trust on account of the lower yield of Government Securities.

9. The market value of the assets of the Trust has increased to Rs. 6,21,00,000 as against Rs. 6,17,00,000 shown last year, in spite of the fact that shares of the book value of Rs. 50 lacs of three companies which were the subject of comments in certain quarters were sold at a premium and the sale proceeds invested in Government Securities. This has, however, resulted in a decrease in income, from Rs. 41,03,142 in 1959-60 to Rs. 33,64,936 in the year under report.

10. In pursuance of the decision of the Trustees, regarding construction of an Orthopaedic Hospital in Hyderabad, a Governing Board has been constituted and registered as an autonomous body under the Societies Registration Act No. I of 1950 Fasli on 16th July, 1960, with the Trustees and Secretary of this Trust, and four representatives of the Government of Andhra Pradesh, namely, the Secretary to Government, Health, Housing and Municipal Administration Department, the Secretary to Government, Finance Department, the Director of Medical Services and the Professor of Orthopaedics, Osmania Medical College, as its members, and the sum of Rs. 30 lacs set apart by the Trustees for this purpose was handed over to the above Board. A site measuring about 19 acres in Khairatabad, situated within 3 miles of other major general hospitals, in the twin cities of Hyderabad and Secunderabad, was purchased at a cost of Rs. 2,90,000 for the construction of an Orthopaedic Hospital with provision for 200 beds. The members of the Executive Committee are evincing keen interest for the early accomplishment of this scheme. It is estimated that the construction would be completed in the first half of 1963, and the hospital would begin functioning in the latter half of the same year.

11. With a view to implement the project for the establishment of a school for training artisans and mechanics, to which a reference was made in the previous report, the Trustees, in collaboration with the authorities of the Alladin Technical Institute, constituted a Society called "H.E.H. the Nizam & Alladin Technical Education Society" which has since been

registered under the Hyderabad Societies Registration Act I of 1950 Fasli. The Trustees have contributed Rs. 10 lacs to this Society, to enable them to implement their scheme of technical education in Hyderabad, and the Alladin Mecca-Madina Trust have agreed to continue their contribution of Rs. 30,000 per annum to the Society for the same purpose. A beginning has been made and the scheme is likely to be finalised and put into shape during the current year.

12. The Trustees were disbursing large sums of money every year by way of lumpsum financial aid to poor students for purchase of books, instruments etc. The amounts, so paid, were misused in some cases, as the Trust Office has no control on hundreds of recipients who are sanctioned such lumpsum grants. The Trustees have, therefore, created a "Text Book Lending Library", in collaboration with the Rotary Club of Hyderabad, for the purpose of providing books to poor students in Hyderabad, Secunderabad, Adikmet, Bolarum and the contiguous areas, especially in colleges and institutions established within the city limits and affiliated to the Osmania University, or preparing for examinations held by such other examining bodies functioning within the city limits as may be recognised by the Governing Council of the Society.

A PASSENGER FROM WEST BENGAL WRITES.....

.... I think I should express to you the keen satisfaction which I felt as a result of the KLM service. I had an excellent flight and could not have been better looked after

*Improved MOIST-O-GRAPH
measures regain...
controls automatically*

The electronic Moist-O-Graph takes the guesswork out of regain control. In addition to measuring regain for fibres and filament, regardless of blends or sizes, it provides automatic control that helps speed up production and improve quality in the slasher room; increase efficiency in the weaving room.

Honeywell is the recognized world's leader in the design and manufacture of automatic control equipment. An organization of more than 30,000 persons, with factories in the United States, Canada, France, Germany, Holland, Japan and the United Kingdom. Honeywell products are used in scores of widely diversified fields.

Honeywell products—more than 13,000 of them—fall into these three principal categories:

Honeywell
H First in Control

PS-70/13

Heating and air conditioning controls and control systems for residences and industrial, commercial, public and educational buildings.
Instruments and instrumentation systems, process controls and control systems, valves, precision switches and data processing systems for business and industry.
Precision electronic instruments and control systems for aircraft and missiles.

"LIC appear to be growing very rapidly!"

"They are among the largest insurers in the world!"

PEOPLE ARE TALKING ABOUT LIC

The LIC is winning favourable notice everywhere. And with reason. In 1960, the LIC achieved Rs 496 crores in "new business". This was an increase of 91% since Life Insurance was nationalized only a few years ago.

Consider also the value of the total policies in force. By 1960 it had spiralled to Rs 2285 crores or nearly double the pre-LIC level.

The rapid strides made by the LIC have created a new confidence in the insuring public—a growing trust in the LIC's business initiative and sense of social mission.

27 factories

Twentyseven Factories in twentyseven Countries. Twentyseven Productive enterprises in which experience is gained. Twentyseven observation posts that watch each technical advance, investigate, develop and apply the same.

The fruit of all this immense amount of knowledge and experience is contained in just a small piece of carbon paper, in just one inked ribbon, and in that sheet of Stencil Paper, all products of the House of Kores.

If you buy equipment that is going to cost you a great deal of money, then the knowledge that you are buying from a firm with a world-wide reputation gives you that very comfortable feeling of safety. For just the same reason, it is preferable to choose 'KORES' when you need Carbon Paper, Ribbons and Stencils.

In this way, you will preserve and add to the distinction of your organization by sending out letters that are clear and legible and which leave behind them as a fitting memorial copies which are clean and clear.

On behalf of twentyseven Kores Companies.

KORES (INDIA) LTD.

For your Kores-ponden

Beat the drum...strike the cymbals...and somewhat loudly sweep the strings — there's yet another ALIND achievement to wax lyrical about! Now, for the first time in the country, ALIND makes high-tensile, galvanised steel wire — the reinforcing core of ACSR!

From aluminium ingot to EC grade rod...to wire...to conductor, including the inside steel core, Alind ACSR will be Indian, Indian, Indian!

THE ALUMINIUM INDUSTRIES LIMITED
India's largest manufacturers of aluminium conductors and accessories

ALIND

Registered Office: Kundara (Kerala)
Works at: Kundara, Hirakud & Hyderabad

Nuclear Testing: Back to a Treaty?

THE news that both sides are going back to the Conference Table at Geneva after exploding their bombs is the best news of the week. Exactly how much optimism can be attached to it will naturally be read in historical context; and that is not very encouraging. For two years the Geneva test ban negotiations went back and forth with fluctuating hopes and despair and then ended in the megaton explosions. Under the stress of international tension, multiplied extremely, it seems, by the neurosis of nuclear detonation, international psychology itself has become unpredictable. What has been gained by either side by the failure to reach an agreement in the first two years of the negotiations? Almost none can give a positive answer and yet almost no one can be sure that the statement of either side blaming the other is devoid of truth. But the fact remains that the megaton explosions were a mighty denial of all negotiations. The U.S.S.R. will never escape in India criticism for having departed from the Conference Table to explode its terrible toys.

While there was much to be said for this view and the American explanation of the case formulated in a well-publicised booklet on the nuclear ban treaty, who can be quite sure that the display of Russia's tremendous nuclear armoury in megaton explosions has not encouraged new negotiations at the Conference Table? Can it be that the psychology of fear is now more important than the claims of pure reason in making the great nations of the world advance constructively to a Conference Table? It is the Russian claim that, but for the megaton explosions, disarmament talks would have taken place in an "unreal" atmosphere. It is the American claim that the megaton explosions have shown that their own reading of the Russian mind has been proved once again. Undoubtedly, the world is better ready to negotiate on the threshold of annihilation than it is in the calmer days of negotiated peace. Undoubtedly, the display of determination by the USSR has

shown what should have been known that, in the single-minded pursuit of its aims, the Soviet Union will disregard neutral opinion whenever it suits its purpose. It has kept its eye on its enemies and certainly it is plausible to argue that the mood for negotiation has been brought closer by the display of Russia's strength. Similarly, on Berlin there might have been no negotiations unless Mr. Khrushchev had presented his notorious ultimatum. But if each ultimatum is to be presented only to advance negotiation why not negotiate in the first instance? It is inevitable in the face of nuclear weapons on both sides that the ultimatum will be withdrawn or suspended—as it has been on three occasions on Berlin already—and thus suffer from the diminishing marginal utility. Is not the world making itself fairly ridiculous by operating on a psychology of fear, which contains attackers and defenders alike? The Conference Table approach for nuclear powers is the only one that has merit in our time.

It is the more unfortunate that we who have advocated this method are losing faith in ourselves. Those of us who live, so to speak, at the mercy of others since we do not possess nuclear bombs and cannot decisively influence those who have it, must wonder whether or not neutral opinion in the nuclear age has suffered a major decline. But if, as most of us still contend, the Gandhian message is full of meaning, one can view with some little alarm the angry appeals for the use of force now being made in India which might reduce our international position as peacemakers in the world. Sabre-rattling might be a good maker of morale for countries whose power of attack and defence can stand up to all challenges. *The Eastern Economist* holds the view that the breaking off of negotiations between the Indian Union and China will be as great an error as was the error of breaking off the Geneva talks. But while we talk diplomatically let us keep our powder dry.

Fertilizer Prices

THE cold reception that has been accorded by the Union Cabinet, at its this week's meeting, to Mr. S.K. Patil's proposal to cut pool prices of chemical fertilizers by Rs. 14 per ton is bound to dampen his enthusiasm to make the country self-sufficient in food and some essential agricultural raw materials by the end of the current Plan. Mr. Patil, indeed, had put forth his case ably when he pleaded before the Cabinet that the agriculturist needed the imperative incentive in the form of lower fertilizer prices if the Third Plan agricultural targets—which, in fact, may have to be exceeded in view of the rapidly increasing population of the country—are to be achieved. India today is on the threshold of the fertilizer revolution in her agrarian economy and any measure that helps in hastening this revolution is welcome.

The objection raised by the Union Finance Minister, Mr. Morarji Desai,—with which the Planning Commission is also reported to have concurred—against the proposed measure, though plausible on the face of it, is hardly convincing. The public sector enterprises—owned by the Centre as well as the States—it has been argued, would be required to contribute no less than Rs. 450 crores towards the finances needed for the implementation of the Third Plan. And if fertilizer prices are cut, it will lead to

accruing of lower profits to the State-owned fertilizer manufacturing units which would, in turn, upset the entire scheme of financing the Plan. *The Eastern Economist*, of course, has been pleading that the price policy of public sector enterprises should be such as to enable them to contribute materially towards financing the Plan. But at the same time it is the view of this Journal that this policy has to be flexible in the case of State undertakings where there may be certain other overriding considerations to be taken note of. The case of fertilizer units falls in this category. The small fall that might occur in the profits of the State-owned fertilizer factories, consequent upon a cut in fertilizer prices, will obviously be more than compensated by increased agricultural production which can have very healthy effects on the economy as a whole.

One might also argue that some reduction in fertilizer prices is warranted even to make the working of the public sector fertilizer manufacturing units more efficient. Artificially rigged up prices always contain an element of protection and invariably result in the management becoming complacent about reducing the overhead costs. Further, the estimates of the Planning Commission and the Finance Ministry of the contribution to be made by the State-owned fertilizer factories

towards financing of the Plan may not even otherwise be fulfilled. One has only to recall in this regard the terrible setback that has been caused to the output at Sindri by shortage of coal supplies of the right quality. If the Union Cabinet can put up with such cases, there is no reason why it should stand in the way of a deliberate cut in fertilizer prices which is to be effected in the larger interests of the country's agrarian economy.

Meanwhile, the Government's decision to go in for an installed capacity of 1.1 million tons of nitrogenous fertilizers to enable the production of such fertilizers to increase to one million tons, as stipulated in the Third Plan, is a step in the right direction. There is even a case for having some more installed capacity in this respect, arising out of the fact that there occurs invariably inordinate delay in this country in the setting up of new plants. If the targets of fertilizer pro-

duction fixed in the Plan are exceeded as a sequel to having higher installed capacity, it will be all to the good. Equally welcome is the decision of the Government to allow issuance of new licences for granulation of mixed fertilizers to the existing undertakings, subject to the condition that the firms should make their own arrangements for foreign exchange required to import components of the plants and equipment for the purpose. Though nitrogen is the limiting factor of fertility of soil in India, the soil here does react favourably to the use of potash and phosphoric acid when applied in conjunction with nitrogenous fertilizers. There is at present a great leeway in making the Indian peasant conscious of this fact. This can be made up through an active propaganda and demonstration programme relating to the use of mixed fertilizers. Lower prices for fertilizers in general can be the first important step in this battle.

The State Financial Corporations

THE eighth annual conference of the State Financial Corporations was in no sense a routine meeting. Their progress and operations were subjected to a searching examination and not a little outspoken criticism. The utility of this conference was enhanced by the fact that the representatives of the relevant Ministries of the Union Government, the Industrial Finance Corporation of India, the Industrial Credit and Investment Corporation of India and the State Bank of India enriched the deliberations by their active participation.

A depressing feature of the working of these State Financial Corporations has been their inability to meet their commitments of guaranteed dividends. During the last few years, in almost all cases, these Corporations needed subvention from their States for honouring this obligation. This state of affairs cannot be allowed to continue for long without creating conditions of stagnation in these Corporations. During the past few years these Corporations have come in for severe criticism because of their persisting incapacity to expedite the procedure for screening of loan applications and lack of innovation in expanding their business. Reasonable complaints are mounting up in regard to the time-consuming formalities of screening of all applications for loans put up by the small and medium-scale industries. Some of the entrepreneurs have been scared away from these Corporations because their reliance on them tended to prolong the completion of their projects and, indirectly, enhanced the initial cost. In some cases arrangements made for obtaining supplementary finance fell through. The Governor of the Reserve Bank of India, Mr. H. V. R. Iengar, stressed in a pointed manner the urgency of shedding all such practices which ultimately result in thwarting their own growth and restrict their potential to play an effective role in the industrial development of the country.

While the State Financial Corporations cater to the needs of the medium and small scale industries, the bigger units look to the Industrial Finance Corporation of India and the I.C.I.C.I. for accommodation. The total assets of all the 15 State Financial Corporations are hardly 60 per cent of those of the Industrial Finance Corporation of India, which is a sharp reminder that the Corporations at the State level have to accelerate the rate of their operations if they are to meet the challenge of expansion in the economy. The growth in the past eight years has been slow and halting mainly because of the irksome adher-

ence to their red-tape. This is not to suggest that the screening is superfluous. In fact, it is vital that sound banking principles must govern all the dealings of the Corporation. But it is of the essence of sound bank management that shrewd judgment must be exercised as to where to be liberal or meticulous. The lesson needs to be driven home to the Corporations that industries at the medium and small scale level are progressing at a very fast rate due to the overall speedy expansion of the economy and their extra-conservative policy can be instrumental in hampering their own growth as well as that of the industries.

Amongst the 15 State Financial Corporations, the Madras State Financial Corporation alone has steadily increased its operations by venturing in participation of the equity capital of companies, by drawing loans from the Refinance Corporation and by refusing to be tied down by arbitrary upper and lower limits of loan advances, with the result that it now stands at the top of all the State Financial Corporations. The Financial Corporations in Bombay and Punjab take the second and the third ranks in so far as the total assets are concerned. The Corporations in Gujarat, Orissa and Jammu and Kashmir have not been able to contribute substantially to the industrial development of the States as their total assets are still below the one-crore rupees mark; unless drastic steps are taken in the working of these Corporations, the stalemate is likely to continue. These Corporations will have to spread themselves out in the large untapped areas of their States in order to provide assistance to industrialists who are far removed from the State capitals. They will also have to strengthen the machinery for checking and screening the applications, and, if necessary, undertake some calculated risks for encouraging industrialisation in their zones.

The working results of all the 15 State Financial Corporations indicate that they suffer not from any lack of resources; as against the resources of the order of Rs. 33.08 crores, at the end of September 1961, loans and advances were of the order of Rs. 19.53 crores, the balance being either in the shape of cash or in investments. It is the poor expansion of provision of industrial credit which casts a reflection on their progress. This is so because the State Financial Corporations, unlike the Industrial Finance Corporation of India, cannot draw upon the resources of the Reserve Bank of India for raising loans simultaneously with the creation of demand. In the case of these Corporations the resources have to be mobilised before any commitment can

be made. This has naturally resulted in the time-lag between the raising of resources and their disbursement. If the tempo of their working is to be hastened, it is necessary that the State Financial Corporations should be placed on a par with the Industrial Finance Corporation of India in this regard.

The most vital decision taken at the Conference was the clarifications finally offered by the Reserve Bank that there was no ban on the participation by the State Financial Corporations in

How Forward is the Forward Market?

AT no time has the Forward Markets Commission been subjected to such severe criticism as in the past few days. A redeeming feature of this criticism, however, is that no one has accused the F.M.C. of being partial either to this section or that. Criticisms have mainly centred around the propriety of the timing of its action, rather than against the action itself, although opinions are also somewhat divided about the advisability of the F.M.C.'s actions as such. There has been criticism, for example, of the F.M.C.'s action in imposing a ceiling on futures prices during the currency of a contract as much as about the actual levels of the ceilings. But, save for a small interested section, there would appear to be more or less general approval of the action in the context of the prevailing price situation. That there is imperative need to arrest the rising spiral of prices has been accepted by all, a point which has been lately high-lighted by the report of the Tamilnad Congress Sub-Committee, headed by Mr. T. T. Krishnamachari, which examined the problem of rising prices of essential commodities. The T.C.S., it is reliably understood, has strongly criticised the Union Government's attitude towards the question.

Towards the end of October, it may be recalled, the Mustard Futures developed a sudden bullish trend owing to a variety of factors. For one thing, the contract was nearing its maturity; secondly, there was a relatively shorter crop, and, thirdly, as a result partly of the second factor, there was a bigger demand. The result was a rise of nearly Rs. 3 for mustard seed in Delhi during the second week of November, as against a rise of around 70 nP. during the preceding week. In retrospect, it would appear that the introduction of special margin in respect of Mustard Seed Futures has not been wholly unjustified in the light of the subsequent price trends, at any rate immediate.

Then came the intervention in the Jute and Jute Goods Futures Market. But, here, it is significant that the initiative came not from the F.M.C. but from the trade itself. The trade organisation concerned, namely the East India Jute and Hessian Exchange, Calcutta, apprehended trouble when there was a squeeze in the hessians and jute goods following an acute shortage of ready goods and suspended the market for three days, (14th, 15th and 16th November) with a view to checking an undue rise in prices and to curbing speculation. It has been admitted, even by critics that, but for this timely action of the trade body, the upward trend in prices in this market would have gathered momentum. If these and other measures taken by the East India Jute and Hessian Exchange received the blessings of the F.M.C., surely the F.M.C. cannot be blamed; on the other hand, the prompt co-operation and guidance extended by the F.M.C. to that body requires to be commended.

Then came the most controversial intervention, as it has since proved to be, in the Oilseeds and Oil Futures Market. It may be noted that the Oilseeds and Oils Futures Market has attract-

ed the attention of the F.M.C. more often and also more than any other commodity in the market. The sudden suspension of the market from October 28, for almost a week and the subsequent permission to resume trading from November 6 under certain restrictions have evoked both appreciation and abuse. The F.M.C.'s action has been described by some as a successful retrieval from an awkward situation created by the F.M.C. itself when it placed a ceiling (Rs. 215 for 250 kg. on groundnuts and Rs. 17.65 for 10 kg. for groundnut oil) in Bombay with similar maxima at parity prices in other recognised centres and postponed (until further notice) outward payments to "longs", in respect of transactions in groundnut and groundnut oil contracts. The background to this was the sharp fluctuation in groundnut futures, which began trading at Rs. 220 with a ceiling of Rs. 225 and a floor of Rs. 175. The permission to resume futures trading without any restrictions in the closing days of June was probably deliberate and, in the context of the prevailing Indian and international situation (favourable monsoon prospects of high crop, downward trend in world prices, etc.), it was not surprising that the bears took full advantage of the position and brought down the prices sharply from about Rs. 225 early in July to about Rs. 195 in the beginning of October. It was at this stage that the bulls began to play their cards and, assisted by co-operative interests, on the one hand, and the delay in the crop movement on the other, they took up the prices sharply to Rs. 207 (the peak touched at one time was even higher at Rs. 211!) and forced the hands, as it were, of the F.M.C.

Now it is not so much the intervention as such as the introduction of a ceiling of Rs. 215 and the timing of the intervention, that is fixing the ceiling during the currency of a contract, that have evoked criticism. It has been stated, for instance, that when the contract had almost touched a level of Rs. 225 on the very first day itself of its opening, the decision to fix a ceiling at Rs. 215 was unwise. Again, the fixing of a ceiling during the currency of the contract has been characterised as highly arbitrary.

The F.M.C. is neither perfect nor fool-proof. Indeed, on occasions, it has blundered and blundered badly at that being too conscious of its extraordinary powers (although be it said to its credit it has not used all of them). If only because of this it is suggested with all seriousness that the F.M.C. study all its decisions so far, the extent of their effectiveness or otherwise, and the reasons for their failure on not a few occasions, and then, above all, keep an open mind to receive any impartial and constructive criticism freely from whatever quarter with a view to making its work more acceptable to the trade and more useful to the nation. It is only when the F.M.C. fails to respond that one need think seriously of a change in its composition or an amendment to the Forward Markets Act.

A DELHI DIARY

BOUQUETS

THE event of the week has been the arrival of Major Yuri Gagarin who, as was only to be expected, has taken Delhi by storm. Those of us who have met and shaken hands with the hero have tended to brag about the reflected glory which we have enjoyed. I justify those who have had this arrogance by arguing that, in some mysterious way, they have also touched outer space; for Yuri Gagarin is the only thing currently outside the Soviet Union which has been in true outer space and returned. Two things equal to the same thing are, by the grand Euclidean equation, equal to one another. In much the same way, may one say that those who have touched a man who has glimpsed outer space have had a glimpse of outer space themselves? I know this is by no means equally true. But one does get a glimpse in talking with Yuri Gagarin of a supreme vision which none of us have been able to see and yet, miraculously, have been able to experience. The U.S.S.R. Embassy had done very well to put on at the Reception given, on the evening of November 30, by the Ambassador and Madame Benediktov for Major Gagarin, a coloured picture showing Major Titov and his feat—or rather its—before and after. The picture was nothing glorious as a sequence, but it was superbly interesting in Gagarin's presence. Sometimes seeing is believing, and sometimes it is even more. Seeing Yuri Gagarin and then seeing the picture one has more than a belief in the triumph of the Soviet cosmonauts. One has a belief in the supreme courage of men and their eternal triumph over Nature.

GREATER THAN COLUMBUS?

I have little patience with those who are now arguing that Yuri Gagarin was not as great a discoverer as Christopher Columbus. The theory is that science has so far advanced today that Yuri Gagarin was not surrounded by the uncertainties which must have, at all times, weighed heavily on Christopher Columbus' mind. Secondly, he was protected from the harsh elements in his spaceship more perfectly than the petty vessels in which Christopher Columbus was going round the world, based only on a favourable wind and upon the mercy of Providence. I cannot understand this denigration of outer space discovery today. Did anyone know, until Yuri Gagarin showed that it was possible, that re-entry could be made in the earth's atmosphere without the whole of the little spaceship and its gallant occupant being burnt to cinders? Did anyone ever have, in real life, to deal with the battles of weightlessness? There was nothing more than some theoretical equation with which to maintain faith in the venture. One instance mentioned by Yuri Gagarin was to the effect that as he looked out of the window of the spaceship, his whole ship was aglow with fire due to the incandescence while cutting back into the earth's "heavy" atmosphere. Secondly, how can one ever have theoretical knowledge which can precisely measure conditions in outer space where the full facts are unknown? This voyage of discovery was as momentous as that of Christopher Columbus and I, therefore, argue that the attempt to detract something from Yuri Gagarin's superb performance is largely a matter of backward looking—a deep disease in the human mind. Or has it partaken also of that great disease in our time which is called the Cold War? I believe that even in a shooting war, Albert Einstein, a great citizen of an "enemy" country, was received everywhere with honour and gratitude in the World War I. Can we not show that in Cold War I science and its admirers have no nationality and no prejudices? It matters little today whether Christopher Columbus was Italian, Portuguese or Spanish; he seems to have some roots from all three. It should matter not at all that Yuri Gagarin is a Russian. The greatest thing about him is that he has illuminated a new page in the annals of the human race.

There are naturally attempts to translate outer space in other respects. I reproduce, without descrip-

tion, the outrageous attempts of my naughty cartoonist to pass from the sublime to the ridiculous!

What a Life!

How do you like OUR Space-men, Major Gagarin?

Courtesy "The Hindustan Times"

BRICKBATS

If there have been bouquets this week, there have also been brickbats. Master Tara Singh, again elected President of the Shiromani Akali Dal, has been found guilty by the religious commission of the Panj Piyaras, for violating his own vow and has been subjected to what seems to us terrible punishment. The punishment has been decreed in words such as these:

1. He should arrange one akhand path (incessant reading of the Granth Sahib at the Akal Takht).
2. Besides his daily routine prayers, he should recite for a month Jap Sahib containing the sayings of Guru Gobind Singh.
3. He should offer karah parshad (halwa) worth Rs. 125.
4. He should clean the shoes of a congregation in Gurdwara for five days.
5. He should clean the used utensils for five days in a langar (free kitchen).

It has suddenly been discovered that this punishment is 'historic'. I was totally unaware, I must confess, that the religious heads of the Sikh community exercised this tremendous sway over everyone in their community. But it now transpires, for the glory of the community as well as for the recognition of its discipline, that Maharaja Ranjit Singh, over a hundred years ago, was ordered by the Panj Piyaras—the five big religious priests—to undergo a similar self-purifying punishment for the sin of marrying a Muslim woman who had not been converted. People tell me that the great Maharaja was whipped and had to undergo the same punishment of cleaning utensils and did so in public exhibiting the discipline of what might be called the Church Militant in its most militant form. I do not know whether there is political strength to be found in this decree which implies that the Punjabi Suba is a high religious issue and that those who fail in its achievement are to be punished by the maximum severity of the Sikh canon law. One asks whether or not punishments of this kind are suitable for a secular State. It would be a terrible thing, however, if every politician in the Indian Union is brought before a bar of religious heads of his community. Which of them would appear unscathed? Perhaps this is an additional argument for the truly secular State!

ARGUS.

THE WEEK'S NOTES

Malayasia

IMPARTING STABILITY TO S.-E. ASIA

THE FORMATION of Malayasia—a Federation of Malaya, Singapore, North Borneo, Sarawak and Brunei—as envisaged in the joint communique issued in London last week after Tenku Abdul Rehman's confabulations with Mr. Macmillan, is a step, which though will encounter some hurdles, would go a long way in imparting political stability to South-East Asia. The Malayan Prime Minister's earlier opposition to the move for unincorporation of the Crown Colony Singapore and Malaya has apparently softened with the prospects of inclusion of North Borneo, Sarawak and Brunei in the Federation. The enlarged Federation would give the people of Malay origin a majority as compared to the Malaya-Singapore Federation in which the chances of Chinese domination were there.

Whether North Borneo, Sarawak and Brunei, which are yet to attain their independent status, would ultimately join the Federation is not certain. But judging from Tenku's optimism, there may not be any great difficulty in their becoming partners in this family. Their attitude towards the proposed federal set-up is likely to be conditioned to a great extent by the amicable settlement that has been achieved recently between the Malayan Premier and Lee Kuan Yew, the Prime Minister of Singapore, which gives special status to this island in the Federation. The Federal Government will be responsible for only defence, external affairs and internal security; the general direction and control of Singapore's economy would continue to be vested in the hands of the State Cabinet. Singapore, thus, will be able to maintain its free port status which has brought immense prosperity to it. Further, the Malayan Premier has shown commendable resilience in agreeing to the continuance of the British naval base at Singapore, though Malaya has always refused to join the South-East Asia Treaty Organisation of which Singapore forms a vital link. The acquiescence of Tenku Abdul Rehman in this arrangement has obviously emanated from the Malaya-U.K. Defence Treaty of 1957 under which the consent of the Malayan Government has to be obtained in all cases where the British troops stationed in Singapore have to be deployed in non-Malayan situations.

The formation of the Federation should give a great fillip to the economic development of this region. Malaya is one of the premier producers of rubber and tin in the world. Besides, it exports large quantities of copra, coconut oil and palm oil. Brunei and Sarawak will add to the material prosperity of the Federation because of their oil industry. Singapore's tourist and entrepot trade should strengthen the Federation's economy further. A politically and economically strong Malayasia would be in a better position to counter the menace of Communist China in South-East Asia than its constituents individually can do.

Assam

DEFENCELESS BORDERS?

ONE MIGHT not give any credence to reports from Pakistan of a sinister move there for adjustment of the boundary between East Pakistan and India, but one can hardly ignore the serious threat which infiltration by Pakistani nationals into the border districts of Assam poses. The population of Assam, as disclosed by the recent census, has gone up abnormally by 34.3 per cent, from 8.8 million in 1951 to 11.9 million in 1961. Partly this population explosion reflects the opening up of new avenues of employment, consequent upon the discovery of large oil reserves in the area and the development of new industries, which have

attracted people from the other States of the Union, and partly it may be due to higher birth rate and lower death rate. But there is no denying the fact that there have entered illegally into this border State large number of persons from East Bengal, may be for seeking employment to escape the privations which they would have encountered in their home country. This is apparent from the staggering increase in the Muslim population of the State. The Government of India is collecting details about these illegal immigrants from Pakistan. But unofficial estimates put this figure at over two lakhs upto the middle of 1961.

This large-scale infiltration from East Bengal does little credit to the border authorities on the Indian side. Along with the Chinese incursions across the McMahon Line, it shows how ineffective our border defence in the east is. The reason that India's border with East Bengal, being a long one, would require huge investment if barbed wire fencing is erected is hardly tenable. So is the plea that if army is put in charge it would lend exaggeration to the issue which according to the official circles is unwarranted. Uncontrolled inflow of Pakistani nationals into a border State, especially when it is sparsely populated and contains a proved oilfield of immense value, can create an unhappy situation any day. The misgivings expressed by the Opposition Members in the Lok Sabha last week, therefore, are not misplaced. It is earnestly hoped that the Government would take energetic measure to stop this illegal inflow before the situation worsens. Meanwhile, all efforts should be directed towards screening these illegal entrants and repatriating them to Pakistan.

Constitution

AN ILL-CONCEIVED AMENDMENT

THE PROPOSAL to amend the Constitution to enable the election of the President despite completion of elections to Parliament and State Legislatures in territories snowbound during the winter months, though apparently well-intentioned, has implications which probably have not been fully weighed. Every member of the State Legislatures and Parliament has a right to vote for the highest office in the country and to belittle the importance of this fact in the case of representatives of these hilly districts is something which can hardly be justified. The real complication arising out of the proposed measure may not be clear as long as one single political party has an overwhelming representation in the State Legislatures and the two Houses of Parliament. But the eventuality of there occurring a tie in the voting for the President's election, however remote, cannot be ruled out. The Constitution has to provide for it.

Apart from this consideration, there is another important factor which should be a deterrent to the amendment of the relevant clauses in the Constitution, especially at the present juncture when Chinese are in forcible occupation of a fairly wide strip of the Indian territory in this snowy region. The amendment will give them a mighty handle in their propaganda and misconceived expansionary plans. They can well argue that since we have virtually deprived the representatives of this area of the right to vote in the Presidential election, we have relinquished our claims on the territory occupied by China or claimed by her.

The proper way to complete the elections, which includes the election of the President, in the shortest possible period without creating undue complications is to hold the elections at a time when the ballot box is easily accessible to all the voters in the country. Alternatively, the election of the President may be staggered by about a year after the elections to the State Legislatures and the Parliament.

The World Abroad

INDIA'S UNITY: THE EXAMPLE OF EUROPE

By ODYSSEUS

A WEEKLY COMMENTATOR, who is struggling to interpret the changing kaleidoscope of current affairs—Is Berlin worth risking an atomic war? What will be the effect of the Common Market on India's prospects of foreign borrowing? and so on—is forced by the limited space at his disposal to assume that his readers are broadly familiar with the background history, or the basic principles, of the problem that he discusses.

On the other hand, memories are short, life hurries on, and civil servants, diplomats, business executives, and even commentators, need periodically to remind themselves of the background—to catch up on their reading, in fact.

I take it to be one of this column's jobs to be on the look-out for new books which may be of particular value to busy people with the minimum of leisure. An outstanding example, which has just come across my desk, is "The Challenge of the Common Market" (Blackwell, Oxford, 1961. Paper back. 150 pages Price 10sh. 6d.) by U. W. Kitzinger. For six years, Mr. Kitzinger was one of the senior economists of the Council of Europe at Strasbourg, and he was secretary of its Economic Committee while the Common Market was being negotiated. He has taken advantage of his inside knowledge to write a clear exposition of the mainsprings of the post-war movement towards European unity.

Those who are struggling to bring unity into the sprawling diversities of the sub-continent of India must sometimes feel dismayed and discouraged by the vastness of their task. When will the lion of the Sikhs be induced to lie down with the tiger of Bengal and the nilgai of Mysore, with the crescent moon of Islam glowing overhead? They should be inspired by the story that Mr. Kitzinger has to tell, since the diversities of European races and languages, the clash of regional economic interests, and the persistence of ancient national animosities, were, in 1945, perhaps even greater and deeper than those of India.

THE MEN WHO ACHIEVED EUROPEAN UNITY

The Europeans who, contemplating the physical devastations and the spiritual ravages of war, cried "Never again!" were a handful of lone individuals. Robert Schuman, in 1945 a Frenchman, had been born a German and had served in the German army in World War I. Alcide de Gaspari, an Italian, born a citizen of the Austro-Hungarian empire, had been a member of the Viennes Parliament when Austria was at war with Italy in World War I. Konrad Adenauer, a German, had been the anti-Prussian mayor of Cologne, who toyed with the idea of separating the Rhineland from Prussia after World War I. These three were Catholics. But the stalwarts of the "European idea" came also from the ranks of the fiercely anti-clerical Left, organised in the early post-war years in the Movement for a Socialist United States of Europe. The Belgian Socialist, Paul Henri Spaak, was a powerful individual driving force; he refused to acknowledge defeat after the failure in 1954 to secure the European Defence Community, and doggedly picking up the splintered pieces of European unity, pushed ahead with the drafting of the Treaty of Rome. Guy Mollet, the French Socialist, secured the votes of 100 out of 101

French Socialist M.P.'s in favour of the Treaty. Jean Monnet, father of the French Planning Commission, saw far wider than national planning, and envisaged a free trade area for the coal and steel industries of Europe, from which eventually emerged the European Coal and Steel Community. Today, these and many other individuals must feel a wondering satisfaction as they look round the European Economic Community, and see other countries queueing up to seek admission.

The great movements of history do not spring, fully fledged, out of the air. They germinate in the minds and hearts, and come to fruition from the determination of individuals. That is why I feel that all those concerned to combat separatist tendencies in India should be encouraged and inspired by Mr. Kitzinger's little book.

From the beginnings of European Economic Community, Mr. Kitzinger guides us to the Rome Treaties, through the Common Market's challenges to GATT, to national agricultural policies, and to the products of North America, the UK, and the Commonwealth, and then on to analyse the problems of the EEC's developing relations with Africa and Asia.

At the present time, Africa is divided into separate preferential systems along the old colonial frontiers. For many tropical products, especially for cocoa, coffee, and tea, there are now two separate preferential areas in Europe: the UK granting preferences on Commonwealth imports, and the EEC on imports from the associates of the Six. In addition, there are countries, such as Liberia, Ethiopia, Tunis, and Morocco, left outside both preferential areas. This situation is as much a political as an economic anomaly.

WORLD SOLUTION FOR A WORLD PROBLEM

As part of various proposals to enable the UK to join the EEC, it has been suggested that the EEC and the Commonwealth should extend their tariff preferences to each other and give their respective associates joint preferences. This would naturally be opposed by India, Asia, South America, the USA, Japan, and GATT. Nor would it be in the interests of the free world as a whole.

The time has come to ask what the purpose of tariffs on tropical produce is. Only in a few examples, such as vegetable oils, can a tariff be held to protect domestic interests. At a time when the industrialised countries are trying to find capital to help the developing countries, it is merely self-defeating to impose levies, which not only distort the consumer's choice but, above all, restrict the amounts that the developing countries can earn for themselves. The German consumption tax on coffee, for example, in 1959 alone brought in \$180 million—almost the amount that Germany is due to contribute to the European Development Fund in the whole first five years!

This gives point to the worldwide solution proposed by President Kennedy, that all industrial countries should abolish tariffs, consumption taxes, and quotas on tropical produce. There are signs that the European Economic Commission would welcome such tariff disarmament. But since it implies abandoning discrimi-

nation in favour of former French territories, it must reckon with opposition from France and the present associated territories. This opposition could be appeased if at the same time other measures of aid for tropical producers were instituted.

Because, after all, tariffs and tariff discrimination are only minor factors in determining the export income of tropical producers. As India knows only too well, the world level of commodity prices is far more important. During the year 1958, the main tropical products, whose total exported value was \$25,000 million were subject to average price fluctuations of 23 per cent. In the same year, the USA, the UK, and France, between them, gave investment aid totalling \$3,000 million to the Asian and African countries, which are the main producers of tropical goods. A drop of 12 per cent in the average price is thus enough to wipe out the entire flow of development aid into the countries.

Stable prices for tropical products must be the first concern of all interested in the political stability of the tropical producing countries. The world's free economic market is, in fact, the market of the free political world. By buying up half of Guinea's banana crop for several years ahead at a favourable price, the USSR won political sympathies in a way which vast gifts of capital might not. A rise in the world market price could, of course, make the deal look less attractive. But the USSR, with its centralised buying, can give better terms to any country willing to form political links with

her. The Communist bloc, at the present stage of improving its living standards, may soon turn out to be the world's fastest growing market for tropical products. No Western country would wish to try to prevent tropical producers from making any trade agreements with the USSR that they like, but Mr. Kitzinger rightly points out that the West should be keenly alive to the need to be itself also an attractive trade partner.

This is a problem which the Six, even in collaboration with the UK market for tropical products, cannot solve by themselves. Any solution depends on American co-operation, and this may well be one of the most important tasks of the new Organisation for Economic Co-operation and Development. The US Government has suggested that if both the Six and the Commonwealth dismantle the protection in favour of their respective tropical producers, the USA could contribute to a general compensation fund to help the tropical producers to stand on their own feet despite the loss of special protection. If agreement is reached on the minimum that each consuming country would pledge itself to buy, and the maximum that each producing country would sell, the producers could draw on the compensation fund in lean years and pledge themselves to replenish it as prices improved. The practical difficulties of such a solution are enormous, but then so were the practical difficulties which faced, in 1945, the courageous individuals who, within fifteen years, had overcome them and seen their dreams come true in the creation of the European Economic Community itself.

*The European Scene***FRENCH PLAN APPROVED**

From Our Special West European Correspondent

PARIS, November 25.

FRANCE'S "fourth plan of economic and social equipment" was definitively approved by the Cabinet this week, after being voted last week-end by 130 against 15 (with 42 abstentions) by the Economic and Social Council, a sort of third House of Parliament nominated on corporative principles to represent professions and economic groups. Its application is thus assured as from the first of next year, whereupon France's national objective will be a 24 per cent expansion of her economy by the end of 1965. This Plan has benefitted from much more publicity than its predecessors; one may say "benefitted" even though some of this publicity was ill-informed, indeed misleading, because the main thing with a plan in a free society is that its aims should be as widely known as possible. A plan that might remain totally inapplicable if it were left to a government hampered by democratic rules can become a reality and a success if enough people take notice of it and freely adjust their projects to its forecasts. For that, they need to be told about it, to be induced to think about it, and to look through it for the few lines of text that concern their own particular business or their own region. Publicity that secures this is welcome, even if it leaves private individuals with a false idea of the role and efficacy of the plan in the nation's life in general.

The extra publicity given to the Fourth Plan in France itself is in line with the style of the Gaullist regime, which prefers the enunciation of long-range ambitions to day-to-day negotiation with parliamentary lobbies. Deputies naturally conceive the nation's development in budgetary terms, for the annual Finance Bill is the big event of their year; anti-parliamentarians prefer a plan which is written outside parliament and which, if it appeals directly to economic groups over the heads of their deputies, can serve as a limitation on budgetary innovation. The extra publicity secured by the Fourth Plan outside France had other causes. France's economic recovery, which began in 1951 and was stabilised in 1957-58, became known just when the Fourth Plan was being framed, and many people seem to have jumped to the conclusion that there was a cause-and-effect connection between the plans and this nation's prosperity. That would be exceedingly difficult to prove, and as far as I know no French economist or administrator has ever made such a claim. It would be easier to argue that some measure of co-ordination of investment plans and some sort of long-term wage policy were essential for a modern democracy, which wanted to do too many things at once, all of them entailing investments that take several years to mature. Planning, then, would be less "the secret of success" than just one of the things an expanding democracy must do to avoid inflationary dispersion of effort.

Nevertheless, the idea that planning is the secret of recent (and insecure) French successes has got abroad, and is not likely to be diminished by the despatch of a British mission to Paris lately to study French planning techniques. This "homage of Keynes's disciples to the descendants of Colbert", as Raymond Aron has called it, does not mean that London now believes that the fount of economic wisdoms is by the Seine. Indeed, writing this week from England, Aron suggests less flattering reasons: French expansion, just because it is less spectacular than West German or Italian, seems a more reasonable ambition to Britain's conservative leaders; and French success seems less explicable than the German and Italian miracles, which British opinion has come to take for granted. In other words, there is the feeling on the other side of the Channel that

if the French can do it, then surely anyone can; and since British thought was already turning to planning methods for the same reasons as Belgium and a number of other countries, there is no harm in looking at French experience.

This very reasonable attitude is far removed from the curious enthusiasm for French planning methods that has been shown in some places, and not least in India, this year. No one here has been tempted to imagine that France has discovered some new secret, or even a firm formula, for planning expansion. On the contrary, as has several times been emphasised on this page, French planning techniques are in constant evolution; for a time this year they even seemed to be on the verge of radical revision. They are interesting precisely for their suppleness and empiricism, their willingness to follow rather than dictate the evolution of the economy, more than for their "success". After all, the Third Plan that is just ending (1958-61) set a "target" of a 4.9 per cent annual growth rate (against more than 6 per cent in the Third Plan) but this could not be attained in the first two years because of the payments crisis and deflationary reform, so a new interim plan was written whose objectives for this year do not seem likely to be reached. The four years will show a growth rate of barely 4 per cent, against the 4.9 projected in 1958.

For the target-setters of rigid national planning this would count as a failure, but because no one conceives planning in that spirit here, it does not diminish attachment to liberal planning. The targets of the Fourth Plan have been set in the knowledge that similar upsets are perfectly probable; if they occur, interim targets will be specified and no one will think it tragic if even they are not attained. The important thing is to co-ordinate efforts as one goes along, in order to make the best out of circumstances over which one cannot pretend to have control. The number of circumstances over which France has no control has notably increased in recent years, with the return to freer trade, convertibility of currencies and the like. To hold one's own in these conditions requires a constant discipline, and it may be that Plan targets will have to be sacrificed to the need to hold prices, protect reserves or increase exports. But given a willingness to revise Plan targets in accordance with changing circumstances, there is no contradiction between planning and the discipline required by the more open Western trading system; indeed an economy that seeks to plan the best use of resources and the most equitable division of gains can, if it attaches no sacred importance to initial targets, make easier adjustments to unstable international trading conditions. Nonetheless, planning naturally tries to reduce the number of unknown and unstable variables in the domestic field, and this effort must extend to the international sphere: French planners must press for some sort of six-nation planning in the Common Market. Mere propaganda "targets" such as the Organisation for Economic Co-operation and Development has just assigned to the Western world will not serve; there must be some effort to co-ordinate outlays in basic industries or at least to harmonise inflation rates. There is as yet no sign of this in the Common Market, and this is the biggest uncertainty that presides over the launching of the Fourth French Plan.

One would be much less inclined to believe that France had solved the problem of planning in a free society if one had followed the deliberations last week-end of the Economic and Social Council, where the above-mentioned vote took place on the Fourth Plan. The division of opinion was fairly profound and the

criticisms numerous. Admittedly, the opposition of 15 adverse votes was composed almost entirely of the delegates of the Communist-dominated CGT trade unions, the Communist line being outright rejection of any democratic planning. Even then, this vote provoked a crisis in the party ranks, for M. Pierre Lebrun, secretary of the CGT, resigned in protest against the Communists' refusal to so much as look at a Plan produced by a democratic regime. The large body of abstentionists was composed of private employers; the majority came from the democratic trade unions, the nationalised concerns, agriculturalists, artisans, the co-operatives, representatives of the middle class and of family organisations, and the independent personalities nominated for their competence. All the criticisms expressed concerned the inadequate power of compulsion left to the planners in regard to laggard enterprises or administrations that failed to meet their targets. Only one orator said explicitly that French planning should stay at the "indicative" stage; all the rest openly urged, or tacitly accepted, the idea of making the plan "imperative", at least in some respects. Notably, there was a widespread unwillingness to leave the division of increases in national revenue to "the market"; some positive intervention was favoured to ensure that the nation's planned profits were distributed in accord with some political notion of equity.

These suggestions concerned, of course, only gains: actually achieved increases in national revenue. There was no egalitarian demagoguery, and no inclination to distribute profits before they are earned (this being a sure way of never earning them). But it seems that once a democracy acquires some confidence in its ability to plan expansion, it immediately begins to think of planning a more equitable distribution of the benefits

of that expansion. And once it has the experience of several liberal plans, and sees how general expansion can be held up by laggard sectors, it begins to toy with the idea of obliging defaulters to keep up with the rest of the team. Some may see in this the beginning of an illiberal trend, which they will blame on the practice of planning itself. But as long as the general level of expansion is set by the majority of free economic agents, and not dictated by a commissariat of planners, and as long as progress is being brought about by a free-market economy, it is not necessarily a departure from the contemporary conception of liberalism to exercise democratic authority to make certain corrections and adjustments.

None of this strain of thinking is reflected in the text of the Fourth Plan, which has only the methods and weapons of the earlier Plans. But I think it very likely that it will be reflected in the implementation of the coming Plan. The Council gave notice that it would keep careful watch over the Government's own activities, especially in agricultural and community investments, because the inefficiency of the administration itself has been a major cause of Plan shortfalls in the past. And it demanded a bigger say in the periodic reviews of the distribution of the national revenue. Thus the new Plan is the same sort of project on paper but it starts out in an atmosphere of greater determination to enforce targets and to spread gains equitably. Since foreign interest in French planning was fanned this year by the reports that it was achieving notable economic progress without the least disturbance of the market mechanism, without the use of constraint in recalcitrant sectors and without socialist intervention in income distribution, there is the danger that foreign opinion will be one jump behind French opinion, which is showing signs of evolution on just these points.

10
crore
tyres
plus...

Tyres for the Boeing will soon be added to the very wide range of products manufactured by Dunlop at Sahaganj. Up to now, this factory has turned out more than 10 crore tyres in various shapes and sizes, and for various purposes. The production of bicycle rims began in 1946 and that of Dunlopillo latex foam in 1951. In quick succession followed the manufacture of industrial rubber products—Vee belts and Transmission belts, Conveyor belting and Hoses. For the last two years, Sahaganj has been manufacturing a whole range of domestic and industrial adhesives.

The appetite of our present economy, moving towards "take-off" is insatiable, and the Dunlop Sahaganj factory is constantly expanding its range of products not only for transport, but for industry, agriculture and the home.

Briefly, this is the story of the growth of Dunlop, Sahaganj. With more time behind them, with more working experience, with wider research facilities, and with far-flung distribution, Dunlop offer the automotive world, the industrial world, the world of our own homes, clubs and gardens, the most universal and reliable service.

MORE PIPES to meet the nation's needs

With the addition of a second plant at the Kulti Works of The Indian Iron & Steel Co. Ltd., the production of spun iron pipes has increased from 60,000 to 150,000 tons per year. Besides helping to satisfy India's growing demands for large diameter pipe mains, the increased tonnage saves India many crores of rupees annually in foreign exchange. Employing latest techniques, the Kulti Works of IISCO is the first to produce 3" to 30" diameter spun iron pipes in the country.

Our West German Letter

HIS MAJESTY—THE WORKER

From Our West German Correspondent

BONN, November 29.

THERE is the tiny little town of Beilstein in the Federal State Baden-Wuerttemberg, most certainly unknown to majority of Germans, which suddenly saw itself in the news. The reason for it: the town-clerk was looking for a charwomen to clean the tiny little town hall and its adjoining rooms. When a public notice in the tiny little gazette to this effect did not have the desired result, the town-clerk published another notice which caused at the same time an uproar and made him the laughing stock in the press beyond his township. He said in this notice that the usual cleaning utensils were to be found in front of his office and he would not receive any female visitor between 18 and 50 years who had not cleaned before some of the rooms for at least 30 minutes. We shall not go into details, it might suffice to say that the wives of shopkeepers and craftsmen told the town-clerk that they were cleaning shops and workshops themselves and suggested to him that his wife and daughter should do likewise. At any rate, this incident shows the present situation of the labour market in Germany — there is a tremendous shortage of labour everywhere. And as to charwomen, they prefer to go to factories where they have a five-day week, proper leave, better pay etc. We shall come back to the problem of domestic servants.

You enter a hotel: the receptionist is from Morocco, the waiters of its restaurant are from Italy, the room maids from Spain, and the boots from Turkey — a kind of "UNO pocket edition". Lakhs of foreign workers, about five to six, in Germany are happy that they have escaped the calamity of unemployment in their home countries. Their salaries are equal to those of their German colleagues and so are all the facilities like paid leave etc. Now that the Christmas holidays are approaching, the German Railways have arranged for special trains to bring these people to their dear ones. As they cannot go all at the same time which would upset the production programme of factories, mines etc., the first batches have already started. The other day television went to cover the departure of one such train. An Italian worker told the interviewer that he was earning 700 DM a month, of which he kept about 100 DM and sent the balance home. He hails from Sicily where his family needs about another 100 DM a month and so 500 DM go to the savings bank. Although this example will not hold good for all, one can safely say that foreign workers are definitely earning higher wages here than in their home countries. From experience one has learnt to provide them with more comfortable accommodation than it had been possible in the beginning, and the German radio stations have started to send special programmes in their respective languages.

THE PROBLEM OF FOREIGN LABOUR

Still, there is a fly in the ointment. It has happened not once but many a time that a foreign woman with her children turned up in a manager's office telling him that she was going to stay with her husband. She had, therefore, to get proper accommodation or she would take him home straightaway. The manager is not an ogre and agrees that families should not be separated. He is in a dilemma. He has not even or not yet sufficient flats or cottages for his German workers. Yet, the foreign worker who came completely unskilled to his job has now learnt the trade and has become a

first class man. To train him and paying his passage to and fro has meant an investment of quite a lot of money. So, our manager would not like to lose him. What to do? These are problems which have not yet been solved.

Not only West Germany needs foreign workers. In Switzerland, for instance, which has a population of 5 million, not less than 550,000 foreign workers, amongst them four lakhs from Italy, are employed. Recently, Italy's Minister of Labour, Signor Fiorentino Sullo, demanded from the Swiss Government that his countrymen should enjoy the same facilities as in their home country, in respect to social insurance, family allowances etc. Furthermore, the Minister asked that the right of domicile should also be granted to the families of the Italian workers who were separated from their wives and children. As to the latter, schools where they could be taught in their mother-tongue should be established, the more so as Italian is one of the three acknowledged languages in Switzerland. In case the Swiss Government did not show any willingness to comply with these suggestions, the immigration into Switzerland, the Minister announced, would have to be restricted or even stopped, which means upsetting the apple-cart of the Swiss industry.

ENI CALLS ITALIANS BACK

In this context a news item from Luxemburg is quite interesting, the more so as it has a slight humorous touch. Italy's famous State-owned ENTE NAZIONALE INDROCARBURI Oil Group (ENI), which includes chemical and other industrial undertakings, recently advertised in Luxemburg newspapers jobs for Italian workers in Italy! Nearly 27 per cent of Luxemburg's labour force is composed of foreigners, and if Italian workers there prefer to accept ENI's offer, it can have a devastating effect on the industry of this small but highly industrialised country. The majority of foreign workers in European countries when they arrive are unskilled men, but many of them receive a good training and there is a great chance that they will find suitable and comparatively well-paid jobs in Italy's prospering industry. But it is also known that Italian workers who returned home from Germany for good because better conditions had been offered to them, have now only one desire — to return to their German workshops. At any rate, the race after foreign workers will be won by the European country which is treating them best. About a year ago, it had already been suggested in a "West German Letter" of this periodical to consider the employment of Tibetan refugees in European countries. The climate would be more suitable for them than in India and even the language should not prove a handicap as one can see from the example of the other foreign workers. The Tibetans would not even be the first Asiatics in Europe as already Japanese are working in German mines.

Intimately connected with the lack of labour in West Germany is the mobility of labour, i.e., workers are inclined to change their jobs if they think they can improve their conditions. But from the employer's point of view the situation looks bad. In a statement of the Union of German Employers Associations, it is said in this connection that the expenses for training new men are tremendous. In 1960 six million labourers and employees (engineers, foremen, clerks etc.) changed their place of work. The expenses for advertising for and enlisting as well as training new men amount to

1,000 DM per head which in fact means a loss of 6 billion DM in one year to the country's economy. Besides, with this high rate of mobility the continuity of production is also bound to suffer. But who will stop in a free country, a workman from looking for a better job?

The five-day week is gaining more and more ground in the Federal Republic. According to the latest observations, 52 per cent of all employees are working in undertakings with a five-day week. Some factories which were closing down on one or two Saturdays a month, have now generally switched over to five working days. It is generally not the big enterprise which has introduced the shortened working time but mostly the middle-sized or small-scale factory. In 70 per cent of these two categories the chimneys do not smoke on Saturdays.

THE RIGHT OF CO-DECISION

Since slightly more than 10 years workers in the coal and steel industry have enjoyed the so-called "right of co-decision". The question whether this right has satisfied expectations is now being discussed by the trade unions. Employees have since then their representatives on the boards of directors and one of their delegates is attached to the management. One fact is certain. It is that many of the apprehensions which were alleged when this reform was introduced have proved groundless. The experience of this decade has shown that these representatives, mostly trade union leaders, did not close eyes to the necessary measures which were in the interest of the enterprise to keep it competitive. The employees have generally elected members who had a sound education and a good knowledge of business as well as of technical matters. The trade unions now suggest that this active participation of employees should also be introduced in the other branches of industry. Before the employers of the coal and steel industry have not expressed their views one has to wait whether this "right of co-decision" could be called a success. But it seems that industrial leaders will remain silent for the time being. There is still a boom in Germany and they would not like to disturb their relatively good relations with their employees by a perhaps unpleasant statement. The final demand of the trade unions in this regard is the further democratisation of the industry in order that their members who are now, as they say, "industrial subjects" become in future "industrial citizens".

In a similar direction points another demand of the trade unions. They want a change of the law which regulates the composition of chambers of commerce and industry; in fact, they demand their representation in these corporations. But they obviously overshoot the mark by interpreting the construction of these chambers as "the outcome of haughtiness to decide alone over public undertakings". Finally, the trade unions ask that a ninth and tenth year should be added to the primary school education as, according to their views, boys as well as girls do not show the indispensable maturity when leaving school. Furthermore, the training methods as well as the prototype-workshops have to be modernized to make the apprentice fit for his job.

THE OVERWORKED HOUSEWIFE

There are only a very small number of people who can afford to keep a housemaid who now-a-days demands at least a limited number of working hours per day, one or two free afternoons per week, paid leave, an airy room with radio if not with television etc. One has worked out that keeping a housemaid amounts today, including food, social insurance etc., to about 400 to 500 DM a month. An overwhelming majority of housewives who have even the greatest difficulty to get a charwoman for a couple of hours perhaps twice a week, are overworked. Some German travelling agencies offer now for the next holiday season (1962) bungalows with a serving housemaid in Spain and Italy where there is still considerable unemployment. The price per person and week in such a bungalow comes to 35 to 80 DM (according to the number of rooms) which includes not only the wages for the housemaid but also the charges for electricity, water and gas. In case of language difficulties between the guests and the housemaid, an interpreter of the travelling agency will assist to overcome them.

Still, there are families who simply cannot afford to go to Spain or Italy. But their housewives are equally overworked and need rest very badly. Here the Catholic Church has created a very wise and useful institution. In special seminars, female "family helpers" are trained for the purpose of substituting the housewife for about four weeks. And the housewife is then sent to a health resort where special homes (now more than a hundred) with all comfort are waiting for her. The whole expenses for this scheme which is spread all over West Germany are paid by charity associations.

Economic Report from the U.S.

BRISK ECONOMIC ADVANCE

By GUY SIMS FITCH

WASHINGTON, November 22.

AS anticipated, what began as a year of recession is ending as a year of brisk economic advance for the United States. That advance has been underway since the early months of 1961, and most of the experts, both government and private, confidentially expect the U.S. economy to continue its vigorous expansion through 1962. Probably the best and most comprehensive measurement of the U.S. economy's 1961 performance is the gross national product (GNP), or total output of goods and services. For 1961 as a whole, the GNP currently is being estimated at about \$520,000 million. This represents a solid three per cent gain over the 1960 level. This yearly comparison, however, is not entirely representative of the basic trend or of the magnitude of the change that has taken place in the economy. The fact is that the GNP rose by some five per cent from the first to the third quarter of 1961, and the rise is expected to exceed seven per cent in the fourth quarter. This would bring the total output of goods and services to a year-end annual rate of \$540,000 million or more. The improvement in the economy has been fully reflected in the incomes of American consumers and businessmen. From January to September, the personal income of all Americans rose at an annual rate of more than four per cent—or about \$50 after taxes for every man, woman and child in the United States. Indicative of the continuing expansion, the income rise picked up even more strength in October, reaching an annual rate of \$425,000 million, nearly \$4,000 million above the September rate.

Business earnings, always much smaller than consumer income, also have picked up. By the third quarter, corporate profits after taxes were up 20 per cent from the \$20,000 million annual rate of the first quarter. Along with these income gains have come significant employment increases. While the labour force was gaining two million people from January to October, the number of people employed rose by 3.4 million to a new high in October—67.8 million. Unemployment in October was down to 3.9 million from January's 5.4 million. On the production side, the physical volume of industrial output has increased by more than ten per cent during 1961 to 113 per cent of the 1957 average. Construction, a key industry, is expected to hit a new annual high, with new building valued at \$56,700 million. These gains in production, income and employment have been accompanied by a marked stability in price levels. Wholesale prices actually fell by one per cent between January and September, while consumer prices have risen only seven-tenths of one per cent.

Looking ahead, Government experts anticipate that the vigorous and essentially non-inflationary economic advance will continue, with the GNP reaching an annual rate of \$565,000 million to \$570,000 million by the middle of 1962. Most private economists tend to agree with this view. By and large, a comfortable expansion in general business activity is foreseen, with the majority of experts anticipating that the GNP will average out at about \$560,000 million for 1962 as a whole—which would represent a gain of seven per cent over the estimated 1961 level. Much of the vigour and speed of the current economic recovery is founded on the prompt measures taken by the administration

of President Kennedy and by the U.S. Congress to expand demand and strengthen the markets for goods and services. Among these measures were: extension of unemployment compensation beyond normal limits; early payment of income tax refunds; speed-ups in Government procurement and construction; financial aid to distressed areas affected by changes in industrial patterns; and an extensive housing programme. These actions, which entailed sizable increases in Government outlays, reflect the administration's philosophy that the Federal Budget is a positive and flexible instrument to be used in different ways at different times for achieving high employment with stable prices.

None of this should be taken to mean that the Kennedy Administration is completely satisfied with the U.S. economy as it stands today. While notable progress has been made during the past year, administration officials are cognizant of the problems that remain in meeting the challenges of a dynamic, modern economic society. Unemployment must be reduced further, the business rise must be maintained, and the nation's long-term economic growth rate accelerated if the U.S. economy is to reach its full potential. The important consideration in all, this is that the Kennedy Administration is taking a hard and sober look at the economy and its requirements, and is prepared to take the steps necessary to promote and sustain a high rate of non-inflationary expansion.

Special Article**THE AVRO-748 : A CRITIQUE**

THE successful first public flight of the Indian-built Avro-748 on Monday has naturally for the time being obliterated all the criticism which has figured over some months on this particular project. There is, undoubtedly, a feeling of great elation that the plane has proved worthy so far as its initial tests are concerned. The fact that a good deal of the machine was imported does not detract from the fact that our engineers at Kanpur have done a good job of assembly in an operation which, by any standards, is complicated in a country insufficiently equipped with personnel in this field. It is right, too, that on the eve of the General Elections the Prime Minister should claim that this is a Government success. It certainly owes a great deal to the inspiration given to it by the Prime Minister and the Defence Minister. No one would wish at this hour of elation to deny that there was courage and daring in the manufacture of an aircraft which has yet to enter airline service in Britain or elsewhere. Indeed, it is believed it has not yet received its certificate of airworthiness in Britain, though it is believed this is only a question of time. It is not in any way to detract from the substantial performance that has been made that "The Eastern Economist" presents some reflections on the whole project now to be seen in somewhat altered perspective.

Some competent critics would say that this is the wrong design for an aircraft in India. The alternative which was suggested by Lockheed, however, was equally unproved, and between one paper design and another it is difficult for the layman to come to a conclusion. It is a fact, however, that the aircraft now in flight is somewhat different from the paper design and it has been rumoured that it has collected a substantial additional weight which newspaper reports said at one time was as much as 3,000 lbs. If this is true — and official sources have admitted some significant addition to weight — then its seating capacity, as a civil aviation aircraft, would have been considerably reduced and, therefore, it would seem that the contention that it would be non-commercial as an aircraft, might well be proved. The country is certainly entitled to know exactly what are the facts on this point. Does the success of the Ministry of Defence finally disprove the Department of Civil Aviation's fears, or is there something to be said on both sides? If there is nothing in the previous criticisms, surely the point that there should be a single aircraft serving both defence and civil needs could be reconsidered. On the other hand, if it is wholly unsuitable for commercial operation, has much been gained by an aircraft which is likely to be very much more costly than one manufactured abroad? This is inevitable in view of the production schedule, which seems to be only 12 aircraft in 1963, 18 in 1964 and 36 in 1965. It would also be extremely doubtful, in view of the delays which have attended the first prototype, that the schedules laid down would be even approximately achieved. It would seem, therefore, that this is still commercially a dangerous loser.

There remains also a disturbing question as to whether or not, in terms of comfort and other advantages, such as speed and turn-round, this propeller aircraft would work suitably with other aircraft in the

coming jet age. The extreme distaste with which most passengers now view travelling in a Dakota is partly connected with speed and comfort, but it is also connected with the new psychology which is associated with "modern" travel in the jet age. Some would say, notwithstanding its advantages in terms of landing space, this is an aircraft which is not very suitable for the future. Most of its technical features are derived from the past. It is of no consequence to the civil user of aircraft that his aircraft can take off in a very short space. On the other hand, it might have significant defence advantages which should not be ignored, but why should passengers who have landing space be denied jet-speed and convenience to suit a military contingency?

After the technical issues have been exhausted, there is the difficult question as to what India has gained in terms of the future productive capacity. While great credit should go to the skilful technicians and workers of the Indian Air Force who built the first aircraft, one wonders whether India should dissipate the efforts on her senior Air Force personnel while she has not fully accomplished its major task of defence of India. By diverting senior officers to the manufacture of aircraft, which cannot be considered a vitally strategic role, — since in any case, the number of aircraft produced is so insignificant and these aircraft do not at the present time live without foreign dependence — are we not weakening ourselves? In fact, what has been achieved is merely a licence from the United Kingdom company and the whole of their design and manufacturing units are still made in U.K. from which the great majority of parts still need to be taken. In other words, there is no strategic advantage in deploying technical men of the air on a project which leaves us still terribly dependent on the United Kingdom for supplies and design personnel. We have gained nothing, it seems, but some prestige.

This is not the time for a detailed audit to be made, because a prototype must necessarily always be much more costly than an aircraft produced on production basis. But it is still necessary to see to what extent allocations made on this project have been exceeded within the audit year. The fact that the aircraft has taken six months more than was originally scheduled suggests that it has greatly exceeded its costs in building. This would not matter if there were great savings to be found in other respects. This does not seem at the moment to have been established. All in all, one, therefore, looks upon the flight of this aircraft with mixed feelings. Patriots would like to think that it was a breakthrough on both the technical and strategic fronts. Unfortunately, it is neither. It is, however, a proud beginning, and it may be that after tests have been made, the right aircraft for civil aviation will be found. Almost certainly the answer is that the Avro-748 is not that aircraft, but the country can well be allowed to test all things and hold fast to those which are good. It is probable on balance that, for their respective purposes, the Ministry of Defence and the Department of Civil Aviation have both seen right. For the country as a whole it is not so easy to judge, though it is likely that the I.A.C. was right to refuse this aircraft for its purposes.

THE BUSINESS WORLD

Argentina's Monetary Stabilization

By J. VIJAYATUNGA

ARGENTINA is one of the richest countries in the world. But much of this natural wealth still remains to be exploited. Still, her population of 20,959,100 has one of the highest standards of living. The per capita income is \$700 a year. All this would seem to indicate that the Argentinians have all that they need. The fact, however, is that they do not. This fact has never been realized so acutely by Argentinians as under the Government which was formed when Dr. Arturo Frondizi assumed office in May 1958, having been elected by a sweeping majority in the February 1958 general elections.

Argentina in 1958 was on the brink of bankruptcy. From 1946 to 1955 (the period of the Peron regime) by a series of exchange controls and multiple exchange rates the budget had been manipulated without the people at large becoming aware of the danger they were heading to. There were high wages all right. The descamisados (shirtless ones) were getting State relief and were getting used to a paternal government which gave them assurances. As increasing demand for exports was met by inflation. But actually the country's monetary reserves were strained to the utmost and Argentina's international credit was exhausted.

Argentina has always had a neutralist policy and remained neutral during the first world war. But against the general wishes of the Argentinians, the regime adopted an anti-American, pro-Nazi policy which resulted in America stopping her imports from Argentina and in Argentina becoming isolated economically. So the Peron regime resorted to the one device left—to inflation. Inflation has been defined as "excess liquidity pushing prices upwards". The excess liquidity resulting from higher export proceeds is a controllable form of inflation. But deliberate inflation on the part of a government for the purpose of creating demand and employment, for providing cheap capital for industrial development, is a kind of inflation which pushes a country headlong down the precipice. Argentina had reached this stage by 1955. The Argentine peso had devalued to a fantastic degree. Taxes soared incredibly. The worst phase was after 1951 when Peron having got the Constitution amended to enable him to be re-elected (according to the Argentine Constitution of 1953, a President or a Vice-President could not be re-elected to a second term while yet in office) gambled more recklessly than ever with the country's economy. The situation reached a climax, and powerful elements in the army, navy, and air force took over in a bloodless coup, the "dictator" being forced to leave the country. In the general elections which followed Dr. Arturo Frondizi, the candidate of the Union Civica Radical Intransigente Party, was elected President.

No Argentine President assumed office under worse aspects. The treasury was empty. Almost the entire reserves of the social security systems, an estimated 300 million dollars had been taken away by the ex-President. The farms had been deserted and the "shirtless ones" had flocked to Buenos Aires lured by the assur-

ance of doles and security. The foreign exchange resources had been exhausted in buying luxuries from Europe—Paris gowns and costly European and American cars. Such wealth as remained was owned by a few families who preferred to invest it in European securities rather than investing it in Argentine industry.

Frondizi brought down wages: he abolished arbitrary price controls: he did away with social programmes which had been foisted upon the workers to lull them into false security. He flung a challenge to Argentine industrialists. Argentina, though an oil-producing country, had to import petroleum which led to a deficit of 300 million dollars in her balance of trade. It was more than an economic problem, according to President Frondizi. Dependence on a foreign country on such a vital item as petrol was a slur on Argentina's national pride, its very sovereignty. Frondizi had given much thought to the subject. As far back as 1954 he had published a book "Petroleomy Politicia" (Petroleum and Politics).

So within two months of his taking office he called a meeting at Government House, Buenos Aires, and explained the implications of the oil problem both in terms of revenue and in prestige. He urged Argentine industrialists to exploit to the utmost the country's oil resources. The State, he assured them, would give them every support. "The Battle of Oil," as it was called, was launched.

This year (1961) the President was able to announce success of the scheme. Speaking at Comodoro Rivadavia, the South Atlantic city, which is one of the chief oil-fields, President Frondizi said: "The battle is won in such a measure and to such an extent that this victory will definitely constitute the starting point of a bright future in the economic life of the country."

Figures substantiate this claim. According to Yacimientos Petroliferos Fiscales (YPF), the State Petroleum Board, in 1957 Argentina produced 5,400,000 cubic metres of crude oil. In 1959 production reached 10,200,000 cubic metres. By the end of 1961 a target of 15,000,000 cubic metres will be achieved.

In terms of money, this means that whereas in 1957 Argentina spent 300 million dollars on foreign petrol, in 1960 she spent only 124 millions dollars, and during the first five months of 1961 only 16 million dollars. In the course of three years of Frondizi's term of office more than 250 million U.S. dollars have been saved. Of the total estimated consumption of petroleum in Argentina, YPF now accounts for 58 per cent, while Shell supplies 20.1 per cent, Esso 16 per cent, and smaller companies 5.9 per cent. Argentina expects to be self-sufficient in this vital product within the next few years.

Under the impetus given by the Frondizi Government Argentina has become alive to the immense potentialities of petroleum by-products. According to

Dr. Roberto Nobel, Editor of the progressive journal 'Clarín', "In the United States there are 200 processing companies and 400 industrial plants, from which stem some 16 million tons of petroleum by-products, with a net worth of over 4,200 million dollars, a figure which represents 55 per cent of the American chemical industry.

Oil production was the first major industry to which the Frondizi Government turned its attention. But iron, steel, coal, thermal and hydro-electric schemes, roads and highways—all these are now priorities in Argentina's monetary stabilization and economic development plans. Argentina has vast deposits of every kind of mineral—coal, lead, silver, zinc, tin, iron ore, gold, titanium, copper, selenium, radioactive ore, sulphur, wolfram, baritine, fluorite, beryllium, chromium, mica, borates etc. The exploitation of these and the creation of heavy and light industries is on the national development plan of Argentina. They are not long-term projects. The pace has been so accelerated that some Argentinians feel that with their temperament for getting things done, they might achieve their targets very quickly.

The immediate task that President Frondizi and his advisers had to face was to curb the social unrest and restrict the economic insecurity and above all stop inflation, so that by building up a national reserve foreign capital could flow in. The Plan for Monetary Stabilization and the Plan for Economic Development in terms of the greater plan of national economic expansion were launched simultaneously.

To begin with, the exchange market was unified with a single rate of exchange for the peso, free and fluctuating according to supply and demand. Import licences were abolished, credit was limited to financing imports, prices were brought down and subsidies removed (in 1959 there was an increase of 100 per cent in the index price), and retrenchment in public administration was drastically adopted. By freezing vacancies, pensioning off government servants who were statutorily dispensable, and by making "only those appointments that were absolutely essential" the Government effected great savings. The Frondizi Government created such an atmosphere of stability that international credit was forthcoming and the Argentine peso picked up and has remained at the rate of 83 Argentine pesos to the American dollar. Gold and foreign exchange reserves increased from 179 to 703 million dollars during the last two years. The re-establishment of confidence in the Argentine peso has been a considerable achievement. Thus the budgetary distortions created by the previous regime have been set right and the heavy public indebtedness reduced, and investment in key sectors given an incentive.

How all this was achieved may not be appreciated fully unless we know that at the beginning of 1959 the gross foreign exchange reserves of Argentina amounted to only 130 million dollars, equivalent to one month's imports. But the confidence ensured by the Frondizi Government was such that a package deal with the IMF, the U.S. Treasury, the Exim Bank, the DLF, and a group of New York banks was readily available. In 1960 conditions were easier and, in all, credits to the tune of over 500 million dollars were obtained.

With the restoration of the Argentine peso to its normal value, foreign investments began to flow in. As a result of Frondizi's state visit to the U.S. in 1958 and through agreements reached, nearly 500 million dollars of American investments flowed into Argentina. Dr. Frondizi has plainly stated: "In Latin America we are short of capital. This is true and we are prepared to obtain it from abroad. But if it is true that we must look to other parts of the world, it is also true that we must turn our eyes to our own soil."

Argentina's two-century-old trade with India is still maintained. Argentina imports 20 million dollars worth of goods, chiefly jute and hessian, from India annually. India has serious competitors in Pakistan, Thailand and Formosa, all of whom offer competitive terms. India's imports from Argentina amount to only 50 thousand dollars a year. But whichever way the trade balance between the two countries turns, we have much to gain from closer relations with Argentina.

We must also remember that Argentina does not think solely of her economic prosperity. Argentina thinks in terms of Latin America and this has been a dream of Dr. Arturo Frondizi. Even before the establishment of the European Common Market Dr. Frondizi had mooted the idea of a Latin American Free Trade Area (LAFTA). In 1959, at a meeting in Montevideo, Argentina, Brazil, Chile, Paraguay, Peru, Uruguay and Mexico signed an agreement on a free trade area. Colombia and Ecuador are prospective members. Argentina and Brazil are the main trading partners of LAFTA. The keynote of LAFTA is private enterprise. Government policies and negotiations require the co-operation of private management for tariff reductions, for better import-export opportunities. To quote Dr. Arturo Frondizi from his speech at the University of Chile, Santiago, on April 15, 1958: "It is true that the creation of wealth is the task of society and not of the State, but the latter, conscious of its responsibility, can and must contribute to the economic development by removing the obstacles which stand in the way, and by taking positive steps which will promote and carry it through."

Business Notes

Shipping

INDIA COMMITTEE OF LLOYD'S REGISTER

INDIAN SHIPPING may be said to have received a new international status on November 27, 1961. For, on that day was formed in Bombay the India Committee of Lloyd's Register of Shipping. Appropriately enough, the inauguration took place in "Scindia House", from where the late Mr. Walchand Hirachand used to carry on his struggle for the survival of Indian Shipping against severe foreign competition. The formation of the India Committee indicates the recognition by Lloyd's Register of Shipping of India's growing importance as a maritime and industrial nation. It also provides a means whereby Indian views can be expressed in the Lloyd's General Committee. The India Committee con-

sists of Sir A. Ramaswami Mudaliar as Chairman (as Chairman of the India Committee, Sir Ramaswami becomes an ex-officio member of the General Committee), Mrs. Sumati Morarjee as Deputy Chairman and Mr. J. P. Bhargava, Sir Jehangir Ghandy, Mr. G. T. Kamdar, Mr. D. M. Khatau, Mr. G. L. Mehta, Sir Biren Mookerjee, Mr. H. K. Shah, Mr. Vasant J. Sheth, Mr. Pratapsinh S. Vallabhdas and Mr. C. P. Srinivasa as members. Incidentally, Mrs. Sumati Morarjee is the first lady member of any such National Committee of Lloyd's. Mr. A. C. Grover, a Deputy-Chairman and Treasurer, and Mr. W. J. Ferguson, Secretary and Chief Executive, of Lloyd's Register of Shipping attended the inaugural meeting of the Committee.

For many years, Lloyd's Register of Shipping has had National Committees in leading shipping and ship-building countries in order to ensure that the Society's

practices reflect international experience and opinion. The India Committee of Lloyd's Register of Shipping, which was inaugurated last Monday, is the twelfth of such National Committee to be formed and has the following objects:

It will provide an effective means of placing at the disposal of the shipping interests in India, the experience and knowledge of Lloyd's Register of Shipping. The Committee will be in a position to discuss the rules and requirements of Lloyd's Register of Shipping in their application to India and make recommendations thereon to the General Committee of Lloyd's Register in London. It will supervise the activities of Lloyd's Society in India and make representations thereon to the General Committee in London. It will, from time to time, originate proposals which may be considered expedient and send it to the General Committee for consideration. The Committee will meet once in a quarter, and the meetings will be held mainly in Bombay or Calcutta, though they may also be held in Delhi or Madras.

A Technical Committee has also been formed, consisting of technicians connected with shipping, ship repairing, shipbuilding and other allied interests. A representative of the Technical Committee may be nominated to attend the meeting of the Technical Committee of the Society in London. It is expected that, with the natural growth of Indian Shipping, the India Committee will prove a very useful auxiliary.

Provident Fund

PERFORMANCE DURING 1960-61

THAT OVER 12,000 established factories and establishments employing 29.29 lakh workmen were covered by the Employees' Provident Fund Scheme during 1960-61 is revealed by the annual report of the Fund. Initially the scheme was applicable to six well organized industries and now covers 47 industries, the recent additions being mica mines, plywood, automobile servicing and repairing industry, etc. The scheme now covers a wider range because it was applicable to the establishments employing 50 or more persons (20 in the case of newspaper establishments) if these had completed three years of their existence. In the face of persistent demand from workers of smaller units, the Act was amended with effect from December 31, 1960, so that it is applicable to establishments employing 20 or more persons. Another important amendment which came into effect this year was in respect of the advance the members could get from the scheme. Till recently the members could get the advance to meet expenses in connection with their serious or prolonged illness or that of a member of their families and for financing their life insurance policies. The scheme has now been amended enabling a member to get a non-refundable advance for the purpose of dwelling house or dwelling site or for the construction of a dwelling house or dwelling site or for the construction of a dwelling house under the Subsidised Housing Scheme for Industrial workers. This seems to be an encouraging development.

There has been some controversy regarding the rate of contribution which at the moment continues to be 6½ per cent of basic wages, dearness allowance, retaining allowance and cash value of food concession. An equivalent sum is contributed by the employer. A member may, if he desires, voluntarily contribute as his own share upto 8-1/3 per cent of the contribution of the employer. In such a case the contribution of the employer remains restricted to 6½ per cent. The report reveals that as many as 32,000 members voluntarily had contributed higher rates. The proposal to increase the rate of contribution from 6½ per cent to 8-1/3 per cent in respect of four of the six industries initially

covered under the Act was referred by the Government to a specially constituted technical committee under the chairmanship of Mr. M. R. Meher, President, Industrial Court, Bombay, for holding an investigation as to which of these industries are unable to bear the additional financial burden. The report in respect of these four industries — paper, electrical, mechanical or general engineering products and iron and steel — was received by the Government in June 1961 and is being studied. The final decision by the Government is still awaited.

Foreign Companies

INDIANISATION OF THE STAFF

A STATEMENT of Indianisation of the staff of foreign companies was placed on the table of the Lok Sabha last week. The statement gives employment details for 1,208 foreign-owned or controlled companies operating in this country. A perusal of the statement would reveal that there has not been rapid Indianisation at the top level. Indians drawing salaries above Rs. 3,000 have increased only from 372 to 689 as a proportion of the number of employees at that level.

It will be wrong to exercise any pressure on the companies to proceed rapidly in Indianising the staff at the top level. The fact is that there are very few Indians available to man these top posts. The State undertakings are inviting highly qualified technicians to give them advice on technical matters and the granting of income-tax concessions to foreign specialists is again a recognition of the dearth of qualified technicians in this country to prepare the requisite technical schemes for various projects. So under the circumstances the importation of qualified people would seem to be a normal and desirable procedure.

It cannot also be denied that the foreign companies have been collaborating with the Government of India to a considerable degree. So far as the Indianisation of posts carrying salaries below Rs. 1,000 is concerned, it may be specified that it was virtually completed by 1955. From then onwards, there has been a steady rise in the number of Indians employed at higher levels. Indian in the salary group between Rs. 1,000 to Rs. 2,000 have increased from Rs. 5,575 to 7,907 between 1958 and 1961. The higher and later figure forms as much as 88.9 per cent of the total employed in that category. As the economy of the country progresses, the existing situation is likely to be set right. Things, of course, cannot be done overnight. Training schemes are under way and in due course of time it is expected the necessity to import highly qualified people from abroad would be put to an end.

Jute

STABILIZING PRICES

THE QUESTION of stabilizing jute prices has been engaging the attention of the Government for some time. At one time, it was considered that a floor price should be fixed for jute. The idea had to be given up because it was thought that it might lead to many complications. Besides, considerations like competition in overseas market had to be kept in view.

It may be mentioned that the fall in jute prices has been gradual. The price of Assam Bottom variety at Calcutta ranged between Rs. 33 and Rs. 35 a maund throughout September and October, 1961. In November there was a further fall and the price touched the level of Rs. 30 a maund on the 20th of this month. But the price of Rs. 30 has been the middle man's price in Calcutta and in the interior stations the price has been even lower. In Orissa, the price was about Rs. 25. Such price variations can, of course, take place because of the fact that there is likely to be variation in accordance with the transport and other factors

involved. Anyhow it is a matter of relief that something at least has been done in this sphere. A buffer stock agency constituted by the Indian Jute Mills' Association will now conduct a jute purchase operation in the market with a view to stabilizing prices. This has been decided upon as an alternative to a floor price for jute. This agency would enter the market as and when prices tend to fall to uneconomic levels. The formal registration is now awaited and pending the registration of the agency, Indian Jute Mills' Association has asked its member mills to make purchases. As a result jute mills in India have stepped up their purchases of raw jute considerably. The total quantity of jute purchased by the mills in the four months ended October, 1961, was 2,492,000 bales. It was 1,797,000 bales in the similar 1960 period.

The agency should be able to impart stability to the market by its judicious operation and thus assure to the grower an economic price for his produce.

Hind Lamps

FLUORESCENT TUBES AND AUTOMATIC BULB-BLOWING PLANT

THE INSTALLATION of automatic bulb-blowing and fluorescent tube plants at the Hind Lamps Factory at Shikohabad, 40 miles from Agra, is to be welcomed for it would help in obtaining self-sufficiency in many of the items of daily electrical use. Nearly 10 years ago when Hind Lamps was established, only 15.4 million general lighting lamps and other types of lamps were manufactured in India. There was not any production of miniature lamps or of fluorescent tubes. The position in regard to components was not happy either. Glass shells were manufactured in a limited quantity and there was no production of lamp caps and glass tubings. Credit goes to Hind Lamps that it is now meeting entire requirements of glass shells and caps for lamps from indigenous sources and is manufacturing a substantial part of the requirements of glass tubing and lamps. The saving in foreign exchange that has been brought about is over Rs. 30 lakhs per annum that used to be spent on the import of copper, zinc and chemicals needed in the manufacture of components.

The production target for lamps was fixed only at 65 million instead of 100 million, because of the reason that the Government of India wanted to save the much-needed foreign exchange. With the commissioning of the automatic bulb-blowing plant the capacity of Hind Lamps for manufacturing glass sheets will rise to about 30 million a year. The fluorescent tube plant will produce one million tubes a year on a single-shift basis. Incidentally, the installation of these two plants completes the expansion programme of Hind Lamps envisaged during the Second Plan. The programme for the Third Plan is quite ambitious and given the proper facilities like the supply of electricity, there is every possibility that Hind Lamps might be able to achieve the desired target. With the supply of electricity to more villages the future for the electrical goods industry, of course, seems bright. So far electricity has reached only 23,000 villages of the 500,000 villages in India.

The installation of these plants will not only be helpful in producing items of daily electrical use but would also help in solving the problem of unemployment in the State of Uttar Pradesh to a certain extent. It is comforting to note that the State Government realizes the importance of electricity for the industrial development and has allocated Rs. 109 crores for the generation of power in the State's Third Plan. If the plans of Hind Lamps go through in the Third Plan, there is every possibility that it may be able to manufacture all lamps and tube components.

STC

ANNUAL REPORT FOR 1960-61

A PERUSAL of STC's annual report for 1960-61 published recently reveals an expansion in the activities of the State Trading Corporation in the field of India's foreign trade. The report says that the total turnover increased from Rs. 43 crores during the nine months — July 1959 to March 1960 — to Rs. 65 crores in 1960-61. Exports handled by the Corporation had risen from Rs. 23.23 crores to Rs. 36.6 crores. Private trade and industry had been assisted to import essential capital goods and raw materials and other commodities and to export finished goods to the total value of Rs. 20 crores without any charge for its services. The Corporation also handled indirect business on behalf of industry and trade to the tune of Rs. 28 crores in return for a nominal service charge. With a view to expanding trade with various countries in Western Europe the Corporation finalised several trade arrangements. These arrangements, it is expected, would afford opportunities for catering to difficult markets and retaining them, particularly in view of adverse trade balance with the European (OEEC) countries in the past. There has also been further enlargement of trade with the countries with whom bilateral trade agreements have been entered into by the Government.

In the field of exports the sizable increase has been in respect of ores and mineral products which accounted for 52 per cent of the total turnover as against 44 per cent during the preceding year. In respect of manganese ore where the position has not been happy in the past, the Corporation took a series of measures to step up exports.

On the import front the Corporation was able to arrange imports in respect of several items like caustic soda, muriate potash fertilizers, raw silk, non-ferrous metals, lubricating oils, art silk, yarn, etc. As regards prospects for business in 1961-62, the report mentions that iron exports would be stepped up by 2 lakh tons to 32 lakh tons. Pertaining to the profit and loss account, the report records a net profit of Rs. 1.44 crores.

Although all this seems to be encouraging, it should not be taken for granted that all is well with the State Trading Corporation. It might claim to be faultless, but the snag is that the Corporation is manned by personnel who are not much familiar with trading and accustomed to bureaucratic methods. This outlook will, of course, have to be changed if it is to increase its business and bring in more profits for the economy. Since a lot of criticism has been voiced in and outside the Lok Sabha, in spite of the encouraging reports that are issued every year, it would be quite fair to appoint a committee which should evaluate the working of the Corporation during the past five years. In this way the public would be in a position to know the exact position. In fact the Corporation itself should take such an initiative and clear the doubts that linger in the minds of people who have been critical of the Corporation's activities.

Pimpri

COMMENDABLE PROGRESS

THE PROGRESS made by the Penicillin Factory at Pimpri deserves many plaudits. It has now reached a stage when it can be proud of its record. In the year 1960-61, the factory made a net profit of Rs. 79 lakhs. Profit apart, its production has helped in bringing down the price of penicillin which can easily be said to be now within the reach of the masses. It will be interesting to observe that as a result of increased production at Pimpri international cartels were forced to reduce their prices. The production of finished peni-

cillin tested and passed during 1960-61 was 42.76 million mega units as against the target of 35 million mega units for the year and against the actual production of 33.15 m.m.u. in the previous year. Its expansion programme is under way. The 60 per cent expansion scheme is complete, as a result of which the production capacity has gone upto 40 m.m.u. per annum. The target for the year 1961-62 is 45 m.m.u. of finished penicillin. A streptomycin project with a capacity of 40-45 tons per year at an estimated cost of Rs. 210 lakhs is expected to go into production before 31st March, 1962.

One may recall that at one time the prices of penicillin were prohibitive. A kilogram of streptomycin used to cost Rs. 450. But now with the progress made at Pimpri a kilogram of it is available for Rs. 120 only. In October 1959, the bulk price of penicillin was reduced from 69 nP. to 50 nP per mega unit. This obviously is a welcome relief.

Penicillin factory at Pimpri has been receiving valuable help and assistance from agencies like WHO and UNICEF. It would be interesting to note that by November 1964, this factory will be completely independent and would not require any assistance which was essential in the initial stages. Another notable factor is that there is not a single foreigner employed at Pimpri and the entire running is by Indians. The record that the Penicillin Factory at Pimpri has set up is indeed commendable and it is only to be hoped that other state enterprises would follow in its foot steps.

Hungarian Collaboration

FIVE NEW SCHEMES

THE PROPOSALS of five private companies for collaboration with Hungarian concerns have been approved by the Government of India envisaging the manufacture of chemical machinery, electric hoists wind shield glass and fluorescent lamps and glass tubes. The participating Indian companies are: New Standard Engineering Co. Ltd., Bombay; Garlic and Company (P) Ltd., Bombay; Light Glass Industries, Bombay; The National Instruments Ltd., Bombay and Zenith Lamps and Electricals Ltd., Madras.

New Standard Engineering Co. has entered into an agreement with Messrs. Nikex Hungarian Trading Co., Budapest, to set up a plant for the manufacture of chemical machinery in India. Under the agreement which is to run for ten years, the Hungarian company will receive, apart from Rs. 2.5 lakhs in lump sum as fee for the supply of technical documents, royalty of 5 per cent subject to Indian taxes. Garlic and Co. has signed an agreement with the same Hungarian company for setting up a plant to manufacture electric hoists. Under the terms of the agreement, the Hungarian concern will get a royalty at 5 per cent subject to Indian taxes. It will also be reimbursed for its expenditure on the preparation and supply of drawings and designs for the plant upto a sum of Rs. 2.30 lakhs. The agreement will be for ten years. Light Glass Industry has secured the collaboration of Messrs. Kompvax Hungarian Trading Co. for Factory Equipment, Budapest, for setting up a plant to manufacture wind shield glass for automobiles. The National Instruments Ltd. has entered into an agreement for 10 years with Messrs. Metrimex Hungarian Trading Co. for Instruments, Budapest, under which the Hungarian company will be entitled to a royalty of 4 per cent subject to taxes. Zenith Lamps and Electricals Ltd., has signed an agreement with M/s. United Incandescent Lamps and Electricals Co. Ltd., Tungstran, to set up a plant for the manufacture of fluorescent lamps and glass tubes. The Indian Company has been allowed to import machinery and equipment worth about Rs. 13.52 lakhs for fluorescent tubes and Rs. 3.32 lakhs for glass tube plants. It has not to pay royalty or technical fee to the Hungarian Company.

Netar Krishna Shegals (Private) Ltd., New Delhi is already manufacturing watt-hour electric meters in collaboration with M/s. Meter Factory Ganz, Budapest. Under the terms of the agreement, the Indian company will pay Rs. 1,32,800 for the supply of technical know-how in instalments. In addition, it will pay a royalty, subject to Indian income-tax per meter as follows: On production of first 12 months (Rs. 0.1875), on production of 13th to 24th months (Rs. 0.3750), on production of 25th to 36th months, (Rs. 0.5625), and balance period of agreements (Rs. 0.7500). The agreement is for four years.

Collaboration has also been sought by the Andhra Pradesh Industries Development Corporation Limited. It has submitted an application for the grant of licence under the Industries (Development & Regulation) Act, 1961, for setting up an integrated glass factory at Hyderabad which will manufacture 12,500 tons of sheet and plate glass per annum, 12,000 tons of glass hollowware per annum, 1,800 tons of glass shells and tubes per annum and 1,500 tons of crystal glass per annum. The proposal is at present under the consideration of the Union Government involving, as it does, installation of capital equipment worth Rs. 134 lakhs including the value of imported equipment Rs. 80 lakhs. The details of the scheme are awaited from the Hungarian organizations.

Pharmaceuticals

CIBA'S NEW PROJECT

IT IS somewhat heartening to note that CIBA of India Ltd., Bombay, who are already licensed under the Industries (Development & Regulation) Act for the manufacture of drugs and pharmaceuticals now propose to manufacture in India four of the items which they were hitherto importing from abroad. These items are Esidrex, Nepresol, Entobex and Dianabol. Such a step would not only go a long way in making India less dependent for her requirements on foreign supplies but would save India of the much needed foreign exchange. On the basis of prices furnished by the Company, the following table will show the foreign exchange savings made against each item per kgs:

1. Dianabol	..	Rs. 27.052
2. Esidrex	..	Rs. 99
3. Nepresol	..	Rs. 1,335
4. Entobex	..	Rs. 210

CIBA also propose to expand their capacity of certain hormone products, Testosterone esters and progesterone esters with the help of their present foreign collaborators, CIBA Ltd. of Basle, Switzerland. They plan to set up a multi-purpose plant for undertaking in the earlier stages certain synthetic hormones and other drugs, in addition to an independent Research Laboratory to investigate new drugs and improved methods of production. This is likely to help in developing methods for large-scale production of newer drugs. The imported equipment which is estimated to cost Rs. 18 lakhs will be obtained from their Swiss collaborators against a tax free loan, bearing an interest of 6 per cent. It is anticipated that on the implementation of the project, CIBA would be able to save Rs. 5,35,752 on the basis of actual current imports and Rs. 13,99,171 on the basis of the proposed capacities.

CORRIGENDUM

Madras State Electricity Board

The issue price of the 4½ per cent Madras State Electricity Board bonds 1971 should read as Rs. 99.50 per cent instead of Rs. 90.50 per cent as has inadvertently appeared in the advertisements of the Board on pages 642 and 685 of "The Eastern Economist," dated the 6th and 13th October, 1961.

hamare bhai
ko le jao

It happened some years ago in the steel melting shops at the Jamshedpur works. A large ladle, carrying 75 tons of molten iron, suddenly crashed to the ground with a deafening noise from an overhead crane. The spattering sparks and red-hot metal seriously injured a number of brick-layers working at what seemed to be a safe distance. The air was rent with the frenzied shouts of the men and the hissing of steam.

The first ambulance could remove only five of the injured to the hospital. General Manager Keenan could take only three more in his car. He chose the three who had a better chance of survival than the rest. One of these men, a Hindu worker, however, re-

fused to go. "Do not take me away", he said. Disregarding his own agony, he feebly nodded towards a half-burnt Muslim colleague, and said: "Hamare bhai ko le jao." As Keenan recalls, "The Hindu who was in pain and danger of death remembered, not that the Mohammedan was of a different faith, but that he was his brother."

This feeling of comradeship, born of the common bond of labour, is the spirit that characterises Jamshedpur, where industry is not merely a source of livelihood but a way of life.

BOOK REVIEWS

CONTEMPORARY POLITICS: A RIGHTIST'S VIEW

Satyam Eva Jayate by C. Rajagopalachari, in two volumes, Bharatan Publications, Madras, Price Rs. 6/- per volume.

Reading the brief and modest preface in Rajaji's first volume, which he has described as "a bundle of weekly outpourings of sincere feelings" on several topics of current interest, one is apt at first to miss its real quality—but not beyond the first few pages. One quickly realises that in the penetrating analysis of the policies of the present Government, is the beginning of "a movement for freedom," of "revolt against the policy of increasing regimentation introduced by the Congress party." It is not necessary to agree with him on every point to appreciate how timely and essential it is to build up a real Opposition. This veteran statesman is campaigning with remarkable conviction and vitality against what he fears may be the inevitable result of Congress policies, namely, "totalitarianism" and "an extension or a mockery of the democracy which we promised to ourselves in 1950, and in the wiping out of all the guarantees of freedom inscribed in the Constitution."

Rajaji has covered a wide range of subjects in this volume, and a reprint of the articles written for a weekly journal is bound to result in a measure of repetition of certain views and sentiments. On some of these, notably those like religion and philosophy, nuclear weapons, India's official language, etc., he has written separately, elaborating his standpoint in far greater detail than is possible in articles intended for a weekly journal.

'Satyam Eva Jayate', the title of the volume under review, reflects the author's deep-rooted conviction which Einstein once described, a few weeks before his death in 1955, as "faith in the universal law of righteousness." Rajaji was first in free India's political field, because of his clear insight and vast experience, to perceive the urgent need for developing "scope for a free and open discussion and criticism." His complaint is that "the Almighty Party Apparatus is sapping the strength of the people and that is vital to democracy." And "since the Congress party is swinging to the Left, what is wanted for the body politic is not an ultra or outer Left, but a strong and articulate Right." He favours the separation of general elections to the State legislatures from those for Parliament. "These," he suggests, "should be held on different dates, so that the electoral issues in the States may not be mixed up with all-India issues and strangled out of life."

Commending independent thinking as a vital feature of democratic functioning, he expresses the fear that "if subservience and slavish adulation take the place of independent thinking and criticism is never resorted to but with fear and trepidation, the atmosphere quickly breeds the political diseases peculiar to democracy." Again and again, Rajaji expounds with the zeal of an ardent gospeller the genesis of the Swatantra Party: "the new party seeks to oppose the trend of the ruling Congress party to adopt the ways and ideals of the Communists in its eagerness to prevent the Communists from going forward."

In a reminiscent mood, Rajaji refers to his relationship with Gandhiji in an article entitled, "The way to peace." "He (Gandhiji) always felt acute pleasure when I agreed with him! For he had found that of his half-a-dozen colleagues I was the one most inclined to disagree when he laid down the law."

His answer to the criticism often levelled against the Swatantra party that it stands for conservatism is that "conservatism is not lack of patriotism or fervour; it is consistent with the concern for the poor, it is wisdom and good management of national resources, and can help as much in social welfare as any other party labelling itself Socialist." What he objects to is "power without wisdom." Quoting Bertrand Russell who once said, "the spread of power without wisdom is utterly terrifying, and I cannot much blame those whom it reduces to despair," he condemns a tendency increasingly prevalent in the Congress, namely, "the slightest attempt at dissent (from Mr. Nehru) meets with stern disapproval and is, so to say, nipped in the bud."

On Socialism, as introduced by the Congress, Rajaji has clear-cut and emphatic views. It has bred "corruption, mismanagement and bureaucratic wastefulness." Gandhiji's alternative was, he asserts with many passages from his writings to support his claim, entirely different in character from the Marxian solution—being based on religion. Gandhiji had stated, "I do not like the assumptions underlying many of the presuppositions in the Socialist programme which go to show there is necessarily antagonism between the classes and the masses, or between the labourers and the capitalists. . . . If you have only State production, men will become morally and intellectually paupers and they will forget their responsibility." As Rajaji puts it, "the question is whether we want a way of life or prison discipline." "What is recommended may seem to be a long road, but shorter roads do not lead to the goal, though they may give sadist satisfaction."

A number of articles underline this point: regarding "welfare without freedom" Rajaji observes, "State compulsion, direct and indirect, as a substitute for people's character and the expansion of the size and function of the bureaucratic machine—these are supposed to usher in paradise. Communism is anathema, but all the same it is the pattern of Communism we are asked to work out for our happiness." Elaborating this point he observes "the only way worth living is the way that Socrates, Buddha, Christ and the Rishis of India preached, which included sympathy and helpful co-operation in its hygienic forces and excludes collectivism."

Strongly as Rajaji is opposed to Communism, he has no doubt in his mind that the methods adopted to bring about the downfall of the Communist Ministry in Kerala was "laying the axe at the root of parliamentary democracy" in that State. He does "not like the Communist party, but this is not the way to deal with it. . . . It is through the Constitution and the Constitution alone that we should deal with the Communists."

While under parliamentary democracy governments are brought into power by majorities, "this does not give them the authority to extinguish or restrain the individual freedom of any one except for the maintenance of peace and order. . . . It will lead to the development of a new ruling class and it is tyranny." Rajaji sees no difference between "the Nehru-guided Congress party and the orthodox Communists." In fact, he holds that "the uncandid and gripping totalitarianism (of the former) is worse than the avowed totalitarianism (of the latter)."

The volume, which is dedicated to Khasa Subba Rau, contains a well-deserved and very touching tribute. "Here is a rare man, look at him from any

FROM THE CAPITAL'S CORRIDORS

ENGINEERING INDUSTRIES

IN accordance with the new procedure adopted by the Union Ministry of Industries to save time, following are some of the Engineering Industries in respect of which licences may be granted, without reference to the Licensing Committee.

1. A.C.S.R. and all aluminium conductors.
2. Agricultural tractors.
3. Automobile instruments.
4. Bare Copper strips.
5. Antimony.
6. Automatic pirn winding machines.
7. Bearings - thin - Walled.
8. Bifurcated rivets.
9. Calculating machines.
10. Conduit pipes.
11. Coated abrasives.
12. Crawler tractors.
13. Dumpers and scrapers.
14. Earth moving machines.
15. Electric fans.
16. Expanded metals.
17. High carbon steel blades.
18. Hosiery needles.
19. Jute cutting knives.
20. Machine screws, set screws, coach screws.
21. Mild steel Bright Bars and Bars and Shaftings.
22. Radiators.
23. Railway points and crossings.
24. Railway wagons and railway wagon parts.
25. Road rollers except expansions.
26. Sewing machines.
27. Shovels.
28. Telephone relays.
29. Twist drills.
30. Washing machines and drying machines.
31. Wire ropes.
32. Gelatine — technical, edible and photographic.
33. Hollow-ware including table and pressedware and glass bottles made on semi-automatic machines.
34. Hard board.
35. Insecticidal formulations (other than BHC & DDT).
36. Methanol.
37. Pesticidal formulations.
38. Plasticizers.
39. Poly-vinyl acetate.
40. Rayon and Staple fibre (other than acetate filament yarn and acetate and viscose staple fibre).
41. Boilers and steam generating plant.
42. Boats and crafts for fishing industry.
43. Conveyors — chain belt and screws.
44. Construction machinery.
45. Electrical motors above 20 H.P. and special motors above 20 H.P.
46. E.O.T. cranes and wharf cranes.
47. Fabricated structurals (heavy).
48. Industrial machinery.
49. Machine tools.
50. Precision industrial instruments.
51. Small tools such as cutters, and cutting tools (except saws of all types).
52. Sluice gates and gearings.
53. Structural ropeways.
54. Transformers above 33 KV.
55. Tungsten carbide brazing of tips.
56. Winches (land marine).

SUGAR EXPORTS

Details about sugar exports effected so far this year were given in the Lok Sabha on Tuesday by the

Union Deputy Minister for Food and Agriculture, Mr. A. M. Thomas. The total quantity exported upto November 12, he said, was about 2,28,000 metric tons — 1,38,000 tons to the United States and 90,000 tons to the other countries. The average f.o.b. realisation on these exports were estimated at Rs. 536 per metric ton to the U.S.A. and Rs. 411 per metric ton in respect of other countries, bringing in foreign exchange to the tune of Rs. 11.5 crores. The amount of subsidy the Government will have to pay to the industry to meet the loss on these exports is yet to be worked out. Tentatively, it has been estimated around Rs. 5.5 crores.

Meanwhile, the U.S. Government has agreed to resumption of sugar shipments from India on the understanding that all the future consignments would be equated against the next year's quota and held in bond at ports if they arrived before December 31. Announcing this at a Press Conference here on Wednesday last, the U.S. Ambassador, Mr. J. K. Galbraith stated that this understanding had been reached on the belief that the question of import quota for Indian sugar for the first half of 1962 would be resolved well before the new shipments reached the U.S. shore. The U.S. decision on the quota for the next year, it is hoped, would be favourable to India.

The Indian Sugar Mills Association has made a plea to the Government to regulate the releases of sugar for the domestic market on the ground that since the industry had to pay a fixed statutory price for cane, it was entitled to fair price for its product. Sugar prices in the domestic market have shown a downward trend, especially in respect of sugar produced by sulphitation process, during the past one and a half months as a sequel to removal of distribution and price control on the commodity. Bold crystal sugar, however, is still being quoted at a slight premium over the controlled rates, presumably because of greater demand for it.

CAUSTIC SODA, SODA ASH AND CALCIUM CARBIDE INDUSTRIES

The Government of India has accepted the Tariff Commission's recommendation that protection granted to the caustic soda industry should be continued for a further period of three years, i.e., upto December 31, 1964, at the existing rate of duty, namely, 30 per cent *ad valorem* (preferential) and 40 per cent *ad valorem* (standard). The Government's resolution on Tariff Commission's recommendations was published here on November 24.

The resolution further says that the Government has taken note of certain other ancillary recommendations of the Commission and steps would be taken to implement them as far as possible. These ancillary recommendations are:

1. While licensing additional capacity for caustic soda, existing units should be encouraged to expand their capacity to an economic size. In licensing new units also due attention should be paid to the importance of setting up plants of large capacity in areas advantageously situated with regard to power and common salt.

2. Caustic soda is a basic raw material for a large number of industries. It is, therefore, of paramount importance that it should be made cheaper. This aspect should be borne in mind while licensing further capacity for chemical caustic soda.

3. The railways should take necessary steps to increase the allotment of tank wagons (broad-gauge and meter gauge) for movement of liquid caustic soda and also consider the question of adjusting railway freight in such a way that movement of liquid caustic soda over long distance is encouraged.

4. The higher freight rate for bulk movement of salt under class 37.5-A of Goods Tariff need not be enforced if a consumer undertakes to carry out protective measures for wagons as required by the railways. The railways should, in consultation with the manufacturers of caustic soda, evolve a workable arrangement for bulk movement of salt in wagons and extend the facilities to cover long distance movement of salt.

The Union Government has drawn the attention of the State Governments to the recommendation of the Commission that the State Electricity Boards should be requested not to effect the increases in electricity rates charged from the caustic soda industry during the Second Plan period.

The Government of India have also accepted Tariff Commission's recommendation that protection to Soda Ash and Calcium Carbide industries should be continued for a further period of three years ending December 31, 1964 at the existing rates of protective duties namely Rs. 8.37 per quintal (preferential) and Rs. 11.32 per quintal (standard) for Soda Ash and 50 per cent *ad-valorem* for Calcium Carbide. The Government resolutions on the Tariff Commission's recommendations were published on November 27, 1961.

IRON AND STEEL INDUSTRY

The Union Government has decided to constitute a Wage Board for Iron and Steel Industry with Mr. G. K. Shinde, ex-Chief Justice of the former Madhya Bharat High Court, as Chairman. According to Mr. Abid Ali, Deputy Labour Minister, the other members of the Board will include Mr. Akbar Ali Khan, M.P., Mr. Gopeshwar (representing the public sector) and Mr. Saradindu Gupta (representing the private sector) and Mr. Michael John and Mr. Gopeshwar (representing the labour). The Board will aim at achieving the maximum standardisation in both the public and the private sectors of steel industry in regard to remuneration. The terms of reference of the Board are, however, expected to be finalised soon.

FERRO-MANGANESE INDUSTRY

The Government of India have decided to constitute a Committee to consider various problems relating to the Ferro-Manganese Industry.

Shri N. N. Wanchoo, Secretary, Department of Iron and Steel, Ministry of Steel, Mines and Fuel, will be the Chairman of the Committee. Other members of the Committee are: Shri B. D. Kalelkar, Senior Industrial Adviser, Ministry of Commerce and Industry; Shri A. B. Guha, Coal Mining Adviser, Department of Mines and Fuel; Shri K. L. Ghei, Joint Secretary, Ministry of Finance; Shri Jagjit Singh, Director (Traffic), Ministry of Railways and Shri M. Satyapal of the Planning Commission. Shri A. N. Banerji, Iron and Steel Controller of the Government of India, will be the Member-Secretary.

The Committee will study the ways and means of ensuring regular supply of raw materials of requisite quality and consider the question of railway freight for movement of raw materials and finished products. It

will also study the economics of production with special reference to cost of transport of ore, power costs, manufacturing process and use of by-products, etc. Problems relating to export and marketing abroad of the ferro-manganese and any other connected matter will also be studied by the Committee. The Committee will submit its report as early as possible, preferably by the end of February, 1962.

MANGANESE ORE

Yet another case of a State Government contesting the claims of the Union Government in the matter of holding equity shares has come to light. The Government of India, it will be recalled, recently reached an out of court settlement with a British firm, which held a 100-year mining lease for manganese ore in the pre-independence Central Provinces. Under the terms of the settlement, a new limited liability committee was to be formed in which the Government of India were to hold fifty-one per cent of the equity capital, the remainder was to be shared by the British company and Indian investors, including Indian Mining Association. In order to provide an incentive, the Government of India had offered twelve and a half per cent in the equity capital each to the States of Maharashtra and Madhya Pradesh, retaining twenty-six per cent itself. The Government of Maharashtra has now demanded twenty-six per cent in the share capital.

BHILAI STEEL PLANT

The Government of India has approved the Russian project report for the expansion of the Russian-built Bhilai Steel Plant from one million tons to 2.5 million tons at an estimated cost of Rs. 128 crores, including Rs. 60 crores in foreign exchange which are already provided by the Soviet Union. When fully commissioned, the expanded plant will produce 500,000 tons each of rails and merchant sections, 250,000 tons of heavy structurals, 300,000 tons of wire rods and 400,000 tons of billets, making a total of 14,50,000 tons as against 7,75,000 tons at present. The Plant in addition will produce 300,000 tons of pig iron.

Tenders for the expansion of the German-built Rourkela Steel Plant by 0.8 million tons have already gone out and those for the Durgapur Plant by 0.6 million tons are being issued by end of year.

MYSORE IRON AND STEEL WORKS

The expansion of the Mysore Iron and Steel Works raising their capacity from 30,000 tons of steel ingots to 100,000 tons per annum, which was originally included in the Second Five-Year Plan will now be executed during the Third Five-Year Plan. The new items included in this expansion are the L. D. Plant and Electric Furnace for steel making, a Billet and Light Structural Mill and ancillary schemes for expansion of yard, foundry, etc. In addition, the Works will be completing, during the Third Plan period, the installation of the Sintering Plant and the Ferro-Silicon Plant which were undertaken during the Second Five-Year Plan period.

A proposal for the setting up of a Tool and Alloy Steel Plant with a capacity of 15,000 tons per annum is also under the consideration of Government.

AGRICULTURAL PRODUCTION

As part of the plan to intensify agricultural production and increase crop yields through irrigation and other means and to restore the productivity of land which has become infertile because of flooding and

for all interior construction
and decoration
the wise choice is

JOLLYBOARD

the modern material

JOLLYBOARD—India's leading hardboard—is ideal for use in department stores, factories, offices and modern homes. It's strong, light, durable and highly decorative. It can't crack, split or come apart. **ECONOMICAL TOO—JOLLYBOARD** is very economical. It's not only surprisingly low priced, but also saves up to 50% of your money in labour and painting costs.

Remember the name

JOLLYBOARD

...its your guarantee of quality!

waterlogging, the International Development Association (IDA) yesterday extended to India three development credits totalling \$22.5 million for projects to increase agricultural production in three States. A credit of \$8 million will assist the Salandi Project in Orissa for the irrigation of 225,000 acres. Another credit of \$4.5 million will help finance the completion of the Shetrunji Project in Gujarat for the irrigation of 86,000 acres. The third credit of \$10 million will assist a project of flood protection and surface drainage of about 8 million acres in the Punjab.

The credits extended are repayable in foreign exchange over a term of 50 years and are free of interest. Repayment will begin after a ten-year grace period. The repayment of the irrigation credits will begin on April 15, 1972 and that of the drainage credit on May 15, 1972. Thereafter, 1 per cent per annum of the principal will be repayable for ten years and three per cent per annum will be repayable each year for the final 30 years. A service charge of 1 per cent per annum on the amounts withdrawn and outstanding will be made to meet IDA's administrative costs.

The Salandi Irrigation Project includes the construction of a dam on the Salandi River, a main canal 45 miles long and about 450 miles of distribution canals as well as related structures necessary for the operation and maintenance of the dam and the canals. Extension services are well established in the area. In addition, the State Government will provide technical assistance to farmers in the planning, construction and operation of field channels and in the establishment and operation of a training programme to improve techniques of irrigation farming. As a result, it is expected that full use will be made of the available irrigation water sooner than is usually the case in this country. The total cost of the project is estimated at the equivalent of \$16 million. The State Government will provide 40 per cent of the financing needed and the Centre will provide 60 per cent as a loan, most of which will come from the proceeds of the IDA credit.

The Shetrunji Irrigation Project will irrigate 86,000 acres of land in Gujarat. It is already partially built including a dam across the Shetrunji River. The work now to be undertaken to complete the project consists of the construction of main canals about 94 miles long and distribution canals, houses, workshops, buildings and service roads. The State Government will provide technical services to farmers to bring about prompt utilisation of the available water. The lands most suitable for irrigation will be selected on the basis of a detailed soil survey now being carried out. The State Government will organise two demonstration farms and provide extension services for improving techniques of irrigation farming. As a consequence, it is expected that, like the Salandi Project, irrigation water will be fully utilised sooner than is usual. The total estimated cost of the project is the equivalent of \$9 million. Half of the money will be provided by the State Government and the other half given as a loan from the Central Government of the equivalent of \$4.5 million IDA credit.

Punjab Flood Protection and Drainage Works will help Punjab tackle the problem of flood damage by building embankments along the rivers to contain them and by construction of a system of adequate surface drainage. The Project being assisted by the IDA credit consists of the construction of 17 miles of embankment along rivers, the enlargement of 300 miles of existing drains and the excavation of 2000 miles of new drains. The estimated cost of the works is of the equivalent

of \$20 million. The Government of India will finance the entire cost through loans to the State Government, half of which represents the \$10 million IDA credit.

RICE

Two Working Parties of the International Rice Commission, one dealing with rice production and protection and the other with soils, water and fertiliser practices, will meet in Delhi from December 11 to 16, 1961. Delegates from about 30 countries are expected to attend the meetings which will be inaugurated by Shri S. K. Patil.

The Working Parties will discuss a number of subjects, such as reduction in the number of rice varieties and intensified breeding of varieties with wide adaptability; large-scale distribution of recommended seed varieties to farmers; steps to fight insect pests of paddy; better storage practices for paddy and rice; training programmes for storage personnel; efficiency of different fertiliser materials as well as methods of application and soil analysis. There will also be a discussion on the preliminary report of the survey of the fertilizer economy of the Asia and Far East Region.

DAIRY INDUSTRY

The following four firms have been granted licences by the Ministry of Commerce and Industry under the Industries (Development and Regulation) Act, 1951 for the manufacture of various types of dairy equipment in collaboration with foreign manufacturers:

(In lakhs of Rs.)	
Name of the Firm	Annual Capacity
1 Messrs. Larsen and Toubro Ltd., Bombay	106
2 Messrs. A. P. V. Engineering Co. (P) Ltd., Calcutta	47
3 Messrs. Vulcan Trading Co., (P) Ltd., Bombay	26
4 Messrs. Alfa Laval (I) Private Limited, Bombay	78

Messrs. Larsen and Toubro and Messrs. A. P. V. Engineering Company are already manufacturing a few items of dairy equipment while Messrs. Vulcan Trading Company and Messrs. Alfa Laval are expected to go into production by the middle of 1962.

SHIPPING RATES

It will be recalled that the Delegation of the Conference Lines after visiting New Delhi went to Pakistan to place its case for an increase in freight rates. As is already known, Pakistan had a bargaining counter provided by a German Shipping Line, which had offered to carry jute at much lower rates. To meet this challenge, the Conference Lines had offered to carry jute by tramp steamers. This alternative, it appears, is not acceptable to Dundee Jute Industry, which would like speedier carriage of jute than would be possible by tramp steamers. The British Shipping Delegation has returned to England. Meanwhile, India can

watch with interest the development during which there would be no increase in freight rates.

AIRCRAFT INDUSTRY

Mr. B. C. Vallieres, the President of the Syndicate of French Aeronautical Industries, offered French collaboration and assistance in the manufacture of civil and military aircraft in India. Mr. Vallieres further stated that his country could also supply components and accessories in India to help indigenous production, in addition to providing technical assistance in research, design and flight-testing fields. According to Mr. Vallieres, who was talking to Pressmen at the French Pavilion at the Indian Industries Fair, a Caravelle would be flown to India by March or April next for purposes of demonstration.

INDIAN INDUSTRIES FAIR

As more and more pavilions are being opened to the public at the Indian Industries Fair, currently being held at the sprawling Exhibition Grounds on the Mathura Road here, the number of visitors to the Fair goes on increasing. Nearly 95 per cent of the pavilions are now more or less complete. The rest are expected to be put into shape in another couple of days. The Fair, thus, will be in full swing from Monday next.

Situated in the north-west sector of the Fair are the pavilions of the private sector industries in India, probably the most exquisite among them being the Birla Industries pavilion which tells the epic story of one of the biggest industrial houses in the country. Displayed here are a wide range of consumer goods as well as machinery manufactured by various Birla enterprises. As one enters the pavilion, one views Prime Minister Nehru's grand vision of emergent India. Alongside is depicted the story of investment that would have gone into the Indian economy under the first three Plans. The contribution that Birla Industries are making towards converting an Indian home into a cosy and comfortable one is amiably depicted by laying out a modern home. Steel furniture for this home has been provided by Allwyn, jute and linoleum floorings by another Birla enterprise, fans by Orient, tapestry by Sirsik, cooking appliances again by Allwyn, sugar, tea and vegetable ghee by various Birla group industries, music by Jhankar Radios and conveyance by Hind cycles and Hindustan Motors. The roofing for the house and the fittings in the bathroom have been provided by the Charminar Asbestos Co. Elsewhere are shown a wide variety of fabrics — rayon, cotton and woollen — manufactured by Gwalior Rayon, Century, Jiyajeerao and Digjam. Of special interest to the visiting public in the present cold weather should be the woollen suitings and blankets produced by Digjam in a wide range of attractive colours and designs. A luxury coach, fully air-conditioned, is also there on view. To delight the young ones, there are Morton sweets.

Tatas have also put up an impressive show. They display at their pavilion, one of the biggest at the Fair, the various products which this house manufactures — from soaps and perfumes to heavy machinery and locomotives. The pavilion is divided into three sections, one displaying the products of the Tata Engineering and Locomotive Company, the second devoted to the display of textiles, costumes, chemicals etc., and the third one showing the manufactures of Voltas. In the TELCO section are displayed a number of photographs and charts which throw light on the various manufacturing activities of this company. On view are also two Tata-Mercedes-Benz buses (one of them a luxury bus, fully air-conditioned), a cut-out model of a diesel engine, an 8.5 tons jointless spun wheel cast by the steel foundry of the works, a core grinding machine, a couple of hydraulic presses, drilling machines, multi-

spindles, heavy P.H. excavators, diesel shunting engines etc., — all designed by TELCO engineers. In the second section are displayed exquisite textiles manufactured by Tata mills, toilets, washing soaps, hair oils, shampoos, cosmetics, perfumes, edible oils and a wide variety of chemicals. A small sector in this section displays the products of Tata-Fison — insecticides, fungicides, herbicides, rodenticides, and acaricides — which are of particular interest to the farmers. The Voltas section displays various kinds of engineering goods, agricultural implements, domestic and industrial air-conditioners and water coolers.

The arch-shaped pavilion set up by the Walchand Group of Industries tells the story of the growth of this industrial house. On display in this pavilion are beautiful models of Rihand, Koyna and Vaitrana dams (completed by Messrs. Hindustan Construction Company, one of the Walchand Group enterprises) and sugar-making and vanaspati-making machinery (produced by Walchandnagar Industries Ltd.). There are also on display here the products of Cooper Engineering Ltd. These include slotting and shaping machines, huge vertical turret lathes, various sizes of diesel engines and a powerloom. The products of Indian Hume Pipe Company have been shown in the form of specimens of pipes used in the Koyna project and several other works successfully completed by the company. The products of this group in the field of automobiles are displayed in another pavilion set up by Messrs Premier Automobiles Ltd.

An important foreign pavilion that has been thrown open to the public this week is that of Italy. Though a medium-sized pavilion as compared to the pavilions of the other foreign countries participating in the Fair, the various exhibits displayed here are well laid out. Of particular interest in this pavilion are the latest model of Fiat 2300 (being displayed for the first time in the world), a pressing machine (claimed to be one of the best in the world) and an Amut machine which can produce all sorts of plastic moulds.

angle—talent or character . . . Khasa has become a symbol for fearlessness and justice for all, and his journal is an institution of the highest national value."

It is an indispensable volume for any one who undertakes a serious study of the currents and cross-currents of contemporary politics in India.

B. SHIVA RAO

COMMERCE AND FINANCE

Vyapar, Annual Diwali Number; Bombay; Editor H. Z. Gilani; Price Rs. 1.50.

'Vyapar', India's only Bi-weekly Journal of Commerce, Finance and Industry, published from Bombay in Gujarati, edited by Mr. H. Z. Gilani, has brought out its twelfth Annual Diwali Number.

Although the main theme of this special number is India's Export Promotion, the number also contains many informative and interesting articles on several other different aspects of interest to industry and trade contributed by experts, each eminent in his or her own line, like Dr. Jivraj Mehta, Chief Minister, Gujarat, Mr. H. M. Patel, Mr. H. T. Parekh, Sm. Sumati Morarji and Prof. D. T. Lakdawala, Mahesh Bhatt, J. Dholakia and Dr. R. K. Amin, among others.

The Annual has also published the views of a number of prominent brokers on the Outlook for Stocks and shares, Bullion, Cotton and Seeds during the year 1961-62. This is an annual feature of 'Vy-par' which investors always eagerly look forward to read.

CUT AIR CONDITIONING COSTS LOW

with **BLUE STAR-WORTHINGTON**

Packaged Air Conditioners

5, 7½, 10 tons

Now made in India

Here's how BLUE STAR-WORTHINGTON Packaged Air Conditioners offer you a four-way saving in air conditioning costs.

CUT COSTS on tonnage. Single units range from 5 to 10 tons, operate independently.

CUT COSTS on installation. Units can operate without ductwork.

CUT COSTS on subsequent expansion. Single units connect up into multiple systems with minimum alterations.

CUT COSTS on operation and maintenance.

Every unit is engineered, built and individually performance-tested in BLUE STAR'S own plant to WORTHINGTON specifications.

For a better air conditioning job, call in BLUE STAR

COMPANY AFFAIRS

TITAGHUR PAPER

The directors of Titaghur Paper Mills Co., Ltd. in their annual review for the year to March 31, 1961 reveal that the sale proceeds during the year were lower at Rs. 9.52 crores against Rs. 9.86 crores during the previous year. This was partly due to the reduced selling prices of paper and paper board. The general working of the Company otherwise was quite satisfactory. If a machine in the mills in West Bengal had to be closed down it was compensated by higher output in another mill. One more mill was being erected to raise output of the Company. The closure of a mill was essential due to transport difficulties and non-availability of trained labour. The directors have pointed out that stocks of bamboo at their mills have been barely adequate throughout the year and paddy straw and bagasse had to be used as supplementary raw materials. Lack of wagons for the despatch of paper, which enjoys a low priority, has resulted in the accumulations of stocks at the mills.

The profit and loss account shows a profit of Rs. 23.92 lakhs after making provision for tax and depreciation which is far below the last year's profit of Rs. 55.142 lakhs. The directors have transferred Rs. 8 lakhs from dividend acquisition reserve. A sum of Rs. 6.26 lakhs has been transferred to statutory development reserve. Interim dividend for the year to March 31, 1961 on first cumulative preference shares, second cumulative preference shares, transferred ordinary shares and 'A' and 'B' ordinary shares absorbed Rs. 12.51 lakhs. The directors have proposed the payment of another Rs. 12.54 lakhs as a payment of final dividends for the year subject to deduction of tax on first cumulative preference shares at the rate of 10.4 per cent per annum, on second cumulative preference shares at the rate of 5.85 per cent per annum, on preferred ordinary shares at the rate of 13 per cent per annum and on 'A' and 'B' ordinary shares at Re. 1 per share.

MYSORE CHEMICALS AND FERTILISERS

The working of the Mysore Chemicals and Fertilizers Ltd. for the year to March 31, 1961 shows all round progress. Output during the year has been the highest on record and the sales too touched the peak figure of Rs. 50.52 lakhs against Rs. 47.55 in the previous year. This improved working is partly due to the fact that there were fewer interruptions and the manufacture of mixed fertilizers were also stepped up due to the growing demand in the country. The directors still believe that the electrical charges levied on the Company for the supply of energy are far too high and are a great burden on the finances of the country. This in addition to other handicaps such as the reduction in the selling rate of superphosphate fixed by the Government, the necessity for payment of heavy clearing charges at Madras and Cochin on account of non-availability of sufficient wagons for the movement of raw materials and the steep rise in the price of certain chemicals affected the financial reserves of the Company to some extent during the year under review. The directors have complained that the Government of Mysore has enhanced tax to be paid on electricity from 0.7 nP to 1.5nP per unit which would aggravate the problems of costs faced by the Company.

The Company is busy with its expansion programme and an order for a 50-ton capacity sulphuric acid plant has already been placed which is likely to operate towards the end of December 1961. Industrial licence has also been received by the Company for putting up a fully mechanised superphosphate plant which will increase the output of superphosphate to 33,000 tons per annum.

The Company recorded a profit of Rs. 3.13 lakhs after making provision for depreciation and develop-

ment rebate. The directors have proposed the payment of a dividend of 10 per cent (Re. 1 for a share of Rs. 10 each), subject to tax, which will absorb Rs. 2.48 lakhs.

CAPITAL ISSUES

Seven companies have been granted consent by the Controller of Capital Issues for the issue of a total capital of Rs. 1.8 crores. Of these six companies will issue equity shares and one company ordinary shares. The consent is valid for a period of 12 month in each case:

Modella Woollens Ltd., Bombay, has been granted consent to issue capital of Rs. 65 lakhs divided into 6,50,000 equity shares of Rs. 10 each for cash at par. Of this, shares of the value of Rs. 13.33 lakhs shall be issued to the foreign collaborator, Messrs Robert Jowett and Sons Ltd., Bedford, the U.K. The proceeds of the issue shall be utilised for the manufacture of woollen shoddy yarn and wool tops.

Nuboard Manufacturing Company Ltd., Bombay, a Company recently incorporated in Maharashtra for the manufacture of chipboard in collaboration with the Indian nationals resident in British East Africa, has been accorded consent to the issue of Rs. 25 lakhs in equity shares of Rs. 10 each. Of this, 50 per cent will be allotted to the foreign collaborators, against the supply of machinery and the balance for cash at par. The requisite licence under the Industries (Development and Regulation) Act has been granted.

Thomas Mouget and Co. (India) Private Ltd., proposed to be incorporated in West Bengal, has been granted consent to the issue of capital of Rs. 37.60 lakhs in 37,600 equity shares of Rs. 100 each. The Company is being formed for undertaking the recovery of iron and steel scraps from the steel melting shop slag at the Durgapur Steel Project. Messrs Thomas Mouget and Co. Ltd., of Redcar, England, will invest shares worth Rs. 27.82 lakhs, being the cost of plant and machinery to be supplied by them.

Electro Equipments Corporation Private Ltd., Bombay, has been granted consent to issue capital of Rs. 24,99,800 divided into 3,49,980 equity shares of Rs. 10 each for cash at par. The proceeds of the issue will be utilised for financing the expansion from 60,000 meters per annum on a single shift basis to 2,20,000 meters per annum on a double shift basis. The Company is now proposed to be converted into a public company. The Company has subscribed a paid-up capital of Rs. 10,00,200 in equity shares of Rs. 10 each.

Calcutta Credit Corporation Ltd., engaged in business as financier of automobile vehicles and development of lands and buildings, has been granted consent to the issue of capital of Rs. 15 lakhs in 1.5 lakh equity shares of Rs. 10 each. Of this, 1 lakh shares shall be issued for cash at par and 50,000 shares shall be issued as bonus shares on capitalisation of its reserves to the extent of Rs. 5 lakhs. The Company's existing paid-up capital is Rs. 14 lakhs.

Assam Government Marketing Corporation Ltd. Shillong, has been granted consent to the issue of further capital of Rs. 10,00,000 in equity shares of Rs. 100 each for cash at par. All the shares will be issued to the Government of Assam. The proceeds will be utilised for the implementation of some new schemes of marketing of small-scale industry products. The present paid-up capital is Rs. 4,83,000 in equity shares.

The Federal Bank Ltd., Alwaye, has been granted consent to the issue of capital of Rs. 1,14,280 divided into 5,714 ordinary shares of Rs. 20 each for cash at par to the existing shareholders on right basis. The object of the proposed issue is to maintain a better ratio between the paid-up capital and deposits. The present paid-up capital is Rs. 3,85,720.

Company Meetings

TUBE INVESTMENTS OF INDIA LIMITED

Twelfth Annual General Meeting CHAIRMAN'S REVIEW

Speech delivered by Sir A. Ramaswami Mudaliar, K.C.S.I., D.C.L. (Oxon), Chairman, Tube Investments of India Limited to the Shareholders at the Twelfth Annual General Meeting held on 29th November, 1961.

Gentlemen,

I have much pleasure in extending to you a cordial welcome to this the Twelfth Annual General Meeting of the shareholders of Tube Investments of India Ltd.

The directors' report, the balance sheet and audited accounts for the year ended 31st July, 1961 have been in your hands for some time and with your permission I shall take them as read.

The financial results of the working of the company during the year have been gratifying and as mentioned in the directors' report, the net profit for the year is a little over Rs. 55 lakhs. In accordance with the policy adopted by the directors of a cautious appropriation of the net profits having regard to future liabilities, the recommended dividend is the same as in the last year, being Rs. 10 per share subject to tax.

In view of the various schemes your company has undertaken, some of which will come into production in the course of the present financial year, it has been desirable to transfer a substantial amount to the general reserve. In connection with these schemes, plant and machinery costing a sizable amount have begun to arrive and are expected to be installed during the year.

In my speech last year I referred to the legal provision regarding the development rebate and how and when it was to be provided for. The response of the Government of India to the appeals by Industrialists in this connection has not resulted in the grant of the request for spreading over a period of years, the provision for development rebate, but has only resulted in the amount being reduced from 25 per cent to 20 per cent. This can hardly give any satisfaction to Industrialists trying to set up new industries or expand existing ones. It seems to be taken for granted by the Government that as Industrialists are coming forward in large numbers and applying for permission to establish new industries or increase capacity of existing ones, there is apparently no need to give the relief that has been almost unanimously asked for. Having regard to the fact that a large percentage of the development rebate has to be provided in the year of the installation of the plant and taking into consideration as already stated, the plant and machinery that have to be installed, your directors have carried forward the somewhat large sums of over Rs. 12 lakhs from the net profits to the next year. I trust that this cautious policy will be appreciated by you.

I do not desire to repeat the difficulties that I pointed out in my last speech about the power supply in this part of the State; but one factor has emerged during discussions with the Authorities which must cause concern to several of the Industrialists in the north and south of Madras State. The Electricity Board draws its supply of power for distribution to industries from two sources — from the Hydro-Electric Power Stations and from the Thermal Power Stations. It is a fact that the power generated by the Hydro-electric works is necessarily cheaper than the Thermal Power generated in this State, owing to the fact that the most important raw material, coal, has to come from great distances and freight charges either by sea or rail are necessarily very heavy. While

it can be recognised that the cost of these two different kinds of power must differ widely, it is extraordinary to note that Industrialists in the favoured zone where Hydro Electric Power is being supplied are charged very much less than those who are supplied power from Thermal Stations. In fact the charges are double in the latter case. This is an anomalous situation amounting to discrimination as between industry and industry and when it is remembered that the budget of the Madras Electricity Board is one budget, it is difficult to justify it in any way. I trust that the Electricity Board and the Government will consider the obvious justice of having a uniform rate in the State for all industries and that if it is not possible immediately, to bring about that uniformity, a phased programme of reduced charges in one case and correspondingly increased charges in the other case will be adopted which will ultimately bring about that uniformity within the State itself, having regard to one agency like the Madras Electricity Board being in charge of all power. This reform is urgently called for.

The chain factory to which I referred last year has gone into production and is producing to the limit of the present factory area available, and it is, hoped that it will come up to the planned programme as soon as the plant is shifted to the new building which is under erection, I need hardly emphasise that the chain for bicycle is one of its most important parts and the Indian Standards Institution has a task to see that chains produced anywhere comply with proper standards.

The machinery for saddles has been installed and it is gratifying to note that the saddles produced within the last few weeks have been very satisfactory. The saddles are now being offered to the market.

The import content of components of our cycles is now a negligible figure being .025 per cent and such items as are being imported are those which are not yet manufactured in this country. With the installation of a new cold rolled mill we shall have the tube factory at Avadi supporting itself from indigenous supplies provided such supplies are continuous and of the quality required. Apart from tubes required for cycles, different kinds of mechanical tubing and high quality cylinder tubes for shock absorber manufacture are in production.

The two subsidiary companies, TI Diamond Chain Ltd., and TI Miller Ltd., are progressing satisfactorily. The former, in addition to bicycle chains now produced, are expected to start manufacture of industrial chains.

In all these projects and developments, I must gratefully acknowledge the ready help and valuable advice which the company has received from its associates. Messrs. Tube Investments Ltd., U.K., and other companies in their group. The new foreign collaborators for chains and lamps have also given their best advice and help and placed their technical know-how at the disposal of the factories.

We are grateful both to the Government of India and to the Government of Madras for the interest that they have shown in the development of this company.

(Continued at the bottom of page 1056)

THE DECCAN SUGAR AND ABKHARI COMPANY LIMITED

Sixty-Fifth Annual General Meeting

MR. C. R. SRINIVASAN'S REVIEW

BEFORE commencing the proceedings of the Sixty-fifth Annual General Meeting of the Shareholders of the Company held on 27th November, 1961, Mr. C. R. Srinivasan, Chairman, made the following statement and requested Shareholders to observe 2 minutes silence in memory of Mr. H. I. Wonfor, a past Chairman and Director of the Company.

"Before commencing the proceedings of the meeting it is my melancholy duty to convey to you a most distressing piece of news. I refer to the untimely and altogether unexpected death of Mr. H. I. Wonfor on Friday morning. He arrived from England for consultations on many matters of business on Thursday noon. I found him in very good spirits and I was talking to him till 9 p.m. Next morning I heard the tragic news that he had died in his sleep. I believe all of you know him or heard of him as one of the prime architects of the new deal in the Parry Group of Companies. Personally, I have moved with him in close intimacy for the last 25 years and with every passing year our friendship has found fresh points of contact and concord. He was a friend of this country in the fullest sense of the word and had faith abundant in its destiny. It almost looks as though he came to die in the land of his adoption where he had spent the greater part of his fruitful life. May God rest his soul in peace. I will ask you to stand up and observe 2 minutes silence in memory of a great Britisher who has served this country as well as any Indian could have, and in doing so, served his own country also."

In his review of the working of the Company the Chairman said:

"It gives me pleasure to welcome you to the Sixty-fifth Annual General Meeting of this Company.

The Accounts for the year ended 31st May, 1961 and the Report of the Directors thereon have been in your hands for the statutory period and with your permission I shall take them as read.

The results contained therein reflect the position that was forecast in my statement at the last Annual General Meeting, namely that stocks at our factories would build up due to the increase in the all-India sugar production. Releases of sugar for sale by Government were severely restricted and this accounts for the drop in turnover of not less than Rs. 86 lakhs compared with the previous year.

This is the major reason for the reduction of Rs. 8.50 lakhs in our Net Profit before Taxation. I would mention that although the Company received a bonus in the shape of a rebate of Excise Duty of some Rs. 4 lakhs for increased production, this was more than offset by the contributions of not less than Rs. 6.50 lakhs that had to be made towards Sugar Export losses.

Thus, bearing in mind the need to conserve the resources of the Company, your Directors have been reluctantly forced to recommend a lower final dividend of 13½ per cent for the year under review as against 18½ per cent paid for the last year, thus making the total for the year 21 per cent against 25½ per cent last year.

In other respects I consider that the printed Accounts and the Notes thereon are self-explanatory and do not require further specific comment, but I shall, of course, welcome any questions thereon at the conclusion of my speech.

As you may have seen from the Report before you, the quantity of cane crushed and sugar produced during

the year at Samalkot and Pugalur constitute a record for both factories. While this achievement, by itself, is gratifying, the immediate benefit was, as I have just said, largely lost by reason of smaller releases of sugar from both factories. The policy of the Government of India is to release every month a fixed percentage of the production of each factory, the total quantity released being the estimated all-India consumption for the month, excluding exports for which special releases are made from time to time. The effect of this policy is to make available in the States of U.P. and Bihar a much larger quantity than can be consumed in those States. Under controlled conditions, much of this surplus was allotted to other States including Madras and Kerala, in spite of the fact that the Southern Region as a whole is self-sufficient and had no need to import anything like the quantities allotted by Government during the control period.

Now that decontrol has come in the wake of over-production, with uncertain prospects as to the size of exports, we are entering a period of unstable prices and selling pressure. Already prices have come down by about Rs. 20 per tonne. We can only hope that they will become stabilised at a level which would not have serious repercussions on all sugar manufacturers.

The rehabilitation and consolidation of Samalkot Factory to which I referred in my speech last year is proceeding. The suppliers of the fourth mill are expecting shortly the licence to import the foreign components. All going well, it is hoped to instal the mill in time for the 1963-64 season.

I stated in my speech last year that orders had been placed for almost all the equipment required for the expansion of Pugalur Factory from 1,000 tons to 1,250 tons cane per day, at an estimated cost of between Rs. 25 lakhs and Rs. 30 lakhs. The advantages of expansion need no emphasis. A lower cost of manufacture from higher output enhances the ability of a unit to withstand competition in times of abundance of supplies, but considering the position in which the industry is today, it would be wise to review decisions taken under somewhat different conditions a year or so ago. Your Directors, after careful consideration, have come to the conclusion that it would do no harm to go a little slow with the expansion scheme. Accordingly, the proposed extension originally scheduled to be completed before the 1962-63 season will be delayed probably by another year. These considerations however do not apply to the Samalkot factory where the more urgent need is rehabilitation and not expansion.

An interesting development in connection with Pugalur Factory is an agreement made with Seshasayee Paper and Boards Limited whereby they will supply the factory with two oil-fired boilers and the necessary oil fuel to burn in them, and in return take all the bagasse produced in the factory for the manufacture of paper in their new factory near Erode. No capital expenditure will be incurred by the Company, and while no monetary remuneration will be received for the bagasse, it is hoped that the oil-fired boilers will provide steadier working conditions with a constant steam pressure, thus resulting in slightly reduced working costs. In the interests of the industrial development of the country this is a welcome step and I am sure our co-operation will be appreciated. The present position is that an application for an import licence for the two boilers

made by Seshasayee Paper and Boards Limited is pending with the Government of India.

The Tariff Commission's Report on the Price Linking Formula is still under consideration of the Government of India. We continue to be in the unhappy position of not knowing the final price for cane for the years 1958-59, 1959-60 and 1960-61. Reasonable provision has been made in the Accounts for these years, and some interim payments have been made to the growers.

The distillery at Samalkot is not doing very well. Our main market is West Bengal where competition is keen. To add to our difficulties, the Government of India have fixed a very low ex-distillery price under the Ethyl Alcohol Price Control Order 1961. If we sold at this price, we would be making a considerable loss. Representations have been made to Government to consider the question of price for smaller distilleries after an examination of their actual costs. It is to be hoped that the Price Control Order will not be enforced in the meantime.

Sales of Carbonic Acid Gas were not unsatisfactory but, here again, there is severe competition in a restricted field. Nevertheless, this section of the factory makes a useful contribution to Overheads.

Our relations with Labour and Staff during the course of the year have remained satisfactory. The Sugar Wage Board recommendations have been published and accepted by Government, and preliminary arrangements have now been made for negotiations with Staff and Labour, both at Samalkot and Pugalur, with a view to arriving at a long-term agreement on future terms of service. It is hoped we shall be able to conclude a settlement with the Unions on suitable lines.

Now you will expect me to say something about future prospects. In my speech to you last year I stressed that a state of over-production was being reached and, in the event, the present position is worse than I envisaged at that time.

The sugar year 1960-61 started with a carry forward of 5½ lakh tons which is generous but not unduly so. Five lakh tons is generally considered the carry forward required to take care of any unexpected shortfall in production. Production for the year 1960-61 reached the record figure of only just short of 30 lakh tons against which internal consumption has amounted to only 21 lakh tons and in addition 2.7 lakh tons have been, or are to be, exported by the 31st December, 1961.

You will see, therefore, that we started the current sugar year 1961-62 with a stock of 11.8 lakh tons and, allowing for the buffer stock of 5 lakh tons, there is 6.8 lakh tons surplus. As you all know, Government is trying to adjust the position by stipulating that factories shall only produce ninety per cent of their highest production in the preceding two years; various exemptions however are being made in favour of new factories and those with a small output and which for various reasons did not reach a certain minimum production in 1959-60 and 1960-61. In the result I therefore fear that we must look forward to a production of very nearly 30 lakh tons again during the current year. I sounded a note of warning last year when I said that the bulk of next year's sugar crop is already in the ground. It is very difficult to see how factories which have registered cane for their full requirements are going to deal with their excess production. In the case of our two factories, I am glad to say that as production last year reached record figures, we are unlikely to exceed the ninety per cent target this year, and I, therefore, hope that the question of payment of the penal excise duty will not arise. Other factories are not so fortunately placed and there must be considerable hardship in those areas where there is no jaggery industry to take up the surplus if factories refuse to crush all the

cane offered. Even if the surplus cane is used to produce jaggery, or khandsari sugar, this is likely to be offered at give away prices which in turn will restrict the offtake of factory sugar. Government have still not made any announcement regarding sugar cane prices for the 1962-63 season, and with all the earnestness I can command I would urge Government to set at rest without delay the anxiety of growers and millers. Ministers have admitted in Parliament that the current sugarcane price is attractive compared with the realization from other crops, and if it were not, how is the increase of over 8 lakhs acres under sugarcane during the last two seasons, mostly in U.P., to be explained? The simplest and most efficacious way of reducing the production of sugar in the country to something approximately to the country's requirements is an adjustment of cane prices by an emphasis on payment for quality, and may I take this opportunity of pleading once again for a floor price which will cover growers' out-of-pocket expenses, the balance to be paid on the basis of quality. This I consider one of the most important aspects of the problem, both to meet the immediate situation and to build up an industry which may stand a chance of competing in the world markets in the future. As long as cane is paid for on the basis of weight irrespective of quality, I fear that India will be priced out of the export market.

Other steps which might be taken to remedy the situation are to cancel a number of licences for additional factories already granted, but for which no effective steps have yet been taken. Government have announced that they will not licence any further new factories, but this does not go far enough. There may be difficulties in the way of cancelling licences already granted, but is it fair to allow factories to go into production with little chance of operating profitably, to the detriment of the interests of shareholders? There is general agreement that the demand for sugar in the country must be stimulated to mop up the surplus production and there is no reason why this should not be done. The average annual consumption per capita of the population in India is 5.5 kg. compared with 47 kg. in U.S.A. and 55 kg. in U.K. The significant fact is that the annual consumption in 1957 was 20 lakh tons and in that year the then Finance Minister doubled the excise duty on sugar with a view, as he said, to restrict consumption and to make sugar available for export. How well he succeeded in the first part of his intention is shown in the offtake for subsequent years.

1958	20.5 lakh tons
1959	20.7 lakh tons
1960	20.2 lakh tons
1961	21.0 lakh tons (estimated)

It is significant that offtake should have remained static over this period despite the increase in the population, and surely this is evidence enough that the decision of 1957 should be reversed and the excise duty reduced by fifty per cent. Our people want sugar, but at a price they can afford to pay.

There has been much talk about exporting our surplus production and earning valuable foreign exchange, but even if the Government, the industry, and the growers are prepared to subsidise exports, such exports can only absorb a small part of India's surplus production. India has become a member of the International Sugar Agreement, a step which was necessary to enable her to take advantage of the American quota, and her rights under this Agreement are not likely to exceed 1,50,000 tons per annum. What our quota will be from America this year is anyone's guess, but we well know what happened to the initial quota of 2,25,000 tons which, overnight, was cut by 50,000 tons. It would be wise to realise that U.S.A. has her own problems and

we cannot expect her to accommodate us at all costs. Efforts are also being made for a quota for supply to Great Britain under the Commonwealth Sugar Agreement, but the latest information is that this is not likely to materialise. It is, therefore, unlikely that India's exports will reach 5,00,000 tons, and this, only at a loss of something on an average of Rs. 300 per ton after full rebate of excise duty, cane cess, etc. We doubtless need foreign exchange, but some may ask whether it cannot be bought at too high a price.

Andhra State is already surplus in the production of sugar and Madras State is approaching that condition. As long as Government maintain the system of monthly releases adjusted to the approximate offtake of the markets, I think a price level can be held which will give a reasonable margin of profit, but I would be failing in my duty if I did not warn you that the industry is passing through a most difficult time and I wonder if we have seen the worst yet. Stocks are moving, but not as fast as they are accumulating, and this is a situation which cannot go on indefinitely. There are two difficulties to be faced — one, financial; and the other, physical. By the time our two factories stop crushing in April next, we expect to be holding stocks amounting to 23,000 tons and valued at Rs. 1.84 crores. That is a heavy enough burden to carry financially. Any further addition will be a severe strain. The purely physical problem needs no explanation from me. No Company can go on building godowns indefinitely to store unwanted stocks, nor does sugar quality improve through storage. I, therefore, fear that a further and probably more drastic restriction of production may have to be enforced during the 1962-63 season.

In my opinion, the crisis in the industry, and it is a crisis although the Food Minister denied this at the last annual general meeting of the Indian Sugar Mills Association, cannot be met by exports. Exports can only be made at a substantial loss which the industry cannot afford to bear. The solution lies in increasing national consumption, and this can be done by paying for cane on the basis of quality, and also reducing the excise duty on sugar which will make sugar available at cheaper rates. Should consumption then rise faster than expected, the capacity is available, and it should be easy to match increased consumption with increased production.

And now, may I strike a personal note before I close. I joined the Board of this Company in 1943 and have functioned as its Chairman from 1956. The Company is in fine fettle and during the past few years in particular, shareholders have gathered a rich harvest in dividends. At the moment the outlook may not be quite so promising, but there is no need to take a pessimistic view. I have indicated some of the correctives the situation calls for and I have no doubt Government will give serious thought to the problems posed, once the General Elections in the offing are over. The malaise affects the whole industry and not a particular unit and sugar represents too large an investment in our national economy to be ignored. We have been dealing with problems of sugar so far only in terms of internal and external consumption as edible sugar — sugar as a detergent is coming into the picture and if expectations are not belied, quite a new outlet for sugar may perhaps enter our calculations. So let us wait and hope for the best; and in that confident hope let me bid you farewell. This is the last meeting of the general body that I shall preside over. A few weeks back when I had occasion to address the shareholders of Perrys Confectionery Limited, I told them that I have decided to retire from all active work and from the Boards of all Companies I have been associated with, as soon as convenient, for reasons of health. I regret I have to say the same thing to you. I have carried a heavy burden on my shoulders these fifty years

and need rest. I am sure you will not begrudge it. My best wishes are with the companies I have lived and worked for — God Bless You."

The Report and Accounts for the year ended 31st May, 1961, were adopted and a final dividend for that year at the rate of 15.5 per cent, subject to deduction of tax, on the Company's Ordinary Share Capital was declared payable on the 28th November, 1961.

The retiring Directors, Sir T. S. Venkataraman and Kumararajan M. A. M. Muthian Chettiar of Chettinad, were re-elected and the retiring Auditors, Messrs. Lovelock and Lewes, were re-appointed.

Mr. G. N. Noel-Tod, in proposing a vote of thanks to the Chairman, said:

"At this Meeting, which Mr. Srinivasan has said is the last over which he will preside as Chairman, it is fitting that I, who have been associated with him on the Board since 1954, should propose a vote of thanks.

It is difficult for me to realise that my association with Mr. Srinivasan in this Company will before long terminate. It has been a great experience for me to have worked for these years with, and under the guidance of, Mr. Srinivasan.

Mr. Srinivasan has pointed out that of recent years Shareholders have consistently enjoyed good dividends and I can assure you that the build-up of the Company to its present level of prosperity has been, in no small measure, due to Mr. Srinivasan's leadership as Chairman of the Board. It would be idle for me to attempt to disguise the fact that there have in the past been differences of opinion between the Board and certain Shareholders. Such differences of opinion must inevitably arise from time to time, and do in fact arise in other companies. Nor in this Company are they unique to the time of Mr. Srinivasan's Chairmanship. I remember well the apprehensions of Shareholders as to the conduct of the affairs of the Company by the Board and the Managing Agents in the early fifties when, due to disease in the cane, the Pugalur factory had temporarily to be closed. Consistently, however, this Board has always had as its objective the achievement of maximum prosperity for the Company. Equally, I do not doubt that Shareholders have the same objective, the differences of opinion relate only to the methods adopted to achieve this end.

I would like on your behalf to thank Mr. Srinivasan for his services to the Company over the past 18 years and to wish him many happy years in retirement."

On behalf of the Shareholders, Mr. S. Srinivasa Iyer, desired it to be recorded that the Company greatly appreciated the services of the Chairman and this was carried with acclamation.

N.B.: This does not purport to be a report of the proceedings of the Annual General Meeting.

(Continued from page 1053)

and the facilities they have afforded and the advice they have given in its expansion.

Our relations with all our employees including factory labour have been of the most cordial kind and it is a pleasant acknowledgment to make that all of them have been eager to promote the progress of the company and thereby its ever expanding programmes. I therefore acknowledge with thanks the excellent and enthusiastic co-operation we have received from all our officers and from our staff both in the administrative offices and in the factories.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

The Great Chinese Puzzle

THE much-publicised debate on Monday, December 4, on Chinese incursions in India, was a deep disappointment to those who expected that it would be a stirring preview of the North-Bombay election. The show was actually stolen by the Chinese, and the Prime Minister's speech on Tuesday derived all its interest from two announcements produced from a very recent Chinese communication to India. The Prime Minister said that China had "hinted" that, if India stepped up its military activities in Ladakh, China would be well justified in sending her troops across the McMahon Line in NEFA. Secondly, in all innocence, the Chinese had asked for a renewal of the treaty on Tibet. Thus breathing fire and sweet reasonableness the Chinese puzzle was placed fully in our coat. It is one of the great marks of uncertainty which colours all Indian policy that on neither could the Government of India give an indication to the House of what it would do. The Prime Minister said, however, that India would repulse "the invaders". The Stock Exchanges registered the full force of this declaration by a panicky crash as though a war were imminent. But almost everywhere else complacency has ruled supreme as before. Thus one wonders whether or not the Indian people have understood the implications of the deep challenge that has been thrown at us by the arrogance of our one-time Panchsheelian friends.

There will be sympathy with the Prime Minister when he argues that on Tibet there was very little else that he could do positively to stop the Chinese. It was pointed out, however, that moral or soul force still has some significance for the Indian mind. Even an ineffective protest against Chinese high-handed action in Tibet would have absolved us from the charge that we acquiesced in the change from "suzerainty" to "sovereignty", thereby losing whatever rights the Tibetan people had by custom or by that curious dichotomy between suzerainty and sovereignty which has hitherto never been adequately defined. It is one thing to argue that we were relatively helpless in the area and it is quite another thing to argue that every single action we pursued was designed to maintain Tibetan autonomy for as long as possible. At the present time, there will be no patience for any Government to agree with the Chinese on Tibet; their actions on Tibet have been shown everywhere to be as ruthless as their word is deeply false. The problem is somewhat different in regard to Indian affairs. The Chinese threats here, as everywhere else, have to be taken seriously. If only because diplomatic exchanges give us an opportunity of knowing which way the abstruse Chinese mind is moving they are necessary components in the great Chinese puzzle which India is now called upon patiently to resolve. The breaking off of diplomatic relations would only mean that India will not have any information of the meagre kind she currently obtains. The Chinese lose nothing, because, as far as one can determine, they seem to know every movement of our forces as well as every other vital strategic element in the border scene. Exactly how this happens no one can explain. Perhaps in the art of espionage we are basically inferior to the Chinese, as well as practically every other country that has made a long practice of military intelligence. Neverthe-

less, the Prime Minister is right to argue that, nothing is gained by cutting off diplomatic relations at this moment. If war should be declared this would be inevitable. One can hope, however, that this is some little distance away.

The Prime Minister deserved some sympathy for his presentation of his own rather weak case in which his repeated trust has been belied by repeated aggression on the other side. It is a fact that he still enjoys to a very marked degree the confidence of the Indian people. The nice debate on Tuesday as to who represents the Indian people or the Indian mind in this case was, however, dealt with by him with less than his usual political skill. It is true that the Congress has a majority in terms of seats; but it has never had a majority vote in this country. And, so far as seats are concerned, one might as well argue that absurd proposition that the Communist Party in Kerala is non-existent because it was routed at the polls. The fact that the Government of Kerala has the seats, though the Communist Party in Kerala is the largest single party in the State, would, in the Prime Minister's calculation, be relevant. It is quite erroneous in an emergency for the narrow view to be taken that the Opposition does not count. As a democratic compromise this is all very well in domestic affairs; foreign affairs must generally be non-partisan. Therefore, it is perfectly appropriate to argue against the Prime Minister that, whilst he has confidence in terms of the democratic arithmetic, neither he nor his Government have any proof that the majority of Indian people approve of his current action on the country's defence. It is true, there may be proof of a kind in the elections early next year. But everyone knows that this election will be fought—except in North Bombay—on other issues than the country's defence, and the overall defeat of the Opposition does not prove in any way that the Indian people, if they were allowed to choose freely without party alignment, would support either the Prime Minister or the Defence Minister in their current defence policies as against Chinese incursions.

This is the central point in the hotly-argued question as to who should handle India's defence at the present time. There is no alternative to the Prime Minister. It is the judgment of all that he should preside over the country's destiny at this hour of trial. It is not by any means the same as far as the Defence Minister is concerned. It was wise for the Defence Minister to be kept from speaking in the debate, because his unpopularity would have been immediately revealed. But the Prime Minister's defence of the Defence Minister has done nothing to provide unity in any party in the country. And for an emergency, the country needs a national, not a party, approach. For morale unity is essential. It is vital the Prime Minister should understand that his administration, while victor at the polls, cannot forge unity or strength by that victory. Indeed, the greater the feeling of frustration of the minority as a result, the greater the decline of internal morale, while facing a foreign threat. It is essential, before it is too late, that the Prime Minister should recognise that the popular vote which he enjoys and Indian

morale means identical things and that, if the Indian people are to be solidly behind his leadership at this critical hour, he must be willing to make such adjustments in his Cabinet as will enable it to command the full confidence in the country.

The Defence Minister, Mr. V. K. Krishna Menon, divides the country and weakens its morale. This has nothing to do with his great mental gifts and the powerful assistance he renders to the Prime Minister on many matters. It has everything to do with the fact that a great number of Indian people, possibly a majority, do not consider that he is wholly trustworthy in his assessment of Chinese diplomacy. His emphasis on Pakistan and Goa as against China, is certainly open to considerable questioning so far as India's vital interests are concerned; neither Pakistan nor Goa are currently encamped on Indian territory. The issue is whether or not, in these circumstances, the country's devotion to her defence effort can be as enthusiastic as it needs to be. The Chinese, if one can judge them correctly, intend to attack us in NEFA "because we have stepped up our military activities in Ladakh". To treat this situation as one which can be handled with the routine measures, which Mr. Krishna Menon has initiated without a great appeal for public support, is an error in assessing that great element of military

strategy which is to forge unity behind the fighting lines.

Because the Defence Minister escaped lightly in the debate, one might be tempted to consider that his continuance in that particular office is not in question. *The Eastern Economist* believes that, since the Prime Minister refuses to recognise a patent fact, namely, that we are greatly handicapped by the Defence Minister's leadership, the President of India, as Commander-in-Chief of the forces, should make his own position plain. It is right and proper for the Head of the State, if he ceases to have full confidence in the Defence Minister, to make his views known to the Cabinet in no uncertain terms. Should Dr. Rajendra Prasad place before the Government his own views on these matters, it will not be the first time that he will have used his great influence to obtain a hearing for a point of view which is summarily brushed aside by the mechanical majority in Parliament. Should the Cabinet reject his view that an emergency requires a different Defence Minister, the President might choose to take the supreme step of offering to resign to show how much weight he attaches to national unity at this juncture. We need to shed all our differences; it is essential that the President should prevail upon the Prime Minister to recognise the passion which many in the country feel on this point.

Guest Editorial

The Price of Silver Leaps

By PAUL BAREAU, Editor of 'The Statist'

LIKE a bombshell in the bullion market came the announcement on the 29th November that the U.S. Treasury had suspended sales from its disposable silver reserve. Let it be added that this was a bombshell which had been expected for some time past. The silver market had for some time been watching the week to week erosion of this reserve of disposable silver held by the U.S. Treasury and had been anticipating the day on which the shutters would have to come down. It had been so widely expected that a large speculative position in silver had in fact been built up—a position which, as it is liquidated, may soften the impact which this decision of the U.S. Treasury would otherwise have had on the price of the metal.

The situation in the silver market has been for some years past one of extraordinary complication and interest. For years now the demand for silver has substantially exceeded the supplies of newly mined metal. The days of bimetallism have long disappeared and country after country has also ceased to use silver for its token coins. Nonetheless, there is still a considerable coinage demand for the metal. It has been increased recently by the decision of France to give its new or "heavy" franc the dignity of a substantial silver content.

The current demand for silver, however, is mainly industrial. Large quantities of the metal go into the manufacture of photographic film and are, thereafter, irretrievably lost. Silver is also widely used as a solder in complex electronic machines. It has at times been in considerable demand by oil companies for use as a catalytic agent in refineries.

This heavy demand has in part been met by production of new silver. This metal, however, is essentially a by-product and the low level of prices for non-ferrous metals, such as lead, zinc, has kept down their output and, therefore, the output of silver, which is in such large part produced from lead and zinc ores.

The supply gap was for some years filled largely by sales of demonetised silver coins. This has certainly been true of the British market where silver coins have now been replaced by cupro-nickel and the melted proceeds of the silver coins used in the first place to repay the lend-lease silver secured from the United States during the war, and thereafter to meet current demand in the London market.

More recently the deficiency in supplies has been met by substantial sales from China. These have been caused by the need to mobilise foreign exchange in order to pay for the large imports of grain and other foodstuffs made necessary by the serious crop shortages that have occurred for three consecutive years in that country.

The seller of last resort, however, has been the United States Treasury. It holds a vast reserve of 1,800 million ounces as backing for the silver certificates which circulate side by side with Federal Reserve notes. This reserve is sacrosanct; it cannot be touched without a change in legislation. Although the silver bloc in the U.S. Senate is no longer quite so powerful as it once was, it could still prevent any change in law which could be interpreted as a device to free silver and throw it on the market in order to keep down the price of their beloved metal.

In addition to this statutory reserve, the U.S. Treasury held what was once a considerable amount of silver, secured in part by purchases from American mines, made at what was one time a subsidised price. This reserve was also swollen by the return to the United States by India, Great Britain and other countries, of lend-lease silver which the United States made available during the war. The U.S. Treasury was empowered to sell this disposable silver at 90½ cents per ounce and it has done so on a massive scale. In June 1960 this available silver in the U.S. Treasury amounted to 310 million ounces. By the end of that year the figure had been brought down to 124 million ounces and by mid-November 1961 it had sunk to a mere 32 million ounces. The time had obviously come to call a halt and the U.S. Treasury did so after the close of business on November 28th.

It would probably have done so earlier had it not been for the reasoning that by taking an initiative which would cause the price of silver to rise the United States would be assisting Communist China by enabling that country to secure a higher price for what is thought to be still substantial reserves. Whatever may be thought of the propriety or other aspects of this argument, the harsh logic of reality has dictated otherwise. The U.S. Treasury has had to stop sales because there was virtually nothing left to sell. The result was an immediate jump in the price. In the London market on the first day after the announcement

from Washington, the price jumped from 80d to 85d per ounce. The move would have been much sharper had it not been for the fact that speculators who had anticipated this development began to take their profits. Once again the speculator has proved not only his acumen but the benefits which his operations can and often do confer in smoothing out price fluctuations.

It has not escaped the notice of keen observers that there might be a parallel between what has happened to silver, the junior metal in the bullion market, and what might later be the fate of its elder and better, gold. The argument against putting up the price of silver because it would help Communist China is exactly that which is used against putting up the price of gold, except that in this case Soviet Russia takes the place of China. The loss of silver by the U.S. Treasury is in some respects comparable with its recent loss of gold in that each helps to balance the continuing deficit in the U.S. balance of payments. Within the last few days the U.S. Treasury's gold reserve has been further depleted by the British Government's decision to convert £100 million worth of dollar into gold. Might this unleash another run on the dollar, further declines in the U.S. gold reserve and ultimately a decision by the U.S. Treasury to stop sales of gold just as it has stopped sales of silver? There is no prospect of affirmative answers to these questions in the near future. But the questions are nonetheless being asked.

A DELHI DIARY

A SYMBOLIC BOMBSHELL

ON Monday, with every mark of sudden decision, certain trains moving from Delhi Station — the Defence of the Realm prevents me from giving details — were suddenly cancelled, making life for passengers to various destinations indescribably difficult. The reason for this sudden decision appeared in Parliament on Tuesday when it was confessed, rather sheepishly, that this was the result of sudden troop movements. Thus did Mr. Krishna Menon deliver his symbolic bombshell before December 4, when the Opposition was demanding his head on a charger. In the last three days many people have been trying to discover how real the preparations are. The Defence of the Realm again prevents me from speaking with that freedom with which I ordinarily talk of Captains, Cabbages and Kings. But I might say that the headlines in the Delhi newspapers, which now argue that there is no substantial change contemplated in policy on China and a lot of sabre-rattling on Goa is far in excess of requirements, reflects my humble view. All in all, a wonderful show has been put on that an emergency is arriving; but, thereafter, the impression is given in Parliament that there is, in fact, no emergency, and that India will continue to talk in polite diplomatic language wherever possible and, of course, will continue to make preparations which, it seems, in the last decade — not an unduly short time — have been substantial.

One Congress member who shall not be named because it seemed so outrageous that he should make the observation, thought that things were "much better" than they were some years ago. Some years ago we had no need of defence at any point, and if the argument is that working up from zero we have a rate of infinite progress, obviously very little needs to be said. The question is how much progress we have made in actually meeting the Chinese forces on the other side, deemed to be 150,000 in Ladakh and possibly 500,000 over the whole northern frontier. Again, the Defence of the Realm forbids me to reply to the Hon'ble Member whose capacity for complacency is greater than that of any Gandhian I know. But on the new Chinese treaty may I present my outspoken cartoonist's latest attempt at simplification?

What a Life!

"It is a very polite communication..." — Mr. Nehru on the latest Chinese note

Courtesy "The Hindustan Times"

ANIMATED SUSPENSE

The Government's policy is — animated suspense! It is animated in the cancellation of trains and in the belief that "ultimately" war might have to be waged. This is not different from the policy some months ago, and presumably we will only strike when our military authorities tell us that they are sure of success. If it should happen that the military authorities feel that we should wait for the Chinese to come to the plains before we can fight successfully, India will have to suffer

even a greater humiliation of the occupation of more territory rather than a risk of defeat. The revealing thing about the debate is, however, written in between the lines; one might guess that Congressmen are as bitter as the Opposition. How else can one explain Dr. Sushila Nayar's outburst that we needed not only a philosopher like the Prime Minister but a strong man of action, such as Sardar Patel was on Hyderabad? There are a large number of people in the Congress Party who are whispering just this, that the Prime Minister and the Defence Minister will never be able to summon enough courage to launch military action lest they should be proved in the event "wrong". The Prime Minister himself was more frank than the Defence Minister when he said plainly in the House: "I am free to confess to this House that my soul reacts against war anywhere. That is the training I have received throughout my life and I cannot easily get rid of it at the age of 72". In the face of this statement can one assume that the animated display of preparedness to resist aggression and "ultimately" to throw out the Chinese has any immediate application? Most people in Delhi consider that it is extremely unlikely that any action will be taken in winter. There are very large number more who feel that it will not be taken at all under the Defence Minister. Question: Why?

THREE TAILORS OF TULI STREET

This brings me to the Prime Minister's somewhat light-hearted reference to people involving "the people of India." He said he was reminded of the story of the three tailors of Tuli Street who issued a manifesto beginning, "We, the people of England, say..." He went on to argue that since the people of India had returned him to power five years ago, they were in agreement with his policy. With great respect to the trappings of democracy anywhere in the world, I would argue that this argument is deeply fallacious. The only way to prove whether or not the Indian people support the gallant policy is to have a referendum on this particular issue, and to have a completely free vote where Party discipline does not operate. I defy the Prime Minister to have a "free" vote in the Congress Parliamentary Party in Delhi on the retention of Mr. Krishna Menon in his present office. So far as the Opposition and Mr. Krishna Menon are concerned, we will soon know in the North Bombay election. But it is to be remembered that it is of a prestige character; Congress members are being dragooned to vote for his own candidate irrespective of their own ideas.

HARI

I leave this subject to deal with an event of some sadness. This is the sudden demise of Hari, the Prime Minister's valet, who was found dead in his sleep on Wednesday afternoon. The greatness of Hari was not that he served the Prime Minister with a dedication and devotion to duty which had no element of intrigue or preferential treatment to anybody, including recruitment to the domestic staff. The greatness about Hari was his past. Few people realised that he was a member of the legislature of Uttar Pradesh and that he stepped down from a political career to become what in foolish Indian language is called a "menial" of the household. He was not, indeed, a Boswell in that he did not narrate the greatness of his master, but it is true that he had the spirit of Boswell in his utter devotion to the Prime Minister. I need only quote a pregnant observation that 'if Johnsons are rare, Boswells are even rarer.' I salute with sorrow and affection that dedicated life based upon the principle of service to man because he was serving a cause. If only hero-worship in our time could be as dedicated and as free from personal interest as this, Thomas Carlyle's doctrine of hero-worship could be enshrined as one of the lasting instruments of salvation of the human race.

ARGUS.

THE WEEK'S NOTES

Kenya

MAGNITUDE OF THE TASK

MR. REGINALD MAUDLING's press conference of last week, on the eve of his departure from Kenya after a five-day intensive tour, was remarkable for the plain-speaking which he courageously made. The greatest danger in Kenya at this crucial point in its constitutional transformation, as he put it in outspoken words in his brief written statement, was "fear — fear of discrimination, fear of intimidation and fear of exploitation". In essence, this fear has seized the African nationals belonging to diverse alignments and it would be an error to envisage it as referring to the European and Asian settlers. In his talks with the leaders and individuals representing different shades of opinions or groups of interest, Mr. Maudling got enough indication of an undercurrent of apprehensions about developments on the pattern of the Congo. It may be that when the leaders of the political parties or groups in Kenya come face to face with the reality of the responsibility to manage their own affairs, a sense of consolidation may draw them closer and narrow down their differences. But the secessionist elements in the north-west province and the coastal region, with the dominant influence of tribalism, may not be dismissed either as of little consequence or as devoid of depth of feeling. Mr. Maudling confessed to a feeling of having been impressed by this fact. The KADU which includes the non-majority tribes, is placing accent on a federal constitution, but the implication of this term as it seems to contemplate can hardly be distinguished from a concession to regionalism. Mr. Kenyatta, who heads the KANU — a position which belongs to him by dint of his political past — has grown a wiser and more realistic leader with one month's bitter experience. He has discovered a threat to the strength of his party and its capacity to run the Government in the rapidly growing indiscipline, when each party organizer at any level is acting as a law unto himself. Mr. Maudling has disclosed that his talks with the KADU and KANU led him to believe that there existed common ground between the two on the creation of "other authorities" — other than the Central Government. But their precise nature need not be taken as a matter amenable to a smooth agreement.

India has a positive interest in Kenya's constitutional problem, apart from her legitimate sympathy for the achievement of sovereignty by the people of Kenya. This positive interest was tacitly underscored in Mr. Maudling's exhortation to the Africans to recognize the vital contribution made by the European and Asian settlers to the growth of Kenya. In another context, he made a reference to the desirability of incorporating in the constitution individual rights — rights to landed and other types of property. The Government of India has acted discreetly in making a move to cement the bonds of friendship between Kenya and India. But far more practical and concrete work must be done to obtain a square deal to settlers of Indian origin in Kenya who are adopting it as the land of their nationality. High principles of goodwill are no doubt important, but securing effective protection to nationals of Indian origin constitutes no less an important obligation of the Government.

A.I.R.

ELECTION BROADCASTS

AT LONG last the party in office owned, in a sense, the untenability of its blundering attitude in withholding such a vital and effective medium of mass communica-

tion as the radio from use for electioneering. When this issue was agitated prior to the last general election of 1957, it made a show of conceding the validity of the principle behind the demand for the use of the All-India Radio for election broadcasts by the recognized parties, but it reduced the principle virtually to a nullity by making the preposterous proposal that the party leaders should submit the scripts of their broadcasts to the AIR authorities to be read out by its announcers — apparently in the same dull and mechanical manner as the routine bulletins are usually read. This time, however, the Government has moved a long way from its former intransigent attitude and this has brought not a little gain.

It was an act of wisdom on its part to entrust the settlement of this issue to the Election Commission. The agreement now reached with the Election Commission by the six recognised parties in the Lok Sabha and a still larger number in the State Legislative Assemblies is described by the Chief Election Commissioner as tentative until the final formula is drawn up in consultation with the Ministry of Information and Broadcasting. But it is extremely unlikely that the proposal unanimously agreed upon (and to which the party in office stands committed) will be modified in any material particular. The central issue for determination was the allocation of time to the different parties for their broadcasts. The allocation is to be made on the basis of the votes polled at the last election and the number of effective candidates to be put up at the forthcoming election. The latter criterion is probably laid down to accommodate a party which was not in existence in 1957 — the Swatantra Party. In all, a total of 270 minutes are to be rationed between the recognized parties at the Central and State levels for broadcasts from New Delhi and the State Capitals. The allocation is expected to be somewhere between 12 and 15 minutes on the above tests. The purpose of equitable access to the radio to explain party policies and programmes in the calm and receptive atmosphere of the broadcasts would have been better served by allocating equal time to all the parties. There is to be no censorship of the talks (without which no agreement could have been possible), but recorded talks are to be broadcast in the interest of keeping to the time schedule.

Civil Aviation

RELAXATION IN THE AIR

ABOUT MORE than a year elapsed since the Minister for Transport gave the indication of the Government's intention to relax the rigidity in the State ownership and operation of the air services. Practical effect to this welcome modification of the policy of nationalisation is being given by the Air Corporations (Amendment) Bill which was passed last week by the Upper House. Two features of this shift in policy ought to be noted. Basically this is not denationalisation of civil aviation since the main routes now being exploited will remain the monopoly of the State-owned corporations. No parallel private scheduled operators' services are to be licensed on these trunk routes. In the next place, for all practical purposes, external civil aviation will be a State monopoly. The amendment is unlikely to make any impression on the overseas routes for the obvious reason that in the highly competitive sphere of overseas operations costs of obsolescence in particular and standards of de luxe service which have become an integral part of these operations will be deterrent to private investors. Moreover, routes with an attractive flow of traffic are served by Air India International.

But the Amendment Bill will introduce a moderate element of relaxation in domestic civil aviation. The

Bill, in effect, stipulates that privately operated services will be supplementary to those of the Indian Airlines Corporation, meaning thereby services on the feeder routes. This change in policy has been dictated by expediency and recognition of expediency is proof of the fact that rigidity on the score of nationalisation has given place to restricted pragmatism. It used to be the case of the Transport Ministry that the pace of replacement of Dakotas (necessitated by the paucity of their components and spares) by the Herons had not been as rapid as intended. Now a situation has arisen where seven Herons have been grounded and grounding of each aircraft entails a deadweight loss for the airline's finances. The scope for feeder routes is said to be encouraging on an assessment of the traffic potential that can be tapped. Development of feeder routes, in fact, was often stressed as an effective means to ease the strain on the IAC's finances. But it has currently reached a saturation point in expansion. Some of the licensed non-scheduled operators may switch over to scheduled services, but other entrepreneurs are not debarred.

The Judiciary

SIGNIFICANCE OF A JUDGE'S AGE

CAN THE question of the age of a Judge be reopened after his appointment and what is the *raison d'être* behind a resort to such an abnormal course? These interesting issues arose in a writ petition filed by Mr. Justice J. P. Mitter of the Calcutta High Court against the decision of the Central Government calling upon him to resign office by December 26, 1961, on the ground that he would attain the limit of superannuation. The gist of the facts in the case was that the age given out by Mr. Justice Mitter on his initial appointment as an Additional Judge of the Calcutta High Court was recently found to be two years shorter than the age disclosed in his matriculation certificate to which he stuck also in the certificate of age tendered on the occasion of the ICS examination. His plea was that the age mentioned in the matriculation certificate was inflated by two years to enable him to be eligible to appear for that examination.

Mr. Justice Mitter's contentions in the petition were that the age of a Judge should be determined before his appointment, there should be a finality to it, the question of age could not be reopened, the Government was acting arbitrarily in the matter and Article 217 of the Constitution was being violated in removing him from office in this manner. Article 217, which governs High Court Judges, adopts the provision of Article 124(4) applicable to the Judges of the Supreme Court, for the purpose of the removal of the former. Removal can be affected only by an address approved by a two-thirds majority of the members of each House of Parliament present at the meeting and an order passed in pursuance of it by the President. All the contentions were rejected by the Punjab High Court which heard the petition. The Chief Justice, Mr. Khosla, who delivered the main judgment, ruled that the question of age was a point of fact, neither the age specified in the matriculation certificate nor the age disclosed at the appointment by the office-holder was conclusive evidence of the genuine age and, if a particular age was accepted under misapprehension, the question of real age could be reopened as a question of fact. In the course of the inquiry instituted by the Union Home Ministry prior to making its decision, Mr. Justice Mitter declined to accept the opportunity offered to him to adduce evidence of the age in terms of his contention, such as the horoscope, family almanac, etc. In the result, the age in the matriculation certificate stood un rebutted. It is apparent that conclusive official documentary evidence of the date of birth will be available, when the entry of each birth is scrupulously made in the birth register and the name of the new-born child, after it is christ-

ened, is made compulsorily registerable alongside the father's name in it. Even so, there may exist difficulties in making the register fool-proof. There was no violation of Article 217 since the Judge is being asked to resign office and not being removed from it.

Curiosity, however, will remain unsatisfied unless the significance of a Judge's age is explained. Article 217 laying down the limit of superannuation for a High Court Judge on attaining the age of sixty (or completing the age of fifty-nine) is mandatory. If the Judge does not vacate office on superannuation due to an error about his real age, all judgments or orders passed by him thereafter could be declared to be null and void, at the instance of a party. Innocent parties affected adversely would be the victims of the error and subjected to virtual miscarriage of justice.

U.P.S.C.

RECRUITMENT POLICY

THE LOK SABHA debate on the Union Public Service Commission's report for 1959-60 was of a different variety from the annual debates that normally take place. A Congress member made the extraordinary demand for the appointment of a high power commission to conduct a probe into the recruitment policy of the UPSC and to consider the specific issue whether it is the best instrument for the purpose for which it is set up under the Constitution. It was plain from the tenor of the debate that this demand was made without properly weighing the implications to which it gives rise. In the entire debate no argument whatsoever was advanced to suggest that the UPSC was committing grave lapses in the performance of its functions under the Constitution which alone would justify the appointment of a high power commission. No human agency can claim to be the best or most perfect instrument for its assignment. But the significant fact about the debate was that any reference to an alternative agency to replace the UPSC was conspicuously omitted. In the event, Mr. B. N. Datar had an easy time in disposing of the demand and further asserting that the UPSC was the best instrument for recruitment available in the circumstances, although there would always be room for a rational effort to enhance its efficiency and improve its recruitment policy.

Nevertheless, there was some weight in the criticism against the choice of officials on the verge of retirement when the Constitution provides for a minimum period of ten years' administrative experience. Infusion of younger blood in the UPSC would cure it of some of its weakness to succumb to routine methods of selection. It would be an error to suppose that the UPSC is applying the best tests it can even now, although imperfections may persist in the written and oral tests conducted by it to judge the suitability of candidates, partly due to the subjective element involved. But it is common knowledge that the *viva voce* tests are held in a perfunctory manner, sometimes reaching the regrettable level of frivolous questions. Certainly, much greater diligence can be exercised in asking questions which can elicit the level of the candidates' knowledge and intelligence pertaining to the job. Mr. Datar made most of the point that during the year under discussion the UPSC's recommendations were accepted in all the 15,136 cases save one. But what was the proportion of departmental candidates who were confirmed in the posts to which they were recruited under "emergency"? Often, outsiders come all the way long for interviews with a sense of frustration that the entire procedure is a bare formality intended to provide a permanent placing for departmental candidates.

The World Abroad

INDIA'S CONTRIBUTION TO BRITAIN'S HEALTH

By
ODYSSEUS

THAT THE UK's population of 5 crores get free medical attention and hospitalisation, at a cost in 1961 of Rs. 114 crores, is perhaps a source of envy in India, where, with present population and resources, the cost would be prohibitive. Nevertheless, with India's Socialist ideals, I presume that when the national income rises sufficiently, a future government will seek to inaugurate a National Health Service on the UK model.

Be warned. The UK's National Health Service, like all the other government enterprises set up in the first flush of Welfare enthusiasm after the war, evokes increasing informed criticism and popular discontent.

This is not primarily because of the cost. Allowing for inflation, the increase in real costs of the NHS between 1949-59 has been only 36 per cent. As a proportion of total social service expenditure, NHS costs have fallen from 28 to 23 per cent.

Nobody in any country would grudge free medical benefits, within the capacity of the national income, to those too poor to afford them. But that is different from laying down that all individuals, irrespective of their incomes, shall be compulsorily included in a national health scheme. Some 17 lakhs of UK citizens are currently in receipt of National Assistance (i.e. relief of the poor). But the effect on the remaining 4.8 crores of inclusion in the NHS, without the right to contract out of it, is that the total amount spent on doctors, drugs, and hospitals, is decided not by the choices of individual consumers but in a Government department.

Even if officials could know how to allocate expenditure in accordance with the multiple wishes of millions of individuals, they would not be free to do so, because they have to weigh medical expenditure against other items of public outlays, as part of the Government's policy to deal with rising prices and expenditure. Far from being extravagant, UK expenditure on the NHS has been less than consumers would probably have chosen to spend in a free market, and all the evidence suggests that it has not been allocated in accordance with the real wishes of consumers.

"RICH" AND "POOR"

The Welfare argument is that if people are free to pay for medical services, there will be one standard for the "rich", another for the "poor". But, as Dr. D. S. Lees points out in his newly published "Health Through Choice" (Institute of Economic Affairs, 86 A, Eaton Square, London, S.W. 1. 64 pages. Prices 7sh. 6d.), there is no difference between medical care and other goods and services, and if you accept "two standards" for clothing, food, and all the other necessities of life, why reject it for doctors and hospitals? Nor does the distinction between "rich" and "poor" fit the facts of any society transformed by twenty years of full employment and rising incomes. The worker's average weekly wage in the UK today is Rs. 195. Why should he be free to buy a better television set and a new car, but not better medical care? Moreover, the standard medical care that he does get is, of course, not "free". He pays for it out of his rates and taxes. Further, the idea of "two standards of service" is misleading. In a free medical market, there would be numerous, com-

peting facilities, to suit individual incomes and preferences, as in all other free markets.

The weakness of the British NHS is that it is monolithic monopoly with nothing to be compared against it. Other nationalised industries monopolise the supply of their products, but all compete with substitutes, and are likely to do so still more if the UK joins the Common Market. Granted that the UK's nationalised industries react slowly, competition does nevertheless over a period compel them to improve quality and keep prices down. Medical care should be open to experiment and innovation. In the UK it is not. No new ideas can be tried without the approval of some over-worked official. As Professor W. A. Lewis, an eminent Socialist, has said, collective judgment of new ideas is so often wrong that progress depends on the freedom of individuals to back their own judgment despite collective disapproval. To let a Government committee monopolise decisions has the disadvantage of both worlds.

The great German economist, Walter Eucken, said in "This Unsuccessful Age" (W. Hodge, London, 1951), "the problem of economic power is not solved by further concentrations of power... Nationalisation amalgamates economic and political power... and increases the problem of power." The danger of the concentration of government power over doctors, dentists, and nurses is that the NHS is their sole employer. That many dislike their positions and prospects is shown by the steady emigration of young UK doctors. Between 1955-59, no fewer than 1,100 settled in Canada alone.

INDIA FILLS THE GAP

And medicine is attracting fewer students. It is interesting that the gaps thus created in the UK hospitals are being largely filled by students from developing countries, particularly India. By 1960, 41 per cent of junior posts were filled by doctors from overseas. Dr. J. R. Seale said in the Manchester "Guardian" of Oct. 23: "If present trends continue, the British themselves will soon be unable to care for their own sick." On Oct. 26, another doctor explained in the "Guardian" that medical students emigrate because the NHS has turned general practitioners into mere sorters and certifiers. Today, a doctor is not esteemed because of his skill and knowledge, but for his ability to produce the correct NHS form or to address a letter to the appropriate outpatient department of a hospital. Since the doctor's main job is to channel patients on to hospitals, the hospitals have become overloaded with the treatment of diseases, many of which unnecessarily occupy the time of the consultants, who would be better employed tackling unsolved medical problems. Today, most young registrars have to spend a period in the USA to study the recent advances in their chosen subjects. According to the "Nursing Times", 200 UK nurses emigrate every month, and again the gap is filled by overseas students, who naturally return to their own countries after training.

All this means that doctors, dentists, and nurses are not free to earn what their abilities would bring them in a free market, but must accept the scales dictated by the NHS. This creates a permanently dissatisfied group, because everyone thinks that he is worth more than he is getting. In a free market, this belief is tested, and failure to earn more (human nature being

what it is) is attributed to bad luck. In times of rising prices, doctors' fees rise with the rest, but under the NHS's fixed scales, the doctors' standard of living has fallen by one fifth. So the UK medicine has become part of politics, with mass bargaining for wages. In 1956, the Ministry rejected the doctors' claim for a 24 per cent increase in pay because to have granted it "would have been inconsistent with the Government's general economic policy". Thus the NHS uses its monopoly power to fix incomes as part of the government's policies to prevent inflation. The doctors angrily call this discrimination because this power does not extend even to the other nationalised industries, still less to private enterprise, and it is less efficient in controlling inflation and income distribution than normal fiscal and monetary policy.

A Royal Commission concluded in 1960 that the supply of candidates for doctors was reasonable and that higher salaries to encourage a greater intake were unnecessary. Since the facts do not support this conclusion, the Government may be forced to reconsider its policy, but Ministers and their staffs are overworked and this, added to the sheer inertia of a massive government machine, means that changes are difficult and infrequent.

A free market would work smoothly, without creating bitterness among patients and doctors. Doctors' fees would have been rising and more young men and women in the schools attracted by the prospects in medicine. Those in charge of medical schools would be planning for expansion. The process would be automatic, continuous, and non-political. It would generate far more information about the special economic needs of the public, and the gaps in supply, as well as direct medical research where it was found to be most needed, than can ever be comprehended by planning committees,

whose range is limited by the guesses of a few well-meaning officials.

Doctors are at present paid so much a year for each patient. This does nothing positively to foster higher standards of performance by doctors, and turns patients into anonymous "doctor-fodder", to be got through as quickly as possible. With queues in their waiting rooms, overworked doctors now lack time for the unhurried consultations with each patient, which establish a relationship of personal interest and confidence, that, psychologically, is just as, or sometimes more, important than mere prescriptions.

Above all, there is no means other than the market to determine the numbers required in any one profession within the total of all professions. Without the market, this is left to official guess work, based on previous trends, which do not allow for unexpected changes in population, techniques, or consumers preferences. The professions as a whole compete for young people, and one of the functions of a national pattern of professional earnings is to lead to a proper distribution of these young people.

Dr. Lees concludes that financial anxiety could be removed in a free medical market by combining (a) private health insurance for the majority with (b) public grants for the minority in need. The biggest medical expenses arise from hospital care. Such risks are ideal for insurance. The cost, high for the individual, is small if spread over the population. Dr. Lees' suggestion has been carried out in Australia, where a Labour government introduced universal free hospital care in 1946, which was ended by a Conservative government in 1952. Since then, Australians have been insured against hospital expenses by private organisations.

(N.B.—The Conservatives are still in office!)

The European Scene

PLANNING AND WAGES POLICY

From Our Special West European Correspondent

PARIS, December 3.

A SET of pay increases, which seemed to threaten the "wages pause" demanded by the Chancellor, was enough to start rumours last week of a devaluation of the pound sterling. The inference was too hastily drawn, no doubt, but it shows widespread realisation of the fact that if the pound is to founder it will be because of inability to secure agreement on a wages policy. The British case is not unique, but simply the most dramatic example of the dilemma that today faces all the major Western economies, whose balanced development depends on keeping wage increases within the limits set by the growth of national product. In West Germany, where those limits were held to indicate a 5 per cent annual rise in wages, there was a 9 per cent jump last year and a rise of over 10 per cent in the first half of this year; and the wages boom is still continuing. In France, where the Prime Minister wrote to employers asking them to keep the rise in wages at 4 per cent for the year, the increase will be at least 9 per cent—and the country was paralysed for 24 hours this week by strikes aimed at making that percentage much higher. In the USA, where the Administration has no power over the level of wages, the President has had to ask employers not to pass on increases in wage costs to their selling prices; and, in the face of their refusal, he is reported to be considering submitting a long-term wages plan to labour and employers and to have asked his economic advisers to study French methods of seeking labour-capital co-operation on the point.

The problem is not new, of course; the level of wages has always been recognised as a decisive factor in price-formation, in the trade balance and hence in economic development. What is new is that all these governments are thinking of assuring smooth and rapid expansion over the coming decade in order to match the performance of the Communist states, and once they think of planning, however loosely, they discover that the hardest thing to plan, and yet one of the most important, is the balance between wages and the supply of goods. It is comparatively easy to achieve this balance on average over a number of years, by allowing periods of deflation and unemployment cancel out periods of inflation; but most governments are committed to maintaining full employment all the time, so that they are obliged to try to keep the balance exact at every moment. It is easy enough to average 50 miles an hour in your car if you can drop back to 30 mph. when necessary and speed up later; but if you have to average 50 and are forbidden ever to fall below 49 mph., driving becomes a strain. Moreover, all the preliminary enquiries into planned expansion have made perfectly clear the limitations on the growth of production. As long as these were not recognised, or exactly calculated, generous wage increases could be given in the hope that productivity would keep pace; but once it is known for certain that there is a maximum of 5 or 3 per cent, depending on the local circumstances, in the rate of expansion, then the pace of wage increases has to be adjusted accordingly. Finally, the liberation of trade and of capital movements between the various Western economies means that they have to co-ordinate inflation rates; one country can no longer afford to let wages get out of hand and protect its economy by blocking the entry of goods and the exit of capital.

Not only has a wages policy become, for these reasons, more urgent, but government have a better conscience about asking labour to accept it. The trade unions (very naturally, in view of their experience under the old form of capitalism) take a wages policy to be a one-way affair, to mean the limitation of workers' rewards in favour of other classes. But once governments are guaranteeing the workers full employment and once they can demonstrate that wage increases beyond a certain point are immediately wiped out by inflation or, a little later, punished by unemployment in export industries (and not only in export industries, now that imports are liberalised), then they feel entitled to present a wage policy not as a means to limit workers' rewards but as a means to maximise those rewards in terms of real purchasing power. They are encouraged to do so by the fact that most trade union leaders now know and admit this. But there are three sources of indiscipline: the rank and file workers, the Communists and private employers.

In countries where the rank and file are not obedient to their union leaders, these latter are pressed from the base to demand wage increases which they know not to be in the workers' interests. In countries (such as France) where there is an irresponsible Communist labour movement which seeks to extend its clientele by outbidding the non-Communist unions, regardless of the consequences for the working class or for the national economy, union leaders hesitate to collaborate in a policy which they know to be just. Finally, in fully employed and expanding economies, such as the Western countries almost all have today, private employers compete for scarce manpower by offering increases above the national average. Although governments have removed many of the "rigidities" that ensured that increases in one department were automatically passed on to all the others, they cannot abolish the "rigidity" of envy. One group's earnings may no longer be indexed, even indirectly, on another group's earnings, but the first will want to keep up with (or to keep a certain distance ahead of) the second. A clear case exists in Britain and France, where the State is a large employer. As an enlightened employer, it seeks to keep wage rises within safe limits, but if the private sector competes for manpower by offering bigger salaries, the State's employees are soon out on strike. The French Government is so convinced that its employees are being "debauched" by the unbridled wage increases in the private sector that it has had the idea of penalising private firms that grant increases above the national average: the money required for raising the pay of the State's employees is to be raised, in part by taxing firms that agree to increase salaries too fast. However, since this means punishing the most dynamic firms, which need more labour exactly because they are expanding fastest, it means penalising progress, and is no substitute for a national wage policy.

The Government of Britain, the Common Market countries and the USA are all in quest of such a policy today. The Common Market Commission has recommended labour-capital-government collaboration in fixing a wages plan, and the defunct OEEC has left behind an interesting study on how this is achieved in certain countries. (A 270-page appendix to its report on the Problem of Price Increases, published this year.)

cites the examples of Sweden and Holland. In the former country the confederation of trade unions, the L.O., meets every year with the employers' federation, the S.A.F., and they fix a global rate of increase for wages in the following 12 months, with indications on the variations from the average that can be tolerated in special cases. Individual unions and industries then negotiate wage agreements within this framework, and their agreements have to be submitted to a tribunal representing equally the L.O. and the S.A.F., which endorses or rejects them. It is to be noted that the Government has no say in this procedure.

In Holland, on the contrary, the control is tripartite. Firms and unions negotiate wage pacts and then send them to a national tribunal of employers' and workers' organisations; this tribunal simply expresses a judgment on them, and then forwards a copy of each agreement and its opinion on it to the "college of State mediators". This body is nominated by the Minister for Social Affairs from independent quarters (mayors, deputies, academic people), and it receives the advice of the Planning Commission and the Finance Ministry. It has the final say on wage agreements; no employer can raise salaries without its approval, and it can fix wages in sectors where there has been no agreement between employers and workers. The system works, in that unions and firms have been brought to admit the fatuity of short-term wage increases that are damaging in the not-so-long run, and at times of balance-of-payments crisis the unions have even agreed to freeze wages while prices rose—and over the past decade strike-time lost has been only 10 minutes a year per worker.

The Swedish and Dutch examples are interesting, but one needs to remember that these are small countries that depend on international trade much more than most, so that even the most ignorant, selfish and short-sighted employer or worker knows that any untoward rise in costs and prices would be instantly translated into trade losses and possibly unemployment. The connection between a local wage agreement and the national interest is harder to see in bigger countries that are less sensitive to international competition. It

exists there, of course, but it requires a greater effort of imagination to grasp it. All the more reason to make that effort, and what the bigger countries can learn from the Swedish and Dutch examples is the utility of frequent confrontations between labour and employers to discuss this very question. Britain and France might never be able to set up such smoothly operating mechanisms for wage control, but they would lose nothing by seeking to enlighten unions and employers at regular intervals on the effects of their wage agreements. This confrontation now takes place in the course of French planning, but once every four years is not often enough; there is a move to make these meetings six-monthly affairs.

Current British experience, where a capital gains tax has had to be offered to the unions as the price of their collaboration in a wage policy, warns us that labour will not accept an over-all control of its earnings unless it is convinced that other classes are also submitting to a national discipline. When a single firm negotiates with its union, the workers already ask embarrassing questions about real profits, directors' salaries and the like. When the representatives of the nation's unions meet employers' organisations, they will raise questions about stock market profits, the earnings of shopkeepers and professional men, the gains of entrepreneurs and shareholders' dividends; and this is only natural. People who do not want such matters aired should abandon hope of a national wage policy. Moreover, if the government intervenes in the discussions and pleads the limits set by the "national interest", it must expect to have unions—and employers too—call its conception of that interest into question. For example, if it claims that defence expenditure and aid for development make restriction of wage increases inevitable, it will find that its partners do not accept its estimates of those needs unquestioningly. If it is unwilling to discuss these matters with unions and employers, it too should abandon hope of a national wage policy. It appears, then, that the search for a wage policy could lead governments into paths they would rather not enter, and yet they are being pushed in that direction by the need to plan maximum expansion without inflation.

MR. AL FOIL WRAPS CONFECTIONS TO PERFECTION

"Why not say it 'sweetly' Sir," said Mr. Foil helping out the worried gentleman. "Delicious chocolates and toffees to tempt sweet sixteen, soft candies to please Grand-Ma and ice-cream or biscuits to delight the kids at home... your choice in sweet presents is wide. Only be sure that they are all foil wrapped. Confectionery protected by aluminium foil looks attractive and tastes wonderful as only fresh sweetmeats do... because foil packing keeps in the tasty goodness while keeping out dirt, damp and dangerous contamination."

Long and extensive experience as Manufacturers of Aluminium Foils for packing goods in Cigarette, Pharmaceutical, Confectionery, Tea and many other industries.

NATIONAL AC 2561 A

Economic Report from the U.S.

ACCELERATED GROWTH RATE

By GUY SIMS FITCH

WASHINGTON, Nov. 29.

WALTER W. Heller, Chairman of President Kennedy's Council of Economic Advisers, is an economist with a gift for words—a combination that is refreshing and all too rare. Nowhere is this combination more in evidence than in Mr. Heller's penetrating views on economic growth—its problems and its requisites, its challenge and its promise. This scholar with a style sees economic growth as both an end in itself and an instrumentality, "both the pot of gold and the rainbow." The why's and wherefore's of this view can best be summarized in Mr. Heller's own words: "We seek economic growth, in part, to raise the American standard of living and diffuse its benefits more rapidly. Economic growth will also make it easier to meet the needs of a rapidly expanding population for a higher standard of public facilities and public services. In addition it is our great pride to be an open society without class conflict, with careers open to talents, and a high rate of social mobility. Much of what is best in the American character is a reflection of growth—first through the external frontier as the nation pushed West, and now through the internal frontier of expanding educational, occupational, and economic opportunity. Finally, we need to grow faster to meet the challenge to freedom in the world today. Our growth performance will not only determine our capacity to strengthen the defences of the West and to assist the underdeveloped nations in realizing their awakened aspirations, it will also affect the choice which uncommitted countries make in charting their own paths to economic development. Growth in our own country will help make this a 'decade of development' both here and abroad."

What does an accelerated growth rate require, and what is the administration of President Kennedy doing in this sphere? "Faster growth requires a more rapid rate of increase in productivity. To achieve this, the administration is committed to policies which will encourage a higher rate of investment in both physical and human capital—to expand both plant capacity and brain capacity. To step up the rate of investment in business capital, we need, first of all, full recovery in the sense of full realization of our existing productive potential. The administration also is moving ahead with reforms in the Federal tax system designed to stimulate business investment. The administration has moved aggressively to make investment funds readily available to small business. It has also sought, and will continue to seek, to maintain credit readily available to business investors at reasonable rates of interest. But more material capital is not enough; we must also have more research, better organization, and a higher level of productive skills. Recent research has shown that over half the increased output in the United States since the turn of the century has sprung from such relatively invisible sources. Fortunately, these invisible sources can be deliberately cultivated by private initiative and public policy."

What part will education play in this? In recognition of the contribution made to productivity by improved education and training, the administration has given heavy emphasis to the desirability of improving education at all levels. Further, ways and means of stimulating industrial research are under active study. Since Government provides the major source of finance for research and development projects in the American economy, Federal policy can, and we are determined it will, exert a powerful stimulative influence in this field.

How far can Government go in this direction? "The Government, of course, cannot decree a higher rate of economic growth. A better growth performance rests on individual decisions of businessmen, workers, teachers and professional people throughout our society. Government can only seek to create an atmosphere which will encourage the kinds of behaviour which are conducive to rapid economic growth." How does prosperity, a by-product of growth, contribute to the achievement of economic and social goals? "Prosperity facilitates the adjustments required by economic growth and progress and international trade. Firms will be better able to make needed adjustments to the ebb and flow of competitive forces, workers will be better able to respond to the changes in the regional and occupational pattern of the demand for labour; and the economy will be better able to absorb needed structural alterations. In a full and functioning economy, change need not be feared. Instead, change becomes an engine of progress. Our nation has made a good start on the road to full recovery and faster economic growth. We must maintain the momentum."

Special Article

A FOOD POLICY FOR EMERGENCY

THE Prime Minister's statement in the Lok Sabha on Wednesday on the Indo-China border dispute and movement of troops to the Goa border portend an extraordinary emergency that may overtake India in the near future. The troop movement has led to the cancellation of some trains in the northern, central and western railway zones. Though these cancellations have been confined as yet to passenger trains, it will not be long when the schedule for goods trains will also be affected. This will obviously lead to an accentuation of transport bottlenecks the impact of which on the general price level in the country is not difficult to visualise. In so far as this upswing in prices relates to non-essential commodities of consumption, one need not worry much about it. But the effect they are likely to produce on the prices of food-stuffs is positively a matter on which action must be taken before hand.

It has been only during the past one year or so that food prices have shown a tendency to go down or at least not spiralling up. This welcome relief has been brought about by a fairly good harvest in two successive years, 1959-60 and 1960-61, and massive imports arranged from the United States under the PL 480 programme. Though the current year's crop outlook is no less promising and the food stocks with the Government are by far the best in recent years, the emergence of new transport bottlenecks will upset the distribution pattern and give an upward push to food prices, especially in the deficit States, two of which, unfortunately, are situated close to the areas where deployment of troops will be concentrated. That can have a great demoralising effect on the population in these States. A well thought-out plan has thus to be prepared in advance to mitigate the hardship which the deficit States in general, and Maharashtra and West Bengal in particular will have to go through consequent upon the out-break of hostilities on the Indo-China and Goa borders. Special care has to be taken in the case of Maharashtra and West Bengal for these two States have also great concentra-

tion of industries.

A recent study made by the Directorate of Economics and Statistics, Ministry of Food and Agriculture in respect of fluctuations in prices of rice and wheat—the two staple food crops—since 1958-59 provides a wealth of data on the basis of which it is possible to proceed with the formulation of a food policy for an emergency such as the one that seems imminent. The study points out that although the wholesale price index of food articles has more or less shown a linear downward trend since 1958, there have been witnessed wide disparities in the prices of foodgrains in different States as a sequel to formation of food zones and imposition of restrictions on movements from one zone to another. The tables reproduced here reveal that rice prices in the deficit States like West Bengal, Bihar and Maharashtra, have commanded an appreciable premium over those prevailing in the surplus States like Orissa, Andhra Pradesh and Madhya Pradesh. Similarly, wheat prices in the deficit States of Bihar, Maharashtra and Gujarat have commanded a high premium over the prices prevailing in Punjab, Madhya Pradesh and U.P. These wide disparities in prices in the deficit and surplus States have tended to narrow down recently with the readjustment of the food zones and relaxation of restrictions on the movements from the surplus States to the deficit ones. The improvement in the movement of food stocks which has recently become feasible will be upset with the emergence of abrupt transport bottlenecks.

To guard against this danger, it is imperative that the Union Ministry of Food and Agriculture should take energetic action in recasting its food policy. The movement of foodstuffs, of course, will continue to receive high priority, but much of the strain on the country's transport system can be obviated if sufficient stocks of essential foodstuffs are built up in the deficit States. So far as wheat is concerned, there may not arise any great difficulty because the wheat imported from the United States is already being stored on Government

account in some of the deficit States. The problem in the case of rice will, however, be more serious as imports on Government account from abroad form only a negligible portion of the total supplies. Fortunately, the present time is opportune for the Government to build up stocks of this essential commodity by resorting to procurement in surplus States; rice prices touch

their lowest level in December-end or January. It is, of course, inevitable that large-scale purchases on Government account for distribution in other regions will have a direct repercussion on the internal prices in the surplus States. But this is a sacrifice they will be called upon to make in the context of the national emergency.

THE MYSORE KIRLOSKAR LIMITED,

REGD. OFFICE: YANTRAPUR P.O., HARIHAR,
(MYSORE STATE-INDIA)

NOTICE

Notice is hereby given that the Twentieth Annual General Meeting of the Company will be held on Friday the 29th December, 1961, at 11-00 A.M. (I.S.T.) at the Registered Office of the Company at Harihar, to transact the usual business and also special business, the details of which have been made known to the shareholders separately by notice sent along with the Balance Sheet and Profit and Loss Account, and Directors' Report.

The Share Transfer Books and Membership Register shall remain closed from the 19th December, 1961, to the 2nd January, 1962, (both days inclusive).

By Order of the Board,
For THE MYSORE KIRLOSKAR LIMITED,

M. S. VARTAK,
SECRETARY.

Dated 17th November 1961

SITUATION VACANT

ASSISTANT SECRETARY

APPLICATIONS are invited for the post of Assistant Secretary in the Office of the Institute of Chartered Accountants of India, New Delhi in the scale of pay of Rs. 850-50-1250 (In addition, the officer will be entitled to Compensatory and House Rent Allowances but not to any Dearness Allowance. Detailed particulars may be obtained on application).

A higher starting salary in the grade may be given to a deserving candidate.

The officer will be entitled to contribute to the Provident Fund as per the Rules and to avail of Medical facilities as per the Rules.

Qualification: A Chartered Accountant possessing administrative and secretarial experience.

The Council may however waive this condition in the case of a candidate possessing qualifications otherwise considered suitable for the post.

The Age limit: 35 to 40 years.

The selected candidate will be on probation for a period of one year.

Apply to the Secretary, Institute of Chartered Accountants of India, Post Box 268, New Delhi-1, before 10th January, 1962.

In this we believe

This their dedication, that
we come closer to each other

CHITTARANJAN. The day India became a Republic, Chittaranjan started production...turning out an average of a hundred locomotives a year. The men at Chittaranjan have achieved a high degree of efficiency. For they are men dedicated to a new way of life bringing our people closer together.

We of the Mafatlal Group believe in this way of life. That is why our production is geared to the hungry demands of a growing nation. We produce today a wide range—textiles, jute, sugar, dyes and chemicals. To people in every walk of life we pledge these products, with confidence and faith in the future.

historic voyage ended as the steamship "Enterprise" reached Calcutta on 9th December, 1825. The first steam-powered vessel to make the England-India run, the 500-ton "Enterprise" won a cash prize of Rs. 100,000 offered by Calcutta's trading community for this truly pioneering achievement. Her captain on the hazardous voyage round 'the Cape' was James Henry Johnson, Commander, Royal Navy, and a hero of Trafalgar.

Though the "Enterprise" was the first ocean-going, partly steam-propelled ship to arrive at any Indian port, small steam-powered craft were being built in Calcutta as early as 1823.

Among the oldest and best known marine and general engineering firms in the country, a privately-owned concern known as Reid & Company's Hooghly Dock (founded 1819), the forerunner of The Hooghly Docking & Engineering Company Limited, was already flourishing before the introduction of steam to India. The 'Hooghly Docks' are a part of the vast industrial and engineering organisation of Martin Burn Ltd., an organisation which is playing an important role in India's industrial progress.

THE BUSINESS WORLD

Meddlesome Muddling

By CROESUS

LAST week-end's announcement of their decision, by the directors of the Shivrajpur Syndicate Ltd., to effect a further considerable reduction in the operations of the Shivrajpur group of mines provides yet another proof, if further proof were at all needed, of the Government of India's meddlesome muddling in manganese, especially since the advent of the State Trading Corporation. The situation that this decision betokens is very serious indeed, for, I learn, it will be the second closure in the past 20 years — the first was during World War II — and, according to these responsible persons, "unless immediate remedial action is taken by the Government, it may not be possible for the Company to continue operations for very long even at this reduced rate." (It may be noted here that, although the Shivrajpur Syndicate Ltd. has three mines, Shivrajpur mine, Pani mine, and Bamankua mine, with an average manganese production of 7,000 tons — this was so until 1960 — it is only the Shivrajpur mine which is being worked now, the other two having closed down several months ago.) As it is, even in the Shivrajpur mine, underground mining has been stopped ere now, and the directors have been contemplating to close down even surface mining. If this should happen, the ranks of the unemployed in this country (which are even now not inconsiderable by any means) will swell further by a couple of thousands or so. But, apart from this purely human angle — a fundamental one though — and such losses as the Shivrajpur Syndicate Ltd. — that is, the poor shareholders of the Company — may incur, there is a national angle to this question, namely that of our exports, especially to the U.S.A. It may not be known to many that, out of the total exports of manganese ore from India, the Shivrajpur Syndicate Ltd. accounts for nearly 10 per cent and that out of the latter, as much as 95 per cent is exported to the U.S.A. to earn precious dollars for this country.

One would have thought that any responsible authority would think a thousand times before throwing a spanner into an otherwise smoothly working mechanism such as this. And, if perchance, any such misadventure happened, one would have thought the authorities concerned would lose no time in looking into what has happened, find out what has gone wrong and set it right without any avoidable loss of time. I had a glimmer of hope that this eminently sensible approach was being followed by our Government also, when, following the meeting of the Mineral Advisory Board in May last, a special ad hoc committee for manganese was formed at the instance of the Union Minister for Mines and Fuel and this committee made a number of extremely useful recommendations. That hope grew further when, in September last, at both the Export Promotion Council meeting and the two conferences arranged by the Union Ministry of Commerce, heartening assurances were given by official spokesmen to afford immediate relief to the industry. And I said to myself that the manganese interests were the luckiest when, on the top of these encouraging developments, the Union Minister for Railways announced a 50 per cent reduction — to take effect very soon — in the freight on manganese ore, the credit for which has been rather prematurely

appropriated by the State Trading Corporation (vide its rejoinder to the Economic Intelligence Unit of the "Economist", London)! But, alas, as ill luck would have it for the manganese interests, these rosy promises yet continue to remain as promises. "Unfortunately to date" — I am reproducing verbatim what Mr. A. N. Haksar, Chairman of the Shivrajpur Syndicate Ltd., told us at a Press Conference only a few days ago — "the Government has not taken any action whatsoever to grant these essential reliefs to the industry. There has been no reduction in Railway freight."

This is bad enough in all conscience. But the Government, it would appear, was not content to be only negatively unhelpful thus. Wanting to be positively unhelpful too, perhaps, — and to make matters worse — it is alleged to have discontinued the barter transactions, which have been mainly responsible for maintaining our manganese exports during the past 2-3 years. No wonder then that about 75 per cent of our manganese mines are believed to have closed down.

It is, of course, known that, for a number of years past, the Indian manganese ore industry has been facing great difficulties, as a result of which this country's exports of manganese ore have steadily declined, and the pace of this decline has accelerated perceptibly during the first half of this year. Thus, whereas, over the last five-year period (1956-1960), these exports averaged 12.04 lakh tons per year and yielded approximately Rs. 19 crores (or an average of Rs. 154 per ton) by way of foreign exchange, during the first half of 1961, they have fallen to 3.18 lakh tons and yielded only Rs. 3.15 crores (or less than Rs. 100 per ton!). It is also known that, in this particular case, there are also factors over which we have no control, such as a contracting world market, for example, but this does not explain away all our losses on the manganese export front. Nor do the following causes listed by the manganese interests:

- i) Slump in the international market (there has been a fall in prices of Rs. 50 to 54 per ton);
- ii) Entry of new producers into the field (Russia, Brazil, and others);
- iii) Arbitrary export tax on buyers and unhelpful attitude towards forward contracts;
- iv) Demands for higher wages by dock labour.
- v) Unhelpful Government policies, including
 - (a) abolition of barter deals,
 - (b) absence of sufficient incentives to manganese exporters,
 - (c) compulsion on free sample shipment analysis, and
 - (d) entry of the S.T.C. on the scene.

Among all these, perhaps, the entry of the S.T.C., which has had its functions clearly defined for the first time only a few days ago — that is, six full years after it took birth — is the major villain of the piece. To quote the London Economist Economic Intelligence Unit's Report on The State Trading Corporation and India's Export Trade, "since 1956, however, the S.T.C.'s mishandling of the manganese ore trade has tended to

reduce India's share of the world market still further, and the full effects of this mishandling are probably yet to be felt." It is understandable that those in charge of the S.T.C. do not accept this serious charge. They have made a feeble attempt at refuting the criticism, which has not raised them or the S.T.C. in the estimation of the public. But all is not lost yet. They can still retrieve their reputation and prestige only in one way, and that is by not taking credit for what they have not achieved but by really achieving something —

I mean by getting the Railways to implement their promise to reduce the freight by 50 per cent and by prevailing upon those concerned to reduce royalty — and by not coming in the way of resumption of barter deals with the Western countries in their enthusiasm to build up trade with the Communist countries. These reliefs may have been demanded by the Directors of the Shivarajpur Syndicate Ltd., but that is no reason why they should receive scant attention, if the resulting good also helps the country at large.

The Associated Chambers on Power

THE Associated Chambers of Commerce of India at the annual general meeting held last week at Calcutta highlighted the problem of power shortages that could cause so much distress to the industrial producers not only today but in the coming few years as well. Naturally, therefore, one of the most important resolutions passed at the meeting was to persuade the Government of India to raise the power supply in the immediate future, especially in the regions of Punjab, Madras and West Bengal. The general opinion was that the investment in power generation and distribution provided for in the Third Plan was insufficient for the country's industrial needs and that even if the projected targets were achieved, a serious power shortage would remain. It therefore urged that immediate thought be given to an upward and realistic revision of power targets and that the highest priority be given to the implementation of the existing expansion plans.

The problem of power shortages in fact originated when the Second Five-Year Plan, in the face of foreign exchange crisis, was cut to the core and instead of a target of 6.9 million kW, actual production at the end of Plan was only 5.7 million kW. It is significant to note that the target for the Third Plan which was to increase the installed capacity from 5.7 million kW to 13.4 million kW, of which 12.7 million kW were expected to be in commercial operation by 1965-66 has to be read in a different light. It is important that only one-third of the additional capacity planned may be actually generated during the first three years of the Plan with the result that the industrial development expected to materialise during these years will be hampered. In fact, power shortage at the moment is perhaps the most important single factor preventing the achievement of most of the industrial targets.

The speakers at the meeting made it known that the shortage of power supply in the Bombay region was not very serious, perhaps, due to the speedy accomplishment of the Tata's Thermal Power Station at Trombay, the Koyna hydro-electric project now under construction and the progress made with the proposed atomic power plant at Tarapore. The state of power supply in the Northern India, however, was going to be really difficult. Despite the proximity of the Bhakra Nangal Hydel System, the power cuts in this region were common and were explained as the result of the fall in water level in the reservoirs. The speaker from Punjab indicated that industrial consumers of power in that region had to put up with restrictions, load cuts and 'staggering' and new industrial units were not getting connections. It was indicated that the gap in the Punjab region which was expected to be nearly 53 million watts in 1962 may widen and may be nearly 334 million watts by 1965-66. This was after taking into consideration the additional power that was scheduled to be generated in the region. The off-take of power in the Punjab region by bigger units like Nangal Fertilizers is to increase progressively and the same is expected in the industrial townships, like Shahdra around Delhi.

In the South too, fluctuations in availability of power due to lack of water in the dams had been a serious problem. It was indicated that certain industrial interests in Madras State had become so apprehensive about power supply that they had formed themselves tentatively into a consortium of companies to investigate the possibilities of establishing a new power station as a measure of ensuring against crisis which would result in inevitable cuts and shortages which they so much feared. Even if this scheme failed to materialise, it would serve to focus attention on the real fears of the industrialists which could not be ignored.

A similar crisis was envisaged in North-East India and the coal industry it seemed was specially hit by frequent power cuts which seriously prejudiced the safety of workers due to interruptions in cage winding, dewatering and ventilation of mines. The 'staggering' working hours could not help since collieries habitually worked three shifts. Similarly the jute industry, perhaps the single biggest industrial consumer of electricity in Eastern India, lost over 40 lakh man-hours during February-June this year. This dislocation hit the industry very seriously because the shortages of raw jute were another problem and if the power cuts came when the raw materials were available the factories faced a double disadvantage. Similar losses were registered among engineering industrial units and electro-chemicals plants. The region, it was pointed out, would have a demand around 2,090 MW by 1965-66 against the total saleable capacity of only 1919 MW. This shortage of 171 MW was, therefore, going to cause serious problem.

Various suggestions were made at the meeting to face this impending crisis, apart from the raising of the targets for investment on long-term projects during the Third and Fourth Plan periods. It was, for instance, indicated that to raise the power supply immediately while larger hydel projects were not likely to start their supplies, it was necessary to erect thermal stations based on coal, lignite or oil in the regions where power supply was required most urgently. These units could be moderately sized from 200 to 400 MW capacity or even of smaller sizes of 50 to 75 MW capacity. It is important to note that the supply lines from larger power stations were vulnerable to cyclonic storms and high floods, particularly in the regions of Punjab, Madras and Bihar where floods were more common. Such thermal power stations with comparatively limited supply lines would be of specific advantage. It was suggested that the additional power capacity of smaller units could be advantageously granted to organisations already in existence because they could utilise their experience as also their distribution networks which were in operation. Relief could also be given by bringing in small generating sets, diesel or steam, of capacity between 50 and 2000 kW for use of individual industrial units. What is required, therefore, is a special enquiry into the needs of power requirements in various regions during the coming years and a revision of investments and targets for the Third and Fourth Plans.

Business Notes

Shipping

A BOLDER POLICY URGED

WORLD SHIPPING tonnage has almost doubled, having risen from 69 million gross tons in the pre-war years to nearly 130 million gross tons today. Over the same period, world maritime trade too has increased more or less to the same extent. In fact, over the last decade (between 1951 and 1960), it has improved from 349 million tons to 1,100 million tons, i.e. an increase of 70 per cent, according to statistics published by the U.N. The increase in actual capacity is found to be due, at least in part, to the faster ships in service today than before. Another factor contributing towards this development has been the increase in the proportion of tanker tonnage from about 20 per cent of world tonnage in 1951 to 31 per cent in 1960. And this development in turn is mainly due to the gradual replacement of coal by oil in industries and ships.

During the last decade, the world has witnessed the emergence of a number of new independent nations, many of whom are naturally endeavouring to build up their own industries and trade, as also the shipping of their own to carry this trade. As is only to be expected, they have been facing stiff competition from those who are already well entrenched in the shipping line and, for daring to compete with them, doubtless, they are not infrequently accused of indulging in "flag discrimination". Mr. G. L. Mehta, Chairman of the National Shipping Board, availed himself of the third Shipping and Ship-building Conference, held in Bombay last week, to make it very clear to all concerned that the argument of "flag discrimination" was not only untenable in the context of developing countries, but particularly so as regards India which has a vast coast line and a very large maritime trade. If only because of these two considerations, Mr. Mehta maintained, this country was justified in taking all such measures as are designed to give legitimate assistance to national shipping in order to enable it to carry a due share of its maritime trade and thereby to compete with the shipping of those countries which have been established for decades. Whilst conceding in principle that, shipping being an international industry, "flag discrimination" was rather untenable, the N.S.B. Chief observed that reasonable protection accorded to a nascent industry like the shipping industry by the Government of India should not be construed as tantamount to indulging in discriminate practices. "The contribution which shipping can make to assist exports and correct or improve the balance of payment," he declared, "is an important economic consideration that justifies the positive and helpful attitude on the part of the Government of its national shipping."

Referring to some of our shipping problems, Mr. Mehta recalled how, during the first two Plans, our merchant shipping had increased from a little over 100,000 to 900,000 gross tons—it is expected to touch a million-ton mark very soon—and while he regarded this as a matter of great satisfaction, he cautioned that this should not create a feeling that all is well with the industry. For, over the same period, as he pointed out, the progress achieved by countries like Germany and Japan has been startling. It was the pertinent contention of Mr. Mehta that the expansion that has already taken place in our shipping has not been in tune with the increase in our foreign trade. It would have been in the fitness of things, therefore, he observed, that our Government should have accepted the recommendations for an addition of 500,000 gross tons during the Third Plan. As everyone knows, however, this has not been done and the Planning Commission has allotted only Rs. 55 crores which is sufficient to create an additional

tonnage of 200,000 only. Though our meagre foreign exchange position does not permit of higher allocations, he went on to stress the point that, in view of the needs of the country, a higher allocation was absolutely necessary.

Accepting the need for further allocation—and this certainly is no small mercy—Dr. Subbarayan, the Union Transport and Communications Minister, who inaugurated the Conference, was frank enough to admit that, even if the Government could have allotted some more funds, it could not afford to give all of it in the form of foreign exchange. He, therefore, exhorted the industry to seek ways of acquiring ships on a deferred payment basis on easy conditions and also to utilise the credit facilities offered by countries like Czechoslovakia and others.

Power

CAPICITORS TO THE RESCUE

THE CURRENT shortage of power in the country should be relieved to some extent when the capacitors manufactured at the Bhopal factory of Heavy Electricals Ltd. find their way into the market in near future. The first such capacitor, now on display at the Indian Industries Fair in New Delhi, is being made available to a textile mill in Coimbatore very shortly. The factory has also booked many more orders from other textile mills in Coimbatore area and several others from Ahmedabad. These capacitors will help in mitigating the power shortage by improving the power factor by 10 to 15 per cent; by ironing out fluctuations in power-load, they conserve supply for more even utilisation.

Though the Bhopal factory is at present working about three months behind schedule owing to shortage of raw materials, consequent upon non-receipt of some essential items from abroad, every effort is said to be being made to make up this delay. It is encouraging to note that the management is taking action in placing future orders abroad well in advance.

The output at the factory otherwise is picking up quite well and the value of works now at hand is estimated around Rs. 1 crore. The present lines of manufacture of the factory are switchgears, transformers, capacitors and liquid rotor starters. The switchgears manufactured at the factory have as much as 80 per cent indigenous content. The 20 per cent imported content is envisaged to be brought down to 10 to 12 per cent in about a year's time. In the case of transformers, the imported content amounts to nearly 40 per cent. This will be reduced to 25 per cent as soon as the Rourkela Steel Plant commences production of steel for transformer core, and further to about 10 to 12 per cent when the manufacture of copper strips is arranged indigenously. The first completely indigenous transformer can only be produced when the production of electrolytic copper starts in the country.

The company has also drawn up plans to export about 10 per cent of its output to the East and West Asian markets. Steps have already been taken to book orders for switchgears and transformers from these countries. Full production at the Bhopal factory is expected to be achieved by 1964-65 when the annual output would be stepped up to Rs. 25 crores. Plans have also been drawn up to double the capacity to Rs. 50 crores. These are currently being examined by the Government. When this expansion programme is completed, the Bhopal factory will be able to meet approximately 50 per cent of the annual requirements of heavy electrical equipment in the country. To meet the remaining 50 per cent requirements, two more factories are being

put up, one with Russian collaboration and the other with Czechoslovak assistance. Self-sufficiency in this vital equipment is envisaged to be achieved in about a decade.

Wire Industry

SMALL AND LARGE-SCALE OUTPUT

IN FEBRUARY 1961, the Development Commissioner, Small-Scale Industries, recommended that certain wire-based industries should be reserved exclusively for development in the small-scale sector. These industries were: wire nails and panel pins, wood screws and machine screws, bolts, nuts and rivets, paper pins, clips, safety pins, hair pins, barbed wire, umbrella ribs and bicycle spokes. There were other industries in which 50 per cent of the capacity was recommended to be reserved for the small-scale sector; these being wire gauge and netting of finer mesh, stranded wire and coil springs. The entire capacity for wire ropes, it was pointed out, may be developed in the large-scale sector. In the case of ferrous wire drawing industry, 75 per cent of the future demand for mild steel wire was to be reserved for development in the small-scale sector. Drawings of other types of wire and wire rods were to be undertaken in the large-scale sector.

These recommendations were examined at a joint meeting of the office of the Development Commissioner, Small-Scale Industries and the Development Wing in August 1961. As an outcome of the meeting it was decided by the Licensing Committee that an additional production capacity of wood screws of 1.5 million gross per annum (on single shift) be created in the large-scale sector and further expansion thereafter should be reserved for the small-scale sector and that efforts should be made to bring up production and quality in the small-scale sector. The matter was to be further reviewed after a year, namely, by September 30, 1962.

Taking into account that the estimated demand of machine screws was 6 million gross in 1961, which was expected to double itself by 1965-66, the meeting was of the view that in future, further capacity upto 2 million gross may be developed in the large-scale sector.

It was pointed out by the Development Commissioner, (SSI) that the main difficulty in the capacity for developing welded wire mesh industry was the raw material shortage. The meeting did not consider it necessary to take the factor of raw material shortage into account and decided that further capacity should be developed to the extent of 15,000 tons each in the large and the small-scale sectors. In regard to bicycle spokes, it was agreed that future development of this item should be reserved for the small-scale sector. Umbrella ribs, which have an export angle, besides not being an easy item, were agreed to be licensed in the large-scale sector upto 1,000 tons and in the small scale sector to the extent of 3,000 tons.

Items like wire nails and panel pins, paper pins and clips, safety pins, hair pins, staples and cotter pins were agreed to be reserved for the small-scale sector. Further development in wire gauge and wire netting was to reach the estimated demand of 8,000 tons on a 50:50 basis between the large and small-scale sectors. Bolts and nuts were agreed to be developed in the large-scale sector. Rivets were to be reserved for development in the small-scale sector. As regards other nuts and bolts, it was agreed that further capacity to be developed should be equally distributed between the two sectors.

Barbed wire and stranded wire licensing was to be reserved for the small-scale sector. The output of wire

drawing industry was being examined separately in consultation with the Ministry of Steel, Mines and Fuel.

Nuts and Bolts

PROSPECTS FOR 1965

HIGH TENSILE NUTS, bolts and studs form an important item in the automobiles, motor-cycles, scooters, tractors, earth moving machinery, machine tools, aircraft and other ancillary industries. At present manufacture of most of these items is dependent on imported components and as such the import of high tensile nuts and bolts is taking place in "packs of components" for the manufacture of the mentioned items. The exact quantity of high tensile nuts and bolts is, therefore, not available. The estimate of the requirements of these items can, however, be made with reference to the production targets of the industries utilising them.

The total annual estimated requirements of bolts, nuts, rivets, studs etc. was 1,00,000 tons by 1961 which was expected to go up to 2,00,000 tons by 1965. The manufacture on the large-scale will be 75,000 tons by 1961 and 1,50,000 tons by 1965, the remaining quantity being left over to be manufactured by the small-scale units. Manufacture of high tensile bolts and nuts requires special capital goods machinery along with testing and inspection facilities. This demand was accordingly included in the manufacturing programme of the large-scale sector. No doubt, the use of high tensile bolts and nuts is limited at present. It may be added that there are about 35 firms enlisted with the Development Wing for the manufacture of bolts and nuts by hot-heading and cold-heading processes.

The imports of these items have gradually been reduced. Actual imports during 1959-60 were to the extent of Rs. 5.21 lakhs as against Rs. 4.64 lakhs during 1960-61. The latter does not include the import of "packs of components" allowed for automobile industry.

While estimating the requirements, it was considered that a motor car required about 250 numbers of nuts, bolts, rivets and studs, and a truck required about 350 number of them and their cost came to about 1 per cent of the ex-factory price of a vehicle. The same had been assumed for all the other items including the machine tool industry. Moreover, in the production of high tensile bolts, nuts, rivets, studs, etc., the price of steel raw materials was about 20 per cent of the total cost of the finished product. Taking into consideration all the factors, the approximate requirement of high tensile bolts, nuts, etc. may be around 6,000 tons out of total requirement of 75,000 tons by 1961 and 12,000 tons out of 1,50,000 tons by 1965.

Engineering

JAY ENGINEERING'S EXPANSION PLANS

MESSRS. JAY ENGINEERING WORKS LIMITED have drawn up an ambitious plan to expand their production in India and to set up assembling and manufacturing units in some of the South-East Asian and West Asian countries in collaboration with the local interests there. The Company's output of sewing machines will be doubled to 50,000 units per month when its proposed plant at Hyderabad goes into full production in 1963.

The company has already entered into agreements with the Ceylon and South Viet-nam for providing technical know-how to these countries and for setting up sewing machine assembly plants there. In the case of Ceylon, the parent company will be holding 51 per

**WE
IN
BIRDS
MEET
THE
DEMAND**

Rising steel production requires more and more vital raw material, iron and manganese ore, limestone, coal, dolomite, and refractories... New plants need essential water treatment processes... Agriculture requires tubewells in greater volume... the country's growing markets demand more jute products, paper, electricity, steel structurals and castings. And the Birds/Heilgers group is always there to spur their production... to meet these demands. But expansion doesn't stifle achievement. Nearly a hundred years of experience and research continues as Birds strive harder to bring you better products and better materials to keep pace with India's fast expanding economy.

cent interest, while the remaining 49 per cent shares will be subscribed by Ceylonese. The details of financial collaboration in the case of the South Viet-nam factory are yet to be finalised. The company is negotiating similar arrangements with Burma, Pakistan, Thailand, Iraq, Egypt and Yugoslavia.

The Company's products, Usha fans and Usha Sewing machines, are today being exported to nearly 50 countries, amongst which are included such highly advanced countries as the United Kingdom and the United States. These exports fetch over Rs. one crore in foreign exchange. Nearly 25 per cent of the fans and sewing machines output of the company is earmarked for export purposes. The export potential of the company's products is expected to increase when commercial production of three new types of sewing machines and fans—zigzag sewing machines, exhaust fans with ventilators and dry heat fans—is undertaken.

Bicycle Industry

TUBE INVESTMENTS: A YEAR OF PROGRESS

SIR A. RAMASWAMI MUDALIAR, Chairman, Tube Investments of India, at the annual general meeting of the company, outlined broadly the progress made by the company in respect of bicycle manufactures. He pointed out that the import content of components of the company's bicycles was now negligible, being around 0.25 per cent, and only those items were imported that were not yet manufactured in the country. The chain factory of the company went into production. Though its output was not upto the planned programme, he expected that it would materialise as soon as the plant was shifted to the new building under construction. He also indicated that the machinery for saddles manufacture had been installed and only recently the output had started and the saddles were being put in the market. The company would soon have the tube factory at Avadi which would supply the tubes required for cycles and would also manufacture different kinds of mechanical tubing and high-quality cylinder tubes for shock-absorber manufacture. The company's progress was, therefore, of a fairly encouraging nature.

The Chairman, however, made an important point in respect of power costs. He pointed out—and, perhaps, rightly so—that the different rates charged by a single electricity board for supplying power from hydro-electric stations and the thermal stations was not justified. It is true that the cost of generation of power by the hydro-electric works is necessarily cheaper than the thermal power generators, but if the supplier was the same electricity board, it could discriminate and introduce some sort of equalisation in the rates of power from different sources.

Sugar

DECCAN SUGAR FACES THE CRISIS

MR. C. R. SRINIVASAN, Chairman of the Deccan Sugar and Abhkari Company, at the annual general meeting indicated the effect of sugar crisis on the company. He pointed out that the cane crushed and sugar produced at the two factories of the company was of a record quantity. The company could not, however, exploit this increased output to its benefit. The advantage of this higher output was largely lost on account of smaller releases of sugar from both the factories. The Chairman added that the Government's policy was to release every month a fixed percentage of the production of each factory, the total quantity released being the estimated all-India consumption for the month excluding exports for which special releases were made from time to time. As a result of this policy the stocks of the factories belonging to this company were inflated and

there was a loss in turnover to the extent of Rs. 6 lakhs as against the previous year. This in turn led to a reduction in their profit too. The directors of the company, as stated by the Chairman, had in mind the need to conserve the resources of the company and, therefore, recommended reduced dividends of 13½ per cent as against 18½ per cent during the previous year making the total of 21 per cent against 25½ per cent last year.

One effect of this overproduction has been that the company decided to go slow with its expansion programme. Though, as the Chairman indicated, the rehabilitation and consolidation of the factories were in progress, he made a pointed reference to the fact that the expansion programme which was scheduled to be completed before the 1962-63 season was now delayed probably by another year. These considerations did not, as stated above, apply to the factories where rehabilitation was in question. He referred to an interesting agreement signed by the company with Seshasayee Paper and Boards Ltd. whereby the latter company will supply the former with two oil-fired boilers and necessary oil fuel to burn in them and in return take all the bagasse produced by the Deccan Sugar for the manufacture of paper in their new factory near Erode. No capital expenditure was to be incurred. This arrangement seems to be very interesting because it will mean some economy for both the companies leading to reduced working costs. This is an indication for many other companies to follow wherever such co-operation could be envisaged.

Transport

NEED FOR GREATER ALLOCATION

AN EFFICIENT system of transport is not only a pre-condition to, but also a powerful means of, attaining quick and unhindered industrial development. This is particularly so in the case of a country like India which has embarked on an ambitious programme of planned economic development. But what is the actual position? To take road mileage, for example, India stands no comparison with the advanced countries of the West, not even with some semi-advanced countries of the East. Mr. Lalchand Hirachand, President of the Maharashtra Chamber of Commerce (MCC), who has made a special study of this problem, accordingly chose it as the main theme of his presidential address to the 34th annual general meeting of the Chamber last week and remarked that the present condition of national and State highways, with all their potholes and rough surface, warranted immediate repairs and a constant and consistent attention of the authorities. Mr. Lalchand was not oblivious of the steady increase in the volume of traffic in recent years, for he said, in the context of planned industrial development and progress in the country, traffic was bound to increase, and to meet the situation, he wanted a greater allocation of funds than has been made at present. In his view, not only the national and State highways should receive top priority, but by a programme of linking up intermediate and minor ports with good all-weather roads, all the gaps in the existing roads system should be filled. In this connection, Mr. Lalchand also pleaded—and rightly—for the diversion of the Sugarcane Cess Fund and the Motor Vehicles Tax collections for repairs and maintenance of bridges and roads.

Referring to the problem of power shortage in the country, the MCC Chief pointed out that, as production and distribution of electrical energy remained in the hands of State Governments, it was for them to ensure adequate supply to all industries. So long as they cannot guarantee this, contended Mr. Lalchand, especially in view of the present situation, the Government ought to keep the field open to any entrepreneur who might

like to generate and supply electrical energy. In order to facilitate this, he wanted the Government to amend the Electricity Act suitably so as to enable entrepreneurs to undertake this responsibility as before. Introduction of an element of competition in this sector, remarked the M.C.C. Chief, would not only improve the efficiency of both the public and private units but also their usefulness.

Technical Aid

GREATER ASSISTANCE FROM POLAND?

IT IS, indeed, gratifying to note that possibilities of long-term economic co-operation between India and Poland are being recognised in both the countries. An economic mission sponsored by the Polish Ministry of Foreign Trade has had discussions last week with the officials of the Government of India in this regard and a communique issued at the end of these talks reveals that a fair measure of understanding has been reached between the two countries on fostering this co-operation and on working out of details about advance planning in respect of assistance that might be available from Poland for the development of coal mining and zinc smelting in India.

The Polish economy has witnessed a great upsurge in the recent past and in view of the rupee payment agreement that we have with Poland there is every reason to expect a greater flow of trade between the two countries. India has also to gain much from the experience of Poland—one of the biggest producers of coal in the world—in the field of deep-mining of coal. It is earnestly hoped that the assistance that Poland has been extending to this country for setting up the Karanpura washery and development of Sudamdih coal mines will be carried a step further as a sequel to the understanding that has been reached between the Polish Economic Mission and the Government of India. India has yet to make a beginning in zinc smelting and the Polish offer to make available technical know-how in this field should stand us in good stead. "The Eastern Economist" will, however, plead for—as it did in the India and Poland Blue Supplement published on October, 6, 1961—greater co-operation between the two countries in the wide field of manufacture of capital goods such as tractors, heavy machinery and certain sections of steel in which Poland has acquired a pre-eminent place in the recent past. The significance of the Polish experience in these fields is yet to be fully understood in this country.

ANNOUNCEMENT THE STATE BANK OF INDIA

have pleasure in announcing the introduction
from the 1st January 1962 of

special credit transfer system

whereby any customer having a personal account with the Bank, will be enabled to use any office of the Bank for transfer of money paid in cash, for credit to his account to the extent of Rs. 1,000 in any one instance FREE OF CHARGE.

* * *

A deposit relationship with the Bank will entitle the use of the services of any of its 900 and over offices throughout the country for the free SPECIAL CREDIT TRANSFER FACILITY.

FROM THE CAPITAL'S CORRIDORS

THIRD PLAN COAL TARGET

SOME rethinking has been done in official circles here on the Third Plan developmental programme for the coal industry. The target of 97.5 million tons actual output fixed in the Plan is now considered to be rather on the low side. An approach has been made to the Planning Commission to fix a higher target of about 110 million tons.

The financial resources allocated in the Plan for stepping up coal output to 97.5 million tons (actual production and not rate of output) too are considered to be inadequate. They are sought to be revised upwards.

Besides, the Planning Commission has been requested to reconsider further the development of power resources for the coal industry and rail transport capacity. It has been suggested that power should be made available from now on itself to meet the full requirements of this vital industry and that power availability in future must cope progressively with the expansion programme of coal production. The rail transport capacity even on the basis of 97.5 million tons coal target, it has been pointed out, should be planned for movement of about 100 million tons per annum. Additional financial allocations under these heads have, therefore, been suggested.

The financial allocation for all the above three programmes—namely, coal production, augmenting of railway capacity and provision of power for the coal industry—will have to be stepped up further if the target of 110 million tons of coal by 1965-66 finds favour with the Planning Commission.

Meanwhile, the National Coal Development Corporation has taken on hand the planning and implementation of measures designed to reach the target set for it under the Plan. The Corporation has been allocated foreign exchange for the half-year to March 31, 1962, to the tune of Rs. 4.02 crores for the development of collieries owned by it and another Rs. 71.36 lakhs for stepping up production from the Singareni collieries. Of the Rs. 4.02 crores allocated for the development of Corporation's own collieries, Rs. 50 lakhs will be coming from the Exim Bank credit, Rs. 30 lakhs from the West German credit, Rs. 2.68 crores through rupee payment arrangements and Rs. 54 lakhs (Rs. 48 lakhs for the Second Plan projects carried over to the current Plan and Rs. 6 lakhs for the new schemes included in the Third Plan) from resources available for maintenance and replacement works. The allocation made for the development of Singareni collieries will be made available from the following sources: Rs. 8 lakhs from free resources; Rs. 53.6 lakhs from rupee payment countries and Rs. 10 lakhs out of the West German credit.

The Corporation has secured the services of three West German experts, one British expert and one T.C.M. expert for assisting it in its development programme. Some more experts are also intended to be obtained from the U.S.A. under the T.C.M. Programme, from France under the Indo-French Technical Co-operation Programme and from the United Kingdom under the Colombo Plan. Some experts from Russia and Poland are also expected to render help to the Corporation under the credit agreements entered into by the Government of India with these two countries.

Of the three West German experts now assisting the N.C.D.C., two are engaged on the washeries projects of the Corporation and one on the workshop project. These experts will advise the Corporation for a period of three years.

The British expert, Mr. Elliot, is advising the Corporation on the development of mines in the Jharangdih

area, included in which are some gassy mines abandoned about fifteen years ago. The British National Coal Board has offered the services of four more experts in connection with the development of deep mines in Jharangdih, Kathara and Swang areas. Another British coal expert, Mr. H. W. Collins, who visited this country in August-September this year, has also submitted his report in which he has recommended further development of Bokaro coalfields.

Discussions have also been held with a team of French experts who visited India in July last. As a result of these discussions, the N.C.D.C. will take up the work of development of the steeply inclined thick seams of Karanpura in three stages. In the first stage, mining engineers of the Corporation will go to France to study the techniques of depillaring steeply inclined thick seams. Under the second stage actual mining work will be taken up with the assistance of French technicians. The project will be completed in the Third stage. A second team of French experts is expected here in the near future to prepare a project report for the development of these mines.

The T.C.M. authorities will be assisting in the development of Ramgarh coalfields. They have offered the services of Mr. John Marshall, President of the Pieree Management Company, for this purpose. Mr. Marshall will be assisted by some other U.S. experts.

The Polish Government has agreed to render assistance in the setting up of the Karanpura washery and development of Sudamdih mines.

The Soviet Union will be assisting in the development of two underground mines, one at Surakachar and the other at Banki in Korba coalfields. The Corporation has entered into an agreement with TJAZH-PROEXPORT of Moscow for the preparation of working drawings and designs for the exploitation of these two mines. Russia will also be supplying machinery and equipment for setting up of the central workshop in Korba coalfields, the revised project report for which has been approved by the Government. The establishment of this workshop will be synchronised with the commissioning of the Surakachar and Banki underground and Korba open-cast mines in order to ensure full utilisation of the capacity of the workshop. According to the present indications, the workshop is expected to start functioning in 1964.

AID-INDIA CLUB MEETING

The next meeting of the Aid-India Club is expected to be held in Washington on January 29 and 30, 1962. The Club at present is composed of the United States, Britain, West Germany, France, Japan, Canada, the International Bank for Reconstruction and Development and the International Development Association. Three more countries—Italy, Austria and Sweden—are expected to join it at its forthcoming meeting, raising its membership to eleven.

At its last meeting held on May 31, 1961, the following commitments were indicated by the members of the Club for the first two years of India's Third Five-Year Plan.

Canada	..	..	56	Million Dollars
France	..	..	30	" "
Germany	..	..	364	" "
Japan	..	..	80	" "
United Kingdom	..	..	250	" "
United States	..	..	1,045	" "
I.B.R.D. & I.D.A.	..	..	400	" "
TOTAL	..	..	2,225	Million Dollars

Some more aid is envisaged to be made available by West Germany, United Kingdom, Japan, France and

Canada along with the three new members so that their contribution should match the U.S. offer.

FOREIGN PRIVATE INVESTMENTS

The increasing interest that private entrepreneurs in foreign friendly countries are taking in the economic development of India is evident from the following table which gives the number of collaboration arrangements entered into between these countries and India since 1959:

	U.K.	West Germany	U.S.A	Japan	Others
1959	51	29	27	15	49
1960	137	85	69	38	99
1961	63	37	42	14	45
TOTAL ..	251	151	138	67	193

STC'S FUNCTIONS

The functions of the State Trading Corporation of India have been redefined by Mr. Nityanand Kanungo, Minister for Commerce in the Union Government. According to Mr. Kanungo, STC has (a) to undertake trading generally with the State-trading countries as well as other countries in commodities entrusted to it; (b) to explore new markets for traditional items of export and develop exports of new items with a view to diversifying and expanding the export trade; (c) to undertake at the instance of Government import and/or internal distribution of any commodities in short supply with a view to stabilising the prices and rationalising distribution; and (d) generally to implement such special arrangements for import, export or internal distribution of particular commodities as Government may adopt in the public interest. The main Objects Clause incorporated in the Memorandum of Association of the State Trading Corporation is being suitably amended for the purpose.

OUTPUT OF MINERALS IN 1960

The provisional estimates made by the Indian Bureau of Mines place the total value of mineral production in India in 1960 at Rs. 1,590 million, compared with Rs. 1,409 million in 1959. The increase of Rs. 181 million or nearly 13 per cent over the total value of mineral production in the previous year was mainly due to the increase in the output of coal, iron ore, bauxite, copper ore, china clay, dolomite, limestone and salt and the higher prices of gold bullion. Coal, with an output of 52.6 million tonnes, was the leading commodity. Its total production was valued at Rs. 1,089 million, about 68 per cent of the total value of mineral production. The share of public sector, namely, the National Coal Development Corporation and Singareni Collieries, in the total coal production was 8.5 million tonnes while the remaining 44.1 million tonnes were produced by the private collieries. Next in order of value were manganese ore (Rs. 82 million), iron ore (Rs. 77 million), salt (Rs. 67 million), gold (Rs. 57 million), limestone (Rs. 56 million), mica (Rs. 25 million), copper ore (Rs. 24 million) and ilmenite (Rs. 15 million).

In terms of physical volume also there was a marked increase in mineral production during the year as indicated by the Quantity Index of Mineral Production which stood at 136.6 in 1960 (base 1951=100) as compared with 126.6 in 1959. The increase in the index was shared by all the groups. The index in respect of

coal increased by 13.5 points, that of metallic minerals by 4.2 points, and non-metallic minerals by 6.4 points.

The production of metallic minerals, valued at Rs. 270 million, accounted for 17 per cent of the total value of mineral production in 1960. Of this total value, the ferrous group of minerals accounted for Rs. 164 million and the non-ferrous group of minerals for Rs. 106 million. Among the metallic minerals, there was record output of iron ore and bauxite. The production of iron ore reached a peak figure of 10.68 million tonnes during 1960. This marked increase in output was due to the higher internal and external demand. The despatches of iron ore for consumption in the domestic iron and steel plants rose to 7.23 million tonnes recording an increase of 27 per cent when compared to the despatches of 5.68 million tonnes during 1959. As a result of large expansion in the domestic aluminium, refractory and chemical industry as well as higher overseas demand, the output of bauxite reached the all-time peak of 384,000 tonnes, representing an increase of 75 per cent over the output in the preceding year. There was also a slight increase in the output of copper ore. The output of chromite crossed the one lakh tonnes mark, while the output of gold, ilmenite, lead and zinc concentrates showed a decline. The output of manganese ore in 1960 was 1.18 million tonnes which is almost the same as in 1959.

The total value of non-metallic minerals produced was Rs. 230 million, which is about 13 per cent of the total value of mineral production in 1960. As compared to 1959, the value of non-metallic minerals was higher by Rs. 26 million. Of this, salt alone accounted for an increase of about Rs. 8 million. The output of salt at 3.44 million tonnes and crude mica at 29,003 tonnes was higher compared to the preceding year. Consistent with the increase in the internal demand, the output of limestone, dolomite and gypsum reached new peaks. The output of limestone was 12.7 million tonnes recording an increase of 18 per cent over the previous year. In the case of dolomite there was an increase of 90 per cent in output while the output of gypsum was higher by 16 per cent compared to 1959.

STATE-WISE ANALYSIS

State-wise analysis of mineral production indicates that Bihar was the leading State and produced minerals valued at Rs. 569 million which is 36 per cent of the total value of mineral production in 1960. Next in order of value of mineral output was West Bengal and Madhya Pradesh, their shares in the total value of mineral production in India being 21 per cent and 12 per cent respectively. The increase in mineral production in 1960 over 1959 was mainly accounted for by the States of Bihar, West Bengal, Madhya Pradesh, Orissa, Andhra Pradesh, Mysore, Rajasthan, Maharashtra, Gujarat and Madras. West Bengal alone accounted for an increase of Rs. 102 million or nearly 57 per cent of the total increase. This was the result of significant increase in the output of coal in West Bengal and iron ore and coal in Bihar.

The total value of metal production in India during 1960 was estimated at Rs. 1,948 million as against 1,554 million in 1959 recording an increase of nearly 25 per cent. The increase was mainly due to higher production of ferrous metals which recorded an increase of Rs. 384 million or 27 per cent as compared to 1959. The output of pig iron, steel ingots and finished steel reached an all time peak. The production of finished steel increased from 1.8 million tonnes in 1959 to 2.2 million tonnes in 1960. The production of pig iron was 4.2 million tonnes, an increase of 35 per cent over the preceding year. The output of ferro-manganese at 86,000 tonnes was higher by 26,000 tonnes compared to 1959. A new ferro manganese plant at Kanhan near Nagpur was commissioned on the 17th November, 1960. The output of ferro silicon was 7,118 tonnes in 1960 as

If you can say so about all the purchases you make, you will be saying good-bye to the uncertainty of material, quality, durability of product etc.

Unfortunately, there are many articles produced in India which do not conform to any standard—although they should. For, standards ensure quality products, fair competition, consumer goodwill, increased profits. To manufacturers producing goods according to Indian standards, the Indian Standards Institution grants licences for applying on their goods the ISI mark which is a third-party guarantee of quality.

Write to ISI for a list of products which are manufactured to prescribed standards and carry the ISI mark. Make sure that the next time you buy anything, it is a quality product carrying the ISI mark.

against 7,459 tonnes in 1959. In the case of non-ferrous metals the year was marked by record output of aluminium, antimony and copper.

EXPORTS

The total foreign exchange earned by the export of minerals and ores during 1960 was Rs. 511 million as against Rs. 470 million in 1959. In terms of foreign exchange earnings, iron ore led the list of the minerals exported from India. The exports of iron ore during 1960 were 3.4 million tonnes valued at Rs. 173 million as compared to the export of 2.5 million tonnes valued at Rs. 129 million in 1959. Japan and Czechoslovakia which are the principal buyers of Indian iron ore accounted for 58 per cent and 23 per cent respectively of total exports from India. The exports of manganese ore totalled 1,166,000 tonnes which was higher by 175,000 tonnes compared to 1959. The exports of mica at 30,000 tonnes though higher quantitatively by 6,000 tonnes compared with 1959, fell by Rs. 5 million in value due to lesser offtake of block mica by U.S.A.

The principal markets for Indian minerals were Japan, U.S.A., U.K., Czechoslovakia, Pakistan, West Germany, France and Italy. Country-wise analysis of our mineral exports indicates that the share of Japan was 31 per cent, U.S.A. 17 per cent, U.K. 10 per cent, Czechoslovakia 9 per cent and Pakistan 8 per cent.

The total value of exports of metals and alloys (excluding silver) increased from Rs. 73 million in 1959 to Rs. 142 million in 1960. The value of export of ferrous metals was Rs. 138 million, an increase of Rs. 70 million over the preceding year. Export of ferro-alloys recorded a 5 fold increase while the export of pig and sponge iron increased by more than 50 per cent. Except for copper the exports of all the non-ferrous metals (mostly in the form of utensils and scrap) showed a decline during the year.

IMPORTS

The total value of imports of minerals during 1960 was Rs. 108 million as compared to Rs. 102 million in 1959. The increase of Rs. 6 million in the value of imports was mainly due to larger imports of sulphur, apatite, abrasives, china clay, emeralds, diamonds and cryolite. The total value of imports of metals and alloys increased from Rs. 1,230 million in 1959 to Rs. 1,578 million in 1960. The imports of ferrous metals at Rs. 1,087 million recorded an increase of Rs. 234 million as a result of higher imports of ferro-alloys and iron and steel materials. The imports of non-ferrous metals totalled Rs. 491 million and they were higher by Rs. 114 million or 30 per cent compared to the preceding year. Copper led the list of non-ferrous metals imported into India and was responsible for 44 per cent of the total foreign exchange spent on this group. There was a considerable increase in the import of aluminium, brass and bronze, copper, silver and zinc. The imports of lead and nickel were slightly higher while there was a considerable decline in the imports of antimony.

TRENDS IN PRICES

The prices of manganese ore were steady during the first three quarters of 1960. After a slight fall in the month of October the prices of various grades of manganese ore remained unchanged in the subsequent months. Prices of iron ore maintained the same level as in the year 1959. There was a decline in the prices of chromite as a result of low demand in foreign markets. There was a slight increase in the price of chemical grade bauxite, calcined magnesite and sillimanite in 1960 while that of ilmenite, rutile, burnt and unburnt fire clay and white and off colour barytes remained unchanged. There was a general increase in the F.O.B. prices of various types of mica due to rise in demand from the European markets.

The outstanding features of the Indian metal market during the year 1960 were the firmness in the prices of zinc, easy stock position of lead and sufficiency in the supply of virgin copper metal by the actual users. There was a persistent rise in the market prices of zinc during the first three quarters of the year. As a result of considerable increase in stocks of lead under moderate demand, there was a decline in the price of lead ingot. The prices of aluminium scrap and copper metal showed an upward trend. The average prices of gold and silver also recorded an increase during the year under review. There was, however, no change in the prices of pig iron and steel fixed by the Iron and Steel Controller.

ORISSA MINING CORPORATION

The Government of India has agreed to allow the Orissa State Government to acquire the interests of the Centre in the Orissa Mining Corporation.

The Corporation was set up in May, 1956, as a joint venture of the Central and Orissa State Governments with an authorized capital of Rs. 50 lakhs, held in equal proportion by the two Governments.

The Corporation is at present working three iron ore mines — Maharajpur and Khandadera in Mayurbhanj district and Sakradhi in Keonjhar district. It has also acquired mining leases and prospecting licences over additional areas for iron ore, manganese and chromite.

A programme of development by the Corporation during the Third Plan period has been drawn up involving a capital investment of Rs. 86 lakhs and envisaging a production of 8 lakh tons of iron ore, 25,000 tons of chromite and 20,000 tons of manganese by the end of the Third Plan. There are also possibilities of acquiring more leases and raising the targeted production.

The State Government has also formulated a scheme to develop iron ore mines through the Corporation in the Sukinda area to export 2 million tons of iron ore by 1964-65.

GORAKHPURI LABOUR IN COAL MINES

The Government of India has reorganised the set-up relating to recruitment and employment of Gorakhpuri labour engaged in coal mining industry. The aim is to remove all forms of control, regulation and regimentation exercised so far over Gorakhpuri labour.

Under the reorganised system, there would now be no distinction between Gorakhpuri labour and other workers in the coal mining industry. Facilities previously enjoyed by the former under the Coalfields Recruitment Organisation will now be available to all workers. All recruitment would be channelised either through the local employment exchange or the Labour Depot at Gorakhpur. Continuity of employment would be ensured to all workers — local as well as Gorakhpuri.

The step has been taken on the recommendations of the Committee of Members of Parliament on Gorakhpuri Labour and in consultation with the representatives of colliery owners' and workers' organisations. Besides recruitment facilities and better conditions of employment, the reorganised set-up provides for improved facilities for medical care, banking and lodging in Miners' Hostels.

I.F.C. STATUTE AMENDMENT

A bill has been introduced in Parliament to amend the statute of the Industrial Finance Corporation. It provides for empowering the Corporation to advance loans to hotel and transport industries and to industrial estates. It also seeks to enable the Corporation to guarantee loans raised by industrial concerns from the State Bank and other scheduled and co-operative banks, guarantee deferred payments and under-write shares.

The Corporation's efforts to secure credits in foreign currencies other than the dollar have started bearing fruit. The German Bank for Reconstruction has agreed to make available to the Corporation a credit of DM 15 million (Rs. 1.8 crores) to enable it to assist in private sector projects requiring import of machinery and equipment from West Germany. The Government of India has approved of the agreement. The details of the agreement, however, are yet to be finalised.

FERTILIZER PRICES REDUCED

The Union Ministry of Food and Agriculture has decided upon reduction in the prices of fertilisers included in the "Pool". The reduced prices came into force on December 1.

The old and the new prices are as follows:

	Old Price (per metric ton)	Revised Price (per metric ton)
Ammonium sulphate	Rs. 344.50	Rs. 330
Urea	Rs. 684.10	Rs. 670
Ammonium sulphate nitrate	Rs. 408.50	Rs. 400
Calcium ammonium nitrate	Rs. 324.80	Rs. 310

A spokesman of the Food and Agriculture Ministry has pointed out that as a result of these reductions in the "Pool" prices, cultivators even after paying the usual "distribution margin" will benefit to the extent of Rs. 14.50 per metric ton of ammonium sulphate, Rs. 14.10 per metric ton of urea, Rs. 8.50 per metric ton of ammonium sulphate nitrate and Rs. 12.80 per metric ton of calcium ammonium nitrate.

PROBE INTO CLOSURE OF TEXTILE MILLS

The Government of India has decided to set up a committee to enquire into the causes of closure and "sickness" of textile mills in the country and to suggest timely remedial measures in this regard. The committee will be presided over by Mr. G. D. Somani, M.P., and shall make a careful perusal of production trends and balance-sheet and accounts of selected mills.

The step, it is learnt, has been taken as a sequel to the report of the Working Group for the Cotton Textile Industry. This report had called for a comprehensive study of the finances of textile units which ultimately led to closures. The Labour Ministry also has recently expressed concern at the effect the closure of textile mills has on the employment situation.

MULTI-POINT TAX ON MOTOR VEHICLES

The State Governments have decided to abolish the multi-point tax on motor vehicles. This was communicated to the Lok Sabha this week by the Minister of State for Transport and Communications, Mr. Raj Bahadur. The step has been taken to facilitate move-

ment of coal by road. Further steps in this regard in the form of consolidation of taxes to avoid octroi duty are also being taken.

IMPORT OF MOTOR VEHICLE PARTS

It has been decided to issue supplementary licences on an ad hoc basis to established importers for the import of motor vehicle parts from the United States under the forthcoming DLF loan. An import trade control public notice has been issued here to this effect.

The licences will be issued to established importers on a quota of 5 per cent of half of their best year's imports, subject to a minimum value of Rs. 1,000 in any individual case. The last date for receipt of applications from intending importers is January 31, 1962.

PRECISION INSTRUMENTS FACTORY IN KERALA

The exact site for the location of the precision instruments factory in Kerala is yet to be selected. A team of U.S.S.R. experts has been invited to help in this task.

The factory would produce pneumatic, hydraulic and mechanical instruments and is expected to cost about Rs. 6 crores. The recommendations of the U.S.S.R. experts on the nomenclature of production are awaited. The plant is envisaged to go into production during the later half of the current Plan.

MACHINE TOOLS FACTORY IN PUNJAB

The machine tools factory proposed to be set up by the Hindustan Machine Tools Ltd., at Pinjore, in Punjab, is expected to be completed by the end of next year. It will have an initial capacity to produce 1,000 machine tools per annum. In the course of the next few years production will be stepped up to 2,000 machine tools per annum. The total cost of setting up this factory is estimated around Rs. 7.5 crores.

SUGAR EXPORTS TO JAPAN

Prospects of exporting sugar to Japan in exchange for Japanese fertilizers are being explored through diplomatic channels. The subject, it is understood, came up for discussion between the Japanese Prime Minister and the Government of India, during the former's visit to New Delhi recently.

INDO-POLISH ECONOMIC CO-OPERATION

Discussions between the Economic Mission sponsored by the Polish Ministry of Foreign Trade and Government of India officials on the possibilities of furthering economic co-operation between the two countries were concluded here last week. During the discussions it was felt that a fair measure of advance planning of economic co-operation between India and Poland was feasible in several sectors, particularly in the fields of coal mining and zinc smelting. It has also been agreed at these discussions to continue the study in regard to the possibilities of long-term arrangements in trade relations.

Where on
earth is
Mogadiscio?

Frankly, till somebody in Mogadiscio ordered BINNY's cloth, we too didn't know that it was the capital of Somalia in East Africa.

Today BINNY's cloth is imported by 50 countries—superb fabrics made from cotton of the best quality and dyed with the fastest colours or so carefully bleached that the full strength of the cloth is preserved.

Rigid Quality Control* ensures maximum durability and perfect finish.

Quality Control:

Modern machines process yarn and cloth so fast that often defects, invisible to the naked eye, creep into the cloth. Quality Control is laboratory testing to eliminate defects at every stage of production. That's why BINNY'S fabrics stay smart so long.

*Testing cloth for defects

Every yard of cloth from the looms is examined thoroughly for defects before it is passed for dyeing or bleaching and finishing.

BINNY'S manufacture nearly 90 million yards of cloth every year. Here are some of the varieties they make:

Shirtings . Khaki Drills . Bleached & Dyed Drills . Towels . Anticrease Suitings . Tussorees . Union Fabrics . Silk Sarees etc. etc.

Buy your requirements of BINNY'S fabrics at controlled rates from authorised BINNY Stockists who display this sign board.

BINNY—a great name in textiles

TELL US YOUR JOB—

AND WE'LL GIVE YOU THE TOOLS

The size, shape or complexity of a project doesn't overawe us. We have the tools to help build it with a minimum of time, labour and cost. For nearly 70 years, BATLIBOI have supplied Industry and Trade in India with goods ranging from complete power plants to hacksaw blades. We represent internationally known manufacturers from the United

Kingdom, U.S.A. Czechoslovakia, France, Germany, Japan and many other countries. BATLIBOI also represent some of India's leading manufacturers of Machine Tools, Diesel Engines and various other types of machinery. Industry and Trade are vitally connected with the economic growth of any country, and BATLIBOI are vitally connected with Industry and Trade in India

COMPANY AFFAIRS

CAPITAL ISSUES

Four companies have been granted consent for issue of capital by the Controller of Capital Issues. Of this, one company will issue debentures and the other three entity shares. The consent in all cases is valid for 12 months. The following are the details:

ACC-Vickers-Babcock Limited, Bombay, has been accorded consent to the issue of debentures of the total value of Rs. 6.65 crores in units of Rs. 10 lakhs each for cash at par. The First and Second Mortgage debentures of the total value respectively of Rs. 3.30 crores redeemable after 10 years and Rs. 1.33 crores redeemable between 7-10 years, will bear a rate of interest of 6 per cent per annum while the third series of the value of Rs. 2.02 crores will carry a rate of 7 per cent per annum and will be redeemable after 20 years. The proceeds will be utilised for the company's project of manufacturing cement making, coal mining and other general machinery and complete range of steam raising plant.

Heavy Electricals Limited, Bhopal, a wholly owned Central Government undertaking engaged in the manufacture of heavy electrical equipment and having a paid-up capital of Rs. 21.95 crores, has been accorded consent to issue further capital of Rs. 1.67 crores in equity shares of Rs. 1,000 each, for cash at par.

Hindustan Photo Films Manufacturing Company Ltd., Madras, wholly owned by the Central Government engaged in the manufacture of raw films for cinema industry, X-ray and roll films and photographic paper and having a paid-up capital of Rs. 15 lakhs, has been accorded consent to issue capital of Rs. 45 lakhs in equity shares of Rs. 1,000 each to be subscribed by the Central Government for cash at par.

Bolani Ores Limited, Calcutta, engaged in business of raising and supplying iron ore and other allied minerals to the steel works sponsored by the Government of India, has been granted consent to the issue of capital of Rs. 30 lakhs in 30,000 equity shares of Rs. 100 each for cash at par. The share capital is held by Government of India and the Orissa Mineral Development Company Limited. The existing paid-up capital is Rs. 70 lakhs.

GENERAL TYRES LIMITED

During the year to June 30, 1961, General Tyres Limited made considerable progress in construction as revealed in their first report. The question of profits, however, did not arise. The profit and loss account shows a loss of Rs. 1.05 lakhs. The factory of the Company was still under construction and since June 30, 1961, further progress had been recorded. Buildings, roads, trains were being constructed and further consignments of plant and machinery had been shipped.

The directors have reported that they have received from the Government of West Bengal sanction for the supply of electric power and two senior technical personnel had been deputed for technical training in Czechoslovakia.

During the year under review 7,99,125 equity shares of Rs. 10 each and 20,000 9 per cent (free of Company's tax but subject to tax deducted at source at the prescribed rates from time to time) cumulative redeemable preference shares of Rs. 100 each were allotted. The Company also secured a loan of Rs. 60 lakhs from the Industrial Finance Corporation and drew Rs. 25 lakhs against this loan upto the end of the period under review. The directors' report has also furnished deferred payment guarantee for Rs. 39.62 lakhs in respect of plant and machinery to be imported from Czechoslovakia.

MANDYA NATIONAL PAPER

The Directors of the Mandya National Paper Mills Ltd., in their report for the year to June 30, 1961 point

out that all the transactions of the Company during the year were of a non-revenue nature representing expenditure incurred during the period of construction to be allocated towards capital expenditure. The profit and loss account therefore was not drawn up. The construction of the factory building was practically complete and the entire plant and machinery except for very small consignment had been received at the site. The erection of the machinery will be over very shortly and before the end of 1961 the factory will go into production.

It is reported that the Government of Mysore assured the Directors that the electric power would be made available when the mills would be ready to go into production. They point out that there was a serious difficulty in supply of all requirements of power to the mills owing to delays in the completion of their power generating project. The Company had therefore purchased a generator set which was being installed speedily. The Company has, however, approached the State Government for subsidising the difference between the cost of generation and cost of hydro-electric power supplied by the State Government and negotiations to that respect were in progress.

The production capacity of the mills at present is 35 tons a day and the Company had decided to develop it to double capacity. The Industrial Finance Corporation of India had already sanctioned a loan of Rs. 1 crore to implement the expansion project. In addition to this a further amount of Rs. 80 lakhs will be raised by the Company in the form of equity shares from shareholders and sanction from the Controller of Capital Issues had been received. The Company may be in a position to issue the capital to the shareholders early in 1962 and the mills will go into expanded production before the middle of 1963.

Note: A line has been drawn between 1956 and 1957 in order to indicate that figures for 1957, and onwards, are not strictly comparable with those of earlier years. Since 1957 the coverage of the statistics is all-India, whereas upto 1956, they covered only the erstwhile part 'A' States and Delhi and Ajmer.

† As the figures of man-days worked for 1959 are not available, 1958 figures have been repeated.

†† This is only an estimate and hence provisional.

** Excluding Punjab and Delhi, as the figures of man-days worked were not available.

* As the figures of man-days worked for 1957-59 are not available, 1956 figures for man-days worked for all-India have been repeated.

§ Inclusive of estimated man-days worked for Mysore and Jammu and Kashmir as no figures are available.

The Afro-Asian Economic Conference

BUT for the fact that the accent is strongly elsewhere — Goa, China and the Elections — the Afro-Asian Economic Conference held in New Delhi over practically the whole of this week might have struck headlines. Few people are aware of the existence of a Secretariat which covers seventy countries and has purposeful plans for fostering economic co-operation over practically the whole of Asia and Africa. Even in strictly political terms, the canvas is an attractive one; its economics, too, could be better phrased. Unfortunately, apart from the fact that current interest lies elsewhere, the Conference has had a bad sense of timing so far as the content of its working papers was concerned. The idea of a common market and of some spacious, but undefined, methods of co-operation may belong to the waves of the future. There may be powerful waves when they choose to arrive, but the emphasis in the current context is on the fact that they do not belong to the present. Much of the discussion on the working papers is obviously academic, and it is a great pity that the Secretariat has not recognised that hard business must be done in a hard business way. Their specific proposals should have been worked out in very great detail to show how any particular proposal of co-operation would affect the member countries. It is quite unrealistic to expect Governments to make momentous decisions on the kind of material which has been presented at this conference.

It would be a pity if the inadequacy of preparation were for all time to hold back what is basically a sound, and eventually a practical, idea. It was detailed preparation which accelerated the European Common Market even though it was actual working which showed that the detailed preparations were pessimistic in terms of possibilities and not the other way about. What the Afro-Asian Economic Conference needs at the present time is a far greater Secretariat to which far greater resources need to be committed for research. The Federation of Indian Chambers of Commerce and Industry has done its best in trying to undertake its share of the work and has produced an interesting factual statement of India's trade with Afro-Asian countries as part of its paper work for the Conference. It is needless to say that most of this information is available elsewhere and, therefore, the work only presents consolidation. Far more work needs, in particular, to be done on currency and payments problems.

When one considers the difficult payments problem of most of these countries, it is hard to believe that there will be any easy surrender of local autonomy to a common market with a political system which is by no means yet in sight. What, however, is required is one or two limited steps in this direction which, it seems, could be taken without causing undue strain on national sovereignty or international jealousies. The first central point of policy is some small expansion or liberalisation of payments agreements. One of the most obvious, so far as India is concerned, is to extend the rupee payment area over countries of South-East Asia on terms which should be acceptable to our friends in this area. Most of the countries are willing to hold rupees provided their current balances in foreign exchange — dollars and sterling, for the most part — are not affected. Translated into physical terms, this seems to im-

ply that the additional trade created by the opportunities of liberal payments agreement must never involve the diversion of trade from Western European countries or the United States. If it did, it would encounter such opposition when the capacity for supply is so limited that it is natural that the negotiations would founder on the erroneous belief so easily created that a rupee payment agreement is designed in India's interests to tie these countries to our exports as closely as we can. Obviously, it is essential that some detailed work should be done to indicate that a rupee payment area is in fact not only in India's interest, it is in the interest of the entire area as well. If this can be done — and we in India should certainly do it — a campaign of persuasion would not be out of place through the Afro-Asian Conference Secretariat. Since, however, the work has been so poor on this subject up to date, it would appear that if we are serious about extending rupee payment agreements in Asia, the Government of India and its research agencies must combine with private agencies to make a really serious effort to present this problem in its best aspect with an objectivity which is believed to be notably scarce.

For the rest, our guests from abroad who may well be disappointed with the meagre results of this Conference, must recognise that historical forces have at the present time decreed a very small place for Afro-Asian inter-regional trade as a fraction of total trade, not only of the world but of the region itself. Because we are operating on a relatively small fraction of our own trade we are very apt to discount the advantages of small fractional rise of say 10 per cent, which might result from inter-regional co-operation on a practical and businesslike basis of negotiation. It is quite true that each transaction will be hardly fought, largely because of the very small room that most of these countries have to manoeuvre. In a sense, against the opportunities of selling to the United States and to the European Common Market, much of this effort might seem relatively expensive. This is not, in fact, the case. The more hard-pressed these countries, the more necessary it is that even marginal changes in their trade should be carefully promoted. Most of us need to recognise that a large fraction of our trade which lies elsewhere should not be any detraction from our argument that a competitive basis is best when trading with one another. It is, therefore, literally true that the opportunities for expansion are greater inside the region than they are outside; largely because most of the countries, because of their high cost structures cannot have better prospects of trade expansion in the European countries and the U.S.A. Only in areas close to themselves can they really be competitive in the manufacturing field. So far as the primary products are concerned every one knows that unless there is demand from inside the area, world prices will tend to fluctuate at the will of Western purchases. Even as a defensive measure, somewhat collective action to organise sales would pay substantial dividends in time.

All in all, therefore, while the Afro-Asian Economic Conference is full of promise, it still needs a will and a strong desire for action. The best friends of the Afro-Asian Economic Conference will not claim that it has these links of action at the present time.

Tanganyika: "Uhuru na Kazi"

TANGANYIKA'S emergence to independent sovereign statehood on December 9, has been hailed unanimously as a historic event with some difference from similar events of political emancipation that are sweeping over the African continent. That the dawn of *uhuru* was advanced by nineteen days, prior to the day originally agreed only nine months ago, is not so significant as the fact that the entire process of the constitutional change has been expedited with a rapidity and smoothness which have hardly any parallel in the continent. The country had its real taste of the general elections for qualified participation in responsible government as recently as August 1960. The ball once set rolling gathered momentum and in the two constitutional conferences held in March this year at Dar-es-Salaam and in June at London the pace of change was hastened. No gesture could be more eloquent of the smoothness with which transfer of political power was accelerated than that the Queen appointed the royal consort to represent her at the independence celebration at Dar-es-Salaam.

The speed with which constitutional transformation was brought about in Tanganyika may hardly be taken as a model example, much less a precedent, for most of the remaining non-self-governing countries of Africa. Nearer in East Africa, Tanganyika has stolen a march over Kenya, Uganda and Zanzibar. The elements which have emboldened Britain and Tanganyika to take the risk of speed need passing emphasis. Over four decades of relationship with Britain, first as a mandated territory and after 1945 as a trusteeship territory, have proved fruitful in securing steady, if gradual, advance in social and economic stability.

The influence of tribalism in Tanganyika's social order does not disclose the virulence which is its dominant trait in several other societies in the African countries. Tanganyika's African population of about 9.11 million is drawn from as many as 120 tribes of which only the Sukuma is of a substantial size accounting for 12 per cent. The distribution of the residual majority between the rest of the tribes, with no wide disparities of size, may connote diversity in the social texture, but it has been conducive to stability.

Coming to stability in that most dominant sphere of politics, Prime Minister Nyerere's moderate and far-sighted leadership has been its sheet anchor. Mr. Nyerere has firmly set his face against racial policies as well as tribal divergencies and consistently placed first stress on the concept of nationality. The fact that he pilots the affairs of the State is a guarantee that there will be a true urge to lay its foundation soundly. In this task, the virtual one-party rule of the Tanganyika African National Union may prove a positive gain initially. Whether this type of structure will be modified and when is a matter of pure speculation. This problem has been a question mark not for Tanganyika alone, nor for the African countries only.

Tanganyika stands firmly for membership of the Commonwealth and her admission into the United Nations will run a smooth course. Bloc-wise alignment is not her choice, but she is equally emphatic on her resolve to maintain and safeguard the democratic values of life. In these conscious preferences there will be little intervention. The major problem posed for her leadership is that of economic betterment. On this count, Mr. Nyerere has minced no words and left his countrymen in no doubt whatsoever. Whether it is housing, jobs, roads and communications, schools, hospitals or other welfare institutions, he has bluntly put the question to the vocal and impatient sections: Where is the outlay for all these tasks to come from in one sweep? There is enough political consciousness in Tanganyika to realise that freedom brings in its train heavy responsibilities of hard work without which real content cannot be imparted to it. This consciousness found ample expression in the first slogan, *Uhuru na Kazi* — Freedom and Work. But Mr. Nyerere is more a realist than a moderate statesman. At the risk of causing some disillusionment, he is giving his fellow countrymen the new slogan of *Uhuru na Jasho* — Freedom and Sweat.

The known potential resources of Tanganyika for economic development can hardly be considered to be plentiful. Agriculture lends itself to fruitful intensification, but it is a matter of investment primarily in the commercial crops. Service co-operatives have a larger spread in Tanganyika than in most other countries of the continent and they promise to mitigate in some degree the dearth of capital. Mining appears to be an emerging sphere of industry with the known resources in diamond, gold, lead and copper, but hopes of more plentiful minerals await corroboration by geological surveys and prospecting on an extensive scale. The development fund of £24 million which Britain has undertaken to provide will be inadequate for the three-year expansion programme. American credit of \$10 million has been announced in the wake of independence. India, too, has expressed her willingness to offer her modest contribution. But it is through larger trade and supply of technical skills that India can make the real impact of her co-operation on Tanganyika's new task of raising her economic stature.

This prospect notwithstanding, the larger consideration of viability underscores the importance of the scheme of the East African Federation. Mr. Nyerere has been an advocate of the Federation comprising Tanganyika, Kenya and Uganda. The plan of a common civil service for these three countries stands and, in fact, the formation of a new civil service is a major worry for him. The achievement of the Federation, however, will bring new influences in Tanganyika from her partners. Not all of them will be necessarily healthy. How far Tanganyika will be able to use her influence for the preservation of racial harmony in the federal set-up will be a matter of great interest.

India and Malaya

THOUGH the current visit of His Majesty Yang di-Pertuan Agong, the Paramount Ruler of the Federation of Malaya, is his first one to this country, the feeling of his being no stranger here, expressed by him at the civic reception given to him and his consort, the Raja Permaisuri Agong,

at the historic Red Fort on Monday, bears eloquent testimony to the bonds of friendship that have existed between India and Malaya through no less than a score of centuries. These bonds have only been strengthened during the past one decade, particularly since 1958 when Malaya be-

came independent, and today the two countries have forged new links to suit the modern times. Malaya, which drew immense inspiration from India's struggle for freedom, believes, as passionately as India does, in the moral force of peace rather than in the material force of power, in justice and fairplay and in the rights of man rather than in the might of arms or money. By their own choice, both the countries have shunned involvement in power blocs and adopted a policy of neutralism in their dealings with other countries. The forces of both India and Malaya are fighting shoulder-to-shoulder the battle of the U.N. in the Congo. To stress the broad identity of outlook that the two countries have on various political, economic and moral issues facing the world today, one has only to recall the leading role that the Malayan Prime Minister, Tenku Abdul Rahman, has played in forcing South Africa to withdraw from the Commonwealth in pursuance of her misguided policy of apartheid.

The glowing tribute that His Majesty has paid to the people of the Indian origin in Malaya is something of which India can well be proud of. Mr. Nehru has always advised the Indians abroad to identify themselves with the local people. It is, indeed, heartening that this advice is being followed, both in letter and spirit, by the Indians in Malaya, who form no less than 10 per cent of the Malayan population. The role that Indians have played in Malaya's economic development, which with the formation of Malaysia — a Federation of Malaya, Singapore, North Borneo, Brunei and Sarawak — will foster, it is hoped, will grow

in future. An appropriate step in inculcating a sense of unity among the various racial groups that inhabit Malaya — the Malays, the Chinese and the Indians — can well be the reorganisation of the political parties there on economic programmes. That would deepen the roots of democracy in South-East Asia and should go some way in creating a powerful bulwark to counter the menace of Red China.

The interest that India has shown in the economic development of Malaya, especially after the visit of President Rajendra Prasad to that country about three years ago, is evident from the technical assistance which this country has afforded in the reorganisation of the Malayan economy. This aid perforce has been only on a limited scale as yet because of the paucity of technical hands in India to cope with her own developmental programmes. But there can be little doubt that it will flow in a greater measure before long. Malaya has also benefited to not an inconsiderable extent from the industrialisation that has taken place in India during the past one decade; since 1952, Malaya's export trade with this country has gone up from Rs. 2.66 crores to as much as Rs. 13.66 crores, due to increased demand for her various raw materials, the most important among which are base metals, rubber, oilseeds and oils. Development of the Malayan economy similarly should help in stepping up of Indian exports which have practically been stagnant all these years around Rs. 4 crores. The current visit of the Paramount Ruler of Malaya and his consort, it is earnestly hoped, will further strengthen the ties that bind the two countries today.

The U. S. Taxman Foots the Bill for Art

By WILLIAM REES-MOGG

IN the last ten years a number of sizable fortunes have been made in the international art market. A few of them have been made by dealers, the people who buy and sell; far more have been made by collectors, the people who buy and hold. What is more the market is still going up, although all the world's stock markets have passed beyond the big boom years.

Some of the profits have been truly remarkable. Discounting the speculative moderns, like Jackson Pollock, prices have increased between two and ten times for works of art's, furniture and rare books of the first class. This season's sale of the Erickson collection at the Parke-Bernet Galleries in New York brought in \$4,679,250 in sixty minutes, the largest amount ever realised at a one-day sale. No one knows what Erickson paid for his collection. On the big Rembrandt he made a modest profit of about 300 per cent in 30 years.

It is not only, or even chiefly, the great impressionists, or the Rembrandts which represent the rise in the market. The modest collector, who spent a few hundred pounds in the late forties on silver or china, will show an equal or greater capital appreciation.

There are a number of reasons for the way the market has gone on rising. Probably the most important single one is the American tax law which allows a gift, in cash or kind, to a museum or a university, to be offset against tax on up to 20 per cent of a man's income. This means that it is literally possible for a collector to make a bigger profit by giving away a painting than by selling it. Supposing Mr. Pantograph of Indiana bought a Renoir, just an ordinary small Re-

noir, for \$20,000 in 1949. It is now worth \$100,000. If he sells it, he will have to pay the auctioneers commission (10 per cent in London, normally more in New York) and a 25 per cent long-term capital gains tax under the U.S. tax laws. That means that his net profit comes out at \$51,250 in cash. If he gives it to the university of his old home town, he can deduct \$100,000 from his taxable income and save \$90,000 on tax, giving him a true net profit of \$70,000.

This means that the eventual purchaser in the art market is the U.S. Treasury; it also means that the U.S. Treasury is normally bidding against itself. When Rembrandt's picture of Aristotle was sold to the Metropolitan Museum for \$2,300,000, the friends who were going to put up the money were no doubt largely intending to claim it against tax: the underbidder at the auction was the Cleveland Museum of Art. Who were its friends? No doubt another group of wealthy men willing to put up \$90 of Uncle Sam's money to match every \$10 of their own.

This is not particularly scandalous: it means that U.S. institutions are increasingly becoming the richest in the world. It means that the U.S. tax laws are an engine for pushing up the prices of all works of art of museum quality.

On top of this the supply is much thinner than it was. Take the case of books. In the 1920's death duties and the shortage of servants led to the sale of half the country house libraries in

(CONTINUED ON PAGE 1120)

A DELHI DIARY

NON-VIOLENCE AND OCCAM'S RAZOR

MANY people in Delhi have been going about in a state of animated suspense expecting something or other to happen on Goa. The whole week has passed by without the expected result or, if I might be so bold as to say so, without a reversal of India's traditional faith in non-violence. On the other hand, it is difficult for one who goes about Delhi at the moment — and I am told this is even more so in Bombay — not to recognize that non-violence as a creed, if it ever was a central pillar in Indian political thinking, has lost its virtue. I have heard in the last week from a historian, who has lived through the whole Gandhian age, the view that non-violence is just not a "fact". Questioned more closely, he presented to me what is known as Occam's Razor. For those not so learned in dialectics, may I display my learning by saying that William of Occam, who lived in the first half of the fourteenth century, set down a proposition which is now called "Occam's Razor", because it makes such a clean-cut of every idealist argument. Translated into English — Oxford English Dictionary version — Occam's Razor reads: "Things not known to exist should not, unless it is absolutely necessary, be postulated as existing". In a somewhat similar vein, may I say that non-violence has been shown in an absolute sense not to exist; therefore, was the Gandhian Age a fraud? What then is this little hesitation about? Some of my journalist friends call it had conscience; some of them call it lack of decision; others call it "the fear of destroying the image." I leave readers to make up their minds what it is that holds back an entry into Goa. For myself, I am still hoping, William of Occam notwithstanding, that non-violence is a fact in Indian political thought.

Undoubtedly, the overwhelming majority of the Indian people are in favour of action. Whether they are equally in favour of action on China is a different matter. But action on Goa is easy and, it seems, justified on the ground that we are being slighted by someone much smaller than ourselves. I will not say my piece on this David and Goliath business. I remember when Mr. Morarji Desai was bold enough to say his piece in the seminar on Portuguese colonies, he was left in no doubt as to what majority opinion was both in India and in Bombay. May I, therefore, do no more than to say that on that occasion I felt that Mr. Morarji Desai rose higher in my estimation than by his displays of financial excellence? It is something that the great passion for action should occasionally be clouded over with a pale cast of idealistic thought.

Let me put the position somewhat differently. The Gandhian experiment may or may not have been a success. It ran parallel rather than centrally before Indian Independence. In other words, it cannot be definitely proved that it was the Gandhian technique which was victorious in this case. The great majority of the people all over the world believe that it "probably" worked because the British (and conceivably some other nations) are sensitive to the kinds of moral pressures which non-violence generates. But if the case is unproved, surely the fertile soil in which the seed was first sown should not be the first to reject the efficacy of this doctrine. It is a slow doctrine and a painful one; it operates over a long time by a three-fold process which cannot be immediately effective. In the first place, the victims of tyranny have to create conviction amongst themselves that they need to sacrifice much for their cause. Secondly, this sacrifice must engender amongst the hesitant both courage and a decision to bear the consequences of further tyranny accentuated by resistance. Thirdly, environment in the classes exercising tyranny must be affected by a mental process which is by no means quick; because power blinds, as does anger and irritation at resistance. The final process which is the victory

of the tyrant over himself — the supreme proof of non-violence — is naturally a very doubtful affair. But if we believe that this is not possible, are we not denying the application of Gandhian techniques in a grand, or should I say, tragic manner?

ELECTIONS AND THEIR SINEWS

Let me pass on to an even more querulous subject. I see that the Prime Minister has decided this week (only) that firms which contribute to the Swatantra Party, or presumably any other Opposition Party, will not have the great privilege of contributing to Congress funds. I understand many firms have already distributed their "donations". Is the Congress Party really willing to return these donations and, if so, why? Does this mean that the "Congress" firms will get licences and the non-Congress firms will get crumbs which fall from their tables? Is there an element of threat in the proposal that those who support the Opposition Parties will have to bear the consequences? I only ask this question because it is being repeatedly asked whether, in choosing to select its sources of finance, the Congress Party is not accepting any corresponding obligations. Personally I have never been convinced as I am now, that the receipt of all political funds from companies is an error. It would have required a tremendous amount of sacrifice on the part of the Congress, but who knows the Congress vote might have grown by the triumphant display that the ruling party was not to be bought by the money of big-business. Like Caesar's wife, I would like to see the successors of Caesar held above suspicion.

People keep on asking me when D-Day on Goa is coming. I quote to them that momentous utterance of the great Don Quixote: "Patience, and shuffle the cards".

Next to Goa there has been some special excitement in Delhi on the U.S.S.R.'s break with Albania. A large number of people are now amused by the fact that, in addition to Chinese opposition to India, we now have Albanian opposition. However, on this I am more concerned with Mr. Nikita Khrushchev's feelings best expressed by my naughty cartoonist below.

What a Life!

A Soviet satellite out of orbit!

THE WEEK'S NOTES

Company Contributions

A DECISION WITH A DESIGN

HARDLY WITHIN a few months of the passing of the amended Companies Act, the Congress Party has come face to face with the awkward consequences of the Central Government's unbending attitude in refusing to consider the logical and long run effects of the retention of the provision which enables joint-stock companies to pay contributions to political parties out of their funds. This journal, among others, staunchly opposed this enabling provision both on grounds of equity as well as public morality. A peculiar situation has arisen which, be it noted, does not raise any complex issues of principle. Such issues of principle that have arisen are simple and amenable to a straightforward decision. But the ruling party has gratuitously imported complications into them. The results of these complications—direct or indirect—threaten the freedom of choice to make contributions to political parties.

Some joint stock companies, whose contributions the ruling party will be only too eager to grasp, sound the views of their shareholders (the owners and, therefore, the legitimate distributors of the funds to be contributed to the parties) and found that, while some of the shareholders wanted the contributions to be made to the Congress Party, some others opted for the Opposition Parties. The Companies Act does not restrict the right to make contributions in so far as the beneficiaries are concerned and it does not in the least purport to dragoon the shareholders into voting the funds for a single party alone. In the liberal tradition of our legislation, it ensures the freedom of choice and leaves scope for a contingency, where multi-party contributions are desired by the final dispensers, who are the shareholders.

The Central Election Fund authority of the Congress Party has reportedly issued a policy directive to the Pradesh Congress Party Executives on this subject to the effect that, where a company proposes to make contributions to the Congress Party as well as the Opposition Parties, the former should not accept them. This is an unprincipled decision. It is not only unprincipled but it strikes at the plain meaning and spirit of the provision of the Companies Act. It goes even a step further in putting a veiled pressure on the companies to behave and contribute to a single party. The plea that the Congress Party has a conscientious objection to accepting funds from a source, which also provides the Opposition Parties with the wherewithal to fight elections, cannot hold water. These contributions, in the last analysis, partake of a tainted complexion and the Congress Party, which fought hard in Parliament to preserve them, did so not on the ground of good conscience but sheer expediency—the harsh reality that the Party candidates and members cannot simply bear the burden of the election outlay. It may possibly be argued that the grievance of indirect pressure to contribute to a single party (which in most cases will be the ruling party) is not proved and is, therefore, baseless. In such matters experience is the genuine testimony. And to ask for tangible proof of the intangible is a strange way of silencing reasonable criticism.

Laos

ROAD TO NEUTRALITY

THE SICKENING stalemate created by the hurdles across the path of a peaceful government in Laos, long after an agreement was reached in principle on the formation of a neutralist government, promises to come to an end soon. This time it was not so much the leaders of the power blocs behind the two factions in Laos that were responsible for prolonging the rot as the princes themselves. If confidence in the neutral

character of the coalition government was to be inspired, it was obvious that the balance of convenience lay in putting Prince Souvanna Phouma at the head and not Prince Boun Oum or Prince Souphannouvong for the simple reason of their declared alignment with the right or the left respectively. But having recognised this fact, the two princes could not overcome their internal resistance to putting the neutralist coalition into active power. In this atmosphere of vacillation and uncertainty, their external supporters could not stay their hands. Aid build-up continued as an inevitable strategy.

There existed, of course, vital international issues of divergence between Russia and America, but they could have been resolved once the three princes had come forward without reserve to work out a neutral government. In a way, the Laotian problem moved in a vicious circle, but the circle had been broken with the initiative emanating from Geneva. The Kennedy Administration's firm decision to back neutralism has cleared the way for the British Co-chairman of the Geneva Conference to make positive proposals to his Russian colleague to arrive at a fresh agreement on a broad basis of accommodation. According to a version of the agreement, whose authenticity need not be doubted, Russia has abandoned her insistence on "troika" inside the International Control Commission. Its voting procedure is not to be based on unanimity among the three members, but on majority. It is not clear, however, whether action to implement the Commission's decisions is to be governed by this very procedure. Agreement has been reached between the Co-chairmen on a comprehensive area—functions to be assigned to the inspection teams, investigations into allegations of breaches of neutrality, power of the ICC relating to the supply or infiltration of arms to local groups and, what is most important, preventing use of foreign territory for intervention in Laos or of using Laos as a base of incursions into neighbouring countries, South Vietnam, for instance. Responsibility now shifts, by and large, on the three princes to put neutrality into operation. There will be universal satisfaction with this forward step, except in China, which will feel chagrined at the accommodating spirit of the Big Brother in her "orbit".

Railway Accidents

AN UNCONVINCING DEFENCE

MR. VAJPAYEE'S motion for the appointment of a high power judicial committee to inquire into the three recent major railway accidents involving heavy casualties need not be branded as a mere manifestation of the new-found faith in judicial enquiries as the really impartial agencies for enquiries into problems of public interest. It should be interpreted as an indication of the deep concern which is felt about the possible share of the human element in the responsibility for these accidents. The speeches during the debate on the motion were highly critical of the explanation of sabotage that is being offered in the case of the Ghatsila accident. A judicial enquiry does not automatically become advisable. Mr. Jagjivan Ram could have carried conviction on this specific point, if he had not created the impression that judicial enquiries are much too overrated for their weight and authority. He asserted that in all the previous judicial enquiries the findings of the Chief Inspectorate of Railway Accidents were corroborated. If this reasoning is to be followed rigidly, what would have been lost by getting the seal of approval from a judicial committee, since it would have also silenced his Lok Sabha critics? His colleague, Dr. Subbarayan, Minister for Transport (under which the Inspectorate comes), came to his rescue when he explained that the expert opinion of the Chief Inspector counts heavily with the judicial committees.

This, however, was no occasion at all for scoring debating points. Both the Ministers misconstrued the nature of the demand and the particular aspect of heavy casualties in the accidents which were the subject-matter of the demand. They proceeded in the placid manner of an arithmetical assessment of the incidence of accidents to railway trains and argued with the coolness that befits a statistician that in the last five years accidents were on the decline. This is not a matter of assessment in numerical terms. Its qualitative aspect is more important, as the three accidents have shown. Nor did the citation of the small number of accidents during 1960-61 being attributable to the railway staff meet the questions raised in the debate. The Railway Minister could have done well to convey a definite feeling of assurance to fortify confidence in the safety factor by explaining elaborately his Ministry's measures to prevent accidents or to award adequate punishments for acts of negligence or omission. On the other hand, his critics made references to light punishments. He took his unconvincing attitude a stage further in telling the House that he was "thinking" of appointing a special committee (including experts and M.P.s) to enquire into this matter. If a judicial committee is superfluous, how does he put this extra-departmental committee in a different class?

Albania

THE KREMLIN CUT

RUSSIA'S DIPLOMATIC rupture with Albania has come much sooner than many would have anticipated. This break stands on a footing entirely different from the break with Yugoslavia. In the case of Yugoslavia the break was for ex-communication. For Albania what seems to be intended is segregation. Nevertheless, it is important to note another vital aspect of the rupture, Stalin waited long before he took the final decisive step

against Marshal Tito. Mr. Khrushchev could have gone on treating with indifference and a superior air of disdain Mr. Enver Hoxha's tirade against Russia. Albania possesses a minor weight in the Communist scale and geography has imposed upon her a state of isolation from the rest of the red world. The easiest access for Albania lies through Yugoslavia, but it is an open secret that no sympathy will be wasted by the latter for the simple reason that Albania herself has prevented such a course by her deliberate attitude of causing greater alienation with Yugoslavia.

A probable explanation of the promptitude with which this drastic step was taken by the Kremlin lies in China's overt acts of support and encouragement to Albania. If Albania is now found guilty of 'left deviation', China has openly come out against Russia's shift towards liberalisation and posed as the self-appointed guardian of ideological purism. The rebuff to Albania is intended to convey an unmistakable hint to China. Now that Russia has broken the diplomatic tie with Albania will the other countries of the Communist bloc in Eastern Europe stay their hands? The likelihood is that they will follow suit. This will be the crucial point for China to re-examine the new posture she has adopted and make a decision whether and to what extent to continue her backing to Albania. China's ambition to be the arch-leader may lead her to greater adventures and involvements, putting a heavy strain on her relations with Russia. Extreme intellectuals in Albania, in their impatience to force the pace of industrialisation and modernisation with Communist techniques, have forced the hands of the party leaders and precipitated the rupture. China is just not in a position to provide the assistance that Albania badly needs. Plainly, China herself is heavily dependent on Russian aid to achieve her giant ambitions whatever the efforts to disguise this fact. The chances appear to be that if she takes another adventurist step and backs Albania in her segregation, she will invite difficulties for herself in her leaps either way.

(CONTINUED FROM PAGE 1117)

England. There are by now only a handful left. There is Longleat and Chatsworth among the great houses: most of the rest are gone. An automatic increase in the volume of money seeking a diminishing supply which can in no way be replenished is a formula for the inflation of prices which would be hard to beat.

There has also, of course, been the effect of inflation itself, combined with high taxes. The one disadvantage of a Queen Anne coffee pot, now worth £700, for a fairly good example, is that it does not produce a cash income. But if it is going to be worth £1,500 in 1970, and is very beautiful now, who cares about the unearned surtaxable income that is being forgone. In an age of rising prices goods are better than money, and these are goods which cannot be duplicated. There will never be any increase in the number of Queen Anne coffee pots, or Cezannes, or Nymphenberg figures or Ming vases: there may be a few fakes, but the man who employs a good dealer, or consults the experts at a good auction house, has relatively little to fear from them.

Of course, there is one requisite before the collecting of antiques or works of art of any kind becomes really profitable. There must be skill. It is always possible to buy the wrong object at

the wrong price. Supposing two men, one highly skilled and the other unskilled, set out to collect furniture of the same period. The skilled man will be able to achieve the same collection at perhaps only a half or even a third of the total cost. But the movement of the market will probably take care even of the innocent collector. A man who has doubled his money should not complain too much that he failed to quadruple it.

The profitability of collecting is likely in the next decade to make it one of the best investments—for many people the best. There are three points to be made. The first is to trust the experts—you cannot go wrong by taking the advice of Sotheby's or Christies or Agnews or Quaritch or Maggs or Partridge or any of the other leading firms. The second is to buy for love as well as money. Enjoyment is the revenue one gets from works of art—it is a crime to buy what one does not enjoy even if the crime is profitable. The third is to stick to the best. That dreary looking little painting with its scratched varnish may be a Constable—but it is probably dear at £100. The best of each kind is likely to be expensive of its kind, but it need not be expensive absolutely. It is only the best which can be relied upon to hold and increase its value.

Messrs. Ashok Leyland Ltd.,
Ennore, MADRAS

Dear Sirs,

We operate 4 Nos. of Leyland Comet trucks and have ordered two more chassis.

The Comets are used for the carriage of liquid oxygen from the producing factories for local distribution as well as for supplying to depots remote from the factory. As an operator of a large number of trucks, our main considerations are reliability of transport consistent with economy of operation and Leyland Comets have met these requirements to our satisfaction.

Yours faithfully,
T.P.L. Sinha

U. S. INVESTMENT BENEFITS BRITAIN

By ODYSSEUS

IN VIEW of the difficulties that India has had from time to time in attracting foreign capital, and sometimes in her relations with foreign companies once they are established in India, the U.K.'s experience with U.S. investors should be of interest.

Mr. John H. Dunning, writing in "Moorgate and Wall Street" (a review published jointly by Philip Hill, Higginson, and Erlangers Ltd., merchant bankers, of 34, Moorgate, London EC-2, and their American associates, Harriman Ripley & Co. of 63, Wall Street, New York), says that the book value of U.S. business interests in the U.K. totalled \$3,200 million in 1960, i.e., about half of U.S. investment in Europe. Between 1958-59, investment in the U.K. by U.S. subsidiaries and Anglo-U.S. financed firms was 71.7 per cent of all non-resident investment, and their accumulated capital stake was equivalent to 4.2 per cent of the U.K.'s gross national product (compared with 2.3 per cent in 1949) or \$48 per head of population (compared with \$15 in 1949).

Table I shows the number and value of U.S. direct investment in the U.K. by industry up to 1946 and up to 1957. Table II shows the number and value of U.S. financed firms in the U.K. up to 1946 and up to 1957 by

TABLE I
NUMBER AND VALUE OF U.S. DISTRICT INVESTMENTS IN U.K. INDUSTRY

percentage of U.S. ownership. The U.S. share in 1959 in the total net assets of branch plants and U.K. registered companies with a U.S. equity holding of 25 per cent or more was \$2,475 million. Table II shows that in 1957 in all but 53 of the 842 U.S. financed companies, the U.S. affiliate had a controlling interest, and of the total investment of \$1,974 million, 73 per cent belonged to fully-owned subsidiaries. Including the U.K. share of equity capital in those companies where U.S. ownership is less than 100 per cent, the value of net assets under the control of U.S. firms in U.K. was \$3,500 million in 1960.

Mr. Dunning concentrates his study on manufacturing industry, partly because this absorbs most U.S. investment, partly because statistics for petroleum refining and marketing are inadequate. One in twenty workers in U.K. manufacturing are employed by U.S. firms, compared with one in 80 before the war. The 440 firms with U.S. affiliations accounted for 5.7 per cent of total manufacturing sales and slightly more of net output. Table III, which analyses the distribution of U.S. products and the relative importance of their sales to U.K. industry, shows that 67 per cent of investment, 62 per cent of sales, and 72 per cent of workers are concentrated in the chemicals, machinery, and vehicles groups, and U.S. firms supply 12 per cent of U.K. sales of these goods. These industries are among the most rapidly expanding of the U.K. economy and include pharmaceuticals, cosmetics, office machinery, earth-moving equipment, agricultural tractors, and domestic electrical apparatus, in which, since the war, U.S. firms have been prominent innovators.

U.S. firms generally operate in the more capital intensive industries which partly, but not wholly, explains their higher net output per head. Other data shows that the share of U.S. firms in the U.K. in gross and net trading profits is well above that of the labour force, and total sales and their average rate of return in relation to capital (net assets) and sales turnover is also greater. This is partly because U.S. firms are concentrated in high profit industries, partly because of their efficiency. Finally, U.S. affiliates earn higher rates of return in the U.K. than their counterparts in the U.S.A. For 1958-59, while the net assets invested in manufacturing in the U.S.A. yielded (net of tax) an average of 10.7 per cent, U.S. firms in the U.K. earned 16.7 per cent. Even allowing for the loss of domestic taxes from overseas, these figures reveal a handsome social, as well as private, return to the U.S. economy, and it is not surprising that increasing numbers of U.S. companies prefer to invest their surplus funds overseas, particularly in the U.K., since U.S. investment there is

yielding higher profits than in the Common Market countries, 16.4 per cent compared with 11.1 per cent (1958-59).

EFFECT ON THE BALANCE OF PAYMENTS

What effect has U.S. investment on the U.K. balance of payments? In 1957, U.S. firms accounted for 11.8 per cent of all U.K. manufactured exports and on average exported 27.5 per cent of their output. Since then, the figures are known to have risen even higher.

The U.K. economy had benefitted from U.S. investment as a source of new capital, technical and managerial expertise, and because the parent companies of U.S. affiliates in the U.K. spent more each year (in real terms) on research and development than the whole of British industry (on private account) combined.

The price of these benefits is usually measured by the outflow of dollars in the payment of dividends, etc. Ignoring that the U.K.'s national income is raised by U.S. capital formation, will the dollar outflow overstrain

the U.K. balance of payments? Table IV sets out the answer for 1957, which shows a small deficit of \$51 million. Mr. Dunning points out, however, that 1957 was exceptional, because of heavy purchases by U.S. firms of crude oil from the U.S. following the Suez crisis, which temporarily cut Middle East supplies. In normal years, such oil imports are much less. Table IV shows that the activities of manufacturing industry yield a net gain of \$26 million in dollars, and of \$650 million in all foreign currencies. "Other industries" yielded a net loss of \$33 million, mainly because of their low export earnings. On final balance, if there was in 1957 a net loss of \$51 in dollars, there was a gain of \$482 million in other currencies. As a whole, Mr. Dunning considers that U.S. causes neither a marked loss nor gain to the sterling/dollar account. In the future, remittances to the U.S.A. will grow, but whether, over a period, they will exceed capital imports from the U.S.A. is hard to say. On the other hand, current trends suggest a long-term increase in the dollar exports of these firms.

TABLE IV
INTERNATIONAL TRANSACTIONS OF U.S. FINANCED FIRMS IN U.K., 1957 (\$ million)

	Manufacturing	Petroleum	Other Industries	Total
(a) Receipts of Foreign Currency:				
(i) Exports of goods and services to U.S.	+136	—	+2	+132
(ii) Imports of capital from U.S.	+76	+90	+7	+173
Total inflow of dollar currency	+206	+90	+9	+305
(iii) Other exports of goods and services	+699	+76	+3	+778

The European Scene

BRITISH AVIATION JOINS EUROMARKET

From Our Special West European Correspondent

PARIS, December 10.

SINCE the British Government decided to seek admission to the Common Market, the question has often been asked (particularly by Continentals profoundly attached to the ideal of European unity) whether Britain has really been converted to the European faith and is willing to forswear her traditional, and rather superior, attitude to her neighbours; or whether her latest move is not a manoeuvre designed to prevent a unification that she is not willing to assist but cannot afford to let go forward without her. The question is no doubt insulting, as suggesting duplicity, even perfidy. There is no evidence that the British decision is hypocritical on the contrary, there is every reason to think that London is sincerely willing to co-operate in all forms of unification that will bring her economy more benefit than damage, and after all this is just the attitude of the Continentals themselves. But the whole question is there: the Continentals learned a decade or more ago that there was no hope or scope for their economic progress without the creation of a common market; is British industry convinced of the same thing? It is not a matter of being more or less sincere, more or less hypocritical; it is a question of fact: is economic integration regarded as an ineluctable necessity on the other side of the Channel as it is on this side?

Naturally, opinion on that score will differ from one British industry to another, as it does (or rather did four years ago) from one French or Italian industry to another. Yet certain leading industries enjoying great influence or prestige could, by opting unequivocally for European integration, secure the conversion of the others. This is what happened on the Continent, where coal and steel blazed the trail of unification. The first clear sign of similar leadership in British industry has come from the aeronautical industry, and the case is highly significant because it was in this field that Britain tried until recently to be the cat that walks by himself. The spectacular progress of aero engineering in Britain during the war (notably with the invention of the jet engine), the advance that Britain seemed to have secured even over the Americans in jetliners with the first Comets, the responsibility thrown on the industry by the decision to build an independent nuclear striking force, and the still acknowledged British mastery in turbo-prop and pure jet engines, all seemed to justify a strictly nationalist approach and to exclude the pooling of resources implied in economic integration. At all events, it meant that the aeronautical industry represented a considerable investment of national amour propre.

Yet in recent weeks the British aero industry has admitted the impossibility of "going it alone" and has virtually created with its rivals in the Common Market the foundations of a unified aircraft industry that rationally pools resources and divides labour for a common task. And by the same token, it has at once opened up a grandiose prospect, as notable as any so far revealed by industrial concentration inside the Common Market. In 1968 we shall be able to fly from Delhi to London between breakfast and dinner at a speed of 2,500 kilometers an hour in a plane that will be neither British nor French, but a "Common Market Plane" (possibly run by a "Common Market Airline"), and which will have no Russian or American rival or counterpart. It is by examples such as this, which demonstrate the futility of nationalist effort in modern industry and the immense possibilities of British-Continental co-

operation, that the ideal of economic integration will make its way among British industries.

The turnabout in British aviation has come suddenly. As recently as 1958, the British submitted their own version of an anti-submarine plane to NATO, and when the alliance preferred a French plane, they withdrew and refused to co-operate. The plane was built by the Common Market industries: Breguet and Sud Aviation (France), Dornier (West Germany), Fokker (Holland) and ABAP (Belgium). The British limited themselves to a free-trade operation: they sold the engines on a commercial basis to the Common Market makers. This month, by contrast, they are submitting joint designs to NATO for its vertical-take-off fighter along with Continental manufacturers, and will co-operate in building whatever machine is chosen. There are two main entrants. The British Aircraft Corporation (Vickers Armstrong, English Electric and Bristol Aircraft) are working with the two French firms, Sud Aviation and Marcel Dassault, on a VTO (vertical-take-off) version of Dassault's Mirage 3 V. The Hawker-Siddeley group (Hawker Aircraft, de Havilland, Avro, Folland and Blackburn) have signed an agreement with Breguet, Fokker, Dornier, SBAC-Fairey (Belgium) and Republic Aviation (US) to produce in common whichever of their machines is selected by NATO, despite the fact that Hawker seemed to be comfortably placed by itself in the VTO field. I suppose I need not emphasise that the quest for a VTO craft does not concern only NATO: VTO or STOL (short take-off & landing) planes are of vital importance to countries without adequate airstrips, for operation in the bush or in jungles, and for landing near cities where land values are high. VTO promises to be the next significant advance in aviation, and its coming has been brought nearer by the British decision to abandon, in one case, their own plans in favour of a French machine and, in the other case, to work from the start with the Continental industries.

These decisions are not isolated but are part of a general revision of British thinking on the subject. Simultaneously, the British Aircraft Corporation has signed up with Dornier Werke (West Germany) and with Finmeccanica (Italy) for research on a STOL transport plane. Bristol-Siddeley, the motors subsidiary owned jointly by Hawker and Bristol Aeroplane, has signed up with SNECMA, the French Government's aero engine corporation for the joint construction of the Olympus jet engine for multi-mach craft. These co-operation pacts are in line with the policy adopted by the Common Market construction for some years past, and which was initiated by the anti-submarine craft mentioned and is being continued by work on the Transall. The Transall, a big turbo-prop cargo plane, is the first Franco-German venture in aeronautical construction and is being produced by Nord Aviation (France) and Blumeleight, Hamburger and Weser (West Germany). A new step in the same direction has just been announced, in the shape of an agreement between Breguet and Fokker for the construction of the Friendship transport plane. Agreements of this sort are multiplying inside the Common Market because everyone realises that the cost of progress in aviation is too enormous for any one national industry to bear, whereas, if talents and money are combined, the Europeans can hold their own against the Americans and Russians. What is new is that the British industry has been converted to this same point of view.

The most striking proof of its conversion concerns the project for a supersonic airliner. The British and the French were working on this independently. They had set their sights lower than the Americans, who are perhaps reaching for the moon: the USA, in its Project Orion, is planning a 2,000 mph. airliner, which will involve immense difficulties since it will need to be built of steel to withstand the heat generated at such speeds. The Europeans had in view a machine that will fly at mach 2.2 (against mach 3 for the Americans), will have a shorter range and thus necessitate a stop at Gander in crossing the Atlantic. Even this project, however, would be beyond the capabilities of the separate national industries. So the British Aircraft Corporation have just signed a pact with Sud Aviation makers of the Caravelle) for long-term technical co-operation and, eventually, joint production and sale, covering their work in progress and their future projects. This means in effect that the schemes for a Vickers Armstrong VC10 long-range jet transport will be shared with the Super Caravelle. Implementation of the agreement is now to be discussed and will depend on technical factors and on the assistance provided by the two Governments. The French Government, for its part, has already approved a contribution to construction of a supersonic airliner; the companies are awaiting similar approval from London. It is then likely that the purely British plan will be dropped and both nations will concentrate on the Super Caravelle.

Such a decision would prove that one British industry at least had resolved, very definitely, to join the Common Market and for the same reasons as are pushing Continentals to integrate their industries. Moreover, it would be a rational way for Europe to find its place in a world dominated by Russo-American competition. As we see with their respective space projects, the Russians and Americans seem willing to ignore all reasonable economic considerations in the pursuit of extensive prestige. Europe would be well advised to leave them fight out the uneconomic battle over the prestige project for an airliner that will (maybe) fly at mach 3.5 somewhere between 1970 and 1975 but will be too costly

for the airline companies to buy. Coming on to the market in 1968 (prototypes will fly in 1965) with a 90-ton, 100-passenger machine for which there already exists a demand, the Europeans will have made better use of their resources. In this field as in others, the Europeans could show that the object of their economic integration is not to "be as big as the biggest" but to combine their abilities in the pursuit of reasonable goals.

The British aeronautical industry's option in favour of European co-operation is not just a flash in the pan; as Continental experience has proven since 1957, one thing leads to another once one begins to integrate national industries. Concentration at home is a necessary prelude to concentration inside the Common Market, and the reorganisation of the British aero industry this autumn is a sign that the current round of agreements with the Continentals forms part of a general shake-up such as the British Government hoped to stimulate when it applied to the Six for admission. (The Hawker-Bristol and the Rolls Royce-English Electric-Napier groups have been concentrated, leaving only one independent engine maker, Avon). Moreover the national airlines companies will soon find that accelerated progress in the European aero construction industry sets them problems that can best be resolved by similar international agreement. These companies are already groaning under the strain of keeping up with the aircraft manufacturers (some have failed: TWA's financial crash may mean that it cannot pay for its Caravelles). The Common Market airlines drew the moral some years ago, when Air France, Lufthansa, Alitalia and Sabena formed Air Union. KLM, which backed out of the agreement, is now thinking of coming back, and if Britain joins the Common Market the question of admitting BOAC and BEA will arise. The supersonic airliner planned by the British and French as a joint venture will cost Rs. 35 millions to produce. The airline companies may well find that they cannot buy and amortise machines of that order without getting together the way the firms that make them are getting together.

"Here are five ways BOAC Air Cargo can help your business!"

- ★ Fast BOAC jetliners slash transit time by hours.
- ★ Direct BOAC city-to-city freighting cuts out time-wasting journeys to and from docks.
- ★ Simple (cheap) packaging is all that's needed with careful BOAC handling.
- ★ Safe, efficient BOAC freighting means lower insurance costs, wider coverage.
- ★ Experienced BOAC staff give all goods individual attention all the way.

We deliver your goods in hours, instead of days or weeks! And that's only one of the things you gain. Speed alone may not be enough for you—but BOAC Air Cargo gives more and more successful businessmen these extra advantages...advantages that can help and benefit your business!

Economic Report from the U.S.

IMPROVEMENT IN EDUCATIONAL STANDARDS

By GUY SIMS FITCH

WASHINGTON, December 6.

It is an accepted assumption that rising levels of education contribute importantly to a nation's economic and social development. In a nation in the early stages of economic advancement, where even basic skills required for modern industrial and agricultural development may be insufficient, this assumption is hardly to be challenged. Yet even in the U.S. where formal education is widespread and where basic skills have been developed to a high degree, the need for continuing improvement in educational standards is a subject of considerable interest.

Historically, growth in education has been one of the striking features of the U.S. scene in the twentieth century. Expenditures on education have more than doubled every 10 years since 1900. Some 40 per cent of Americans in the 18-21 age bracket are in college today compared with only 4 per cent at the turn of the century. Last year, formal education cost Americans nearly \$45,000 million — an amount equal to 9 per cent of the U.S. production of all goods and services. This includes the salaries of two million teachers plus other school employees, maintenance and carrying charges on buildings and equipment, and the estimated amount of money students might have earned if they had been working instead of attending school.

The question remains as to how all this education contributes to economic progress. As far as the individual is concerned, of course, he becomes better equipped to handle important, more demanding, and presumably higher-paying jobs. According to measurement made a few years ago, for instance, college graduates had an income almost two-thirds higher than high-school graduates. But money return is far from the entire

answer. It is, rather, a reflection of the fact that the fastest-growing occupations have been those requiring higher levels of education. This development is directly related to the demands of economic growth. Obviously, the better educated the labour force, the more productive it tends to be. And basic to growth is technological progress and its related services, which rest primarily on education. It is difficult, of course, to arrive at statistical measurements of the importance of an element as intangible in its impact as education to the economic progress of a country as large and complex as the U.S. Yet it has been concluded that over a recent 30-year period some 24 per cent of the increase in the nation's total output of goods and services — its gross national product (GNP) — and 44 per cent of its advance in output per worker could be attributed to the higher levels of education in its labour force. And this does not take into account the application of increased knowledge — another intangible — that may have accompanied the higher educational levels.

Of course, investment in education is not the only ingredient of economic growth. One cannot ignore the fact that increased capital investment also is essential to put technological advances to work. Moreover, the gains from education may not be immediately evident. They tend to accumulate over a long period, with net addition to economic growth often generated only in succeeding years or decades. Nor is there any set formula as to how much a nation should spend on education. From the record, however, it appears that the growth in the U.S. GNP resulting from education has been sufficient to cover much of the total cost of U.S. school systems despite the rapid rise in enrolments and expenditures. To this extent, a large part of the cost of education can be considered as self-financed over the years.

THE IDEOLOGY OF COOPERATIVE CAPITAL FORMATION

By BERTIL MATHSSON

Director, I.C.A. Education Centre, New Delhi.

AMONG the Rochdale principles, those which in different ways have to do with the question of capital and finance, occupy an important place. Out of the seven principles, the following three deal directly or indirectly with the problem of finance: (i) limited interest on capital (ii) dividend on purchase, and (iii) cash trading. The central question is the principle of "owned capital" and the maximized rate of interest. The principle of "dividend" or "patronage refund" in direct relation to the members' utilization of the services offered by the co-operative society is, however, also of essential importance.

These principles might seem simple and very clear. However, as soon as one tries to tackle the main practical problems connected with the formation of capital, one will find that differences of opinion arise, not only as to how the principles should be interpreted, but also as to how, from time to time, they have been interpreted in different Cooperative movements. From this point of view it appears well worthwhile to try and define the basic reasons and motivations underlying the special methods of capital formation utilized by the Cooperative movement.

The principle of "owned capital" is motivated by the necessity to ensure freedom of action for the Cooperative movement. It is when the Movement is independent of outside credit-giving institutions that it can most effectively protect the interests of its members.

To be independent of outside providers of credit does of course not mean that the movement should be excluded from borrowing money. It involves no threat to independence to borrow money, if the loans are practically always available and can be replaced if the need arises. From this point of view, the following interpretation of the central contents of the "owned capital" principle seems reasonable:—

Cooperative activity should be financed by capital raised by the members. If needed, borrowing may be allowed in the form of mortgages of real estate (as a general rule, such mortgages should not exceed two-thirds of the taxation value of the mortgaged real estate).

The formation of capital by efforts on the part of the members themselves can, broadly speaking, be achieved in three different ways: (1) formation of collectively owned capital; (2) shares; (3) loans. For a long time the emphasis was placed on those types of capital formation which constitute "owned capital," namely, shares and funds. Deposits from members have, generally speaking, been relatively unimportant in the economy of Cooperative societies, and, although looked upon with favour, in most cases they have not been considered as essential a method of capital formation as shares and funds.

In this connection, the Swedish Cooperative Movement offers one interesting example. In 1953 this movement introduced what has been called "family savings." These savings are achieved by placing a part of the

members' patronage refund in a special account*. The money—naturally with accumulated interest—is made available to the member only when he reaches the age of 60. The Board of the Society may, however, allow a member to withdraw his money from the family savings account if he needs it for reasons specified in the rules adopted for the family savings system. (The general opinion in the Swedish Movement is that the family savings in effect mean that deposits from members have been put on par with shares and funds).

The members can raise the necessary capital in several different ways. First comes the formation of collectively owned capital, which includes depreciation, reserve funds or other funds which can be used only according to specified rules. Next in order come shares and financial deposits of various kinds such as savings banks, member deposit accounts, five-year loans and other long-term loans from members.

This variety of possibilities obviously enables the Cooperative movement to create, in every given situation, its "owned capital" in the most advantageous manner. The problem is to decide which method is the most advantageous one. This can be determined only by referring back to the objectives of the Cooperative Society. In a Consumer Cooperative Movement the main task is to promote the household economy of the members by procuring goods and making them available to members. It is a matter of organizing the procuring and distribution of goods at the lowest possible costs to the members.

The different methods of capital formation must therefore, be compared with respect to how effective they are from the point of view of promoting the members' household economy. One main consideration is of course, that the method of capital formation should not be a too costly one to apply. Secondly, the interest to be paid, taxes, if any, and costs of administration must also be taken into account.

However, it is not at all certain that the "cheapest capital" is always the most useful kind. One must also consider the special need for which the capital is to be raised. It might happen that it would be more advantageous to pay somewhat more for the money if this means that one can acquire more quickly a particular kind of equipment which will increase the movement's capacity to perform. One must also reckon with the speed with which capital may be formed. This of course varies between different methods of capital formation. Some will "collect" the capital more quickly than others. If loans are to be floated it is necessary also to consider the terms of repayment, and the strain on liquidity which repayment will place on the movement. Finally capital formation should always be viewed with a high regard for the members' interest in having capital collected by methods which are advantageous to them as private persons. From this point of view, different forms of loans from members offer great advantages. The members will place money at the disposal of the Cooperative movement but, at the same time, they must be able to count on having the use of this money, and when the need arises.

*The rule has hitherto been "a sum corresponding to 1% of the members' purchases in the year, if the dividend is higher than 2%," but a new rule is proposed, saying "all of the dividend above 3%."

To sum up, capital formation should be made in such a manner that the costs for providing the services for which a Co-operative Society has been established can be made as low as possible. Furthermore, the methods of capital formation should be as advantageous as possible to the members in their capacity of financiers.

In the Co-operative Movements, by and large, the interest paid on capital raised by the members has corresponded to the market rate of interest. Interest paid on loans from members has, broadly speaking, been equal to the rate paid on similar loans in the common capital market.

Interest on shares is a special case. After all, shares are not a loan from the members to the society, but money which makes the members part-owners of the society. In other words, the interest paid on this capital is in principle to be regarded as a share of the profits. Since the basic principle of Cooperative activity is not to create interest on capital, the two principles regarding distribution of surplus are: maximized interest on capital and patronage refund in relation to the members' utilization of the services offered.

The relationship between capital formation in the Cooperative movement and the price policy and patronage refunds of the movement is a subject of special importance.

The objective of "promoting the members' household economy" does not give a specific lead as to the price policy of a Cooperative movement. Two extreme interpretations might be mentioned to illustrate this. The first extreme is to adopt a price policy by which prices charged barely cover the costs. In Cooperative history advocates of this line have been many. After all, such a price policy will serve the interests of the members' household economy, and it will immediately make available to them the benefits which the Cooperative activity can create. On the other hand, there will be no surplus. Experience has shown that the great disadvantage of the "selling-at-cost policy" is that capital formation is neglected. A Cooperative organization following such a price policy will remain weak and will not be able to make any real contribution towards raising the standard of living of its members.

The other extreme has better "standing" and has even become a principle, adopted by many Cooperative movements. It is the policy of selling goods at market price. This policy means, by and large, that the price policy of the Cooperative movement is passive. The Cooperative movement accepts whatever prices are current in the market. Obviously, the patronage refund becomes very important in movements adopting this policy. The prices offered by the movement are of no special advantage to the members. Whatever the movement can achieve in terms of savings will go back to the members in the form of patronage refund. The member gets back what he has been overcharged. A high rate of patronage refund is a sign of success, and the patronage refund itself becomes an important argument by which the movement seeks to increase its membership. The market price policy thus provides the members with a simple "measure" of the usefulness of their society.

However, this extreme price policy has considerable disadvantages. It serves to maintain a high price level, and there is no incentive to force down costs, as in the case of an active price competition. This is the reason for a third line: an active price policy. This

has become the favoured one for instance in the Swedish Consumer Cooperative Movement. By introducing rational methods of production and distribution, the Cooperative movement attempts to bring down costs. Prices charged by Cooperative enterprises will fluctuate according to the variations in costs, always with a surplus included in the prices. A certain portion of the surplus can be used for depreciations and for setting aside funds. Both are of course to be utilized for the development of the Cooperative Movement. Whatever is left will be returned to the members in relation to their utilization of the services.

In fact, the question as to how large a surplus a Cooperative society should aim at can be answered only if one is clear about the purpose of the surplus. In the case of an active price policy, one cannot make out a case for "paying back that amount which the member has been overcharged"—the prices charged should be so calculated that the member has not been overcharged. Nevertheless, one must take into account some margin of risk which has to be included in the surplus. A more important purpose of the surplus is, however, the need for capital formation. In the Swedish Movement, the formation of "member owned capital" has so far been achieved largely by utilizing the surplus. In other words, the size of the surplus is made dependent upon the need for capital.

What then will be the function of patronage refund? The difference between patronage refund and other forms of surplus distribution is that the refund transfers a portion of the surplus into money, privately owned by the members. Still the intention is that this money also should contribute to the capital formation of the Cooperative Movement, i.e. the patronage refund is one way of transferring a part of the working capital to the individual members.

As we have already stated, it is desirable that this transfer of capital is done in such forms as will be advantageous for the individual member. It is necessary to enable him to use his own money freely as and when he needs it. It is therefore essential to weigh against one another the need of the Cooperative society for long-term and stable capital and the members' interest in having the right to use their contributions towards the capital. This is the basis of the Swedish method of transferring half of the patronage refund to the member's share up to the time when he has paid his full share. The other half is transferred to a member account. Money deposited into the member account is immediately available. After a member has paid his full share, patronage refund exceeding 3% of the member's purchases during the year are transferred to the family savings account, from which money can be paid out according to the rules mentioned above. The remainder is deposited in the member account.

In the case of sales from one Cooperative society to another, the same basic view of the patronage refund must be maintained. If a product passes through several Cooperative enterprises and is priced so that a considerable patronage refund becomes possible at each level, the result can easily be a high purchase price at the final stage, that is the distributing Cooperative society. The Cooperative Movement will then either be placed in an awkward position as far as its ability to compete is concerned, or it must reckon with the patronage refund as a possibility for giving rebates. This is not a rational approach. The different levels must be in a position to count the given price as the net purchase price. Naturally the surplus which is needed to ensure capital formation, must be included in the price.

THE BUSINESS WORLD

Textile Policy—A Stock-Taking

By CROESUS

THANKS to the Tariff Commission's special questionnaire issued to the Indian Cotton Mills' Federation in connection with its enquiry into the cotton mill industry, we now have a very well documented and connected account of the present state of the industry and the circumstances leading to it. Any one who has followed the fortunes of this industry for the past decade will have nothing but sympathy for this much-harassed sector of our cotton industry. And, if this unsatisfactory state of affairs is to be stopped, as it must, the least that the authorities should do is to accede to the eminently reasonable request of the I.C.M.F. that "the various problems of the industry be viewed against the broad canvas of the action and interaction on so many other sectors of the economy and on the millions of persons depending directly or indirectly on the stability of the industry, and not from the narrow viewpoint of the effects on the cotton mill industry itself." In my opinion, this refreshingly "live-and-let-live" approach of the Federation deserves to be emulated by the apex organisations of other industries also in the country, if only to disabuse the unfortunate impression in certain quarters that our industrialists live only for themselves and don't care a hang about what happens to others, in particular the consumer, the worker, and the tax-payer. I must say the I.C.M.F. has rendered a distinct service to the business community in the way in which it has gone about in tackling this problem.

Now, broadly, what is the sum and substance of the I.C.M.F.'s replies to the Tariff Commission's questionnaire? According to me, the main burden of the theme of all the replies is the injustice done to, and the indifference being shown towards, the Indian cotton mill industry and the imperative necessity to make amends for it all in the best interests of everyone concerned. To put it differently, generally speaking the Federation wants a solution to the four-fold problem of (a) supply of quality goods at reasonable prices to both the domestic and the export market, (b) payment of higher wages to labour, (c) fair deal to the investor. None of these is exceptional and yet none is being achieved because of the Government's unimaginative, if not unhelpful, handling of this problem.

Everything seemed to be all right with the cotton mill industry until 1951, when a decision was taken by the Government ostensibly to help the handlooms which, however, has not happened even to this day. This decision was not to allow the balancing of new spindles with looms because of the so-called need to protect the handloom industry from competition. Other measures, which were similarly designed to achieve the same end but which, again, hardly did so, included, *inter alia*, reservation of certain lines solely for the handlooms and small powerlooms, restriction on production of dhoties by the mills, imposition of a handloom cess on every yard of mill cloth, and discouraging of installation of automatic looms. Assuming that the intentions of the authorities in imposing these restrictions on the mills were well motivated, one must also pause to take stock, at some stage or other certainly before the position becomes irretrievable — and ascertain whether all the desiderata have been achieved. If not, it behoves one to change or reorientate one's strategy. But not to accept that things have gone

wrong and, therefore, persist with the same policy is to wrong the entire nation's economy.

This is precisely what the I.C.M.F. has neatly set out to establish in its replies to the Tariff Commission's questionnaire. Thus, while all the policies and actions of the authorities have been aimed at benefitting the handloom interests, it has been shown that the greatest beneficiary has been the powerloom industry and not the handloom industry. And the irony of it all is that, owing to its peculiar method of compiling production statistics, the Government was fondly hoping and implicitly believing that it was the handloom industry that had been benefitting from its policy. Thus, whereas the Government's statistics of production had been indicating the 1960 output of the handloom sector at 1,855 million yards and that of the powerlooms at only 341 million yards, the Federation's figures following an intensive study, published earlier this year, revealed that the position was far from being so flattering to the authorities. According to the Federation, the production of the handloom industry in 1960 was only 800 million yards or only a little over two-fifths of the Governments' computation!

Apart from adversely affecting the consumer — as, indeed it must be in the necessarily restricted market occasioned by the Government's policy of assisting the decentralised sector — this policy has affected our exports, low even as they are, being no more than 14 per cent of mill production. For a proper and sound functioning of any industry in both the domestic and the overseas markets, this percentage ought to be considerably higher, but the Government's policy has been anything but conducive to such a goal.

The labour policy generally and the wage policy in particular of the powers that be also have been unhelpful to the mills. Not only have wage rates risen, especially since the last war, but risen without a commensurate rise in productivity as in other countries, which, again, militates against exports and domestic consumption alike. Realising this no doubt, the Wage Board urged speedier modernisation and rationalisation, but, as the Federation's replies show, while the authorities have not been slow in implementing the part relating to wage increases, they have done precious little to push on with the process of rationalisation. It is a pity that the Government of India has failed to draw any lesson from the relative performances of the mill industry in the U.K. and that in Japan, both of whom were more or less similarly affected by the World War II. Whereas the still conservative approach, by and large, of the authorities in the U.K. has led to that country ceasing to be the foremost exporter of cotton textiles and becoming a net importer, the highly imaginative policy of prompt modernisation pursued by Japan had led to its remarkable recovery in the post-war period to reach the foremost position in the international textile trade. To quote the I.C.M.F. "India cannot afford to be slow in learning the lesson from the contrast in the fortunes of these two leading countries of the world."

Of the utmost importance perhaps among all the Federation's replies is the portion dealing with price

control. It is the considered opinion of the I.C.M.F. that "control on prices will not bring any relief to the consumer". All that the controls do, as the Federation has observed, is "to limit to the stipulated level the invoice price of a mill company, without bringing any relief to the consumer. Large amounts of money will escape taxation and the only tangible result of the controls will be demoralisation and reduction of quality to the lowest common denominator".

It is noteworthy that, despite these objectionable features of any control on prices of textiles, the Federation is prepared to submit itself to an upper and

lower limit within which prices may be permitted to fluctuate without any interference. In the opinion of the I.C.M.F., such a flexible policy must also take note of the necessity to give incentive to quality producers as well as the need to exempt industrial fabrics like tyre canvas, tyre cord, etc., which are used as raw materials by other industries. That is a very sensible suggestion, I should think. Considering the unique position that the Indian cotton mill industry occupies in our economy, it would be a great pity if the I.C.M.F.'s replies were not to receive the consideration they so richly merit.

Growthmanship in Concrete

REFLECTIONS ON THE A.C.C. PAVILION

IT is becoming fashionable in recent economic usage to describe economic development by a magic word 'growthmanship.' The word itself is significant, because it implies that at long last there is recognition that the substantially human factors which lie behind economic development are substantially human factors connected with inspiring leadership and management. In every industry—as one learns heavily in the classical textbooks of economics—one needs the factors of production: capital, labour, land—a generic term for raw materials—and management. But the acceleration of economic growth is primarily the result of the last factor in its inventive form. In looking at the story of an industry, one must look particularly for the forms of human organisation in which the personal element has triumphed over the niggardliness of nature.

In the cement industry in India over the last half century, there have been more than one company associated with entrepreneurship, but, in the public mind, the ACC—the result of a merger of ten cement-making companies which took place in the thirties—has tended to occupy the spotlight, though the agencies of the growth have by no means been confined to the ACC. It is a fact that, whilst the ACC has continued to provide leadership in every aspect of the cement industry, its share of the Indian market has tended to decline from about two-thirds in 1947-48 to less than half in 1960-61; it is still the leading manufacturer and continues to break fresh grounds by manufacturing new products such as slag cement, oil-well cement and hydrophobic cement. Paradoxically, the Associated Cement Companies themselves have made possible the entry of other units by the great expansion of the market which their pioneering efforts has generated.

The multiple uses of cement and their adaptation to conditions in India, sun and dust, rain or snow, have been a major factor in expanding a market which, currently, is going faster than ever before. Indeed, if one looks at the graph of consumption of the cement industry in the Indian Union, one might proclaim that the long period rate of growth of a little over 8 per cent per year has now nearly doubled itself and currently is at the point of rising further. Indeed, as an industrial economy develops, the responsibilities on the cement industry tend to grow unevenly. Currently, the rate of growth of the cement industry might be said to be three times the growth of the national income in the Indian Union. This rate of growth will level off when the base of the Indian national income increases and, perhaps, the long-term rate of growth might be 8 per cent per year again after ten or fifteen years. In the early stages of industrialisation cement growth is necessarily significantly higher than the growth of the economy as a whole; in the later stages when the economy is buoyant enough to make full use of this basic building material, there is no parallelism between the rate of rise in cement and the national product as a whole. In the

Indian Union not a little of the task which is faced by the cement companies is the development of the markets for a relatively expensive material. Much the greater work of developing a market is consistent with the developing of right products and in illustrating their use. This is often called the education of the consumer.

PRODUCTION

Here in Delhi in a splendid pavilion in the Indian Industries Fair this education is attempted by a demonstration, all in concrete, architecturally exciting and at the same time based on materials, all of which reflect the many facets of the stock-in-trade of the Associated Cement Companies. Precast columns support the attractive dome roof and the pavilion is a permanent structure capable of being used long after the exhibition is over. Continuing the process of education, the Pavilion contains a large model of a cement factory, with an illuminated flow-chart which shows the manufacturing process. Round this central feature are grouped the wide range of the Company's products which include silvitrete white cement, slag cement and the more recent products, viz. oil well cement and hydrophobic cement. Another side deals with refractories, growing more important every day with the addition of furnaces to so many Indian engineering industries and, finally, building of heavy machinery in the Company's Workshops at Shahabad. Another panel describes the AVB Heavy Machinery project which ACC, Vicker and Babcocks have started at Durgapur for the manufacture of Babcock boiler plant, mining and other machinery—equal to the world's best.

Opinions may differ somewhat on the water pool designed by Satish Gujral, presumably intended to demonstrate the virtues of colour and the use of Silvitrete. Silvitrete itself has become a household word in many Indian cities, where colour and architectural daring have changed drab houses into exciting living rooms; as they also provide the most hygienic bathrooms. Each of these numerous products has been propelled, so to speak, by the Company itself with the assistance of engineers inside and outside its apparatus. The engineering profession, in the country as a whole, has had in each case to learn specific uses of cement such as prestressed concrete, in which a major service is being performed by the readiness of the cement companies to sponsor more economic methods of construction, particularly in view of the country's shortage of steel and limestone, inevitably involving difficulties in cement production.

There will naturally be different views on the Pavilion as there will be on the cement industry's performance. But there can be no difference on the outlook of those who have sponsored developments in the research and marketing fields from which, as balance-sheets show, no larger profit arises.

In the last analysis it is not a Company's balance sheet which itself meets a challenge. The challenge, at the present time, is the maintenance of production with the fulfilment of welfare needs on an expanding scale, always recognising that in a poor country as distinguished from an affluent society there are constraints on the use of expensive building materials. Today, as

this Pavilion demonstrates, the cement industry is fulfilling a double responsibility. It has harnessed itself to the planned development of heavy machinery, and at the same time contributes greatly to day-to-day comfort and cleanliness particularly in the houses of the lower income groups in India's hard-pressed town population.

Business Notes

Insurance

MORE FACILITIES FOR FIELD OFFICERS

NEARLY 7,000 field officers of the Life Insurance Corporation will stand to gain substantially as a result of the decisions taken by the Board of the L.I.C. on the recommendations made by a Joint Committee appointed for the purpose. This Committee was constituted by the L.I.C. Chairman and included both L.I.C.'s senior officials and field officers' representatives. After going carefully into the service conditions of field officers, the Committee unanimously recommended payment of gratuity and increases in conveyance and travelling allowances (either by cycle, motor cycle, or car). The car allowance was recommended to be raised from 25 nP. per mile to 30 nP. and motor cycle allowance from 12 nP. to 30 nP. If a field officer's salary exceeded Rs. 350 per month, the Committee recommended, he should be allowed to travel by first class.

Besides accepting all these recommendations, the Board also undertook to extend other facilities, such as telephone connection, establishment of libraries, and distribution of free literature to facilitate development of business. All told, these facilities together with those chalked out for retirement age, hospitalization expenses, designation and duties of field officers, new recruitment policy, etc. recommended by the Joint Committee, are estimated by the L.I.C. authorities to entail an additional expenditure of Rs. 11.08 lakhs (Rs. 8.38 lakhs on gratuity and Rs. 2.70 lakhs on non-recurring expenditure.)

Although these concessions should go a long way towards rectifying an anomalous situation, the non-acceptance of one of the unanimous recommendations, namely payment of annual bonus to field officers, seems to leave a sore spot behind. Under Regulations 58 and 59 of the Staff Regulations, as approved by the Government, however, it is not possible for the L.I.C. to accede to this and, yet, it is strange that the Joint Committee, on which were also represented three senior L.I.C. Officers, should have recommended it. Surely they ought to have known what the L.I.C. spokesman was at pains to explain, namely, that the field officers are already recipients of other benefits, such as multiple and temporary increments and bonus commission, not available to other employees of the Corporation, and that this benefit (of bonus commission) is limited to field officers only. If, as the L.I.C. spokesman maintained, all these benefits far exceed the total amount they would get if, instead of bonus commission, an annual bonus were paid to them as recommended by the Joint Committee, the field officers cannot very well exploit this lapse, perhaps indulged in a fit of generosity, and demand their pound of flesh. But they obviously want both the bonus commission and an annual bonus. If so, like Oliver Twist, they are asking far more. Since bonus commission more or less fulfils the same purpose as an annual bonus, it can be either the one or the other, but not both, unless the field officers cease to have any consideration for the poor policy holder who it is that has to foot the bill eventually.

N.S.I.C.

ANNUAL REPORT FOR 1960-61

IT APPEARS from the annual report of the National Small Industries Corporation for 1960-61 that, in com-

parison to the previous year, its activities have widened fairly steadily. The Corporation secured from the Director-General of Supplies and Disposals contracts for the value of Rs. 385 lakhs in favour of small-scale units, as against Rs. 265 lakhs in 1959-60.

Under the Hire-Purchase Scheme, the Report says, applications were received for the supply of machines and machine tools to the value of Rs. 1,480 lakhs. Value of machinery delivered during the year under report was Rs. 179 lakhs, as against Rs. 167 lakhs in the previous year.

In addition to the normal Hire-Purchase Scheme already in operation for six years, the Corporation introduced two special schemes for utilisation of the Development Loan Fund Credit, namely, Bank Guarantee Scheme and Special Hire-Purchase Scheme. Under the former, on acceptance of an application by the Corporation, the applicant is required to deposit 20 per cent of the c.i.f. cost of the machine as earnest money and to furnish a bank guarantee for the remaining 80 per cent which has to be repaid to the Corporation in four equal annual instalments inclusive of c.i.f. cost, interest and service charge. Under the latter, applicants are required to pay 20 per cent as earnest money against offer and 20 per cent before the handing over of shipping documents. The remaining 60 per cent (including the principal, interest and service charges etc.) is recovered in five equal instalments; the first falling due after one year from the date of handing over the shipping documents.

On the internal marketing side, the turnover of two wholesale depots, one at Agra for leather footwear and the other at Khurja for potteries, amounted to Rs. 5.68 lakhs and Rs. 1.52 lakhs respectively. Besides, the Corporation has a Raw Materials Depot at Ludhiana for the supply of pig iron and steel to small industrial units whose turnover during the period was Rs. 23.72 lakhs.

Shoes worth Rs. 69 lakhs were exported as against Rs. 43 lakhs in 1959-60. Sales of cycle components and hosiery needles, which were obtained by imports, amounted to Rs. 62 lakhs during the year.

In the existing set-up of things, there is a persistent need for the Corporation to increase its activities for the development of small-scale sector which is to exist side by side with an imposing large-scale sector.

Diesel Engines

T. MANEKLAL'S NEW VENTURE

T. MANEKLAL MANUFACTURING COMPANY LTD. has drawn up plans to go in for the manufacture of high range diesel engines. A new company, by the name of SLM Maneklal Industries Limited, has been formed for the purpose and registered in Gujarat. The plant is proposed to be set up at Vatva, near Ahmedabad. The plan is to produce diesel engines in the ranges 163 h.p. to 655 h.p. The initial output will be 45 engines a year on single shift. It will be stepped up in about three years to 75 engines per shift per annum. It is also proposed to undertake in course of time the manufacture of blowers, watering pumps and compressors.

The authorised capital of the new company is Rs. 100 lakhs, divided into 80,000 equity shares of Rs. 100 each, and 20,000 preference shares, also of Rs. 100 each. Ten per cent of this capital, all in equity shares, is envisaged to be held by Swiss Locomotives and Machine Works, Switzerland, with whom technical collaboration has been arranged. In lieu of this share, the Swiss firm will not only be supplying technical know-how, but also its patent rights and part of the machinery and equipment to be installed at the Vatva factory. The rest of the machinery, estimated to cost Rs. 20 lakhs, is proposed to be procured on rupee payment basis. The foreign exchange component of the project, thus, will be around Rs. 30 lakhs, out of the total cost estimated at Rs. 70 lakhs in the initial stages and at Rs. 100 lakhs at the completion of the project.

The promoters, their friends and associates have agreed to invest substantially in the new venture. Part of the capital of this new undertaking may also be issued to the shareholders of T. Maneklal Manufacturing Company. The rest of the capital will be offered to the public for subscription as soon as the necessary consent is received from the Controller of Capital Issues.

Much of the preliminary work on the project has already been completed. Nearly two lakh square yards of land have been purchased and negotiations are in progress for procuring another one lakh square yards. Arrangements have also been completed for the supply of electric power. Construction of the factory is to be taken up soon. The licence for the import of capital goods is expected to be received in the near future. If all goes well, production is likely to commence by 1962 end.

Indian Oxygen

EXPANSION PLANS

INDIAN OXYGEN LIMITED, CALCUTTA, which has already got as many as 45 factories and depots throughout the country, has drawn up an ambitious plan to expand its activities further. Besides setting up another oxygen plant at Madras and doubling the present capacity of its Bombay and Jamshedpur oxygen units, it proposes to undertake manufacture of explosives at Burmool and cartridges at Ranchi. The company has also decided to set up a booster plant at Jamshedpur and another nitrous oxide plant at Bombay.

The main activities of the company fall into four broad categories — (1) manufacture and sale of industrial and medical gases; (2) manufacture and sale of gas welding and cutting and medical equipment and accessories; (3) manufacture and distribution of electrodes and fluxes; and (4) sale of automatic, semi-automatic, gas-shielded and manual electric welding equipment and accessories. Among the industrial gases which the company produces are oxygen, acetylene, argon, nitrogen, nitrous oxide and compressed air. Indian Oxygen is the largest producer of these gases and the only producer of medical gases, argon and high purity nitrogen in the country.

Digjam

EXPORTS TO BE STEPPED UP

DESPITE FANCY prices that its products fetch in the domestic market, Shree Digvijaya Woollen Mills, Jamnagar, it is learnt, has drawn up plans to step up its export effort. The company, it is understood, is at present carrying on negotiations with North Korea and Hungary for exporting sizeable quantities of its woollen fibres to these countries. If these negotiations fructify, the company, it is further learnt, will be able to export nearly 20 per cent of its annual output, which currently is of the order of Rs. 1.10 crores. The present exports

of the company — mainly to the U.S.S.R. — form about 10 per cent of its annual production. Exports to Hungary and North Korea will be channelled through the State Trading Corporation of India.

The company has been specialising, since 1953, in producing quality fancy suitings and blankets which compare favourably with the foreign stuff. A wide range of its products in attractive colours is on display at its stall in the Birla Industries Pavilion at the Indian Industries Fair.

The company is one of the biggest suppliers of woollen fabrics to the Government. About 10 per cent of its yearly production is supplied to various Government departments, prominent among which are the Railways and the Navy.

Cables

BIG RISE IN OUTPUT.

THE HINDUSTAN CABLE FACTORY recorded a rise of 56 per cent in the manufacture of cables in 1960-61. This fact was revealed in the annual report along with a review of the factory's working, placed on the Table of the Lok Sabha recently by the Minister of Industry, Mr. Manubhai Shah. Production during the 1960-61 was 1,077 miles which was valued at Rs. 152.00 lakhs, as against 691 miles valued at Rs. 115 lakhs during the previous year. During the year under review the factory also commenced production of coaxial cables, the output being 57 miles valued at Rs. 13.62 lakhs. The Company recorded a net profit during 1960-61 of Rs. 24.29 lakhs which was nearly 50 per cent more than Rs. 15.64 lakhs recorded during 1959-60.

The Government approved the expansion of the Hindustan Cables Factory for the manufacture of dry core cables upto 2,000 miles per annum, plastic insulated switchgear cables and wires (Rs. 48 lakhs per annum) and for the installation of a Wire Drawing Plant (capacity — 1,500 tons per annum) to meet their requirements of copper wire. The capital costs of this expansion was estimated at Rs. 179 lakhs (excluding township) and necessary foreign exchange was proposed to be met out of the U.K. Credit. Steps were being taken for the extension of the factory, ordering of plant, etc. for the implementation of this expansion scheme. Plans were also under consideration for taking up the manufacture of paper insulated power cables, small size coaxial cables and increasing the capacity of large size coaxial cables upto 750 miles per annum on double shift basis. In order to increase the output of the factory as a whole and of the individual worker in particular, the management had introduced a production incentive scheme and an attendance bonus scheme. Government, the report added, also approved of the payment of a sum of nearly Rs. 90,000, as an ad hoc ex-gratia monetary award to the employees of the Company for increased production. Such incentives if accompanied by genuine effort by the workers to increase their affective input could certainly add to the overall productivity in industry.

Rod-Rolling

A NEW PLANT

FIVE CABLE manufacturing companies — Asian Cables Corporation Ltd., Cable Corporation of India Ltd., Insulated Cable and Wire Industries Ltd., Wandleside-National Conductors Ltd., and Henley Cables India Ltd. — have joined hands in floating a new concern, known as New India Rolling Mills, to roll out copper and aluminium wire bars into rods required for the manufacture of cables in the country. The authorised capital of the new venture will be nearly Rs. 2 crores.

The plant is proposed to be set up at Thana, near Bombay. It will have a capacity to produce about 30,000 tons of rods per annum on two-shift basis. The production of this factory apparently will have a ready market since the annual demand for copper and aluminium rods in Western India alone is estimated around this figure.

The project is estimated to cost Rs. 80 lakhs, of which Rs. 45 lakhs will be the foreign exchange component. Possibilities of securing technical know-how and some financial collaboration from some foreign firms are being explored. An application for securing an industrial licence to set up the plant has already been made to the Government. If no untoward hurdle arises, the factory is expected to be commissioned into production by the middle of 1963.

New Issues

SHAMA ENGINES

THE SUBSCRIPTION list for the share capital of Shama Engine Valves Ltd. opens for public on December 18, 1961. The company has been floated to undertake the manufacture of six lakh engine valves for internal combustion engines on single shift working. These valves form an important part in petrol-engines, diesel-engines and all types of power engines. With rapid industrialisation there is naturally a widening market for these valves. Considering the fact that the country's requirements at the moment are met by imports and the indigenous output is much below the present demand, the sales potential of the valves proposed to be manufactured by the company is quite high.

The plant proposed to be erected by the company will be located at Bhopal in Madhya Pradesh. The company is likely to utilise nearly 10 acres of land and in regard to power, Madhya Pradesh Electricity Board agreed that they would meet the demand of the company for 700 KW. The promoters, Messrs. B. K. Khanna and Company Private Limited, indicate that the plant will be modern and will be geared for mass production with quality and precision. They have made arrangements for technical collaboration with Messrs. Bayerisches Leichtmetallwerk K.G. of West Germany who are well known manufacturers of valves. The president of the collaborators joins the Board of Directors of the company thereby providing the company the benefit of his knowledge and experience.

The capital requirement of Rs. 26 lakhs are made up of Rs. 2.10 lakhs for land and buildings, Rs. 17.50 lakhs for machinery and plant, Rs. 2.65 lakhs for preliminary and pre-operation expenses including furniture and Rs. 3.75 lakhs for working capital. The company will raise Rs. 4.25 lakhs from promoters etc., Rs. 1 lakh by way of subscription from Madhya Pradesh Government, Rs. 10 lakhs by way of loan from M.P. Finance Corporation, Rs. 1 lakh from the Banks as loan and a sum of Rs. 9.75 lakhs will be raised from public by this issue. The present issue is made up of 60,000 Equity Shares of Rs. 10 each and 3,750 Cumulative Redeemable Preference shares of Rs. 100 each carrying an annual dividend of 9.3 per cent free of company tax but subject to deduction of tax at source at prescribed rates. The whole of present issue is underwritten. In view of the sound nature of the project, the shares are likely to get a ready response in the market.

French Steel

INDIAN MANGANESE EXPORTS MAY LOOK UP

THE BOOST that the formation of the European Common Market has given to the French industry can be gauged from the progress the iron and steel industry in that country has made during the recent years.

France's production of raw steel is expected to go up from 14 million tons in 1956 to 18 million tons during the current year. Per capita consumption has gone up from 267 kgm. in 1956 to 326 kgm. in 1960. Nearly 25 to 30 per cent of the French steel output is exported every year.

France has made particular strides in the production of special steels. Output of sheets during the two years, 1959 and 1960, has gone up by as much as 19 per cent and that of tin-plate by over 50 per cent. Production of stainless steel has almost doubled during these two years. The next four years are expected to witness more rapid advance by this industry. According to Mr. Louis Charvet, Vice-President of the Chamber of the French Iron and Steel Industry, who was here in Delhi last week, the French steel output would reach 25 million tons by 1965.

The strident progress the French steel industry is envisaged to make during the coming years obviously affords an opportunity to India to step up its exports of manganese ore to France which in the recent past have shown a downward trend. India which exported to France 242,000 tons of manganese ore in 1957, exported only 109,000 tons in 1958, 135,000 tons in 1959 and 118,000 tons in 1960. It is earnestly hoped that this trend will be reversed in the near future. This can, however, be done only if the State Trading Corporation, which has a monopoly of these exports, takes time by the forelock and keeps a constant vigil on the demand trends for the commodity in that country as also in others, such as Japan and West Germany where too ambitious programmes have been drawn up to increase steel output.

Spring Steel

A NEW VENTURE

A NEW Company, Bombay Electric Steels Corporation (Pvt.) Ltd., is proposed to be floated in Bombay to undertake a Rs. 50 lakh project for the manufacture of Silico-manganese spring steel by the scrap process, which is utilised for making laminated and leaf springs for the railways and automobile industry. The Company is being floated by the people already dealing in the sale of indigenous steel, import and export of iron and steel for over a decade. They also have sufficient experience of structural workshops.

The project will have a phased manufacturing programme, starting with an initial capacity of 6,000 tons of rolled spring steel per annum, to be gradually stepped up to 12,000 tons. The promoters propose to manufacture also any other types of alloy and special steel which should come under the economic scope of the project. The capital outlay of the project is likely to involve a sum of Rs. 50 lakhs, including the foreign exchange component of Rs. 15 lakhs. The promoters are negotiating for collaboration with foreign firms along with technical assistance. It is proposed to raise a loan of Rs. 15 lakhs from one of the industrial finance institutions. The promoters and their friends would provide the remaining Rs. 30 lakhs.

The company will have an advantage in respect of raw material, because steel scrap is easily available in the country and the requirements of other alloying elements too can be met indigenously. The promoters have approached the Government for the industrial licence, which is likely to be granted soon because against the present demand of 45,000 tons of spring steel, the indigenous output is nearly 10,000 tons.

Banking

THE BANK OF INDIA

THE BANK OF INDIA has opened two new branches in New Delhi this week and has also installed safe deposit vaults in one of its old branches. The policy

of "cautious adventure" pursued by this pioneering bank has yielded happy dividends. The information made available about the Bank during the current month shows how rapid strides the Bank has taken during the last half a century. Between 1906 and 1960 the Working Capital of the Bank has grown from Rs. 67 lakhs to Rs. 133.34 crores. This fact is clearly illustrated in the graph below. Of great significance is the growth recorded since 1956. From the level of a little above Rs. 100 crores, the Working Capital rose to Rs. 133 crores in 1960, indicating a rise of more than 30 per cent in five years.

WORKING CAPITAL:
1906 Rs. 67 Lakhs
1960 Rs. 133.34 Crores

At one of the functions organised by the management, Mr. B. R. Bhagat, Union Deputy Minister for Finance, particularly praised the adventure-with-caution policy of the Bank; he also stressed the need for spread-

ing banking facilities in the rural areas. He cited the remarks of the American businessmen who were in Delhi recently, that "more cash than credit was rolling in the Indian economy", pointing to the need for inculcating the banking habit amongst the people.

The policy of the Bank of India to open new branches in urban areas is praiseworthy in the sense that it will bring into the banking system the new purchasing power which is being created as a result of the Five-Year Plans. A policy of "aggressive salesmanship" alone can raise the tempo of bank deposits in the country and the feverish activity displayed by the management of this bank during the current month shows that it will continue to lead in this race for expansion.

Refrigeration

INDIGENOUS REFRIGERATOR

IN TECHNICAL collaboration with a Swiss firm named Mena-Lux, the Himalux Refrigerator factory of Calcutta, which was formally inaugurated recently by Dr. B. C. Roy, Chief Minister of West Bengal, is to produce the first indigenous refrigerator specially suitable for the tropics.

Except two imported components—thermostat and the heating element—valued at Rs. 20 per refrigerator out of a total cost of Rs. 1,100, all other parts are to be manufactured locally.

Claimed to be ideally suited for middle-class people in India, it will work on electricity, gas or kerosene and its service will be guaranteed for five years. Having surveyed the Middle East and the Far Eastern markets, the manufacturers hope to earn some foreign exchange by exports.

DON'T CARRY CASH CARRY BANK OF BARODA TRAVELLERS CHEQUES!

Keep your money safe as in a bank with Bank of Baroda Travellers Cheques! They can be cashed easily, conveniently at any branch of the Bank of Baroda, State Bank of India, Bank of Rajasthan, and some branches of the Punjab National Bank. Only your counter-signature will enable them to be cashed!

Bank of Baroda Travellers Cheques are available in denominations of Rs 25, Rs 50 and Rs 100 at any of the Bank's branches!

THE BANK OF BARODA LTD.

(Estd: 1908) Head Office: Baroda

Branches: Over 135 branches in India and also in East Pakistan, London, British East Africa and Fiji Islands.

107-28, 201

STEEL PRODUCTION SOARS BY 425% AT MUKAND

We reckon our production in 1960-61 to be 69,552 tonnes of rolled products and 5,624 tonnes of castings. In other words a rise of 48% over the previous year.

In 1951-52 MUKAND employed 1,064; in April 1961—2,306. Over the past ten years production figures have soared—13,615 tonnes of rolled products and 704 tonnes of castings in 1951-52; and 425% more in 1960-61.

	57/58	58/59	59/60	60/61
	(Rs. in lacs)			
CAPITAL	51	51	71	61
Depreciation provided to date	32	36	41	50
Profits retained in business to date	25	35	45	57
Profit for the year	19	30	31	53
Dividend for the year	5	5	8	10

MUKAND manufactures high grade steel products—bars, rods and castings. Presently an expansion programme is under way. It will cope with the growing flux of big orders—like the one placed by the Railways with MUKAND in October 1961 for 4,862 sets of Centre Buffer Couplers valued at Rs. 1,14,00,000.

MUKAND provides India's new and growing industries with the quality components that they must have.

MUKAND IS STEEL

FROM THE CAPITAL'S CORRIDORS

THIRD PLAN

THE Planning Commission, it is understood, has revised the Third Five-Year Plan in respect of allocations to certain industries.

It has permitted the Railway Board to step up its development programme, using its five year allocations of Rs. 940 crores within three years, apart from raising its allocations to Oil and Natural Gas Commission from Rs. 115 crores to Rs. 202 crores and assuring that as much as 90 per cent of its foreign exchange requirements would be made available to it. The original allocation of Rs. 115 crores included Rs. 53 crores in foreign exchange. This has now been raised to Rs. 71 crores. The Planning Commission has also accepted the offer of the Italian firm, E.N.I. of an additional credit of twenty million dollars. All these additional allocations to the Oil and Natural Gas Commission are intended for exploration in Assam, Cambay and through E.N.I. as contractors in Kutch.

The Planning Commission is also considering the advisability of re-opening the present licensing policy for industrial units. It is believed, it has asked the Ministry of Commerce and Industry for information about the total amount of foreign exchange liability it had created in respect of which licences had been granted. According to its estimates, the Ministry has already exhausted the allocations made for five years for industries. It will be noted that the development programmes for industries envisaged under the Plan entailed an expenditure of Rs. 2,455 crores, including Rs. 1,338 crores in foreign exchange, both for public and private sectors. Of this, the total for the private sector was Rs. 1,125 crores including Rs. 450 crores in foreign exchange. According to the Planning Commission there has been over-licensing during the first nine months of the Plan, and, unless this tendency was checked in time, India might have to face another foreign exchange crisis, notwithstanding the massive aid given to her by friendly countries.

On the other hand, the view of the Commerce Ministry is that there might have been over-licensing during the first nine months of the Plan period, but, as recently explained, a fertilizer factory, for example, takes about two and a half years before it goes into production. Secondly oil in Assam was struck some six years ago but still lies in Assam unused because there has been defective planning. It is, therefore, contended that, although licences might have been issued, overall development would be so phased as to fit into the pattern of the Plan with most essential items of production enjoying priority. It appears that there is some force in the Planning Commission's contention that all licences should be granted on the basis of single shift and that there is a good deal of capacity lying idle for want of raw materials.

PUBLIC SECTOR UNDERTAKINGS: ANNUAL REPORTS

Annual Reports and reviews of the workings of three public undertakings were presented in the Lok Sabha on 8th December, 1961, by the Minister of Industry, Mr. Manubhai Shah.

HEAVY ENGINEERING CORPORATION

The Corporation has been set up to develop manufacture in the country of heavy capital equipment through a Heavy Machine Building Project, a Foundry Forge Project, a Heavy Machine Tool Building Project and a Coal Mining Machinery Project.

The report says "that 1960-61 should be deemed mostly as a preparation year rather than as a year of substantial progress of heavy construction work for the Corporation. It further observes that the levelling and dressing of the plant sites at Ranchi and Durgapur have been completed and arrangements for the supply of water and power during the construction stage have been made. To feed the projects regularly with adequate trained artisans and workers, proposals for the setting up of a Training Institute, complete with workshop facilities to train approximately 800 trade apprentices and 200 graduate and technical apprentices from the second year of its operation, have been worked out. To ensure a regular flow of technical personnel, artisans, skilled and semi-skilled workers so essential for a project of this type, a comprehensive programme of training in India as well as in the U.S.S.R. and Czechoslovakia has also been drawn up and is being implemented. Contracts for the import of machinery for the initial stages of Heavy Machine Building, Coal Mining Machinery and the Foundry Forge Plants have been executed. Plant and machinery worth Rs. 126.98 lakhs have already arrived at the plant sites from the U.S.S.R. and Czechoslovakia. Contracts for some of the major civil works, fabrication and supply and erection of steel works, water supply and sewerage and residential buildings have been awarded.

The Corporation has estimated that the total capital costs of their projects including the township in the final stage, would be of the order of Rs. 200 crores. The authorised capital of the Company is Rs. 50 crores. Up to March 31, 1961, the subscribed capital was Rs. 6,64,49,000.

NAHAN FOUNDRY

The report states that the Foundry has made steady progress, the value of production in 1960-61 amounting to Rs. 25.36 lakhs, against Rs. 22.05 lakhs in 1959-60. The financial results for the year 1960-61 show a net profit of Rs. 4.40 lakhs. After providing for depreciation, tax liability, general reserves etc. the Company has declared a dividend of 4 per cent which amounted to Rs. 1.60 lakhs. The Company has also paid a sum of Rs. 1.97 lakhs to the Government towards arrears of interest on the loan granted to them. The production in the Foundry has been in respect of traditional items like cane crushers, Brake blocks, G.I. sleepers etc. Steps have been taken to further diversify production by undertaking the manufacture of electric motors, mono block pumps, improved types of agricultural implements etc., Electric Motors up to 10 H.P. are being manufactured and ISI certification mark has recently been obtained.

The management of the Foundry have recently signed an agreement with the Mazdoor Panchayat for setting up of the Joint Management Council. It is expected that the Council will start functioning shortly. The Government have approved of the payment of an ex-gratia award by the Company for the year to all its regular full time employees drawing less than Rs. 500 per month at the rate of half month's pay, subject to a minimum of Rs. 25 and a maximum of Rs. 200.

PRAGA TOOLS CORPORATION

The Praga Tools Corporation has entered into technical collaboration agreements with three U.K. firms for undertaking the manufacture of drill chucks, lathe chucks, and tool and cutter grinders. The land for the expansion of the factory has been acquired and orders for importation of machinery required have also been placed.

TWA G. 217

The Annual Report further states that a sum of Rs. 75 lakhs has been set apart under the Polish credit for establishing a complete machine tool plant to manufacture Polish types of light and medium variety machine tools. A licensing agreement with Centrala Handlu Zagranicznego Objektow Przemyslowych-Chekop of Poland for the supply of a Project Report has also been signed. Pending receipt of the report, the Corporation has made arrangements for supply of essential equipment required for the project. In addition to these expansion proposals, the Corporation is making arrangements to enter into technical collaboration with a UK. firm for undertaking the manufacture of milling machines. As a result of the collaborations and diversification programmes, the value of turnover is expected to improve substantially in the near future. The total value of production for the year under review was Rs. 48.26 lakhs. Major items of manufacture were machine tools, machine tool accessories, precision tools, auto and diesel parts, railway duplicates etc.

The Report in the end states that recently the management of the Company and Employees Union entered into an industrial truce for a period of 3 years, during which the Union or the workers will not resort to any strike, stoppage of work or go-slow practices.

HINDUSTAN STEEL: CAPITAL OUTLAY REVISED

The capital outlay of the three public sector steel plants has been further reviewed and the total cost is now expected to be of the order of Rs. 607.42 crores, excluding escalation, as against the earlier estimate of Rs. 605 crores.

The steel plant proper at Rourkela will cost Rs. 177.86 crores as against the original estimate of Rs. 170 crores, excluding escalation. The cost of all other ancillaries including township, ore-mines and quarries, water supply, fees to consultants, other expenditure on the work undertaken by the Project outside the perimeter and cost of the project staff and customs duty is estimated at about Rs. 43.47 crores.

In the case of Bhilai, the revised cost of the steel plant is placed at Rs. 145.57 crores as against Rs. 131 crores originally. The cost of ancillaries and other items is estimated at Rs. 53.75 crores as against the original estimate of Rs. 47.65 crores.

According to the revised estimates the total cost of Durgapur steel plant including ancillaries, but excluding escalation, will be Rs. 186.77 crores as against Rs. 165.87 crores envisaged earlier.

It is doubtful if the Company will show a surplus of Rs. 150 crores as envisaged in the Third Plan. On the contrary, the Company has reported a loss of Rs. 74.34 lakhs for the year ending March 31, 1961. It is now anticipated that the Tariff Commission would raise the retention price of steel to make it possible for the Company to come up to the Planning Commission's expectations, so far as profitability were concerned.

AFRO-ASIAN ECONOMIC CO-OPERATION

A five-day Conference of Afro-Asian Organisation for Economic Co-operation (AFRASEC) commenced in Delhi on Monday with an inaugural address by Mr. Nehru. The provisional agenda of the Conference includes the following objects on which papers for discussion have also been prepared by the organisation's secretariat.

- (a) Arbitration arrangements in the region.
- (b) Possibility of increasing the regional trade in specified commodities in conjunction with world trade.

(c) The impact of external market groupings on the trade and economic development of Afro-Asian countries.

(d) Economic development of the Afro-Asian countries through mutual aid and investment.

The paper on External Market Groupings should give an idea of the objectives of the Organisation. "Our aim is a comprehensive Afro-Asian Common Market. The opportunities are there, and the benefits of achievement are stupendous. In the meantime, some countries within the area have found it expedient to promote regional grouping. The danger inherent in such approach is to fan dissension and retard the influences of unifying forces. If in the short run a regional grouping is envisaged it must always be made accessible to other countries within the area."

Referring to the foreign efforts to partition Africa, the paper says that such attempts must be actively opposed. "The 'linking' of the former metropolitan countries to African territories presents a negative aspect of the latter's progress towards complete independence. At best it can only be regarded as a stage in economic emancipation at which they remain linked to the former metropolitan country. Sooner or later such links will not withstand the forces which had made independence possible. In this connection, it is significant to note that a news from Paris says that the six Common Market Countries and sixteen African states have agreed on an association which gives the African states advantages, at least equal to those guaranteed by the Treaty of Rome. The Convention of Association will take effect from January 1, 1963. In Asia, the picture, which emerges is this: On the one hand the highly industrialised Japan, in a tie-up with the U.S.A., is competing with India and on the other, Communist China, with no labour costs to bother, is dumping goods in South-East Asia. As for the Middle East, Egypt is claiming its leadership.

Over 200 delegates and observers—75 from abroad—representing more than 30 countries of Asia are attending the Conference. Among the observers are representatives of seven important international organisations.

BONUS COMMISSION

The Government of India have decided to set up a 7-man Commission to study the question of bonus to workers in industrial employments and to make suitable recommendations.

Mr. M. R. Meher will be the Chairman of the Commission which will have two independent members and two members each representing workers and employers. Independent members are Mr. M. Govinda Reddy, M.P. and Dr. B. N. Gahguli, Director, Delhi School of Economics. Other members are: Mr. S. R. Vasavada and Mr. S. A. Dange, M.P. (workers' representatives) and Mr. N. Dandekar and Mr. D. Sandilya (employers' representatives).

The terms of reference of the Commission whose headquarters will be in Bombay are as follows:

1. To define the concept of bonus and to consider, in relation to industrial employments, the question of payment of bonus based on profits and recommend principles for computation of such bonus and methods of payments.

The term "industrial employments" will include employment in the private sector and in establishments in the public sector not departmentally run and which compete with establishments in the private sector.

2. To determine the extent to which the quantum

of bonus should be influenced by the prevailing level of remuneration.

3. To determine what the prior charges should be in different circumstances and how they should be calculated.
- (b) To determine conditions under which bonus payments should be made unit wise, industry wise and industry-cum-region wise.
4. To consider whether the bonus due to workers, beyond a specified amount, should be paid in the form of National Savings Certificates or in any other form.
5. To consider whether there should be lower limits irrespective of losses in particular establishments, and upper limits for distribution in one year and, if so, the manner of carrying forward profits and losses over a prescribed period.
6. To suggest an appropriate machinery and method for the settlement of bonus disputes.
7. To make such other recommendations regarding matters concerning bonus that might be placed before the Commission on an agreed basis by the employers' (including the public sector) and the workers' representatives.

SHIPPING RATES

As discussed earlier in these columns the U.K. Conference Lines have now dropped their proposal to increase the freight rates on Indian and Pakistani exports. This seems to be as a result of the firm stand taken by the two countries. It is estimated that their proposal to increase by 10 per cent the freight rates on all west-bound cargo would have resulted in a loss of Rs. 5 crores of foreign exchange for India every year. About 50 per cent of country's annual freight bill amounting to Rs. 150 crores is accounted for by the India-U.K. Conference Lines.

HALDIA DOCKS

Before their departure for the U.K. Mr. G. A. Wilson, Chief Engineer and Mr. G. T. Johnson, Superintendent Royal Docks, Port of London Authority, who visited Calcutta at the request of the Calcutta Port Commissioners to advise them on the preparation of a master plan for the proposed new dock system at Haldia, gave a joint note to the Chairman of the Commissioners of the Port of Calcutta. They have expressed their firm opinion that it was essential to undertake construction of new docks lower down the Hooghly, together with adequate road rail communications, as soon as possible, and that, in their view there could be no objection to going ahead with the construction of the Haldia Docks. They have also agreed with the Chairman and other officers of the port and the Director of the Poona Research Station that with the new Hydraulic Research Department that was being set up by the Port Commissioners, it would be possible to maintain the Haldia Channel and counteract the tendency for deterioration of the channel, if any. They have further emphasised that the Haldia Docks should form part of the Calcutta Port.

LEATHER INDUSTRY

The informal Consultative Committee of Parliament, at their meeting held during the week in Delhi, discussed problems relating to the indigenous tanning and leather goods industry and considered further measures of assistance.

It was estimated that the requirements of hides during the Third Five-Year Plan would be of the order of 22.64 million pieces. As against this the internal availability of hides by 1965-66 would be only about 20 million pieces or even less. The additional quantity

of hides required therefore would have to be met by taking steps to collect, preserve and process the hides indigenously available, imports of raw hides and restricting export of semi-processed hides. In regard to foot-wear manufacture, it was revealed that the Second Plan production and export targets envisaged at 102 million pairs and two million pairs, respectively, had been achieved and as for the Third Plan period, the Development Council for leather, leather goods and picker industry has recommended a target of 153 million pairs, but the Planning Commission had felt that a target of 125-128 million pairs would be more realistic. The matter was therefore under discussion in the Planning Commission for fixation of a suitable target.

The Khadi and Village Industries Commission, it was stated, would intensify its programme of assistance for the village leather industry. It had been decided to set up 200 centres of the type of Kora Gramudyog Kendra (near Bombay) in various parts of the country for proper and intensive exploitation of dead bodies of animals. The Commission had set up a ten-member Advisory Committee to formulate a suitable programme for the development of flaying, tanning and leather industry. For the Third Plan period, the Commission had proposed an outlay of Rs. 5.38 crores for the development of village leather industry.

DOUBLE TAXATION: TALKS WITH FRANCE

Discussion between India and France for the conclusion of a Double Taxation Avoidance Agreement opened in Delhi on Monday, December 11, 1961. A four-member French Delegation is headed by Mr. Serre, a senior official of the French Treasury. The Indian Delegation will be led by Mr. V. V. Chari, Senior Member of the Central Board of Revenue. The pattern of Indo-French trade is as follows:

Indian exports to France in the calendar year 1959 were valued at Rs. 8.14 crores and French imports to India totalled Rs. 18.10 crores. Commodities exported to France included chemicals, manufactured goods in leather, textile yarns, crude minerals, metallic ores and scrap, hides, skins, timber, textile fibres and food articles such as coffee, tea and spices. French imports to India included base metals, machinery and transport equipment, medicinal and pharmaceutical products, chemicals, fertilizers, finer qualities of textile fabrics, dyeing, tanning and colouring material etc. It will be recalled that similar agreements for avoidance of double taxation have been concluded with Sweden, Denmark, Norway, West Germany and Japan, and agreements at Government level have also been finalised with the U.S.A. and Finland.

INDO-ARGENTINE TRADE

At a press conference the party of Argentine businessmen, who accompanied their President to Delhi during the week, sounded a note of warning to India that unless it had a balanced trade with their country, Argentina would resort to substitutes for jute. They said that their country imported twenty million dollars worth of jute from India, which in her turn imported particularly nothing from Argentina. India till two years ago, did import wheat from Argentina, which due to wheat imports from the U.S. under P.L. 480 had now stopped. "Unless India revised its policy to balance its trade, Argentina will be forced to shut out Indian jute imports by using substitutes," they said.

INDO-CZECHOSLOVAKIA TRADE TALKS

Trade talks between Czechoslovakia and India commenced in Delhi during the week. The Delegation from Czechoslovakia is led by Mr. Josef Urban, head of the Treaty Department.

The progress of trade talks between the two countries was reviewed and the Delegations will soon finalise the trade arrangements for 1962. Under the cur-

Take the guesswork out of Lubrication...

Chances are you do not use the right lubricant in the right quantity for the right machine. You may be replacing too many costly parts and writing it off as a normal maintenance expense. It isn't really—it is the result of faulty lubrication practices.

Machinery shutdown means loss in production, time and money. Correct lubrication is therefore essential to ensure the protection and efficient operation of costly machinery. Planned lubrication is vital for increased production at lower costs.

The service is yours for the asking—call in your Caltex Lubrication Engineer—arrange for a correct lubrication programme for your plant. Let us help you in conserving parts and money.

Company executives can obtain a free copy of this booklet by writing on their official letterhead to their nearest Caltex office.

PLANNED LUBRICATION—A VITAL FACTOR IN COST CONTROL

CALTEX (INDIA) LIMITED Bombay · New Delhi · Calcutta · Madras

When camels were customary

The year—1903. Remington opened their first office in India to sell typewriters and sometimes had to deliver them by camel.

However, you cannot keep back progress. Sales grew—so did Remington. Today, there are 30 fully staffed Remington Rand branches in strategic positions throughout India.

In 1952, the Company first started the indigenous manufacture of typewriters and record systems at their factory in Calcutta. Still sales increased, and to meet the demand Remington Rand in 1960 opened the

largest factory of this kind in Asia at Howrah.

Now 85% of the components of Remington typewriters are manufactured in India—with Indian raw materials—by Indian Staff.

Remington Rand, pioneers of the typewriter in India, have plans afoot to expand even further. Negotiations are under way to once more double production—a move which will offer employment to many hundreds more skilled and unskilled personnel—and enable the Company to meet the ever increasing demands of this growing Nation.

Remington Rand of India Limited

rent Indo-Czechoslovak Trade and Payment Agreement, signed in Prague in November, 1960, trade between the two countries is to be conducted on a balanced basis and payments regulated through non-convertible Indian rupees. Trade between India and Czechoslovakia in 1960 amounted to Rs. 13.12 crores both ways. It is expected that during 1961, trade between the two countries will be of the order of Rs. 20 crores approximately.

AT THE INDUSTRIES FAIR

A wide range of exhibits at the German Democratic Republic pavilion fascinates the minds of the uninitiated and the experts alike. For example, the Glass Woman—the transparent model of a woman in life-size—is drawing a large crowd of visitors everyday. The transparent figure is already well known in India by the debut of the Glass Man at the Indian Industries Fair 1955 in New Delhi and the Glass Cow "Heidi" at the World Agricultural Fair, New Delhi, 1959-60.

Of particular interest to the general visitors is the exhibit, the Godrej-Optima Hindi typewriter which is considered to be the most practical devised to date. Another showpiece is the "Malimo", a novel machine for the manufacture of textile fabrics, without weaving, at a high rate of output. The high labour productivity makes it possible to manufacture "Malimo" product cheaper than Turkish towelling fabrics. The range of products includes, besides bathing articles, table-cloths, baby clothing, polishing cloths and dusters. These apart, there are other interesting items such as, Two-Room Process Camera-Supernova, Automatic Wire-Weaving Machine and Two-Revolution Letter Press Printing Machine, Modern Dental Unit etc.

The New Bemco Engineering Products of Belgium manufacturing 'BEMCOVOCO' presses in collaboration with Messrs Vogel & Co. of West Germany exhibits a 25 ton capacity "BEMCOVOCO" Press in the West German Pavilion. Bemco is manufacturing other types of presses too, suitable for rubber, ceramic, sheet metal industries etc. Bemco also supplies hand operated or power operated hydraulic pumps up to 8000 lbs. P.S.I. and 4000 lbs. P.S.I. respectively. In addition to this hydraulic equipment, the Company has specialised in the manufacture of mechanical and hydraulic jacks for automobile industry, Indian railways and Government projects.

BRIEFS

According to a study by the Research unit of the Ministry of Finance in 1953-54 indirect taxes formed 3.6 per cent of consumer expenditure of all households in the country. By 1958-59 the proportion went up to 5.7 per cent. The rise was mainly under Central excise duties and sales taxes.

A project report for setting up of an Alloy and Special Steel Plant prepared by the Director General of Ordnance Factories has been received and is under consideration of Government. The proposal is to set up a plant with a capacity for 50,000 tons of alloy and special steels annually.

Government have recently received an application from a Indian firm for setting up a unit in India for the manufacture of Polypropylene in collaboration with Messrs Montecatini of Milan. The scheme is under consideration of Government. Recently the Managing Director of Montecatini was in India and discussed general proposals for setting up of industries, for which Montecatini have the technical knowhow, in collaboration with Indian parties.

Messrs. Aluminium Cables and Conductors (Uttar Pradesh) Private Limited, Calcutta, have been granted a licence under the Industries (Development and Regulation) Act, 1951 for the manufacture of paper insulated power cables using aluminium conductors.

The Government of India have accepted the offer

of the Government of Czechoslovakia to establish an institute to undertake research in the designing of machine tools and to impart training to technicians for operating the machine tools as well as the recommendations of the Committee set up by the Government for the purpose. The institute will be set up as an autonomous body under the Societies Registration Act, 1960 and will be located at Bangalore.

A decision has been taken to set up "Institute of Applied Manpower Research" under the Societies Registration Act, 1960 with the object, among others, of advancing knowledge about the nature, characteristics utilisation of human resources in India. It is understood that the Ford Foundation has indicated its willingness to meet the cost of equipment and half the recurring expenditure for a period of five years apart from meeting the costs of experts and consultants. The balance of expenditure will be met by grants-in-aid from the Union Government.

The production of bicycles in the small-scale sector will be doubled by the end of the Third Plan period. A production target of five lakh bicycles annually has been fixed to be achieved by the end of the Third Five-Year Plan. There are about 150 units in the small-scale sector which are now engaged in the production of bicycles. Since September this year the import of bicycle components has been completely stopped.

At their meeting held on the 12th December, the Committee of the Indian Jute Mills Association considered the market situation in the light of the stocks of jute goods held by the mills at the end of November and decided that the working of the additional 2½ per cent of the looms should be extended for a further period of one month up to the end of January 1962. It will be recalled that the Committee of the Association, in order to assist relieving the shortage of ready goods in the Calcutta market, decided early in November that an additional 2½ per cent of the member mills' loomage should be unsealed from the 13th November, 1961, to the end of the year, thereby reducing the sealed proportion of the looms to only 9½ per cent.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national. Saving in the form of Bank Deposits provides resources for the National Plan.

COMPANY AFFAIRS

CAPITAL ISSUES

Three new companies, five existing companies and two banks have been granted consent by the Controller of Capital Issues for the issue of a total capital of Rs. 5.45 crores. Out of these new capital issues, 9 will be in equity shares and one in debentures. The consent is valid for one year in each case.

H. K. Steel and Wire Ropes Limited, Bombay, a new company has been granted consent to issue capital of Rs. 55 lakhs for cash at par divided into 45,000 equity shares of Rs. 100 each and 10,000 cumulative redeemable preference shares of Rs. 100 each, carrying a dividend of 9.5 per cent, free of company's tax, but subject to deduction of taxes at source at the prescribed rates. Of this, equity shares of the value of Rs. 12.5 lakhs would be offered to Messrs. Siegfried Schumacher KG Stehldrahtwerk, West Germany. The proceeds of the issue would be utilised for the manufacture of steel wire ropes.

The Barium Chemicals Limited (Proposed), New Delhi, has been granted consent to the issue of capital of Rs. 50 lakhs, for cash at par, in 40,000 equity shares and 10,000 (free of company's tax but subject to deduction of all taxes at source at the prescribed rates) cumulative redeemable preference shares of Rs. 100 each. The proceeds will be utilised for setting up a factory in Andhra Pradesh for the manufacture of barium chemicals.

Bharat Fritz Warner (Pvt.) Limited, a new company registered on October 17, this year in Mysore State for the manufacture of milling machines, has been accorded consent to the issue of Rs. 30 lakhs divided into equity capital of Rs. 24 lakhs and preference capital of Rs. 6 lakhs carrying dividend at 9.5 per cent, free of company's income-tax, but subject to reduction of tax at the prescribed rates. Out of this issue, equity shares of the value of Rs. 10 lakhs will be allotted to the West German collaborators, namely, Messrs. Herbert Fenner, Fritz Warner, against the supply of machinery, and the balance will be issued for cash at par.

Jeewanlal (1929) Limited, Calcutta, has been granted consent to the issue of 360,000 equity shares of Rs. 10 each and 18,000 cumulative redeemable preference shares of Rs. 100 each carrying a rate of dividend of 9.5 per cent, free of company's tax but subject to deduction of tax at source at the prescribed rates. The Company's existing capital is Rs. 72 lakhs in equity shares. The Company proposed to establish a rolling mill for aluminium industry in the Madras State at a cost of Rs. 171.5 lakhs, which will be met partly by the issue of capital and partly by loans. The equity shares will be offered, in the first instance to the existing shareholders in the proportion of one new share for every two shares held.

Hindustan Electric Company Limited, Bombay, has been granted consent to issue capital of Rs. 60 lakhs divided into 60,000 equity shares of Rs. 100 each for cash at par. The entire issue will be made to Messrs. Brown Boveri and Couk of Switzerland. The proceeds of the issue would be utilized for the manufacture of AC and DC generators, circuit breakers, etc. The Company has a paid-up capital of Rs. 80 lakhs (Rs. 60 lakhs in equity and Rs. 20 lakhs in preference).

The Indian Hume Pipe Company Limited, Bombay, has been granted consent to issue debentures of Rs. 50

lakhs divided into five thousand 7 per cent taxable debentures of Rs. 1,000 each for cash at par. The proceeds of the issue will be utilised for redeeming the existing debentures and for financing the increased business activity of the Company. The Company has a subscribed and paid-up capital of Rs. 100 lakhs.

Sun Paper Mills Limited, Madras, has been granted consent to issue capital of Rs. 30 lakhs for cash at par. The proceeds will be utilised for setting up a paper mill in Tirunelveli district, Madras.

Ludha Colliery Company (1920) Limited, Calcutta, has been granted consent to the issue of Rs. 23 lakhs in 2,30,000 equity shares of Rs. 10 each at a premium of Rs. 7.50 nP. per share. The capital is required for the development of the Company's collieries in the Third Five-Year Plan period. The shares will be offered for public subscription by means of a prospectus. The existing paid-up capital of the Company is Rs. 87 lakhs.

The Bank of India Limited, Bombay, has been granted consent to issue capital of Rs. 2 crores divided into 2,00,000 ordinary shares of Rs. 100 each, Rs. 50 per share paid-up, for cash at premium of Rs. 20 per share. The proceeds of the issue would be utilized for financing the Bank's increased activities. The Bank has a subscribed capital of Rs. 550 lakhs and a paid-up capital of Rs. 300 lakhs.

The Catholic Syrian Bank Limited, Trichur, has been granted consent to the issue of further capital of Rs. 10 lakhs in equity shares of Rs. 100 each for cash at par. The proceeds will be utilized for strengthening its capital base.

CUT AIR CONDITIONING COSTS

with **BLUE STAR-WORTHINGTON**

Packaged Air Conditioners

5, 7½, 10 tons

Now made in India

Here's how **BLUE STAR-WORTHINGTON** Packaged Air Conditioners offer you a four-way saving in air conditioning costs.

CUT COSTS on tonnage. Single units range from 5 to 10 tons, operate independently.

CUT COSTS on installation. Units can operate without ductwork.

CUT COSTS on subsequent expansion. Single units connect up into multiple systems with minimum alterations.

CUT COSTS on operation and maintenance. Every unit is engineered, built and individually performance-tested in **BLUE STAR'S** own plant to **WORTHINGTON** specifications.

For a better air conditioning job, call in **BLUE STAR**.

Get complete details from **BLUE STAR** offices at:

Lotus Court, Jamshedji Tata Road, Bombay 1

Monsanto works constantly both to develop new, better chemicals—and to improve those chemicals already used in every major industry.

PHARMACEUTICALS
acetylsalicylic acid, phenacetin, benzoic acid, phenol, phenolphthalein, germicides are but a few of the many Monsanto products in this field.

RUBBER
Monsanto's accelerators help speed vulcanisation, add quality. Anti-oxidants improve resistance, prevent early cracking, give increased flexibility.

TEXTILES
Monsanto Syton is widely used in spinning cottons and woolsens. Increases yarn strength, allows for reduction in twist.

PRESERVATIVES
Monsanto's pentachlorophenol chemicals help to preserve a wide range of products. Monsanto sodium benzoate helps prevent corrosion.

PAINT
Monsanto's chemicals are used extensively in the manufacture of high-quality paints, varnishes and lacquers.

SYTON is a Registered Trade Mark

chemicals for every industry.

MONSANTO CHEMICALS OF INDIA PRIVATE LTD.
Wakefield House, Sprott Road, Ballard Estate, Bombay 1.

Goa: Defeat in Victory?

GOA, Daman and Diu have been restored to the Indian Union from which, but for one of the great, and tragic, accidents of history, they might never have been separated. The return has been celebrated, as is only natural, with great jubilation in the Indian Union and, possibly, substantial rejoicings amongst large sections in the old Portuguese enclaves. In a great wave of popular emotion both ends and means have been joined in an act of approval and assurance which has had few parallels in Indian history since Independence. Every single political party has chosen to associate itself with 'liberation' as though it were a unanimous decision of the nation, and no doubts could exist as to the manner in which an end, deeply desired by all, has been achieved. For the short period, if there is any feeling against the popular current, it has been timid and afraid to speak. This is hardly the time to strike a discordant note. But it may well be that, when history comes to be written, the fact that there were a few who disassociated themselves from the millions who were applauding both the planning and the end of this operation, will be proof that the Gandhian legend in the Indian Union survived at least for a little while beyond the victory which came with Indian Independence on August 15, 1947. Patience for fourteen years is not necessarily proof that in the fifteenth year Mahatma Gandhi is alive. All in all, the balance-sheet is difficult to strike at this hour — almost as difficult as it is for those few who feel that India's course of action has not lived up to the highest standards to speak out their minds.

The result in terms of *realpolitik* and even of economic considerations is entirely good for both the Indian Union and for the old Portuguese enclaves. Portuguese Colonialism has been traditionally the worst of all forms of colonialisms, and although some of its worst inhuman brutalities were reserved for Africa, no one will deny that administration in Goa has been full of tyranny, and constituted a denial of the free spirit of men to determine freely the manner in which they should live in their own communities. There will certainly be more freedom of expression now than before, although the choice of a government is equally not to be left to the residents of Goa, Daman and Diu. Secondly, on the question as to whether or not aggression has taken place, it is possible to argue a nice point as to whether or not the determination of the Portuguese to remain upon Indian soil was not, in a moral sense, a continuation of aggression against the great majority of the Indian people, with whom obviously these enclaves should have been associated. The legal fiction of two different nations operating on the border of the enclaves even, in the first instance, was obviously thin. All in all, the political balance sheet now looks cleaner in the sense that the union of these people with their motherland was an objective which was justified in Indian historical tradition, geography and perhaps even political philosophy. It is a fact, however, that the method of its attainment constitutes a violation of the Charter of the United Nations.

Because of the technicality of this violation, it was to be expected India would encounter very little support in the West. The U.S.S.R. and our friends in Asia and Africa have much more feel-

ing for the substance, so far as colonialism is concerned, than for the written word. And the voting in the Security Council reflects what might be described as the balance between the legal and the moral sides of an international dispute. The question which needs to be asked at this moment of victory is not whether or not we have won international support. On balance, we have certainly lost, since the West is far more important to us at this time than the Soviet Union; but whether we have not, over the long haul, sustained a defeat in "intangibles" which might reverse the undoubted appearance of unity by which India has proclaimed to herself the rightness of her own purposes. There will be few who will worry unduly about international opinion in this case, if their own consciences were completely clear. The volume of criticism has, indeed, been somewhat greater than expected. But that remains only a question of degree. What has been surprising is the volume of opinion inside India that has chosen solidly to stand against what might have looked like a Gandhian rendering of our obligations at this time.

The issue is often confused by stating that the ends are so obviously right that the means we have chosen in this case cannot suffer by the admitted defect that it is non-Gandhian. Equally, it can be argued that the technical breach under Article 2 of the Charter of the United Nations cannot be read in the wider context as an excuse for violations which bear no similarity to the Indian case in terms of history, geography and natural law. Nevertheless, the issue must be raised as to whether the Indian people themselves — ignoring fully the volume of international abuse — are clear in their own minds that they have not betrayed some trust which was reposed in them when the Father of the Nation, as we proudly call him, passed on a torch to us to serve as a beacon in a world of relative darkness, reaching constantly for arms for the solution of tensions for which, down the ages, arms have provided no permanent solution. *The Eastern Economist* most reluctantly has come to the view that, when history comes to be written, the great adventure which has just been triumphantly concluded might well be described as a turning point in India's devotion to the doctrine of Satyagraha and soul force as applied in the international scene.

Not, indeed, that there has been much doubt that the hard core of Gandhian doctrine is today not alive and moving as it was in the twenty years before Independence came or fell upon us. An all-India survey undertaken by the Indian Institute of Public Opinion in February, 1959 showed in a sample of 1,200 interviews chosen in urban areas in the Indian Union at a random basis, only 28.6 per cent answered affirmatively the question, "Do you believe in the efficacy of all the teachings of Mahatma Gandhi?"; 28.8 per cent said they believed in "some" but not all his teachings, 21.1 per cent said they do not know and could not give a definite answer, whereas 21.5 per cent had "no opinion" to present. In rural areas where 1,800 random interviews were conducted, the corresponding figures were 23.8, 20.3 and for 'Don't know' and 'No opinion' 55.9 per cent. It will thus be seen that even two

INDUSTRIAL IBCON CONSULTANTS

The industrial consultancy services offered by the group fall under the following headings:-

years ago only a fourth of the Indian people were committed emotionally to all the teachings of Mahatma Gandhi as they understood them at the time. The basic common element of the teachings was that the best of ends cannot justify means inconsistent with the doctrine of non-violence except in self-defence. This is a crucial question to be answered at the present time. Has the figure of about a fourth of the Indian people who believe in Gandhian doctrine altered substantially so that, today, if the question were to be asked we would be shamed by the proportion of those who had lost faith in one whose name has hitherto been used as the great preceptor of the Congress? Can it be true of Mahatma Gandhi, as it has been of all great prophets, that they are not without honour today except in their own country? This, and no other, is the moral issue so far as the Indian conscience is concerned. We may face the world with assurance, but we may find it difficult today to pray at Raj Ghat with anything like the same conviction that we displayed on October 2 this year. January 30 will soon come. What answer will we be able to make to him at that time?

For the rest, the balance-sheet is almost entirely favourable. It now transpires that the Indian balance of payments will be substantially improved by the export of iron ore from Marmagao, thereby possibly adding between Rs. 15 to 20 crores per year to our export earnings, even after allowance is made for the reduction of ore exports from other parts of India. There are few places anywhere in the world so happily placed for economic exports of ores as is Marmagao. Similarly, on the other side, for the Portuguese enclaves committed to an economic pattern devoid of all expansion, there has now opened, by the tremendous market of the Indian Union and the enterprise and capital associated with it, great opportunities. In other words, the enclaves themselves will be great economic beneficiaries as a result of their return to the Indian motherland. It is difficult to

believe that those who live in the material world will, therefore, find on either side any disadvantages in the new economic arrangements which have been reached. Any transition will purely be temporary and the wisdom of the Government of India in maintaining current laws for the period of the transition will make any hardship marginal in terms of the larger opportunities that are now open to all those resident in the enclaves.

There is, indeed, a somewhat uncomfortable postscript to this assessment of our position today. It may be that the weapons of the spirit are not entirely without their repercussions even in the hard world of material things. There may be built up amongst our friends abroad in the Aid-India Club or elsewhere a feeling that assistance to the Indian Union is not as great a fight for peace and democracy as it once was. *The Eastern Economist* does not believe, on balance, that the volume of aid will be significantly affected since India's strategic position and her own importance as a political friend will make it necessary for the nations of the West to recognise, even if we have erred, that the structure of the world is such that India can be neglected only at the risk of their own security. Thus it may be that, again after a period of transition, the international balance-sheet will bear, in material terms, no great difference; only there will have been left a permanent residue of distrust in that our mundane practice may be some distance behind our professions. It may be that the international world will rank us permanently lower on that account. In the last analysis, nations as well as individuals, must live by faith. For nearly half a century we have been sustained by the Gandhian faith. The question is what faith we now profess. We cannot, in our hearts, go on as before, and we cannot be empty as sounding brass. If we have lost the Gandhian salt, how shall we be savoured? And what message does India carry now in a world on the brink of moral collapse? Let those answer who must, or forever hold their peace.

Statisticians in Conference

THE Prime Minister inaugurated on Wednesday in New Delhi the tenth Conference of the Central and State Statisticians which will hold deliberations on some of the important problems in the statistical field which have provoked severe controversies in recent years. One of these relates to the computation of comparable State income estimates which were needed by the Planning Commission last year at the time of allocating funds for the States' Third Five-Year Plans and are currently required by the Mahalanobis Committee in order to determine the disparities in regional incomes. The National Income Unit of the Central Statistical Organisation has circulated a paper for consideration at this conference which sets out comparable estimates of States' agricultural incomes only for the years 1955-56 to 1958-59. It seems that the National Income Unit will need perhaps a minimum of two more years to complete its estimates for the States, though considerable hopes were raised regarding quickening of its operations by the recent reorganisation of the Advisory Committee for the National Income Unit. The paper submitted by the Unit for computation of agricultural income is extensive in coverage and is based mostly on direct evidence. Real difficulty is likely to be encountered in the case of the tertiary sector for which enough basic information is not available and the States' Statistical Bureaus will have to undertake elaborate surveys so as to fill the gaps in our knowledge,

especially about the pattern of wages in the different professions at the regional level.

Special interest centres round the seminar which will be held on the last two days of the conference in regard to the suitability of the National Sample Survey design to provide the growing requirements of data for planning and plan assessment, with special reference to current needs. There has been a long standing complaint against the National Sample Survey for undue delay in the release of the results of its surveys. The technique of combining different studies under the same survey has come in for severe criticism in recent years. It has been a practice with the National Sample Survey to undertake, within the framework of the same survey, such studies as the crop cutting experiments and the demographic and other economic enquiries. This naturally resulted in increasing the burden on the interviewers and also in lowering the standard of their performance. It seems as if the administrative considerations have prevailed over the technical considerations in laying down the objectives of the various rounds of the National Sample Survey. Besides highlighting some of these anomalies and throwing up some useful hints from the practising statisticians who have used this data over the years, this conference is likely to urge the Department of Statistics to accelerate its activities in the National Sample Survey, especially in the

field of consumer expenditure. Results of the consumer surveys made available with a time lag of two to three years lose much of their value. The seminar will have done a good service to all researchers in the country if, somehow, the National Sample Survey could be persuaded to hasten its operations.

The evaluation and appraisal of Plan projects, construction of wage indices for industrial workers, compilation of inland trade statistics and prevention of over-lapping by Central and State Governments in regard to family budget surveys are the other subjects which will be deliberated upon at this conference. The working class consumer price index numbers which are being used currently in the industrial centres are completely out of date as some of them were based upon the family budget surveys conducted three decades ago, and the necessity of holding fresh surveys has already become obvious. It is interesting to see that this conference has thought of applying its mind to the evaluation and appraisal of Plan projects as well. Hitherto, the

Central Statistical Organisation with looking at the balance sheet projects alone. For a these projects, it will be needed surveys in the field to projects—especially the multi had achieved the objectives for been planned. Also, very little is

inland trade statistics in this country suitable machinery has been evolved for inter-zonal movements of commodities. There has been much talk in the past about this subject but has yielded very poor results because of the low priority allotted to it in academic discussions as well as in financial allocations.

It is to be hoped that this conference will result in pressing upon the slow moving agencies of the Department of Statistics to accelerate their activities so that the results of their findings are made available without much loss of time and estimates of regional income, evaluation of Plan projects and the construction of new consumer price indices are undertaken without undue delay.

Transport Diversification

THE debate on the inadequacy of the transport system, in terms of its planned development, to provide the requisite transport capacity during the Third Plan is bound to continue so long as reasonable apprehensions about the recurrence of crises in production due to lack of transport have not been allayed. The factual data on rail and road transport, which have a positive bearing on the formulation of a long-term policy, have been supplied in copious detail, according to the Planning Commission's frank admission, in the preliminary report of the Neogy Committee on Transport Policy and Co-ordination prepared enough in advance of the final version of the Third Plan. But it has made little impact on the transport plan which remains virtually unaltered in its draft form.

What has actually been done in the Plan is to approach the transport problem from the objective angle in the immediate future. It is unlikely that this approach will be changed by indulging in the experiment of swapping horses mid-stream, although the text of the Third Plan suggests that the transport plan will need appreciable review in the light of the final report of the Neogy Committee. The basic principles which should determine the allocations to the major forms of transport—railways, roads and shipping—and some sort of workable co-ordination to prevent lopsided growth will inevitably be left over to the Fourth Plan. In so far as the current plan is concerned, it is apparent that attention ought to be focused on the diversification of transport to ease the strain on the railways and to supplement the shortages in their capacity rather than on the full share that is due to the other modes on the logic of co-ordination. A pragmatic, or more precisely, an ad hoc, approach may now be taken as written in the Third Plan. The debate on transport will be useful to the extent it demonstrates the possibilities of diversifying transport capacity especially by exploiting the undoubted potential of road transport. In this process of diversification, it is well to recognise that the railways do not admit of further burdens, that coastal shipping has a modest part to play and timely relief can be expected from road transport.

Mr. K. Barua's presidential address to the Indian Roads Congress at its annual session last week makes some constructive suggestions from this angle. Two at least of the suggestions

he has forcefully made merit attention, if greater diversification in the provision of transport capacity is to come from the roads. One major drawback which road transport in India has betrayed so conspicuously in relation to its counterpart in many other countries is its unsatisfactory level of productivity. Applying the criteria, which an expert road engineer cannot resist the temptation to apply, he has located the causes of inadequate productivity in the insufficient attention paid to "specialisation, standardisation and mechanisation". But this will not be enough. Road transport units in the freight sector are operating on small scales and many of them are admittedly struggling on the margin. Viable units commanding large vehicle fleets will be indispensable if the economies of large-scale operation and benefits of superior efficiency are to be reflected in higher productivity. The Third Plan throws a hint that the State may have to extend its activities to freight transport by road. It should hold its breath until the private sector fails to raise its stature. The unsuccessful experience of the former Bombay State on a fractional scale utters a warning. The President of the Indian Roads Congress has made another point, perhaps, by way of a reminder. Too often accent is placed on road mileage, but insufficient attention to priority for bridge construction is apt to detract from the productivity of roads.

Global comparisons of vehicles per mile are not necessary to demonstrate the low ratio prevailing in India. One of the major factors which will determine the capacity of road transport to assist diversification is the expansion of vehicle stocks. Indigenous manufacture and imports are both operating on a restricted range and availability can be increased by greater expenditure of foreign currency. In the Third Plan, on a conservative estimate, freight traffic will rise by 120 per cent from 10,600 million ton miles to 23,250 million ton miles. As against this, stocks of goods vehicles are estimated to increase by 78 per cent from 160,000 to 285,000. Already in the first two Plans, freight traffic was raised by 200 per cent with only a 100 per cent addition to vehicle capacity. Planning in the present Plan obviously ignores the harsh fact that this technique cannot be worked except with diminishing results, unless, of course, the severe restrictions on motor transport are removed.

A DELHI DIARY

NOT MR. MENON'S WAR?

IF the noises that I hear all around me and the echoes of those from Bombay prove anything, it is that the liberation of Goa was not only—in the words of the "Daily Telegraph"—Mr. Menon's war. The extraordinary unanimity of opinion of all Indian parties to climb on the Goa bandwagon suggests that, if any political party has sought Goa for election purposes, no other party wishes to be left out on that account. Similarly, a quick (Gallup?) poll amongst my friends convinces me that possibly only one in a hundred regrets that we have lent some colour to the view that the Gandhian legend is dead. There is no doubt whatever this is "popular" opinion in India, quite apart from the general evoking of the national sentiment that colonialism must die on Indian soil. So far as external opinion is concerned, there has naturally been a sense of some shock at the virulence of the attack upon us. But most people have developed a very great indifference to international opinion when it conflicts with our own. Thus it has come about that, if there is guilt of any kind in the liberation of Goa, it is shared by practically all Indian people. It is unfair that all the blame should be given to those who spearheaded something of which everyone seems to approve no less than the Prime Minister.

Obstinate man that I am, may I say that I still adhere to the view expressed last week that in the world of the spirit there are intangible things which are of long-term value to a nation more than any of us at this moment has admitted? All in all, while we rejoice at the return of Goa to India, there are still a few of us who feel that we have tarnished the mirror into which we took and that we have forgotten some of the great commandments of all time. We have preached so much in the last fourteen years that perhaps the cruel picture of India as Humpty-Dumpty—in the "Times" of London of all papers—falling from the wall might well appeal to Western observers. None of us should worry unduly about the opinions of others if we have a deep sense of righteousness within. Can I say that our conscience is truly clear or should I qualify it by saying that at least one per cent feel that we have done some intangible damage to our own selves far greater than anything that can be done to us in the 'foreign Press'?

THE PERILS OF PUBLICITY

For reasons which are not entirely clear to me the Indian Press has been prevented from entering Goa and Daman and we are now in the bitter predicament of having to accept the versions of foreign journalists of what happened in Goa. I see Mr. Jan Colvin, special correspondent of the "Daily Telegraph", is prominently presented on the front page of every newspaper that I read as though to deny the validity of the editorial which the same paper has made in denouncing us in London. Surely, if publicity is a good thing permission should be equally given to leading Indian journalists to be able to tell their own story in their own way. I have often said that a copy of a copy is, in Plato's phrase, twice removed from the truth. No doubt all Mr. Colvin has said is true, but why cannot we say having seen it with our own eyes and felt the jubilation which the residents in Goa are stated to have displayed?

Publicity has had another dangerous side. The President, whom every one is happy to see back at his post of duty, paid a tribute to our army for their splendid performance. Thunderous applause also greeted them when Mr. Menon paid his tribute at Bombay. Why then has it been necessary for the Prime Minister to argue that there has been practically no fighting of any kind and that the opposition was so pitiful that the casualties, believed to have been 20 in all, showed that the whole of the country was on India's side? Either there was a battle, for which honours are due, or there was not. If it was a walk-over, as seems now to be evident, surely praise for the army can be overdone. It is far better to present the point that the Goa administration was hollow and the people were fundamentally ready for a change than to indicate that this was a rapid and efficient defence operation which shows the fighting quality of our soldiers.

N. K. SIDHANTA

I leave this controversial subject of the inconsistent views presented on the Goa operations to deal with the sad demise due to a heart attack of Professor N. K. Sidhanta, Vice-Chancellor of Delhi University. Those of us who have known Prof. Sidhanta for many years have come to value his tremendous dedication to duty, his fine sense of tolerance and his great capacity to accept responsibilities far exceeding his health or his age. His current travels all over India in connection with the Inter-University Board meetings were unwise being clearly beyond his physical capacity. And thus he literally died in harness in Bhubaneswar while attempting to complete tasks which were accepted too rapidly. There are very few men of whom it can be said that they are thus willing to sacrifice themselves for quite unrewarding routine. There was naturally great feeling in Delhi University when his cremation took place. May I add my warm tribute to many that have been openly voiced, including that by the Vice-President, Dr. Radhakrishnan, the Chancellor of the University?

SIR B. P. SINGH ROY

Speaking of Dr. Sidhanta my conscience rebukes me that a month ago I omitted to say a piece in these columns about a great gentleman who passed away also by heart attack. I refer to Sir B. P. Singh Roy whose wonderful urbanity, fine sense of balance and unfailing courtesy are engraved deep in the minds of all of us. Sir Bejoy had a distinguished career in politics in what are called the old British days, as well as in business after Independence, having been President of the Federation of Indian Chambers of Commerce and Industry and Chairman of several companies including Jessops and others which had to be reorganised after what I might describe, in masterly understatement, as a period of bad management. In all these tasks his great sense of fairness, his tact and his almost infinite patience endeared him even to those who often disagreed with the somewhat unpleasant measures he had to take to destroy the rot. Some people say to me that the British period produced more great gentlemen than the subsequent period of national reconstruction. Let me incur unforgivable unpopularity by asserting that this seems to be true!

ARGUS.

THE WEEK'S NOTES

China

NO ENTRY AGAIN

THE RUSSIAN resolution for the admission of the People's Republic of China to the United Nations in displacement of KMT China provoked a preliminary battle on the floor of the General Assembly on a vital point of procedure whether a two-thirds majority was necessary for its passage. It was certainly curious that Russia should have taken the indefensible position to insist that her substantive resolution on the admission of China should be taken up first and the procedural point about two-thirds or simple majority afterwards. She has to thank herself if she lost on this count. Mr. Zorin expressed the optimism after the substantive resolution on admission was lost that the balance was tilting in favour of China and next year the General Assembly would open the door to her. On what calculations he based his optimism is difficult to guess. But one fact which has emerged clearly is that the increasing membership of the United Nations (Tanganyika is the latest and 104th member, which, by the way, cast a negative vote), essentially accounted for by the African countries, cannot be presumed to bring an accession of strength to the Communist bloc. Mr. Zorin's hope may be realised next year only in the event of a sudden and radical shift in the voting alignment.

The vote against China was undoubtedly a great victory for America. The negative vote was unexpectedly large and, even assuming that the significant size of abstentions was not there, the resolution could not have mustered a two-thirds majority. As the actual division shows—36 for and 48 against—China lost even on a simple majority. The Kennedy Administration's forward and bold policy on the Congo paid ample dividends on this occasion. India voted in favour of China's entry as she has consistently held that the anomaly of keeping out a land and its people of such a huge size from the United Nations would not but weaken its basis. But this time India's total silence during the debate was far more eloquent than her advocacy—some times very enthusiastic on earlier occasions during the past decade. Spokesmen of other countries quoted freely from Mr. Nehru's recent candid observations on China's international behaviour. This was important. China's aggressive attitude and disregard of norms of international behaviour came in for criticism this time also, but how far the criticism will produce a salutary effect will only need to be watched.

Britain voted in favour of Russia's substantive resolution for China's admission in view of the diplomatic relations she is maintaining all these years with the latter. But Mr. Joseph Godber made the meaningful remark that Britain's vote may not be taken as affecting the position of KMT China. Was there anything in this remark except the vital implications that two Chinas should be accommodated? Many would be inclined to endorse this suggestion—by no means novel, however—as a proper solution. Who, in that event, will hold the permanent seat on the Security Council? Even apart from this hurdle, Russia and China will not agree to it. The permanent seat and the power of veto which go with China's membership make it necessary that the People's Republic should render itself acceptable to those who now object to her admission.

Population

FAMILY PLANNING

THE CENSUS results published earlier this year placed India's population at 437 millions—much above the most

optimistic forecast of 431 millions—and focused the attention of the planners on the necessity of controlling the population, if the increased benefits of planning were not to be frittered over larger numbers, resulting in giving the impression that our planning was making a very slow and halting progress. One of the key solutions usually offered for controlling population relates to what is popularly known as "family planning" or "planned parenthood" for which there are many practical techniques. In the past, some store was set by the rhythm method. There are only two efficient methods of controlling rapid expansion in population and they are (a) the increased use of contraceptives and (b) sterilization. The latter also, like the rhythm method, has not succeeded in the past. The technique of family planning in the coming years will, thus centre round the extensive use of contraceptives, which unfortunately, are prohibitive in cost. Should these contraceptives be distributed free? This is a financial problem, much bigger than the Rs. 50 crores allocated for this purpose in the Third Five-Year Plan. Also, no scientific study has been conducted so far to show that the people would make use of these contraceptives, if they were made available without any cost. In fact all academic research in this particular field has thrown up very little information of practical nature.

Mr. Karmarkar, recommended the establishment of a separate Ministry in the Centre for dealing with this vital problem. Mere multiplication of ministries at the Centre or in the States will not solve the problem. But the spirit behind this suggestion is sound in so far as it urges increased activity to tackle this problem. The Ministry of Health has, in fact, failed in its primary duty of at least gathering the essential detail regarding the motivation behind the resistance of the people to the adoption of family planning techniques. In limited areas, the impact of free distribution of contraceptives needs to be studied. If it is not possible to distribute contraceptives free of cost, the contraceptives should be sold at nominal price over a period of time in certain areas and then systematic surveys should be undertaken to see how far people had availed themselves of these opportunities.

General Elections

CODE OF CONDUCT

SINCE THE political parties came to an agreement at the National Integration Conference a few months back on the urgency of evolving a code of conduct for the general elections, very little is heard about the progress made in this desirable direction. But it is gratifying to observe that the subject has not only cropped up again but advanced some way in Madras State, where its need should be felt keenly along with a few States similarly handicapped by the resurgence of casteism, communalism or groupism. In the course of the discussion on the budget demand for advance grants during the financial year 1962-63, grievances were ventilated about the subject of elections. It was as a result of this provocation that the subject was taken up in earnest by Mr. C. Subramaniam, the State Finance Minister, and in consultation with different parties it was agreed that a conference should be convened at the State level on December 20. At the time of going to Press, reports of the results of this conference were not available to us.

Although in the heat of the hustings the temptation is irresistible to fling wild or carping criticism at the opposition parties or candidates, it is certainly possible for the party organisers as well as independent candidates to follow certain minimum norms of conduct and put the election propaganda on an appropriate and dignified plane. The most important point on which agree-

ment will be quite easy is that the programmes and policies of the parties should be the real targets of criticism during the campaigns and not the personal failings or facts of the private life of the candidates which have no bearing on their public status. The experience of the last general elections has shown that none of the parties takes sufficient care to educate the electorate on the programmes and policies which it would enunciate if voted into power. Their elucidation in the election manifestoes is all with which they rest content, but it does not reach the average voter. Another important point which will be included in the draft code is to refrain scrupulously from making any appeal to caste, communal or linguistic or any separatist sentiments. If this rule of discipline is observed (which can hardly be taken for granted), some purpose will be served in lessening the impact of this virus. But it surpasses comprehension how merely this rule can be enough. It is a fact of universal knowledge that in numerous cases the selection of the candidates by the parties (to which the Communist Party of India, too, is not an exception) is influenced by the communal or sectional complexion of the constituency. Basically what is needed is a choice of candidates according to their merits. The question of election expenses which has become a great headache to all the parties was also touched, but it would be naive to suppose that the code will succeed in putting any reasonable curbs on extravagance during the elections.

Kerala

THE AGRARIAN RELATIONS ACT

IT IS a mixed bag of judicial pronouncements which the Supreme Court delivered on the writ petitions filed before it by parties contesting the constitutional validity of certain provisions of the Kerala Agrarian Relations Act. Mainly, three issues of different character and giving rise to different points of validity were raised in these petitions. In one, the decision of the Bench consisting of five judges has been unanimous, while in the remaining two the majority decision of three prevailed over the minority judgment of two. Taken as a whole, one cannot be quite sure that the pronouncements on the three issues will set at rest the constitutional fight relating to the validity of analogous legislation in States other than Kerala and even the unanimous judgment may, perhaps, create embarrassing situations where a newly elected government belongs to a different party from its predecessor and desires to change the legislation before its final stage. It may not be able to do so by reason of the Supreme Court's decision.

In the three petitions a preliminary and common contention was raised that the Kerala Agrarian Relations Bill had lapsed when the Kerala Legislative Assembly was dissolved by the President by a proclamation, since the assent of the Governor or the President to the Bill had not been given prior to the dissolution of the House. The Supreme Court by its unanimous verdict ruled that the Constitution did not make any provision to set a time-limit for the assent of the Governor or the President to a Bill and therefore the Bill must be held as pending and not as lapsed. In this particular case, the Bill which was referred back by the President to the Legislative Assembly for certain modifications came up for consideration before the new assembly. On the preliminary objection, therefore, the petitioners lost their case.

Of the two other issues, one related to the contention that the "Pandarwaka" and "Purawaka" lands held by the petitioners in the Cochin region of the Kerala State had a peculiar legal character as

"Ryotwari" tenures and therefore they did not come within the application of the term 'estate' as construed in the Kerala Agrarian Relations Act. It was contended that application to ryotwari tenures of the provisions of the Act offended against the right of equality of law, the right to property and the right to adequate compensation conferred by the Constitution. But once the ryotwari holdings were held to be estates, these contentions also lost ground. Rather somewhat strangely, the petitioners in the other petition, who held ryotwari land in parts of South Canara which were transferred to the Kerala State after the State re-organisation have come in for a severe deal. Their contention that the ryotwari land which they held under the former law relating to land tenures in Mysore State protected them from the mischief of the Agrarian Relations Act of Kerala. This contention, too, was turned down and their ryotwari lands were held to be estates attracting all the liabilities under the Act.

D.M.K.

ELECTION MANIFESTO

IT WOULD have been a shock if the pride of place had not been given in the election manifesto of the Dravida Munnetra Kazhagam to its article of faith of the secession of Dravidanad from the rest of the Indian Union. Dravidanad is to comprise Tamilnad (Madras State), Mysore, Kerala and Andhra States. Whether these regions agree to the formation of Dravidanad does not worry the DMK in the least. Apparently, it is taken for granted that they can be made to come into the fold. The formation of Dravidanad, however, need not be taken as an act of hostility towards the rest of the Indian Union. In all seriousness, the manifesto proclaims that it endorses the Indian Government's stand on the Sino-Indian border. Such is its solicitude for territorial integrity. In the face of this solicitude, the fact that it is committed to secession should not be regarded as a violation of the principle of India's territorial integrity.

The entire face of Dravidanad will be changed out of recognition if the DMK is put into power and its programmes are translated into its administrative policies. For the present, however, they are confined to Madras State where it will obtain a strong base for its formation and later on extend it to embrace Mysore, Kerala and Andhra States. The problem of power from which Madras suffers so acutely has an easy solution in terms of this manifesto. Oil will be explored in the Cauvery basin without delay and a refinery will be set up there. An atomic power plant will be established in the South and solar energy will be utilised to the fullest extent. The DMK will establish a casteless society based on the principles of democracy and it will be governed by the socialistic pattern. Economic development is a crying need in the coming years, but foreign loans will be procured only in cases of absolute necessity. It is, however, not clear whether cases of absolute necessity will be equated with cases of normalcy. There will be a radical redistribution of land, heavier direct taxation, a minimum wage for agricultural labour and wage boards for all industries. Land armies will be organised in the districts and the rural economy will be revolutionised by the renovation of tanks, construction of roads and an extensive activity for rural housing. In other spheres the DMK will not be lagging behind. For instance, it will promote the cause of education in a unique way. A separate Dravidian university will be established to conduct research in the glory of Tamilnad. These are only a few among the manifold images to convert Dravidanad into a land overflowing with milk and honey.

Carrier are a hidden asset at the Bank of India Limited, Bombay

We may not be entered in the books. But we are a hidden asset in many of India's leading banks. We're air conditioning people. Operate behind the scenes. Balancing, not the books, but temperature and humidity. This adds up to cool, dust-free working conditions. Increased staff efficiency and goodwill.

"A sound investment," people say. "You can always bank on dependable Carrier equipment, Voltas' design, installation and service." Not customary for us to indulge in grandiose claims. Leave it to bankers (among others) to say: "Carrier and Voltas are the people who know air conditioning best".

Some other banks air conditioned by us:
Bombay Mercantile Co-operative Bank Ltd., Bombay
National City Bank of New York, Calcutta and Bombay
Netherlands Trading Society Ltd., Calcutta
Reserve Bank of India, Bombay, Madras, Nagpur and New Delhi
State Bank of Mysore Ltd., Madras
United Bank of India Ltd., Bombay.

AGENDA FOR A FREE SOCIETY

By ODYSSEUS

ADAM SMITH (1723-1790) was the first person to see that the reasons why some nations became richer than others constituted a specialised branch of knowledge. His "Wealth of Nations" (1776) speeded the Industrial Revolution by its epoch-making recognition that individual freedom in enterprise, combined with the division of labour among specialists, multiplies wealth. But his book was also a tract for the times, attacking the established ideas of his day, criticising hoary institutions adapted to long vanished mediaeval conditions, exposing the futility of mercantilism — the attempt of governments to regulate trade and industry in order to try to secure a surplus of exports over imports in the illusion that this ensures national prosperity. By releasing individual initiative from centuries of bondage, Adam Smith introduced change in a static world.

But the solution of one problem always creates new ones, and in the 185 years since Adam Smith wrote, many governments in their efforts to solve new problems have, in many countries, gradually built up new accretions of regulations and protectionisms, which have increasingly stifled the initiative of the individual, and made him unable, or reluctant, to act without a permit, or a directive, from some authority.

I maintained here on October 14, 1960, that Prof. F. A. Hayek's "Constitution of Liberty" (Routledge & Kegan Paul, London, 1960. Price 45 sh.) was another "Wealth of Nations", that in its breadth of vision it is (1) a positive restatement of basic principles for a free society, and (2) a tract for the times, attacking established ideas. Today, I rejoice to find this view supported by Mr. Arthur Seldon who, in his introduction to "Agenda for A Free Society" (published in 1961 by Hutchinson for the Institute of Economic Affairs, 66A, Eaton Square, London SW-1. Price 25 sh.) compares Hayek's book to Adam Smith's great work.

"Agenda For A Free Society" contains ten essays by leading philosophers, lawyers, and economists, of the calibre — to name but four — of Frederic Benham, Graham Hutton, A. A. Shenfield, and Sir Henry Slessor (Solicitor-General in the 1924 U.K. Labour Government), who discuss the practical significance that Hayek's book has for the solution of contemporary problems. These essays reinforce the impression already made on anyone who has read Hayek with an enquiring mind: they point up the profound scholarship of the "Constitution of Liberty", which draws on, or appraises, more than a thousand authors.

Since Hayek examines afresh some of the most widely prevailing ideas of our times, such as social justice, progressive taxation, and Welfarism, it is natural that he should have drawn on himself ridicule and scorn. It is also natural that a book of such extraordinary scope, which bases its discussion of freedom on economics, political theory, philosophy, sociology, anthropology, and jurisprudence, should be unequal in its treatment of so large a canvas, and many specialists have been quick to point out gaps, errors, or weaknesses, in some of Hayek's theoretical positions. Nevertheless, it is remarkable that, although every contributor to "Agenda For A Free Society" has criticisms to offer, they all agree that the "Constitution of Liberty" is a monumental work, full of challenging, corrective ideas. Indeed, that these ten authorities should think it worth while to assess Hayek at all, and that his idea should emerge broadly intact from their criticisms, is evidence both of Hayek's impact and of his stature.

TWO GREAT SOCIAL REFORMERS

There are two further parallels here with Adam Smith. First, Adam Smith's view did not win the day without massive attacks from what J. K. Galbraith calls the Old Guard of conventional wisdom. For thirty years or more, the air was full of solemn warnings that the creation of a liberal society would end in ruin.

Secondly, Adam Smith, his followers, and Hayek, have been scourged as the apologists of capitalist exploiters, opponents of social reform, exponents of a harsh laissez-faire. It is true that a hasty reading of the "Wealth of Nations" and of the "Constitution of Liberty" could create the impression that their authors oppose government intervention in principle and propose total freedom in economic activity. But, ironically enough, this is precisely because they are both essentially social reformers. Smith showed the poverty created, impeded, and prolonged, by the restrictive mercantilist institutions and habits of thought, which survived from the 17th and 18th centuries. Hayek exposes the strangling effects (a) on individual liberty, and (b) on the multiplication of wealth, of the jungle of controls, priorities, allocations, permits, and restrictions, that have grown up, following the teachings of Marx and his socialist or communist disciples. Smith was, and Hayek is, concerned with the evils around them. It is, therefore, natural that the emphasis in both is on setting men free. But neither stops there. Neither envisages the government's role as that of a passive onlooker. Both expect the government to be active in promoting reforms, laws, and institutions, to enable a market economy to work, not for the benefits of a few capitalists but for the community as a whole.

Who was it, for example, who insisted on ".... the duty of erecting and maintaining certain public works and certain public institutions, which it can never be for the interest of any individual, or small number of individuals, to erect and maintain, because the profit could never repay the expense to any individual or small number of individuals, though it may frequently do much more than repay it to a great society"? Karl Marx? No, Adam Smith. The anonymous author of the article on the Classical Economists in "Everyman's Encyclopaedia" (J. M. Dent & Sons, 1958) sums up their strength by saying that they made two realistic assumptions: first, that man sought his own interest (and this did not mean merely self-interest but also the interest of those whom he benefitted by his efforts); second, that while the world was getting richer, it was still poor, and that all had to be given incentives to contribute to the common good. Hence the need for machinery that would gear self-interest to the social advantage. "The record of the 19th and 20th centuries," says the Encyclopaedia, "suggests that no system known to man or conceived by him, except a market economy, can, in modern industrial society, achieve these objectives and leave man to live out his life in freedom. The classical economists must be judged not from the interpretations of others, but from their own writings and from the experience of those who have ignored or learned from their teachings."

THE BLUDGEON BEHIND SOCIAL JUSTICE

Hayek re-interprets these teachings in the light of post-World War II experience. Professor H. B. Acton of London points out in "Agenda For A Free Society" that Hayek rejects the rationalistic method of consciously reconstructing society in favour of the spontaneous adjustment of free activities to one another through market processes. The arrangements and institutions that so arise are generally better than any that can be

planned by powerful individuals or groups, however wise, because any man or group must be ignorant of many of the relevant facts, and of the consequences of their policies, whereas the adjustments of multitudes of individuals to one another promote a harmony too complicated for any individual to grasp. Hayek contrasts a free society, developing in unforeseeable ways, with a society in which a governing system of priorities and allocations is imposed from above. The latter is the type widely favoured today, although many of its supporters do not realise the extent to which it is essential that the individual must be coerced in order to maintain it. Hayek reveals the bludgeon behind the back of many of those who call for social justice, fair shares, the abolition of inequalities, and so on.

A state based on the principle of individual freedom and the rule of law is not static. It is dynamic, because it allows both the proliferation, and the testing, of many varying and conflicting ideals. Progress is not towards a goal pre-conceived in the minds of some well-meaning men whose vision is necessarily conditioned by their education, limited by the state of existing knowledge,

and subject to fleeting contemporary passions, prejudices, or fashions, but is towards ideals not yet conceived. Any one who has read any history is likely to agree with this. Would the circumstances and problems of 20th century independent India have fitted into the strait-jacket of Plato's 5th century BC Ideal Republic? When, in 1867, Marx proclaimed that capitalism would keep the working classes on starvation wages until they were saved by the revolution, did he foresee that the average industrial wage in the U.K. in 1961 would be Rs. 200 a week? Did he foresee that the Russian revolution would supply powerful arguments to the upholders of free enterprise? So slowly was Russia, which had been hit by World War I far less than most other belligerents, recovering, and so impractical did Lenin find Marx's blue-prints that he introduced the New Economic Policy, allowing a degree of private enterprise. And what about incentives? Did Marx foresee that in the U.S.S.R. of 1961 top people's earnings (exclusive of free transport, houses, and expense accounts) would run between Rs. 40,000 and Rs. 120,000 a year, and that income tax (highest level at present 13 per cent) is to be eliminated by 1965?

MEDICINE MAN MR. AL FOIL F.G.S.P.P. . . .

"... Fellow of the Grand Society for the Protection of Pills" said Mr. Foil, greatly impressing the awed Chemist who had never heard of the degree before. "That is just one of many honours conferred on me", continued Mr. Foil modestly, "by Pharmacists for having rendered valuable packaging service to the medicine manufacturing industry. Whatever the pharmaceutical product, be it pills or potions, aluminium foil wrapping safely seals in the prophylactic and curative properties for long periods and effectively protects them from contamination, moisture and dirt ... And that," finished Mr. Foil, "is just what the doctor ordered."

Long and extensive experience as Manufacturers of Aluminium Foils for packaging goods in the Cigarette, Pharmaceutical, Confectionery, Tea and many other industries

The European Scene

REGIONAL DEVELOPMENT IN EUROPE

From Our Special West European Correspondent

PARIS, December 18.

LOOKED at from the outside, the Common Market seems to promise West Europeans an increase in their economic power that they will be able to use in providing more effective help to under-developed regions abroad. No doubt that expectation will be justified, but it will be for political reasons: because governments decided that it is urgently necessary to promote development in backward countries that would otherwise be exposed to political instability. It will not be for simple economic reasons, e.g. that expansion in Europe generates a greater capital surplus, which becomes available for more generous development programmes. Because, when it is looked at from the inside, the Common Market promises to create, or exacerbate, inside Europe itself large tracts of relative under-development whose needs will be directly competitive with those of overseas backward countries. The notion that economic progress creates poverty may seem absurd, but in fact it is confirmed by the economic history of most advanced nations. Development takes places in nodes, whose progress sets them further and further ahead of less developed parts of the country; the favoured regions get richer, while the unfavoured regions may progress much more slowly (which is already serious, as setting up grave disequilibrium inside the nation), or may stagnate or may even retrogress absolutely. It is a commonplace that the decadence of South Italy dates from the unification of the kingdom, which created a common market in the peninsula so that capital and labour concentrated in Lombardy, leaving the South to sink into its present squalor.

Inside one political nation, this tendency toward cumulative regional disequilibrium is countered by representative democracy. One of the most important economic effects of that system, in contrast to other forms of governance, is that it gives less developed regions a voice out of proportion to their economic status and even, in federal systems such as those of India, Australia and the U.S.A., out of proportion to their population. Thus there is effective political opposition to the "natural" tendency of economic progress toward unequal regional development. This tendency is much more marked, and meets less opposition, in a process of unification such as the Common Market. Firstly, by breaking down international barriers it coalesces frontier regions which could not exert their maximum "pull" as long as they were divided between nations. For example, the valley of the Rhine has an evident vocation to become the heart of West Europe, but as long as it was split into French and German sectors this vocation was limited by corrective action from Paris and Berlin. If the Rhine valley becomes, as it will in a full Common Market, a single economic unity and if there is no supranational authority to control its hypertrophy, its "pull" could become extravagant. The result could be that the decadence and depopulation of peripheral regions (e.g. South Italy, Brittany and Schleswig-Holstein) are accelerated.

Secondly, democratic regimes which sought, as long as the nation was taken as the economic unit, to maintain some balance between their various regions, tend naturally, as soon as international integration is the task, to think first of balance between participating nations, even at the cost of growing unbalance within the nation. Thus, Rome, Paris and Bonn today are inevitably concerned with protecting the position of Italy, France and West Germany in the Common Market, and if that is best protected by letting their most advanced regions

prosper quickly, they accept the relative impoverishment of peripheral zones. Regional action in favour of those poorer zones can only be financed at the expense of the active zones, and that would mean hampering these latter in the contest with other nations' industries. Alternatively, such regional action would be regarded by other capitals as a subsidy in favour of one nation's industry, and such subsidies are outlawed by the Rome Treaty. Finally, and most obviously, the free movement of labour and capital over the whole six-nation region allows a greater degree of concentration in advanced zones.

The upshot could be that the Common Market would tend — indeed is already tending — to become a long but fairly narrow strip of highly developed activity, running from north-west to south-east and comprising the Belgo-Luxemburg plain, North France, the Ruhr, Lorraine, the Rhone Valley and North Italy. This strip today produces 60 per cent of the Common Market's total product although it covers only one-third of the region's area, and contains half its population. The only major agglomerations that are external to it are West Berlin and the Parisian basin; the former is insecure, and the latter is itself another bad example of excessive concentration which does nothing to correct the balance in favour of backward zones.

The consequences of this unbalance might seem to be the Europeans' concern, but I suggest that they will have an influence on future discussions of assistance for development overseas. Though they are temporarily intoxicated by the first fruits of industrial concentration in the Common Market, democratic politicians cannot long remain indifferent to the impoverishment relative or absolute, of the peripheral zones of their own countries. The longer corrective action is postponed, the more costly it will be, until it is directly competitive with foreign aid programmes. One can envisage the day when the announcement that Bonn is going to build a steel mill in India or Paris a bridge in Senegal will be greeted with violent demonstrations by the populations of stagnant zones in Europe. Already the discrepancies between various parts of Europe are as striking as between Europe as a whole and certain developing nations. If we take as 100 the production of the average citizen of the Common Market, the differences between nations are not too exaggerated: Belgium 128, West Germany 117, France 114, Holland 107 and Italy 61. But if we look to regions within those nations there are some extraordinary differences: Hamburg 186, Bremen and Paris 166, North Italy 100, Schleswig-Holstein 83, Limbourg (Belgium) 82, Corsica 38 and South Italy 26. The inhabitants of these latter zones have a way out that is denied to citizens of under-developed countries; they can migrate to the centres of greater activity, and the obstacles to that migration are falling every month; indeed their movement is being facilitated, for West Germany and France finance the training of illiterate labour in South Italy so that it can find work in North Europe.

But this only resolves the problem for the individual, and then not in the best way. It hastens the decay of his region, adding depopulation to economic stagnation, cuts him off from his native culture and makes him another rootless slumdweller in the inhuman, and probably foreign, city. So it is opposed by the labour movement and by regional organisations, who would prefer to see work brought to the worker in his home province. Besides, by exaggerating the over-development of the favoured central zone it produces conse-

quences there that are just as anti-economic as under-development in the peripheral provinces. Once a certain optimum population density is exceeded, every extra inhabitant costs the collectivity more (in public services, drainage, transport, police, etc.) than if he had found work at home. No matter how unhygienically housed, uncomfortably transported and ill educated he may be, an extra worker in Hamburg, Paris or Milan costs more than an extra worker in a small provincial town. Private industry may realise an economy, but the nation suffers a loss.

Moreover, it is unlikely that the Common Market can maintain the high growth rate of recent years if it continues to concentrate in the central zone. After achieving a 20.8 per cent increase in its gross product between 1958 and the end of 1961, it may find that returns will diminish in the most advanced sectors, and that a comparable average can be kept up only if productivity in the zones so far neglected is stimulated. It is not a matter of choosing between a high average national income that is ill distributed, and a lower income that is better distributed; it is rather that the average will grow faster if it is evenly distributed. In the last generation, Western nations have learned that this is true as between social classes; a wider spread of purchasing power stimulates industry more than an excess of savings in a small class of rich people; at least this is true in nations that have attained a certain level of equipment and have completed the "primary accumulation of capital". It remains to put the same lesson into practice as between geographical regions. An industry that was till lately the "pilot" of the European economies, the automobile industry, is very keenly aware of this fact. Intensified urbanisation promises it much less custom than a regeneration of provincial economies.

The methods that might be used to combat the excessive centralisation that threatens the Common Market

were discussed at a congress in Brussels in the second week of December; its proceedings would no doubt interest those charged with similar questions in India. Participants debated the merits of the two systems that have been used to decentralise industry, both of which have been tried in India at various times. On the one hand, a whole region may be declared deserving of development, and financial or other incentives offered to industrialists who establish themselves anywhere in it; to the extent that this method succeeds, it leads to the dispersion of enterprises, often of small dimensions. On the other hand, particular towns or villages in a backward region may be selected by the administration for conversion into "points of attraction". Schools and other amenities may be built there, factory sites prepared and buildings put up which are then leased or sold to enterprises. This latter method, known in Germany as the *Zentraleorte* Program, has been successful in mitigating the congestion of industrial zones, whereas the regional approach has been preferred in the south of France and Italy. Each has its advocates, but they seem to answer different needs. The creation of "central points of attraction" works when it is a problem of filling in gaps in a generally advanced region, such as West Germany and hence, one would guess, in West Bengal; the other method suits vaster and more backward belts of territory, such as the Italian *mezzogiorno* and, one would guess again, South India. In any event, they are not contradictory but could be combined. European experiments in harmonising regional advance are, then, not only directly instructive to other nations facing similar problems, but will have an influence over European willingness to support development elsewhere. If the Common Market creates, by suction of labour and capital into a central zone, a vast periphery of economic desert, the political arguments in favour of aid for foreign development will meet formidable opposition.

For those you leave behind

DO you realise that you expose those who depend on you to grave risks, by failing to make immediate arrangements for their welfare, when you are no longer there to look after them yourself?

If you haven't yet done so, please make a will — or execute a Trust in their favour — *now!*

The administration of estates is a highly complicated matter these days, and it would be difficult to find a better Executor or Trustee than a bank which is always accessible, and which can be depended on to act with prudence, sympathy and impartiality. A bank is human — but it never dies.

The State Bank of India accepts appointment as Executor and Trustee, solely or jointly with any other person — and its services are at *your* disposal.

Why not call on your nearest Bank Agent or send for a copy of the Bank's Booklet on Executor and Trustee business?

The State Bank's branch at Delhi, one of more than nine hundred offices waiting to serve you throughout India.

*hamare bhai
ko le jao*

It happened some years ago in the steel melting shops at the Jamshedpur works. A large ladle, carrying 75 tons of molten iron, suddenly crashed to the ground with a deafening noise from an overhead crane. The spattering sparks and red-hot metal seriously injured a number of brick-layers working at what seemed to be a safe distance. The air was rent with the frenzied shouts of the men and the hissing of steam.

The first ambulance could remove only five of the injured to the hospital. General Manager Keenan could take only three more in his car. He chose the three who had a better chance of survival than the rest. One of these men, a Hindu worker, however, re-

fused to go. "Do not take me away", he said. Disregarding his own agony, he feebly nodded towards a half-burnt Muslim colleague, and said: "Hamare bhai ko le jao." As Keenan recalls, "The Hindu who was in pain and danger of death remembered, not that the Mohammedan was of a different faith, but that he was his brother."

This feeling of comradeship, born of the common bond of labour, is the spirit that characterises Jamshedpur, where industry is not merely a source of livelihood but a way of life.

Economic Report from the U.S.

NEW APPROACH TO TRADE POLICY

By GUY SIMS FITCH

WASHINGTON, December 13.

THE new and bold approach to U.S. trade policies which President Kennedy has now enunciated takes into account a broad range of emerging requirements at home and abroad, with emphasis on strengthening the fabric of the entire free world. What is more, the President now appears determined to present his formal foreign trade recommendations to Congress early next year, which means that he intends to bring this matter to a decision as soon as possible.

At the heart of the President's programme is drastic revamping — he calls it a "replacement" — of the existing Trade Agreements Act. While Mr. Kennedy's specific proposals have yet to be announced, his administration appears to have in mind the granting of brand new tariff-cutting authority to the President. This would include, presumably, authority to negotiate reciprocal tariff concessions with other nations on a category-by-category basis rather than the item-by-item basis required by the existing legislation. This legislation, under which the U.S. has reduced its tariff levels substantially, was first passed in 1934, has been extended and modified a number of times since, and is due to expire next June 30.

Basic to the Administration's new approach is the recognized need to negotiate meaningful trade concessions with the six-nation Common Market, or European Economic Community (EEC), which is in the process of setting up a common external tariff against outsiders, and already represents a prime export market for U.S. goods. By trading cuts, the U.S. would avoid being shut out of that market and would be able to benefit from its expanding potential. That potential would become even greater if and when other European countries, such as the United Kingdom, join the EEC.

It would be a mistake, however, to see this merely as an attempt by the United States to support its export trade. The U.S. officials tend to view the emergence of the Common Market as an opportunity to force a great new partnership between the world's two major trading areas — the United States and expanded EEC — which together contain some 90 per cent of the free world's industrial might. This partnership would be anything but an exclusive grouping working only for the benefit of those directly concerned. Rather, in the U.S. view it would present a new and unparalleled opportunity to strengthen the trade relations and advance the economic progress of all free nations everywhere. This is a cause to which the United States historically has been dedicated, and which it would continue to support through its insistence on non-discriminatory trade relations and the most-favoured-nation principle of granting the benefits of tariff reductions to other trading partners. Also, through this kind of trade partnership and co-operation among the leading industrial nations of the free world, Europe would be able to take up a greater share of the leadership in assisting the economic advancement of developing lands.

In formulating its new foreign trade approaches, the Kennedy Administration is paying close attention to related domestic issues. It is recognized that in accepting the new trade challenge U.S. industry would have to compete both in prices and the quality of its products with industries abroad. This means greater emphasis on efficiency and productivity on holding down costs. Hence, the Administration is urging restraint on both management and labour in wage and price policies. In addition, it has submitted recommendations involving special incentives for business investment in new and modern productive facilities through special tax programmes and through special depreciation allowances on equipment.

In accepting the new trade challenge, the U.S. industry also must recognize that the United States would not only be exporting more, but through reciprocal concessions with other countries and areas also would be importing more. This would enhance the earnings of other countries, which then could be used to buy more U.S. products. It also would make available more of the materials and products required by the U.S. industry, would give U.S. consumers a wide choice of goods at competitive prices, and keep a healthy competitive pressure on the U.S. economy. This undoubtedly would force adjustments — some of them relatively severe, perhaps — on a number of American companies and workers. While meeting these adjustments may be the responsibility, in the main, of the affected business and labour communities, it also is the responsibility of the Government to assist them.

The idea, however, is not so much to protect affected U.S. interests by a wide range of special tariffs that would shut off foreign competition, although some aid along these lines may be needed to help cushion adjustments in severe cases. Rather, it is to facilitate the adjustments to changing conditions through such measures as financial help and training programmes, thereby in effect strengthening the U.S. economic structure while keeping the doors wide open to international trade.

THE BUSINESS WORLD

Economic Consequences of Goa

By CROESUS

IF the reactions in the markets, especially the Bombay Stock Exchange, are any proof, the action taken by the Government of India in respect of Goa has had a very good reception. However, there is still a sharp conflict of views as to whether India was at all well advised to have taken this type of action. To the Government of India, caught as it was between the pressure of the recent conference on the Portuguese colonies and the polite hints of Britain and America as to the likely repercussions of any military action against Goa, the choice was undoubtedly extremely difficult. Although it might not seem strictly correct to describe the decision of the Government of India either as a cavalier denial of the application of the Gandhian techniques in a tragic manner or as a deliberate election stunt of the party in power, no one can deny that either of these or, perhaps, each in its own way, or, to be even more precise, both to some extent, must have influenced the fateful decision. That India's armed forces have hardly met with any stiff opposition or that there has not been much loss of life consequent on the Goa action, welcome though, is liable to be pressed into service by the critics of the Government of India's decision to malign this country in the eyes of the world. And it cannot be confidently predicted that the Portuguese do not still have something up their sleeves to spring an unpleasant surprise on us. Against this background it would seem that the jubilation and excitement that one notices is somewhat premature. This is not a reflection on any Indian's natural joy and delight at the end of the rule by Portugal on a part of this country that legitimately belongs to us. Nor is it an attempt to minimise the importance of the extremely tactful and able handling of the whole campaign by our armed forces. But it is just to sound a note of caution that we cannot afford to be complacent with a victory that everyone had almost taken for granted, at a time when even some of our most friendly countries are becoming visibly critical, if not actually suspicious, of the bona fides of our foreign policy. The one question that is bound to trouble most thinking people, both here and abroad, today is how other countries similarly placed, e.g. Indonesia, would behave. Taking shelter under the plausible precedent set up by India — however much we may endeavour to disapprove of it — it is not improbable that these countries would precipitate similar action elsewhere, which may lead to a world conflagration, unless the developing situation is carefully watched and skilfully handled by the major powers. But all this is not my domain, I am afraid.

What I am concerned with as a student of economics is the economic consequences of Goa. Goa is not a very big area, being not more than some three thousand sq. miles in extent and having a population of

no more than 8.7 lakhs. But, from the geophysical point of view of the Indian sub-continent, it is strategically situated. And with its fine natural harbour, enormous mineral resources and extensive forest wealth, this stretch of land is undoubtedly a welcome acquisition. Per contra, it is a great loss to Portugal. Although until 1947 Goa was an economic liability, in recent years it has become a great source of foreign exchange to Portugal. Following the intensive and extensive development of the iron and manganese mines and the lucrative contracts for the exports of these ores with countries like West Germany, Goa had almost become the mainstay of Portuguese economy, especially since the disturbances started in Angola and disrupted the economy of that colony.*

It is not possible to estimate the extent of Indian investment in Goa, but, judging from the operations of several well-known Indian companies operating in Goa, such as Chougule and Co., Damodar Mangalji and Co., Salgaokar and Co., it would seem that the Indian stake in Goa is not negligible, although it may not be of such a magnitude as to find a place for itself exclusively or separately in the Reserve Bank's compilations of Indian investments in foreign countries. Similarly, the extent of investment of other countries (other than Portugal) in Goa is anybody's guess, and, as things stand, it is also a bit in the dark to make any attempt at estimating the Portuguese investment in Goa, apart from such ostensible indications as those provided by the Marmagao Harbour, the Goan Railways and other communications for what they are worth. As soon as things settle down, therefore, the most important task of the new administration at Goa should be to take a comprehensive stock of these and other economic facets of Goa.

There is one very important aspect of the Goa action which does not appear to have received adequate attention. This relates to the position of Indians residing in Portuguese territories. Already reports have appeared about the internment of Indians and confiscation of their property in these territories. Compared to the number of these, the number of Portuguese residents in Goa is admittedly very small; similarly, the aggregate value of the properties of Indian settlers in Portuguese territories may be expected to exceed that of the Portuguese residents in Goa by a fairly good measure. This unequal state of affairs would perhaps leave the bargaining lever more in Portuguese hands than in our own. Accordingly, the whole problem of Indian investments in Portuguese territories vis-a-vis Portuguese investments in India needs to be very carefully and tactfully tackled to avoid undue hardships and harassments to our nationals residing in Portuguese territories.

* The export trade figures of Goa that are immediately available reveal that this former colony of Portugal exported last year about 6 million tons of iron ore worth over Rs. 25 crores (2.2 million tons to West Germany, a similar quantity to Japan, nearly 1,00,000 tons to France and 75,000 tons to Italy), half a million tons of manganese ore, cashewnuts and dried fish worth over Rs. 1 crore each, betel nuts worth about Rs. 14 lakhs, canned food worth about Rs. 33 lakhs, bamboos worth over Rs. 1 lakh and coconut worth Rs. 8,000.

CENTRAL COMPLETES 50 YEARS

SIR PHEROZESHAH MEHTA SIR SORABJI POCHKHANAWALA

in the service of the people

We have travelled a long way since we set out on our journey fifty years ago. During this eventful period, we have striven hard—and achieved something. Our present position as **INDIA'S LARGEST JOINT STOCK BANK** in the Private Sector is due to the unfailing support of our vast clientele. We owe them a deep debt of gratitude for their trust and confidence.

We can repay this debt in the only way open to us—by rededicating ourselves, on this, our Fiftieth Anniversary, to the service of the people. With their co-operation, we hope to continue to play our part in the economic development of the far-flung territories in which we operate.

The Profit Motive in Public Sector

By P. KODANDA RAO

DURING his visit to Madras in October last, the Prime Minister declared that the uplift of the four hundred million people of India could never be left to private enterprise which believed in the "monstrous philosophy of grab and private profit", but should be undertaken by the State. In the same breath he granted that "private enterprise had, of course, its own sphere to develop." It is not obvious how he reconciled himself to tolerate private enterprise with its "monstrous philosophy of grab". The sphere allotted to it in the three Five-Year Plans has not been so small as to be ignored.

Time was when the philosophy of public enterprise was public service, even at a loss, as against that of private enterprise, primarily for profit. But Mr. Nehru has himself abolished the vital distinction. In his speech in the Lok Sabha on August 19, 1961, he asserted that the State was justified in making maximum profits, subject to reasonable prices. Mr. Manubhai Shah, the Minister of Industries, made a similar affirmation. The proviso of "reasonable prices" does not distinguish the State from the private sector, for even the latter professes it, though the customers accuse both of charging unreasonable prices. For instance, many consumers complained that the State Trading Corporation charged monstrous prices for cement and grabbed monstrous profits!

If "grab" is anti-social in competitive private enterprise, it is infinitely more so in monopolistic State enterprise, as it amounts to indirect taxation without legislative sanction or by delegated authority, which is even worse. Even as no Government may budget for more revenue than it needs to meet the expenditure sanctioned by the legislature and may not accumulate surpluses, so also no Government may seek profits through State enterprise. In the discharge of its inalienable duty of ensuring the safety and well-being of all its citizens, the State should keep out of economic activity as far as possible, and control the operation of the private sector in the interests of the consumers who constitute the whole citizenry. If the State itself launches on economic enterprise and seeks maximum profits, like private enterprise, the consumers will have no protector left; they will be exploited by both the sectors. Even as the function of the judiciary is to stand apart and protect the fundamental rights of the citizen from encroachment by the executive, so also it is the function of the State to stand apart and protect the citizen from being exploited by the private sector. The State may undertake economic enterprise only when private enterprise is unavailable or unequal to the task. After pioneering and establishing an enterprise, it should persuade private enterprise to take it over. This was the wise policy followed by Sir Visvesvaraya, than whom there has been no more ardent and competent advocate of industrialism in India. In the pursuit of public service, the State might well prefer loss to profit from its economic activity.

There is another vital difference between State and private enterprise. While the capital for the latter is provided by **voluntary** subscriptions of the investors, the capital for the former is provided by **compulsory**

taxation of the citizens. While the former is free capital, which respects the Fundamental Right of the citizen to invest or not in any particular venture, the latter is conscript capital, which violates it. Public confidence in State enterprise is not enough to attract voluntary capital. The over-subscription of State loans is no proof of confidence of the investing public. It is well-known that most of them are furnished by banks under ill-concealed official pressure. In his speech in Nagpur on October 23, 1961, Mr. S. K. Wankhede, the Finance Minister of Maharashtra, let the cat out of the bag; he threatened with disconcerting frankness that if the commercial banks did not subscribe to Government loans, they would be nationalised!

State enterprise has a very serious political defect from which private enterprise is free. The employees of the former become Government servants, and, as such, are precluded from criticising the actions of the Government, and are thus deprived of a most valuable Fundamental Right of a citizen. When the State represents a political party, Government servants have to serve the party even at the sacrifice of the nation.

Advocates of private enterprise postulate yet another defect of State enterprise; it is inefficiency. As proof thereof, they point to the frequent losses suffered by it. Their philosophy may be thus summed up: Efficiency is a function of profit. Private enterprise is efficient because of its profit motive, while State enterprise is inefficient for lack of it. A comparison between the two is easy because the economic enterprises of both lend themselves to "Profit and Loss" assessment. The State, however, has very many other and bigger functions, like defence, police, education, health, etc. which involve much larger expenditure than its economic activity, but which do not lend themselves to "Profit and Loss" assessment. If efficiency is a function of the profit motive, should the motive be extended to all State activities, or should all of them be handed over to private enterprise to improve their efficiency? Or, should there be a diarchy: profitable, efficient, economic activity to the private sector and non-profitable, inefficient and uneconomic activities to the State?

There is, and there can be, no nexus between efficiency and profit. There are innumerable organisations all over the world which are efficient but which eschew the profit motive. It is desirable that efficiency should be improved in all State functions, irrespective of the profit motive. In the economic sphere, the test of efficiency must be **price** and not **profit**. The paramount consideration should be the interest of the consumer; he must be provided with goods and services at the lowest possible price, even as in the political field the citizen's right to maximum freedom should be the paramount consideration.

The State should not undertake economic enterprise, except as a transition to private enterprise; if it does, it should not seek profit through higher prices to the consumer, but may even face losses through lower prices, subsidised by taxing the richer citizens. While tolerating profit in the private sector, it should limit it to ensure lower prices to the consumer.

Business Notes

Tea

TEA-DRINKING: A HABIT

THE STATISTICS BRANCH of the Tea Board has been, for the last five years, conducting tea surveys mostly in urban areas. The results of the polls conducted in

21 towns in 1960 have just been released providing useful information regarding the consumption of tea in Indian towns.

An analysis of the findings relating to the main urge for drinking tea shows that the chief reason for taking tea is the long formed habit, followed by the refreshing and stimulating qualities of this beverage.

For top grade Industrial Chemicals

Monsanto works constantly to develop new, better chemicals - and to improve those chemicals you already use. In every industry, whether it be agriculture - automotive - aviation - ceramics - chemical processing - cosmetics - electrical - foods - insecticides - mining - oil - paint - paper - rubber - soaps and detergents, there is a Monsanto chemical that will help to improve production and quality.

Monsanto Chemicals Limited, London • Monsanto Chemical Company, St. Louis, U.S.A. Dependable service from Monsanto companies in London, Melbourne, Montreal, Paris, Bombay, Tokyo, Mexico, D.F., Buenos Aires and from sales representatives in all principal cities of the world.

Among those who did not take tea, the main reason was that they were not habituated, while poverty was an equally strong reason. Other pulls working against the consumption of tea were, competition with such beverages as coffee and milk and avoidance due to medical reasons. In other words, there is ample scope for raising consumption of this beverage in urban areas as and when standard of living rises.

The Statistics Branch has also calculated income elasticity of consumption of tea for all the 21 towns. It has been found that in nearly 60 per cent of the cases, the elasticity of income is above 0.5, indicating that every 10 per cent increase in income is accompanied by more than 5 per cent increase in consumption of tea in terms of money spent, though not in terms of volume. There is significant evidence to show that the rural coefficient is much higher than 0.5. It means that if the objective of 30 per cent increase in national income in the Third Five-Year Plan is achieved, there is every possibility of an increase in consumption by more than 15 per cent during the next five years. To that extent the domestic market will certainly expand, whatever the fluctuations induced by the international factors affecting exports.

Copra

DIFFICULT TIMES AHEAD?

COCOANUT AND COCOANUT products production in the world is largely shared by the eastern and the far eastern countries specially, Philippines, India, Ceylon, Thailand and Australia. Some of the European countries, such as France, Britain and the Netherlands, as also the United States of America, comprise the main bulk consumers of copra. In recent years, while the production of copra has considerably increased, there has been a progressive decline in consumption by the principal importing countries. Similarly, the consumption of coconut oil also has not appreciably recovered fully in these countries. According to the information available from the Food and Agricultural Organization, world production of copra in 1961 is expected to reach the peak level of 1956-57, while the exports are estimated to be within 5 to 10 per cent of the 1956-57 volume. This situation has naturally aggravated the concern of the main producing-cum-exporting countries. To this concern is now added the further anxiety occasioned by the moves that are afoot lately to evolve a common oils and fats policy by the European Economic Community (E.E.C.) and the proposed programmes of the United States of America for soyabean and edible oils and its probable effects on the world market for copra and coconut oil.

All these questions were discussed at length by the Food and Agricultural Organisation group on coconut and coconut products which met at Trivandrum last week. This meeting was attended by all the delegates of the producing, exporting, as well as importing countries. Despite the statement of the exporting countries that the proposed plans and programmes of the E.E.C. and the U.S.A. were as yet in their initial stages, there was considerable concern among all the exporting countries. The only redeeming feature of the deliberations was the assurance of the F.A.O. to study this question before coming to any decision.

Insurance

L. I. C. INVESTMENTS

LIFE INSURANCE has been an important form of personal savings and, in many an advanced country, this sector has been playing, along with other financial institutions, major role in not only mobilizing the community's savings but also in channelling them for sound in-

vestment in the economy. According to an article published in the latest issue of the Reserve Bank of India Monthly Bulletin, life insurance in force in India has increased by nearly 8 times between 1937 and 1960, which compares favourably with the trend in some of the industrially advanced countries. However, the life insurance ratio in India, when compared with the rise in national income at 16 per cent, happens to be still one of the lowest in the world. Thus, whereas the assets of life insurance companies in the U.K. and Canada formed over 55 per cent of the assets of the monetary and the banking system, in India, the corresponding proportion remained at only 13 per cent.

Nevertheless the article proceeds to make the point that the life insurance sector has come to be the most important industrial investor in India, in that it has been able to influence the market for private capital issues, as also government securities, to a considerable extent. This is to be expected by reason of the long-term nature of funds held by the insurance sector. Thus, in India, the proportion of investments in Government and semi-government securities remained around 60 per cent throughout the last two decades, while those of Australia, Canada, Japan, Norway, the U.K., and the U.S.A. has declined considerably after the World War II. On the other hand, over the same period, the proportionate rise in investments in these countries to their total assets in shares and stocks has increased considerably, while, in India, the rise has been to the extent of 15 per cent by the end of 1960 from 2 per cent in pre-war period. This rise, however, was not in tune with the rise in the investments in the gild-edged. This was mainly due to legal limitations in the field of investment. According to the provisions of the Insurance Act of, 1938, as amended in August, 1958, the Life Insurance Corporation has to invest (a) at least 50 per cent of the controlled funds in Government or other approved securities, (b) another 35 per cent should be invested in approved investments, and (c) the balance 15 per cent in other investments. Whatever be the pattern of investment, the first and foremost thing, according to the article is that "a large portion of such funds should be invested in assets which are safe and readily marketable with little or no loss of capital so as to enable the companies to fulfil their contractual obligations to policyholders in full and without delay." It is a matter of opinion whether all these tests would strictly apply in the case of the L.I.C.'s investments.

Machine Tools

GROWTH IN SIGHT

THE RAPID industrialisation of the country during the Third Plan has necessitated the expansion of the existing industries in public and private sectors and have naturally generated a growing demand for machine tools. During 1960, the total value of machine tools produced was worth nearly Rs. 5.86 crores which indicated an increase of more than 40 per cent over the previous year. Mr. S. L. Kirloskar, President of Indian Machine Tool Manufacturers' Association pointed out that the output would have been much higher than that achieved in 1960 had it not been for the fact that most of the manufacturers concentrated their energy on expansion and modernisation of their factories with the object of manufacturing a wide range of modern and more advanced types of machine tools with foreign collaborations. Their efforts naturally will result in improved utilisation of the planned capacity and a substantially rapidly increasing production can be expected in the coming two or three years. In fact during the first half of 1961 alone as much as worth Rs. 3.28 crores graded machine tools were produced showing a better performance.

It was indicated that Indian machine tool manufacturers are making determined efforts to export their

latest types of machine tools to neighbouring countries to earn foreign exchange. It is good that they realise that it is in the interest of the country as well as industry to strive hard to export a part of their manufactures even if they have to undergo minor sacrifices in the process of competition. There are possibilities of expanding their trade in the neighbouring countries like Australia, New Zealand, Indonesia, Malaya, Ceylon, Iraq, Egypt, etc. One major hurdle they faced was in respect of raw materials though the supply position was gradually improving now. Although, as Mr. Kirloskar pointed out, quantitatively sufficient pig iron was being produced in the country, quality pig iron required for the machine tool industry was still in short supply. It is hoped that the successful implementation of the Third Plan would considerably improve the supply position of the required qualities of iron so that the machine tool industry could flourish.

Heavy Vehicles

DEFENCE MINISTRY'S AVADI PROJECT

THE MINISTRY OF DEFENCE is setting up a Heavy Vehicles Factory at Avadi, near Madras, for which Mr. V. K. Krishna Menon is to lay the foundation stone on December 29. The proposal to undertake the manufacture of track vehicles and other items of heavy engineering equipment required for the Defence Services was approved by the Government of India recently. It is going to be a self-contained unit making all the major assemblies, including the engine, gear-box and suspension units. The well-known British firm, Messrs. Vickers-Armstrongs (Engineers), Ltd., are the main consultants.

The military base at Avadi, the site for the factory, it is pointed out, was set up during the last war to serve units in the South-East Asia Command at an approximate cost of Rs. 80 crores, with an employment potential of about 50,000. The existing defence assets at Avadi, like the ready availability of suitable developed land and railway spurs and roads, and its proximity to a big town would not only reduce the capital expenditure on the project but also mean substantial saving in the time required for the execution of the project, which is a vital consideration. The Madras Government have assured the Defence Ministry of adequate supply of water and power requirements.

The factory and the housing colony will be located in an area of 1,400 acres, out of which about 770 acres of land belonging to the Madras Government have been given free by them. An Artisan Training School for training skilled craftsmen required for the factory started functioning from November 27 last. It has facilities for training 100 craftsmen at a time. A hostel to accommodate 100 trainees has been built by the Madras Government at their cost.

Detailed planning of the factory buildings has been completed in consultation with the collaborators and construction work is due to commence shortly. The factory is expected to employ 2,500 to 3,000 men. Apart

from effecting substantial savings in foreign exchange, the project will create capacity for the production of vital defence equipment.

During the past few years, the Defence Ministry has made great strides to achieve self-sufficiency in a variety of defence equipment, including vehicles. Quite logically, it was considered of vital importance to create additional capacity for the production of a complete range of heavy track vehicles. Dependence upon the purchase of vehicles of this type from abroad not only entailed a very heavy expenditure in foreign exchange but also involved the risk, in an emergency, of the replacements being unprocureable or fresh supplies not materialising. It may, however, be added that it would be more logical for the Defence Ministry, in view of the exchange shortages faced during the Third Plan period, to make use of the capacity available in the private sector in respect of light vehicles. In the running factories it is naturally easy to expand capacity and the private sector would be glad to share the manufacture of defence equipment of routine nature.

Newsprint

NEPA MILLS WORKING AND EXPANSION

THE NATIONAL NEWSPRINT PAPER MILLS LTD., Napanagar, has decided to have its own plant for the manufacture of chlorine and caustic soda. This, it is stated, has been necessitated by difficulties in securing supplies from far off places like Delhi, Bombay and Ahmedabad. The scheme has already been approved by the Government. Orders for the requisite plant and machinery too have been placed.

The company has also under consideration a proposal to step up its capacity from 100 tons to 200 tons per day. The main decisive factor in this regard will be the availability of raw material, the prospects of which are being assessed by the management.

During the five years of the Second Plan, the company appears to have turned the corner and is today contributing its mite in saving the precious foreign exchange for the nation. Supplies of indigenous newsprint to the newspaper industry were stepped up from 9,375 tons in 1959-60 to 13,250 tons in 1960-61. Supplies during the first seven months of the current year, i.e. upto October 31, 1961, amounted to 10,646 tons. The remaining production of about 8.8 thousand tons has been supplied to printers and publishers of textbooks and books of general interest. Though production has been going up, the company has not yet been able to consistently attain the target output of 100 tons per day. On several occasions, of course, production has been even slightly more than 100 tons a day. Attempts are being made to raise output to the target capacity.

The financial position of the company has been steadily improving for the past few years as is evident from the following table:

	1956-57	1957-58	1958-59	1959-60	1960-61
Gross Turnover	106,67,950	129,34,941	228,18,599	235,25,412	246,73,924
Depreciation	38,11,901	35,49,803	32,41,074	31,25,322	29,02,499
Repayment of Loans	Nil	Nil	10,13,752	102,73,000)	25,00,000)
				12,19,219)	11,00,000)
Provision for Taxation	Nil	Nil	1,67,000	Nil	Nil
Net Profit	114,90,670(—)	33,38,114	36,82,758	37,76,279	32,94,035
	(Loss)				

(In rupees)

The entire interest-bearing loans due to the Union and Madhya Pradesh Governments have been repaid by the company. Out of interest-free loans of Rs. 111.19 lakhs, two instalments have been paid, leaving a balance Rs. 88 lakhs. This is to be liquidated in eight equal annual instalments. Adequate provision is also being made for depreciation.

Though the gross turnover in 1960-61 was higher by nearly Rs. 11.49 lakhs, the net profit earned by the company showed a decline of about Rs. 4.78 lakhs, due to increase in cost of chemicals, raw materials, power and steam.

Industrial Finance

B.S.F.C. TO RAISE SECOND LOAN

TO STRENGTHEN its resources, the Bombay State Financial Corporation is entering the market to raise a new loan—the second one since its inception—of Rs. 1 crores. The subscription list will open on January 12, 1962, and close on January 25, unless the loan is fully subscribed earlier. The Corporation reserves the right to retain subscriptions received upto 10 per cent in excess of the loan amount.

The loan bonds are being issued at par in denominations of Rs. 100, Rs. 500, Rs. 1,000, Rs. 5,000, Rs. 10,000, Rs. 25,000 and Rs. 50,000 and are repayable in 10 years i.e. on February 14, 1972. They will carry interest, with effect from February 14, 1962, at the rate of 4½ per cent, subject to income-tax. Payment of interest and repayment of capital are both guaranteed by the Government of Maharashtra.

The Corporation has been in existence since 1953, but its jurisdiction was limited to only the State of Maharashtra after the separation of Gujarat from the former Bombay State in May 1960. Its present paid-up capital is Rs. 2 crores. The first loan it raised in 1957 brought in Rs. 1,13,50,800.

During the financial year ending March 31, 1961, the Corporation sanctioned loans aggregating Rs. 176.2 lakhs to 126 applicants, which included such diverse industries as chemicals, metal products, electrical machinery, textiles, engineering goods, paper and paper products, basic materials, food manufactures, under rubber products and transport equipment. Total loans sanctioned by the Corporation during its eight years of existence to March 31, 1961, amounted to Rs. 6,50,21,500 (Rs. 1,13,88,500 to 172 small-scale concerns, Rs. 5,32,58,000 to 173 medium-scale units and the remaining Rs. 3,75,000 for subscription to the debenture issue of one more concern). Of this, a sum of Rs. 3,27,38,950 had been actually disbursed. The Corporation, thus, had not only used up by that time its paid-up capital, but also the proceeds of its 1957 bonds. It has been now lending out of the sums received by it as repayment of its earlier loans.

The improvement in the working of the Corporation during the recent years is evident from the fact that in 1960-61 it paid dividend out of its profits, keeping the State subvention at the previous year's figure of Rs. 27,59,170.85 nP.

Electricals

GLOBE AUTO'S EXPANSION PLANS

MESSRS. GLOBE AUTO ELECTRICALS LTD., who have already planned to manufacture windshield wipers, ignition coils, distributors and voltage regulators in collaboration with Magneti Marelli of Italy, intend to undertake production of dynamos (both A.C. and D.C.) and starter motors as well. Technical collaboration for this programme has been secured from Electric Autolite Company of Ohio (U.S.A.). An application for the grant of the necessary industrial licence for implementing the plan, as also for approval of the collaboration arrangement, has already been made to the Government.

As a sequel to the contemplated increase in the

company's activities, its present paid-up capital of Rs. 20 lakhs is envisaged to be raised to Rs. 50 lakhs. Half of the new capital is proposed to be offered to the U.S. collaborators in payment for the consultancy fees and import of machinery. The balance Rs. 15 lakhs will be offered to the existing shareholders of the company. Equipment worth nearly Rs. 5 lakhs may have to be imported from Europe. To finance these imports, the company hopes to secure a foreign exchange loan from one of the Government financial institutions.

The total capital outlay on the enlarged expansion plan will be Rs. 1 crores. The capacity for manufacture of dynamos and starters will be 25,000 A.C. dynamos, 25,000 D.C. dynamos and 25,000 starters per annum. Fifty per cent of the components are envisaged to be produced indigenously in the very first year. The ratio of indigenous components is proposed to be stepped up to about 85 per cent during the second year.

The construction of the factory at Mulund, Greater Bombay, is expected to start early next month. Production is scheduled to commence towards the end of 1962. When in full production, the net saving in foreign exchange resulting from the company's turnover in the new fields will be nearly Rs. 100 lakhs.

MANUFACTURE OF TAPE-RECORDERS

INDIA WILL make a beginning in the manufacture of tape-recorders when the Guindy factory of Jupiter Tapes, Madras, is commissioned into production early next year. The programme is to manufacture 10,000 machines per annum. The total capital outlay on the project is estimated at Rs. 7.5 lakhs.

India today imports from the United Kingdom tape-recorders worth nearly Rs. 35 lakhs a year. Production at the Guindy factory in collaboration with M.S.S. Recording Company Ltd., Colnbrook, U.K., should help in reducing the foreign exchange expenditure on these imports to a considerable extent.

Jupiter Tapes hopes to price its machines at Rs. 650 or Rs. 700, which compares quite favourably with the cost of imported machines. The company is already engaged in the manufacture of radio components.

United Carbon

A NEW VENTURE

IN A joint announcement, Mr. C. H. Bhabha, Vice-Chairman of Central Bank of India and Mr. Richard W. French, President of United Carbon Company (Texas) revealed that the Government of India had approved their scheme to form a company which will operate a carbon black plant near Bombay. United Carbon is to be the owner of a substantial part of equity share in the new company but it was outlined that majority interests will be controlled by Indian nationals. Mr. French was of the opinion that participation by nationals in a joint venture contributed to the strength and progress of the company, which evidently was a sound idea. It may be added that United Carbon (Texas) has always been a major exporter of carbon black to India and during 1960 it shipped nearly 50 per cent of all the carbon black used by the Indian rubber industry.

Initial rated capacity in this new carbon black plant is to be at least 30 million lbs. per year. Bombay has been selected as location because two other suppliers are located on the eastern side of the country thus giving a new source of supply on its western coast. At this location United Carbon will be able to provide its customers with prompt and economic delivery. There are to be two other carbon black companies too, that have been granted permission to manufacture and are now building plants in India. Mr. Bhabha pointed out that the Government's forecasts had indicated a need for the third plant and the current demand estimates revealed the fact that the production from these carbon plants will meet the country's needs for some years to come.

Date: 23.6.1961

Dear Sir,

Our Ashok Leyland Comet 203" wheelbase passenger bus has covered over 400,000 miles with the original engine. It is remarkable that this extremely satisfactory performance has been achieved despite the difficult journeys the vehicle has done all these years. It has carried tourists from Bangalore to Ootacamund making over 450 trips to the hill station, averaging 15 miles per gallon of diesel oil. The majesty of its run over the winding ghat sections has won the admiration of not only the passengers but also of other motor operators.

It is a pleasure to own a Leyland bus, to experience its economy, its great strength and its smooth run over all types of roads. It is a pleasure too to talk about it to others.

Yours faithfully
for S R M S

Pumps

PROGRESS AND PROBLEMS

MR. K. K. Jajodia, Chairman, Indian Pump Manufacturers' Association, reviewing the progress of the industry during the last few years indicated that there are at the moment 48 registered units manufacturing various types of power driven pumps with rated annual capacity of 1.18 lakh units. This performance compared quite favourably with the figures given for 10 years before. In 1950, for instance, the output of power driven pumps was nearly 33,000 which has now risen nearly four-fold. There have grown during these years a number of units of small as well as medium scale.

The Planning Commission has fixed the capacity for power driven pumps at 1.84 lakh units for 1963-66 and the demand is also likely to match that capacity. Mr. Jajodia however pointed out that a stage had come when more realistic target had to be fixed keeping in view the demand. He made a reference to the fact that out of 63 manufacturers registered with the Development Wing a good number had not yet started production. This, he felt, caused inconvenience to those already in the line because they could not utilise their capacity to the full.

One encouraging factor in the progress of industry has been that a wide variety of pumps were now being manufactured. For instance, the industry undertook the production of centrifugal pumps—single, double and multi stage—for handling water, reciprocating pumps, tubewell pumps and many other varieties. He however complained that a number of consumers of these pumps imported them while these varieties were available with the indigenous manufacturers. This definitely should be taken note of by the consumers as well as the Development Wing.

Chemicals

MANUFACTURE OF SYNTHETIC MENTHOL

THE CALCUTTA CHEMICAL COMPANY LIMITED has started manufacturing menthol B.P. (synthetic) under a manufacturing licence from the Central Government. The manufacturing process has been evolved indigenously. The plant also has been designed by the company itself.

Though the scale of production is only limited at present, plans are to increase output by effecting some additions to the plant. The company is also negotiating collaboration arrangements with some foreign firms. If these efforts bear fruit, it is hoped to step up output to meet the entire demand in the country.

Menthol B.P. is one of the basic materials for chemical industry and is widely used in medicinal products like pain balm, liniment, embrocation and cough remedies. During the recent past, its use in the cigarette industry has also increased. Hitherto, most of the demand for menthol B.P. was being met through imports. This is the first time that synthetic menthol has been manufactured in the country itself.

Trade

FOREIGN TRADE SEMINAR

UNDER THE auspices of the World Department of the Indian Chamber of Commerce, Calcutta, a two-day seminar on foreign trade problems is to be held in Calcutta towards the end of January 1962. The problems to be discussed are likely to include various aspects of declining share of India's foreign trade in the light of world export trade during the last decade and the pressing need of foreign exchange on a large scale for the implementation of the Third Plan.

There will be three group discussions for this purpose. One group will concern itself with the main export problems of all traditional and non-traditional items and consider ways and means of augmenting exports, in view of India's share in the world export trade falling

from 2.1 per cent in 1950 to 1.1 per cent in 1960. In fact, the value of agricultural commodities and related manufactures actually declined from Rs. 496.5 crores in 1950-51 to Rs. 473.6 crores in 1959-60, the decline in the case of cotton and jute manufactures being from Rs. 250.5 crores to Rs. 180.5 crores in the same period. Another group will dwell on the problems arising from the U.K.'s decision to join the European Common Market. The third group will consider ways and means of saving and earning foreign exchange in the context of the industrial and trade policies and their impact on industrial development.

Triveni Engineering

A READY RESPONSE

THE TRIVENI ENGINEERING WORKS LTD., that opened for public subscription its issue of capital on Monday the 30th of October and closed on the 5th November, got the preference issue fully subscribed and the equity issue over-subscribed three times. Allotment has already been made to the applicants. The company is expected to go into production early in 1962 which is a comparatively short period.

The machine tools arranged for the company are amongst the heaviest in the country and will constitute a specialised source for a wide variety of engineering manufacture. The company has negotiated further collaboration for other lines of manufacture of industrial machinery and plant in order to utilise its full three-shift working.

P. N. B.'S NEW GENERAL MANAGER

MR. R. L. TULI, Deputy General Manager of the Punjab National Bank, has been appointed as General Manager of the bank in place of Mr. A. M. Walker. Mr. Tuli has been associated with this bank since 1943 and has served it in different capacities. He has significant experience in the matter of medium-term and long-term advances which would be useful specially at a time when the Reserve Bank of India is urging the big banks in the country to take an increasing part in providing medium-term finance to industry. Mr. Tuli has been instrumental in instituting various incentive schemes for the staff and for the growth of the institution.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

PROUD ACHIEVEMENT

The J. K. Organisation can legitimately be proud of the fact that it has been the first in various fields of industrial activity in India.

FIRST to manufacture *Calico Prints* in India—J. K. Cotton Spinning & Weaving Mills Co. Ltd., Kanpur.

FIRST to install *Electric Furnace* for manufacturing steel in Northern India—J. K. Iron & Steel Co. Ltd., Kanpur.

FIRST to produce *Baling Hoppers* for use by the Jute and Cotton Textile Industries in India—J. K. Iron & Steel Co. Ltd., Kanpur.

FIRST to manufacture hydraulically operated modern cane crushing mill for small-scale Khandwari sugar units—J. K. Iron & Steel Co. Ltd., Kanpur.

FIRST to produce *Aluminium virgin metal* from Indian Bauxite in India—Aluminium Corporation of India Ltd., Jaykaynagar.

FIRST to produce *Engineers' Files* in India—J. K. Engineers' Files, Bombay.

FIRST to establish *Plastic Industry* in Northern India—Plastic Products Ltd., Kanpur.

FIRST to produce *Heavy Chemicals* in Western India—Eastern Chemical Co., (India) Bombay.

FIRST in the world to produce on a commercial scale *Hydroaliphatic Soda* by Sodium Amalgam Process—J. K. Chemicals Ltd., Thana.

FIRST *Continuous process Rayon Plant* in India to produce *Vicose Rayon* and the first such factory in India to be built up in record time—J. K. Rayon, Kanpur.

FIRST *Nylon Plant* in India—Jaykaylon (under construction), Nara.

FIRST to manufacture *Portable Typewriters* in India—Blackwoods India Ltd., Calcutta.

FIRST *Woollen mill* in India to export woollen goods to Norway and Sweden—The Raymond Woollen Mills Ltd., Thana.

LARGEST *Jute Mill* in Northern India—J. K. Jute Mills Co. Ltd., Kanpur.

FROM THE CAPITAL'S CORRIDORS

CAPITAL ISSUES

TWO hundred and fifty-eight companies were granted consent by the Controller of Capital Issues during the period from April 1, 1961 to November 30, 1961. The total capital to which consent was given was Rs. 160.81 crores. They include the following foreign companies:

1. British United Shoe Machinery Co. Ltd., U.K.
2. P. Leiner & Sons Limited, U.K.
3. Carrier Corporation of New York, U.S.A.
4. Whiteley (Rishworth) Ltd., U.K.
5. Massey Ferguson Ltd., Canada, U.K., and/or their subsidiaries.
6. Mississippi Glass Co. Ltd., U.S.A.
7. A.B. Svenska Fullager Fabriken, Sweden.
8. Skefko Ball Bearing Co. Ltd. of Lutan, U.K.
9. Metallurgical Research & Development Co. Inc., U.S.A.
10. Dr. Paul Lohmann, Chemische Fabrik, West Germany.
11. Mitsubishi Electric Mfg. Co. Ltd., Japan.
12. H. Miller and Co. Ltd., of Birmingham, U.K.
13. Mr. Arthur G. Wellman (President, Nichols and Co. Inc., Boston, U.S.A. and other individuals and companies associated with them).
14. Hackethal-Draht-und Kabel-werke, Hanover, Germany.
15. International Finance Corp., Washington, U.S.A.
16. Reichholds Chemicals Inc., New York, U.S.A.
17. United Malleable Mfg. Co. of Ohio, U.S.A.
18. McNally Pittsburg Mfg. Corp. of U.S.A.
19. A. Freidr Flender and Co., West Germany.
20. Siegfried Schumacher K G Stehldrahtwerk, West Germany.
21. Kerabadarf, West Germany.
22. Stevens Paper Mills Inc., New York, U.S.A.
23. EMPACEL of Paris, France.
24. Ledoga S.P.A., Milan, Italy.
25. Scovill Mfg. Co., U.S.A.
26. Tokyo Seiko Kaisha and Moritani and Co. Ltd., Japan.
27. Joseph Lucas (Industries) Ltd., U.K.
28. ASEA, Sweden.
29. Great Lakes Carbon Corp., New York, U.S.A.
30. Air Products Inc., Pennsylvania, U.S.A.
31. Felten and Guilleame Carlwerk Eisen and Stahl A.G., West Germany.
32. Thomas Mouget and Co. Ltd., Yorks, U.K.
33. Robert Jowitt and Sons Ltd., Bradford, U.K.
34. Alfred Wiseman and Co. Ltd., Birmingham, U.K.
35. Robert Bosch G.m.b.H. Stuttgart, West Germany.
36. Dow Chemie A.G., Switzerland.
37. D. Perrie and Co. (London) Ltd., U.K.
38. Von Kohorn International Corp., New York, U.S.A.
39. Phelps Dodge Copper Products International Corp., U.S.A.
40. Enfield Cables Ltd., U.K.
41. Pfizer Corp., Panama.
42. Fisons Limited, U.K.
43. Byrce Berger Ltd., U.K.
44. Raleigh Industries Ltd., of Nottingham, U.K.

45. Powers-Samas Accounting Machine (Sales) Ltd., U.K.
46. Gutehoffnungshette Sterkrade A.G., Oberhausen, W. Germany.
47. Heinrich Koppers G.m.b.H., Essen, West Germany.
48. J.M. Voith G.m.b.H., Heidenheim, West Germany.
49. Kimberly — Clark Corporation, Klisconsin, U.S.A.
50. Parsons and Whittemore Inc., New York, U.S.A.
51. Commonwealth Development Finance Co. Ltd., London.
52. Babcock and Wilcox Ltd., U.K.
53. Vickers Ltd., U.K.

HEAVY ENGINEERING CORPORATION

Further to the review of the working of the Corporation in these columns of the previous issue the plant being erected at Durgapur is scheduled to be completed during the second half of the Third Five-Year Plan and will manufacture 45,000 tons per annum of machinery (valued at Rs. 2,400 lakhs). The project will include foundry capacity expected to produce the following tonnage of heavy castings and forgings:

Grey iron castings	11,000 tons per annum
Steel castings	6,000 tons per annum
Steel forgings	7,000 tons per annum

The full programme of manufacture was announced as follows:

	Tons
Coal cutters	1,715
Loaders	1,371
Conveyors	22,500
Trolley and battery type electric mine locomotives	1,300
Haulages	3,816
Electric winders	1,167
Main axial fans	1,170
Booster fans	50
Pumps	945
Ball mills	—
Sand pumps	72
Automatic gauge keeps for use in vertical shafts	—
Safety detaching hooks	2,000
Light drill rigs for exploration drilling	25
Spare parts	25 per cent of total weight of article.

The plant is expected to go into production by the end of 1963 with the following items:

Centrifugal pumps, Booster fans, Sand pumps, Scraper chain conveyors, Direct and endless haulages, Belt conveyors, Main axial fans.

The manufacture of Winding engines is expected to begin by 1965.

BOKARO STEEL PROJECT

The Government has written off steel production from the fourth Steel Plant at Bokaro during the Third Plan period. The Plan, it will be recalled, had taken into calculation one million tons of steel ingots and 0.35 million tons of pig iron from Bokaro Steel Project. The question of U.S. collaboration had been under discussion for some time and the U.S. Ambassador, earlier this month, had thought of making an announcement in this

regard. But even if this announcement were made by the end of this month, it will take almost two years before orders for plant and machinery are placed for the project. It will thus be seen that it has become humanly impossible for this proposed plant to go into even token production, much less attain full production target, by 1966 as envisaged by the Planning Commission.

INDIAN SHIPPING

The Union Minister for Transport and Shipping, Dr. P. Subbarayan, said in Delhi during the week that he was not certain whether it had been wise on the part of Indian Shippers to have joined the UK conference lines and that he might have to ask them to get out of it at some stage. Inaugurating the Maritime Law Association of India, of which he is the chief patron, he asked the Indian members of the Committee, Sir Ramaswamy Mudaliar and Mrs. Sumati Morarjee, to persuade the conference lines representatives "to see more sense", when dealing with India.

AID TO INDIA

The Deputy Director of the Asian Department of the International Monetary Fund, Mr. Henry Murphy, with his two colleagues arrived in Delhi from Bombay during the week for the annual survey of the Indian economy. While in Bombay, the Mission already had discussions with the Reserve Bank on monetary policy and India's balance of payment position. Discussions in Delhi will largely centre on planning, industrial policy and public finance. The World Bank representative, Mr. Peter Wright left for Washington during the week after collecting the data for discussion by the Aid to India Club meeting, due to be held at Washington on January 24, 1962. Mr. Wright also studied the economics of Koyana Project, which the World Bank proposes to finance. While in India, he also familiarised himself with the development plans of the Bombay Port which had earlier been studied in detail by Mr. Charmichael.

MANGANESE ORE

The Railway Board have decided to allow freight concession on all grades of manganese ore booked to ports for export to foreign countries from January 1, 1962.

The traffic booked from stations situated upto and including 252 kilometres from ports will be charged at the ordinary tariff rate. Traffic from stations situated between 253 and 689 kilometres will be charged at a flat rate of Rs. 14 per ton. Traffic from stations situated at 690 kilometres and more from ports will be allowed a 50 per cent reduction in the classified rate. As at present, no supplementary charges will be levied. No reduction will, however, be allowed in the additional charges leviable like siding charges, port charges, etc.

The concessional tariff rates will apply on the consignor's certifying on the Forwarding Note that the traffic was intended only for export to foreign countries. The new concessional rates will remain in force for a period of one year from January 1, 1962. On the introduction of these rates, the rebate on freight, allowed at present on export traffic in medium and low-grade manganese ore, will be withdrawn.

COAL MINING EQUIPMENT

The following industrial undertakings are either manufacturing or are planning to manufacture Coal Mining Equipment:

ACC-Vickers-Babcock (Private) Limited, are licensed to manufacture Rs. 112 lakhs per annum of coal mining, cement, and other general machinery. Vickers Limited of United Kingdom are collaborating for coal mining machinery.

Barakar Engineering and Foundry Works Limited are licensed to manufacture Haulages (30 to 100 H.P.) in collaboration with Clarke Chapman and Company Limited, United Kingdom. Production has not yet commenced, and the capacity is to be determined on the basis of production to be achieved in the first year.

C. Comens and Sons Limited have received a licence to manufacture 48 Haulage Gears per annum and 6 Conveyors per annum, on single shift basis, and are in production. The factory is in Calcutta.

Dynacraft Machine Company Private Limited with factory at Bombay are manufacturing Belt Conveyors, Roller Conveyors, Bucket Elevators, etc.

Elecon Engineering Company Limited with factory at Goregaon, Bombay, are licensed to manufacture Rs. 12 lakhs per annum Belt Conveyors, Screw Conveyors, Bucket Elevators, etc. on a two shift basis. Production has commenced.

International Combustion India Private Limited, a subsidiary of International Combustion (Holdings) Ltd., London, with factory at Howrah, Calcutta, have received a licence to manufacture Conveyor belt troughing, pulleys assorted (4,000 per annum), and fabricated steel work for conveyors, tressles, gantries, stringers, decking plates, chutes, skirt plates (100 tons per annum).

Jardine Henderson Limited are collaborating with four British companies to manufacture Coalcutters and Gate-end boxes (Anderson Boyes and Co. Ltd.); Belt, Shaker and Scraper chain conveyors (Mining Engineering Co. Ltd.); Winders and Haulage machinery (John Tinsley Ltd.); and Mining electric rotary drills and accessories, Gate-end boxes, Drill bits and rods (Victor Products (Wallsend) Ltd).

Kilburn and Company (Private) Limited in collaboration with two British companies have received licences to manufacture electric and compressed air colliery haulages and two speed colliery haulages (Austin Hopkinson and Co. Ltd.); and Electrically driven open type single and double drum, and endless rope type haulages from 48 H.P. to 150 H.P. (John Mills and Co. Ltd.) Production has commenced on the Electric and compressed air colliery haulages.

Larsen and Toubro Limited with factory at Powai, North Kurla, Bombay in collaboration with Wiegner Maschinen Bau, West Germany, are licensed to make Portable belt conveyors and Hand scrapers, (150 tons per annum on single shift basis.) Production has commenced.

Macneill and Barry Limited in collaboration with Hugh Wood Limited, United Kingdom are manufacturing at Calcutta Chain conveyors. Licence is to the value of Rs. 21 lakhs per annum.

Roberts McLean and Co. Pte. Limited with a factory at Tollygunge, Calcutta, have received a licence and are manufacturing Industrial belt conveyors up to 48 inch width; Industrial package handling elevators in different sizes; Elevators in general including Belt bucket types, Overhead chain conveyors, and Skip hoists valued Rs. 15 lakhs per annum.

Sterling (India) Co. Private Limited are manufacturing at Calcutta in collaboration with T.T. Works Limited, Leicester, Conveyors, including mining type, incorporating electric motors.

the British Mining Mission which visited India recently told the Press that the Indian Coal Mining Industry would have to be fully mechanised, if it were to reach the production target of 200 million tons a year by 1971. Mr. Anderson was gratified to know that a number of British firms had succeeded in securing collaboration with Indian companies to undertake the manufacture in India of Coal Mining Machinery. The advantage of this Indo-British partnership, he added, would be that Indian companies would get all the advantage of research and development of their British collaborators. Notwithstanding all these developments, India, according to him, will always have to import some equipment and these imports could easily be channelled through Indian companies having tie up with British collaborators.

The target for coal production by the end of the Third Five-Year Plan (1966) has been set at 97 million tons per annum, an increase of 37 million tons over the Second Plan target. 20 million tons of this additional production is expected to come from the public and 17 million tons from the private sector. The order of development expected of the Industry during the Third Five-Year Plan can be gauged by comparison with the Second Plan figures. In 1955 coal production was 38 million tons; between 1955-60 the private sector was to increase its production by 10 million tons per annum and the public sector by 12 million tons per annum. The rate of increase is to be very nearly doubled during the next five years.

Of the additional production of 17 million tons expected from the private sector 4.87 million tons will be coking coal, 1.12 million tons blendable coal and 10.84 million tons superior grades of non-coking coal. The coking coal will come mainly from the Jharia coalfields, blendable coal from the Raniganj coalfields and non-coking coal also from Raniganj, with small quantities from the Bokaro, Karanpura and Madhya Pradesh coalfields. The major portion (11 million tons) will come from existing mines and the balance from new sinking in existing leasehold areas. The capital investment required to achieve this programme is expected to be Rs. 60 crores with a foreign exchange component of Rs. 28 crores, which is to be covered by the World Bank loan. Private sector collieries have estimated their demands for plant and machinery and their plans are being screened.

COAL FOR STEEL PLANTS

At an inter-departmental meeting held recently, the position regarding the supply of coking coal to the steel plants in the Third Plan was reviewed. The requirements of the steel plants were examined and it was decided that planning for coking coal should proceed on the earlier basis of 16.14 million tons of coal, on dry basis, to be charged to the blast furnaces. The equivalent of this in terms of raw coal is 27 million tons. In addition, there is a demand for 2 million tons by the merchant cokeries.

As regards private sector steel plants, while IISCO were developing their collieries to meet ultimately, their requirements entirely from their own collieries, TISCO were not only looking to Government to supply 0.9 million tons of washed coal from Bhojudih washery, but were asking for more on the ground that their requirements had gone up. It was felt that with the coking coal production subject to serious delays and shortages, TISCO must find their entire requirements of coking coal from their own collieries especially as they were in possession of substantial reserves of coking coal. TISCO were however reluctant to work on account of their apprehension that their raising costs would be high. It was, however, considered that TISCO could raise the necessary coals within two or at the most three years. It was therefore agreed that TISCO should be informed that washed coal from Bhojudih would not be available

to them beyond 1964 and they should make arrangements to produce and beneficiate all the coal required for the Jamshedpur steel plant from their own collieries.

COKING COAL

It is understood that most of British assistance will be used in re-opening the abandoned mines. The present indications are that as against a targeted production of 3 million tons from Sutikdih-Sudamdih mines, only 0.5 million tons is expected to be achieved by the end of Third Plan. In the Sutikdih-Sudamdih area in Jharia, a small area to the north-east of the area already notified is said to contain coking coal of fairly good quality. The Polish experts have confirmed during discussion that if this area could be acquired, it would be possible to obtain coking coal production from this area quickly and in greater quantity. It is proposed to discuss this matter with the present lease holder of the area. Additional coal washeries are to be established to conserve the utilisation of metallurgical grade coal and a public sector network of ropeways is to be constructed in the coalfields to serve private collieries with increased facilities for sand-stowing.

Reserves of coking coal are of the order of 2,800 million tons and are low in relation to known reserves of high grade iron ore. Steps are therefore necessary to conserve the comparatively limited supplies of coking coal. The capacity of washeries set up at Dugda and Bhojudih is to be doubled, 2 new washeries are to be set up at Kathara, two washeries at Karanpura and a further washery in the Central Jharia field, towards the end of the Third Five-Year Plan. In addition a washery is planned as an integral part of the West Bengal coke oven plant at Durgapur. These are expected to cover the requirements of the steel development programme. Additional washeries are to be set up for non-coking coal required by the Railways. Tentatively these are to deal with 7 to 8 million tons in terms of raw coal. A major project for manufacture of coal washeries in India has recently been announced by Bird and Company in collaboration with McNally of the U.S.A. Three non-coking coal washeries are presently being planned for—one at Karanpura, with an input capacity of 2.8 million tons per annum (which is a mixed washery) and the other two at Anuppur and Singrauli, each with an input capacity of 2.5 million tons per annum. A project report for the Karanpur washery has been prepared by the Central Fuel Research Institute, Dhanbad. The Polish Government have agreed to set up this washery under the terms of the Economic Co-operation Agreement of May 1960 between the Governments of India and Poland. A team of Polish experts is presently in India in connection with the preparation of the detailed project report for the Sudamdih mines; the team will also discuss the Karanpura project report with the National Coal Development Corporation's experts in Ranchi. The washery at Singrauli will be an integral part of the development of the Singrauli coalfield, which is proposed to be entrusted to the Technical Co-operation Mission authorities. One Technical Co-operation Mission expert has already arrived and is holding discussions with the National Coal Development Corporation officers. It is only after he has studied the available data that further steps for concluding an agreement with the Technical Co-operation Mission authorities for the Singrauli project will be taken.

Of the 11 million tons of additional production from existing coal mines, 2 million tons is to be achieved without additional equipment by increased use of sand stowing. The Central Government Coal Board is planning to install 7 ropeways in the Jharia and Raniganj coalfields to supply sand for stowing. The total cost of the whole project is estimated at Rs. 18 crores. The contract for the installation of the first ropeway in the Jharia field has been awarded to British Ropeway Engineering Company Limited. Tenders for three rope-

ways for the Raniganj field are under examination by the Government.

Capital investment required for the whole of the public sector over the next five years has been estimated at Rs. 103 crores. No internationally available funds have so far been allocated to this development which, as things stand at present, is therefore likely to be financed from tied sources of purchases to the extent that free foreign exchange is unavailable. East European countries notably Russia and Poland are strongly interested in the public sector expansion plans and it, therefore, seems likely that substantial quantities of equipment will be purchased under rupee payments agreements. A sum of 35 million dollars has been allocated to the Government of India for the first two years of the Third Five-Year Plan. It is expected that \$5 million will be spent on equipment for new mines, \$14 million for replacements, \$2.5 million for spare parts, and the balance for new equipment for existing mines. The World Bank has indicated that a further \$25 million will be made available later to cover the requirements of the remaining three years of the Plan period.

COAL LOADING TARGET

The Government of India have decided to increase the daily coal loading target from 6535 wagons as at present to 6925 wagons next year as a new measure to improve the delivery of coal.

Measures adopted earlier had resulted in despatch of 37.6 million metric tons of coal during the first nine months of 1961 as against 33.9 million metric tons during the corresponding period last year. The steps taken included increase in the rail transport capacity from Bengal-Bihar fields by 200 wagons per day from July last in addition to introduction of movement in block rakes in case of industries having low priorities like brick burning and small-scale industries. The Southern and Western parts of the country are being served now by the rail-cum-sea route via Calcutta port and coal dumps are also being set up at suitable consuming centres by the various State Governments apart from the fact that movement of coal and soft coke by road has been liberalised. It will be recalled that the Government of India has also decided to develop coalfields in Central India during the Third Five-Year Plan period so that the nearby States may get their supplies from these fields and the long haulage from Bengal-Bihar areas may be avoided.

NEW COLLIERY PROJECTS

The National Coal Development Corporation has decided to undertake two new colliery projects — one at Umrer in Maharashtra and the other near Talcher in Orissa. Each will produce over a million metric tons of coal per annum. The Umrer project will be the Corporation's first colliery in Maharashtra. Situated 2 KMs north of Umrer town and 46 KMs from Nagpur on the narrow gauge railway connecting Nagpur and Chanda Fort, the colliery will be fully mechanised and opencast. The total coal reserve has been estimated at 70 million metric tons of which only one half is quarriable. The life of the mine will be nearly 50 years. The overall quality of the coal is expected to be Grade I. Production will start in the second half of 1964 and attain the rated capacity in 1965-66. The estimated capital outlay of the project is Rs. 4,38,80,000 and when working to full capacity the colliery is expected to give an annual profit of nearly Rs. 35 lakhs. Industries in Western and Central India will be able to effect savings in transport charges when this colliery starts production. Umrer's coal will be consumed by the power houses of Maharashtra at Akola and Bhusa-

wal and by the proposed low-shaft iron smelting furnace for smelting the iron ore from Ratnagiri.

The other project, Jagannath Colliery, is almost an extension of the N.C.D.C.'s colliery at South Balanda near Talcher in Orissa. The reserve in the area covered by this project has been estimated at 57.6 million metric tons. This coal has a high ash content, but is suitable for power generation. The life of the mine will be about 30 years. Coal from this fully mechanised open cast mine will be consumed by the new power house which is being set up in Jagannathpur village.

TEXTILE INDUSTRY

The Government of India have decided to license 10,000 automatic looms in units of 500 each as part of the programme of expansion of the textile industry during the Third Plan period. Licences will be issued subject to the condition that 75 per cent of the cloth produced on these looms should be compulsorily exported. Failure to carry out this obligation will entail a penalty which will be related to the short-fall in the export performance. Bonds will have to be executed and bank guarantees will have to be given for the fulfilment of the export condition. For a unit with 500 looms, the matching spindlage will be of the order of 25,000 spindles. Applications for the looms will be entertained only from those who have the matching spindlage. This may be either from out of the available surplus spinning capacity of an existing mill or from the regional quotas of new spindles allotted to the States out of the two million spindles proposed to be licensed during the first two years of the Third Plan. The allotment of the new looms will not be on regional considerations, but will be solely on the basis of the ability of the applicants to discharge their export obligation.

This is one of the oldest and most commonly used of standards. But it is certainly vague. And when you use it, you are never sure of getting your exact requirements.

This is where Indian Standards come in useful. Developed by the Indian Standards Institution, each standard helps you to easily specify your requirements, ensures quality of the product and good value for the money you spend.

ISI prescribes standards for industrial and consumer goods. Under its certification marking scheme, goods produced to relevant standards qualify for carrying the ISI Certification Mark. This is a third-party guarantee of the products' continuous satisfactory performance and service. The next time you buy anything, look for the ISI mark.

BOOK REVIEW

PANCHAYAT-I-RAJ

Panchayat-i-Raj: By S. K. Dey: Asia Publishing House: Rs. 7.50.

'Panchayat-i-Raj', Mr. S. K. Dey's new book, might be considered the hard core of India's spacious statements on all that is involved in the creation of new institutions to buttress the needs of India's rural development. In a large sense, Mr. Dey is the true architect of current thinking on the subject. He is generous in his tributes to others and, of course, the century has been marked by much rural effort in a somewhat patchy, if pioneering, manner. Tributes are paid in an interesting chapter of history called "New Pilgrimage" to a wide range of persons, interestingly of all nationalities. Mr. Elmhirst, Dr. Spencer Hatch, Mr. F. L. Bryne, were from Britain, Albert Mayer and Harry Holmes from the United States, Dr. Konisberger, a member of the Narielwala Committee, from Germany and so on. Appropriate tributes are also paid to Rabin-dranath Tagore's work at Santiniketan and Sir V. T. Krishnamachari's outstanding work at Baroda. Nevertheless, it would be the judgment of history that the current thinking on the subject is largely the creation of the Community Development Ministry of which the author is rightly considered the moving spirit.

It has been difficult — and much of this book deals with the problem of transition — to move out of the chrysalis stage before, as Keynes once said, "thought had wings". Mr. Dey is not afraid of projecting himself into the stratosphere. He looks forward, in the last chapter, in a much wider horizon to a tremendous decentralisation of administration in this country and, eventually, to a translation of this concept of decentralisation on to a world scale so that institutions composed of strictly local communities form the central elements of democracy in all countries of the world.

This might look as though it were current Indian thinking but, in fact, Indian democracy has been in practice very different from the pattern which he conceives. His pattern is in his words, a "synthesis" of three institutions "which should work out separately and jointly the destiny of the nation as a socialist society". The three institutions are the Panchayat, the Co-operative and the Village School "on which rests the future of our culture and our democracy." There is to be a progressive increase in "competence from the 'ground' upwards and a corresponding transfer of responsibilities from the Centre to the 'ground'". The State Governments are to be relieved of responsibilities that can be discharged by the Panchayat-i-raj institutions along the line — the Zila Parishad, the Block Panchayat Samiti, Panchayat's Associated Voluntary Institutions and individual families. The Panchayat-i-Raj will thus grow to be "a way of life, a new approach to government as against a unit of Government" (Page 95). It will bring about what the author considers "a link-up all along in terms of the people from the Gram Sabha to the Lok Sabha" — a kind of popular government which will disperse the executive authority all along the line to rid it of its monolithic character, now both an anachronism and a disease. There will naturally be in some circles a horror of a weakening of

authority in Delhi, but this is the whole purpose of the prescription.

In the sense that Mr. Dey is advocating a complete departure from the existing tendency of centralisation in Delhi and the State capitals, he is in truth a revolutionary, although he appears to enjoy the most happy relationship with the source of central power, that is the Prime Minister. He does not, however, deny the paradox that one of the most centralised governments in the world is seeking, because of its anxiety to solve people's problems, some way out of its own passion for power. Reading between the lines, one might argue that the book is, in fact, a criticism of the Government's present performance, whatever its utterances in regard to actual building up of village institutions.

Having made this revolutionary decision that the "wider horizon" must entail much greater delegation to the "ground", Mr. Dey does not think there will be an easy transition to such devolution. He is clear, in fact, that if it takes place quickly, there might be "chaos" and that if the chaos is to be avoided "clearly defined laws must be understood, accepted and honoured". The action on three fronts he suggests is (i) administrative, (ii) representative and (iii) economic. On the administrative front, it will call for an immeasurably higher level of administrative competence in all those employed by the community as its instruments of action. A growing community will inevitably call for a rising level of functioning in its public servants. Free and frank participation in thinking, action and fruit-gathering by the strong and the weak alike will call for the highest of tolerance, understanding and wisdom on the part of the leaders of the community who are the representatives.

On a book, so seemingly idealistic, though in fact cast powerfully in the role of history, opinions may well differ. This is definitely a plunge into cold and somewhat unfamiliar waters. There are some who will argue that it contains too much warmth born of emotional and, even wishful, thinking. "The Eastern Economist" believes, however, that it is cast in the same mould as Gandhian thought. Once the power of the people is appreciated and the possibility of their education to responsibility admitted, the argument of "incompetence" and "dishonesty" can be resolved as Mahatma Gandhi did by using weak instruments under control for great objectives. The course is a long and difficult one. Is that an argument for ignoring its capacity and power?

This is a book which, in somewhat simplified form, should be available in all Indian languages; and, since it is the people in the villages who have to learn this way of life, it would be good if Mr. Dey's philosophy were translated into every language of the Indian Union in simple village textbooks. That is where the new thinking must find its fulfilment. If it cannot find its soil there it will find its soil nowhere, because the towns of India are too far involved in the struggle for economic power for them to appreciate that a multitude of institutions is, in fact, the only way to secure a very large, base for people's participation in their own uplift.

"Do LIC actually invest at the rate of Rs. 1½ million a day?"

"More! In fact they're the largest investors in the country."

PEOPLE ARE TALKING ABOUT LIC

With LIC's mounting business turnover, comes a steady increase in its premium income. A large part of this income is invested in the country's economy — averaging more than Rs. 1½ million every day.

These investments stimulate the economy, creating new wealth. By helping to finance industries LIC catalyses more jobs, more incomes and more goods.

Today there is increasing recognition everywhere of the part which LIC is playing towards domestic and national stability.

COMPANY AFFAIRS

NEW ISSUES

Three companies have been authorised to issue bonus shares totalling over Rs. 11 lakhs. Nine companies have been allowed to raise capital through equities amounting to more than Rs. 4 crores. The grand total for all the 12 companies exceeds Rs. 4½ crores. The consent of the Controller of Capital Issues, in all cases, is valid for 12 months.

The Paper Products Limited, Delhi, has been given consent for the issue of bonus shares of the total value of Rs. 8 lakhs on capitalisation of its reserves to a like extent. The company's paid up capital is Rs. 16 lakhs.

A.V. Thomas & Co. Ltd., Kerala, is to issue capital of Rs. 2,35,100 in equity shares of Rs. 10 each to be issued as bonus shares on capitalisation of share premium and reserves to a like extent.

Panama Private Limited, Calcutta, which is engaged in business as dealers in blades and cosmetics has been allowed to issue bonus shares of the value of Rs. 86,250. Its existing paid up capital is Rs. 69,000.

Premier Automobiles Limited is to issue further capital of Rs. 2,40,40,000 divided into 2,40,400 equity shares of Rs. 100 each for cash at a premium of Rs. 10 per share to be offered to the existing shareholders in the ratio of one new share for every three shares held. The proceeds of the new issue will be utilised for setting up a sheet metal plant. The company has a subscribed capital of Rs. 5,63,36,000, all in equity shares of Rs. 100 each.

Ennore Foundries Limited, Madras, is to issue further equity capital of Rs. 60 lakhs. The proceeds will be used for buying plant and machinery from the company's collaborators, Leyland Motors Ltd., U.K.

Papchemi Corporation Ltd., Bombay, a new company, has been authorised to issue capital of Rs. 30,00,000 divided into 30,000 equity shares of Rs. 100 each for cash at par. The capital will be used for manufacturing pulp and paper.

Ghazipur Paper Mills Ltd., a public company, proposed to be registered in Uttar Pradesh, has been given consent for the issue of capital of Rs. 25 lakhs divided into two lakh equity shares of Rs. 10 each and five thousand 9 per cent (taxable) preference shares of Rs. 100 each for cash at par.

The Aluminium Manufacturing Company Private Ltd., Calcutta, has been authorised to issue capital of Rs. 24 lakhs in 24,000 equity shares of Rs. 100 each of which Rs. 5.5 lakhs will be issued for cash and Rs. 18.5 lakhs in repayment of the loan from the British Aluminium Co., Ltd.

The consent has been given on the understanding that the company will convert itself into a public company in 1964 when shares of the value of Rs. 30,00,000 will be offered for Indian participation.

Thanjavur Textiles Ltd., Madras, is to issue equity capital of Rs. 20 lakhs for cash at par. The proceeds will be used for establishing a cotton textile mill in Madras.

Etawah Paper Mills Ltd., a public company, proposed to be registered in Uttar Pradesh, has been given consent for the issue of capital of Rs. 20 lakhs divided into 1,50,000 equity shares of Rs. 10 each and five thousand 9½ per cent (taxable) redeemable cumulative pre-

ference shares of Rs. 100 each for cash at par. The Company will manufacture pulp and paper.

National Buildings Construction Corporation, Ltd., Delhi, a Government undertaking has been given consent for the issue of further capital of Rs. 13 lakhs divided into equity shares of Rs. 1,000 each for cash at par. The Corporation which has a paid up capital of Rs. 21 lakhs, is engaged in the construction of buildings, roads and other civil works throughout India.

Adarsh Chemicals and Fertilisers Ltd., Udhna, in Gujarat, has been authorised to issue additional capital of Rs. 12 lakhs in equity shares of Rs. 100 each for cash at par. The new capital will be used for financing the increased cost of the manufacture of superphosphate and sulphuric acid.

Consent was given to 258 companies representing 65 industries. Of these, the highest number of companies for any one industry was 30 representing cotton textile mills. Next came process and manufacture of electrical machinery, apparatus, appliances, etc. which was 21. During the same period, 54 foreign companies participated in the capital issues consented to both in respect of initial and supplementary issues of equity and issue of debentures.

BRITISH COMPANIES WORKING FOR INDIA

DEC 22

His costs will go up this month...

Because he has had a machine breakdown and has had to replace costly parts which were ruined by faulty lubrication. This didn't have to happen—a Caltex Lubrication Survey could have spotted the trouble—solved the problem.

Machinery shutdown means loss in production, time and money. Correct lubrication is therefore essential to ensure the protection and efficient operation of costly machinery. Planned lubrication is vital for increased production at lower costs.

This service is yours for the asking—call in your Caltex Lubrication Engineer—arrange for a correct lubrication programme for your plant. Let us help you in conserving parts and money.

PLANNED LUBRICATION—A VITAL FACTOR IN COST CONTROL

CALTEX (INDIA) LIMITED Bombay • New Delhi • Calcutta • Madras

Poland in India's Third Plan—and Beyond

"THE Eastern Economist" has chosen the subject of Indo-Polish Economic Co-operation for its second Blue Supplement on the relations between the two countries with a set purpose. Some readers will note that its appearance coincides with the first visit to India of Poland's President of the Council of States, Mr. Aleksander Zawadzki. It is right that tribute should be paid to him, and through him, to his country. Few Indians acquainted with Poland's tragic, yet glorious, history can withhold admiration for the courage and endurance that runs like a golden thread through five centuries of trial and tribulation. There are far too few Indians who know this story. It is time that people here recognised that Poland is not the creation of World War II, or a Socialist community alone, or a mere instrument in the tiresome Cold War game. The country, notwithstanding its current limited room to manoeuvre, has a tremendous vitality of its own. Its springs are cultural and spiritual, even deeply religious. Paradoxically, Poland is certainly as much Catholic as it is Communist. Here is a fascinating story of Challenge and Response with the currents always flowing back and forth. Only superficial observers conclude that Poland is in repose. She is vital; and the essence of her vitality is her tradition of questioning even when, as with both Catholicism and Communism, the doctrines both inflexible and unchanging. In a larger sense—whatever the forms—the relentless questioning which goes on in Poland shows that the democratic faith of its people is built not in doctrines but in a way of life.

concerned with economic co-operation directly for the next five years but, in the larger context, for the very long haul. "The Eastern Economist" believes that Poland can be an imaginative and serious partner over many years, recognising that long-period trade arrangements supported where necessary by credits may be the only way in which the economies, hitherto so far apart, can be joined by an enduring and an expanding bond. "The Eastern Economist" endorses strongly the plea made by the Ambassador for Poland in the succeeding article for a consideration of the implications of such long-period co-operation.

Apart from thus assisting in what might be called the philosophy of Indo-Polish economic co-operation over the long haul, the present Supplement deals with those particular industries in which Poland is assisting India's Third Plan. Her pre-eminence in mining and mining equipment is being increasingly recognised. But her place in shipbuilding and in the wide field of capital goods—tractors, heavy machinery and certain sections of steel—have still to be understood. Some glimpse of her new capacity can be had at the annual Poznan fair; but in fact capacity is rising far more rapidly than Indian observers even at Poznan have appreciated. After some initial slowness—largely because of the demands of reconstruction after the terrible mutilation of World War II—Poland is gaining pace. If only this trend can be left to gather force there will, perhaps, be found here, as in Yugoslavia, a Socialist state with a record for performance, which will bring her fame in areas different from the many which fill her romantic past.

The current Supplement is not, however, committed to issues such as these. It is, more prosaically,

Planned Foreign Trade

By **DR. JULIUSZ KATZ-SUCHY,**

Ambassador of Poland in India

THE Editor of "The Eastern Economist," Mr Eric da Costa, has again taken the initiative to present in his publication some features of the development of Polish economy and to review the prospects of Indo-Polish economic co-operation.

This is a most timely initiative. When the first Blue Supplement of "The Eastern Economist" on Poland was published, a new and upward trend in the development of Indo-Polish economic relations was becoming noticeable. Since 1959, this trend became more stable and not only an increase in the volume of trade and the favourable changes of the pattern of trade have been achieved but also some new prospects opened and forms of economic co-operation have developed. Having adopted the non-transferable rupee as a basis of our trade with India, Indo-Polish trade has been considerably raised slowly overcoming the difficulties arising out of the lack of tradition of Polish goods on the Indian market, payment difficulties as well as some necessary formal arrangements.

Indo-Polish trade which started in reality only in 1952, modest in figures and the assortment of goods, shows a steady growth from year to year and includes more and more investment goods such as heavy machinery or equipment produced by Poland previously imported by India from industrially highly developed countries. A new and additional form of economic co-operation between Poland and India was established in 1960, when an Agreement on Economic Co-operation on the basis of a Polish credit to India was signed. The negotiations and discussions on the utilization of these credits have brought to the surface the widely existing potentialities of new possibilities of trade which the present position hardly exhausts. There is every prospect that trade and economic co-operation between Poland and India should develop.

The future development of this economic co-operation between India and Poland should be viewed not only on the basis of yearly lists and agreements and current requirements, but against the background of the economic growth of both the countries and their plans of future progress. The existence both in Poland as well as in India of a national development plan facilitates the planning and the harmonization of bilateral economic relations and setting of long term perspectives for trade and exchanges.

The problems of economic growth form today a very important chapter of the political economy. An ever-increasing flow of literature on this subject reflects the intensity and the urgency of efforts made by the developing countries. Though various theories with regard to economic development are being sponsored and applied, there is a general acceptance of planning as the best policy of development. That arises out of the necessity for the developing countries having limited means to mobilise the maximum human and material resources and to direct the effort into channels necessary to create conditions for reaching the stage of self-sustained economic growth. Planning, however, is a vast and complex subject, a science and an art, requiring learned technicians and skilled economists to analyse the general process of economic activity, their coordination and their inter-connection in order to achieve a balanced growth without the strains and stresses, tensions and upsets, likely to

appear in every process of development. An important field of planned activity must be foreign trade. Next to the internal effort, foreign trade is the most important means of assuring the reality of the plans and development and securing the steady flow of means for the acquisition of the necessary investment goods to be bought from abroad. Foreign trade activity affects the rate and effectiveness of investments and its development accelerates the growth of production and income. A country set upon a road of development cannot afford its foreign trade to be subject to fluctuations and changes on world markets creating new difficulties or increasing the already existing ones. In planning the rate and direction of economic growth of a country, the planning authorities certainly must determine the volume of its foreign trade, the relation between exports and imports, and aim at achieving an equilibrium in the balance of payment. Rapid rate of development may cause not only inflexible demands for large imports, but internal requirements of development may also absorb goods traditionally supplied for exports. When the national economy is seriously dependent on imports of important raw materials, semi-products and investment goods and at the same time has difficulties in the development of its exports, foreign trade can retard the rate of development of a country. Thus, foreign trade has to be planned as any other branch of economic activity if we want to reach a harmonious rate of growth.

The planning of foreign trade seems to give a chance of reaching a more specialised trade which in turn will lead to a more rational use of production resources, greater effectiveness of investment and accelerated growth of national income. It gives a chance of gaining from the new international division of labour and at the same time of limiting the uncertainties resulting from the present situation. This chance is provided by planned economic cooperation based on bilateral and multilateral agreements, on a closer coordination and specialisation in long term agreements and contracts and in a constant study of the changing patterns of production and therefore also of trade.

This is true for both India and Poland.

Therefore, the basis for the future of Indo-Polish relations must be viewed in relation to the plans which India and Poland have embarked upon and their fulfilment in the nearest future. That must provide the basis for increasing Indo-Polish exchange. The industrialisation process which is changing rapidly the face of India and especially the magnitude of the demands for the Third-Five Year Plan creates a better market for the deliveries of investment goods and materials. The problem of finding the planned requirements for imports must be sought in an increase of balanced trade and diversification of India's exports. Poland, while developing her industries, will produce ever-growing quantities of capital goods for export. On the other hand, engaged in an ambitious programme of industrial expansion, Poland is producing a greater volume of heavy industry and equipment, increasing her requirements for both raw materials and machinery as well as various types of consumption articles as a result of full employment and the growing standard of living of the population. This creates not only a firm basis for trade between Poland and India, but also

possibilities and necessities of trade to be planned ahead and even coordinated in the development plans through perspective requirements of certain types of machinery or other products with a specific destination for Indian or Polish market.

The present pattern of trade shows Poland's ability to meet some of the investment needs under the Indian Third Five-Year Plan. The discussions have established our readiness to supply coal mining machinery and coal washing equipment, power generators, heavy machine tools, grain silos, heavy construction machinery, tractors and other investment goods. At the same time Poland's needs make it possible to exceed the traditional line of exports and to accept new raw materials and products produced by the young Indian industry. A significant example is the readiness of Poland to purchase in India textile machinery.

It should be said frankly that Polish trade and credits are not high in absolute figures and could hardly compete with assistance or trade with economically powerful countries. But the importance of those relations lies in the potentiality of providing diversification in the suppliers of investment machinery making it possible to immunize the development process from various conditions, extraneous factors and situations often of a non-economic character. The success of the socialist countries in their ability to offer an alternative market is probably one of the most impor-

tant factors of our times influencing the development prospects and plans of the countries of Asia and Africa.

The existence of plans and of favourable conditions will not increase automatically Indo-Polish economic co-operation. The existence of favourable conditions makes it necessary that a steady effort be undertaken by both sides based on a careful study of plan requirements. Such a trade viewed in long terms and coordinated to planned economic requirement will have a stabilising effect for production levels and price levels and may become an important stage in developing specialisation in production between the two countries in the field of machinery and equipment. This is specially important in view of the existence and activities of integrated and close economic groups on today's world markets. Increase of trade can be connected with the increase of scientific and technical cooperation. Poland is willing to make available her technical knowhow in the fields in which she is well advanced, such as coal mining, ship-building, geological research, certain types of machine building as well as planning techniques.

The fact that both Poland and India are at a stage of rapidly expanding their economy and therefore have numerous needs with regard to planned investments should enable them to take steps in that direction from the point of view of setting in advance the pattern of trade between them. In my opinion, the differences between the social systems do not impede such a co-operation.

Matching of Polish and Indian Plans

By **PROF. DR. WITOLD TRAMPCZYNSKI,**

Minister for Foreign Trade, Polish People's Republic

THE prospects of further expansion of economic relations between Poland and India ought to be examined in the light of the development of these relations heretofore, and of the opportunities opened up by the five-year plans now under implementation in our two countries.

The present year marks in many respects a turning point in Polish-Indian trade. In 1958, the volume of mutual trade between the two countries amounted to less than 50 million hard-currency zlotys, or 60 million rupees; in 1960, it was below 60 million zlotys (72 million rupees); but by the end of 1961, judging from the results attained in the first six months from the contracts signed, we shall have passed the 100-million mark in hard currency zlotys, or 120 million in rupees. In other words, within two years the volume of Polish-Indian trade will have doubled; this means such a dynamic rate of expansion as to make us regard the future development of our trade with great confidence.

Our optimism is all the more substantiated considering, on the one hand, that commodity structure of our trade is changing to the better and, on the other hand, that investment credits totalling 120 million hard-currency zlotys or 144 million rupees (a sum far exceeding the annual volume of our mutual trade so far), allocated by Poland in 1960 for the duration of India's Third Five-year Plan, have not yet been covered by commodity deliveries. It is only in the present year, in 1961, that contracts are being signed within the present agreement. As to the changes in the commodity structure I mentioned above, what I have in view is that

an increasing portion of our exports is taken up by deliveries of complete industrial plants. Thus, over and above the items covered by the credit agreement, Poland has or will have supplied India with a steel-construction works, a face-hardening plant, a fire-resistant materials factory, a rolling mill, an electric counters factory, a motor-cycle factory, and many others. The items enumerated—and there are many more on the export list—are eloquent enough for anybody who realises how essential are deliveries of complete plants for the developing countries. Moreover, an additional number of plants, their estimated worth totalling at least 300 million rupees, will be put up in India owing to credit deliveries from Poland within the next five years.

A significant evolution is also to be noted in India's export lists. At the recent Poznan Fair in Poland we negotiated the purchase of the first batch of textile machines made in India; Poland has already placed her first order. This was by no means an act of courtesy on our part; on the contrary, it was done as a token of recognition of high quality of the goods manufactured by Indian industries and in acknowledgment of the fact that continuous international division of labour implies taking into account the speedy evolution in the developing countries as a result of their industrialisation. There is every reason to expect that Poland will be buying increasing quantities of iron and manganese ores, crude iron, oleaginous fodder, condiments, etc. Incidentally, Poland's imports from India also reveal a dynamic rate of growth. We started practically from scratch; in 1955, Poland bought 3.6 million zlotys (4.32

million rupees) worth of Indian goods, and by 1960 our purchases in India soared to total nine times as much as in 1955.

And now, a glance at the five-year plans of our two countries.

The goal of the five-year plan of socialist development of Poland's economy for the years 1961-1965, now being carried out, is to enhance further growth of Polish industries, particularly the metallurgical, engineering, and chemical industries. It also envisages substantial expansion of Poland's sources of raw materials; along with hard and brown coal these include sulphur and copper, which are the key items in the planned programme for the present five-year period. Farming and cattle-breeding are also expected to rise in production. The following figures may give the readers a notion of the planned tasks in Poland: industrial output is to increase by 52 per cent, agricultural produce by 22 per cent, and national income by some 40 per cent.

The key to such speedy and all-round progress is to be found in mounting efficiency of work, which in turn will be the effect of new technical achievements and latest techniques applied in industrial production. Extension of up-to-date technological processes along with large-scale modernisation of the Polish industry as a whole, is bound to add to the prospects for Poland's exports. It will certainly be of great advantage for those purchasing machinery, industrial goods, and particularly complete plants made in Poland—which, of course, also involves imparting the Polish know-how.

From the point of view of assessing the future of Polish-Indian trade it is worthwhile to know what are the planned tasks as regards raising the living standards of Polish population. Housing is an important aspect of the living standard; housing conditions are going to improve a great deal. Besides, the plan provides for some 23 per cent rise in real wages per one employee; the total individual consumption fund, which in a sense determines the volume of purchases of consumer goods, will increase by some 32 per cent as against 1960. This means continuation of the processes noted in the previous five years, i.e., speedy growth of purchase capacity and living standards. The last five years witnessed a 29-per cent rise in real wages in Poland; simultaneously, production potential was considerably augmented, giving a 59 per cent increase in industrial output and more than 20 per cent in agricultural produce in 1955-1960.

These figures illustrating the economic development of Poland are, I dare say, a convincing corroboration of the conclusion that Poland's export capacity as well as her import needs are going to grow at a speedy rate, which cannot but augur well for the development of Polish-Indian trade.

The same conclusion can be drawn from India's Third Five-year Plan, initiated this year in continuation of the general outline of the previous five-year plans.

India's Third Five-Year Plan envisages a tremendous effort in industrial and mining investments, which are to amount to some 25 to 30 milliard rupees. Considering the very high rate of development of the engineering industry (a five-fold increase is envisaged in the plan), it can be estimated that in the course of the fourth and fifth five-year plans India will be able radically to reduce the foreign component in her new industrial projects. But during the Third Five-Year Plan India's balance of payments is still expected to remain under great pressure of the industrial development programme. To be sure, India does not try to conceal the great difficulties facing her in this respect. Consequently, the ambitious goals of her Third Five-Year Plan

make it imperative to import investment goods from abroad, if possible on credit.

Poland on her part is prepared to expand her deliveries of investment goods on credit. It is worth noticing that, apart from the state-to-state loan mentioned above, Polish foreign trade companies as a rule are ready to grant trade credits when selling complete plants. Credits offered by Poland are, I think, attractive for India as the recipient, in so far as they are self-liquidating. Since the Polish-Indian accounts are in non-transferrable rupees, this means in practice that the credits granted by Poland will be paid by India in commodities, and that every purchase of Polish-made plants ensures additional market for India's exports.

The range of investment goods offered by Poland is to be systematically enlarged within the current five years. The five-year plan now under way in Poland envisages a 57 per cent increase in the output of investment goods. Given the high level of industrial production in Poland, a less than 60 per cent rise in the output of industries manufacturing investment goods will render it possible to more than double their export capacity. By the end of the current five-year period Poland's annual exports of investment goods are expected to reach more than three milliard hard-currency zlotys (3.6 milliard rupees), out of which some 600 million rupees worth of such goods will be delivered to the developing countries.

It is our belief that India should keep her place among the main importers of Poland's investment commodities. A comparison between our respective five-year plans reveals how vast are the prospects of our mutually beneficial co-operation. Polish supplies can be of particular help in coal mining.

For many years now we have specialised in delivering equipment and technical services for the coal industry. India's coal output is expected to rise from 60 to 100 million tons during the current five-year plan, to be doubled again within the fourth five-year plan. This is a gigantic task indeed; it implies putting up a great many collieries, coal washeries and other installations; it also calls for extensive geological research and exploration work, and for speedy training of skilled personnel. We believe that Poland might aid India in all these undertakings; accordingly, we on our part consider the contract on building a group of coal mines, now under negotiation within the credit agreement, as the first—though very important—step on the way of our co-operation in developing India's coal industry. It is our opinion that, as regards its volume and the time span it covers, the said co-operation ought to exceed by far the limits set by the present credit agreement.

However, the emphasis on the possibilities of co-operation in coal-mining must not make us lose sight of other prospects. I mean, in particular, deliveries of Polish equipment for India's iron-ore mines, port installations, tube-wells for irrigation purposes in co-operation with Indian pump-manufacturing industry, and a number of complete plants, especially machine-building factories. Deliveries of Polish ships are open for consideration, with promising prospects in store. Also, technical co-operation is an important matter in itself.

Speaking for myself, it seems obvious that it is quite possible for both sides to double again our trade in the nearest years, especially if we make full use of such instruments for matching our respective five-year plans as long-term agreements, long-term contracts on commodity deliveries, matched contracts, and economic counselling, the latter being facilitated by the fact that long-range planning is the rule in both Poland and India.

India and Poland: the Patterns of Economic Growth

IN the pre-war days, 41 per cent of Poland's national income originated in agriculture. As much as 64 per cent of its working population was engaged in agricultural pursuits. In the case of India (including Pakistan) more than half the national income came from agriculture, animal husbandry and ancillary activities while more than 70 per cent of the population was directly engaged in agricultural activities. Thus, there was a close parallel between these two countries in the pre-war days in so far as the structure of their economies was concerned as it showed heavy dependence in each case on the primary sector.

The end of World War II created problems both for India and Poland though much more for Poland because it was directly hit by the ravages of war which left many a wound to be redressed. The reconstruction activities which started after 1945 made a slow but steady impact on the Polish economy and within five years a great change had already occurred. The percentage of national income originating from agriculture was reduced to nearly 29 of the total while the percentage of the working population engaged in agricultural activities was reduced to 53. This steady process of industrialisation continued in such a way that by 1960 less than one fourth (22 per cent only) of the income came from agriculture while nearly 62 per cent came from industry and building activities.

In the case of the Indian Union the tempo of industrialisation was hastened after World War II but

much of the investment went to replacing the over-worked machinery. The First Five-Year Plan laid the foundation for large-scale industrialisation and the Second Plan made a sizeable impact in the field of industry, raising out 100 per cent in 10 years. Despite this steep rise in industrial production and huge financial investments (which did not fail to cause severe strains in the economy), the share of industry—both large and small—remained as low as ever. Whereas in 1948-49 the share of mining, manufactures and small-scale industries was 17.1 per cent of the total national income, it was almost the same at 16.8 per cent in 1959-60. This is because the relatively vast rate of growth registered under the organised sector of the manufacturing and mining industries was counter balanced by the slow and meagre growth in smaller enterprises.

Thus, it is discovered, that with a continuous stress on heavy and basic industries, the economy of Poland continued to march at a steady rate (in terms of national income and not in the restricted sense of industrial growth) which has however, now slowed down to about 5 per cent per annum. The earlier speedy rates of rise witnessed in Poland were due to the fact that post-war reconstruction activities were intended to take the economy to at least the pre-war level in industry and agriculture; after the attainment of that level, the rate of rise has now come to the same level as planned for India's Third Five-Year Plan.

Exports of Economic and Technical Services and Consultations

POST-WAR international economic co-operation covers more and more branches of economy, science and technique, exceeding largely the framework of conventional trade agreements which, formerly, were limited to the specification of conditions for the exchange of goods, and payments connected therewith.

This expansion of co-operation gives all countries—partners in international trade—much greater possibilities of economic advantages. In the past, trade exchange—in the event the parties were countries of different economic structures (one of them exporting industrial products, the other raw materials)—resulted, especially in the long run, in rather one-sided advantages, higher for the industrialized countries.

DEVELOPMENT TRENDS OF POLISH INDUSTRY

A country offering exports of economic and technical services must really be in a position to ensure a high quality of such exports. In the case of Poland, it is the dynamic development of Polish economy which can, in the first place, ensure a proper implementation of the obligations undertaken; that development has, in the years following the war, considerably exceeded the overall development of economy throughout the world.

The data quoted below will illustrate the rapid development of Polish industry, in comparison with similar results in other countries throughout the world. These data pertain to the increase in production obtained by Poland in several of the basic industry branches.

PRODUCTION OF SOME OF THE MOST IMPORTANT LINES IN POLAND, AS COMPARED WITH WORLD PRODUCTION*

	Production Indices		
	in 1959 1937=100 1949=100		
1. Black coal			
world production in mn.t.	1885.6	145	143
Poland	99.1	274	134
2. Electric power			
World production in bn. k Wh	2099.5	471	247
Poland	26.4	727	318
3. Raw steel			
World production in mn. t.	304.0	224	190
Poland	6.2	420	267
4. Sulphuric acid			
World production in mn. t.	45.144	274	—
Poland	0.610	339	221
5. Cement			
World production in mn. t.	289.0	350	247
Poland	5.3	413	227

* All figures in this table were taken from the 1961 Small Statistical Yearbook, published by the Central Office of Statistics of the Polish People's Republic, Warsaw.

The indices illustrating the increase in production in Poland in the separate lines, are the more emphatic as this country has undoubtedly been among the most heavily devastated, and that not only by war operations, by which Polish industry has suffered twice, but also be intentional damage caused by Hitlerites during the occupation years.

It should be added that, in addition to the industry branches enumerated, which have been developing in Poland much more rapidly than elsewhere in the world, new branches of production were created in this country since the war, the production level of which cannot be compared with the pre-war status, as they were non-existent at that time. One of such branches is, for example, the Polish shipbuilding industry, created in Poland only 11 years ago. Despite the short period of time, the output of that industry was, last year, on the 6th place of the world list.

THE GROWING STAFF OF SCIENTISTS AND TECHNICIANS

The development of industrial production in Poland, which now is more than seven times up on the pre-war level, would not have been possible, had industrialization not been accompanied by the organization of training facilities for a staff of scientists and technical personnel large enough in the new situation. The achievements obtained by Poland in this field are another, and by no means less important, evidence of this country's ability to export technical and economic services.

In the years preceding the war (1937-1938), when the population of Poland was 35 million, 91,600 pupils attended regular vocational schools, and 130,000 more similar schools for working people. In the same year, the number of students in higher technical schools was about 10,000, with about 1,100 graduating every year.

At the present moment (school year 1960-61), with a population of almost 30 million, approximately 730,000 young people are studying in vocational schools. Over the past fifteen years, 930,000 skilled workers graduated from these schools, with another 460,000 trained as semi-skilled workers.

Poland now has 75 higher schools. As regards the number of students per 10,000 inhabitants, it occupies the 6th place in the world. From Poland's 22 higher technical schools, about 9,500 engineers graduate every year. In the past fifteen years, 90,700 engineers graduated from all higher technical schools in Poland. Approximately 90 per cent of Poland's present-day staff of engineers and technicians received their education already in People's Poland. The majority of them have already been in employment for from a few to a dozen or so years, in industrial works, design offices, at construction sites, in research institutes, etc. This means that Poland's staff of engineers and technicians are, in their majority, 30 to 40 years old—an age when one's creative capacities are at their highest.

In 1960, Poland had one engineer for every 80 workers—an index higher than in such economically highly developed West-European countries as Great Britain, France or Italy.

Polish engineers and technicians, who received a sound technical education and a thorough practical training, constitute a factor of importance for technical progress.

All of them, who are working for domestic needs, participate in international trade as well; and that not only indirectly, by preparing and supervising export production, but also directly, by means of exports of technical services. And this role of theirs is steadily expanding.

That export branch of Poland which involves technical services is becoming more and more important for Polish foreign trade. This is why a special Bureau for Exports of Technical Services (BEUT) has been set up some time ago in "CEKOP" Foreign Trade Agency which specializes in exports of complete industrial objects. The general development of political and economic situation—namely the conclusion of trade agreements with Poland by several Asian and African countries, and the growing demand for most various technical services on the part of Poland's trade partners—have, however, made it necessary to reorganize that branch of exports. This resulted in the creation of the "PolSERVICE" Foreign Trade Agency which, as of June 30 last, has taken over the handling of exports and imports of technical, scientific and other services, and also of all matters connected with patents and licences. This agency will—in agreement with all industry Boards—keep records of specialists in all industry branches; it will, moreover, undertake upon request supervision of the implementation by the Polish industry of contracts involving exports of investment equipment.

Exports of Polish technical services involve different activities. First of all, there are consultations, covering different operations such as supply of blueprints, elaboration of production technology, expert examinations, starting of plants, etc. Technical consultations cover all branches of production in which Polish technique has had adequate experience. It embraces, practically, all branches of Polish economy.

The numerous design offices existing in Poland in all specialties as well as departments of higher schools and 75 scientific and industrial institutes, are called to extend export services.

There exist in Poland two basic sections of research institutions taking care of technical progress: the Polish Academy of Sciences and higher school department; secondly—research departments in industrial establishments.

The Polish Academy of Sciences and departments of all higher schools are doing all the fundamental research work, involving invention of new materials or processes, and connections existing between them; while research offices in industry take care of research work which can be applied in production, evidently under consideration of all other factors, both economic and pertaining to organization, essential at large-scale production. Evidently, in practice, both kinds of research work usually intermingle, exceeding the conventionally outlined limits.

Progress in industry calls for employment of specialists, holders of scientific degrees, and also with experience in research work. However, the range and trends of technical progress are limited by economic considerations: It can be realized only if found satisfactory from the point of view of economic calculations. For technique is not an objective in itself; it only is to help to obtain an increase in national income, and an improvement in the financial situation of the country.

The tasks involving the increase in income and the raising in the living standard of the population, are implemented not only by means of investments and modernization of technical equipment, but also by finding out and utilizing all the reserves of the old equipment, by a full and rational utilization of all the means available. Thus, along with technical progress, also progress in organization is an unfailing method for raising the yield of raw materials, materials, machine, equipment and human labour. However, before any changes in organization are made, it is

highly recommended to first ask for the opinion of experienced specialists, consult scientists.

"PolSERVICE", which is to organize exports of technical and economic services, and services involving organizations, has gained co-operation of 18 basic Polish design offices, representing all boards of economy, and the health service board too. Respective agreements have been concluded, among others, with the Marine Engineering Design Office, Marine Institute, Fish Economy Association, etc. Under the agreement concluded with the Marine Engineering Design Office, that Office will supply all blueprints and cost estimates, and also all building and assembly services for the construction of sea harbours.

Some of the above-mentioned services have already been exported to a dozen or so countries. In India, for example, Polish scientists have elaborated for the "Nisco" company plans for the modernization of rolling works. Other negotiations with the same country are now in progress; they involve exports of Polish industrial licences and services for the following industries: textile, machine tools, mining equipment, internal transport equipment (industrial slide bars).

In Iraq, preliminary plans for the construction of a power industry project for Basrah district have been elaborated to orders placed by the Iraqi government; in preparation are plans for the development of the irrigation system in Amarah district.

In Afghanistan, roadbuilding plans were elaborated. To Guinea, Poland has supplied chemical laboratory equipment for geological purposes. Polish specialists are co-operating in that country in geological prospecting for manganese ore, copper, calcium, and other mineral raw materials. Geological research with participation of Polish engineers is also conducted in Mongolia, Ghana and Indonesia.

To Brazil—technical help has been extended at the starting, and then at the operation of sodium works.

Polish services, and consultation work of Polish engineers, are exported not to overseas countries only. In Czechoslovakia, emergency drillings, for finding an outlet for gases in a black coal mine, have been carried out under supervision of Polish specialists; in Yugoslavia, Poland has helped at the elaboration of the technology and technical blueprints for metallurgical works.

An important section of technical services exports are different kinds of works connected with building, city planning, architecture, building structures for residential and industrial building, hospitals, sports developments, ports, etc. We must not fail to mention here that Polish specialists have prepared blueprints for, and cost estimates of several shipyards: in Bizerta (Tunisia), Alexandria (UAR), for Burma and Indonesia.

In Egypt, Polish specialists have designed, and supervised the building of 19 crude oil reservoirs, of from 5,000 to 10,000 cu.m. capacity. All of them have been completed, and turned over for use in May 1960.

In Tunisia, Polish architects have won the first prize in the competition for the elaboration of designs of a new worker settlement for about 1000 houses (district Sidi Fat Amach). In the city of Tunis was organized last April an exhibition of Polish architecture and city-planning, called "Realisations d'architecture polonaise" which has found great favour with the public and the press.

Services of Polish city planners, architects and designers in the field of construction are not limited to planning alone—they also involve supervision of building work.

Poland is also undertaking all technical services in the field of road, railway and water transport. In the branch of power industry, Poland can accept elaboration of designs of hydro-electrical lines, high-and low-tension industrial lines, etc. Moreover, any other services pertaining to utilities: waterworks, sewers, city transportation, etc.

Exports of Polish licences and patents are another important section of services. Transactions in this field have recently been concluded with India. In Calcutta, for example, a new production department will be constructed to a Polish licence in one of the steel works: namely cast-iron cylinder works. To the E.E.C. company in Bombay, Poland has sold a licence for the production of single-phase electrical engines.

We must not fail to mention economic consultations and expert opinions extended by Poland's leading economists at the time of the elaboration of development plans of India, Ceylon, Iraq and other countries. That work has been done by Professors Lange, Kalecki and Pajestka, and was found extremely interesting at home, too. An evidence thereof can, for example, be

the publication in Poland of a book entitled: "Social and economic problems of India", containing enunciations by some distinguished political and economic representatives of India, which has been extremely popular with readers in Poland. In addition to that book, Polish daily and periodical press has carried many articles on the same subject during prof. Lange's stay in India.

Exports of Polish technical thought have a double aspect: on the one hand, they represent sales of services, and constitute thus trade transactions; and on the other—and this is their more important aspect—by consultations, expert opinions and services of its specialists, Poland gains confidence in countries, with which it has but shortly established business relations, for Polish technique, thereby paving the way for prospective exports of Polish-made complete industrial projects and investment goods.

At the present moment, Poland plans to considerably develop exports of services in the field of geology. This branch is especially important for every country which, while undertaking economic development, wishes to find out what its own raw material resources are. Along with this line, Poland also intends to substantially expand its co-operation with abroad in the field of communication systems, and also in the field of city planning, building, and development of the countryside.

Power Industry in Poland and Rural Electrification

THE Polish power industry is extremely dynamic; at the present moment (late in 1960), the rated power of all power plants in Poland amounts to 6315 MW, as against 1668 MW in 1938 (an increase by 3.8 times); production of electric energy has grown more than seven-fold since 1939; right now, Poland produces 29.3 billion kWh, which amounts to about 1000 kWh per capita, attaining standards of Italy and Japan.

The 1961-1965 Five-Year Plan provides for a further increase in production of electric energy, which is to reach 45.5 billion kWh by 1965; this will increase the value of the share of electric and thermal power production in Poland's gross industrial product from 2.1 per cent in 1960, to 2.4 per cent in 1965.

This increase will be possible by the turning over for operation of more production units, generating a total of about 4700 MW. Considering the withdrawal from operation of certain old power plants, this will mean a 70 per cent increase in the overall power of electric plants in this country.

The quantity of electric energy generated by means of the cheaper local fuel—brown coal—is steadily increasing (in 1955, it amounted to 0.7 per cent; in 1960 4.5 per cent); plans for 1965 provide for 30.9 per cent of electric power produced with the use of brown coal.

Also envisaged is a further improvement in exploitation indices: a decrease in the gross consumption of fuel per unit to 0.4 kg/kWh (1949—0.796 kg/kWh; 1955 — 0.588 kg/kWh; 1960 — 0.485 kg/kWh), and decrease in losses in the network to less than 11.2 per cent of the overall quantity of electrical power fed to it.

The number of electrified villages grows in Poland year by year at a very rapid pace. Right after war's end, less than 9 per cent of the total number of Polish villages had electricity. At the present moment, 58 per cent of all villages are electrified.

Plans for the years 1961-1965 provide for the electrification of more than 10,000 villages—this means that up to 80 per cent of all villages in Poland will be electrified by then. Long-range plans, covering the period up to 1980, envisage electrification of more than 90 per cent of farmsteads.

The expansion of power industry investments in rural areas is followed by an increase in the number of farms able to take advantage of all kind of electrical facilities. While, in 1945, a scarce 5 per cent of farms had electricity, today more than 2 million peasant farmsteads are using power, i.e. more than 55 per cent of the overall number of such farmsteads, and almost 5800 state farms (more than 90 per cent of all such farms); moreover, different other units located in electrified villages have electrical installations, namely State Machinery Centres, co-operative farms, flour mills, starch works, potato processing works, schools, stores, etc. It is expected that, by 1965, electrical installations will be set up in another 2.8 million peasant farms, i.e. in about 70 per cent of all farmsteads in Poland, and in almost all state farms (more than 6300). By 1970, the number of users of power installations in the countryside is expected to reach almost 4 million.

Power industry investments in the countryside—at their present level—permit a broad use of different electrical implements. State farms are equipped with all such electrical installations, and are supplied with a sufficient quantity of power to permit them to utilize in full all the mechanical equipment they are expected to have. Similar is the situation of co-operative farms. In all such farms there is at present no need for any expansion of power installations, for even now they are in the position to take advantage of:

complete electrical lighting system of administration premises, farm buildings and yards; electrical drive of threshing machines, fodder

beaters, silo fodder cutters, blowers, and all major mechanical units;

electrical drive of all minor implements, such as chaff cutters, cleaners, sorters, conveyors, washers, etc.;

electrified hydrophore units;

electrification of cow-sheds, electrical milking devices, fans, vacuum cleaners, manure conveyors; electrical drive in farm dairies;

electrification of poultry farms, permitting the use of incubators, breeders, and irradiation lamps; electrification of hot-beds and hot-houses by means of heaters and lamps, and electrical sprayers;

electrification of refrigerated stores;

electrical boilers and, in certain instances, high-capacity, column steam heaters with 10 kW engines; full electrification of residential premises.

If a farm cannot get electrical current from the power network, generators are used; they are also used in all emergencies.

Generators are applied, first of all, for lighting and supplying power for the following:

farms and residential settlements; industrial works, such as flour mills, saw mills; construction sites.

Power-generating units are also highly useful as a reserve power source for feeding electrical wiring in emergencies in hospitals, industrial establishments, and in all other places where an interruption in power supply means danger for human life, may cause material losses, or wherever continuity of operation of the equipment is required.

Poland is now making, or preparing production of different power generating units, from less than 1 kVA, to 250 kVA:

Power of Unit		Tension	Kind of Current
Rated	Actual		
0.625 kVA	0.5 kW	230 V	single-phase
2.5 kVA	2.0 kW	230 V	"
5 kVA	4.0 kW	230 or 400 V	single and three-phase
10 kVA	8.0 kW	400 V	three-phase
20 kVA	16.0 kW	400 V	"
37.5 kVA	30.0 kW	400 V	"
75 kVA	60.0 kW	400 V	"
125 kVA	100.0 kW	400 V	"
250 kVA	200.0 kW	400 V	"

All these units are combined combustion-electrical generators. Smaller units, up to 8 kW, are propelled by gasoline engines; the larger ones—by Diesel engines.

Units under 2 kW are portable; the 4 kW units—transportable; the larger ones—are either transportable or stationary. All transportable equipment comes either with undercarriage, or set up on trailers.

All such units have a complete measurement-and-control equipment, and installation for remote automatic control; they can also be adapted for automatic switching-in. They are supplied together with spare parts and equipment needed for operation, and with an instruction describing their starting and operation.

Work is in progress for adapting generating units for parallel operation.

Poland is also turning out generators which can be operated in tropical countries; work aiming at an improvement of this type of generators will be carried on.

Poland's Machine Tools Industry

THE economic development of a country is reflected by, and depends upon, to a large extent, on the progress it has made in the field of machine tools manufacture. The development of machine tools industry in a country also gives an indication of the advance made by that country in technology. The Socialist countries have taken particular care to foster the manufacture of machine tools in their own lands, firstly, because of the antagonism of some of the Capitalist countries towards them and, secondly, because confronted with general lop-sided development of their economy in the initial stages, they had to take up manufacture of machine tools so that they could have sufficiently large quantities of up-to-date and highly efficient machines to form the base of their industrial growth. The under-developed countries are not without reason fascinated by the charm of building up this basic industry. While planning their programmes of economic development, they have laid great stress on it.

The Socialist countries have started exporting heavy machinery and machine tools only recently. For several years following World War II, the world market for machine tools was dominated by a few Western countries which had escaped the ravages of war. A notable exception to this, however, has been the German Federal Republic whose nationals were far advanced in technical education; Western Germany rapidly built up its heavy machine and machine tools industry practically from shambles, and has again emerged as one of the most important machinery exporting countries of the world. The share of the

Socialist countries of East Europe in the world trade of machines tools is today on the increase as in evidenced by the following table:

TABLE I
EXPORTS OF METAL-WORKING MACHINE TOOLS
FROM PRINCIPAL COUNTRIES
(In \$ million)

Country	1956	1957	1958	1959
German Federal Republic	159.2	209.3	198.4	229.6
U.S.A.	149.3	183.6	173.4	127.4
Switzerland	63.9	68.7	67.2	72.5
Great Britain	66.9	78.6	68.0	63.3
Italy	19.0	24.2	25.2	26.3
France	18.4	22.1	16.2	23.2
Belgium	11.2	11.8	11.8	9.6
Austria	4.1	4.4	4.3	3.4
Japan	2.6	4.1	2.3	2.7
U.S.S.R.	9.9	9.6	18.1	21.2
Poland	6.9	7.8	9.4	9.7

Among the East European Socialist countries, development of machine tool industry in the recent past has been quite rapid in three — the U.S.S.R., Poland and Czechoslovakia. The development in Poland has been far more rapid than in the other two. The total number of machine tools produced in Poland in 1960 amounted to 24,650, as compared with only 3,825 in 1950. This represents an increase of nearly 545 per cent, as against 118 per cent increase in the Soviet Union and 130 per cent increase in Czechoslovakia.

TABLE II
MACHINE TOOLS MANUFACTURE IN
SOCIALIST COUNTRIES†

(Number of items)

Year	Poland	U.S.S.R. Czechoslovakia
1950	3,825	70,597
1955	12,723	117,087
1957	17,111	130,908
1958	19,125	138,290
1959	23,800	145,853
1960	24,650	153,711
U.S.A. (1959)		143,380

† The data pertaining to Poland, the U.S.S.R. and Czechoslovakia includes only metal-working machine tools.

FLASHBACK ON POLAND'S MACHINE TOOL INDUSTRY

The Polish machine tools industry has experienced vicissitudes not unknown in countries which have had to suffer ravages of war. Poland was manufacturing machine tools, and even exporting them, as early as the second half of the 19th century — more precisely about the year 1870. At that time and in the years that followed, quite a large number of industrial works were built up in Poland which besides diversifying its economy, led to considerable advance in technology. Particular role in this field was played by the establishment of large designing offices along with the machine manufacturing plants. These design offices worked out blueprints for new machine tools. One such establishment by the name Gerlach & Pulst was not only known in Poland, but also in the markets abroad to where it exported its high quality products. This Company at that time was considered amongst Europe's best machine tools producers.

The first major setback the Polish machine tools manufacturing industry suffered was in World War I which disorganised the entire industry and led to sharp fall in its output. At the termination of War, however, the industry was again reorganised and a number of

machine tools manufacturing units set up. In the course of time, these scattered enterprises formed a Machine Producers' Association which fostered specialised production of certain standard types of tools. Production started picking up; during the years 1925 to 1938 the output of machine tools in Poland increased to nearly 3 times that the pre-War period. Certain specialised types of machine tools, however, were still being imported by Poland during this period. Some surplus machine tools of indigenous manufacture, of course, were exported.

The outbreak of World War II dealt a death blow to the Polish machine tools industry. Most of its production works were razed to the ground by Hitler's forces; the production machinery installed there was carried away by them. The technology offices and institutes suffered equally.

The cessation of hostilities in the middle of 1940's, however, marked the beginning of a new era in the Polish economy. With the country going Socialist, greater emphasis now came to be placed on the development of heavy machinery and machine tools industry. Favourable climate for the development of this industry was created by going in for a planned economy in which industrial development was accorded a prominent place. The requirements of machine tools at home were determined within a relatively short period and the task of building up the industry on new foundations taken up in right earnest. A Central Machine Tools Design Office was created to guide the studies in new designs. The development was also fostered by supply by the Soviet Russia and the sister Socialist countries, of not only machinery and equipment but also of designs, technological blueprints and technical personnel. Polish technicians and designers were also trained by the Soviet Union during this period.

In the subsequent years, under the Mutual Economic Aid Council's aegis—an organisation composed of Poland, the Soviet Union and the other East European countries — plans were devised aiming at a division of task of designing and production of machine tools in the Soviet Bloc. This co-operation among the East European countries has enabled Poland to again stand on its legs and Poland produces machine tools not only for its domestic consumption, but also for exports to various parts of the world. A notable development in Poland's machine tools industry during the post-World War II period has been effecting of standardisation in the industry which has resulted in increased production at low cost. Further integration in the Polish machine tools manufacturing industry has been effected early this year. The progress achieved by Poland's machine tools industry since World War II is reflected in the following table:

TABLE III
OUTPUT OF POLAND'S MACHINE TOOLS INDUSTRY

	Measurement unit	1937	1949	1955	1959	1960
Overall production of metal-working tools	Items ('000)	4.3	5.4	14.5	23.8	24.6
	Output ('000 tons)	1.7	9.4	27.8	37.0	38.7
Including: cutting tools	Items ('000)	3.8	5.2	12.7	20.8	21.9
	Output ('000 tons)	1.2	8.9	22.9	28.7	30.5
Plastic machining tools	Items ('000)	0.53	0.18	1.8	3.0	2.7
	Output ('000 tons)	0.53	0.55	4.9	8.3	8.3

Exports of machine tools from Poland have also picked up appreciably during 1950's. The number of items exported which stood around only 107 in 1959 have multiplied to 1,852 in 1961; the number of items exported in 1955 was 447 and in 1959 nearly 1519. In 1960, Poland was amongst the first ten on the list of machine tools exporters of the world. Today Poland is in a position to compete successfully with some of the more advanced countries in regard to supply of automatic machine tools, milling-copying machine tools, machining wheel sets for railway, universal milling machines, etc. Poland has also started manufacture of machine tools particularly suitable for tropical countries. Poland's economic plans for 1961-65 provide for production of certain specialised items such as programmed cutting machine tools, automatic lines, single automatic machine tools, machine tool lines, and equipment for plastic processing etc.

In 1960 Poland emerged as a net exporter of machine tools for the first time in its recent history.

Poland's Participation in the Indian Industries Fair 1961

POLAND will participate again in the Indian Industries Fair to be held in New Delhi in November and December this year. Polish exhibits will be displayed in a separate national pavilion, which will be constructed under the supervision of a Polish architect. This year Polish industry will be represented at the Fair on a higher scale than before thus reflecting the increase in the commercial relations between India and Poland.

The following Polish Foreign Trade agencies will exhibit various products of the Polish Industry.

CEKOP:—

Cekop prepares technical designs and technological documentation and exports machinery and plant for complete factories as well as supply technical assistance by supervising erection and by putting the plant into operation. Cekop supply also technical know-how necessary for the manufacturing of new products. In the Pavilion, they are displaying only the models of some Plants as noted below:—

1. Pit-frame
2. Boiler section
3. Foundry
4. Chimney stock
5. Tank Bottom
6. Power House
7. Fan type cold store
8. Samples of Cellular Concrete [Building material]

(At the Seventeenth Annual General Meeting of the shareholders of the Praga Tools Corporation Ltd., Shri S. Ranganathan, Secretary, Ministry of Commerce and Industry and Chairman of the Board of Directors said, among other things, that the company has negotiated and signed an agreement with CEKOP of Poland for the preparation and supply of a Project Report for a unit manufacturing tools of various types. This Project Report is expected to reach the company in a month or two. The Government of India, he said, have already earmarked Rs. 1 crore out of the Polish credit for the use of the company. A second agreement with CEKOP for the supply of machinery under this credit arrangement is under way).

CENTROZAP:—

The main items which will be displayed by the above agency in the Polish Pavilion are given below:—

Model of a mechanized mine, electric boster, percussion drill with complete equip., electric flameproof

The surplus is anticipated to grow; the Polish machine tools industry, it is stated, has orders on hand from abroad until late 1965. Polish machine tools industry's agents are also active abroad to book orders.

Poland's exports of machine tools to India have also picked up in the recent past. The total value of machine tools exported by Poland to this country in 1959 amounted to about 10 per cent of her overall export trade in this line. The number of tools exported amounted to 250. In 1960 the number of machine tools items imported by India from Poland increased to 300 — about 18 per cent of the value of Poland's machine tools exports. Recently, talks have been held between the two countries on the possibility of increasing trade in this line. Though Poland's share in India's imports of machine tools is as yet relatively small (0.02 per cent in 1958-59 and 3 per cent in 1959), it is likely to go up in the years to come because of the rupee payment agreement that governs foreign trade between the two countries.

rotary coal drill, hexagonal tungsten carbide drill rods, prop withdrawer, exploders, isolating oxygen apparatus, self-rescue co-absorber, co-detecting pipes, detecting apparatus, ohmmeter, pneumatic jolt-squeeze moulding machine, electromagnetic drum separator, knock-out grid, portable belt aerator with electromagnetic separator, vibratory screen with electromagnetic separator, rolling mill roll, wheel set, tyres, rail type 90R fragments, indicator benzene mining lamp, turbo-electric compressed air mining lamp.

CIECH:—

CIECH will exhibit the following items:—

Dyestuffs coloured samples of stuffs and fibres, organic chemicals, pharmaceutical products, advertisement-patterns of paints and varnishes, photochemical products, pressed carbon products, inorganic chemicals.

ELEKTRIM:—

In the Polish Pavilion the following items will be displayed by this agency:

Rotary welding sets, battery electric trucks, flame-proof mining transformer station, flame-proof squirrel cage electric motor, oil testing set, link testing ammeter, universal link-testing instrument, lightning arrestors, voltage transformer, single-phase electric meter, single-phase fractional horse power motor, electric motor, rotary welding set, single-phase portable generating set, oil fired furnace with measurement control panel, electric drying oven, neon rail indicators, universal low voltage circuit-breaker, electrical measuring instruments, earth-resistance meter, technical wheatstone bridge, resistance box type, galvanometer, H.P. signal generator, valve isolation meter, out-put power meter, valve coil-meter, regulated autotransformer, cathode ray oscilloscope, T.V. valve ohm-voltmeter, valve millivoltmeter, cathode ray oscilloscope, double beam ray oscilloscope, cells, battery, gasproof alkaline accumulators, fraction cell, telephone sets, selenium rectifier, infrared type, CB private manual branch exchange switchboard, fluorescent lamps, incandescent bulbs, industrial T.V. equipment, amplifier, insulator, ferrit isolator, phase-shifter, local fire alarm equipment, mining signalling equipment.

IMPEXMETAL:—

They are exhibiting the following items in the Polish Pavilion:

Ball & roller bearings, special exhibit set with auxiliary appliances, cylindrical double row roller bearings for railway purposes, double row roller bearings etc.

METALEXPORT:—

They will display the following items:

Carding willow, automatic carding set, helical pump, pumping set, submersible pump, automatic nail making machine, compressor, gas cylinder, cast iron soil pipes and fittings, malleable iron fittings and galvanized, material for tests and accessories for attendance of universal punching & shearing machine, soil pipes, ring spinning frame, hard waste opener, various materials necessary for erection, auxiliary apparatus loom for cotton.

MOTOIMPORT:— Export-Import.

They are displaying the following items:

All-purpose test-bench for testing motorcar electrical equipment, test case, testing apparatus for automobile electrical equipment, armature testing apparatus, condenser tester, flames analyser, tyre compressor, air compressor, lubricating aggregate, spraying guns complete, injector and nozzle testing unit, spack checking and sand plating unit, hydraulic lifting jack, foot operated grease pump, lever operated grease gun, pneumatic grease pump, grinder power tool for brake shoe, cylinder re-boring machine, grinding machine for valve faces, valve seat refacing power tool, cylinder honing machine, special equipment for grinding machines, microbus "Nysa", delivery van "Zuk", motorcycle "Junak", wheeled tractor "Uzus", crawler tractor, plours, disc harrows, mounted multi-purpose implement, Z-5 horse mover, fire pump, parts of cars.

POLIMEX:— Export-Import.

They are displaying the following items:

Universal excavators, stationary free-fall concrete mixer, power bar eropper, power bending machine, pipe

threading machine, vacuum brick press, worm brick press, semi-automatic brick cutter, hydraulic plastic press, universal sheet filter, saturator, aerated carbonised water filter, orangee drum, double roller milk type, pneumatic lifting, free swinging plansifter.

SKORIMPEX:—

In the Polish Pavilion they will exhibit only tyres.

VARIMEX:—

They will display the following items in the Polish Pavilion:—

Industrial sewing machines, optical pirometer, industrial pressure gauges, refrigeration controls, household gas meter chlorator, foot electro dental origine, universal operating table, accessories, dental lathe with chucks, set of medical instruments, P-H meter with millivoltmeter, spectacle trial cases, aciascopy frame keratometer, sterilizer for surgical instruments, shadeless operating lamp, surgical diatemy lancetron, galvanostimulator, photo camera, projector, equipment to projector, episcop, epidiascope instar, projector, amplifier, apparatus for elektroforesis without analyzer, optical instruments, brinells hardness tester, apparatus for measuring deep drawing quality of sheet metal, ultrasonic flaw detector, ultrasonic concretescope, hydraulic press, laboratory distilling apparatus, colorimeter, magnetic stirrer, electric thermostat, accessories, motor-anglecentrifuge, pharmaceutical balance, torsion balance, water bath, universal laboratory stirrer, flat wedge gate valve, oblique acide valve of silunim, Oval wedge gate valve with flange connoction body of cast iron packing of brase pnom, stop valve sereved body of cast iron packing of brase pnom, cast iron stop valve flanged brass packing pnom, cast iron flushing cistern, cast iron foot stand closet, cast iron support stand for bathing stove, workshop tods, analitical balance, automatic analitical balance, semi-microanalitical balance.

Shorter Notes

MINING MACHINERIES

THE MAJORITY of mining machinery manufacture and equipment factories in Poland are operated by the Mining Machinery Union in Byton, grouping 16 mining machinery and equipment factories, 2 drilling equipment factories and 5 power plant equipment manufacturing and repair works. The mining machinery industry is planned to develop at a much higher rate than the mining industry itself, so that increased mining equipment exports will be possible.

Since, apart from up-to-date machine tools, increase in the total production area of the factories in operation is necessary to augment the production capacity of the factories, the following factories have so far been expanded:

1. The Mining Machinery Factory at Niwaka which manufactures loaders, scraper conveyors, winches and hoists with an annual production capacity exceeding 13 thousand tons.

2. The Julian Lenski Mining Machinery Factory at Katowice-Piotrowice with an annual production capacity of 20 thousand tons specialises in the production of coal-cutters, coal-cutting combines, winches and belt conveyors. Opened in 1921, this factory has now been fitted with well-lit spacious production shades and up-to-the-minute machine tools to produce, among other things, the WEN-505 coal-cutter for use in thin seams in difficult geological conditions, the KNB-2 drum type, short wall cutting combine, as well as long wall coal-cutting combines.

3. The Mining Machinery Factory at Rybnik, specialises in the production of scraper conveyors. The

"Grot" conveyor intended for use in haulage galleries and "Slask" armoured scraper conveyor designed for transport of the coal cut from the face are particularly popular.

Among the newly started mining equipment factories, the following deserve mention:

1. Mining Machinery Spares Factory at Oswiecim, manufacturing spare parts for machines of both Polish and foreign make. In addition to spare parts, the factory produces also mining machinery. Much interest had been awakened by the large-diameter drilling machine of WWP-IA type.

2. The T. Zarski Mining Machinery Factory at Piotrkow Trybunalski, specialises in the production of machinery and equipment for mechanical preparation plants of which particularly noteworthy items are: the PA-3, 8-chamber, rotor-type floatation machine for the preparation of coal duff, with a capacity of upto 35 tons of coal duff per hour, and the cascade type, heater-drier with a capacity of up to 25 tons coal duff per hour.

3. The Rescue Equipment Factory at Tarnowski Gory, manufacturing protective respirators, artificial respiration apparatuses, oxygen breathing apparatuses and other rescue equipment.

The production capacity of the factories referred to, with 3-shift-per-day operation, is to reach 400 thousand tons annually; about 4000 machine tools will be operating in the factories, and the quality of the machines and equipment manufactured will be consider-

ably improved. With this end in view, the following measures are being taken:

1. Setting up of specialistic design offices in factories.

2. The extension of the work's prototype departments.

3. Use of high grade steel and other materials to reduce the weight of the machines and equipment manufactured.

4. Wider use of plastics and corrosion-resistant coatings.

Much more exacting quality control with respect to the mining machinery and equipment produced will be ensured due to:

1. Setting up of testing stations for all series-production units;

2. erection, at Piotrkow Trybunalski, of an experimental station for mechanical coal preparation plants;

3. application of a greater number of more up-to-date measuring instruments in the works' technical inspection departments.

In addition to the works discussed above, the production of electrical equipment for use in mines has considerably been developed in Poland. It is worth noting the explosion and flame-proof machines and equipment of Polish production have made a name for themselves in a number of countries the world over.

ELECTRONIC AND TELECOMMUNICATION INDUSTRY IN POLAND

ELECTRONIC and telecommunication industry in Poland has made rapid strides during the last few years. While its development started in 1930, it is the period of the First Five-Year Plan 1956-60 that has brought about a substantial increase in the rate of production. The range of goods manufactured by Polish electronic industry has now become quite wide as new items are being constantly added to it. Whereas in Britain the electronic industry production increased annually by 10 per cent on the average during that period, in Poland a fivefold increase was noted within five years, from 1956 to 1960. The value of all the electronic and telecommunication industry production increased from 1,200 million zlotys to 6,100 million zlotys during this period. The increase was particularly marked in the case of electronic equipment used in the various branches of the economy. Some of the goods manufactured by the Polish electronic industry at present are: radio, television and radio-location equipment, electroacoustic and measurement equipment, and telecommunication equipment transmitters, receivers, radio-telephones and others. Another important group consists of electron tubes generally used in electronic equipment, cathode-ray tubes used in television sets, transmitter tubes for a wide range of frequencies, as well as semi-conductor diodes. Belonging to the same group are transistors and resistors, various types of capacitors, loudspeakers, transformers, ceramic radio parts and ferrite elements. A wide range of lighting lamps as well as machines and metals used in their production constitutes another group controlled by the electronic industry organisation.

It is now gathered that the electronic industry is to start production of radiolocation equipment and transistors for use at sea and electronic computing

machines for statistical offices and larger industrial establishments. It is also to expand the production of automation, control, regulation and measurement equipment, semi-conductor elements and electronic automation devices.

Export potential of the industry is also great. Exports of complete plants cover not only the delivery of the equipment but also full technical and economic consultation and advice, assistance in designing, supervision over the assembly and starting operations, as well as the training of local technical staff.

Telecommunication industry has not remained behind and can well claim an equally good progress. Some of its new factories were built after the War. Its annual production approached 1,500 zlotys in 1960. At its works there are various groups of equipment produced like automatic subscriber telephone exchanges for local and trunk calls, manual telephone exchanges and various types of telephone sets; cable teletransmission equipment, multi-channel telephone and telegraph equipment, industrial control, signal and alarm installations; control and measure equipment and feeding equipment.

The future of the industry is quite bright as Poland possesses high quality materials, highly skilled designers and executors.

THE CHEMICAL INDUSTRY IN POLAND

THE GROWTH of the Polish chemical industry has been quite remarkable. Between 1938 and 1960, the increase in chemical production was more than fifteen-fold. Many novel chemical products are turned out every year by the industry, including new brands of dyestuffs, medicaments, plant protection agents etc. Now the chemical industry has reached a stage that it is turning out polystyrene, synthetic resins, synthetic rubber, synthetic phenol etc.

A major expansion in Polish chemical industry during 1961-65 is planned for large-scale petrochemical production based on domestic resources of natural gas and waste gases supplied in big quantities by crude oil processing plants. Oil gases for syntheses will also be made available by special installations for benzene pyrolysis. The Plan assumes a much quicker development of chemical production than of the entire industrial output. The target for the former is an increase of 109.3 per cent by 1965 over the present level as against an increase of 51.9 per cent for the latter. According to the targets stipulated under the Five-Year Plan, synthetic rubber output will rise by 1965 to 45,000 tons annually, that of synthetic detergents to 9,000 tons, of dye-stuffs to approximately 15,000 tons and of paints and enamels to 181,000 tons. At the same time a major increase in pharmaceuticals production is also stipulated. The production of sulphuric acid (based upon home sulphur supplies), of calcinated and caustic soda, of fertilizers and weed killers is also proposed to be enhanced. Nitrogenous fertilizers will be based entirely on the processing of natural and coking gas.

Present exports value of chemicals is about 60 million U.S. dollars which equals approximately tenfold the pre-war level. It represents also nearly 5 per cent of the entire exports from Poland, with a tendency towards a steady growth. According to the Five-Year Plan, the value of exports would by 1965 be around 110 million U.S. dollars.

COMPOSITION OF INDIA'S FOREIGN TRADE WITH POLAND
(1957-58)

(Rs. '000)

Yugoslavia in India's Third Five Year Plan

THE current Supplement on India and Yugoslavia was intended to be issued on the last Friday of this month which happens to be near the Yugoslav National Day on the 29th. The coming of the Indian Industries Fair and the possibility that Indian readers would wish to know more about Yugoslavia when visiting the spacious display in that Fair have prompted earlier publication. "The Eastern Economist" is happy to be able, first, to provide a guide or at least some signposts on a journey of discovery which is essential for all forward-thinking Indian citizens.

It is not that the Indian and Yugoslav political systems are alike or, indeed, that there is a unanimity of views in regard to political "neutralism." The Belgrade Conference failed to show parallelism in respect of immediate policy, and, at the time of writing, the marked differences between India and Yugoslavia in regard to the Berlin situation in which Marshal Tito has endorsed the Soviet line suggests that there are significant differences even in a neutralist approach. There are more radical differences in terms of the democratic structure of thought and its expression. Some would say that there is less political freedom in Yugoslavia, but that there was more economic freedom than in India. Others might argue that the word 'freedom' in the context of overall progress has two components and it is the resultant which determines the volume of total freedom. Is the volume of freedom in India substantially greater than that in Yugoslavia? It is difficult for those who have not lived under the Yugoslav system to give a definite answer.

While doubts might exist here and there—and undoubtedly great differences in philosophy obtain—the quality of Yugoslav performance and, indeed, the spectacular rise in national income in the last five or six years

show that, even if Yugoslavia is not to be copied in detail, she has sources of strength which, for some reason or another, India has not experienced. Few Indians are aware that India's rate of economic progress is less than half that of Yugoslavia: that this rate of economic progress has been achieved in spite of the fact that the country was devastated by war and went through a cold war in which non-economic considerations dominated the location of steel plants as well as other major economic units. At the same time, the old leadership of Yugoslavia was almost wiped away and she has had to build a generation of managers many of whom established themselves well before 35, and have managed to train and enrich comparatively young people by the devolution of responsibilities on a grand and daring scale. These are points which in any comparison between the two countries must show India in a lowlier place. It is not, however, the intention of this Supplement to suggest that the greatest success of Yugoslavia at this time is reason for us to copy the Yugoslav system in every respect. It is, however, to suggest that there are lessons to be learnt in techniques of management, participation and decentralisation, which, while not inconsistent with our political principles, are somehow or another obstructed by economic confusion and, in the last analysis, a lack of human trust and loyalty. The great success of Yugoslavia might in one sense be called technological, because they have exploited modern techniques. But in substance there are human successes providing quality of leadership which might be described as one of the greatest in the world.

Those who have seen this remarkable experiment and have felt the revolutionary character of its operation and its abiding virtues in the creation of human dignity as well as material production are anxious to

share that experience with their fellow citizens in India. "The Eastern Economist" is happy to have received co-operation of high officials of Yugoslavia in regard to factual data, and in particular in regard to the two articles which follow. These articles are particularly commended because they strike the note of balance in the development of an economy and balance is a factor which, it might be contended, has not yet been found in Indian production. All in all, one might also argue

that apart from an understanding of Yugoslavia's tremendous achievements we have a more mundane interest in her progress in that Yugoslav trade with India has doubled in the last two years and is capable of doubling every two years, possibly for the next six years. This is a measure of the new capacity we are finding in one another. It is also a measure of growing understanding and a wish to march together, though not on parallel lines.

Economic Co-operation Between India and Yugoslavia

By **SERGEJ KRAJGER,**

President of the Committee for Foreign Trade of the FPR of Yugoslavia.

I SHOULD like to thank, first of all, the editor of "The Eastern Economist" for his kind decision to devote the columns of his esteemed journal to the economic relations between Yugoslavia and India. This decision comes at an appropriate time considering the forthcoming talks on economic co-operation in New Delhi during which the results achieved so far in the promotion of economic co-operation will be reconsidered and new possibilities explored.

Yugoslavia is one of the countries which was the first to endeavour to establish direct trade relations with India upon her attainment of independence. Furthermore, mutual adherence to the principles of active co-existence and a similarity of view as to what international economic relations should be have provided a firm platform for the development of bilateral economic links and for discovering possibilities for new forms of cooperation. The favourable climate prevailing in political relations has also had beneficial influence on the development of cooperation on the economic and technical plane. The economies of Yugoslavia and India, which are constantly growing and are complementary to a considerable extent, as well, constantly promote not only economic but also all other forms of relations, providing them with a rich material content.

The planned economies of both countries, however, demand a more far-reaching concept and regulation of trade. The existing three-year Trade Agreement, the Agreement on Crediting Capital Investment Construction in India as well as the Agreement on Scientific-Technical Cooperation constitute the first foundation on the plane of the establishment of long-range cooperation between our two countries. This can introduce a valuable element of stability at a time when the integration movements and regional groupings of the highly developed countries are bringing about developments which affect the exports and balance of payments of underdeveloped countries as well as their position in the world market. The results achieved so far in mutual trade and in cooperation in investment construction have already shown that a long-range approach to economic relations is justified. Furthermore, the concept of a long-term approach in mutual relations offers the possibility for a continuous expansion and evolving of new forms of cooperation. In view of this, the present level of Yugoslav-Indian economic relations should not be viewed merely from the point of view of figures, but attention should be also drawn to the rapid growth of trade in the past three years and to the broad spirit in which both sides approach the question of the further strengthening of economic relations.

If we compare the total level of trade in the course of the last five years, we note that the total volume of trade increased from 1.4 billion dinars in 1956 (4.7 million dollars) to a total of 5.8 billion dinars in 1960 (19.4 million dollars). On the other hand, during the

first nine months of this year, trade exchanges have already reached the 1960 level. The foregoing data clearly indicate that the rate of increase of mutual commodity exchanges has exceeded by far the rate of growth of foreign trade both of India and of Yugoslavia. Yugoslav industry has already established itself firmly in the Indian market. It has gained the reputation of a reliable and competitive supplier of industrial and general consumer goods, including complete installation for industrial plants and other equipment. The construction of a number of industrial projects has been undertaken in different parts of India, as for example: filling up of saline lakes in the vicinity of Calcutta; delivery of equipment for the second and the third construction phase of the Barauni thermo-electric power plant; construction of the Durgapur gas pipeline; delivery of equipment and assembly for the Mata-tilla dam and the Yaldhaka and Trisuli hydro-electric power stations; boiler plant and equipment for the Basin Bridge thermo-electric power plant etc. Ten to fifteen new construction sites will be opened in India as a result of the implementation of 40-million dollar credit that the Government of the Federal People's Republic of Yugoslavia has placed at the disposal of the Government of India.

Parallel with this process, Indian exports found their place on the Yugoslav market. In this respect an encouraging growth has been registered both in regard to volume and nomenclature. An agreement has been concluded on long-term deliveries of iron and manganese ore. In addition to traditional Indian exports, which used to consist mainly of primary products, Yugoslavia has begun to import industrial products as well. Such exports have been made possible by the development of Indian industry. Thus, in the course of this year, textiles, linoleum pumps, chemicals and other industrial products have been imported from India.

However, the results achieved thus far in the promotion of mutual trade are far from meeting fully the needs of the two developing national economies or their real possibilities. In this respect it will be necessary to work towards a better familiarization with mutual possibilities and towards the finding of new forms of co-operation. The participation of Yugoslav enterprises at the Indian Industrial Fair 1961, being held in New Delhi, and the participation of Indian firms at Yugoslav fairs will further strengthen useful contacts between the businessmen of the two countries.

Concurrently with the advancement of commodity exchange, we are faced with the necessity of promoting all forms of industrial co-operation. In this sense it will be necessary to develop a far greater activity in the future, because co-operation in industrial production is one of the basic pre-conditions for the successful and long-term development of economic co-operation and trade, being, at the same time one of the most effective

means for overcoming, on the one hand, negative impact of existing integration movements in the world on the development of less developed countries, and, on the other, for introducing profit-yielding mass production. The successful industrial development of India and Yugoslavia provides a sufficiently broad basis for the study of the possibility of establishing closer industrial ties between the industries of the two countries. The exchange of experiences and technological processes as well as assistance in the form of the sending of experts and training of personnel would be one of the initial and very important elements in this respect.

Structural Changes in Yugoslav Economy

By **JANEZ STANOVNIK**

Director, Institute for International Politics & Economy, Beograd

ECONOMIC DEVELOPMENT is not merely quantitative growth of production. It is first of all a qualitative change in the structure of the whole national economy. The main task of economic development policies is to transform the national economy which has been characterized by low productivity levels, backward technology and low capital formation, into an advanced and thriving national economy.

From the very beginning economic policy in Yugoslavia—like in any other underdeveloped country at the beginning of its economic development—had to face several main "strategic" problems,* as such

- (a) the problem of accumulation;
- (b) the problem of industrial versus agricultural development;
- (c) the problem of allocation of resources between capital goods and civilian consumer goods industries;
- (d) the problem of building up the infrastructure of the country versus building up the commodity production facilities.**

The problem of accumulation of capital for investments has, of course, posed itself primarily in the form of need for a higher rate of accumulation.

* Here the term "strategic" is used in an indirect sense, the same as by Albert O. Hirschman, in his study "Strategy of Economic Development", Yale University Press, New Haven, 1958.

** Concerning Yugoslavia, this problem has been treated in the most comprehensive and systematic way by Dr. Nikola Cobeljic, in his study "Politika i Metodi Privrednog Razvoja Jugoslavije" (Policy and methods of Yugoslav Economic Development), Ekonomska biblioteka NOLIT, Beograd, 1959, while in world literature it has been treated in a study of MIT, Center for International Studies, Investment Criteria and Economic Growth, Cambridge, Mass 1954, and in the recent study of Benjamin Higgins, Economic Development, Problems, Principles and Policies, W.W. Norton and Co., New York, 1959, and Pei-Kang Chang, Agriculture and Industrialization, Harvard University Press, Cambridge, 1949. In the Soviet literature this problem has been particularly elaborated by J. A. Kronrod in his book Socijalisticheskoje Vospriozvodstvo, Gosudarstvennoje Izdatel'stvo Politiceskoj Literaturi, Moskva 1955 and Notkin, Vaprosi Teorii socijalisticeskogo vasproizvodstva, Gospolitizdat, Moskva 1950. See also papers of Polish economists in the symposium published by Ekonomska biblioteka br. 12, Nolit, Beograd, 1960.

The results thus far achieved in the promotion of mutual trade relations, irrespective of their significance, must nevertheless be considered as initial steps towards the realisation of existing possibilities. Their importance lies in that they serve as a proof that economic co-operation, both in the field of trade and in that of economic development of Yugoslavia and India, is in the mutual interests of the two countries and can substantially contribute towards the strengthening of national independence and the overcoming of the legacy of economic underdevelopment.

This need by itself has determined the solution of the question whether accumulation will be formed by the central authorities of the State or if the formation would be decentralized. As the initial stage of economic development required a maximum effort of the whole national economy, no one could have expected that individual decentralized units would by their own decision restrict consumption in order to increase accumulation. In addition, no one could have expected that the individual decentralized units would allocate the expenditure to be financed out of their own capital funds according to their priority projects at this first stage of economic development. This is the reason why during this first stage it was necessary to proceed with compulsory formation and allocation of capital investment funds. Just at the second stage of development, when new stimuli were built in the mechanism of the economy, thanks to a certain number of basic projects, it was possible to decentralize to a large extent the collection and allocation of the accumulation without fearing a decline of the rate of investment. It is precisely here that we may seek the reason for the most characteristic phenomenon of the development of the Yugoslav economy, namely, a continuous tendency towards increasing investments, alongside with a growing decentralization of capital formation and investment.

AGRICULTURE VS. INDUSTRY

In Yugoslav economic policy many problems did not appear in the form of possible alternatives but rather in the form of priority choices. There can be little doubt that continuous economic growth cannot be achieved without raising productivity levels in agriculture. The question which has to be solved is whether an underdeveloped country should start modernizing its farm production, or should the modernization of its agriculture be a process parallel to that of industrial development, or should it adopt the third alternative which consists in delaying agricultural development, for the sake of concentrating all the forces at its disposal on industrial development with the plan to return to the development of agricultural production at a later stage of economic development.

The traditional form of technology on the farms was labour intensive, while modern methods tend to be capital intensive. This, in turn, implies that the introduction of new farming techniques—more particularly in countries plagued by rural overpopulation—shall reduce the labour force necessary to agriculture faster than other branches outside agriculture could absorb it. As a result, technological advance in agriculture will not directly involve an increase in overall national production and income; it rather seems that its most immediate consequence will be the freeing of agricultural labour force and a subsequent pressure on

urban centres. During the first stage of economic development all the possible arguments speak in favour of giving priority to industrial development; industrialization creates new employment opportunities, directly in manufacturing industry and at the same time increases employment opportunities in the sector of services and construction industry; through the industrialization process self-subsistent agriculture is to a large extent being commercialized, diversification of agriculture is being promoted, this being an indispensable prerequisite for achieving a higher level of labour productivity in villages; industrialization helps to organize the production of a series of mechanical and chemical products necessary to modern agriculture; industrialization creates processing facilities for many primary products and helps to increase and stabilize demand from this sector etc.

This is the reason why investment in agriculture remained at a relatively low level, during the first stage of economic development, running up to 1953, while after that period they were rapidly increasing. On the other hand, investment in manufacturing was rapidly increasing, relatively and in absolute figures.*

CAPITAL GOODS VS. CONSUMER GOODS

The problem of choice between investment in production facilities in the sector of capital goods, or in the sector of consumer goods is similar to the one above. A limited domestic market in a relatively backward country cannot serve as a basic promoter, let alone as an allocator of economic resources in order to promote an accelerated growth of the economy.** The task of "strategy" in economic development lies precisely in such allocation policies as regards the resources of the economy which in the long run serve to maximize economic growth. For this reason it is easy to understand that during the first stage, ending 1953, investment in capital goods production facilities amounted to

* During the 1947-1956 period investment in the manufacturing industries, mines and building construction accounted for 62 per cent of total gross investment, while during the same period investment in agriculture amounted to a mere 7 per cent. It is easy to see to what extent this pattern of investment has been overstrained when we compare it with the investment structure of the First Five-Year Plan of the Soviet Union for the period running from 1928-1929 to 1932, when investment in manufacturing industries, mines and building construction absorbed 41 per cent of the total amount of gross investment, while the share of agriculture was 19.1 per cent, See M. Kaplan, Soviet Capital Formation and Industrialization, Rand Corporation, Santa Monica, 1952, Table 7 page 151, or with the investment structure of the First Five-Year Plan of India, where the share of investment in manufacturing industries and mines amounted to 7.6 per cent, compared with 43.2 per cent representing the share of investment in agriculture power and irrigation projects. See Government of India, Second Five-Year Plan 1956, page 21, 22 or with the First Plan of Indonesia where the share of agriculture is 38 per cent, while industry and mines were absorbing 25 per cent of the total amount. See Benjamin Higgins, Indonesia's Economic Stabilization, Institute of Pacific Relations, page 178.

** Ragnar Nurkse, in his study "Problems of Capital Formation in Underdeveloped Countries," Basil Blackwell, Oxford 1953, professes a contrary opinion, which has been exposed to criticisms emanating from Lewis, Singer, Hirschman and others.

† Yugoslav Federal Assembly, Industrijski razvitak Jugoslavije (Industrial Development of Yugoslavia), Kultura, Beograd, 1957, page 9.

23.4 per cent of total gross investment, while investment in consumer goods production facilities was no more than 16.8 per cent of total gross investment. Up to 1956, an important change took place, with a reverse ratio—thanks to the impact of new economic policies inaugurated in 1953. By that time investment in consumer goods production facilities increased to 24 per cent of the total gross investment, whereas investment in the sector of capital goods production declined to 16.1 per cent.†

INVESTMENT IN INFRASTRUCTURE

The same economic thinking also applied as regards investment in the infrastructure of the country. Even in assuming the risk that this may involve a certain disinvestment in public utilities sector, efforts were made to raise to the maximum the degree of utilization of the existing transport system, of housing and trade facilities, in order to free to the largest possible extent the available resources for immediate wealth producing investments.

The pattern of investment in several key periods of the post-war development in Yugoslavia reflects the above strategy, as can be seen from the following table:

STRUCTURE OF GROSS INVESTMENTS DURING THE 1947-1959 PERIOD

Branch of the economy	(In percentages)		
	1947-52	1953-56	1957-60 Estimates concerning the implementation of the plan
Manufacturing industry and mining	56.4	59.1	43.8
Agriculture	7.7	7.0	15.8
Forestry	2.3	1.8	1.5
Building construction	3.4	3.2	3.6
Transportation	26.7	22.9	22.4
Commerce & tourist trade	3.0	5.0	6.5
Artisan trades	0.5	1.0	1.4

A rapid rise of investments in the economy was not immediately and proportionately reflected in the movement of the gross product, neither in the individual branches nor in the economy as a whole. The tempo of maturing of particular forms of investment was rather unequal, although the time series show that the strategy used in the initial period of Yugoslav development policies was instrumental in inducing a rapid acceleration in the growth of national income in the subsequent period.

YUGOSLAV NATIONAL INCOME DURING 1939 - 1960

(In millions of dinars, at constant 1956 prices)

Year	National Income
1939	985.7
1947	968.1
1948	1,149.0
1950	1,132.3
1951	1,232.6
1952	1,055.2
1953	1,269.0
1954	1,315.7
1955	1,455.5
1956	1,449.1
1957	1,781
1958	1,811
1959	2,135
1960	2,420

An unavoidable consequence of the strategy used in framing the development policies, laying stress on the necessity of achieving a maximum increase of national income, was the unequal growth of individual branches of the economy. The changes which have been registered in the structure of national income — as between the individual branches in the economy — reflect, on the one hand, phenomena of temporary disequilibrium caused by policies aiming to promote the long-range development of the economy, while on the other hand, they reflect a long run tendency towards

structural changes which enable the raising of the whole economy to higher productivity levels.

The fifteen-year long process of accelerated economic development of Yugoslavia has brought the national economy to an incomparably higher level than before the war. This development has produced deep changes in the structure of employment. The changes in the structure of national income were even deeper if we consider the fact that during the last fifteen years manufacturing industry and agriculture have changed their respective places in the overall pattern of income.

STRUCTURE OF NATIONAL INCOME ACCORDING TO BRANCHES

(In Percentages)

Branch of the Economy	1939	1949-51	1952-56	1960
Manufacturing industry	26.8	35.8	41.7	43.5
Agriculture	44.3	34.4	29.6	23.9
Forestry	4.6	5.3	3.4	1.7
Building construction	2.5	8.5	6.6	5.5
Transportation	6.6	5.2	5.0	7.8
Commerce	8.1	6.7	8.5	12.6
Artisan Trades	7.1	4.1	5.2	5.0

India and Yugoslavia: The Pattern of Growth

THE pattern of expansion of the Yugoslav economy is best illustrated by a study of the national income figures. Between 1947 and 1959 the national income (at constant prices) of Yugoslavia more than doubled. The progress recorded during the last five years was of great significance because the Social Product rose by 80 per cent from 1.55 milliards* of dinars in 1955 to 2.79 milliards* of dinars in 1960. On the other hand, the national income (at constant 1948-49 prices) of the Indian Union rose at a steady rate of about 3 per cent per annum during the last decade. It rose by about 42 per cent from 88.5 billions of rupees in 1950-51 to 125.3 billions of rupees in 1960-61. The tempo of growth is likely to be accelerated during the Third Five Year Plan when a rise of more than 30 per cent is expected to be recorded in five years. It may not represent as high a rate as that recorded in Yugoslavia during the last five years, but considering the prominent part played by agriculture in India's national economy, this is likely to be a no mean achievement.

In the case of Yugoslavia, the growth of national income was predominantly based on industrial production which was designed in the first few years, for repairing the war damages. The foundations for industrial expansion were laid in 1947 and the volume of industrial production has grown four-fold since then. It was the leading role played by industry which accelerated the rate of growth of the Yugoslav economy. It also brought about a great structural change. In the first years after the Second World War, i.e. up to 1950, the share of industry in the Social Product was not more than one-third; between 1956 and 1960, it increased to 45 per cent of the social product. This vast expansion in industry naturally resulted in decreasing the share of agriculture from 40 per cent to 25 per cent of the Social Product during the same period. The contribution of other activities in the national income was considerably smaller, in percentage terms. In any case, transport, trade and handicrafts strengthened their improvement while the contribution from forestry and building declined gradually. In the

case of the Indian Union, a slow and hesitant structural change has been witnessed during the last decade. The share of agriculture, animal husbandry and ancillary activities was about 49 per cent of the national income in 1950-51. It stood reduced by 3 per cent to 46 per cent in 1960-61. Despite the strident expansion in the organised industrial sector, the percentage share of mining, manufacturing and small industries remained static around 17 per cent of the total during the last decade. Marginal gains were recorded by "other services" and commerce, transport and communications. It is obvious that the fast structural change witnessed by the Yugoslav economy is slow in coming over the Indian economy, and it may need another three to four Five Year Plans to reduce the share of agriculture so as to give greater importance to industry.

One of the important features of the Yugoslav economic development in the post-war period and one of the basic conditions for the spectacular growth and the changes in the economic structure is the relation between investment and personal consumption in the

* Millard = 1,000,000,000.

national income. The rate of investment has been consistently very high and works out at about 30 per cent of the Gross Product. Personal consumption hardly takes more than half of the Gross Product and general consumption some 13 to 15 per cent. On the contrary, the rate of investment in India is not significantly high. In 1950-51, the base year of the First Five-Year Plan, it was estimated that 95 per cent of the national income was consumed while only 5 per cent was invested. During the past decade, the rate of investment has

been steadily raised to about 11 per cent of the national income. The gradual stepping up of the percentage of national income invested is likely to lead to an investment of 14 per cent of total national income by the end of the Third Plan. This will be nearly half of the present rate of investment in Yugoslavia. Once over again, it may be stressed that the rate of investment in the Indian Union may not be raised to 30 per cent of the national income because of the heavy dependence of the economy on the primary sector and because of the highly fluctuating performance of the sector. The percentage of investment will be steadily raised during the Fourth and the Fifth Five-Year Plans so as to rise to the level of 20 per cent of the national income. At that stage, it is believed, the economy will have acquired the self-generating capacity for further expansion.

The Yugoslav economy is currently reaping the fruits of this wide distribution of its Social Product in its two basic components, namely, investment and consumption. It is a well-known fact that a relatively higher rate of increase in economic expansion was recorded in countries where private consumption represented proportionately a smaller part of the Social Product. Pointed attention needs to be invited to this practice as it prevailed in Western Germany, Japan and many of the East European countries. Also, maintenance of a high rate of investment leads to a discipline in the social and economic structure of the country so as to enable a full swing in the economy, leading to the development of many inter-connected branches of production and distribution. This automatically results in expansion of the home market and a high rate of growth in productivity.

While in the case of the Indian Union the problem of unemployment continues to become acute from year to year, the Yugoslav economy is placed in a very happy position. Because of its policy of high rate of investment, it is in a position to create new possibilities of employment for the rapidly multiplying Yugoslav population. One of the greatest successes of the Yugoslav economy lies in its capacity to offer employment to about 2,00,000 people yearly which represents quite a high rate of employment growth considering the dimensions of Yugoslav population. The Indian economy, on the other hand, has the capacity to offer possibilities of fresh employment to nearly 1.5 to 2 million people every year while the number of fresh entrants is nearly 3 million per annum. This results in additional unemployment of 4 to 5 million people at the end of every Five-Year Plan.

The fast tempo in industrial production in Yugoslavia is accompanied by an increase in productivity which grew by 19 per cent in the period 1955 to 1960. This order of rise in productivity was achieved during the period under review when industrial employment rose by 40 per cent. Another important feature of the Yugoslav economy is the radical structural change from the production of consumer goods (such as textiles, food etc.) to producers goods. Great efforts were made after World War II to diversify the industrial structure with particular reference to the basic industry. The first results of these efforts could be observed in the early 1950's, but since 1955, basic and capital goods industries have assumed a predominant position. In the case of India, the basic and heavy industries assumed great importance from 1955-56, the base year of the Second Plan. It was in this year that the Indian Government took the vital decision of raising steel output to 6 million tons and cement to 13 million tons. In the case of steel, capacity has currently been raised to 6 million tons though production is still lagging behind. It is believed that the steel factories in the Indian Union will be in a position to turn out steel upto 6 million tons and cement upto 10 million tons during the next one or two years. Thus, a break has been made in the case of the Indian Union for giving greater stress to basic and heavy industries so as to accelerate the growth

of the economy during the Fourth and Fifth Five-Year Plans.

In Yugoslavia, the means of transportation production, electricity, machinery and basic chemical industry recorded a high rate of increase, followed by iron and steel industry, non-ferrous metals production (which represents the basis for further processing of metals) while the lowest rate of increase was realised in the large consumer goods industries. The development of investment goods capacity can be best illustrated (vide graph on page vi) by citing the production figures of some important products. The production of metal and wood processing machinery reached a level of 4,500 tons in 1960-61 as compared to only 84 tons in 1939 and only 1,900 tons in 1952. Production of machinery rose from about 5,000 tons in the pre-war period to 38,000 tons in 1960. The production of building machinery and equipment reached a level of 14,000 tons in 1959 as compared to a production of only 100 tons in the pre-war period. The production of agricultural machinery and tools has also a fascinating story to tell. As against only 1800 tons in the pre-war period, production rose to 23,600

tons in 1960. The means of transportation also recorded a steady growth in production. In 1960, 3,400 railway carriages, 7,300 tractors, 4,600 lorries, nearly 900 buses, 10,500 motor cars and 41,000 motor cycles were built.

Similar results were recorded in electric industry. This industry has a natural disposition for development in Yugoslavia because it is mostly based on domestic raw materials, the other favourable conditions being the constant increase of electric power consumption in Yugoslavia, the increasing demand on the domestic market and the existing traditions which guarantee quality. In 1960, Yugoslavia produced more than 8000 tons of electromotors, more than 10,000 tons of transformers, 42,000 tons of cables, more than 40,000 telephone sets etc. Considerable growth was noted in the production of rolled steel goods which approached the figure of one million tons. The production of railroad tracks came up to 80,000 tons, of plates to 113,000 tons, of thin plates nearly 100,000 tons, seamless tubes 68,000 tons, wire 88,000 tons, drawn wire nearly 70,000 tons etc. Production of rolled copper reached nearly 35,000 tons and of aluminium 40,000 tons.

Indo-Yugoslav Trade: 1947 to 1961

THE trade between India and Yugoslavia developed practically after World War II. Although there was a small exchange of goods before 1939, the volume was insignificant. Even in the post-war period it was not before 1955 that the trade between the two countries developed in a fast tempo. The pattern of growth in trade was rather irregular; India's imports showed a steady upward course while exports were erratic. The long-term growth of trade between the two countries is illustrated in the graph below.

The level of Indo-Yugoslav trade has possibilities of vast expansion; one should expect the level to be raised much higher than the present one. The mere extrapolation of the present trend will not give a true picture of the future course of Indo-Yugoslav

trade. In the course of the past few years, the structure of trade has steadily changed and considerable diversification has already developed. The Indian imports from Yugoslavia in the first phase consisted of metals, especially heavy metal goods and certain investment goods. In due course, capital goods gained greater importance. The place now occupied by imports of equipment from Yugoslavia is an honourable one, while means of transportation such as locomotives, ships, etc., are slowly catching up. On the Indian export list to Yugoslavia, stood mostly the primary products such as food, raw materials, while the processing industry products constituted only a small part. Efforts are currently being made in Yugoslavia to orientate a good deal of exports on to the Indian market in goods in which she is specially interested in view of her industry-biased plans. The Yugoslav Government has given credit facilities so as to accelerate the trade between the two countries. The fulfilment of this credit in itself will provide a vigorous stimulus not only to Yugoslav exports to India but also to Yugoslav imports from India.

The great effort being made in India to develop productive forces puts investment in the fore-front of the trade relations. In Yugoslavia, there is keen awareness of the fact that India's development plans will need industrial machinery and equipment as well infrastructure equipment. It is believed that it is possible for the Yugoslav economy to orientate its exports to India so as to cover most pressing needs of the development plans of the Indian Union. Accordingly Yugoslav iron and steel, processed metal products, engineering goods etc., are finding a ready market in India. This also applies to motor vehicles and other means of transportation. The fact that consumption of electric energy in India is rising from 15 to 20 per cent every year is of great importance because it offers vast opportunities for Yugoslavia to supply electric motors and other electric plants, appliances and electronic equipment. The pattern of Indo-Yugoslav trade from 1958 to 1960 is set out in the table on the next page.

It will be possible in the future for Yugoslavia to offer even some raw materials and semi-finished products which could be absorbed by Indian industry in its normal operation. Besides, the products like semi-manufactures of steel and non-ferrous metals, various plates, rods, wire cables etc. could also be supplied. Finally, chemical products also need to be mentioned

whether in the crude form such as carbides, soda, etc. or in the processed form. It is possible to transact trade in these commodities under the existing conditions. Since living standards in Yugoslavia are rising at a very fast rate, the consumption of such articles as coffee, tea, spices, etc. is also likely to rise. It certainly points to a vast expansion in India's exports of commodities to Yugoslavia. There are vast opportunities in Yugoslavia for raw materials from India such as iron and steel, manganese ore, hides and skins, textiles, cotton, shellac, oils, etc.

The underlying idea in promoting Indo-Yugoslav trade should be to encourage a "distribution of production" so that the export of goods would enrich the structure of both countries' markets. Both the countries might develop—and in fact are developing—identical industrial branches, but the variety of products is so great that large scale co-operation, not competition, is clearly visible. Another basic idea pre-supposes growth of both production and consumption in India as well as Yugoslavia. Plans of expansion exist in both the countries and it is possible that they will be fulfilled, at least in their basic aims. This is equivalent to saying that both the countries will be economically stronger in the future which fact alone warrants a more optimistic approach to co-operation in trade.

Analysing long-term prospects and plans one is able to put one's fingers on many lines which can be successfully explored for leading to a greater exchange of goods between the two countries. One obvious case is that of Yugoslav market for steel. Yugoslavia is developing its iron and steel industry at a very fast rate but its production of steel will not be able to cover its domestic needs in the foreseeable future and the Indian steel production could fill in the gap. It would be of mutual interest to arrange an exchange of products which would cover the deficiencies in the structure of the respective markets. Since Yugoslavia needs raw materials as well such as ores, coal for coking, etc. the Indian Union would play a great part in supplying the Yugoslav market with raw, semi-finished or finished products.

Another symbol of future co-operation lies in the engineering sector where each partner can supply the other with a specific assortment of machinery or equipment and supplementary goods entering into trade. Yugoslavia is currently playing the part of investment goods supplier to India and is considering to enlarge greatly her exports but there is no reason why the Indian Union as well should not increase its exports of capital goods to Yugoslavia.

There is clear evidence to show that the steadily rising standards of living in Yugoslavia coupled with a

diversifying consumption pattern will stimulate exchange of consumer goods as well. Yugoslavia will certainly need more of agricultural products from India. As mentioned earlier textiles could also be exported to Yugoslavia from India. Because of the world-wide fame enjoyed by Indian jute manufactures and cotton manufactures there is a clear possibility of expanding India's exports of these products to Yugoslavia. Also industrial consumer goods of a more durable character could be supplied to Yugoslavia to meet the rising demands of a population which is still inadequately equipped with durables.

IMPORTS FROM INDIA

(Value in thousands of dinars)

Workers' Management in Yugoslavia

THE history of workers' management in Yugoslavia represents the history of one of the most important factors in Yugoslavia's post-war expansion. Looking back upon the experience of the past decade it may be safe to conclude that Yugoslavia formulated the most suitable form of management which enabled her to achieve good results in output and which stimulated the development of productive forces. The theoretical problem of the democratisation of production management was solved, in practice, with the introduction of workers' control. It also resulted in the automatic moral and material stimulation of the direct producers i.e. the workers. The range of other very complicated relations in production was also successfully tackled.

In the first year after the Second World War, when

reconstruction was of paramount importance, the creation of the basis for further development and management in the economy—particularly in industry—required special revolutionary changes. The production plans were mostly centrally decided both for purposes of supplies and distribution while the management of the enterprises looked after the fulfilment of the out-of-the-factory tasks. Thus, the management of the enterprises was nothing more than a transmitting body with rights and duties which were severely limited. As soon as the expansion of productive forces gathered momentum and foundations were laid for the new industrial development—this happened in the early fifties—it was considered that necessary conditions existed for a radical reform of the managing system. For successful execution of the development plans of the enterprises, more indepen-

dence was required. Simultaneously, greater decentralisation was needed to speed up the operations. It was felt that excessive planning from the top was to be avoided; hence a large number of workers were introduced to and mobilised for managing duties.

It was in 1950 when the turning point came and all factories and, in fact, all the economic enterprises were transferred to the working force i.e. the first Workers' Councils were elected. Since then, the system has been constantly improved, diversified and enriched in the light of new experience. The new system was without doubt, unique in the whole world and has rightly provoked considerable interest owing to its achievements. The system of the election of Workers' Councils will need to be described in brief before proceeding further. At the head of each enterprise a Workers' Council is the supreme management body. Its members are all elected by workers and employees of the firm. At least three-fourths of the elected Managing Board must come from workers directly engaged in production so as to prevent bureaucratic tendencies in management. The Workers' Council has its special functions concerning enterprises' basic economic activities such as production plans, sales, supplies, the problem of finance, internal relations in the establishment and distribution of funds. In bigger enterprises of more than 30 workers, a Managing Board is elected as an executive body of the Workers' Council. This body also has its precisely defined functions which are prescribed either by law or which are governed by special rules and regulations of each individual enterprise. While the Workers' Council is a directive body, the Managing Board is an operating body primarily concerned with short-term tasks and problems in the enterprise.

It should be emphasised that with the introduction of workers' management the positions and functions of the director of the enterprise have been fundamentally altered. He is no longer the sole authority of management in the establishment but only the top leader and organizer of the process of production, who directs the business of the enterprise in accordance with the decisions and instructions of the Workers' Council and the Managing Board, and in keeping with the laws and other legal regulations relating to the organization and business of the enterprise. The Workers' Council has its influence on the election of the director for the half of the Producers' Community Council consists of the Workers' Council members. Director is directly engaged in everyday management and operates normally within the limits established by the Law or by specific conditions in the particular enterprise.

In relation to the Workers' Council's organs, he plays a somewhat less important part, but he can put his veto on the Managing Board resolutions if he thinks that they are incompatible with the Law. The same Council is empowered to dismiss the director.

The process of democratization and decentralization did not stop at this, but it evolved even further, Work-

ers' Councils were organised in departments of any big enterprise and recently in the so-called units also.

Accordingly in bigger enterprises the following structure exists:

The supreme managing body—Workers' Council and Department Workers' Council, the operating body—Managing Board, the executive body—the director and department managers. From the start, the new method of management proved to be more elastic, more adjustable to changing conditions and more productive than the old one. It goes without saying that in the first place it was necessary to correct many aberrations, to experiment and the Workers' Council only gradually succeeded in absorbing the difficult task of general management. Only with time was the long-term policy of an enterprise correctly treated, but it must be noted that such a policy presents no more problems for the Workers' Councils, which are becoming more and more competent in deciding upon long-term projects and policy. Particularly the drawing up and fulfilling of the investment policy devolved to a large extent on the Workers' Councils, who were able to display necessary qualities for such management decisions. There was, namely, earlier a tendency with the Workers' Councils to distribute funds to the people in the enterprise in order to raise their standard of living. It was only in the course of time that the idea crystallized that right investment best guarantees the success and progress of an enterprise.

The growth of production with its extraordinary rates can certainly be attributed also to workers' management and the striking of adequate balance between the executive authority and the Council. The recent new regulations concerning the distribution of income will undoubtedly also influence the development of the Workers' Council. The increase in productivity, the development of initiative, the furthering of modern technology, rationalization of the productive processes and the gradual improvement in organizational forms, all are strongly stimulated by the establishment of economic units and Department Workers' Councils. By introducing a greater number of workers in the management bodies very positive results have been achieved in the sense of heightening workers' qualifications, developing efficiency, responsibility and the sense of common collective benefit and progress. The sense of responsibility should be particularly underlined. A constantly growing number of workers come to be directly engaged in management, are facing new problems and must devote their capacities to general considerations. This enlarges their horizon and their qualifications. In this way is secured the basis for selection and quick promotion of individual leading experts and managers which can use their personal qualities developed for the progress of their enterprise and in the last resort of the productive forces in general.

The Yugoslav Machine-Building Industry

SUBSTANTIAL investments have been made in the development of the machine-building industry in the course of the post-war period of the industrialization of Yugoslavia with the aim of manufacturing the types of machinery and equipment urgently needed by the economy. The resources invested and the efforts expended have made it possible to increase production in this sphere by some 18 times as compared to production in 1939.

In addition to a wide variety of mass production machines, transportation facilities and other equipment, the Yugoslav machine-building industry also manufactures a number of made to order units. It is in a

position to manufacture and deliver complete industrial plants for various branches of industry. The Yugoslav machine-building industry is equipped to manufacture very complicated machinery to rebuild old factories, to equip new factories as well as different types of machines for agriculture, transportation, building-construction, commerce, catering etc.

This development of the Yugoslav machine-building industry required the establishment of modern machine designing bureaus and departments.

EQUIPMENT FOR ELECTRIC POWER STATIONS

Complete electric-power station equipment is being manufactured by the machine-building industry. Co-

operation with well-known foreign manufacturers is included here. A group of enterprises manufacturing water turbines, hydro-mechanical equipment boiler systems, steam turbines, various fittings etc. including those manufacturing electric equipment, are in a position to supply complete plants both for hydro-electric and thermo-electric power stations.

Production of water turbines includes the manufacture of Francis, Kaplan and Pelton turbines in all models and sizes as well as small standard turbines of 150 H.P. The manufacturer of steam turbines manufactures condensed stationary turbines, pressure turbines, turbine generating sets, etc. The production of water turbine alone has reached a volume of some 3,000 tons annually.

The steam boiler industry manufactures a wide assortment of boilers of various types, sizes and for different purposes. The following types of boilers are being manufactured for thermo-electric power stations and for other industrial purposes: fire-tube vertical boilers with automatic firing, vertical steam boilers with moving and cascading grate, sectional boilers with mechanical and moving grates, water tube boilers, vertical stationary boilers, locomobile boilers, as well as all others types equipped to use all varieties of fuel. All boilers are of most modern design with a very high co-efficient of fuel. Over 6,000 tons of boilers are produced annually.

MACHINE TOOLS FOR METAL AND WOOD

The machine-building industry has increased its production of machine-tools to a considerable extent in relation to pre-war production. Not only has the volume of production been increased but the assortment of these machines broadened to such an extent that the Yugoslav machine-tool industry has included in its production programme over 100 different machine tools for working metal and over 40 for working wood. The group of metal cutting machine-tools includes universal, production, copying, mechanical, and other lathes, vertical boring mills turret lathes, milling machines, shapers and planers, mortising machines, grinding machines, drill presses, screw cutting machine, tool grinders and other machine tools. Other metal forming machine-tools include frictional and hydraulic presses, hydraulic and spring hammers, sheet metal shears, sheet rolling machines, structural steel cutting machines, etc. The above machine-tools used in metal processing are of the most modern construction, hydraulically powered with built-in automatic mechanism of remote-control.

Many of the machine-tools used for wood-working are also of the most modern design. Within the framework of a wide assortment of the Yugoslav machine-building industry we have: portable circular saw stands, band and swinging saws, circular saws, planing machines, milling machines, chain mortising machines, band cylindrical machines and other grinding machines, combination machines, copying lathes, presses for gluing veneer, gluing machines, knot drilling machine, automatic sharpening machines for saws etc.

MACHINES AND EQUIPMENT FOR THE BUILDING CONSTRUCTION AND MINING INDUSTRIES

The Yugoslav machine-building industry manufactures a wide assortment of machinery, equipment etc. for various purposes in the building-construction and mining industries. Most of these machines and other equipment are manufactured on the basis of the factory's own design and a part of them on the basis of foreign designs and patent arrangements and in co-operation

with foreign manufacturers. The production programmes of manufacturers of building-construction machines are such that they make a complete mechanization of various types and sizes of construction sites possible, that is, the assortment meets the requirements in road building as well as in the construction of building.

The Yugoslav machine-building industry manufactures the following machines for the requirements of the building-construction and mining industries: earth moving machinery, equipment for preparing construction material, working and auxiliary machines on the construction sites and in the mines transportation facilities, lifting facilities, pulling facilities, various pneumatic and other tools etc.

The production programme of earth moving machinery, dredgers, scrapers, bull-dozers, anglo-dozers, sheep-foot rollers, etc. and those used for preparing the building-construction material: concrete and mortar-mixers, crushers, rotary screens, mixers for asphalt etc. For lifting and transporting material, the production programme includes building-construction winches, needle cranes, overhanging cranes, wqif cranes, stationary and mobile transporters, wagonettes, two wheel steel barrows, various sizes of transmission compressors with pneumatic tools, vibrator tampers, metal scaffolds are being manufactured. The industry also manufactures various machines used in road construction. Some of these are steam and motor rollers, asphalt mixing machines, bitumen sprayers, complete finishers for roads, etc.

A large number of machines and equipment used in the building-construction industry are also used in the mining industry. In addition to this manufacturers of mining equipment also manufacture the following machines and equipment exclusively for mining purposes: coal and ore raising equipment, winches, various types of conveyors and elevators, measuring conveyors, automatic narrow gauge tipping wagonettes, crushers, various types of screens, coal washers, pneumatic mining tools, steel supporters and other machines as well as machines and equipment for mining excavation work.

TRACTORS, AGRICULTURAL MACHINES AND IMPLEMENTS

For the requirements of agriculture the Yugoslav machine-building industry is manufacturing in addition to tractors a wide range of other agricultural machines and implements and has thus raised the volume of agricultural production to a considerable extent. From 1949 up to now, several tens of thousands of tractors were manufactured in Yugoslavia. After the completion of new factories tractor production will be increased to 20,000 per year.

The agricultural machines and implements industry has specialized its production to a considerable extent, depending on the type of machine and implement. The volume of production has been increased substantially in this way. Total production in 1960 reached a figure of some 24,000 tons while in 1959 it amounted to only 1,805 tons. After the war over 120 different types of new agricultural machines have been introduced, among which a larger number of the very large and complicated ones such as wheat harvesters, grain elevators, automatic tiers, various kinds of sowers, selectors, threshers, sprayers, etc.

Agricultural machines, equipment and implements are chiefly for tractor traction or operation and only some of them are manufactured for draught animals. Many of the machines are being manufactured as tractor implements and some of them for automatic operation.

The Yugoslav machine-building manufacturers also manufacture the following machines and equipment for land tilling, fertilizing, sowing, repairs, harvesters threshers, cleaning and sorting machines, machines and equipment used in plant protection, fodder preparing machines and implements, various vineyard and fruit sprayers, trailers for transporting agricultural products etc.

PUMPS AND OTHER HYDRAULIC EQUIPMENT

The Yugoslav machine-building industry has achieved much progress in the manufacture of pumps, hydraulic equipment and accessory equipment after the war. Pump production has developed to the various purposes it is to serve, but also a very broad assortment and types, system of production and capacities. Total pump production has reached a volume of several thousand tons annually. The manufacturers production programme includes the manufacture of centrifugal pumps, deep well pumps, propeller pumps, gear pumps, piston pumps, feed pumps, clay pumps and various pumps for the chemical, food-manufacturing and other branches of industry. Furthermore, the Yugoslav machine-building manufacturers make various pumps for the building construction industry, mining, agricultural and other branches. Various types and sizes of field sprinkling equipment with complete accessories are being manufactured within the scope of the same production programme.

HOISTS, CRANES AND VARIOUS IRON AND STEEL STRUCTURES

The Yugoslav machine-building industry has developed capacities for the manufacture of various hoists, cranes and various types of iron and steel structures to a considerable extent. The volume of production of steel structures amounted over 64,000 tons in 1960 alone. Various bridge, portal, winch, port and other hoists and cranes, various bridges, power transmission poles, construction of shops and roofs, various tanks, pipe lines, and other types of welded and rivetted iron and steel

constructions, are being manufactured. In addition to this production of various types of passenger and freight elevators as well as internal transport facilities has increased and developed to a considerable extent.

INDIVIDUAL EQUIPMENT AND COMPLETE PLANTS

A large number of machine-building enterprises manufacture among other things in their vast production programme also individual equipment and complete plants. The manufacturers prepare for this equipment complete designs and complete engineering, including here buildings and other relevant installation for the various industrial plants. Consequently, equipment for the metallurgical industry, metal manufacturing industry, chemical, food-processing, wood-working and other equipment for the various branches of industry is being manufactured to meet the individual requirements.

The following products are being manufactured for the requirements of the metallurgical industry: equipment for open hearth furnaces, charging equipment etc. rolling mill equipment (blooming equipment) rolling mills for steel, tin etc. blast furnace equipment, equipment for foundries, kupo'a furnaces, sand preparation equipment, moulding machines etc. Production for the chemical industry includes among other things equipment for making sulphuric acid, detergents, glue, ferro-chrome and equipment for many other chemical industry products. The machine-building industry is manufacturing equipment for sugar refineries, edible oil refineries, breweries and tin manufacturing of the food-manufacturing industry.

Manufacturing of the Yugoslav machine-building industry are also manufacturing on the basis of the available raw materials complete industrial plants of various capacities. Among the most important we should mention: cardboard factories, ship board factories, leather-dressing plants, complete equipment for the manufacture of steel, aluminium and other constructions as well as other products of the metal-manufacturing industry.

Yugoslavia on the I.I. Fair

By DR. MILAN ALEKSIC

Secretary of the Federal Chamber of Foreign Trade; Director General of Yugoslav Pavilion.

SINCE 1955 when for the first time Yugoslavia participated in the Industrial Fair in New Delhi there has developed a close economic co-operation with India which has advanced parallel with her own economic development. Since then, several agreements have been concluded between the two countries on exchange of goods and on economic-technical co-operation. A number of economic delegations from Yugoslavia have visited India and vice versa. Events like these Fairs have helped businessmen of both countries to get acquainted with the variety and quality of goods of their respective countries and the conditions under which these goods could be purchased. This has given a fresh impetus in expanding trade between the two countries. It is for this reason that Yugoslavia participated in the Industrial Fair at Bombay two years ago and India in the Zagreb Fair.

Yugoslav businessmen attach great importance to this year's Fair at New Delhi. They regard it not only as a big international display of industrial development, but more important as a first hand opportunity to them to view India's rapid industrial development in the past few years and study in this context the vast possi-

bilities of the export of her goods. It gives them also an opportunity, though naturally on a more restricted and modest scale, to show to their Indian counterparts the development and variety of products Yugoslavia's economy offers and which can promote and strengthen their trade relations to mutual advantage. Here, in the Yugoslav Pavilion, the Indian visitor will see 150 Yugoslav enterprises represented. It will enable them to get acquainted with a variety of machines, tools for craftsmen, products of the electro-industry, engines for ships and different types of vehicles, machines and tools for agriculture, chemical and pharmaceutical products and last but not least articles of everyday use.

Yugoslavia's participation in this Fair will not be restricted to a mere display of her products but will be followed by visits to the Fair by a large number of Yugoslav businessmen. This will enable them to see for themselves the products of Indian industry, rich and varied, and which will surely result in an increase of trade between India and Yugoslavia to their mutual benefit. Yugoslav businessmen will come to the Fair with the slogan "We want to sell in order to buy, the more we sell, the more we can buy and vice versa".

Shorter Notes

LOOKING AHEAD

It is anticipated that an increase of about 10 per cent per annum in the national income of Yugoslavia will be maintained in the next five years. This should make it possible to ensure, alongside an estimated population growth from 18,904,000 in 1961 to 19,821,000 in 1965, an increase in the average national income per capita from 138,000 dinars (Rs. 2208) to nearly 222,000 dinars (Rs. 3552) for the same period.

The Five-Year Plan of Economic Development of Yugoslavia (1961-1965) foresees an accelerated development of the entire economy resulting in a further rapid development of the social services so as to raise the standard of living all round. According to the estimates of the Plan, total industrial production in 1965 will increase by 65 per cent as compared to 1960. These estimates are quite realistic in view of the fact that industrial production in Yugoslavia has increased 2.8 times in the last eight years and 4.5 times since 1939. The rise in agriculture will be somewhat smaller than in industry, which is likely to be about 50 per cent for the five-year period with the two-year average of 1959 and 1960 as base. It is hoped that between 1961 and 1965 inclusive, the country's economy will employ an average of some 177,000 new persons each year of which the majority will be absorbed in industry. It is estimated that the ratio between agriculture and industry will be 57.6 per cent to 42.4 per cent in favour of the non-agricultural population in 1965. Special attention is also being given to remove regional economic disparities.

It is expected that Yugoslavia will expand her foreign trade to a considerable extent in the next few years. This particularly applies to her trade with Latin American, Asian, and African countries. The total volume of foreign trade may increase by approximately 75 per cent in the next five years. The role of finished industrial products—particularly metal, chemical and food-manufacturing industry, shipbuilding and the electric industry—will constantly increase in exports, while imports of production materials and raw materials will also likewise be increased. The constant decrease in imports of agricultural products and finished industrial articles will make possible a considerable improvement in the balance of trade and a gradual reduction of the payments deficit with foreign countries, which should be completely eliminated by 1965.

One of the characteristics of the Yugoslav Five-Year Plan is the setting aside of considerable material resources for the development of social services such as hospitals and other health institutions, apartments, theatres, cinemas, education, and housing.

YUGOSLAV INDUSTRY TODAY

Rapid growth in Yugoslav industry has changed the character of her economy which was predominantly agricultural two decades ago. This fact is amply borne out by the structure of her exports where agricultural products, raw materials and semi-finished goods have been steadily replaced by finished industrial products such as tractors, ocean-going vessels, electric motors, equipment for hydro-electric and thermo-electric power plants.

The fourth Five-Year Plan (1960-65) is characterized by a more balanced development and increased investment in those sections of economy which have up to now lagged behind in relation to industrial development. Even then in these years industry retains a high rate of growth of thirteen per cent annually. A sizeable increase in production is expected in the iron and steel industry, which produces the bulk of semi-finished goods. In 1960 the production of pig iron was one million tons. The production of other metals too has been quite encouraging.

A number of chemical industry projects have been constructed in various parts of the country in the course of recent years. A huge chemical industry project was put in Loznica, Serbia—a viscose factory with annual production of about 3,000 tons of silk yarn and 16,200 tons of acetate fabrics. At the end of 1960, a new cellulose factory was put into trial operation in Banja Luka (Republic of Bosnia and Herzegovina) which will annually produce about 40,000 tons of sulphate cellulose for the production of viscose. By expanding and completing its production capacities, the output in this factory would later be increased to 60,000 tons of cellulose annually. The average annual growth of production in the chemical industry was nearly twenty per cent in the last four years. In view of sizeable capital investments in the coming years, it is considered that this industry would retain its high rate of growth.

The automobile industry too has achieved outstanding results in recent years. In 1960, Yugoslavia manufactured over 3,500 motor trucks, 570 motor buses, 12,000 motor cars and service vehicles, 40,000 motor-cycles, 4,500 trailers, etc. as well as 15,000 internal combustion engines and several thousand tons of spare parts.

In order to ensure the anticipated pace of industrial production, the supply of energy is being expanded considerably in the Five-Year Plan (1960-65). Twenty-one hydro-electric and thermo-electric power plants, when put into operation will doubly increase the total production of electric energy from 8,800 Mw/h in 1961, to 17,500 Mw/h in 1965. In the same period, the production of coal will increase from 22.8 to 35 million tons, and crude petroleum from 900,000 to 2.2 million tons.

The Crisis in Coal

IN this cold season in Delhi there is a severe shortage of coal with prices at their peak. This itself might have been an excuse for a Blue Supplement, but in fact, the subject has been chosen for much more important reasons. At the present time, the shortage of coal is acute in almost every portion of the country and the shortage of particular varieties with low ash content is severe in all the steel plants. Naturally industrial costs are continually being raised by the low quality of coal used in all smelting operations. It is obvious that the paper figures in tons of coal production do not tell the whole story of the thermal energy which is short of immediate requirements. There is also the long period of growth ahead for which very inadequate provision has been made.

'The Eastern Economist' believes that the coal target in India's Third Five-Year Plan, even if it constituted only fairly good coal with low ash content, would be an inadequate one. Now that thermal units are being added in the power stations, naturally coal requirements will be greater. But apart from this the estimation of coal industrywise has been done on what might be described as a rule-of-thumb basis. With the high ash content there is a very real danger of India's engineering industries losing many of the export advantages which they should naturally possess.

At this time of shortage of good coal the incentives for the production of the maximum quantity of good coal have been reduced by a series of quite unne-

cessary handicaps. One of these relates to the shortage of explosives; another to the absurdity by which equal priority seems to be given for the movement of bad, as well as of good, coal. Finally,—and so much in economic discussion rests on incentives—the price of coal available to coal owners required to open out new mines is sadly deficient in terms of average profits available for other industries.

This Blue Supplement attempts to present in a series of articles a comprehensive picture of the handicaps which weigh on the coal industry at this time. Naturally the picture is an incomplete one. What is needed at the present time is a recognition that an emergency exists in this industry, which can only be dealt with by emergency directives designed to remove handicaps to the extent physically possible. Coal policy, like so much else, rests in Delhi on the leisurely movement of files while immediate decisions are required.

If this Blue Supplement could do something to inform the Indian public of the tremendous challenge presented by the coal situation it will serve its purpose. It is hoped, at a future date, to make a much more elaborate survey of particular proposals so far as the coal washeries are concerned, improved transport arrangements, and above all, a price structure which will break the worst of the difficulties that have now made coal India's problem industry.

The Pattern of Growth: 1925-60 With Projections to 1965-66

DURING the last three and a half decades, the energy requirements of India have grown enormously. Coal has always played a dominant role in India's energy picture and, currently, it provides nearly four-fifths of the total. In the last two decades, in particular, the rise in coal output has been very much steeper. This may be illustrated with reference to production figures (page iii). In 1925, India's total output was not more than 20.9 million tons. On the eve of the World War II in 1939, it has risen to 27.8 million tons only indicating a slow rate of rise of around 2.0 per cent per annum. During the War, the production remained almost static; by 1947 it had risen to 30.2 million tons only. The era of independence which started in 1947 brought with it new visions of economic growth; the foundations of the Five-Year Plans were laid in 1951 when production had not exceeded beyond 34.4 million tons. The First Five-Year Plan placed the demand at 39.0 million tons and there was success upto 38.4 million tons. The Second Five-Year Plan pitched the target of production at 60 million tons, three-fourths of which was assigned to the private sector and one-fourth to the public sector. The total production for the fiscal year April 1960 to March 1961, was 54.6 million tons. Whereas the private sector almost achieved its target of 45 million tons, the shortfall was mostly due to the failure of the public sector collieries.

The historical rate of growth of the coal industry witnessed during the last three and a half decades at around 4 per cent per annum is absolutely out of tune with the dynamic growth in demand due to the vast expansion envisaged in Indian industry. The spacious industrial expansion planned for the next five years envisages an increase of more than 60 per cent in 5 years or a little above 12 per cent per annum. By carefully correlating the plans for expansion of the industrial structure of the economy with pressures on the supply of coal, the Planning Commission has fixed the target at 97 million tons of coal in 1965-66. Thus, additional production envisaged in relation to the Second Plan target is 37 million tons. Since there was a shortfall of the order of five million tons in the Second Plan, the absolute increase will have to be of the order of 42 million tons. The private sector in this additional target is expected to add nearly 17 million tons (page iii). On the other hand, the share of the public sector has been placed slightly higher at 20 million tons out of which the N.C.D.C. is expected to contribute 17 million tons and the Singareni collieries are anticipated to increase output by 3 million tons. These targets are likely to put a great strain on our capacity to expand and unless the tempo of expansion is accelerated right from the beginning, the targets may turn out to be 'academic'. It will, indeed, be unfortunate if the gap between the actual performance and the target fixed turns out to be high because it cannot fail to be reflected in slowing the tempo of industrialisation of the Indian Union during the next five years. Already, there are indications of a slack in the production pattern of this vital industry in the first five months of the Third Five-Year Plan.

PRODUCTION OF COAL (A Comparative Study)

('000 metric tons)

Period	1959	1960	1961
April	4,048	4,453	4,540
May	4,079	4,421	4,599
June	3,876	4,222	4,182
July	3,922	4,058	4,166
August	3,811	4,204	4,370
TOTAL	19,736	21,344	21,851

The production of the five-month period from April to August is compared for the years 1959, 1960 and 1961. It will be seen that the total volume of production in 1959 during this period was 19.7 million tons; it rose to 21.3 million tons in 1960 recording a rise of 1.6 million tons. Unluckily, the corresponding figure for 1961 at 21.9 million tons shows a rise of 0.6 million tons only — nearly, one third of the rise registered in 1960. Thus, it is clear that the first year of the Third Five-Year Plan may not record a sizeable improvement and this has rightly caused concern in the country.

Quite a severe controversy was carried on in the press recently regarding the failure of the transport system in carrying the output of the coal industry. It was stated by N.C.D.C. officials and even the private collieries that the railways were not able to provide sufficient wagons as a result of which stocks at the pit-heads started accumulating. The fact is clearly brought out in the table below:

STOCKS IN RELATION TO PRODUCTION

('000 metric tons)

Period	1960			1961		
	Production	Stocks at pit-head	Ratio of (2) to (1)	Production	Stocks at pit-head	Ratio of (5) to (4)
	(1)	(2)	(3)	(4)	(5)	(6)
January	4,182	2,739	0.65	5,137	3,886	0.76
February	4,365	3,018	0.69	5,225	4,808	0.92
March	4,434	3,117	0.70	5,524	5,567	1.01
April	4,453	3,272	0.73	4,540	5,423	1.19
May	4,421	3,546	0.80	4,599	5,375	1.17
June	4,208	3,578	0.85	4,182	5,129	1.23
July	4,058	3,556	0.88	4,160	4,581	1.10
August	4,204	3,306	0.79	4,370	4,023	0.92

Whatever the merit in this sweeping argument, it needs to be stated that the problem of transport must be examined in detail in terms of pressures on certain regions in the country. This particular aspect of the problem has been analysed carefully in a separate article by Mr. O. S. Murthy, Director of Planning, Railway Board. The conclusion which emerges from a study of this article is that both the coal industry — whether in the private sector or in the public sector — and the railways will have to work in close collaboration if serious bottlenecks in this vital sector of the economy are to be averted in the coming years. Railways will have to double their capacity by providing about 12,000 wagons in 1965-66 against the present level of 6,000 wagons if all the fresh loads offered by the industry are to be lifted without any serious dislocation.

The pattern of this industry is conditioned not only by the transport problem but also by other factors such as increased supply of power and easy and efficient availability of explosives. The price factor is also an important element and the recent increase in coal prices as well as the assistance under the subsidy schemes have failed to meet the legitimate demands of industry. All these shortcomings must be set right so that they do not act as brakes in its expansion.

LONG-TERM PRODUCTION OF COAL: 1925 TO 1966

2. Share of Private Sector	17	million tons
(i) As coking coal	4.87	million tons
(ii) As blendable coal	1.12	million tons
(iii) Superior grades of non-coking coal	10.84	million tons

Coal Transport by Rail

By: O. S. MURTHY, Director, Planning, Railway Board

THERE is, at present, widespread dissatisfaction on account of the non-availability of coal in adequate quantities of the requisite grades at various consuming centres throughout the country. In analysing the contributory causes of such a situation, there is a general tendency to over-simplify this vastly complex problem. It is not always remembered that coal has all along been in short supply, more so under the impact of rapid industrialisation. Consequently, coal, like any other commodity in short supply that cannot be had freely at will, has to be distributed under a system of priorities and control. Another equally important fact which has to be borne in mind is that in giving effect to this policy of control over coal, its production, allocation, and movement have to be planned in advance to meet the essential demands in the country. Before coal, therefore, reaches the prospective consumer there are three main problems to be solved. Firstly, the coal of the grade and quality required has to be produced in sufficient quantities. Secondly, the consumer must have an allocation in terms of the prevailing priority schedule designed in the overall interest of the country's economy. Thirdly, the coal has then to be moved from the centres of production to the consumers as allocated by the Coal Controller's Organisation which functions under the Department of Fuel in the Ministry of Steel, Mines and Fuel.

The production of coal by itself is a difficult task. Enormous quantities, reckoned in millions of tons, have to be mined over widespread areas. There is also the question of different qualities of coal in the various seams that are met with in the mines.

As regards the allocation to different consumers, the Coal Control Organization has the unenviable and complex task of apportioning coal from different sources to various consumers bearing in view not only the grade and qualities of the requirements of the consumers, but also varying raisings of the collieries concerned. The variations of coal production run through the full range of coal dust to metallurgical coal. The Coal Control Organization has also to keep in view the proximity of the sources of supply to the consuming centres.

After these two important stages have been covered, the next stage is that of movement. It is unfortunate

that the movement aspect of the problem has drawn unduly disproportionate share of public criticism which attributes the coal shortage to inadequate rail transport. Transport of coal to the public mind is easy to visualise but in making a fair assessment of the availability of transport, one must guard against the usual tendency of considering only one component of the movement question, viz. the weight of the commodity lifted or the number of wagons loaded to the neglect of the other two equally important components. These are, first, the distance the commodity is carried, and second, the route over which it moves. To have a correct appreciation of the service performed by the Railways, we have, therefore, to consider not merely the tons of coal lifted but also the ton-miles or tonne-kilometres carried. Even this additional dimension of the movement aspect does not take into account the limitations set by route capacities. Thus a movement planned over one route cannot be transferred to another saturated route even when both operations involve equivalent quantities of ton-miles. This is why an appraisal of the Railways' performance must not be based on merely the total number of wagons loaded in a coal-field but should take into account the distance and route aspect of the movement. In other words, the comparison should be between the pattern of movements executed against the pattern planned or set for the Railways to execute.

The target of coal traffic at the end of the Second Five-Year Plan envisaged the movement from Bengal-Bihar coal-fields of 1,434 wagons a day to the steel plants and 3,596 to all other consumers. The actual performance since October 1960 up to the end of March 1961 (i.e. the end of the Second Plan) has been that the demands of steel plants have been fully met and for other consumers 3,717 wagons have been loaded daily. In terms of the units in which Railways' service is normally reckoned viz. ton-miles, they achieved, on the coal front, during the last year of the Second Plan, a performance of 6 per cent higher than their allotted task. At present the Railways are meeting in the Bengal and Bihar coalfields not only the full demands of steel plants but also the increased planned target of 3,796 wagons per day for consumers other than steel plants. In the outlying coalfields, the coal demands are being met in full. These movements have been achieved under the handicap of a substantial drop in the loading of wagons on Sundays and holidays. It will be appreciated that transport installations are

geared to work throughout the 24 hours of a day and every day in the week. If any part of it remain unutilised on any particular day, it is a dead national loss. During the last six months, the average coal loadings on week days and on Sundays were as below:

Month	Week Days	Holidays/Sundays
June ..	5,754	5,264
July ..	6,000	5,555
August ..	6,456	5,430
September ..	6,301	5,504
October ..	6,149	5,012
November ..	6,373	5,425

These figures highlight the fact that had the loading been uniform throughout the week, the coal movement could have been stepped up by at least an additional one million tons per annum.

In the press and on several platforms, there has been a frequent mention of the Railways having undertaken to move 5,000 wagons from Bengal-Bihar coalfields and of their failure to achieve this. This is based on the fallacious assumption that the transport capacity unutilised by the steel plants could be readily diverted to other consumers. As explained earlier, this adjustment is not possible as the movement has to take place over saturated routes. It would be appreciated that carriage of 5,000 wagons of coal from Jharia and Raniganj coalfields to nearby areas of Asansol and Calcutta is quite a different proposition from carrying these 5,000 wagons or a major part of it to the destinations in Gujarat and Rajasthan or to consumers more than a thousand miles away.

In support of the criticism that the Railways have not fulfilled their part in the planned development of coal, the rising stocks at pit-heads are often quoted. It is, however, not realised that every year the months of December to April constitute the busy season at which peak production of coal is achieved. This is also the busy season for the movement of other goods for the railways and so, every year the pressure of December-April period has to be cleared later. It is the accumulation of January to April that is available for movement in the subsequent period, July to October. This pattern is apparent from year to year over a long period in the past. While this general pattern is apparent during the year 1961 also, as seen from the figures given below, a significant fact is that since April of this year, rail transport movement has exceeded availabilities from the current production so that the stocks have been steadily going down:

STATEMENT SHOWING THE PRODUCTION OF COAL AND THE PIT-HEAD STOCKS

Month	Total Coal Production (m. tonnes)	Pit-head Stocks (m. tonnes)
January ..	5,136	3,886
February ..	5,225	4,808
March ..	5,524	5,567
April ..	4,540	5,423
May ..	4,599	5,375
June ..	4,182	5,127
July ..	4,160	4,580
August ..	4,369	4,023
September ..	4,592	3,776

It will be seen further that even in September, the stocks were lower than in January last and there has, doubtless, been some further reduction since then by the end of November.

The movement of coal by the Railways during the Second Plan and subsequent period has, therefore, to be viewed not against the background of the unsatisfied demand of consumers, which has certainly outstripped the planned production as well as transport, but against the overall rail transport policy of the nation. Is the nation to allocate and consume, for the movement of coal, the costly commodity of 'ton miles', produced by the Railways at enormous expense, even for irrational and uneconomical moves? Or should it be so regulated as to achieve the best results in the interests of the economy of the country as a whole? Situated as we are with limitations on resources, men and materials, which inevitably necessitate orders of priority in furtherance of planned development, there can only be one answer. The answer is that transport facilities should be planned and developed on sound economic, rational lines and the available transport of the nation should be utilised in the most economical way.

The most economical way of utilising the rail transport resources of the country would be to feed its various regions from the nearest coalfields. For instance, Singareni coalfields are ideally situated in this respect for meeting the demands of coal in the South. Similarly, a rationalised way of movement would be to supply coal to consumers in Central and Western India from Pench and Chanda and Central India coalfields, Bengal and Bihar coalfields catering to needs of the steel plants and consumers in the Eastern and Northern parts of the country. Another aspect of rationalised movement is that carriage by rail of coal beyond a distance of 850 to 900 miles is uneconomical and is warranted only as a last resort if no other means of transport could reach the consumer. For consumers all along the coast and near the coastal regions in the Southern and Western parts of the country coal from Bengal-Bihar coalfields could be carried through coastal colliers. Accordingly, it has been planned that in the first instance, coastal shipping be allotted the task of carrying two million tons of coal to consumers in the South and in the West. With the growth of coastal shipping to meet the fuller needs of these parts and with the development of a rationalised planned movement of feeding the consumers in the Central, Western and Southern India from nearby coalfields, 800 wagons which are now sent to these consumers via Moghalsarai would be available to meet the additional demands for coal in Punjab and U.P.

It has been suggested in some quarters that the Railways should develop reserve capacity well ahead of transport requirements to forestall any possible shortfalls in the movement of coal. In a planned economy where there are several sectors competing for limited resources, it is clearly impossible to achieve such an abundance of transport facilities. Even for developing the limited additional capacity for movement of one million tons of coal from Bengal-Bihar coalfields over long distance to destinations in Southern and Western India would require a fleet of nearly 1,500 wagons and 20 locomotives involving an expenditure of about Rs. 5 crores. In addition to this, as the routes from Bengal-Bihar coalfields to these destinations are already saturated, additional line capacity work such as doubling etc. would have to be taken up. These works would need about Rs 15 to Rs. 20 crores depending upon the route which is selected for such movement. On the other hand, the movement of 1 million tons of coal by sea, even if it is arranged by purchase of new colliers, would involve a capital outlay of about Rs. 5 to Rs. 6 crores. If it is arranged with second-hand colliers, the initial investment would be very much less.

Taking a long-term view of the problem of movement of coal to Central and Western India and to ensure that irrational movements are avoided, the Railways have undertaken to provide capacity and move all coal that is produced in the outlying Central India Coalfields, and limit the movement of coal from Bengal-Bihar coalfields to quantities planned in advance. Also, as a long-term measure, the Government has decided that a major portion of the movement of coal should be organized in heavy block trains to major consumers and to coal dumps in important consuming centres. Without such movement, which would ensure quick and scheduled moves of these heavy trains, the task set for the Railways would be practically impossible of achievement.

One important factor which has a vital bearing on the utilisation of available transport for coal is the wastage that occurs because of having to move unbeneficiated coal which often contains a large percentage of inert material. As an instance, in the case of Railways, who rank very high in the priority scheduled for allotment of coal and who consume nearly 30 per cent of the total production, it has been estimated that their transport needs could be reduced by about 18 per cent

or 3 million tons per annum if beneficiated coal in grades required is made available to them. The setting up of washeries for beneficiating non-coking coal is, therefore, a very important and necessary step for making the best use of available transport.

The Railways are only a link between the producer of coal and the consumer. They do not control the production, the quality or the source from which the commodity emanates; nor do they make the allocations according to prevailing priorities to the various consumers. In their role as carriers, they have fulfilled the tasks set for them during the Second Plan and will continue to provide the transport on a planned basis during the Third and subsequent Plans. They cannot, however, be expected to meet all unanticipated upsurges in demands of coal consumers or be in a position to meet readily any major revisions in the anticipated patterns of the coal movements. In the overall planning of coal transport in the country, adequate regard must be paid to tie up the supply sources of various regions in the country to the nearest available coalfields in order to maximise the transport output within assigned resources.

Ash Content and Washeries

INDIA'S current coal problem has three dimensions—shortage of production, movement bottlenecks and high ash content. Elsewhere in this Blue Supplement the first two issues have been discussed at length. The purpose of this article is to assess the situation in regard to the ash content in coal, which has contributed to not an inconsiderable extent to the acuteness of present-day coal crisis.

Though the ash content in Indian coal has been going up gradually, but steadily, for the last two or three decades, its impact on the industrial costs in the country has begun to be felt only recently. This is because the demand for coal had not been moving up so fast before the Second Plan period and the necessity of resorting to raising of inferior coal had not been felt so acutely. With restrictions placed on raising of coking coal in 1952 and other high grade coals in 1953, with a view to conserve none-too-plenty reserves of metallurgical coal, the position has deteriorated appreciably in the past few years.

The increased ash content in coal started affecting the steel industry nearly three years ago and since then this has formed the theme of the speeches of the TISCO and IISCO chairmen. The other major industries have felt the impact during the last one and a half years when supplies of high grade coal had to be directed to meet the demands of the public sector steel plants. Railways efficiency too has suffered in the recent past due to supplies of coal with high ash content. Experts opine that for every one per cent increase in the ash content above 15 per cent, coal requirements of railways go up by 2 to 2.5 per cent and those of other industries by about 1.5 per cent. In the case of metallurgical industry, every one per cent increase in ash content leads to about 4.6 per cent reduction in steel output. If the ash content rises to over 20 per cent, the penalty is even higher.

The high ash content in coal affects industrial costs not only by increasing coal requirements, but also affecting the operational efficiency of an industrial unit. The consumer has to pay not only more for his additional coal requirements (including the rail freight and various taxes), but may have to incur unnecessary expenditure on repairs and upkeep of his boilers and furnaces. At the present level of 52 million tons coal consumption with high ash content, the country, it has been estimated

by experts, consumes about 5 to 6 million tons more than what is warranted. The movement of this additional quantity, it is estimated, has involved over 12,000 wagons which could have gone a long way in alleviating the distress caused by non-availability of rail transport for movement of other goods traffic.

Much improvement can obviously be effected in industrial costs and movement of coal if the ash content is reduced through beneficiation. It is a pity that adequate attention was not paid to this crucial problem under the Second Five-Year Plan which called for setting up of four central washeries. This would have raised the washing capacity in the country to 11.63 million tons of raw coal. Up to the end of the Second Plan, however, only 6.03 million tons capacity had been established, thus leaving a deficiency of 5.60 million tons. Only one washery at Kargali has been commissioned into production so far. Of the other three, the one at Dugda may start supplying washed coal shortly. The Bhojudih washery is envisaged to be commissioned towards the end of next year, and the Pathardih washery in 1963.

With the strident increase in consumption of coal that is envisaged under the Third Five-Year Plan, the need for washing coal assumes all the greater significance. Already the Government has started thinking in terms of stepping up the coal target from 97 million tons to about 110 million tons, to move which herculean efforts will be required to be made by the railways. But to keep the strain on transport to the minimum, it will only be appropriate that the ambitious programme of coal washing that has been drawn up for the five years to 1965-66 is completed expeditiously. The Plan envisages setting up of additional washing capacity to the tune of 12.7 million tons in terms of raw coal to meet the requirements of the steel industry alone. This capacity is proposed to be achieved by doubling the capacity of the Dugda and Bhojudih washeries, setting up of two washeries at Kathara with a capacity of three million tons; another two at Karanpura to wash 3.5 million tons and one washery at Ramgarh with a capacity of three million tons. There are also plans to set up a capacity of 7 to 8 million tons for washing non-coking coal required for use by the railways. Some energetic action seems to have been taken to fulfil these targets according to schedule; negotiations have already been started for securing technical assistance from

Russia and Poland for setting up the Karanpura and Ramgarh washeries. But only time will show whether administrative delays will make it possible for these targets to be fulfilled. Washing of non-coking coal, according to the Plan documents, is a comparatively difficult task and data on the washability characteristic

Relief from Substitutes

THE output of coal as planned during the Third Plan period and the demand for it are very precariously balanced. There can hardly be two opinions that the expectations of the output being realised are only broad estimates, whereas the full magnitude of the demand has not been assessed. Even so, with such rough data as have been accepted for the coal development programme, the outlook is one which would persistently demand a careful watch and a continuous process of adjustment and readjustment. In this process ample attention will need to be paid to maximizing the use of alternative fuels as a relief to the intense pressure on the output of coal. In this article the major outlines of this problem of the need for relief and the directions from which the relief can possibly be expected to come certain important substitutes are discussed in a general manner.

It would serve little purpose to ignore the fact that the programmes of expansion of coal production in the Second Plan could not be fulfilled and there was a shortfall in the output by 5.38 million tons below the target of 60 million tons. The private sector collieries have fulfilled their part of the programme, but the deficiency has come essentially from the public sector. An attempt has been made in defence of the public sector to stress the accelerated rate of output achieved at the fag-end of the period and explain it in terms of annual rates. Even this plea cannot disguise the fact of the shortfall. It is true that the necessary investment has been made for installing the capacity to raise the full order of output of 60 million tons, but at the same time it is equally true that there is the undesirable distinction between installation of capacity and the extraction of the targeted quantity of coal. The consequence of this underfulfilment in the Second Plan will be that the burden for the Third Five-Year Plan in the coal sector will be increased proportionately.

For the Third Plan the target in the last year has been fixed at 97 million tons, which means that excess production of 37 million tons will have to be achieved. Add to this the shortfall of over five million tons which occurred in the Second Plan and the actual increase which will have to be recorded in the Third Plan comes to 42 million tons. Out of 37 million tons excess production as included in the exclusive target of the Third Plan, the private sector collieries account for about 17 million tons. This figure is based on an examination of the programmes which they have prepared and there is no element of exaggeration in them because they are prepared to undertake even a greater responsibility given the permission to exploit the resources without the present restrictions of policy. The public sector has to share the burden of producing 20 million tons out of the additional production. Unlike the private sector, which has to exploit the existing collieries as well as those situated nearby, the public sector has to fulfil its assignment by working a substantially large number of new mines in the areas already taken up and, what is significant, in the virgin areas. This involves not only a good amount of investment but considerable initiative, enterprise and other managerial resources required for exploitation of this type. It would be premature to be confident that the public sector will rise to its full share of responsibility. Then there also remains the question of making the shortfall of 5.38 million tons left over in the Second Plan.

of these coals are yet to be properly collected. The coal crisis may, thus, aggravate further in the next two or three years. To ward off this danger, the Government will do well to give some incentive to coal producers to enable them to go in for beneficiation of this vital energy producing material manually.

India's reserves of coking coal are limited and there is the utmost necessity to conserve them by undertaking measures which are discussed elsewhere in this Blue Supplement. It is somewhat paradoxical that a grade-wise classification of the output actually obtained and also envisaged in the Third Plan shows that the superior grades of coal account for by far the highest proportion of total output. Thus, in the Third Plan, out of the total output of 97 million tons, Grade I, coal will account for 44.28 million tons, whereas Selected A and Selected B coals will account for 12.05 million tons and 18.87 million tons respectively. The inferior qualities will account for the remaining quantity of over 21 million tons. This maldistribution grade-wise in the output underlines the necessity of blending coking coal and giving the top priority in the consumption of the higher qualities to the requirements of the steel plants and the merchant cokeries. This priority is a matter of familiarity and it was attempted in the Second Plan also. But it did not work satisfactorily. For instance, it was agreed that the railways should turn to partial use of the non-coking coal for their locomotive requirements over a phased programme, but it actually transpired that the essential consumers for whom the coking coal was to be allotted did not absorb all the quantities produced and a surplus was left over which was offered to the railways. It is possible that some of the essential consumers did not develop the anticipated capacity, whereas some others must have suffered from handicaps of railway transport. Whatever the cause, the quantity of superior coal which the railways were asked to take over were as high as 5 million tons in 1957, but towards the end of the Second Plan they were brought down to 1.5 million tons.

A 'post mortem' into the causes of this failure is not necessary in this context. But here it is vitally important to note that coal and transport have got a very intimate correlation and the problem of substitutes for relieving the pressure on the demand for coal have also to be considered in their direct bearing on the transport capacity too. This can be explained more explicitly with reference to the programmes for the freight traffic expansion of the railways during the Third Plan. The magnitude of additional freight traffic which the railways will have to carry during the Third Plan has been put at 91 million originating tons. This target is expressed in the most unsatisfactory terms and it would not help either the railways or the consumers to know what precisely is the additional capacity that will be required and what is the readiness of the railways to satisfy that transport capacity. The scientific assessment of the traffic load ought to be made in terms of ton-miles and not in originating tons. Neither the railways nor the Planning Commission have attempted this in the Third Plan. It is significant that out of 91 million originating tons, as high a proportion as 40.5 million tons is attributed to the movement of coal.

Now the most significant aspect of coal transport is that by far the largest concentration of our coal resources has been in Bengal and Bihar coalfields, whereas the consuming ends are far flung in the North, South and West. Its meaning is quite plain. It is that the average lead for coal transport cannot be presumed to be the same as the average lead for the overall traffic which may be assumed in the Plan, but it will certainly rise as high as 2½ times as much as the average lead.

The average lead of traffic in the Second Plan rose to 354 miles from 292 miles in the First Plan, but no estimate for the Third Plan has been made by the Planning Commission or the Railway Ministry because of the present insufficiency of data as regards the location of new industries and the directions of the density of traffic. Nevertheless, coal transport will take a heavy toll of the capacity of the railways and this in turn will increase the requirements of the railways for the consumption of coal.

In order to reduce the demand of the railways for coal consumption for steam traction, programmes of electrification have been drawn up. Electrification in the Third Plan is to extend over 1,100 miles, its specific object being to relieve congestion in high density traffic areas with which steam traction cannot cope. But a pronounced peculiarity of the location of the routes to be electrified is that they are all concentrated in the steel and coal belt. The only new electric railway line to be opened, as at present planned, is from Mughalsarai to Kanpur. This will bring partial relief to steam traction. But it will be seen from the concentration of the programmes of electrification in the steel and coal belt that electrification will not bring any mentionable relief to the railways in their consumption of coal. It would, therefore, appear that whenever transport bottlenecks occur, from whatever causes, the special pool of diesel locomotives, maintained to prevent in the crisis of industrial capacity being put out of commission, will have to be expanded. But this substitute of diesel locomotives, in turn, raises the question of foreign exchange expenditure. Nevertheless, the overriding need to take coal where it is required also gives priority to the allocation of foreign exchange for the procurement of diesel locomotives. It would thus appear that so far as the railways are concerned, in their consumption of coal there is not much scope for any substitute for the reason that sufficient allowance has been made for electrification and dieselisation in assessing the overall requirements of coal in the Third Plan.

Likewise, an allowance has been made for the generation of thermal power from the use of lignite in the Neiveli project. This is an integrated project which comprises, besides lignite exploitation, an establishment of a thermal power plant with a capacity of 250 M.W., a fertilizer plant, a biquetting and carbonisation plant and a clay washing plant. There are programmes of increasing the capacity of the thermal plant by 150

M.W., but the whole lignite project has been planned in such a tight setting that it would be difficult to expect any additional relief from this source to coal than what has been assumed.

The real relief would appear to proceed in some modest measure from the substitution of oil as an alternative fuel to coal. This fact has been well-recognised in the text of the Third Plan and it has been specifically emphasized that industrial consumers in Western and Southern India should consider in earnestness a switch-over to the uses of oil in place of coal. To what extent oil as a substitute for coal can be a commercial proposition has been demonstrated in a convincing way by the change to the consumption of oil by a number of engineering units situated around Calcutta, where, ostensibly, the need for such a switch-over is far less urgent than it is in the remote regions of Western and Southern India. It is certainly a revelation that the Calcutta engineering undertakings should find it advisable to use oil in place of coal. This one instance is quite enough to bring home the feasibility of giving relief to coal by greater use of oil.

At the present time the Ministry of Steel, Mines and Fuel is giving consideration to this question and it has appointed a three-man committee to estimate the requirements of industries in Gujarat for crude oil which can be supplied from the newly discovered oil-fields in Ankleshwar. Side by side with it also there is the question of a greater utilisation of furnace oil by the industrial plants. The question of prices of these oils on which a greater stress is being laid now is one of the important factors in the change-over. The Ministry apparently was taking a very stiff attitude in demanding the price for the furnace oil at a level of 1.5 times as much as the landed cost of coal in those remote areas, but since then its attitude is softening. Then there is also the question of bringing the oil prices to a rational level by a reduction in the excise duty. It ought to be recalled that oil will be a substitute for coal other than the very low grade coals which is another reason why its potentialities should be investigated. The question need not be confined within narrow limits, as is being done by the Ministry at the present time. There is great force in the demand of the All-India Coal Consumers' Association for the appointment of a special commission to go into this question exhaustively and recommend a scheme for the substitution of oil.

Trends in Prices

THE fact that the selling price of coal at the moment is comparatively unremunerative when put against the rising costs of the industry has more than once been brought to light. This fact was brought before the Mazumdar Tribunal which was set up in 1954 to look into the wages and other emoluments of the workers. The All-India Industrial Tribunal (Colliery Disputes) published in 1957 awarded along with a rise in wages a rise in coal prices to an extent of Rs. 3 per ton. But that increase did not prove sufficient and subsequently the coal producers, in view of the rising labour costs due to various tribunal awards and the compensations that were to be paid by the collieries, urged for higher prices. It was their complaint that the coal industry was never granted adequate increases in the price of coal to the extent it required to implement labour awards. Their complaint was genuine enough, because their operating costs — apart from the labour costs — due to increases in prices of stores, plant and equipment, new rates of electricity charges, various types of cesses and increases in railway freights, had risen beyond the bearing capacity of the industry.

This question assumed acute dimensions and the Coal Prices Revision Committee had to be constituted in May 1957 to make recommendations to the Govern-

ment in respect of necessity of increasing the prevailing prices of coal. It was made clear that the report was to be submitted within two months but the Committee submitted its report after nearly two years. It was only towards the end of August 1959 that a price increase of half a rupee per ton for different grades of coal above grade III in the Bengal, Bihar and outlying fields was announced by the Government against an increase expected by the industry of the order of nearly Rs. 4 per ton. Thus, in spite of all these efforts on the part of the industry, the price of coal has not kept pace with the inflationary tendencies that have prevailed during the last few years. It has naturally kept the industry in a comparatively disadvantageous position. The table on page xii gives, in some details, the prices that prevailed at certain periods between 1955 and 1961. It is interesting to note that the price of the specific quality of non-coking coal (column 1) that was selling at Rs. 18.37 per ton in the middle of 1956 was priced at Rs. 21.37 towards the middle of 1961. Similarly the price of non-coking coal of steam quality (column 4) increased only from Rs. 19.4 to Rs. 22.37 during this period. This rise of nearly 11 per cent could be considered comparatively mild when it is known that the general price index has moved up during this period by nearly 30 per cent.

An important factor that is responsible for persistently higher costs is the fact that coal industry has a long history and its capital block at the moment needs rehabilitation. The current prices of capital replacement being very high, it is evident that the depreciation reserves cannot suffice the total needs for rehabilitation. This rising cost of capital replacement has to be observed in the context of the fact that out of the additional production in the private sector of 18 million tons in the Third Plan, about 7 million tons will be from new mines and 11 million tons from expansion of existing ones. Thus both capital replacement and fresh investments will be of a substantial order. It is certain that the capital costs will be of the order of Rs. 80 crores of which Rs. 28 crores will be foreign exchange component. It is necessary that the coal industry should be able to finance a part of the replacements. The possibility of a reasonable rise in prices of

coal cannot, therefore, be ruled out and in fact will be necessary for the industry to finance fresh investments. Thus, in the present circumstances the price of coal may have to be raised.

There are a few more factors which may operate as additional pressures on prices. For instance, the additional coal output from deeper mining may become necessary, which is a comparatively costlier process. Another factor which will be causing pressure on the coal price will be the Government's decision to levy 2½ per cent royalty on the f.o.r. price of coal raised from areas leased prior to October 1949. In addition to this larger stocks of coal at the pitheads — about 4 million tons at present — which are generally financed from borrowed capital tend to increase the costs and naturally the price. In the coming years, in view of the difficulties of transport, pitheads will have to have higher stocks which will again be a pressure on prices.

Shorter Notes

IN view of the development plans of the Government to raise the output of coal steeply, the question of mechanization of coal mines has assumed special importance. It is true that the coal mining industry suffers from low productivity as compared to the performance of mines in advanced countries but the average output per man hour per shift has taken a slow but steady upward course since 1952, as showed in the Table below:

Year	Average Output Per Man shift
1952	0.36
1953	0.36
1954	0.38
1955	0.39
1956	0.40
1957	0.42
1958	0.42
1959	0.43
1960	0.45

It will be seen that between 1952 to 1960 the average output per manshift has risen from 0.36 tons to 0.45 tons—a rise of 25 per cent in 8 years. This works out to a little more than 3 per cent per annum and is indeed quite encouraging. It, however, needs to be stressed that this increase in productivity has been attained by increased expenditure on plant and machinery. The Reserve Bank's analysis of 47 companies shows that in the brief span of four years from 1955 to 1959, the addition to plant and machinery was of the order of Rs. 4.04 crores. Gross investment in plant and machinery in the case of 47 companies was Rs. 15.77 crores in 1955 and rose by 25 per cent in four years. In other words, all the increment in productivity has been attained, by and large, through greater capital investments.

In order to bring India in line with other coal producing countries, it is of paramount importance that India should change its mining methods, particularly in respect of transporting and loading of coal right from the face of the mine to the railway siding. Both these are being done mostly with the help of cane baskets. Several mechanical methods have been tried successfully in other countries and there is no reason why they should not be adopted in this country as well. For example, Armoured Flexible Conveyor Belts have been successfully used in the U.K. Besides, the Bord and Pillar system at present commonly practised in the Indian mines, though saves the cost of stowing which, it may be noted, has been made compulsory for conservation purposes, is not economical and efficient. It has been demonstrated in other countries that it is more economical to use long wall method which, it is understood, also makes supervision, ventilation, transport and load control easier. It is true that this system cannot be adopted without difficulty in the old mines but it will be a good thing if it is introduced in

the new mines. All these changes call for greater safety measures and to achieve this, one of the methods that has been suggested is that of dust suppression by the infusion of water which has also proved economical in other countries.

There is an erroneous impression in the mind of the labour in the country that mechanization is likely to render some labour redundant. This is indeed far from the truth. The target of production for coal in the Third Plan has been raised by 60 per cent. The introduction of mechanisation will certainly need the present labour force and substantial additions as well, though the workers will have to be trained in the use of new machinery. It should not be forgotten that labour can be given higher wages only by raising their productivity. Mechanisation alone holds out the promise of a quick rise in wages through increased productivity.

INDIGENOUS MANUFACTURE OF COAL MINING MACHINERY

The need for manufacturing coal mining machinery in India cannot be over-emphasized. One of the reasons given for the fall in the monthly output of coal since April last is the non-availability of spare parts and components of mining machinery. The World Bank has granted a loan of \$35 million for the first two years of the Third Plan to the private sector for the coal mining industry to finance their imports from abroad. It is understood that \$5 million will be for equipment for new mines, \$14 million for replacements, \$2.5 million for spare parts and the rest for new equipment for existing mines. But the distribution of this amount has been left to the Government of India, who will make final allocations to various mining companies after screening their applications.

The answer to the problem of the coal mining industry lies in the indigenous manufacture of the mining machinery and components. Such a step will not only make India less dependent on foreign imports but save her the much needed foreign exchange. The Third Plan envisages the setting up of a mining machinery manufacturing plant at Durgapur but the project will be ready only by the end of 1965-66. The British Mining Mission which visited India recently has shown interest in collaborating with Indian firms to manufacture mining machinery in the country. Other countries, such as the USA, Poland and Hungary have also evinced interest in collaborating for the manufacture of coal mining machinery. A dozen firms are already manufacturing or are planning to manufacture coal mining equipment. That makes a good augury for the coal mining industry.

STATE-WISE PRODUCTION OF COAL:1950 — 61
