The President has now thanked Senator Fulbright publicly for drawing attention to this unconstitutional infiltration of the military into politics. Mr Kennedy indicated that the 1958 directive was being clarified to prevent abuses and in fact the Department of Defence has already instructed military men to avoid political topics in their speeches. As a result such right-wing Senators as Mr Goldwater and Mr Thurmond are complaining loudly about unjustifiable censorship.

Park by the Sea

AUGUST, when half governmental Washington goes to Maine or Massachusetts and the other half wishes that it could, was a suitable month for Cape Cod, a uniquely beautiful summer resort, to become the first new national park since 1947. And Cape Cod was a suitable national park to begin the new series of parks and recreational areas which the Administration is planning; for the man who signed the final Bill first introduced it, as Senator Kennedy of Massachusetts, in 1959, and he is one of those who spends his weekends on Cape Cod, at the Kennedy family home near Hyannis. Moreover Cape Cod is a typical example of why more parks are needed and why it is urgent that they be established. With an expanding population increasingly anxious to "go places," there is an ever-growing demand for recreation, open spaces, scenic wonders, wild-life refuges; yet these are being steadily over-run by the houses and roads required to shelter and move that same expanding population.

If land is not preserved now in its natural state for parks and wildernesses, soon there will be no unspoilt land to preserve, particularly in the eastern part of the country where there are few national parks and a great concentration of people. A few days after the Cape Cod Bill was signed the Bureau of the Census announced statistically what everyone knew already: the whole east coast of the United States has become one huge metropolitan area with 32 cities and their suburbs, containing 31.5 million people in 1960, 17.5 per cent of the country's population, forming an unbroken belt of urban development from New Hampshire to Virginia. Super highways mean that all these people, and as many again, are within a day's drive of Cape Cod—and a large proportion of them make the journey during the summer months. The result has been a proliferation of bungalows, motels, hot-dog stands and all the commercialism of tourism; this is overwhelming the wild and lovely seashore, the beaches and dunes, the heaths and woods, the villages and ports, which the tourists come to enjoy.

Congress has now decided that the only way to save Cape Cod is to make 26,670 acres—the actual boundaries of the area were a matter of some negotiation—into a forty-mile long national park, or rather a national seashore since some of the regulations applied to national parks will be waived. Shooting and fishing will be allowed and existing residents, more numerous than in other parks, will not be displaced for the present although some of their land may be taken over. The Park Service, famous for its efficiency, good taste and restraint, will be responsible for recreational facilities in the area and will control building on it and access to it once the land has been acquired. The Secretary of the Interior has power to do this by purchase, or condemnation if necessary, but Congress has not yet appropriated the necessary $16 million.

While there are few full- or part-time residents of Cape Cod who are not zealous for the protection of its beauties, there are many who doubt whether the creation of a national park is the best way of doing this. The hard core of opposition comes from those who have been profiting from the recent development, which has brought an increase of 10 per cent a year in land values for the last ten years, a bonanza which is now presumably, over, in the area of the park at least. A national park is always in itself a great attraction and it is feared that this one will bring a huge increase in the number of one-day trippers who spend little or nothing on the Cape and make it unpleasant for those who stay longer and spend more. Moreover, some of these residents argue that the park authorities will be unable to resist the pressure of the increased number of visitors and will be forced themselves to litter the park with motels and other facilities. These people feel that they and the local officials were quite able to protect the amenities of Cape Cod by themselves. But most Cape Codders welcome the help which is now coming from the national capital for the preservation of what they consider to be a national asset.

THE WORLD OVERSEAS

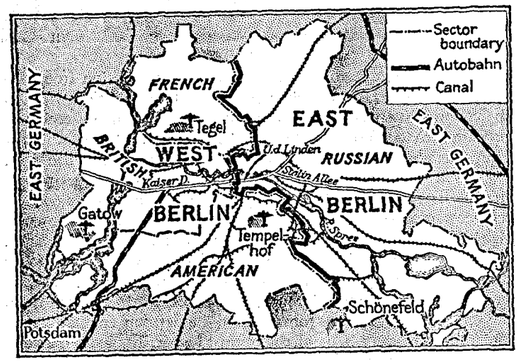
Berlin Divided

FROM OUR SPECIAL CORRESPONDENT

ABOUT two o'clock last Sunday morning, an hour when the west Berlin night clubs are going full blast, and when, in the east, the security police reputedly pay their less friendly visits, a strong east German para-military force moved up to the sector boundary between east and west Berlin. When Berlin awoke, the sector frontier was effectively closed and movement from the eastern side was at a halt.

The operation bore all the marks of careful preparation, political and military. The east German decree and the measures enforcing it carefully distinguished between foreigners, welcomed with a smile to go in and out of east Berlin, west Berliners allowed in and out after careful scrutiny, and east Germans and east Berliners against whom the frontier is now virtually closed. It was endorsed by a communiqué of the Warsaw Pact powers, which again made a sharp distinction between the need for measures in east Berlin and the right of access to west Berlin, which it acknowledged. The communiqué was published on August 13th but apparently agreed when the pact members met from August 3rd to 5th. Not long before, Marshal Koniev, who commanded the Russian forces in Hungary in 1956, had been appointed commander of the Russian troops in eastern Germany. The stage was evidently set when on Friday, August 11th, Mr Khrushchev told the western ambassadors in Moscow that he was leaving next day for a holiday by the Black Sea.

Militarily, the moves were equally systematic. The east German forces—a mixture of para-military people's police, frontier police and auxiliary factory brigades—hardly looked smart, but they were equipped with enough barbed wire, concrete road blocks and road digging equipment to seal the frontier completely, and this they did with the exception of 13 (later 12) control points. During the night heavy concentrations of tanks, armoured troop carriers and trucks carrying hoses and tear gas took up position at these and other key points just behind the frontier. Much of the 55 kilometres of sector boundary consists of canal or railway. Where it is not, and houses in the east face directly across the frontier, police have occupied basements or sealed off doors. Since Sunday a few bold spirits have hit the headlines by swimming canals or creeping through the wire at night, but they number only a few hundred altogether, and each day the barrier becomes more elaborate. Throughout the week columns of armoured troop carriers have cruised through east Berlin, making sure there is no repetition of the rising of June, 1953. There have been further troop movements outside west Berlin's boundary within east Germany itself.

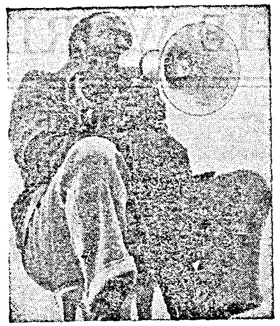


Herr Ulbricht's coup is, as the West has seen and noted, a confession that the east German state has signally failed to win its people's loyalty. Seen from the start as an imposition from outside, the Democratic Republic has carried the political vices of the communist state—the arbitrary justice, the social and economic pressures to conform—as far as they could be taken with the escape hatch still open. In economic reconstruction it had a far worse start than west Germany. Drained since of a large proportion of its most valuable working population (half the 2,600,000 refugees since 1949 have been under 24), no wonder it shows no signs of keeping pace with west Germany's expansion, let alone catching up (Herr Ulbricht's avowed aim). "We have failed to make a community," one east German high-up admitted ruefully, in private, a year ago. Berlin, gateway to the richer, freer West, not only for refugees, but for news and the personal contacts which undermine the very basis of communist power, has been the yeast in the east German ferment.

For Herr Ulbricht last Sunday's measures thus had a defensive character, but to Berliners they looked like an attack. Despite the difference between the two halves of the city in currency, and still more in politics, Berlin, under four-power rule, remained one city to a remarkable extent. The 50,000 eastern workers who until last Sunday crossed each day to the west to work, and the 10,000 or so who went the other way, were only the most obvious element in a constant flow of people and knowledge from which only the politically prominent were excluded. Now, though the east Germans emphasise that west Berliners can meet their families in east Berlin, the chance of getting a breath of fresh air in the west is gone. West Berlin's economy and western ties are still untouched, but a blow has been struck at its morale, for if Berlin has been a thorn in Herr Ulbricht's flesh, its function of bridge between the two Germanies has also sustained the hopes of the Berliners. Only the hope of unity after all makes any sense of their weird island situation. It has been a nasty shock, in short, and both east and west Berliners first reacted by going to the new barriers to look and sometimes to protest and argue. But they soon found out that the authorities on both sides of the border were determined to prevent the situation getting out of hand. In the east, Communist party members in plain clothes moved among the people who tended to collect behind the frontier, asking them to move on. Twice this week they failed, and crowds perhaps three hundred strong were driven back from the symbolic Brandenburg Gate by people's police. On Monday west Berlin police did the same on the western side, pushing and persuading the crowd several hundred yards back from the gate.

Unable to act themselves, the west Berliners' feelings have turned in the direction of demands for counter-measures. Some, it is true,

who are increasing in numbers as the first shock passes, are beginning to accept that nothing can be done. But most feel strongly that unless the West retaliates in some way the eastern appetite will grow with eating. It is partly in response to this deep current of feeling—a feeling that is beginning to take the form of resentment against the western allies—that the west German government has been scurrying about demanding action.



Unfortunately, no kind of effective and helpful retaliation has yet been thought of. On Monday Dr Adenauer suggested a trade embargo on east Germany : next day the east German government replied that it would respond to such a move by cutting west Berlin's communications. On Tuesday the Berlin Senate considered removing from eastern administration the part of the elevated railway that runs through the west and setting up a separate western organisation: next day the east Germans cut off the railway's power for an hour, just to show their strength—though at a pinch, it is true, the railway could be supplied from power sources in the western sectors. Retaliatory measures may be limited to closure of

the tiny offices of the SED (communists) in west Berlin, a boycott by west German businessmen of the Leipzig fair and an ending of the currency facilities which enable west Berlin workers to work in east Berlin. All these measures look disquietingly like responding to the banging of a door by banging all the other doors in sight. Herr Brandt, west Berlin's governing mayor and the Social Democrats' candidate for Chancellor, therefore had a difficult task when he spoke on Wednesday to an impressive rally of perhaps upwards of 300,000 Berliners in front of the Senate House. He had little to offer in response to the popular demand for action. He got past the difficult moment well, explaining that he had written to President Kennedy that morning and that he had invited Dr Adenauer to Berlin—though if the Chancellor's visit next week is marred by the kind of electoral wrangling this week has seen between the two men, it will hardly help.

Only negotiation will show whether last Sunday's measures are to remain permanent and be followed by more. The signs on the east German side are not encouraging. The press of east Berlin is unpleasantly jubilant. Even the armoured columns patrolling the streets are wearing flowers—gladioli, for some reason—in their caps. When your correspondent called at the east German foreign office to learn its views, he was told no purpose would be served by talking now ; the West had missed its chance to talk.

Whether Mr Khrushchev shares this view is another matter. But no neat, clinical short-run solution—a recognition here in return for a right there—can in itself still the anxieties of the Berliners, so sharpened by this week's events. That can perhaps only be achieved if there are signs that the world's statesmen are at last seeking a future for their divided country. As one Berliner put it, "We have already hoped too long."

Kenya's Search for Unity

FROM OUR CORRESPONDENT IN NAIROBI

WHILE Jomo Kenyatta was under restriction in the northern frontier district Kenya's political future was kept on ice. With his tranquil and well-organised return to his home near Nairobi on Monday it is beginning to thaw. But what final shape it will take can only be conjectured. This is not so much because his own views are in doubt, as because it is far from clear who will come out of the inevitable political manœuvrings of the next few months as the acknowledged men around Kenyatta.

Mr Kenyatta's views, so far as he revealed them to the 108 visitors he had during his four months idyll at Maralal, were universally reassuring. He would offer members of immigrant races equal rights as long as they considered themselves Kenyan citizens and demanded no special privileges. He paid respect to work done by the different churches and saw their role as increasingly important both in education and in social reform. Many times he told white farmers that they had nothing to fear as long as they were using their land productively for Kenya's benefit. He summed up his political philosophy in the Christian terms of "love thy neighbour," and this week, on his arrival at Gatundu, added expansively to inquiring journalists: "The world is my neighbour."

Until he is given an opportunity to put some of this admirable talk into practice (which can only come with the revocation of the order in council banning him from the legislative council) there will remain those who say that this is just fine talk covering a vindictive nature, and that he has left himself many verbal loopholes so that he can take tough measures against Asians and Europeans later on. But none of his recent visitors is numbered in this fearful group. There is slightly more concern that he is not yet prepared to condemn the activities of the Land Freedom Army, the extremist organisation of ex-Mau Mau detainees which was officially proscribed this month. But while excusing himself on the grounds that he did not know enough about their activities to pass judgment, Mr Kenyatta added that he condemned anything harmful to Kenya's interests. It can be hoped he will soon see that this group of violent-minded "irreconcilables," who according to official estimates number at most 2,000, must be checked.

The central problem in Kenya is not one of policies but of personalities. Not only have the two rival parties, the Kenya African National Union and Kenya African Democratic Union, to be united if tribal fears are to be dissipated ; there are also many senior Kenya African politicians to be fitted into place on their release from restriction or their return from exile. Mr Kenyatta has loyalties to several of his old Kenya African Union executive members and other detainees now returning to politics. There is, for instance, Paul Ngei, who has already re-established himself as a leader of the Wakamba, a tribe important for its preponderance in the police and army. There is Achieng Oneko, a young Luo who also stood trial with Mr Kenyatta at Kapenguria and could be his picked man in this trusting tribe if the other leaders, Oginga Odinga and Tom Mboya, take too individual a course. There is Joseph Murumbi, still in exile in London ; Peter

Koinange, pioneer of the independent schools, who recently moved from pan-African work in Accra to the organisation of the pan-African Freedom Movement for east and central Africa in Dar-es-Salaam. There is Fred Kubai, the tough Kikuyu trade union leader on the last stage of restriction. All these men are looking for suitable places in the hierarchy.

The 37 African elected members of the legislative council, many of whom have made their way in the vacuum left by the detention of the Kenya African Union leaders, are understandably anxious about this challenge from the older generation. Their anxiety may be the prelude to some positive good: for it has made them eager at last to resolve the differences between the two parties and indeed inside Kanu. They know that if they cannot report news of unity soon to the old man at Gatundu, pacing round the muddy two-acre plot where he is still confined, he will rightly lose patience and look elsewhere for men to fill leading positions.

Last week, after many delays, the joint committee of the Kanu and Kadu parliamentary groups began "peace talks" under the unlikely chairmanship of the individualistic vice-chairman of Kanu, Mr Oginga Odinga. They have wisely surrounded their discussions with seven veils of secrecy and each evening's communiqué reveals little more than that the day's play was cordial. Although theoretically they are only concerned with further steps for constitutional advance, they are clearly discussing the form rather than the simple timing of a new constitution.

THE Kadu members, leading a minority party representing mainly pastoral tribes, began by wanting to advance to internal self-government, and if possible even to independence, without any constitutional conference which would need to be followed by elections. Nevertheless, they believe their prestige and electorate support have increased through their having broken the constitutional deadlock in April: their supporters, marching round Mr Kenyatta's house on Monday, sang songs claiming credit for his release, gained, they said, by their having formed a government. Kanu members, who honoured an election pledge by refusing to enter the government before Mr Kenyatta's release, are now quit of this promise and are anxious to take office at the first opportunity. Their terms seem to be agreement to hold a constitutional conference (probably in November) at which the date for independence would be set ; advance to the cabinet government stage without a pause for the appointment of a chief minister ; and the reorganisation of the administration into a caretaker rather than a coalition government, which would mean that ministries would be allotted more on an individual than a party basis.

Kadu's stand was much weakened by the resignation last month of the minister for tourism and forests, Mr Peter Marrian, in protest against Kadu's determination to seek self-government without a conference or elections. Since then the party's tactics seem to have changed. Its liveliest junior minister, Mr Peter Okondo, published a paper suggesting that Kenya should adopt the American system of the division of powers between the legislature and the executive and should elect on a qualitative franchise an upper house of elders having equal legislative rights with the lower house. This scheme would help minority tribes by offering a brake on the house elected by adult suffrage, but has little chance of acceptance: the pan-African tide is too strong for even Mr Okondo to swim against. Kanu can argue also that this is too large and too late a break with "the Westminster model."

Agreement has been so hard to reach that party leaders had to postpone a visit to Gatundu. Inexplicably (for they could hardly have abdicated responsibilities to this extent) the African party leaders this week invited members of the public to submit ideas for a new constitution rather in the offhand way that newly independent countries run competitions for a national anthem. This adds weight to conjectures that the talks, if cordial, are getting nowhere. The idea has been resurrected of scrapping both parties in favour of a new one led by Mr Kenyatta. This would accommodate the senior detainees who have remained uncommitted and it would also provide the opportunity many politicians search for of jettisoning Mr Tom Mboya, whose many talents are vitiated by a knack of antagonising nearly all his colleagues. Aware of this, Mr Mboya has recently shown signs of being more co-operative and self-effacing, noticeably over the arrangement for American scholarships for Kenya students.

There are many pressures on the parties to reach swift agreement, not simply from the direction of Gatundu. Mr Bruce Mackenzie, the former minister of agriculture, now a leader of the Kanu parliamentary group, has been urgently to Bonn to try to salvage the half-promised loan of £4 million towards Kenya's agricultural development which the west German government has been on the point of withdrawing because of the lack of stability here. White farmers, wavering over whether to leave their Kenya farms, are approaching the decisive time in September, and are hoping for reassurance before then about their land titles, either from these party talks or from the subsequent conference with the Governor at which their interests will be more directly represented. Mr Julius Nyerere, with his eyes on an east African federation, is also prodding constantly.

If these economic pressures towards unity are reinforced by the greater weight of Mr Kenyatta's personal impatience, positive and happy results may come soon. Asked this week if he was confident of his ability to unite the parties, Mr Kenyatta wasted no words on reservations. His emphatic "yes" was perhaps the most cheering word heard for many months in a country that has floundered in doubt for too long.

Partnership Exploded

FROM A SPECIAL CORRESPONDENT IN BLANTYRE

The result of Tuesday's elections in Nyasaland is discussed on page 695.

THE ELECTION campaign in Nyasaland has finally exploded the pretension of the United Federal party to represent the best interests of all with a formula of "partnership" which has never been applied, or even believed in. The party's local leaders, who harped on the virtues of federation, have shown themselves not only inept, but hopelessly out of touch with the electorate. They were beaten before they began ; and they knew it. Their despairing call for Sir Roy Welensky's personal appearance was ill-advised. It is doubtful if the half-dozen speeches he made, mostly to private audiences, swayed a single vote. He was preaching to the converted few, and his abortive intervention has damaged his prestige. There was nothing left but to cry "intimidation," and this Sir Roy Welensky duly did, with a threat that he might ask the British Government to postpone the election. But he refrained in the end from inviting a certain rebuff from London.

Most notable about the campaign was the quiet that prevailed throughout. Dr Banda decreed that there should be peace and calm ; and there was. The Governor, his officials, and the police are agreed that there was no significant intimidation. It is true that an African who openly associated himself with the UFP would, in a psychological sense, incur the displeasure of the herd ; but the same kind of group disapproval could be found in industrial England. Sir Roy made much of the burning down of a few African houses, but the police investigated and failed to discover a political motive. And no one has challenged the secrecy of the ballot.

The Malawi Congress party has made good its claim to represent the hopes and the clamour of African nationalism in the territory. The sleepy mountain capital of Zomba will soon be invaded by a score of black politicians, eager, friendly and terribly inexperienced. The new legislative council (28 elected members and five officials) is likely to meet within a month; but now that power is within their grasp the Malawi leaders will be more interested in the composition of the executive council, about which the Governor is required to consult with the party leaders. The Malawi Congress will claim the three from the lower roll as a matter of course; it remains to be seen how many more they will expect. Dr Banda is thought to be considering one of two posts for himself—the ministry of natural resources, in view of his known preoccupation with the development of the territory, or a new ministry without portfolio, which would leave him free for wider activities.

In Malawi eyes the two main issues in the election were independence and secession from the Federation. The two cannot be disentangled. Constitutionally, it will not be easy for Nyasaland to secede; the federal link cannot be broken without the agreement of others, but Dr Banda is more than likely to make his gesture by introducing a motion in the legislative council. The next step would presumably have to await the federal review which is due to take place in September or October, but may well be postponed until next year, when the two other territories will have held their own elections. But even if the very word "federation," in its present connotation, is execrated among nationalists, there would be some serious disadvantages from Nyasaland's point of view if the present structure were dismantled; and Dr Banda is not unaware of them. In recent months, with the prospects of political power ahead, his public utterances have shown a growing restraint. But if federation as an idea, at least, is not anathema to him, it would certainly not take the form of a partnership with the United Federal party.

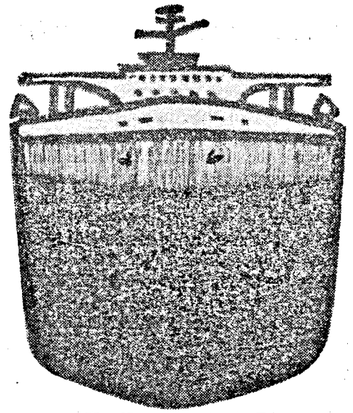
France and the New Member

FROM OUR PARIS CORRESPONDENT

WHAT will France say to Britain's proposal to enter the European Economic Community? Among the questions that follow from Mr Macmillan's announcement of July 31st this is the one that seems, in London, to come first. There are obvious reasons why the British are suspicious about the reception they are going to get in Paris. The complicated Rome Treaty is in itself a compromise between the Continental free-traders and the Continental economic-unionists. France, which was the leader of the second group, may fear that Britain's accession to the treaty would alter the balance and water down the "unifying" safeguards. But the chief reasons for French doubts are political.

As everybody knows, no place was allowed for Britain in General de Gaulle's original conception of a European alliance of countries bordering on the Pyrenees, the Alps and the Rhine, a coalition which would be strong enough to keep up "with the Russians and the Anglo-Saxons" (as he said plainly enough in the third volume of his memoirs). If Britain were to be admitted to the community, France would no longer be the only member that also belonged to the more exclusive clubs of the great (and nuclear) powers. Moreover, British participation would strengthen the "Atlantic" features of the community and make it more difficult to adopt a policy diverging from that of the United States.

Although French experts admit all these reasons for gaullist reluctance, they maintain that an assessment based on them neglects the more important realities. General de Gaulle, they argue, is a realist, as was demonstrated by his conversion to the European idea on his return to power. The French economy is now geared to the common market and the country's economic progress is the Fifth Republic's main success so far. General de Gaulle cannot, therefore, afford to wreck the European framework of this success, and he would risk doing this if he were to ask Britain for exaggerated concessions. French negotiators can resist British demands only by invoking the spirit and the letter of the Rome Treaty and even then only as far as they can carry their Continental partners with them; in other words, the French line cannot differ too much from that of the Brussels commission. Britain's bid for full membership has altered the bargaining positions from what they were in the last months of 1958, when the Free Trade Area project was defeated.



Influential French officials, who are both "European" and in favour of British participation, are convinced that a compromise safeguarding basic British interests and the spirit of the Rome Treaty can be reached, provided the negotiations do not drag on too long. To speed up the process, they suggest that the protocol could include some provisional clauses, providing temporary exceptions that would ease the transition for Britain. Discussion of the external tariff for some of the more awkward commodities might be put on a separate list, similar to the List G which accompanied the Rome Treaty. But the need for speed is emphasised, a year being given as the utmost limit if the negotiation is to be successful. Centrifugal forces would take advantage of any long delay, and there are people in Paris who think that the common market itself might not survive the failure of a serious attempt at negotiation.

The views of influential and knowledgeable Frenchmen about some of the matters to be negotiated are given below.

The European Free Trade Association.—The real question here is what can be done for the neutral members of Efta. As they argue the matter at present, the French do not seem to allow any place for neutral states in the European Economic Community system. Those members of Efta who are also members of the North Atlantic Treaty can, if they wish, follow the British example and apply to join the community. The three neutral members of Efta—Austria, Sweden and Switzerland—are, or believe themselves to be, prevented by their neutrality from taking this political step. The French argument is that, if this is their position, they must simply stay outside. It is claimed that this French attitude simply reflects that of Washington, which is prepared to accept that European countries should make tariff agreements at its expense only when there is a substantial political benefit to be shown. Pursuing this argument to its logical end, the French say that a formal association of the European neutrals with the European Community is apparently ruled out. The most they will suggest to meet the interest of these countries and the British obligation to them is that the community might establish an exceptionally low external tariff for a selected number of commodities that are particularly important in the foreign trade of the three neutrals. But this should be negotiated within the framework of the Organisation for Economic Co-operation and Development, where the United States is a member; and the benefits should be extended to all the members of that organisation.

British Farmers.—In Paris it is argued that the problem of farm prices is not as difficult for Britain as is often thought. Naturally, within the community the British farmer could not look directly to Whitehall for support. But his interests are not so divergent from, say, those of the French farmer; and if the community does evolve a common agricultural policy they will not be neglected. (An interesting study of comparable farm prices in the common market, Britain and the United States has been published in the July issue of *Études et Conjoncture*; this shows a great similarity between French and British prices.)

French experts, on the other hand, take a more serious view

than do some English economists of the immediate rise in British food prices that an alignment with EEC practice would cause. They think that a sudden rise in the food bill, even by a few per cent, would have an inflationary effect on wages and prices. A British proposal to dismantle the food subsidies only gradually has a good chance of being accepted.

The Commonwealth.—This presents the most complex bargaining problem, and its various aspects might, therefore, be subdivided:

(1) *Tropical products:* Britain's problems are quite familiar to the French, who are subsidising their former African colonies. They consider that a bargain can be struck between the two countries with African connections (Asian tea could also be fitted in), and that once it is struck the opposition might be between a Franco-British attitude on the one hand and that of their European partners on the other. The Netherlands is already questioning the right of the former French colonies, now formally independent states, to enjoy a privileged status. Another protest echoing the violent discontent of Latin American competitors is bound to come from Washington. But the French say that this cannot be helped. In the first stage, they hold, Europe must pursue its connection with Africa while the United States looks after Latin America. Only in the long run can one aim at an equalisation of preferential treatment.

(2) *Cereals:* Grain output within the common market is growing, not only in France and Italy, but in Germany as well. This growth is partly the result of rising productivity and partly of artificially high prices. The official intention is to establish a community price, computed as a weighted average of the prices prevailing in member countries. Britain's entry would weight the price heavily downward. It is argued that if the price is kept sufficiently low to limit the growth of production to genuine increases in productivity, total imports of grain into the common market should not be reduced substantially. The gist of the argument is that Britain should press for a reasonably low price; and that the sooner it enters the community the more influence it will have on the shaping of the common agricultural policy.

(3) *Dairy produce:* It is generally admitted that New Zealand presents a special case and that, since its exports of dairy produce are a matter of economic life or death, an exception should be made in its favour. One proposal is to include a New Zealand representative in a special EEC body that would define the policy for milk and dairy farming. But the exception must be limited to New Zealand and cover only dairy produce.

(4) *Industrial imports:* Here it is mainly a question of Canada's interests and the solution proposed is the same as for the neutral members of Efta: the negotiation, within the framework of OECD, of particularly low tariffs for selected commodities, such as aluminium, that are of special importance in Canada's trade.

A brief summary can do no more than indicate points of argument. The real detailed positions will emerge only as the negotiation proceeds. The French attitude will be affected by other factors besides gaullist political bias. French industrialists are not, on the whole, showing signs of great excitement. The *patronat* (the employers' federation) began by being violently opposed to the common market until it realised what could be done by deals with the Germans and other partners. There are those now who fear that the deals will be between the British and the Germans, but the mood of the big French firms is confident. Politically, British participation is popular. It is welcomed for different reasons both by those who still fear a *tête-à-tête* with Germany, and by those who hope that it will bring a reinforcement to liberal and progressive trends on the Continent. While in London the first question was whether the French would consent, in Paris the question most often asked is still: Are the British really in earnest?

Gentle Boost for Australia

FROM OUR CANBERRA CORRESPONDENT

As was to be expected, the Australian budget brought down last Tuesday is mildly inflationary, but not as inflationary as it would have been if the political future for the Menzies government did not look so unexpectedly bright. Manufacturers and trade unionists are still loud in their protests about the government-induced recession of the past year, and workless migrants have been rioting at one of the camps. Yet last month in Victoria, the very home of injured businessmen and disappointed migrants, the Liberal-Country party won a resounding victory in the state elections. It is very encouraging for the federal government which will no doubt go to the country in December, and in these circumstances the treasurer, Mr Holt, did not feel any pressing political obligation to be generous.

There is to be a deficit of £A16.5 million, compared with a surplus of nearly £A16 million last year. There will be increases in pensions, an overdue increase in the dole, and sales tax is reduced from eight and a third to two and a half per cent on most household appliances and furnishings. There will be money for some impressive sounding capital works, such as roads for beef cattle in northern Australia, the search for oil, and better railways. These projects, it is hoped, may cause Australians to take their eyes off present problems and to fix them once more on a glorious future. Yet confidence is slow to return, and the budget has been received without enthusiasm.

Many an over-expanded business is still licking its wounds, but there is more to the general uncertainty than that. The gloom of 1960-61 has been the greater simply because the confidence of the preceding year was so extreme. Faith in Australia seemed symbolised as an inexhaustible cornucopia pouring out motor cars, washing machines, television sets and so on"; the check came as a great shock. The inebriated exuberance of 1959-60 will not easily return, and this is good in so far as the future of Australia depends on solving a number of problems about which there is no cause to be complacent.

Looking back over the past year with all its storm and stress, one might draw the moral that economic measures must be given time to work. In 1959 the treasurer budgeted for a deficit just as activity was rising anyway, and so a boom was engendered. This flourished in 1960 and caused the great upsurge in imports, pressing against quantitative restrictions, which the government, in February 1960, decided to remove. The budget of August, 1960, made plain the government's intention to crack the boom—or should have made it plain, but the message was wrapped in too many soothing words about prosperity. There was to be a rise in income tax of one shilling in the pound and a budget surplus of over £A15 million. Yet the boom was an unconscionable time a-dying. Imports continued at a high level, the reserves were running away and although, as is now evident, signs of a downturn were already there, the treasurer plunged into the harsh measures of November 15th. Of these, the plan to compel the life insurance offices to invest more in government funds proved impracticable and the rise of 10 per cent in the sales tax on motor cars proved too severe. So the economy has come jolting to the point where all the deflationary measures have been removed except for higher interest rates (belatedly introduced) and the ban upon bank advances for speculative purposes.

Looking to the future, one wonders how long, despite solid international reserves of £A570 million, it will take the balance of payments problem to return. But this involves long term questions about the future of Australia.

Sheikhs Seek Protection

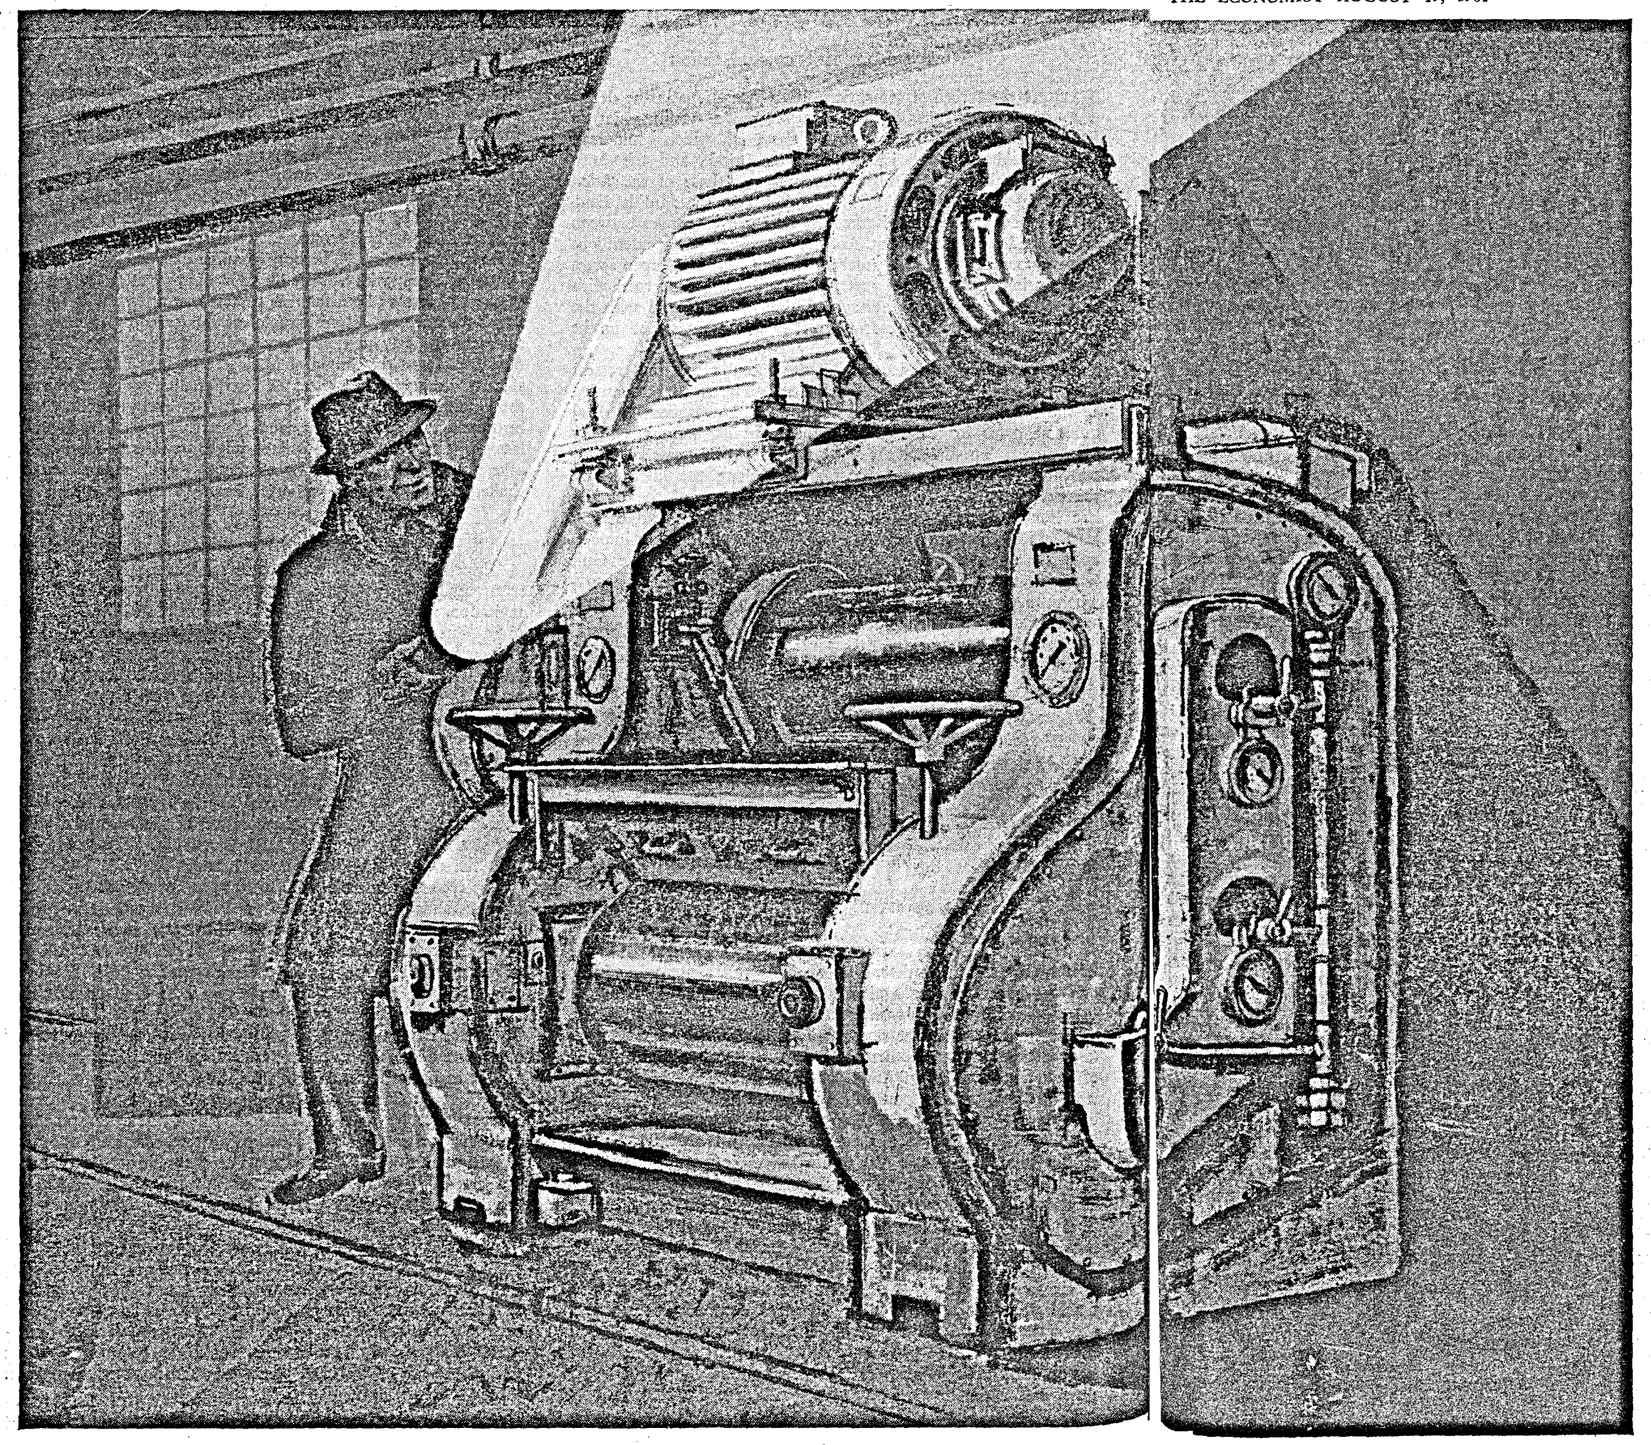
FROM OUR MIDDLE EAST CORRESPONDENT

Behind the screen of romantic military operations in the desert recent events in Kuwait have marked a turning-point in British policy towards the Arabs of the Gulf, which could lead to a more healthy relationship between Britain and the Arab world generally. The Gulf sheikhdoms and those of the Aden protectorates are the last British footholds in the Middle East. From time to time their existence has poisoned exchanges between Britain and the independent Arab states, often to an extent out of all proportion to the real interests at stake. It is an open secret that, during the past few years, British officials concerned with Persian Gulf politics have disagreed about how to deal with the many anomalies that arise from treaties that were signed in the nineteenth century.

The view that prevailed until quite recently was that retreat was more dangerous than standing firm. The treaties governing Britain's position in the Persian Gulf, although concluded at different dates in response to different needs, were essentially of a piece. To disturb the pattern at any one point might, it was thought, provoke repercussions all along the line. While the exponents of this view conceded that many of the treaties had lost all bearing on real British interests, they held that at least one of them, the treaty with Kuwait, was of major importance. In other words, since all the arrangements in the Gulf hang together in delicate balance, nothing should be done anywhere to upset the Kuwaiti ruling family. An unspoken but awkward corollary of this view was the supposed obligation of the

British Government to defend the sheikhly rulers, not only against external aggression, but against internal upheaval as well.

Spokesmen for the opposite view argued that the archaic nature of the treaties, and of the ways of life that they helped in practice to perpetuate, caused the British Government an intolerable degree of embarrassment in the Arab world and elsewhere. The British were saddled with responsibility for situations which they had little power to influence. The scandalous extravagance of the former ruler of Qatar was a case in point and, although he was persuaded at long last to abdicate in 1960, the means of ensuring that his successor behaves himself better are strictly limited. Many officials in the Gulf express consternation at the prospect of Sheikh Shakhbut of Abu Dhabi getting oil money on a large scale, and this is expected to happen next year. Sheikh Shakhbut has made a start by insisting on payment in hard cash, an insistence that recalls the early days of the Arabian American Oil Company, when truckloads of silver coins for distribution to the tribes were rushed across the Saudi Arabian desert to the king's camp sites.



At a stroke, much of the argument has become academic. If independence can be granted safely to Kuwait, there can be no good reason for clinging to tiny unproductive enclaves, such as Ajman and Fujairah, especially as they owe their present privileged status to the misdemeanours of ancestors who were forced to accept British "protection" as a curb on their propensity to plunder and piracy. The problem, now, is to argue these petty rulers out of arrangements that their forebears were argued into.

Since it is highly questionable whether the continued balkanisation of the coasts of Arabia is desirable, it is not, in terms of *Realpolitik*, a vital British interest whether most of the sheikhdoms, given their independence, swim or sink. In fact, several of them would probably swim. The only claim to Bahrain is the frivolous one advanced by Persia, which would certainly be resisted by the Arabs and strongly discouraged by Persia's allies in the Central Treaty Organisation. The only possible claimant to Qatar is the House of Saud, with which the ruling family of Al Thani is on the best of terms; both families profess the austere Wahhabi faith and both have an astonishing talent for spending money. The rulers most likely to suffer by standing alone are the Sheikh of Abu Dhabi and the Sultan of Muscat, who may live to regret the alacrity with which they accepted British military support to enforce their claims to the Buraimi oasis. It is unlikely that they would be threatened in their homelands, but they would be bound to lose Buraimi; and the Sultan might well see his shadowy sovereignty over the interior of Oman again, and successfully, challenged by the Saudi-supported Imam Ghalib bin Ali.

It is true that some of the gilt of Kuwaiti independence was ripped off by General Qasim's ill-considered reaction. But the sequel underlined the changes. British troops entered Kuwait by invitation, not by right. A Kuwaiti mission toured the Arab states to reassure those who still suspected that the agreement of June 19th was an imperialist sham. An agreement was concluded on August 12th with the Arab League mission, headed by an Egyptian brigadier-general, for the replacement of British troops by a joint Arab defence force. International guarantees have been forthcoming in the shape of Kuwaiti membership of the Arab League, with Iraq casting the only dissentient vote, and of the inter-Arab defence pact. As a result, the ruler of Kuwait formally asked the British to leave as soon as the Arab force could take over, an operation which according to present Arab expectations will be completed by late August or early September. British compliance with the ruler's wishes has never been in doubt.

The readiness of the British to leave has evoked surprised relief in the Arab world. After a few days of routine attack against British intervention, Cairo dropped the theme. Nowhere in the Arab world, outside Iraq, are voices now raised against the British action. One of the most instructive features of the crisis has been the obvious reluctance of President Nasser to turn it to his own immediate advantage by providing the greater part of the Arab defence force. The calm deliberation with which the issues are being faced is a measure of the brashness of General Qasim's claim.

Yet, in the long run, there must be a *quid pro quo*. And the way is clear: Kuwait can repay the Arabs who supported its independence by investing some of its oil money in productive Arab enterprises. This is a two-way street. If the Kuwaitis are to lend money the Arab states must create a climate favourable for investment. The Kuwaitis have already had some shocks; they acquired substantial holdings in Belgian enterprises in Egypt not long before President Nasser, losing his temper over Belgian policy in the Congo, nationalised the lot. But, provided the Arab states really want the participation of Kuwaiti capital in their development plans, it should not be beyond the wit of their governments to furnish the necessary guarantees. If Kuwait's economy could be firmly interlocked with that of the Arab world, General Qasim's pretensions, already insubstantial, could be forgotten altogether and the path cleared for progressive British disengagement throughout the Gulf.

MONSANTO PUTS CREATIVE CHEMISTRY TO WORK

This motor is a thief's stooge

ELECTRIC CURRENT can be stolen—and capacitors impregnated with Monsanto Aroclor are often the factory Works Manager's best police force. They are supplied by leading electrical equipment manufacturers.

Electric current operating induction motors is utilised in two components. One component becomes productive energy and the other (wattless current) is, without efficient Power Factor correction, as wasteful as excess froth on a pint of beer. And you pay for it.

In industrial Power Factor correction, Aroclor-impregnated capacitors are smaller, lighter and cheaper than other types; also, Aroclor gives improved electrical efficiency and high fire-resistance.

Aroclor-impregnated capacitors are used with other electrical equipment such as welding machines, high-frequency furnaces and fluorescent tube-lighting for factory, shop, office and street illumination. Apart from saving money on electricity, they also improve the efficiency of electrical distribution systems and, in some conditions, enable plant to be extended without the need for heavier cables and additional control gear.

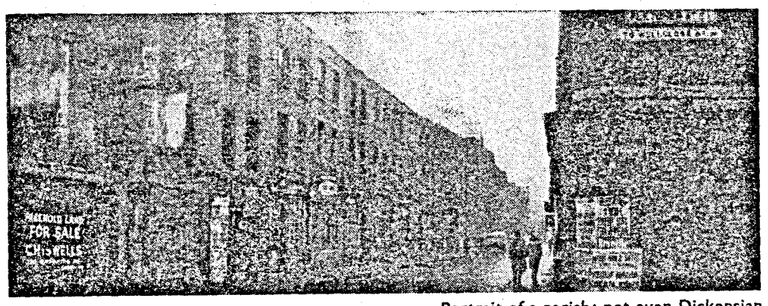
Aroclor benefits more than one industry. Other grades are used in the paint, lacquer and ink trades, as heat transfer media, and in a special type of paper from which copies can be taken without the use of carbons.

The versatile Aroclor family is another example of how Monsanto puts creative chemistry to work—and brings a better future closer.

If you, as a manufacturer, are interested in chemicals or plastics, it will pay you to get in touch with Monsanto.

MONSANTO CHEMICALS LIMITED,
992 Monsanto House,
Victoria Street, London, S.W.1.
and at Royal Exchange, Manchester 2.

Monsanto
Reg'd.



In association with: Monsanto Chemical Company, St. Louis, U.S.A. Monsanto Canada Limited, Montreal. Monsanto Chemicals (Australia) Ltd., Melbourne. Monsanto Chemicals of India Private Ltd., Bombay. Representatives in the world's principal cities. Aroclor is a Registered Trade Mark

HOME REPORT

In HOME REPORT members of the editorial staff and local correspondents report on life and happenings in and around Britain.

Stepney's Turbulent Priest

FROM OUR SPECIAL CORRESPONDENT

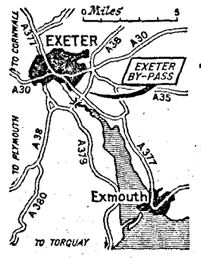
Portrait of a parish: not even Dickensian

The facade of Church House in Wellclose Square is a monument to Victorian bad taste. But inside it is as full of colour, light and cleanliness as the square outside is dirty and dark. Eight women live in Church House, six of them recent prostitutes, two of them devoted social workers in the mission. The mission itself was begun eight years ago by the Rev. Joseph Williamson, vicar of St Paul's Church, Dock Street, a tall elderly man with a fine build and a clear brow.

WELLCLOSE SQUARE is tucked behind Dock Street, Stepney, close to Commercial Road. It is small, quiet and decrepit. The property is, in fact, like all the property in the area around Cable Street: no Dickensian charm, merely a scabrous and unrelieved squalor. The life that revolves around the streets and alleys matches the dwellings: it is Hogarthian, without the humour or the hedonism of Hogarth's more cheerful characters.

Stepney has 3,600 families on its housing waiting list, which means about 14,000 individuals—appreciably beyond the present re-housing programme, combined with the LCC borough clearance plan. Councillor Edith Ramsey has persistently attacked conditions which, for example (and in her own words), allow a family to live in a slum "sordid beyond belief, in three small rooms—two barely larger than cupboards—father and mother and their eight children aged from 15 to one year old. One bronchitic boy must sleep alone—the other nine share two cupboards. Round the corner . . . only one house survives from the bombing. A stench rises from the pool of stagnant water in the basement. Paper peels off the damp, cracked walls. Rats run riot round the house. Here live eight adults and eight children." It is common for twenty people to share an outside lavatory.

This state of affairs both invites and exacerbates the vice which parades itself in Cable Street and the surrounding squares. A rash of so-called "clubs" has grown up—converted shops with a few tables and chairs scattered around a juke box. They are garish, cheap, tasteless; the main drink is beer. Each race tends to gravitate to its particular club. The prostitute is common to almost all.



When he began his work of rehabilitating the Cable Street women Father Williamson realised that the first necessity was to take them away from the men controlling them. Fortunately, Church House existed as part of the vicar's freehold, though the task of giving room and board to six women of the streets on the pittance of a vicar's benefice was an impossible one. Early appeals to charity brought in about £1,000, and the work of converting the interior of Church House began.

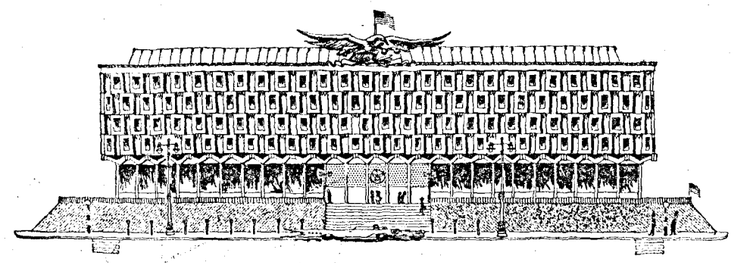
Five or six women are admitted at a time and, with Father Williamson's recommendation, local factories have been very willing to employ them. To date, about 153 women have been received in Church House. Of these, about 40 have been re-united with their families and of the remainder, about half have gone on to a decent life. The rest have slipped back to their former ways. Greater success can probably come only when the present acres of slums, beer-shops and "clubs" have been swept away.

WHAT are the authorities doing? In Father Williamson's view, precious little. He deplores a London County Council which spends money on exhibitions, festivals, parks and gardens while his parish still festers. Even the restricted finance of a poor borough like Stepney, he argues, should be able to do much more than at present. Landlords who charge £2 and more for a rat-infested room with dry-rot and no plumbing are protected by agents who decline to give the names of their principals. Is it really true, Father Williamson demands, that neither the council nor the courts have power to inquire or intervene? It is not enough, he argues, to preach pious sermons in St Paul's when filth and vice lie in the shadow of the cathedral. He notes with scorn that in a recent House of Lords debate on these problems only one of the Lords Spiritual was present.

He is no less angry with an immigration policy which allows unrestricted entry from the Commonwealth. This does not come from prejudice but from the simple fact that his parish lies at the bottom of a human chute: the mentally-retarded, the idle and the vicious of all races are borne there by social and economic gravitation. Father Williamson and Councillor Ramsey both affirm that the Maltese are the chief offenders in living off prostitution. Of 35 persons convicted recently, 27 were Maltese. These realities of Stepney life have formed Father Williamson's doubts on immigration. Yet they do not make him a pessimist or cynic about human nature itself. For a second Church House is now in being—again the fruit of his personal efforts. It lies a good ten miles from Stepney and the women who go there will have an even better chance of escaping permanently from the life behind them.

Slum clearance is the first of Stepney's problems, and it is clear that past programmes have been inadequate. Stepney Town Hall is unwilling to give details of present plans: it may be embarrassed. In his statement at Alnwick last week the Minister of Housing, Mr Henry Brooke, observed that slum clearance remained a first priority of national policy despite the new housing cuts elsewhere. The force of this social necessity is nowhere clearer than in St Paul's parish, Stepney.

The Bypass Bogey



FROM OUR SPECIAL CORRESPONDENT

AUGUST puts the Exeter bypass slap on to the front pages and into the news bulletins. In its way, this clotted artery of the far west has achieved a national notoriety which everyday (and more serious) trouble spots might envy. As the map shows, the bypass is the funnel through which all traffic between the north, midlands, east and south and the south-west must squeeze: for there is no crossing of the Exe below it, and no northern route round Exeter for 20 miles or more. From the midlands and north (where wakes weeks and fair fortnights combine with school holidays) A38 comes down through Bristol to join A30, from London, at the bypass head. And A30 itself is already carrying a double load from its confluence with A303 at Honiton, 20 miles to the east.

The junction is uncontrolled and therefore, when descended on by 50,000 cars, chaotic. However, this hazard past, the by-pass is an adequate, not to say good, four-lane highway quite able to cope even with the additional traffic from A35 which joins it just to the south. Its capacity here is theoretically 5,000 vehicles an hour.

But the sole crossing of the Exe between Exeter and Exmouth is the Countess Wear swing bridge, part of the bypass. It has only two traffic lanes. The capacity of the entire bypass is therefore halved. This is the genesis of those 20-mile queues of stationary cars boiling in their own indignation on four or five weekends a year (the worst of which are those immediately before and after August bank holiday). There are other hazards: Kennford is a small town not easily adapted to large volumes of traffic; and the junction of the bypass and A380 (the infamous Telegraph Hill) is uncontrolled and disruptive. But the main source of frustration is that bridge.

Unfortunately for August holidaymakers, the bypass is more than adequate for the rest of the year, and it is thought hardly worth it, for the sake of a few weekends, to build a new bridge or to take the even more expensive course of building a ring road round Exeter to the north, between the two arms of A30. What would certainly help here—and on a host of other roads—would be a new willingness on the part of landladies to book holidaymakers from midweek to midweek, abandoning their insistence on Saturday to Saturday. But that, too, will only come about with properly staggered holidays.

The Bird in Grosvenor Square

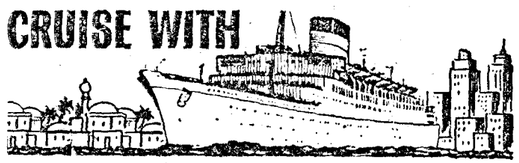
FROM OUR SPECIAL CORRESPONDENT

IT is just over a year since the controversial bald eagle was hoisted to its perch atop the United States embassy in the early hours of a Saturday afternoon. By now the die-hard xenophobes, who once fanned up fears that London would become a zoo populated by thirty-five-foot Welsh dragons, Siamese elephants and Nyasa leopards all fiercer than the English lion, have turned their wrath against the common market octopus. Peace has at last descended upon Grosvenor Square, and Theodore Roszak's eagle rests virtually unmolested, disturbed only sporadically by passing cosmonauts.

Behind the Portland stone walls of Eero Saarinen's edifice, a flourishing bureaucracy has now comfortably implanted its roots. Things have come a long way since an overworked John Adams first took on the task of representing the United States in 1785 (even before there was an American President). Today, in an era of slightly more amicable Anglo-American relations, the embassy rooms are cluttered with a staff of over 700, most of whom are British "locals." (They are screened for nearly two months before being hired.)

IN less prosperous times, this might have been thought a gesture towards relieving British unemployment; but, in actuality, the employees are kept busy (so they claim) performing what have become the duties of the modern major embassy. "Diplomacy in depth" is the byword, and the most prominent activity of the embassy is "selling" the image of America's personality.

This crucial task belongs to the United States Information Service. Washington has given it nearly twice the staff of the Political Division; and whereas the latter consists almost entirely of Americans, the USIS personnel is four-fifths local. The approach of the USIS is many-pronged: American literature and history are presented in a sizeable (25,000 volumes) public library, supplied also with periodicals ranging in intellectual appeal from *Better Homes and Gardens* to the *Bulletin of Atomic Scientists*. American art is represented in exhibitions, and music by a recording library and a variety of often well-attended lectures and concerts given in the plush 185-seat auditorium.



For the prospective tourist, if he has managed to emerge unscathed from the rigours of United States entrance regulations (the Consular Division on the southern side of the building grants some 9,000 visas a month to the British citizenry, four-fifths of them to non-immigrants), the USIS has produced a travel guide, gloriously portraying America as the air-conditioned nation of conventions and visitors' bureaux, national parks and civic orchestras that it is.

Nevertheless, the efforts of the USIS, admirable (and costly) as they may be, still constitute only a "soft sell"; the interested Briton must first pass voluntarily through the gold-framed portals. According to the librarian, on a busy day some 300 visitors make use of the library, and there is a similar number of phoned inquiries. But those who do avail themselves are only a small intellectual upper stratum of British society: they are the educators, journalists, BBC-types, and the occasional specialists seeking the latest word on the American art scene, or some recent research in cybernetics from MIT.

—

THESE diligent seekers-after-truth are important intermediary disseminators, but if America desires to project its own image directly to the greater depths, there is something to be said for the "hard sell"—which will strike and impress the passing bloke-in-the-street. There are, of course, three-quarters of a million American tourists who make contact with the blokes each year: but in Grosvenor Square there is only the eagle. This may be why some Americans, after Major Gagarin's triumph, yearn for a visiting Shephard or Grissom.

CRUISE WITH

'CARONIA'

1961
1962

Two outstanding cruises to a galaxy of wonderful places in the luxurious 34,000-ton, fully air-conditioned "CARONIA", largest liner built exclusively for cruising. And before either cruise you can, if you wish, see something of USA and Canada.

WORLD OIL IN TRANSITION

BY WALTER LEVY

Walter James Levy was born in Hamburg in 1911. After studying at the universities of Heidelberg, Berlin and Kiel he left Germany in the early thirties first for Britain and then for the United States. After serving during the war in the Office of Strategic Services he became for a time head of the petroleum department of the European Co-Operation Administration. Since then, as an independent consultant, he has acted for various departments of the United States Government, for other governments and agencies such as the World Bank, and for major oil companies. In the preparation of this study he was assisted by his associates Mr. Milton Lipton and Miss Helen Delage.

NO industry is more world-wide in its ramifications, is more essential to the world economy, or is more entangled in world politics than oil. Industrial growth throughout the world economy depends increasingly upon petroleum; its rise towards pre-eminence among commercial fuels, since the war, gained momentum during a period of inflation, but has continued since the market for oil, as for many basic commodities, swung over into surplus. During oil's history, indeed, there have been more years of surplus than of shortage; and the current surplus seems likely to be here for several years at least. The readjustment of policy and behaviour among the producers and consumers of oil is taking time: particularly among producers, both companies and governments.

The political instability of some of the areas where oil production—and oil riches—have been growing fastest; the uncertainty of consumer governments apprehensive about that instability and with home fuel industries to protect; the entry of far too many newcomers into the world oil market for "orderly competition" among the established major companies still to dominate the market; the steady drip of Russian oil into the West—all these make for turmoil in the world petroleum industry. Changes in the kaleidoscopic pattern, developments in detail, come so fast that it is difficult to look at the whole problem in the round. It is to offer readers a chance of doing so, from one expert and synoptic viewpoint, that *The Economist* has opened its columns to Mr Walter Levy, one of the oil industry's best-known consultants, to present at length a comprehensive survey and analysis of the oil problems now facing the world and not just the oil industry, and of the methods, and chances, of meeting them. These views are Mr Levy's, not *The Economist's*: our diagnosis and prognosis would largely overlap his, but differ significantly here and there. But they are given a platform here as a distinguished contribution to discussion of one of the most important economic and political problems now facing the world.

THE world oil industry has just rounded out fifteen years of unprecedented expansion. In this time, petroleum provided for most of rapidly rising energy requirements—supporting the postwar industrial reconstruction and subsequent economic growth. Behind all this was a prodigious exploration effort to search out crude oil reserves; refinery construction to provide the many petroleum products used for light, heat and power; and development of transport and distribution facilities linking widely scattered producing areas with markets in all parts of the world.

Looking ahead, the next fifteen years will present an even greater challenge to the world oil industry. Energy requirements will be mounting, not only in the industrialised West, but especially among underdeveloped areas. The ability to achieve higher living standards obviously depends on constant improvement in the productivity of labour. So capital formation becomes a crucial factor; with it, the availability of energy. And for most countries, increasing energy requirements will have to be met by oil.

Over the next fifteen years, for example, oil consumption outside North America could mount at the rate of perhaps 7.5 per cent per annum. Together with North American consumption this would mean free world oil requirements of around 2 billion tons a year by 1975, against about 900 million tons now. Fortunately, huge proven resources are available to meet these future requirements. Eastern hemisphere reserves are at present conservatively estimated at 28 billion tons, accounting for some three-quarters of the free world's established oil resources and representing 30 years' consumption for it at current rates. And huge new reserves are certain to be proved—in view of potentialities in the Middle East and North Africa, and widespread exploration elsewhere. It would appear, therefore, that eastern hemisphere resources should be adequate to meet the area's rapidly rising requirements plus whatever the western hemisphere needs to import, and still leave ample reserve-to-production ratio in 1975, even at the very high rates of production that would be reached by that time.

But between retrospect and prospect there is a troubled present—with world oil operations beset by economic uncertainties and political tensions.

The prolific oil reserves offer an assurance of adequate supplies to meet mounting requirements in the future, but pose serious difficulties today. What stand out are the disruptions brought about by a surplus of oil in the free world and the intrusion of Soviet oil. But the oil industry has worked through periods of surplus before; and a previous episode of aggressive Soviet competition, in the 1930s, coincided with an earlier glut of oil on world markets. It is not so much the immediate economic dislocations alone that are cause for concern, as the continuity of effective commercial arrangements and the political situation in key oil areas.

THE IMPACT OF NATIONALISM

FOREMOST among the critical factors bearing on world oil operations in recent years is the upsurge of nationalism and the urgency for economic advance in underdeveloped areas. Governments in some of these countries are increasingly concerning themselves with oil operations that had until lately been the function of private companies. In some instances—e.g., Brazil, India—the governments enter directly upon oil operations: in exploration where prospects appear to be favourable, in refining and even in marketing. In Ceylon and some other countries the governments interpose themselves on established oil operations, affecting significantly the conditions under which the industry can continue to function—both in producing and in consuming countries. Superimposed on these, the cold war exacerbates any difficulties between the companies and local governments. The Russians, whenever the subject of international oil is raised, immediately refer to "monopoly profits," charging the companies with having exploited the national resources in countries from which they export and of the consuming public in countries where they market.

The essential function of the internationally integrated companies—to programme production among diversified areas and to match supplies with world requirements—is thus complicated by changes in the structure of the industry and by politically inspired limitations on both their freedom of disposal and their freedom of supply. Nowadays subsidiaries of international oil companies are coming under pressure to consider simply the national interests of the countries in which they happen to operate. International co-ordination of investment, of production among various areas and of supplies for various markets would in such circumstances have to yield to whatever political imperatives are most urgent. Withal, the major international companies have to meet the competition of the many "newcomers" who are now active in foreign

production, and of independent refining and marketing companies with access to low-cost crude from a variety of sources.

The world oil trade plays a central role in the economic life of many nations. The economic strength of the industrialised West depends on uninterrupted availability of oil at reasonable terms. But foreign oil is largely concentrated in areas that are the focus of political tensions, and the cold war points up the danger inherent in Western dependence upon sources of supply that may not always be securely available. Access to foreign oil is essential to consuming countries; access to markets is essential to producing countries. And the conditions of trade are vital to each—from both economic and political standpoints.

This interdependence, even though it is the keystone in the whole structure of world oil trade, has not been adequately appreciated by all concerned. Each participant must obtain certain benefits; at the same time, each must realise that the contribution of others is vital. Accordingly, each participant may take as a guiding consideration his enlightened self-interest; but must also accept as a limiting consideration the basic interests of others. It has been through the operations of an internationally integrated oil industry that these diverse, but interdependent interests have been accommodated. But the world oil industry today is confronted by a number of issues that go right to the heart of its economic rationale, its institutional structure and its relationship with both producing and consuming governments.

THE MIDDLE EAST

A FACT of overriding importance in the current oil environment is the large size and relatively low cost of reserves discovered in recent years in a few Middle East countries. Proven reserves in this area are conservatively estimated at around 25 billion tons, enough to support production at current rates for nearly 90 years. In effect, the economics of Middle East oil production more nearly resemble those of a manufacturing operation than of exploration with its normally uncertain finding costs and results. From a physical as well as from a cost point of view, Middle East oil could presumably replace a substantial proportion of the oil that the free world produces elsewhere, as well as a large part of the output of competing energy sources, such as coal.

There are compelling reasons, however, why Middle East output has not expanded at such rates. The producing countries' governments are interested in a relatively high level of prices because their revenues largely depend on an income tax levied on the producing companies' profits. Similarly, the governments would prefer to see less of their oil sold at higher prices than more at lower prices, as long as their revenues would remain unaffected. They would obviously wish to enjoy the benefits from oil revenues over as long a period as possible and to recapture for themselves at the end of the concessions the highest possible proportion of the oil in place.

International oil companies, too, because of their geographically diverse production interests would not all benefit equally from cheap Middle East oil. Moreover, all of the companies are dependent for part of their requirements on more expensive sources of supply. The economics of past investment thus lead to the maintenance of production in other areas than the Middle East. Significantly, too, any concentration of production in a few Middle East countries would undermine the national economies of higher-cost oil-exporting countries.

Diversification of production has been undertaken to assure that expanding world requirements would be met, and also to provide against any possible interruption of supply lines—which could occur with unforeseeable swiftness and for unpredictable reasons. This diversification is also essential for the companies to retain bargaining strength in their relations with the various producing countries (of which more later).

Many consuming countries possess some local energy supplies. Local production of energy may be more costly than imported oil; but strategic, economic or social considerations often lead governments to develop such national energy sources and to protect them in the home market.

But there are continuing pressures to produce more and more, both in the Middle East and elsewhere. Concessionary companies have a strong inducement to step up output as rapidly as is feasible. For one thing, their concessions, although generally running for another 40 years or so, are still of limited duration. Reserves already proven in some of these countries, such as Kuwait and Arabia, would in some instances sustain production at levels rising above present offtake for more than the full period of the concession. And the sooner a barrel of oil is produced, the more valuable it is to the company in terms of cash income.

TOO MUCH CRUDE

THE pressure rapidly to expand output of crude oil is particularly acute for "newcomer" companies. Their financial resources generally do not match those of larger, established rivals. The need to recover exploration and development expenditures is thus correspondingly greater. They generally have no extensive investments in refining and marketing to protect and may thus be less reluctant to resort to intense price competition to gain outlets for their oil.

In spite of the state of crude oil markets, major oil companies as well as newcomers continue looking for more oil. Established international companies spend large sums on the search for oil each year. One reason is that they have explicit or implicit commitments to meet minimum drilling programmes in various concession areas. Also, contagious competition impels companies with far-flung markets to carry on continuous exploration—to protect indigenous hydrocarbons, to achieve greater diversification of supply sources, as a protective measure to forestall rivals from preempting an inordinate number of promising locations, and to maintain the continuity of their organisation and staff.

In recent years medium-sized and smaller companies, especially American, which had previously limited their search for oil largely to their home countries, have been attracted into foreign exploration, partly by the lure of the big strike, which is always a potent factor in oil ventures. They have also been attracted by the profits earned in successful producing operations during the postwar oil boom. And they were concerned over their future supplies—particularly American companies facing the high and rising cost of adding to their domestic reserves.

National policies have also played a growing role in the expansion of exploration. Many countries have encouraged the search for oil within their own borders and abroad, in order to save foreign exchange, gain greater security or enhance their national prestige. And countries which are already major producers have opened up additional areas to concessions, in part because sharp competition among bidders promised handsome terms in the form of initial bonuses as well as future revenues.

In sum, on the supply side, there are obviously strong and continuing incentives to produce and market extra low-cost crude from prolific producing areas. In addition, there is the increasing importance of new sources of supply, of newcomers to foreign production and of government demands for expanded output in virtually every producing country.

FOCUS ON NARROW MARKETS

ON the demand side, surplus production tends to focus upon relatively narrow markets. This aggravates the pressure both on the price of crude oil and on the price of oil products in such markets. It gives rise to an increasing prevalence of discounts

off the posted price and of investment in refining and marketing facilities in order to gain or protect crude oil outlets. In general, independent crude producers sell only to refineries that are not affiliated to any of the major groups. Since these refineries themselves have limited outlets for their products, the independent producers of crude are often obliged to make very steep concessions to dispose of supplies during periods of surplus. These may take a great variety of forms in addition to, or in lieu of, direct discounts from posted prices. Profit-sharing arrangements, low-interest loans, refining and/or transportation below cost—all may be resorted to on one occasion or other. Established suppliers naturally fight to keep their customers from the independents. Having access to very low-cost crude on a large scale, being under strong pressure to produce additional quantities and possessed of large financial resources, they are usually able to match, and often better, the offers of independent suppliers.

The pressure of surplus crude oil has led to considerable investment in refining and marketing that would not have been made under more normal conditions. New refineries are built in markets that might more economically be served from existing capacity. Established companies do so to protect their crude sales; newcomers, to provide a "home" for their production.

Access to low-cost crude from a wide range of sources, in turn, permits independent refiners (or marketers, through the use of processing arrangements) to sell finished products very cheaply, at times in direct competition with the refining or marketing affiliates of companies that supplied them with crude. Even though the quantities involved may not be very large relative to the size of the market, they may still be sufficient to force major marketers to lower their prices in order to hold existing customers. Depressed product prices, in turn, affect the earnings of these affiliates, at times even to the point of causing substantial losses in their accounts.

At the same time, potential market outlets are constricted by the efforts of many important oil-consuming countries to develop their own sources of supply, at home or in associated areas. Argentina and France are cases in point. Japan may soon have access to substantial "national" oil production from an off-shore concession in the Persian Gulf. In the United States the imposition of mandatory controls over oil imports has left various American companies that had ventured into foreign oil production with limited access to domestic refineries. In consequence, the pressure of surplus tends to be focused on a few accessible marketing areas.

All these factors have robbed posted prices of a great deal of their sensitivity to changes in supply and demand. For a balance between supply and demand in the short run to be achieved through the price mechanism, oil prices would have to fall to an impossibly low level—below the operating cost of all production except from a very few prolific sources. This would mean abandoning or destroying large segments of the petroleum industry—and of other energy industries, notably coal. Incentives for exploration and development would be impaired; current consumption at ultra-cheap prices would be at the cost of future supplies; and overall this would involve the economic waste of scarce resources.

In fact, economic adjustment through a destructive play of market forces is manifestly intolerable, being harmful to all parties involved. The petroleum industry and the governments of oil-producing countries are naturally concerned to avoid such severe consequences. The governments of oil-producing countries, for whom posted prices serve as the basis for determining their tax take, have indeed increasingly resisted any price reductions by the companies. Many consuming countries, too, are determined to avoid the disruption of their domestic energy industries. To the economic forces that are typically expected to shape and adjust the activities of an industry there are added in oil not only the interplay of physical and commercial factors, but institutional, political and strategic considerations as well.

SOVIET OIL

THE pressure of surplus on various markets is further aggravated by the reappearance of Soviet oil as an important factor in international trade. Oil exports by the Soviet block to the free world rose from 5 million tons in 1955 to about 23 million tons last year. It is estimated that the Russians could export in 1965 twice their exports in 1960. Russia's substantial oil reserves are likely to be developed, along with increasing volumes of natural gas liquids ; and the planned expansion of natural gas production there would also release oil supplies for export.

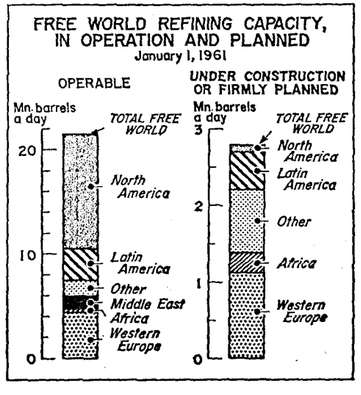
With substantial production coming from relatively new fields, the average cost of Soviet oil is apparently quite low. Second, because the bulk of Soviet production moves to protected markets in the USSR and its satellites, the cost of incremental production for export is still lower. In addition, Soviet cost accounting obviously differs from Western commercial practice ; the Russians are in a position to charge costs according to a politically determined scale of values. Finally, it would appear that oil exports are an especially attractive source of foreign exchange earnings, involving relatively small capital and labour inputs as compared with the goods that the Soviets may expect to receive in exchange.

The Russians are accordingly in an advantageous position to compete aggressively in terms of price, and price cutting has become common in the Soviet oil trade whenever it is required and promises to be successful. At the same time, the Russians can be selective in pricing policy : within their own block, prices are often considerably higher than for exported oil delivered to distant markets.

Where price competition alone may not succeed, the Russians conclude government-to-government arrangements to place their oil. Soviet willingness to accept payment in soft currencies and bartered commodities carries an obvious trading advantage in countries with balance of payments problems—such as most of the underdeveloped countries of Asia, Africa and Latin America.

The market impact of Soviet oil, coming at a time of already serious surpluses, is far greater than the volume of shipments alone might indicate. And the problem is not only one of commercial competition. The Russians have made it quite clear that they regard oil as an instrument of national policy. They are prepared to intrude it where it is likely to disrupt relations between Western industry and various governments ; or to withhold it where it serves their political purposes. Within the framework of stated intentions toward the West the Russians are bound to consider, in addition to whatever commercial advantage it may give them, their international oil activities as an ideal weapon in the cold war, even though sales of Soviet oil would contribute to Soviet economic strength.

Any build-up of Soviet exports that leads to undue dependence on the flow of such supplies or tends to undermine the economics of commercial oil operations would pose a very real problem of continued availability. Nor is it a matter that involves just the countries that happen to be substantial importers of Soviet oil. Should the Russians decide to cut off their exports (e.g., in conjunction with a political crisis that may also affect access to other oil sources), the responsibility for maintaining essential oil supplies would eventually become a common concern to the entire Western community.



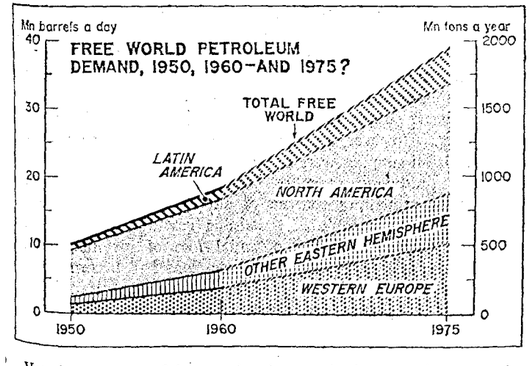
In the major oil exporting areas, oil companies have generally acquired their production rights through long-term concession contracts over very large areas. The companies have normally been promised freedom from government interference in the determination of such matters as levels of production, size and destination of exports, setting of prices, and the disposal of foreign exchange receipts. Government revenues are at present generally defined as 50 per cent of production profits at posted prices, though in Venezuela the government's share of earnings actually reached 69

per cent in 1960. These concessions offer the companies contractual protection that was asked for and freely granted at a time when they were undertaking heavy investment at considerable risk. For the major oil producing governments, the concessionary arrangements have yielded oil revenues that are far beyond what they might have expected.

Yet the budget accounts and foreign exchange resources of some of these countries are precarious and most are not satisfied with their rate of economic and social progress. They now criticise the very arrangements that have contributed so much to the progress they have made. And local dissatisfaction can easily and conveniently be directed against one target—that is the "rich and powerful foreign-owned oil companies."

TERMS OF CONCESSIONS

PRODUCING governments also often complain that the concessions were negotiated when their countries were under colonial administration, or when they were ignorant of the value of the resource and were otherwise unable to secure equitable terms. Many concession areas, they argue, are too large and cannot be properly explored by the company in the foreseeable future ; the concessions, they complain, extend too far into the future. And they feel the present 50:50 arrangement tax gives them too low a share. Recent concessions that include new features add to the pressures even though the improvements in terms generally reflect the fact that the prospects of finding oil appear much more favourable mainly as a result of earlier discoveries nearby. In the late fifties large bonuses were paid for the acquisition of new concession rights in oil countries such as Venezuela and Iran. When certain American, Italian and Japanese companies acquired new Middle East concessions, they agreed to pay more than 50 per cent of profits to host governments or allow governments a share of profits on subsequent refining and distribution operations in consuming countries. Further, they admitted the possibility of purchase by the producing government, at cost, of up to 50 per cent of the corporate interest in the new producing venture (in addition to the 50 per cent income tax) once oil was discovered in commercial quantities. In the most recent concession granted to Royal Dutch/Shell for uncommitted offshore Kuwait rights, a Kuwaiti-owned company holds the option to acquire at cost up to a 20 per cent interest in the venture if successful. Shell also binds itself to purchase the 20 per cent share of oil production enuring to its Kuwaiti partner at not less than 10 per cent below posted prices and to give it other business assistance. Even though some of the arrangements between governments and private companies in the newly-formed ventures appear to be impracticable, the direct participation of producing countries in oil production seems to reflect the trend in their expectations and demands.

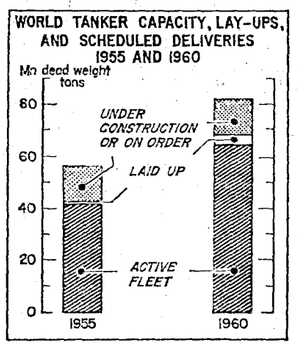


Most of the existing concessions, formally, would run beyond the end of this century. In point of fact, the companies have been in practically continuous renegotiation with producing governments over the years and the provisions of their contracts have been fairly regularly adjusted to contemporary conditions. But revisions in the concessions' fiscal and operating arrangements have frequently resulted in only temporary accommodation between companies and governments.

But if sovereign power is imposed against the companies' contractual rights to the point at which essential management prerogatives are eroded, the results will defeat the purposes of the producing countries themselves. Consideration might perhaps be given to a new approach for the settlement of major issues that may go unresolved through protracted negotiation over long-term concessionary arrangements. In such instances, and where relations between companies and government may be seriously disturbed by inability to arrive at a *modus vivendi*, it might be possible to agree on independent arbitration arrangements. The intent would be to arrive at a reasonable balance of inherent merits, taking account of the respective legal rights under the concession and also of other compelling circumstances.

There would be both limitations and difficulties in such an approach. Certain issues, involving most fundamental interests of either company or government, might not be arbitrable. On the other hand, negotiation of outstanding issues might become more difficult—demands more peremptory, agreements more reluctant—if recourse to independent arbitration were available. However, the critical state to which industry-government relations may be brought, and the far-reaching consequences of a breakdown in confidence, suggest that the possibility of arbitration on a much broader scale than is usually conceived warrants serious consideration.

OPEC



THE creation of the Organisation of Petroleum Exporting Countries (OPEC) in 1960 was obviously related to the policy goals of producing governments. While the first aim was to gain a voice and possibly even control over posted prices for crude oil, OPEC's resolutions have included also the possibility of production or export controls. Agreement on such controls presupposes that the various producing countries would be ready to exercise self-restraint. This would not appear to be the case today, as witness the frequent demands by various countries for stepped-up production. In the event, abstention of a few of them would render any attempt at controls ineffectual.

Yet the concept of international prorationing remains attractive to some producing governments—as a means of containing potential surplus production, preventing price weakness, of conserving an exhaustible resource, and, in particular, of gaining a greater measure of control over oil company operations. It is suggested that such prorationing would simply follow the pattern of conservation as practised in the United States. However, this

fails to take into account an important distinction between prorationing within a country such as the United States, where domestic production is used internally, and prorationing that would affect the export operations of a producing country and thus involve the varying and often conflicting interests of a large number of countries, as well as companies. Such controls as might be administered by a few producing countries could not fail to have disturbing implications for the security of supplies and the terms at which oil would then be available to the free world.

Any system of controls over international production or exports, no matter how broadly based, would give producing countries inherent incentives to advance their interests by manœuvring within the limitations of the system. To improve their positions, all countries would try to build up their reserves or productive potentials, depending on the statistical criteria that were adopted in such an allocation scheme. And companies with only limited access to supplies in pro-rated areas would be induced to intensify the search for oil elsewhere. All this would tend to add to, or at least prolong, the oil surplus.

Moreover, oil stands in sharp contrast to many other primary commodities moving in international trade, for which production, prices and employment have fluctuated violently within short periods of time. Oil, on the other hand, has enjoyed a rapid and steady growth in demand, relatively stable prices, and has made an unparalleled contribution to the revenues of producing governments. For all these reasons and also because of the difficulties in resolving a range of political issues, it is unlikely that any effective prorationing scheme will be established in the near future.

WESTERN OIL COMPANIES NOW

THE bulk of oil reserves and production in the free world outside North America has been developed under long-term concessionary agreements by a relatively small number of internationally integrated oil companies, of American, British, British/Dutch (and French) nationality. These same companies have also undertaken the transport, refining and distribution of oil in practically every country of the free world and they have come to supply the greater part of the world's oil requirements. The effectiveness of their operations is due in large part to the fact that they are *international* and *integrated* companies.

These major companies undertook most of the highly uncertain and risky search for oil. They put up the capital for pioneering oil ventures in numerous areas where geography, climate and terrain made operations difficult and expensive. Later, they spread their risks, and the financial stability of their operations no longer depended on the success or failure of any individual effort. Exploration in many areas, allied with their international integration of transport, refining and marketing, enabled the companies to finance uncertain ventures, bear the cost of repeated disappointments and to accept the heavy cash drain often involved in the development of new producing areas.

Most significantly, the companies' scope of information on trends and developments in many geographic areas and on all phases of oil operations enables them to co-ordinate the timing, location and scale of their investments and thus to plan far ahead for future needs. And it ensures an ample range of petroleum

products at attractive terms in all parts of the world—undoubtedly one of the most important factors contributing to the striking growth in oil consumption and production. As a result, the oil companies have been able to maintain orderly and efficient operations from which they, together with both producing and consuming countries, have benefited greatly. For the most part, output has been continuously increased, prices have remained relatively stable, local government revenues from production have expanded and rapidly rising demands in consuming countries have been equitably satisfied. Assisted in their foreign operations by the international prestige of their home countries, the companies in turn have assured the flow of essential oil supplies in time of war and crisis.

There is now a threat that the companies may be more and more handicapped in maintaining the efficiency of their world-wide operations. Recent trends are toward the "Balkanisation" of world oil. While the technical contributions of these companies are clearly essential to effective oil operations in virtually all sectors of the industry, they would tend increasingly to take on the character of service organisations if this were the limit of their contribution. The danger is that the world oil surplus acts to obscure the contributions they make in their basic operating functions of producing, refining, marketing and the financing of investment.

As noted previously, however, mounting world oil requirements will require a great and uninterrupted expansion in proven reserves, and in the facilities to translate reserves into petroleum products in the hands of consumers. For all this, the internationally integrated oil industry is uniquely in a position to make essential contributions. These include forward programming, in exploration and also in refining and distribution; diversification of risk, as among areas and functions; and the internal generation of capital, to finance necessary investment without undue capital demands upon individual countries. But the continued effectiveness of industry operations will depend on how well it can cope with the strains to which it is currently subjected and on the policies of governments in matters intimately affecting world oil trade.

In this respect, it is of paramount importance that expanded opportunities, and improved procedures, should be provided for consultation, on critical issues, between the oil companies and their home governments. Western policy is closely concerned with

developments in all areas where the companies have operating responsibilities. Nor is it merely Western oil policy that is involved. It is essential, therefore, that company decisions be made

with full regard for the far-reaching political and economic consequences that may be involved. It is equally essential that the companies' position be strengthened and appropriate ways found for the companies to consider in concert those broad problems that bear on the entire industry's vital position, without running foul of an interpretation of American antitrust laws that in such instances might be self-defeating or harmful to the basic interests of the free world. Otherwise the companies cannot be expected to carry out their commercial functions effectively, the while acting as a buffer between conflicting government interests.

By 1975, the share of oil in energy consumption outside North America, will have increased to over 50 per cent. Petroleum products are becoming more and more important in a wide range of uses, including essential and strategic industries that have hitherto depended on local energy sources. In consequence, the economic effects of interruption in the flow of oil become more severe; and there is a risk that this very vulnerability might become the target of hostile manœuvre.

SECURITY OF SUPPLIES

In the interest of the prosperity of the free world as well as its security, oil operations need to be kept as far as possible on a genuinely commercial basis. Should the provision of supplies come to be determined more by political than economic or commercial considerations, the dependability of supplies would be seriously impaired. By the same token, the terms under which oil can be obtained must not involve economic, commercial, or political conditions that would make it impossible for the user to accept them.

Viewed from this perspective, the nations of the free world, and especially the industrialised countries, must aim for as balanced an energy supply position as possible—drawing on the availability of low-cost energy, but promoting the diversification of sources that would ensure adequate supplies at reasonable prices over the long run. This involves concern both for the security of oil imports and for the viability of domestic energy industries. Consuming countries would continue to draw ever increasing quantities from the oil resources of the large producing areas, which would thus be assured of expanding production and revenues. But consuming countries would also try to avoid an undue measure of dependence that would leave them totally vulnerable.

Maintenance of diversity—and security—in one's sources of energy would likewise provide continuity between present and future. By support of diversified oil-producing sources and of reasonably economic domestic energy industries, it would ensure the maintenance of capacity that could contribute significantly to energy requirements over the years ahead.

There is no simple formula to determine the requirements of oil security. However, a general approach might be somewhat as follows. If oil supplies were to be interrupted from one or several important producing areas, or become subject to unacceptable terms, then remaining sources of supply together with extant stocks should be capable of sustaining essential activities for a prolonged period, until the potential loss of revenue and the possible economic and political repercussions had become matters of serious concern to the producing country. If this were appreciated in advance, any threat of interruption might well be avoided; and if it came to pass, the consuming countries would be in a position to withstand it.

The greatest measure of security undoubtedly rests in the diversification of producing areas from which oil supplies can be obtained. Here the internationally integrated oil companies contribute very considerable diversification through the development of production in widespread areas of the world. In their established operations, these companies have been singularly successful in meeting unexpected increases in demand or disruptions in normal patterns

of supply. Recent years have also witnessed a greater emphasis on the exploration of new producing areas. And the number of companies engaged in the search for oil has increased sharply. If these developments have contributed to the present world oil surplus, they have also promoted increased diversification of supply which in the long run would help to ensure a continued flow of oil.

Oil policy in the United States is also an important factor bearing on the potential security of other oil-importing countries. Import restrictions, instituted in July 1957, seem to an American to have a two-fold effect. The United States avoids dependence on the same sources of supply as go to meet European and other eastern hemisphere requirements. And protective measures taken on behalf of the American producing industry help to sustain a large "resource base." This represents capacity in being, to which other countries could also turn in an emergency, should normal sources of supply be disrupted.

Reasonable provision for ready stocks of crude oil and products within consuming countries, as is already the case to a substantial extent, also contributes to security. An obvious problem is the cost of stockpiling—to provide storage facilities and to carry oil inventories. The oil companies themselves are certainly aware of the importance of carrying stocks in consuming areas, but obviously they cannot be indifferent to the burden which such costs impose on their commercial operations. On the other hand, consuming industries also have an interest in the ready availability of oil supplies; and national governments too. Under the circumstances, stockpiling would properly involve some reasonable apportionment of costs among suppliers, users, and governments.

At the same time, indigenous energy industries would warrant support, wherever they can produce under reasonably economic conditions. This does not necessarily mean that local fuels need everywhere and at all times meet the competitive prices of imported energy. In world oil commerce, for example, it has not been the case that petroleum requirements were met entirely from lowest-cost producing areas. If it had, a few producing areas might have pre-empted the world oil trade; productive capacity elsewhere would then have been abandoned, and the search for oil cut back

TABLE III
ESTIMATED OIL REVENUES*, SELECTED COUNTRIES, 1950, 1955, AND 1960
(Millions of Dollars)

sharply. In the event, the conditions of world oil trade might have become subject to a one-sided dependence on the small number of producing areas that remained. As a result, and with the natural exhaustion of the few producing fields, the trend in oil prices might soon have been sharply upward.

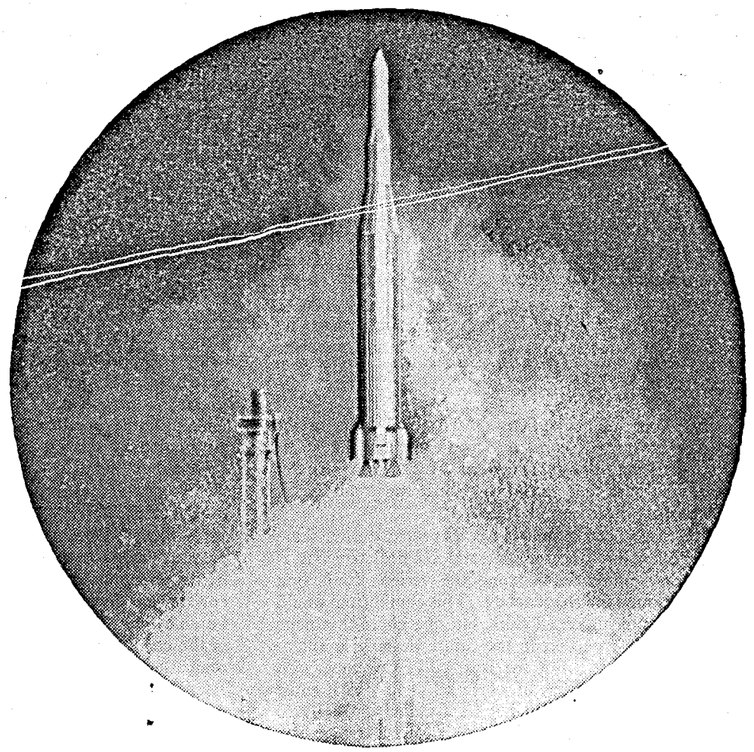
Perhaps the most that can reasonably be expected during these difficult times of economic uncertainties and political tensions is some sort of uneasy equilibrium among the various conflicting interests centering around international oil. This equilibrium would be sensitive to developments on all sides, but one hopes that none need endanger it. It is true that in the future nothing is apt to be as secure as in the past. But the free world can cope with uncertainty and a lack of tidiness in world oil affairs, as it must in all others. The problem should not be abandoned wholly to governments merely because a simple or neat settlement appears unlikely.

There is a tendency now for many countries to secure their own interests in this business solely through political devices. Whatever the intentions or merits in individual instances, it is important to avoid such a proliferation of barriers as would undermine the rational allocation of resources and the efficient performance of oil operations. It is an unfortunate reality that government interposition in producing countries tends to beget a political reaction in consuming countries, and vice versa. The danger is that every oil problem, commercial or otherwise, would tend to become an intergovernmental affair, or subject to a tug-of-war between political blocks, or an issue in the East/West struggle.

LESSONS OF INTERDEPENDENCE

What may be called for is not so much a solution to the difficulties of the moment as comprehension of underlying realities. One is the basic and continuing interdependence of all parties to the world oil trade. There is a real danger that a few producing countries, because they have physical control over huge resources, might believe that they have special power over the world oil equation. In fact, producing countries depend to an extraordinary extent upon the countries that are their major customers, and upon the companies that are responsible for the development of their resources and the marketing of their production. In the Middle East, for example, government oil revenues have risen from less than $200 million to about $1.3 billion a year in the past decade. On the other hand, importing countries likewise depend on the major producing areas for the energy that is essential to their continued prosperity.

Inevitably there will be marked changes in world oil arrangements, through the renegotiation of concessions or different approaches in new agreements. But the recognition of interdependence should prevent either side from asking too much, or attempting to achieve its ends through unilateral action. And whatever new arrangements might evolve, they must not destroy the incentives for continued investment; they must provide for reasonable stability of operations; and they must assure the companies of sufficient managerial control for the planning and co-ordination of their world-wide responsibilities toward producing as well as importing countries.



But while the difficulties of the present are substantial, the prospects for the future are impressive. As noted earlier, oil consumption in the free world could reach almost 2 billion tons by 1975 of which more than half would be in the eastern hemisphere. Over the fifteen years, eastern hemisphere production could aggregate almost 10 billion tons—to meet the area's own needs and to fill the import requirements of the western hemisphere. The oil resources should be available to meet these rapidly rising requirements. But great investment will be needed.

It is precisely here that the international oil industry will have to play a pivotal role. In consideration of demand among all oil-consuming countries, it will have to provide for increasing production in existing areas and maintain exploration in widely scattered regons. In anticipation of future demand, it must plan now to provide the necessary facilities. To do these, the industry must be left with reasonable freedom to plan its investments and to manage its affairs. If nationalistic, political and "cold war" pressures tear our world asunder, the international oil company can hardly remain alone as a cohesive and constructive world-wide enterprise. Given a modicum of law and order, the industry will be able to function in a rapidly changing world; though many of the changes may not be easy or attractive. But in any rational evaluation of future prospects, its contribution should be no less essential than in the past. And a period of huge expansion in oil demand and production should offer untold opportunities to all if only industry and governments can tackle constructively with the problems of transition.

EUROPE into SPACE

HAWKER SIDDELEY 'BLUE STREAK' FOR EUROPEAN SATELLITES
Blue Streak will be the first stage booster to put satellites into orbit around the earth for the European Space Programme • Blue Streak, powered by two Rolls-Royce RZ.2 rocket motors has been developed and produced by de Havilland, a member company of Hawker Siddeley Aviation. The vast aircraft, electronic and industrial engineering capacity of the Hawker Siddeley Group is now at Europe's disposal to speed the practical formation of the new European Aerospace Industry.

THE BUSINESS WORLD

Should Gas Be Nationalised?

For several years it has been a matter of interest to speculate whether, and how soon, a Conservative government would have to nationalise the British gas industry. Now it looks as if this one may have to, and soon. "Nationalise," in this context, means just what it says: make national. What the Labour government did in 1948 was to concentrate a huddle of big and little gas undertakings, owned privately or municipally, into twelve biggish, regional, publicly-owned businesses. But to outsiders it has been growing steadily more obvious for years that certain of the things this industry needed to do to survive in a competitive fuel economy—the only "growth elements," indeed, that offer much hope for its future development—would have to be planned and organised, at least, on a national scale. By 1960, even the gas industry—or most of it—had come to accept this. But how?

That is the question to which the Select Committee on Nationalised Industries addressed itself at the conclusion of an eight-month look at this industry, upon which it reported this week. It did not take this committee, which has become in the last four years so much more effective an instrument of Parliament than anyone would have predicted from its beginnings, long to appreciate that "the present structure of the industry is not suitable for developing and establishing large-scale production and distribution facilities," or the reasons why:

> It is clear that recent technological advance has brought the gas industry to a position which was not envisaged in the Gas Act, 1948. The emphasis of that Act was on the independence of Area Boards; technologically, the emphasis today is on their inter-dependence. To make gas more cheaply, to store and transmit it more cheaply, require collective action of some kind.

The technological changes involved have often been discussed at some length in these columns*; but the briefest outline of them is necessary, in that decisions about them are integral to decisions about the structure of the industry.

The two significant technological developments in the supply of gas that are now impending, as alternatives or in conjunction, for this industry, are the import of methane and the development of complete gasification of non-coking coals, primarily by the Lurgi process. The development in storage is the utilisation of underground cavities and structures for the storage of gas in great volumes, which would allow a steady, base-load supply of cheap gas to be married with the industry's fluctuating annual demand. The development in transmission would be the movement of gas over distances that are relatively long for this country along pipelines or mains at high pressure. To offer really cheap delivered prices, methane would need to be imported and/or Lurgi gas produced in volumes too great for any single regional board to assimilate into its regular supplies alone. The places where underground caverns happen to be bear no necessary relation to where the largest volumes of gas happen to be saleable. Long-distance transmission of gas over a "national grid" is only an economic proposition at high pressures, so that even a cheap, large-scale source of gas at low pressure would incur the extra costs of compression if it had to travel this far. But this transmission requirement would fit in neatly with methane from the reforming plant where it might be converted into town gas or Lurgi gas from the gasifier, both of which come in any case at high pressures.

It is probably true, as the Ministry of Power argued to the select committee, that neither the industry's decentralised structure of twelve economically responsible boards and a kind of loose confederation at the top, the Gas Council, nor the terms of the Gas Act of 1948, would formally quite preclude joint operations on a scale broader than any one board. But the select committee, considering the practical difficulty of getting a number of independent chairmen to fall in with the lead of a council of limited powers, concludes: "While the existing statutory powers may in theory be adequate, in practice they are not so." Anyone who in recent years has watched the slow awakening of most of this industry to its predicament as well as to its technical possibilities, under the prodding of its few zealots, must have the same feeling. For these technical developments are by no means further advances in a steady progression; they are opportunities for the gas industry to escape from traditional technology at the end of its tether. Carbonisation plant makes coke as well as gas; demand for coke is probably in secular decline, and in any case its high costs of transport preclude the concentration of production into really large plants that might reap significant further economies of scale. That has left carbonisation, an extremely highly-capitalised process, unable to escape the full inflation of plant prices; and these have now risen to a level that makes replacement of existing plant hardly economic without increasing the price of gas in a market

* For instance, in "Choosing Cheaper Gas" *The Economist*, December 10th and 17th, 1960.

where the fuel costs too much already. Getting the industry to realise this has been a long business. It is true that on one positive development, the import of methane, it has not moved so slowly. But this was because the whole methane project is in the hands of certain of the zealots of the industry—whose problem of replacing plant that is on the verge of falling down is perhaps bigger than anyone else's in the industry.

The select committee reckons that there are three possible ways of developing these new large-scale forms of gas technology, which are probably the industry's only hopes for the future, though possibly quite bright ones. First, leave the present structure of the industry unchanged. Seven area boards have after all accepted the methane scheme. Cannot they be trusted to show the same "spirit of collective co-operation" again? The select committee agrees with the Gas Council (or at least, presumably again, with its chairman, who appears to have given a marathon performance with evidence) that the Council as is cannot.

A second possibility is to harden the Gas Council, the existing soft centre of the industry, with fresh powers, and give it the job of new large-scale development. This, apparently, was what the council itself proposed to the Ministry in July last year. What it wanted were powers to manufacture and supply gas. These powers would be permissive, and used only in cases that the council could justify to the Minister, but, on the other hand, before approving any proposal to manufacture gas by an area board wishing to make its own gas rather than take the council's grid gas, the minister "would have to take into account the Gas Council's views." Area board chairmen had agreed to this proposal to give the council coercive power—though some of them, to the select committee, voiced subsequent doubts.

THE third possibility, which the select committee appears itself to have suggested to the industry's witnesses, would be that

> a thirteenth board should be set up to develop and carry out the large-scale manufacture of cheaper gas which would then be sold to all or some of the Area Boards.

This would become eventually, though not from the outset, analogous to the position of the Central Electricity Generating Board and the Electricity Council. For quite a long time the area boards would go on operating their existing plant themselves. As this wore out and the base load of demand was taken over by cheaper gas from a national grid, area manufacture of gas might be reduced to peak load supplies from old or specially-designed plant; or possibly to the manufacture of gas (for enrichment with methane or not) by other methods than Lurgi, such as the reforming of naphtha, which if economically competitive might well be so on a smaller scale. Gradually the area boards would become to a much larger extent what they are in electricity supply—retailers of a fuel they buy wholesale.

This third way of giving the gas industry the new technology it needs is the one that the select committee, albeit somewhat tentatively, would choose. It thinks there would be an advantage in having a board with responsibility for production and distribution on a national scale but no other responsibilities, leaving it single-minded to apply the drive that has been so notably lacking in pushing on development of the Lurgi process. It also thinks there would be an advantage in leaving the Gas Council impartial and disinterested in any conflict between large-scale production and area board production. It is worth adding that putting this responsibility for large-scale manufacture and transmission at the centre would put steadily increasing power there. Whether this power could properly be exercised by a council of a few full-time members surrounded by ex-officio members from their somewhat subordinate customers—something like the old Central Electricity Authority?—is doubtful. Admittedly, we have not yet had enough experience of the alternative formula under which a collective council oversees a generating and transmission board plus its retail customer boards, in electricity, to judge it properly. But at least it offers the possibility that a highe body can hold the balance.

The argument for centralising this responsibility for th new processes, to the select committee and the onlooker, arise basically from the feeling that impetus needs to be put behin getting them from controversy to operating reality, whicl certainly has not happened with the development of coa gasification. The committee's report paints a depressin picture of delays, indecision, changes of mind and pace. Th impetus, indeed, will probably be needed—if developmen of both these lines of advance is to go on—primarily in th next few years, "from ideas to ironmongery." For methane this has already been given by the North Thames Gas Board backed by the great technical capacity of the oil industry. And once methane got on the move, at least, one would no have to worry about continued impetus: the oil industry could be trusted to keep its distributors technically up to the mark. Coldbloodedly, one could say that if the intention were simply to go for reformed methane, and to drop Lurgi development, that is to say, the immediate need for a new body to push on would be less strong, and the question of ownership of reforming plants, if not of the transmission grid, might possibly wait.

The Gas Council insists, however, whether the Coal Board believes it or not, that it does not wish simply to take methane-reformed and perhaps later straight, as a single source of cheap gas. It says it does want to develop Lurgi, for enrichment with methane, if this is economic. If that is so—and if that is the way that the Minister's decision on these matters should oblige it at least to start going—then the case for a new body to push on development of all the chosen large-scale techniques, and probably for one independent of the Gas Council, becomes that much stronger. For most of the top people in the arguments about Lurgi and methane have become far too polarised in judgment or prejudice one way or the other. If the technical decision is for or includes Lurgi, enriched with methane or some cheaper hydrocarbon, there will be a need for some new protagonist committed only to develop cheaper gas quickly, by whatever route the Government points out. Whether such a body could usefully be made purely a department responsible to a council several of whose members are now almost emotionally opposed to further development with coal is doubtful. To quite a considerable degree, therefore, the new structure that one would choose for this industry will depend on the basic decisions that have to be taken about its technology. But that is as it should be.

BUSINESS NOTES

OVERSEAS INVESTMENT

How Strict a Scrutiny?

WHEN the Chancellor of the Exchequer announced as part of his July measures a "more severe" test of investment projects in non-sterling countries, he said that this would require

> clear and commensurate benefits to United Kingdom export earnings and to the balance of payments.

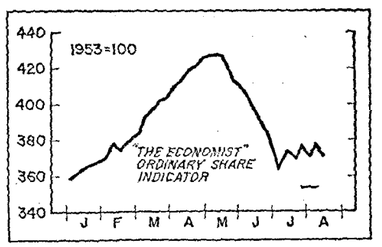
The next day Mr Anthony Barber, Economic Secretary to the Treasury, stiffened this by adding "in the short-term"; and press comment this week has suggested that the Treasury is in fact interpreting this criterion so narrowly that virtually the only projects that will meet the new test are those directly related to export promotion. The Treasury, for its part, stands pat on its spokesmen's words, and emphasises that these mean what they say. They do not involve anything like a general ban on overseas factory projects; "short-term" does not necessarily mean twelve to eighteen months, and the long-term considerations in each case will not be disregarded. The change is one of emphasis: the prospect of getting something back soon in current earnings, whether through exports or remitted income, is being given considerably greater weight than before.

What is still unclear is whether the Treasury is proposing a major change of policy—a "pause" in overseas investment as well as wages—or whether, as most people took Mr Lloyd to mean, the tightening in official scrutiny will affect only the marginal proposition, rather than the general run. Like most aspects of the new policy this has been very poorly explained to the public. The point needs to be cleared up.

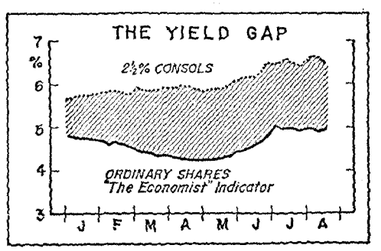
This is a sphere in which supposed toughness could have odd and undesirable results. For one thing, no similar controls apply to investment in the sterling area. It is true that in recent years political influences have themselves acted as a forceful deterrent; the City no longer seeks to circumvent the credit squeeze by putting money into Rhodesia. At the same time, however, Britain is sending growing amounts to sterling countries through Government loans and grants, which however desirable they may be on political and humanitarian grounds yield precious little return financially. A general curb on investment projects in non-sterling countries that business firms judge profitable would therefore almost certainly reduce still further the average rate of return that Britain gets on its overseas capital outgoings as a whole; while Treasury officials would hardly claim that they are in a position to apply a selective curb in any scientific way.

There is much more sense in present official efforts to get more income back from existing investments: exchange control officials from the Bank of England have been renewing old contacts in the past week or so. But here too there is no control on investments in the sterling area; while it is anomalous, to say the least, that present tax legislation actually puts a penalty on distribution. There is a further point. Restrictions on direct investment in European countries—and it is these countries that are attracting most attention at present—could not be maintained without a special dispensatoin if Britain signed the Treaty of Rome. Possibly the Treasury feels that this need not get in the way of an interim pause. But a break in the policy of freer movement of this kind of capital, which has proceeded steadily over the past few years and would be bound to proceed further if Britain joins the common market, would make little sense.

IN THE MARKETS



Gilt-Edged Recovery



THE London stock markets have become quieter and steadier this week following the gyrations of the previous fortnight. The sudden inflation of equity prices and further marking down of gilt-edged that took place on the two days following the enactment of the trustee bill can now be clearly seen as a momentary aberration. The subsequent recovery in gilt-edged has continued this week, though partly under the influence of Berlin the volume of buying has been smaller than in the previous week, when the government broker was able to resume his funding sales in a big way. Selling by trustees has continued, but not on a scale sufficient to upset the market.

Indeed it has been considerably less than many people had reckoned on, and the bears have been squeezed. Institutions that had held off the market in the hope of seeing prices go still lower have now stepped in to buy, and personal investors have also come in as buyers, especially at the short end of the market. As the tabulation on page 735 shows, short bonds now offer outstandingly attractive yields, with little risk of depreciation. More venturesome investors have been prepared to put their money into irredeemables again, and War Loan has edged up to 53—its net price of 52¼ comparing with the all time low point of 49⅞ on August 4th. There are indications that the government intends to apply its new measures more toughly than some sceptics first thought likely, and this influence should tend to favour gilt-edged in relation to equities. Much still needs to be proved before the gilt-edged prospect is assured. The government must go through with a tough policy, not merely proclaim it. It must consolidate foreign confidence in sterling and before long there must be a significant rise in exports. Even if all this happens, the investor in gilt-edged is likely to have his nerves tried in coming months by outcries over Berlin abroad and strikes at home. On balance, at the least, more investors are now likely to agree that there is once again a place for gilt-edged in their portfolio.

Impact of New Issues

THE Berlin crisis gave equities a knock after the weekend but it was only a slight one, not least because equities had fallen sharply the week before on more sober assessments of the state of the British economy. The growth in international tension, however, has not been minimised in Throgmorton Street. The underwriters of the convertible debenture issue by Courage Barclay and Simonds have taken it seriously enough to introduce a war risk clause. Such clauses were common before the war but have not since been greatly used, except at the time of the Korean crisis; they give the underwriters the right to cancel their obligations if in their opinion international conditions have deteriorated so far as to involve the risk of an imminent outbreak of hostilities. Another effect of the Berlin crisis has been

the reduction in the volume of business in the industrial market, where in the middle of the week a small amount of buying, including a little by trustees, pushed enquiry prices up slightly.

One reason for caution is the knowledge that as a result of the Chancellor's measures new issues will press even more heavily upon the market. The failure of the big rights issue by Colvilles of 5,324,906 ordinary shares at 57s. 6d. each, of which nearly 85 per cent was left with the underwriters, illustrates the pressure that is building up on investible funds and, as it leaves the underwriters with so much stock in their hands, it may contribute to further failures unless the terms of future issues are made even more generous to the lenders. The borrowers have to find ways of making their issues attractive while trying to limit their liabilities as much as they can. Courage Barclay and Simonds has chosen this course for funding its bank loans of £6.1 million, largely raised to pay for Bristol Brewery Georges. CBS proposes to raise nearly £7.5 million by offering a 6¾ per cent convertible debenture, 1976-81, at 99. On a straightforward debenture issue the coupon would not be high enough to attract full subscription and the carrot is the terms of the conversion, which give the debenture holders the right to convert into ordinary shares at a price equivalent to 61s. 10d. in 1963, 63s. 10d. in 1964 and 66s. in 1965. By the time the rights are exercisable, many of the benefits of integration within this brewing group should be apparent and so, too, should be the degree of initial success attending the "Harp" lager venture in which CBS is participating. But this looks some way ahead and, in marking the CBS shares down by 4s. to 57s., the market was more conscious of the immediate fact that CBS will have more permanent capital to service.

PUBLIC INDUSTRIES

The Rate for the Man

WHILE one nationalised industry is losing one of its senior men to private industry, another has managed to make a catch the other way. The common factor in this week's bout of management trading has been willingness to pay the right price. What the Coal Board was paying Mr Henry Longden, who is leaving the chairmanship of the board's west midlands division at the end of next month to become deputy chairman and chief executive of the Cementation Company (which sinks a lot of the board's new pit shafts), has never been disclosed. The board, whose own members are appointed by the Minister of Power at salaries that are fixed by him and published, has complete freedom in appointing its own divisional board members. But there is apparently a practical limit. Lord Robens, commenting upon Mr Longden's resignation, said that the terms offered by Cementation were "such that the Coal Board could not match them."

For the only one of this week's three new appointments to the Transport Commission (and eventually to the British Railways Board) that involves any real poaching from private industry, the Minister of Transport has got away with the minimum rate possible. Mr P. H. Shirley, at present Chairman of Batchelors Foods, in the Unilever group, is to be paid £12,000 a year "to place him in the same financial position" during his period of secondment which at present will be five years. Thus Mr Shirley, who is now 48, will retain his Unilever pension rights in the same way that Dr Beeching's status for a pension from Imperial Chemical Industries has been preserved. The second new appointment to the commission is of a man who, at the age of 52, had already retired. Until May 1960 Mr L. H. Williams was managing director of Shell Chemical; he was then transferred to Shell International Chemical for an appointment that apparently did not materialise and last month resigned "by mutual agreement" on a pension boosted by nearly twenty years of overseas service with Shell. On the commission he will receive the basic rate for full time members of £7,500 a year. The third appointment is the promotion of Sir Philip Warter from part-time chairman of the Southern region and part-time member of the commission to be Sir John Benstead's successor as deputy-chairman under Dr Beeching—also a part-time post as he will remain as chairman of Associated British Picture Corporation. But his salary from the railways will go up from £2,000 a year to £6,000, compared with the £8,000 Sir John Benstead has been receiving.

Ministers and the Law

IN what is to some degree an aside from the main argument of its report on the gas industry (which is discussed in an article beginning on page 731), the Select Committee on Nationalised Industries this week returns to one of its recurrent complaints, and takes issue with one significant detail of the government's new policy towards nationalised industries. It agrees with the broad purpose and method of that policy, as set out in a White Paper* early this year—that each board should be set an individual "target" rate of return on capital which it would be required to earn as an average over five-year periods. But it notes acidly that this white paper's reference to the informal control that the ministers concerned exercise over these industries' prices "appears to admit that governments have always acted beyond the statute" and to suggest that they should go on doing so.

The white paper did confirm that the industries concerned had the right to publish—later, in their annual reports—details of cases where the Minister had overruled them on price changes, putting the responsibility back to the ministry where it belongs. The select committee comments

> But until the matter is made public there would be no knowledge of where the responsibility lay, and Parliament would have no basis on which to question the Minister.

How generally, indeed, does the fact and result of the intervention—which for example in 1958-59 and 1959-60 put one gas board that would have made a profit into the red, and reduced the degree of self-financing of investment that another had intended to achieve—ever get known?

The select committee, which has been a strong critic of this kind of underhand intervention ever since it began reporting on the public industries, is not satisfied. It suggests that a written statement of any ministerial intervention on tariffs should be laid before Parliament at the time it is made. Secondly, as soon as possible "an amending Gas Bill" (and by implication amending bills for the other public industries) should be introduced, giving the Minister the statutory power to intervene as he in practice, outside the law, does intervene already. There may be a case for giving ministers an ultimate right of veto over price changes in these publicly-owned industries. There is no case for allowing them to do so without regard to the statutes.

* The Financial and Economic Obligations of the Nationalised Industries. Cmnd. 1337, 1961.

OUTPUT

An Increase Observed

INDUSTRIAL output, as measured by the official figures, has moved up a little since Easter. But only by a little. For the second quarter as a whole the increase, allowing for seasonal differences, was just over one per cent above the volume of production in the first three months of 1961 and in the three previous quarters of no change. By June industrial production was almost two per cent higher. Clearly the rise in personal and government spending, the pick up of exports, and the sustained high rate of investment earlier this year has now made some mark at the factory. Output among the engineering industries rose rather faster at the beginning of the summer, partly reflecting a higher tempo of work by some electrical capital and consumer goods manufacturers and probably also under the impact of larger orders for intermediate supplies from the motor firms. Car output has picked up quite sharply. Some of the "soft" consumer trades, such as textiles, were also doing a little better.

INDEX OF INDUSTRIAL PRODUCTION
(1954=100)

	Unadjusted		Seasonally Corrected	
	1960	1961	1960	1961
January	120	120	119	120
February	123	125	119	121
March	126	126	120	121
April	120	123	121	122
May	125	122	121	122
June	119	126	120	123
July	109		120	
August	104		121	
September	123		121	
October	127		121	
November	127		120	
December	120		121	

The more important question, however, is what will be the trend of output in coming months? Consumer spending appeared set on a somewhat slower rate of growth before last month's increase in excise and customs duties (and the momentary splurge of anticipatory buying that induced). But investment in plant and machinery, though possibly not in new buildings, remains buoyant. Government and other public sector expenditure of all kinds is under renewed restraint. The course of exports remains to be discovered. Basically the answer may still hinge upon future trends in stocks. There are signs that some retail stocks are in better balance, cars for instance but certainly not refrigerators. At the other end of the line, however, steel users have been reducing their holdings.

OVERSEAS TRADE

Back in Surplus?

THE monthly figures of Britain's overseas trade shipments, which all this year have been closely watched by the stock markets as well as the exchange markets, once again show little decisive movement. The July returns suggest that exports, after their modest lift at the beginning of this year, have since then run about level, while the decline in imports from their peak at the end of 1960 has continued, though at a modest pace. The balance of trade in July was in fact less favourable than in June, but exports in that month were somewhat swollen by left-overs from the latest of London's dock strikes. Even so it is a little disappointing that the seasonally adjusted figure calculated by the Board of Trade dropped on the month by as much as £24 million, to £307 million. The combined total for May, June and July was just one half per cent above that for the previous three months, while imports fell by 2½ per cent over the same period.

UNITED KINGDOM TRADE
(Seasonally adjusted. £ million per month)

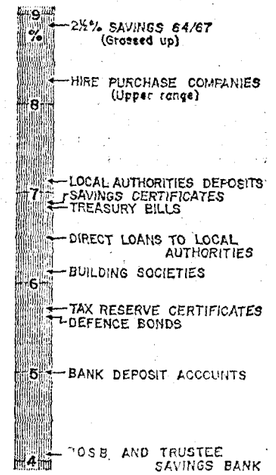
The apparent trade deficit in July as shown by these figures was £31 million;



Savers' Choice

THE increase in Bank rate to 7 per cent has produced marked changes in the relationships between returns offered by different fixed-interest investments; now that the new rates are more settled, a critical review is worthwhile of where one's savings are placed. In general the rates are above the levels prevailing after September, 1957, when Bank rate was last at 7 per cent. There are two exceptions—the savings banks' deposit rate, which never changes from 2½ per cent; and the deposit rates of the finance houses, which were in the region of 8½ per cent in 1957 when the houses lacked the associations with the clearing banks that most of them now enjoy.

The increases in interest rates have, however, largely by-passed the traditional openings available to the small saver (shown in the top half of the table): as frequently happens when money is very tight, the dramatic increases have been for big lines of money. Only the clearing banks' deposit rate has increased in line with Bank rate, and this rate, which in modern times has usually been uncompetitive, now offers a return of 5 per cent—which to the saver who pays little or no income tax is among the most attractive rates available. For these truly "small" savers the returns offered by the National Savings movement and the building societies now compare unfavourably: but it is a fair point that the terms of savings certificates were also unchanged when Bank rate was reduced to 4 per cent at the end of 1958.

	Rate of interest	Grossed-up allowing for tax at 7s. 9d.	Holding Maximum	Holding Minimum
	Per cent	Per cent	£	£

Treasury bills (On interest rate basis)	6 27/32	6 27/32	...	5,000‡
Gilt-edged :—				
3 per cent Exchequer 62/63	6 9/32§	8 1/8	...	
2½ per cent Savings 64/67	6 19/32§	8 7/8	...	100 nom.
3½ per cent War Loan	6 25/32	6 25/32	...	

* The first £15 of interest is free of tax. ** Only after balance of £50 in an ordinary account. † Allowing for the tax free redemption payment of 3 per cent after seven years. ‡ Minimum direct tender is £50,000, but a bank will supply customers with individual bills of £5,000. § Redemption yields. ‖ Interest credited for maximum of two years against tax dues.

The highest effective rates for the taxpayer are obtainable from short-term marketable securities; the 2½ per cent Savings Bonds 1964-67 now offers a grossed-up redemption yield of 8⅞ per cent. The effective rates are still higher for the surtax payer—though the budget reliefs have in most cases reduced the marginal surtax rate on unearned income too. The reduction in the number of surtax payers may also limit the demand for tax reserve certificates, the rate for which was raised from 3 per cent to 3½ per cent tax-free this week.

Investors who dispose of sizeable sums now enjoy unprecedented opportunities—and they are increasingly aware of them. Having discovered Treasury bills a few years ago they are now moving into the local authority mortgage market in a big way, and in the past two weeks rates in this market have eased from 7¼-7½ per cent to 7-7⅛ per cent.

and since distortions such as the uneven valuation of imports and exports swell the debit items by as much as £40 million a month compared with the Treasury's payments figures, there appears to have been a true balance on the right side in July. In the first seven months of the year as a whole however the crude deficit was £50 million, which implies a deficit even on the true basis. A few years ago this would still not have been inconsistent with a surplus on current payments as a whole, but the disappearance of net invisible income has now shifted the whole burden on to merchandise trade.

THE EXCHANGES

Not Only Berlin

THE recovery in sterling that proceeded almost without interruption in the fortnight following the Chancellor's economic statement on July 25th has been checked in the past week. Anxieties over Berlin have certainly been an important influence; but they are not the only reason for the markets' caution. The July measures were generally regarded as a step in the right direction, but as no more than that; judgment on their ultimate efficacy has mostly been withheld, abroad as well as at home, until the wages issue is put to the test.

The limited restoration of confidence was sufficient to encourage dealers to cover their very short (i.e. speculative) positions in sterling, but now that this first flush is over the underlying hesitations are becoming more apparent. The general mood is still quite different from what it was before the measures were announced. But for the time being confidence in sterling might be said to be in neutral rather than positively favourable.

The gathering crisis over Berlin has naturally thrown its shadow over the financial markets as a whole, though the effect has generally been to reduce the volume of business rather than cause sharp price movements. Some funds have moved out of Germany, mainly to Switzerland and Italy—seeking a refuge from both the nuclear bomb and the stresses of the gold exchange standard nowadays poses some pretty problems for the fearful—but the movements have probably been smaller than in previous weeks. These outflows have turned the tide of the Bundesbank's exchange reserves, which showed a fall of some DM 700 million in the four weeks to August 7th. The bank has now suspended its free facilities to German banks for forward swap operations in dollars, and is making a charge of one quarter of one per cent.

At the same time some German banks still see the threat to Berlin as a reason to sell sterling, and on Tuesday the Bank of England appears to have sold some dollars to prevent the rate from falling below its parity of $2.80. The volume of selling was relatively small however and on Wednesday sterling came in demand on a thin market, and rose to $2.80¾. The US dollar, while it has been relatively strong at Frankfurt, has fallen to its lower support point of 4.31½ in Zurich, though the Swiss National Bank has not had to take in large amounts. Demand for gold coins and gold bars in Zurich has received some stimulus, and in London the dollar price of gold has edged up to $35.16, but demand has if anything been rather less than in earlier weeks. Repayments by the Bank of England under the Basle arrangements are expected in the next week.

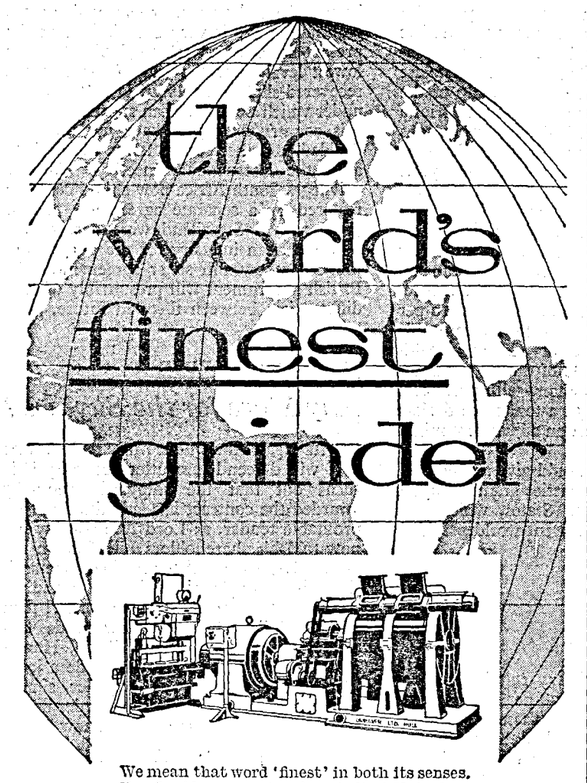
OVERSEAS AVIATION

Flying into Trouble

THE collapse of a small charter airline, Overseas Aviation (C.I.) Ltd, this week has set other small airlines wondering whether their suppliers may become less generous with their credit now than they have been in the past. Just how generous they have been to small airlines can be guessed from the debts of Overseas Aviation (C.I.) Ltd, which ran up bills of about £250,000 each with Rolls-Royce and British Petroleum before both companies cut off its supplies, so grounding the company's aircraft and effectively putting it out of business. The only unique feature was that unlike most airlines, this company does not own the aircraft it flies and could not, therefore, offer its fleet as security for its debts. These aircraft belong to a quite separate company, Overseas Aviation, which is not an airline, which unlike Overseas Aviation (C.I.) Ltd, is registered in this country and not in the Channel Islands, and which hires out the fleet for the charter airline to operate. This aircraft-owning company has only recently made a big purchase from Canada of Trans-Canada Airlines' old fleet of piston-engined Canadairs and now owns about 40 assorted vintage machines. These facts about the ownership of the aircraft were presumably known to the two suppliers when they advanced credit.

The oil companies usually give small airlines a month to pay their bills, but it may take much longer than this to prepare the invoice. Fuel taken on abroad for the journey home is supplied against an international credit card given to the airline by its domestic fuel supplier. It may take up to two months before the domestic supplier (in this case, BP) gets notification from the foreign oil companies of how much fuel they have supplied, so it is not unusual for an airline to get an effective three months' credit, measured from the date the oil was pumped into its tanks. During the busy summer months quite a small airline can easily run up fuel bills well in excess of £100,000 in this way while still paying its bills on the dot. Even if they wished, the oil companies could not avoid giving this kind of credit. By the time belated warning signals do appear, the airline usually owes so much to its suppliers that for oil or for spare parts they are tempted to keep up deliveries in the hope of future profits rather than cutting them off, forcing the company into liquidation and cutting what by this time are very substantial losses. In the case of Overseas Aviation (C.I.) Ltd, which has expanded rapidly during the past two years, the aircraft it was using may have cost too much to fly to show a profit in the highly competitive holiday tour business in which it operated however much traffic was carried.

The Independents



OVERSEAS AVIATION (C.I.) Ltd was not one of the 18 independent airlines that are licensed to fly regular scheduled services although it had applied for a licence and had suggested that it might put Viscounts, Vanguards and even Trident jets on these routes. Excluding this company, there are perhaps 23 privately-owned airlines in Britain and another 25 or so crop-spraying and air taxi companies. Some of these own a single aircraft only, occasionally as old as a Rapide biplane, others are better and more ambitiously equipped and have great hopes of expanding—albeit modestly—under the new air transport licensing regulations that give them some freedom to fly in competition with the two nationalised air corporations. These are the airlines that must rely on generous credit from their suppliers to get into the air at all; in the past they have existed on a somewhat lean diet of holiday bookings, making what profit they can during the summer. On regular scheduled flights, where they can charge higher fares, they should be able to earn a higher rate of profit; and it would be a disaster for them if this credit was curtailed, just when they have a chance to grow.

The only independent airlines able to expand rapidly are the four big operators in which the shipping companies have a stake. Biggest of them all is British United Airways, backed by the Clan Line, British and Commonwealth Shipping, Blue Star and Furness Withy. BUA has taken over several of the smaller independent airlines, as has British Aviation Services, better known perhaps as the Silver City car ferry; this group is backed by P and O. Cunard has only recently bought Eagle Airways, which will start regular flights on the North Atlantic with Boeing jets next summer if BOAC loses the appeal to be heard next month against these. The last of the four, Skyways, is backed by the Bibby line.

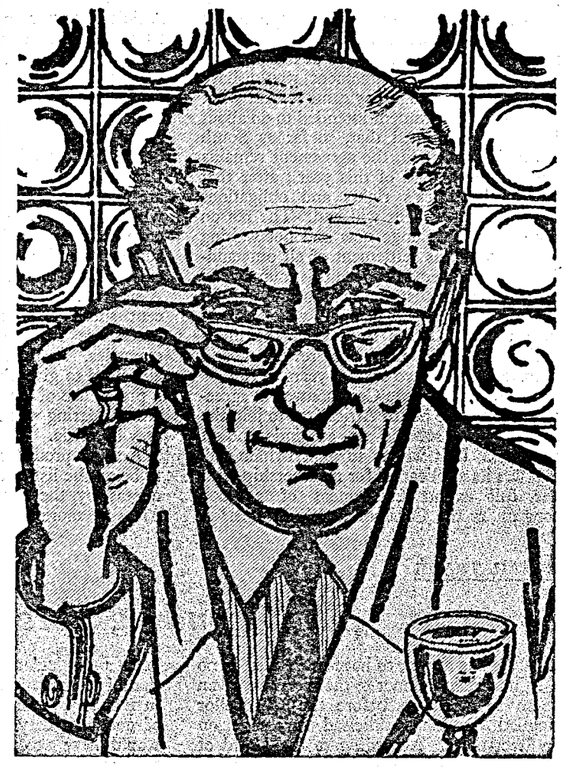
SOUTH AFRICAN SUGAR

Bitter Truths

IN Whitehall's words, continued participation in the Commonwealth sugar agreement by the South African sugar industr

We mean that word 'finest' in both its senses. For (besides our natural prejudice) Unipulver is the only mill which will economically fine-grind a large number of resilient, fibrous or glutinous materials. Unipulver will grind any materials finer than you have ever seen them commercially ground before. Including liquids and semi-liquids. And Unipulver is the only mill we know of which has run for a period of years at 140 hours per week with no renewals and no maintenance other than routine inspection.

Startling claims? That's only a beginning.... Unipulver will produce more output of low-micron particles at less cost.... Unipulver will regrind, progressively finer, material which it has already ground. Unipulver Mills need no skilled supervision, are self-cleaning (even with "difficult" materials).



But don't, please don't imagine that Unipulver Mills are for just anyone. You have to be able to cope with Unipulver's fantastically high output.

By the way, we can prove all we've said about Unipulver Mills. Like to see our catalogue which tells you how?

Unipulver

Chateau Tongariro!

WHAT KIND OF CLARET IS THAT?

As a matter of fact, it isn't a claret. It's a hotel in a national park in the North Island of New Zealand. Not that we claim to be connoisseurs of good wine, but we do believe we're experts on topics connected with our country. For it is our business to know about such things. Whatever your interest in New Zealand and wherever those interests may lie, you can be sure we shall be able to help you. After all, knowledge and experience are the cornerstones on which our business has been built. And with more than 160 branches and agencies throughout the North and South Islands, there's little wonder we're so well informed on things of national interest. That's one of the reasons why we are named—

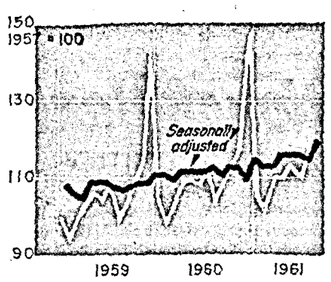
The National Bank
OF NEW ZEALAND LIMITED

Head Office:
8 Moorgate, London, E.C.2. (MONarch 8311)

West End Branch: 14 Charles II Street, London, S.W.1. (TRAfalgar 6791)

and exporters is not compatible with South Africa's status as a foreign country. South Africa's representatives did not come 6,000 miles to hear that: a glance at the opening paragraphs of the agreement would have told them as much. They came to hear what the British government intended to do about it and have learned that, so far as South Africa is concerned, the agreement remains valid until the end of this year; after that all South Africa's rights and obligations under the agreement will end. The reason for taking the plunge now and not waiting for the omnibus settlement of all outstanding trade problems between this country and South Africa is that a crucial meeting of the International Sugar Council will be held next month. In its third year, the international scheme must be reviewed and adjusted; it has two further years to run.

Exclusion from the Commonwealth agreement will leave South Africa free to join the international scheme as an independent member. If it wishes to join, Britain will support its application for membership with the full export entitlement of 217,000 tons under the Commonwealth scheme. A straight swap from membership under Article 16 to "independence" under Article 14 of the international agreement can presumably be fairly easily arranged. There are several clubs in sugar; membership of the Commonwealth scheme gives South Africa a right to £45 a ton (cif UK) for 157,000 tons of its exports this year. South Africa produces about 1 million tons of sugar a year. Permissible exports to Britain and Canada are about 217,000 tons, on the balance of which South Africa receives imperial preference, now worth £4 2s. 6d. a ton for raw sugar of standard grade. A slight confusion exists about the present rate of preference. A side-effect of the recently imposed 10 per cent surcharge has been to increase this preference in favour of Commonwealth countries. As the scale of duty was originally fixed to give Commonwealth producers a preference of £3 15s. a ton, some dealers are wondering whether an adjustment might now be made.



A sugar producer would give a good deal to be on the list of countries granted import quotas by the United States, which also offers far more than current world prices to its suppliers. An exporter left outside these groupings finds it very cold indeed at the present time. Sugar fell to £22½ a ton, the lowest level since the end of the war but recovered slightly on Thursday. The terms under which South African sugar may enter this country next year have not yet been decided. Further consultations will be held after the international meeting. All the privileges South Africa now enjoys could be restored by a separate agreement. Sugar producers in Swaziland were part of the South African industry for the purposes of the Commonwealth sugar agreement. The British government will presumably wish to differentiate between them in future.

RETAIL TRADE

The Spending Spree

Shoppers appear to have responded in no uncertain manner to the incentive given them to stock up before the Chancellor applied his long-publicised surcharge on indirect taxes. According to the Board of Trade's provisional estimate, retail sales, seasonally adjusted, rose 4 per cent above the June level and although at present the statisticians are more worried than usual about their first shots at this index, there is no doubt that business was at an all-time record in July. Admittedly it followed a rather dull trading month, but the rise cannot be explained away as a rebound from exceptional slackness, as was the case when a rise of a similar order occurred last December.

The boom was apparently by no means confined to durable goods shops although, as would be expected, these did particularly well. Nearly one-tenth of all retail spending goes on durables, other than on cars which are not counted as "shop goods," and much the same proportion on tobacco and drink together, on which there must also have been a particularly heavy run in anticipation of extra duties. A 20 per cent increase in monthly purchases of these three kinds of goods, if they alone had been affected, would have accounted for the rise in the total retail index.

Retailers must now expect some backwash from this spending spree. Before it came, there was no evidence of any momentum in their business. Total turnover in the second quarter of this year was 2 to 3 per cent higher than it had been in the closing months of last year; but prices of goods bought over the counter had risen by about a like amount. Allowing for price rises, food and clothing shops were doing less business and nearly all the increase reflected the recovery in durable goods. Any undue buoyancy seems to have been in the other forms of spending outside the shops, which take about an equal amount of money. Information about these does not go beyond the first quarter of the year but then spending in the pubs, on housing, cars and general services had risen in total about 4 per cent from the previous quarter, whereas retail spending had gone up only about 1 per cent.

Even so, spending as a whole was not keeping up with incomes; contrary to what might have been expected, savings seem to have risen again. Estimates are necessarily very tentative, but, allowing for seasonal influences, personal savings in the first quarter seem to have amounted to nearly 10 per cent of disposable income, a higher proportion than in any quarter on record since these statistics started in 1955. There is nothing in these indicators to suggest that consumer demand was getting out of hand.

THE NEW CUNARDER

Any More for the Skylark?

The saga of the *Queen Mary* replacement will descend into utter absurdity if it turns out that the shipyard eventually awarded the contract has submitted an unprofitable tender, as Lord Aberconway has now told his shareholders John Brown has done. His argument for having done so is that the group's shipbuilding subsidiary would be "better off with [the order] than without it." The five other yards that tendered (counting as two Swan, Hunter and Vickers-Armstrongs who made a joint, Tyneside bid) have been under similar pressure of rapidly diminishing order books, as the figures in the table show. The

SHIPS IN THE YARDS

Total number of ships	124	92	65	68	49

(Based on figures published by *Shipping World*.)

question is whether any of these other yards reckoned they could build a 75,000-ton luxury liner at a profit for £30 million, the price that sets the ceiling for Government assistance and which is now also the limit Cunard itself is prepared to accept without "reconsidering the entire project." The answer will presumably become apparent after October, when Cunard hopes to have completed its scrutiny of the tenders—a process, incidentally, that is being compressed into two to three months compared with the even tighter three months that the shipyards had to compile the tenders.

The situation at the moment, then, is that the liner that cannot be run at a profit can not apparently be built at a profit by the shipyard in the best position to do so by reason of its long and intimate association with the owners. What could be sillier? And while this goes on the number of trans-atlantic passengers going by sea is growing smaller and smaller—the very factor that thirty years ago caused work on the *Queen Mary* itself to be brought to an abrupt halt.

AIR TRANSPORT

Filling Those Seats

Passengers crossing the North Atlantic this summer in half-empty jets might be forgiven for thinking a disastrous drop had taken place in air traffic this year, but the figures leaking through from various sources do not bear this out. The International Air Transport Association reports that an extra 87,000 people crossed the North Atlantic on regular scheduled air services in the first half of this year, making a total of nearly 800,000—an increase of more than 12 per cent. Pan American World Airways has just announced that its passenger traffic in June, when the holiday season begins to get under way, was 21 per cent greater than the year before. In addition, IATA records that both freight and mail traffic increased by substantially more than a third during the summer. This hardly spells "slump," and these relatively comforting returns take no account of the numbers that must have flown the Atlantic on non-scheduled, holiday charter flights. In recent years, charter passengers have accounted for perhaps 10 per cent of all North Atlantic traffic but BOAC, which drew £4 million, or nearly five per cent of its revenue last year from charters in the North Atlantic and Caribbean, has increased its charter traffic this summer by 50 per cent.

There has probably been some diversion of traffic from normal scheduled flights to chartered aircraft in which passengers travel for roughly half the normal fare, but in the main those conspicuously empty seats are part of the 50 per cent extra seating capacity that the airlines have put on the North Atlantic this year. They cannot seriously have expected that air traffic would have increased by as much as this. North Atlantic traffic increased by a quarter last year and it has never been suggested that the rate of growth could double itself in twelve months—at least without some special stimulus such as striking cuts in fares. It is reported that airlines inside the United States are tying themselves in knots trying to design fares that will attract new holiday business into the air without leading to a stampede of regular air travellers, mainly business men, into the cheaper seats. Special excursion fares and half-fares for under 21s are among the devices being tried. But the US internal airlines have the added problem that their first-class business traffic is leaking away as more big companies start to operate their own executive aircraft. This form of competition does not exist yet on the North Atlantic, but it might come one day.

BRITISH COLUMBIA POWER

An Arbitrary Act

At this distance it is difficult to discern the shades of political opinion that colour the decision by the provincial government of British Columbia to expropriate British Columbia Electric, the principal electrical operating subsidiary of British Columbia Power. The Premier, Mr W. A. C. Bennett, leader of the Social Credit Party, is pushing through a measure that one of the opposition parties had been urging for years. The clue to this decision may be hidden in the tangled skein of argument about the development of hydro-electric power on the Columbia and Peace rivers. By taking over the ownership of the principal user of such power in Western Canada, the provincial government may be seeking to strengthen its hand in any negotiations; and, as many of Canada's electrical utilities are publicly owned, it may feel that it is treading on safe political ground.

The argument about BCE, however, does not involve the principle of expropriation so much as the manner in which the provincial government has applied it. A bill was first tabled on August 1st and passed by August 3rd. Its effect is to expropriate the assets of BCE for compensation of about $111 million and to offer about $68 million for the other assets of BCP, if it chooses to sell. Both valuations are based on $38 for each BCP common share. On August 4th the $111 million for BCE was paid and accepted under protest.

The haste is manifest; so is the extraordinarily arbitrary nature of the Act which precludes any right of appeal. This has evoked angry complaints in investment circles here and in Canada. Another complaint, hardly less strong, is about the valuation itself. An earlier decision of the British Columbia Supreme Court on West Canadian Hydro Electric Corporation laid down the principle that any such valuation should take account of future earnings prospects, historical and replacement costs of physical assets and prices paid for similar utility com-

INSURANCE

Higher Profits at Lloyd's

The 1958 account of Lloyd's underwriters, which closed at the end of last year, produced a profit of £14.1 million (including £2 million of interest income) from premiums of £301.7 million received for all classes of insurance. This represented a profit of 4⅝ per cent on the premium income, compared with 3½ per cent in the 1957 account on premiums of £276 million. This is as much as most insurers seem likely to make in a normal year nowadays and it compares favourably, as did Lloyd's surplus for 1957, with the results achieved by insurance companies from their non-life business. Two of the three years of the 1959 account have been completed and this account may produce the biggest surplus since 1953, when a profit of £24.9 million arose from premiums of £226 million. The 1960 account has also opened well; but it is fortunate that aviation claims were abnormally light in the first year of the account, as Lloyd's underwriters have since been faced with heavy claims.

More people are becoming names at Lloyd's each year. In 1960 there were 4,506 underwriters of marine and aviation risks, grouped in 166 syndicates, compared with 3,436 underwriters in 171 syndicates in the 1954 account; non-marine insurance is now underwritten by 4,622 names in 92 syndicates, compared with 3,484 names in 97 syndicates in the 1954 account. Their shrewdness is reflected in the consistent profit achieved before taking credit for investment income, which, in sharp contrast to insurance company accounts, is a relatively unimportant source of income for them. The rise in profits from the traditional types of insurance has probably played a part in the recent decision to shelve the idea of greatly expanding the insignificant life assurance business. With interest rates high, this might seem to be a good moment for Lloyd's to begin building up a life fund; but profits from life policies emerge only slowly and a new fund would need to build up contingencies reserves fairly quickly.

* Largely fire and accident insurance. † From all classes of insurance, including interest on underwriting funds.

panies. How far the government has followed these criteria for BCE is not clear, It is not fruitful to compare the $38 valuation with the current market price of BCP of about $33 nor with recent "highs" and "averages." But BCP has recently raised a good deal of capital for development from which earnings will not emerge fully until the middle of this decade. Some of the new capital has been provided by British investors, who are estimated to hold a quarter of BCP's equity. The directors are urging the British Columbia government to give "favourable consideration to an increase" in the compensation. As the law stands, all they can do is protest; but they have strong arguments, first, on grounds of equity and, secondly, on the practical consideration that the credit standing of British Columbia must be affected in this country as well as in Canada.

BIDS AND DEALS

Soap, Shoes, Shops . . .

In a quiet stock market a number of deals and take overs, some still in the course of negotiation, have attracted attention.

1. Unilever is to make an offer worth 27s. per share for the 1,800,000 shares of 5s. each of **Pinoya Holdings**, which makes "Stergene," "Domestos" and "Sqezy." The full terms have yet to be announced but they will probably involve an exchange of shares and some cash. Acceptance of the offer is recommended by Mr R. Muckle and his fellow directors who with their associates control about two-thirds of the capital. Before the offer the shares were last dealt in at 18s. 9d. and this week they have risen by 6s. 9d. This acquisition appears to be an important move for the struggle for supremacy in the fast growing liquid detergent market. Unilever's acquisition of "Sqezy" together with "Quix" and "Lux Liquid" which it already manufactures is likely to give it close to half of the market in which it competes with Hedley's "Fairy Liquid" and Colgate's "Ola." The CWS with "Mil," Cussons with "1001" and Thawpit, controlled by Hugon, with "Doby" are others in this field. Control over the supply of the plastic containers, of which Metal Box is by far the biggest manufacturer in this country, can also be important in the struggle; only a few days before the Pinoya acquisition Unilever announced that it had purchased for what is believed to be a very good price the capital of **E. R. Holloway** of Welwyn Garden City, a private company which makes these containers and other plastic products.

2. H. and M. Rayne, the high quality shoe manufacturers and retailers is acquiring a 55 per cent interest in a new company, **Rayne-Delman,** which has been formed to sell Delman shoes in North America. The other 45 per cent will be held by **Genesco** (formerly the General Shoe Corporation) which has the lion's share of the market in high quality ladies' shoes in the United States. Rayne's investment in the new company will cost about $590,000 and at the same time Genesco will acquire 200,000 shares of 5s. each in Rayne at 20s. each (representing 12½ per cent of its equity). This is slightly above the current market price.

3. R. H. and O. Hills, the department store group which earlier this year acquired Frederick Gorringe, is now engaged in talks which may lead to a bid for **William Whiteley,** the Bayswater department store. No ordinary dividend has been paid by William Whiteley since 1953 but last April the chairman, Sir Harold Gillett, held out some hopes of a return to the dividend list in 1961-62. News of these talks sent the £1 ordinary shares up by 4s. 4½d. to 44s. 4½d.; this compares with an earlier peak this year of 51s. 3d. and the low, touched only last week, of 36s. 3d.

4. A bid of 45s. each from **Brooke Bond** for the 530,000 stock units of **Doom Dooma** follows close upon the heels of the announcement of much better results from this tea producer in Upper Assam. Following a rise in pre-tax profits from £78,000 to £199,000, the tax free dividend was raised from 10 to 15 per cent. Thus the offer from Brooke Bond, which has estates in India, Ceylon, Kenya, and Tanganyika, puts the £1 units on a 12½ per cent dividend yield basis. The 1959 balance sheet revealed net assets of £2.1 million. The Brooke Bond bid is worth £1.2 million. The Doom Dooma directors are considering the offer and in the meanwhile they have advised shareholders not to sell their units, which have risen sharply from 31s. to 43s. 3d.

BUILDING SOCIETIES

Pressure on the Giant

The half yearly figures of the Halifax Building Society have to be viewed against the directors' decision in June to follow the recommendation of the Building Societies Association, of which it is not a member, in raising its interest rates on shares from 3½ to 3¾ per cent, net, and its mortgage rate to new borrowers from 6 to 6½ per cent. The higher rates of interest will not be payable to investors until December 1st and existing borrowers will not have their mortgage rates raised until next February. As the table shows the net inflow of new money in the first half of 1961 was higher than in the corresponding period of 1960 when the Halifax was offering 3¾ per cent, net, on shares. It raised this rate to 3½ per cent, net, in August,

Six months to	July 31, 1960 £m.	Jan. 31, 1961 £m.	July 31, 1961 £m.
Total assets	461·9	490·5	515·1
Liquid funds	70·7	74·6	75·4
Liquidity ratio, per cent	*15·3*	*15·2*	*14·6*
Receipts	55·8	56·5	62·6
Withdrawals	41·1	38·3	45·9
Net receipts	14·7	18·2	16·7
Mortgage advances	54·8	47·7	62·6
Mortgage repayments	32·8	35·2	45·9

1960, and this helped to check withdrawals But, like other building societies, the Halifax came under pressure in the second quarter of this year and a comparison with its first quarter's figures shows that while receipts in the three months to end July were virtually unchanged withdrawals rose from £21 million to £24.8 million to reduce the net inflow to £6¼ million.

It is not surprising, therefore, that the Halifax has continued to ration mortgages. Even so, its new advances rose from £21.4 million in the first quarter of its financial year to £25.8 million in the second quarter. In the same three months in 1960 the Halifax deliberately reduced its holding of cash and trustee securities to meet the heavy demand for mortgages and advanced £30½ million. At the end of July its liquidity ratio at market values was 14.6 per cent compared with 15 per cent three months earlier and 18.6 per cent at the end of January, 1960. The directors are unlikely to allow this ratio to fall much below its present level, and as high interest rates will probably reduce the flow of new savings to building societies still further, the Halifax can hardly hope to satisfy the existing heavy demand for mortgages. The demand for mortgages from the Halifax may well rise, for though higher mortgage rates will act as some deterrent the suspension of the Government's house purchase scheme for older

houses may cause some borrowers to look to the Halifax for money. It has lent quite generously in the past on such properties from its own resources and without making use of the Government's money.

COPPER

Conflict in Chile

COPPER prices normally respond to the mere threat of a strike. But when wage negotiations broke down recently in Chile, the market refused to discount a strike before it happened ; when it occurred, the market assumed it would not last. Even when suppliers of Chilean copper declared *force majeure* on Wednesday, which meant that, because of the strike, they could not fulfil all of their contracts, the announcement put only 10s. a ton on the price of copper. At its current price of about £230 a ton, spot copper seems to have become temporarily insensitive to news of all kinds. A report of disappointing deliveries to American consumers last month following the earlier improvement made little impression. The market has been equally impervious to the political troubles of Northern Rhodesia.

The recent unresponsiveness of copper prices that might have given outsiders the impression that the market is either dead or paralysed has been caused mainly by the high level of stocks that can be drawn on if a gap develops in the supply line, and the capacity to produce more copper which is still being held in reserve by most of the major producers. Copper prices have therefore remained exceptionally stable. The old argument of primary producers—now being put with more conviction—that they are paid "unjust" prices for raw materials by industrialised nations, has cropped up again to cloud relations with Chile.

Two American mining companies operating in Chile, Kennecott and Anaconda, are under constant pressure from would-be nationalisers or socialisers. In 1957, communists tried to introduce legislation to abrogate the Chilean Copper Law of 1955 that removed some of the injustices under which the companies laboured. Subsequently, socialists, then radicals attempted to pass legislation to the same effect. Now according to Bache and Company of New York, the extreme right, angered by suggestions from Washington that privileges enjoyed by the rich should end, has joined in the attacks on the companies. The companies are being pressed by workers who demand higher wages and a government which relies on copper for part of its revenue and demands a high rate of expansion in output. Various changes in smelting and sales policy have also been demanded. The value of Chilean copper production approaches £250,000 a day. That is one reason why the market feels that the Chilean government will ensure a fairly early return to work.

ROYAL DUTCH/SHELL

Profits Up: Expenditure Down

IN the second quarter of 1961 the Royal Dutch/Shell group was selling on the average 2,643,000 barrels a day, about 250,000 barrels a day less than in the first quarter of this year. But as the table shows the gross value of its sales rose, only for this benefit to be eaten away by a further sharp rise in sales taxes and duties. In the past five years sales taxes have risen by over £260 million and in the first six months of this year they rose by a further £20 million.

A reduction in operating expenses was mainly responsible for the improvement in gross income compared with the first quarter. There is some seasonal element in this comparison. Operating expenses were higher than they were in the corresponding period in 1960 and only a further cut of £2 million in taxation enabled the group to report a slender improvement in net income and in net profit margins. On the whole the trading results show little change but, significantly, capital expenditure does. Following a decline of £15 million in capital expenditure in the first quarter, expenditure in the second quarter was £20 million less than in the corresponding quarter in 1960. This suggests that total capital expenditure this year might well be completely covered by the group's retained cash flow ; last year's expenditure of £419 million was £69 million more than the retained cash flow. An immediate result of this cut in expenditure has been that the group's holdings of cash and short-term securities have remained almost intact.

SHORTER NOTES

London Midland region of British Railways has decided after all to let work go on at the Kingmoor marshalling yard near Carlisle, but at a slower rate. The region has reallocated its capital budget for this year so as to avoid a complete cessation as construction had recently been going at a faster rate than expected. Apparently the project could have been completed in about five months' time had the present tempo been sustained, but the region claims that it would not have been possible to bring the new yard into full operation immediately since other integral but unspecified parts of its improved freight programme would not have been ready.

*

Introduction of a full electric service on the London, Tilbury and Southend line of the railways' eastern region, planned for September 11th, has been put back for several months partly because of delays in completing the overhead wiring but mainly because the rolling stock intended for this route will still be needed on the Chingford line out of Liverpool Street. English Electric and General Electric are still in process of modifying this line's rolling stock after last December's failures.

*

The meeting of the International Tin Council arranged for next week has been postponed until mid-September. No reason was given. The Council had earlier asked the United States for talks on releases of tin from its stockpiles. Recently, United States officials have said that America was prepared to consider joining the International Tin Agreement. Next week's meeting had been expected to discuss proposed changes in the agreement's floor and ceiling prices for tin.

*

Mr W. F. Crick, general manager for research and statistics at the Midland Bank, will retire next month. Mr J. E. Wadsworth, the present manager of the intelligence department, will become economic adviser.

*

Plessey, which owns 51 per cent of the capital of Semiconductors, of Swindon, has bought the remaining 49 per cent from the Philco Corporation of Philadelphia. Semiconductors was set up in May, 1957, with a capital of £500,000 to manufacture transistors and other semiconductors.

COMPANY MEETINGS

THE UDDEHOLM GROUP

UDDEHOLM—SWEDEN

A YEAR OF RECORD TURNOVER FOR STEEL AND FOREST PRODUCTS
NEW SHARE ISSUE DECLARED

The ninety-first Annual General Meeting of Uddeholms Aktiebolag was held in Karlstad on May 27th, Mr Alf Lindahl, Chairman, presiding. The following is an extract of the report for the 93rd year of business issued by the Managing Director and the Board and circulated with the accounts.

REVIEW OF THE BUSINESS YEAR

The general improvement in demand for the company's products noted in the previous report continued unabated through 1960, and the Company's plants could be utilised to full capacity. The turnover rose to Kr. 552 million, from Kr. 489.4 million in 1959. Of the increase, Kr. 36.5 million applied to steel and Kr. 26.0 million to forest products and chemicals.

Although the volume of steel deliveries, as well as prices, showed only a modest increase, the turnover of the steel division rose by 13 per cent, from Kr. 282.6 to Kr. 319.1 million. The improvement reflects a shift towards higher product grades and therefore better priced materials. The output and sales of stainless steels, high alloy tool steels, and cold worked products increased and contributed to the satisfactory results. This trend is expected to come further accentuated during 1961.

The forest industries, which suffered a sharp decline in 1958 with poor prices and lowered output, enjoyed a substantial improvement in demand during 1960. The output of pulp rose by 8 per cent and paper by 22 per cent. Of the total sales, 59 per cent were placed abroad.

Pulp prices, however, still remain unsatisfactory due to competition from American mills, and it has not yet been possible to offset the increased costs.

The Degerfors Plant, previously managed as an independent subsidiary, was merged with the parent company and its assets and liabilities are included in the accounts.

The unappropriated net earnings at the end of the year amounted to Kr. 78.7 million, and the Board proposed that Kr. 41.3 million should be retained in the business by the issue of one new share for four old. By this issue the share capital of the Company will increase from Kr. 165 to Kr. 206.3 million.

PRODUCTION AND SALES

The following is a summary of the output of major products in 1960:

	1960	1959
Production :		
Electric power, '000 kWh	1,040,000	729,000
Timber, own forest, cu. ft.	36,000,000	25,300,000
Iron ore, tons	84,623	89,150
Dolomite, tons	19,160	18,391
Steel ingots, tons	338,834	310,300
Finished steel, tons	213,689	208,722
Sawn timber, standards	24,863	24,807
Sulphate pulp, tons	101,785	80,980
Sulphite pulp, tons	68,965	64,433
Paper, tons	71,058	56,157
Chemicals, tons	110,204	95,064
Sales :	Kr. M.	Kr. M.
Iron and steel products	319·1	282·6
Forest products	168·4	147·6
Chemicals	35·2	30·0
Others	29·3	29·2
Total	552·0	489·4

DETAILS OF OPERATIONS

The Uddeholm Company has been engaged since 1668 in extracting and processing the natural resources of iron ore, timber and water power in the province of Värmland, in western Sweden.

To that end the Company owns and operates mines at Persberg, Nordmark and Långban, as well as sponge iron works at Persberg. Steel is made in three integrated mills, at Hagfors, Nykroppa and Degerfors, which supply the Munkfors cold rolling mill and the tube mill at Storfors. Wire rope is made at a factory in Blombacka. Tungsten carbides and carbide tipped tools are manufactured in a plant at Vällingby, in Stockholm.

Processing of forest products is concentrated to the Skoghall Works, on Lake Vänern, which include sawmills, pulp mills and paper mills. The chemical plants, engaged in the electrolytic processing of salt into chlorine and alkalis for use by the Company's pulp mills as well as for sale, are also situated at Skoghall.

The Company, either alone or in partnership, owns and operates 33 hydro-electric power stations with 220,545 kW installed capacity. The timber holdings exceed 565,000 acres.

STEEL DIVISION

Owing to the firm demand during the year, all mills were able to upgrade their output, with particular accent on stainless and alloyed tool steels, as well as cold worked products. As a consequence, invoiced deliveries increased in value by 13 per cent, as previously noted.

Mild steel produced at Degerfors was also in demand, and the manufacturing department of the mill was kept busy with deliveries of digesters for the pulp industry and similar large pressure vessels. During the year work proceeded on the reactor tank R3/Adam, partly made of clad steel and partly of solid five-inch acid resistant stainless steel. The reactor tank is scheduled for delivery in the summer of 1961.

The Hagfors mill increased the output of stainless bars and high alloy tool steels and stepped up deliveries of hot rolled strip and rod to enable the Munkfors mill to increase its output of cold rolled strip, springs and cold drawn stainless wire. The output of cold drawn stainless tubing at the Storfors mill also increased substantially. Deliveries of cold worked products, excluding tubing, amounted to Kr. 53.4 million.

The growth of the tungsten carbide business is encouraging. The carbide factory in Stockholm collaborates with the tool shop in Hagfors in the development of the UDDIA and UDDEX lines of standard and special tools for the metal working industries and rock drills for the mining and construction industries.

Of the total turnover of the Division 35.1 per cent was exported.

FOREST PRODUCTS DIVISION

The Skoghall plants enjoyed a record year. The output of the sawmill remained at 25,000 standards, but production of sulphite pulp rose by 8,000 tons to 69,000 tons. The output of sulphate pulp rose by about 21,000 tons to 102,000 tons, and paper by 15,000 tons to 71,000 tons. Manufacture of paper sacks and gummed paper continued to grow, in terms of volume and value.

With added plant facilities the electrolytic plants succeeded in raising the output of chlorine and alkali by 20 per cent, to 76,000 tons of which 36,000 tons were chlorine. The output of ammonia increased at the same rate, whereas tri and perchlorethylene solvents remained stable. Acetic acid and ethyl acetate were also in good demand.

Of the total output of the chemical department, 39,186 tons were retained for own use and the remainder, or 71,518 tons, sold at an invoiced value of Kr. 35.2 million.

Of the chemicals, carboxymethylcellulose (CMC) retained its position as an export leader to 28 countries. A more refined product *Cekol* enjoyed increased sales for use as a sizing material in the paper and textile industries ; it is also finding wide use as a mud in oil drilling.

Of the total sales of forest products amounting to Kr. 203.6 million, 63 per cent were exports.

POWER DIVISION

Owing to the rainy year, the mean annual flow of the Klarälv River, principal source of the

* Kr. 14·5 = £1.

Company's power, reached 146 cu.m. per second, or nearly 15 per cent above normal. By August, water stores were filled to 90 per cent, and by the end of the year to 98 per cent. The power production exceeded 1,200 million kWh, of which 70 per cent were consumed by the Company's production plants.

Work on the Höljes II power station, begun in 1957, is proceeding according to plan. The dam is nearing completion and the machine installations began early this year. By autumn 1961, the first unit will be put into production, followed by the second towards the end of the year. The output of the station will be about 500 million kWh.

The Höljes station is financed by Uddeholm and AB Mölnbacka-Trysil. The Company's own share of the annual construction costs came to Kr. 20.8 million, making a total to date of Kr. 49.9 million.

FOREST DIVISION

Favourable weather facilitated work in the forests, and the annual campaign ended with an increase of the timber cut by 30,000 cu.m., to 748,000 cu.m. A further 502,700 cu.m. of timber were purchased from outside producers.

During the year 44 miles of forest motor roads were built, whereby the Company's forest road net increased to 800 miles, in addition to 400 miles of jointly built roads.

Ample rainfall also facilitated re-afforestation, and some 12 million seedlings were planted during the year.

INVESTMENT PROGRAMME

Plant investment during the year amounted to Kr. 58.5 million. A major part was devoted to increasing the capacity of the steel mills, particularly the output of stainless and high alloy steels. Some Kr. 30 million were spent on a new combination rod and bar mill at Hagfors.

At Degerfors, the building of the new plate mill was completed and the rolling plant is being installed. The new mill, estimated at Kr. 35 million, will turn out stainless, clad, and boiler plate.

A new factory for spring fabrication, a traditional Uddeholm specialty, has been erected at Munkfors where the cold working capacity has been increased. At Hagfors, an automated plant for the production of road grader and bulldozer steels was put into production.

At Hagfors, new electric furnace plant is being installed, at an estimated cost of Kr. 15 million, whereby the capacity will be increased by some 45,000 ingot tons. The new facilities will be available in 1961.

The increased ingot capacity necessitates rebuilding the blooming mill at Hagfors to enable it to handle heavier ingots and a larger tonnage. The melting and rolling capacity of the Nykroppa mills is also being increased. At Munkfors, a new stainless wire drawing plant is being installed.

As the Company's Skoghall works the rebuilding and expansion of the sulphate and paper mills have been completed. The capacity of the four Fourdrinier machines has been enlarged, and a new plant for the manufacture of paper sacks and gummed paper has been added. New steam plant, including a 3,000 kW back pressure turbine and a 20,000 kW condensing turbine, was completed during the year, in addition to ancillary plant facilities for the pulp mills. A new sulphate bleaching plant is being erected this year, at an estimated cost of Kr. 12 million. The capacity of the existing chlorine plant is being extended by 7,000 tons.

PERSONNEL

The average number of employees rose during the year from 14,646 to 15,253, of whom 2,504 were salaried staff and 12,749 production workers. Wages and salaries paid during the year amounted to Kr. 190.5 million.

The great demand for labour throughout Swedish industry necessitated increased recruiting efforts, in collaboration with the government employment service. Owing to the continued shortage of skilled production workers, the Company's training programme has been expanded. Permanent schemes are now in force at all major works, and their scope was enlarged during the year. A new school, costing Kr. 1.2 million, was built at Skoghall and taken over by the training department during the year.

THE RESULTS

The net profit for the year was Kr. 18 million which added to the balance of Kr. 37.240 million carried forward from the previous year, plus Kr. 23.464 million resulting from the merger of the Degerfors subsidiary made Kr. 78.704 million available for allocation, as follows:

	In millions of Kronor
To statutory reserves	6·250
New share issue	41·250
Dividend of Kr. 10 per share	16·500
Balance carried forward	14·704
	78·704

The report and accounts were adopted.

NEWRITH GROUP LTD.

The Twenty-fifth Annual General Meeting of the Newrith Group Limited was held on August 16 in London, Mr B. W. Mason, chairman, presiding. The following is an extract from his circulated statement:

Whilst the year under review has been a difficult one, it has not been without some progress. The building sub-contracting side was appreciably busier, in fact, towards the latter part of the period, was approaching peak production. In spite of a decline in the rate of gross profit, there was an overall improvement in earnings.

Net profit has risen from £31,054 to £46,580 and the Holding Company's proportion, after taxation, has increased from £15,651 to £24,460. These figures reflect an improvement of 50 per cent over the reduced profit of 1960. Your Directors recommend an increase of 2 per cent in the dividend to 6 per cent and, to commemorate the 25th anniversary of the Company, it is proposed that the capital distribution be doubled from 1½ per cent to 2½ per cent.

The Group has commenced the new financial year with a record order book for plumbing, heating, glazing and electrical sub-contracting work. Although the building industry is extremely busy, profit margins continue to be unduly low.

Providing the present wave of increased costs throughout industry is kept within reasonable bounds, I am fairly confident that the Group results for 1962 will show an overall improvement, but no substantial increase in earnings is to be expected.

The report was adopted.

UNITED DOMINIONS TRUST LIMITED

RECORD VOLUME OF BUSINESS IN A DIFFICULT YEAR

The thirty-ninth annual general meeting of United Dominions Trust Limited was held on August 16th in London, Mr J. Gibson Jarvie (the Chairman) presiding.

The following is an extract from his Statement to Stockholders:

Despite the disheartening character and the numerous problems of the year, it gives your Board considerable pleasure to tell a most heartening story of growth and diversification.

The Balance Sheet figure has now reached in the circumstances the prodigious total of £215 million, an increase of some £40 million in the year.

With last year's increase in the company's capital, the Capital and Reserves of the Group have increased from £20,282,471 to £26,327,912. Loans from banks and current deposit and other accounts have risen from £134,351,109 to £167,306,718 and Cash in Hand and at Bankers now stands at £15,487,825. The total of Current Assets is £205,517,983 against Current Liabilities of £170,059,639, a most significant and conservative ratio. Deferred future income has grown to £13,956,054, a new high level, and Profit and Loss Account stands at £1,266,740. The market value of our portfolio of investments is very substantially higher than their cost but that surplus is not reflected in the Balance Sheet.

RECORD VOLUME OF BUSINESS

Although the year just concluded has been one of accumulating difficulties, problems and events beyond our control, the Group has conducted a record volume of business, a quite remarkable expansion and diversification in its character, and has contrived to incorporate the whole administratively within the Group.

I think, therefore, I am entitled to say that the Group is in a position to face with every confidence a future which still, by no stretch of the imagination, can be described as stable. I am fortified in my view by the continuing and upward trend in the volume, variety and quality of the business offering. Subject to our being permitted to carry on our various activities in a more or less normal manner, the year in which we have entered is full of promise.

We have weathered all sorts of storms in the past forty years and I have no doubt that we shall successfully ride those of the next forty. Crises of one sort or another are inseparable from the shaky economy which most nations are supporting just now and I am not sufficiently sanguine about our own pattern of government to expect that we shall escape any of them.

Yet, in spite of all, the evidence of prosperous growth in the U.D.T. Group cannot be gainsaid and your Directors have unbounded faith in the future of the Group. The Stockholders whose names have been on our books for years have found U.D.T. a safe and extremely profitable investment. Your Board intends to give serious consideration in the not distant future to the advisability of altering the nominal value of the shares. Since growth value has always been a particular attraction of U.D.T. stock, it may prove desirable to split the present £1 stock units so as to induce a wider group of the investing public to participate in the fortunes of the company.

ASSOCIATED BRITISH PICTURE CORPORATION

SIR PHILIP WARTER REVIEWS PROGRESS AND DEVELOPMENTS

The thirty-fourth annual general meeting of Associated British Picture Corporation Limited was held on August 11th in London, Sir Philip Warter (the Chairman) presiding.

In his statement which had been circulated to members, Sir Philip said that the Net Profit of the Corporation for the year ended March 31, 1961, showed a substantial improvement over that for the previous year and was very nearly as high as the record achieved in 1959.

He added: The cinemas have done substantially better due to the remission of Entertainments Duty and Television, following on the re-organisation, has improved its business.

In the year under review £3,016,629 of the Group Trading Profit of £5,717,282 was contributed by Television and £2,700,653 arose from the Production, Distribution and Cinema Sections of the business. The Board is recommending a total dividend of 60 per cent for the year, and has also decided to recommend a Bonus issue of one-for-one so as to bring the issued Ordinary Capital more into line with the Capital employed in the business.

The Net Profit of the Group before taxation amounted to £4,929,959, a rise of £1,979,132 on last year's figure of £2,950,827. The Net Profit Available amounted to £2,543,937.

Commenting on Film Production and Distribution, Sir Philip said: Since the formation of the Company Elstree Studios have been an important factor in British film production and during the year under review they have been fully employed in making feature films for the home and overseas markets.

Associated British-Pathe is responsible for four departmental operations, i.e. the production of Pathe News, T.V. Commercials and Documentary Films and also the Foreign Distribution of Cinema and T.V. Films.

The T.V. Commercial Department has been particularly active and last year's turnover constituted a record.

Documentary Department: Its work with Government Departments and important industrial companies has been increased, quite apart from the home and overseas success of the weekly magazine, "Pathe Pictorial."

The Chairman then referred to A.B.C. Cinemas, and said that much of the improvement in the cinema trading during the year had been due to the abolition of Entertainments Duty in the 1960 Budget. That improvement, however, was only significant if they could be certain that the fall in attendance figures was levelling off. He added: If we disregard the cinemas closed during the year, the attendance figures decreased as against the previous year by about 3 per cent.

Twenty-six cinemas were closed during the year and we commenced the current year's trading with 313 cinemas.

During the year we opened Bowling Centres in Dagenham, Essex and Wylde Green, Birmingham, and we are commencing conversion of cinemas at Leytonstone and Levenshulme, both of which will be opened during the current year.

We have long-term plans covering a number of other situations and although we regard Bowling as a promising venture, the extent of our development in this field will be determined in the light of our experience.

Turning to ABC Television, Sir Philip said that that Company had shown improved results, and continued: ABC Television has a particular difficulty, unlike other Programme Contractors, in that it is restricted to the provision of programmes on Saturdays and Sundays and, as a result, has found it necessary to provide facilities which in themselves would be capable of a much wider field of operation.

Referring to the current year, Sir Philip said: I am always reluctant to make forecasts so early in the year. However, so far, business both in the cinemas and in television, is being maintained on a comparable basis with last year.

BANQUE NATIONALE POUR LE COMMERCE ET L'INDUSTRIE

Registered Office:
2/16 Boulevard des Italiens—Paris

1350 BRANCHES, AGENCIES AND OFFICES IN FRANCE, OVERSEAS TERRITORIES IN THE FRANC ZONE AND ABROAD

The balance sheet of the B.N.C.I. on December 31, 1960, approved by the Control Commission of Banks at its sitting on June 14, 1961, comes to, before distribution, NF 8.528.430.228.64. The distribution allocated to those nominees entitled to share in the profits but not the capital has been fixed at NF 1.125.

The activity of its subsidiaries in 1960 has been satisfactory. The British and French Bank Ltd., whose registered office is in London at Imrie House, 33/36 King William Street, has increased its network of offices in Nigeria where it is now installed at Lagos, Apapa, Ebute-Metta, Ibandan, Ikeja, Kaduna, Kano and Port-Harcourt. Its balance at December 31, 1960, after distribution, comes to $41.769.442.

SUN REAL ESTATES

PERIOD OF STEADY GROWTH

The annual general meeting of Sun Real Estates Limited was held on August 15th in London, Mr John Gaul (the Chairman) presiding.

The following is an extract from his circulated statement:

It is now eight years since I became Chairman of your Company which, at that time, had the unique record of never having paid a dividend since its formation some 17 years earlier. We still have among our 1,200 present shareholders some who have held their shares since those days and whose patience has been rewarded. The Company's assets have increased year by year and with almost daily improvements to our Properties, plus regular new acquisitions, it is certain that at this moment their true value is once again substantially higher than the figure shown in the Balance Sheet.

The Financial Year now under review has not been one in which your Company has been the subject of any sensational headlines, but we have nevertheless—*within that period*—quietly been improving the state of the Company in at least four different ways simultaneously:

(1) The acquisition of further income-producing investment Properties; (2) The continuous granting of fresh leases at improved rentals, and general financial consolidation; (3) A 50 per cent participation in a most interesting and rewarding development now taking place in Rochester, Kent; (4) Negotiations for the creation of Debenture Stock on satisfactory terms, concluded shortly after the close of the year under review.

The final dividend of 35 per cent, making a total of 55 per cent for the complete year (paid out of 57 per cent earnings) continues its upward climb which I hope will be a yearly feature of this Report and is, in any case, a 25 per cent uplift on last year. On the subject of dividend forecasts I would prefer this year not to make one solely because of the difficulty of knowing when certain income-producing Properties which we are now in course of acquiring will actually be finished. My feelings can perhaps be inferred from the fact that I now announce the interim dividend for the present trading year will be increased to 25 per cent.

My caution in building up *Sun Real Estates* has been such as to debar us from embarking on grandiose schemes involving millions of pounds, but we have nevertheless built up a formidable portfolio of Freehold and Leasehold medium-sized Properties in permanently good letting areas. A special feature of your Company's activities continues to be the provision of moderately rented office accommodation serving that large group of tenants who are out-priced by the mammoth developments into which they might otherwise like to move.

Quite a number of Property Companies are relying to a great extent for their annual dividend on the results of dealing in Property, as opposed to investing in it and developing it. Your Company is by character an expanding investment group and dealing forms no part of our activity.

The report was adopted.

APPOINTMENTS

LONDON COUNTY COUNCIL
ARCHITECT'S DEPARTMENT
Vacancy in the Town Planning Division for Statistical Officer. Town Planning experience desirable but not essential. Salary *on scale*

(continued in next column)

£1,500-£1,700, according to qualifications and experience. Duties include research from prime sources in connection with land use, population, housing densities, employment and traffic, and the interpretation and application of statistics to the solution of town planning problems including liaison with computer installation. Application form and particulars, returnable by 11th September, 1961, from Hubert Bennett, F.R.I.B.A., Architect to the Council (EK/EL/2372/8), County Hall, S.E.1.

VICTORIA UNIVERSITY OF WELLINGTON
NEW ZEALAND
LECTURER IN POLITICAL SCIENCE
Applications are invited from suitably qualified persons for the above-mentioned post.
The salary will be £1,250 per annum, rising to £1,700 per annum. The initial salary will be determined according to the qualifications and experience of the appointee.
Approved fares to Wellington will be allowed for the appointee, his wife and his dependent children; in addition, actual removal expenses will be allowed within specified limits.
Further particulars and information as to the method of application should be obtained from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Pall Mall, London, S.W.1.
Applications close, in New Zealand and London, on *16th October, 1961.*

MINISTRY OF AVIATION requires an INFORMATION OFFICER in London for general Press Office work and the preparation of articles on technical subjects. Applicants should have *wide experience in journalism,* and preferably knowledge of or interest in Aviation. They should be capable of absorbing technical knowledge and expressing it in non-technical language. Appointment will be unestablished but there are prospects of becoming pensionable by means of a Civil Service Commission competition. Salary £1,250 p.a., rising to £1,490 p.a. (London). Good holidays and paid sick scheme.—Write, giving age, full details of experience and qualifications, to Manager (P.E. 3241), Ministry of Labour, Professional & Executive Register, Atlantic House, Farringdon Street, London, E.C.4. *Closing date 31.8.61.*

STATISTICIAN. Market Investigations Ltd. seek a graduate in mathematics or mathematical statistics to join their unit dealing with the application of experimental statistical techniques to the problems of market surveys. This unit is responsible for planning sample design and analyses of market research data for a wide variety of industries and also for liaison on computer programming. Initial salary £800-£1,000 p.a.—Please write, with full details, to S. J. Orwell, Managing Director, Market Investigations Ltd., 1-2, Berners Street, W.1.

STAFFORDSHIRE COUNTY COUNCIL
EDUCATION COMMITTEE
STAFFORDSHIRE COLLEGE OF COMMERCE
WEDNESBURY.
Principal: H. Harman, B.Com.
Applications are invited for the post of Senior Lecturer in Accountancy and Secretarial Subjects.
Salary in accordance with the Burnham Technical Scale, i.e. £1,550 x £50=£1,750.
In certain circumstances allowances towards the cost of lodging and removal expenses may be made to married men teachers.
Form of application, returnable by 1st September, 1961, and further particulars of the appointment may be obtained from the Director of Education (Staffing) Education Office, Earl Street, Stafford, on receipt of a stamped addressed foolscap envelope.

CENTRAL OFFICE OF INFORMATION requires an ASSISTANT INFORMATION OFFICER (unestablished) to write, and acquire articles on trade topics and synopses suitable for use overseas. Preference will be given to the candidate with varied experience of writing for the trade and technical press. Some knowledge of industrial matters essential. Starting salary according to experience and qualifications rising to a maximum of £1,214.—Write, giving age, *full details of experience* and qualifications to Manager (PE 1587), Ministry of Labour, Professional & Executive Register, Atlantic House, Farringdon Street, London, E.C.4.

EXPORT
OZALID, the leading Company in the photocopying field with established overseas markets, wishes to augment its Export Sales Force and young men of *proved selling ability* with some experience in the export field and a knowledge of several languages are invited to apply for a restricted number of vacancies which will becomes available in the near future.
Good salary and incentive offered. Contributory Pension Scheme. All expenses paid. Applicants must be *willing* to travel extensively. Apply in writing in confidence to:
The Administrative Controller of Sales, Ozalid Company Limited, Langston Road, Loughton, Essex.

UNIVERSITY OF GHANA
Applications are invited for the CHAIR OF SOCIOLOGY. Secondment for a reasonable period also considered. The Professor, besides administering the department, will have to undertake most of the teaching in Social Theory and Comparative Institutions.
Salary: Ghanaian £G2,600 p.a.; non-Ghanaian £G3,000 p.a.
Appointment normally five years in first instance. Outfit allowance £G60. Car allowance £G150 p.a. Family allowance for non-Ghanaians for each child in West Africa £G50 p.a. or, if under age of 21 and receiving education *outside West Africa,* £G100 p.a. (maximum five children). Part-furnished accommodation at charge not exceeding 7.5 per cent of salary. F.S.S.U. policies maintained if already held, or superannuation on similar basis.
Passages for appointee and family on appointment and normal termination. Annual leave with 3 overseas return passages in every 4 years for non-Ghanaian and one every other year for Ghanaian.
Applications (six copies) with full details of qualifications, experience, etc., and naming three referees, to be sent before 25th September, 1961, to the Assistant Registrar (London), University of Ghana, 15 Gordon Square, London, W.C.1, from whom further *information* may be obtained.

For other appointments see page 753

COMPANY AFFAIRS

Property Finance Now

THE *Financial Times* index of property shares now stands at 95.2, compared with its mid-May peak of 124.7. This fall of over 23 per cent is the tailpiece of a long period of almost uninterrupted boom in the property share market. The reasons for the present setback are not hard to find. Many shares had been pushed to very high levels and their meagre yields were discounting pretty fully the benefits of future developments. Secondly, the market was influenced by fears of restrictions on finance for property developments, and these fears proved to be well founded when the Chancellor asked both the banks and the insurance companies to restrict advances for property development. The institutions, particularly the insurance companies, had already furnished a number of property companies with ample funds or had entered

Town & Com.	8/-	11/6	9/4½ xd	8/9 xd	3·7

into commitments to provide finance and, they were clearly experiencing difficulty in translating the Chancellor's request into practical terms. This week, however, the British Insurance Association sought to guide its members by putting its own interpretation on the request. In a letter to its members, the BIA said: "No objection would be raised to members completing their commitments in regard to property investments even though they may extend for some years ahead, and relate in some cases to an undertaking to finance projects not yet formulated. Where members have either a legal or a moral obligation to proceed with such projects they may, therefore, complete them. They should, however, exercise a restrictive policy to new property financing unless there are clear and early benefits for exporting industries in prospect."

The letter went on to suggest that members were free to deal with propositions for underwriting or subscribing for new issues in the normal manner even though the new money was designed to finance property development. The assumption underlying this interpretation is that market forces and the marshalling of any queue by the issuing houses will keep new issues by property companies down to a minimum. The general import of the letter from the BIA must be that, while those property companies which have already established links with the insurance companies can feel free to go ahead with developments for which finance has been promised, companies which have no such links will find it difficult, if not impossible, to raise money either directly from the insurance companies or from the capital market. Some pause in property development appeared to be on the cards even before the Chancellor spoke, and his request may not therefore appear too onerous. What its ultimate effect on property development and values will be must depend upon the length of the pause.

In the case of **Kennedy Leigh** it has been decided that a proposed loan of £1 million from Norwich Union should be postponed until April, 1962. Interest on this loan, which is to take the form of a debenture secured on some of Kennedy Leigh's properties, will be at 6¾ per cent, and in addition Norwich Union has been given an option to take up 550,000 ordinary shares at 8s. 6d. (which is close to the current market price) in the three years beginning on April 1, 1962. Norwich Union already holds 1,040,000 of Kennedy Leigh's 5s. ordinary shares, having paid just over 5s. a share for them. The shares were first offered to the public in March at 6s. 9d. each and they later touched a peak of 12s. 9¾d.

Another big loan which was apparently in the pipeline when the Chancellor spoke is the £9¼ million debenture issued to various undisclosed institutions by **Stock Conversion and Investment Trust.** These institutions will also have the right to subscribe for 900,000 5s. ordinary shares at 15s. each; if they take up their options in full they will secure about 13 per cent of the ordinary capital after the capital reorganisation. The shares in their existing 2s. form stand at the heavy price of £21, but they are to be written up to 5s. nominal with an eleven-for-one scrip issue to follow. This will bring their market value down to about 35s. So far the company has not paid a dividend and has charged its spending on development properties against revenue; in future this will be charged against capital. The directors say that the company is unlikely to pay a dividend during the next two or three years but they promise that when the developments are sufficiently advanced the company's income will be distributed as fully as possible.

It seems unlikely that **Town and Commercial Properties** will have any difficulties in financing its developments. The total cost of developments in hand at March 31st amounted to more than £2½ million, but the chairman, Mr R. C. Yablon, reminds shareholders in his annual statement that the Legal and General has acquired about 10 per cent of the equity and has made provision for long term finance amounting to about £4 million. The shares issued to Legal and General did not rank for dividends in respect of the year to March 31st last but they will rank for the 6½ per cent payment forecast for the current year on the capital to be increased both by the writing up of the 2s. shares to 4s. nominal and by the one-for-four scrip issue that will follow. On this forecast the 2s. shares at 8s. 9d. yield 3.7 per cent.

The first offer of property shares since the Chancellor spoke came this week with the issue of 750,000 ordinary shares of **Sovereign Securities,** which entered the property field less than three years ago. This company's future income is very much bound up with the successful completion of various developments now in hand. In addition to the £247,000 of ordinary capital, of which about 60 per cent is being offered for sale, there is £353,000 in deferred capital held entirely by the chairman, Mr Laurence Knight. These shares rank equally with the ordinary except that they do not rank for any dividend until the ordinary shares receive an annual dividend of 12½ per cent. On such a payment half the deferred shares will rank for the dividend and will be converted into ordinary shares and similarly the other half of the deferred shares will be converted when the ordinary dividend is raised to 17½ per cent. For the year to April 30th next a dividend of 5 per cent is forecast, so that the shares which are offered at 7s. each have an initial yield of no more than 2.9 per cent; but for the succeeding years the directors envisage dividends of 10 and then 12½ per cent.

John Brown

THE full report from John Brown once more emphasises that it is the group's machine tool interests which have protected shareholders from lean times in the shipbuilding industry and may continue to protect them from the still leaner times to come. The main point of interest in the statement by the chairman, Lord Aberconway, is that the group "greatly needs to win the order for the new Cunarder." At the moment its Clydebank yard, where only two more keels are on order to be laid, is far from fully occupied and overhead costs and the need to hold the skilled labour force together have prompted Lord Aberconway to say that both shareholders and employees would be better off with an unprofitable contract than without it.

Lord Aberconway also reveals that even though gross profits rose by 24 per cent, from £3,645,000 to £4,491,000, some sections of the group's business other than shipbuilding have given cause for concern. In the land boiler division competition is extremely strong and "price margins are quite inadequate." Cravens, the rolling stock subsidiary, expects to make a "substantial loss" on its contract for 464 cars for the London Transport underground and Lord Aberconway also describes margins on water turbines and chemical plant as in-

adequate. Hence future profits will be dependent upon the machine tool division. The rise in consolidated net profits is more than accounted for by the higher earnings of the two wholly owned machine tool subsidiary companies, Wickman and Firth Brown Tools. Last year Wickman bought the Coventry Machine Tool Works and had the current year record orders on hand when the current financial year opened while Firth Brown Tools is being reorganised and expanded. The £1 ordinary shares have lost 3s. to 37s. xd this week and now yield 5.8 per cent.

Ultramar

THE decline of oil shipments from Venezuela to the United States cut the earnings of the Ultramar group in 1959 and last year the fall in profits was even more marked. Although production was higher, Ultramar's consolidated trading profit slumped from £2,107,000 to £310,000. The proximate cause of the decline is the much reduced dividend from Mercedes, in which Ultramar and Texaco each has a 50 per cent interest: last year it made a cash payment of £163,000 whereas in 1959 it paid a dividend in kind of £1,995,000, made up of transferred concessions and distributions from profits accumulated mainly before 1959. After a slightly lower tax charge but a much higher depreciation provision the Ultramar group made a net loss of £209,000 last year, its producing companies being hit by the lower prices ruling for crude oil and products. In addition, the wholly-owned Golden Eagle Refining Company of California made a loss in developing marketing outlets before going ahead with its plan to expand its Los Angeles refinery. The Ultramar directors have cut the tax-free capital distribution from 1s. 6d. to 1s. per 10s. stock.

The preliminary statement also reveals that the structure of the group has been changed, as the Canadian-Caribbean Oil Company of the Bahamas has acquired a 50 per cent interest in the equity of Golden Eagle of Panama and Golden Eagle of Canada on the payment of $2 million to Ultramar. Can-Carib, which is organised and controlled by the J. M. Shaheen interests, is also providing a "capital contribution" of $2 million to each of the Golden Eagle companies and, in addition, a $6 million mortgage loan to Golden Eagle of Canada. The new arrangement will obviate the need for Ultramar to raise any additional funds for its Golden Eagle interests. But other finance to cover the cost of equipment supplied from this country to the Panama refinery, where work is well advanced on the site of over 400 acres, is being negotiated and United States banking facilities should be available to cover local costs incurred in Panama and the United States. The 10s. ordinary shares lost 1s. 9d. on the news of the lower profits and now stand at 28s. 1½d. which is barely above their lowest point for the year. This was always a gambler's stock —and it still is.

Furness Withy

THE accounts of Furness Withy are never very informative, as this shipping group cloaks the results of a combination of associated and subsidiary companies behind the Shipping Exemption Order. Last year the rise of 19½ per cent in net profits may have some compensation for the absence of an adequate explanation of how the group's ventures were faring; in the latest year, which ended on April 30th, there is not even this consolation, for net profits fell by nearly 30 per cent from £1,834,000 to £1,293,000. The preliminary statement gives no figure for depreciation, which amounted to £3¼ million in 1959-60 and which may have been even higher in 1960-61 as it included special depreciation on new tonnage.

The directors have maintained the ordinary dividend at 10 per cent but the cover has fallen from 2.7 to 1.8 times. The London dock strike and higher wages probably help to account for the fall in profits as well as the depressed state of shipping rates over the period. The £1 ordinary shares lost 1s. 1½d. after the results were published and at 39s. 7½d. yield 5.1 per cent.

International Nickel

THE interim report from International Nickel strengthens the impression that productive capacity has run ahead of demand and that margins have been squeezed. The results of the group for the first half of this year are slightly better than those for the second half of 1960, but worse than those for the first half of 1960.

The directors say that deliveries of nickel in all forms in the first six months of this year were a little lower than in the corresponding period in 1960 but about ten per cent above those in the second half. Sales and profits, moreover, were slightly better in the second quarter of this year than in the first. But to match last year's net earn-

Six months to	June 30, 1960 $'000s	Dec. 31, 1960 $'000s	June 30, 1961 $'000s
Net sales	268,758	236,363	258,845
Costs and expenses	179,927	162,952	177,693
Operating earnings	88,831	73,411	81,152
Total income	90,920	74,327	81,925
Income tax	34,161	26,017	30,981
Net earnings	43,902	36,799	37,653
Net earnings per share	$1·50	$1·26	$1·28

ings per common share, net earnings in the second half of the current year will have to amount to $1.48 per share and the latest results do not provide much of a guide to the year's outturn as the price of nickel was raised by ten per cent at the beginning of July. Demand is expected to rise in this period but the costs of running in the new Thompson mine have to be covered and International Nickel may continue to pile up stocks. So far, three quarterly payments of 40 cents per share have been declared but it is still not clear whether this portends a payment higher than the 1960 rate of $1.52½. Even if the dividend were to be raised to, say, $1.60 the yield on the npv shares at the current London price of $153 would be no more than 1.8 per cent.

London Stock Exchange

FIRST DEALINGS:	July 24	Aug. 4	Aug. 21
LAST DEALINGS:	Aug. 3	Aug. 18	Sept. 1
ACCOUNT DAY:	Aug. 15	Aug. 29	Sept. 12

BEFORE last weekend equity prices fell back further and gilts continued to rise. But on Tuesday of this week the fall in equities was halted and prices improved slightly in a very quiet market, with the number of bargains marked on Tuesday and Wednesday around the lowest levels recorded this year. Over the week to Wednesday *The Economist* indicator lost 8 points to 369.2. Turnover in gilt-edged was also limited but prices held up after the weekend. Before the weekend interest in gilt-edged stocks was displayed by small investors attracted by high yields, and there was also some foreign buying; after the weekend Continental support continued and there was also some switching. Short dated gilt-edged stocks still showed net losses over the week to Wednesday but the long and undated stocks were appreciably higher. Exchequer 5½ per cent 1966 lost ⅛ to 96¼ while Redemption 3 per cent 1986-96 showed a notable rise of 1⅛ to 53⅜. 2½ per cent Consols and 3½ per cent War Loan each gained ⅞, to 38⅝ and 52¾ respectively.

The equity market was depressed at first by the Berlin crisis; but later there was a small amount of buying both before and after the publication of the trade figures. Some of the buying was by trustees, but they did not come into the market for any large amount of stock. Bank shares fell back over the week and Westminster "B" were typical in losing 2s. to 79s. 9d.; but hire purchase shares gained small amounts, Bowmaker closing 3d. higher at 14s. 4½d. Insurance shares made small mixed movements and brewery shares fell slightly.

Among building shares the heaviest falls came in the cement producers, with Associated Portland and Rugby Portland each losing 2s. 6d. to 73s. 6d. and 52s. 9d. respectively. Marks and Spencer gained 1s. on Wednesday but still lost 4s. 3d. over the week to 97s. and other leading store shares also lost smaller amounts. Electrical shares generally lost small amounts though Decca Record fell more heavily by 3s. 9d. to 63s. 3d. and Thorn made a net gain of 1s. to 51s. on favourable press comment.

Widespread losses occurred in engineering and steel shares though Jaguar "A" and Leyland, which are thought to be among those that will do well if Britain joins the common market, advanced among motors. Tobacco shares put on small amounts with BAT 6d. up at 68s. 3d. Elsewhere among British equities there were falls: in food, shipping, textiles, property and oil.

The Kaffir market was also fairly quiet. Anglo-American gained 2s. 6d. to 126s. 3d and Free State Geduld lost the same amount to 81s. 3d. Tin shares continued their recent upward trend and Tronoh put on 3s to 77s.

EXCHEQUER RETURNS

For the week ended August 12, 1961, there was an "above-line" deficit (after allowing for sinking funds) of £27,571,000 compared with a surplus of £66,268,000 in the previous week and a deficit of £6,240,000 in the corresponding period of last year. There was a net expenditure "below-line" of £7,038,000 leaving a total cumulative deficit to date of £246,290,000 compared with £352,560,000 in 1960-61.

Money and Exchanges

THE MONEY MARKET

FOR the third week since the rise in Bank rate the syndicate of discount houses submitted an unchanged bid of £98 6s. 4d. at last Friday's Treasury bill tender; and it received 41 per cent of its application against 44 per cent at the previous week's tender. The level of most outside bids again fell slightly and the average rate of discount rose by 5.18d. to £6 14s. 8.51d. per cent. Total applications for the £259 million bills on offer rose by £9 million to £395 million last week, despite an apparent decline in official applications.

Credit was in short supply throughout the week and the authorities helped the market by means of fairly large bill purchases up to Monday. But on both Tuesday and Wednesday one or two houses were forced to borrow small amounts at 7 per cent from the Bank of England. The market's bill allotments over the past three tenders have been relatively low and it will be under pressure to raise its bid for bills at future tenders; but the Bank has no desire to see the rate forced down too quickly.

In New York the three month bill rate rose for the fourth successive time last week, from 2.366 per cent to 2.519 per cent.

(1) Current statistics of employment by industry, based on the 1958 Standard Industrial Classification, *go back only to* May, 1959. Manufacturing employment for earlier dates is shown on the old basis (*1948 SIC*). (2) Engineering and electrical goods, shipbuilding and marine engineering, vehicles, metal goods. (3) Textiles, leather *goods*, clothing, food, drink and tobacco, timber, furniture, paper, printing and publishing. (4) *Number registered as* unemployed expressed as a percentage of the estimated number of employees. (5) *Dorset* (excluding Poole) was transferred from the *Southern* to the *South* Western Region on May 12, 1958. (6) Average for first *quarter*. (7) Great Britain. (8) Excluding all screening losses normally amounting *to around 5,000 tons* a week. (9) Average for second quarter. (10) England and Wales. (11) Generation for public supply. (12) Deliveries.

APPOINTMENTS

ORGANISATION AND METHODS

The Birfield Group of Companies has a vacancy for an O. and M. Officer to take charge of this function. He will be executively responsible to the parent company's Secretary who has been trained in O. and M. and he will undertake assignments to advise companies of the Group.

Applications are invited from men interested and experienced in this work. It is likely that the successful applicant will be aged 30-35 years, of sound commercial training, with two or three years O. and M. experience, the requisite personal qualities and currently earning in excess of £1,000 per annum.

The department is located at the offices of Hardy Spicer Limited in Birmingham and initial application should be made, stating age, education, training and experience, to the

Personnel Manager,
Hardy Spicer Limited,
Chester Road, Erdington,
Birmingham 24

EXCEPTIONAL OPPORTUNITY— NEW ZEALAND

An exceptional opportunity for a Chief Accountant/Administration Executive exists in the Head Office of a progressive industrial finance corporation in Wellington. The company has international affiliations, and branches and associate companies throughout New Zealand.

The applicant should be a qualified accountant, aged between 30 and 45, and with a background of proven ability, commercial accounting experience and organisation. Duties include the supervision of all accounting of the parent company and associated companies at Wellington, the development of mechanical accounting, records, general office routine and co-ordination of accounting staff.

Salary will be commensurate with the position and there is a superannuation scheme.

Applications, marked "Confidential," to Box TE.913 c/o Hanway House, Clark's Place, London, E.C.2.

B Nylon S

ECONOMIC RESEARCH

British Nylon Spinners Limited invite applications from graduates with a good honours degree in economics for an appointment in the Economic and Market Research Unit of their London Office.

The activities of the Unit are interesting and varied, covering a wide range of markets and products, and the successful candidate will be in a position to obtain a thorough understanding of all aspects of the Unit's activities.

Initially, the successful candidate's particular concern will be events and developments in international trade of importance to the Company's interests. These include the trend to regional free trade groups, such as the E.F.T.A. and the E.E.C., activities of the G.A.T.T. and the trade policies of a number of countries with particular reference to tariffs and quotas.

Applications should be addressed to the Recruitment Officer,

British Nylon Spinners Ltd.,
PONTYPOOL, MON.

quoting reference L/14.

DEMERARA COMPANY LTD.

Proprietor of two Sugar Estates and a Distillery in British Guiana requires

FINANCE OFFICER

who would be stationed at the Company's Georgetown Office and would be responsible to G. H. B. Hutchinson, Chairman of the Estates Management Committee, as his financial adviser, as co-ordinator of all accounting control information and its presentation and return to Head Office in the U.K. and generally.

Preference given to candidates of Guianese or West Indian origin aged between 30 and 40, who should possess Chartered Accountant's qualifications and should have had experience of modern budgetary control systems.

Remuneration will be about £2,500 p.a., depending on qualifications, with free housing and a car. Generous contributory pension scheme and leave, with passages paid to country of origin.

Applications to Managing Director, Demerara Co. Ltd., Martins Bank Building, Liverpool, 2, for onward transmission to British Guiana. It is hoped to hold final interviews for shortlisted candidates in London about 21st September.

CONSUMER MARKET RESEARCH.—Sociologist/Economist required for interpreting a series of the most comprehensive household habits surveys ever implemented in U.K. Age about 25-30, with knowledge of marketing or advertising preferred. Practical experience in the field of sociological research important. Opportunity to study data from one of the largest operations of its kind for a man who will make an active contribution to this developing area of research. Salary range £1,250-£1,500. Pension, etc.—Applications, with full details of age, education, qualifications, experience and present salary, to Vice-Admiral Sir Guy Sayer, Attwood Technical Services, Limited, West Halkin House, West Halkin Street, London, S.W.1, quoting ref. RP/7.

COMMISSION FOR THE NEW TOWNS

SECRETARY AND FINANCE OFFICER

The Commission for the New Towns which will come into being on 1st October, 1961, will require a Secretary and a Finance Officer. There will be a contributory pension scheme.

The Secretary will be the chief executive officer of the Commission which is charged with taking over, holding, managing and turning to account the property now vested in Development Corporations. The post will demand organising and administrative ability of a high order. Salary £5,000; a higher figure would be considered if warranted by exceptional experience and qualifications.

Applicants for the post of Finance Officer should be Chartered Municipal Treasurers, Chartered or Incorporated Accountants or certified Corporate Accountants, or have equivalent qualifications, and should have a wide and varied experience in commerce or in public service. Salary £4,000; again a higher figure would be considered if warranted.

Applications, giving date of birth, education, qualifications and experience, should be addressed not later than 15th September to the Chairman-designate, Commission for the New Towns, c/o The Ministry of Housing and Local Government, Whitehall, S.W.1.

UNIVERSITY OF GHANA

DEPARTMENT OF SOCIOLOGY

Applications are invited for (a) SENIOR LECTURER or LECTURER with special interest in social anthropology and experience and interests in Africa, and (b) SENIOR RESEARCH FELLOW or RESEARCH FELLOW particularly competent in advanced research methods, including statistical techniques and with interest in problems of economic development and social change.

Salaries: Senior Lecturer and Senior Research Fellow: Ghanaians: £G1,750 x £G75—£G2,200; *non-Ghanaians*: £G2,100 x £G90—£G2,640. Lecturer or Research Fellow: Ghanaians: £G1,050 x £G50—£G1,400 x £G75—£G1,850; £G1,900; *non-Ghanaians*: £G1,260 x £G50—£G1,680 x £G90—£G2,220; £G2,280. Entry at appropriate position.

Appointment normally five years in first instance.

Outfit allowance £G60. Car allowance £G150 p.a. Family allowance for non-Ghanaians for each child in West Africa £G50 p.a. or, if under age of 21 and being educated outside West Africa, £G100 p.a. (maximum 5 children). Part-furnished accommodation at charge not exceeding 7.5 per cent of salary. F.S.S.U. policies maintained if already held, or superannuation on similar basis.

Passages for appointee and family on appointment and normal termination. Annual leave with 3 overseas return passages in every 4 years for *non-Ghanaians* and one every three years for Ghanaians.

Applications (six copies) with full details of qualifications, experience, etc., and naming three referees to be sent before 25th September, 1961, to the Assistant Registrar (London), University of Ghana, 15 Gordon Square, London, W.C.1, from whom further information may be obtained.

For other appointments see page 746

STAFFORDSHIRE COUNTY COUNCIL

EXPORTS AND MARTINS British banking will be required to play a vital role in the expansion of our export trade. It is a challenge that Martins is well placed to meet with its Head Office in the city-port of Liverpool, with over 600 branches at home and with world-wide connections overseas. For many years Martins has offered a range of specialised services to those engaged in overseas trade. These services are continually being strengthened and improved and the Bank is always looking ahead to provide new facilities quickly when changed conditions demand them. Information and advice on exporting matters are available from all our branches, who can call upon the special facilities of our Information Department at Head Office.

UNILEVER LIMITED AND UNILEVER N.V.

Interim announcement of Turnover and Results 1961—First Half-Year

The Boards of Unilever Limited and Unilever N.V. announce the Companies' estimated combined turnover and consolidated results for the first half of the current financial year. The corresponding figures for the first and second half-years of 1960 are given for comparison. In compiling the figures for 1961 the turnover for the months March to June and the profits for the whole period, so far as attributable to the Netherlands and Germany, have been converted to Sterling at the new rates of exchange that followed the revaluation of the Guilder and the Mark in early March. The effect has been to make the combined figures for 1961 of turnover about 1% and profits about 1½% greater than would have been the case under the previous rates. (The revaluations have the opposite effect on the combined figures in Guilders being released by N.V. in Rotterdam, making turnover about 2½% and profits about 3½% lower.)

(ALL FIGURES REPRESENT £ MILLIONS)

Joined for strength and owned by two great banks

two important finance houses are organized for expansion

Two long-established finance houses, Olds Discount Company Limited and Scottish Midland Guarantee Trust Limited, are now linked together in Lloyds & Scottish Finance Limited which, in turn, is owned jointly by Lloyds Bank and the National Commercial Bank of Scotland.

With a capital of £15,000,000 and assets exceeding £100,000,000, the Group offers comprehensive hire purchase and block discounting facilities for the distributive trades, industry, commerce and the individual.

Traditionally, a large proportion of its turnover is in the motor vehicle business: cars, commercial vehicles and motor cycles. The manufacturing and building industries, and other large scale users of capital equipment and machinery, including agriculture, are employing the Group's financial facilities on an increasing scale. In the field of household equipment—radio, television, refrigerators, washing machines, furniture, etc.—its block discounting and direct collection facilities are used extensively by enterprising traders. Convenient payment arrangements are provided for individuals for central heating installations, marine craft, garages and garage extensions, boarding school fees and other such personal requirements.

Through a nation-wide network of over 100 branch offices the Group has established a reputation for efficient, courteous and understanding service to all its customers.

Enquiries are welcomed at any office of the two operating companies, Olds Discount and Scottish Midland Guarantee Trust; or may be addressed to the head office.

WASH-and-WEAR! EASY CARE

Japanese Man-made Fabrics "SHATSU"

After the introduction of synthetic fibre manufacturing techniques from abroad, man-made fabrics became increasingly popular among the Japanese people. Now, "shatsu" (shirts) of these fabrics are in great demand.

With this new industry, Japan has become the world's second largest producer of man-made fibre products accounting for a third of the world's exports.

The Nippon Kangyo Bank is proud of its part in the development of this new Industry and the promotion of its exports. "Kangyo" means "industrial and commercial promotion." And in continuing these policies, The Nippon Kangyo Bank will endeavor to assist firms trading with Japan and cordially invites their use of its facilities.

BRITISH INDUSTRIAL PLASTICS LIMITED

WOULD IT BE BETTER IN PLASTIC?

OBOE REED. Made of temperamental French cane. The crossevery player has to bear. Could plastics make it more dependable? Certainly—but nobody wants to spend development money on such a specialist item.

Your product, though, *has* to be a commercial proposition and it's worth a lot to you to make it better than the competition. Plastics (that is, British Industrial Plastics) might help you to do just that.

BIP are the people to advise you. We know how to make things *of* plastics and *with* plastics: colourful, comfortable saucepan handles; bus bodies, lifeboats, a thief-proof brief case; and weatherproof cabs for mechanized peat-cutters in Ireland; and our resin adhesives have just repaired the ravaged timbers of Britain's oldest tithe barn.

But what about you? Your product is the one we're interested in. If plastics are to give it a new plus—in attractiveness, durability, ease of production—BIP's Advisory Service will seek it out for you. Design is the other field where we can help: we know the ins and outs of these new materials (we process them, make our own moulded products, build the press and tool plant) so we offer a Product Design Service which will work for you (without fee) either independently or with your own designers.

GO ON—ASK US!

WOULD IT BE BETTER WITH PLASTICS?

INTERNATIONAL

Pleasure of Giving

The United Nations can be regarded as a place for talking away difficulties; or, more hopefully, it can be used as a dynamic instrument, capable of service to the big as well as the smaller members (p. 775).

AID IN PERSPECTIVE Three pages of charts and tables show who is giving and who is receiving—and the amounts (p. 788-90).

Giving of Pleasure

Kenya : Mr Jomo Kenyatta has given hope to some of his countrymen (p. 781).

Britain : Now is the swarming season for overseas students to the United Kingdom (p. 782).

Northern Rhodesia : The future comfort of the protectorate lies in the hands of the British Government (p. 780).

Pan-Africa : Europe may yet donate an element of unity to those gay receivers, the anti-colonialists (p. 782).

Giving of Displeasure

Mozambique : The exiled Africans in Dar-es-Salaam wish few delights on the Portuguese governors of the overseas territory to their south (p. 809).

Portugal : The topsy-turvy outside world is, in Lisbon eyes, painfully misguided. No matter—in Lisbon's view, the world will return to its senses again one day (p. 806).

Spain : Basque partisans, royal dukes, and Pimpernel figures from the past are disturbing the long sleep imposed by General Franco (p. 779).

Germany : Not all the voters are pleased with Dr Adenauer (p. 805).

Berlin : Tugs from both east and west : it has long been split at the seams (p. 777).

Geneva : It is hard to calculate what technical advantage there would be for the West if America resumed nuclear testing (p. 777).

Tel Aviv : Mr Ben Gurion is frustrated because he is apparently unable to bequeath a two-party system to Israeli politics (p. 808).

Displeasure of Giving

President Kennedy is trying to avoid a Waterloo over his foreign aid Bill (p. 791).

The American Vice-President may have been too much of a Texan in Berlin last weekend (p. 792).

The American refusal to allow direct flights between New York and Moscow is a way of expressing disapproval of Russia's behaviour in Berlin (p. 792).

This year's Farm Act makes no basic change in the unfortunate system by which American farmers are subsidised (p. 796).

In British Guiana, Dr Jagan must offer his leadership to the country, not to his Indian followers alone (p. 808).

HOME

Grand Strategy

The government's and British industry's new ideas on how to plan the British economy need to be looked at rather quizzically (p. 771).

NATO and Berlin: The West's inadequate conventional forces are acting as though negotiation were the key to the crisis; the politicians are less certain (p. 774).

Leyland Motors: From the lorry-driver's cab, Leyland has no doubt formed some decided views on the world of pleasure motoring, but it has not made clear where it intends to steer Standard-Triumph's car production (p. 811).

Television manufacturers are puzzling over lines and colours, while the viewer has been left in the dark—a full-length documentary would help (p. 812).

Bold Designs

Coal: By raking some of the dirt out of the fireplace, Mr Robens hopes to sell more coal (p. 818).

TUC : This year's annual report is stodgier than ever : but some recent actions give brighter grounds for hope (p. 778).

The Press : A professional contribution to the great Fleet Street debate (p. 780).

School Building : Some exemplary progress—and the case for further rationalisation (p. 779).

National Insurance : Britain has a remarkable machine for social succour : it also needs some gears to control it (p. 780).

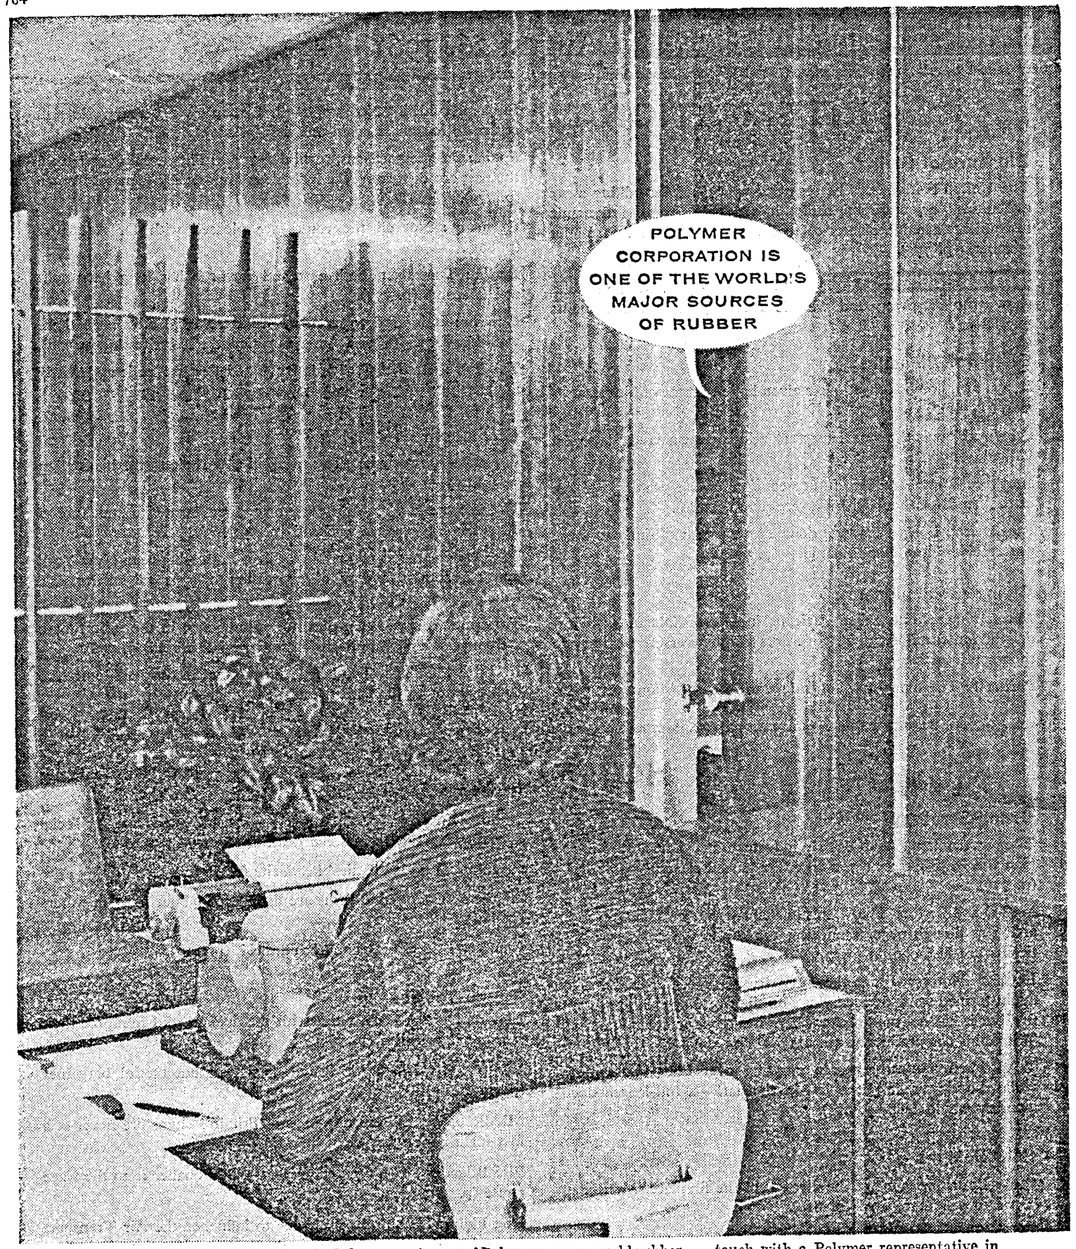
Brighton : The landladies' headache (p. 786).

Workers : Continental firms are fishing for labour in Irish waters (p. 786).

Channel Bridge or Channel Tunnel? (p. 817).

Tough Tactics

London Docks : Harder times hit the dockers and reinforce their traditional wariness (p. 785).

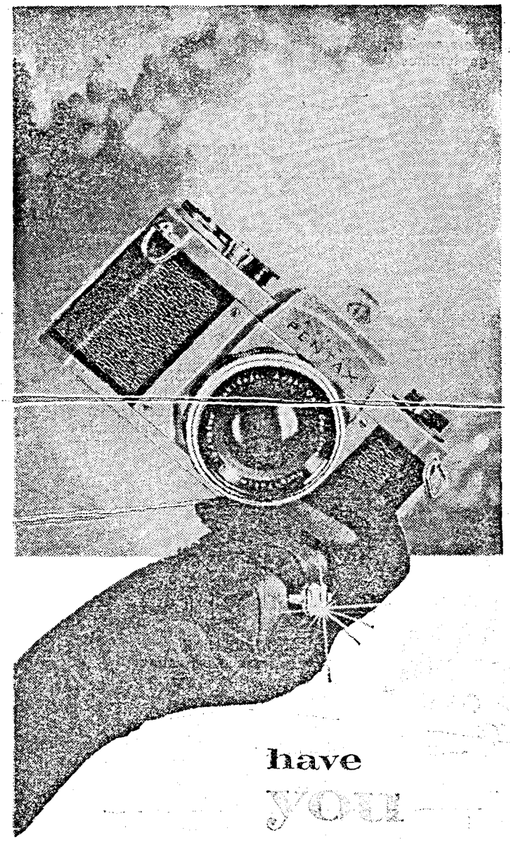


Europe : Mr Heath for Britain is a firm but tactful bargainer (p. 777).

Middlesbrough : The bully-boys of Britain's slums are never at a loss for a handy scapegoat (p. 778).

Fire Brigades : The firemen present a bold challenge to the wage pause (p. 781).

Dog Fight : BEA probably hopes to influence the Air Transport Licensing Board's consideration of applications by rival fliers with its announcement of a prospective loss this year (p. 815).



Detailed contents on page 771

INDUSTRY AFTER INDUSTRY, all around the world, has found that new Polysar* rubbers, produced by the Polymer Corporation Limited, have helped to solve a wide variety of raw material problems. The result has been a steady growth in production, leading to the present pre-eminence of Polymer among world rubber suppliers. Additions are constantly being made to these versatile elastomers. One of them could supply you with the answer to your raw material problems. A letter to the Marketing Division, Polymer Corporation, Sarnia, Canada, will put you in touch with a Polymer representative in one of 43 countries.

Dresser is everywhere in the WORLD of INDUSTRY

Wherever industry turns a wheel . . . shapes a metal . . . "cooks" a chemical . . . purifies a pharmaceutical or food . . . pipes or pumps a liquid . . . moves, compresses or measures a gas . . . some Dresser product is somewhere at work, helping to get the job done – and done well.

Under world-famed trade names, Dresser provides heavy duty engines, pumps, compressors, solvent extractors, gas turbines . . . for countless tasks. Dresser supplies foundry clays, couplings, blowers, exhausters, gas meters and scores of other products. In automation, Dresser is playing an increasingly important role . . . particularly in electronic control instrumentation for pipe lines, process plants and automated oil production systems.

In fact, Dresser Industries, through its far-flung group of integrated companies and licensees, is able to provide essential equipment for virtually any industry – general manufacturing, chemicals, pharmaceuticals, food-processing, steel-making, non-ferrous metal processing, electronics and communications, power and petroleum in any land.

Call on Dresser for technology, for experience and initiative, for reliable, world-proved products and technical services . . . no matter what you make or where you make it.

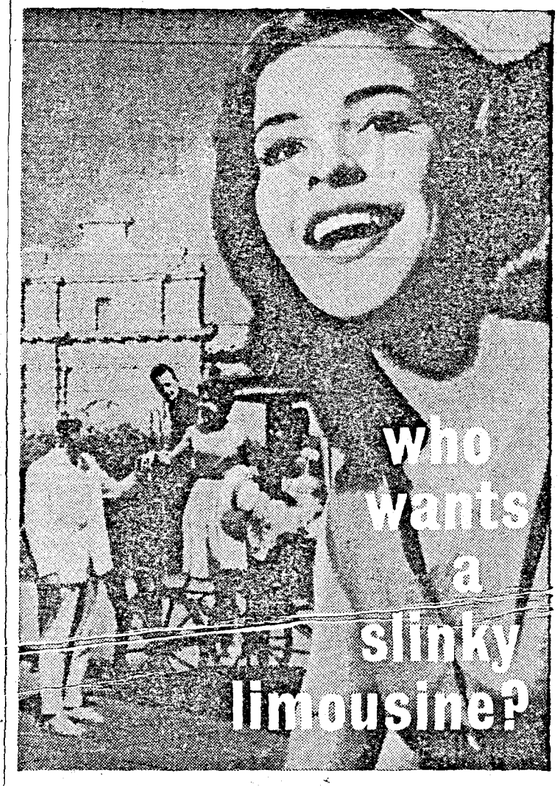
TUFNOL SIGNS OF THE TIMES

Adder-sign of Tufnol



Those people born under the sign of the Adder climb the ladder to the top of their profession. Adder men become chief purchasing officers, chief engineers, chief draughtsmen and chief designers. Adder men add two and two together and make for one material that combines the properties of many materials—a material that is light yet strong and hardwearing, resistant to corrosion and a good electrical insulator. They also find that this ideal material is resistant to deterioration in storage, machines easily with ordinary tools, and is available in sheets, tubes, and rods. Most Adder men have discovered this remarkable material—"ADDER" brand Tufnol. They have also discovered that Tufnol is available in eleven other brands, each with predetermined properties.

All brands of Tufnol are laminated plastics; *each* formulated to satisfy specific requirements—*your* requirements. If your birthday falls between January 1st and December 31st, this could be your lucky week—the week you discovered Tufnol. *'Phone or write to your local Tufnol Branch Office and we predict you'll thank your lucky stars.*

Now rivers of paper link Canada with Kent

Every year, millions of logs flow down Canadian rivers heading for the pulping plants of Anglo-Canadian Pulp and Paper Mills Ltd.—a new dollar area pulp and paper partner of the Reed Paper Group.

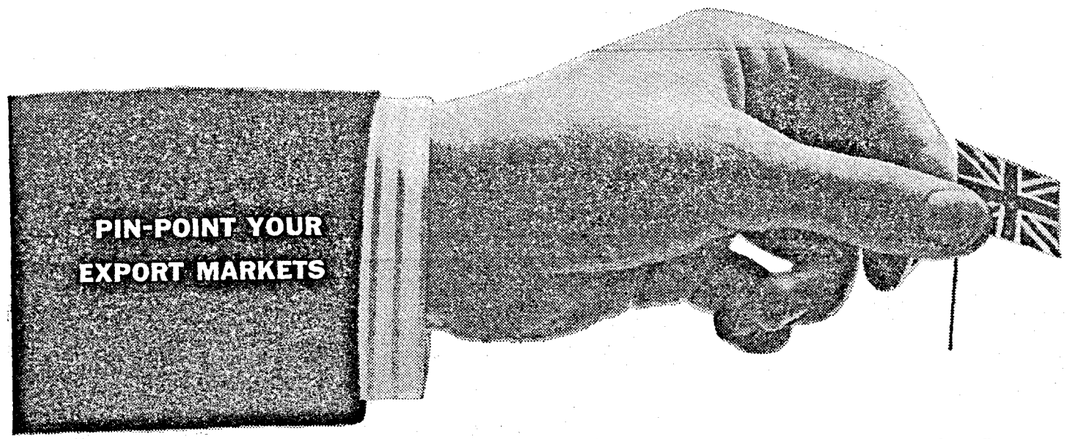
Pulp arrives at the huge Aylesford site on the river Medway, biggest single paper and paper converting centre in Europe. Here too is the site of the new £500,000 research centre, to serve member companies of the Reed Paper Group throughout the world.

A BIG STAKE FOR THE REED PAPER GROUP IN THE BUSTLING DOLLAR MARKETS

—that is the significance of the Group's westward expansion. A £37 million transaction last year brought three Canadian companies —Anglo-Canadian Pulp and Paper Mills Ltd., the Dryden Paper Co. Ltd., and the Gulf Pulp and Paper Co.—into the partnership of the Group. Thus Canada becomes the springboard for expansion by the Group into the huge U.S. and the growing Latin American markets.

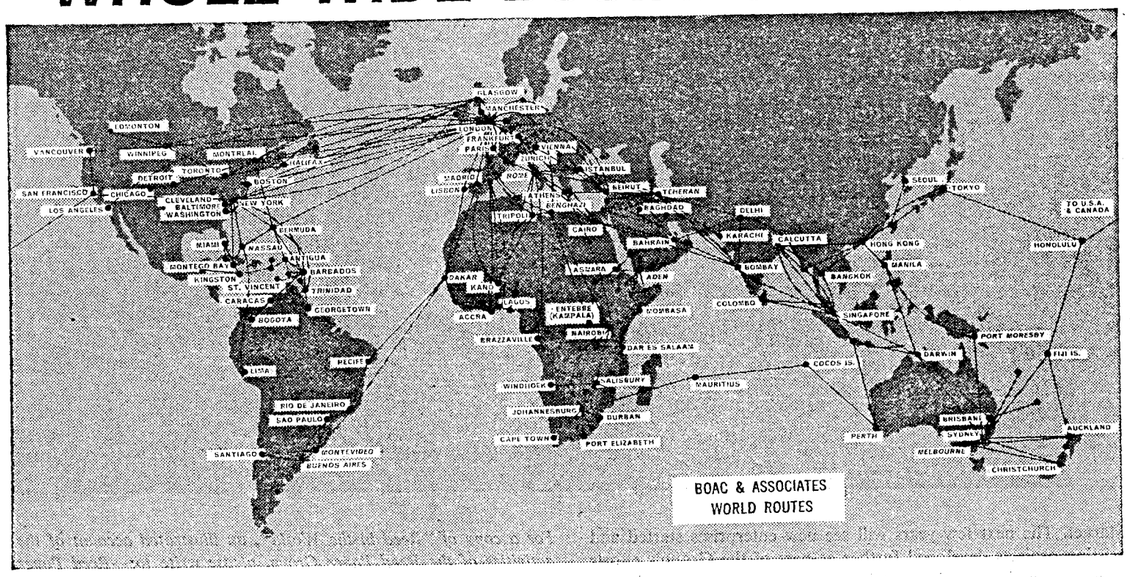
Yet this new partnership is only a part of the global pattern of expansion which the Reed Group is undertaking. Recent additions include a £2½ million pulp and paper mill under construction in Norway; a £2 million packaging company operating throughout Australia; in Italy the Group, in partnership with one of Italy's most progressive organisations, has acquired a leading packaging company and is building a carton board mill.

To each of these partnerships, the Reed Paper Group brings its vast technical, research and production experience. Each member company, for its part, makes full use of its knowledge of local conditions and markets.



The Reed Paper Group is now firmly established in the four main trading areas of the free world—the Dollar Market, the Commonwealth, the European Free Trade Area and the Common Market. The next few years will see new enterprises started and existing projects developed further as part of the Group's efforts to expand and diversify its activities in this country and all over the world.

For a copy of "Reed in the World", an illustrated account of the activities of the Reed Paper Group, please write to:—Reed Paper Group, Group Publicity Department, Blackfriars House, New Bridge Street, London, E.C.4.



REED PAPER GROUP a world-wide partnership producing pulp, paper, board and packaging

Visit our stand at the Packaging Exhibition, September 5—15.

BOAC ROUTES COVER THE WHOLE WIDE BUSINESS WORLD

BOAC & ASSOCIATES
WORLD ROUTES

Nobody wins big export business just sitting at a desk. And nobody keeps it—unless they keep giving sales and technical service on the spot. But what's the best way to get down to big export business *fast*? Take a look at the BOAC world map. Your people at all levels—chasing new business, following it up or seeing it completed—can fly *anywhere* in a matter of hours by BOAC and its associate airlines. No other airline can match it.

Any BOAC Appointed Travel Agent or any BOAC office will gladly help you.

Planning by Whom?

IT is not very clear what sort of new machinery for long-term economic planning the Chancellor was trying to adumbrate to trade unionists and employers this week, but there are indications that he may be misconceiving what the aims of planning should be. Possibly this was because his immediate audiences were not exactly the easiest people to whom to explain them. But it had better be said straightaway that the objective of planning should not be to get some "representative" committee of trade union leaders, large employers and establishment figures to sit down together, air their mutual prejudices, and strike meaningless verbal compromises with each other, in the hope that Britain's economic difficulties will then somehow be rubbed away. On the contrary, the purpose of any effective new planning machinery should be to diminish the practical power of some of these organised groups, and to increase the influence over public policy and attitudes of what might be called the economic technocrats.

Everybody who has studied the way in which various nations' economic policies have been run since the war knows who these economic technocrats are. They are men who think and operate in terms of (sometimes infuriatingly glib) production targets and planned efficiency drives ; they play something of the role in some nations' affairs that time-and-motion-study men play in some individual factories ; and they have some of the disadvantages and drawbacks of those stopwatch men. Any organisation in which they have too much authority or prestige can become rather soulless ; and even at quite an early stage their extreme worship of figures can look more than a little absurd. One should always be ready to grin at such announcements as a recent one from Japan that "the Government, at a Cabinet conference held in December, 1960, decided to set the 1961 target of the nation's real economic growth at 9.2 per cent." The planning technocrats can also make big mistakes. Yet the fact remains that several successful countries in Europe—not merely France, which is the case everybody talks about now—have clearly expanded their economies more quickly because men who try to guide governments' policies with both eyes on these statistical production targets are in positions of public influence.

In Britain, our nearest equivalent to men with the chance (and with sufficient access to economic information) to act as such technocrats are some civil servants hidden from public gaze in the Treasury and possibly some officials in the Bank of England. Britain, like Europe but unlike America, has the advantage that if the Government has any ideas about how to influence the economy, it can put those ideas fairly quickly into legislative and budgetary effect ; our parliamentary system is superior to America's congressional system in that respect. But the difficulty in Britain has so far been that the climate of opinion has been peculiarly unfavourable to the economic technocrats. Blame for this must be laid on almost every section of what might be called opinion-forming people in our national life. Among Britain's "establishment" and among parliamentary backbenchers, the desire for productive efficiency is very far from being a driving force. Whenever it is proposed to extend a factory in a booming industrial area, there are protests that the proper sites for such ventures are those where 4 or 5 per cent of unemployed local workers need jobs rather than those where production costs will be lowest ; and whenever it is proposed to build a new works in an undeveloped part of the country, angry leading articles declare that it will spoil

some local villagers' or yachtsmen's or nearby gentlemen-farmers' view. British trade unions, too, have never allowed themselves to recognise that the only way in which real wages can be raised is by raising real production; they are much more eager to try to get money wages increases far in advance of productivity increases, and their "examinations" of the ways in which they themselves hold production back always tail off in the end into explanations that they need do nothing because other people are holding back production too. Industrialists do not welcome surveys of ways in which their own particular industries might be improved; they regard such criticisms as libels, and complain that for official bodies to publish them is insulting and unfair. Finally, the Government has hitherto—or, at least, until recently—opposed the publication of target figures for economic growth, apparently because it fears public criticism if these targets are not hit.

Public Sector Planning

THE first advance that has been made in the last few months is that the Government seems to have been converted into viewing the publication of production targets with more favour. It seems probable that, following the recent Plowden report, it is now going to make some attempt to plan or project its own public expenditure programmes for some five years ahead; and that it will do the same, within very broad limits, with the investment programmes of the nationalised industries. When its dissertation on this "public sector plan" appears, some sort of proviso is likely to be made that the plan will only make sense if national production can be raised by an average of, say, 3 per cent a year over this period. Once such a figure is published, it could have the important psychological effect that political argument will be centred on the steps that are needed to achieve it; indeed, the Opposition is likely to say that the target should be set higher, and that might impose some obligation upon the Opposition to devise its policies in a way that would seek to persuade people that it was production-minded too. At the same time it would be logical if the annual Economic Survey and the Chancellor's Budget speech dropped back into the habit of forecasting what sort of increase in production it seems reasonable to aim at in the year immediately ahead; and in conjunction with this the Government might at last begin to plant in the public mind the sort of figure which annual increases in earnings (i.e. in total earnings, including piece-rate earnings, not merely basic wage rates) must not surpass if the country is not to plunge into inflation. The Chancellor has started on this last exercise with his plea for a wages pause: public opinion is being told that the safe immediate increase in wage rates is nought. Although the immediate expostulating reaction of the TUC has been to issue statements about how wicked the Chancellor is, it is noteworthy that the main practical reaction of individual unions has been to slow negotiations over their own wage claims down, to take a later place in the queue.

These fairly long strides towards more public planning can be achieved without any changes in Whitehall's administrative machinery, without setting up any new outside committee. The Chancellor's and the Federation of British Industries' idea of setting up a new two-tier committee (consisting of about twenty-five businessmen and trade unionists in a top council, with an "office" of economic technocrats beneath them) is relevant to a different problem: to whether Britain should be prodded into what might be called "indicative planning" for the private sector of the economy as well. If this is to be done, it is important that the economic technocrats should do most of the estimating work, and (even if they are nominally called subordinate to the businessmen and trade unionists) exert most of the real influence. The French system of planning (which is excellently described in a recent pamphlet by Political and Economic Planning*) has arranged this division of power rather well. It deserves close study.

The French Model

THE French *Commisariat Général au Plan*, which was the brainchild of M. Jean Monnet shortly after the war, at present has a total staff of 140 people; it comes under the Minister of Finance, but it is not incorporated into his department. These technocrats are now in the throes of drawing up France's fourth Four Year Plan. At the beginning of last year they produced alternative sketches of what would be the likely increases in demand in various sectors of the French economy if production between 1962 and 1966 rose by 3 per cent, or 4½ per cent, or 6 per cent a year. After considering the various sketches and reports, the government ordered the *Commisariat* to prepare its final plan on the basis of a target of 5 per cent annual growth. It was felt that "the 6 per cent version seemed to imply a vulnerable balance of payments, and therefore appeared a little over-ambitious." The *Commisariat* then drew up its detailed plan of likely increases in demand on this basis and submitted it to its twenty-five Modernisation Commissions. Each commission consists of some thirty or fifty unpaid volunteers, drawn from heads of big firms, trade union leaders and government officials. Twenty of them deal with different industries or branches of social activity (e.g., chemicals, energy, housing, education, etc.); and five deal with problems that are common to all sectors (e.g., manpower, research and regional planning).

The Modernisation Commissions play a secondary role in the plan. For example, they check the *Commisariat's* "assumptions regarding the evolution of technological coefficients and the progress of productivity," and examine how far the investment intentions of private industry make it likely that production of different things will be available to meet the expected increases in demand in the different sectors. To some extent, the mere publication of these estimates helps to divert investment into what the planners think are likely to be the right places; the *Commisariat's* plan extends "to a nation-wide scale the market surveys made by each single firm." But the French government also has pretty extensive powers both over its wide sector of nationalised industry and over private industry—for example, it gives special tax incentives and provides capital on favourable terms—to encourage investment to take place in sectors where the plan suggests that expansion is particularly desirable.

How far does a similar system seem desirable here? The idea of "extending to a nationwide scale the market surveys made by each single firm" has everything to recommend it.

* PEP, Vol. XXVII, No. 454, 31 pages, 5s.

It could have all sorts of practical and psychological advantages: in concentrating people's attention on industries that ought to be growing (instead of reserving public concern for uneconomic industries that are rightly declining), and perhaps even in providing some yardstick of possible annual increases in total demand against which wage claims can sensibly be discussed in each industry. It is more doubtful whether Britain should also adopt the idea of using tax and credit incentives (presumably, in Britain, selective investment allowances and some government loans) to guide investment in the directions that the planners think are going to be profitable. But this would partly depend on who and what the plan-formulating body in Britain was.

An important feature of the French system is that the Modernisation Commissions, on which employers and trade union leaders sit, do not draw up the plans or projections of demand themselves. To let them do so in Britain would be disastrous; if, for example, a group of employers and union leaders in shipbuilding were asked to estimate their future market, they would certainly come up with a wildly over-optimistic guess and say that it was essential they should have government aid to put them into a position to satisfy it. But the matter is different when some outside body like the *Commisariat Général* makes the original estimate, and interested bodies of employers and trade unionists merely pass comments on technical difficulties attached to it; if, for example, a British planning body estimated that the demand for new houses was bound to increase, there might be some advantage in getting builders and building trade unionists to discuss ways in which the supply of them could be helped to rise. What form, therefore, should Britain's master-planning body, its equivalent of the *Commisariat Général*, take?

What Board for Britain?

THE idea seems to have taken root in Britain that French experience has shown that any Planning Board's staff should be "quite distinct and independent from the Treasury." This may well be a mistake. M. Monnet, it should be noted, formed France's *Commisariat Général* at a time when he was in a position to build up more influence and expertise in an outside body than the French Treasury at that time could command. In Britain, however, the expertise and the power are already vested in the Treasury. Any entirely new body that was set up would be likely to find its authority overshadowed and its importance diminished thereby. One's fear is that a completely outside body might in time either repeat the relative inefficacy of the Cohen Council (which was also at first provided with a fairly high-powered research staff), or else (which would be much worse) might become a pressure group for some of the protectionist measures that would be favoured by its top council of businessmen and trade unionists. To say this is not to deny that there would be some disadvantages in completely rigid Treasury control of any planning machinery. The traditional anonymity of Treasury civil servants is a disadvantage; any planning staff should preferably have a well-known and forceful national figure as director. There may also be some substance in a point made by *The Observer* last week: that the Treasury is always liable to be "more concerned with immediate financial objectives" than with giving a real impetus to growth. In addition, the Treasury is a monstrously over-swollen department already, and if important new functions were loaded on to it, it might be more than ready to burst.

Readers of *The Economist* will know what our own solution would be. We have often argued that the Treasury should now be split under two Cabinet Ministers. The more senior of them—to be called either Minister for the Economy, or the First Lord of the Treasury (at present a nominal post held by the Prime Minister), or Chancellor of the Exchequer—should be in charge of general economic policy. The British equivalent of the *Commisariat Général au Plan* could then be vested in his department. If, in order to ensure some continuity when ministers change, his top civil servant were called a director-general instead of a permanent secretary, and was encouraged to be a less anonymous and more national figure than civil servants usually are, and was allowed to make public speeches stating his own views (like the Governor of the Bank of England, only more so), so very much the better. The second and slightly less senior Cabinet Minister in the Treasury—to be called either Minister for the Budget, or Minister of Finance, or Chancellor of the Exchequer—should then be responsible for narrower financial operations and for exercising an efficiency audit over government expenditure: it should also be his job to introduce the annual budget and Finance Bill, but he should be required to cast it in a form that exerted whatever degree of reflationary or deflationary pressure the Minister for the Economy thought desirable at that time.

Each year, it seems more clear that Britain will eventually have to move towards this sort of ministerial reform. At present, however, for various reasons of entrenched interest and *amour propre*, there is no prospect that it will be undertaken. In the interim, therefore, the best course might be for the Chancellor, working through normal Treasury machinery, to draw up and publish a plan for public sector expenditure in the next four to five years—acting initially on the assumption that gross national product can be made to increase by an average of, say, some 3 per cent a year. An Economic Planning or Estimating Board, whose director should be allowed much more freedom to make public declarations of aims than other civil servants are, should then be set up, but more closely linked to the Treasury than the Chancellor suggested this week; its first job should be to estimate what will be the state of demand in various sectors of the economy by 1966 or 1967, which industries should be declining by then and which expanding, and what will be the requirements for such things as exports and skilled labour and wage restraint, if the 3 per cent annual target is to be achieved without inflation or balance of payments difficulties. If a council of employers and trade unionists could then be persuaded to pass comments on these estimates, and sometimes even set its seal of approval on them, this would be an additional advantage. Between this sort of system and the system of joint FBI-TUC seniority that the Chancellor seemed to be adumbrating this week, there are many graduations. But, in general, the more that influence is exerted by economic technocrats, and the less by organised industrial groups, the better; it would be a bad mistake to give too much planning power to those who, to some extent, need to be planned against.

Facing East

Western attitudes to the Berlin crisis suggest that the soldiers are preparing to negotiate, and the politicians to fight

THE despatching of 1,500 American troops (and a train-load of British armoured cars) to west Berlin may or may not make sense in terms of raising public morale in the city. In hard military terms, it makes no sense at all. The presence of these reinforcements is a negligible factor in the number of hours that the west Berlin garrisons (now some 12,500 men) could resist attack; the net result of their movement has therefore been a slight loss to the western capacity to conduct a delaying conventional action west of the Elbe. Indeed, it might logically be concluded on both sides of the iron curtain that the very act of putting still more troops into the Berlin bag means that Nato does not apprehend any more serious operations this autumn. Unfortunately, military dispositions are not always logical: reinforcements arrived in an equally indefensible Hongkong shortly before the Japanese attack in 1941.

This week's movement seems, however, to be the first false step (and a minor one) which Nato has made in the immediate crisis. If General Norstad is in a weaker position than he should be, it is the result of political decisions taken several years ago. Contingency planning in western Europe for any emergency short of the outbreak of a major nuclear war has to make the most of limited, and sometimes entirely sketchy, resources. But the soldiers had better now work out calmly what the contingencies to be guarded against are.

Western military calculations have to take account of four conceivable developments arising out of Soviet actions in the coming months. The first is the simple resumption of the land blockade against west Berlin. The riposte favoured in some quarters in Washington and Paris is to call the Russian bluff and send a column, or columns, along the access routes to the city. The argument is that either the Russians and east Germans will not open fire (thus allowing the blockade to be lifted) or that, if they do, they will be universally judged to have precipitated a general conflict. This may well be fallacious: for a start, there are more ways of blocking a hundred miles of road than by opening fire on a convoy. The western column would most probably find itself having to start the shooting. This would hardly be a solution.

The second and even grimmer contingency would arise if overt Soviet and east German efforts were made to prevent an airlift to Berlin: to be effective this kind of Soviet obstruction would have to go beyond such semi-passive means as jamming radar or buzzing aircraft. In such a situation the communist block would be much more likely to put itself demonstrably in the wrong with uncommitted opinion. But if Mr Khrushchev chose to accept this diplomatic consequence he would still be able to confront the West with the hard reality of its guarantee to protect west Berlin without the nuclear monopoly which it still possessed when the obligation was last fulfilled in 1948-49. For the West to force its way into Berlin against really determined resistance would require two to three years of total mobilisation (and arms production) and a concurrent and improbable undermining of the whole Soviet strategic position in central Europe. Certainly, no immediate reinforcement of Nato with conventional forces can affect this western predicament in the slightest.

The third and grimmest contingency would arise if the Red Army, instead of standing impregnably on the defensive, were in fact planning a deliberate advance westward: the "try-on" conventional attack which, in a situation of nuclear balance, some Russians might believe would not draw down nuclear retaliation by the United States. Such a move could be prompted by long-term Soviet calculations of the duration of the communist block's superiority in missiles; or it could come about (on the lines of the Austrian desire to crush Serbia in 1914) as part of a determined policy to destroy west German power before the irredentist groups there feel strong enough, through the possession of nuclear arms, to precipitate and exploit a major uprising in the east.

Fortunately this contingency does not at present look a very likely one, and it is fairly clear what precautions the West should take to guard against it. The key military factor to note here is that, in normal circumstances, the Warsaw Pact command does not possess sufficient reliable divisions outside the Soviet Union to undertake an operation of this magnitude against even the patchy screen of 21⅓ Nato divisions in the central European theatre. A rough and unsteady parity is now in being. The Red Army's 10 armoured and 10 mechanised divisions stationed in east Germany would need to be supplemented by a further 20 or more divisions from Russia itself to upset the balance. If the east German, Polish and Czech divisions did no more than restrain civilian uprisings and sabotage they would perform all that Marshal Koniev probably expects of them: even so, further Soviet divisions would have to be deployed to protect communication lines and hold down other satellites like the Hungarians.

BEFORE the Soviet Union undertook a westward push of this kind, it would need, on the experience of the closing stages of the second world war and of the Korean war, a minimum superiority of three to two in divisions along the front, and a superiority of something like five to one in the decisive sectors. (This is based on Captain Liddell Hart's calculations.) If the basic Nato defending forces were at full strength, well trained and properly mobile, they could be expected to give a good account of themselves against anything less than a sustained Russian build-up. There can be legitimate doubts whether General Norstad's forces (including the three British divisions) are in quite this resilient condition as they stand: but this is an argument for supplying them with the technicians and specialist categories that they now lack, not for supplementing them with hastily assembled scratch formations—which the Russians can always match two or three times over and far more quickly.

Something of this kind appears to have been the British argument in Nato counsels up to now: if minor reinforcements are sent to the British Army of the Rhine in the next few weeks it will be as a local precaution, not a major supplement. In no circumstances should any movements be presented in such a way that the Russians would then feel obliged and justified

in moving more divisions of their own into east Germany, thereby triggering off further feverish preparations on each side of the Elbe. A minor Russian build-up because of nerves or fear of an east German revolt could conceivably be matched in the first instance by the British strategic reserve (including its new armoured elements) and by such forces as General de Gaulle possesses on his side of the Mediterranean. But Marshal Koniev must be fully aware that major Red Army movements across the satellite communication systems would be detected by allied intelligence, and that once General Norstad felt himself totally overmatched in conventional forces the definite prospect of a nuclear war would confront not simply Nato but the Soviet command. This possibility, in turn, would presumably have an influence on Mr Khrushchev's own actions in and around Berlin. Since he cannot possibly be sure that the United States would accept defeat in conventional war in western Europe (whatever he thinks it might do over Berlin itself) reason must argue against his taking any risk of this kind.

THE fourth contingency is perhaps the most serious of all, because it introduces the one major element of irrationality that could upset all other calculations. This is the prospect of an east German uprising, either spontaneous or provoked by west German activists to counter an eastern move to seal off west Berlin entirely. There are sound psychological reasons why such an attempted insurrection might not receive substantial support in east Germany after the experience of 1953 and in the absence of any prospect that the Soviet system itself was in a state of turmoil and uncertainty similar to that after Stalin's death. Unless Mr Khrushchev were falling from power, the Soviet and east German forces could certainly stamp out any half-hearted rising, but two dangers would then arise. West German feelings would be registered in loud interventionist noises; and even if actual intervention by the eight or so west German divisions was avoided, the Russians might be sufficiently alarmed to take precautionary action along the border, including stabs into the West to secure key communication points and a better defence line. If such a crisis were not to blow up into a general East-West trial of strength, it might be thought desirable to keep the previous build-up of forces on each side to the minimum and to ensure that west German forces were not too far forward in the western screen.

It is logical that the West, being in the weaker military position in central Europe, should now avoid any heavy-handed preparatory steps that—by provoking the transfer of more Russian divisions to east Germany—would merely exchange a precarious balance of power in the area into total western conventional inferiority. As in the past, the whole question of western military planning in Europe is bedevilled by political uncertainty over the function that Nato is really intended to serve. Nato's present military posture suggests that the intention is to negotiate with the Soviet Union; if so, the idea of negotiation on the German problem must now be pursued seriously and purposefully. But the western political posture suggests that there is no such clear intention; in that case, the West faces the eventual prospect of having to fight for the central Europe it wants to see. To meet that contingency Nato, as it now stands, is evidently inadequate. The West must make its choice: if it does not, it will condemn itself to achieving neither a settlement nor its own security.

Dynamo for Diplomacy? BIZERTA BERLIN

Invoked over Bizerta, but ignored—so far—by the parties to the Berlin dispute, the United Nations mechanism is still little understood, and only partially used

AN innocent might be forgiven for scratching his head in puzzlement at the present preoccupations of the United Nations Assembly. Ninety-nine governments have sent representatives to this week's special session on Bizerta. The dispute is a serious one, but not at first sight a direct threat to the safety of all mankind; and the few days when Bizerta was the scene of large-scale bloodshed are now more than a month ago. Meanwhile, the headlines are black with grave talk of Berlin, and the great powers are looking to their arms; but the question is not even on the agenda of the regular Assembly session that will open on September 19th.

For the bewildered innocent, the cynic has a ready explanation: the Berliners are not brown enough; the alarms of a couple of million white people strike no answering chord in a body whose predominantly non-European membership would respond with alacrity to a similar plaint from a non-white community anywhere. To some degree, this cynical view of the United Nations is held by a fair number of people, including General de Gaulle. Hence, in part, the French boycott of the Bizerta debate.

Reality, however, is less simple. The Bizerta session itself shows that. It has not taken the shape of a headlong assault on France by the "anti-colonial" phalanx in the assembly. The Tunisians would have preferred a settlement achieved without this week's sound and fury. The Afro-Asian resolution has been moderately worded; if it is not moderate enough to ease the embarrassment of the United States and Britain, that is small wonder, for their sensitivity to French reactions in present circumstances would make it hard for them to vote for any form of words other than empty pieties; but it seems bound to attract a sufficiency of support, including some from European members. The Russians, though glad enough of the openings the Bizerta debate has given them for general denunciation of all foreign bases, have publicly complained of the Afro-Asians' moderation; while Mr Adlai Stevenson, although arguing that the chances of a direct settlement would be better if no resolution were passed, has supported the substance of the Tunisian case.

The Bizerta debate, then, is not fresh evidence that the UN assembly is merely a forum for Afro-Asian diatribes against the West, with the Soviet group gleefully exploiting these ructions. It is evidence to the contrary. And if more

evidence were needed, it is amply to be found in the record of UN dealings with the Congo problem during the past year, the year covered by the secretary-general's latest annual report.

Mr Hammarskjöld's measured, unemotive prose is not easy going. But innocent and cynic alike would find in the introduction to his report an illuminating analysis of what the United Nations actually is ; more, what it could be. He points out that the events of the year 1960-61 have brought to the fore two quite different concepts of the organisation's character, authority and structure—concepts between which the member states must choose to decide its fate.

Some, he remarks, see the UN strictly as "a static conference machinery for resolving conflicts." Others regard it as "a dynamic instrument" through which governments should not only seek reconciliation but also "try to develop forms of executive action, undertaken on behalf of all members," with the aim of forestalling conflicts as well as of resolving them after they have arisen. The "conference" concept is "firmly anchored in the time-honoured philosophy of sovereign national states in armed competition." The dynamic concept takes the traditional notion of a diplomatic conference only as a starting point, "envisaging the possibility of continued growth."

Naturally, he continues, those who would restrict the UN to a traditional conference role tend to "side-step the mandatory nature of the decisions by the Security Council," to oppose "a gradual increase in the weight of decisions of the General Assembly," and even to refuse "to shoulder the financial consequences of a decision." Equally naturally, they resent the development of the secretary-general's office in cases when, having been instructed to carry out decisions of the council or assembly, but being unable to get full and timely guidance from those organs, he himself "has had to shoulder responsibility for certain limited political functions." Again, the conference concept leads its adherents to see no need for the Charter's insistence on the exclusively international character of the secretariat as a whole. In the field of economic aid, the same concept sustains a preference for bilateralism.

MR HAMMARSKJÖLD shows cogently that this static conference concept cannot be made to fit either the letter or the spirit of the Charter, while the dynamic concept can. He points out that it is up to the member governments to decide which course the organisation is to follow ; but he feels bound to give warning that

> those whose reactions to the work of the organisation hamper its development, or reduce its possibilities of effective action, may have to shoulder the responsibility for a return to a state of affairs which governments had already found too dangerous after the first world war.

If a fault may be found in his analysis. it is his tendency to classify governments as adherents to either the dynamic or the static concept. Are there not many who are divided in their own minds ? It is all too natural for a government (and people) to favour, in principle, the protection and other benefits offered by a developing organisation, while resisting, in practice, the consequential restraints and demands on itself. These mental conflicts may be traced in present attitudes to the Berlin problem—to which Mr Hammarskjöld refers briefly.

Realistically, he does not press any claim to a central position in the matter for the United Nations, but at the same time he insists that, if peace is threatened, it cannot be denied the "right to make its voice heard." One may deduce that "its" voice, in such a context, means essentially the voice of "the majority of nations who wish to stand aside from the big-power conflicts." Next week, some twenty-five of those nations will be represented at the Belgrade conference by their heads of government or other leading personalities. Three weeks later, regardless of whether there has been any move to put Berlin on the UN assembly's agenda, the uncommitted countries' foreign ministers and chief delegates will sit down in New York together with those of the West and of Russia ; and the topic will hardly be avoidable, on the floor or off it.

In the past, the habit by which the powers concerned keep the Berlin controversy to themselves has been fully matched by the disinclination of remoter states to take any real interest in it. But times have changed. Active canvassing of neutral opinion by both parties is in full swing. Mr Nehru's voice has been heard ; that of Dr Nkrumah has echoed, in a perhaps strained tone, from Peking, where he agreed with his hosts last week that a German peace treaty and "normalisation of the situation in west Berlin" were of urgent importance. Neither party to the dispute need have any illusions that it could carry a resolution frankly in support of its position through the assembly ; but both aim at exerting leverage through the weight of "uncommitted" opinion.

NEITHER Berlin nor the United Nations will benefit if the assembly is used only as a sounding board for familiar recriminations. If a discreeter line is taken, it might provide the occasion for quiet Soviet-western contacts of a kind that would not offend against French scruples about negotiating under pressure (it may be recalled that it was after informal talk between UN delegates that the Soviet blockade of Berlin in 1948-49 was lifted). A focusing of the attention of third parties, whom both sides wish to stand well with, may serve to inhibit both from making tough moves. But does this represent the effective limit of a UN role in regard to Berlin ?

Obviously the great powers cannot be physically coerced in such a matter by even the broadest coalition of weaker states. But the prospects for a solution might well be improved if the uninvolved nations applied themselves to working out auxiliary mechanisms. Supervisory and shock-absorbing functions have become a familiar UN chore in other areas ; so has the building of "golden bridges" over which contestants can withdraw, without loss of face, from over-committed positions. The idea of simply replacing the western garrison in Berlin by a UN one has been turned down by the West, and is not likely to be revived by Mr Khrushchev while his campaign against the secretariat continues ; but there are other useful forms a UN "presence" might take. Any such contribution by the uninvolved nations would clearly depend on a will to agree between the principal parties ; but the offer of the contribution might help that will to emerge. At all events, sheer dislike of the idea of a great power having to pray the aid of the small fry ought not to be allowed to stand in the way. The story of the mice who set free the entangled elephants has pointed a moral, in Asia at least, for well over two thousand years.

NOTES OF THE WEEK

BERLIN

Bipartite

HERR ULBRICHT'S new restrictions on movement inside Berlin, announced on Tuesday, differ from his previous measures by affecting west Berliners, and the allied troops and administrators in the city, as well as the unfortunate east Germans. But the new measures are themselves of two different kinds, and should be treated by the West accordingly. Those designed to keep westerners out of the eastern part of the city (by reducing the number of crossing points, and by requiring west Berliners to buy entry permits from so far non-existent travel offices) are objectionable on grounds of humanity, and because it is contrary to reason that a city should be cut rigidly in two in this way. But the battle for Berlin as one city was fought and lost in 1948, when the elected assembly of the city was forced to withdraw to the western sectors, and the administration was cut in two.

Since then, it has always been in the communists' power to choose where they would tolerate what had become the fiction of one Berlin, and where they would ride roughshod over it. The sector boundary has now been turned, *de facto*, into a state frontier of the hermetic kind favoured by communist governments. These actions can be protested against, but in fact they have to be accepted.

Of the measures announced on Tuesday, the really unacceptable one is the "warning" to people on the western side of the barricades to keep a hundred yards away from the boundary. Presumably the allies will tell Herr Ulbricht that what happens in west Berlin, even fifty yards within it, is no concern of his, and the west Berliners that they are free to go peaceably where they want in their own sector. The West's primary interest remains to protect the integrity of, and their own access to, west Berlin. This also makes it necessary to look with a wary eye on the Russian note received on Wednesday, which complains about the "abuse" of the air traffic to and from Berlin. By allowing east Berlin to be sealed off, the Russians have deprived themselves of a ground for concerning themselves with who visits west Berlin and who does not. The freedom of the air corridors, unlike what happens in east Berlin, cannot be accepted as lying within communist jurisdiction, even *de facto*. Here is a potent source of trouble to come.

In their notes to Moscow on August 17th, the allies said that Herr Ulbricht's actions had violated the quadripartite status of Berlin. The Russian reply of August 20th retorted that the quadripartite status had already been eroded by the setting up of a separate political and economic system in west Berlin. It is by now somewhat academic to argue about who started the process of pulling Berlin apart at the seams. Bipartite in fact, if not in theory, it now is. The West can hardly much longer escape the obvious necessity of seeking a new agreement, safeguarding the part of Berlin that has been under its protection for the last dozen years, in place of the uncertain protection afforded by the old quadripartite arrangements.

NUCLEAR TESTS

Itch and Edge

IS it, or is it not, "one last effort"? At Geneva, Mr Dean and Mr Ormsby-Gore are resuming the attempt to agree on a treaty effectively banning nuclear weapon tests. Since midsummer, when the Russians dug in on the "troika" line, the talks have been at a standstill. There is no indication of any Anglo-American retreat from the argument that a three-headed inspecting staff as demanded by Mr Tsarapkin would mean a built-in veto that could turn "inspection" into a farce. President Kennedy has said that he expects the new round of talks to be decisive. He has had a gloomy report from the team of scientists whom he had asked to study the possibility that Russia might stage secret test explosions, during the present "unpoliced" period of voluntary abstention from tests, without being detected. His chief disarmament adviser, Mr McCloy, said on Tuesday that he simply did not know whether the Russians are now secretly exploding nuclear devices.

Mr Khrushchev's assertion, in his recent talk with Mr McCloy by the Black Sea, that Soviet scientists have asked for permission to test a bomb 5,000 times as devastating as the one dropped on Hiroshima, may have been meant for effect; but there doubtless exists a Soviet lobby in favour of resuming tests as well as the better known American one. Mr Khrushchev says he told his nuclear scientists that if the Americans, who were "itching" to resume testing, did so, they would be free to follow suit.

There is admittedly force in the argument that Russia may get a dangerous edge over the West if it can get away with secret tests while other powers continue to tie their own hands. It is less easy to calculate what technical advantage there would be for the West in a general resumption to outweigh the political odium of having initiated it. Mr Kennedy's problem is to keep the nice calculation of edges quite separate from the natural itches.

MR HEATH

The Historic Commuter

THE Prime Minister has probably made the right choice in selecting Mr Edward Heath, the Lord Privy Seal, to conduct Britain's negotiations with the Six. The other possibles were Mr Maudling and Mr Thorneycroft. Mr Maudling had the overwhelming disadvantage of having been over the same course unsuccessfully (with a different brief) once before, and the creator of Efta would not have been exactly happy presiding over its liquidation. Mr Thorneycroft is one of the most enthusiatic Europeans in the Cabinet, but does not have the close relationship with the Prime Minister which is enjoyed by Mr Heath. A high degree of mutual congeniality and confidence between the Prime Minister and the leader of the British delegation is essential, since at every stage of the negotiations a heavy burden of responsibility will rest on Mr Macmillan personally. Mr Heath also has the advantages of being held in high esteem by the leaders of the Six, while enjoying the confidence of most members of his own party who regard him rightly as a convinced but not a fanatical European ; some Tory backbenchers would have suspected Mr Thorneycroft as being too "fanatical" from the start.

Mr Heath: convinced

Mr Heath's position as minister in charge of European affairs, which he has held since July last year, has given him a good opportunity to familiarise himself with the complexities of the European situation. Finally, while he was Conservative chief whip, he displayed gifts of tact, persuasiveness and toughness combined—all of which will be needed in the negotiations that lie ahead; and since he has been a cabinet minister he has emerged as an adept simplifier of complicated issues. One doubt about the appointment is whether the Prime Minister

has been wise to decide that Mr Heath should still discharge his normal duties at the Foreign Office while the negotiations proceed, and remain as Foreign Office spokesman in the Commons. The fact that Mr Heath's desk in London will still be at the Foreign Office may heighten the impression that the negotiations have been "given" to that department; some other departments may not be too pleased with that. But in the long term Mr Heath has been accorded an opportunity to associate his name in history with a momentous change of direction in British policy; and in the short term, if he is successful, he will find himself well in the running for the leadership of the party.

Brussels is Britain's preferred venue for the talks which may open late next month. This would be a convenient centre for Mr Heath, given that his duties in the Commons are to remain; commuting by air between London and Brussels should not be too arduous. When Mr Heath is in London his functions as head of the delegation are likely to be discharged by a senior civil servant. That will be a particularly important appointment too.

TRADES UNION CONGRESS

Muffled Report

LAST year the annual report of the TUC's general council contained some remarks on unofficial strikes and shop stewards: they were much criticised by people outside the unions for excessive caution, but it was said that this was only a preliminary report and that the sequel would show that the central body of the trade union movement was at last getting to grips with its most threatening problem. This year's report, which will be the nucleus for debates at the 1961 congress at Portsmouth on Monday week, contains that sequel: the general council almost apologises for having almost spoken plainly last year, and the subject is let drop with a vague promise of further discussion. The highly pertinent discussions organised by the Minister of Labour between employers and unions in the motor industry are not mentioned, because they were formally outside the TUC's machinery. In fact the answer is a lemon, and a squashed one at that.

Elsewhere in the report, thirteen pages on the encouragement of the arts by trade unions wind up with the conclusion that the TUC as such can do nothing. And, after setting out the potential advantages of a new central body for trade union education, the general council state that they "would wish to reconsider their recommendations, even though they were acceptable to a majority, should they be questioned by any significant minority." Here the leaders of the TUC are hugging to themselves the doctrine of their own assumed impotency: without effective unanimity they feel that they can do nothing. The general council can advise, but not command: congress can instruct the general council, but it has no means of ensuring that its instructions are carried out. Sometimes, this may be a good thing. In explaining why they took no action following last year's congress vote for unilateral nuclear disarmament, the general council say that "it was thought that the time was not opportune for further steps to be taken." No doubt, too, the unions have more urgent uses for their money than subsidising the theatre. But it makes one wonder where the trade union movement is to get its leadership from.

Perhaps the general impression that emerges from all this is too gloomy. Although the Portsmouth congress the week after next is certainly going to pass angry notions against the Chancellor's wage pause, the leadership hardly seems in an embattled mood to demand a showdown with the Cabinet. The general council's report apparently went to press too early for it to take credit for its success in persuading the executives of the two warring unions—the Shipwrights and the Boilermakers—to make some progress towards joining forces. Disputes between these unions have been a main cause of demarcation disputes in shipyards, and if the TUC has succeeded in abolishing craft demarcation with the fusing of the two bodies, it has done a most useful thing. Towards the Electrical Trades Union, also, the TUC is preparing to act with firmness; the Portsmouth congress will open with the ETU being expelled—which presumably means that other unions can recruit electricians—until such time as the union's communist leadership either reforms itself or admits itself voted out of office. One can therefore still have some hopes that Mr George Woodcock's period of office as general secretary will see the TUC start to do the things it should be doing. But this year's stodgy annual report is a setback to those who had pitched such hopes very high.

THE AMERICAS

Tender Feelers

DR FRONDIZI's brief meeting with Major Guevara last Friday has set a swarm of military men buzzing round the Argentinian president's ears. He was forced, on Monday, to defend himself in a broadcast that reaffirmed his government's opposition to communism, but gave little indication of what passed between him and Cuba's Argentinian-born minister of industry. The rush to the microphones shows again how hard it is for any Latin American political leader to act against the prejudices of his armed services. But Dr Frondizi's willingness to see Major Guevara is evidence of the concern, shared by most responsible Latin Americans, however anti-communist, to foster whatever signs there may be of a *détente* between the United States and

Cuba. Attempts at mediation have been repulsed by both sides before now; it is just possible that Cuba, at least, is no longer in so militant a mood.

The return of the hijacked Electra in exchange for a Cuban patrol boat was a welcome hint of a return to reason. Dr Castro acted wisely and quickly in dissociating himself from other, non-Cuban, feats of sky piracy. And although Major Guevara found himself unable to sign the declaration of Punta del Este on August 17th (despite the removal of the clause about honest and periodic elections suggested by Peru), his conduct at the conference was, for the most part, shrewd and constructive. At one point he even seconded a resolution put forward by Mr Dillon. Although these attempts at courtesy and good sense eventually collapsed when Major Guevara attacked the "meagre objectives" of the alliance for progress, and Mr Dillon looked forward to a change of regime in Cuba, the possibility of some sort of future accommodation did not, for once, seem entirely out of the question. With his economy slipping towards bankruptcy, Dr Castro may put out feelers to the West. Latin American leaders as adroit as Dr Frondizi recognise the folly of treating these feelers roughly.

EGYPT

Brave Heresy

FOR writing and printing a controversial article in Cairo's weekly paper *Al Mussawar*, its editor, Mr Mohamed Fikry Abza, has been dismissed by presidential decree. If there is anything remarkable in this it is not that Mr Abza was punished but that his article appeared at all. It was flagrantly nonconformist, envisaging a neutral federation of all the Arab countries, whose unification would be confined to armies and foreign policy: Israel was to be included provided it foreswore Zionism. This was heresy indeed. But heresies of this magnitude are not conjured out of a vacuum. They are generated in the flow of civilised conversation. Mr Abza, both poet and journalist, has merely given proof that the pursuit of ideas in his country is still a healthy activity. It was through a long tradition of intellectual liveliness that Egypt first acquired its authority to lead the Arab people. Such a tradition is precious and should be cherished.

MIDDLESBROUGH

Sunday Night, Monday Morning

CANNON STREET, Middlesbrough, is not exceptional in its way of life, its attitude to the police or its belief that coloured people are somehow fair game for a punch-

up. The dingy communities and dingier minds that exist in a good many British cities are declaring themselves one by one: the peculiarity about Cannon Street is that its denizens and hangers-on succumbed to a stupefied hysteria last weekend in sufficient numbers to pack the stipendiary magistrate's court on Monday morning and attract the attention of the newspapers and television. Smaller stirs reach the courts, but not the headlines.

The Middlesbrough authorities have been confident (perhaps over-confident) in their declarations that colour prejudice is not at the root of the trouble there: if this is accepted, it is still true that the coloured man, or the coloured man's car or shop window, is regarded as a natural target for the resentment that Cannon Street directs at any section of society that is mildly energetic or successful—or simply different from itself. The police, as the immediate representatives of society, inevitably came in for a mobbing. Incited by their local harpies and followed by gangs of excited adolescents, the men of Cannon Street emerged at closing time to prove their manhood according to their lights. One policeman, according to the chief constable, was "buried under screaming lunatics"; one received a fractured skull, another a fractured spine. This kind of occurrence is far from unusual in back-street life in a number of cities; but the news that this is so may now jolt some comfortable consciences.

It is easy to condemn Cannon Street. It is very hard to discount or excuse its own stupidity. It is harder still to do anything immediate or positive (barring stiff sen-

Cannon Street: publand punch-up

tences) to bring home to it the consequences of its outlook and prejudices. Middlesbrough's experience is bound to be quoted to support the demands for controlling immigration into this country. But before Britain indulges in such a confession of its own intolerance, the story must be looked at as a whole. The Irish and Jewish immigrants over the past century and a half have been as easily identified through their religion, their appearance and their habits, as many West Indians and Pakistanis today: bully boys will always pick on someone when they want to. The point is that the great bulk of public opinion chose to persevere with the long process of assimilation and self-education: there are hopeful signs now of greater tolerance for West Indians in London and the Midlands. It is silly to panic at the sight of Cannon Street, or Price Street or Notting Hill: their problems and self-deceptions will not come to an end with an immigration ban.

SCHOOL BUILDING

Clasp for Councillors

THE Estimates Committee's report on school building (HMSO, £1), published on Wednesday, should help to encourage more business-like methods by local authorities in their building projects, and more assistance from the Treasury and the departments, particularly in Scotland, in avoiding wasteful delays and fluctuations in local programmes. Local authorities often suffer after economy cuts when their new programmes are delayed and then put out for tendering at the height of a general building boom. By and large, however, the Ministry of Education deserves approval for its control over both costs and standards in the past ten years. One justified complaint against the Scottish Education Department concerns the rigid definition of minor works (under £5,000); despite the large number of small schools in Scotland, this looks something of an anachronism today. It is also welcome to see emphasis placed on the need for a general examination of maintenance costs.

Progress in rationalising local authority building of any kind comes chiefly from actual example rather than exhortation. The committee, as might have been expected, is enthusiastic about the pioneering work in Nottinghamshire which led to the creation of Clasp (Consortium of Local Authorities Special Programme) in which a group of councils collaborate in both bulk purchase and prefabrication methods. Clasp's members (almost entirely in mining districts) were originally attracted by Nottinghamshire's success in coping with land subsidence: the savings through co-operation are substantial both in costs (averaging 10 per cent) and time. Only a few local authorities with annual programmes running at £5 million or more can make similar savings on their own. There is an optimum number of councils that Clasp itself could handle, but it is high time for ratepayers to agitate for further rationalisation of this kind in building and equipment. The award of the Milan triennale prize for design to a Clasp school should be spurring on the doubters.

Further attention also needs to be given to the adaptability of new school buildings to serve more general social purposes in after-school hours. To keep down the cost of heating and maintenance there is a strong case for particular wings being built with the community centre principle in mind. Swimming pools and playing fields are obvious extensions of this idea. Backward councils should study the report to see just how far behind the times they are lagging.

SCANDINAVIA

Some Go to Market

NOT unexpectedly, the Scandinavian countries are divided in their attitudes to the Common Market. Last weekend's meeting of the Nordic Council's economic committee indicated the different courses each country will steer in respect of the Six and the Seven. Denmark's attitude has been clear all the way. It is dictated by the Danes' trading position. They export more to the Seven, but import more from the Six. Since Britain and Germany are Denmark's chief export customers, her wish to enjoy the tariff reductions within the Six is thus understandable.

Norway is receptive to the idea of entry into the Common Market, but its government is moving with caution. On Wednesday Mr Gerhardsen, the prime minister, once more expressed Norway's concern to ensure some protection for its fishing industry and agriculture. No firm decision will emerge until the matter has been debated by the new parliament after the elections in September, but meanwhile a White Paper is being prepared on the motion of the old parliament. For all the reservations, it is likely to recommend that the government proceed to negotiate for entry into the Common Market.

Sweden remains the odd man out. The statement by Mr Erlander, the Prime Minister, on Tuesday reaffirms the Swedish decision not to sign the Rome Treaty in its present form. (But Mr Erlander repeated that Sweden would like associate membership.) Here, political considerations outweigh economic ones. Sweden's balance of trade is comfortable; it is the traditional policy of neutrality and freedom from entangling alliances that is decisive. There is also a sense of loyalty to Sweden's neighbour, Finland, whose choice is hardly free. The Nordic Council's committee agreed, therefore, that in respect of these problems the member states would have to go their own way for a time. The courses now plotted suggest that two members may soon find themselves regrettably in isolation, which it will be for the European community to find some way of tempering.

SPAIN

Uneasy Slumber

IF it is true, as a Spanish refugee has stated, that "nothing is serious in our country; that is why the least serious ventures always have a chance of success," then the unsuccessful attempt of a Basque resistance group to derail a train early in July may be treated with some gravity. The government of General Franco did so, since it did not announce the news till mid-

August, and then coupled the announcement with the reassuring statement that a number of arrests had been made. A similar respect may be accorded to the statement to *Le Monde* by Don Jaime, Duke of Segovia, which seems to amount to a withdrawal of his previous renunciation of the claim to the throne. Being the eldest son of Alfonso XIII, he said, he has not and could not renounce his hereditary rights to the throne, though his representative also stated, on his behalf, that "juridically, no pretension (to the throne) exists which is not the creation of caprice, ambition and arbitrariness."

The duke's earlier statement, in which he broke with twenty years' abstention from politics, took the form of an open letter to General Franco on August 10th, and was less patently self interested. It enunciated a doctrine which his younger brother, Don Juan, the most prominent pretender to the throne of Spain, might have endorsed. Don Jaime urged the Caudillo to "recognise the sacred right of the Spanish people to choose in the most complete peace and freedom the political regime which will govern them." It was this letter that earned its author the praise of the republican veteran known as El Campesino, who has been engaged in his own epistolary exploits, sending messages to General de Gaulle and M. Debré assuring them of his support in their struggle against the right-wing rebellion in Algeria and its inspiration, General Franco. This same veteran is believed to have instigated the raid across the Franco-Spanish frontier into Navarre, on August 9th, which ended in the arrest of twelve out of the thirteen guerrillas.

These happenings merely underline the present uncertainty of Spain about its future, and the strain this imposes on relations between France and its southern neighbour. Whether or not General Franco will take the hint and make solid provision for the succession remains to be seen. The sleep he has imposed on his country since the end of the civil war is increasingly unquiet.

We offer apologies to two gentlemen with the same name who were confused in last week's issue. The portrait on page 695 was not of Sir Douglas Harkness, the newly-appointed economic adviser to the government of Northern Ireland, but of Mr Douglas Harkness, the Canadian minister of national defence. We hope that this identification will make amends in Ulster and in Ottawa for our lapse.

Sir Douglas

Mr Harkness

NATIONAL INSURANCE

Twelve Million Benefits

In any week, the Ministry of Pensions and National Insurance now pays out about 12 million benefits and allowances. The Ministry's annual report (Cmnd 1458) records that at the end of last year 3½ million families were receiving family allowances, and that the number of retirement pensioners had risen to over 5½ million. Exactly how many households this latter figure represents can only be surmised, but taking into account the other benefits or allowances, probably about one out of every two households in Britain gets its income supplemented each week from one or other of the Ministry's schemes. In addition, the National Assistance Board at the end of last year was paying out 1,857,000 weekly grants, over a million of these going to retirement pensioners.

The cost this year of the old, in retirement pensions, is expected to be £776 million; the cost of the young, in family allowances, £134 million. A survey of the 3½ million families receiving allowances at the beginning of last year showed that there were just over 9 million children in them,

NUMBER OF BENEFITS IN 1960
(weekly averages or end-year figures)

	Thousands
Retirement pensions	5,563
Families receiving allowances	3,544
Sickness benefits	900
War pensions	724
Widows' benefits and guardians' allowances	570
Unemployment benefits	190
Disablement pensions	170
Injury benefits	60
Industrial widows' pensions	19

including the elder or eldest child for whom no allowance is payable. Just over 2 million of these families had two children and therefore received 8s. a week; at the other end of the scale, 112,000 families with five children were receiving 38s. a week and a further 72,000 with six or more children were receiving 48s. or more a week.

This is a remarkably smooth administrative mechanism that Britain has built up to pump out usually rather small weekly sums to enormous numbers of people. What is lacking is a similarly smooth and unpolitical mechanism to re-examine constantly which particular rates should be going up, and which could go down, to deploy this help where it is most needed.

THE PRESS

Ownership in Trust?

Mr Iain Colquhoun was the deputy editor of the *News Chronicle* when it closed down,; in a pamphlet this week* he offers some suggestions about altering

* A Prosperous Press. Hobart Papers. Published for Institute of Economic Affairs by Barrie and Rockliffe. 5s.

circumstances in which such medium-circulation papers, appealing to a popular audience, can die even though they still have more than a million readers. Total revenues, from sales and advertising, are static or declining; he thinks that by "slide-rule methods" advertising agencies place advertisements mainly by going for the big battalions; and costs of production are too high.

"The first thing which a really intelligent newspaper industry would do in this country," says Mr Colquhoun, "would be to shed some of its dependence upon advertisers." This is not simply because advertising revenue allows papers to sell for less than their total cost of production; but also because "British papers are far cheaper than those of other countries." "Far cheaper" may put this a bit high: the examples that Mr Colquhoun quotes suggest that allowing for purchasing power British papers are significantly cheaper than many on the Continent, but not cheaper than some in the United States. Some people may feel he takes too little account of the effect of price elasticity—i.e. that increases in price would reduce circulations, at any rate for a time. But he says fairly that had the rise from 2½d. to 3d. a copy come for London popular papers about a year earlier than it did, it might have wiped out the current loss that the *News Chronicle* and *Star* were then incurring.

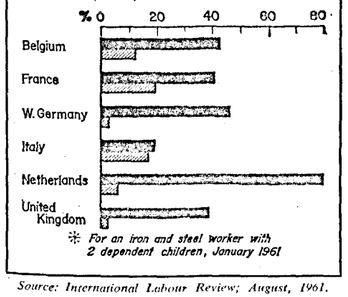
A significant increase in price, certainly, would be one way of restoring expansion in the revenues of the press, which could restimulate competition in the popular newspaper field—though this might not help the weaker papers for long. His idea that if advertising agencies drew their income from fees from their clients, rather than from commissions paid by the newspapers on the value of space booked, this would mean more careful choice of media seems less convincing. Quite a number of agencies do: in any case it is not clear that more careful "media research" would benefit weak papers; it might merely concentrate even more advertising into mass papers that offered the best bargain. Finally, he proposes that the transfer of newspaper ownership should be subject to the consent of trustees, or perhaps a single kind of public trustee. This, he feels, would prevent mergers arising from "nothing more than short-run profit and business ambition." It would also, as he recognises, represent a significant restriction on ordinary rights of ownership; and not everyone will be as ready as he to shrug this off. Anything liable even further to deter new capital from entering this industry, which is already not financially a very attractive one, may weaken rather than strengthen it.

NORTHERN RHODESIA

Natural Brake

Television drama producers would reject, as too familiar, most of the plot now being acted out in Northern Rhodesia. In outline, it goes as follows: colonial

subjects demand independence; less than independence is granted; colonial subjects riot; governor declares state of emergency. Almost any viewer could spell out what ought to follow; the next step, as in so many similar cases in the past, is to give the nationalists something better.



In Northern Rhodesia, the new constitution keeps white politicians in power and, in the resulting demonstrations of protest, sixteen Africans have died in clashes with the police, hundreds have been arrested, schools, shops and houses have been burnt down, bridges have been blown, and roadblocks have been set up. The United National Independence party (apparently less in control of its followers than it has claimed to be) has been prohibited in one part of the protectorate. Its leader, Mr Kenneth Kaunda, has launched a non-violent passive resistance campaign which, so far, seems to have been ineffectual. By denying the possibility of constitutional concessions, the Northern Rhodesian authorities are bolstering the power of less self-disciplined and peaceful-minded leaders than Mr Kaunda.

The objection to the new constitution is that, according to almost everyone's calculations, it makes a victory for the white United Federal party more likely than a victory for anyone else. Small changes in the constitution could turn the chances the other way. If this happened, there would not only be the possibility of peace in Northern Rhodesia; there would also be a renewed hope that association, in some form or other, with Southern Rhodesia and Nyasaland could be maintained. One reason why the British Government is slow to make such minor concessions, apparently, is the fact that the military force in Northern Rhodesia—and indeed, all the Central African Federation—is in local white hands; the mention of this has so far been enough to weaken the knees of the Colonial Office. But the existence of this force is not such a strong bargaining counter for the settlers as it looks at first sight; a federation preserved by military repression is unlikely to be a congenial place for the small white minority. Coming to terms with Mr Kaunda and his associates is in the best interests of all races in the federation.

SOCIAL SECURITY

All wage-earners in the common market countries are protected in one way or another, although to varying degrees, against sickness, death, old age and unemployment; they also draw family allowances or survivor's benefit. In the chart two types of benefit are compared in EEC countries and Britain; but EEC wage-rates take the added security benefits into account.

Family allowances granted by the state start only with the third child in West Germany (the amount shown is a family supplement paid by the employer) and the second child in the United Kingdom; they are paid for each child in the other countries.

KENYA

United Nationalists

Oddly like Dr Sture Linner, the head of the United Nations operation in the Congo, Mr Jomo Kenyatta of Nairobi (and, since Monday, of anywhere he pleases, the restrictions on his movement and residence having been lifted) finds himself saddled with the task of bringing nationalist factions together. He spent this week, his first in full liberty for nine years, meeting people and waiting for his courtiers to reach agreement among themselves. It is time they did. Kenya's progress has been held up for more than a year by differences, personal and tribal, between the National Union and the Democratic Union. The absence of a leader possessing national authority—that is, of Mr Kenyatta himself—has partially excused the behaviour of the two parties. But Mr Mboya, Mr Gichuru, Mr Odinga, Mr Ngala and Mr Muliro now have their country and their Kenyatta; and they cannot expect the neighbouring East African nationalists to wait much longer for Kenya.

Fortunately, there were signs this week that the two parties might reach an accommodation. People close to the Kenya government thought it likely that the peace talks designed to bring the National Union and the Democratic Union together may get somewhere. A suggested settlement was that the majority party, the National Union, would accept four ministerial posts. In return the minority party would agree to a constitutional conference this year and general elections in May or June, 1962. For the time being the post of chief minister would be kept open for Mr Kenyatta. Some kind of pledge would be given about European-owned land. Such a settlement would keep the minority Democratic Union in the govenment (albeit a coalition) for another year. It would also give Mr Kenyatta something to work on: perhaps posts could also be found for some of his former associates who have been conjured up out of the past to enter present-day Kenya politics. Their power, along with Mr Kenyatta's, has been underlined by the Governor's visit to Mr Kenyatta on Tuesday, and by the anticipated decision to release the remaining detainees and to allow their exiled associates back into Kenya. Mr Kenyatta's return seems to be having the same effect as the United Nations presence in the Congo: both have more work ahead.

FIRE BRIGADES

Up the Ladder?

Of all the public employees pausing in the wages queue after the Chancellor's moratorium, the firemen are among the most strongly and most militantly unionised: their case for a wage increase is not an idle one. Brigades throughout the country are under establishment by a total of 2,000 men, while fire losses—and deaths—rise steadily from year to year. The basic pay on entry is £11 for a 56-hour week (although much of this may be spent waiting for something to happen rather than in actual work). The last improvement in pay and conditions of work in 1955 showed an immediate increase in recruitment and—more important—a sharp drop in the wastage rate. Firemen can point to advertisements for dustmen or traffic wardens promising a higher initial wage than they get: they also remember the rises given to policemen last year to help recruiting.

The joint council for the fire brigades negotiates a national wage rate which is generally uniform for the whole country

Leader (Mr John Horner, right) and member

(although Birmingham, Coventry and London have succeeded in working in small local differentials under various disguises). But now the cat has been put firmly among the pigeons by the proposal of the London

County Council—before the Chancellor's appeal—to pay a further local differential amounting to £4 1s. 6d. more than other brigades: Middlesex offered 32s. 6d. on a similar basis. But these increases have not in fact been paid in the face of union resistance. The union pointed out that some brigades in the London region were even weaker than the LCC one, and that they would be drained of all their men by such a decision: they mustered some Edinburgh firemen who actually said they would move to London if this happened. They also argued that fire brigades often operate in each other's areas, and that it would be anomalous for men facing the same duties and dangers to be getting different rates of pay. No doubt a number of local authorities would like to put up their firemen's wages—if only to safeguard local houses and factories. If they did so it would be a serious breach in the Chancellor's wage front; but it is hard to see what he could do to stop the use of the block grant system.

BRITISH COUNCIL

Challenge and Response

Now is the swarming season for overseas students to Britain. The next few weeks will see an airlift here of 1,200 Nigerians alone. At London airport, Liverpool and Southampton, British Council couriers are almost daily gathering in young travellers. Of the 50,000 students from abroad getting higher education in this country the Council cares directly for some 9,000 and arranges educational courses for many more. The bulk of those in its charge are from Commonwealth, colonial, African and Asian countries. As more countries obtain independence the number of students grows. So does the problem of housing them. But this task at home of providing for impressionable scholars from countries still in transition is only a facet of a much bigger challenge abroad.

For nearly every student who comes to Britain there are hundreds in his native land who are clamouring for education either in the English language or in technical subjects that are most easily learnt from English textbooks. In response the British Council has refined its general cultural functions to a point where educational service is its main activity. In this guise it has branched out tremendously in India, Pakistan, Nigeria and West Africa. It has opened shop in the Congo, and is going into Senegal and Mali, whose French-speaking people need some English if they are to commune with their English-speaking neighbours. Now that English has become the predominant international language there is simply no end to the places where the Council is invited—indeed, implored—to go.

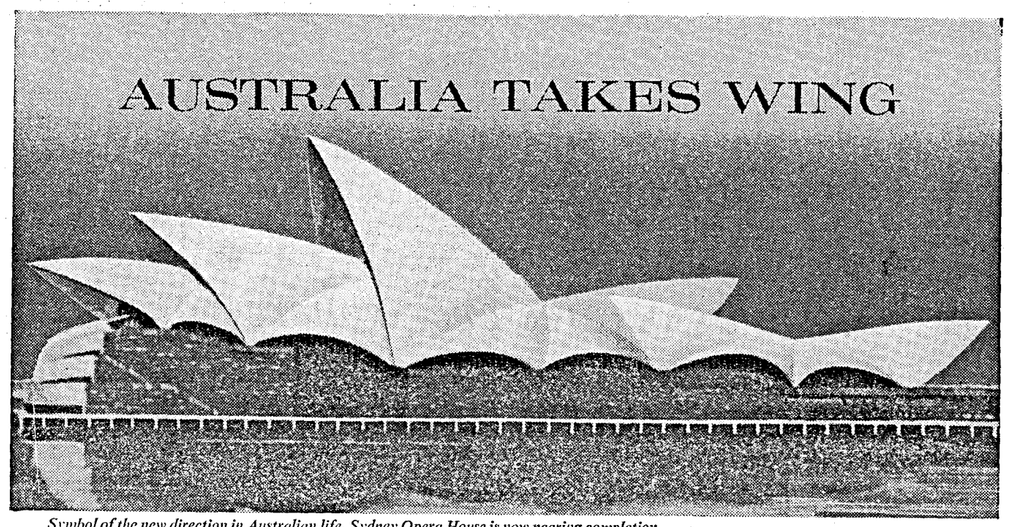
Here at home the outstanding problem of accommodating overseas students should to some extent be met by the government's grant of £3 million for hostels. The first nine projects were announced in the House of Commons by Mr Sandys on August 3rd. One must hope that the commitments abroad are not going to be cut down in the present attack on overseas expenditure. The Council's work took years to recover from the severe budgetary cuts of 1951. But its destiny then was not so clearly marked. Today it is working the richest language mine in the world and was never in a better way to gain friends for this country.

PAN-AFRICA

Whi te Cement

Economic unity in Africa, if it comes, may well be the result of work done by what Dr Nkrumah, in his recent travellings in communist countries, has called "colonialists, imperialists and neo-colonialists"—in other words, by western Europe. The premier of eastern Nigeria, Dr Okpara, has allowed that Britain's membership of the common market (the one in Europe) may be a good thing, but only if tariffs against produce from Commonwealth countries in Africa are abolished. Almost in answer to Dr Okpara, it was decided by the European Economic Community in Brussels last week that duties on imports of coffee, cocoa and bananas from "outside countries" will be halved.

This still leaves, of course, a wide margin of discrimination against countries not associated with the common market. It remains to be seen whether Britain can persuade the Six to do away with all discrimination against the products of Commonwealth countries in tropical Africa, still more whether the United States, with its eye on Latin America, persuades Europe to abolish tariffs on tropical products altogether. But it may become possible for countries like Nigeria and Ghana to choose association, if they wish. If they did, they would share in the aid fund for Africa; enjoy free access to all countries of the common market; and have freedom to protect their infant industries from European competition.



The difficulty, however, is political. The countries of the common market, and their linked territories, will start talks next month on a new form of association between Europe and Africa. A committee of association, a joint ministerial council, and an annual inter-parliamentary session are included in the new grand design. It will be hard to persuade the former British colonies that this is simply a free association between equals; Dr Nkrumah is not alone in being deeply suspicious of any formal arrangement between Europe and Africa. This sentiment is at the root of his distrust of the Monrovia group, some of whose members can (from one point of view) fairly be described as General de Gaulle's client states. The Nigerians are no less aware of this than the Ghanaians, but the Nigerian prime minister is attempting to coax the Monrovians towards a more assertive independence by helping to bolster their economies and their self-confidence, rather than by heaping insults on them as Dr Nkrumah does. If the economic pressure for unification is to overcome these political difficulties, Europe's politicians will have to tread warily.

The Economist

AUGUST 24, 1861

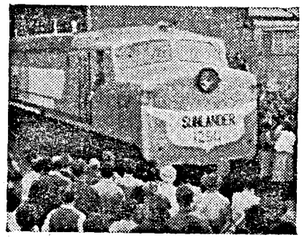
THE RATE OF INTEREST

Some time or other,—how soon we do not venture to predict, and we are not at this moment concerned in predicting,—the trade of the country, both foreign and domestic, will revive so far as to provide for the augmented capital of the country. Experience shows that the inherent energy and mercantile capacity of the industrial classes will soon absorb any probable accumulation of resources. For a moment they may be at fault: they may be harassed by the untoward confusion in America—an anomalous and perplexing result, to which there is no guiding precedent and scarcely an approximate analogy in the previous history of the world. But, in the long run, trading sagacity and trading industry will triumph. Whatever money they can obtain, that money they will employ. When this event shall happen, when the natural augmentation of trade has outstripped the natural accumulation of uninvested capital, then the fall in the rate of interest will cease at once. The producing cause will be no longer in action, and the Bank will not only be justified, but be bound to pause likewise, in its course of reduction. And it may be compelled to pause by a second cause .... The effect of the recent high rate of interest was to attract much capital here from countries in which that rate was much lower. Now that the rate of interest is approaching to the rate of other countries, it is very possible that we shall part with much of this money, and it is very improbable that we shall retain the whole of it .... If, therefore, a foreign demand should spring up for the repayment of the capital which we formerly obtained from the Continent by offering very high rates of interest, the rate of interest might again move upwards. The money market is very sensitive and delicate; a little too much will send it rapidly down; a very slight deficiency will cause it to rise just as rapidly. At present the foreign exchanges are extremely favourable to this country, and it is very probable that we shall see more than one reduction in the Bank rate of discount. But it is probable also that the low rate of interest will produce the reverse effect of the recent high rate,—that we shall not retain the whole of the money which we obtained by bidding high for it,—and that, if the improvement in trade, and especially in the domestic trade, should be contemporaneous with a foreign demand, we may see the rate of interest rise again as rapidly as it has lately fallen, and as it at present seems likely to fall still further.

Symbol of the new direction in Australian life, Sydney Opera House is now nearing completion

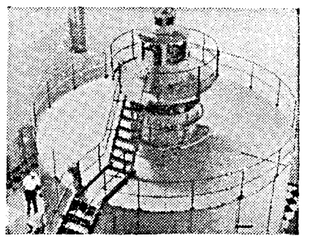
—and the next ten million Australians will take a big load of **power**

Australia's population has reached the ten million mark. Time now to look to the next ten million. And whether they are born there or arrive on a boat, they'll be joining a nation exulting in new life and strength.



Already the post-war flood of immigrants from Europe has given Australia a broader world view: new citizens with new intellectual contributions to make, different cultural ideas, specialized skills and knowledge. The community has never been more *alive*—healthy, enquiring and full of purpose—as Australia takes wing to wider horizons.

If the Sydney Opera House symbolizes the new direction of living, other monuments now shooting up mark the pulsating economic prosperity which makes this richer life possible—skyscrapers in the cities, new steelworks and, perhaps greatest of all, the huge dams in the Snowy Mountains scheme, bringing the power which is vital to all development.

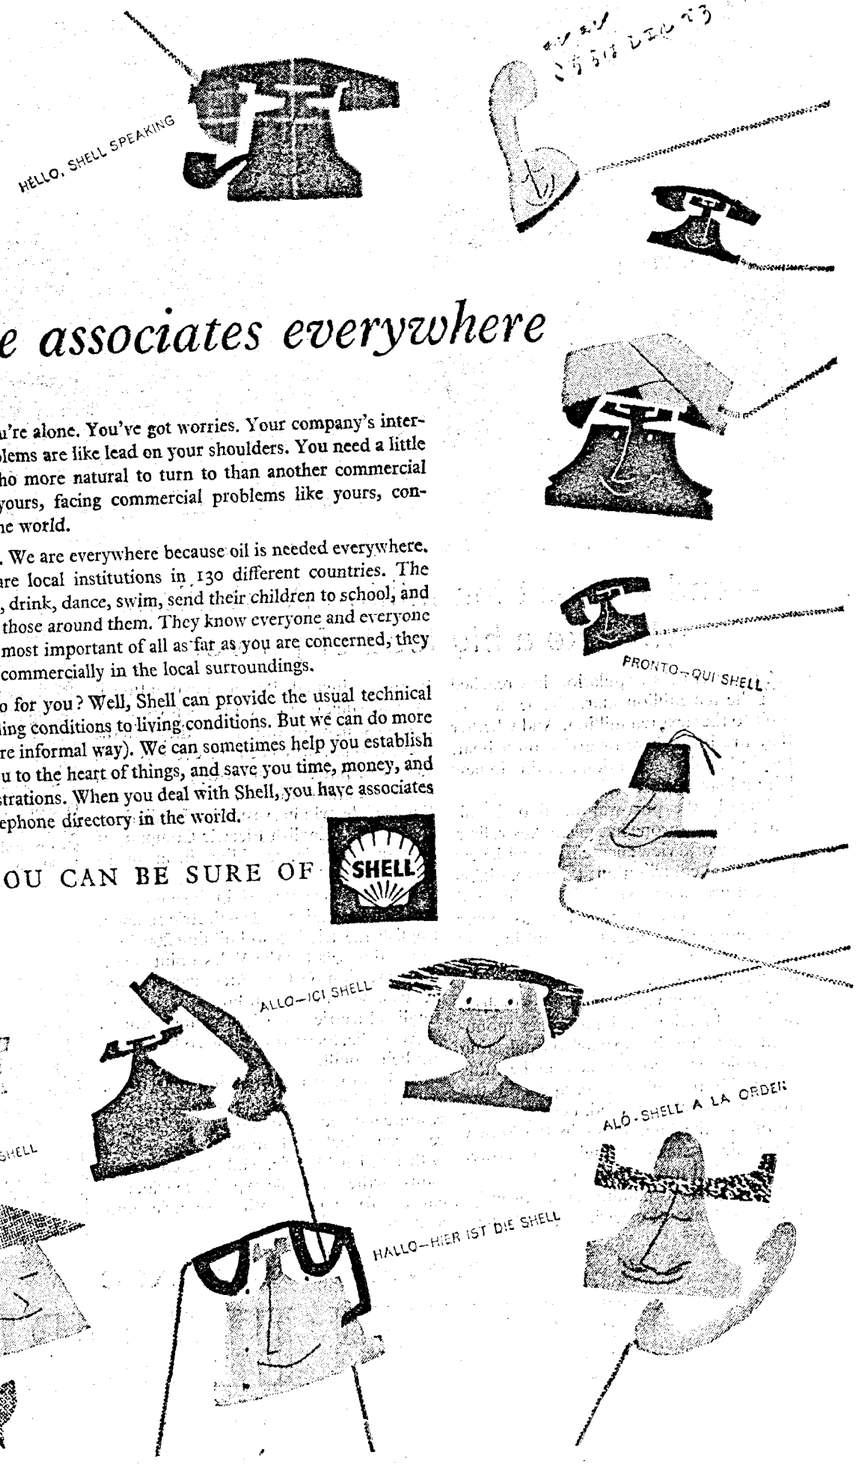


In a country expanding so vigorously, the importance of electric power cannot be overestimated. Power consumption is the yardstick of any country's prosperity, and those new Australians, as they join the present ones, will need an ever-growing supply of power for industry, commerce, transport and the home.

English Electric in Australia. In all these spheres The English Electric Company is busy in Australia, providing the means to *generate, distribute* and *use* more and more electricity. Hard at work in the enormous Snowy Mountains hydro-electric scheme, English Electric is also building 200-MW generating sets for the Vales Point steam power station on Lake Macquarie; while at Rocklea in Queensland, at one of English Electric's two flourishing factories in Australia, locomotives and rolling stock are being built.

And so the fruitful relationship grows. Australia knows she can depend on the resources of technical knowledge, skill and research which lie behind every contract with English Electric, while the company gains further valuable experience which it can use for work in other countries and at home.

One of five 1,500-h.p. locomotives for the Queensland Government Railways, who also placed repeat orders for twenty-five 1,650-h.p. units with The English Electric Company of Australia Pty Ltd.



Tasmania's island economy is based on her considerable resources of hydro-electric power. This English Electric 45,000-h.p. water turbine generating set is in the Lake Echo power station.

POWER FOR PEACE

'ENGLISH ELECTRIC'

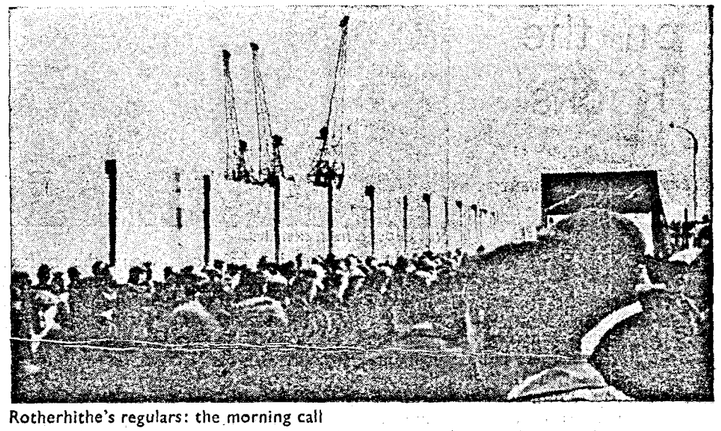
The English Electric Company Limited, English Electric House, Kingsway, London, W.C.2

How to have associates everywhere

You're abroad. You're alone. You've got worries. Your company's international trade problems are like lead on your shoulders. You need a little muscular help. Who more natural to turn to than another commercial organisation like yours, facing commercial problems like yours, continually, all over the world.

Us, for example. We are everywhere because oil is needed everywhere. Shell companies are local institutions in 130 different countries. The people in them eat, drink, dance, swim, send their children to school, and live amicably with those around them. They know everyone and everyone knows them. And most important of all as far as you are concerned, they know how to live commercially in the local surroundings.

What can we do for you? Well, Shell can provide the usual technical advice—from loading conditions to living conditions. But we can do more than that (in a more informal way). We can sometimes help you establish contacts, guide you to the heart of things, and save you time, money, and nerve-fraying frustrations. When you deal with Shell, you have associates listed in every telephone directory in the world.



YOU CAN BE SURE OF SHELL

Slack in the Docks

FROM OUR SPECIAL CORRESPONDENT

Rotherhithe's regulars: the morning call

Symbols of seniority

At half-past seven in the morning, Lower Road, Rotherhithe—a jumble of old grey back-to-backs and jazzy council flats—is already blue with diesel smoke. Knots of men gather in front of little shops that offer everything from Johnny Mathis discs to "Colonial Boots, 21 shillings": the over-sixties wear cloth caps with mufflers, the over-forties cloth caps with open-necked shirts and formidable leather belts, the under-twenties tight jeans and sharp Italian jackets. Pretty daughters and sisters teeter past to the tube and their jobs behind City typewriters, their tight skirts and smudged eyes typical of their generation anywhere in Britain. But however variegated their clothes, the men are marked out by their occupation as clearly as if they wore a uniform. Conspicuously short, disproportionately broad, their hands battered with work and their eyes quick to suspicion of the stranger, these are England's most powerful and most deeply mistrusted manual workers—the London dockers.

Along a grey wall, the employers are recruiting their teams for the morning's work: but here at the Surrey Docks, as elsewhere on the lower Thames, more than one in ten of the waiting dockers will not be hired. The next chance will come at midday, and for those who live some distance from the dock gates the morning will be frittered away chatting or playing cards over thickly stewed tea in a dingy cafe. Those not hired have to "prove attendance" at the eleven weekly calls, which entitles them to payment of 7s. a time: if they are unlucky enough to earn less than the guaranteed fall-back pay of £7 8s. 6d. in a week, the dock labour board makes their pay-packets up to this amount. What with overtime and weekend work, very few of them are in fact in this position, but a drop in earnings to this level is a very real fear for a docker who in good times may earn as much as £30 a week. In 1947, after years of struggle by leaders like Ernest Bevin, the national dock labour scheme was established "to ensure greater regularity of employment for dock workers and to secure that an adequate number of dock workers is available for the efficient performance of dock work."

Last year port employers in London were complaining that there were not enough men to do the work: the register of dockers, established by the local dock labour board, on which sit representatives of the port employers and of the men's unions, rose to 29,500 in London this year. Since then it has dropped, through retirements and normal wastage, to 28,300; and in a typical week this month 2,786 men were away on their annual holiday. But even so, the average number proving attendance at the call but not finding work had risen to 3,179. As the holiday period ends, the dockers are fearing some really hard times; and the labour board, which pays the men's attendance money and makes up their wages to the minimum fall-back pay from a fund to which the employers contribute a percentage of their total wage-bill, is looking forward to some heavy outgoings. "Security they said it would give us," grumbled a square-set docker, "I call it nothing but a bloody swindle." What, one wonders, would Bevin say?

THE dock labour scheme is, in fact, the subject of virulent attacks from all sides. When times are good the employers cannot get labour; the men, with heavy earnings in their pockets, seem prepared to strike on trivial pretexts—and have twice, disastrously, done so during the past year. In bad times it is the men who are unsure of their prospects; resistance to labour-saving devices reaches a new peak; and the hours of unscheduled idleness provide a breeding-ground for resentment which will find its outlet in yet more labour troubles next time full employment comes round. A succession of inquiries and reports have shown that, within the limits of the possible, the members of the dock labour board arrive at a reasonable compromise between the employers' desire to have a large reserve of labour and the unions' wish to restrict entry to safeguard their members' employment. But tides and trade cycles wait for no man: despite forecasts that the recent strikes would frighten cargo away from London docks, there is no evidence that the position is any better in other ports. The men in Lower Road know that, highly paid one month, they can never be certain of not being poor the next: it is on this account that, clannish and wryly humorous, and never easy to understand, they stoutly refuse to co-operate with those more fortunate than themselves.

Brighton on the Rocks

FROM A CORRESPONDENT IN BRIGHTON

Not enough in deckchairs

To judge by the steady stream of visitors piling out of the London trains this summer, Brighton's holiday trade might be thriving. Only the absence of luggage larger than picnic hampers and portable radios suggests that there is little in it for local traders and that the most popular ticket is the day return. Brighton, in fact, is desperately short of the old-fashioned holidaymaker who stayed at an hotel, ate in restaurants, and spent his money in the town. The Londoner's family fortnight beside the nearest stretch of pebbly beach is becoming a thing of the past, replaced by trips abroad, tours in the West Country, and a tendency to spend less time in more places.

This year the "vacancy" signs outside Brighton's innumerable guest houses have told their own story. The hotels, although less forthcoming about their business, are in the same position. Increasingly the trade is depending upon one short seasonal peak —the Sussex fortnight. In these two weeks, centred on the August bank holiday racing enthusiasts—a large proportion from the north—converge for the meetings at Goodwood and Brighton itself.

But a fortnight of solid bookings is not enough. Nor can a fairly healthy conference trade (the 4,000-strong Conservative conference will arrive next month) and windfalls like the Toy Fair make up for the failing holiday trade. Some hoteliers go so far as to forecast that the forthcoming introduction of parking meters in the town will be the last straw for some small hotels and guest houses.

As the paying guests stop coming to Brighton, feeling in the town tends to be directed against the non-spending trippers who still do. The typical tripper's day by the sea has almost become a model of thrift. He is likely to bring his own refreshment and music, and to prefer the shingle to a corporation deckchair. If he spends money at all, it is usually limited to the beach kiosks—which are now barred from cooking on health grounds—or fish-and-chips on the upper promenade. The hundreds of touring holidaymakers who sleep in their cars along the seafront, emerging at breakfast time to cook bacon and eggs over primuses on the pavement, are all customers lost to the hotels. The only part of the town which seems to benefit from the shoestring trend is the municipal camping ground at Sheepcote Valley, which happens to be doing very nicely.

The increase in day-trippers this summer has been accompanied by a rise in vandalism. Seafront shopkeepers have asked for extra police protection for their premises. None of this helps to ease the town's worries.

Can Brighton regain its lost prosperity? The feeling is that it must break with its tripper tradition and aim at a more affluent class of visitor. The town's two largest hotels, the Grand and the Metropole on the seafront, are both acting on this assumption. It is probable that the Grand will be pulled down and replaced by a new luxury hotel on a corner of the Kings Road redevelopment area. The Metropole has already gone ahead with a £500,000 scheme of modernisation and improvement.

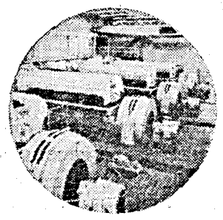
The focal point of Brighton in the future will inevitably be the key 16-acre redevelopment area on the seafront. This multi-million pound scheme has now been approved by the town council. It includes a giant entertainments building, with a 1,000-seat restaurant-cum-conference hall, a bowling alley and a dance hall; blocks of flats rising to 30 storeys; and a shopping patio to replace part of the main shopping centre in Western Road.

The new director of entertainments and publicity, Mr George Hume, considers that the town must "turn respectable." He is a former administrator of the Shakespeare memorial theatre at Stratford and, with this in mind, strongly supports the idea of a Brighton festival on the Edinburgh model. He argues that a first-rate arts festival could draw 20,000 people a day for three weeks and set the town up as a holiday resort for the rest of the year.

Although this has the backing of entertainment interests in the town, the local imagination still finds it difficult to visualise a Brighton divorced from sticks of rock and saucy hats. The town council will certainly take some considerable persuading before it agrees to subsidise such an ambitious project.

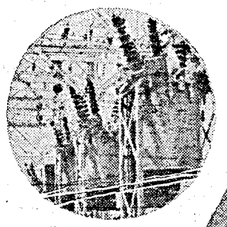
SITUATIONS VACANT

Continental Drift



FROM A CORRESPONDENT IN BELFAST

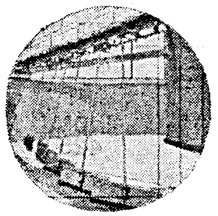
ARTICLE 48 of the Treaty of Rome, which concerns the free movement of workers within the European community, is already, in a way, operating for some Ulster people. Representatives from the Fokker Aircraft Corporation in Amsterdam have been in Belfast in search of 100 skilled machinists, sheetmetal workers, fitters and other types of aircraft tradesmen. The deputy personnel officer of the company interviewed nearly 300 redundant skilled workers in Belfast last week, offering them good jobs in Holland, with wages about equal to those they have been used to, boarding house accommodation for single men, houses for married men with families, and two paid vacations a year. The men that have been accepted have been offered permanent security—the Fokker corporation says it has enough orders to keep it busy for five years —and there will be no language difficulty because more than half the Dutch employees speak English.



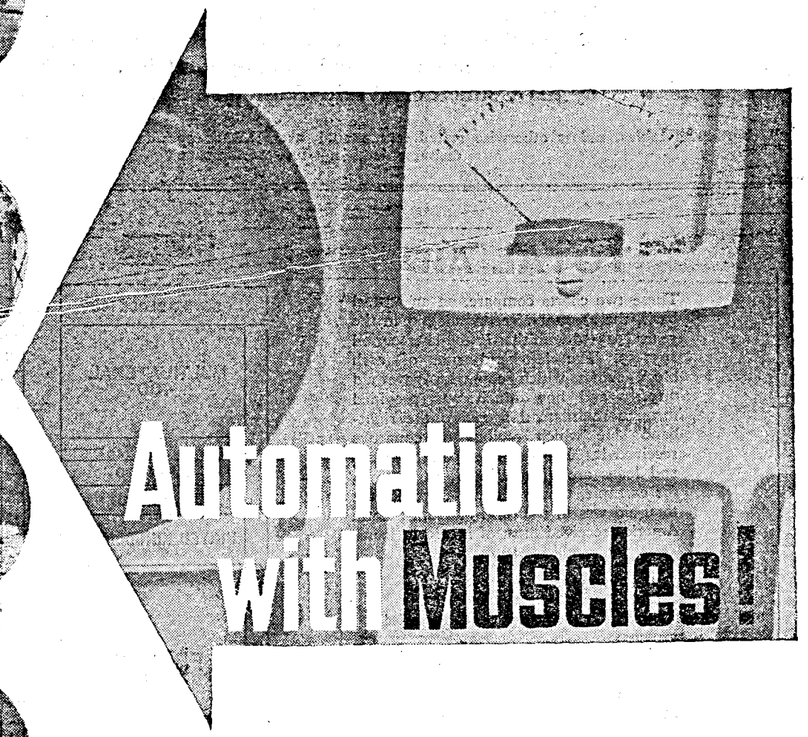
Firms in west Germany have also sent representatives to Northern Ireland in search of labour. An advertisement in the Belfast newspapers last week by a German electrical company offered well-paid employment to girls between 18 and 35. They will be provided with training, fares paid to Germany and back, health benefits, language classes, good wages, and modern hostel accommodation. Apparently the idea is to train these women workers in Germany and then send them back to Ireland where they would be employed in German-owned industries.

This particular firm has been interviewing prospective employees in the Republic as well as in Northern Ireland. The first batch of Irish girls to join will fly from Dublin on Monday. The Verolme Shipbuilding Company at Cork continues to send young Irishmen for a nine months' training period in Amsterdam.

The Irish response to these continental offers has been more encouraging than that of the Clydeside shipyard workers. So few Scots applied that the German shipbuilding firms concerned withdrew their offer.



Power Stations



Electrification

Harbour Installations

Sewage Plant

Automation with Muscles!

A NEW CONCEPT IN POWER ENGINEERING

Now, for the first time, comprehensive automated engineering schemes are available from one source —Hawker Siddeley Engineering. Backed by the vast resources of the Hawker Siddeley Group this newly formed Division of Hawker Siddeley Industries Ltd. offers a service unequalled by any other organisation. The advantages of a single supplier with centralised control are now available for electrical power systems, sewage plant, harbour installations, radio telescopes, automatic railway control equipment, automatic warehousing, automated manufacturing plant and telemetry applications. This is "Automation with Muscles". Hawker Siddeley Engineering will engineer and develop any of these schemes, with or without automatic and/or remote control. We have representatives throughout the world. Please write for further information.

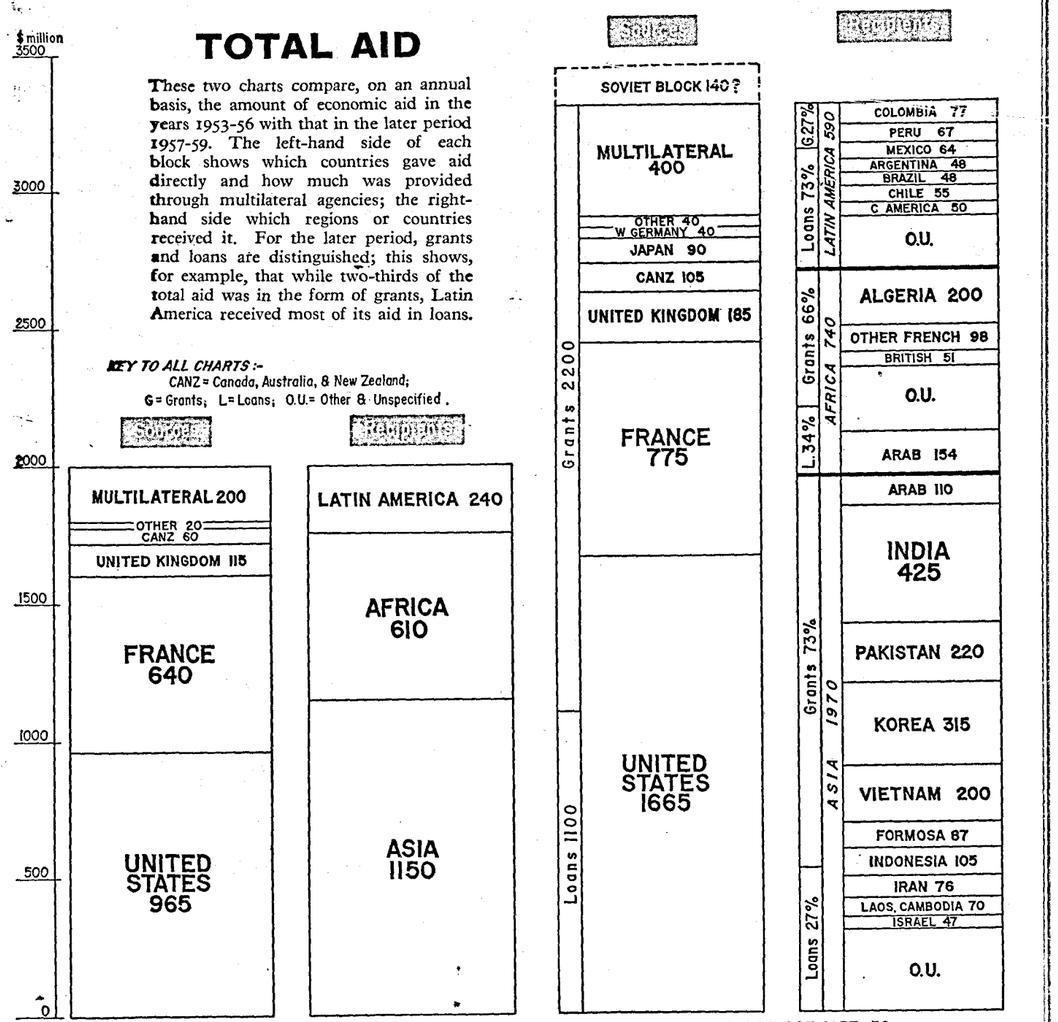
AID IN PERSPECTIVE

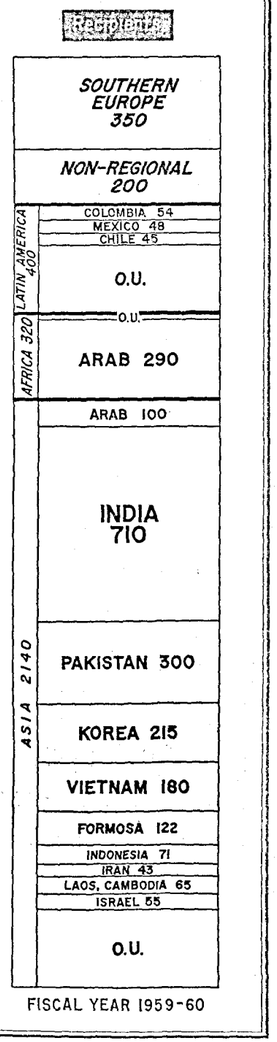


On this page, and the next two, an attempt is made to put together a picture of the flow of economic aid to under-developed countries in recent years. A conference on aid and development is being held at Oxford next week by the Council on World Tensions and the Overseas Development Institute.

Figures in all charts and tables, unless otherwise stated, are annual averages for period shown, are in $ million, and refer to actual disbursements, not to commitments.

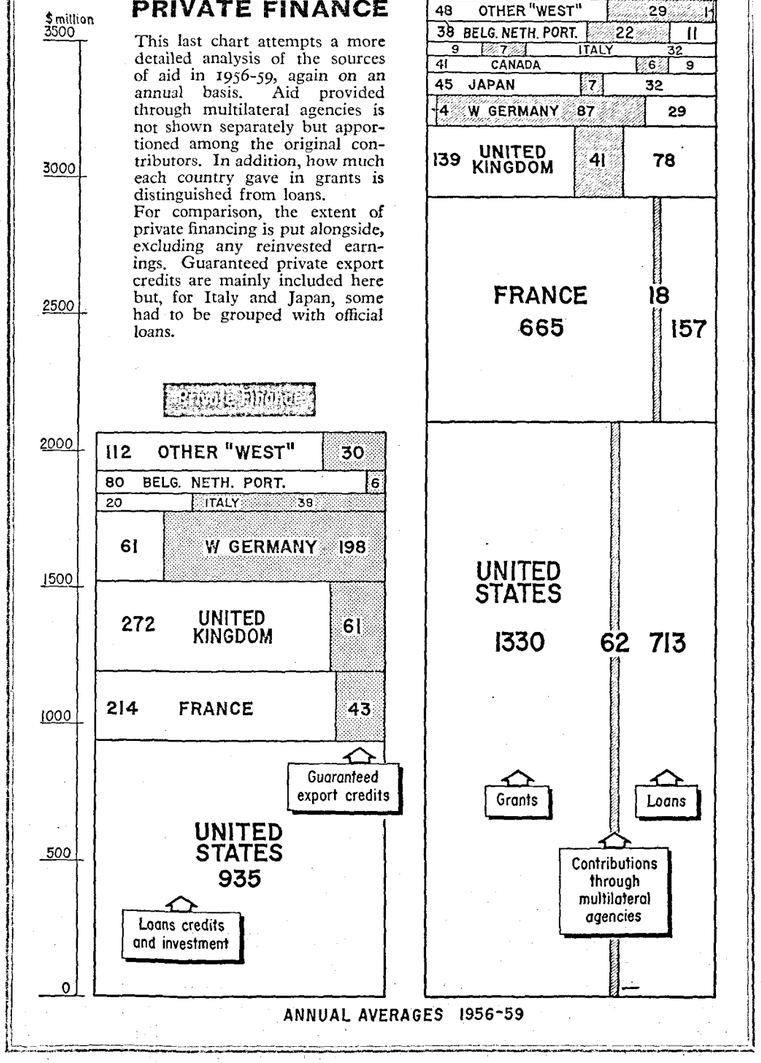
TOTAL AID

These two charts compare, on an annual basis, the amount of economic aid in the years 1953-56 with that in the later period 1957-59. The left-hand side of each block shows which countries gave aid directly and how much was provided through multilateral agencies; the right-hand side which regions or countries received it. For the later period, grants and loans are distinguished; this shows, for example, that while two-thirds of the total aid was in the form of grants, Latin America received most of its aid in loans.



KEY TO ALL CHARTS :-
CANZ = Canada, Australia, & New Zealand;
G = Grants; L = Loans; O.U. = Other & Unspecified.

US AID



A more up-to-date picture is available of the commitments of the United States to overseas aid. This chart shows, for the fiscal year 1959-60, how such commitments were distributed, both regionally and to individual countries.

This chart is on the same scale and comparable with those on the opposite page.

GOVERNMENTAL AND PRIVATE FINANCE

This last chart attempts a more detailed analysis of the sources of aid in 1956-59, again on an annual basis. Aid provided through multilateral agencies is not shown separately but apportioned among the original contributors. In addition, how much each country gave in grants is distinguished from loans.
For comparison, the extent of private financing is put alongside, excluding any reinvested earnings. Guaranteed private export credits are mainly included here but, for Italy and Japan, some had to be grouped with official loans.

NOTES

The principal sources of the data are given on the next page. Available figures are inadequate in many respects. There is not even any agreed definition of what exactly constitutes aid, and information obtained from donor and recipient governments is often incomplete and sometimes incompatible. Figures taken from the sources cited have been adjusted where it seemed necessary, e.g., to make them more directly comparable with one another.

Some apparent discrepancies can be simply explained. The 1956-59 figures, for instance, relate to calendar years, the others to fiscal years. The figures adapted from the United Nations report, cited overleaf, do not cover aid to under-developed European areas, e.g. in Spain and Jugoslavia.

Reliable figures for actual disbursements of aid from communist countries are almost wholly lacking; the estimates shown here are slightly more generous than those commonly cited.

AID IN PERSPECTIVE

All figures, unless otherwise indicated, are in $ million, and are annual averages.

SOURCES

The principal sources used on this page and the two previous pages are, for 1953-56 and 1957-59 figures, the United Nations report on "International Economic Assistance to the Less Developed Countries" (1961); for 1956-59 figures, the recent OEEC publication "The Flow of Financial Resources to Countries in Course of Economic Development, 1956-59"; and publications of the governments of the United States, France, United Kingdom, India and Pakistan.

Figures for aid exclude military aid, private financing, grants from non-governmental foundations (except in the detailed figures for India and Pakistan), consolidation credits, IMF movements, withdrawals from sterling balances accumulated in wartime, and postwar reparations and indemnification payments.

AMERICAN SURVEY

AMERICAN SURVEY *is prepared partly* in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Reluctant Philanthropists

WASHINGTON, DC

PRESIDENT KENNEDY has not yet met his Waterloo over the foreign aid Bill, but in terms of foreign policy, personal prestige and congressional influence he is throwing in his last reserves. The outcome will turn on whether he can induce Congress to have second thoughts on a formula for long-term financing which is not understood by one in ten thousand Americans, including some of those in Congress. Both Houses have once again passed Bills authorising another year of foreign aid—military assistance, grants and loans for economic purposes and all the rest—though the Senate cut the President's request for $4.8 billion back to $4.1 billion and the House of Representatives to $4.4 billion. But the crucial issue is whether the President is to get an advance appropriation for future years without being required to subject it to an annual scrutiny and an annual trimming by Congress; this means that he must be given not a mere authorisation to spend without any actual money being provided but a fixed sum (he asked for $8.8 billion, $1.2 billion of it for this year) to be put at his disposal by the Treasury to lend abroad in stated amounts and ways each year over a period (the $8.8 billion was to last for five years for loans only). Last week the Senate, though it chopped something off the sum and tied on a few strings, said "Yes": but notwithstanding a stream of telephone calls from the White House, the House of Representatives voted "No."

Selected members of the foreign policy committees of both Houses are now meeting to agree on a common Bill. President Kennedy has lost on the floor before this, only to win back most of what he wanted from the joint conference (notably on the minimum wage Bill). But this will be his severest test yet. Despite the spectacular failure of his supporters in the House he has first to induce the conferees to put in the compromise Bill the principle of long-term financing by borrowing from the Treasury; here the choice of conferees favours him. But then he has to win enough additional votes in the House to get the new Bill accepted there—to reverse the effect of Representative Saund's amendment which lays down positively that foreign aid must be appropriated annually after the usual procedure of hearings by, and justification of the expenditure to, the Appropriations Committee. True, the Saund amendment won by only 197 to 185 votes—but the whole tenor of the debate in both Houses shows that it will be hard to reverse it. The Administration assumed that Russian aggressiveness and the Latin American Alliance for Progress would propel the Bill through Congress (as the situation in Cuba put through $600 million of Latin American aid earlier). Also the Administration was mesmerised by its succession of narrow congressional victories into thinking that even an unpopular clause in an unpopular Bill could be squeezed through if the President demanded it persistently enough.

The White House miscalculated on three points. The first of these was that the House Committee in charge of the Bill is one of the most poorly-manned; ambitious and able Congressmen prefer to serve on committees whose decisions affect their constituents directly, rather than negatively as does the Foreign Affairs Committee. Its members fumbled the ball at the critical moment. Another was that even with the President pulling out all the stops, the Bill needed to be brilliantly presented. Yet the International Co-operation Administration failed to supply the Bill's champions with the success stories that alone could have offset the allegations of waste and corruption cited by its opponents. But most important of all, the Administration was wrong about the effect of the Russian successes. The House is genuinely close to American popular prejudices; it sensed the growing suspicion in the country that these successes might be proof that foreign aid is ineffective, as well as wasteful and burdensome.

The loss of Cuba or Laos to the Soviet orbit, the tendency for other countries like Brazil or India to lean leftwards, the stories of corruption in the ruling classes of Latin America or Asia, have all nurtured doubt rather than a sense of urgency. The State Department's argument that aid achieves its purpose even if it only keeps moderate, although left-leaning, governments going does not convince grass-roots Americans. As one Congressman put it inelegantly: "The people of the United States are tired of being taxed to subsidise every country in the world whether they kick us in the teeth or not."

THIS sense of being taken for suckers ties in with Congress's misgivings that its constitutional control over finance is being progressively filched by the Executive: that "backdoor spending," like George III's power, has increased, is increasing and ought to be diminished. In the Senate Messrs Byrd's and Hickenlooper's attempt to nullify this encroachment was no sooner foiled than the Dirksen amendment was accepted. This requires that even foreign loans financed by borrowing from the Treasury, if they exceed $5 million, must be delayed for thirty days to give Congress an opportunity to veto them. Further, Senator Fulbright was forced to appease suspicion by declaring that Congress retained the sovereign right to terminate the five-year appropriation and the unspent balances at any time and that it possessed adequate investigatory powers already under the rather obscure Government Corporations Control Act.

All this, and more, fell on deaf ears in the House. When the Administration cut its obvious losses by retreating to a request for an advance appropriation for only three years instead of five, the opposition leapt in first with the wrecking amendment which bears the name of Mr Saund, a disgruntled Democratic Congressman of Hindu origin from California, who is merely a front-man for the newly reknit coalition of Southern Democrats and Republicans which voted solidly for annual appropriations. Only six liberal Republicans stayed with the President after a floor count. The Administration did not dare to insist on a vote counted by tellers lest defeat were turned to rout—and this was wily, since in conference it can now be argued that the House was in an emotional state when it voted and did not really mean to do it.

The result has plunged the agencies operating foreign aid into gloom. They had been caught up in the prevailing optimism over the Bill and now find themselves in the awkward position of having already made a two-year commitment of $1 billion to India

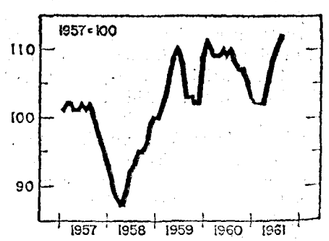
with further large sums promised to Brazil and Pakistan which they are trying to keep secret. Mr Dillon's vaster, if vaguer, forward commitments to Latin America drew the wrath of the House down on his head, a wrath that will fuel Castroist propaganda for months. Even to cut the five-year appropriation to three is seen as disastrous by the foreign aid experts.

The Administration is demanding long-range five-year plans for balanced economic and social reform and investment from the "lesser developed countries." This should ensure the greater efficiency on which Congress is insisting but on the self-help principle this also requires these countries to make large forward commitments too. However this can hardly be stipulated if the House on its side will only allow indefinite advance authorisations for aid—which may well be all that is in the final Bill—with every actual appropriation being cut and cut again by the penny-wise Appropriations Committee. In these circumstances any country with a five-year plan risks finding itself stranded with half-built dams or factories, industries operating below economic levels for need of raw materials or spare parts and unpaid bills to suppliers, all for lack of the necessary foreign exchange. As one official vainly told Congress: "We are still tackling twenty-year problems with five-year plans staffed with two-year personnel working with one-year appropriations." Yet Congress certainly does have a legitimate complaint.

The attempt to reduce its power of the purse-strings, which the Bill was designed to do, was unavoidable because twentieth-century realities clash with eighteenth-century shibboleths. But here the President's prestige is involved vitally—as his desperate public appeals show. The world will interpret a defeat in Congress as a vote of no confidence in his programme and particularly of no confidence in a realistic policy towards the uncommitted countries. And a defeat will undermine the President's painfully-built hold over Congress. The reactionaries have tasted blood but Mr Kennedy will avoid a Waterloo if he can. If he gets only a two-year appropriation out of the sullen House, he will claim a virtual victory and go patiently to work to build on that. If he gets only one year, he will withdraw in good order as Wellington so often did. Mr Kennedy shares several qualities with the Iron Duke.

A Texan Goes to Berlin

THE Vice President of the United States, Mr Lyndon Johnson, was sent to Berlin last week-end because he is the next best thing to the President and because no American official of such high rank had visited the city since the war. But since his task was to reassure the West Berliners, resentful at the slow allied reaction to their latest crisis, to convince them that they were not forgotten, to check an incipient panic that might have sent them fleeing west in their turn, it was helpful that Mr Johnson came from Texas and was a typical son of the Lone Star State. For Texans specialise in energy, self-reliance, independence and defiance —of the rest of the United States in their case— and these were just the qualities the Berliners want, at this moment, to see in their friends. Moreover he is a politician, experienced at enlisting sympathy on his side, and the theatrical methods which succeed so well at home succeeded in West Germany too. It was not the shower of ball-point pens inscribed with his name and of gilt-edged tickets to the United States Senate which won over the Berliners but his genuine concern for their unhappy situation. The seal was set on his popularity when the convoy of 1,500 extra American soldiers arrived to strengthen the city's garrison and the Vice President left Berlin with his morale-building task accomplished brilliantly—for the moment.



But in Washington there is some concern that he may have accomplished it too brilliantly. Texans also specialise in rashness and over-confidence and some of Mr Johnson's emotional promises to the West Berliners went farther than some experts think wise. And the promises were made in the name of the President and people of the United States. It may not be long before the Berliners need reassuring again and then it may be difficult to satisfy them without some retaliation against communist pressure more drastic than mere words. In particular they may be bitter when the allies start negotiating with the Russians, something that is expected in the near future in Washington. How Americans themselves, and their representatives in Congress, may react to these negotiations, and especially to any concessions that may be made during them, is also uncertain. Many of them are becoming truculent as they see the Russians apparently scoring all along the line. But at least negotiations, like Mr Johnson's dramatic flight to Berlin, are a way of winning time, of postponing and perhaps avoiding a final clash with the Russians. And to do this is President Kennedy's patient purpose during the "difficult weeks and months" which he sees ahead.

No Jets to Moscow

ALTHOUGH the Administration thinks it unwise, at this stage, to impose economic sanctions on either East Germans or Russians, it does not feel that the time is appropriate for establishing a new economic link with the Soviet Union by opening a direct commercial air service between New York and Moscow. So for once it is Americans, not Russians, who are refusing to sign an agreement. On again, off again since 1958, depending on the temperature of the cold war, negotiations were finally opened in July and all but a few details such as radio frequencies, maintenance, operational standards—and fares—were settled in the remarkably short time of three weeks. The twice-weekly, non-stop service was to be started next spring by Pan American World Airways and Aeroflot; at present passengers have to change aircraft somewhere in Europe if they wish to fly between New York and Moscow.

One reason why the negotiations went so smoothly is that there is at present no suggestion that either airline should go beyond these terminal cities, although it is presumed that the Russians would like to fly to Cuba and other Latin American countries and Pan American would certainly like its route to Japan to go across the Soviet Union rather than the much longer way round which it now follows. The hope that permission to fly over Siberia may be granted one day explains why Pan American is ready to undertake a service on which it expects to make little profit; direct flights may, however, encourage more American tourists to go to Russia and, perhaps, more Russians to come to the United States. It is suggested that the Russians wanted an agreement both because of the prestige of having their aircraft land regularly at New York and because the service would provide their pilots with experience

INDUSTRIAL PRODUCTION

Seasonally adjusted.

In July the output of America's mines and factories broke all records. It is only five months since the recent recession touched bottom—a quicker recovery than ever before, which shows also in the final figures for the gross national product in the April–June quarter. This rose by $15.3 billion from the previous three months, to an annual rate of $516.1 billion, also a record.

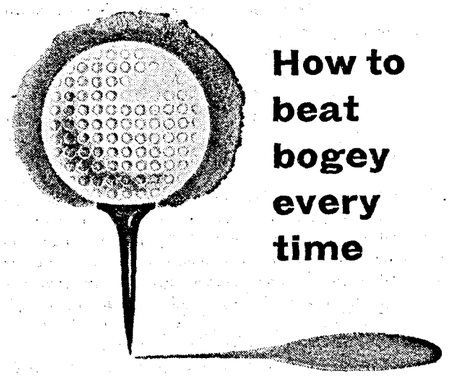
SHERATON HOTELS

IMMEDIATE CONFIRMATION DURING JULY AND AUGUST



EXCELLENT accommodations reasonable rates

From New York to San Francisco, from Montreal to Dallas, there's a Sheraton Hotel waiting to welcome you. Each is located in the heart of the city, near business districts, theatres and shops. In addition to fine food and superb service, Sheraton Hotels offer many extra values such as the Family Plan (children under 14 FREE when they share your room), air-conditioning, free TV and radio. If your ship or plane is delayed, Sheraton will hold your reservations. To get reservations at any Sheraton Hotel, see your travel agent or Sheraton's General Agent:

FRAMES TOURS LTD.,
25-31 Tavistock Place, London W.C.1,
Telephone: Euston 3488.

How to beat bogey every time

If I slice my drive into that patch of rough over there, it will cost me two extra strokes to get round the dog-leg and on to the green. On the other hand, if I'm too cautious and drop short, I'll get into the deep sand behind the first bunker, and very likely take three to get back on the fairway . . .

Relaxing on the golf course at the week-end, high-ranking industrialists and businessmen may reflect that during the week they are faced with similar, but even more complicated, problems. Every project, like every hole on the golf course, has its bogey—a target date which *must* be achieved, however complex the operation, however many component sub-operations are involved. Management must know at *every* stage of the project as it proceeds, not only how each individual sub-operation is going, but how it relates to all the others—a knowledge which can only be achieved by the techniques of Continuous Project Evaluation or Critical Path Analysis with the aid of high-speed electronic computers. C-E-I-R are regularly handling such techniques on behalf of clients, particularly in constructional fields such as the building of ships or the erection of factories—thus not only helping these clients to meet and beat target dates, but saving them money as well.

Project Evaluation and Critical Path Analysis are only two of the many scientific management techniques offered by C-E-I-R, the largest computer services organization in the world. At the London C-E-I-R Centre, with its advanced on-the-spot computer facilities, C-E-I-R are handling on behalf of clients a wide variety of operations ranging from routine Data Processing on a regular contract basis to the solution of the most complex industrial and commercial problems. If you have any problem, large or small, which can be solved by logical or mathematical means—then send for C-E-I-R.

To-day's big rubber news comes from I.S.R.

NOW IT'S

Diene

RUBBER

Stereospecific · Low hysteresis · Highest purity · Narrow molecular weight distribution · Stable price · EX STOCK

DIENE is a new stereospecific polymer with remarkable properties. DIENE is a new elastomer—it has properties which cannot be matched. DIENE is outstanding in four vital qualities—resilience, abrasion resistance, low temperature characteristics and purity. DIENE's primary use is in compound with other rubbers, when the compound acquires the most valuable DIENE properties. 50% DIENE compounds are characteristic; greater or lesser proportions are of course usable. In production DIENE is economical, it can be readily extended with any of the usual extenders or fillers. DIENE's purity is of special value to the electrical industry, but in any application it results in excellent colour. In truck tyre applications DIENE has now undergone several millions of test miles and its value is established beyond doubt. Proved in tyres, DIENE is now ready for other products—electrical, footwear, domestic, industrial—*and in production quantities.*

DIENE is available NOW, Ex Stock, from I.S.R.

of flying the Atlantic which would be useful in time of war—and for espionage purposes.

The other paradox about this agreement with a country which is practically an enemy is that it was reached without difficulty at a time when similar bargaining over bilateral air services with allied countries—Holland, Scandinavia, Britain, Italy, Japan, India—has broken down almost completely and is giving rise to serious friction. This is either because these countries are trying, as the Russians did not, to get permission to extend their flights—the Dutch and Italians to Los Angeles, the Japanese to New York and across the Atlantic, the Indians across the Pacific—or because the Americans are trying to make these rival airlines reduce their services to the United States. This situation is the result of the increased competition in the air, particularly on the North Atlantic routes, where larger aircraft, more services and fewer passengers have meant financial difficulties. The two American transatlantic carriers complain in particular that the Dutch KLM and the Scandinavian SAS schedule more flights than the demand warrants and that they are picking up more than their fair share of transatlantic passengers from the other countries which they serve. Sympathetic American aviation officials are showing growing signs of protectionist tendencies, particularly in their reluctance to make additional air rights available in the United States to other countries unless American airlines get some very worth-while concessions in exchange.

Untranquil Drugs

SENATOR KEFAUVER, who as chairman of the Senate's anti-trust and monopoly subcommittee is becoming an old hand at leading the Justice Department to its prey, has scored another tentative victory. Last week a grand jury in New York charged three of America's largest pharmaceutical manufacturers (and their top officers) with conspiring to maintain excessively high prices and to monopolise the manufacture and distribution of the so-called "wonder" drugs. The companies involved are Charles Pfizer & Company Incorporated, the American Cyanamid Company and the Bristol-Myers Company (two more firms have been mentioned as co-conspirators) and the three products named are all in the tetracycline group. Retail sales of these widely-used antibiotics are running at about $250 million a year and the Justice Department claims that the accused are responsible for nearly three-quarters of this business.

It is nearly two years since Mr Kefauver scandalised a pill-swallowing public with the news that the drug industry is not only callous enough to make profits out of its invaluable services to mankind but that these profits have for years been about double those for manufacturing generally. Most Americans are now convinced that drug prices are inflated by excessive advertising expenditures and profits, even though the industry has taken pains to draw attention to its large investment in research which does not always show results. Both the Federal Trade Commission and the Food and Drug Administration have been taking a very close look at the industry with a view to tighter controls over advertising claims and labelling, but Mr Kefauver is urging Congress to go a good deal further. He has proposed that the companies should operate under licence only; that the FDA should not only pronounce on the safety of a drug (as it does now) but on its efficacy; that the life of patents on new drugs should be shortened from the present 17 years to three (with an 8 per cent royalty for the remaining 14 years); and that the FDA should give simple generic names to new drugs so as to discourage doctors from referring in prescriptions to the trade names promoted by the leading companies.

Both the pharmaceutical companies and the American Medical Association look upon such government intervention with great disfavour. The latter body has argued that the doctor alone should decide on the efficacy of a drug and that the substitution of generic for trade names would do no more than shift the emphasis in promotion from the doctor to the chemist who makes up the prescription. The Administration would like to see more regulation of the pharmaceutical industry but its proposals, when they come, are likely to be somewhat milder than Mr Kefauver's prescription.

Lessons in Politics

WHEN, last May, a New York rat emerged from the skirting of a Harlem school-room as the Mayor paid his official call (with the usual bevy of newspapermen in tow), the way the city runs its huge school system became a leading battleground in this autumn's mayoral election. The spotlight of publicity soon shifted from the rats (who, it seems, put in a fairly regular attendance in some of New York's less favoured schools) to the dilapidated state of the school buildings generally; even those built in the last few years are showing signs of imminent disintegration. To top it all, a hasty check by the city investigator revealed that many of the people in charge of building and maintenance had been in the habit of accepting small donations from contractors. The latest move in the drama came last week when Governor Rockefeller summoned a special session of the State Legislature to pass an emergency measure abolishing the present Board of Education (a voluntary nine-man body appointed by the Mayor which presides over the city's school system) and laying down the rules for the appointment of a new one.

New York City provides schooling (free of cost) for about a million young residents and operates nearly 900 schools. The annual cost amounts to some $650 million, of which the state provides a third. In the past New York's schools have had a fairly good reputation as big city systems go, but over the last few years their administration has come in for heavy criticism and the State Commissioner of Education, in particular, has been pressing hard for reforms. A succession of special studies has pointed out that the system is in danger of being strangled by excessive red-tape at the centre; that the board inevitably has more political than professional loyalties; that the 54 local school boards, which should serve as a link with the communities they serve, are virtually defunct; and that a Republican-controlled State Legislature has thwarted the Democratic city's attempts at self-improvement.

But there can be no doubt that the timing and intensity of the present uproar are politically inspired. In this autumn's mayoral election, Mr Wagner's bid for a third term is being opposed not only by a Republican, Mr Lefkowitz, but by two fellow Democrats, all of whom are making as much capital as they can out of the school issue. Mr Wagner has thus been trying, somewhat unsuccessfully, to keep ahead of state officials and his rivals in the city in exposing corruption and inefficiency, while at the same time hiding as many skeletons as possible in the cupboard until after the election. In summoning a special session of the Legislature Mr Rockefeller, too, has been accused of being more concerned with promoting his candidate for Mayor than with the scholastic fate of New York's schoolchildren; the Democratic members were highly suspicious of the motives behind the emergency Bill, but in the end most of them felt bound to join their Republican colleagues in voting against corruption, and against the Board of Education.

Goliath in Bonds

NEW YORK

THE business of raising capital for state and local governments by the sale of tax-exempt bonds has long been dominated by Wall Street's established investment houses and the big banks. But now this procedure has been shaken up thoroughly by last week's award of a $100-million Californian issue for school build-

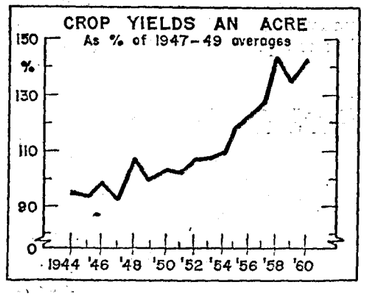
Status Quo on the Farm



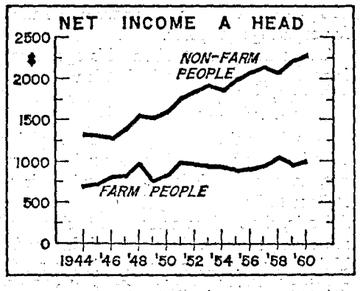
WASHINGTON, DC.

THIS month's wheat referendum, an annual formality in which thousands of wheat farmers ratify the programme devised for them by Congress, will reaffirm once again the *status quo* in American agriculture. The farm Bill passed earlier this month by Congress makes no real change in the method of subsidising the farmer which, since the last war, has produced the triple problem of massive surpluses of grains, steadily rising government expenditures for agriculture and incomes for farmers well below those of their fellow citizens.

Mr Orville Freeman, the Secretary of Agriculture, and his publicists are proclaiming loudly, perhaps a bit too loudly, that the new Bill is the most significant piece of farm legislation since 1938 and a real begining to the end of the agricultural dilemma. The Bill does seek to curb surpluses by requiring a reduction in the acreage planted to wheat in the coming crop year and tries to raise the income of wheat growers by pushing up subsidies. At the same time it extends through the 1962 growing season a similar programme for maize and other feed grains enacted by Congress earlier this year for 1961 only. Furthermore the fact that the Bill has been passed at all ends the deadlock between the Agriculture Department and Congress which blocked any farm legislation whatever during the final years of the Eisenhower Administration.

But the measure is but a pale shadow of the complete overhaul of the farm programme promised during his election campaign by President Kennedy. The basic ingredients and the basic contradictions of the old system are retained by the present Bill. Production is controlled not by regulating the amount to be sold but by limiting the acres to be planted, a hopeless approach when busy scientists are constantly increasing yields an acre. The farmer then disposes of his excess production to the government at an artificially high price through the fiction of price support "loans" that really amount to sales.

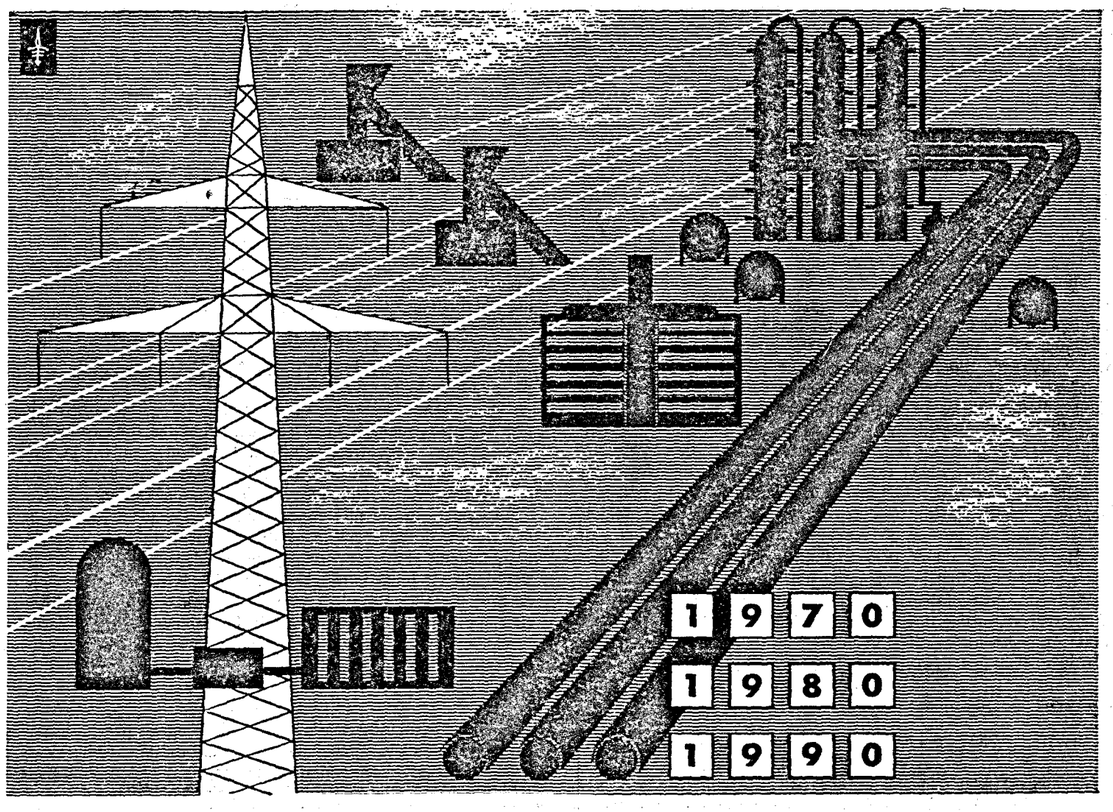
For all the breast-beating in Congress over the inefficiency and waste of this system, the latest farm Bill demonstrates once again that legislators simply will not pay the political price of adopting a new plan whether it is the one proposed by Mr Freeman or the diametrically opposite one futilely advocated by his Republican predecessor, Mr Benson. The Freeman system, called "supply control" by the theoreticians at the Agriculture Department, would enforce controls on farm production and reduce output enough to drive prices up in the market place and end the need for government supports. The Administration's experts believe that the jump in food costs would be relatively painless but the strict regulation of farm output which would be involved would mean that Congressmen could no longer pay lip service to the myth of a free and unregimented agricultural economy, a psychological and political price far too great for them.



The ultimate and unfulfilled goal of Mr Benson's eight dreary years at the Agriculture Department was quite the opposite. Featuring a gradual end to all subsidies and controls on production, his plan would have forced small, marginal farmers out of business; as production then tapered off, farm prices would have climbed gradually. But this solution too was intolerable for a Congress that adheres to the Jeffersonian concept of the independent yeoman as the backbone of a democratic society.

Like Mr Benson's programme, Mr Freeman's proposals sought their goal by indirect means. He wanted to establish a complicated procedure under which he, as Secretary of Agriculture, would have had the basic responsibility instead of Congress for devising plans for controlling the various farm commodities. Another key provision in the Administration's programme called for extending to all crops, and even livestock, the use of the marketing order, an obscure device now applicable only to dairy products and a few fruits and vegetables, which can reduce production indirectly by permitting only those items meeting a certain standard of quality to be sold.

Trying to look at the brightest side of the lack-lustre Bill passed by Congress, the Agriculture Department's publicity men call its mandatory reductions of wheat and maize acreage a step toward control over supply and exult over a tiny and insignificant broadening of the use of marketing orders. But, in truth, the coalition of Republicans and conservative Southern Democrats which dominates the Agriculture Committees in both the House and Senate has hurled the Administration's farm programme into a deep grave. No member of the Kennedy Cabinet has won less from Congress than Mr Freeman.



Nevertheless, he cannot be branded as an ignominious failure. He has been operating almost on his own deprived of help or even encouragement from the White House. President Kennedy believes that he can pursue actively just so many projects in a lethargic Congress and he clearly does not give priority to the farm problem. His economic advisers are not particularly interested in agriculture, and his political aides remain bitter over the thrashing which he suffered throughout the mid-western farm belt in last year's election. Accordingly, Mr Kennedy has not worked against the massive opposition to the farm Bill of the American Farm Bureau Federation, the richest and most conservative of all agricultural pressure groups.

Nor has Mr Freeman been helped much by the Democratic leaders in Congress. He is particularly bitter about the refusal of Mr Rayburn, Speaker of the House, to lift a finger on behalf of the Bill. Moreover, the circumstances surrounding Mr Freeman's appointment to the Cabinet did not help his prestige in Congress when he first took over the job. His troubles in his final two years as Governor of Minnesota cost him re-election in a state that was carried by Mr Kennedy and other Democratic candidates. Not particularly well versed in farm matters, and hardly rating a Cabinet seat, he was named to the agriculture job only as a compromise to stop a bitter struggle over the post between various other supporters of the President.

Against this background, Mr Freeman's accomplishments, scant though they may seem, are remarkable. By tireless and personal cultivation of members of Congress, he has become one of the best liked Cabinet members on Capitol Hill. He astounded congressional observers by winning support for his programme from Mr Ellender, the conservative chairman of the Senate Agriculture Committee, who more often than not follows the Farm Bureau line. Moreover, Mr Freeman seems to be gaining prestige among the farmers themselves.

Despite this, prospects are even less favourable for action on his programme in 1962 than they were this year. Senator Ellender now declares that he was subjected to so much abuse for his support of the Administration's plan that he is in no mood to resume the struggle and the backing of big city Democrats in the House of Representatives cannot be counted on indefinitely. These urban Congressmen have supported the Freeman proposals this year out of loyalty to Mr Kennedy while remaining apprehensive about their impact on their city-dwelling constituents. But next year they will be running for re-election. And next year President Kennedy, faced with even more difficult congressional struggles, is not likely to push farm legislation any more energetically than he did this year.

STEEL 2000

By the year 2000, the world population will probably have grown from 2.8 billion to more than 6 billion *). Huge energy reserves will have to be exploited to generate many times as much light, heat and power as is produced today.

From pipelines to engines and industrial furnaces, from mining props to power plants, from nuclear reactors to high voltage poles, steel determines the modern technique of energy production and supply.

On the road to the year 2000, the energy producing industry, like all other important fields of civilization, will have an immensely growing requirement of steel.

In 1960, about 350 million tons of steel were produced throughout the world. Experts estimate that world requirements of steel will rise to between 1.5 and 2 billion tons. This huge demand for steel calls for world-wide cooperation.

During the last decade PHOENIX-RHEINROHR increased its annual production of crude steel from 1.5 to 3.2 million tons. Intensive long-range research and planning characterize our work for the world-wide markets of the future. Our most important products: pig iron – semi-finished products – sections – steel tubes and tubular goods – plates and plate products – clad plates – SICROMAL- and RHEINROHR-special steels. One of our subsidiaries, PHOENIX-RHEINROHR-INTERNATIONAL, Düsseldorf, Thyssenhaus, delivers pipelines, refineries, fertilizer plants and water supply systems.

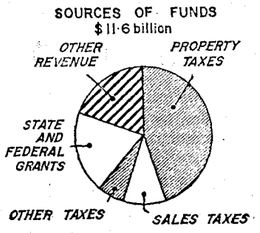
All steel users trust this brand:

PHOENIX-RHEINROHR AG VEREINIGTE HÜTTEN- UND RÖHRENWERKE DÜSSELDORF GERMANY

*) According to population statistics compiled by the United Nations in 1958

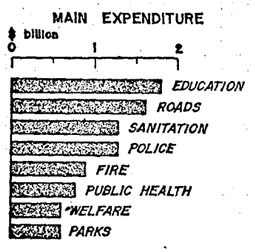
Continued from page 795

ing purposes to a small and virtually unknown firm. As a major borrower in the tax-exempt market, California's Treasurer, Mr Bert Betts, has been looking for ways of reducing the burden of interest on the state. Over a year ago, he gave up borrowing on a fixed schedule and changed to a more flexible policy of going to the market only when conditions appeared favourable ; but he still had to contend with a lack of competition in bidding for the right to issue his bonds. To all intents and purposes a syndicate headed by the giant Bank of America has been California's sole underwriter, largely because other potential underwriters have felt that only a big selling group could handle the state's huge volume of offerings (averaging over $800 million in cash annually).



Thus, when Mr Betts invited bids on three issues totalling $225 million, it was regarded as inevitable that the Bank of America's syndicate would be the sole bidder. So there was genuine consternation when William S. Morris & Company, a New York firm with only $500,000 in capital, won the school bonds. Its bid amounted to a net interest cost of 3.75 per cent a year compared to the syndicate's bid of 3.86 per cent. The crowning ignominy was that California rejected the syndicate's offer for the other two issues because there was no competition.

Other underwriters have recovered from their shock to the extent of acknowledging that this "sneak" bid for the school bonds was not only wholly legitimate but highly profitable : the Morris company had to put up $100,000 as a good faith deposit and should make a profit of over $1 million after expenses. It has been pointed out that in making its bid the syndicate had to consider the prospects of distributing the entire package of three issues ; moreover, by turning down the remaining $125 million worth, Mr Betts made it much easier for Morris's to dispose of the bonds it had won. If in fact the syndicate had been awarded the remainder at higher prices, Morris would have run the risk of taking a loss.



Even so, the victorious Morris bid suggests that the tax-exempt market may be in for more aggressive competition in future. The big underwriters, who pride themselves on being able to handle an increasing volume of offerings, acknowledge that they have become more engrossed in the problem of distribution than in the actual bidding. But they also insist that California is a special case. They agree that competitive bidding may save the state money in the short run ; but they contend that Mr Betts ignores the marketing aspect and warn him that an underwriting failure, based on too low a bid, could bring much higher interest rates in the long run. Nevertheless the chances are that, when he re-offers the bonds which he withdrew—the $100 million exservicemen's issue is coming on September 13th—there will be more than one bid for them and that the Morris company will try again.

Cities Take Stock

During the fiscal year 1959-60, the 18,043 cities in the United States drew into their coffers some $11.6 billion in general revenue and spent about $11.8 billion. In addition, many of the cities operated public utilities and handled retirement funds for their employees; if these are included in the totals, revenue reached $14.9 billion—an increase of over $1 billion from the previous year—and expenditure $15.3 billion. During 1959-60 the cities raised $2.4 billion in new money through the issue of long-term bonds ; at the same time they paid off $1.3 billion of long-term debt incurred previously.

The cities derived nearly half of their general revenue from taxes on property and a further fifth from the equivalent of grants-in-aid, mainly from state governments. While the average city raised and spent about $100 for each resident, big cities carried much larger budgets, in relation to their numbers, than small ones. The five cities with over a million inhabitants spent over $200 a head on the average, while those with fewer than 25,000 residents spent only about $50 a head in the year.

SHORTER NOTES

The vagueness in the Constitution about how it is to be decided whether a President is unable to carry out his duties—in which case his powers devolve on the Vice President—and the persistent failure of Congress to remedy this omission make it necessary for each President and Vice President to agree on a personal arrangement. President Kennedy and Vice President Johnson have now followed the example of their immediate predecessors and have announced that, if possible, the President, when incapacitated, would ask Mr Johnson to take over ; if Mr Kennedy was unable to do this, the Vice President would take over on his own authority after appropriate consultations with the Cabinet ; in either case the President himself would decide when he was ready to resume his powers.

* * *

To prepare for next year's battle with Congress over tariff policy the President has appointed a special assistant—Mr Howard Petersen, a Republican and a banker—to examine American foreign trade policies in the light of the changing conditions of today, to co-ordinate the activities of the various departments concerned and to draft a new international trade programme.

* * *

Last month the Battle of First Manassas (or Bull Run, as it is known in the North), the first great battle of the Civil War, was re-enacted with striking realism on the original site in Virginia by about 2,200 costumed members of the North-South Skirmishers Association and the National Guard. The spectators, who totalled nearly 100,000 on the two days of the display, and who were mostly Southerners, suffered heat of 101 degrees and a good many casualties of their own to watch the Confederates rout the troops of the Union. The spectacle was part of a four-year observance of the centenary of the war.

* * *

Although Washington, DC, contains more Negroes than whites it has never had a Negro on its governing body, the Board of Commissioners. This was altered last month when the Senate unanimously confirmed Mr John Duncan, a Negro, as a member of the board. Mr Duncan was chosen by President Kennedy after his first choice, who was also a Negro, resigned when his troubles with the tax authorities were brought to light by a Senate committee.

* * *

In 1959 there were only 280 millionaires in the United States, according to the tax authorities. Their taxable income amounted to $425 million and they paid $268 million of it to the Treasury.

LETTERS

Atlantic Union

SIR—As a devoted reader of your publication, I have long respected its factual thoroughness and lucidity of thought and presentation. I have been somewhat shocked, therefore, by an aura of mystery or mysticism which has crept into your columns recently.

I say mystery *or* mysticism, for I am not sure as yet whether to label this phenomenon "The Mystic Presence of Atlantic Union" or the "Great Atlantic Union Mystery." What I am referring to, of course, are the delphic remarks at the end of the article "Atlantic Union Next" on July 29th and "The European Venture" on August 5th, which suggest that any British hesitation about entry into the European Economic Community should be stilled by a no-longer-fantastic Atlantic Union. Except for a few veiled remarks about "political institutions on an Atlantic level" and "a joint attempt to manage the economy of the West on Keynesian lines" you have not as yet revealed to your readers just what will be the nature of this no-longer-fantastic beast. Therefore, it is hard to tell whether you are carefully concealing the exact structure of such a union, to reveal it at a more suitable time, or are simply exploring new political territory with hope, but no map.

In all seriousness, past experience suggests that the former is closer to the truth. May I be permitted to wonder, then, why the mystery? If Atlantic Union is worth invoking, is it not all the more worth analysing? The problems suggested by your cryptic remarks are of themselves vast. Keynesian control of the Western economy suggests by necessity a high degree of budgetary co-ordination. It would also require unified credit policies. Credit and fiscal policy are political issues of the first magnitude here and throughout the Atlantic area. Their co-ordination would require supra-national institutions with considerable power, and to create such institutions would be a political feat of phenomenal proportions. Here in the United States strong constitutional objections would be raised to the creation of the necessary institutions.

The logic of your suggestions is attractive, but there is much to be said on all sides of this issue before it can be translated into political reality *in any form*. If, as you suggest, that translation is not only desirable but basic to the survival of the West, then the sooner the debate is begun, the better.—Yours faithfully,

New Haven, Conn. DAVID M. TRUBER

A Century of Progress

SIR—I observe with regret that, in your note of August 5th, you appear to accept without comment the average annual rate of increase in output per head from 1950 to 1959 as providing a true representation of the rate of increase in British productivity since the war.

The year 1950 was one of extreme full employment, while in 1959 there was, on the average, a substantial margin of unused capacity, much of it in the form of the under-utilisation of employed labour. To obtain a valid indication of the rate of growth of output per head, it is necessary to compare years in which the proportions of capacity employed were similar.

If, instead of 1950 and 1959, we take the years 1948, 1953 and 1960, which fulfil this requirement, we find that from 1948 to 1953 real gross domestic product rose cumulatively by an average of 2.5 per cent a year, while from 1953 to 1960 the average annual rise was 2.9 per cent. The corresponding rates of growth in output per head are 1.9 per cent and 2.3 per cent. The latter figure is nearly 50 per cent larger than the average annual rise of 1.6 per cent from 1950 to 1959.—Yours faithfully,

F. W. PAISH

London School of Economics, WC2

The article to which Professor Paish objects was a summary of one in the National Institute's "Economic Review" prepared by a team headed by Miss Deborah Paige. We asked Miss Paige, therefore, for any comment upon his points. Her reply follows.

SIR—In the article quoted in your note, we were making international comparisons over the last hundred years. For the post-war period we used figures for 1950-1959 and 1954-1959. 1950-1959 was the longest available postwar peacetime period ; figures for 1948, 1949 and 1960 were not available for some countries, and in any case in a number of them 1948 and 1949 included a substantial element of post-war recovery which we wanted to exclude. For this reason, we gave figures also for 1954-1959, to provide better comparisons for those countries where the process of postwar recovery went on for longer.

The selection of any starting and finishing years is bound to favour some countries and be hard on others ; but we found in practice that selecting different years did not make much difference to the ranking of the eleven countries, which was our main concern. On any basis, Britain is at or near the bottom of the table of postwar growth rates. If 1948 and 1949 are added at the beginning or 1960 at the end, it improves the performance of most other countries, as well as that of the United Kingdom.

Professor Paish is probably right in suggesting that, for the United Kingdom, the growth of output between 1950 and 1959 underestimates the growth of capacity, because capacity was less fully employed in 1959 than in 1950. The comparison of 1953 and 1960 suggested by Professor Paish seems valid for this purpose—though the period is rather a short one. The comparison of 1948 with either year seems much more doubtful. First, there was probably still a significant post-war recovery effect in 1948 and 1949. Secondly, unemployment and unfilled vacancy figures suggest that capacity in 1948 was much more fully employed than in the later years,—Yours faithfully,

London, SW1 D. C. PAIGE

Southern Rhodesia

SIR—May I answer the four points on which Major Patrick Wall charged me with "complete disregard of fact" (in your issue of August 12th) in my report on the Southern Rhodesian referendum?

First, the question whether government party members said they could and would eliminate the fifteen lower roll seats "if Africans proved unco-operative." Despite the official government denial by which Major Wall sets full store, I can give him the names of two United Federal Party MPs who made this point most explicitly at a private meeting and explained it could be done by getting a simple two-thirds majority. Major Wall, as a Southern Rhodesian landowner himself, should know that in Rhodesia what is said in private house meetings often wins more votes than do public statements. He is of course right in saying a two-thirds majority is needed to alter the composition of the assembly and that agreement by all four races voting separately in a referendum is needed to raise the franchise qualifications. But he is wrong in suggesting that "the franchise qualifications in effect determine the composition of the legislature" and implying that no matter which roll, there is a uniform equation between voters and seats. Official government estimates dispose of such an idea: they calculate there will be from the start twice as many voters to each lower roll constituency as there will be to each upper roll constituency. (Even that statement is a simplification, as most statements have to be with Rhodesian constitutions, and it disregards the cross voting effect which is irrelevant to this point.)

Secondly, the number of dead. On the day I cabled my article it was reliably reported that four had been shot dead. The government later denied that more than one had been killed on the Monday night; but on the day of this denial a young man died in hospital from wounds received the night before. The death toll was therefore two.

Thirdly, the number of people who voted in the National Democratic party's referendum. Frankly, I don't know who these "official observers" were who estimated that only 90,000 voted. If they were police they were present at only a few polling stations. If they were a network of African informers, did they stand conspicuously by the stations counting the queues all day? I don't believe they did. The organising secretary of the UFP gave a figure of

150,000 voters three days later and it was lowered to 90,000 only a week after the referendum. I would place more reliance on the NDP figure of 300,000: after all, they had the advantage of having the ballot papers to count. Major Wall is entirely unfair to the NDP in saying the referendum "paid no regard to the secrecy of the ballot box." I visited about twenty polling stations and at every one of them a voter could have voted secretly. The fact that few voters bothered to hide their preference is quite another matter.

Lastly, my "fantastic distortion of the facts" in writing that Sir Edgar Whitehead "has wiped away" clauses requiring laws that technically discriminate against Africans to be submitted to Britain. That paragraph summarised Sir Edgar's achievements as seen through the eyes of an average white Rhodesian voter. Would Major Wall call that view distorted? The Declaration of Rights which he praises so highly has been criticised by many Rhodesians, including a group led by Mr Garfield Todd, the former premier, as offering "totally inadequate safeguards" because of the powers left to ministers to interfere with the courts. Sir Robert Tredgold, the former federal chief justice who campaigned against the proposals, has also spoken of the "defects" of the Declaration of Rights.

I would like to be able to agree with Major Wall that the referendum result was "a tremendously encouraging victory for liberalism and multiracial co-operation." Sir Edgar has perhaps a year's opportunity to turn it into such a victory by radical reforms; but the methods by which his party won the referendum did not suggest they were fighting for liberalism.—Yours faithfully,

YOUR SPECIAL CORRESPONDENT IN SALISBURY

Information and Investment

SIR—The way in which your reviewer of July 29th has misunderstood the nature of the destructive part of the argument of Mr G. B. Richardson's new book will be immediately obvious to anyone who reads, as any serious economist will have to, the first two chapters of the book. But fairness, if not the plight of the marginal buyer, demands that the record should be set straight.

Mr Richardson does not indeed give us any empirical evidence that would be relevant for testing the predictions implied by the usual model of a perfectly competitive market. He would be inconsistent if he did. His principal object seems to be to show that the model, quite apart from those empirical questions, so fascinating to your reviewer, of how it is to be modified to fit a particular case, is a logical mess. For if we make all the assumptions required in the model we find we have left no friction and no ignorance. Now if each producer is to know how much he should plan to produce in the long run, he has to know how much each other producer intends to put on the market, and when. There is then a dilemma. If there are no imperfections in the market which allow or compel a sequence of actions, how is it logically possible for all producers to acquire this amount of knowledge? On the other hand, if such imperfections in the diffusion of information, or in response to it, are logically necessary (though not sufficient) for equilibrium to be approached, then what becomes of all those arguments about economic policy which are conditioned by, if not dependent upon, the workings of the model of perfect competition?

Mr Richardson repeatedly admits the tentative and incomplete nature of the later constructive sections of his book. But he has made it clear to at least one reader, if not to your reviewer, that some new analytical construction is necessary. For the "extremely useful" taxonomy of the perfect competition model has been shown to be the result not merely of theoretical abstraction, which is obvious, but of a fundamental logical flaw, which was not. As a result of Mr Richardson's work, before the economist can follow your reviewer into the field with a questionnaire he will have to spend some time in his ivory tower making sure that his questions still make sense. And is that not what ivory towers are for?—Yours faithfully,

Leeds A. SUTHERLAND

China and Cambodia

SIR—The Ministry of Industry of Cambodia has requested me to point out that your Note of the Week "Unhappy Customers" on page 445 of *The Economist* of July 29th is inaccurate in two particulars.

The state plywood factory referred to has not ceased production but is still working. The quality of our plywood products is not inferior to those of imports of the same categories, and the sales of these products from our factory are maintaining a normal rhythm. Admittedly there is a slight surplus in production, but there is no slump in sales.

The state textile factory is not losing customers, and indeed is at present unable to meet all the demand for its production.—Yours faithfully, CHEA SAN,
First Secretary

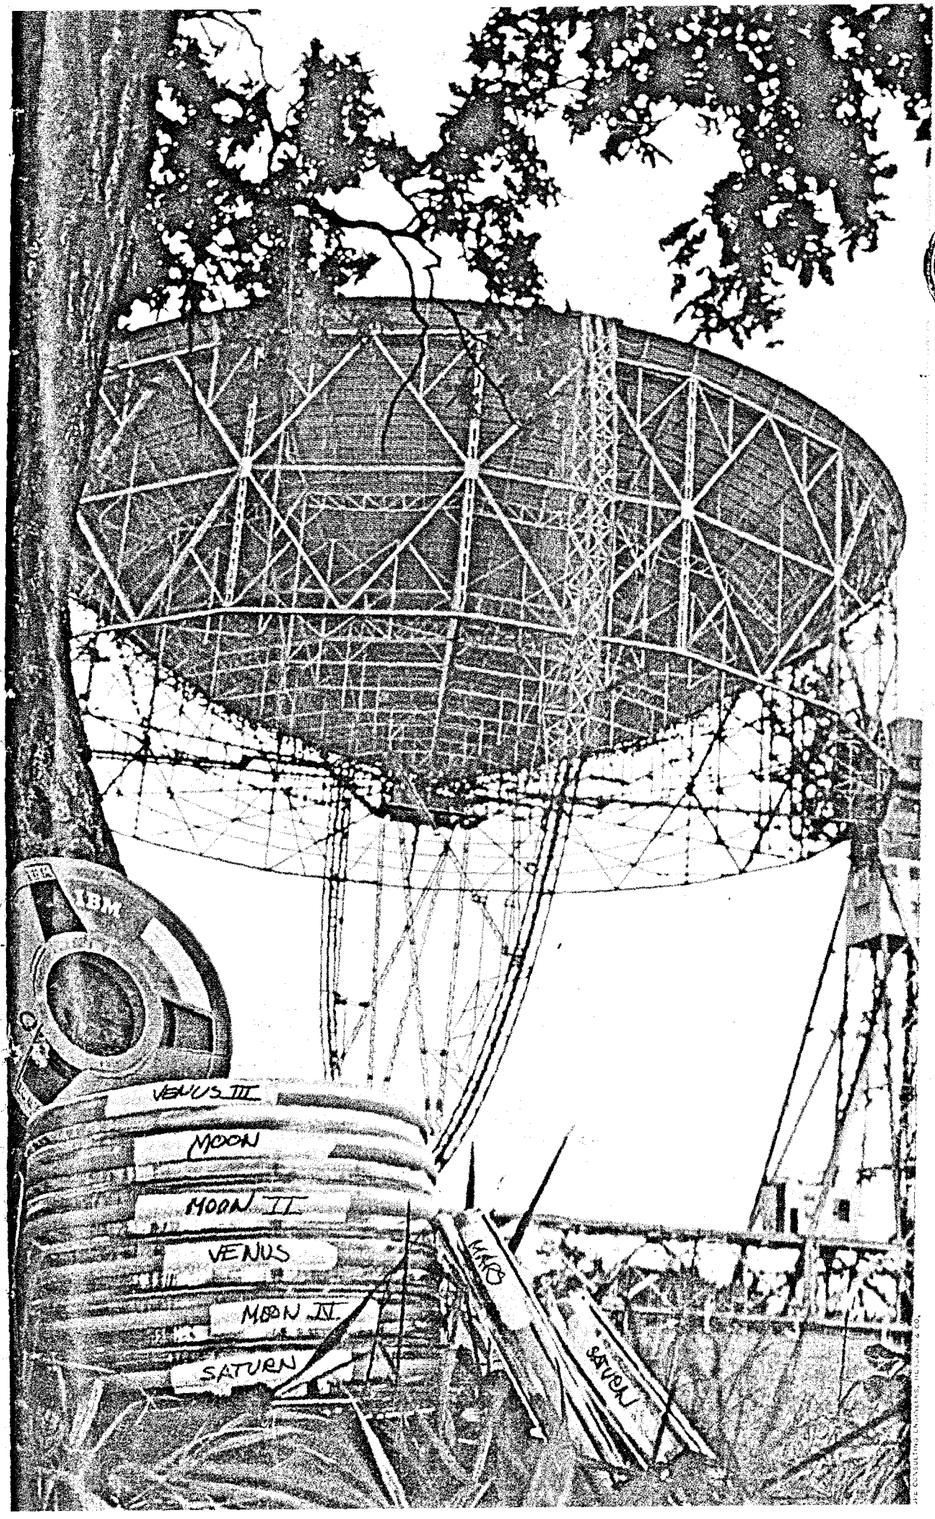
Royal Cambodian Embassy,
London, NW8

BOOKS

Inhuman Nature

The Informed Heart

By Bruno Bettelheim.
Thames and Hudson. 318 pages. 35s.



Thought Reform and the Psychology of Totalism

By Robert J. Lifton.
Gollancz. 520 pages. 30s.

THESE books have much in common. Dr Lifton describes the experiences of twenty-five western people, mainly missionaries and businessmen, and fifteen Chinese intellectuals, all of whom had undergone thought reform in prisons or revolutionary universities in China, and who had later left China for Hongkong. A year in Dachau and Buchenwald provides the background of Dr Bettelheim's book.

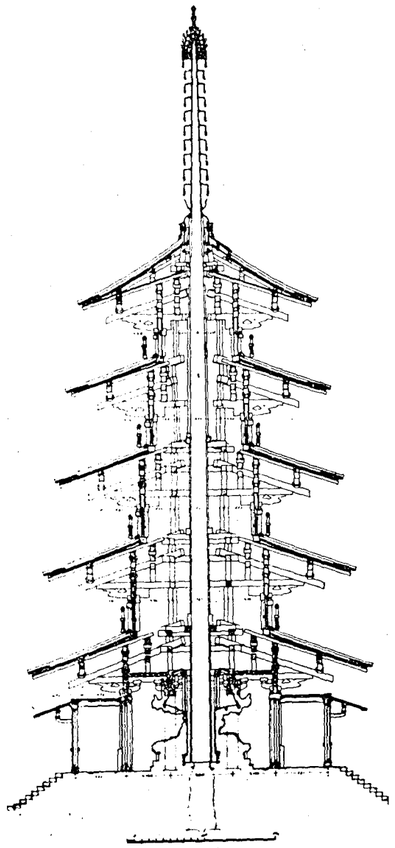
Both, therefore, have a common theme: the deliberate modification of personality by coercion and by unwearying exhortation. Both share a common language and were written by psychiatrists who have practised psychoanalysis, though Dr Bettelheim found the psychoanalytical framework quite inadequate to account for human behaviour under extreme conditions. Both, also, successfully explain mysteries that have long perplexed outsiders. What makes prisoners consent to dig their own graves? How are children induced to denounce their parents? Why should honest people make false confessions about germ warfare? Why should prisoners betray each other? How are people induced to file in thousands into gas chambers?

Dr Bettelheim's book is the more interesting: perhaps because Germany is nearer than China in both distance and culture, and its pathological behaviour in the past is more familiar; more probably because the book is autobiographical. The sickening process of dehumanisation has never been described before with quite such insight. His account of the psychology and motivation of the SS guards and their curious two-way relationship with their captives sheds light on similar relationships in institutions nearer home—in boarding schools, in mental hospitals and in prisons. The author's achievement is the more impressive because he was unable to bring out of the camps a single note of his observations on the behaviour of his fellow prisoners or their guards; he implies that his determination to remember, and to make something constructive out of his appalling experiences, was the thing that may have saved him from becoming one of the "*muselmänner*," the walking corpses who, defeated in their efforts to adjust themselves to their surroundings, had surrendered to it and lost the will to live. The survivors seem to have determined to retain some shred of

SPACE PROBES HAVE BEEN SUCCESSFULLY TRACKED BY RUSHING REPORTS FROM THIS RADIO TELESCOPE AT JODRELL BANK, ENGLAND, TO IBM COMPUTERS IN LOS ANGELES. CONSULTING CELESTIAL DATA ON REELS OF MAGNETIC TAPE, THE COMPUTERS CAN QUICKLY FIGURE A PROBE'S SPEED AND TRAJECTORY.

UNDER SECRETARY TO STATE
4 SEP 1961
PUBLIC DEPARTMENT

A watch on space in a quiet meadow



A huge silvery dish swinging high above a lush Cheshire meadow has been teamed with IBM computers 6,000 miles away in California to link scientists on the ground to probes far out in space. The dish is the Jodrell Bank radio telescope at the University of Manchester, the largest fully steerable radio antenna in the world. The computers are in the Space Technology Laboratories, Inc. centre in Los Angeles. Together with smaller antennas, they have formed a world-wide tracking network.

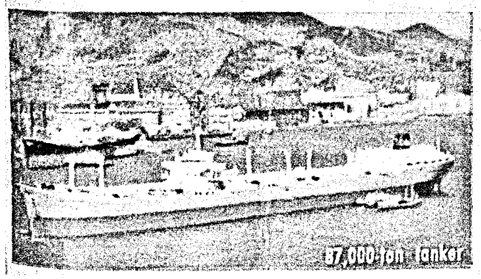
Far out in space—they've been tracked up to 22 million miles—the vehicles, little larger than a beach ball, speed at almost 20,000 miles an hour. To pinpoint signals as a probe swings up over the horizon, each tracking antenna must be aimed with exquisite precision—the computers' job. Fed information rushed from each tracking antenna in turn, the computers can compare it with celestial data in their memories and race through complex calculations to find a probe's trajectory and speed. These are needed to aim the next antenna in the network and thus track a probe continuously.

Space exploration would be impossible without computers to analyse data, carry out involved calculations. IBM data processing systems do this sort of thing fairly quickly. A problem that would take 800 years to solve with pencil and paper can be cracked by an IBM 7090 in just five minutes.

Few scientists have the patience to wait 800 years for an answer; advanced research laboratories all over the world are equipped with IBM high-speed computers.

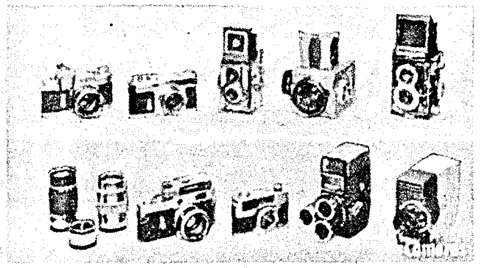
IBM

HORYUJI PAGODA

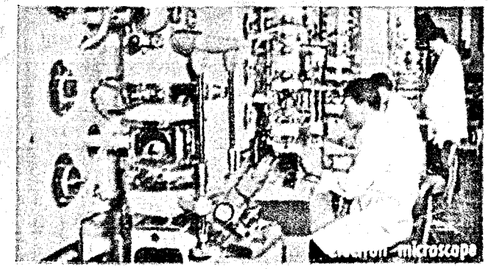


The exact year in which the Horyuji Pagoda was built is not known, but it is recognized as being completed in the early part of the 7th Century. The Horyuji Pagoda is the world's oldest wooden structure and is now being preserved by the Japanese Government as a national treasure. It's total height is 30 meters. As can be seen in the diagram the center pillar is not touching the ground. It is hung from the top and held in place by spring-like wooden supporters. This type of architecture makes it very strong against earthquakes and wind because the center of gravity is flexible. On the walls and ceilings of this pagoda were beautiful colored paintings which are now barely discernible.

THE ECONOMIST AUGUST 26, 1961



THE BRAINS THAT BUILT THE PAGODA



The most astonishing feature of the extravagant Japanese pagoda is that it is built around a single wooden pillar . . . and the base of this pillar does not touch the foundation. Besides the pagoda, some of the world's oldest and largest wooden structures are still standing in very good condition in Japan today. The brains and skill that accomplished such architectural feats centuries ago have been handed down through the years to the modern industrial age.

Today, Japan's industries are geared to take in stride the rapid industrial revolution which marks our century as unique in the field of technical developments. Outstanding among the numerous Japanese industries whose annual export figures show a steady increase are the shipbuilding, electronics, optical, heavy electric, camera, rolling stock, textile machinery, chemical fertilizer, and power machinery industries. JETRO cordially invites your inquiries on trade.

self-esteem, some tiny realm of self-assertion, some slight opportunity to make a personal decision. The others had given up any effort to control their environment, they no longer fought for food, and died.

Dr Bettelheim has little or nothing to say of the long-term effects of these conditions on those who survived. One would expect them to be scarred for life and incapable of living ordinary lives again. It is, however, reported that they usually quickly recovered and that the legacy of invalidism and inability to live in ordinary society has been surprisingly small, even after years of extreme stress.

Dr Lifton's book bears out the impression that the effects of these conditions are transient. He assiduously followed his western subjects to Europe many years after their experiences of thought reform, and several years after his original interviews with them in Hongkong, and tried to estimate how effective, in the long term, their brain-washing had been. All appear to have been affected in some degree, but only one or two at all seriously; to the extent, for example, of changing the former pattern of their lives. That thought reform does not usually produce enduring changes is also implicit in the short-lived episode of "the hundred flowers." In 1957, an invitation to "freedom of independent thinking, freedom of debate, freedom of creative work, freedom to criticise, to express one's own view" produced such a storm of criticism of party, regime, despotism and thought reform itself that the lid had to be hurriedly clamped down again. That all those years of talk, millions of words, tons of group pressure, and sinuous coils of subtlety could prove so monumentally ineffective is profoundly encouraging, for Chinese techniques of thought reform have clearly left the Russians far behind.

The episode of "the hundred flowers" lessens the force of the obvious criticism of Dr Lifton's work: that because he worked in Hongkong he saw only the failures of the thought reform process. But there are other criticisms. Unfortunately, the picture of thought reform in operation reaches the reader only at second-hand and through the psychoanalytically trained filter of the author's mind. The case histories are very long life histories and abound in terms like "negative identity", "identity reinforcement," "negative self-image" and "group identity." The index, in fact, lists forty-four nouns and adjectives qualifying "identity." A brief scanning of half a dozen pages shows that the index is incomplete, as it omits "i-struggle," "supernatural-i," "i-collapse" and (as one might expect) "overall-i." It is the kind of language that makes one want to implore the author to present the facts and cut the cackle, an impulse that is not evoked by Dr Bettelheim's book though it is just as heavily loaded with psychoanalytical interpretation.

These over-interpreted case histories occupy more than half of Dr Lifton's book. The remainder, which deals with the history of thought reform from its origins in the twenties, with its impact on native culture and religion, and with its relation to Marxism and Russian communism, will be new to many readers and could not have been better done.

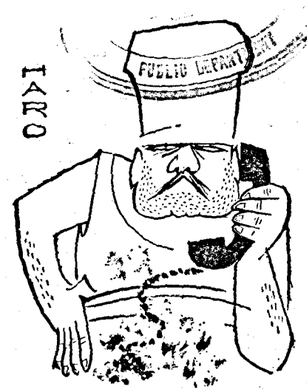
The authors of both these books have done humanity a service in thus exposing inhuman motives and methods. At least we can now better understand man's inhumanity to man even if we can do precious little to prevent it.

The Human Past

The Dawn of Civilization

Edited by Stuart Piggott.

Thames and Hudson. 404 pages. £8 8s.



WRITTEN history gives a patchy record of man's endeavours in the last five thousand years, but to the archaeologist the tale of his achievements and failures stretches back over a period a hundred times as long as this. The aim of this book is to sift the evidence and survey the foundations of civilisation on a worldwide basis. The result, complex, authoritative yet still questing, is pre-eminently exciting.

An all-British team of thirteen scholars, each an expert in his own field, has contributed the thirteen sections, each of which is devoted to a region where a distinct civilisation arose. There is, for instance, Sir Mortimer Wheeler on India, who incidentally supplies the definition of what this book is about. "Civilisation, in a minimum sense of the term," he writes, "is the art of living in towns, with all that the condition implies in respect of social skills and discipline." There is Mr Cyril Aldred with such lively comments on Ancient Egypt as this:

> All this achievement was the exotic flower upon a plant whose root was the eternal Egyptian peasant, forever toiling in the fields, living with his animals for the moment only, never far from sudden plague and famine, hedged around by grosser superstitions than those of his masters, but able unlike them to escape the inhibitions of polite society, and preserving intact the same sardonic gusto, the same manners and customs that have brought them virtually unscathed through five thousand years of changing history.

There is Mr Seton Lloyd on Anatolia, describing the historic bridge between Europe and Asia, and Mr Sinclair Hood conjuring up the "water-linked paradise" of the Aegean some five thousand years ago.

The profusion of talented writing has been brought together under the editorship of Professor Stuart Piggott and each section is presented in a similar way. Coloured and monochrome illustrations on glossy paper, supported by subsidiary text rather too substantial to be described as captions, is followed by the learned text on buff-coloured matt paper with maps, architectural plans and other drawings. The assiduous reader may well question this arrangement. It involves cross-references, the retracing of steps and, in parts, the re-reading of almost the same chunks of type on two kinds of

The chef's nightmare

A MORE OR LESS apocryphal story about a young dramatic critic at Oxford tells how he would, in restaurants of reasonably refined moeurs, order and eat an ice-cream, the main course and the soup, in that order.

This is all very well for a critic. But it is very worrying for the chef. Tradition and training tell him that this is against the natural order of things, and incidentally takes no account of his efforts to plan a logical sequence of courses.

There's a similar problem of precedence when you pick up The Observer on Sunday. Here is a veritable beanfeast of ideas and articles and features. But where should one start?

Beginning at the end

Does one begin at page one, and work steadily through? This isn't a bad answer, but it lacks enterprise, and so it is out of harmony with the paper itself. And there is, incidentally, a good case for starting at the very end, for this is the page that carries 'The Week', a useful digest of news that brings you up to date with the events that you may have missed.

Clearly the main course on the menu is news, real news. But why start with the main course? How about a wry Feiffer cartoon, or a Paul Jennings fantasy, as an appetizer? And then there's the effervescent fashion-writing of Katharine Whitehorn, if you're a woman. Or if you aren't.

Unexpected insights

You might turn first to the financial expertise of the City pages. Or to Table Talk's unexpected insights into the lives of the great, and the talked-about. It may be that you will head straight for The Observer Profile. Or you may begin your Sunday-morning feast with the review pages; Kenneth Tynan, Maurice Richardson, Philip Toynbee and A. Alvarez are among the famous names who provide fare that is rich, rare, and never over-sweetened.

But in the end, and this is where the culinary analogy breaks down, you will probably decide that it doesn't much matter where you start reading The Observer. The important thing is to start! J.B.L.

ADVT.

paper. Its justification, presumably, is that it caters for the quick-to-please reader who will be content with the glossy pages only. Be that as it may, even he is unlikely to profit from the childlike, highly-coloured views of "reconstructed scenes," which, scattered through this book, are intended to show man's living conditions in different environments and cultures but succeed only in displaying the same hand of modern execution. These are quite out of keeping with the high, sophisticated standards of the photography.

These minor doubts apart, all praise must go to this publishing enterprise, which has taken three years to complete. The fact that the last word has not been said on the subject, that even while the book was being put together new archæological discoveries were being made, the reflection of how comparatively recent is our knowledge of even the Sumerians—all this adds to the fascination of this material. Since man has succeeded in multiplying himself chiefly by improving his equipment for living, this is a record of the beginnings of technology, the story of man asserting his mastery over the world, his discovery and use of metals and other materials. There are some superb photographs of the earliest known products of human handiwork and genius, of exquisite works of art designed perhaps as part of a magical ritual or perhaps as memorials. The painted pottery from the later Chalcolithic period, the Mesopotamian scarlet ware, Indus stone sculpture, a Javanese bronze warrior on horseback, the haunting statue of an Egyptian god-king, a delicate piece of eighth century BC Phoenician ivory—all form part of these splendid illustrations of cultural variety.

A Feminine Hand

Gertrude Bell: *From her Personal Papers, 1914-1926.* Volume Two.

By Elizabeth Burgoyne.

Benn. 399 pages. 45s.

Intimate letters hold the mirror even closer to the writer's face than does a diary. For, once posted, they are gone and cannot be tailored to fit later thoughts. They therefore represent the limitless vagaries of the mind. All of us think in zigzags and circles as well as straight lines, and in few of us would private thought stand up to public scrutiny as well as do these letters home written from Mesopotamia by Miss Gertrude Bell.

She is already familiar in the two volumes of such letters published by her stepmother and sister not long after she died, but both these editors, for reasons of delicacy, omitted most of the personal story. Now that time has blunted the cutting edge of some of her private comment, Miss Burgoyne has been given a freer hand. Most unobtrusively, for she never adds a word where none is necessary, she has done a skilful job, for she has contrived to produce a consecutive narrative without repeating what we already know.

Nineteen-twentieths of the book, therefore, are by Miss Bell, and, in her loving, swift and easy prose, scribbled to inform and entertain her family, she gives the minutiæ of the formative years of the Kingdom of Iraq. The rebellions and unexpected smooth passages, her relations with her colleagues, the endless comings and goings of Arab notables, the hesitations, the trying summers, the green shade of date groves and the delicious taste of power—all are there till, at the last, she felt the pang of being needed less by Arabs in a hurry to manage for themselves.

It is debatable whether all the details will interest those who come fresh to the subject, but any specialist will learn much about British imperial practices, including the permanent urge to administer unadministered areas, and the skill with which King Feisul (helping with his charm but hindering by his weakness) was eased on to a throne that was anything but warm for a stranger. Yet even the reader who gets lost in the jungle of Arab names will find that the book has worth as a human document. Gertrude Bell is a daughter of her class and generation; she takes servants and money for granted and was never tired till she was forty-six. She is so accustomed to her own way that she trusts her judgment above that of colleagues and superiors, and, though she "almost invariably" shows them her letters to the great in London, does not see how awkward they might at that date find it to tell a woman colleague to shut up. She could be maddening, but they all admired her for her integrity, hard work, indifference to publicity, creative achievement and good company. So did servants; one of the most endearing figures in the book is her maid Marie Delaere, who is caught packing crepe-de-chine nightgowns for a rough shooting party because someone's Sudanese servant is sure to look. This book is a self-portrait; it remains for a biographer to examine a very remarkable woman through the eyes of the rest of her generation.

Miss Burgoyne calls for one important reproof. When she published her first volume (*1889 to 1914*), reviewers mentioned her many careless mistakes, and well-wishers sent her lists of them. She has paid no heed, and here are many more. She places Lawrence's revolt in the desert a year too early; she makes a jumble of Persian place names where a glance into a gazetteer would have put her right; did Gertrude always spell Edwin Montagu with a final "e" and Ralph Glyn with two "n's"? She confuses the peace treaty with Turkey with the treaty that terminated the mandate and draws a wrong deduction from her mistake, and she indexes the same man as two separate people when (as he is alive today) a dip into "Who's Who" would have told her that he served both in Iraq and Palestine. In a word, she often irritates where, since she was handling such splendid raw material, she should have given nothing but pleasure.

Telly Lobby

Pressure Group: *The Campaign for Commercial Television*

By H. H. Wilson.

Secker and Warburg. 232 pages. 18s.

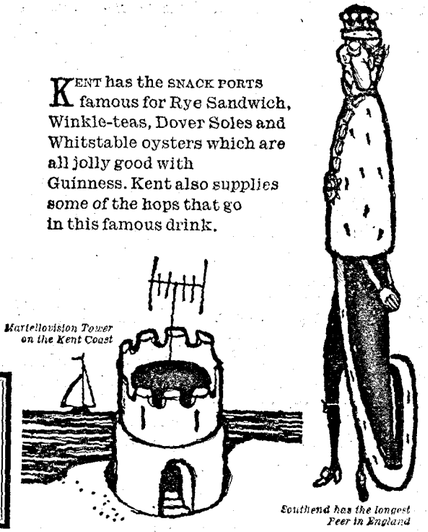
The decision to adopt commercial television in Britain represented the greatest triumph that any pressure group (the word is not used here in any pejorative sense) has won in the last generation. Professor Wilson's admirable book was not needed to show that; but he documents the nature of the triumph in an original way and offers a work that no serious student of British politics can afford to miss. It is not brilliant—but it is very readable: it is not without errors—but it is scholarly; above all, it tells a story that is important in itself and it provides a revealing example of how, in special circumstances, a government's policy can be influenced.

This book tells more about the genesis of the decision to adopt commercial television than about details of the 1954 Act. Even on the basic decision, Professor Wilson leaves major questions unanswered, because those involved were inaccessible, or discreet, or just forgetful. He remarks that his difficulties in piecing together just what happened seven or eight years ago makes him look with awe at the confidence with which historians write of events long past. A future scholar looking at the struggle over commercial television will find that, though some new papers may be available, others will have been destroyed and that fewer and less accurate memories will be at his disposal for consultation. Professor Wilson may be at fault on details and may leave some problems unresolved, but he probably goes farther towards the truth than anyone setting about the task ten or twenty years later would have done.

Perhaps the most significant revelation of this book is the extent to which Lord Woolton and certain figures in the Conservative Central Office were involved with the forces pressing the Conservative Government to introduce commercial television. In his last chapter, Professor Wilson puts forward some provocative speculations about the changes in the nature of the Conservative party that facilitated the defeat of the traditional, rather paternalist, values of Lord Halifax and the many Establishment defenders of the BBC. Unquestionably television advertising has helped to spread the ideals of the new consumer society and to continue the undermining of the older socialist appeals.

Since the study of pressure groups in Britain was seriously launched five years ago by Professor Finer, it has been taken up assiduously by American scholars. Professor Wilson now joins Professors Eckstein and Beer as a major contributor to the understanding of how these necessary but extra-parliamentary forces operate. Perhaps he overrates the wider significance of the television struggle. It was an extreme case in which everything worked aright to favour

LESSON 5



DEVON is famous for Sea Dogs who went out in barks to meet the foe. (An Exe marks the spot where they went out.) PLYMOUTH has a Ho which it gives whenever a Guinness comes in sight.

SOMERSET is famous for BATH which was occupied by the Romans. A Cheddar gorge can also be enjoyed in this county. Usually accompanied by Guinness.

A Roman Bath Chap

KENT has the SNACK PORTS famous for Rye Sandwich, Winkle-teas, Dover Soles and Whitstable oysters which are all jolly good with Guinness. Kent also supplies some of the hops that go in this famous drink.

Martello-tower on the Kent Coast

Southend has the longest Peer in England

the lobbyists. Another such issue is unlikely to arise in the same way—although after the Pilkington report appears, the battle over commercial radio and the third television channel may have many resemblances to what has gone before. Professor Wilson's book will undoubtedly provide ammunition in the struggle.

Link Between Revolutions

Marxism: *An Historical and Critical Study*

By George Lichtheim.
Routledge. 432 pages. 40s.

STILL they come. Here, one is tempted to say, is yet another ill-advised attempt to fan the dying embers of Marxian polemics. But Mr Lichtheim's book is a genuine contribution with novel elements to a study of a neglected aspect of *Marxforschung*: the interrelation between Marxist theory and the historical circumstances in which it arose and flourished. This application of Marxist analytical method to Marxian theory yields interesting results, and the author has put scholars under a considerable debt with this pioneering effort. The book is, moreover, well and clearly written—a virtue not often found in the literature on this subject.

Mr Lichtheim regards Marxism as the doctrinal link between the French and the Russian revolutions; and he sets out to show how its theory and practice developed under the impact of Central European political and intellectual problems in the hundred years after 1848. After an introductory account of the heritage of the French revolution (1789-1870), he gives a brilliant summary, in less than twenty pages, of what he calls the "Marxian Synthesis." The only criticism one might make of this part of the book is that it hardly touches on the economic aspects, which are left for a much later stage. The next four parts bring the story through the next hundred years, ending with "The Dissolution of the Marxian System 1918-1948."

There is much in this history that will enlighten both those who come new to the subject and others who are already familiar with the tortuous polemics among Marx's followers. Mr Lichtheim most skilfully interweaves the critical analysis of ideology with the historical presentation of the various phases through which the socialist movement passed during this eventful period. These sections form a useful supplement to Professor Acton's coldly logical analysis in "The Illusion of the Epoch."

Inevitably, the most interesting part of the book is the final one, which shows the last phase of Marxism, inaugurated by the Russian revolution and culminating in the "petrifaction" of the doctrine after the second world war. The essence of the author's thesis is his description of Leninism as an ideology in the Marxian sense, "i.e. as a system of thought which obscures the facts it purports to describe," in particular in the "systematic misuse of the term 'proletarian revolution' to describe the totalitarian rearrangement of society *after* the capture of power by a party." Mr Lichtheim has not much difficulty in showing (but he shows it very well) that Marxism, as an intellectual system, has stagnated since the 1930s notwithstanding the fact that it has become the official ideology in the Soviet orbit; and that there is little relation between its relevance and adequacy to the present day and the expansion of Communism.

Prophecy as Business

Prophets and Prediction: *The History of Prophecy from Babylon to Wall Street.*

By Richard Lewinsohn. (Morus)
Secker and Warburg. 318 pages. 30s.

"PROPHECY," declares Dr Lewinsohn, "has always been a kind of business." In the early days, 2500 BC or so, the seer who probed into the future did so with an eye on the temperament of the king his patron. Today the art of prediction, as practised in government and business circles, is surely more impartial. Yet, when all is said and done, every prediction is a gamble, and a professional gambler cannot go on losing for ever: in the old days, his bad luck might have cost him his head, today it may cost him his job. No wonder that there is a fashion to substitute for prediction the term projection, which has a less committed ring.

This book describes how prediction has advanced from irrational and mystical procedures such as the inspection of the intestines of an animal or a flight of birds, heathen rites and the searchings of the sky. Stuff and nonsense, certainly: yet the language of the stars is still used and the horoscope seems to be an essential feature of the twentieth-century mass-circulation paper.

The Donne theory of time is discussed, the attempts to forecast wars, business cycles, weather, elections, sex, diseases—the whole bag of tricks. But when Dr Lewinsohn, who is a doctor of medicine, touches on the mathematical theory of probability and present day methods of econometric forecasting, he gets himself into deep water. It is nonsense to quote Bernouilli's theorem as stating that the probability of an event is a function of its occurrence in the past. Gallup appears as the priest of public opinion polls, but there is little about the way in which sample inquiries are being used to judge business and consumer intentions. And surely electronic computers should have crept into the chapter on the future of prediction?

But, after all, this is a history book and if there is comparatively little about current methods of forecasting and decision-making in it, it has much to interest, stimulate and amuse its readers. It is a pity, however, that there is evidence of hasty proof-reading, including a complete inability to spell "stochastic." And why econometry and econometrists?

Engaging Demagogue

Feargus O'Connor

By Donald Read and Eric Glasgow.
Arnold. 160 pages. 21s.

FEARGUS O'CONNOR was recognised by his radical contemporaries, and has generally been accepted by posterity since, as a colourful, bibulous, lunatic Irishman, sincerely committed to the improvement of the lot of the poor but without any practicable plans for that purpose, and wholly blinded by his own conceit. He was, as Lovett put it, "the great I AM of politics," who introduced into the Chartist movement "his Irish braggadocio about arming and fighting." Astonishingly successful in arousing the passions of the poorest classes, whether by speeches at vast public gatherings or through the pages of his newspaper, the *Northern Star*, which for a brief six months sold as many as 50,000 copies a week, O'Connor achieved nothing. Four years after his death his admirers erected a statue of him with an inscription that carried no more than his name and the date; there was little else to add.

This engaging demagogue is now revived and reinflated by Mr Read and Mr Glasgow. Stimulated by the sentimental judgment of the late G. D. H. Cole that O'Connor was "the most influential figure in nineteenth century British history still without a biography," they have sought to provide his biography and to demonstrate his influence. But the facts of the one, which are lucidly presented with admirable brevity, remove all grounds for believing the other. If, as the authors claim, "O'Connor shared the centre of the political stage with Sir Robert Peel and with Richard Cobden," then they have strikingly failed to prove their case. It is not, as they put it, that O'Connor was not sufficiently "respectable" to appear in the National Portrait Galleries of London or Dublin, but rather that he was not sufficiently important. As they themselves admit, O'Connor "had no intention of leading an English revolution"; and he got nowhere in his "serious political purpose" to repeal the Irish Union and to establish the six points of the Charter. His dreams of Anglo-Irish co-operation made no progress; his attempts to frighten the government into conceding the Charter "failed completely"; and his hope of making "a paradise of England in less than five years" through the medium of his cranky land scheme was utterly falsified by events.

It is not, then, on the grounds of his political significance that O'Connor is worthy of remembrance. But there is, perhaps, some comfort to be drawn from the story of his failure, as from that of his twentieth century counterpart, Horatio Bottomley, that effective political power in Britain cannot be achieved by demagogy alone.

THE WORLD OVERSEAS

Bonn in Search of a Policy

FROM OUR BONN CORRESPONDENT

ALONE political sandwichman—such as one would expect to see in Whitehall rather than in the Koblenzerstrasse—plodded to and fro near the federal chancellery the other afternoon. Fore, his home-made inscription ran: "17 million Germans in a concentration camp. But K. Adenauer abuses Willy Brandt." Aft, it was: "Ulbricht is satisfied with Adenauer. We Germans are not." The police ignored him for a while, then moved him on. Passers-by observed, outwardly at least, a strict neutrality. Were no hearts whispering applause?

We shall have to wait until polling day to determine the extent of the damage done by the latest developments in Berlin to the Chancellor's reputation for political sagacity. Probably it is not far-reaching. Yet the sandwichman is certainly not alone in his displeasure. Misgivings expressed more decorously by others suggest that unless he effectively defends his policies during the next three weeks Dr Adenauer will at any rate not win the absolute majority upon which he has been counting. A new opportunity has been presented to the Free Democrats to bid for a share in the government, and they are planning to exploit it as vigorously as the game and the hour allow. It was not surprising that before he left for Berlin on Tuesday Dr Adenauer found time and stamina to make a twenty-four-hour election sortie in Lower Saxony with the object of wooing the many former supporters there of the disintegrated right-wing German party.

Polling day is Sunday, September 17th. At the peak of last week's excitement over Berlin, the chairman of the Free Democrats, Herr Mende, proposed that it should be advanced to September 3rd. In arguing that the distractions and animosities of the election campaign ought now to be curtailed, Herr Mende was unquestionably sincere. At the same time he must have scented the probability of new doubts in the country about the merits of Dr Adenauer's past inflexibility—the uncompromising approach to east-west problems that the Free Democrats have often condemned. But the federal president, who decides the date of the Bundestag elections, rejected Herr Mende's application. No harm would be done by sticking to the present arrangement, Herr Luebke ruled, so long as the contending parties conducted their hostilities with due moderation. The president named no names. Few of those who read his appeal can have failed to reflect once again on the lack of dignity and the ill-chosen timing of the chancellor's diatribes against the governing burgomaster of Berlin, "Herr Brandt, alias Frahm." The coldness between these two candidates for the chancellorship palpably chilled what was intended to be Dr Adenauer's morale-raising trip to Berlin this week; and there has been the incredibly childish dispute between the two major parties for the honour of having invited Vice President Johnson to West Berlin last week.

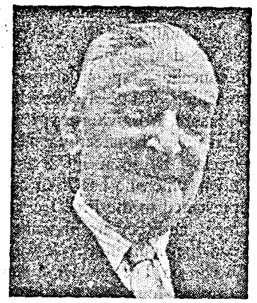
And so the election campaign goes on, though for the time being with a marked hesitancy among most of the participants. Towns and villages are still plastered with the pre-Berlin slogans—with the Christian Democrats' proud claim to "Success and experience," the Social Democrats' vague exhortation "Forward with Willy Brandt," and the Free Democrats' laconic "Germany," shrieking with a black eagle a ground of shrieking scarlet. But at all the party headquarters heads are pressed anxiously together, reassessing the current propaganda effort and thinking up appropriate readjustments in the light of what has happened. Unqualified appeals to the voter's sense of creature comfort have abruptly been made to appear in thoroughly bad taste. The problem is to find any new sound, positive planks to put into the party platforms. The Social Democrats have already come out with "Go to the poll—help Berlin and Willy Brandt." The All-German party, a shaky amalgam of the remnants of the German and Refugees' parties, is triumphantly proclaiming the "total and catastrophic end of the policy of Dr Adenauer and his government," without proffering the slightest guide to a way out of the mess. As Herr Mende, on behalf of the Free Democrats, modestly put it at the emergency session of the Bundestag on August 18th: "In this hour nobody can claim success for his *Deutschlandpolitik*." The German policy that had been conducted since 1945, he said, would be judged by what had been achieved for the whole German people. Its undeviating aim must still be the restoration of German unity in freedom. This was the special task of the present generation of Germans, and they would be judged by their success or their failure. Herr Mende agreed with Dr Adenauer, who had spoken before him, that the government (hitherto so suspicious and full of doubts) should now actively encourage negotiations with the Soviet Union concerning the future of Germany and Berlin.

Indeed, this was the only practical step that Dr Adenauer had been able to indicate in his government declaration. The greater part of this formal statement had been devoted to chronicling the east German communists' incompetence and perfidy. Appealing to the Russians "to look at things realistically," Dr Adenauer remarked that it was "unworthy of a great nation to protect creatures despised by their fellow countrymen."

The negotiations now devoutly desired to forestall further attrition are not a matter for the Germans alone. Indeed, the Germans would have to stand, for the most part, in the wings, fanning western resolution and preparing themselves for the required sacrifices. It is what the Germans should and could do by themselves in the long run that is perplexing conscientious patriots. The first reactions to Herr Ulbricht's damming up of his leaking domain, and its long-term significance, have naturally been fiercely emotional. They have also been pathetically impotent, and by no means unanimous. The Federation of German Industries has advised its members not to exhibit at, or even visit, the Leipzig autumn fair. Herr Erhard, the economics minister, declared at first that nobody should be prevented from going to Leipzig, but he has added since that he assumes that no one would be so unworthy as to want to go. The chairman of the Hamburg Christian Democrats, Herr Blumenfeld, a prosperous young business man, has demanded a trade boycott against east Germany; but the minister of defence, Herr Strauss, has said such a move would only aggravate matters. The German Sports Federation and the national Olympic Committee have ruled that there shall be no more sports fixtures between the two Germanies. In west Berlin the Schiller Theatre has cancelled arrangements for a Bertolt Brecht premiere

on August 30th. Protest meetings, full of sound and fury, signifying little, are being held all over west Germany. The only practical measures that have yet been taken concern the continuation and, if necessary, intensification of west German industry's support for the precariously placed, but still at the moment thriving, industries of west Berlin.

But again, west Berlin is in the main beyond the federal republic's safeguarding. On August 11th the east German foreign minister, Herr Bolz, told the People's Chamber unequivocally that the foreign ministers of the "socialist countries" would be holding a conference in the late autumn to discuss preparations for a German peace treaty. With or without west Germany, the treaty would be signed before the end of the year. This week the east German communists' chief propagandist, Herr Norden, announced that the treaty would be signed in December. It is their own response to the inevitable and utter partition of Germany that the west German politicians have now to decide. So far they have done no more than declaim that right is on their side, and all will be well in the end. Presumably some more detailed thinking is in progress.



One effort to help such a process along was made by the Stuttgart historian, Professor Golo Mann, in an article in the Hamburg weekly *Die Zeit*. Professor Mann combined a judicious but devastating analysis of past policy with some interesting recommendations for a future course of action. He envisaged east-west negotiations of some kind (possibly through the United Nations Security Council, through neutral mediators, or direct) with the object of making the east German regime more palatable to its subjects. The conditions might include free elections if that proved possible—but elections in which the issue of reunification would play no part—and a guarantee of basic civic rights, including the right of free speech. The new element is that he envisaged the recognition of such a reformed and tempered east German regime, after a trial period, by the western powers and by Bonn; the Oder-Neisse line would also be recognised; the "irritants" of which the communists complain in west Berlin would be gradually removed; and finally there would be a redefinition of the status of west Berlin in such a form as to preserve the essential rights of the western allies. But this is the sort of down-to-earth stuff which we shall not hear from the party leaders during the next three weeks.

Henry the Navigator

Lusitanian Dialogue

BY A SPECIAL CORRESPONDENT LATELY IN LISBON

Salazar the Defender

SCATTERED about the globe, unchanged and—until this year—unchanging, the crumbs and gobbets of the Portuguese Empire have become the political coelacanths and dinosaurs of the Bandung age. From the six square miles of Macao to the half million square miles of Angola, the empire that Prince Henry the Navigator founded 500 years ago still spans the world—the oldest and now also the largest remaining relic of European territorial expansion. It is an impressive imperial achievement but, like the coelacanth, it is hard to relate it to the contemporary world.

The visitor to Lisbon, probing at the nerve centre of this imperial creature, finds himself listening to a language he had thought defunct, and must bellow back across the gulf of centuries in a tongue that is equally incomprehensible on the other side. The result is not so much a conversation at cross purposes, as an exercise in sheer, mutual irrelevance. There should, of course, be some common ground in the shared historical experience of colonialism. But this is only the visitor's point of view. The Portuguese, he finds, straining his attention across the abyss of incomprehension, deny having shared the experience at all. Their colonialism, they assure him, is not like anybody else's, and never was. It is the fruit of a unique vision of creating a specifically Lusitanian civilisation through cultural uplift and biological miscegenation. Its essential quality is permanence; it does not, and by its nature cannot, entertain any prospect of abandonment or withdrawal from the overseas territories.

To suggest that British, French, Dutch or Belgian experience may be relevant is useless. "We do not seek the same ends," say the Portuguese; "how can we use the same means?" And besides, look what has happened to Africa in the wake of the European abandonment—red dictatorship in Ghana, chaos in the Congo, a wave of anti-white racialism everywhere and Russian penetration throughout the continent. "It seems to me that the hasty abandonment of many territories by European powers is a crime more against the black man, whom it was their policy to instruct, than against the white, even where the latter is threatened with expulsion and is deprived of all his possessions." There it is, the authentic voice of the Portuguese mission—Dr Salazar solemnly lecturing the National Assembly last November.

> We have been in Africa for 400 years, which is rather more than to have arrived only yesterday. We carried with us a doctrine, which is not the same as to be carried away by self-interest. We are present there with a policy that authority is steadily effecting and defending, which is not the same as to abandon human destiny to the so-called 'winds of history.'

Pained by the folly and treachery of his fallen friends, angered by the calumny that his enemies heap on Portugal, alarmed by the sinister successes of the Communists, Dr Salazar has similar rotund rebukes for nearly everyone.

Here he is, for instance, on the role of the United States, after the American vote against Portugal during the Security Council's discussion of Angola last March:

> Of course the United States would not advise or prepare acts of terrorism, directly or indirectly . . . (but) although with different intentions, the United States is now engaging on a parallel policy to the Russian one in Africa . . . weakening Europe's resistance and depriving it of its human, strategic or economic strong points. . . . It is therefore irreconcilable with what America seeks to do through the North Atlantic Treaty. . . . When France, Belgium or Portugal is harmed or weakened by such an African policy, not only is the reciprocal confidence of America's allies in Europe affected but their defensive capacity is also diminished. The troops that are sent to Algeria cannot then fight on the Oder or the Rhine. . . . I believe that if America, tied to ideological oversimplifications, persists in this policy it will become a victim, the last, of this contradiction. (Speech to the National Assembly, June 30, 1961.)

On the United Nations he is more severe:

> The invitation to the Portuguese authorities to cease at once the measures of repression in Angola is an attitude we might call theatrical on the part of the Security Council . . . so seriously does it offend the duties of a sovereign state. Since mid-March neither the Council nor the Assembly has found any opportunity to order the terrorists to cease their massacres and depredations. . . . There may indeed be some foundation for the assertion that the situation in Angola is a potential threat to international peace and security, but only to the extent that some of the voting countries may decide to pass from political and financial aid, as they are giving at present, to direct aid with their own forces against Portugal in Angola. Everything in the world is becoming so topsy-turvy. . . . (June 30th, 1961.)

But there will be nothing topsy-turvy about Portugal:

> I hope we who are sure that we are right and are convinced that we can prove it will not be intimidated. International life is not all lived in the United Nations Organisation. . . . At present the Afro-Asian powers seem to be in the right. But with a little courage on our part they will finally come to understand that there are limits that cannot be outstripped. (June 30th, 1961.)

In this language, self-determination is magisterially dismissed as "the brilliant principle of political chaos in human societies." Those who talk of emancipation "come too late, for the job has already been done. (Portuguese) unity does not allow of transfers, cession or abandonment. The juridical figures of the plebiscite, the referendum, auto-determination, do not fit into its structure either." (November 30th, 1960). And let us try to understand and sympathise, too, with "the drama of societies . . . such as, for example, in Algeria, the Rhodesias and South Africa," whose governments are so sorely misrepresented in the name of "baseless ideologies and instinctive passions." (November 30th, 1960.)

A strange set of bedfellows with which to face the world? Very well, but Portugal will be proved right.

> In a few years . . . . one of two things will happen in Africa. Either progress will be paralysed in many parts with the total ruin of economies, the degradation of peoples and the horror of internecine strife, or we shall see attempts at, or experiments in, international colonialism, irresponsible and for that very reason inhuman, before which the black man, cultured or not, will be no more than a statistical element. Then many of those who . . . demand the emancipation of Portuguese territories, with no

Spanish Shoe-Blacks

FROM OUR BARCELONA CORRESPONDENT

ONE of the impressions that every visitor to Spain carries home, or, at least every male visitor, is the ubiquity of the shoe-blacks. They prowl the streets and squat in the corners of tobacconists', hairdressers' and practically every bar. They are apt to be insistent, and a foreigner may find that they have started work on his shoes before he has had time to protest. They can also play tricks, such as ripping off a sole or a heel.

Spaniards themselves sometimes complain of being overcharged or of finding that they have been given new heels or laces while they were reading the newspaper. But such practices are mostly confined to the *ambulantes*, the shoe-blacks who roam the streets. This is an occupation that commends itself to the vagrant and unskilled, often as a cloak for hawking contraband and touting. To prevent an influx of such people and reduce the number of shoe-blacks, the big cities have a system of work permits, which are only granted to those with a fixed place of work. Some of the latter simply have their post in the street, others are attached to cafés and other establishments, others are employed in *salones de limpieza*, special shoe-cleaning shops with shadowy interiors where the clientèle sit on thrones (there is an old-established one in the Plaza Real in Barcelona founded two generations ago by a conjurer).

These regular *limpiabotas* are honest and efficient. They charge only the authorised price (it varies in different cities between three and four pesetas, being fixed locally by the civil governors). To watch them going through their ritual with leather, brush, polish and paint is alone worth the money, and they produce a glitter on the shoes that no sergeant-major could scorn. This public shoe-cleaning is one of the bases of Spanish male elegance. There are certain tasks that the Spaniard considers beneath his dignity and simply will not perform, and cleaning his shoes is one of them. If he cannot afford the *limpiabotas*, he will give his shoes to the maid, or even his wife, or let them go dirty—and one does in fact see quite a lot of dirty shoes, particularly at present with the internal trade depression. But, if possible, he will sit at ease in a café and have them cleaned. The *limpiabotas* is part of the social life of cafés and hairdressers. A triangular conversation is often carried on between the customer, the hairdresser and the shoe-black, and the hairdresser, before setting to work, may ask "What would you like to discuss this afternoon—bullfights? Football?" In fact, to the Spaniard, having his shoes cleaned is more than a necessity of good appearance or even a diversion. It is an addiction; in Madrid and the south there are men who would feel unkempt with only two shoe-shines a day.

Winter is the best season for the shoe-blacks. In the summer months trade is bad—so many people are on holiday and those who remain take to fancy footwear that presents technical problems (three times the normal charge is made for cleaning the fancy models with white and coloured canvas uppers). And then, of course, there is not the kindly aid of rain and mud.

Shoe-blacks' earnings are low. The best off are those employed on a wage basis at the *salones*, bars and so on. With their share of the tips they may make three to four pounds a week. They also enjoy full security benefits, because the employer pays their insurance. Many of those who attend regularly at bars and other places, however, as well as those with posts on the street, are working on their own account. They belong to the *sindicato* and pay a *cuota*, but it is necessarily a small one and any benefits are correspondingly small. Many of these men work a seven-day week.

Nevertheless, few leave the trade—despite the fact, for example, that during the tourist season there is a rising demand for waiters who get good pay. Many, no doubt, are unfitted for other work. It is, apart from the recent restrictions in the main cities, easy to set up as a shoe-black. A large proportion of them come from the poorer areas of the south and the back streets of Malaga, and there are even some who have found it difficult to enter other trades owing to a political past. Largely, however, it is a question of temperament. There is a certain sturdy independence about the Spanish shoe-blacks, men who work in their own way, move on when they want to, and generally live as they please.

other advantage than to wrench them from the motherland and thus diminish the resistance of the Iberian peninsula, will come to think that we did a great service to mankind . . . having spared them new forms of slavery. (November 30th, 1960.)

And supposing the rest of the world is not convinced? Then, "I can see no other attitude for us than to continue on our way." (June 30th, 1961). "There is nothing more to be done than to proclaim (Portuguese unity) to the four winds and, as far as possible, to protect it on all our frontiers." (November 30th, 1960). And, most resounding and most final: "Stand firm! Stand firm! Nothing more is needed for the storm to subside and for justice to be done to us." (May 23rd, 1959.)

In the two years since Dr Salazar sounded that exhortation, the storm has grown fiercer and no justice has been done, but the Portuguese attitude remains unchanged. There are motions in the direction of some administrative autonomy for the overseas provinces, and talk of speedier economic development, even of the admission of foreign capital, at last. But on the ultimate questions, the government is unyielding. As the visitor goes the rounds of the ministries in Lisbon, the echoes of Dr Salazar sound repeatedly in every conversation—severe, sonorous, paternal and imbued with such an absolute conviction that he begins to wonder, with an anxious tremble, whether he has not altogether misread the world outside. Perhaps, after all, it is only the Portuguese who possess the key to life, bequeathed to them by Prince Henry 500 years ago and maintained ever since as a sacred trust? Perhaps. It is a discomfiting thought to go to bed with. But one recalls on waking that the dinosaurs also had the key to life once—until the locks were changed.

Mapai's Tarnished Halo

FROM OUR CORRESPONDENT IN TEL AVIV

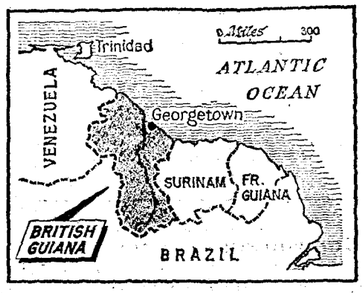
MR BEN-GURION, as depicted by an Israeli cartoonist, is a lion whose claws have been clipped. His party, Mapai, lost five seats at the elections on August 15th, and now has 42 members in a Knesset of 120 members. But the prime minister's frustration, when he explosively called the results a disaster, was not due to his party's setback but to the destruction of his hopes for introducing a two-party system into Israeli politics. Now the prospects of this are dimmer than ever. Mr Ben-Gurion's claim that the voter would have given him a clear majority if a referendum on electoral reform had been held also appears unfounded.

While Mr Ben-Gurion's friends are dejected, the new Liberal party, which won 17 seats, also feels thwarted. The Liberals had hoped to serve as a rallying point for all who wanted a radical change in government, and to act as a counterweight to the party that now controls the government, the Jewish Agency and the labour federation. They had hoped to bring together supporters of private enterprise, members of collective settlements who were on the side of Mr Lavon, students and university professors, and all those who had developed a grievance against the Establishment. They found out that Mapai's party machine was able to hold together the mass of voters who represent its main strength in the villages and towns; that opposition to Mapai in the collective settlements resulted only in abstentions; and that Mapai's position among most of the new immigrants remains unimpaired. The newcomers either voted for Mapai, or else for Herut, which succeeded, against expectations, in holding its position.

If the modest success of the Liberals is to develop, they must learn how to overcome the barrier that now separates them from the immigrants from Moslem countries. The political influence of this group is bound to grow as their children reach voting age. Mr Ben-Gurion understands this very well, and has promised free higher education for gifted children. Over the past ten years the new immigrants have been given work and housing. Now they seek a higher standard of education and living, and they will vote for the party that they hope will give it to them. Liberal ideas do *not concern them*—yet.

Mapai will have to confront two main issues in the near future; first, the unrest within the party, caused by the Lavon affair but suppressed during the election campaign, is now likely to erupt again. Mr Ben-Gurion's friends accuse Mr Lavon and his supporters of having harmed the party. The other side claim that Mr Ben-Gurion himself caused all the trouble by his dictatorial methods, and by his clumsy handling of the Lavon affair. Mr Lavon himself, who returned from a long journey abroad just before the election, keeps in the background, but he may not stay there. The election post-mortem within the ranks of Mapai will be neither gentle nor conciliatory.

The second problem is the building of a new coalition. Mr Ben-Gurion will again be prime minister. He will start on a series of negotiations to find out which parties are ready to join a coalition and on what terms. In the past this has always taken several months of tough diplomacy during which not only practical economic and political issues, but general questions of ideology, are explored at length. There is no time-limit for these negotiations, since, in Israel, the old government continues in office until a new cabinet has been formed. Thus, Mr Ben-Gurion, whose resignation in January brought about the elections, is still prime minister. On the other hand, urgent issues such as the possibility of currency devaluation, and recent moves over the Arab refugee question, make it important that a new coalition should be formed quickly.



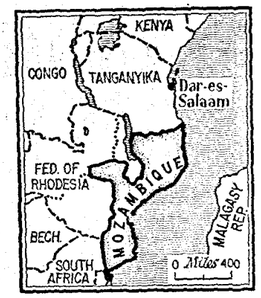
Early speculations about the composition of the new cabinet predicted a coalition between Mapai, the Liberals and the religious parties. But, two days after the elections, Herut proposed a joint front with the Liberals. This would create a block of 34 votes, and would be a considerable power in the Knesset. However, many Liberals may rebel against the idea of joining with the militant right-wing Herut.

Whether Mapai's wings, as well as Mr Ben-Gurion's claws, have been clipped remains to be seen. The party's extraordinary success over the past ten years has given it a halo of invincibility. This halo has now been tarnished. It has been proved that the rising strength of Mapai can be checked, and that a steadily increasing standard of living does not prevent opposition. If the Mapai leaders understand this they will try, first of all, to put their own house in order and end the internal strife which, more than anything else, was responsible for their setback last week.

British Guiana on its Own

DR CHEDDI JAGAN'S decisive victory in last Monday's elections gives him a free hand in shaping British Guiana's first years of independence. As free a hand, that is, as is possible in a country four-fifths of which is swampy and largely impenetrable jungle, whose population of half-a-million is crowded into a narrow coastal strip that has constantly to be guarded against the encroaching sea and the flooding rivers, and whose economy is dependent on British investments in sugar and Canadian investments in bauxite. Without a lot of money and technical help from outside, there is not very much that Dr Jagan can do to make his country more self-contained and less backward as an independent state than it was as a colony. The cards would seem to be unfairly stacked against British Guiana if it were not that its coming independence coincides with the new respect which both the United States, and to a lesser degree the Soviet Union, are beginning to pay towards even the smaller countries of South America and the Caribbean.

British Guiana is now self-governing and will probably be completely independent in a year or less. Dr Jagan's People's Progressive party has won 20 of the 35 seats in the new parliament. The voting was mainly on racial lines: Indians (many of them the descendants of indentured labourers brought over in the eighteenth century) outnumber Africans by three to two, and Dr Jagan himself is an Indian. His support comes from the rice farmers and the labourers on the sugar estates, while Africans predominate in the towns. But because of what seems to have been an unofficial electoral agreement between Dr Jagan and a small third party which is right wing and fervently anti-communist, Mr Forbes Burnham, the leader of the African party, did less well than a straight counting of black and brown faces would suggest. Mr Burnham, whose party won 11 seats, claims to have unearthed some dark deeds, and is trying to have new elections, in several constituencies.



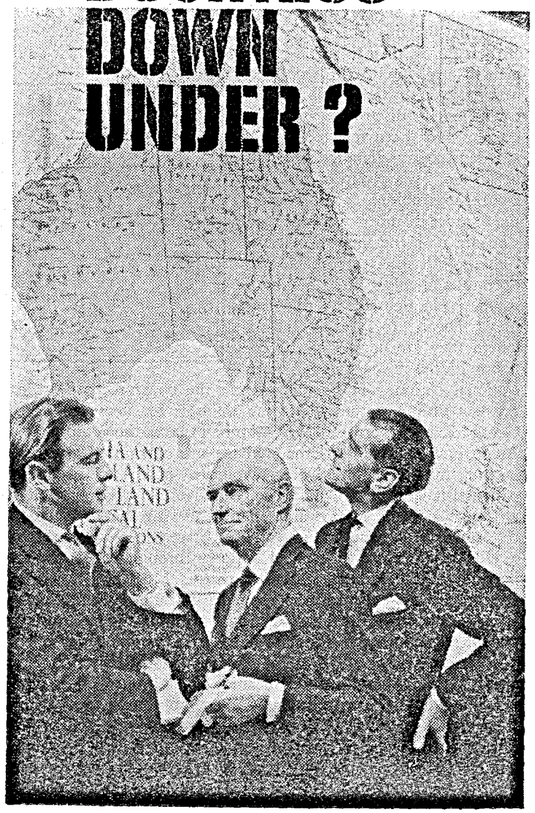
Dr Jagan calls himself a Marxist, and there are undoubtedly a number of orthodox communists within his party. He will certainly look for outside help from wherever he can get it, and is planning a visit to the United States. Equally plainly, he looks forward to a time when the state has more control over the country's industry, and the sugar companies have already been asked to surrender a little of their land so that the government can start up some sort of co-operative farming venture. In Castro-hunting circles in America and Britain there have been panicky comparisons between Dr Jagan and Dr Castro. But although Dr Jagan professes to admire the Cuban leader, and has made a trade deal with him, the two men are temperamentally far apart. Dr Jagan has come to power by a more conventional route and, profiting from Cuba's mistakes, is unlikely to do anything in too much of a hurry, and especially not nationalise the country's industries until he has the men to run them. The basic test is whether Dr Jagan can show that he is a national, rather than an Indian, leader.

Mozambique Next?

FROM A CORRESPONDENT IN DAR-ES-SALAAM

THE National Democratic Union of Mozambique, or Udenamo, to which it is commonly shortened, "welcomes all Mozambiquans to join with us in independence struggle for our motherland"; these are the words that straggle somewhat unevenly across a piece of paper stuck in the window of their headquarters, a room and a half in Dar-es-Salaam. The half-room, a windowless box entered through a usually locked door, serves as the office of their president, Mr A. C. Gwambe. The slightly larger room is furnished with three desks, covered with a collection of magazines and newspapers, mostly in Portuguese, though there is a "Teach Yourself Political Thought" and the Penguin edition of "Lady Chatterley's Lover." Here work the secretary, Mr C. Mahlayeye, who also has a Czech portable typewriter on his desk, the treasurer, Mr B. J. Mapanje, and the publicity organiser, Mr J. R. Sigauke. The vice-president, Mr F. G. Malhuza, drifts in and out, as do various others who look like officials, and a considerable number of what appear to be hangers-on who, one suspects, come in to take advantage of the bench provided; a selection of Swahili papers is also available.

In these unimpressive surroundings, Mr Gwambe claims, the union has accomplished as much in the ten months of its existence as many political organisations do in five years. But the truth of this statement is not easy to ascertain; no one is willing to reveal such facts as the number of genuine supporters that Udenamo has in Mozambique (the claim was made that it has eighty officials canvassing for support there) or in the various foreign countries, including Britain, where they say they have agents; the source of their funds, their financial position, or the extent of their equipment if armed rebellion is deemed necessary. This last possibility has been much discussed and has certainly not been rejected.



Udenamo was founded in October, 1960, by a group of refugees from Mozambique in Bulawayo; the founder members were the men who are now the union's officials. Finding themselves unable to operate openly in Southern Rhodesia, in February of this year they moved to Dar-es-Salaam, where they are housed at the expense of the Tanganyika African National Union. This support from the government party may prove a little awkward now; the minister for home affairs, Mr George Kahama, ordered Mr Gwambe to leave the country before August 1st because he is reported to have announced at a public meeting that there would be a revolution shortly in Mozambique with assistance from Ghana. The Ghanaians deny having promised any such aid, and Mr Gwambe denied making the statement. All the same, he left on August 10th for, it is said, Morocco.

Udenamo claims widespread support throughout Mozambique in spite of the lack of education there. Most of the available education is limited to Catholic dogma in the government mission schools, and this is interspersed with the compulsory manual labour which, says Udenamo, occupies most of the children's school life. No African with any education is permitted to leave the country unless he can convince the authorities of his loyalty. The type of schooling common in Europe is given only to a few Africans, who then take Portuguese citizenship and are expected to swear allegiance to the Portuguese regime. A few Africans (of whom the vice-president of Udenamo was one) are fortunate enough to get into one of the Anglican mission schools; these are not under direct government supervision, and so are able to give a slightly wider education. African newspapers are not allowed; all papers are censored by the government. To talk politics may lead to arrest; Chief Zintambira, of Vila Contínho, was shot dead some weeks ago for addressing a group of people about Udenamo.

Another party opposed to Dr Salazar's regime, the Mozambique African National Union, is not considered as a rival by the leaders of Udenamo; they say that Manu started life as a social and tribal organisation and has only recently entered politics, and that its officials are mainly Kenyans. It is thought that Manu intends to set up an office in Dar-es-Salaam.

Since the majority of refugees from Mozambique go to Southern Rhodesia and not to Dar-es-Salaam, it is impossible to assess the true state of Mozambique from here. One suspects that, in the words of a south-west African who gave evidence before the UN committee on south-west Africa, the Udenamo leaders feel "one has to exaggerate to prove one's point and bring home to the rest of the world the realisation that a proper investigation is necessary." All the same, it is clear that, with the example of Angola before them, the enthusiasts of Udenamo are confident that the potential conflagration in Mozambique will one day be set off.

PLANNING BUSINESS DOWN UNDER ?

The
Bank of New South Wales
will look before you leap

Gentlemen! The motion proposed is that we consult the Bank of New South Wales for an independent view of the situation in Australia and New Zealand.

Carried unanimously!

This is just one of the specialised services which the Bank of New South Wales offer their clients.

They are the oldest and largest bank in Australasia, providing key services throughout Australia, New Zealand, Fiji, Papua and New Guinea . . . well over 1000 well informed branches and agencies.

Good people to do business with, they are the oldest and largest bank 'down under'.

Main London Office: 29 Threadneedle Street, E.C.2.
Head Office: Sydney, Australia.
(Incorporated in Australia with limited liability)

All over Australia and New Zealand

How much do you know—about CANADA?

Can you say—

—what is the greatest problem affecting the country's economy today?
—what specific proposals were included in the 1961 budget to assist Canada's recovery?

Did you know—

—that it was in an attempt to improve Canada's competitive position and thus broaden its markets that the authorities brought the Canadian dollar to a discount on the U.S. dollar?
—that a sharp increase in sales of aircraft, aircraft engines and ships has been responsible for a rise in total U.K. exports to Canada this year?

If you trade abroad, you need a clear understanding of the economic problems in your markets. The latest report on Canada, prepared by Barclays Bank, will help to provide that understanding; in the same way the Bank's reports on other countries can give you similar assistance with problems elsewhere. For copies of any of these reports, in particular those on Bolivia, Brazil, Ecuador, Greece, Iraq, the Netherlands and the Persian Gulf States which have been rewritten this month, please apply to:

THE BUSINESS WORLD

Where Is Leyland Driving?

WHEN you remove all but one of the directors who have any experience of the car business from the board of a motor company, the obvious inference would be that you intend, sooner or later, to stop making cars. But Leyland Motors bought control of Standard-Triumph International early this year with the avowed intention of forming a group that could make any vehicle from a heavy lorry to a light car ; and, now that it has removed Mr Alick Dick and his colleagues from the board of S-TI, Leyland is at pains to insist that the obvious inference should not be drawn. It says that it is not going out of the car business, " though increased concentration on the commercial vehicle side—in vans and light trucks—is one of the possibilities that Sir Henry Spurrier (the chairman of Leyland) spoke about recently after the merger." Certainly Leyland has invited four of the directors, who were responsible under Mr Dick for much of the management of the company, to stay on as executives ; as some of them were abroad or on holiday when this decision was taken, it is not yet known whether they will accept this demotion. Before the break-up of the board, it appears, a production and development programme for the next 18 months had been agreed and some tooling ordered for new models: one cannot tell how much of this could now go back into the melting pot.

Leyland lives in a very different world from that of S-TI ; the wage rates of Coventry must seem ruinous to anyone accustomed to competing for labour with the cotton industry. Under the rule of Sir John Black, the creator of the present firm and mentor of its departed board, Standard had become about the most generous employer in the motor industry, in wages and also in working conditions. As life became leaner for the company in the last few years life became a little less cushioned for its workers. But they are still well off even by the standards of Coventry, which probably enjoys the highest wage rates in Britain. The attempt to get the unions to agree to a cut of £5 a week in wages that the company made in its blackest days last winter ended in ignominious failure, and the original S-TI directors may well have been more reluctant to face the risk of another such debâcle—or the strike that would be the consequence of persistence—than those who came from Leyland. No doubt there was some difference of opinion about the chances of getting any significant reduction in labour costs between those who have tried—and S-TI did sack 2,000 men last winter, as well as letting another thousand more go by wastage—and those who have just arrived, determined to cut costs. The power of the unions in S-TI, another characteristic of the motor industry and one that was encouraged by Sir John Black, must also come as a shock to a Lancashire employer whose paternalism is still authoritative ; and again those who have grown up to live with unions in this way must view the chances of changing it rather differently from people who are shocked by the whole idea.

The methods used to sell and to produce cars are utterly different from those of a firm like Leyland making and selling the heaviest and most expensive types of commercial vehicle. This may have provided further grounds for disagreement: the amount spent by a car manufacturer on advertising and selling its products may seem exorbitant to anyone used to building to order for industrial concerns, instead of turning out cars *en masse* and then persuading the public to buy them. Selling organisation and advertising might seem to the lorry maker a logical point at which to start cutting overheads, but the car maker would regard such a policy as disastrous. S-TI has been noticeably active—and successful—in its advertising policy since the introduction of the Herald 1200 in April ; but the kind of budget needed to maintain large advertisements in daily papers may have shocked Leyland, even though S-TI's advertising expenditure per car sold is modest in relation to that of other car makers.

STRINGENT economies in the cost of selling and advertising would be justified only if Leyland had decided to reduce the scale of S-TI's car production. It had apparently been agreed to continue the attempt to find specialised niches in the car market not being exploited by the two bigger companies, such as that the Herald was designed for, presumably in the hope that the new cars would not be as promptly followed by competing and cheaper cars from the big two as the Herald was ; and to continue in the sports car market that it had so successfully exploited with the TR3 with a revised version of this car. After the slump in sales of the Herald last year that followed its encouraging reception in 1959, the revised 1200 version has been selling well for the past four months—perhaps aided by the delivery delays on BMC and Ford cars, but also by the fact that the changes in specification simply made the car more competitive. The effect of these has been nearly to double S-TI's share of the British market over the last six months. So if Leyland had broken up the S-TI board by any decision to reduce emphasis on cars, its timing would seem a little odd. The autumn may well see sales fall, and S-TI's share of the market fall as well, when other makers introduce their new models ; but

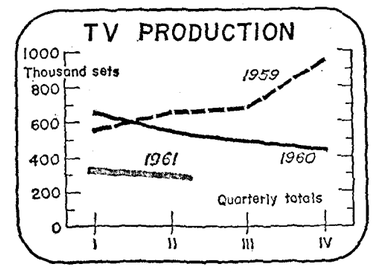
the group's exports, at any rate, ought to be helped by the new sports car.

Any idea that the S-TI plants could readily be turned over to vehicles very much heavier than cars would be quite unrealistic. They cannot build anything bigger than a 15-cwt van with existing machinery and assembly facilities; if Leyland wants to make light trucks, it will have to build new factories or largely re-equip some of the existing ones. The van market would be as difficult to compete in as that for cars, when BMC and Ford can use the same mechanical components —and, for the smallest sizes, the same body pressings—for their vans as for their cars, and thus get savings in cost that would not be available to S-TI. Even if the company chose to specialise in diesel-engined vans, as Leyland has hinted that it might, these factors might still tend to make its costs higher than those of the competing vehicles that BMC or Ford might offer.

One cannot help wondering how far Leyland realised what it was doing when it decided to buy S-TI, though its silence on its plans makes it difficult to judge. Assumptions that this group could easily be made into a group comparable with Daimler-Benz or Fiat, are surprisingly naïve; both these companies are far larger and more widely based, and possess engineering resources that such a British company could not match. Leyland will no doubt be anxious to make its recent acquisition more profitable as quickly as possible, to justify the deal to its shareholders; but an outsider needs to be convinced that the removal of a managing director as closely concerned as was Mr Dick with running the company is the best way of doing so. Most of the firm's present management down the line consists of men who had been taught, like Mr Dick, by Sir John Black or had been picked by Mr Dick himself. The effect on their morale could be disastrous; if many follow their managing director out of the company, efficiency is bound to decline, and it is very doubtful whether Leyland has the spare managerial resources to fill the gap. Leyland now has a clear field in which to make whatever changes it wishes, but drastic re-organisation is hardly the way to raise profits—at least in the short term.

The new managing director, Mr S. Markland, faces a difficult task indeed. He and his board of three other Leyland directors and the one left from S-TI, Mr. F. B. Dixon—the former managing director of Hall Engineering, the Merseyside firm that S-TI bought to provide facilities for building bodies —have to keep the firm running through a difficult part of the year while they try to win the loyalty of the staff, learn about the details of the company's affairs, and introduce whatever changes Mr Dick thought incompatible with the interests of the company. Leyland's shareholders are awaiting a statement from Sir Henry Spurrier with avid interest.

Television Plain or Purled



A BOY is said to have bought two television sets in Luton last week for 1s. 1d. No one visiting the current Radio Show in London is likely to pick one up there for less than £60, but earlier this year the radio industry was itself selling off stocks of new receivers at prices which manufacturers shudder to remember. The experience has left its scars. Although brand names are as numerous as ever, several companies have ceased to market domestic sets and mergers have reduced the number of big producers to five. The largest is still Thorn, followed perhaps by the Pye-Ekco group with Philips Electrical and the GEC-Radio and Allied team close behind. Since a number of small companies have receivers manufactured to their specifications by Plessey, this company ought possibly to be included in any list of major set makers. These five, together with Bush and Murphy, are the only companies still with a big stake in the domestic market for television receivers; it is a market now so different from the market for other forms of electronics that the two properly constitute separate industries.

Last year's slump was caused by market saturation, coinciding with the re-imposition of credit restrictions after an exuberant year of freedom. It is being perpetuated by the long shadow of an impending change in television standards. Buyers—which in this instance means radio dealers—would not pull such long faces at the prospect of a change in standards if bitter experience of a quite minor technical change was not so raw and fresh in their minds. Two years ago, the industry embarked on a television boom that led to the production of nearly 3 million television sets and the sale of almost as many. Credit restrictions suddenly re-imposed brought this to an abrupt halt, but the industry, being geared to a high rate of production, went on producing three sets for every two that it sold until well into the winter. By this time, stocks in the factories and the shops had reached figures estimated at between 1.2 and 1.5 million, or a normal year's supply. These stocks could have been liquidated over a period by cutting back production at the factories. Instead, the sets became obsolete overnight a week or so before Christmas when a long-agreed change took place in the cathode tube production lines, which switched from a standard 17-inch to a standard 19-inch cathode tube, and the first 19-inch screen television sets came on the market. This was the most expensive two inches in the industry's history, for the only way to dispose of close on 1½ million sets with 17-inch screens was by cutting prices, not by a pound or so but by as much as £20 at a time. Dealers cut list prices in many cases by a third, manufacturers had to take whatever price the shops would offer. In this way, stocks have been halved, but there might still be between half and three-quarters of a million of these obsolete sets still unsold.

The industry's resilience commands admiration in the face of circumstances that would have caused other manufacturers to despair. With a virtual buyers' strike, it has channelled more and more of these unsaleable sets off into the rental side of the television business. Some of the biggest companies estimate that two-thirds of their sets are now being hired rather than bought outright. In this way the viewer protects himself against the risk of buying a set that is likely to become obsolete if television standards change. But the risk is merely shifted from the viewer who rents the set to the company that hires it to him. A great part of the effort at this year's radio show is directed towards re-assuring dealers that if standards are changed, sets bought now can be re-engineered to the new transmission systems.

THE Post Office has records of 11½ million television licences, which means that seven homes in ten are known to have television, before allowing for the families that have a set but not a licence. This more or less spells saturation and it means that the industry is now dependent on replacement demand. Since the effective life of a television set is seven years, although it may give a picture of sorts for ten, the industry might expect an annual replacement demand for 1½ to 1¾ million sets a year, plus whatever extra it can sell by persuading people that they need a second set. In its present contracted form, this is the kind of output to which the industry is geared. But if viewers think that television standards are liable to change, they may not be disposed to replace their present sets with current models that may be out of date in four years' time—the date when the BBC and ITA charters expire. They may at least be tempted to keep their old models until next July, when the Pilkington committee gives the Government its views on, among other things, television standards and the introduction of colour.

The industry is sharply divided and exceedingly worried about the proposed change in standards. The BBC may huff and puff in favour of a colour service now, so projecting itself as a more enterprising and go-ahead organisation than the somewhat stuffy and middle-aged commercial companies. But across the Atlantic is living proof of sales resistance to colour television that is three times the price of a black-and-white set; after eight years of colour services in the United States, only 1½ per cent of the 50 million sets in use are colour receivers. The American system of colour television needs what amounts to three cathode tubes, one for each primary colour, although the three may be enclosed in a single package. This is the basic reason for its high cost, and after many years of experiment the industry is beginning to believe that the only way to get colour television at an acceptable price is either by a completely new system of transmission or a completely new kind of tube. By sponsoring a French colour system that has already aroused much interest among engineers, GEC becomes the first radio manufacturer in this country to back one of these outsiders; it may prove a shrewd move.

The industry and its dealers know, however, that colour is some way off; not so the change in black-and-white transmission standards. The Government's Television Advisory Committee has recommended a change in the number of lines, to bring the picture on British screens up from 405 lines to the 625 lines used in Europe. It has complicated the issue by not recommending complete standardisation with Europe, so that there could still be important basic differences between television in this country and on the Continent. No decision on this will be taken until the Pilkington committee on broadcasting presents its report, although it is widely believed in the industry that the committee is expected to take the TAC report as its guide on technical matters.

Conceivably the committee might reject the recommendation to change the number of lines—and many engineers in the radio industry sincerely hope that it will. The main short-term objection to the change is that while, on the present system, a third television service could be started up with no trouble at all in the very high frequency wavebands where it could be received by all sets now in use, if the change is made to 625 lines, a third service can only be started in the ultra high frequency wavebands which cannot be received by any set now in use and which present technical difficulties in transmitter and receiver and aerial design that the industry is in no way confident of solving. The long-term objection to the change is that it reduces the number of television services that could in theory be provided, but this is not an argument that concerns the industry very deeply at the present time.

WHAT worries dealers, and it also worries private buyers, is the likelihood that if they buy an "ordinary" set between now and the next Radio Show, that set could become obsolete if the Pilkington committee reports in favour of a change in standards. But the change can only be made gradually. Even if the Government accepted the report outright, new 625-line transmitters would not start working even in London before 1964 and it could take three or four more years before these covered the whole country—particularly since ultra high frequency services require a large number of small transmitters rather than one big one. From this it could be argued that sets bought now would be almost due for replacement by the time the new services were available, but this argument does not seem to cut much ice with customers.

The industry is therefore trying to reassure them in two ways. The majority of companies are building sets with chassis that can be fitted with ultra high frequency circuits if the new 625-line system gets the go-ahead. The cost is estimated variously at between £15 and £20. Some companies, like Philips, are telling dealers flatly that the bill to them will be a maximum of £15, hoping that this promise is not going to cost the company a great deal of money. In this way, the price of sets can be kept down to as low as £60 for the cheapest models, with the possibility of a fairly costly modification later on. Pye, on the other hand, has decided to standardise production on a set that is already partly converted to receive 625-line pictures on ultra high frequencies, and which will need only a few modifications and the addition of a tuner to receive the picture. This increases the price of the set to 73 guineas, which is only a few pounds more expensive than the Pye models it replaces, but is substantially dearer than the cheapest, run-of-the-mill models of other makers. Here Pye has taken a gamble, for the Government need not recommend the precise system of transmission assumed by Pye in designing its sets. But the policy appears to have impressed the radio dealers, especially those who rent sets and want some guarantee that their stock will not become obsolete half-way through its life. For this

assurance they appear willing to pay something of a premium.

Controversy grows sharper, but not clearer, as companies carry out more research into the technical implications of moving to the ultra high frequencies. Not everyone would argue that a 625-line picture is any great improvement on a 405-line one, but most engineers seem resigned to the change as the inevitable price of keeping up with the European Joneses. This explanation just is not good enough. Someone ought to spell out to the customers just what are the advantages of changing the present method of transmission and why the Television Advisory Committee recommended it, just as someone should say why the majority of the industry is objecting vehemently to the change and why it is so mortally afraid of moving to the ultra high frequencies. What are the massive technical difficulties about which manufacturers throw out dark hints ? Television sets are large capital items for most households and it would serve both sides right if customers stopped buying them until all the parties in this dispute came down from the clouds and explained just what they were arguing about. It is, after all, the customer, not the industry or the ITA or the BBC or the Post Office who pays in the end.

BUSINESS NOTES

IN THE MARKETS

Restraint in London

THE holiday, the Berlin crisis, the Chancellor's deflationary measures, have all combined to make a quiet and restrained week in the stock market. Few investors want to commit themselves very far until it is clear how the government's new policies, particularly on wages, will work out. Investors, moreover, have learned rather painfully that trustees are more realistic and sober in their actions than speculators. There has been a little selling of gilt-edged stocks and a little buying of equities by trustees this week but not on a sufficient scale to have a decisive effect on prices. Equities, having fallen a little just before and after the weekend, recovered slightly later but this rally soon tailed off and over the week to Wednesday's close *The Economist* indicator fell by 3.2 points to 366.0. Gilt-edged prices, however, turned down slightly and by Wednesday War Loan was back to 52½, compared with 53 a week earlier. This provides yet another indication of the built-in handicap of the gilt-edged market. As soon as demand increases the authorities feed more stock into the market through their funding sales and this checks the rise in prices ; when the demand dries up the authorities do not reverse operations but stay out of the market and the jobbers quickly take the precaution of marking prices down.

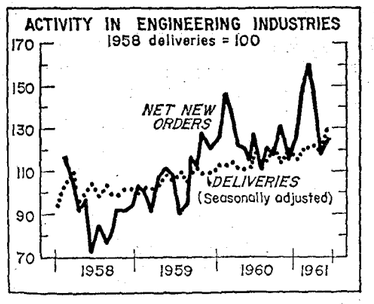
The major influence throughout the industrial as well as the gilt-edged market is that investors and underwriters alike have to pre-empt much of their money for new issues. In the not too distant future the flow of new issues may diminish, because, first, the lenders already have plenty to digest and, secondly, because borrowers may not be prepared to pay the terms demanded. But at the moment the market has to be concerned with the heavy demand now being made upon it. It was made heavier this week by the announcement that Eagle Star Insurance proposes to raise just over £10½ million by a rights issue of one new ordinary share at 50s. for every four held. The calls are well spread and as the shares stood at 111s. 6d. on the eve of the announcement there is a bonus element in the terms which slightly raises the dividend yield on the shares. But, after taking all this into account, the market's reaction was to mark the shares down to 105s. 6d., making the rights worth about 12s.

Like other insurance companies, Eagle Star has participated in property finance and one of its links is with Beaumont Property. This company proposes to raise about £1¼ million by a one for four rights issue of ordinary shares at 9s. each (against the current market price of 10s. 3d.). In addition it has arranged to borrow from the Prudential Assurance up to £2½ million in the next four years on a 6½ per cent debenture. The directors and their associates have made available to the "Pru." 350,000 ordinary shares at 10s. 6d. each. In announcing this arrangement the directors say that it has always been their policy to buy existing properties for investment and not to take part in property development. They intend to adhere to this policy "at any rate while the government's present request to restrict building operations remains in force" and they have given the lenders an assurance to this effect. They appear to have secured the debenture finance reasonably cheaply. Only this week James A. Jobling, the manufacturers of "Pyrex," controlled by Thomas Tilling, announced the placing of £1½ million of a 7 per cent debenture, 1971-86, while Whitbread, the brewers, announced the placing of £2 million of a 6¾ per cent debenture, 1984-87, at 96 to yield just over 7 per cent.

Optimism in Wall Street

A correspondent cables :

WALL STREET remains optimistic about the domestic economy and international problems though the rise in equity prices was tempered this week by profit taking, particularly in stocks in industries where trouble may arise. Motor shares, for example, were under pressure partly in reaction to the earlier sharp rise based on next year's prospects and partly because of the strike threat. Cosmetics issues, which had made big gains earlier, also reacted on the announcement of legal suits from the Department of Justice. The Dow Jones industrial average, which rose to a new peak of 725 this week before falling back to 720 on Wednesday, is not accurately reflecting the high degree of selectivity in the market ; it has been pushed up more by a strong demand for tobacco and chemical equities than by overall buying.



INVESTORS are still favouring cyclical blue-chip issues on the grounds that the coming business boom should boost earnings sharply. Whenever the analysts on Wall Street are unanimous about the future course of prices, the market usually surprises everyone by going off in an entirely different direction ; but it is difficult to argue with conviction that the current rally is spent. A motor strike could be temporarily upsetting, but Wall Street seldom sells on news of a strike as it is generally believed to have bullish implications for the longer term. Similarly, the growing evidence of the administration's tougher anti-trust policies may be a blow to particular companies but it is not yet regarded as a serious threat to the market. With selectivity very much in the vogue, it is probable that buying will switch from one group of shares to another quite rapidly. The focus of attention is likely to be on issues with favourable profit prospects and low price/earnings ratios, such as paper, rubber and textile equities. Investors will probably continue to take their capital profits and this may check the rise in prices ; but with the economic indicators pointing to greater business activity and with inflationary signs beginning to appear, Wall Street's faith in equities is unshaken even though the future rise may be slower and more hesitant than the recent advance.

ENGINEERING

Pressure Slackens

THROUGHOUT the months of unchanged industrial output last year and the beginning of this, production in the heterogeneous group of engineering industries kept on growing in response to heavy ordering from industry for new plant and machinery and various other pieces of factory equipment. The plant and machinery firms raised their output further still this spring and summer, when industrial production generally began to edge upwards: by June their output had reached its highest level yet, eight per cent above last summer and a good thirty per cent more than in 1958.

But there are signs that the impetus, and indeed the pace, of this engineering boom may be altering. Apart from March and April, when new home orders were sharply inflated by some very large orders for a new power station, the rate of ordering from firms in this country has noticeably sobered down this year. Net new home orders in May and June were, in fact, fractionally lower than a year ago. Export orders, in contrast, are still rising: they were two per cent higher than last year in the first quarter of 1961 and four per cent higher in the second quarter. This is a much smaller rate of growth in overseas business than was customary in 1959 and most of 1960 but it would seem that export enquiries have perceptibly increased in more recent months. Certainly if pressure from the two-year capital investment boom is slackening off, engineering firms should soon have more capacity to spare to meet export business if they can get it. For the last few months total engineering orders outstanding have remained at about the same level after rising pretty consistently month by month since the autumn of 1959. Indeed in May and June deliveries of engineering goods actually exceeded new orders received. The length of most firms' order books should not portend any slowing down of production yet. But from now on it seems that every new order will have to be won rather than taken.

STERLING

Back in Demand

THE recovery in sterling has been resumed this week, following the temporary check partly attributable to the Berlin uncertainties. Movements in the rate this week have been modest, from $2.80¼ to $2.80⅞, and the rise has certainly been held back by sales of sterling for dollars by the official exchange account. These tactics make sense. The bears who sold sterling short when the rate was $2.78½ and contracted to take $2.75½ in three months for the sterling they had not got have already been given a fair squeeze. Now the authorities may not be anxious to see the rate rise too close to the official limit of $2.82, at which point there would be nothing left to go for (this is the case for a modest and opportune widening of the margins). In any case the reserves are badly in need of all the dollars the authorities can buy back.

The demand for sterling has been mainly on commercial account, including purchases that had previously been delayed. There is still no sign of any large inflow of funds for short term investment. Few operators are inclined to leave their funds uncovered. But buying of forward sterling by continental operators this week has brought the cost of exchange cover down from about 4 to 3¾ per cent, leaving a small margin in favour of London on most forms of interest arbitrage.

THE DOLLAR

Widen the Gold Points?

A correspondent writes from New York:

IN order to strengthen its tactical defences for the dollar, the United States Treasury has put half of the $150 million of gold provided by the International Monetary Fund (as a consequence of the recent British drawing of $450 million in US dollars) at the disposal of the Exchange Stabilisation Fund. Although the balance sheet of the Stabilisation Fund is published with a delay of several months, it is no longer a secret that it has been used by the Treasury as a buffer for handling minor transactions in gold with foreign authorities. While the acquisition of $75 million of gold is not a major one, it will permit an increase in the limited transactions that have taken place and is regarded as a useful safety valve to cope with special and unforeseen demands. Any sales of gold from the Stabilisation Fund, moreover, will not show up in the weekly figures on the Treasury's general gold account, which suggests that the authorities are hopeful that the market will attach somewhat less significance to the changes in the published statistics. Together with its other innovation such as the acquisition of D-Marks and its intervention in both forward and spot exchange markets, the Treasury's latest move gives it greater flexibility in coping with short term pressures.

It is likely that the authorities will experiment with other measures to buttress the gold-dollar pivot. The techniques that have been adopted are considered a first line defence, and while the Treasury is counting on the strengthening of the IMF as a second line, officials acknowledge that they would like additional short-term weapons designed to discourage speculative runs and reduce danger of disruptive flows of gold from monetary stocks to private hoards. While they are silent over specific plans, officials are plainly unhappy about maintaining convertibility for foreign authorities *sans questions* when US citizens are prohibited from holding gold. It is impossible to close down private markets abroad, but the hope is that the speculative attractiveness of gold can be lessened. One possibility, put forward in *The Economist* a fortnight ago, would be to widen the margin between the fixed gold buying and selling points, which at present are $34.91¼ and $35.08¾. Such a move is permissible under US regulations and is regarded as consistent with fixed exchange rates. Treasury officials refuse to go further than comment that increasing the spread is only one of a number of avenues open to them.

The Treasury is also likely to seek liberalisation of IMF provisions in order to increase its freedom of manœuvre and moderate longer term pressures. The Treasury contends that short-term pressure and long-term illiquidity are connected problems, though it emphasises that the heart of the matter is a maldistribution of reserves rather than an absolute insufficiency. Its criteria for evaluating liquidity, however, are vague and may be supplanted by new yardsticks to compel countries enjoying a surplus to choose from a variety of measures designed to prevent further gains. The immediate emphasis on short term, market orientated steps such as more liberal use of the Stabilisation Fund is thus being flanked by continuing efforts to secure co-operative measures of long run reform.

BRITISH EUROPEAN AIRWAYS

Wolf at the Door

BRITISH EUROPEAN AIRWAYS has every incentive at the present time to cry "wolf" as long and as loudly as possible, since the Air Transport Licensing Board has just retired to consider whether to allow independent airlines to fly competing services on the corporation's routes. At any other time, the chairman might have found it difficult to convince anyone that a modicum of new competition would harm the corporation, which carries nearly half the traffic between this country and Europe, has just announced net profits of £1½ million on last year's (1960-61) operations and has

accumulated reserves standing at the remarkably healthy figure—for an airline—of about £5 million. But events have played into his hands. If it had to come at all this year's set-back in air traffic could not have occurred at a better time for BEA, and there is a certain gloomy relish about the corporation's forecasts of a probable loss in the current year. The wolf on BEA's doorstep is a cub compared to the shaggy monsters panting down the key-holes of the North Atlantic airlines, some of which are said to have flown services without a single passenger, but it is unmistakably a wolf.

Its appearance after seven years' profitable operation does not necessarily spell disaster to BEA. The corporation has achieved, what few airlines manage, the accumulation of a financial reserve big enough to cushion it against the temporary traffic set-backs that occur in aviation with monotonous regularity. The origins of the present one are easy enough to trace. Last year, BEA carried 4 million passengers, which represented an increase of a fifth. It had in fact increased its capacity by 24 per cent, while total traffic, including freight and mail, increased by 19 per cent. This meant that roughly two-thirds of the available capacity was filled. It was filled, however, only by cutting rates, which meant that although revenue, at more than £42 million, was nearly 16 per cent up, expenditure, at nearly £41 million, was rising even faster in spite of a reduction in costs. BEA, however, was working to the supermarket theory of bigger turnover and smaller margins so it seemed reasonable to develop along the same lines this current year. Capacity was again increased by a quarter, but the growth in traffic lost some of its momentum and has so far increased only 15 per cent.

Thus BEA finds itself at the end of the first quarter of its present financial year with £1.7 million less revenue than it had budgeted for, and the prospect of a profit likely to be measured in thousands rather than millions, if indeed it can make a profit at all. Comparable detailed accounts are not available for the independent airlines, so it is not possible to guess whether under similar conditions they would have done better or worse than BEA. They may find it difficult to match the corporation either for efficiency of management or—where it has its head—for fares; the standard £3 3s. ticket proposed for flights to Belfast and Scotland during the winter is a measure of the kind of price competition that BEA intends to offer. But there is no reason why they should not be allowed to try.

BANK CREDIT

Advances' Steep Fall

In the four weeks to August 16th outstanding advances of the London clearing banks fell by £103 million and advances by the Scottish banks by £3½ million. This decline—which has been exceeded only once in recent years, in September, 1955—follows increases of £50 million in both June and July. The turning of the tide has coincided exactly with the Chancellor's new measures. In fact a substantial part of the August fall must be the result of the tighter scrutiny imposed by the banks earlier this year, when it was already clear that the ordinary pressures of bank liquidity themselves demanded a tightening in bank lending. It was surprising that this tightening did not show up in the figures earlier, and this may have been due in part to fortuitous influences such as a few large day to day increases coinciding on the make up date—just as there is evidence that fortuitous influences the other way may have swollen the August decline. The decline was however well spread among different banks and also, it seems, among different categories of borrowers. The Chancellor's measures may have had an immediate impact on loans to local authorities, which had turned to the banks during the period when foreign money was draining out of the mortgage market—but now have the

opportunity to return to this source for their temporary borrowing. The nationalised industries, on the other hand, raised their borrowings from the clearing banks by a further £4 million in August. It is uncertain whether the new squeeze on hire purchase and property companies can yet have been reflected in the figures, but the banks are certainly taking it seriously.

They have little option. The August figures themselves reflect the pressures the banks are facing. Despite the near-record fall in advances, the liquidity ratio improved only marginally, from 32.86 to 32.94 per cent. An additional £38 million had to be paid up in special deposits, and liquid assets fell by £23 million. Now that the government is budgeting for an overall surplus, for which the bankers have called so long, the market no longer feels flooded with the government's floating debt. Treasury bills have rather become a scarce product, for which a wide range of lenders compete. The clearing banks are faced with a further ½ per cent call to special deposits by mid-September, bringing the total to 3 per cent

of their deposits. Unless the high overdraft rates of 7½-8½ per cent themselves deter the borrowers, the banks will not find it easy to raise their liquidity ratio to the 34-35 per cent needed by the end of the year to withstand the seasonal flow of funds to the Exchequer.

MOTORS

Last Weeks of Summer

The motor industry closed for its summer holidays at the end of July faced with the question of what the increase in purchase tax would do for its sales in the autumn, but with another month of reasonable prosperity behind it. The big fall in sales that usually takes place in August makes it difficult to say just how far this month's activity is being affected by Mr Lloyd's measures, but there are signs that sales are beginning to disappoint some makers—which does not make the industry feel happier about its propects for the rest of this year. Used car prices are still falling, though the trade seems to have been warned by its experience of last year and has avoided ending the summer with heavy stocks. A sharp break in the market should therefore be avoided, but lower trade-in allowances for used cars inevitably depress the sales of new cars.

The industry's production in July had been higher than that in June, 24,584 a week compared with 23,192, but after allowing for the effects of strikes on output in June and of the beginning of the summer holidays on that in July, it seems as if there was no significant change in the state of activity between the two months. The difference between the rate of working of the two bigger companies and of the smaller ones remained marked, with the industry as a whole operating at about 77 per cent of capacity but the British Motor Corporation at nearly 95 per cent. Output may have been reduced in some plants, however, by model changes, which should produce a corresponding increase in output this month. Sales of cars in Britain were slightly lower than in June and July last year at 79,408, which suggests that the buying public took at least the threat of increased prices calmly.

Exports of cars remained unchanged at 31,000, and it is now unlikely that there will be any significant recovery before the new year: the increase that shipments of new models will produce in the autumn will be offset by the seasonal fall in sales. The only encouraging feature is that shipments to most European markets continued to be higher than they had been a year ago; shipments to the United States remained low, at 2,291, but were also well below the level of actual sales in that market. Some time the fall in overseas stocks will have to end, as the fall in sales does seem to have been checked this summer. When stocks stabilise, it might add several thousand a month to car exports.

CHANNEL LINK

Over or Under?

The official talks—as distinct from "consultations," which have been going on in a desultory way for some months now—that are being arranged between the French and British governments about some kind of physical link across the Channel should at least bring the differing arguments about the various rival schemes to a head—and perhaps also end the very real uncertainty for existing cross-channel services, especially the ferry operators, in deciding their own future investment. If the present revival of interest in the idea of a cross-channel link does reach a positive conclusion, the main choice now seems to lie between a rail tunnel and a road and rail bridge—though there are various other possibilities in between these two, such as an immersed tube lying in a trench cut into the sea bed and carrying a road or rail tracks or both. Both pose major technical problems. Ventilation and the suitability of the geological strata in the case of the tunnel: resistance to high seas and gale force winds for the bridge which would straddle one of the busiest, and at times the foggiest, shipping lanes in the world. The bridge would cost decidedly more, at least £200 million against about £130 million according to the latest estimates of the rival groups, but its supporters have a much more optimistic view of the traffic a road link would attract. Both schemes are claimed to be economic propositions on the basis of the rival groups' own assessments of costs and revenue.

The Channel Tunnel Study Group, which was formed as the result of the Suez Canal Company's search for something else to put its money into after the canal was nationalised, reckons that virtually all of the capital for the tunnel could be raised privately, much of it from abroad, provided, however, the two governments gave certain guarantees. The other group, which is headed by M. Jules Moch and financed by French banking and road interests, and which has adopted in essence the scheme put up by Dorman Long in association with a French and an American company, would call for rather more direct financial involvement from the two governments—a point that will go down even less well in Whitehall. But perhaps the greatest difference between the two projects, tangible arguments aside, is that a purely rail link, first thought of by Victorians, just does not appeal to the French imagination whereas a road bridge does. It is both a challenge and more in keeping with contemporary technology. Whatever the political and symbolic implications of a cross-channel link in the context of the coming common market negotiations, there seems to be a gulf between the approach of the two nations to the most suitable kind of link that is as wide as the Channel itself.

EIU Quarterly Economic Reviews
covering 57 countries or groups of countries
Out this week:
PAKISTAN AND AFGHANISTAN
On Pakistan, the review considers the possibility of a big leap forward—the aid outlook—an analysis of the budget—progress in mining and manufacturing, and recent development projects—the government's plans for the jute industry—export achievements and prospects, and import liberalisation—relations with the U.S.A.—the prospects for the restoration of democracy.
Afghanistan's search for foreign aid—progress in cotton production—the recent slump in exports, are also covered.

RAILWAY SITES

Going Commercial

The formation of Railway Sites Ltd., a company to put steam behind the commercial development of the larger properties owned by the railways in the major cities, means that the Transport Commission is no longer going to wait for Mr Marples's new bill to lift the statutory restriction preventing the railways by themselves undertaking schemes of site development for commercial letting. That limitation will still operate for at least a year longer but some of the wind has already gone out of the property boom. Further delay might mean opportunities forfeited. Already a year has passed since the idea of a property company was first discussed by the commission: it was put in limbo when the government's white paper on reorganisation appeared last December and resurrected when Dr Beeching took over in June.

General Russell, who has been responsible for the management and development of the commission's property since he became one of its full time members nearly two years ago, will be chairman of Railway Sites Ltd. and Mr Roy Matthews, a surveyor, chairman of Crosse and Blackwell (Holdings) and a member of the commission's present property committee, is to be deputy chairman. The board of the new company, which also includes Sir Reginald Wilson, a full time member of the commission, and Mr W. S. Barnes, previously the commission's chief estate and rating surveyor and now the new company's managing director, may yet be strengthened by the addition of an outside property expert. The railways have no lack of urban sites crying out for fruitful development: indeed any number of schemes for rebuilding stations and similar sites of varying degrees of ambitiousness and preparation are in the pipeline. They are short, however, of money to finance big commercial projects such as these and the freedom to develop beyond their own particular needs.

It will be the new company's job to meet both deficiencies by finding property developers and institutions prepared to put up the money. To begin with at least it will operate mainly by forming companies with other developers for particular projects, with Railway Sites Ltd. holding a minority interest so as to meet the present statutory restrictions. Development will be financed by loans, and profits will be shared by Railway Sites Ltd. and its partners to each project. Thus the railway regions, who can expect to be chivvied by General Russell and his board into looking at every major site that might have a potential development value, will receive ground rent and the railways' share of development and management profits. Not quite the rack rent, but something better than many property owners without capital might otherwise expect to get.

OIL

Compensation for Anglo-Egyptian

Shell and BP this week formally "reserved their position as to the adequacy of the compensation" that the United Arab Republic has now announced it will pay for the majority shareholding in Anglo-Egyptian Oilfields that it is compulsorily acquiring along with similar holdings in a large variety of other business concerns in Egypt. The government originally owned 9.6 per cent of Anglo-Egyptian share capital of some £5½ million (in £1 "B" shares); Shell and BP each owned 30.9 per cent, and the remainder was held by private investors in the United Arab Republic (22 per cent) and Britain (6 per cent). Under its new decree the government share goes up to 55 per cent, and each of the other interests is halved, leaving some 15 per cent each to Shell and BP, and 3 per cent to private British investors.

The government proposes to pay compensation in 15-year bonds carrying 4 per cent interest, to the value of £E2.07 for every £1 share compulsorily acquired. This valuation is based on the last Cairo stock exchange quotation before the decree taking over the majority interest was announced. This stock exchange price had been falling for some years, largely no doubt because of the uncertainties of business operation in Egypt under the Nasser regime. Anglo-Egyptian's production of oil from Red Sea and Sinai fields (with Mobil), also, has been declining over the years, as the companies had no new areas to explore; more than half the throughput at its Suez refinery has recently been for the account of the government's General Petroleum Authority. This authority has a powerful grip on all oil business in Egypt: it is the sole importer of fuel oil and kerosene (which Egypt needs to import, though its own refinery output leaves a surplus of gasoline for export); it allocates these imports to the marketing companies, and fixes prices for the main products.

PAINT MERGER

Another Big Group

OVER the last few years sales of paint have been rising steadily though not spectacularly, with the emphasis shifting slightly from industrial uses to building and within the building trades from contract work to "do-it-yourself." But competition has been forcing margins down and profits have not been rising at all quickly. Last year, indeed, they fell despite bigger sales and when sales began to tail off a little in the recession in the motor industry competition became even more severe. One consequence has been mergers into bigger units. Probably the biggest producers are ICI and Wallpaper Manufacturers, which only recently acquired Smith and Walton and KL Holdings. Courtaulds has taken-over Pinchin Johnson and other fair-sized groups have been formed from the mergers between Lewis Berger and Jenson and Nicholson and between Blundell Spence and Permoglaze.

The proposed merger between British Paints and International Paints comes therefore as no surprise, for it creates a group which in size is not far behind the principal producers. Both reported slightly lower profits last year and both have specialised to some extent in marine paints, in which prospects cannot look overbright in view of the slump in shipbuilding. The new grouping may therefore be seen as a natural defence against the powerful competition of the other big manufacturers. Though the merger is to be effected through the medium of a holding company and the two partners intend to market their products under existing brand names, the directors are confident that considerable benefits will accrue. There is some over-lapping in overseas markets as well as at home and there is obvious scope for economies through integration.

The terms of the merger are one 4s. ordinary share in the holding company for every one 4s. ordinary share in British Paints and three ordinary shares in the holding company for every two 4s. ordinary shares in International Paints. These terms were in line with market values, with British Paints quoted at 17s. 6d. and International Paints at 11s. 6d. They give shareholders in British Paints slightly more than half the combined equity, although, on the basis of the last published figures, British Paints contributes just under half the combined equity assets and earnings. If the income of shareholders in International Paints is to be maintained the holding company would have to declare a dividend of 20 per cent and this would effectively raise the income of shareholders in British Paints from the 27½ per cent paid last year to 30 per cent. Presumably, therefore, in fixing the terms the companies' financial advisors have taken some account of British Paints' rights issue and the current state of trade and prospects of the two companies.

COAL

Pay As You Burn

FIFTEEN shillings a week for five years, plus the cost of coal or coke of guaranteed quality, should be a relatively convenient way of paying for some central heating in an average-size house. This package deal, which Lord Robens spoke about in Sheffield last week, fulfils one of the National Coal Board's ambitions of making coal a considerably more convenient fuel to use and thus more competitive in the domestic and industrial heating market where convenience as well as cost counts for much. No form of central heating can be got really cheaply. Coal and coke are probably about the least expensive, but they are not the most convenient to use. For fifteen shillings a week, under the board's new scheme, a householder will be able to have a boiler installed behind an open grate with an underfloor draught, costing in one payment about £150 to £170 and supplying heat to a 30-gallon hot water tank and about 70-100 square feet of heating surface—say three or four radiators and a heated towel rail. That would not provide full central heating for a three-bedroom house, but it might be sufficient for a distinctly smaller one.

Later this autumn and winter a number of manufacturers of domestic appliances will be putting on the market some improved types of solid fuel boilers and stoves, designed to stay in for two days, to need attention once only in every twenty-four hours, and equipped with automatic ignition devices. These, the fruits of special co-operation between the manufacturers and the Coal Board, are intended to be followed somewhat later by more sophisticated—and rather more expensive—boilers with completely automatic feed and ash removal. In the end it will be improved appliances to take the work out of solid fuel heating, rather than easy ways of paying, that will settle coal's chances of making a come-back in domestic heating.

BUILDING SOCIETIES

Before the Squeeze

THE figures published by the Building Societies Association for the second quarter of this year show that while new savings were about £1¾ million lower than in the first quarter withdrawals were about £1¼ million higher, so that net receipts fell from £38 million to £35 million. It could have been much worse; but it is clear that the announcement early in June that most societies would raise their rate on shares to 3¾ per cent, net, checked withdrawals in the last few weeks of the quarter. Indeed, some societies are prepared to admit that any benefit arising from the increase in rates has already been experienced and that with Bank rate at 7 per cent their borrowing rates are not attractive. Certainly, though they hope to ride out this period of dearer money by paying 3¾ per cent, net, on shares and charging 6½ per cent. on mortgages, the societies are openly admitting that if high interest rates persist for a lengthy period they will have seriously to consider whether 4 per cent, net, and 7 per cent are more appropriate. What inhibits the societies from accepting these rates now is the obligations they feel they have to old borrowers and the fact that a rise to 7 per cent on old mortgages originally contracted at low rates stretches repayments over a long—possibly an undesirably long—period of time.

* Based on returns made by 195 Building Societies whose combined assets represent 77 per cent of the total assets of the movement.

The societies have therefore to accept what appears to them to be equally unpleasant: mortgage rationing by quota. The member societies of the association did succeed in advancing as much as £110 million in the second quarter; but this was made possible by a slight reduction in liquid assets, by a high rate of repayments and by the lending of £11½ million under the Government's house purchase scheme. One of the Chancellor's proposals was to suspend this scheme and if and when the suspension comes into effect one source of finance for older houses will be blocked up. The societies, moreover, are likely to be reluctant to draw down their liquid balances much further so that if net receipts of new savings fall new mortgage advances will be more dependent than ever on the flow of repayments. The probability is that net receipts will fall and that for a few months at least the movement will in effect be marking time.

STERLING TRADE

More Help for Sterling

IN the first quarter of the year, the overseas sterling area increased its exports though Britain was importing less, and reduced its imports though Britain was exporting more. Despite their largely complementary trade, both components of the sterling area suffered a parallel deterioration in their balance of payments last year. It now seems that the rest of the sterling area can get just as quickly on to the other foot when mother changes step. Exports from the whole of the ster-

THIS IS THE EAST...

Economic development in Asia is bringing higher living standards to these young people and to the vast population of that continent. Demand for an ever increasing range of merchandise is steadily rising. If you are interested in trade with these expanding markets, you are invited to avail yourself of the banking and information services of The Chartered Bank and its subsidiary, The Eastern Bank Limited. The combined organisation of the two banks comprises one hundred branches in twenty-five territories extending from the Eastern Mediterranean to the Pacific Ocean.

THE CHARTERED BANK
(Incorporated by Royal Charter, 1853)

HEAD OFFICE: 38 BISHOPSGATE, LONDON, E.C.2

West End, London branch: 2 Regent Street, London, S.W.1 · Branches in the United Kingdom also at Manchester and Liverpool · Agencies at New York and Hamburg.

The Eastern Bank Limited HEAD OFFICE: 2 & 3 CROSBY SQUARE, LONDON, E.C.3

Associated Banks: Allahabad Bank Ltd. (Incorporated in India) · The Irano British Bank (Incorporated in Iran)

ling area rose by about 4 per cent in the first quarter; imports were cut by about one per cent (seasonally adjusted) below the level of the last quarter of 1960. On the incomplete evidence so far available,

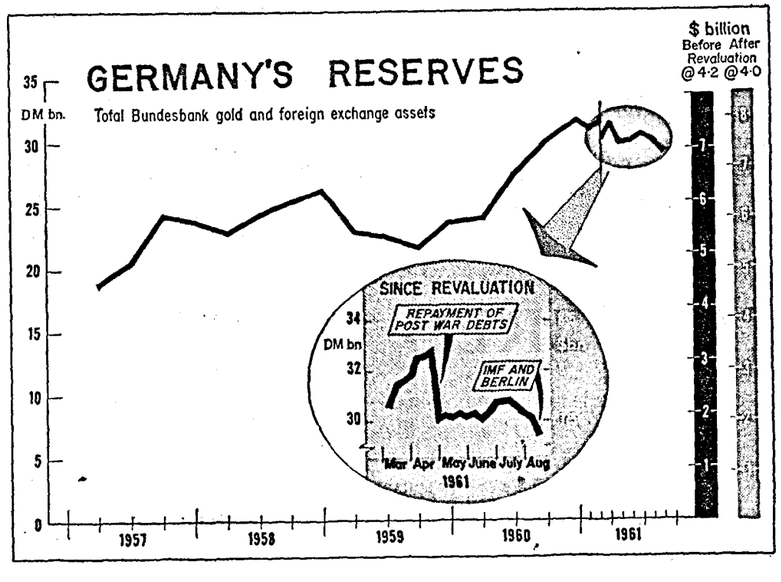
the Board of Trade reckons that the improvement persisted through the second quarter in both parts of the sterling area.



Compared with a year earlier, exports from the overseas sterling area were about 4 per cent lower in the first quarter, mainly as a result of the fall in commodity prices. Malayan exports dropped by 19 per cent, reflecting the decline in rubber prices after last year's boom. Exports from Rhodesia and Nyasaland fell by 13 per cent following the restriction of copper production and concurrent weakening in price. Ceylon and Ghana suffered an above-average fall in exports, but the West Indies, South Africa, India and Pakistan (helped by the very high prices of jute) increased their exports.

The fractional improvement in Britain's exports in the past three months over the February-April level was caused by an increase of £30 million (seasonally adjusted) in shipments to western Europe and a smaller rise in exports to the communist block and Latin America. Exports to the sterling area dropped by £23 million. In this period, imports of basic industrial materials fell by £21 million. Even so, total imports from the sterling area rose by a similar amount. Imports from North America declined by 11 per cent and from western Europe by 4 per cent.

GERMANY

Revaluation Begins to Work

At last, money is leaving Germany in substantial volume. The fall of 678 million marks (£60 million) in the external reserves of the Bundesbank in the week to August 15th was admittedly swollen by official transactions, notably by Germany's participation in the International Monetary Fund's credit to Britain. Britain is keeping over 400 million marks, of the 1,080 million drawn, on deposit with the Bundesbank. But it appears to have used some 600 million marks for repayments of Basle credits; and these and other liquidations of the Bundesbank's claims on foreign banks have much more than offset the addition of gold to the value of 360 million marks sold by the IMF as part of the United Kingdom credit operation. This complex of official transactions makes it difficult to calculate the residual movement of the funds—hardly any country's reserve figures mean what they say nowadays—but there was certainly a substantial further outflow in this week covering the closing of the Berlin sector boundary. In the previous fortnight the Bundesbank's reserves fell by around 500 million marks,

and the dollar has been consistently strong in Frankfurt. The outflow is still small compared with the intake equivalent to 8 billion marks in 1960, of which more than half was attributable to capital movements. But this turn of the tide may be a significant one; it coincides not only with the new Berlin crisis but also with the new economic measures in Britain and the check to speculation against sterling. This may be the beginning of the movement that revaluation should itself have set off five months ago.

It is still too soon to judge the final impact of the 5 per cent revaluation on the underlying payments balance. The evidence so far can be read both ways. German exports in the second quarter were over 11 per cent higher than the year before, though against the experience of previous years they were very little higher than in the first quarter. Imports were only 4½ per cent up on the year, despite a continuing rise in imports of finished manufactures—which are now double their level at end-1957 and account for 36 per cent of total German imports. This buoyancy has been partly offset by some caution in adding to stocks of imported materials at a time of continuing exchange uncertainty, and also by the sharp fall of around 4 per cent in import prices since revaluation.

The one clear effect of revaluation indeed has been to turn the terms of trade in Germany's favour; what is still not clear is whether this movement will be outweighed by changes in export and import volume. A survey by the German IFO Institute found that in May only just on a quarter of the firms interviewed had reduced their export prices, whereas in March more than one third of those interviewed had proclaimed their intention of doing so. But the Bundesbank reports a decided impact on export orders, which in the second quarter were down on the year by 4 per cent in value and 6 per cent in volume. One important deterrent is that since revaluation German exporters have found the strongest resistance among their customers to invoicing in D-marks—so that now the German exporter has to take the exchange risk. Not surprisingly, the most strongly placed export industries—notably machine tools and electrical engineering, where performance and availability are often more significant in international competition than price alone—have been relatively unruffled, and their orders continue to grow at a higher rate than their deliveries. But in other sectors including the steel, chemicals and optical industries, new export orders are now falling behind; while the plight of the shipbuilding industry, and to a less extent of textiles, has become worse still. Revaluation, some German critics have complained, has been little help in improving the domestic balance of the German economy—the strong sectors are as overstrained as before while the weak need still more help. But the impact may still have been in the right direction internationally.

BOAC SUBSIDIARIES

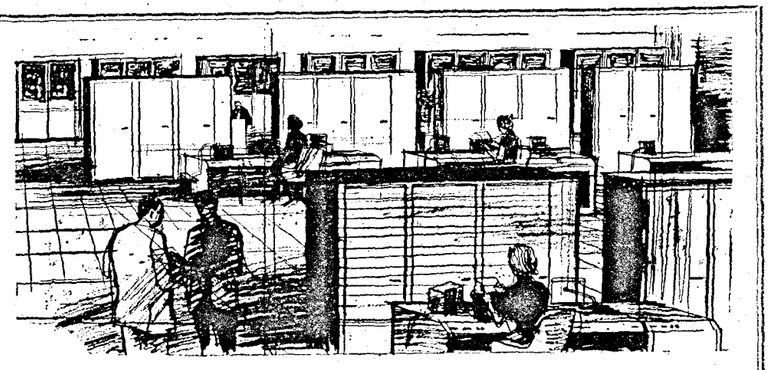
The First to Go

BOAC and Middle East Airlines ended their stormy six-year association last week to the mutual relief, no doubt, of both sides. A sum of £3½ million has been raised privately in the Lebanon to buy out BOAC's 49 per cent interest; when the managing director of MEA, Sheikh Najib Almuddin, offered the corporation £5 million for its interest almost exactly two years ago his offer was curtly refused. The present settlement can hardly compensate BOAC for the sums invested in Middle East Airlines since 1955 to make it viable, nor for its losses in MEA and its even bigger losses in the Mideast Airport Service Company, a vast maintenance base now taken over by MEA. But the fact that the corporation was prepared to let both companies go, marks a change of policy towards its subsidiaries in which it has been losing huge sums over the years.

The corporation's accounts for 1960-61 show the following pattern of profit and loss on its 12 subsidiaries which added up to a loss of more than £1½ million:

Aden Airways	− £58,000	Bahamas Airways	− £406,000
Borneo Airways	− £7,000	British W. Indian Airways	− £645,000
Cathay Pacific Airways	+ £5,000	Fiji Airways	− £5,000
Gulf Aviation	+ £9,000	Kuwait Airways	− £293,000
Malayan Airways	Small profit	Middle East Airlines	Small profit
Mideast Aircraft Service Company	− £418,000	Turkish Airlines	Not available

This loss, said Sheikh Almuddin, is largely the corporation's own fault. He argues that those few subsidiaries that are locally managed, including Middle East Airlines, have made profits (he maintains, with some justice, that MEA can hardly be blamed for the losses that it made during the Lebanese revolution; BOAC loses equally large sums, he said, when it has a strike). The subsidiaries that are wholly managed by BOAC are, he claims, those that made the biggest losses. Whatever the justice of this argument, BOAC is now making strenuous efforts to get rid of these subsidiaries, not all of which are so anxious to be detached from its apron strings as MEA. With luck, the corporation may manage to dispose soon of its British West Indian and its Kuwait subsidiaries; it seems incredible that the British taxpayer should be asked to subsidise Kuwait.



WHEAT

Crumbs of Comfort

DROUGHT threatens to halve Canada's wheat crop this year. Canadian farmers, who have had a thin time in recent seasons, can now expect worse; this year they stand to suffer a drop of at least $250 million in income as a result of this failure. The bulk of Canada's exports will be drawn from stocks this season, so that by next July the wheat carryover should be cut from more than 500 million to about 250 million bushels. But the weight of this stock, and the even bigger surpluses carried by the United States, will damp the market's normal reaction to a calamity of this magnitude. It is now obvious which side the bread is buttered in this trade; growers overproduce in good years and prices are depressed by huge surpluses. When crops fail, consumers have a comforting cushion of grain reserves conveniently provided by producers and they need not pay the scarcity prices that usually console farmers with blighted crops.

COMPUTERS

£3½ million Brain

THE price of a computer is a fairly reliable guide to its mathematical skill, so when the Atomic Energy Authority announces that it is buying one that will cost, with its equipment and buildings, a clear £3½ million, this can be taken to mean that the machine is probably the most powerful in the world. Here the AEA is paying for speed; the Atlas computer designed at Manchester University and built by Ferranti, should calculate 1,000 times faster than the ordinary run-of-the-mill commercial computer. Speed, again, indicates not only the machine's ability to do more work in a given time but something that computer makers are perhaps less anxious to discuss, namely accuracy.

If the only criterion were ability to do work in large amounts, it might be cheaper to buy two medium-sized computers than one giant like Atlas which costs a minimum of £2 million in its simplest version. But an electronic brain has this in common with a human brain, if it works for too long without a break, it can get fuddled and drop a digit in the middle of its equations. Scientists who use computers for long, abstruse calculations—which is a far cry from making up wage packets or processing bank accounts—say that there is a predictable rate at which errors begin to multiply as the computer gets fagged and they consider that 1½ hours is the maximum length of job that it is reasonable to ask one of these highly scientific computers to perform; the ideal length of job they put at 30 minutes. Other computer users might not agree with this, but one reason for growing international interest in Atlas is the fact that some scientists want to do sums that would take 2½ days' uninterrupted working on the best machines now in their laboratories which, they say, would be impossible because of the errors likely to creep in over that period.

It has not been easy to design into Atlas the performance demanded by the AEA and other potential customers; the huge IBM organisation, which is Ferranti's main competitor in this scientific market, seems to have run into severe difficulties with its Stretch computer than would, had it worked as planned, have been without question the biggest, fastest computer in the world. The new systems, designed by Manchester University for adding, for storing information and for monitoring work inside the computer, which give Atlas the necessary speed, have been proved on a prototype that has been working since last year, the first full-scale production model is now being installed in the University and the AEA should get its computer in 1964. If Ferranti were able to offer the computer for immediate delivery, it would probably sweep the market which is not big but is certainly highly lucrative and brings prestige that rubs off onto the company's humbler products. But the market for these calculating mammoths is if anything more competitive than that for simpler computers and the kind of technical lead that the company now possesses need not last. IBM will certainly do everything in its power to see that it does not last, but it will first have to deal with the difficulties encountered with Stretch and this may take some time.

So far this year, Canadian wheat prices (expressed in Canadian dollars and therefore reflecting the recent depreciation) have risen about 10 per cent.; No. 2 Northern Manitobas are now quoted at 177¼ cents a bushel. In Britain, prices have risen about 30s. to £28¼ a ton for forward deliveries in the past two months. Resales of wheat by dealers who bought large tonnages at lower prices earlier this year when severe damage to this year's crop seemed likely are checking the rise. But the recovery in prices, which excluding freight charges, has already lifted them to the highest level for five years, will not make good more than a fraction of the prospective loss facing Canadian farmers this year.

Durum wheat, an extremely hard wheat normally grown in hot climates and used to make pasta dishes like spaghetti and macaroni, has risen steeply in price. In this class, there is no surplus. In July, Canada offered a common grade of this type of wheat at $2.06⅝ cents a bushel; by last Friday the price had advanced to $2.94¼ cents a bushel. There will be no such mouth-watering rise in run-of-the-mill wheats. Though most of Canada's wheat is a hard variety essential to the manufacture of high quality flour and has few direct competitors, it is still not isolated from competition from softer wheats. Within limits, the proportions of hard and "filler" wheats used by millers are governed by price. Other suppliers can also regrade their exported grain to give a quantity of better quality wheat if the price differential is attractive. Russia, which seems particularly anxious to increase its exports to Britain, has a climate similar to that of Canada, and can presumably produce wheat of a corresponding quality.

ELECTRICITY

Oil Power or Nuclear?

IF THE Central Electricity Generating Board receives permission to build a 2,000 megawatt oil fired power station at Fawley on Southampton Water, it will "defer" consideration of a site at Hamstead Isle of Wight for a nuclear power station. The idea of a Hamstead nuclear station had caused a good deal of local opposition on grounds of amenity, which the generating board recognised last December when it said it would look at alternative ways of providing the power. The oil-fired station would be on land close to Esso's refinery, which would ensure it a good bargain on fuel oil, and thus is in an already industrialised part of the area. Local residents objecting to industrial development sealed another victory last week: Caltex announced that it would put up for sale the site on Southampton Water where it had originally proposed to build a refinery.

The two first nuclear power stations of the CEGB, at Bradwell on the Thames estuary and Berkeley on the Severn, are due to start up any day now, although this does not necessarily mean that they will be ready to generate power for several weeks. Both stations are roughly a year behind schedule; it had been hoped that they would be commissioned in time to meet last year's winter peak demand, but it will be difficult now to have them run in before this November. The first big nuclear power station at Calder Hall will have been running at full power for five years by the time these two stations begin to feed current into the Grid, and much of the experience learned during those five years has been fed into these two stations. But Calder Hall is not a commercial power station designed to get the maximum value out of its fuel; it is not even designed to be re-fuelled while the reactor is working.

This leaves large gaps in engineers' experience of running nuclear power stations that will not be filled until Bradwell and Berkeley have been working for several years. It would be optimistic and indeed unreasonable to expect under these conditions, that either power station would meet at the outset even their comparatively modest target of producing electricity at between 0.8d. and 0.9d. a unit. The prospects are better for the CEGB's next nuclear power station at Hinkley Point, due to start work next year. Power from Hinkley Point might cost ¾d. a unit, which would still be 50 per cent more expensive than thermal power. Thereafter the CEGB should be bringing in one new nuclear station every year and might achieve parity with thermal costs in 1966 or 1967.

WOOL

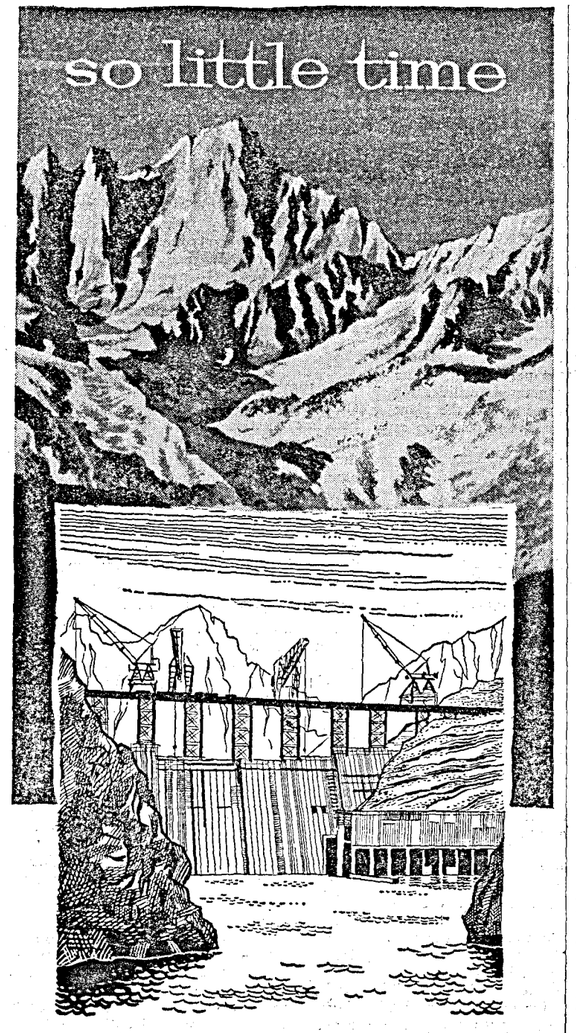
Hitch in Wool Tops

INTERNATIONAL tension is not the force it was in commodity markets; shortages of primary products have become too rare and political crises too frequent. On Monday, the new season's wool auctions begin in Australia. Although the trouble in Berlin has jogged the United States into ordering 4½ million yards of wool cloth for its armed forces and the New York wool futures market responded sharply, Mr Khrushchev's impact on wool is unlikely to be resounding. But any drop in temperature is good for wool; the extra degree of frigidity in East-West relations should help to ensure a firm start to the new wool season. Between seasons in private deals, buyers have apparently paid several pence a lb over last season's closing prices. If these gains are held, prices will be not far below their May peak.

Australia expects its clip to be slightly bigger this season; a small increase in wool production should be general. Stocks of wool in manufacturing centres, particularly Britain, are relatively low. Demand from Britain, Japan and America might therefore be stronger. Japan's growing imports, mainly to satisfy internal needs, helped to rescue wool from the doldrums last season. But besides being woolgrowers' main encouragement, Japan's consumption is the chief variable in demand. Japan's wool textile imports seem to be less buoyant now; following trade liberalisation, Japan's balance of payments looks less healthy. In the past, swings in Japanese trade have been comparatively violent; much as Japan's population wishes to wear more wool, it might have less opportunity to do so next year.

Prospects seem slightly less rosy in Britain. Topmakers, who prepare raw wool for spinning into worsted yarns and have built up a promising export trade, now have fewer unfilled contracts and they have run into difficulty with their Chinese customers. China normally buys about a fifth of all merino wool tops exported by Britain, though its demand has recently tailed off. Pekin has chosen this time to challenge a principle on which the British trade is founded—testing in the Bradford Conditioning House. As an invariable rule, payments are adjusted on the results of tests for moisture and oil content made on samples in the Conditioning House, which is known to be and can be seen to be uninfluenced by the local wool trade. The same cannot yet be said of a rival testing establishment in Pekin on whose tests China wants all contracts to depend from the beginning of August. Differences between tests in Bradford and Pekin could eliminate the topmakers' margin of profit, and the high cost of transporting tops makes their diversion unprofitable once they have been shipped. Despite protests Pekin is adamant, and Bradford topmakers have so far refused to surrender their principle. Trade in wool tops with China is consequently at a standstill.

SHORTER NOTE



Mr Anthony Tuke, chairman of Barclays Bank since 1951, has decided to retire early next year when he will be 65. He will be succeeded by Mr John Thomson, now deputy chairman. Like Mr Tuke, whose father was a former chairman of Barclays, Mr Thomson comes from one of the Barclays families—his family bank, Parsons, Thomson & Company of Oxford, was amalgamated into the group in 1900. Mr Thomson is 53.

BCA

INTERNATIONAL WOOL SECRETARIAT

REGIONAL DIRECTOR FOR ASIAN ZONE

The Board of the International Wool Secretariat invites applications for the new post of Regional Director, Asian Zone. This will be the chief executive position in that zone and the Regional Director will be responsible to the Managing Director of the International Wool Secretariat. Initially his headquarters will be in Tokyo.

The International Wool Secretariat is the organisation maintained by the statutory Wool Boards of Australia, New Zealand and South Africa, to carry out their policies for the global promotion of wool and the stimulation of scientific research. The Regional Director will be advised by technical staffs in the fields of publicity, scientific research and economics.

The successful candidate will be a man of established reputation in administration and experienced in promotion. He should be thoroughly conversant with conditions in the Far East, especially Japan. He will not be older than 50 years, and be prepared to spend many weeks of the year travelling away from home.

Terms of appointment and remuneration compare favourably with those of executives in the Far East.

Candidates should submit brief details of their background and experience, as well as the names of 3 persons to whom reference could be made if necessary, to:

THE MANAGING DIRECTOR,
INTERNATIONAL WOOL SECRETARIAT,
578 BOURKE STREET,
MELBOURNE, AUSTRALIA.

All applications should be submitted not later than 30th September. The post is being advertised internationally.

No details of the applications received will be disclosed without the authority of the candidate.

COMPANY MEETINGS

ENI

Ente Nazionale Idrocarburi, Roma

RESULTS OF THE 1960-61 FINANCIAL YEAR

HYDROCARBON EXPLORATION

In 1960 AGIP MINERARIA and its associated companies completed 161 wells in Italy (73 of them exploration and 88 development) and drilled altogether 320,349 metres. A natural gasfield of considerable importance was discovered offshore opposite Ravenna.

Some small gasfields were also found in northern Italy, at Pontetidone (Piacenza), Orzinuovi (Brescia), Soncino (Cremona), Migliarino and Poggio Rusco (Ferrara), and Grignano Polesine (Rovigo). In the Abruzzi the further delimitation of the San Salvo gasfield proved that it extends as far as the areas of Cupello, Furci and Scerni. Other notable gas discoveries were made at Pisticci (Matera) and Gagliano (Enna). The overall exploration area abroad rose from 153,364 sq. kms. at the end of 1959 to 159,293 sq. kms. at the end of 1960. Offshore exploration in Iran, in the Persian Gulf, and in the United Arab Republic, in the Gulf of Suez, led to the discovery of two oilfields.

PRODUCTION

In 1960 the Group companies' overall output was 6,167.8 million cu. metres of methane, 408.5 million more than the year before. Liquid and liquefiable hydrocarbon output rose from 364,065 tons in 1959 to 673,362 tons in 1960, an 85 per cent increase. In 1960 COPE produced 1.9 million tons of crude oil from the Egyptian oilfields.

TRANSPORT

In 1961 work began on building the "Central Europe Pipeline." It will be about 1,000 kms. long in all and have a carrying capacity of 18 million tons per annum. Starting from Genoa, the pipeline will go as far as Ferrera (Pavia) and there divide into two branches, one going on to Aigle in Switzerland and the other to the regions of Ingolstadt and Stuttgart in southern Germany. At the end of 1960 the methane transport pipelines were 4,382 kms. long and the urban methane and propane supply networks, 1,308 kms. long. Altogether, therefore, the Group's natural gas pipeline systems were 5,690 kms. long at December 31, 1960.

In 1960 and early 1961 three turbo tankers of 48,900 dwt each were launched and one of them is already in service. Orders have been placed for a motor tanker of 1,065 tons for carrying liquid petroleum gas, which will be launched in August, and for two motor tankers of 49,200 tons each. Once this ship-building programme is complete the ENI Group will own about 430,000 dwt of tanker vessels. Its fleet carried 3,480,044 tons of crude oil and petroleum products in 1960.

REFINING AND PETROCHEMICALS

In 1960 the refineries in which ENI has an interest processed 6.5 million tons of feedstock (5.4 million in 1959). Various projects now under way will add very much to the ENI Group's refining capacity in the next few years. In Italy the refining units are being built in the Gela industrial centre and a new refinery is planned at Ferrera (Pavia). Abroad the work of building the Mohammedia refinery, with an annual capacity of 1,250,000 tons per annum, began in Morocco and other refineries to be built include one at Bizerta (Tunisia), with an initial capacity of 1 million tons per annum, one at Tema (Ghana), with an annual capacity of 1,250,000, and two in southern Germany with an initial capacity of 2 million tons per annum. The ENI Group will also be granted facilities for refining 700,000 tons of crude oil at the plant belonging to Raffineries du Rhône going up at Aigle (Switzerland).

Turning to petrochemicals, at ANIC's factory at Ravenna the fertiliser plants reached a productive capacity of 1 million tons per annum and the rubber plants will very soon be capable of making 95,000-100,000 tons per annum. At Ravenna too, the plants belonging to PHILLIPS CARBON BLACK ITALIANA for making carbon black and others belonging to SOCIETA' CHIMICA RAVENNA for making polyvinyl chloride, were completed. Work is going ahead on the ANIC GELA industrial centre and at the same time a plastics factory has been planned for Pisticci (Matera). It will use some of the natural gas from the Ferrandina field as feedstock.

MARKETING

In 1960 AGIP became an important competitive force to be reckoned with in the motor fuel trade, being the first to reduce its retail selling prices. This action, followed by a Government decision to lower the tax on motor fuels, had a very stimulating effect on sales. AGIP continued to expand its marketing organisation in Italy throughout the year. Sales of petroleum products rose significantly compared with 1959, with the following increases for the main products: 28.7 per cent for gasoline, 12.6 per cent for gas oil, 20.5 per cent for fuel oil and 20.7 per cent for lubricants. By the end of 1960 the number of *Agipgas* users was 7 per cent more than at the same date the previous year. There were 18 motels open at April 30, 1961 and others will be ready during the year.

AGIP set up new associated companies for extending its roadside marketing organisation in Germany, Tunisia, Ghana and Kenya. A company was formed in Argentina for liquefied petroleum gas bottling and distributing. It made a very successful start.

NUCLEAR INDUSTRY

In 1960 AGIP NUCLEARE continued its study and research work in the nuclear field both in connection with the design of the Latina atomic power station and in connection with the programmes agreed in conjunction with other national and international bodies. A very advanced stage was reached in the design of the Latina plant and SIMEA is going ahead with the actual building work. The plant will be ready to operate in 1962. SOMIREN successfully carried out a search for uranium in Italy.

OTHER OPERATIONS

The various design, erection and engineering activities carried out by ENI's associated companies on behalf of customers inside and outside the Group continued to expand during the year. Outstanding successes were achieved by NUOVO PIGNONE, SNAM PROGETTI and SAIPEM.

Orders received by NUOVO PIGNONE had reached record levels by the end of the year and it became necessary to enlarge and expand its plant. It was furthermore decided to build a factory at Bari for making pneumatic, electrical, mechanical and electronic equipment for controlling industrial processes and another at Vibo Valentia for fabricating light engineering goods.

Among some of SNAM PROGETTI'S most important work was the completion of contracts for designing oil and natural gas pipelines in Pakistan and Iran and a refinery in Jordan. Present work includes the design of plants for the refinery now under construction at Mohammedia. Once again SAIPEM's achievements both in Italy and abroad were highly commendable. In Argentina, as a result of its successful work the previous year and proved technical ability, it was awarded the contract to drill another 300 wells, thus bringing the total number of wells to be drilled up to 600. Another work of considerable importance was started in India. This is an oil pipeline 1,140 kms. long for Oil India Private Co.

PERSONNEL AND WELFARE FACILITIES

Very careful attention was paid to the preparation and training of the Group's personnel. Courses for executives were held at ENI's Business Management and Technical Institute and the companies at the head of each of the various sectors of activity arranged workmen's courses at their training centres. On the welfare side, thousands of employees and their families spent their holidays in the hotel and chalets at ENI's village built in the mountains at Corte di Cadore, near Cortina, and something like 2,500 children enjoyed the camping and holiday home facilities both at Corte di Cadore and by the sea at Cesenatico.

WILLIAM JACKS & COMPANY, LIMITED

(Merchants and Engineers)

A NOTABLE TRADING ACHIEVEMENT

The thirty-fifth annual general meeting of William Jacks & Company, Limited will be held on September 12th in London.

The following is an extract from the statement by the chairman, Mr W. Gray Buchanan, which has been circulated to Shareholders:

As forecast at our last meeting, the results for 1960 were better than those for 1959. Turnover increased and the group net profit was £157,000 compared with £109,000 for 1959. Your Board recommend a Final Ordinary Dividend of 5½d. making 7½d. per share for the year compared with a total of 6d. per share for the previous year. It is also proposed to repeat the distribution of 2d. per share out of realised capital profits. At a later meeting it will be proposed to make a Bonus Issue from General Revenue Reserve of one Ordinary Share for every ten held. This will increase the Issued Capital to over £1 million and will make the ordinary shares eligible for trustee investment. An increase in the Authorised Capital will be necessary.

Mr Buchanan then commented on conditions and price fluctuations in the metal market, i.e. copper, tin, lead, zinc and pig iron.

Referring to overseas trade, he said that the company's exports in 1960 amounted to £4,667,000, an increase of £200,000.

Commenting on prospects, Mr Buchanan said: Results for the first quarter of this year were very much the same as for the first quarter of 1960, but I will give a more up-to-date indication at the meeting on September 12th. Unexecuted orders on hand at overseas branches at June 30th were, however, greater than at the corresponding date last year.

COLVERN LIMITED

ANOTHER RECORD YEAR

IMPORTANT ACQUISITIONS

MR L. A. REDDALL ON THE PROSPECTS

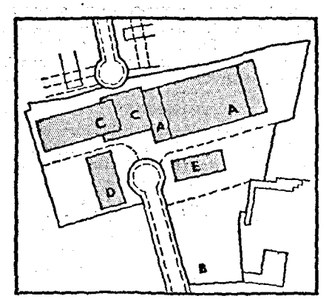
The Sixth Annual General Meeting of Colvern Limited was held on August 17th in London.

Mr L. A. Reddall FCA, the chairman, presided.

The following is his statement, which had been circulated with the report and accounts for the year ended March 31, 1961:

As forecast in my interim report in December, 1960, the outcome of the year's operations was another successful and record year for your Company. The net result, a profit before taxation of £264,007, being £42,392 greater than the previous year, i.e., an increase of 19 per cent.

FINANCE



The increase in profits tax this year makes the incidence of taxation 51¼ per cent, but even after this burden is provided for, the profits remaining amount to £133,194 and your directors recommend that the final dividend be raised to 27½ per cent on the ordinary share capital as increased by the bonus issue of February, 1961.

This distribution will amount to £54,163 net, which added to the dividends already paid, i.e., the 10 per cent interim dividend on the ordinary share capital prior to the bonus issue and the 7 per cent on the preference share capital makes a total distribution for the year of £70,295 net—some £22,000 more than last year.

As most shareholders are aware, and as will be noted from the profit and loss statement, we acquired by an issue of shares in September, 1960, the Childen Engineering Co. This purchase resulted in a credit of £30,625 to share premium account which was subsequently capitalised together with £76,562 10s. out of the unappropriated profits brought forward from last year and issued as bonus shares in February, 1961. After allowing for this capitalisation of earlier unappropriated profits the amount carried forward to the current year is still £179,810.

EXTENSION OF PREMISES

The increase in the value of freehold land and buildings shown on the balance-sheet results from the purchase of adjacent properties during the year and progress payments on our main building extension. The importance of these acquisitions to the future progress of your Company can be fully appreciated by reference to the site plan printed below which shows our three-acre site at Spring Gardens, Romford, and the disposition of the buildings thereon, which can be identified, viz:

"A" Spring Gardens Offices and Works.

"B" Industrial Building Site purchased 1956.

"C" 40,000 sq. ft. Four-storey extensions.

"D" Childen Engineering Ltd.

"E" Warehouse cum factory Building with additional land—Purchased December, 1960.

(Our Mawneys Road Works, approximately one mile distant from Spring Gardens, is not included in the site plan.)

Prior to our taking it over, the Childen Engineering Co. had for some time been largely engaged on work for your Company. This fact, coupled with the strategic position of the building and land immediately adjacent to our property, made it a most desirable and useful adjunct for us. Childen Engineering Ltd. has been formed as a wholly owned subsidiary and the factory building is leased to them at an economic rent.

The warehouse and land marked "E" on the diagram was purchased when it came on the market in December, 1960, and as it is situate between our original Spring Gardens Works and an industrial building site acquired some four years ago (marked "B" on plan), its acquisition, in addition to providing immediate storage space, will facilitate long term future planning, and must, by bringing these factory sites together under one ownership increase their value.

The major extension to our works ("C" on site plan) is showing good progress and we hope to obtain possession by the end of this year. We cannot, however, expect benefits from this project in the current year. With ever-rising costs, particularly labour costs, and the threat of a pay-roll tax, the need for constant study and change of methods in production is vital and this extension is primarily intended for rationalisation of our production methods so as to make the most economic use of our labour force, introducing automation as far as possible, and it has been found that mechanisation of this nature tends to require more space for machines. The opportunity is being taken to provide working conditions of the highest order for all our employees whose loyal and enthusiastic efforts have contributed so much to this most successful year, and to the fine progress generally.

FUTURE PROSPECTS

Sales, which for the year ended March 31, 1961, were a record for your Company, both at home and overseas, have continued at a satisfactory level so far in the current year. Our order book is extensive and provided political and economic conditions permit, I see no reason why your Company should not continue its steady progress, sharing in the growth that must undoubtedly take place in the electronics industry.

The report and accounts were adopted.

DAIMLER-BENZ AKTIENGESELLSCHAFT,
STUTTGART

At the Annual General Meeting of Daimler-Benz Aktiengesellschaft, held on July 28, 1961, the following report was presented to the shareholders:

PRODUCTION (number of items)

	1958	1959	1960
Private motor-cars	99,209	108,440	122,684
Annual rate of growth	22·6%	9·3%	13·1%
Monthly average	8,267	9,037	10,224
Commercial vehicles (including assortments of assembly parts)	57,482	62,598	72,960
Annual rate of growth	33·8%	8·9%	16·6%
Monthly average	4,790	5,216	6,080

In 1960 there has been a shift in emphasis in the production of private motor-cars as compared with 1959 inasmuch as more 220 types (+ 73 per cent) and fewer 180 types (— 20.5 per cent) were produced. It was possible to improve delivery periods for the 220 types quite considerably but in view of the limitation of the overall capacity this led to a temporary increase in the delivery periods for the four-cylinder types. In 1960, the production of commercial vehicles and "Unimogs" showed an even greater increase than that of private motor-cars.

Orders received in the first five months of 1961 show an increase in all lines of production as compared with the same period in 1960 and, as there is little opportunity for increasing output, have brought about a further increase in orders in hand as at the end of May, 1961.

TURNOVER

The turnover, without that of associated companies, rose in 1960 by 17.5 per cent and, at 2.905 mill. DM, very nearly reached the Three-Milliard-Limit. In 1960 the home market was supplied rather more strongly than during the previous year, the rate of growth being 19.2 per cent. Exports increased by 15.3 per cent and the share of exports in the total turnover amounted to 1,184.4 mill. DM—40.8 per cent (41.6 per cent in the previous year).

The increase in turnover was achieved, despite stronger competition, without any noteworthy increase in prices.

EXPORT

More than 50 per cent of the total items produced is being exported, with Europe, in 1960, being the principal buyer, followed by America, Asia, Africa, Australia/Oceania, whereas, in the previous year, America was in the leading position. It was nevertheless possible in 1960 to increase exports to North America, considered the most important export market, and watched over by Daimler-Benz of North America, New York, by 7.7 per cent as compared with the previous year. In the first five months of 1961 exports to the USA, compared with the same period last year, increased by 5.5 per cent. Undisturbed exports are necessary for optimum utilisation of productive capacity.

ASSOCIATED COMPANIES

Auto Union, Ingolstadt-Duesseldorf, a 100 per cent subsidiary, reports for 1960 an increase in production of 70.6 per cent, an increase in turnover of 34.7 per cent and an increase in the number of persons employed of 20.6 per cent. Auto Union will transfer production from the Duesseldorf works (private motor-car type Au 1000) to the now completed Ingolstadt works where the "Junior" type has been produced in constantly increasing numbers. The Duesseldorf works which cover an area of about 77,000 square metres and, at present, employ 3,800 persons, will be placed at the disposal of Daimler-Benz in order to bring about a decisive improvement in their own bottlenecks in productive capacity.

The foreign producers Mercedes-Benz Argentina SA Buenos Aires (participating ratio now about 91 per cent owing to capital increase by 400 million Pesos to 500 million Pesos) and Tata Engineering and Locomotive Company Ltd., Bombay (participating ratio unchanged at 12.8 per cent), are able, for 1960, to report again increased production and turnover figures and satisfactory trading results.

Owing to the inflationary tendency, increased competition in the motor-car trade in Brazil, and the loss of accessories supplied at more favourable prices by the German mother firm, Mercedes-Benz do Brasil SA, Sao Bernardo do Campo (capital increased by 1.6 milliard Cruz. to 6.6 milliard Cruz., participating ratio continued at 50 per cent) found themselves in a more difficult economic position in 1960. Production suffered a slight set-back and trading results deteriorated.

INVESTMENTS

185.0 mill. DM were invested in 1960. This is 15.6 per cent more than in 1959. Investments made since the currency reform have thus passed the one-milliard mark. Investments in 1960 served the purpose of expanding production, reducing delivery periods, rationalisation, and further improvement in the quality of the products. Production was increased particularly in respect of private motor-cars with a monthly maximum of 11,000 units at the end of the year under review. Present planning envisages an increase to a monthly total of 13,000 units by the end of 1962.

PERSONNEL

In spite of considerable difficulties encountered in obtaining labour, particularly in the congestion areas Stuttgart and Mannheim where the three largest works of the company are situated, the number of persons employed was increased in 1960 by 4,089 to 67,521 at the end of the year. At the end of 1960 the whole concern employed about 90,500 persons.

BALANCE SHEET

The balance sheet for 1960 is characterised by the increase in capital in the ratio of 2:1 to 270.6 mill. DM. For this purpose 100 mill. DM have been allotted to the reserves, 60 mill. DM of which are from the 1960 result and 40 mill. DM from the liquidation of value adjustments. For the capital increase about 90.2 mill. DM will be required from "General Reserve." After allocation of about 9 mill. DM the "Legal Reserve" has been increased to 10 per cent of the new capital (27.1 mill. DM).

The balance-sheet total is increased by 230.6 mill. DM, compared with 1959, or 22.9 per cent. The percentage increase in capital assets in 1960, as compared with 1959, was slight, and working assets have decreased correspondingly. [The ratio 4/10 capital assets and 6/10 working assets is unchanged in 1960 and, in comparison with other motor-car firms, represents a low investment intensity (sic).]

There has been a slight improvement in the ratio between own capital resources and capital from outside sources shown in 1960, as compared with 1959, but own capital resources are not sufficient to cover capital assets. Excess cover results only when long-term capital from outside sources is taken into account.

In the balance-sheet for 1959 the working assets are still financed by 18.6 per cent but in 1960 only to the extent of 14.1 per cent by long-term borrowings from outside sources and further by medium- and short-term funds from outside sources. Of the increase in short-term funds from outside sources in the 1960 balance-sheet by 148.0 mill. DM, 58.2 mill. DM alone are in respect of fairly large commitments to suppliers resulting partly from the increase in the volume of business and partly from the more extensive stock held caused by delay in supplies from sub-suppliers.

Out of the net profit of 32.4 mill. DM, which has risen by 50 per cent as compared with 1959, a dividend of 12 per cent is paid on the increased capital of 270.6 mill. DM.

VARIOUS FIGURES FOR THE BUSINESS YEAR 1959-1960

	1959	1960
Number of staff (to the end of the year)	63,432	67,521
Wages and salaries (in Mill. DM)	404	483
Turnover—without participating companies (in Mill. DM):		
Home	1,444	1,721
Abroad	1,027	1,184
Total	2,471	2,905
Capital assets—without participations (in Mill. DM)	330	405
Additions to capital (in Mill. DM)	160	185
Since the currency reform (in Mill. DM)	860	1,045
Sum set aside for depreciation (in Mill. DM)	116	133
Since the currency reform (in Mill. DM)	639	772
Share capital (in Mill. DM):		
Before capital increase from business funds	72	180
After capital increase from business funds	180	270
Reserve Funds (in Mill. DM):		
Before capital increase from business funds	182	174
After capital increase from business funds	74	84
Long-term foreign debts (in Mill. DM)	237	235
Balance (in Mill. DM)	1,008	1,239
Tax on income, earnings and property (in Mill. DM)	172	214
Dividend per cent	12%	12%
Amount of dividend (in Mill. DM)	22	32

Include: 7½ per cent bonds 1954, other long-term loans, bank debts, amounts placed to reserves for uncertain debts of long-term character and Daimler-Benz provident fund.

SHEEPBRIDGE ENGINEERING LIMITED
INCREASED PRODUCTION AND SALES
FINANCIAL RESULTS JUSTIFY CAPITAL EXPENDITURE
LORD ABERCONWAY'S STATEMENT

The Annual General Meeting of Sheepbridge Engineering Limited will be held on September 27 in London.

The following is the Statement by the Chairman, The Right Hon. Lord Aberconway, circulated with the report and accounts:

During the year covered by the accounts, increased activity resulted in the invoiced sales of the Group being considerably higher in value than in any previous year. The increase in production was made possible largely by the decision taken last year to incur greater expenditure than usual on capital equipment. Without such expenditure we could not have met the demands for our products especially from the motor trade; while the financial results achieved this year in the face of constantly rising costs have fully justified that policy.

PROFIT AND ALLOCATIONS

The Consolidated Profit for the year before taxation was £1,157,889 compared with £1,029,538 for the previous year. After providing £575,045 for taxation, and deducting £20,581 attributable to minority interests in subsidiary companies, the profit attributable to the parent company is £562,263, which is £13,799 more than in the previous year.

The directors have decided to increase the General Reserve to £1,200,000 by the transfer thereto of a further £100,000, and recommend the payment of a final dividend of 10 per cent, making with the interim dividend of 5 per cent paid in February, a total distribution for the year of 15 per cent, the same as last year.

Since the end of the year Mr Willoughby Norman has been appointed a director of the company. We consider ourselves fortunate to have secured the benefit of his ability and experience, and are glad to have him as a colleague.

SUCCESS OF FURTHER DIVERSIFICATION

The efforts to diversify still further the activities of Sheepbridge Equipment Limited were successful, and the intake of orders was higher than in the previous year. The products of this company are being used by a widening range of industries. A new crusher, the Cuber crusher, has been introduced, and has evoked considerable interest in the quarrying industry. A new man-riding car has been developed and introduced into several collieries; and it is hoped that substantial sales will be achieved during the current year.

At Sheepbridge Stokes Limited production should be increased still further when an extension to the machine shops is completed this year. The modern transfer machines to be installed in the extension will improve the competitiveness of the company's products, and should satisfy the increasing requirements of our customers.

COMPONENTS FOR THE MOTOR INDUSTRY

Other subsidiary companies producing components for the motor industry—Automotive Engineering Limited, Light Production Limited, Harold Andrews Sheepbridge Limited and Clews Petersen Limited—also had a very busy year and were fortunate not to suffer to any appreciable extent from the recession in the motor industry. Automotive Engineering Limited has opened a new factory at Reading and already plans are in hand for the production area to be enlarged. New plant being installed by Light Production Limited will enable the production of piston rings to be considerably increased.

During the year British van der Horst Limited installed specialised plant for the copper plating of photogravure and calico printing rolls. Such rolls were shown at the Moscow Trade Fair recently.

The business of Sheepbridge Alloy Castings Limited increased. They sold more heat-resisting centrifugal castings for gas turbine engines for civil aircraft, and more heat-resisting tubes and fittings for the petro-chemical and allied industries.

The recession in the motor industry affected the demand for some products of Sintered Products Ltd., but total sales for the year were higher than ever before because of the constantly widening range of applications for components sintered from powdered metal. Agreements have been entered into under which the company will provide technical information and assistance for the manufacture of such products in India and Australia.

Demand for the Twiflex-Dunlop industrial disc brakes manufactured by Twiflex Couplings Ltd. is rapidly increasing. One interesting development is their application to steel rolling mills.

EXTENSION OF FACTORIES

Bray Construction Equipment Ltd. continues to develop and improve its range of earth-moving equipment. The additional buildings purchased during the year have increased the manufacturing capacity and are being fully used. Record deliveries were again achieved; export business was some 40 per cent higher than in the previous year, and accounted for the majority of sales.

Last year I reported that the demand for the high precision lathes made by Hardinge Machine Tools Ltd. had showed considerable improvement during the latter half of the year then being reviewed. The improvement has continued unabated and the year's sales have been a record both at home and overseas. To increase production of lathes, and thereby shorten delivery dates, a factory is being built at Exeter and production should start early next year.

RECENT ACQUISITIONS

Last September the shares of two relatively small connected companies were bought—Purfection Engineering Co. (Coleshill) Ltd. (now renamed Perfection Engineering Ltd.) and Station Engineering Co. (Coleshill) Ltd. These companies make honing machines and spline gauges, which should be useful and suitable additions to the machine tool side of the Group's activities.

The introduction during the year of the shorter working week in the engineering industry, and the wages award to engineers and staff, led once again to an increase in costs, both directly, and indirectly in the form of high prices paid for materials and services. It has not been possible to absorb all these additions to cost, and inevitably some increases have had to be made in the selling prices of the Group's products. The policy continues of constantly reviewing manufacturing methods and facilities, with a view to improving the quality and cheapening the cost of our products. To that end new equipment is continually being installed. This policy has enabled price increases to be kept to a minimum, and has doubtless contributed to the orders on hand at the end of the year being substantially higher in value than at any previous year end.

CURRENT YEAR'S PROSPECTS

The profitability of your company's business is highly susceptible to volume, and in view of the critical economic position of the country, your directors regard the future with caution. Nevertheless, subject to any general deterioration in trading conditions or to any difficulties peculiar to the industries we serve, the prospects for the current year look good. Increased turnover should offset narrower trading margins, and the overall profit should be maintained.

Our managing director, our executives, staff and workpeople form an able and industrious team, and shareholders should be grateful to them for achieving another successful year.

CARTER & CO.
INCREASED TRADE

The fifty-third annual general meeting of Carter & Co. Ltd. was held on August 24th at Poole, Mr C. Cyril Carter, chairman, presiding.

The following is an extract from his circulated statement for the year to April 1, 1961:

The money that has been put into equipment, and where necessary into building, has been fruitful. The fact stands out in sharp relief. In short, plant has been brought to a standard of efficiency that has made its profitable utilisation possible. Efforts to maintain the volume of trade have not only done that but have increased it appreciably.

I said last year that the demand for Poole pottery had then stretched production to its limit. To meet the situation and to make facilities for the production of Poole ovenware, buildings and new equipment had to be provided and are now in use. The Contracting Companies have produced better results but will inevitably be affected by the rise in building trade wages announced for next autumn.

Export trade of the Manufacturing Companies has been maintained. In February last I went to Australia and New Zealand where I gained much general information necessary in the consideration of trading policy and possibilities in what are, at present, our most important export markets.

Our belief, expressed last year, in the fundamental soundness of our organisation, and our confidence in its increasingly profitable operation, would appear to have been justified.

The report and accounts were adopted.

THE INTERNATIONAL TEA COMPANY'S STORES, LTD.

LARGER TURNOVER

The Annual General Meeting of this company will be held on September 11th in London.

The following is an extract from the circulated statement of the chairman, Mr F. E. Hawkins, for the year ended April 29th, 1961:

In spite of a substantial increase in turnover and in the tonnage of goods sold the trading profit for the year under review, before charging taxation and depreciation, of £2,562,021 shows a decrease of £83,407 as compared with the record profits of the previous year. The profit before taxation amounts to £1,903,416. From this has to be deducted £956,344 in respect of taxation, including equalisation reserve, leaving a consolidated net profit of £947,072, a decrease of £74,312. We propose a final dividend on the ordinary stock of 10 per cent less tax, making 12½ per cent for the year (the same as for the previous year).

We have had to contend with rapidly increasing and intensified competition. This increasing competition has brought with it a general lowering of retail prices in order to attract custom and whilst we have been successful in securing increased turnover, to do so we have had to accept a reduced margin of gross profit. At the same time we have been faced with increases in expenses amounting to approximately £350,000, of which increases in wages and salaries alone accounted for nearly £250,000. These are the main reasons for the somewhat lower profits.

SUCCESS OF SELF-SERVICE

Your board were among the first to appreciate the advantages of self-service, both to the company and its customers, and for several years have been engaged in converting all suitable existing branches to this method of trading and in the opening of new self-service shops. During the year under review we have made good progress, no fewer than 70 branches having been added to the self-service list (as compared with the predicted 52 in my last review), making a total of 322, and we anticipate completing a similar number of conversions and new openings during the current year. The profits of some of the latest self-service branches, in spite of immediate increases in turnover, have been temporarily affected by disturbance to trade during conversion and by the heavy initial expenses involved. On the basis of past experience, it is reasonable to assume that these branches will produce considerably improved profits in future years.

Of the 322 self-service branches within the group, 23 come within the accepted description of "supermarkets" each having a selling space of over 2,000 square feet, and into these and, in fact, into all self-service shops where there is sufficient room, we are introducing fresh meat and non-food departments. We have now embarked upon a programme of further expansion.

With regard to the future, I feel it would be unwise to make any forecast, but our turnover for the current year is showing a further substantial increase—in fact, greater than the increase at this time last year over the previous year.

This announcement appears as a matter of record only.

New York, N.Y. August 23, 1961

THE TUNNEL PORTLAND CEMENT COMPANY LIMITED

PRODUCTION CAPACITY STRETCHED TO THE LIMIT

FUEL TAX AND GOVERNMENT'S EXPORT EXHORTATIONS

The fiftieth Annual General Meeting of The Tunnel Portland Cement Co. Ltd. will be held on September 14th.

The following is an extract from the Review by the Chairman, Mr N. M. Jensen, which has been circulated with the Accounts:

The Company's deliveries during the year under review constitute a record, and so does Trading Profit which reached the sum of £3,217,925 for the group.

Home deliveries for the Industry increased by 7 per cent during the calendar year 1960. During the first six months of the current year Home deliveries of the Industry were 11 per cent in excess of the same period last year, which means that capacity has been stretched to the limit. We have been able to deliver our full share of these increases.

The expansion programme which I referred to last year was put in hand during the Autumn. If the demand for cement continues to rise, your Directors will consider the duplication of the works in North Wales.

In the April Budget, the Government introduced a tax on fuel oils approximately equal to £2 per ton of the fuel oil we use and as a result of the recent emergency measures this has been increased by a further 4s. Have the powers that be, really stopped to consider the implication of such a tax? It affects many industries. In most cases these industries have no alternative but to pass the tax on to consumers, and this is bound to have an inflationary tendency of the worst kind.

When we decided to switch over to fuel oil, we were assured that should we wish to revert to coal, there would be no difficulty. This position has now materially changed.

The imposition of the 44s. fuel tax means that our fuel oil costs are now 60s. to 71s. per ton more than those of some of our Continental competitors. The answer to the Government's request for us to export more of our product is that it just cannot be done, except by heavy sacrifice or by home production subsidising export. We have endeavoured to find out whether the Coal Board can supply us with suitable coal, but their response has been far from satisfactory. Prices have again risen substantially; yet at the same time suitable British coals are sold to some of our competitors on the Continent at prices approximately two-thirds of those we are being asked to pay.

When the full impact of the fuel oil tax has been felt, I hope the Government will have realised it is no use imploring British industries to export more unless such industries are able to obtain their fuel and power requirements at competitive prices.

With regard to former Egyptian investments, Mr Jensen says:

The compensation so far received represents no more than 21 per cent of the claim, and I am sorry to say that in spite of our efforts we have been unable to obtain any information about future distributions.

EDUCATION: BUSINESS AND PERSONAL

B.Sc.(ECON.)

LONDON UNIVERSITY

U.C.C. founded in 1887, successfully prepares students for this Degree (obtainable without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal posts.—Prospectus, giving details of Courses for other London Degrees, G.C.E., Law Exams., etc., from Registrar, University Correspondence College, 60 Burlington House, Cambridge.

TOP CITY MEN prefer good secretaries introduced through STELLA FISHER BUREAU, 456 Strand, W.C.2.

EXPERT POSTAL TUITION

for Examinations—B.Sc.(Econ.), Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus and/or advice, mentioning examination or subjects in which interested, to the Secretary (G912).

METROPOLITAN COLLEGE, ST. ALBANS

or call at 30 Queen Victoria Street, London, E.C.4. Established 1910.

TUITION FOR B.Sc. ECONOMICS

Wolsey Hall (Est.1894) provides Postal Courses in a wide range of subjects for the two examinations for London Univ. B.Sc.Econ. (three if entrance is included) at moderate fees. 1,431 Wolsey Hall students passed London Univ. B.Sc.Economics exams. 1950-60. Tuition also for G.C.E., Law, Statistical, other exams. —Prospectus (mention examination) from E. W. Shaw Fletcher, C.B.E., LL.B., Director of Studies, Dept. P.17.

WOLSEY HALL, OXFORD

SECRETARIAL TRAINING, especially for university graduates and older students. Six-month and intensive 14-week courses.—Write Organising Secretary, Davies's, 158 Holland Park Avenue, W.11. PARK 4654.

CRYING OVER SPILT MILK is unforgivable. But all the world would excuse outright sobs over a spilt bottle of superb FI. CID Sherry. That's the precious Amontillado one guards with loving care.

SHRINKAGE 5 PER CENT PLUS. Under test 13 out of 20 branded curtain fabrics gave this negative result. SHOPPER'S GUIDE (15s. p.a.) shows the way to safer buying.—Write Consumer Council, Orchard House, Orchard Street, W.1.

MORTGAGE LOANS

INVEST IN IRLAM

URBAN DISTRICT COUNCIL

6½% Mortgage Loans of £50 and upwards for 3 to 5 years. No Expense to Leader.

Application form from: The Treasurer, Council Offices, IRLAM. Telephone: IRLAM 2224.

CITY OF CHESTER

TRUSTEE INVESTMENTS

MORTGAGE LOANS 6½% 2-5 years Min. £100

DEPOSIT LOANS 7% 7 days' notice. Min. £500

Apply: City Treasurer, Municipal Offices, Chester. Tel.: 20432, Ext. 23.

BASFORD MORTGAGES

6½% 3 Years. Trustee Status.

Details: Treasurer, BASFORD R.D.C., BASFORD, NOTTINGHAM.

Invest Safely With CROSBY CORPORATION IN TRUSTEE SECURITIES

6½% FOR 2 TO 5 YEARS

Application forms and particulars from: Borough Treasurer, Town Hall, Waterloo, Liverpool, 22. Waterloo 1000.

WYCOMBE R.D.C.

6½% Interest on Mortgage Loans 2-10 years. No costs to lenders. Minimum £500. Special terms £10,000 +

Apply to— TREASURER, 17, High St., High Wycombe, Bucks.

INVEST IN BOROUGH OF SALE

6½% TRUSTEE SECURITY MORTGAGES £100 and upwards 3 to 5 years.

Further details from Borough Treasurer, TOWN HALL, SALE, CHESHIRE. Telephone: SALe 2255.

Invest in THURROCK U.D.C.

Mortgage Loans

(Pop. 109,700) 6½% (R.V. £1,860,000)

COUNTY BOROUGH OF IPSWICH

6½% MORTGAGE LOANS (Trustee Securities) for 2 to 10 years

Particulars from Dept. T, Borough Treasurer, Museum Street, Ipswich.

APPOINTMENTS

COMMERCIAL OFFICERS

required by the Tanganyika Government for the Commerce and Industry Division. Appointment will be on contract for one tour of 21/27 months in the first instance.

Commencing salary according to qualifications and experience in scale (including Overseas Addition) £1,227 a year, rising to £2,025 a year. Gratuity 25 per cent total salary drawn. Outfit allowance £45.

Free passages. Liberal leave on full salary.

Candidates between 25 and 35 years of age must possess a University degree in Commerce or Economics or be members of one of the recognised accountancy bodies.

Apply to Crown Agents, 4 Millbank, London, S.W.1, for application form and further particulars, stating age, name, brief details of qualifications and experience, and quoting reference M3A/33597/LN.

AUSTRALIA THE UNIVERSITY OF NEW SOUTH WALES

LECTURERS SCHOOL OF ECONOMICS

The School of Economics at The University of New South Wales has two hundred and forty students, specialising in economics, statistics, and industrial relations. Courses are also provided for some students in the Faculties of Arts and Science. There is at present a staff of eighteen Senior Lecturers, Lecturers, and Teaching Fellows, headed by Professors M. Kemp and A. Hunter. The School is located in Kensington, an inner suburb of Sydney.

Economists who are interested in joining the staff of the School as Lecturers must have a degree with honours or equivalent qualifications, and should have special knowledge in any of these fields:

Statistics, with an interest in econometrics or mathematical economics.

Macro-economics or *micro-economics*.

Economic history or the history of economic thought.

Successful applicants may be required to supervise the work of post-graduate students. Salary: £A1,772 range £A2,477 per annum. Commencing salary is determined by qualifications and experience.

After passing a medical examination, successful applicants will be eligible to join the State superannuation scheme.

First-class ship fares to Sydney of appointees and families will be paid.

Appointees will be eligible for 12 months' study leave on full salary after six years' service.

Preliminary enquiries about the work of the School may be addressed to the Head of the School of Economics, Kensington.

Four copies of applications, together with the names of two referees, should be lodged with the Agent General for New South Wales, 56-57 Strand, London, W.C.2, and a copy forwarded by airmail to the Appointments Section, The University of New South Wales, Box 1, Post Office, Kensington, N.S.W., to arrive before September 29, 1961.

UNIVERSITY OF GLASGOW

DEPARTMENT OF SOCIAL AND ECONOMIC RESEARCH

Applications are invited for a Lectureship in Applied Economics in the above Department. Salary scale: £1,050-£1,850 per annum. Initial salary according to experience and qualifications. F.S.S.U. and family allowance benefits.

Applications (8 copies) should be lodged, not later than September 16, 1961, with the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHESON, Secretary of University Court.

STC INDUSTRIAL SUPPLIES DIVISION

SALES OFFICE

Our Industrial Supplies Division, which provides industrial and commercial undertakings with a wide range of telecommunication equipment, is currently expanding its activities, and TWO vacancies have occurred:

MARKET RESEARCH: For this position, which will involve the full range of techniques associated with Market Research, a Degree in Economics would be a useful qualification. A technical (not necessarily formal) background would be desirable, although commercial experience is essential. Candidates should have a knowledge of the structure of industry, statistical and survey techniques.

TECHNICAL WRITING: Initially, this position would involve the writing of copy for sales literature, and thus a flair for writing would be necessary combined with a technical background (O.N.C. telecommunications or equivalent). A particular knowledge of telephone exchange systems would be useful. Later, the holder of this position will be required to produce more technical handbooks for customers, and to make administrative arrangements for exhibitions, together with general publicity liaison.

For both these positions, candidates should be at least 25 years of age.

Salaries are attractive, and the Sales Office is at Footscray, a pleasant residential district, only 13 miles from central London.

Please apply, in confidence, stating age, qualifications, experience, present position and salary, to—

W. J. YEOMANS, Personnel Manager, Standard Telephones & Cables Limited, Footscray, Sidcup, Kent.

For other appointments see page 836 and 837

PETROLEUM ECONOMICS LTD., 146 New Bond Street, London, W.1, invites applications from graduates, male or female, under 30. Duties will consist initially of selection, analysis and preparation of data and statistics for studies and reports. Previous oil industry experience advantageous but not essential. A knowledge of languages desirable. Salary according to age and experience.

COMPANY AFFAIRS

H. J. Heinz

FOR H. J. Heinz, the British subsidiary of the American parent, to secure an increase of 6½ per cent in sales is a commendable but not an exceptional achievement, for the trade in foods of convenience is becoming increasingly dominated by self-service stores and supermarkets. But to secure at the same time an increase of 11 per cent in gross profits from £4,279,000 to £4,753,000 in the year to April 29th, and of 9½ per cent in net profits from £2,330,000 to £2,554,000 certainly is remarkable, for margins on pre-packaged food are under the double pressure of competition between manufacturers and the growing power of the grocery chains to demand and to get better discounts. The crumbling of resale price maintenance in the grocery trade has, in fact, put a premium on management in food manufacture. The latest results suggest that Heinz is well able to hold its own.

In preparation for the growth in sales, the company built a new factory at Kitt Green and is busy modernising the older one at Harlesden. Additional finance was secured by the issue of a 5½ per cent debenture and the final call on this debenture in May, 1960, is reflected in the reduction in the bank overdraft from £2,239,000 to £972,000. Interest rates have risen sharply since then so that completion of the capital programme, on which outstanding commitments amounted to £775,000 at the end of April, appears to be more dependent than before upon the cash flow. In preparation for competition the company added to the number of varieties it produces, especially in the "ready to serve" and "condensed" soup ranges and in baby foods (where Heinz, developing what its chairman now characterises as a "major product group," appears to have established a good lead over its rivals). Competition among food manufacturers is really joined at the grocer's counter and though Mr Howard J. Heinz says that higher wages, more costly marketing and increases in other costs were more than offset by operating economies and lower costs for some materials, he also refers to "more intensive marketing activities" and an improvement in "merchandising and delivery services." In particular, the new terms of trade introduced by Heinz last year, which apparently offer better discounts for bulk orders, have stood the company in good stead. Exports, too, have risen, even though new manufacturing facilities have been established abroad.

In all, the company has adjusted its operations to more intensive competition and, not surprisingly, Mr Heinz's conclusion is that, while margins will be under greater pressure then ever, he believes that the company will hold on to its market and continue to grow satisfactorily. For the few minority shareholders of the unquoted ordinary capital in this country, this statement must appear as heartening as the increase in the ordinary dividend from 23 to 29 per cent, covered about 2½ times, and in the gross return on capital employed from 22 to 22½ per cent in a year of greater competition.

International Tea

FIERCER competition confronts not only the food manufacturers such as H. J. Heinz but the grocers themselves. This is made abundantly clear by the results of International Tea, one of the pioneers in self-service stores and supermarkets in this country, for the year to April 29th. In 1959-60 the company's policy of releasing money by selling and then leasing-back freehold properties so as to convert its stores to self-service appeared at last to be paying off, for its trading profits rose by about 17 per cent. In 1960-61, however, they fell slightly from £2,645,000 to £2,562,000 and the ordinary dividend which had been raised to 12½ per cent in 1959-60 was left unchanged. Depreciation, reflecting the fitting-up of shops converted to self-service, has risen and the gross return on capital employed has fallen from 13¼ to 11½ per cent.

This, as the chairman, Mr F. E. Hawkins, explains, is the natural consequence of more intensive competition. New food shops have been opened, often in close proximity to International Tea's own branches; prices have been cut; costs, particularly of wages, have risen; and though International Tea has again added to its turnover it has earned lower margins. The fall in the gross return is also partly the result of International Tea's own policies, for it has secured the finance it required for converting its stores at the cost of higher rentals. Clearly, however, the directors are convinced that conversion to self-service is the policy that they must continue to pursue. In 1960-61, International Tea converted or opened another 70 self-service branches, bringing the total number up to 322 stores (of which 23 stores are supermarkets) and it expects to complete a similar number of conversions and new openings this year. But this is not the end, for new sites and premises are being acquired and the directors have signed another contract with Legal and General for the sale and leasing back at appropriate times of further freehold properties. Thus financial provision has been made for further development and expansion, which in addition to self service stores and supermarkets includes the building of a new warehouse. The profits of new self-service stores are affected, Mr Hawkins admits, by the disturbance to trade during the conversion and by heavy initial expenses, and he says that warehousing expenses may also rise while the new warehouse is being completed.

Investors cannot therefore look for the certainty of jam tomorrow but they may look for the possibility of jam a few years ahead. Before, however, they commit themselves whole-heartedly to the concept of growth in International Tea's shares (which currently yield 4.8 per cent, 1½ times covered, at 13s.) or, for that matter, in other grocery equities they should ask themselves whether self-service and supermarkets, even if they squeeze the independent traders out, will add all that much to the profits of the multiples and the chains. The latter's bargaining power with the manufacturers is enhanced but the sheer size of their operations may well add to the ferocity of competition for the customer's shillings.

Mercury Securities

THROUGH Mercury Securities the public can share in the fortunes of S. G. Warburg, one of London's liveliest merchant banks, and this potential puts a high price on Mercury's shares. Most of them are tightly held and they are quoted at £17¾ to yield 2 per cent. In the year to March 31st, profits before tax of Mercury Securities, after the usual undisclosed transfer to reserves by the banking subsidiary, were £2.13 million, 14 per cent below the record level of £2.48 million in 1959-60, but still 72 per cent above the 1958-59 level of £1.24 million. After deducting tax and minority interests profits amounted to £1,003,000—£90,000 lower than in 1959-60, but £440,000 higher than in 1958-59. The total payment has been left unchanged at 35 per cent, including a bonus of 10 per cent, and it is covered over three times.

The chairman Mr Sigmund Warburg, again emphasises that banking profits, which account for a substantial part of earnings, are subject to "marked fluctuations." In the 1959-60 accounts it was mainly the fees from handling big single financial transactions that doubled profits. This year profits from this source have obviously been much smaller, since the slight fall in profits was accompanied by a big increase in the bank's customary business. Advances doubled from £6.3 million to £12.3 million and acceptances rose by £2.5 million to £7.4 million. During the year Mercury Securities acquired the United States companies associated with Stewart Smith and Co., the London insurance broking firm owned by Mercury since 1955. This move is reflected in the charge of £562,000 against Mercury's reserves during 1960-61, and presumably in the appearance of £2 million United States Treasury bills in the accounts.

Pasolds

AT 60s. 6d. the 5s. "A" shares of Pasolds are close to their high point for the year and yield only 1.3 per cent. Clearly investors have as much confidence in the group as mothers appear to have in its well-known brand of "Ladybird" children's wear. The report for the year to March 31st supports this feeling of confidence. The rise in turnover in 1959-60 was 8 per cent, but in 1960-61 total sales rose by 18 per cent to £4¾ million while trading profits rose by 19 per cent, from £695,000 to £819,000 compared with 7¾ per cent in 1959-60. A sharp increase in tax limited the rise in net profits to less than 6 per cent from £372,000 to £391,000 but the ordinary dividend has been raised from 15 to 16 per cent, covered 3¼ times.

The outlook appears to be good. The Canadian subsidiary has added steadily to its sales, even though other textile firms in this market have found the going hard in the face of American and Far Eastern imports. In Europe the directors believe that if Britain enters the common market the group, having already established a German subsidiary, will more than hold its own. The group's expert merchandising kept its expenditure to about £80,000 on advertising last year. The directors are confident that the big European market offers great scope for a policy of automation and economies of scale. Although demand for the group's products in this country is still running ahead of supplies they have therefore deliberately set out to establish a foothold in more competitive markets overseas.

Tunnel Portland Cement

THE second biggest of Britain's cement producers, Tunnel Portland, supplies about 13 per cent of deliveries in the home market, compared with Associated Portland's share of about 60 per cent and Rugby Portland's share of about 8 per cent. All have recently been working to capacity and all intend to add new kilns, primarily to serve the home market. All, however, export some cement and the chairman of Tunnel Portland, Mr N. M. Jensen, has pointed out that the rising cost of fuel, which forms a substantial part of total costs in the industry, is jeopardising the industry's attempt to export, remarking that "the answer to the government's request for us to export more and more of our product is that it just cannot be done, except by heavy sacrifice or by the home production subsidising export." The group has therefore applied for permission to import coal from Poland.

Years to March 31	1959 £'000s	1960 £'000s	1961 £'000s
Trading profit	2,569	3,069	3,218
Depreciation	558	647	685
Investment income	214	229	273
Taxation	1,025	1,173	1,279
Net Profit	*1,083*	*1,404*	*1,472*
Ordinary dividend	426	539	575
Ordinary dividend, per cent	*12*	*15*	*16*

The preliminary results of Tunnel published in July came as a disappointment to the market for though the total dividend was raised from 15 to 16 per cent and the tax-free distribution from capital profits was doubled to 2 per cent the profits rose by rather less than had been expected. Trading profits in the year to March 31st rose by only 5 per cent from £3,069,000 to £3,218,000, compared with a 20 per cent rise in 1959-60. The lack of buoyancy reflects in part the failure of one of the older kilns at West Thurrock. As the cement industry's deliveries are currently 11 per cent higher than they were in the same period in 1960, capacity has been stretched to the limit and Tunnel has only been able to hold on to its share of the market by importing clinker. The group is adding to its capacity, though Mr Jensen says the developments now in train will be inadequate if demand continues to rise at its current rate. In any case benefits from using the new capacity will not appear for another twelve months and this could limit the rise in profits this year. The 16 per cent dividend, however, is covered 2½ times and at 38s. 3d. the 10s. ordinary shares yield 4.2 per cent.

Steel and Company

AN interim statement in January from this engineering group revealed that profits for the first eight months of the financial year to March 26th last were higher than those for the whole of 1959-60 even though the year opened on an admittedly dull note. The improvement was well maintained in the last months of the financial year and over the full twelve months gross profits rose by as much as 77 per cent, from £721,000 to £1,276,000. A less than proportionate rise in the tax charge resulted in a rise of 92 per cent in net profits, from £326,000 to £625,000 and though the interim dividend was left unchanged at 10 per cent the directors have now raised the final from 10 to 12½ per cent on the capital as increased by the one-for-six rights issue in February. The bigger dividend is covered almost 2¾ times by earnings, compared with less than 1¾ times in 1959-60.

The group's products include mechanical handling equipment, process plant, merchanting and service plant and components and the chairman, Mr J. Steel, says that the record trading profit in 1960-61 is the result of capacity working in the group's more important factories. Traditional products are still proving profitable and newly introduced products that have widened the group's range should contribute to profits very soon. Further products are due to be introduced and this will involve some development expenditure. The order book is full enough to keep the group busy for most of the current financial year and output is currently running ahead of last year's record level. Mr Steel welcomes Britain's application to join the common market and though entry would require some readjustment in the group's facilities and policies he believes that the group would do well in the European market. In particular, the group's principal division which is concerned with mechanical handling equipment should gain from a broadening of the market. The 5s. ordinary shares have risen by 4s. 6d. since the results were published and at 20s. yield

London Stock Exchange

FIRST DEALINGS:	Aug. 4	Aug. 21	Sept. 4
LAST DEALINGS:	Aug. 18	Sept. 1	Sept. 15
ACCOUNT DAY:	Aug. 29	Sept. 12	Sept. 26

LAST week was particularly quiet on the stock market with the lowest number of bargains marked for any week this year. The opening of a new account on Monday aroused very little interest; before the weekend the failure of the Colvilles rights issue had depressed the market. The tense Berlin situation and signs of narrowing profits continue to discourage buyers after the weekend. This week small sellers have been in a majority in a very thin market and the firmness of gilt-edged over the past fortnight has given way to small falls, partly because some holders have sold in order to meet their new commitments in rights issues. Equity prices also declined just before and after the weekend but a minor rally on Tuesday limited the net fall and over the week to Wednesday's close *The Economist* indicator lost 3.2 points to 366.0.

Price movements among gilt-edged stocks were small by comparison with those of recent weeks. Both short and medium dated stocks displayed small but mixed movements as a result of switching. Long-dated stocks fell back slightly, with 3½ per cent Funding 1999-2004 losing ⅛ to 56. The irredeemable stocks were also lower; 3½ per cent War Loan lost ¼ to 52½ and 2½ per cent Consols lost ⅜ to 38¼. Dominion stocks fell back around the weekend but closed the week to Wednesday's close without net losses. Corporation stocks also held their ground.

Bank share prices declined before the weekend and on Monday the opening of dealings in the new Barclays shares following the rights issue led to further falls. Despite gains on Wednesday, Midland lost 2s. to 77s. 6d. Insurance shares were also dull before the weekend, and the announcement of the Eagle Star rights issue led to further falls; Eagle Star lost 8s. 6d. to 107s. 6d. and Prudential "A" ⅝ to 22⅝. Hire purchase shares were firm before the weekend but eased later; Bowmaker gained 4½d. to 14s. 9d. but UDT lost 3s. 9d. to 146s. 3d. The failure of the Colvilles rights issue depressed steel share prices but later press comment on United Steel led to some improvement. Colvilles lost 4½d. over the week to 55s. 9d. and John Summers 9d. to 43s. 10½d. Engineering shares were dull and stores also lost ground.

Oil shares closed lower with Shell falling back on Paris selling and Ultramar on the publication of the full report. Among motor shares, Leyland lost 7½d. to 97s. 10½d., in all, having fallen quite sharply on the announcement of the changes in the board of directors of Standard Triumph. Though Unilever lost 2s. on Wednesday, earlier American buying contributed to a net rise over the week of 1s. to 144s. 9d. Kaffir shares showed little net change over the week but tins held up and Tronoh gained

THE MONEY MARKET

AFTER submitting the same bid for three weeks running the syndicate of discount houses raised its bid at last Friday's Treasury bill tender by 2d. to £98 16s. 6d., a reduction of 8d. in the annual discount rate. The average rate of discount on the whole allotment fell by only 6.68d. per cent to £6 14s. 1.83d. per cent. The outsiders left their bids largely unchanged; the upshot was that the market's allotment increased from 41 to 61 per cent.

Credit was generally adequate before the weekend but conditions on Monday and Tuesday brought help from the authorities through special purchases of bills. The market also borrowed small amounts from the Bank of England on these two days. But while the authorities were not unwilling to see the market in the Bank, there was no question of forcing the issue. The market chose to take loans at 7 per cent in preference to conceding a rate of $6\frac{5}{8}$ per cent on the sale of November bills to one of the clearing banks when the general rate was 6 19/32 per cent.

This week's Bank return shows discounts and advances at £92 million, a very high figure reflecting the run-down in the Basic balances.

APPOINTMENTS

HEAD OF OPERATIONAL RESEARCH AND STATISTICAL ADVISORY SERVICE

London Transport's Operational Research and Statistical Advisory Service undertakes operational research and provides a consultant statistical service for other departments of London Transport. The work is interesting and varied.

There is a vacancy at the head of the Service for a graduate with a good degree or the holder of a major professional qualification in a relevant field. The occupant of this post must be able to collaborate with his colleagues in the operating ('bus and rail), engineering, commercial, research and other departments of London Transport, and with research organisations elsewhere.

Candidates must have a knowledge of statistical methods with practical experience of operational research, or the application of statistical techniques, or both, in a responsible position in industry or commerce.

The commencing salary will be of the order of £2,000 per annum, with the prospect of substantial advancement within a short time, subject to satisfactory service.

VALUABLE FREE TRAVEL · CONTRIBUTORY SUPERANNUATION FUND

Enquiries and applications should be addressed to the Staff and Welfare Officer (Ref. 153/3),

LONDON TRANSPORT · 55 BROADWAY · LONDON, S.W.1

YOU have had at least *four years' experience in a Production Planning* department —preferably on batch-production processes.

YOU are ambitious and want to get ahead faster than seems possible in your present firm.

The position we are offering is a new one.

YOU will be given scope to develop your own ideas and to build up a department to introduce Production Planning into a mainly clerical data-processing organisation.

Your salary will be determined only by your ability. (*Reference* RP.9.)

Apply stating age, education, experience, current salary and quoting reference number to :—

Attwood

Vice-Admiral Sir Guy Sayer, K.B.E., C.B., D.S.C.
Attwood Statistics Limited,
West Halkin House,
West Halkin Street,
London, S.W.1.

LONDON COUNTY COUNCIL
ARCHITECT'S DEPARTMENT
TOWN DEVELOPMENT DIVISION

This Division, newly formed to plan and build *in towns throughout* south-eastern England, has vacancy for a planner with initiative and experience, of planning administration, and able to direct planning analysis and research. Qualifications in either B.Sc (Estate Management), A.M.T.P.I., or equivalent. Salary up to £1,760.

Form and particulars, returnable by September 1st, *from Hubert Bennett*, O.B.E., F.R.I.B.A., Architect to the Council (EK/E/2396/58), County Hall, S.E.1.

COMMISSION FOR THE NEW TOWNS

SECRETARY AND FINANCE OFFICER

The Commission for the New Towns which will come into being on 1st October, 1961, will require a Secretary and a Finance Officer. There will be a *contributory* pension scheme.

The Secretary will be the chief executive officer of the Commission which is charged with taking over, holding, managing and turning to account the property now vested in Development Corporations. The post will demand organising and administrative ability of a high order. Salary £5,000; a higher figure would be considered if warranted by exceptional experience and qualifications.

Applicants for the post of Finance Officer should be Chartered Municipal Treasurers, Chartered or Incorporated Accountants or certified Corporate Accountants, or have equivalent qualifications, and should have a wide and varied experience in commerce or in public service. *Salary £4,000; again a* higher figure would be considered if warranted.

Applications, giving date of birth, education, qualifications and experience, *should be addressed* not later than 15th September to the Chairman-designate, Commission for the New Towns, c/o The Ministry of Housing and Local Government, Whitehall, S.W.1.

BP HAS a vacancy for a MALE STATISTICIAN in the Economics and Estimates *Branch of its Head Office* in London. The successful candidate for this position will work in a unit that is responsible for economic intelligence concerning the fuel *market and for the* prediction of the pattern of oil requirements throughout the world; he will be called upon to analyse the factors governing the demand for oil and energy, and therefore some experience in *business forecasting* is desirable. Applicants should be in their middle twenties and should possess a good degree in Economics with a genuine interest and *ability in Statistics.* In exceptional cases applications can be considered from men with little or no commercial experience. Salary according to age, qualifications and experience. Non-contributory Pension Fund. Assisted House Purchase scheme. Removal and settling-in allowances payable in certain cases. Luncheon club.—Write, quoting reference H.5639, to Box 6784, c/o Hanway House, Clark's Place, E.C.2.

D.S.I.R. Headquarters, London, W.C.1, invites applications for two posts *in Economics* Section. Duties: To take part in planning and executing studies of the research and development needs of industries or sectors of the national economy. Quals.: 1st or 2nd Class Hons. degree in Economics with at least 3 years' post-graduate experience either in industry or in research in industrial economics. A lively interest in technological development is desirable. Salary range: £1,402-£1,719. Application forms from Manager (PE3324), Ministry of Labour, Professional and Executive Register, Atlantic House, Farringdon Street, London, E.C.4. Closing date September 25th, 1961.

UNIVERSITY COLLEGE OF THE WEST INDIES

FACULTY OF AGRICULTURE
(IMPERIAL COLLEGE OF TROPICAL AGRICULTURE),
TRINIDAD, WEST INDIES

Applications are invited for:—

(i) Lectureship or Assistant Lectureship in AGRICULTURAL ECONOMICS;
(ii) Lectureship or Assistant Lectureship in FARM MANAGEMENT.

Salary scales: Lecturer £1,050 x £50—£1,400 x £75—£1,850 p.a. Assistant Lecturer £800 x £50—£950 p.a., plus local allowance of £250 p.a. (pensionable). *Entry according* to qualifications and experience but in case of Assistant Lecturers and Lecturers below merit bar consideration is given to age in living salary. Child allowance. F.S.S.U. Unfurnished accommodation at rental of 10 per cent of basic salary. Up to 60 full passages on appointment, normal termination and triennial study leave. Detailed applications (6 copies) naming 3 referees, by September 16, 1961, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

The Wellcome Foundation Limited require for their Biological Control Laboratories a STATISTICIAN to take charge of their Statistical Unit at Dartford.

Applicants should possess a degree in statistics or mathematics, or an equivalent professional qualification. The work entails the design and analysis of routine biological assays and of research projects. Previous experience in this field would be an advantage. Salary according to qualifications and experience.

Applications should be made in writing to the Personnel Manager, Wellcome Chemical Works, Dartford, Kent.

STATISTICS APPLICATIONS

The Glacier Metal Company Ltd., the largest manufacturers of plain bearings in Europe, is now able to offer extremely good career potential to a Statistics Research Investigator, aged 22 or over, in its Research and Development Organisation.

The man we select for this newly created and responsible post will have full scope to *build up an Operations Research Section* within two years. He will be concerned with applying statistics to a variety of *research problems, including investigations* on the best methods of utilising the capacity of an X-ray Spectrometer and providing a statistical service for the design and analysis of experiments within the Research Organisation.

He will therefore need to possess a degree in statistics or in mathematics with statistics as principal subject; alternatively he can be A.I.S. He will also have some years' *experience in applying statistical techniques within industry.*

Starting salary: £950 to £1,350 a year.

Please telephone PERivale 6611 or write fully, quoting Ref. PD/RI, to the Personnel Division,

THE GLACIER METAL COMPANY LTD.,
Alperton, Wembley, Middx.

AIC Executive Selection Division
is advising on the following appointment

TREASURER

The Board of Trinity College, Dublin, intend to appoint a Treasurer to take full responsibility for the accounting staff, prepare accounts and estimates, advise the Board on financial matters, discuss and interpret financial policy with members of the college, review investments and properties with advisers and agents. This, a new appointment, will appeal to qualified persons attracted by the special conditions associated with a University atmosphere. Applicants should have a University education, be a qualified Accountant and have a commercial background. A knowledge of management accounting and the management of property and investments will be an advantage. Preferred age is 33-45 years; a salary according to qualifications, within the range of £1,900-£2,300 is envisaged. There is a non-contributory pension scheme and also marriage and family allowances. Applications, which will be treated in confidence, should be submitted to Mr. D. Richardson, Reference 3684.

ASSOCIATED INDUSTRIAL CONSULTANTS LIMITED
39 WESTMORLAND STREET, DUBLIN

Associated Industrial Consultants

AUSTRALIAN NATIONAL UNIVERSITY
INSTITUTE OF ADVANCED STUDIES
FELLOWSHIP IN DEMOGRAPHY

Applications are invited for a Fellowship in the Department of Demography (Head of Department: Professor W. D. Borrie).

While a considerable part of the Fellow's time will be available for his own research, he will also be required to assist in the organisation of departmental projects and in the supervision of students.

The current research interests of the Department cover historical and social studies of migratory movements, nuptiality and the factors and implications of population growth. In area the main work has been upon Australia, New Zealand and the Pacific Islands, but research interests are now extending to south-eastern Asia and more generally to problems associated with growth in areas of high fertility and decline in mortality.

Applicants should provide a succinct statement of their research interests as well as full details of their training and experience in the field of demography.

The salary range of a Fellowship is from £A2,120-£A3,000; increments are £80 per annum. The successful applicant will, in the first place, be appointed at a salary and incremental limit fixed by reference to his standing and experience. Appointment is made for an initial period of five years; thereafter it may be made permanent. A Fellow is entitled to one year's study leave on full pay, plus a contribution towards travel and other expenses in every seven years.

Superannuation is on the F.S.S.U. pattern. Reasonable travel expenses are paid and assistance with housing is provided.

Further details may be obtained from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S.W.1.

Applications close in Australia and London on *October 27, 1961.*

ORGANISATION AND METHODS

The Birfield Group of Companies has a vacancy for an O. and M. Officer to take charge of this function. He will be executively responsible to the parent company's Secretary who has been trained in O. and M. and he will undertake assignments to advise companies of the Group.

Applications are invited from men interested and experienced in this work. It is likely that the successful applicant will be aged 30-35 years, of sound commercial training, with two or three years' O. and M. experience, the requisite personal qualities and currently earning in excess of £1,000 per annum.

The department is located at the offices of Hardy Spicer Limited in Birmingham and initial application should be made, stating age, education, training and experience, to the

Personnel Manager,
Hardy Spicer Limited.
Chester Road, Erdington.
Birmingham 24

British Nylon Spinners

ECONOMIC RESEARCH

British Nylon Spinners Limited invite applications from graduates with a good honours degree in economics for an appointment in the Economic and Market Research Unit of their London Office.

The activities of the Unit are interesting and varied, covering a wide range of markets and products, and the successful candidate will be in a position to obtain a thorough understanding of all aspects of the Unit's activities.

Initially, the successful candidate's particular concern will be events and developments in international trade of importance to the Company's interests. These include the trend to regional free trade groups, such as the E.F.T.A. and the E.E.C., activities of the G.A.T.T. and the trade policies of a number of countries with particular reference to tariffs and quotas.

Applications should be addressed to the Recruitment Officer,

British Nylon Spinners Ltd.,
PONTYPOOL, MON.

quoting reference L.14.

Pan Am
gives you
the priceless extra
of
experience...

Pan Am has more million-mile pilots than any other airline

and
the most
frequent jets
from Europe
to the U.S.A.!

Choose Pan Am . . . relax with the world's most experienced airline

This summer, Pan Am offers far more transatlantic jet service than any other airline—72 big jets every week from Europe to the U.S.A.—serving 22 cities in Europe, 11 in the United States. Your choice of first-class *President Special* or low-fare *Rainbow* Economy service on every flight.

Equally important is the knowledge that you are flying with the world's most experienced airline.

This Priceless Extra of Experience is reflected in many things: in the faces of the Pan Am pilots and flight crews, in the spotless condition—inside and out—of your airplane, in the way you are cared for by Pan Am's flight attendants, in the gracious manner they serve the rare wines and gourmet meals.

For the ultimate in convenience and comfort fly Pan Am—the world's most experienced airline. See your Travel Agent or call your nearest Pan Am office.

INTERNATIONAL

B is for Black . . .

. . . like the Berlin outlook. The allies seem to be getting little nearer to negotiation with Russia over this crisis, but it is nearly certain that without negotiation things will get even worse (p. 849). Meanwhile, in the divided city itself, it seems clear that Berlin is now, or will shortly be, at Herr Ulbricht's undependable mercy (p. 883).

The Soviet decision to resume **Bomb** tests does nothing to brighten the scene (p. 855). US reservists and conscripts are being called to the colours (p. 879).

Senhor Quadros's resignation from the presidency of **Brazil** threatens not only the order of life there, but also the chances of achieving economic and social progress democratically throughout Latin America (p. 852).

C for Colonial Troubles

. . . still the problem in **Algeria,** whose government-in-exile has just been reshuffled in order to stiffen its attitude to the French and negotiation (p. 851).

. . . and in the **Rhodesias.** In the North, disturbances are sure to increase in default of concessions by the British Government to Mr Kaunda (p. 884); while in the South Sir Edgar Whitehead has given intimations of a cautious programme for African advancement (p. 887).

. . . and in **Portuguese Africa,** where Dr Salazar would like it to be thought that he has embarked on a programme for African advancement (p. 857).

. . . the verdict of the United Nations on France's conduct in **Tunisia:** a verdict the French must have foreseen and should have forestalled (p. 856).

N for Neutrals

The non-aligned rulers who are meeting at **Belgrade** had taken every care that their conference should be smooth and successful; but the Soviet decision to resume nuclear tests confronts them with an unexpected test (p. 855).

Among the non-aligned:—

India's unique standing is gratifying but somewhat burdensome to a big country with big problems (p. 855).

Cypriot prospects are not unhopeful, if the new republic can secure the respect of its citizens (p. 853).

L for Land

Mr Khrushchev can rejoice: **Russia** may have a bumper harvest ahead (p. 859).

Persia and **Iraq** are preoccupied with their land reform programmes (p. 887).

OK for USA

The American economy has recovered more quickly than was expected, so quickly that an explosive boom may not be far off (p. 873) unless there is a strike in the motor industry (p. 877).

Racial integration in southern schools is still a slow process, but massive resistance to it is collapsing gradually (p. 877).

But—President Kennedy has suffered two serious defeats in Congress this week—on long-term loans for under-developed areas and on federal aid for schools (p. 874).

AN for Other . . .

Spain: Britain has exported its caste-consciousness to the Costa Brava (p. 882).

Kuwait: The Arab League is doing its best not to fluff the operation of replacing British troops in the sheikhdom (p. 856).

Poland: Cardinal Wyszynski has a revived conflict with the communist state on his hands (p. 859).

HOME

Conservation of Energy

The Trades Union Congress at Portsmouth next week is likely to produce a superficial unity in condemnation of the Chancellor's pause; and to cover up disunity about other problems (apart from the ETU) by doing nothing about them (p. 850).

Who holds sterling? A new analysis and some conclusions (p. 889).

Atmospheric Pressure

The aircraft industry suffers from a rarification of managerial talent: the vacuum is all too often filled with the inert gas of retired air marshals (p. 891).

American plans to girdle the earth with a belt of copper needles in space have met with stiff opposition from astronomers and others and raise in addition a nice question of legality (p. 859).

Surface Tension

The *nostalgie de la boue* said to afflict new town residents should not be pandered to by artificial crowding: other factors than density are of more importance, if less simple of solution (p. 869).

The gulf between good British traffic engineering ideas and their miserly application may be narrowed by training; but belief in the ideas is the first essential step (p. 902). A possible failure in execution may well be the Tyne tunnel, a good idea delayed too long (p. 858).

The Republic of Ireland continues to lose people, despite a rising national income (p. 858).

The price of gold is moving in response to international tensions (p. 893).

Coefficient of Friction

Prison population is rising steadily, and with it overcrowding: and there is a disturbing fall in the rate of successful rehabilitations by borstal training (p. 856).

Much heat is being generated about high freight rates for Northern Irish goods: they are being over-blamed for industrial stagnation and unemployment (p. 870).

THE GLOW OF THE GOLDEN SIXTIES

THE promise of the sixties is a challenge to the imagination. How will the people benefit from the marvelous advances that are foreseeable? How will closer economic ties and freer trade bring prosperity and higher standards of living?

One thing is certain. Steel will continue to play an increasingly more important role in the progress of mankind. The requirements in steel will grow at an astonishing rate, and FUJI is fully prepared to meet this unprecedented challenge.

You can always trust a steel product ... if it has ◈

There's a good Ant....

The ant finds kingdom in a foot of ground.
John Brown's Body, Book 4.

Admirable ant. Not everyone's idea of a lovable pet, of course. Nevertheless, that "X" Certificate exterior belies many sterling qualities dear to the hearts of industrialists. The ant has guts; the ant has a justifiably majestic confidence in his own toughness. Above all, the ant has a keen sense of order, economy and industry. He works like mad as though he loves it – and uses space as if space did not exist. These are the qualities of "Mechanised Muscle" – the ants of modern industry – which save millions of pounds annually in space, time and effort. Is *your* company utilising existing storage space to fullest advantage? Let us check for you, free of charge or commitment.

At your leisure...

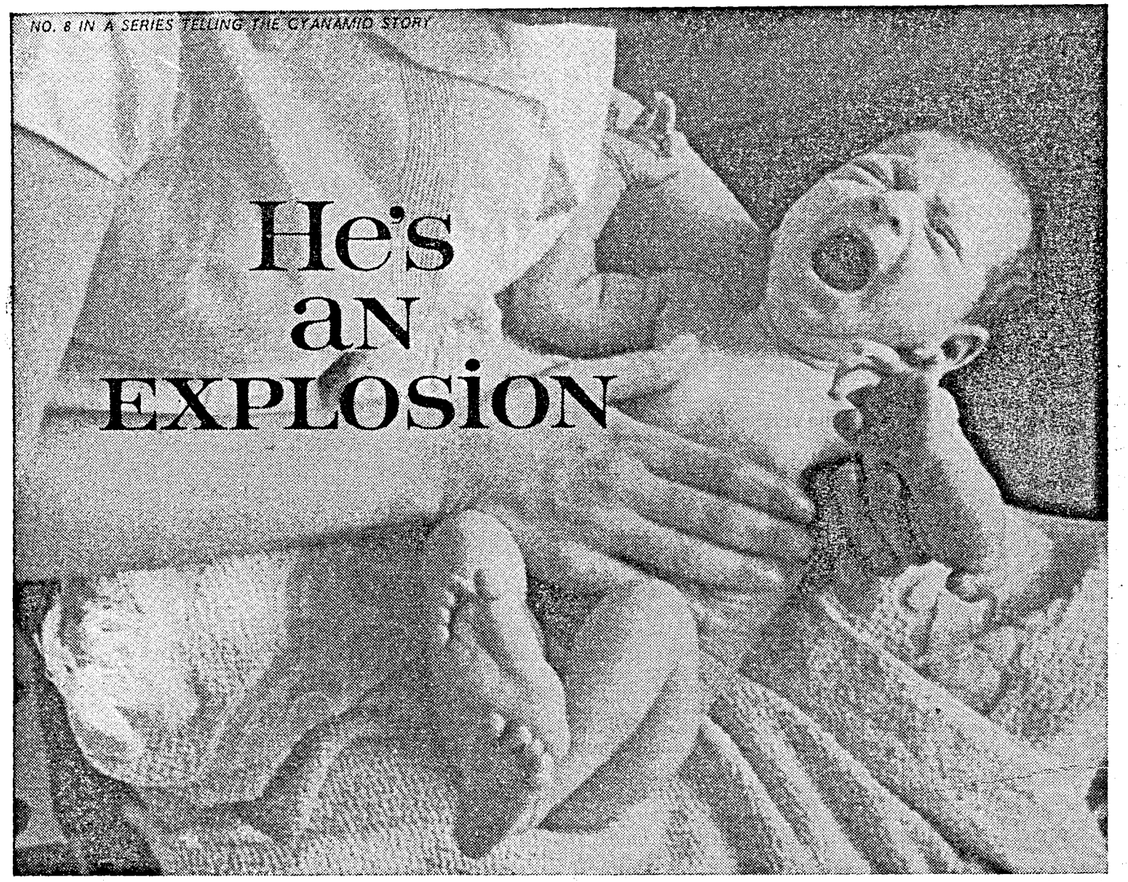
'Variety's the very spice of life.'

It's not always restful just to do nothing.

Someone has said that the formula for complete happiness is to be very busy with the unimportant.

So, people spend their leisure on hobbies—gardening, collecting matchboxes, building unneeded shelves, messing about in boats.

Sailing is a form of leisure and locomotion, which oil has nothing to do with ... except when the wind drops.



Think then of all the little outboard motors and inboard diesels that start buzzing and chugging to help you home for tea.

The variety of ways in which oil can help people in their leisure as well as in their work is the spice of our particular lives at Esso.

Esso

ESSO PETROLEUM COMPANY, LIMITED · 36 QUEEN ANNE'S GATE · LONDON SW1

Founded in 1888

His name is going to be Jimmy and in a few years' time his mum will probably agree with our headline. Right now Jimmy is the incarnation of a statistic—a statistic which sociologists call "population explosion": In every 24 hours throughout the world, there are some one hundred and thirty thousand extra mouths to feed—nearly fifty million a year.

It has been calculated that every 100 million added to the world population needs 13 million tons of additional cereals and 14 million tons of animal products. By 1980 we shall have to increase the world cereal production by one-third and double the present production of milk, meat, eggs and fish.

The problem has been described by Dr. Robert White-Stevens, a British-born agricultural scientist and charter member of the Soil Conservation Society of America, as *"a desperate race between research and catastrophe (in which) we presently are by no means in the van. Four out of five people in this very day of science and so-called enlightenment die either directly or indirectly from starvation."*

Intensive farming aided by Cyanamid research and products is helping food production to keep pace with the population increase. Intensive farming brings the dangers of soil erosion, pests, fungus and livestock diseases that follow in the farmer's footsteps and destroy his work. As long ago as 1947 it was estimated that the losses due to crop pests in these islands accounted for the output of over 33,000 farms and nullified the work of more than 51,000 men. Even here the loss of crops through pests, diseases and weeds reaches £150 million a year. On livestock O.E.E.C. reported in 1952 "losses caused by livestock diseases in United Kingdom have been conservatively estimated at about £80 million per annum, and the bulk of this loss is believed to be ultimately preventable."

Much remains to be done; tomorrow may be too late. Science has shown how to make deserts bloom, how to grow two blades of grass where one grew before, how to keep pests and plagues at bay. Cyanamid, as one of the world's most advanced chemical and pharmaceutical companies contributes its share. Last year this company invested over £10 million on research. And more than that, Cyanamid scientists and technicians go out into the field—to test, to apply, to help the farmer make best use of safe new chemical tools in his efforts to grow more food and provide better nutrition. Food for Jimmy. For us. For our children and their children.

In this and in a thousand other ways

VOLUME CC - NUMBER 6158

Crabwise

NO one can say with assurance that negotiations will solve the problem of Berlin; Thursday's announcement of the Russian decision to resume nuclear tests casts further doubt on the possibility of rational discussion between East and West. What can be said, however, is that unless there are negotiations, the West will very soon face an even more difficult situation in Berlin than it faces now. The least that is likely to happen is that Mr Khrushchev will sign his separate peace treaty with the east Germans. The allies will thereupon either have to seek guarantees for the freedom of Berlin from Herr Ulbricht, or else be obliged to endure a period of dangerous uncertainty in which their presence in the city will rest on no agreement at all. The worst possibility is that the communists will proceed to interfere with western access to the city; the allies will then be confronted with the choice between surrender and war.

This near certainty that things will get worse if they are left to run makes it difficult to sympathise with the timidity of the allies' current approach to east-west talks. They have now dropped the idea, largely because of French resistance, of sending a written invitation to Russia to sit down at a conference. Instead, they have decided to send Mr Llewellyn Thompson, the American ambassador in Moscow, to "explore" the views of Mr Khrushchev. It is not clear, however, whether Mr Thompson has been empowered actually to propose negotiations; or whether, if he does suggest them and the Russians accept, the French will give their blessing to the idea when the western foreign ministers next meet on September 14th. It looks suspiciously as if the fundamental decision has been put off for at least another fortnight.

This crab-like approach might still, in the end, result in negotiations. But, even if it does, there is no indication that the allies have worked out what they are prepared to offer Mr Khrushchev in return for a communist guarantee of Berlin's freedom, if they can still get one. Reports from Washington suggest that the United States is still reluctant to offer any kind of recognition to the east German government, even *de facto*. Nor is it clear whether the Americans, whose decision in these matters carries most weight among the allies, are ready to modify the western position in Berlin in a way that might remove some of the present causes of communist irritation without removing the West's ability to protect the city against absorption by Herr Ulbricht. The result is that the Americans, although they are ready to talk the matter over with the Russians, seem to doubt whether the talking will do any good: a mood reflected, from a different quarter, in the report by our special correspondent in Berlin on page 883.

Obviously, negotiations will not be easy. But, now that President Kennedy has made up his mind in favour of an east-west meeting, he should also take two other decisions. The first is that there are limits to the extent to which the United States can be diverted from the course it wishes to follow by the opposition of one ally—at the moment, France. If necessary, methods are available by which the east-west conversation can be resumed between the United States and Russia alone; and why not? The second decision is that the West's interest in Berlin is not to harass the east German regime, but to preserve and protect west Berlin until such time as the city can resume its all-German function. Ideas of using Berlin as a weapon to weaken, expose, or humiliate the communist system in eastern Europe have already distracted too much attention from this more modest, but far more useful, objective.

Portsmouth's Headless Monster

FOR the Trades Union Congress, 1961 is scheduled to be the year of the expulsion of the Electrical Trades Union. The thousand-odd delegates will be asked, as proceedings open at Portsmouth next Monday, to make this formal sacrifice in the name of their movement's good reputation; to the accompaniment of some loudly expressed protests and many genuinely felt regrets, they will do the deed. Such an exercise of real power—and such a break with the sacred tradition of solidarity—will be a strenuous enough event in itself for the TUC. The congress is then likely to relapse into the easiest form of torpor, and demonstrate a factitious unity by shouting unanimously for more pay.

To find a happy unity in opposition to the Chancellor will no doubt help the delegates to forget for the time being the embarrassments both of the ETU affair and of the period immediately ahead. It will also be supposed to help the leaders to unite behind them the vocal left-wingers who are so eager to proclaim that the ETU is being victimised for its leaders' communist sympathies; it is no accident that, of the union leaders who have published angry denunciations of the Chancellor, the non-communist Mr Byrne of the ETU has spoken with the loudest. But such an unthinking honeymoon will be irrelevant in every way. First, the decisions of the TUC have no effect at all on wage claims, which are the business of the individual unions and their various *ad hoc* alliances in different industries. Secondly, even the claims that groups of workers—the engineers, the railwaymen, the London busmen—have made, or are shortly to make, depend for their progress far more on tactics than on grand strategy. The railwaymen, for instance, have to decide whether to hustle their claim through the negotiating procedure and be ready for a showdown around Christmas time; or whether to let the solemn round of proposals and counter-proposals take its course, in the hope that by the time a climax is reached in March the Chancellor's "pause" may have melted away. At the moment it looks as if the railwaymen will opt for delay; it looks, too, as if Mr Cousins's action in hastily tabling yet another wage claim for his London busmen is designed merely to enable him to call any bus strike at the same time as any stoppage on the underground railways; one does not believe that he (any more than the engineers) is eager to give a lead by being the first to strike this time. But these are matters that will be debated in the executives of the different unions during the next few months. For TUC delegates to achieve the appearance of unity by displaying a wordy militance at Portsmouth will not have the least effect on events.

Such a display at Portsmouth could, however, have the soporific result of leading the delegates to forget the real problems that lie toughly on their plates. Unfortunately, the first of these is traditionally regarded as quite unsuitable for discussion in the emotional atmosphere of congress: it is the question of the real function of the TUC during the 51 weeks when it is not a licensed talking-shop. At present its employees carry out a certain amount of research, the results of which may or may not be useful to the constituent unions; it provides educational courses (and is this year trying to remodel its educational arrangements); it channels some money and help to unions abroad, especially in the developing Commonwealth, but so far in a way that has failed to gain it any real influence there. Once a month the general council meets and discusses the main questions of the day: an occasional dignified deputation to a Minister (and, during Mr Ted Hill's tenure of office, an occasional less dignified speech by the chairman) are the chief apparent activities between congresses. So jealous are the individual unions of their autonomy that nothing more ambitious is considered possible for the organisation that, ideally, should embody their collective power and wisdom.

For the rest, the TUC has a fine new building, an energetic new general secretary, a considerable (if still inadequate) revenue, and a traditional *entrée* to Downing Street to make its views known there. But one cannot recall a single instance in the last decade when it has used this *entrée* to make itself a pressure group for any remotely imaginative or even relevant new departures of policy. The general council has regarded itself as an executive, not as a body of leaders. Its published documents give the impression that they have been designed to ensure the maximum number of signatures at the bottom of a piece of paper—surely the most effective way ever devised of preventing hard thinking. Having never tried to exert leadership, the general council rather prides itself on the fact that it has not looked quite so fratricidal a body as, say, Labour's national executive has sometimes done. But this is because there never is much sign of opposition when there is also no semblance of government. If they are ever to set up in business as an effective general staff for the trade union movement, the general councillors will have to demean themselves to the making of nice calculations about the probable fall of the block votes; they will have to play politics among themselves; and they will not like it. But this is the only way in which the trade union movement can be given the lead which it so sorely needs.

THE question that the top union leaders should be asking themselves at Portsmouth, in the intervals of their ritual denunciations of Mr Lloyd and their sorties against German troops in Wales, is how they can set about endowing their movement with an effective leadership. The first need must be to strengthen the prestige of the Congress House bureaucracy, which would have so large a part to play in carrying out such a design. Perhaps the most useful of all the jobs that the TUC staff could do would be to set about educating their own masters. To organise courses for shop stewards or to pay for terms at Oxford for bright young union officials is a most useful activity; but it often seems that enlightenment is most sorely needed at the very top of the trade union ladder.

Overworked, uninstructed and underpaid, many union leaders have simply never thought out how they might serve their members in ways other than asking for more pay. Pensions, incentive payments, paid holidays or seniority bonuses play an extraordinarily small part in the deals made by most British union negotiators. The unions' own demarcation disputes cost workers hundreds of thousands of pounds in wages a year, but everybody at the TUC turns a pretty blind eye to this problem. At a time when car manufacturers, textile mills and (in Portsmouth itself) aircraft firms are announcing that they will have to lay men off, it is remarkable that a body like the Amalgamated Engineering Union should have no policy at all for handling sackings and severance pay and helping members to find new jobs.

This last, surely, is just the kind of topic on which a study by the TUC's research staff of practice abroad could be of great use—and there are many such. The TUC need not make itself unpopular by pointing out the deficiencies of those on whom it depends for support, but by disseminating information and tactful advice on such problems, its staff could build up influence with the unions. The Congress House staff is particularly proud of its pamphlet "The Uses of Radiations in Industry" that it brought out this year. Such publications could surely deal with subjects directly concerned with the job of negotiator and leader of men in industry.

Nor need the provision of such purely technical services interfere with the trade union leaders' favourite occupation of dabbling in Labour politics. On the contrary, it would help in it. One of the most ridiculous paradoxes about Labour's dreary series of policy documents in recent years has been that the dreariest parts of them have been those concerned with problems of trade union organisation and reform; wherever such problems have been touched upon, a drafting group of trade unionists has hastened to insert a phrase, after a semicolon, saying that all such problems must be assumed not to exist. On one industrial topic, it is true, there has this year been a glint of better things. While the Labour party itself has been so dilatory in forming a policy about the European common market, a supplement to the TUC general council's new annual report, which will be debated at the congress next week, comes down decisively in favour of the Government's action in opening negotiations with the Rome treaty countries. But it remains to be seen whether this will be pressed; cynics will say that it would be more in accordance with the TUC's recent traditions if the general council were first to secure acceptance of its report, and then to accept also one of the four motions on the Portsmouth agenda which in effect says precisely the opposite, and so once more face both ways.

The Portsmouth congress, however, will have to be judged not mainly on the outcome of public debates, but on the mood that begins to emerge there among the leaders of the big unions, now that Mr Woodcock is making his first appearance in the general secretary's seat. That he himself recognises the need for a more purposive and effectual leadership for the TUC is not in doubt: his handling of the lamentable business of the ETU has shown that he can be firm. What is still in doubt is his power to carry with him the senior—and in some cases mutually antipathetic—men who make up the general council. The name of the TUC, and of all the unions connected with it, is at present too firmly connected in the public mind with muddle, delay and ineffectualness for improvement to come quickly or easily. But the task of screwing a head back onto the headless monster that the TUC has become must be undertaken quickly, if the leadership of the British trade union movement is to be rescued from its present status of being at worst a national obstruction and at best an international joke.

Algeria Goes Militant

Disillusioned with negotiation, the Algerian rebels have given themselves tough new leaders

WHEN the Algerian nationalists feel the need to take far-reaching decisions, they call a meeting of the National Council of the Algerian Revolution, remove themselves from talkative Tunis to silent Tripoli, and confer in a secrecy that recalls the Kremlin or a conclave of cardinals. Last Sunday the political leaders, guerrillas and civilian organisers who constitute the council emerged from their deliberations and announced a reshuffle of the "provisional government of the Algerian republic" (GPRA). The reshuffle is far-reaching and probably means what it appears, at first sight, to mean: a victory for the advocates of war to the bitter end, and the acceptance of Chinese communist aid without limits.

No other inference can easily be drawn from the replacement of Mr Ferhat Abbas by Mr ben Khedda as head of the GPRA; Mr ben Khedda, formerly minister of social affairs, was dropped from the provisional government eighteen months ago after a similar meeting of the national council, for having, it is thought, opposed negotiations with the French. A few months earlier, he had led the first GPRA mission to Peking, where he had secured Chinese promises—since fulfilled—of arms and technical assistance, including tactical training.

In a movement that is extremist by definition one should beware of such a label as "moderate." There is general agreement, however, that it fitted Mr Abbas well, as did the adjective "bourgeois," whether in its traditional or Marxist connotations. Congenial and "Mediterranean," the former head of the GPRA was a standing reassurance to the more prosperous Muslims of Algeria, as well as to the more reasonable and less vocal Europeans, against too sudden or violent a revolutionary break with *l'Algérie de papa*. His name, moreover, came readily to the lips of demonstrating Muslims in the Casbah. Now he has gone, and so has his brother-in-law and fellow moderate, Dr Francis, the finance minister; and the almost unknown Marxist doctrinaire and committeeman who now heads the provisional government will replace them both, for Mr ben Khedda has taken both jobs.

The other changes are more subtle and harder to analyse. Another relatively obscure figure, Mr Saad Dahlab, becomes foreign minister. At 41, he is the same age as the new prime minister (Mr Abbas and Dr Francis are older). Mr Dahlab, however, is a man of very different stamp: a warm and attractive personality, he impressed those who met him during the recent abortive Franco-Algerian talks at Evian and the Chateau de Lugrin with his reasonableness as well as his firmness. And indeed, he played a leading part in these disappointing exchanges.

Mr Dahlab displaces Mr Belkacem Krim, hitherto regarded as the "strong man" of the Algerian revolution. At first sight, this seems to indicate that Mr Krim's power is waning;

but deeper consideration belies this impression. Mr Dahlab, a protégé of Mr Krim's, had been running the foreign ministry as its secretary-general and his promotion is a natural reward for ability. Mr Krim apparently remains responsible for the military direction of the war—the Tripoli announcements said nothing about the supreme war council which he directs ; and he takes over the portfolio of the interior, for which his talents are better suited than diplomacy, from another member of the war council, Mr ben Tobbal, who is demoted to minister of state (with four others). Moreover, Mr Krim remains a deputy prime minister, together with the absent leader, Mr ben Bella, still in French hands.

Since it had been assumed in some quarters that the collapse of the peace talks would mean the removal of Mr Krim and Mr Dahlab, the retention of the one and the promotion of the other may be taken as a token of appreciation of their firmness in resisting the French demand that the Sahara question, and Algerian self-determination, should be treated separately.

As if to underline the point, Mr Dahlab told a Cairo newspaper on Monday that the new GPRA did not object to resuming negotiations with the French, on the basis of French territory and the unity of the Algerian people. In sum, then, the militant new team intends to fight on until it gets the terms it wants: independence for all Algeria, without a special status for Europeans, and with sovereignty over the Sahara. There may be various stages on the way—thus, the French may withdraw to a coastal redoubt, leaving the Arabs to press their remaining claims as a sovereign but unsatisfied government controlling part of Algeria. But, so long as the new team remains in charge, peace will not be bought by anything less than complete French withdrawal.

Brazil's Puncture

President Quadros has taken a cue from Groucho Marx (not Karl) ; but his sudden exit is a bad joke for the Brazilians

Quadros: Bravado

Lacerda: Pronunciamento

Goulart: Gaucho

PRECISELY one week after the American republics ceremonially launched their Alliance for Progress, Sr Jânio Quadros smashed an exasperated fist through the programme's rose-coloured windows. He resigned on August 25th after half a year as president of Brazil, claiming that he felt himself crushed by the " terrible forces " of reaction. The story of his explosive departure is tangled with personal threads of feuds, ambitions and, possibly, his own ill-health. It has much broader significance. The economic alliance, according to the declaration of Punta del Este, is based on the principle that " free men working through the institution of representative democracy can best satisfy man's aspirations." Sr Quadros, who was one of the very few Latin American leaders energetically trying to put the ideals of the alliance into practice, has made it perfectly plain that he cannot, or will not, work through Brazil's democratic institutions.

If, as may well be, he is gambling on eventually being summoned back to save the country from civil strife, his recall to power would certainly be on less democratic terms. Because of the country's size, enormous potential wealth, cultural impetus, and momentum and energy in development, Brazil's future is bound to have a profound influence on all its neighbours. What happens next may provide an answer of sorts to the question that underlies all serious discussion on social reform in Latin America ; can the present political structures be moulded to accommodate fundamental social change, or do the reforms to which men aspire, and democracy as practised in Latin America, confront one another incompatibly ? It seems dismally likely that Sr Quadros's decision to throw in his hand will have punctured some of Latin America's chances for democratic, self-generating change.

The Brazilian leader had to battle, with a congress whose members are as adept as they are in most Latin American parliaments at finding ways to block legislation that might touch their own or their friends' pockets. He had no political party behind him. But Sr Quadros, who sometimes looks a bit like Groucho Marx, also shows a flash of the master's genius. The civil service was cut down by a new rule that everybody on the payroll should turn up for a full day's work. The rich rather than the poor began to be taxed because the tax collectors, given a cut of what they roped in, found it worth while to go for the larger incomes. Smuggling was checked, and exchange rackets collapsed with the end of the special export rates. The graft that strangles some of the ministries and social security institutions had at least begun to be unwound. Consumer subsidies were reduced, and a plan was introduced to improve the quality of Brazil's coffee exports. An extensive programme for reforming the feudal system of land tenure in the parched and blighted lands of the north-east was in the air. All this, and much more, seems a vigorous enough start for so short a time, and makes nonsense of the president's confessed discouragement. But evidently he had come to find the hounding from the Right, and to a lesser extent from the Left as well, intolerable.

Of all his adversaries, the most ferocious and the most formidable was Sr Carlos Lacerda, the governor of the state of Guanabara, formed out of what had been the federal district when the capital was moved inland. Governor Lacerda is a man of strong personal ambition with a reputation as a breaker of presidents. The exposure of a scandal in a Rio newspaper, controlled by Sr Lacerda, is commonly believed to have led to the suicide of President Vargas seven years ago. President Kubitschek managed to survive his virulent opposition. Sr Lacerda's friendship for President Quadros, once seemingly warm, froze to the point of publicly accusing the president of scheming to send congress into recess and to govern by decree (an accusation which many European rulers have borne with equanimity). That Sr Quadros was angling to increase his freedom of action seems undeniable ; in other circumstances such an idea might even have had Sr Lacerda's support.

The governor's second line of attack was the president's contacts with the communist world and, in particular, his championship of Cuba. Brazil's shuffle towards a neutral foreign policy was signposted by economic good sense, but has sometimes been sent stumbling by Sr Quadros's own brand of political bravado. The barter agreements with the Soviet Union and eastern Europe are evidence of a sensible trading policy to which nobody, including the United States, now takes real objection. This flicker of so-called neutralism has not prevented Sr Quadros from raising $200 million in new or extended credits, mainly from the United States, or from making conditions for private investment easier and more tempting. The president's commitment to support China's application for a seat in the United Nations was, from the American point of view, treading closer to forbidden ground. His belief that Cuba should, in friendly fashion, be steered away from its direct dependence on the Soviet Union to a respectable place among the uncommitted is, except to fanatics or Cuban exiles, unexceptionable. On the other hand, his decision a couple of weeks ago to decorate Major Guevara with a high award was a characteristic piece of bravado, on a par with his off-hand treatment of certain western statesmen. For some members of Brazil's armed services, as well as for the watchful Sr Lacerda, it may have been a straw too many.

As Sr Quadros travels by boat to England, probably with the intention of once again seeking treatment for his eyes, the dilemma in which he has left his right-wing assailants may give him a Marxian pleasure. (The reference is to Groucho, not Karl.) In an atmosphere marked by tension, bewilderment and press censorship, Brazil's military leaders are looking for a way of changing the constitution in order to prevent the succession of the left-wing vice-president, João Goulart. The typically Brazilian inspiration of allowing Sr Goulart to assume office but taking all his powers away, thought up by a congressional committee, is worthy of Groucho himself. It is unlikely to appeal to the vice-president, who, hurrying back from the Far East where he had been thoughtfully dispatched by Sr Quadros, is now hovering just outside Brazil. Sr Quadros and Sr Goulart were on opposite sides at the election, and their relations since have not been happy for either.

Sr Goulart is an heir of the Vargas regime, and like the strong man himself comes from the cattle country of Rio Grande do Sul. He is strongly supported in his own state and among the trade unions, in whose interests he laboured throughout the Kubitschek administration, notwithstanding the respectable personal fortune that he amassed. He has shown that he would go further and faster than Sr Quadros in his relations with the communist world ; on the other hand, he has not so far evinced much imagination or courage in his attitude to basic social reforms, and his labours have been on behalf of the urban worker only.

The army, which traditionally has been at odds with the navy and air force, is now threatened by a mutiny from its own forces in Rio Grande do Sul state ; their leaders support Sr Goulart. Three generals were dismissed on Wednesday. The service chiefs are handling a gigantic and sizzling firework. Without a sense of national purposes, the Estados Unidos do Brasil is bound to be in danger of exploding into striving fragments. Neither the trade unions nor the cowboys of Rio Grande do Sul are likely to accept quietly the stampeding of Sr Goulart's constitutional rights. The peasant leagues in the north-east might have put their trust in Sr Quadros ; now there is one force less to stand against their control by the communists. The federal army, if it manages to keep together, is strong enough to suppress local revolts, but at the cost of interrupting any serious national progress.

Sr Quadros planned on a lordly scale ; his temperamental reluctance to compromise threatens the unfinished achievements of his predecessor and the infancy of his own new order. At best, the next phase cannot be much more than a salvage operation ; at worst, it could be a partial wreck. Brazil's revolution of rising expectations has battered itself against the barrier of congress, the inflexible well-off, the ambitious and the opportunists. If, in time to come, Sr Quadros is called back, the revolution may be saved, but, it seems, at the expense of the democratic principles of the all-American alliance.

Cypriot Anniversary

Having won its independence, the Cyprus Republic is struggling to establish its identity

NOT unconvivial by nature, the Cypriots still did not feel moved to celebrate the first anniversary of their republic, which passed them by on August 16th, except in the most official and restrained way. This may be sad, but it is not surprising. Unlike most of the new countries born in recent years, the Cyprus republic was unwanted by many of those who belong to it, and it has not yet acquired enough of a personality to inspire them, whether Greek or Turk, with loyalty and enthusiasm. But only the more prodigious of infant prodigies can claim a marked personality on their first birthday. It is something to have survived at all.

During its first year, the Cyprus republic has depended very much on the purely negative fact that it would cause too many people too much trouble if the settlement hammered out in Zurich and London were to break down. The Greek and Turkish governments have plenty of other things on their minds, and Cypriot malcontents must know that they cannot

look for support in Athens or Ankara. In any case, at present most Cypriots do not want the settlement to break down, if only because no other peaceful alternative is at present apparent. On this negative basis, Cyprus has at any rate established its identity on the world stage. It has been admitted to the Commonwealth (and relations with the British in the sovereign bases have been far better than anyone dared to hope). It has become a member of the United Nations, has been invited to the neutrals' conference which opened in Belgrade on Friday, and is about to join the World Bank.

All this is fine as far as it goes—provided, however, that the new republic not merely survives, but thrives. This will depend first on whether the two communities can learn to co-operate as Cypriots, and not just co-exist as Greeks and Turks; and, secondly, on whether the government can persuade the ordinary Cypriot that he himself has a real stake in the future of the republic. He is in fact better off than anyone in the eastern Mediterranean, except the Israelis, but this will weigh little with him if, under the new dispensation, jobs become scarcer and his purse emptier.

An excellent example of co-operation between Greek and Turk has been set right at the top by President Makarios and his Turkish vice-president, Dr Kutchuk; their amity has been marred only by Dr Kutchuk's disapproval of the archbishop's policy of "uncommitted neutrality." Unfortunately, the provisions of the Zurich settlement tend to separate rather than unite the two communities. It may have been essential at the time to spell out the rights and position of the Turkish minority in order to get any settlement at all. But the carrying out of some of these provisions is proving lengthy, difficult and divisive. The detailed arrangements for setting up a separate Turkish municipality in each of the five main towns are still being argued over—not surprisingly, in view of the practical difficulties involved. The provision that 30 per cent of the posts in the civil service must be filled by Turks (18 per cent of the population) bristles with practical difficulties too; it is proving hard to find enough qualified Turks to fill the Turkish quota. Naturally enough, if unreasonably, the Turks are dissatisfied; while the Greeks, although instructed by Archbishop Makarios to do their best to carry out this provision, are irked by its—as it seems to them—illogicality.

If, however, one considers how suspicious and divided the two communities were less than two years ago, one may perhaps conclude that their new essay in partnership might have got off to a much worse start; on the whole, both Greeks and Turks have shown a real desire not to rock the boat too violently. Much now depends on the island's economic fortunes, above all on whether the government can arrest the steady post-independence drift towards greater unemployment and under-employment. The five-year development plan outlined by Archbishop Makarios on August 21st is even more ambitious (and expensive) than the proposals of last year's United Nations mission upon which it is based. Out of a total expenditure of over £62 million, more than £24 million is to be spent on the development of agriculture, in particular of water resources; drought is the Cypriot farmer's most constant and implacable enemy. The archbishop also announced that government land would be distributed to the farmers, and fragmented holdings consolidated. Agriculture is, as the archbishop said, the backbone of the Cypriot economy. If by these and other measures it can be made more prosperous and productive, the economy of the whole island will be put on a much better footing, and a cause of much underemployment will be at least partly removed. Other major items of expenditure announced by Archbishop Makarios were £11 million for harbour development, particularly at Limassol, and £10.5 million for electrification.

The task of raising enough money to carry out the plan is formidable. Archbishop Makarios hopes to finance half of it from foreign, half from internal sources. So far the Cypriots have been rather disappointed in their hopes of foreign financial help; the British have paid up promptly what they had promised (a modestly generous grant of over £5½ million in the first year of independence), but have not been able to oblige with more. The prospects, however, look rosier since the archbishop announced last week that the World Bank was sending a mission to the island in October, and that it was ready to sponsor a consortium (to which the United States and west Germany will almost certainly belong) which would sponsor development projects in Cyprus. Such an international demonstration of willingness to help Cyprus financially should have a steadying and beneficial effect on the island's economy. It should stimulate private investment, encourage the repatriation of Cypriot capital from abroad, and help to reconcile people to the temporary austerities that may follow if the government makes the promised effort to lessen the ever-widening gap between imports and exports. All the same, the government has a stiff task ahead of it.

Archbishop Makarios, however, evidently considers that his feet are firmly planted on the ground. He told the Cypriots last week that many of them had expected too much too soon from the new republic and that he could not promise them more than he could perform. He knows perfectly well that broken promises and hope deferred make splendid propaganda material for the Cypriot communists. These, in the past year, have adroitly exploited for their own purposes the underlying dissatisfaction with the Zurich settlement, communal irritations, the latent antagonism over the British bases, and all the discontent created by economic difficulties. A danger does exist that, if the new republic cannot make good in the eyes of its own people within the next few years, the communists may score heavily at the next elections. Archbishop Makarios does not need to be told this. His speech to the House of Representatives shows that after the cautious and circumspect policies quite rightly pursued over the past year, he now intends to move forward in a more positive way. No doubt he will provide the communists with plenty of opportunities for sniping. What can be hoped is that he will also provide the majority of his people, both Greeks and Turks, with a clearer picture of what their new republic has to offer them.

NOTES OF THE WEEK

NUCLEAR DIPLOMACY

Bang

In deciding to resume nuclear tests, Mr Khrushchev has revealed a major change in the tactics of Russian foreign policy. The deference to world opinion which led Russia (along with the United States and Britain) to suspend these tests in 1958 could not have been more spectacularly abandoned than by making this announcement on the day before the conference of neutral leaders opened in Belgrade, and only three weeks before the General Assembly of the United Nations meets in New York. The point is rubbed home by the emphasis Mr Khrushchev puts on the perfection of "super-powerful nuclear bombs" with yields of up to 100 megatons—which are most likely to be tested in the atmosphere, not underground, and will therefore renew the universally detested fall-out of radioactive matter.

Unless the Russians have already carried out some clandestine tests (a couple of suspicious underground disturbances have been noted inside Russia in the last few days) and are now brazening the matter out before they are accused of cheating, there can be only one explanation for this extraordinary timing. It is fair to assume that Mr Khrushchev, like Mr Kennedy, has long been under pressure from his atomic enthusiasts to let them start exploding again. Perhaps, in giving way to their pressure now, he hopes that his decision will scare the wits out of the West (and everyone else) in the forthcoming test of wills over Berlin.

The United States and Britain can reflect that they were right not to abandon the nuclear test talks in Geneva earlier this summer and resume their own experiments, as many people urged them to. Had they done so, they would have attracted the odium that is now Mr Khrushchev's. But that is the only comforting thought in the matter. The east-west competition in testing will now begin again. More competitors will presumably join in the race; the hope of limiting the number of nuclear powers has had a further, perhaps decisive, setback. Above all, Mr Khrushchev now seems to have concluded that it is more fruitful to intimidate than to reason. This explains his emphasis on testing multi-megaton bombs, the military usefulness of which is only marginal; existing bombs, which can already be delivered with depressing accuracy, are big enough to destroy the biggest target.

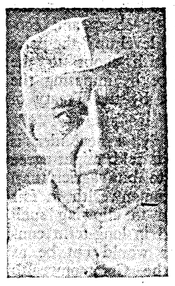
There is no need to conclude that Mr Khrushchev has decided these new weapons will have to be used. The tests he is about to hold may or may not have added to the Soviet armoury by the time the Berlin crisis looks like coming to a head. But, by making this week's announcement, he is plainly giving the attempt to frighten people priority over the attempt to talk to them calmly—even if this loses him popularity in the neutral world. Mr Khrushchev showed in the United Nations last year that he likes to make people jump by banging tables; he is now seeking the same effect by banging warheads.

BELGRADE CONFERENCE

Non-Aligned Rulers

Thus the heads of government of the non-aligned countries, now opening (September 1st) their conference at Belgrade, are face to face with a situation they cannot have bargained for. The road to Belgrade has been paved by a whole series of less exalted consultations, designed to avoid such predicaments. None of the kings, presidents and prime ministers taking part in the Belgrade meeting will have wanted to have to choose between publicly approving of some statement with embarrassing implications, and breaking ranks by refusing to join in a general approval. It will still be astonishing if the final statement of the conference proves to contain anything that could not have been pretty safely deduced from the draft agenda published as early as July.

As regards self-determination, racialism, and the ending of colonialism, the Belgrade governments can hardly speak out any less forcefully than they, with others, have already done in the United Nations Assembly and elsewhere. They are against nuclear tests; they are for general disarmament, peaceful co-existence, and economic arrangements favourable to underdeveloped nations. In principle, at least, they want United Nations resolutions to be respected; and they would like to enlarge African and Asian representation in various UN organs. In the backwash of the Bizerta affair their strictures on foreign military bases are likely to be strong. But how precise and practical a common denominator will they find if they try to "narrow down the area of block conflicts," the Jugoslav foreign minister's definition of their chief aim?



It is one thing to urge negotiation and compromise; quite another to grapple with the substance of the Berlin conflict, disarmament, or the problems posed by nuclear weapon tests, and to lean one's whole weight in the direction that the general interest requires. There will be disappointment, but no surprise, if the heads of government assembled in Belgrade opt for discretion and generalities in such burning matters as these.

INDIA

Embarrassed Giant

India's pre-eminence among the Belgrade participants is almost embarrassing. Mr Nehru speaks for as many people as all the other heads of government combined. India is more sophisticated in international life than most of the other states represented at the conference; its support, on any issue, is particularly prized; its voice rings loud. Mr Nehru's *obiter dicta* on the Berlin question have fluttered both American and Soviet dovecotes, though a second reading of what he actually said has brought some reassurance, at least, to the West. In some eyes, he is already cast in the somewhat thankless role of the regulator of the Belgrade conference's brasher impulses.

It should not be forgotten that India is also one of the few countries taking part in the conference whose governments are exposed to the criticisms of an unfettered press and parliamentary opposition. One form that criticism has lately been taking is a quite natural doubt about the wisdom of India allowing itself to be drawn into so many international issues. India has come to play a key part in the UN operation in the Congo; its involvement in Laos is far from an end; it is almost automatically co-opted to membership of any new international team created for any purpose. The shouldering of these loads is not made easier by the domestic agitations that still plague Indian life. The country's linguistic and religious diversity makes endless opportunities for splinter groups, and recurring trouble for the central government. On top of the recent language conflict in Assam, there has now come Master Tara Singh's most determined bid yet for a new division of the Punjab. The Sikh community is by no means solidly behind "Masterji" in his demands, though his unadmitted aim is clearly to carve off a new state dominated by Sikhs;

and the political fast is by now a weapon blunted by indiscriminate use. But it was an additional complication for Mr Nehru to have to leave while the Akali leader lay near to a self-inflicted death in the Golden Temple at Amritsar.

BRITAIN AND EUROPE

Who Pays for Food?

THE airways have been full in the last three weeks of more-or-less unofficial emissaries from various interests in the Commonwealth, making the grand tour of Europe to report on whether success is likely to attend Britain's negotiations with the common market. The general consensus of opinion seems to be that success *is about 80 per cent likely; but some of* the "possible terms" that are beginning to be discussed look much more satisfying to Commonwealth interests than they would do to Britain's negotiators. This is especially true of suggestions that Britain's entry into the EEC might be met by the formation of some sort of Commonwealth agricultural exporting cartel.

The white dominions' most basic economic interest in the whole common market wrangle is that they should continue to be able to sell their agricultural products in Britain. Continental Europe's main agricultural requirement is that food prices in Britain should go up, so that continental countries may have some chance of selling their own higher cost products here. As far as sales of British farm products on the British market are concerned, the implications of this price mark-up have been accepted by Whitehall: they would mean that the British farmer would henceforth be subsidised by the consumer instead of by the taxpayer. But as far as imports of things like New Zealand butter are concerned, Britain's idea has presumably been that it should continue to buy this from the New Zealanders at their cheap and economic price; and then "level up" the price of that butter in British shops to the standard European price by imposing the import levies suggested by the Treaty of Rome.

Now, almost inevitably, a new idea is creeping in. Europe, it is said, might agree to Britain continuing to buy agricultural products from the Commonwealth in fair amounts, perhaps even to allowing such amounts to be specified in long-term contracts. These amounts would not be as large as those that the Commonwealth countries have been shipping here hitherto, but they would be sold in British shops at higher prices. If Australia, New Zealand, Canada and others got together in an export cartel, they might therefore be in a good position to screw up their selling prices to Britain; to divert into their own pockets money that would otherwise be taken by import levies; and to make a very good thing out of the common market by getting just as big a food cheque from Britain, albeit for smaller total sales. Britain's objection to this is obvious: under certain rather gloomy assumptions, if an export cartel managed to push up all Britain's buying prices for overseas food to a level in line with European target prices, the effect could theoretically be to raise Britain's import bill by £300 million or £400 million a year.

Clearly, Britain would not wear this system in full; but one suspects that, as the common market negotiations proceed, quite a lot more is going to be heard about arguments started up by this line of thinking. On the one hand, it would offer a way of escape from the threatened political clash between Britain and the Commonwealth; on the other, it would raise economic implications for Britain that most definitely need to be watched.

TUNISIA

Waste of Friends

BY spurning the General Assembly's debate on Bizerta, the French government gave Tunisia a walk-over, and was painfully walked upon. The United Nations, scorned, can generate a feminine fury. By a late night count on August 25th Tunisia's case was won by 66 votes and not a dissenting whisper. The thirty abstentions, which included Britain and the United States, expressed a refusal to be associated with the wording of the Afro-Asian resolution, not with its meaning. The substance, the call for negotiations to bring about the withdrawal of French forces from Tunisia, was accepted almost universally. France lost some loving friends: clearly hating what they had to do, four Nato partners and eleven African protégés registered their critical votes. But what could have been expected when French delegates had formal instructions not only to keep away but to say nothing, even privately, even to their nearest friends?

General de Gaulle would have it that this showdown is of no account. The wiser way may be to allow him a cherished illusion. President Bourguiba has secured such a vote of international confidence that he can afford to meet the general in an international no-man's-land. This is now what is needed: an unrecriminatory interlude, divorced from the shadow of last week's General Assembly and that of its regular 16th session, looming up on September 19th. With that session hovers the threat that, if France makes no move, the issue will come up again for an even more damaging debate. The arguments are strong for an early attempt to negotiate, perhaps in two stages. The first would be for retirement to starting positions at Bizerta; the second would envisage France's complete withdrawal from Tunisia. The problem is to satisfy Mr Bourguiba that this withdrawal really will be the outcome if meanwhile he guarantees, not necessarily for ever, the lines of communication between one French enclave and another, thus permitting the French troops to retire to their positions of July 18th. Negotiating now from new strength, he could perhaps take some chances.

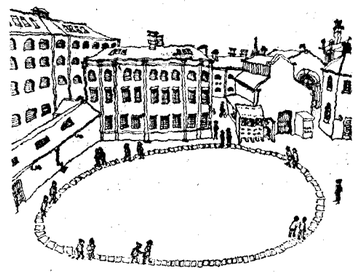
KUWAIT

Slow Motion

IT would little have been thought in July, when British troops pounded to Kuwait, that now, less than two months later, Britain would be straining to get out and urging the Arabs to come in. Yet thus has the picture changed. Britain needs more soldiers on the Rhine and can no longer easily spare its 2,500 in Kuwait. The promised joint Arab replacements—envisaged as 3,000 strong—are awaited impatiently.

But the Arab states attach more importance to not fumbling their operation than to making a punctual appearance. For lack of experience and of ready-made machinery, their preparations may look slow. The Arab League mission that has been touring the Arab capitals to obtain contributions to the force has met some resistance from governments who fear lest their soldiers should actually clash with the Iraqis. That the joint Arab force is designed to prevent armed clashes is an idea that seeps in slowly. So is the notion of working in unison. Up to now the assenting governments, apart from the United Arab Republic, appear to be the Sudan, Jordan, Tunisia (if not too preoccupied) and, naturally, Saudi Arabia. Cairo could send troops tomorrow but considers, with genuine principle, that the first contingents should be formed by at least three countries —thus symbolising Arab unity from the start.

PRISONS



Higher and Higher

THE report of the prison commissioners for 1960 (Cmnd. 1467, 9s. 6d.) opens with the familiar and depressing statistics of a bigger than ever prison and borstal population (over 28,500 by mid-1961 with, at the end of 1960, over 7,000 men sleeping three in a cell); an inadequate staff to cope with them (the net gain in established men officers in the year was only 11); and the usual waste of resources on untried prisoners (27,824 untried prisoners altogether were received during 1960, and about 40 per cent of them were not subsequently sent to prison on conviction).

Of these totals, women account for only a tiny proportion. But in one field they are presenting the prison authorities with a small, but growing and difficult, problem.

During 1960, the report points out, the effects of the Street Offences Act became more obvious; 382 women were committed to Holloway last year under this Act, compared with 98 under the old legislation in the seven and a half months of 1959 before the new Act came into force. In prison these women are uncooperative, are reluctant to work, and any efforts at rehabilitating them are virtually useless since they fully intend to return to prostitution on their discharge. At the moment a prison sentence for these women is purely custodial—a sort of incident in their career which they may come to accept as philosophically as they accept the periodic payment of a fine. The prison commissioners are considering whether they should be treated as a special group in prison, with a special training devised for them.

The report also comments on the general drop in the success rates, measured by absence of reconviction, achieved by borstal

training for boys. All boys passing through reception centres after being sentenced to borstal are now classified according to prediction tables, drawn up to show whether a boy is a bad risk or not. It does seem, according to the report, that boys received for borstal training are, judged by these tables, a worse risk than those received in 1947. However, boys discharged in 1958 were born during the years 1936-40, and research has suggested that people born in these years (or rather between 1935 and 1942) were 8 to 9 per cent more likely to be convicted of offences than the general average for those born between 1925 and 1949. It may be, therefore, that these two factors—a bad risk group and a "delinquent generation"—are militating against the success of borstal training, rather than that the training itself has deteriorated.

TRAFALGAR SQUARE

Laws of Assembly

SINCE 1844 when the Ministry of Works became responsible for Trafalgar Square, it has usually been made available for any *bona fide* public gathering on Saturday afternoons or all day on Sundays. Now the Minister of Works has refused permission to Lord Russell's civil disobedience group to hold a public meeting there on Battle of Britain Sunday (September 17th), because Lord Russell has made it clear that an illegal demonstration in the form of a sit-down in Parliament Square is to follow. The minister's argument is that he cannot be expected to facilitate a declared intention of breaking the law.

Some of the protesters have said that the minister is hereby exceeding his legal rights. This is quite certainly wrong. Rights of assembly in London and elsewhere are not nearly as free as is sometimes supposed. Under the Metropolitan Police Act of 1839 (s.52) the commissioners of police have wide powers to regulate public processions and gatherings in London to avoid obstruction. In 1662 a statute forbad "tumultuous petitioning" of the King or Parliament, which it defined as the presentation of a petition by more than 10 persons. The Seditious Meetings Act of 1817 makes it an offence for more than 50 to meet within a mile of Westminster Hall while parliament is sitting in order to petition crown or parliament for any alteration in Church or State. Since 1936 it has been forbidden to wear any political uniform in public, and the same statute allows the police commissioner to regulate processions and apply to any local authority to have them forbidden altogether. Acts of 1908 and 1936 punish disorderly behaviour at public meetings. Under the Riot Act of 1714, twelve or more persons at an unlawful assembly become felons if they do not disperse within one hour of a justice of the peace ordering them to scatter.

"Bloody Sunday," 1887

These statutes apart, it is the common law offence of "unlawful assembly" to gather in numbers of three or more to carry out a purpose which is likely to involve violence or produce in the minds of rational and firm men a reasonable apprehension of violence. Admittedly, to assemble with the mere intention of acting illegally, although not violently, as in Lord Russell's case, does not constitute a misdemeanour (*Field v Receiver of Metropolitan Police* (1907) 2 K.B. 853 (TAC)). Admittedly, too—here the protesters have a point—the closing of Trafalgar Square has in the past increased rather than diminished violence. When the Democratic Federation was turned away from Trafalgar Square by the police in 1886, a mob marched up Pall Mall and broke the windows which were filled by jeering club members. Again on November 17, 1887, "Bloody Sunday," a serious riot ensued when a crowd assembled by the Federation, forbidden the use of the square, attempted to enter it (with Bernard Shaw and Annie Besant in among them) and were repelled by the police. The following year a working man was actually killed by the police in similar circumstances, and Morris wrote his "Ode to Linnell." Events on September 17th are likely to be less bloodstained.

PORTUGUESE AFRICA

Stitch In Time?

ALTHOUGH it has been stoutly denied, the Portuguese government's new measures for the "overseas provinces," announced on Tuesday, may reasonably be seen as its reaction to the rebellion in Angola and the threat of unrest in Mozambique. The proposed reforms cover a wide field, touching on political, social and economic arrangements; and they are announced in the name of complete equality of race, culture and religion. There will, it is stated, be no discrimination between the citizens of "Portugal"—the metropolitan area and the scattered empire—in any sphere, and it is hoped eventually to set up a Portuguese common market, breaking down the customs barriers between various Portuguese territories.

In concrete terms, these proposals consist of the repeal of the Natives' Statute, under which full Portuguese citizenship was granted only to those few Africans who had certain qualifications; the introduction of some degree of local self-government; the permitting of collective bargaining and collective wage agreements; and the abolition of some vexatious agricultural regulations. There have been hints of more benefits to follow.

These proposals are welcome, as far as they go; but they are to some extent nullified by the plan for encouraging extensive white settlement in Africa with which they are linked. This plan, first mentioned publicly by the minister for the army early in August, seems to have been conceived, at least in part, as a means of reinforcing the counter-terrorist campaign. The phrase "soldier-settler" was used, and the minister for overseas Portugal, when announcing the new programme, expressed the hope that soldiers now fighting in Angola would decide to make their homes there. These statements suggest that the fine words leave Dr Salazar's government as it was—committed to a policy of white supremacy as the only means of maintaining its rule. The insistence on a literacy qualification for the vote, even in a state where the vote counts for so little as it does in Portugal, makes it doubtful how much the abolition of the Natives' Statute will really mean: literacy is rare in Angola. Whether any mere reforms could induce the rebels to lay down their arms at this late date may, in any case, be doubted.

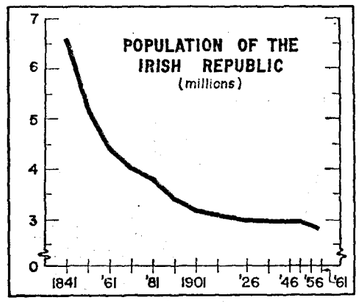
KENYA

Sweetness and Light

MR JOMO KENYATTA'S visit to Nairobi on August 25th, his first since his release, was a personal triumph in more senses than one. The welcoming crowds whose enthusiasm thrust aside police barriers and broke railings in efforts to get near the hero were not even the most concrete evidence of his prestige and influence. Attention has fixed, rather, on the agreement he has induced, at last, between the two political parties, the Kenya African Democratic Union and the larger Kenya African National Union. From now on they promise to work together, and with Mr Kenyatta, on a common programme for national independence. The terms of that programme have clearly been designed to reassure the sceptical, and particularly foreign investors, about Kenya's future ; and they seem to be having this effect.

The two parties' joint statement seems to have two principal aspects. In the first place, it offers a guarantee that all land titles already existing, "including tribal rights and property rights," will be "respected and safeguarded in the interests of the people of Kenya," and promises fair compensation for land "acquired by any future government for public purposes, e.g. schools, hospitals, etc." Mr Kenyatta's gloss on this was that it proved that independent Kenya would not have a "gangster government."

Secondly, the African leaders agreed on the tactics and timetable they propose to adopt in future. A coalition interim government is to be formed, with apparently something like an equal balance between the parties. The legal disability which at present prevents Mr Kenyatta from joining the legislative council should be lifted. A constitutional conference should be held in September, a general election at some unspecified date, and then, next February, Kenya will become independent. Various other proposals, concerning the Masai and the White Highlands and the coastal strip, were presented, with these, to the Governor on Tuesday, but they, though delicate, are obviously of less importance. The two essentials, which call for an early response from London, are Mr Kenyatta's status and the acceleration of the process of reaching independence.



IRISH REPUBLIC

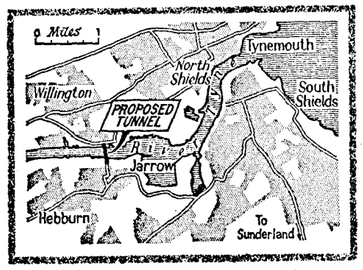
Peak Emigration

Our correspondent in Dublin writes :

THE results of the census taken last April show that the long decline in the Irish population is in a new and more violent phase. The population of the republic is put at 2,815,000 in 1961, compared with 2,898,000 in 1956 and 2,961,000 in 1951. Thus there has been a fall of 83,000 in the last five years, although births have exceeded deaths by 132,000 in that period. The estimated net emigration of 215,000 represents the highest rate for many decades.

The decline has been general all over the country. The only increases in population are in the areas around Dublin and some other towns. The decline is patently most severe in the west and north where the average annual rate of net emigration amounts to 18 per 1,000 in Connacht and 21 in the republic's three counties of

Ulster. This is the area in which, for a half century and more, the loss of population has been heaviest. The root cause seems to be that the system of small farms worked by unpaid family labour has broken down. Since the war, the younger brothers and sisters have discovered the attraction of jobs of their own ; and jobs have been very easy to find in England. It is fairly certain that the bulk of the emigration comes from the category known to the census as "farmers' relatives assisting." In addition, the small farm (however worked) has been under severe pressure. It predominates in the least fertile parts of the country, in the west and north. It depends largely on pigs, poultry and eggs —commodities which cannot now be easily or profitably sold in the traditional British market.



It is possible, from one point of view, to regard the emigration figures as no more than the decision to leave infertile lands which have been thickly populated as a result of historical causes. But the real cause for alarm is that unless agriculture is assisted to become more competitive the same pattern will be repeated in the more fertile parts of the country. Population figures are an emotional issue in Ireland, because of the bitter depopulation in the seventy years after the famine of the 1840s. It had been hoped that self-government would reverse this trend, and at first it seemed to be doing so. But now, despite a rising national income, it seems that numbers will continue to decline until the geographical and occupational distribution of population begins to correspond with the realities of the later twentieth century instead of echoing the abnormalities of the early nineteenth. It is only by stepping up very much further its increasing export trade in goods that Ireland can stop exporting people.

TYNE TUNNEL

Little and Late?

THE award of a £5.4 million main-bore contract for the new Howdon-Jarrow tunnel under the Tyne estuary marks the beginning of an important venture for North-East England—and also the culmination of fifteen years of expensive vacillation. On present estimates the completed scheme will cost £12.5 million, of which the county councils of Durham and Northumberland will find £1 million and the Ministry of Transport grant £3 million and lend another £8.5 million to be repaid out of tolls. The first Tyne Tunnel Act of 1946 envisaged the expenditure of no more than £3.6 million on a comprehensive scheme including both a vehicular tunnel and a smaller tunnel for pedestrians and cycles; but the preparations had hardly begun when one of the postwar capital economy drives forced the postponement of the larger works, although the pedestrians' tunnel continued and was completed in 1951, at a cost of £884,000. The original estimate of £3 million for a vehicular tunnel has thus had to be more than quadrupled in the intervening 14 years, and there is no guarantee that it will not have to be revised again before its completion in 1966.

But one's real fear is that, even now, the project may have been designed too unimaginatively down to its minimum. Its carriageway will have only two traffic lanes with a planned maximum capacity of 20,000

vehicles a day. The asumption is that initial usage will be only 7,000 a day, and full utilisation reached only by 1984. In the Mersey tunnel, it should be noted, traffic is now three times as heavy as was originally forecast ; there is a constant tendency to underestimate the extra traffic likely to be generated by a convenient crossing designed, as this Tyne tunnel is, to foster industrial expansion in the bare areas at each of its ends. An important factor is that this tunnel will be the only direct crossing between Newcastle and the sea, and may be expected to attract nearly all the traffic from the two banks of the Tyne for several miles from the coast. It will be a familiar story of planning muddle if this tunnel is saturated almost as soon as it is opened.

SOVIET UNION

All Good Gifts

MR KHRUSHCHEV may well be able to face his party congress next month with good news from the agricultural front. There are indications that this year's grain crop may turn out to be a bumper one. The Soviet leader himself recently declared that "the harvest and procurement of farm products in the current year will apparently be bigger than at any time since the establishment of Soviet power." The fragmentary evidence available so far seems to confirm this prediction.

At the agricultural session of the central committee last January it was estimated that to satisfy the demands of the Soviet economy the output of grain must reach at least 160 million tons and deliveries to the state reach 68 million tons. If these targets were to be attained in the current year, it would be a very considerable achievement. So far, 1958 is the record year, with a grain harvest officially estimated at 141 million tons and deliveries to the state at 57 million tons. Output fell in the next two years and even the official claims put it only at 133 million tons in 1960, with state deliveries at 46.7 million tons. This figure was certainly exaggerated, not only because of the falsifications so bitterly denounced by Mr Krushchev himself, but also because the state was compelled to return part of the grain to the farmers for seeds.

Two successive bad harvests had their effect on the supplies of meat and dairy produce. There were shortages in Moscow and Leningrad, not merely in the provinces. This was a nasty blow for Mr Khrushchev, who had staked his reputation on increasing agricultural production, and explains his outbursts, earlier this year, against all sorts of "culprits." If the early reports are confirmed, agricultural success will be as sweet for the Soviet leader as continued failure was bitter. But elsewhere in eastern Europe, especially in East Germany, Poland and Czechoslovakia, harvesting has been seriously delayed by bad weather as well as by human failings ; the demands on the Soviet output may still be heavy.

POLAND

At the Church Door

BEFORE a large congregation at Czestochowa, Cardinal Wyszynski fired a fresh salvo last Sunday in the running fight between church and state in Poland. He complained among other things of "further" violations of the agreement concluded in 1956. This uneasy compromise, which Mr Gomulka accepted because at the time he badly needed the support of the powerful Catholic Church, has been steadily eroded by the communists. What has probably provoked the cardinal just now, apart from some minor pinpricks, is a serious thrust by the communists at the church's right to give religious instruction.

On July 21st the law on school reform came into force, putting a stop to religious instruction being given in schools, a provision foreshadowed by Mr Gomulka in January. In recent years the authorities have, by administrative devices, increasingly hampered religious instruction in schools, so that by now most religious classes are in fact held outside schools in church halls and other ecclesiastical buildings. Cardinal Wyszynski seems to fear that the state will now try to bring this extra-school religious teaching under its control, and whittle it away. The new school law gives the minister of education extremely wide powers of control and supervision over educational activities outside schools. Two other laws introduced in the Sejm in July are clearly intended to deprive the church authorities of the use of a number of buildings in the western territories which before 1945 belonged to the German Catholic and Evangelical churches. One law, which gives the state legal ownership of these properties, was passed. The other, which would have prevented the Church from collecting money to pay the rent which the state authorities have lately been demanding for the use of these premises, was strongly opposed by the tiny Catholic group in the Sejm, and was suddenly withdrawn for redrafting.

Thus the cardinal has good grounds for his fears. On the other hand the communists are likely to proceed with caution. Lip-service is paid to the Church's religious and moral mission; and the resumption last month, after a long interval, of the meetings of the church-state mixed commission, suggests that the authorities are anxious to conduct their siege of the Church in a gentlemanly way. Religion is still strong enough in Poland to make a direct assault unattractive.

SPACE RESEARCH

Needling the Astronomers

WITH singularly inept timing, the American administration announced its approval for a controversial project to girdle the earth with a belt of copper needles only a few days before 1,000 of the project's strongest opponents were due to assemble for a meeting of the International Astronomical Union in California. The result was predictable: stiff official protests from learned international bodies who believed that their objections had killed proposals for an earlier experiment called "Project Needles" and were surprised to find it quietly revived under the less explicit name of "West Ford."

The experiment is part of research into space communications. There are two ways of doing this and the best known is by an instrument-carrying "active" satellite that receives signals from earth and relays them down to their destination on the other side of the globe. This system works only while the satellite works and when it is in the right position for the two people sending messages. But for ordinary civil communications it is likely to work very well. It is less attractive for soldiers because satellites can be jammed and

The Economist

AUGUST 31, 1861

THE BLOCKADE

Will the Northern States of America be able effectually to blockade the ports of the South ? . . . *First.* The blockade of an immense extent of coast is a very difficult thing to effect. *Under most* circumstances *it is impossible.* . . . *Next.* The blockade, if it is to be effected, will require a great deal of arrangement *and management*, and the circumstances of the United States are not, as far as we can see, very favourable to its good management. They are engaged in an exciting and dangerous war by land, close to their capital and seat of Government. Their army has been found to be far less efficient than they had hoped, —then almost every one even in Europe expected. They are reorganising that army, and *it seems* likely that this difficult operation will require many months. . . . Nor are the Northern Americans likely to have an Executive Government especially calculated to surmount unexampled difficulties. . . . The constitution of the Union places at this moment at the head of affairs an unknown, inexperienced, *irremovable* man—a man *specially chosen* because he was *not* one of the ablest men in the country. . . . Lastly. The maintenance of such a blockade requires a united people, and in this respect the Northern Americans will hardly be long united, even if they now are so. The Northern manufacturers want cotton as well as we, and they must buy that cotton in Liverpool. Mr Lincoln has just authoritatively proclaimed that they shall have none from the South, for he has interdicted *all trade with* the "rebel" States. The Northern manufacturers, therefore, are as much interested as we that Liverpool should be well supplied, and, therefore, that there shall be no real blockade. . . . They derive great advantages from being the exchange centre, the trading *entrepôt* and manufacturing counterpart of the South. They have derived great profits by aiding the prosperity of the South, and they will lose them if that prosperity should be impaired. It will not only be impaired, but be destroyed by a close blockade *during a long* war, which would raise the price of cotton in Europe far beyond its usual limits for a protracted period, and would effectually stimulate in other parts of the world equal, if not superior, competitors to the plantations of the South. Can the *brokers* of New York afford to ruin their *principals*, and will they consent to do so ?

could be shot down. This has made them interested in "passive" communications systems which keep all working parts on the ground and bounce signals off a purely passive reflector hanging in space. Such a reflector could be the belt of copper needles, a man-made replica of the atmospheric layers used now to reflect radio waves. The theory has already been proved by bouncing signals off a high balloon released from a satellite. Now the soldiers want a dress rehersal. Their experiment is not of much interest to the telephone companies backing the "active" satellites for communications because of the huge power required in the ground transmitters.

Astronomers' objections to the experiment are simple and understandable. A good reflector is going to work both ways: if it stops some radio signals from escaping into space, it will also stop radio signals, and probably some light, from penetrating from space to the earth and so harm the work of both optical and the much newer radio astronomers. In practice, it will also poach on the space reserved in the crowded radio spectrum for radio astronomy. The American sponsors of West Ford have tried to reassure the astronomers by saying that the needles will fall to earth in a year or so, and will in any case, for purposes of the experiment, be so thinly distributed that they will not interfere with astronomical work. The astronomers are less sure because, at some of the heights mentioned, the needles would certainly not fall to earth but stay permanently in orbit. A regular military system would also be permanent and thicker than West Ford.

The most serious objection turns, however, not on precisely how much interference West Ford will cause—no one can know this until the deed is done—but on one small group of scientists putting a far larger number all over the world to great inconvenience and perhaps under a permanent disability for all time. This raises interesting questions for space lawyers. Satellites have never caused inconvenience, nor do they stay permanently in position over other countries. Is the United States in fact entitled to try such an experiment without first getting the agreement of all the countries over which this copper umbrella is likely to hang?

CHURCH ADVERTISING

For Mammon Only?

THE storm that has risen over Church sponsoring of an advertising campaign to "sell" religion to the resolutely non-Church-going English population seems a trifle premature. No commitment, official or unofficial, has been entered into by the Church of England authorities. What appears to have happened is that last June a group of religious enthusiasts with advertising connections called together a small informal committee to discuss the possibilities of such a campaign. The Bishop Suffragan of Bedford, who happened to be on friendly terms with a member of the committee, agreed to preside temporarily; after discussion, a small sub-committee was appointed to investigate the matter further. Nothing would have been heard of its deliberations for some time had it not been rash enough to issue a statement to the press which by-passed the Church Information Board. The press took it up as a good August story, somewhat exaggerating the stage it had reached in the process. Mr George Goyder, Chairman of the Church Information Committee, then denounced the Bishop of Bedford in somewhat arrogant terms—Bedford may be only a suffragan but after all he is a bishop—and claimed that in condemning the committee's work he was speaking after consultation with the "highest authority." (Mr Goyder did not specify whether this Sibylline phrase meant God, the Queen, or the Archbishop of Canterbury.)

The hysterical outburst against Church use of publicity is hardly justified. The objection normally advanced against advertising—that it can be used for trivial ends—obviously does not apply here. Of course extensive advertising campaigns, as Moral Rearmers should know, have their drawbacks. One is that they are expensive. The money might be raised from industry but the Church does not wish to appear as the lackey of capitalism (although contributions from industry for the Christian Stewardship campaign have not been spurned). Another difficulty is that England has little experience of religious advertising. Inter-denominational campaigns have taken place in the United States, for which the rather silly and quite unproven claim of raising church attendance by 50 per cent has been advanced. But the only sustained campaign of religious advertising in England has been carried out by the Catholic Inquiry Centre, which sets out to provide information about the Roman Catholic Church; it has received 200,000 queries in seven years. Doubtless the Bishop of Bedford's committee will take this experience into account as it calmly contrives to continue its very worthwhile investigations.

LETTERS

The National Health

SIR—In commenting on our "Genesis of the British National Health Service" you were good enough to say that we have dispelled some myths. But we wish we could have carried you even further with us. You say, we think correctly, that "the British people as a whole would rather have the health service, in its present form, than not have it." But this, we submit, is the beginning and not the end of the argument. When the national health service was launched it was widely said that it would provide free for the whole population the best possible medical and dental services. This was a hoax; the promise was not, and could not be honoured. To say that it was a successful hoax does not take us much further. So we have in the national health service an institution which, it has been said, helps to create inflation; which, as recent reports have made clear, has proved woefully ineffective at a number of important points and which, to put it no more strongly, may not have given our country a better medical service than it otherwise would have had or than other countries now possess. Why, under these circumstances, should the British people not be invited to think again and to consider whether they would not do better for themselves if they modified the central monolithic principle of the national health service and started to pay privately on a much larger scale (of course with the help of insurance) for their medical services?

As you yourselves have been saying so wisely and powerfully in recent months, this is the time for re-examining most carefully all our British institutions, even the most cherished. Why should the national health service uniquely be immune from challenge of this kind?—Yours faithfully,

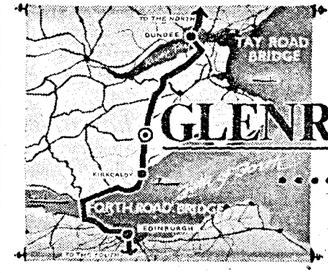
The World Crisis

SIR—There is a surrealist quality in the Berlin crisis which lowers morale. We have had a threat to bomb the Acropolis by Mr Khrushchev; an issue of ball-point pens in Berlin; a partial American mobilisation; and now Gleneagles. (One must distinguish carefully between First and Second Gleneagles, for the Prime Minister's statement on the fairway bore little relation to the communiqué of Lord Home's which he read out in the hotel.) Meanwhile President de Gaulle plays his *solitaire*, Bizerta, ruining himself and us; and Dr Adenauer, after insulting Herr Brandt in an election campaign, stands shoulder to shoulder with him beside the Wall of Ulbricht. What is so eerie in all this is the combination of nineteenth century politicians with twentieth century engines of destruction. Poor Mr Kennedy is indeed a contemporary of ours; but all he gets from his allies are umbrellas sent by derisive West Germans.

There are surely two ways for the West to treat the crisis: to defend the physical *status quo* by a sincere threat to pull the roof down on the Russians if they menace the freedom of West Berlin; or to seek to

Mr. Sho's two worlds



One side is Japanese, the other English—a symbol of how Mitsubishi Shoji serves both worlds.

With 90 years in the business, this big general-trading company has had noticeable results in serving overseas clients who buy and sell in Japan. The silken curtain parts quickly when Mitsubishi Shoji is on the job for you.

Some of Japan's finest products carry the Three Diamonds mark common to all Mitsubishi companies. There are over a score of these companies in light and heavy industries, and each handles its foreign trade transactions through Mitsubishi Shoji.

You can learn how profitable it is to trade with Japan at any Mitsubishi Shoji office.. Branches and affiliates are in all the world's trading centres.

GLENROTHES
...on the road to prosperity

Get ahead in Glenrothes—the new, fast-growing town in the County of Fife . . . strategically sited on the main road linking the two new road bridges over the Forth and Tay. It's a *great life* for industry at Glenrothes, with rich rewards and boundless opportunity for the far-sighted.

Glenrothes is recognised as a Reception Area for Overspill purposes, and financial assistance is available under the Local Employment Act, 1960, in approved cases. Glenrothes offers *you* top-grade labour, houses for all grades and first-class sites.

You'll be in good company too, at Glenrothes. Already established are manufacturers of the calibre of Beckman Instruments Ltd., Anderson Boyes & Co. Ltd., Formica Ltd., Hughes International (U.K.) Ltd., Cessna Industrial Products Ltd.—and the Scottish Milk Marketing Board.

For further information write to the General Manager, Glenrothes Development Corporation, Woodside, Glenrothes, Fife, or phone Glenrothes 2202.

defend West Berliners' freedom by other means. The first course, to put it mildly, has not been taken. The second entails the aid of the neutral or "unaligned" countries, many of whom will meet this week in Belgrade. Their governments do not love Russia and most of them would like to associate with the West, if it treated them as equals. But they are unwilling to take sides with us in a quarrel between the boss-powers over the former capital of Prussia, a quarrel which would destroy some of them if it turned nuclear. If after negotiations under pressure the West had to admit partial defeat, would not many of the "unaligned" turn against the Soviet Union in the United Nations and concern themselves actively not only with oppressed Germans but also with our former allies now under Communist tyranny, Poland and Czechoslovakia ?—Yours faithfully,
London, SW3 CHARLES JANSON

British Columbia Electric

SIR—Your note two weeks ago says: "How far the Government has followed these (i.e. the BC Supreme Court's) criteria is not clear."

I submit that it is crystal clear. The $111 million compensation paid for British Columbia Electric is, as stated in the enabling Act, the book value attributed to the common shares in the balance sheet of December 30, 1960. Note 5 to the 1960 Financial Statements, after explaining that the properties were valued for rate-making by the Public Utility Commission of BC as at June 30, 1939, and that subsequent additions have been computed on the same basis, states:

> The valuations by the Commission are established for rate-making purposes and neither they nor the amounts at which the properties are carried in the consolidated balance sheet purport to represent either present realisable value or replacement value.

The auditor's note is, surely, conclusive evidence that the compensation paid cannot conceivably be held to satisfy two of the Court's criteria, namely historic and replacement costs and prices recently paid for similar utility properties. The third criterion, future earnings prospects, which is particularly significant in this case, has been completely ignored. In short, the terms imposed by the BC Government bear no relation to the principles established by the Supreme Court.

If, however, despite the inherent injustice, compensation is based upon book value, surely capital surplus and earnings employed in the business must be included in arriving at the final price. These two items would increase the BCE compensation by $29.5 million. Moreover, there is a deferred credit, in the last balance sheet, of $44.4 million, representing income tax deferred to future years as a result of claiming capital allowances. If this is included, compensation paid for BCE, even on the basis of book values, should have been $184 million. The same exercise for British Columbia Power produces a final figure of $194 million, representing an improvement of $14 million, or $3 per BCP common share, on the offer for BCP's entire assets.—Yours faithfully, READING
London, EC2

What Price Diplomacy?

SIR—After forty years' consular, commercial diplomatic, and diplomatic service in eleven posts I can testify that all were usually overstaffed. Diplomacy, in essence, is a one-man business. Surplus staff and masses of paper do not help: they merely increase the security hazards.

The abolition of minor consular posts was certainly a great loss for the reasons you give: but it was done, not for economy, since most of them cost virtually nothing. The motive was the Foreign Office's aversion to honorary consular posts, whose links with trade were thought to diminish the status of the career officials.—Yours faithfully, J. G. LOMAX
Llaneilian, Anglesey

Dr Nkrumah

SIR—The Note entitled "Bearer of Tales" in your issue of August 5th is surely less than fair to the British Minister in Budapest.

The sentence in Dr Nkrumah's speech to which he took exception was, according to press reports, to the effect that "Ghana had ended 100 years of British colonial oppression." This was not merely, to quote your words, "a reminder" of our "colonial past"; it was an insulting travesty of it, spoken at an official reception in the presence of the official British representative. How could he let it pass?

And do you really think that it would be "in our interests," or would increase respect for us, for us to "disavow" our colonial record?—Yours faithfully,
London, SW3 GEOFFREY FURLONGE

Home Rulers

SIR—As the Liberal and Home Rule candidate who "intervened" in the Kelvingrove, Glasgow, by-election in 1958 perhaps I may be allowed to comment on your rather ingenuous note of August 12th.

Official help from the Scottish National and Scottish Liberal parties was neither sought nor obtained for my candidature. The primary objective was to deny the seat to the Conservatives. The secondary aim was to resolve the then strip mill impasse. Labour elements, among others, had long been campaigning for a continuous mill to be sited at Grangemouth. Any such development at that most unsuitable point would have broken up the pattern of the Scottish iron and steel industry. The Conservatives, for their part, were not disposed to go counter to the "London" view.

I raised the issue in two television broadcasts. When the Conservative was dislodged her defeat was, rightly or wrongly, attributed to my intervention. Not long after, Colvilles were asked to put up a strip mill in Motherwell (where I had said it should be) and were offered the needful means.

You suggest that the influence of the Home Rulers is now very much on the decline, by way of exerting a reforming influence on social policy or even of securing further administrative devolution. My own view, for what it is worth, is that quite the opposite is in train. Since the last general election, both the Labour and Conservative parties have gone out of their way to placate Scottish opinion, the one to maintain its still strong base in Scotland, the other to overturn it. If the Home Rulers are not so evidently active at the moment it may be because events are conspiring to favour their views.—Yours faithfully,
Cambuslang, Lanarkshire DAVID MURRAY

Room in the Middle

SIR—In your article of August 19th you contrast the progress made by housing co-operatives in Sweden with the fact that in Britain co-operative housing has, so far, been almost a non-starter. Your readers might get the impression from the way you stated it that this is related to the other fact that the Swedish co-operatives are "non-political" whereas the British co-operative movement is "political."

Co-operative housing in Sweden is organised in two movements, HSB and SR. Although there are friendly links between both and the Swedish consumers' movement the latter, as in this country, is primarily concerned with providing its members with consumer goods and services through the distributive trades. Co-operative housing is separate and its origins are separate. This is also true of the highly successful co-operative of car-owners which has its own chain of garages and petrol stations throughout the country. The agricultural co-operative movement, as in Britain, is also separate.

In Britain the Co-operative party has done most to arouse interest in the potentialities of co-operative housing. A policy statement entitled "Housing—A Co-operative Approach" was approved early in 1959. This makes the claim for tenants' co-operatives as a more satisfactory alternative to private landlordism than wholesale municipalisation, and advocates the setting up of a central promotional organisation.—Yours faithfully, HAROLD CAMPBELL
London, SW1 The Co-operative Party

Mr Kenyatta

SIR—For fifty years or so I have been reading *The Economist* in the hope of profiting from expert comment on a world growing steadily more irrational. The article on Mr Kenyatta in your issue of August 5th appears to indicate a change of policy on your part. You now prefer to sell whitewash.

I am neither a South African, still less a supporter of the present South African Government; merely an Englishman who detests humbug.—Yours faithfully,
Johannesburg THEODORE GREGORY

BOOKS

Painful Co-existence

Russia and the West Under Lenin and Stalin

By George F. Kennan.
Hutchinson. 419 pages. 40s.

MR KENNAN is not here much concerned with communist Russia as such, but with the foreign policy problem it presents to the West. He provides just enough background about the internal evolution of the Soviet Union to enable the average student to grasp the vagaries of its foreign policy (the book is largely based on a series of lectures to British students). His central theme, however, is the dilemma that has faced, and still faces, the western powers as a result of the sudden entry, in 1917, of a revolutionary newcomer into the established community of nations.

Once the revolution failed to spread throughout the world, communist foreign policy was bound to pursue two contradictory objectives. "The desire to destroy bourgeois governments," the author aptly points out, was coupled with "the desire to enjoy the advantages of normal intercourse with them . . . so long as they continued to resist destruction." The non-communist powers, too, had to find an answer to this contradiction. The problem is still topical in the vital guise of "co-existence." It is no accident that Chicherin, when foreign minister, spoke of "the parallel existence of the old order and of the new," and of the need for the economic co-operation between the two, in terms so similar to Mr Khrushchev's, though he was speaking almost 40 years earlier.

Nobody is better equipped than a former ambassador to Moscow to describe what the western reaction to this revolutionary challenge was, or what it should have been. Those who discovered Mr Kennan as late as 1957, and who, ignorant of his past, suspected that the theorist of disengagement had pro-Soviet or "appeasing" leanings, will be undeceived by this book. The professional diplomat is shocked by the Soviet manner. "Insulting" is an adjective that crops up all the time. The liberal, with conservative leanings, abhors not only communist practice, but also the doctrine that inspires it. Unlike many of his colleagues, however, Mr Kennan thinks it his patriotic duty to understand and explain the motives of his opponent.

This is one purpose of the book. The other is to counter Soviet accusations of western misbehaviour. In this struggle against Stalinist falsification, the author seems, occasionally, to lean in the opposite direction. Thus, the attempt to explain allied intervention in the revolutionary struggles exclusively by the desire to keep Russia at war is not entirely successful. Why did intervention outlast the world war? The explanation contains too many "sheer coincidences" to be quite convincing. The treatment of Munich gives a similar impression. Communist writers harp on Munich to divert attention from the Nazi-Soviet pact: here, the balance seems slightly tilted the other way. In more general terms, Stalin's evil genius is made to loom somewhat too large in the story, and psychopathology is used more frequently than sociology or economics.

Mr Kennan is at his best when dealing with diplomatic manœuvres and their background. His description of the way in which Germany was driven into Russia's arms, and how the two outcasts of Versailles signed the Rapallo agreement in 1922, is masterly. The general presentation of the book—each chapter dealing with a separate topic and trying to draw some general conclusions—is effective. The narrative is vivid. And in view of the writer's authority, his side remarks on the difficulty of "summitry" or on the nature of American diplomacy have great interest. And yet, until the very last pages, the reader has the impression that the central question concerning the world impact of a revolutionary state, so well posed, is not quite answered.

Mr Kennan, naturally, has his views on what went wrong with western policy. The root of all evil was in the search for "unconditional surrender" in the first world war. The attempt to keep Russia in the war when it was no longer capable of fighting gave the Bolsheviks their chance. The Versailles treaty and the mishandling of the Weimar Republic gave Hitler his. Once Stalin and Hitler are on the stage, war seems as inevitable as doom in a Greek drama. And so the story which began with Allied intervention ends with the wartime alliance for which, in the author's view, the western powers paid too high a price.

It is only in the closing pages that Mr Kennan returns to the problem of co-existence. His own doctrine is based on two premises. Warfare is not an answer to communism, and the advent of the atom has merely reinforced this view. Secondly, world politics is not a field in which one should seek the absolute. Russia was better under Lenin than under Stalin, and things have been improving in the Khrushchev era. Western diplomacy, in his view, should beware of conditioned reflexes; it should not always react to an image of Russia that is ten years out of date. Mr Kennan remarks wittily that he could name many Sovietologists who "seem afraid to admit to themselves or to others that Stalin is really dead." It is to be hoped that Mr Kennan will be able to return to his scholarly task and take his story through the last years of Stalin up to the Khrushchev era. This will compel him to go deeper down below the diplomatic surface, to explain more closely the relationship between the transformation of Soviet society and the evolution of its foreign policy.

Worried Young Man

The Stagnant Society

By Michael Shanks.
Penguin. 236 pages. 2s. 6d.

SINCE Professor Galbraith so brilliantly imposed his catch-phrase on the conscience of the world, reviewers have come to fight a bit shy of books with titles such as this: the more so when it is followed with the portentous sub-title "A Warning." A look at the cover gives just the opposite impression: a team of undertakers' men, formed up with their Rolls in front of the Union Jack, irresistibly recalls the Goon Show in its finest days—what, are Penguin Specials going funny? The answer, of course, is that they are not: the Penguin Special has by now established itself as a genre of its own, falling well clear of the twin sloughs of portentousness and frivolity suggested respectively by title and cover (for which, presumably, the author need bear no responsibility). The object of this one is to examine some reasons for Britain's economic stagnation, as compared with the rapid postwar growth of other economies, western and eastern, and the technique used is that of extended journalism, rather than of weighty analysis.

Mr Shanks is from the *Financial Times* stable: like many of his contemporaries he finds Britain's poor performance in the growth stakes a source of shame and deep anxiety. Believing that economic techniques have been developed to a point where we can now act to avoid the "catastrophic fluctuations of the trade cycle" with their attendant unemployment and business depressions, he argues convincingly that the failure to expand is rooted in our national social structure. He has also looked closely at the state of the trade unions, and has been thoroughly appalled at the spectacle: the pity is that this vision has so upset him as to falsify the balance of his book, a good two-thirds of which are devoted to castigating the unions for their present failures and suggesting how they could do better in future.

Regarded as a book on the unions, there is a mass of good sense here. Mr Shanks's main wish is to give a whole lot more power to the TUC, which could thus eliminate many of the inter-union disputes and squabbles which are so depressing a feature of industrial life. In particular, he would like to see the trade union movement, through its central organisation, drawn into the national machinery for decision-making by its participation in an economic planning group—in fact, through the establishment of some machinery of the kind that the Chancellor is supposed to be contemplating at present. This group would lay down a generally permissible level of wage increases, and the sharing out of this increase would then be

bargained out industry by industry, with unions asking for more than their share being held in check by the strengthened and centralised TUC. It is no fault of Mr Shanks that these ideas are by now familiar to newspaper readers: it is just his bad luck that events have caught up so swiftly with his foresight when he was doing his work on the book.

Forking out from his concentration on the unions, Mr Shanks has some sensible things to say about the way in which our industry is run. His faith in the success of distributing industry into areas of unemployment by refusing building licences for boom areas and subsidising factory building in development areas may be rather excessive; but his remarks on industrial democracy and co-partnership are eminently sensible, especially his wish to see unions brought more closely in touch with factory-level joint consultation machinery. Politically, he seems to stand with those on the wing of the Labour party whose feathers reach out to mingle with Mr Grimond's: he would not mind seeing a bit of moulting on the far side, among the Cousins and the Foots. He argues cogently (if again a little belatedly) in favour of an association with the Rome treaty powers. Clinging to democracy, loving sweet reason, he is a real moderate.

The trouble with his book is what is left out. To analyse the faults of the unions is valuable: but to lay so vast a proportion of the blame for our national economic plight at their feet does seem a bit excessive. Nepotism in industry, retail price maintenance; the public schools; the loss of the colonial empire; the survival of the aristocracy—some of these are briefly looked at by Mr Shanks, others not at all. But the part played by these phenomena—and many other such—in frustrating social mobility, and thus economic progress, in our society is surely as well worth examining as the dead weight of the unions, even if the verdict is to be "not guilty." Trade unionists are all too apt to believe, when criticised before the public, that they are being unfairly picked on and made the scapegoat for other people's vices. The uneasy suspicion remains that this is not the book Mr Shanks meant to write at all, and that he appended to a worthy tract on the unions some too hasty afterthoughts on other subjects, to make up the weight to back his ponderous title.

Aid for Aid's Sake

Economic Aid to Underdeveloped Countries

By Frederic Benham.
Oxford University Press for *Royal Institute of International Affairs*. 121 pages. 12s. 6d.

PROFESSOR BENHAM has written a short general account of economic aid to underdeveloped countries that is both accurate and lucid. He outlines what is now being achieved both qualitatively and quantitatively and gives balanced vignettes on such controversial subjects as price stabilisation schemes, the growth of population and the specious choice that emergent countries are asked to make between trade and aid.

The most challenging sections of Professor Benham's book are, however, those in which he considers the motivation of aid and the inadequacy of Britain's present efforts in this field. He notes that those in favour of increased aid often claim that more aid will help to turn the flow of the cold war in favour of the West. They ask whether we are matching the great challenge of the Soviet economic offensive. But as Mr Nove has pointed out, the Soviet aid programme is not nearly so large as is often thought and still largely consists of promises for the future. Again, a quick glance at those countries which have benefited from shock aid programmes—South Korea, Laos and South Vietnam—will show that such programmes have not been very successful and were exceedingly ill-conceived. The countries receiving aid, Professor Benham aptly points out, are not quite so naïve as they are thought to be and are usually able to weigh up the motivation for aid quite accurately. It is in the interests of the west to encourage the east to give increased help and for the aid programmes of both blocks to be spread over the whole underveloped world. Such peaceful competition will help to ensure that the programmes are well thought out and efficiently executed and will help to remove suspicions of spheres of economic influence and neo-colonialism.

Aid that is intended to stem communism or actively to promote privileged trading conditions is not likely to be very effective as aid and is almost certain to fail in its objectives. Professor Benham quotes Sir William Hayter's belief that Britain's "political end should be the actual raising of the living standards of Asia and Africa, in the interests of the peoples of those countries, but also in the interests of a stable and peaceful world." If the interests of the developing countries are kept right in the foreground, it is much more likely that the other objectives will be achieved incidentally at the same time.

It may seem ungrateful to state that the Government's contribution to the underdeveloped countries is wholly inadequate just after the Chancellor was generous enough not to axe the present programme. But he should carry his ideas of longer term planning into the field of aid. There is no effective opposite number in this country to the plan organisations of the developing countries. Were Britain itself to have such an organisation, it would help to dissolve the bewilderment that a developing country feels in dealing with a plethora of commercial, semi-commercial and public entities when negotiating a contract or in trying to find the most suitable source of help. The new department goes only a short distance to meet this need.

Professor Benham's book provides an excellent introduction to the whole question of economic aid, and also conjures up some inconvenient thoughts that might in due course lead to more effective action by the Government. His concluding plea is that "once the needs of the underdeveloped countries are taken as the sole criterion, one per cent of the national incomes which are far higher per head than theirs, and growing much faster, should surely be the very least which we are willing to contribute towards a better world."

Three Generations in India

Punjabi Century, 1857-1947

By Prakash Tandon.
Chatto & Windus. 256 pages. 21s.

IN three generations, staggering changes have transformed the Indian countryside and the structure of Indian society as a whole. From his grandfather, Mr Tandon learned of the anarchy that accompanied the collapse of the Sikh empire in the pre-British Punjab. A new era of law and order, irrigation, roads, bridges, railways, telegraphs, schools, and public health, was opened by British administrators, who, because they lived among the people for decades without home leave, and moved around slowly on horseback, were intimate with the people, whose languages they learned to speak fluently. Mr Tandon's father was one of the first Indian canal engineers trained in the newly set-up Roorkee college, and made his way contentedly in the service of the British raj. He survived into the new age, when the blessings of peace came to be taken for granted, and fast modern transport, by strengthening their ties with home and making rushed local tours superficial, reduced the intimacy of administrators and people.

The old generation of Indians enjoyed the wide sphere of subordinate responsibilities granted them. They thought it reasonable that the key posts should be in the hands of the British, who taught them their "know-how." The new generation increasingly resented the promotion over their heads of youngsters from England, whom they initiated in technical jobs (such as magistracy, canal engineering and revenue collection) leaving them permanent subordinates. English books fired them with ideas of freedom and self-government. Mr Tandon's generation saw no future in government service. He became one of India's first chartered accountants and has risen to the top in modern industrial India. His account of these changes must remain unique, for nobody will ever again experience in one family and one lifetime the same kaleidoscopic revolution.

Mr Tandon is, however, only passingly concerned with politics. His insight, tolerant yet shrewd, cool but sympathetic, into men and women, his relish of the good things of life, his love of the countryside, and his command of an imaginative, indeed poetic, English prose style, have enabled him to paint a vast canvas, unsentimental but warmly human, of rural life in the Punjab between 1857 and 1947, with its multifarious cycle of marriages,

births and deaths, of festivals with their acrobats, jugglers, licensed jesters, village performances of the *Ramayan* (in which the small boys vied with each other for a part as one of Hanuman's army of monkeys), of quarrels, feuds, murders, ambitions, joys, tragedies. Scholars will thank Mr Tandon for his vivid documentation of a vanished era; ordinary readers, even if they know nothing of India, for a charming book, right off the beaten track.

Freud—for the Many and the Few

Freud and the Post-Freudians

By J. A. C. Brown.
Penguin. 233 pages. 3s. 6d.

Letters of Sigmund Freud 1835-1939

Edited by Ernst L. Freud.
Hogarth. 464 pages. 50s.

THE first book covers rather briefly ground that has been dealt with again and again in recent years. The best and fullest treatment is by Ruth L. Munroe in her "Schools of Psychoanalytic Thought." What Dr Brown has done is to present this material—that is, the account of Freud's own theories, and an account of the theories put forward by one or other of his rebellious disciples—in a brief and accessible form. He says a good deal about recent work in this country, but quite rightly devotes more space to the work of Horney, Fromm, and Sullivan in the United States. This descriptive writing occupies nine chapters and nearly 200 pages, and is sound if not original.

Then Dr Brown goes on to devote the last thirty pages to what he calls "Assessments and Applications." In this section he deals freshly and sensibly with some present controversies, particularly the well-known argument between Professor Eysenck and the psychoanalysts, and makes some practical suggestions of his own; these would, if put into effect, remove psychoanalysis from its socially unimportant position by the couch, and put it to work in industry and society at large. What he has to say here is stimulating, and some people are already taking this line seriously. Whether it will prove widely acceptable is another matter.

Although the edition of Freud's letters has just been edited by his son, and occupies nearly twice as many pages as Dr Brown's little book, the material is not of such general interest. Freud's disciples will, rightly of course, want to read everything he wrote, and those who enjoyed the bibliography "Freud's Life and Work," will find this collection of documents an interesting appendix. In themselves the letters are mainly personal, and often trivial in content. They help to recapture the atmosphere of middle-class Vienna before the second world war, and they add to our knowledge of Freud the man. But the general reader should realise that their value would not be great to anyone who tries to read them without any background.

More Management

Studies in Management

By Guy Hunter.
University of London Press. 158 pages. 10s. 6d.

The Business of Management

By Roger Falk.
Penguin. 251 pages. 3s. 6d.

MR HUNTER'S book, unlike most of those published on management, is about some of the real problems that worry—and when they do not, ought to worry—managers, described by an acute and liberal observer of industry. It is a pithy and forthright discussion of the problems that need to be considered when a personnel policy is formulated. The first half of the book is concerned with the timing and details of personnel policy as well as the aims and methods of management training. The second discusses the nature and context of the industrial community in relation to society as a whole, paying particular attention to the nature of authority, the system of payment and the demands made on the educational system.

It is a book that could be read with profit by managers at every level. Yet its greatest value could be for those at the top provided they are willing to listen to remarks like:

> Top management often has an itch to get down there and inspire, to demand gratitude for welfare and generosity to preach the partnership of man. It is a dangerous one: they are better employed in really good training of their officers, and in the constant improvement of systems.

That is one illustration of Mr Hunter's perception of the temptingly-covered pitfalls that can attract the top manager who is looking for easy solutions to problems of communication and morale. He emphasises that communication techniques have little value in themselves, for it is not what is said or how it is said that matters, but how it is heard. He also utters a warning against the excuses that are commonly made for failures: "Before any man is called lazy or stupid, it is necessary to be very sure that the right challenge has been put before him." One way to improve management would be to abate "the tendency to arrogance and insensitiveness which is possibly the most general defect in managerial character."

The current demand for books about management will ensure that any general book on the subject published as a paperback is likely to sell well. Mr Falk says that his book is not a text book or a manual, but "an attempt to help the thinking of those who feel with the author that management is a subject worth thinking about." But the quality of thinking is not original, hence less stimulating than that of Peter Drucker or Mr Hunter. It will be useful to those looking at industry from the outside who want to hold their own in conversation. It may also interest the would-be manager who wants a clear, brief and up-to-date discussion of management.

A DYNAMIC THEORY OF FORWARD EXCHANGE

PAUL EINZIG

This is the first book to give a detailed account of Forward Exchange practice, theory and policy in the post-war world. Dr. Einzig's pre-war book, *The Theory of Forward Exchange* (1937), has not been superseded as the generally recognised standard of work on the pre-war system. But there have been many important practical changes and these, together with some changes in the broader aspects of the subject, call for a revised theory and a rethinking of official policies. 60s

MACMILLAN

Resistance Agent

Who Lived to See the Day

By Philippe de Vomécourt.
Hutchinson. 288 pages. 25s.

"IF I had known there was a Resistance Movement I would have joined it." The young man who said this in September 1944 is quoted by Jean Galtier Boissier in his "Journal de l'Occupation de Paris." The statement seems less improbable after reading Philippe de Vomécourt's unromanticised account of his adventures as an agent of Special Operations Executive. Seventeen years after the end of the war the spate of literature—and films—about the Resistance leaves many of us as confused or ignorant as the Parisians of 1944 about the real nature and consistence of the movement. Who belonged to it? What were their motives? How was it organised? What co-ordination was there between its branches? What did it do? Few people in Britain, or in France, for that matter, could say for certain at how many levels the Resistance was operating in France in the last two years of the war. And what do we know of the relations between the Free French, obedient to General de Gaulle, and the British, French and other agents of the British-organised Special Operations Executive and its parallel American organisation? Or between these and the communists?

Before the generation that witnessed these events dies out, it is to be hoped that someone will give us an organic and critical history of the Resistance that could help us to read the tragic riddle of contemporary France. "Who Lived to See the Day" makes no claim to be a complete or critical analysis of the Resistance and its springs of action. It is a *témoignage,* whose value lies in its sincerity and in the fact that—to anyone with personal knowledge of France during the German occupation—it rings true. This is important in a book that appears seventeen years after the events it narrates. Was this delay the author's fault or the publishers', one wonders?

The tale is well told and the style sympathetic—no mean achievement for a writer who is recounting his own exploits. In fact one soon forgives him the naïveté of his original premise. The de Vomécourts come from a part of France—Limoges—where memories of personal conflict with the Germans are cultivated in every home and where "patriotism, the love of France, of the country, of her people and her glorious history, are a natural and proper response." Philippe de Vomécourt makes no apology for this unsophisticated outlook and no attempt to analyse the strange contradictions into which it led him. He seems, indeed, quite unaware of these. The desire to fight the Germans without delay led him to enrol in the British rather than the French organisation in 1940 when the Free French, at General de Gaulle's orders, were doing reconnaissance work only while the British-commanded SOE agents were already engaged in sabotage. Later, de Vomécourt could see no merit in communist action in the Resistance. For him the communists were working for the "revolution" not for France. Yet, objectively, one must surely admit that the communists saved a good deal of France's industrial plant from removal by the Germans whereas some, at least, of the sabotage operated by SOE was of doubtful utility to France. Yet de Vomécourt was by no means servile in his relations with his British commanders and made some useful and pertinent criticism of the unnecessary dangers to which their lack of imagination sometimes exposed resistance workers in the field. God forbid that we should need to make use of the experience of Resistance again. But there is a deal of lore in this book that would be useful to anyone still in the job.

Law and Legislation

The British Commonwealth, the Development of its Laws and Constitution, Vol. 9: *Malaya and Singapore, the Borneo Territories*

Edited by L. A. Sheridan.
Stevens. 532 pages. 84s.

THIS is the best volume so far in a useful but patchy series. Professor Sheridan has supplied what was clearly lacking in some of the earlier volumes—skilled and decisive editorship. Instead of a series of essays by different hands bound up in one volume and preceded by a perfunctory introduction, we have a coherent volume over which much trouble has been taken.

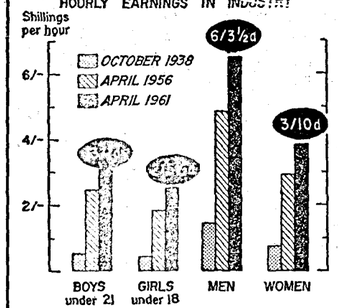
The task could not have been an easy one, for although the common law has been at work in Malaya for nearly two hundred years it left curiously few traces behind it in the way of reported judgments. Until 1932 there were no reports at all in the (unfederated) Malay States except Johore. There were other complications arising from the mixtures of races—Malays, Chinese, Hindus and others. As a result the law throughout Malaya is a mixture of common law and equity as interpreted (quite successfully) by English barristers working with out-of-date books and hazy memories of what they had learnt in the Temple; customary laws regulating the personal and domestic relationships of the various racial groups; and, lastly, local and imperial legislation.

Of legislation there is now no lack—"Enactments pour out from what must surely be the highest concentration of legislatures per head of population to be found anywhere in the world." There seem to be, or to have been, no fewer than nineteen such law factories in the area covered by this volume. (Incidentally, one of the features of the work is a series of population tables and two good maps). In an area of the Commonwealth where the divisive factors are so strong it is good to have this most useful and admirable contribution to unity.

OTHER BOOKS

AMERICAN PERSPECTIVES. Edited by Robert E. Spiller and Eric Larrabee. *Harvard University Press.* London: *Oxford University Press.* 216 pages. 38s.

Ten specialists in American history, sociology, sciences, arts, etc., here contribute essays round the theme: what images of the American character are reflected in these departments of knowledge? The debunking era early in this century has given place to one wherein Americans—especially the younger generation—seek assurances, security, stability and coherence. The book has a good deal of information in it and will convey much of "the American dilemma" to those knowing nothing of that dynamic society which hardly knows whither it is bound. But, for the rest, the book contains little new and little of substance. One can get much more about this subject for much less money.



THE FUR TRADE. 2 vols. By Paul Chrisler Phillips. *University of Oklahoma Press.* 712 and 704 pages. $16.50.

These sumptuous volumes, completed after the death of their main author by his associate, J. W. Smurr, represent a life work on a most important factor in the economic and political development of the United States. Apart from the tussles between American fur traders on the one hand and British, *Canadiens* and French, Spaniards and Russians on the other, this elegant trade, based on much inelegance, shaped American things to come, especially in that north-west which was not developed until this century. Here, richly illustrated, finely described, and economically analysed, is the story of far more than the upbuilding of the Astors' fortune. Not only economists will be staggered by the late author's careful tracking of the trade to its surprising destinations. They may well ponder how palæolithic we moderns are still.

TEENAGE EARNINGS

Among industrial workers, teenagers are still doing relatively the best in pay increases. In the five years to April, 1961, the rise in the hourly earnings of boys and youths was 38 per cent compared with that of 30 per cent for men. And although during the same period the increase of 32 per cent for girls was no more than that for women, this brought their hourly earnings to nearly six times what they had been before the war—a larger uplift even than that given to boys' earnings.

HOME REPORT

In HOME REPORT members of the editorial staff and local correspondents report on life and happenings in and around Britain.

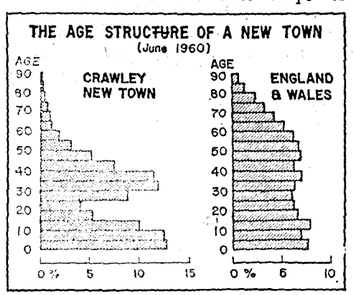
Communities in the Making

FROM OUR SPECIAL CORRESPONDENT

THE housing and industrial triumphs of the new towns are now well known; but are they equally successful and fortunate as social communities? The Ministry of Housing itself recently aired some misgivings about "new town blues" and the absence of "the friendliness of city life"*—words which have started off a sharp controversy. A more measured review of the social problems of these and other new communities has now been offered by Mr J. H. Nicholson, former Vice-Chancellor of Hull University, in a study sponsored by the Carnegie UK Trust and the National Council of Social Service †. These heart-searchings come at an appropriate time, for the older new towns are finishing their period of rapid development and will be handed over one by one, starting with Crawley and Hemel Hempstead next year, to a single body, the recently created Commission for the New Towns. How can the commission help the further social development of these towns, and should the three new ones which may shortly be started at Skelmersdale (Lancs), Dawley (Shropshire), and somewhere in central Scotland, be differently designed?

Some of the criticisms of all newly-built communities (the new towns included) really boil down to criticisms of modern life. It has become fashionable to contrast the matiness of old urban areas, with relatives living close by and with pubs and shops on every corner, with the home-centred and status-ridden isolation of families in new housing areas. But those (the Ministry included) who draw this sort of depressing comparison seem to forget that "fings ain't what they used t'be" even in Bethnal Green, and that it is doubtful whether (say) Paddington and Islington are now even as friendly as Harlow. Part at least of the old urban matiness was linked with disappearing conditions of domestic squalor and of a superfluity of shops and pubs run for a pittance. Equally the home-centred activities of new town families are a natural if overdone reaction to their improved housing, while their problems of loneliness or maladjustment often represent difficulties in achieving a new way of life—one in which the freemasonry of pubs and shops and the omnipresence of "Mum" give way to new activities based on personal preferences and the telly.

England is changing everywhere, but the changes are sharper and quicker in the new towns. These towns are in fact a forcing ground for middle-class values, and it is rather silly to try to put back the social clock by encouraging there a kind of bogus urban matiness. Yet this is just what the Ministry seems now to be proposing. It suggests that new towns might become more "neighbourly" if their housing layout broke away from the "generous densities" of the garden city idea in favour of a more concentrated style of development. This is a most curious argument, first because housing in the new towns is in fact more compact than in the early garden cities and secondly because (as a recent article in *The Economist* demonstrated) it is also more compact than in most old towns of comparable size. If density of development produced neighbourliness, then Harlow should be fully as neighbourly as Worcester—as it may be really.



The new towns have, however, three genuine and important social problems, which also concern other areas. One is their unbalanced age structure—the predominance of large families and the lack of older people. The redevelopment areas of cities have precisely converse problems, since most of their younger and socially more mobile families leave under overspill schemes, leaving behind the smaller families and the lonely old.

This is a problem that clearly must be tackled at both ends. Mr Nicholson points out that similarly drastic social changes are occurring in areas of urban redevelopment, where familiar landmarks disappear and the rows of congested (but "cosy") little houses get upended into great blocks of modern flats. The community becomes unbalanced through failure to provide the kind of housing which families with children will willingly accept. Those authorities like the LCC who include at least some houses (balancing them with taller flats) are on the right lines, but a more ingenious and less hygienic approach could increase the proportion. At the other end, some new towns (with Mr Brooke's encouragement) are building more old people's dwellings, but many more elderly relatives would move to these towns if dwellings were available for them.

THE second and related social problem is that of the numerous new town children who will soon have families of their own. Are the new towns then to be declared "full up," thus starting up the social trek to new areas all over again? This problem already exists acutely at Kirkby, the large overspill estate near Liverpool, just as it arose earlier at Dagenham. It would be a grave mistake to push the new towns in their turn into the lopsided and stagnant pattern of an ageing population, but provision for the next generation will require a great deal of building—most of it by private enterprise—in the next twenty years. Land must be kept for this purpose, and more office employment will be a necessity.

Finally, there is the problem that the provision of social facilities—particularly meeting halls and commercial entertainments—has lagged in all newly-built areas. Most new towns are slightly better off inasmuch as their development corporations have been able, where the Treasury has let them, to contribute to local facilities. Fortunately, the growing resources of the local authorities in new town areas, combined with the ability of the new commission to continue contributions, should solve this problem. But there will remain the different point that no new town is large enough to support such facilities as first class shops or restaurants, theatres or concerts. In Hertfordshire where four new towns exist, a splendid opportunity exists to turn one of them into an attractive regional centre, and the new commission, with its co-ordinating powers, should be able to bring this about.

THE AGE STRUCTURE OF A NEW TOWN
(June 1960)

Enter Yartoft?

FROM A CORRESPONDENT IN EAST ANGLIA

THE Local Government Commission, having dealt faithfully with municipal pretensions and ambitions in the East Midlands, has now moved on to its preliminary investigations in East Anglia, where there are two great bones of contention. One is the proposal of the provincial capital and county borough of Norwich to take in 10,600 acres and 35,800 people in the surrounding suburbs, and thereby to become a city of about 155,000 people instead of 120,000.

The other question is the standing of the ancient seaport and present holiday resort of Great Yarmouth, twenty miles away, which was chartered as a borough in 1208, and has been a county borough since 1889. Yarmouth's population of 51,500, however, is only about half that which, according to the commission's briefing, would justify its retention as a county borough.

This might seem to suggest a simple course of action for the commission. It could recognise the modern growth of Norwich by allowing it to incorporate the 35,800 people and the £408,000 of rateable value in the suburban area. And it could compensate Norfolk county council—with its large but predominantly rural territory—by reducing Yarmouth (rateable value £910,800) to a non-county borough, and thus making it part of the county.

But in both towns this would raise a hornets' nest. In the first place, property-owning democracy in the suburban parishes of Norwich is fiercely opposed to the idea of incorporation in a Labour-controlled city whose rates are now 25s. 9d. per £1, and 40 per cent of whose houses are council-owned.

As for Yarmouth, it has put forward proposals to take in some of its own suburban parishes, which would increase its population by 7,250 and its rateable value by £85,500. But, being no doubt sensible that such a modest expansion might not save it as a county borough, it has asked the commission to consider merging Yarmouth and the neighbouring East Suffolk borough and port of Lowestoft, together with all the intervening and adjoining parishes. This would make a county borough with a population of 108,000, a rateable value of £1,603,000, and an area of 30,000 acres. It would, incidentally, be seventeen miles long—although the centres of Yarmouth and Lowestoft are only about ten miles apart, and the towns are almost joined by a string of holiday camps along the coast.

FORTY years ago the rivalry between Yarmouth and Lowestoft was such that this proposal would have been incredible. Anyone who dared to suggest it would barely have escaped with his life from the enraged populations of two hard-fisted fishing ports. The most astonishing thing about it today is that, having been suggested by Yarmouth, it has been quite favourably received in Lowestoft.

Bureaucracy makes strange bedfellows. The local wits have christened the proposed amalgamation Yartoft, and talked of a new town hall in the intervening village of Hopton—but that is all. The reason for this astounding amiability is that Lowestoft, as a non-county borough of 45,000 inhabitants, resents government from the county borough of Ipswich, the capital of East Suffolk, which is forty miles away to the southward, and feels that it might do better for itself in combination with Yarmouth, with which it has so much more in common.

No-one has said anything about the possible effects upon East Suffolk of losing Lowestoft, as the largest town in its administrative area—although there are hints and winks that the boundary commission might be disposed to merge East and West Suffolk into one administrative county. In fact, none of the three county councils—Norfolk, East Suffolk and West Suffolk—has yet said a word in public about the plans and ambitions of the boroughs. No doubt, like the sailor's parrot, they are thinking all the more. Meanwhile the suburban parishes, whether on the fringes of Norwich or Yarmouth, are extremely vocal about take-over bids.

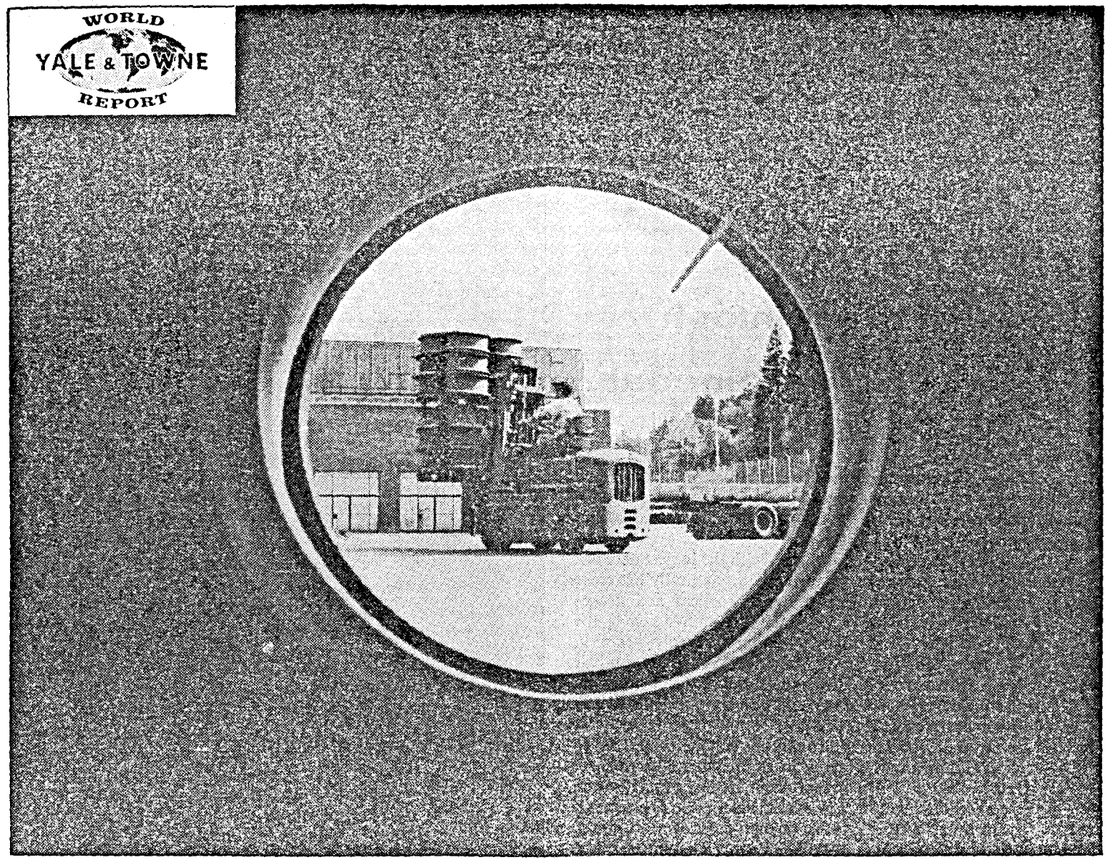
Freights and Fallacies

FROM A CORRESPONDENT IN BELFAST

THE high costs of sea transport are always said to be one of the main reasons why Northern Ireland finds it so difficult to achieve a rate of industrial development that would make an appreciable difference to its unemployment problem. Economists have argued that transport costs militate against industrial growth, and criticised delays and inconvenience at the dockside, the high cost of dock labour on both sides of the Irish Sea, and a general inefficiency arising from a degree of monopoly control in cross-channel transport.

This view is supported by businessmen like Mr Cyril Lord, who has said that it is cheaper for him to transport latex from Malaya to Liverpool than to carry it from Liverpool to Belfast. Other investigations have shown, for example, that freight charges between Southampton and Belfast are higher than between Southampton and Madeira. Mr Charles Orr Stanley, head of the Pye group that has factories both in Northern Ireland and in the Republic of Ireland, even accuses the Northern Ireland government of being "bad and inefficient" because it cannot keep down transport costs.

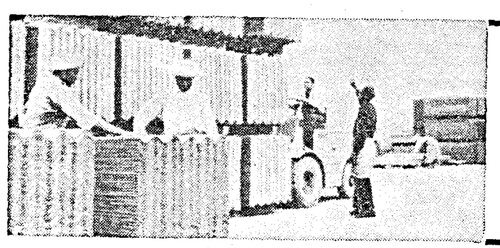
Other critics are the Northern Ireland farmers, especially the stockmen. The suggestion has even been made that workers in manufacturing industries should accept lower wages in order to compensate their employers for the high costs of sea transport. And there has actually been one case, at least, where the workers accepted this advice, though the lower wages did not in fact save the factory in question.



All this tends to engender a feeling of hopelessness about freight charges. But there are occasional voices of dissent. Mr S. R. Dennison, head of the Department of Economics at Queen's University, has said that freight costs are only an excuse for failures that could well have been caused by something else. He argues that manufacturing industry almost everywhere has to contend with some problem of the kind.

It is not surprising that two new surveys, should have arrived at contrasting conclusions. In June this year the Northern Ireland regional committee of the National Union of Manufacturers sent a questionnaire about freight rates to 1,200 firms in the province. More than four-fifths of them would like to see an inquiry into sea freight rates, but considered that a direct freight subsidy should be "the last resort." One firm said it was definitely leaving Northern Ireland because of the high sea transport costs, but many others were more concerned about delays in delivery.

The second survey, carried out by the Northern Ireland Development Council, found that transport costs were of no great significance in the total costs of production. This survey covered 15 different industries. In all but one transport costs did not exceed 2.8 per cent of the sales value of the products, and in 10 of them transport costs were less than 1.5 per cent of sales value.



Such disagreements indicate that there is much more study to be done. But there seems to be quite enough evidence to direct more attention towards the problems of dockside delays, dockside labour costs, and losses in transit. One other point is that many Northern Ireland manufacturers have only themselves to blame if they suffer from transport delays. The shirt manufacturers of Londonderry put up with road and sea transport when their product is one that might be thought ideal for air freight. Radio and television sets, and even carpets, are other commodities that might sometimes gain from air transport.

WORLD YALE & TOWNE REPORT

ANYWHERE IN THE WORLD YOU'LL FIND THE PRODUCTS OF YALE & TOWNE!

STOCKHOLM, Sweden—A double-decked load of palletised wheel rims for the manufacture of highway trucks moves swiftly by Yale petrol fork-lift truck from outdoor storage at the Scania Vabis factory. Yale industrial lift trucks to fit the most difficult or exacting materials handling requirement are available in capacities up to 200,000 lbs. Find out how Yale trucks can reduce your handling costs from your nearest Yale sales and service representative.

CASABLANCA, Morocco—A Yale petrol truck, capacity 8000 lbs., works tirelessly moving, lifting and stacking heat-reflecting corrugated cement roofing materials at the Dimatit Works. Whether in warm desert sands or in the cold, frozen north, Yale industrial lift trucks speed goods, reducing handling costs to a minimum.

YALE®
INDUSTRIAL LIFT TRUCKS
TRACTOR SHOVELS
YALE & TOWNE

● Yale makes the world's most complete range of petrol, LP-gas, electric, diesel and hand lift trucks.

● All Yale industrial lift trucks are uniformly high in quality, wherever they are manufactured.

● All Yale materials handling equipment is available in the currencies of the free world.

● For information contact your Yale sales and service representative, located in principal cities of the world.

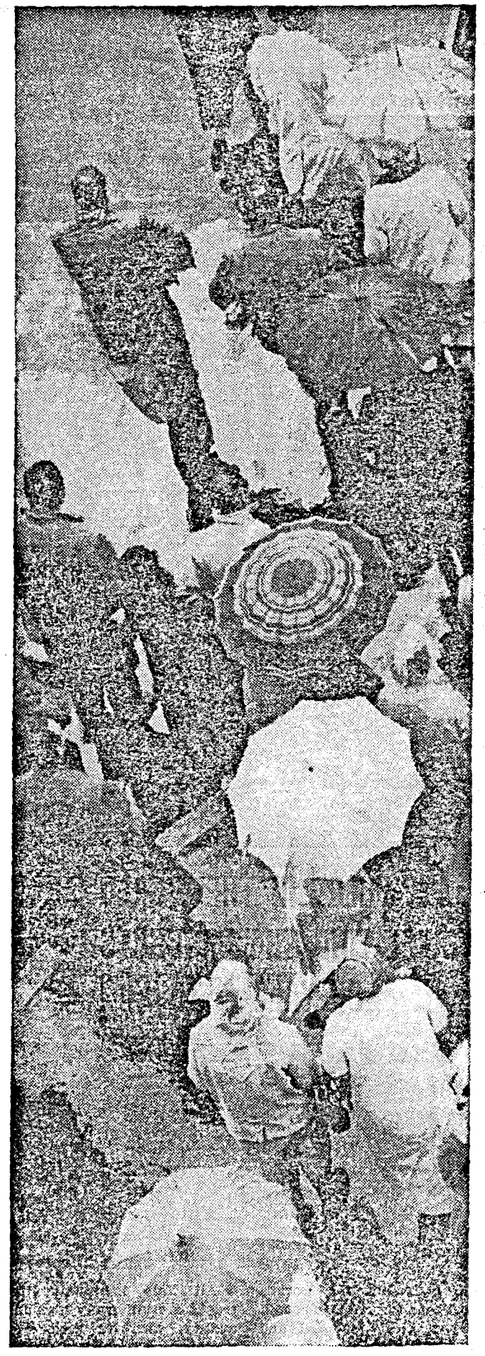
Do you wear a mackintosh ... or a raincoat?

The difference may be slight ... but even small distinctions in language and in customs can assume importance, when people in Great Britain do business with people in the United States.

The Chase Manhattan Bank, with the largest network of correspondent banks in the U.S., naturally has close familiarity with American trade practices and usages —and with the ways in which they differ *among* the fifty states. And after more than seventy years in London, too, The Chase Manhattan is equally familiar with British ways. This understanding of customs on both sides of the Atlantic can be very useful to you in your dealings with the States.

Indeed, The Chase Manhattan can be of service to you almost anywhere you do business. Its network of more than 51,000 correspondent banks, branches and representatives' offices all over the globe can provide you with every type of modern banking service, promptly, efficiently, and on a personal, *localized* basis.



When you do business anywhere abroad ... it will help to talk with the people at The Chase Manhattan, in either of the London Branches.

AMERICAN SURVEY

AMERICAN SURVEY *is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.*

Well-Mannered Recovery

NEW YORK

As the country takes time out for the long Labour Day weekend that traditionally marks the end of the summer season, it is clear that the American economy is moving forward again, far faster than either Washington or the business community had expected. While there is increasing uneasiness over foreign developments, the vigour and rapidity of the rise in business during the normally slow summer months has confounded the sceptics and vindicated Wall Street, where faith in a new boom was evident even before the recession had breathed its last. Labour Day usually ushers in a period of seasonal gains, although last year the decline that had been masked by the summer doldrums appeared in full force during the autumn.

But the new climate of confidence is based not only on the speed of the advance from last winter's trough, but also on the character of the recovery, which has been extremely widespread, with strength in almost every part of the economy, and remarkably well behaved, with a noticeable absence of price increases. Previous recoveries have been more erratic, have owed more to favourable developments in specific areas and have been accompanied by almost immediate pressure on prices and wages. Its safe passage through its early stages gives the present recovery a solid rather than a spectacular look and lends substance to the belief that the new boom developing from it will be stable and long-lived. Indeed, the main problem facing the Administration is not to get the economy rolling but to insure that its momentum is maintained; this may call for the use of restraints far earlier than President Kennedy's economic policy-makers once thought likely.

At the moment, with unemployment stubbornly remaining close to 7 per cent of the labour force and with excess capacity in almost every industry, there is no danger of any immediate strain on resources. But if the motor industry avoids a strike, the rise in industrial production may well accelerate, paving the way for a fairly early renewal of wage-price pressures, at least in certain places. The absence, at present, of any discernible symptoms of strain does not mean that growing pains—and distortions—may not begin to make themselves felt as the recovery enters its adolescent stage.

Just how painful the adolescence will be depends to a large extent on consumers, whose purchases so far have been rising more slowly than the increase in their incomes. Consumer expenditures, which slumped during the first quarter of 1961, went up sharply in the second, an encouraging sign to producers of durable goods, particularly to the automobile manufacturers who, after a succession of relatively lean years, have been plagued with doubts about their prospects. They have now regained their old optimism, pointing out that dealers have reduced their stocks of 1961 cars and that the amount of consumer credit outstanding is relatively low compared with incomes; this suggests that if buyers are attracted by the new cars they will be in a position to satisfy their desires.

Barring a strike, output of motor cars will be in full swing during the rest of the year, which will mean rising demand for steel and other materials, and this will carry the index of industrial production to new high ground. Even if consumer demand rises at a moderate pace industrial output should increase fairly rapidly, approaching a level of 120 on the Federal Reserve Board's index by the end of the year, compared with 102 in February and 112 in July, while the gross national product should be close to an annual rate of $540 billion for the last quarter, as against $501 billion in the first and $516 billion in the second quarter. For manufacturers and retail traders are just beginning to rebuild their stocks, which had been pared to the bone: according to a survey by the Department of Commerce, made before the latest increase in defence expenditures, *manufacturers* will add $1 billion to their stocks in the third quarter on the expectation of higher sales and, with orders continuing to exceed shipments, a substantial increase in output seems certain. The prospect for housing is less glittering, but total spending on new *construction*, which includes commercial and public projects, is at record levels.

THE Administration's anti-recession measures helped to mould the first stage of the recovery and the increase in defence outlays prompted by the Berlin crisis will speed its progress. The new spending will accelerate the rebuilding of stocks and add to both incomes and profits, and—coupled with partial mobilisation—should serve to reduce the level of unemployment considerably faster than the Administration's earlier Budget would have done. Any further increase in expenditures will probably be offset by new taxes, but the decision to increase the probable deficit this year by $3.5 billion is a stimulating tonic—too stimulating, perhaps, for an economy already showing signs of good health.

Although the President's Council of Economic Advisers is now much happier about the outlook and is willing to concede that the step-up in governmental spending will spur the recovery and produce price increases in specific areas, it sees no danger of an early return of widespread inflationary pressures. Its members argue that there is plenty of room for growth without any strain on resources and they believe that the next stage of the cyclical expansion will continue to be well-mannered. In fact, the White House's economists are hoping that the restocking phase will be followed by increases in both consumer and business spending, which might absorb most of the present unemployment. They do not think that this mature stage will be reached until late in 1962, and at that time they expect a Budget surplus which could be used either to restrain excesses or to extend the boom.

Thus there will be practically no government reins on the economy during its adolescent period of expansion, apart from messages urging management and labour to exercise self restraint, a course already being pressed on the steel industry by the CEA. Indeed, with government spending being used to whip up activity, the only rein that can be brought into play is monetary policy. Up until now, the Administration has had the backing of the Federal Reserve Board, which is proving as eager to promote Mr Kennedy's objectives of stimulating production and employment as it was to support Mr Eisenhower's aim of maintaining price stability. The money managers have been pursuing an easy credit policy for far longer than they did after the 1958 recession, partly because they feel that inflation is not an imminent threat, partly

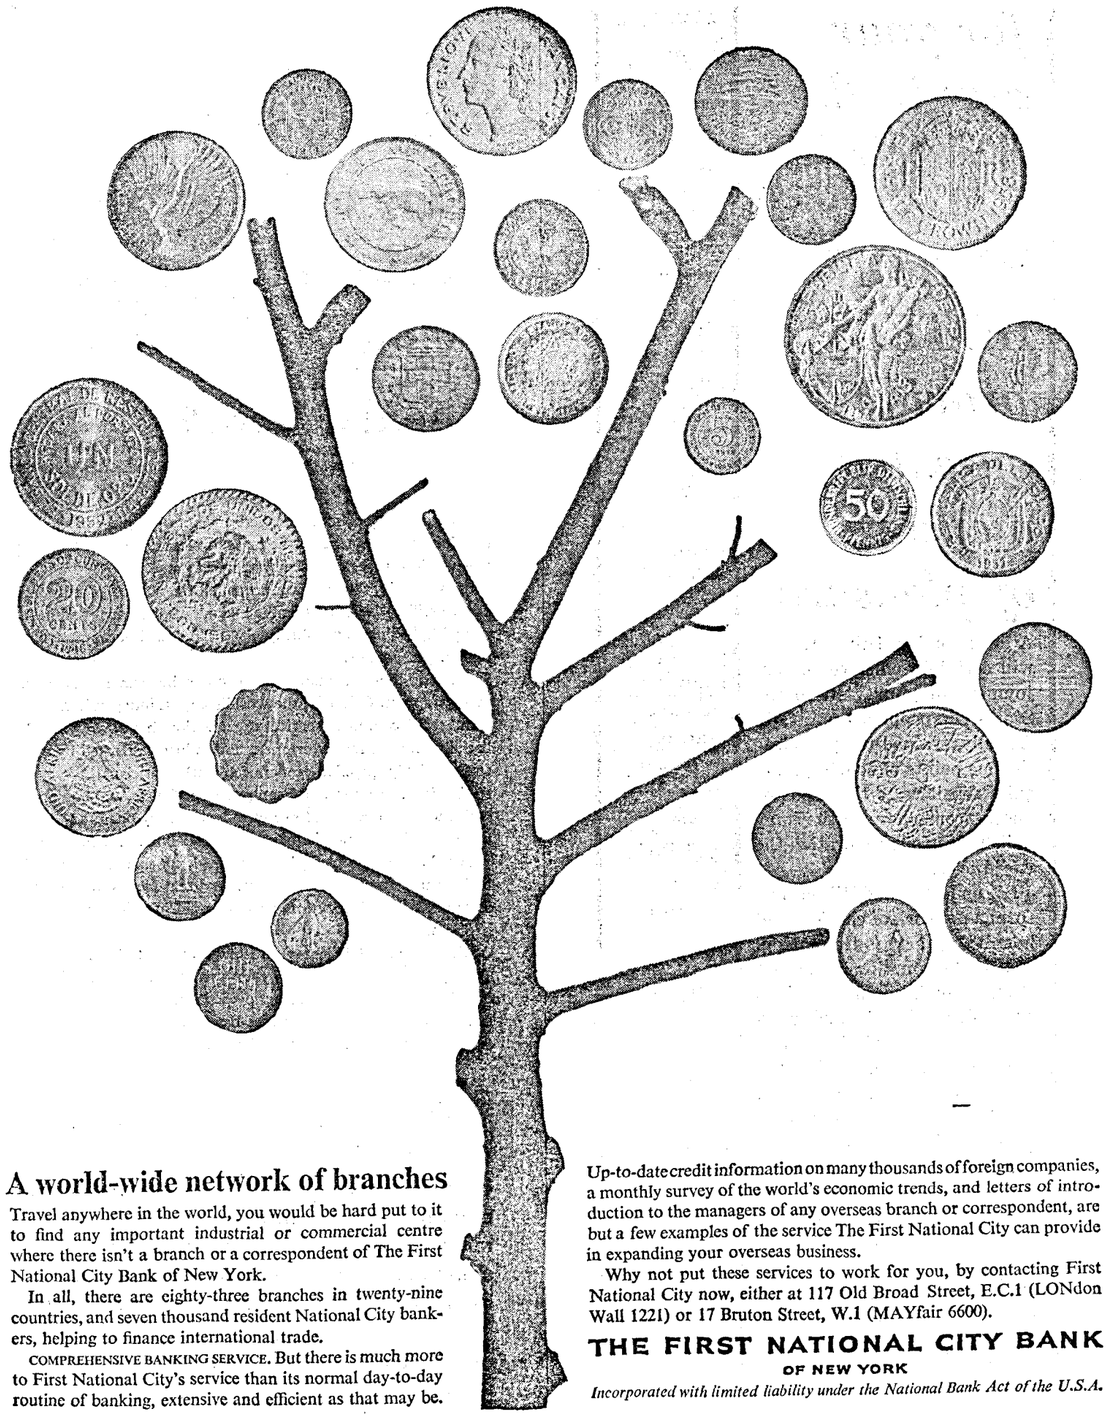
because they are sensitive to the criticism that their aggressive tight money policy in the late nineteen-fifties helped to stifle economic growth. But Mr Martin, the chairman of the FRB, who holds that unemployment is a structural problem that cannot be treated by monetary policy alone and who has frequently observed that inflationary booms are the result of too much stimulation during declines, will undoubtedly begin to apply restraint as the demand for funds increases.

Since the beginning of the year, the central bank has managed to maintain the Treasury bill rate at over two per cent by abandoning its previous policy of dealing only in bills (in both 1954 and 1958, the bill rate dropped below three-quarters of one per cent). Shoring up the short-term interest rate has discouraged an outflow of funds to higher yielding markets abroad without interfering with the availability of credit to potential borrowers at home. Now Wall Street is expecting a tightening of credit if only because the demand for funds should begin to mount. With Mr Martin on record as saying that interest rates will go up as business activity rises the market is undoubtedly correct, although the Fed's drawing on the credit reins will probably be gradual. For one thing, demand for credit by consumers and corporations has been moderate; for another, the Treasury will be in the market as a heavy borrower and the money managers will want to avoid any sharp increase in the government's interest costs.

Too ample a supply of credit at a time when Washington is engaged in stimulating the economy makes for a potentially unstable situation. There is no danger as long as consumer demand is slow in developing the business plans for investment in new plant and equipment are moderate in size. But the shape of the recovery could alter decisively if demand undergoes a sudden rise, whether the reason is higher prices, a war scare or the simple but compelling urge to live better. In any event, the ingredients for an explosive rise are present. If this leads to recklessness, the boom may be difficult to control when it reaches maturity.

Half a Loaf for Aid

THE Administration is sensibly putting the best face possible on the arrangement to finance long-term development loans which has emerged from a conference between representatives of the Senate and those of the House and which both chambers are expected to approve without demur. In place of the authority, which Mr Kennedy has fought for so hard and which the Senate gave him, to draw funds for such loans directly from the Treasury—without having to submit an annual request to the legislators—Congress is to authorise the spending of $7.2 billion in the next five years on development loans and to empower the President specifically to enter into long-term commitments, "subject only to the annual appropriation of such funds." (The President asked originally for $8.8 billion and the Senate gave him $8 billion). This amounts to a moral commitment on the part of Congress. But can it be fulfilled and—perhaps more important—will the underdeveloped countries, which must draw up long-term plans, and employees of the Loan Fund, feel that they can rely on it being fulfilled?



Comparisons are being drawn in Washington between the present scheme and the Marshall Plan. Thirteen years ago Congress refused to commit itself, in the authorisation Bill, to any specific amount but it conscientiously provided the money to finish the job. In recent years, however, Mr Passman, the Democratic chairman of the House subcommittee which deals with appropriations for foreign aid, had had no such scruples about providing the sums which Congress has authorised; since 1957, in spite of the efforts of the friends of foreign aid, 23 per cent less has been appropriated than the President—until now Mr Eisenhower—has requested. The great question now is whether Congress will support international development with sufficient continuing enthusiasm to override Mr Passman and his allies. It is something to be thankful for that the Republicans are identified with the compromise and hence should feel bound to honour the authorisation. At one point Mr Nelson Rockefeller, the Republican Governor of New York, who has strong presidential ambitions, was prepared to go further and support direct financing by the Treasury, but last week he decided to keep in step with his party.

Disappointed as Mr Kennedy must be, after all his hard work, he must realise that it would have needed a miracle to persuade so conservative a House of Representatives to hand over the keys of the Treasury to be used in the interests of foreign countries. And he can be fairly cheerful about the money authorised—but not yet appropriated—for this year. Nothing was cut from his request for $1.2 billion for development loans, although the ceiling for each of the next four years is set at $1.5 billion instead of $1.9 billion. From other programmes a total of about $500 million has been taken: $200 million from military assistance, on which the Senate looked askance, $200 million from the President's contingency fund and $100 million from "supporting assistance" which helps friendly countries to maintain their armies. In all, the new authorisation is for $4.25 billion—substantially more than in recent years.

—Nothing for Schools

ON FEDERAL aid for schools—which Mr Kennedy has rightly called the most important domestic legislation before Congress—the President has suffered his sharpest and most painful defeat of the session, even though in the end he was prepared to accept, not half a loaf, but simply a few symbolic crumbs. On Wednesday all but six Republicans in the House of Representatives and 82 Democrats combined to refuse even to consider a modest proposal to give $345 million for one year to the country's neediest tax-supported schools. Originally the President had asked, and the Senate had approved, a three-year programme costing $2.5 billion. Linking the scheme with two popular ones which Congress cannot afford to let lapse—federal loans to college students and aid to the so-called "impacted areas," communities whose schools are swamped by the children of servicemen and federal employees—was of no avail. The House knew quite well that it could dispose of these two matters in a separate Bill before it goes home.

In his press conference this week Mr Kennedy explained his defeat rather optimistically on the grounds that everyone is for education, but everyone is for different education Bills. This is certainly true of the Protestants and Roman Catholics; how much difference is made by Catholic support and Protestant doubts may emerge when the House votes on a $1.5 billion Bill for a five-year programme of grants and loans to help colleges—both secular and church-supported ones—build class-rooms, libraries and laboratories. The Catholics have opposed federal aid for tax-supported schools unless it is also extended to their parochial schools, something which Mr Kennedy, himself a Roman Catholic, declares would be unconstitutional. It is also true that when the President, to conciliate the conservatives, proposed that federal aid should be restricted to the building of schools, he lost much of the support of the National Education Association, the teachers' chief lobby. But such disputes simply made it easier for conservatives in both parties—who opposed even the compromise as an opening wedge for a costly programme—to vote against it. Mr Kennedy has promised, as he was certain to do, to take up the fight again at the next session. At least he now knows who his enemies are and how strong they are. It is no longer possible to lay all the blame at the door of the House Rules Committee, which buried the President's more ambitious original proposals.

A world-wide network of branches

Travel anywhere in the world, you would be hard put to it to find any important industrial or commercial centre where there isn't a branch or a correspondent of The First National City Bank of New York.

In all, there are eighty-three branches in twenty-nine countries, and seven thousand resident National City bankers, helping to finance international trade.

COMPREHENSIVE BANKING SERVICE. But there is much more to First National City's service than its normal day-to-day routine of banking, extensive and efficient as that may be.

Up-to-date credit information on many thousands of foreign companies, a monthly survey of the world's economic trends, and letters of introduction to the managers of any overseas branch or correspondent, are but a few examples of the service The First National City can provide in expanding your overseas business.

Why not put these services to work for you, by contacting First National City now, either at 117 Old Broad Street, E.C.1 (LONdon Wall 1221) or 17 Bruton Street, W.1 (MAYfair 6600).

Have you one of these in your boardroom?

Yes, an ordinary penny. Cheapest and simplest piece of boardroom equipment on the market. Heads, we do it this way, tails we do it that. Decisions without tears.

More seriously, though, even in the best-regulated boardrooms chance still plays its part in the making of decisions–and in really big business an unlucky guess can cost thousands, even millions, of pounds.

By helping top-level management to cut the element of chance to a minimum, C-E-I-R, the world's largest independent commercial computer services organization, has already saved literally millions for government and industry. Backed by a staff of highly qualified economists, mathematicians, statisticians, scientists, and computer specialists, and equipped with the most powerful force of independently operated computers in commercial use today, C-E-I-R can handle on your behalf any problem, large or small, capable of solution by logical or mathematical means. And that means practically any marketing, distribution, production, or development problem.

At the new C-E-I-R Centre in London, with its IBM 7090 and 1401 computer facilities, your own staff can work with ours if you wish, with offices provided–and they can use the computers on a by-the-hour hire basis. Ask your secretary to write or telephone for more details.

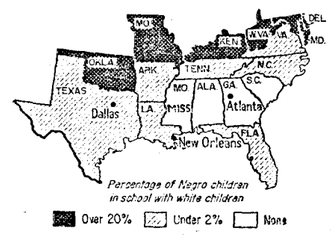
Reuther and Romney

MR GEORGE ROMNEY, Detroit's *enfant terrible*, who first produced the compact car, so successfully that the other automobile manufacturers were eventually forced to copy him, may have set them another example—and one which they are just as reluctant to follow—by his profit-sharing agreement with the United Automobile Workers. First proposed by Mr Romney's American Motors Corporation a month ago, the contract was agreed in principle, although not in all details, at the end of last week. Mr Reuther, head of the UAW, had just rejected as "woefully inadequate" the first and "final" offer which the three big manufacturers—the General Motors Corporation, the Ford Motor Company and the Chrysler Corporation—had produced only ten days before their contracts with the trade union were due to expire. Now the union, anxious that its members should not lose the extra pay to be earned over the present holiday week-end, has agreed to continue working until September 6th, but a strike seems very likely then. The union plans to close down only General Motors' production lines but the other two big companies may respond to these tactics with a lock-out.

Mr Reuther does not expect the Big Three to accept profit-sharing—not this year, at any rate—but he hopes that his agreement with the much smaller AMC will force them to improve their original offer. This did give some recognition to what is Mr Reuther's main concern this year—the present insecurity of jobs in the automobile industry—by proposing to supplement wages when short-time is being worked and to contribute towards the moving expenses of an employee who transfers to a plant in another city. This is perhaps the seed of the fresh approach to labour negotiations which Mr Reuther needs to bolster his prestige in the trade union movement in a year when he cannot expect to get much, if anything, in the way of straight wage increases for his members. In any case these would do his reputation no good with the country at large or with the Administration at a time when inflationary pressures are rising once more.

But the agreement with Mr Romney goes much farther in the direction of a fresh approach and one which Mr Reuther himself has been advocating for years. AMC is to put 10 per cent of its profits before taxes into a fund out of which will be paid wage supplements during short work weeks, medical benefits, higher pensions and moving allowances. Another 5 per cent of profits will buy AMC shares for the company's workers. Last year each would have got about $500 altogether. This agreement contains a clause designed to prevent the union from interfering with the way in which the company is being run on the excuse that the workers' share of the profits is being threatened. But the Big Three do not think that this clause is an effective means of countering what, in their view, is the basic and insurmountable objection to profit-sharing—that it involves labour in management's concerns.

Good Sense in the South



FROM A CORRESPONDENT IN VIRGINIA

WITH the start of the new school year in Atlanta, Georgia, and Dallas, Texas, two of the largest industrial centres in the South are beginning to comply with the Supreme Court's 1954 decision banning racial segregation in tax-supported schools; Georgia is one of only four remaining states in which until now not even a token number of Negro children have attended a few white classes. Over the past months a new approach has developed towards desegregation in these two cities, as well as in New Orleans, Louisiana, where loathsome demonstrations greeted the appearance of the first Negro children at two white schools last year. Alarmed at the economic consequences of such performances business groups in these cities have been risking unpleasant repercussions in order to urge restraint on their communities.

For the South's progress towards economic equality with other regions has begun to falter, partly as a result of the recent recession but also because people interested in establishing new industries have hesitated to come into such potentially disordered places. The individuals who wield power locally—the American counterparts of the British establishment—have therefore set about changing the climate in their areas. They have had two themes—let us have law and order and let us keep our schools open—set against a background of insistence that, while no one is a willing integrationist, the law is the law and that to go on trying to avoid court decisions will damage the community and will be futile as well. This argument provides a ladder by which political personalities can descend with a measure of dignity from the limb of high principle on which they had stranded themselves.

HOW MUCH DESEGREGATION?

Southern and border states at end of last school year–May, 1961

Of the 6,663 school districts in the 17 southern and border states and the District of Columbia, 2,813 have both Negro and white children living in them but only 783 had racially-mixed schools last year. There were 10,173,399 white school children in the region and 3,088,261 Negro children, 706,163 of them in desegregated districts and 213,534 actually attending classes with white children.

Source: Southern Education Reporting Service.

The Dallas Citizens' Council, a highly-representative 250-member body, headed by the president of the local electricity company, has succeeded in gaining the co-operation of a range of organisations—the Bar Association, the Medical Society, the Council of Churches—and has held meetings with a similar group from the Negro community. The council is interested in all points of racial friction, not merely in the schools; its first quiet accomplishment was a pre-arranged city-wide desegregation of restaurants and it has been pressing employers to make more jobs available to Negroes and for the opening of more recreational facilities to them. The new school year begins in Dallas on September 6th; of an enrolment of some 140,000 in the tax-supported schools about one in six is Negro. No announcement as to where, or how many, Negro pupils are to enter white schools will be made in advance; they will all be six-year-olds going for the first time. Meanwhile wide circulation has been given to a pamphlet, "Dallas Opportunity," to leaflets and to a home-made documentary film in which substantial citizens from a variety of occupations urge that the city be kept "a good place to live in." Clergymen were asked to take their holidays early so as to be in their pulpits and ready to give advice during the days before term starts. The Mayor has stated publicly that "our law enforcement authorities have ample means to be very helpful if a disturbance arises."

In Atlanta, where school opened this week, nine Negro pupils entered the two top classes of four high schools without disdisturbance. There the power structure was organised less formally than in Dallas but used similar methods of obtaining signatures to statements, getting positions taken by organisations and so on. Last May General Lucius Clay, who now heads one of

the country's largest corporations which spends about $30 million in the state each year, emphasised the importance of his company's operations to state and local tax receipts in a public speech and warned reactionary fellow Georgians that "none of us want to locate in areas where there is serious risk of conflict between local custom and federal law." Atlanta is the economic centre of the south-eastern region and more and more Atlantans agree with the admonition of the president of the city's Federal Reserve Bank:

> A plant that does not come here does not eliminate employment opportunities and the wealth we might have had for a day or a month or a year but for decades. . . . If we behave like a banana republic we shall get and deserve the economic rewards characteristic of a banana republic.

In Dallas and Atlanta, New Orleans has been held up as an example to be avoided; this has stung the pride of Louisiana's big port, an urbane, cosmopolitan city which was shocked last year by the sudden evidence that "it could happen here." Several more schools are to be integrated in New Orleans this autumn but the situation there is exceptionally complicated. Until recently the constructive lead given by newspapers in Atlanta has come in New Orleans only from one wireless station. The sharp differentiation between social layers makes it difficult to organise leadership in New Orleans and there is acute antagonism between the authorities in the Roman Catholic city and the state government dominated by rural and mainly Protestant interests. A further problem is the existence in New Orleans of a large Catholic school system which is to be integrated when the city schools have been desegregated "effectively." But recent weeks have seen the appointment of a tough and vigorous Roman Catholic archbishop-coadjutor, the formation of a determined group of businessmen, the establishment by the school board of an advisory council to improve the climate and articles in newspapers declaring that "the public schools must be kept open even if some mixing results." All this provides identifiable and highly-respected opposition to the racists.

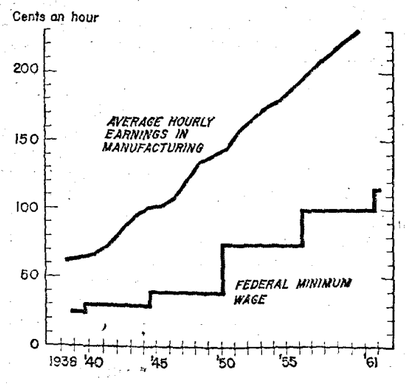
But even if the schools open this autumn in the South without serious incidents, will this mean that determination to comply with the law of the land has now got over the hump of massive resistance? Certainly the Supreme Court's decision is being accepted, however grudgingly, by a broader section of the community. Last year the groups which confronted each other were SOS (Save Our Schools), HOPE (Help Our Public Education) and other liberal elements, some of whom believed in integration as a principle, with GUTS (Georgians Unwilling To Surrender), White Citizens' Councils, Defenders of State Sovereignty and similar racial die-hards on the other side. But the pessimists' view of the future suggests that Dallas and Atlanta, sophisticated urban centres, are the last major areas where desegregation can be had relatively easily, that what remains, mainly schools in backward, prejudiced rural districts and small towns, is the harder part of the task, with sporadic violence to be expected.

But in both Atlanta and New Orleans this year's effort to muster business opinion has been on a state-wide scale and the new industrial plants in the South are mostly in rural areas. Thus the effects of the firm stand taken by financial and business leaders are likely to spread. Further, the lack of any alternative to compliance is being underlined constantly, most recently in Virginia last week and in Louisiana this when rulings on two court cases constituted a clear warning that tax-supported schools may not be closed in order to avoid integration. Moreover fourteen southern school districts are desegregating voluntarily this autumn without waiting for the court orders which have forced integration on Atlanta and Dallas.

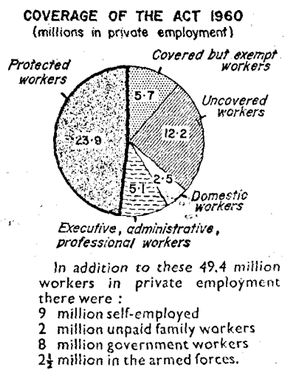
More Wages, Fewer Hours

FROM A SPECIAL CORRESPONDENT

THE increases in the minimum wage and in the number of workers who are protected by the Fair Labour Standards Act, which Congress approved in May, go into effect next week, on September 3rd. For the first time in the history of the 23-year-old Act new groups of workers are to be brought under its protection; 3.6 million of those hitherto uncovered will have to be paid at least $1 an hour. The new amendments also require that the 23.9 million workers already covered by the Act receive at least $1.15 an hour—15 cents above the present floor. After two years this will rise automatically to $1.25 an hour. Newly-covered workers will not be guaranteed this much for five years.



The largest and most significant group of the newly-covered workers (2.3 million) is engaged in the retailing and service industries. Roughly 663,000 of them—mostly shop assistants—are now receiving less than a dollar an hour and the Department of Labour estimates that in the coming year alone the compulsory rise in wages will cost retail traders $173 million. Even after next week only 31 per cent of the 7.5 million men and women who work in shops will be protected. This is because the law will apply only to retail enterprises that have annual sales of more than $1 million and which buy goods worth at least $250,000 a year from other states. Any store with annual sales of less than $250,000 will be exempt. In addition to shop assistants, those brought under the Act for the first time include seamen on vessels flying the American flag (100,000), telephone operators at small exchanges (30,000) and—for wages but not hours—employees in public transport (93,000) and construction workers employed by large firms (about 1 million).



It had been hoped to extend the safeguards of the Act to even more people, but there was heavy pressure on Congress from the industries concerned and President Kennedy might not have carried the day if certain concessions had not been made. A few workers formerly covered actually lost their protection and Congress failed to extend the Act either to the 305,000 employees of motor-car dealers or to the 140,000 in laundries, although Senator Morse protested that "laundry workers are the largest group still working under sweat-shop conditions." Thirty-three states have minimum wage laws, but only 14 protect men as well as women.

Many people feel that the changes regarding overtime may turn out to be as important as the increases in the minimum wage. Workers already covered by the Act receive pay at the rate of time and a half for all hours over 40 a week. The newly-covered workers are not affected by the overtime provisions during the first two years, but at the end of the second year they will be paid time and a half after 44 hours, in the fourth year after 42 and in the fifth year after 40.

The Department of Labour is asking for more wage and hour investigators to police the new provisions. The government hopes to secure compliance without resorting to compulsion but if this is necessary it can take employers to court and force them to pay up. The fine for a first violation may be as much as $10,000 and continued refusal to comply may lead to six months in prison. Administering the Act will be somewhat easier now that all employees of any enterprise doing an annual business of $1 million or more a year will be covered if any of them are. In the past investigators had to determine which workers were engaged in interstate commerce; they alone were protected.

The big difficulties in enforcing the Act will come in 1964 when the overtime provisions will start to be applied to shop assistants. But by that time the trade unions will probably be pressing both for another increase in the minimum wage and for the extension of wage and hour protection to those workers in the retailing and service industries who are still excluded.

In addition to these 49.4 million workers in private employment there were:
9 million self-employed
2 million unpaid family workers
8 million government workers
2½ million in the armed forces.

Cautious Call-up

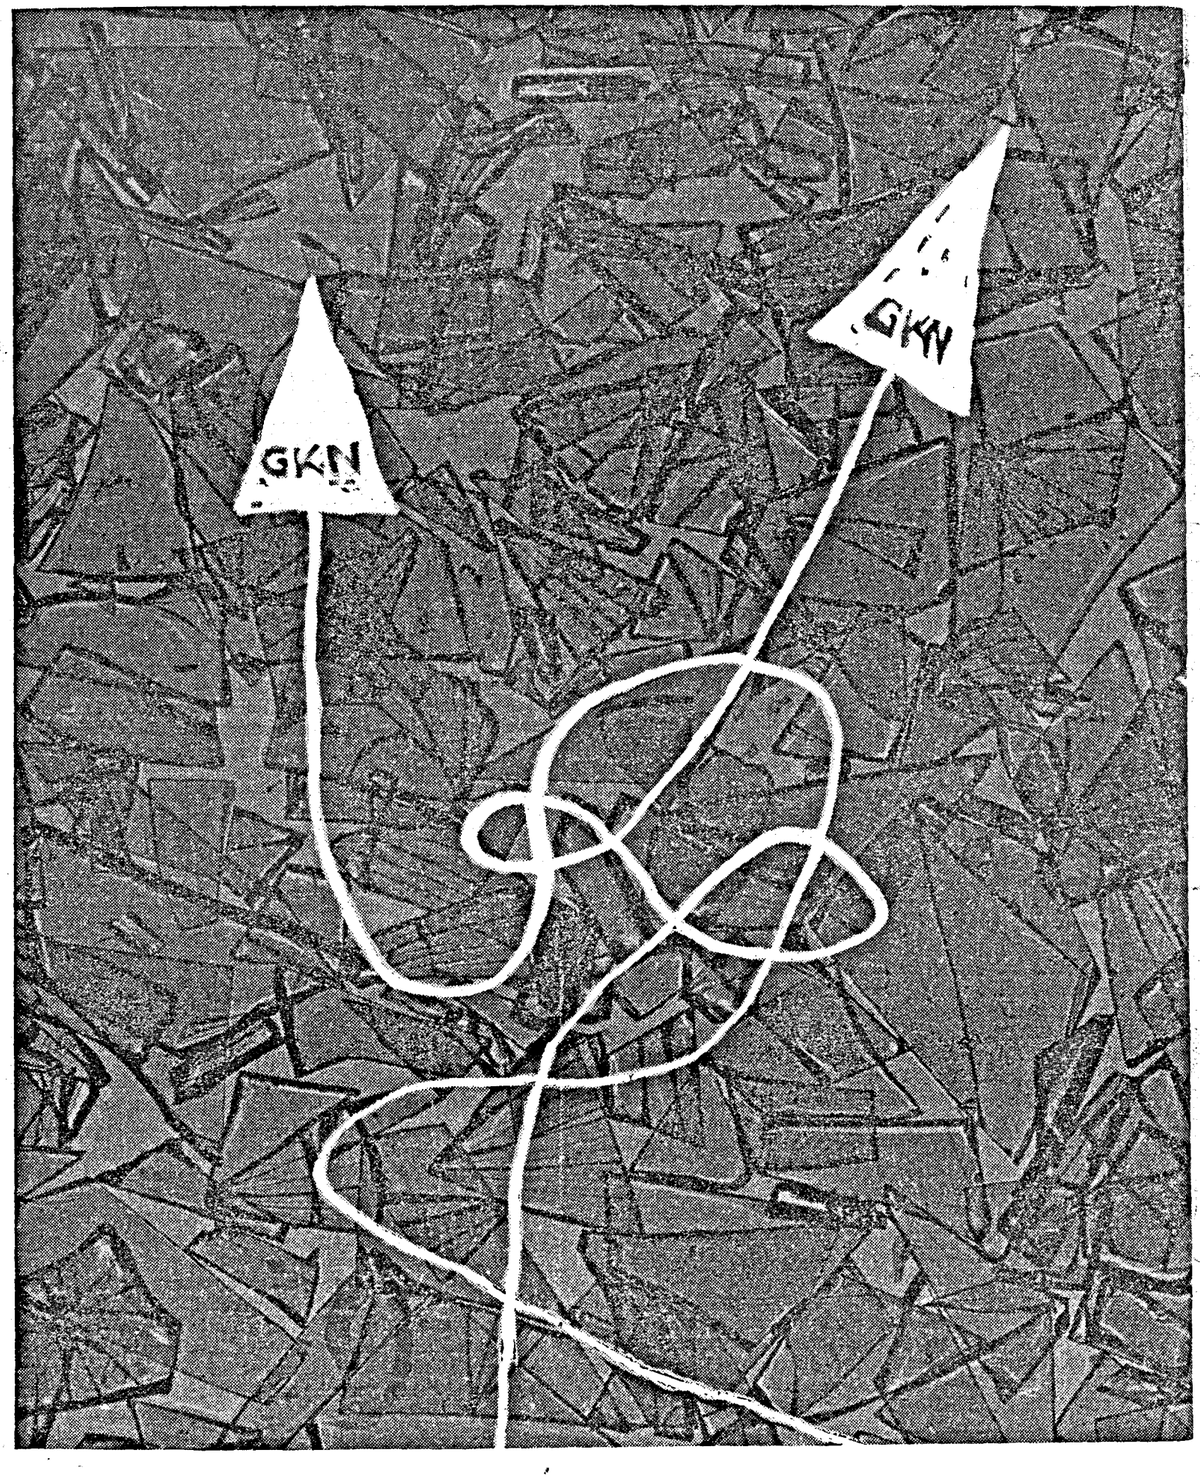
LAST week, for the first time since the Korean war, army, air force and navy reservists received notice that they were being recalled to active duty. Of the total of 76,500, over half are destined for the army, to provide the supporting units in engineering, communication, transport and so on needed by the three training divisions in the United States which are scheduled to be turned into combat units, ready to go overseas, by December. The United States hopes by its example to encourage other members of the North Atlantic Alliance to increase their own contributions.

The present call to the colours represents a very modest use of the authority which Congress gave the President last month to mobilise up to 250,000 reservists without having first to declare a state of emergency. One of the reasons for this caution is that many people still remember with anger that reservists with careers and families had to bear much of the first brunt of the Korean war although there were millions of younger men in the country who had done no military service. Mr McNamara, the Secretary of Defence, hopes that volunteers and young conscripts will provide most of the quarter of a million men whom it is planned to add to the forces. The draft, the monthly call-up of young men, which averaged just over 3,000 up to August, has been raised to 25,000 for September and 20,000 for October and it is already having the desired result of encouraging voluntary enlistments.

Another reason for not depending more than is necessary upon reservists is that under the present law they must be released after a year. Unless the likelihood increases of war over Berlin, the Defence Department wants to go cautiously, and without panic, about the job of building up the forces for all the various crises, in other parts of the world, which they may have to meet in the coming years. At present the Army is only being allowed to add about half the 133,000 men it needs to create the million-man force for which Congress has just provided the money. This leisurely pace is a disappointment to officers who have hopes of adding two more divisions to their present fourteen and there are grumbles from critics who fear that the United States may be falling between the nuclear and non-nuclear stools.

Markets Under a Microscope

NEW YORK



CONGRESS has agreed with the Securities and Exchange Commission, Washington's watchdog over Wall Street, that the time is ripe for a thorough investigation of the securities business. The SEC is to get $750,000 for the purpose; it is to present its report to Congress at the beginning of 1963 but may recommend interim changes before that. The SEC has already embarked on special enquiries into mutual funds (unit trusts) and the American Stock Exchange; but the new investigation will have the broader objective of gathering information on virtually every phase of market activity to determine whether the SEC's present rules and practices, together with the self-policing activities of the stock exchanges and other groups, provide adequate protection for the growing numbers of small investors.

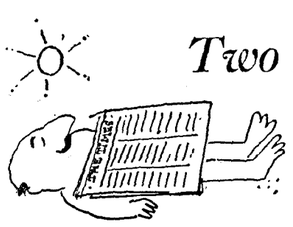
Two fields that have been earmarked for special attention are the mutual funds, which now boast assets of $20 billion, and the over-the-counter market. The SEC will take a close look at the activities of salesmen who tout the shares of mutual funds on a door-to-door basis and it will examine the relationship between the funds and the firms that manage their portfolios; it wants to know, for instance, whether the fees paid annually for professional management (usually from ½ per cent to 1 per cent) are unduly high, and whether the portfolios of some funds are turned over excessively in order to generate more commissions for stockbrokers.

At present the over-the-counter market is free of many of the rules and restrictions applied to securities listed on the exchanges and the SEC will consider whether this state of affairs, which makes it almost impossible to detect manipulation, should be ended. Securities that are traded over-the-counter do not, for instance, have to comply with the principle of "full disclosure" forced on listed securities by the SEC. The double standard also shows up in the use of credit. In the case of listed shares, the Federal Reserve Board limits the amount of credit that banks and brokers can extend; at the present time an investor must produce cash for 70 per cent of any such purchase. But there are no restrictions for over-the-counter issues. As a result, there is no shortage of credit for the would-be manipulator of the market.

The proposed investigation has been prompted by a number of developments: the uncovering of the fraudulent activities of a firm of specialists on the American Exchange; the violent swings that have occurred in prices of small and speculative new issues, suggesting that factors other than the laws of supply and demand may have been at work; the fact that the New York Stock Exchange felt called upon to warn the public against uninformed speculation in over-the-counter issues; and the sheer volume of trading in recent months. For the most part Wall Street has turned a blind eye to increasing signs of abuse, regarding them as an inevitable consequence of the prolonged bull market.

Belatedly and somewhat grudgingly, it is beginning to recognise the need for action. The American Exchange has tightened its regulations and the National Association of Security Dealers (the over-the-counter trade organisation) has been more active in penalising erring dealers. Meanwhile, the mutual funds have finally agreed to adopt a code of ethics which, it is hoped, will curb some of the high-pressure selling of shares on the one hand and, on the other, restrict the turnover in investments. In addition, a few mutual funds have reduced the charges levied for the management of their portfolios, partly because of a rash of suits by stockholders claiming that fees have been excessive, partly in order to forestall the questions of the SEC. One of the main objectives of the new inquiry will be to see whether the present system of allowing the financial community so much freedom to police itself can cope with the emerging mass market for equities.

WE DO NOT FLY JETS



We do not convey V.I.P.'s at a supersonic whisper, nor do we swoop from the stratosphere to attack—or defend; but we do help, in many ways, to make modern civil and military flying possible. Runways, for instance: there is GKN steel reinforcement in many acres of concrete, both on and off the actual airfield. To the manufacture of aircraft, GKN companies contribute both welding and toolmaking equipment. But there is also a great deal of GKN steel in the air. Top quality steel. Some of it in spars, and some in aircraft engine forgings. Some of it is only GKN material, but much of it is in the form of finished articles manufactured by GKN companies: turbine and compressor blades; stainless steel fabrications; laminations for generators and electric motors; and the all-important fastenings for which so many modern manufacturers turn to us. Aerotight Nuts are a GKN patent. And fastenings such as Bolts in Titanium Alloys and Ultra High Tensile Steel come naturally to us—and from us. In flying, as in many other things, the over 80 engineering and steelmaking companies which make up the GKN Group are helping to keep things together—and to keep them moving.

THE WORLD OVERSEAS

Two Englands on the Costa Brava

FROM OUR SPECIAL CORRESPONDENT

Two long-haired youths stood on the edge of the beach snarling obscenities and pointing loaded harpoon-guns at each other. Their companions howled and booed and urged them on. A heavy schoolmasterly man thrust his way into their midst. "Now come along, chaps," he said, "sort it out like Englishmen—with razor-blades or bicycle-chains or something."

A little way along the beach sunbathers were suffering from the proximity of a gang of schoolboys whose time was divided between twisting the arms of their smaller brethren and throwing sand, pebbles and Coca-Cola bottles at one another. A Swiss lady rebuked them once or twice in awkward English that merely provoked guffaws. At last she walked over to a British couple who had recently arrived at her hotel in a bright new Jaguar. "Please," she said, "can you persuade your compatriots to act civilised?" She could not be expected to know that "compatriot" is the sort of title Britons bestow sparingly. The Jag-man squirmed in embarrassment. "You don't mean," he said weakly, "that those . . . those creatures are *English*?"

Your correspondent sat only a few yards away, trying desperately to look unEnglish and conceal an Eric Ambler paperback in the arid bulk of *La Vanguardia*. Neither offered any escape from the crisis. *La Vanguardia* carried a piece about hooligans battling with police in a "typical English street." And here was one of Mr Ambler's characters telling his wife (the quotation is from memory): "You think all Englishmen are lords. But I know them—I was with the tommies during the war. They are ignorant and ugly and have bad teeth." It was not a day for sporting a Union Jack pennant, or even (like those quaint French-speaking Glaswegians) an *Ecosse* plaque, on one's car.

Up to a few years ago, the average British tourist in the main Continental resorts was rarely egregiously alien, however much it flattered him to be considered "eccentric." More often than not, he appreciated good food and wine, and had agreeable manners, and someone in his family usually spoke tolerable French; only his overdressed and presumably colourblind womenfolk were apt to provoke pitying smiles. His children are even more at home on the Continent: you will find them any day playing beach-games, flirting, dancing *sardanas*, and singing in taverns with French, German, Dutch and Scandinavian youngsters as unselfconsciously as if European union were already a fact. But the discovery of the Costa Brava as a cheap holiday centre has brought British travel-agencies a new kind of clientele; and the Continental holiday-makers who also flock to the Spanish Mediterranean coast are acquiring an entirely new conception of the typical Englishman—and woman.

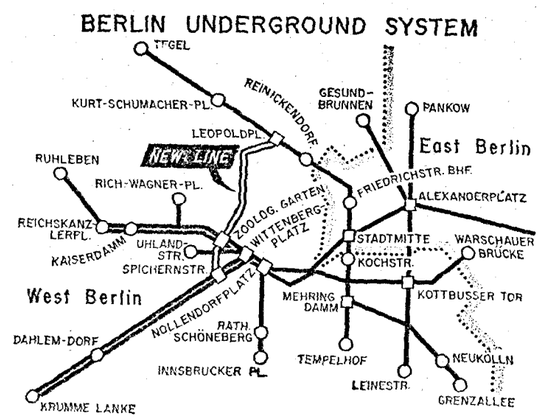
No-one will ever again mock English prudery who has witnessed a lady from Wakefield or Woolwich dressing on a crowded Spanish beach and struggling to cram a half-gallon bosom into a three-pint bra. Continental males are surprised—and often gratified—to discover how high a proportion of the English girls they see on the Costa Brava are unescorted and unchaperoned, except by each other; and on this level Anglo-Continental integration is speedy and mutually satisfactory. ("The boys out here are smashing," two Liverpool typists raved. "They've got *character*. At home you meet nothing but Teds and imitation Yanks.") French, Spanish and Scandinavian youths still knock nostalgically, usually late at night, on the door of the house in Blanes that was rented by five English nurses last July.

So far, fair enough. But marriage, Continental observers remark, seems to sour the New Englishwoman. Her voice tends to acquire a cutting edge. Genial Spanish customs like sitting out in the street in the evening now irritate her ("what would the neighbours say if we did that in Derby?"). She becomes a compulsive nibbler: her morning, for example, is devoted to a continuous throughput of potato crisps, *churro*, fruit cake, chocolate, cheese sandwiches and soft drinks which she leaves lying in the sun until they are hot. Her husband is generally a silent chunky man who sits on the beach in his socks, glancing gloomily at the *Express* and *Mirror*. At 11.55 he moves to a refreshment stall and spends the next hour sadly swallowing beer out of a litre glass. Back at their *fonda* they both discover that they have little appetite for lunch and grimace over the olives and aubergines.

The New English Tourist cohabits uneasily with the old. ("Are they English?" a little girl asked her mother, pointing to a group fifteen yards down the beach. "Yes, duck," mother replied, "but they sound like toffs: keep well away.") And the old-school tourist prefers French, Swiss or German company on the beach to the proximity of lower-caste fellow-countrymen. ("We stopped going to Majorca," the Norwich business man said, "because it was overrun with Coventry nut-tighteners. And now you can't sit on the beach here without Cockney delinquents flinging sand in your eyes. We shall go to France next year.")

Ticket-agents and cabaret-owners have been quick to capitalise English caste-allergies. One agent admits that while he sells tickets for a local cabaret indiscriminately to Continental tourists he tells English inquirers that the "club" is "exclusive" or "selective" and puts on an act of weighing up their social eligibility before accepting their money. "English tourists enjoy even a third-rate show," he says, "if they think other English tourists are being excluded; and they're happiest when there are no other English." Even when buying tickets for a bullfight excursion his English clients sometimes require an assurance that they will not be seated in the vicinity of "all that coach-tour riffraff." To minimise embarrassing confrontations between England's two nations, the more expert travel-agents and house-renting firms are beginning to adopt a policy of *apartheid*, guiding "better-class" families to the beaches around Bagur, Palafrugell, Palamós and S'Agaró, the non-U to Lloret, Tossa and Blanes, and doubtful cases to Estartit and San Feliu. Coping with Englishmen is almost as complicated as being one.

No other people represented here (excluding one's Spanish hosts) is riven in quite this manner, and the detribalised Englishman, embarrassed and a little ashamed, is apt to blame the Affluent Society and to mutter that if other countries' working classes developed a yen for foreign tourism we should see some of their dirty washing, too. But this is sheer escapism. French lower-middle and working-class families, for example, already outnumber their British equivalents on the Costa Brava, but they do not stand out so conspicuously from their wealthier compatriots. They eat the same kind of meals, at the same times, as their more elegant neighbours, and have received a similar basic education; they have, and are conscious of, a common cultural background. Worker and professional man can play bowls and drink an apéritif together without unease or condescension on either side.



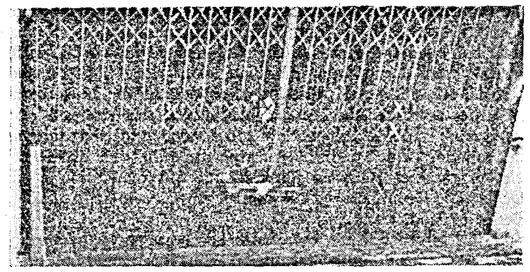
Clearly, the problem is a cultural one, not one of "class" or income-group. Equally clearly, many of the emotional undercurrents responsible for Britain's ungainly approach to Europe derive from differences of outlook between its educationally privileged and educationally underprivileged citizens—the former conscious of belonging already to the mainstream of European culture, the latter cultural outsiders even within their own shores. Western European integration is at last on the horizon; but where is the statesman bold enough to set about integrating England's two nations?

Berlin Faces Adversity

FROM OUR SPECIAL CORRESPONDENT

One would like to write reassuringly about the future of west Berlin: "Say not the struggle naught availeth," and more in that vein. But the truth is unpalatable: all those who over the past sixteen years have backed, morally and materially, the singular status of Berlin are in danger not only of having to eat their proud words but also of losing their investment.

With the authority of the Soviet Union behind him, Herr Ulbricht has said that the disruptive measures taken by his government in Berlin since August 13th are provisional: "The final establishment of normal relations will follow in connection with the peace treaty." The peace treaty, recognising east Germany as an independent sovereign state, will be signed, he has again reminded the world, by the eastern block countries before the end of the year. Before then, the three western powers concerned and the Federal Republic should negotiate with the Soviet Union and



the Democratic Republic with the object of determining the status of a "free city of west Berlin" surviving within the east German state borders. And Herr Ulbricht has restated his conditions for sparing west Berlin from immediate absorption. They include "demilitarisation"; the dissolution of western (not eastern) intelligence agencies; the liquidation of RIAS, the American-sponsored radio station which employs 470 persons in its effort to transmit round the clock to east Germany; the withdrawal of all agencies of the west German government; and recognition of the Democratic Republic's right to control all traffic to and from west Berlin by land, water and air.

So far as can be seen, there is to be no easing of these terms. The east German ministry for foreign affairs is sedulously putting it about that even final recognition of the Oder-Neisse line by the West would not now buy a single concession, either in Berlin or anywhere else. In the circumstances of past communist performance and present ambition there is no justification for supposing that the sovereign east German Democratic Republic would let many months go by before finding an excuse for obstructing commercial traffic and seizing the whole of Berlin—of course, at the request of its peace-loving population. The necessary pressure could be exerted without touching the allied garrisons. Has not everybody that matters said there is not going to be a war about Berlin? Herr Ulbricht is feeling very confident; and this weekend, with that symbolic visitor, Major Titov, at his side, the last thing that will be troubling him is the testimony of the refugees.

A pretence that west Berlin has an independent future is still being bravely kept up by western politicians inside and outside Germany. But the west Berliners themselves are not being taken in. There are just over two million of them, and everyone old enough to think is reviewing his or her individual chances, and canniest course of conduct, in the event of a drastic change of regime in the not distant future. There are no signs of panic. Spectacular as its rise has been, and harsh as its meaning is, Herr Ulbricht's wall has affected the daily lives of relatively few. West Berlin's food supplies, even its milk and vegetables, have long been coming almost wholly from the Federal Republic, not from across the sector boundary.

Many families have been separated, at least for the time being; it is not yet possible to assess how magnanimously inter-sector passes will be issued, or with how much pettiness they will be withheld. Approximately 52,000 east Berliners have ceased to contribute to the daily work of west Berlin; and when the new term begins some sixty teachers and 3,000 students and school children will be "absent, wallbound." The great majority of west Berliners have not been in the habit of visiting east Berlin; the new difficulties therefore do not affect them. West Berlin's transport system is functioning neither more nor less normally than it has since the city was formally partitioned in 1948. The trams have long made the sector boundary their terminus.

The underground, which is controlled by west Berlin, runs as much north and south as east and west, so that some lines go conveniently through without touching east Berlin. A new line doing this, running from the Leopoldplatz via Kurfürstendamm to the Spichernstrasse, was opened this week six days ahead of schedule. (It is characteristic of west Berlin's financial plight that the bill, 198 million marks, is being paid from Bonn, like so many of the city's bills. And it is characteristic of Bonn's unteachable insensitivity that the west German minister of transport, Herr Seebohm, an unabashed irredentist if ever there was one, is expected in Berlin today, Saturday, for the formal retrospective opening ceremony.) Where a line runs for a stretch through east Berlin and re-enters the west, the Berliners' long-practised knack of making things work comes strikingly into play. Thus underground trains leaving west Berlin at the Kochstrasse now trundle non-stop to Reinickendorf, where they are once again in west Berlin. The six east Berlin stations through which they pass, including Stadtmitte

U-Bahn station: chain and padlock

and Friedrichstrasse Station, have been made inaccessible to the east Berliners by chain and padlock. The overhead Stadtbahn, which is administered from east Berlin, is running normally, but the majority of west Berliners are boycotting it in order to deprive the enemy of a useful source of west marks. It is claimed that since August 13th the number of S-Bahn passengers in west Berlin has dropped from 500,000 to 100,000 a day.

Speeches and promises concerning material support are still the order of the day. So long as west Berlin remains its protégé the Bonn government will assuredly continue to pump in the various subsidies that now total DM 1,600 million a year. Thanks to the studied co-operation of west German industry, the west Berlin factories have orders that will tide them over a long period. The big engineering firm of Borsig is advertising on the hoardings all over west Berlin this week for new hands. Siemens, AEG, Telefunken and Daimler-Benz are doing the same in the newspapers. The German subsidiary of Philips announced at the opening of the current radio and television show that it was enlarging its existing west Berlin plant by nearly half. Presumably these prosperous undertakings, whose eggs are in many baskets, can afford to risk some losses.

But west Berlin, which, subsidies apart, has to live from industry and tourists, is already in fact at Herr Ulbricht's mercy, since he controls all the routes through which west Berlin industry receives its raw materials and sends its goods to market. It is probably too late to stop the juridical power being added to the physical control in his hands. Will it be long after that before Herr Ulbricht's mercy runs out?

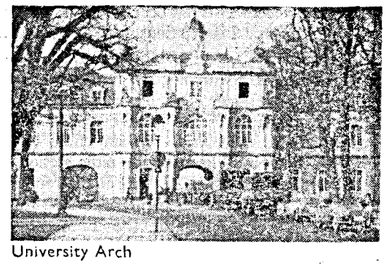
Question Mark over Northern Rhodesia

FROM OUR SPECIAL CORRESPONDENT

IN the calm of Oxford this Friday, September 1st, the Colonial Secretary was due to lecture Mr Kenneth Kaunda and other African leaders on "racial tensions." In Mr Kaunda's country, Northern Rhodesia, on the same day, it was an even bet that a school would be destroyed and a chapel burnt down. Question-time at the Oxford conference may be too academic or too polite an occasion for Mr Macleod's audience to ask whether the disturbances in Northern Rhodesia are going to continue sporadically for an indefinite time or whether Britain is seeking a happier outcome. But that is now the main question being anxiously asked in Northern Rhodesia.

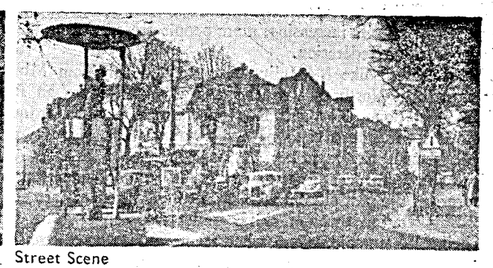
There is no doubt that if Mr Kaunda and the Liberal leader, Sir John Moffat, return from their present visit to Britain without gaining the two constitutional modifications they are asking for, the disturbances will increase. The familiar gloomy pattern of revolt and repression will follow. Sir John and his Liberal ministers will resign and hand over to United Federal party politicians who show every sign of wishing to follow the recent advice of one of their Federal Assembly colleagues and demand that "intimidation be put down with a show of colossal force." Eventually the British Government will appoint a commission of inquiry and the country may be allowed to take a deep breath and start again.

Senior officials of the Northern Rhodesia government claim that they saw all this coming. They warned the British Government that any drastic changes to the February White Paper would bring disorder. Now their chief hope is to damp down the fires of protest as much as possible while an election is hurried through to save Britain's face, and then talks on another constitution can begin. Most of them acknowledge the folly of this process, the risk that Mr Kaunda and other reasonable leaders may become sacrificial victims and the certainty that the faltering economy will sag further.



There are other risks too. Northern Rhodesians were preparing themselves for a transition to African majority rule which promised to be nearly as smooth as Tanganyika's. Now the parliamentary prospects are a sharp racial division with a few officials holding an uneasy balance, and then an abrupt plunge into African domination. Racialism, which so far has been mercifully absent from the disturbances, in which Africans have attacked the emblems of foreign authority and not the foreigners themselves, will almost certainly gain hold of emotions. The hard won successes for African industrial advancement will be jeopardised. After a year's negotiations the European Copperbelt workers have accepted from the Keir report the principle of non-racial technical education. But another murder like that of Mrs Burton last year could undo all this work. A mainly Afrikaner force of 800 local defence volunteers has been raised on the Copperbelt and linked with the Federal army in preference to the territorial police. This organisation may prove more than a mild headache to the Northern Rhodesia government if disorder increases.

ATTITUDES among the country's 70,000 Europeans vary more than an outsider would expect. There is the self-described "hard core of determined Whites" on the Copperbelt who look on a black majority as a foretaste of purgatory. There are the politicians and business men wholly committed to Sir Roy Welensky's Federation. But there is also a surprisingly large number of business and professional people as well as administrators who think the proposed constitution is harmfully delaying the inevitable, and bleeding the country in the process. This attitude has been manifest during the last fortnight's controversy over an attack on federation made by the mayor of Lusaka in front of the Governor and the United Kingdom High Commissioner, Lord Alport. The mayor, Mr Richard Sampson, complained that the economic structure of the Federation, as developed by the federal government, "is of such a nature as virtually to bar the establishment of industry in the north." Of the little industry Northern Rhodesia possesses, he said, some 90 per cent was already established "before the federal government got into its stride." Although anonymous heroes like "Vigilante" and "Disgusted" have maintained a steady barrage of newspaper letters against Mr Sampson ever since, there is also wide support for his forthright words.



The mayor's argument cannot indeed be gainsaid. The new finance minister, Mr Gardner, though less outspoken than this about federation, ended his recent budget speech with an acknowledgement of "strong feeling in the territory that Northern Rhodesia deserves a better fiscal deal." As for development, although last year's gross domestic product was a record £219 million, this was mainly due to the favourable copper prices. Mr Gardner could only praise the territory's year-old industrial development corporation for its promise rather than its performance. He had to give a warning that a 20 per cent income tax surcharge would almost certainly be imposed next year. With architects and merchants

Bonn's Street of Power

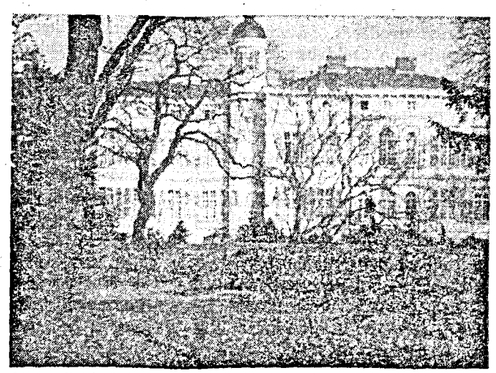
University Arch

Street Scene

FROM OUR BONN CORRESPONDENT

ONCE upon a time it was the metropolitan Wilhelmstrasse that served as a local habitation and a name for German policy-making. Today the provincial Koblenzerstrasse is being pressed, or rather widened and built up, into a similar service. If not yet greatness, at least an immense load of concrete and paper is being thrust upon it. Neither for old Bonn nor old Wilhelmstrasse hands are things what they used to be. True, the Koblenzerstrasse houses such dignitaries as the president of the republic, the chancellor, the foreign minister, and a foreign ambassador or two, just as the Wilhelmstrasse did in the old days. All the same, many of the nameplates on the new and the old buildings would make strange reading to Bismarck or Hindenburg. A different society has set up shop in and around the Koblenzerstrasse, a society with changed components and manners, of which the thrusting political and commercial pressure groups sometimes seem to be the most conspicuous and influential.

Still accurately named (though it must be in mortal danger of becoming the Konrad-Adenauer-Strasse), the Koblenzerstrasse is the main road leading out of Bonn to Koblenz, forty miles to the south. Long and straight, it runs parallel with and at a distance of about three hundred yards at most from the Rhine. Near the Bundeshaus, it changes its name to Friedrich-Ebert-Allee, the hell-for-leather driving strip between Bonn and Godesberg that accommodates such important spill-overs as the German Red Cross, the Social Democrats, the Volkswagen repair station, the Coca-Cola plant and the British Embassy. (The French and the Americans, who gave up hope of finding room in Bonn, are installed even farther south at Godesberg and Mehlem.)



The 1903 edition of Baedeker's *Rhine* describes the Koblenzerstrasse (then spelt with a C) as being "flanked with villas and gardens for about 1*m* beyond the Coblenz Gate (steam-tramway to Godesberg). Among them is the *Royal Villa* for royal princes studying in Bonn." Most of the gardens, none of the princes, and a few of the villas remain. One of the villas, the Villa Hammerschmidt, is the Federal President's residence. (As befits the realities of power, the chancellor and his strong and silent men work in a palace, the Palais Schaumburg, which is more or less next door.) At another villa, Number 108, the Misses Edith and Ingeborg Freudenberg gamely keep on teaching the piano and gymnastics. Others have been taken over by public officials with small staffs, such as the federal minister who handles the central government's relations with the states (*Länder*) and the Bundestag's overseer of the armed forces; by the smaller foreign embassies (Dutch, Swedish, Brazilian, Indian, Argentinian, Korean and Paraguayan); and by such modest concerns as the Rhine-Sieg Fertiliser Company. Scores of others have been demolished to make way for ministries, trade and industry associations, and for the imposing headquarters of a few lone wolves like Krupp and Telefunken.

The biggest new building in the Koblenzerstrasse is the foreign ministry, which keeps its Wilhelminian name of Auswärtiges Amt (AA to its members). On one side this is flanked by the officially subsidised Press Club, and on the other by the new Jewish synagogue. Second in size among the newcomers is the Federal Press Office, from whose windows at night the little red lights of radio apparatus tell of interminable monitoring. The new Hotel Königshof has replaced the old Royal Hotel, and is Bonn's remote approximation to the Adlon of bygone days, or perhaps the Kaiserhof, where Hitler used to take tea. It is near the approach to the Königshof that Krupp has set up his name in letters of stainless steel. This can be quickly taken in. But postmen and messengers must pause longer in front of a shield a little further up the road which announces that it is the collective home of

the *Zentralverband des deutschen Gemüse-Obst-und Gartenbaues*,
the *Aussenstelle Technik im Gartenbau*,
the *Deutsche Gartenbau Gesellschaft*,
the *Kreditgarantiegemeinschaft des deutschen Gartenbaues*,
and the *Blumenwerbung GmbH*.

To cut a long story short, this is the headquarters of a bunch of organisations representing gardeners and florists. At one house after another in the Koblenzerstrasse similar name-plates testify to the political vigilance of grocers, engineers, solicitors, archivists, handworkers, farmers, educationists, philanthropists, research organisations and manufacturers of sweets and chocolate, paper, tiles, and cement.

Many persons must have been pushed out to make way for all this activity. But the university has managed not only to cling on to such old possessions as the *Collegium Albertinum* (a catholic hostel), its children's clinic, and the headquarters of the students' Corps Rhenania, but also to build a handsome new library. And, it seems, there is still room in the Koblenzerstrasse for a little modest private enterprise. Two hairdressers have recently set up shop, and the solitary grocer has installed a beer-vending machine to serve customers after he has shut. The provisional capital has its eternal features.

Chancellor's Office

Continued from page 884

idle and bankruptcies increasing, more people are coming to blame their troubles on federation.

African leaders like Mr Julius Nyerere and Mr Tom Mboya want to reform Northern Rhodesia and Nyasaland into an East African federation. Northern Rhodesia, which in Mr Gardner's words "has the human and natural resources for a prosperous future," is with Kenya a key territory in such a design. Mr Macleod has seemed at times to be on the point of favouring it. The events of the past month, with 27 dead and hundreds arrested, with administration through chiefs under impossible strain and taxes being left unpaid, offers what seems an insane alternative. Many leader writers have blamed African villagers and layabouts for this senselessness. But one Copperbelt worker, Mr J. Mwina, replied for many countrymen when he wrote this week in the *African Mail*: "Welensky too has blocked roads and burnt bridges —the roads and bridges that the original Macleod plan gave us to link Africans with Europeans who are not white racialists."

Congolese Kaleidoscope

FROM A CORRESPONDENT

THE Congo kaleidoscope changes, but is much the same. Already, within a month of the investiture of the Adoula government, the rosy hopes of quick national reunification have faded. At the moment of writing, Katanga is in the throes of a new crisis, which could be the final "show-down," leading to the collapse of Mr Tshombe's regime, or merely the first round of a new, and possibly bloodier, vendetta between the Katangans and the central government (now backed by the United Nations); while in Stanleyville, the pole-squatting Mr Gizenga remains as hostile as ever.

On the credit side there is, of course, one enormous factor. The country has at last got a legally constituted national government. For the UN this means a respite in the nightmare game of Tweedledum and Tweedledee between Leopoldville and Stanleyville, which almost reduced the world organisation to impotence; indeed with the emergence of the national coalition a honeymoon has started between the Leopoldville government and the United Nations—though the UN would be very unwise to take it for granted. The much maligned western embassies feel legitimate relief that the reins of power are in the hands of a "neutralist" so moderate as Mr Adoula. His first policy statement upon his investiture revealed a grasp of political and economic realities unusual among Africa's younger statesmen, and his subsequent actions have had the stamp of courage and sincerity, even if they have not yet borne notable political dividends. Moreover, his ministry is made up largely of men who could be classified as "moderates," and is broadly based in the sense that it has men of nearly all parties, and of several tribes.

None the less, two fish-bones in the throat remain: Mr Gizenga and Mr Tshombe. Mr Adoula's recent mission to Stanleyville was not a success. Having failed to get as large a stake as he would like in the central government, Mr Gizenga has formed a new National Patrice Lumumba party, apparently in open opposition to Leopoldville. Though the working of Mr Gizenga's mind has always been something of a mystery, and purely personal factors may have helped to keep him in Stanleyville, there is little doubt that he has been influenced by the diplomatic missions from communist and Casablanca block countries, which have stayed on in Stanleyville despite the formation of the new government in the capital. The moderate character—so far—of the new regime is undoubtedly a rebuff to Soviet aspirations, and Mr Gizenga's recalcitrance may be useful to Moscow. In addition to signs of Soviet intrigue, there have been persistent reports in recent weeks that arms from communist countries are still finding their way into Orientale province. This has been seized on by Mr Tshombe, and has helped to bedevil his relations with the UN once again.

After days of conflicting statements—and, it might be added by the UN's apologists, after weeks of obvious provocation—the UN has taken action against him. Strategic centres throughout Katanga have been taken over by the UN troops—mainly Indians, Swedes, and Irish—in an effort to "put the screw" on Mr Tshombe. Elisabethville radio station has been used to broadcast an appeal by Mr Adoula for the reunification of the country. The objective at the moment, according to the official UN spokesmen, is solely to disarm the European officers in the Katangan gendarmerie; an action, it is claimed, strictly in accordance with the UN's mandate, as expressed through the Security Council resolution of February 21st.

In many quarters, the UN's action will be widely acclaimed; and the verdict of history may be that Mr Tshombe has "asked for it." The fact that the UN is now working in collaboration with a central government resting on a broad basis of support also strengthens its case. But inevitably there is concern about where this course may lead; and it is a sad commentary on the way the Congo situation has deteriorated in the past few weeks. (Only last month UN officials were talking about the "reasonableness" and "moderation" of Mr Tshombe compared with the people around him, such as Mr Munongo, his minister of the interior; it is not clear whether they regard Mr Tshombe himself, or one of his more sinister henchmen, as the real villain of the piece.) The UN may be right in claiming that its course is strictly and correctly charted along the narrow and delicate lines of the Security Council resolution; but the Congolese, who are not ridden by the same sense of legalism, may not see things in the same light. Mr Adoula (not unlike Mr Lumumba before him) thinks the UN should openly help his forces to suppress the Katangan regime by force; Mr Tshombe, perhaps understandably, views "security measures" by the UN as interference in a country's internal affairs and therefore contrary to the UN Charter.

WHETHER Mr Tshombe can be forced into any effective co-operation with the central government remains to be seen; first reports indicate that while he has accepted the removal of the European officers, he has reasserted Katanga's right to be independent. At the same time, there are reports that Katanga will now withdraw its representatives from the central parliament—which, taken in conjunction with Mr Gizenga's boycott, puts the prospects of Congolese unity back at something like square one. There is a danger that the UN may find itself bogged down in a new politico-military war of attrition with Mr Tshombe's regime, in which it would find itself hamstrung by the limitations of its own mandate, and in which, conceivably, it could undo the good work it has done in the period since roughly the end of May. The fact that much of the "disarming" operation is apparently being done by Indian troops, who are specially unpopular with the Congolese, and who have been involved in sharp clashes with the Katangan gendarmerie, is hardly likely to promote a quick pacification.

Quite apart from the problems of Mr Gizenga and Katanga, the new government has plenty of other problems to tackle. In the economic sphere the national debt still mounts at the rate of £4 million a month; the economy, geared in the past to the wealth of Katanga, is badly run down; shortages are apparent in the Leopoldville shops; and the prospects of investment are dim as long as the present political uncertainty continues. To some extent, the UN itself can help through its technical assistance programme, or through a further injection of financial aid, which the new government is urgently seeking. But neither the UN nor anyone else can give the Congolese political maturity overnight. Through no fault of their own, they are still untutored in democratic ways; indeed, the recent parliamentary meetings at Lovanium were essentially a grandiose tribal palaver. Though parties proliferate, tribal allegiances still, more than anything else, hold sway; and personal motives, rather than political principles, will in large measure determine policy. If in the months ahead the Congolese political situation takes some odd twists and turns, with inexplicable enmities and even more inexplicable alliances, no one need be surprised, or even unduly alarmed.

Meanwhile, for the UN there looms increasingly the question of how long to keep its expensive operation (which costs £48 million a year) in progress. Already, it seems, the plan for a speedy "phasing down" of the military side of the operation has been knocked awry. In the altered circumstances of the past few weeks, Mr Adoula is reported to be anxious that the UN troops should remain; while Mr Hammarskjöld is obviously anxious to tailor both civil and military costs to the available budget. With a new General Assembly due in a few weeks' time, some high policy decisions seem to be called for.

Experiment in Central Africa

FROM A CORRESPONDENT IN SALISBURY

THE present official moves for African advancement in Southern Rhodesia, modest as they are, would have been inconceivable even a year ago. With the referendum behind him, the right wing in total disarray, and the nationalists in not much better shape, Sir Edgar Whitehead has felt emboldened to give the country a lead. It was high time; but with the example of Mr Garfield Todd before him he is unlikely to outpace his supporters.

His policy speech in the Legislative Assembly on August 24th was the clearest outline of his thinking that he has yet given.

> I believe that if we Rhodesians can really bring ourselves wholeheartedly and honestly to try and build a genuine Southern Rhodesian spirit of nationalism, embracing all Southern Rhodesians whatever their origin, that is a weapon capable of defeating external nationalism. . . . However, it has got to be a genuine attempt. This is not a question of making certain changes which some people might call concessions. It is really a question of achieving a change of heart. . . . I believe it is the only salvation for the people of all races here.

These words can mean much or little. In the past the slogan, "partnership," has signified in African eyes the partnership of a rider and his horse; but to some of his listeners at any rate Sir Edgar's words carried a new note of urgency and earnestness which, if they did not rouse the Assembly to acclamation, have been accepted by the electorate with remarkably little fuss. Perhaps this was due to the absence from the speech of any precise proposals to implement the new approach. The prime minister did not particularise; he did not forecast the shape of legislation to come. There was nothing here that could be seen as an immediate threat to white privilege in Southern Rhodesia; and in any case the new constitution cannot become law until towards the end of this year, and new elections are still twelve months away. This leisurely constitutional progress cannot, however, be blamed on Sir Edgar, and developments elsewhere may hasten the advance. It is something that the ground is being prepared.

Sir Edgar's speech acknowledged "the appalling land hunger" of the African people in the Reserves; and clearly there can be no real advance until the major iniquities of the Land Apportionment Act are removed. Sir Edgar would like to see a significant extension of African education. He proposes much closer consultation with people of all races in planning the future, so that the African may feel that he has a stake in the country. He foresees a bright economic future for the territory: there is scope for a large expansion of the mining industry, especially of semi-finished iron and steel products; and the textile industry, too, can recapture lost markets on its doorstep in Africa. As chapter headings these are wholly reasonable, but the book has yet to be written; and, that done, it must be sold to the Africans. Sir Edgar described it as an experiment without precedent anywhere, and it is to be attempted above the heads and in defiance of the African nationalists, whose leaders the prime minister holds in open contempt, and never misses an opportunity of saying so.

Some of the difficulties ahead were reflected a few days earlier in the battle of the swimming pools. Salisbury City Council, not a notably enlightened body, decreed that the central baths should be multi-racial, after it had been discovered that the bye-laws did not permit discrimination among bathers. The ensuing public outcry had more to do with psychiatry than with politics. Outraged mothers announced that their daughters would not be safe; standards of hygiene would collapse overnight; bilharzia and venereal disease would stalk the land. Even the owners of private swimming pools felt that the end of the world was at hand. Faced with the corporate fury of a community at bay, the city council surrendered ignominiously. Under a fresh decree only ratepayers and those on the voters' roll, with their families, would have the use of the baths. This successfully excludes the blacks, and some 40,000 whites as well. Bathing, like the art of government, remains in "responsible" hands; but there is an uneasy feeling among councillors that they have not heard the last of the matter.

Essays in Land Reform

AN economic mission from Persia, led by the deputy director of the planning organisation, has been visiting London and other western capitals in order to hear what others have to say about Persia's third development plan. The plan, supposed to start in about a year, is still in its early stages of creation. Its first objective, according to a summarised outline, is an ambitious land reform programme, now being worked out in Teheran.

Land reform is much talked about in Persia. About three-quarters of the people live on the land, but few of them own any of it. The issue was side-stepped for a time by the Shah's decision to sell back to the peasants some of the 3 million acres acquired by his father. A certain amount of land was also distributed by the government, and a few of the more far-sighted landlords followed suit. In theory, this land should have been evenly divided between the labourers who had been working on the estates. But this was seldom what happened. Mostly, the redistributed land went in uneven chunks to people who could afford to offer the agricultural banks some security for their loans. The peasants who did get land were inclined to let it to a larger farmer, and either continue to work on it as labourers, or else make off to the towns. Though disorderly and unco-ordinated, these early attempts at land reform did result in the emergence of a new group of middle-class farmers.

Persian land reform has been timid, but to a certain extent effective. In contrast, the land reform law for Iraq, passed in September, 1958, was as bold in conception as its result has been unsatisfactory. The peasants' unions, which were set up to help run the new smallholdings, seem to have lost heart in their job. The communists used to have a controlling voice in these unions, and the stagnation that has set in may reflect the break between General Qasim and his former communist supporters in Baghdad. A loan from the agricultural bank of £3½ million seems to have disappeared without leaving a trace of irrigation, fertilisers or seeds. The traditional reluctance of anybody from the towns to set foot in the countryside, much less work in it, is increased by the stories of the violent and hostile reception that has greeted, say, irrigation inspectors from Baghdad. A new impetus is badly needed if Iraq's land reform is to be saved from corrosion by neglect.

FOCUS ON EFFICIENCY WITH INDUSTRIAL DIAMONDS

More and more lenses are being formed with diamond abrasives.
Only diamond tools can cut, grind, or polish with the speed and accuracy needed today.

To find out if diamond abrasives, diamond tools, or diamond impregnated wheels can help you in *your* problem, please get in touch with the Industrial Diamond Information Bureau. THE BUSINESS WORLD

Who Holds Sterling

UNDERLYING the special difficulties of sterling since the war, but underlying, too, the external purchasing power of a number of the world's poorer countries, are those old friends the sterling balances—the recorded monetary claims, mainly short-term, held in sterling by institutions and individuals in other countries. In the aggregate, their amount has changed remarkably little in the past decade and a half; it has remained around £3,500 million, to which it was carried by Britain's wartime spending on supplies and services from a prewar figure of at most £750 million. But the composition of these sterling holdings has changed radically. Because of the traditional banker's secrecy that the Bank of England maintains about the accounts of its foreign customers, these changes receive inadequate attention. Yet the way in which foreign holdings of sterling are spread between different countries is highly relevant to all the main facets of the sterling problem: the vulnerability of the pound to sudden withdrawals of foreign funds; the role of the sterling balances as internationally liquid assets; and the feasibility of any special operation to fund these balances or transform them into obligations of an international institution.

Figures published by the United Kingdom authorities divide the overseas sterling balances into broad geographical areas only; these figures, which now also distinguish official and privately owned balances for each region, are shown in Table I. In addition, the countries that hold a major part of their reserves in sterling—that is, the countries of the overseas sterling area—themselves publish figures of their external assets; and these in conjunction with other sources make possible a rough estimate of the main holdings by individual countries. Table II shows estimates on this basis for March 31st last and for mid-1957; the figures for 1945, however, are distinguished by an official cachet—they were drawn up for the 1945 loan negotiations with the United States and then openly passed on to a committee of Congress, to Whitehall's great embarrassment.

A quick conspectus of these figures shows the compensating nature of the big changes in the pattern of holdings. In the first place the massive holdings built up in the war have been run down completely; in mid-1945 old India alone held £1,108 million (the peak was £1,320 million at end-1945) and these balances, together with the £500 million-odd owned by Egypt and Jordan, accounted for close on half the total. By 1961 holdings of these countries were together probably not much over £200 million, and the broadly similar total of all sterling holdings was spread much more thinly over a large number of countries, institutions and individuals. In the first decade after the war these liquidations of wartime balances were accompanied by a fall in the holdings of non-sterling countries; the official figures show a reduction from £1,240 million at end-1945 to £677 million in mid-1957, though about half of this is attributable to Egypt, which left the sterling area in 1947. The big offsets in this period were provided by the swelling balances of the colonies—between 1945 and 1957 these rose by nearly £1,000 million to £1,386 million—and of the oil-producing sheikhdoms on the Persian Gulf. Between end-1950 and end-1956, the Treasury told the Radcliffe committee in a rare disclosure, these balances together with those of Iraq and Jordan rose from £71 million to £338 million.

The build-up from these two sources has now stopped. In the past four years most of the old colonies have become independent, and their development programmes have gathered pace. This has involved a run-down of perhaps £200-£250 million in the (old) colonial balances as a whole, although the balances of the remaining colonies increased a little further in this period. The fall in old colonial balances has been roughly cancelled by the further addition of perhaps £200 million by the Middle East oil sheikhdoms, but other independent sterling countries have run down their balances by nearly £400 million. The big offset in this period has been the

renewed build-up by non-sterling countries, especially since sterling became convertible at the end of 1958. By end-March these balances had risen to £1,276 million—almost double their 1957 level and a little above the previous peak of 1945.

In the first instance this build-up was concentrated mainly in private holdings. These were run down fairly rapidly in the speculative tumult following the German revaluation in early March; but the withdrawals were partly offset by accumulations of sterling by central banks which formed part of the Basle assistance. Thus the official figures published this week show a fall in the holdings of non-sterling countries of no more than £175 million in the three months to end-June; private withdrawals may have been twice as much and the end-March total of £708 million may conceivably have been halved. The swollen central banking balances are now being reduced by £200 million with the proceeds of Britain's large drawing on the International Monetary Fund. Fuller figures will appear in the next Bank of England bulletin. The figures, however, are not quite comprehensive; they exclude, for example, deposits placed with local authorities or hire purchase houses, though these are picked up when (as is the usual practice) a London bank acts as an intermediary.

Tables II and III show that the highest individual holding at March 31st was Malaya's £260 million—though Australia's balances have risen by at least £100 million since then. With the possible exception of Malaya and, among the remaining colonies, the Borneo territories, none of these countries now disposes of any sizeable cushion of sterling beyond its desirable needs for working balances. The important exception, admittedly, does not figure in the table at all. Many minds have applied themselves to ways of calculating the size of the sterling balances of Kuwait, but the few that have an inkling keep very close about it. For what it is worth, the estimates in Table II fall short by some £370 million of the total figure for all sterling countries (including Kuwait), published by the Treasury, and this is broadly in the range of some recent guesses for Kuwait. But the residual estimate is a shaky one, because the coverage of the individual holdings is not in all cases the same as that of the Treasury's total figures. What does seem clear is that with less lush times in the oilfields Kuwait's balances are no longer rising; they are still the largest and potentially the most volatile of individual holdings.

The more even spreading of the sterling balances round the world in recent years has reduced the danger of large sums being quickly withdrawn and spent. But this is not the only way in which the sterling balances may be run down; they may be switched in to alternative forms of liquid reserves. The privately held balances of non-sterling countries are notoriously sensitive in this way. Officially held balances, which predominate in the holdings of overseas sterling countries, are far less affected by the tide of market speculation. Apart from anything else, a large scale switch out of sterling at a time of pressure would certainly be inconsistent with the tacit arrangements that pass for rules of sterling area membership. But the possibility cannot be ruled out for all time. Up to now this one obligation has been more than matched by the privileges, notably access to the London capital market and freedom from United Kingdom exchange control. Now, however, some of the overseas members may feel that Britain's intended move into Europe and its declining role—relatively—as a supplier of outside capital has altered the balance of advantage; some loud rumblings about all this are expected at the meeting of Commonwealth finance ministers at Accra in ten days' time.

STERLING area arrangements may therefore become looser still. What would this imply for the London balances? Possibly not very much. In the last resort, these countries have held the bulk of their reserves in sterling not because of any club rule but because it was most convenient and profitable for them to do so. The alternatives have been neither numerous nor obviously advantageous. Balances held in New York are decidedly less convenient for most of these countries, with their payments geared to sterling; money market facilities are inferior to London and with rare exceptions interest rates are lower; finally, the dollar has in recent years lost its unique glitter. The hoarders' favourites such as the Swiss franc, the mark or gold itself all involve at present the forgoing of all interest, and in any case have great limitations for a country that has relatively small reserves and needs working balances in international currencies.

The fact is that in the absence of a truly international reserve system—backed by an international currency acceptable for market transactions and thus suitable for working balances—there is no ideal centre to hold reserves. In the current mood of the exchange markets and at current interest rates, London is likely to be judged as good as any, while even an adverse change of circumstances is likely to leave a substantial number of funds that it would be too costly or too inconvenient to transfer. This comfortable assumption could, however, be shattered either by a major shock—a universal rise in the price of gold, a devaluation of sterling or a steep up-valuation of another major currency—or strong anticipation of such action. The question therefore arises whether holders of sterling should be reassured with an exchange guarantee.

The arguments against an across-the-board guarantee to every holder of sterling are probably still decisive. In particular, there is nothing to be said for eliminating one of the normal risks of international arbitrage for private operators, especially as it would be virtually impossible to provide for all the losses of international traders. A guarantee only for official balances makes much more sense, and events are in any case moving in that direction. Under the European Monetary Agreement, which became effective at the time of convertibility, all balances held by West European central banks in each others' currencies are guaranteed—in US dollars; while all International Monetary Fund credits are tied to gold. There is no reason, however, why Britain should now extend the guarantee to all official holders unilaterally. It would be much better to give *ex gratia* compensation in the event of devaluation than to try to provide for an unknown contingency in advance, since it is impossible to say, as a general rule, what form the equitable guarantee would take.

An exchange guarantee for official sterling should rather be held as a *quid pro quo* for an advance in international credit arrangements. Mr Xenophon Zolotas, Governor of the Bank of Greece, has recently proposed that Britain and the United States should accumulate balances in other convertible currencies (as in fact they are beginning to do) and that these and all existing reserves in foreign exchange should be given a gold guarantee. The aim would be to strengthen and widen the gold exchange standard. There is much to be said for this, on one proviso—that it is seen as a half way house to an international central bank and not as a substitute for it. In practical terms, this means that a gold guarantee on foreign exchange balances is quite acceptable—provided the leading countries are fully determined to stand by the present price of gold to the extent of being prepared, at a pinch, to develop radical substitutes for it.

Aviation's Missing Managers

THERE is a time for belabouring the aircraft industry and a time for offering it a helping hand. Currently it needs help. On Monday it will be mounting an air show before the faithful Farnborough pilgrims and also before a hundred pairs of expert eyes of scientists and engineers from Canada and the United States who are visiting this country for a fortnight's conference on what may be called advanced aviation technology. These are not the sort of men who, through charity or bonhomie or in acknowledgement of superb showmanship (no one can stage an air show like the Society of British Aircraft Constructors) will look for swans in the industry's current flock of geese, even if their grandam did lay a basketfull of 429 golden Viscounts. These special visitors will see the industry at perhaps its lowest ebb for 25 years, in terms of clear ideas for future development as distinct from work on established equipment.

Engineers leave their desks and laboratories to travel half across the world to an air show in search of the stimulus of new ideas. Aviation engineers live remote as Tibetan lamas from the hurley-burley of manufacturing and they must go out now and then to see what the other man is doing. Whether their journey to Farnborough this year will be rewarding is a touchy question. If they think not, there will be no profit in trying to apportion the blame. For the future health of the aircraft industry, and in the interests of the taxpayer who subsidises it, someone—and it ought presumably to be the Minister of Aviation if his mind were not on higher things—should be looking now at the British aircraft industry that we have (not the industry that we ought to have), and at its *customers* (they also have their warts), and deciding what aircraft can be built with the resources available and to whom they could conceivably be sold. Here the average industrialist would snort and say that this is a job for management. But managers are precisely the people that the aircraft industry lacks. It has an abundance of the kind of men scarce in other industries—good planners, designers, innovators, production engineers, salesmen, a smattering of dreamers and the occasional genius. But it is thin on the organising men who, for all their defects, translate genius into output. Weak management is not peculiar to Britain; it is noticeable too in the United States where powerful and experienced companies have from time to time made sad mistakes in producing and selling civil aircraft.

There is one remedy for this: the men in charge of Britain's five main aircraft groups should be looking round for heirs to groom for the succession. Are they doing so? The mergers served their initial purpose of forming groups with resources adequate, both financially and technically, for modern aircraft production. But they also produced a surplus of senior executives and this, combined with a steady intake of Air Marshals, makes it difficult to find room near the top for the new management blood the industry needs.

THE first task for these new managers would be to ensure continuity of work. Here three factors are working against them. First, there is the lengthening gestation time of new aviation equipment, now stretching ominously from ten years to a probable fifteen for a supersonic airliner. Secondly, there is the relatively small size of the British aircraft industry. The Ministry of Labour shows it as employing close on 300,000, but this does not distinguish between building aircraft and working on the industry's new industrial products—and these latter could account for half the total labour force. Being small, the industry cannot back with the necessary development effort all the projects that can be on the go at any one time. The penalties are late delivery and teething troubles of a kind that customers will no longer accept with the resignation they might have shown a decade ago. A small aircraft industry cannot spread its risks.

The third and most important factor is a basic change in the way aircraft are bought. Neither the military nor the civil customers of the industry buy in the numbers they were accustomed to order even ten years ago. They ask for tens instead of hundreds, and hundreds where they formerly ordered thousands; this is true the world over and American companies complain just as bitterly about it. There are two reasons for this change; one, without any doubt, is the search for defence economies, but it is the least important. The basic reason for small orders is that the efficiency of the

equipment continually improves. Military equipment is more lethal, and civil airliners do more work. A Boeing jet carries twice as many passengers twice as fast as the old aircraft it replaces, and is more reliable in service. Pakistan Airlines flew between London and Karachi six days a week last winter with clock-work regularity, using a single jet ; this would not have been possible with any other kind of aircraft. The fact is that airlines can do a given amount of work with smaller fleets, and this explains at least in part the present excess capacity that is pushing most civil airlines into the red.

So the manager of an aircraft company faces the prospect of ever rising development costs to be spread over shrinking production runs. The two cannot be made to match, and this fact has been recognised by the British government which, in addition to paying for all military development, has now resumed after a lapse of some years aid for civil aircraft as well, advancing in 1960-61 £9½ million for this purpose. Since the government's policy is not to put up more than half the money needed to develop a "normal" civil aircraft (the "abnormal" case would be a supersonic airliner) the industry has probably invested an equal sum from its own funds. But whatever the government advances, a point is bound to come where the industry sees that it is wasting time and resources putting a massive development effort behind a trifling production order. On Blue Streak, between £500 and £600 million could easily have been spent for an end-product of perhaps a score of rockets. Here is the *reducto ad absurdum* of one current trend in aviation.

COMMON sense would surely demand that every project undertaken in future by the British aircraft industry, with or without government help, has some prospect of a world market. The tendency among customers is towards standardisation and their choice is guided by other factors besides performance. Many airlines standardised on the Viscount as their short-range and the Boeing as their long-range airliner, and many air forces standardised on the Lockheed F. 104 fighter. It is just possible that some of the latter might standardise on the Bloodhound anti-aircraft missile, originally built by Bristol Aircraft, now part of the British Aircraft Corporation. If this happens, the sensible course for other manufacturers would be to stay out of the market, because the limited orders they are likely to pick up cannot compensate for a major development effort.

In its attempts to design for a world market, the British aircraft industry suffers at the hands of its captive customers at home. To tailor any piece of aviation equipment precisely to the requirements of the RAF or the two British corporations is to miss business across the world. The British Aircraft Corporation would be better placed today if it had developed the winner it had in the Viscount and had not built the Vanguard for BEA ; it must be hoped that Vickers' VC-10 airliner tailored for BOAC's off-beat routes will have better success. The same shadow hangs over de Havilland's Trident jet built for BEA ; this aircraft, highly regarded by more than one foreign airline, would sell more easily if, like its small Boeing jet competitor, it was designed around the median of medium-range requirements and not those peculiar to British European Airways' network. When home orders were big enough, and development costs small enough, for a company to break-even on home sales this did not matter ; it matters very much now. It could be a sign of the times that the first order placed for the British Aircraft Corporation's new jet Viscount replacement came from an independent British airline and not from either of the corporations.

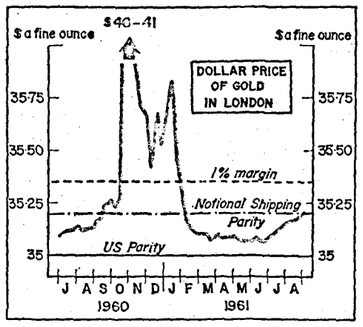
Visitors at Farnborough next week will be seeking answers to three questions. What is this country doing about vertical take-off ? What is it doing about supersonic airliner development—and can it build such a monster at all ? And what is the British view on long-range freighters ? What we are doing has to interest them as buyers, and not appear merely as a contribution to a technical debate. In vertical take-off, Britain has more to show visitors than any other country ; it offers two workable systems developed respectively by Rolls-Royce (this one currently out of favour) and by Bristol Siddeley. If the RAF commissions Hawker Siddeley to develop a vertical take-off fighter around Bristol Siddeley's engine system, as seems likely, who will make sure that this fighter will also meet the requirements of other air forces ? Much has been said in the past about Nato requirements and of the need to conform to them ; the prospects for the British aircraft industry, and particularly of Hawker Siddeley which has had a lean time recently, depend on turning this principle into saleable hardware.

The impression that most people have about British work on supersonic airliners, mainly the responsibility of BAC, is that our research and thinking are blinkered ; the reasons for this became clear at a meeting of airlines and manufacturers in Montreal and were set out in detail in an article in *The Economist* on April 29th. They will doubtless be under discussion in London during the next fortnight. There are risks either way. A clean jump over all the immense technical hurdles to achieve an aircraft flying at three times the speed of sound may involve risks so great that the British aircraft industry would be wise not to court. But it is not clear either that supersonic flight at twice the speed of sound will provide a practical and payable stepping stone towards Mach III flying. And it is this by no means self-evident option that British aircraft designers now seem to be contemplating.

The third argument in aviation concerns freighters, and whether airlines should buy machines designed specifically for carrying bulk loads. The airlines reply with a dubious "no," while the manufacturers argue that without specially designed freighters, airlines cannot bring down the cost of carrying freight to a point where they can offer commercially attractive rates ; there is a piece of special pleading concealed here, for freighters would keep production lines busy when the present jet orders are met and before the supersonic airliners take their place. Meanwhile, the air forces of the world are seeking freighter aircraft capable of moving forces half across the world ; if military and civil requirements could be reconciled, the aircraft industries here, in Canada and in the United States would all feel much happier. Farnborough will provide them with an occasion for the rueful exchange of experiences here rather than real hope of a solution.

The present state of the aircraft industry is not serious enough to call for a Dr Beeching, but it would certainly cause Sir Henry Spurrier to raise his eyebrows. Perhaps the most interesting experiment now being conducted in the industry is the partnership between Mr Peter Masefield and the Pressed Steel company to build executive aircraft by motor industry methods. If this experiment were to come off, it could give the managements of the industry's senior companies a great deal to think about.

BUSINESS NOTES



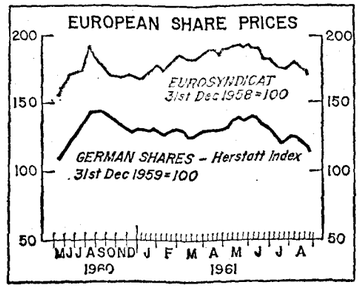
GOLD

Warning Rise

PRIVATE demand for gold, which began to revive in midsummer, has risen farther this week to substantial proportions. The dollar price of gold in London has edged up to $35.19-20 an ounce, compared with the low point of $35.06 to which it fell when speculation petered out within a few weeks of the Kennedy administration taking office. The renewal of interest in gold is attributable partly to the worsening of the international situation—first Laos, then Berlin, now Russia's resumption of nuclear tests. On the Continent demand has been especially concentrated on gold coins —an indication that the current speculation is being led by the small man's fear of war rather than the big operator's attack on the dollar. But this is not the whole story. The upturn in the gold price in late June also coincided with the doubts about currency stability voiced by M. Rueff ; and in the last few weeks much scepticism has been voiced about the prospect of a worthwhile improvement in the International Monetary Fund being achieved at the forthcoming Vienna meeting.

Speculative demand has not yet got out of hand. The London price is still just about within the "normal" range set by the New York dealing price plus shipping cost. Central banks have been in the market as buyers and sellers, though there have been no sales from Russia in recent weeks. The movement in the London gold market at present is almost exactly the same as a year ago: the consequence then to inaction at the IMF meeting was the October explosion. The authorities' grip over the market was, however, improved, in the eleventh hour, by the clarification that the Bank of England could use gold bought from the Federal Reserve for sales in the London market. That arrangement still stands. The Bank has been supplying the market with more gold than its current accruals from South Africa and these "support" sales may have reached sizeable amounts this week. So far, the authorities still have the market in control.

While the London-New York arrangement stands, United States officials are still not fully convinced of the wisdom of feeding gold "cheap" to hoarders. Yet if they mean what they say gold supplied above $35.08¾ is not cheap but dear. United States officials make a second psychological mistake by giving the impression that requests by central banks for gold instead of dollars are "unfriendly." European bankers, for their part, are well stocked with prejudices of their own. The further uncertainty inculcated by the fear of war makes a united and convincing policy on gold all the more urgent. A meeting of minds on this complex but critical question is among the top priorities for the corridors of the Hapsburg palaces.



EXCHANGES AND BOURSES

Money Out of Germany

THE growing tension between Russia and the West is also an increasingly weighty factor in the exchange markets and on the stock markets—notably on the Continent. This time however the major impact has been not on sterling but on the mark. Sterling has been continued in good demand this week, rising to over $2.80½ ; buying has been mainly for commercial transactions and to cover short positions before the month-end.

Operators now seem firmly decided that Berlin is in Germany after all. They are pulling out some of the money they have been sending to western Germany as a currency speculation for years past ; without any threat to Berlin it would be normal and desirable for these funds to move out again. This week the dollar has again been strong in Frankfurt, rising on Tuesday to 3.99¾ (still a shade below parity). The Bundesbank is believed to have given support at this level and its weekly return shows a drop of DM 271 million in external reserves in the week to August 23rd, the fourth fall in succession. Another reversal of recent money flows has been shown by South Africa, where official reserves have risen by nearly £16 million since their mid-June low point of £71 million.

The fall in the bourses too has been most marked in Germany. The Berlin manoeuvrings have exposed the stock market to the test of investors' nerves, and have inevitably set off a bout of foreign selling (which is itself an important influence in the outflow of funds). At the end of last week it looked as if nerves were beginning to go, and on average share prices in Frankfurt dropped by 4 per cent in a single day. This week however the market has been steadier, with prices down on average by over one sixth from their 1961 peak. The Bundesbank continues to aid the capital market by easing bank liquidity—at the end of last week it released the "Blessing billion" that the banks had agreed to keep in Treasury bills—but for the time being political circumstances are predominant in the stock market.

Other Continental bourses have also been subdued by the Berlin crisis, though prices have not fallen on balance this week. They are all below the peak for the year ; in Holland the fall has been as sharp as in Germany, but elsewhere, and particularly in Sweden, Belgium and France, it is now slight.

London Up and Down

BOTH gilt-edged and London equities took a slight turn for the better early this week, though the announcement that Russia was to resume the testing of nuclear weapons made the industrial market more hesitant on Thursday. The rise in gilt-edged prices was not big, but it suggested a slightly more healthy atmosphere in this sector of the market. For one thing, there has been some foreign buying which was reflected in the advance in War Loan to 53 7/16, compared with 52½ before the weekend. For another, there were a few indications that some institutions were switching into longer-dated stocks on yield considerations. In this process the jobbers were squeezed a little, for, having gone short they found that sales by trustees this week were not sufficient to provide them with the stock they required. The disturbing effect of

international tension, so far, has been offset in London by the yield attraction of gilt-edged securities.

The recovery in the gilt-edged market was also thought to be a converse to the state of uncertainty in industrial equities. These were certainly unsettled a little by discouraging statements made by some companies, including those from Monsanto, British Motor and British Match, and before the weekend the heightening of tension in Berlin had led to a fall in prices, just as it had done in Wall Street and on the Continental bourses. When, however, the clouds lifted a trifle early this week, equity prices both in London and New York rallied. The recovery, aided by a small amount of trustee buying of blue-chips, was minimal, lifting *The Economist* indicator by only 0.4 points to 366.4 in the week to Wednesday, and on Thursday it appeared to have petered out.

ECONOMIC POINTERS

Construction Topping Off?

As the resources of the construction industry are at present stretched at maximum tautness over its biggest ever programme of current work, it is very hard to tell whether the random signs of easing off are the mark of congestion in the pipeline or point to some genuine slackening in the pressure of demand for new work. So far shortage of capacity—of craft labour, of certain materials, and of professional time in architects' and builders' offices—seems to be the more common explanation. In the spring and early summer months of the second quarter of this year, building contractors managed to step up their output by a full 8 per cent over 1960 hitting the £600 million mark for three months for the first time, with only two per cent more building

*At current prices

workers, a three per cent increase in brick supplies and an eleven per cent increase in cement supplies—achieved mainly by higher output and a sharp cut in cement exports.

Contracts placed with building contractors were still rising up to last March, the latest date for which complete figures are known. But by then new commission received by private architects had already started to tail off sharply—for the first time since mid-1959. This was partly in housing work but, as the present number of houses under construction — 306,000 — is the highest the industry has seen since 1954, the most favoured reason is the reluctance in overloaded offices to accept any more contracts. But expectations are that dearer and scarcer mortgages and the continued rise in land and house prices will make an impact upon new housing demand before long. New work for public authorities is also expected to show at least a slower rate of increase following the Chancellor's end-of-term budget in July. And new industrial buildings started this year, going on figures for the first six months, seem likely to be somewhat fewer than in 1960. All told, the construction industry has enough work on hand to support its present rate of activity, or even a higher one if resources can be stretched yet further, until well into next year. The coming months should show more clearly whether this feverish busyness can be kept going beyond then.

Foundries Downcast

Signs of a perceptible easing off in the pressure of demand for capital goods, already reflected in the levelling off of orders received by the engineering industries, are now beginning to be experienced by a number of iron foundries. Capital goods suppliers of one kind or another, from heavy plant makers to tractor manufacturers, take the greater part of the foundries' output of iron castings and as few of them hold large stocks of finished castings, orders received by the foundries are often a useful barometer of changes in the climate of investment demand by industry. Up to the middle of this year, production of castings for engineering firms, the railways, the building industry, and tractor and commercial vehicle makers was still rising. Few of the foundries supplying these industries have since raised their rate of output any further. Fewer still expect any increase in the flow of new orders. The labour shortage has noticeably eased—not every man leaving is replaced. And both prices and supplies of scrap have softened. The general tone in the foundry industry is now one of doubt, expecting at the least a steadying down after the heady boom lasting a full two years.

OUTPUT OF IRON CASTINGS

	1960		1961		Change
	I	II	I	II	II
	('000 tons)		('000 tons)		%
For:					
Vehicles	202	202	186	189	− 6·3
Engineering	330	321	342	340	+ 6·0
Building	118	109	121	114	+ 4·6
Gas and Water (pipes and fittings)	150	146	135	134	− 8·1
Steel (ingot moulds)	136	135	138	129	− 4·6
Railways	64	85	73	73	+12·2
Household appliances	33	29	30	29	Nil
	1,033	1,006	1,026	1,007	+ 0·1

In the last year prospects have changed for all sections of iron founding. Demand for pressure pipes from gas and water undertakings fell off about a year ago. Purchases of castings for cars were sharply cut back by the motor industry last winter, and hopes of some revival in ordering early this summer have not been fully realised. The decline in steel output in the last few months has cut demand for ingot moulds. And the household appliance manufacturers, which take a relatively small part of total castings output, still show no sign of increased ordering.

MOTORS

Rugged all Round

Sir Henry Spurrier's statement on the future of Standard-Triumph International confirms the impression that Mr Alick Dick left because he disagreed with Sir Henry's plans to make drastic cuts in S-TI's overheads. And when Sir Henry says that the company is to be run by Mr Markland, the new managing director, on similar lines to the parent company, he does nothing to weaken the belief that he wants to run a car firm like a lorry maker, despite the marked differences in the two operations. A reduction in overheads may well be necessary for the long-term profitability of S-TI, but Sir Henry might do better to look to Jaguar for an example rather than to his own factories in Leyland and Glasgow. If S-TI is to go on trying to establish itself as the maker of the poor man's Jaguar, keeping down overheads has been only part of that company's success—good engineering and flair for publicity and selling are certainly as important.

One surprise in Sir Henry's statement was his expectation that car sales would have recovered even faster than they did in the spring and that S-TI would have progressed beyond a near doubling of its share of the car market. Less unexpected was his revelation that S-TI has continued to make losses—though this seems to refer to the spring rather than the summer, when the rate of output should have been high enough to put the company in profit. But now that its factory workers are returning to a three-day week, its profitability must be again doubtful. After last winter nobody at S-TI wants to risk the excessive piling up of stocks. Output is being cut before the seasonal fall in sales rather than after it. Other car makers may follow this move as the autumn progresses.

Even British Motor Corporation's profitability suffered severely during last winter's recession. The cut in BMC output from 669,000 vehicles in the year to July, 1960, to 601,000 in 1960-61 stemmed primarily from operating on average at little over half capacity for the five months from November to March: at times it was a good deal lower. The company warns its shareholders that profits have been cut by more than the reduction in output would suggest, for the smaller BMC cars now form a higher proportion of its total pro-

Economic development in Asia is bringing higher living standards to these young people and to the vast population of that continent. Demand for an ever increasing range of merchandise is steadily rising. If you are interested in trade with these expanding markets, you are invited to avail yourself of the banking and information services of The Chartered Bank and its subsidiary, The Eastern Bank Limited. The combined organisation of the two banks comprises one hundred branches in twenty-five territories extending from the Eastern Mediterranean to the Pacific Ocean.

duction than in 1959-60 : output of baby cars rose by 62 per cent in 1960-61. BMC's statement adds that its expansion plans will increase overhead costs in the immediate future, and that "some time may elapse before demand, and therefore profits, catch up with the enlarged output."

NEW ISSUES

Lenders v. Borrowers

In the capital market lenders are calling a tune that grates unpleasantly on the ears of borrowers. It was, for instance, revealed this week that James A. Jobling, the manufacturers of "Pyrex" glassware and a subsidiary of Thomas Tilling, had placed £1½ million of its 7 per cent debenture at 97, to give a flat yield of as much as 7.2 per cent and a redemption yield of 7¼ per cent to the latest date. Some stock was made available through the market at 97½ and in early dealings a price of 98½ was established. The rate of interest is high, but even so some of the life offices were not willing to assist, on the grounds that the 15 years' spread of redemption dates between 1971 and 1986 was too wide. An attractive capital premium is offered on early redemption, but the borrower's option to redeem will not necessarily coincide with the interests of lenders. Such a wide spread may be acceptable occasionally by life offices, but not in the case of an industrial company which has no reason to expect a sudden reinforcement in liquid resources. The life offices argue that normally the borrower should make a clear choice between a long-dated stock suitable for their funds or a shorter dated one more suitable for the funds of composite offices ; and now that some of the institutions have displayed disquiet about this issue it is unlikely that its form will be repeated.

The new issue market in general is at one of its most critical junctures for a number of years. On the one hand the banks, with their own liquidity ratios under pressure, are urging some companies to fund their loans. On the other, these companies are naturally reluctant to raise permanent capital at high rates of interest. The issuing houses, knowing too well how the market is suffering from indigestion, are advising their clients to defer their appeals if they can. All this may have the effect the Chancellor intended of forcing companies to postpone or even to cancel some of their marginal investment projects. From the stock market's point of view this may ultimately be reflected in a decline in the number of appeals for new money.

LOCAL AUTHORITIES

Money at a Price

This week a rural district council reported that it was unable to find £100,000 to tide it over until the end of September. It had obviously not looked very hard. The Public Works Loan Board always stands ready as lender of last resort to authorities that cannot obtain the funds they need in the market ; and in any case there are ample funds available in the mortgage market at present. Although the rate for seven-day money hardened by ⅛ per cent to 7⅜ per cent this week, as a result

Methane in the Market

Whether or not natural gas from Algeria is the cheapest gas this country could ultimately get, the British gas industry has had value already from its initiative in developing this technical possibility into a commercial proposition. Nothing revitalises a market like the threat of competition from a really cheap new source of supply: and the prospect of methane has certainly brought the gas industry a variety of other bargain offers that it might never otherwise have had.

It originally planned to make town gas from this rich imported hydro-carbon—for which it has already signed a contract with French suppliers and the Conch group, conditional upon ministerial approval—by "reforming" it. The possibility then arose of using methane to enrich "lean" gas made by the total gasification of coal in the Lurgi process; the small Lurgi plants already developed in Britain use oil for enrichment, but this is relatively expensive. The price competition of methane brought in offers of other cheap enrichment, such as propane (one of the refinery gases usually sold liquid under pressure as "LPG"). Most recently, other oil companies than Shell (which owns 40 per cent of Conch and has put its considerable technical and managerial influence behind the scheme to import methane) have been stimulated into offering the industry naphtha, a distillate fuel that is at present hard to sell, at prices well below those the industry has at present to pay for oil products used in gas-making.

The landed price of methane under the contract already signed has not yet been disclosed ; unofficial figures of 6d.-6½d. a therm have often been quoted, and the Gas Council's estimate that it could deliver methane regasified from liquid storage, via a high pressure main, to area gas boards for 7½d. a therm, reported last week by the Select Committee on Nationalised Industries, might be roughly in line with such a cif price. Propane could be made available in large quantities from the Western hemisphere for just under 5d. a therm landed ; this is the enrichment that the National Coal Board would prefer for Lurgi gas, though its estimates for Lurgi even enriched with methane give lower costs for the town gas produced than those of the Gas Council. Naphtha has been offered to the gas industry by certain oil companies—Esso and Gulf have been mentioned—at cif prices said to be of the order of 4d. a therm. If this were used as an enrichment for Lurgi gas, it might offer town gas even fractionally cheaper, though there are uncertainties about the process to be used, particularly about its flexibility: it might offer fairly cheap town gas alone.

The possibility of methane brought down the prices its competitors would offer ; it always remains possible however, that the reverse could happen. When the Gas Council was bargaining with Conch and the French, it had none of these competitive offers of other rich hydrocarbons to back its argument. This is the first operation of its kind: French tenure of Hassi R'Mel is politically uncertain, and the semi-nationalised company producing gas there may be anxious to write off its well-head installations, pipeline, and liquefaction plant quickly. Equally, there may be some technical risk of extra cost or high obsolescence in the refrigerated methane tanker, which two British yards are prepared to build for perhaps £3½ million apiece. On the other hand, both the French and Conch are vitally anxious for a customer for this initial venture: success could trigger off a significant new trade in natural gas that otherwise has no market outlet.

In such circumstances, the room for bargaining is quite wide ; and if necessary these suppliers might be prepared to match the prices of whatever competition they have to meet. If methane at 6d. a therm cif might not quite compete as a Lurgi enrichment, could other suppliers get under methane at about 5d. a therm cif —which would probably be economically feasible ? At such a price, moreover, using it as enricher for Lurgi would not necessarily be a better bargain than simply reforming the methane ; and there is even the possibility of making a lean gas locally from cheap naphtha and enriching this with cheap methane. The Minister of Power has still to announce his decision regarding the Gas Council's application to import, and he may have decisions to follow regarding the future of Lurgi and the possible reconstitution of the gas industry in order to develop cheap gas as fast as possible. Even before actually penetrating the British gas market, methane has made a radical difference to the gas industry's economic opportunities.

of very large withdrawals by a big industrial lender, it is still below the banks' prime overdraft rate of 7½ per cent. But the margin is not big and could easily disappear; and local treasurers cannot be expected to welcome big cuts in their overdraft limits at the clearing banks.

For their part, the banks regard the increased advances extended to the local authorities while foreign funds were being withdrawn as temporary and exceptional credits which the councils can now repay by returning to the mortgage market. This is not a question of forcing councils to increase their temporary borrowing further. Long-term mortgages can readily be obtained in the London mortgage market. The fact is that many local treasurers are reluctant to borrow on long-term at such high rates. Indeed, ever since Bank rate went above 3 per cent in 1955 they have been increasing their short-term borrowing to meet long-term commitments in the hope that rates would eventually fall. Now rates could indeed be at their peak, and rather than submit to borrowing at 7 per cent plus, some local authorities are cutting back their expenditure. The interest rate appears to have some effect after all.

BARLEY

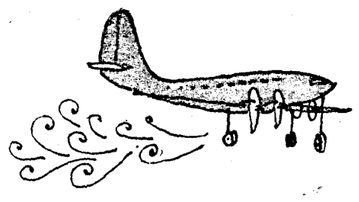
A Crop of Trouble

Those who expected this year's barley crop to go through the mill in a blaze of publicity are not being disappointed. Apart from the price shock, this year has brought a court case and intervention in the market by the President of the Board of Trade. Barley can be nasty stuff to handle, and on the many recent occasions that barley has brought Mr Maudling and his colleagues to their feet in the House they did not handle it very well. Government policy on coarse grains (barley, rye and oats) was set out in December's white paper on agriculture: the search for a plug to the drain on the Exchequer caused by mounting deficiency payments on barley stopped short of renunciation of the "free market" principle. The attempt to graft a free

CEREAL DEFICIENCY PAYMENTS

	Barley production	Barley subsidy	Total cereal subsidy
	mn. tons	£ mn.	£ mn.
1955–6	2·9	8·5	26·7
1956–7	2·8	10·5	34·2
1957–8	3·0	21·3	56·0
1958–9	3·2	20·4	49·7
1959–60	4·0	28·3	58·8
1960–1	4·2	35·1	74·6

market on to the system on guaranteed prices by means of deficiency payments at a level which is rapidly making Britain self-sufficient in barley seems to have produced a hybrid that will not work. When crisis arrived with the impending harvest, the Board of Trade added a hyena's head to the body of an ass by prohibiting "dumped" barley imported for less than £20 a ton: the "free market" price in Britain ex farm subsequently flopped again to around £17 a ton.

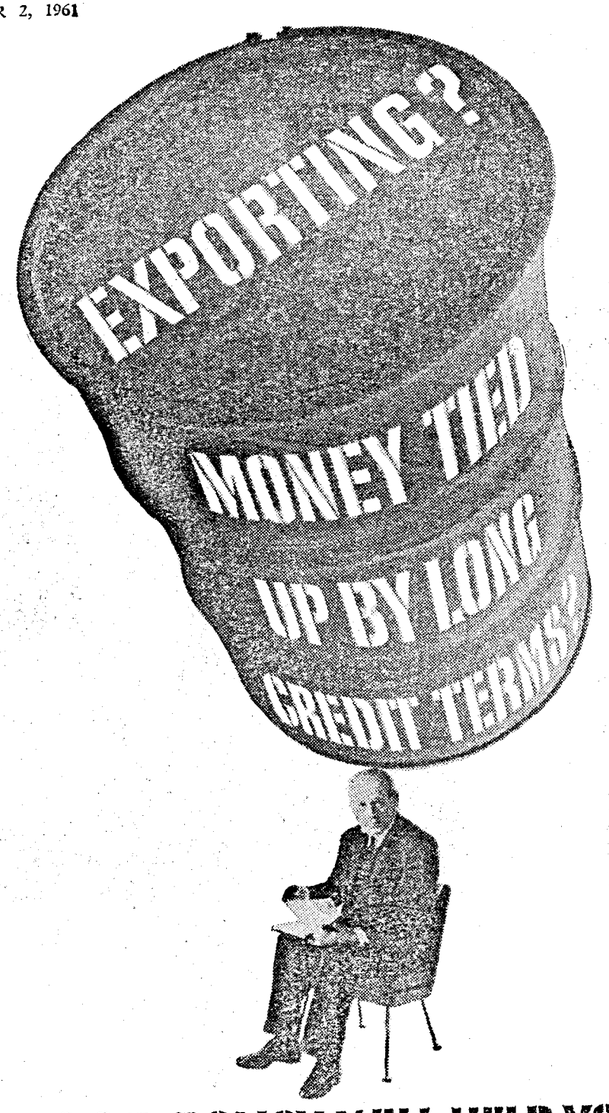


It transpired later that the £20 minimum was a "cif" and not landed price as originally announced; it has since been revealed that in Russia's case—it was our principal supplier this year—a voluntary quota of 150,000 tons had been agreed for exports this season and the question of price discreetly omitted. Contracts for importing 425,000 tons of barley from Russia this season were mentioned in the case at Guildhall where an important dealer in Russian barley was fined £25 for making a false statement in a return to the ministry listing barley deals. These have apparently been commuted to the lower figure probably to the considerable relief of the Exchequer.

Barley imports generally this season will conform to Mr Maudling's edict, though loose ends like imports from Iraq and unfilled contracts have not been tidied. The minimum import price was probably intended to put a floor under the market, but it now seems a ceiling, though it will possibly be neither. The ex farm parity of £20 a ton cif is reckoned to be roughly £18¼ a ton. Heavy imports earlier this year have possibly filled up some of the space in the stores of compounders of animal feeding stuffs that should have been ready to receive the new crop—despite last year's record crop, imports so far this year already exceed those for the whole of 1960. Demand is not strong enough to carry the full weight of the new crop. Farmers, especially those who lost heavily through storing their crop last season, are anxious to unload the new one as quickly as possible. The incentive introduced this year to encourage farmers to store their barley is ineffective, although at its maximum it

AIR TRANSPORT

The Flying 8.15



During the recent American slump in air traffic, from which the airlines are slowly recovering, one device for catching passengers proved so popular that it may be tried out experimentally in this country. This is the commuters' air service, operating between cities like a suburban train. Passengers do not book in advance. They are guaranteed a seat on an aircraft providing they arrive at the check-in point by the prescribed time, and pay for their ticket during the flight. The service has been pioneered by Eastern Air Lines, using old Constellations which would be almost unusable on a normal passenger service. Fares are slightly lower than the standard coach fare. Punctual service combined with the certainty of getting a seat has made these commuter flights popular with businessmen. For the airline, however, the service involves one snag; a stand-by aircraft and crew have to be kept waiting in case the regular 95-seat flight fills up before its scheduled departure time, and such a stand-by aircraft has been flown with only one passenger.

British European Airways is thinking of a similar experiment on its internal flights to Glasgow, if only to see whether it can beat the problem of businessmen who book on five or six different flights but turn up for only one. Nearly ten per cent of the passengers booked on BEA's internal services fail to turn up, and in spite of Mr Philip Mair's complaint to *The Times* that he could not book a seat on BEA's Manchester services, the flights he mentioned almost invariably leave with empty seats. The corporation is going to ask the Licensing Board for permission to increase the penalty for "no-show" from its present level of £1 (which the corporation is admittedly lax in collecting) to a figure high enough to hurt. This would take the form of a booking fee retainable by BEA if the flight was not cancelled in time. But the non-booking commuter service is obviously a better answer. BEA, however, does not possess the large fleet of obsolete aircraft that made the experiment possible for Eastern, and the economics of the service might be jeopardised if the corporation had to keep a large new aircraft and crew permanently standing by. The trial flights being planned to Glasgow may show whether the Vanguard, with its big carrying capacity, is large enough to seat all the passengers likely to turn up for one flight.

PROBLEM NO. 3

YOUR E.C.G.D. POLICY WILL HELP YOU OUT

However well you stand with your bank manager, the finance needed for selling more abroad, or granting longer credit, may set him a problem—particularly if it comes on top of re-equipment, expansion of plant, stockbuilding, or other financial calls. But an E.C.G.D. policy not only tells him that your export trade is secure, its assignment to the bank provides valuable collateral security. Talk it over with your bank manager—and get in touch with E.C.G.D.

amounts to 25s. a ton. But it costs 2s.-3s. to store a ton of barley for one month and rehandling adds about £1 a ton to the bill. However, Russian supplies are now voluntarily restricted, Canada has less to sell and Britain may not have a larger crop, but may export more malting barley. Although Australia is offering barley at the minimum price for delivery next year—so far without response—prices could recover beyond the £20 target. But after last season's experience, too few farmers are prepared to hold on and find out.

TERMS OF TRADE

In Britain's Favour

VALUED at 1954 prices, Britain's imports in the first six months of this year were more than £40 million higher than in either half of 1960, that dreadful year for the balance of payments. But in this period the actual value of imports adjusted for seasonal variation fell by 1½ per cent below the average for 1960: exports increased and maintained their price. Without this favourable twist in the terms of trade, the prospect for the balance of payments in the early months of 1961 would have looked bleak indeed. In July, the normal drop in prices of imported vegetables and fruit lopped three points off the index of food prices; consequently import prices as a whole fell one point to 97 (1954=100). Export prices have been unchanged at 112 throughout the year; the terms of trade (import prices expressed as a percentage of export prices) improved from 88 to 86 in July. Britain should therefore be finding it easier to pay for its imports than at any time since the war.

Even in an exceptional year like 1960, when imports of basic materials and manufactures rose to a level that could not be sustained, imports of food, beverages and tobacco accounted for a third of the value of all imports. To judge from the lengthening list of suppliers who are having to be restrained by the threat of anti-dumping duties from selling to Britain too cheaply, this country has been placed in a happy position by overproduction of many primary products. Last week, the Board of Trade decided a case was made out for "protection" against imports of cheap middle

bacon and representations from other interested parties were invited. This week Britain has asked for another Gatt meeting of butter producers which it expects this time to produce restrictions on supplies of butter to Britain.

ATOMIC ENERGY

Last In, First Out

CROMPTON PARKINSON was the last big electrical manufacturer to go into atomic energy and the first to leave it. The four original atomic consortia, headed by Parsons, AEI, English Electric and GEC, were formed in 1954 and are almost as old as the Atomic Energy Authority itself. Crompton Parkinson did not join with International Combustion and Richardsons Westgarth to form Atomic Power Constructions (now building a 500 MW nuclear power station in Wales) until early in 1957, and then only after considerable pressure from the Atomic Energy Authority, which feared that the four original consortia did not possess enough capacity to carry out the then recently expanded atomic power programme.

Since those days, the programme has been roughly halved and there is not enough work to go round. Mergers have reduced the number of consortia from five to three; after an on-off engagement temporarily broken while GEC flirted with English Electric, Atomic Power Construction and GEC have finally merged their nuclear divisions to form the United Power Group. When the merger talks got seriously under way late last year, Crompton Parkinson intimated it did not want to join the new company. Now the last link has been broken with the resignation of its managing director from the board of APC, which has to be kept in being until the Welsh contract is completed. This decision recognises that there is still considerable surplus capacity within the new groupings on the turbine and the boiler-making side, and not a great deal of work is likely to come the way of the smaller partners in return for the sizeable outlay involved in remaining a member of the nuclear club. The £100,000 *pourboire* that the Generating Board is nowpaying to companies that submit bids for the kind of turnkey contract awarded for nuclear power stations—winners and losers alike—is only a fraction of the cost of actually preparing the contract, which is variously estimated at anything from £50,000 to £500,000.

Council Investments: a New Survey

LOCAL AUTHORITY INVESTMENTS

Investments in real property	7·4	1
Total (excl. inter-authority investments)	462·5	84
Local authority quoted stock	8·4	2
Local authority temporary money (12 months or less)	43·6	8
Other local authority loans	35·0	6
Total	549·5	100

A FURTHER new series of financial information recommended by the Radcliffe committee appears this week in *Economic Trends* on the financial assets of United Kingdom local authorities. The total assets of both sectors, the "general" fund and the superannuation and pension funds are roughly equal—about £550 million. The largest item in the general fund is mortgages and other housing loans to individuals. In Scotland, however, this item is only 7 per cent in total investments, against 56 per cent in England and Wales. Gilt-edged securities account for 14 per cent of investments on average and more than two-fifths of these holdings are in long-term or undated securities. The largest item in the superannuation and pension funds is loans to parent authorities of £266 million followed by holdings of gilt-edged of £88 million. In Scotland internal advances accounted for 67 per cent of assets.

EQUIPMENT LEASING

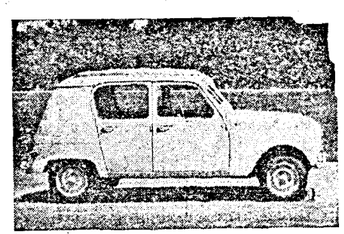
Hire Without Purchase

A SECOND American company has entered the lists to lease capital equipment to British industrialists. The practice of leasing capital equipment rather than buying it, in order to free working capital for more profitable uses, is well established in the United States. In June of last year the United States Leasing Corporation joined Mercantile Credit in forming the Mercantile Leasing Company to offer this service in Britain. Now a new company, Equipment Leasing Ltd., has been formed by Lease Plan International of New York (which has an annual turnover of $73 million in the United States) in association with Hambros Bank, Phoenix Assurance, and Cable and Wireless (Holding). It will offer a leasing service first in Britain and eventually also on the Continent too. The company, with an authorised capital of £500,000, roughly at least half of which will be held equally by the American company and Hambros, will purchase equipment in Britain and will lease it at a rent determined by the cost of the equipment and the period of the lease, plus management and interest charges. The scale of charges has not yet been stated, but the company says that they should compare favourably with hire purchase charges on similar types of equipment.

The industrialist who wants to know whether it will be cheaper to lease or to buy his capital equipment on hire purchase will in any case have to turn to his tax accountant for advice. Broadly, under a leasing agreement the lessee gets tax relief on the whole of his rentals; the lessor receives the capital allowances but must pay tax on the whole of his rental income. Under the hire purchase agreement the capital allowances go to the hirer, who also gets tax relief on his interest charges. Capital allowances vary with the type of equipment, but in general over the initial period of a contract they will be smaller than the tax relief on rent payments by a lessee. But once the stage is reached where the lessee is paying only a very small rental (which happens when the rentals have covered the cost of the equipment) and the hirer has paid his last instalment, the position is reversed. The lessee's tax relief is now small, while the hirer has no more out-goings but is still normally getting his annual tax allowance on the equipment. For the industrialist it is a matter of timing; he must decide whether he wants his tax advantage now or later.

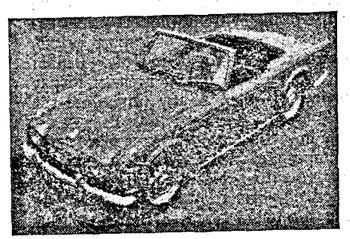
TRAFFIC ENGINEERING

Slow Road Through Red Brick



IT did not need a world traffic engineering conference, such as the one held in Washington last week, to reveal the vast gap between ideas about traffic management in Britain and their actual application. The profusion of ideas continually bubbling from the Road Research Laboratory, within the limits set by its budget and—until its new test track at Crowthorne, Berkshire, was completed last autumn—by its working facilities, are as notable and as advanced as from any other motorised country. But the implementation of even the simplest notions about how to make the best use of existing roads and securing the best design of new ones (which is what traffic engineering in essence means) lags a very long way behind.

This is the direct result of the shortage of trained traffic engineers here. London now has its traffic management unit, under Dr Charlesworth, who was specially drafted from the Road Research Laboratory and who has already shown what can be achieved by applying a little scientific method and common sense to traffic regulation. But less than a third of the county councils and a sixth of the county boroughs in England and Wales yet have traffic engineers, in name or by training, on their highway staffs. One estimate puts the number of qualified traffic engineers that will be needed over the next twenty-five years at a conservative 900. The immediate need, therefore, is for training facilities for the people who will train these 900. The professional engineering bodies and some technical colleges now include the subject in the syllabus. Interested senior engineers are served to some extent by the Institution of Civil Engineers' new traffic engineering study group and by the short and eagerly-sought-after courses run each year by the Road Research Laboratory. But it is to the universities that this nascent profession is looking for its future teachers, for an extension of research effort—and, quite legitimately, for a recognition of status. A chair at Birmingham and a readership at Durham are not sufficient; many of the students and post-graduates at the two places, moreover, come from overseas. The Ministry of Transport and the Road Research Board still have hopes that something positive will yet result from the one-day conference organised by the laboratory in April which was attended by representatives from twenty-one universities and other interested bodies. But their work of conversion and persuasion is still steeply uphill.



NEW CARS

Utility and Pleasure

THE two new cars unveiled this week have only one thing in common: the prices of both have yet to be announced. The Renault 4 and 4L are intended to put the company into the cheap utility car market that Citroen has exploited so successfully with the 2cv. The Triumph TR4 is meant to strengthen Standard-Triumph International's position in the sports car market where the company is already entrenched with the TR3. Renault has taken great care to make the 4 and 4L cheap cars to produce and to run; they use the same 747 cc engine and three speed gearbox as the 4cv, which they replace, and are similar to the engine and gearbox of the Dauphine, which are made on the same production line. But in the new Renault cars the engine is mounted behind the front wheels, which it drives not at the rear as in the 4cv. This space-consuming layout is one reason why the car is relatively big—about 12 feet long. But it is also roomy for a cheap car, like the 2cv Citroen.

The engine of the new Renault is water cooled but the cooling system should never require attention—unless a hose breaks—as it is filled with anti-freeze in the factory and sealed. An even greater saving in maintenance costs comes from dispensing with the need for greasing of joints after manufacture. The springing is conventional, though intended to give a comfortable ride over rough roads; torsion bars are used for the front and rear wheels. If the car is priced close to the Citroen 2cv it should offer stiff competition, for it will have a better performance, especially in top gear. And it should help to extend the market for new cars down the income scale. No British cars at present compete in this nether-end of the market on the continent—though the BMC baby cars might if there were no tariffs. Likewise, British tariffs will, for the time being at least, preserve the British industry from any real threat from the new Renaults in this country.

The TR4 is more closely related to the model it replaces than the new Renault. The body is the biggest change. It is intended to make the car appeal to those who want more comfort than the TR3 could provide: winding windows, for example. The engine has been enlarged to 2,138 cc, mainly to give the bigger car the same performance as the old one; the springing is a little softer and the track wider to improve cornering and there is synchromesh on all four gears. Rack and pinion steering is now fitted; this gives precise control, though it is rather heavy. It typifies a masculine and traditional sports car, which retains the ability to attain 100 mph with ease (mechanical if not mental) on English roads. If its price is not too far above that of the TR3, of which 80,000 have been sold, chiefly because it offered the most performance for buyer's money, it should strengthen S-TI's position in the sports car market—especially in the United States.

COTTON TEXTILES

Another Mill Closes

WHILE negotiations with Hongkong dragged on, the life was being drained from at least one large mill in Lancashire. A quick restoration of orders was confidently expected when the import question was settled. True, only half of this problem was resolved by Hongkong's undertaking to maintain restrictions on exports of cotton goods to this country; imports from non-Commonwealth sources which attract the full import duty are unaffected. But the first significant closure since scrapping ended under the cotton reorganisation scheme within a week of the new undertaking being given was a rude shock. Had Fine Spinners' Lumb Mill near Ashton-under-Lyne been shut down 18 months ago, the group could have pocketed a fairly significant sum in compensation under the scrapping schemes; the shock of this largely unexpected closure will reverberate far beyond the 300 or so workers who lost their jobs. Despite last year's boom and fears that scrapping had been overdone, are there already too many spindles, and possibly looms, in Lancashire?

The cotton industry is still large and diverse; recently, it was not too difficult to unearth weavers with orders that ensured capacity working for about six months. At the same time, doublers have languished and some spinners, particularly of fine yarns, have felt the full blast of recession. Under the new agreement with Hongkong, imports of yarn might be restricted for the first time. But the trend of demand has been unfavourable for doublers and spinners of fine yarns. Single yarns are replacing doubled yarns in some cases, and coarser yarns are eating into the market for fine yarns.

It is not unknown for closures in the wool textile industry to be caused entirely by the shortage of labour. This was evidently an important factor in the closure of the Lumb Mill, which could not staff a second shift, although in part the lack of key workers stemmed from the inability to keep them suitably occupied. In the changed post-war conditions, few firms are prepared to carry large stocks of yarn. In the words of Fine Spinners' chairman, the agreement with Hongkong came too late. This scheme is causing considerable disagreement over its application in the colony. The most controversial clause is one that is alleged to link supplementary export quotas to the state of Lancashire's order books, although especially at times like the present their length is mainly governed by jockeying by potential customers. It also seems to imply that when foreign exporters win orders from Lancashire, Hongkong will lose its bonus. The best that can be said of the arrangement is that it is limited to supplementary quotas.

PLASTICS

More But Cheaper

A TEN per cent increase in the sales of plastics materials in the second quarter of this year does not mean that the troubles of the British plastics industry are over. Much of this growth was won by selling near or below cost. The 30 per cent increase in polystyrene sales, for example, was obtained by exporting at or below full cost and by reducing the home price by 4d. a pound to discourage imports. The rise of 25 per cent in the sales of polyolefines—polythene and polypropylene—is more difficult to explain; there seems to have been no increase in exports and hardly any drop in imports. This means that the home market must have accounted for the whole increase; and, since roughly half British output is exported, home sales must have risen by 50 per cent. Consumption did rise, as a long-term effect of the cut in price made last autumn, but it can hardly have increased as much as this. User's stocks must have grown; it looks as though part of the fall in sales last year was caused by stock reductions, and that buyers had decided to return to the market last spring.

If this was so and stock rebuilding began in the belief that prices would not fall further, buyers must have been unpleasantly surprised when Imperial Chemical Industries took 4d. a pound off the price of polythene early in August. Like the last cut in price, this was caused by the need to keep in step with prices charged by foreign competitors, but this time these were the Italian producers, not American. The Italian plastics industry has considerable excess capacity. Now that polythene costs only 1s. 6d. a pound, sales should increase again; but even if output gets close to capacity, profit margins must be thin for all producers but ICI.

SHORTER NOTES

The Government has refused Tunnel Portland Cement permission to import Polish coal, which is not unexpected following its rejection a few weeks ago of a similar application from Steel Company of Wales to buy American coal.

★

On August 14th, there were 304,976 people registered as out of work in Britain, 16,000 fewer than at the same time last year, although, expressed as a proportion of the labour force, the rate at each time was 1.4 per cent. Excluding school-leavers and those only temporarily stopped, the numbers wholly unemployed had risen by 20,457 since the previous count on July 10th, the usual seasonal increase being about 9,000. Seasonal factors apart, the August count was the third successive one to show a small rise in unemployment, bringing the level higher than at any time since last December. On the same basis, the number of vacant jobs, which had been increasing month by month this year up to June, fell by 28,000 over the next two months back to the same level as in March.

The World Bank has placed $100 million in 4 per cent two year US dollar bonds to replace a maturing issue; the bonds have been taken up by private investors in 32 countries. The bank has also announced a loan of $39 million to Colombia for roads; and its affiliate, the International Development Association, has lent $5.9 million, on its usual basis of 50 years—interest free, to the Republic of China—i.e. Formosa.

COMPANY MEETINGS

BRITISH TAR PRODUCTS LIMITED

MR F. WOOLLEY-HART'S REVIEW

The forty-first ordinary general meeting of British Tar Products, Limited, was held on August 31st in London.

The following is the circulated review of **Mr F. Woolley-Hart, OBE** (the Chairman):

In presenting the Accounts for the year ended March 31, 1961, I have to report a decline in Trading Profit and other Income of £4,566 to £116,845. The reasons for this are explained later in the Address.

The charge for Depreciation has again increased by some £3,000 to £28,001. The net sum of £26,645 has been spent on Capital Account and after this expenditure the surplus of Current Assets over Current Liabilities is £213,454. The charge for Taxation has also increased by £3,265 to £35,048.

However, your Board feel justified in recommending the payment of a Final Dividend of 10 per cent less Tax, making 15 per cent less Tax for the year, a transfer of £15,000 to General Reserve Account and to carry forward to next year's Accounts a slightly increased amount of £28,692.

TRADING REVIEW

In common with some of the large Chemical and other concerns the year started with considerable promise but during the latter portion the general uncertainty of trade had made itself felt and what has been described as the "Behaviour of sales and margins" at the end of 1960 and the beginning of 1961 has retarded—only temporarily we hope—the upward curve of our Revenue and Profit.

The World shortage of Naphthalene seems to be easing and with the prospect of rather more raw material in this Country our refining plant should operate on a more economic footing.

We have extended our Hydrogenation Plant, continuing to enlarge our range of high grade products and whilst rapid expansion is restricted in certain directions by a limited market, it seems inevitable that with the development of the modern chemical industry we shall enjoy the results of our enterprise in due course. Our readiness to undertake special distillation work has enlarged our operations in this field and the necessary extensions to plant will always be undertaken to cope with additional business.

We suffered a setback in production through a rather serious fire at the Naphthalene Plant last July but by the turn of the financial year a considerable amount of the necessary restoration work had been completed. The losses were, of course, fully covered by our insurance.

BULK STORAGE INSTALLATION

As with the manufacturing side so has the bulk storage throughput not advanced during the latter part of the year as quickly as we could have wished, although an increase of 20 per cent over the previous year may certainly be considered satisfactory. There was undoubtedly some slackening in the forward movement of conversion from solid to liquid fuel burning which doubtless militated against a more spectacular increase, but this should not be sufficient to change the existing trend and there are grounds for thinking that the continuing increase in world demand will be accompanied by a reduction in operating costs.

THE FUTURE

As regards the future, we see no reason to deviate from our programme as planned and we shall in due course proceed with the carrying out of such extensions and additions as seem desirable. We have to face narrowing margins due to cheap chemicals produced on the Continent—particularly beyond the Iron Curtain—penal taxation in our own Country as well as the determined efforts being made by the Coal Industry to promote solid fuel burning, but whilst I must observe and endorse the word of warning uttered by leaders of the large Chemical undertakings, I feel that we can, nevertheless, view the longer term position with reasonable optimism.

STAFF

It is with regret I have to report that Mr A. E. Brown, who has been in the employ of the Company since its formation in 1916 and has filled the position of Managing Director since June 1, 1947, has intimated he feels the time has now come when he should retire and his resignation which will become effective as from September 30th next has been reluctantly accepted by the Board, who wish to place on record their high appreciation of his services which I am happy to tell you we have arranged to retain on a consultancy basis.

I end my address with a word of thanks to my Colleagues and to all in the Company's service for their efforts in a somewhat anxious and disappointing year.

The report and accounts were adopted.

THE GLOBE TELEGRAPH AND TRUST COMPANY

(Investment Trust Company)

A DECADE OF REMARKABLE GROWTH

The eighty-eighth annual general meeting of The Globe Telegraph and Trust Company Limited was held on August 25th in London.

Sir Edward Wilshaw, KCMG, DL, JP, LLD, FCIS (the chairman), presided and, in the course of his speech, said:

For the past ten years each succeeding year has been a record one, and I am glad to report that this has again happened in the financial year which closed in June last. Ten years ago, and I quote in round figures, our gross income was less than £600,000; last year it was £1,600,000. Ten years ago the *book* value of our investments was £8,250,000; last year it was considerably over £19 million. The value of the investments ten years ago was £9,700,000; the value at June last was £45 million. This is a very satisfying record and one of which all concerned may be proud.

The dividend has been maintained at 10 per cent since 1955 and during recent years from time to time we have given to stockowners free shares by way of capitalisation of reserves and, in addition, have afforded opportunities of purchasing the Company's shares at prices very substantially less than the market price.

The advantages of our policy and progress to the individual Stockowner can best be seen by considering the benefit arising from the investment of £100 in this Company ten years ago when the gross income receivable was £5 9s. Today that investment, without further cost, is worth £490 and provides a gross income of £13 12s.

I have complete confidence in our ability to maintain the payment of a 10 per cent dividend next year on the full amount of the capital as increased during the past year, and I hope that in due course we may be able not only to continue paying a 10 per cent dividend but also to continue from time to time our policy of issuing free shares and shares on advantageous terms.

DIVIDEND RESTRICTION

The Chancellor's request to companies to refrain from increasing the rate of their dividends does not apply to this company because for a number of years it has been our well known policy to maintain the payment of dividends at the rate of 10 per cent yearly and we shall hope, in normal circumstances, to be able to maintain this rate for so far as we can see ahead. Nevertheless, should your company's income be affected by the Government's current request for dividend restriction it should be borne in mind that a degree of stability for your own dividend is ensured by the provisions made to the General Reserve and to the substantial amount of the unappropriated earnings carried forward.

Normally Trusts, and this applies more particularly to Unit Trusts, own a balanced portfolio of investments, so that if there is a reduction in dividend in some it is compensated for by increased dividends from others. If, therefore, the Chancellor of the Exchequer's request is carried out in such instances it means that the Investment Trust Companies concerned will have to bear the loss of any reduction in dividends received, without any compensating advantage in receiving increased dividends from others who have been more prosperous. So far as this Company and the associated companies within the Group are concerned, this does not worry us, for reasons previously stated that we have sufficient reserves in hand to continue the maintenance of the 10 per cent dividend. But this, I fear, does not apply to all such companies, and certainly will prove an embarrassment to some Unit Trusts which are doing their best to encourage the small saver.

This Company, as you may well know, has for many years done its utmost to encourage the smaller investor and I think the success of our efforts is amply evidenced when I tell you that, over the past five years, the number of accounts on the register of this Company alone of owners of Ordinary Stock, has increased by no less than 100 per cent and at present stands at some 14,000 accounts.

The report and accounts were adopted.

BRITISH MATCH

RESULTS FOR 1960/61

Group profit before taxation was £3,344,000; last year it was £3,574,000.

A final dividend of 1s. 4d. per £1 stock is recommended, making 2/- for the year.

THE MATCH INDUSTRY

Total profits from matches were higher, due to improved trading by our companies in the Commonwealth and South America. A £600,000 factory is to be built at Recife, Brazil.

At home, Bryant & May celebrated their 100th year of match-making by completing their £1,500,000 modernisation plan and were honoured by a Royal Visit.

The Government, despite protests, again permitted higher imports of matches from behind the Iron Curtain. These matches are dumped here, without a specific statement of origin, marked merely "Foreign Made".

DIVERSIFICATION

In general, match consumption has ceased to grow. The group now has 23·9% of its assets in other industries and means to expand and increase such interests. These already include Weyroc woodchip board, Prestfibre woodpulp mouldings, Peerless hotpress blocking foils, Setright ticket issuing machines, Pain's fireworks, Hunt's sparklers, Silver Fleece steel wool, Mills' wire products; also cardboard cartons and boxes made and printed by the Chapman, Coutts and Wolverhampton Box companies.

Report and accounts may be had from British Match Corporation Ltd., Fairfield Road, London E.3.

I.B.E. LIMITED

SUBSTANTIALLY INCREASED PROFITS

The thirty-third annual general meeting of I.B.E. Limited was held on August 29th at Slough, **Mr Robert Montgomerie** (the Chairman) presiding.

The following is a summary of his circulated statement: The increase of 35 per cent in our Trading Profits for the year to March 31st last is a very satisfactory achievement and at £192,163 our Earnings are within a few hundred pounds of the record reached in 1952.

After charging Taxation and all other outgoings the Net Profits attributable to shareholders of the Parent Company show an increase of 39 per cent over the comparable figure for last year and in the circumstances your Directors felt justified in raising the Ordinary Dividend to 12½ per cent.

The opportunity arose during the year of acquiring on satisfactory terms all the shares of Bristowes Tarvia Ltd., a company already established in the road business. Bristowes Tarvia Ltd., and its subsidiaries, operating from factories at Grantham and Hereford, are principally engaged in the manufacture and distribution of bituminous emulsions and the well-known proprietary compound "Tarvia."

SUCCESS OF NEW PRODUCT

Our other companies concerned with roads have made encouraging progress and it is particularly gratifying that the new type of surface dressing material, to which reference has been made in previous years, is being received most enthusiastically by a constantly widening circle of users. The material is now being marketed in Great Britain under the Trade name "Surfix" and arrangements are in hand for the registration of this name in several overseas territories.

Our business in specialised building materials has continued to expand in a very satisfactory manner. These materials, which have been developed over a number of years, were until recently being sold under various names in different parts of the country and consequently during the year it was considered desirable to form a new company, Plycol Ltd., for the purpose of marketing them in attractive packings bearing the uniform Trade Mark "Plycol." The wide range of products being sold under this name includes anti-corrosives, adhesives, concrete additives, jointing compounds and a variety of materials for the treatment of roofs, floors and walls.

Although conditions in the paint trade continue to be highly competitive and margins are consequently restricted, I am pleased to tell you that the position of our own companies in this field has been more than held.

Having reviewed the Group's interests in South Africa and Pakistan, the Chairman continued: Taking a long view I think it is fair to say that the policy being adopted by your Board gives us every reason for confidence. With regard to the more immediate position, current reports of our various activities give every indication that the advancement made last year is being well maintained and, provided we are faced with no unforeseen disturbances, it is reasonable to expect that the present year will be no less satisfactory.

The report was adopted.

THE INDIAN IRON & STEEL COMPANY, LIMITED

(Incorporated under the Indian Companies Act 1913)

INDIA'S OPPORTUNITY IN WORLD STEEL MARKET

The Annual General Meeting of The Indian Iron and Steel Company, Limited will be held on September 5 in Calcutta.

The following is an extract from the statement by the Chairman, **Sir Biren Mookerjee,** which has been issued to the shareholders for the year ended March 31, 1961.

Production of iron for the year at 1,160,576 tonnes and of steel ingots at 914,159 tonnes showed an improvement over the previous year and constituted a fresh record for the Company. There are however no grounds for complacency for with the serious deterioration in the quality of raw materials there can under existing conditions be no possibility of achieving the output envisaged at the time the expansion of our plant was planned, and in fact serious difficulties are foreseen even in maintaining production at the 1960/61 level.

It should be borne in mind that the financial results disclosed are based on provisional steel sales realisation figures which are subject to revision according to the decision of Government on the pending inquiry by the Tariff Commission as to the steel retention prices to apply from April 1, 1960. To obviate hardship while the matter is under reference, Government have granted a provisional price increase as from April 1, 1960.

The main difficulty in achieving the iron and steel output envisaged is the extremely high and varying ash content in presently available metallurgical coal coupled with erratic supplies and the fact that owing to the transport position our stock of coal is diminishing so severely that unless the position rapidly improves, we shall be forced to curtail the production of iron.

Until the raw materials position improves, which I fear cannot be for some years to come, operation must perforce be carried on under extremely difficult and restrictive conditions. In fact, it would seem that before improvement takes place, the position must yet further deteriorate, for there remain still three more blast furnaces to be brought into operation in the public sector plants. I view with the greatest disquiet the consequences of this impending further demand in relation to the existing shortage of coal and transport.

I would make it clear that we have abundantly proved that given working conditions in any way approaching those assumed at the time the extensions were planned, our plant, as now expanded, possesses the full designed output potential. This has been conclusively demonstrated on those unfortunately rare occasions when a combination of fortuitous circumstances has enabled us to operate temporarily under reasonably normal conditions.

Export of Steel: India, at present, stands on the threshold of a golden opportunity to secure a place for herself in the world market for steel. It is now for the Government advantageously to utilise this position and thereby tap a vast source for earning the foreign exchange which is so vital to the progress of the country. Unless adequate measures are taken immediately there is, in my opinion, grave danger of allowing this opportunity to escape.

East of Suez and in most parts of Africa, there is a vast and growing demand for iron and steel at present. India is in an enviable position to meet these requirements being basically one of the cheapest producers of iron and steel in the world, having been abundantly endowed by nature with practically all the essential raw materials and the manpower. This position is however obscured by the inflation of production costs by the large contributions which directly or indirectly are levied on the industry for the benefit of Governmental revenues.

Our iron ore resources are noted as being not only practically exhaustless but also of the highest quality. Yet for the reason I have mentioned we find ourselves in the unfortunate position of being outpriced in so far as our competitive position is concerned *vis-à-vis* the other exporting countries of the world except, perhaps, the USA.

The Government at present allows an export rebate of approximately Rs. 53/- per metric ton of finished steel equivalent to the Excise Duty levied on the steel ingot. Even after taking advantage of the rebate so allowed by Government, the Indian producer cannot compete with the prominent steel exporting countries, namely the UK, Japan, Belgium and Germany. To strengthen the position of the Indian producer I feel that Government should give serious consideration to the adoption of measures which will enable the producers to reduce their production cost as much as possible under present working conditions.

Labour: I referred last year to the persistent rise in our Works cost despite the increase in our production. Much of this increased cost is due to the severe Governmental revenue imposts inflicted on industry in the shape of excise duties, increased customs duties, cesses, sales tax and the like, which either directly, as in the case of the steel excise duty, or indirectly by their effect on the delivered cost of goods, enter into our cost of production. Outside these items however, perhaps the most serious single factor is the persistent and inflationary rise in labour costs which again reflects directly or indirectly on our cost of production.

Labour in the Indian steel industry is better off by and large than similar labour employed in other industries in the private sector and in all industries in the public sector.

Coupled with and directly bearing on the pay to be assigned to a job is the question of manning. In our own case we are at present compelled to employ at least twice as many men as are necessary having regard to the almost complete mechanisation of our plant, and to keep them in employment irrespective of our needs or of our costs.

I would make it clear that I do not for one moment suggest the imposition of a ceiling on the income of any workman. What I do suggest however is in effect a ceiling on the labour cost per ton of output, which is a vastly different matter. If industry is to continue to suffer from overmanning and low productive effort, then wages cannot be increased without inflation and loss of competitive power in world markets.

DONALDSON TEXTILES LIMITED

("Donbros" Ladies' and Men's Knitted Outerwear, "Copley" Hand Knitting Yarns and "Berkshire" Nylons)

GROUP SALES SHOW FURTHER EXPANSION

The fifteenth annual general meeting of Donaldson Textiles Limited was held on August 30th in London, **Mr Alasdair Donaldson** (the chairman) presiding.

The following is an extract from his circulated statement:

The Consolidated Trading Profit amounted to £467,469 compared with £458,438 in the previous year. Depreciation amounted to £133,768 against £126,189 last year, and taxation at £175,532 is £21,346 more than a year ago. The net profit for the period is £183,704 against £205,757 in 1959-60

During the period under review the sales of your Group showed further expansion—a 10 per cent increase over last year's record turnover. Again however we experienced the continued trend of rising costs in a market unreceptive to any form of increased prices. Your company, along with others in the industry, has absorbed these costs through improvement of production methods and factory layout but there is no doubt that as the scope for absorption becomes more limited the problem of maintaining profit margins without increasing prices becomes increasingly difficult.

In my last statement I referred to the increasing competition from overseas countries. This has continued to increase, with imports of knitted goods rising by nearly 50 per cent during 1960 to a total of 14.7 million pounds.

Our sales to overseas countries again show an increase but the demands on our flexibility to meet specialised market requirements become heavier. This we feel is one of the key factors to be overcome if our penetration into some of these markets is going to extend.

FUTURE

Forecasting the future in the textile industry is always something of a dangerous occupation. Perhaps at this particular moment when it seems probable that the Government are endeavouring to find a formula which would permit this country to join the Common Market, forecasting the future becomes more hazardous. If this takes place, no one at this stage can envisage what the costs are going to be to a particular industry or what benefits are going to accrue to other sections of our economy.

The possibility of a market of this size becoming more open to our products must be exciting. We do not minimise the challenge it could make to us, but accepting the fact that we meet the demand for flexibility—a point which I stressed earlier in my statement—I see no reason why we cannot meet this with confidence. Our whole policy over recent years has been to re-equip our organisation for any future developments.

Our sales position in the earlier months of the current year shows increases compared with the corresponding period of last year, but again there has been the continuing tendency to delay in buying for Autumn requirements.

The report and accounts were adopted and the final dividend of 7½ per cent on the Ordinary Shares, less tax, making 12½ per cent for the year, was approved.

BANQUE DE L'INDOCHINE

PARIS

The Annual General Meeting of BANQUE DE L'INDOCHINE was held in Paris on June 28th, and the following are details of the report presented by the Board of Directors:

In general, the Bank's operations in the Far Eastern countries showed satisfactory progress.

Operations in the French Pacific territories also continued to improve. In spite of present political difficulties, *French Bank of Southern Africa Ltd.*, the South African subsidiary, again strengthened its position. Operations in Ethiopia and Saudi Arabia continued to be hampered by current conditions but the Djibouti branch returned favourable results.

The activities of the London branch remained satisfactory, and work began on the expansion and modernisation of the offices, which could no longer accommodate the increased volume of business. In New York, the *French American Banking Corporation* continued to expand the scope of its activities satisfactorily.

As in previous years, the Bank, which ranks as one of the leading "*Banque d'Affaires,*" participated in France's economic development particularly as regards the export trade. In this context, the 1960 report contains most valuable information on the numerous financial and industrial subsidiaries of the Bank: *Comptoir Lyon-Allemand; Crédit Foncier d'Algérie et de Tunisie; Banque Franco-Italienne pour l'Amérique du Sud; Compagnie des Salins du Midi; Entreprise de Dragages et de Travaux Publics; Le Nickel,* etc. As a result of the increased activity, revenue from domestic operations was sufficiently high to offset the lower interest rates in force during the year.

Net profit for the year amounted to NF. 10,217,302.27 as against NF. 9,826,077.58 for 1959, and it is proposed to distribute NF. 7,593,602.95 in the form of a net dividend of NF. 10 per share.

S. HOFFNUNG & CO., LIMITED

TURNOVER MAINTAINED

The Fifty-ninth Annual General Meeting of S. Hoffnung & Co., Limited, will be held on September 18th in London.

The following is an extract from the Statement of the Chairman, **Mr Pierre J. A. Lachelin,** for the year to March 31, 1961:

During the year to March 31, 1961, the overall turnover of the Group was fully maintained; unfortunately the continued rise in overheads and intensified competition have led to lower profit margins, and the Group profit before taxation has been reduced to £492,122 against the record profit of £645,760 achieved last year.

The maintenance of turnover under difficult conditions is a tribute to the exertions of the Management throughout the Group and of their teams in Australia and New Zealand.

The net profit is £302,346 compared with £396,578. The Board are recommending a final dividend of 12 per cent free of tax which maintains the distribution for the year at 16 per cent free of tax.

Turnover for the first four months of the current year has not kept up with the figures for the corresponding period of last year, but owing to seasonal factors this is not necessarily a reliable pointer to the prospects for the remainder of the year. The adverse balance of trade which was causing concern to the Commonwealth authorities last year has happily been corrected. If the improvement is maintained this should enable the Australian Government to continue to give freer rein to the economy and so conduce to a higher volume of internal trade. This volume is of direct interest to us, but at the present time it is impossible to forecast the net effect on the year's results.

APPOINTMENTS

UNIVERSITY OF GHANA
DEPARTMENT OF MATHEMATICS
Applications are invited for the post of
SENIOR LECTURER OR LECTURER IN APPLIED MATHEMATICS
Salaries: Senior Lecturer: £G1,750 x £G75 —£G2,200.
Lecturer: £G1,050 x £G50—£G1,400 x £G75 —£G1,850;—£G1,900.
Non-Ghanaian an additional 20 per cent. Entry at appropriate position.
Appointment normally five years in first instance.
Outfit allowance £G60. Car allowance £G150 p.a. Family allowance for non-Ghanaians for each child in West Africa £G50 p.a. (if under age of 21 and being educated outside West Africa, £G100 p.a. (maximum five children). Part furnished accommodation at charge not exceeding 7.5 per cent. of salary. F.S.S.U. policies maintained if already held, or superannuation on similar basis.
Passages for appointee and family in appointment and normal termination. Annual leave with three overseas return passages in every four years for non-Ghanaians and one every three years for Ghanaians.
Applications (six copies) with full details of qualifications, experience, etc., and naming three referees to be sent before September 25, 1961, to the Assistant Registrar (London), University of Ghana, 15 Gordon Square, London, W.C.1, from whom further information may be obtained.

UNIVERSITY OF MALAYA IN KUALA LUMPUR
LECTURER/ASSISTANT LECTURER IN THE DEPARTMENT OF ECONOMICS
Applications are invited for the above-mentioned post. Candidates should have good qualifications in Economics and Statistics. Teaching experience in these subjects is desirable. Experience in Statistical field work in the Malayan Rural Economy will be an added advantage.
The salary for a Lecturer is £1,148 x £49 —£1,442/£1,540 x £56—£1,820 and for an Assistant Lecturer £1,001 x £49 — £1,099 per annum. In addition a variable allowance is at present paid at 35 per cent of basic salary, subject to certain maxima, together with expatriation allowance at specified rates.
An allowance is made towards travelling expenses and housing assistance is available.
Further particulars and application forms should be obtained from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S.W.1.
Applications close, in Kuala Lumpur and London, on September 30, 1961.

For other appointments see pages 914 & 915

THE QUEEN'S UNIVERSITY OF BELFAST
The Senate of the Queen's University of Belfast invites applications for a Chair in Economics or Applied Economics from January 1, 1962, or such later date as may be arranged. The salary will be £3,000 plus F.S.S.U. Applications should be received by October 16, 1961. Further particulars may be obtained from G. R. Gowie, M.A., LL.B., J.P., Secretary.

TECHNICAL SUB-EDITOR GRADED ASSISTANT EXPERIMENTAL OFFICER required at Building Research Station (D.S.I.R.) Garston, Watford, Herts., to assist in preparation of publications for building industry. Work concerned with results of chemical, physical, engineering and operational research and offers experience of wide range of editorial and information work. Experience in technical editing advantageous. Qualifications: G.C.E. "A" level in two science or mathematics subjects or equivalent. Over 22, pass degree, H.N.C. or equivalent generally expected. Salary range £450 (age 18)—£776 (age 26)—£957.—*Application form from Director* at the above address, quoting BRS. 30G. Closing date September 18, 1961.

BUSINESS AND PERSONAL

ALMOST any learned and scientific journals, transactions, proceedings, etc., wanted. Items such as "Nature" (before 1945) Royal Statistical Society Journal, Royal Society *Philosophical Trans. & Procs.* A & B, and also Bibliography including "English Catalogue of Books" Cumulative Vols., "Palmer's" "Official Index to The Times," etc., constantly sought.—H. Pordes, 158 New Cavendish Street, London, W.1. MUSeum 5250.

THE CORPORATION OF SECRETARIES
Company Secretaryship to-day calls for specialised skills and Boards of Directors have become increasingly aware of the advantages to be derived from appointing INCORPORATED SECRETARIES. The syllabus of the qualifying examinations is obtainable from
THE SECRETARY,
DEVONSHIRE HOUSE,
13 DEVONSHIRE STREET,
LONDON, W.1.

DON'T SIGN away your rights when buying your car. SHOPPER'S GUIDE (15s. p.a.) advises how to deal with Guarantee Forms *that may affect your legal safeguards.*—Write Consumer Council, Orchard House, Orchard Street, W.1.

THE INSTITUTE OF COST AND WORKS ACCOUNTANTS
DECEMBER 1961 EXAMINATIONS
The next Intermediate and Final Examinations will be held at the usual Home Centres on the 4th, 5th and 6th December, 1961. Applications on *Form C* (obtainable on receipt of self-addressed, gummed label) should be lodged with the undersigned as soon as possible, and in any case not later than 10th October, 1961. *No late entries will be accepted.*
DEREK DU PRE, Secretary,
63, Portland Place, London, W.1.

EXPERT POSTAL TUITION
for Examinations—B.Sc.(Econ.), Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write to-day for free prospectus and/or advice, mentioning examination or subjects in which interested, to the Secretary (G72).
METROPOLITAN COLLEGE, ST. ALBANS
or call at 30 Queen Victoria Str. t, London, E.C.4. Established 1910.

MAGEE UNIVERSITY COLLEGE, LONDONDERRY
Applications are invited for a Lectureship in Economics (with statistics or accounting as subsidiary subjects) with effect from October 1, 1961, or as soon as possible thereafter. The appointment will be for two years in the first instance but will carry prospects of permanency. Salary will be in the range £1,000-£1,400 with Family Allowances and F.S.S.U. benefits.
Applications should be sent not later than September 23rd to the Secretary to the Trustees, Magee University College, from whom further particulars may be obtained.

THE Fire Research Station (D.S.I.R.), Boreham Wood, Elstree, Herts., requires an Assistant Experimental Officer or Experimental Officer to work in the Operational Research and Intelligence Section on the statistics of fire and their use in assessing fire hazards and the value of fire protection. An interest, and in the case of older candidates some experience, in the field of Operational Research or Statistics is desirable. Qualifications: G.C.E. "A" level in 2 science or 1 science and 1 mathematics subject or equivalent. Over 22, pass degree, H.N.C., or equivalent. Interim Salary ranges: A.E.O., £478 (age 18)—£841 (age 26)—£1,023. E.O. £1,132—£1,386.—*Forms from* Director, above address, quoting F.R.S.5C. Closing date September 25, 1961.

EDUCATION AND COURSES

B.Sc.(ECON.)
LONDON UNIVERSITY
U.C.C. founded in 1887, successfully prepares students for this Degree (obtainable without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal posts.—Prospectus, giving details of Courses for other London Degrees, G.C.E., Law Exams., etc., from Registrar, University Correspondence College, 60 Burlington House, Cambridge.

SECRETARIAL TRAINING, especially for university graduates and older students. Six-month and intensive 14-week courses.—Write Organising Secretary, Dav's, 158 Holland Park Avenue, W.11. PARK 4654.

TUITION FOR B.Sc. ECONOMICS
Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the two examinations for London Univ. B.Sc.Econ. (three if entrance is included) at moderate fees. 1,431 Wolsey Hall students passed London Univ. B.Sc. Economics exams. 1950-60. Tuition also for G.C.E., Law, Statistical, other exams. —Prospectus (mention examination) from E. W. Shaw Fletcher, C.B.E., LL.B., *Director of Studies,* Dept. P.17,
WOLSEY HALL, OXFORD

COLLEGE OF ADVANCED TECHNOLOGY, BIRMINGHAM
Part-Time Course for Personnel Officers
This course is for people already working in industry, who aim at professional qualifications in Personnel Management, and is for one day and one evening each week for two academic sessions. Successful completion of the course is accepted by the Institute of Personnel Management as a qualification for Graduate Membership.
Subjects of the course include Personnel Principles and Practice, Psychology, Industrial Relations and Industrial Law. Students will undertake practical work in interviewing and projects involving some field study.
Admission is dependent upon acceptance as a Student Member of the Institute of Personnel Management. Students must be of graduate standard or equivalent level of qualification. The next course opens in the week commencing October 2, 1961. Application should be made before September 9th to Bursar, Room 40 (D), College of Advanced Technology, Gosta Green, Birmingham, 4.

ADVANCED STUDIES IN MARKETING
The winter series of one and two day seminars organised by London School of Marketing, includes:—
Oct. 10/11: Marketing skills and higher management.
Oct. 30: Selling in the French Market.
Nov. 13: The Italian demand for British Goods.
Nov. 16: Forecasting—the new techniques.
Reservations and full programmes from:
London School of Marketing Limited, Newspaper House, Great New Street, London, E.C.4. Fleet Street 5635

COMPANY AFFAIRS

Lombard Banking

In the interests of "prudence and caution," Lombard Banking has cut its interim dividend from 9½ per cent to 5 per cent. There was an air of optimism about Lombard's last annual report. The chairman, Mr E. G. Spater, then said that the current year had brought an increasing flow of "excellent new business" which was having a "marked effect on profitability" and that the group was "stronger and better equipped than at any previous time in its history."

What has changed? Have provisions for doubtful debts proved too small after all? Certainly, the increase in Bank rate has reduced the profitability of existing contracts. It is also likely that consolidation has been expensive in the short term—the cost of unwinding its business in Africa must be considerable. Last year's total dividend of 19 per cent was not fully covered; there was evidently no room for a further reduction in profit if the dividend was to be maintained.

Lombard is also caught up in the toils of Overseas Airways, part of whose fleet of aircraft it financed. Although only the operating subsidiary is being liquidated, the position of the parent company, without spares or fuel for its aircraft, cannot be happy. Repossession of the aircraft would possibly result in a loss.

Rank Organisation

The directors' forecast in April of an improvement in the profits of the Rank Organisation in the year to June 24th has been borne out by the preliminary figures. The increase is substantial; gross profits have risen from £4,003,000 to £5,082,000. Earnings on the ordinary capital before the rights issue in May are more than 61 per cent, compared with 40 per cent last year and 5 per cent in 1958-59. As forecast, a final dividend of 15 per cent on the increased capital is recommended, raising the total payment from 15 to 22½ per cent. The latest results include 18 months' profits from Rank Precision Industries, whose accounting year has been altered. This change added £32,000 to the net profit of the group; excluding this, the net profits still rose by 81 per cent from £719,000 to £1,302,000.

The other Rank subsidiaries had mixed fortunes: Bush and Rank Cintel's gross profits dropped by £575,000 and those of Provincial Cinematograph Theatres by £310,000; but Gaumont, Odeon Property, Odeon Associated and General Theatre earned more.

At 23s. 3d. the 5s. "A" shares of Rank Organisation yield 4.8 per cent on the 22½ per cent dividend, which is covered 2½ times by earnings. The 10s. shares of Gaumont British yield 5.8 per cent on the 20 per cent dividend paid this year, compared with 17½ per cent for 1959-60. The group reaped the benefit of the abolition of entertainments tax last year and higher prices for cinema seats throughout the whole of its financial year. The rights issue raised £2.6 million, of which £1½ million was to be used for "general purposes." Last year Rank got out of the record business; it is now enlarging its interests in bowling alleys and has won the contract for running the only service area on the Medway Motorway.

Powell Duffryn and William Cory

Broadly, Powell Duffryn and William Cory are in the same line of business—coastal shipping (with some deep sea ships) and the distribution and storage of coal and oil. Of the two, William Cory seems the more dependent upon colliers and coal. Powell Duffryn is more broadly based, with the greater part of its profits arising in roughly equal proportions from coal, oil, shipping and heating and engineering.

Both companies did well in the year to March 31st. Powell Duffryn reports a rise of 19 per cent in gross profits from £2,157,000 to £2,564,000 and of 17 per cent in net profits from £1,181,000 to £1,385,000. William Cory shows a rise of 18½ per cent in gross profits from £1,519,000 to £1,799,000 and of 17½ per cent in net profits from £912,000 to £1,073,000. About half of Powell Duffryn's increase can be ascribed to first contributions made by new acquisitions. Both companies left their dividends unchanged: at 15 per cent, covered 1¾ times, for William Cory and at 16 per cent, covered 2¼ times, for Powell Duffryn, though the latter would have paid 18 per cent but for the Chancellor's request for dividend restraint.

William Cory has practically completed its development and ship replacement programme and on March 31st its outstanding commitments amounted to no more than £300,000. Powell Duffryn, on the other hand, had commitments on March 31st of £2 million, mainly for ships, and since then further authorisations, including the Purfleet oil storage installation, have added another £1¼ million. Not all of this falls within this year and the group's cash flow should be sufficient to finance it. But the difference does suggest that while shareholders in William Cory can view prospects in terms of the group as it now is, shareholders in Powell Duffryn have to view their prospects after more investment in ships and oil storage.

The chairman of Powell Duffryn, Sir Henry Wilson Smith, describes the outlook as "satisfactory" but it will be surprising if either company is able to manage an advance in profits in 1961-62 comparable with that achieved in 1960-61. Powell Duffryn at 35s. 7½d. xd yield 4¼ per cent and William Cory at 45s. 6d. xd yield 6.6 per cent. Both companies have been able to report a slight increase in the gross rate of return on equity capital employed (up from 9.1 to 10.5 per cent for Powell Duffryn and up from 7.8 to 8.8 per cent for William Cory) but the returns are still low, and are likely to remain so until shipping shows a decisive recovery.

Monsanto Chemicals and Albright and Wilson

Competition in the chemical industry cut Monsanto's profit margins in the second half of 1960 and they did not recover in the first six months of this year. Published profit figures for this period exclude investment income and the earnings of the Australian subsidiary. Compared with the first half of last year, sales at £10,672,000 were slightly higher, but net profits fell by more than 41 per cent from £651,000 to £381,000. Excluding investment income, gross profits appear to have improved from £688,000 to £826,000 between the latter half of 1960 and the first six months of this year. But the Australian subsidiary has made a small loss so far this year, so that these figures may exaggerate the extent of the recovery.

This small recovery might have brought a measure of comfort to shareholders, but the chairman, Sir Miles Thomas, says that the fall in prices has more than offset economies made in manufacturing. The inference seems to be that the profit earned on each item produced is still under pressure, particularly abroad where Monsanto sells 35 per cent of its output. Monsanto's interim dividend has been maintained at 5 per cent. On last year's dividend of 15 per cent the 5s. ordinary shares at 17s. 7½d. yield 4.3 per cent.

Albright and Wilson has also suffered a reduction in profit margins. In the six months to June 30th its gross profits fell by 4½ per cent from £2,889,000 to £2,762,000, allowing for the post-acquisition profits of W. J. Bush. Investment allowances cut the tax charge so that net profits advanced from £1,407,000 to £1,436,000. Though these allowances will continue in the second half of 1961, the directors expect a bigger charge for depreciation and narrower profit margins to cause a further drop in gross profits. Albright and Wilson's 5s. ordinary shares yield 4½ per cent at the current price of 22s. 3d.

C. Townsend Hook

A complicated situation confronted the directors of C. Townsend Hook, the paper manufacturers, and the directors of The Times when the Daily Mirror secured control of George Newnes. The latter held sufficient voting preference and ordinary shares in C. Townsend Hook to control 13 per cent of the votes. The Daily Mirror, with alternative sources of paper, is gradually switching its suppliers; this will be completed by 1966 when the directors of C. Townsend Hook expect to have found other outlets. In these circumstances, the Daily Mirror did not wish to remain a shareholder in C. Townsend Hook and offered its holding to The Times, which itself controlled about 19 per cent of the votes. The Times bought the Newnes holding for about £600,000 and so gained control over about 32½ per cent of the votes.

Its condition for buying was that it could also acquire additional shares to give it a majority vote. Accordingly, The Times acquired a 90 days' option from the directors of C. Townsend Hook and their associates to purchase sufficient preference shares at 21s. and ordinary shares at 116s. 3d. to obtain control. During the option period, The Times agreed to offer 21s. per share to all preference shareholders and to try to buy ordinary shares through the market. This arrangement was made known to shareholders and last week The Times was buying voting ordinary shares at prices marked between 112s. and 114s. 9d. Since then, the price has slumped to 80s., nominal, for if all preference shareholders accept, The Times will have sufficient shares for control. Neither The Times, nor the directors of C. Townsend Hook seem anxious that the options should be exercised. Indeed, the C. Townsend Hook directors clearly wish to remain as shareholders. If no options are exercised, they will retain a substantial portion of the outstanding shares and the number of other public shareholders with voting shares will be small.

A point of principle is involved in this deal. To announce that options had been granted and that The Times would bid in the market is preferable to any attempt to secure control through unpublicised buying in the market; the announcement put all shareholders on the *qui vive* to act as they saw fit. But it was still a partial bid, first come, first served. Such bids can work inequitably and either a full bid for the preference and voting ordinary or a full bid for the preference and a *pro rata* bid for the voting ordinary would have been preferable. Whether any desire of the C. Townsend Hook directors to retain their shareholdings got in the way of such an approach is not clear. But the way is still open for The Times, if it chooses, to offer to buy all the voting ordinary shares from the public, other than those owned by the directors.

British Match

The impression that shareholders might have drawn from the preliminary results of British Match was that although diversification outside the match industry held the key to the group's expansion, in its financial year to March 31st last these other interests had suffered a setback that was partly offset by a recovery in the match trade. But though its Brazilian subsidiary appears to have improved considerably on its previous results, overall profits from its match interests are less than 2 per cent higher. Judged by the published breakdown of profits in the full accounts, the big shift in the source of profits earned last year was caused by a reduction of more than a quarter in profits from business other than matches.

BREAKDOWN OF INTERESTS

	1958-59 %	1959-60 %	1960-61 %
Asset values :—			
Match industry	85·7	77·8	76·1
Other activities	14·3	22·2	23·9
Gross profit :—			
Match industry	85·4	73·6	80·1
Other activities	14·6	26·4	19·9

The Airscrew company suffered from the increased competition in chipboard and reduced demand for the furniture industry. Logging was hit by the depressed lumber market in Western Canada. But in matches, though home demand is static and imports increasing, sales abroad are steady and over a longer period have made good losses in the home market. At 36s. 3d., the £1 units of British Match yield 5½ per cent on the unchanged dividend of 10 per cent.

Furness Withy

The full report from the Furness Withy shipping group gives plenty of reasons why trading profits fell by 7¼ per cent from £4,727,000 to £4,380,000 in the year to April 30th. The wonder indeed is that the fall was no steeper. One of the causes of higher costs in shipping is the recent increase in wages and this together with labour disputes has certainly affected the group. But the directors also list a number of contributory factors. The costs of running the North American Pacific coast service have risen faster than earnings and competition in cruises from United States ports has become increasingly severe. The St Lawrence seaway trade has not lived up to earlier expectations and the Warren Line, operating between Boston and Nova Scotia, has carried fewer passengers. The improvement in the Mediterranean trade in the previous year was not maintained and import restrictions in Australia and New Zealand have had an adverse effect on Shaw Savill's results.

These setbacks have clearly reduced earnings, but the Shipping Exemption Order makes it difficult to estimate by exactly how much. But even on the published figures, the gross return on equity capital employed is only 3¼ per cent. Although the group's additions to its assets are impressive, including six new ships last year, capital commitments still amount to almost £10 million, and it will need a remarkable turn of fortune to raise the £1 ordinary shares much above their current low point of 37s. 9d. xd., at which on the maintained dividend of 10 per cent they yield 5.3 per cent.

London Stock Exchange

FIRST DEALINGS:	Aug. 4	Aug. 21	Sept. 4
LAST DEALINGS:	Aug. 18	Sept. 1	Sept. 15
ACCOUNT DAY:	Aug. 29	Sept. 12	Sept. 26

Activity on the stock market fell to a very low level before the weekend, and the number of bargains marked on Thursday of last week was the lowest of any day this year. Equity prices fell before the weekend just as they did on Wall Street and on the Continental bourses, notably Frankfurt, on the heightening of tension in Berlin. The tone, reflecting a slight easing of this tension over the weekend, was better on Monday though the level of business remained very low. On Tuesday and Wednesday there was a slight increase in the demand for industrial equities but the buyers, including some trustees, were selective and concentrated on the blue-chip issues. Over the week to Wednesday's close *The Economist* indicator gained 0.4 points to 366.4. Prices turned easier on Thursday, partly as a result of the announcement that the Russians were to resume nuclear weapon tests and partly because of further discouraging reports from some companies.

The gilt-edged market was very quiet before the weekend and the prices of all but the short dated stocks fell back. On Friday there was some trustee selling but after the weekend, prices began to rise, partly as a result of some switching into longer-dated stocks by a few institutions and partly because some of the jobbers were squeezed. Limited gains occurred over the week in the short dated stocks; with 4½ per cent. Conversion 1964 rising by ⅝ to 95⅞. 3½ per cent. Funding 1999-2004 gained ½ to 56½ and among the irredeemable stocks foreign buying led to a rise in 3½ per cent War Loan from 52½ to 53⅜.

Despite falls before the weekend bank shares held their prices over the week and Barclays gained 1s. to 69s. 3d. There was some improvement in insurance shares, with Commercial Union gaining 1s. 9d. to 67s. 3d. The news of the lower interim dividend from Lombard Banking resulted in a fall of 10½d. to 14s. 10½d. Brewery shares were quiet, though Watney Mann gained 1s. 6d. to 92s. The news of narrowing margins from Albright and Wilson and Monsanto pushed chemical share prices down; ICI lost 4½d. to 68s. Stores generally held their ground and Marks and Spencer "A" gained 2s. to 99s. 4½d.

Steel shares were generally better with Dorman Long gaining 2s. to 30s. 7½d. Metal Box gained 6s. to 82s. 6d. Unilever fell by 2s. 6d. on Wednesday and thus made a net loss of 3s. to 141s. 9d. over the week. Food shares were slightly firmer but tobacco shares were rather lower. The news of short time working at Standard Triumph led to a sharp drop in the price of Leyland of 6s. 4½d. to 91s. 6d. Kaffirs were fairly steady over the week but the volume of business was small; Anglo American lost 2s. 6d. to 127s. 6d. but Free State Geduld gained 1s. 1½d. to 81s. 1½d.

THE MONEY MARKET

THE syndicate of discount houses submitted an unchanged bid of £98 6s. 6d. at last Friday's Treasury bill tender. The level of outside bids fell fractionally and the average rate of discount rose by 1.71d. to £6 14s. 0.12d. per cent. Total applications rose by £30 million to £410 million, and only £250 million of the £260 million bills on offer were allotted; as a result the market received only 39 per cent of its application against 61 per cent at the previous week's tender.

Credit was very easy on the three days to the week-end and the authorities sold bills to mop up surplus funds. On Tuesday, however, under pressure from the weekly tax transfer, credit was extremely tight and the authorities helped the market by purchasing a very large number of bills. On Wednesday credit was still short and the authorities forced one or two houses to borrow a small amount from the Bank of England. This is the third week running that the market has been in the Bank for small amounts—a sign that the authorities are satisfied with bill rate at its present level.

In New York the three month bill rate fell sharply this week from 2.503 per cent to 2.310 per cent.

APPOINTMENTS

AIC EXECUTIVE SELECTION DIVISION
is advising on the following appointment

ACCOUNTANTS (Consultants)

for Associated Industrial Consultants Limited who require accountants between the ages of 28 and 38 for work in the United Kingdom. Full professional qualifications are essential. In addition, experience of at least five years in a managerial capacity is required. Selected candidates will be trained in the Company's College of Management. In addition to superannuation contributions and expense reimbursements by the Company, appointments carry an initial salary of £1,750-£2,100 with opportunity for regular increases up to £3,000. Opportunities exist for promotion to senior positions with considerable advancement in salary.
(The Personnel Secretary: Reference 422/2).

Brief written applications should be sent, in complete confidence to the Consultant concerned at:

ASSOCIATED INDUSTRIAL CONSULTANTS LIMITED
KNIGHTSBRIDGE HOUSE 197 KNIGHTSBRIDGE LONDON SW7

Associated Industrial Consultants

B Nylon S

ORGANISATION AND METHODS

British Nylon Spinners Limited have two important vacancies in their O. & M. Organisation :

(a) A DATA PROCESSING SPECIALIST is required as a Senior Planner in the Punched Card Section. Applicants must have previous experience of this type of work, with equipment at least as advanced as electronic calculators, preferably of I.B.M. manufacture. The Company has on order an I.B.M. 1401 computer for delivery mid 1962.

(b) A SENIOR INVESTIGATOR is required in the O. & M. Section. Candidates, aged 26-40, must have at least two years' experience of investigational work, preferably in industry, and previous punched card experience would be an advantage.

These posts offer attractive starting salaries and excellent prospects in an expanding organisation, and married men will be given substantial assistance in rehousing their families.

Please reply to ;

THE RECRUITMENT OFFICER,
British Nylon Spinners Limited
PONTYPOOL, MON.,
quoting reference 0/12.

ROYAL INSTITUTE OF PUBLIC ADMINISTRATION

RESEARCH OFFICER *required for two* years to work with study group on an investigation into superannuation schemes in the public services and a comparison with those in industry. Ability to marshal and classify *detailed material essential*; research experience desirable; knowledge of economics and public finance an advantage. Salary according to age *and experience*. Approved employment terms might be possible for civil servants.

GRADUATE ADMINISTRATIVE ASSISTANT, age about 25, required to assist with the organisation of lectures, *conferences and training courses and the development* of membership. Degree in Government or Political Science preferred. Salary scale £700-£900.

Applications by September 15 to the Director, 76a New Cavendish Street, London, W.1.

NORTH WESTERN GAS BOARD HEAD OFFICE, MANCHESTER

Assistant Statistician

Applications are invited for the above pensionable appointment at a *commencing salary* within Grade A.P.T. 7 (£770/£870 per annum).

Candidates must hold a graduate or equivalent qualification in mathematical statistics, preferably combined with economics.

The successful candidate will be engaged under the direction of the Board's Statistician in specialised investigations in the field of market research, operational research, sales forecasting, etc., which call for the use of mathematical and statistical techniques. The work is interesting and offers scope for imagination and initiative in the application of these techniques to business problems.

Detailed applications, giving the names of *two referees*, should reach the Assistant Secretary of the Board, Bridgewater House, 60 Whitworth Street, Manchester, 1, *within 14* days.

Central Electricity Generating Board

ASSISTANT MATHEMATICAL STATISTICIAN

required in the Economic Efficiency Sub-Branch of the Operations Department at Headquarters, London, E.C.1.

The Sub-Branch, consisting of a team of engineers and statisticians, is concerned with the development and improvement of methods of monitoring the economic operation of the system and other aspects of performance which contribute to it.

The successful applicant will be required to initiate and develop techniques necessary for the solution of problems of an engineering and economic character.

A degree in Statistics or Mathematics with Statistics, together with appropriate experience, is required.

- **Salary within the scale £1,520 — £1,890 per annum.**

Applications, stating age, qualifications, experience, present position and salary to the Appointments Officer, 24/30 Holborn, London, E.C.1, by September 18th. Quote Ref. EC/392.

TEMPORARY Officer Grade III (British *Subject) required by MINISTRY OF DEFENCE* for Research and investigation into Publication Material relating to the organisation of *Science and Scientific Resources in all countries*. Interest in Science but need not be Scientist. Capable of collating the results of their work, drawing the right conclusions, writing accurate and succinct reports. Ability to read and translate a foreign language, particularly Russian, is desirable, and must have a good and broad education. Salary range £458 (age 18)–£1,154, plus London Weighting. —Write giving age, qualifications and experience to Manager (P.E.1077), Ministry of *Labour, Professional and Executive Register*, Atlantic House, Farringdon Street, London, E.C.4. Closing date, September 23, 1961.

ASSISTANT SOLICITOR

required

in Legal Department of public Corporation set up by the Development of Inventions Act, 1948, to develop and exploit inventions in the public interest. Duties concerned with the assignment of rights in inventions; *royalty-sharing agreements* with inventors; patent licences; and contracts with industry, and the legal work of subsidiary companies formed, for the development of inventions. Preferred age 35/40. *Experience in industry and/or in commercial practice essential*, and of patents exploitation an advantage. Starting *salary up to £2,000 according to age* and experience. Please send full particulars in confidence to Director of *Administration*, National Research Development Corporation, 1 Tilney Street, London, W.1.

FIRE RESEARCH STATION (D.S.I.R.), Borcham Wood, Elstree, Herts., requires Scientific Officer or Senior Scientific Officer to work in the Operational Research and Intelligence Section in connection with studies of fire *statistics, the economic value of fire protection* systems, and the effect of weather on the occurrence of fires in buildings. Wide interest *in application of scientific techniques* and an ability to use initiative more important than candidate's basic subjects. Experience and/or an interest in statistical methods and operational research techniques expected. Ability to advise on the statistical aspects of the design of experiments advantageous. Qualifications: 1st or 2nd Class Hons. degree in Maths., Statistics or *a science subject*. For S.S.O. at least 3 years post grad. experience. Integrn salary ranges: S.O. £773–£1,267; S.S.O. £1,392–*£1,714.—Forms from Director, above address.* Closing date September 23, 1961.

Research/Senior Research Officer (Sociology)

Required by the West African Building Research Institute for service at Accra, Ghana, to conduct research on the social aspects of the Institute's research on housing with particular reference to the requirements of African occupiers. Appointment will be on probation for admission to the permanent and pensionable staff.

Salary according to qualifications and experience in scale £800 a year rising to £1,700 a year. Free passages provided for officer, wife and up to three children on first appointment and free leave passages to country of domicile once in every three years. Quarters provided at moderate rental.

Candidates must be West African, possess a good honours degree in Sociology and if possible *have had two years' post-graduate* experience. Women candidates must be single.

Apply to CROWN AGENTS, 4 Millbank, *London, S.W.1, for* application form and further particulars, stating age, name, brief details of qualifications and experience and quoting reference M3B/53578/EN.

RICHARD THOMAS & BALDWINS LIMITED

ORGANISATION AND METHODS

We wish to recruit two O & M Officers to be based at Spencer Works, Newport, Monmouthshire, our large new steel works and rolling mills now under construction. They will assist various levels of management in the design of an information system for the whole works using the latest digital computer techniques.

The positions will appeal to men who want to contribute to the *original work necessary for the design* of systems throughout a large new undertaking and who would welcome the challenge that this produces.

Candidates should be under 35 and possess a university degree or a recognised accountancy or secretarial qualification. Previous O & M or similar systems analysis experience is desirable but candidates whose lack of previous experience is compensated by other abilities or personal qualities will be considered.

Apply by sending full details of education, age, experience, qualifications, &c., to

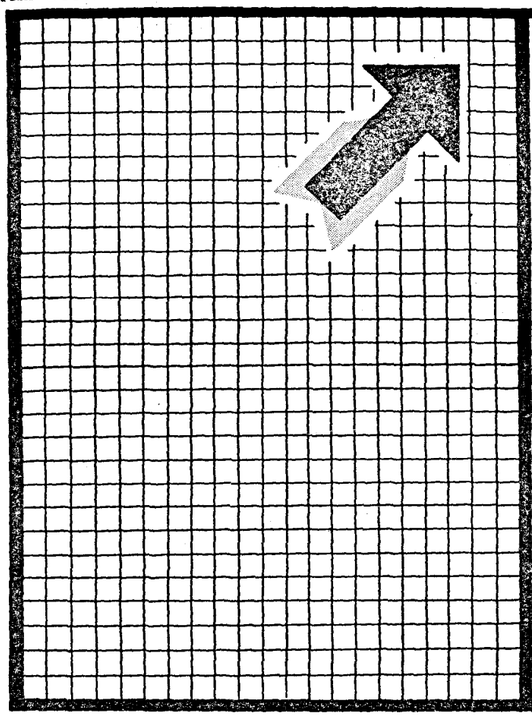
Assistant Manager,
Organisation & Methods Department,
RICHARD THOMAS & BALDWINS LIMITED,
Spencer Works, Newport, Mon.

GKN

The Guest, Keen & Nettlefolds Group of Companies *wishes to make the following* appointment:—

ASSISTANT TO THE COMPANY SECRETARY

A large Group Company in South Wales *requires an Assis*tant to the Secretary, who is also a Director of the Company. His responsibilities will include work on the legal and administrative side of the Secretarial Department.



Candidates should have had legal or accountancy training and preferably some commercial experience since qualifying. The preferred age bracket is 28-35 years.

Appropriately qualified men should write, in confidence, *giving details of age, qualifica*tions and career to date to:

The Group Personnel Officer, Guest, Keen & Nettlefolds, Limited, 22, Kingsway, London, W.C.2.

For further appointments and other classified advertisements see page 907

NATIONAL EMPLOYERS' ASSOCIATION in Westminster requires man aged 25-30 as Economics Secretary. Not less than £1,000 p.a. Applicants must be graduates, preferably with a degree in economics.—Apply to Box 1539.

Investment Opportunities in Japan!

In 1959 Japan attained the highest economic expansion of all the industrial countries of the world. Its gross national products that year increased by 16 per cent over the previous year and has seen a yearly increase ever since. This upward trend has increasingly induced overseas investments in Japanese securities.

Daiwa Securities, as one of the four largest securities companies in Japan . . . capitalized at £8 million sterling and having 4,000 employees . . . is engaged in a wide range of business, acting as broker, dealer and underwriter of securities and distributor of investment trusts. The "pioneering spirit" which has been the motivating power behind its 60 years of expansion is still very predominant today.

Make your money work for you in Japan's booming industries by investing through expert and experienced hands. For investment trusts, etc., write

THE DAIWA SECURITIES COMPANY, LTD.
HEAD OFFICE: 8, 2-chome, Otemachi, Chiyoda-ku, Tokyo, Japan

Tel: BEekman 3-3622/3

UNIVERSITY OF MALAYA IN KUALA LUMPUR

LEE ECONOMICS RESEARCH FELLOWSHIP

Applications are invited for the above-mentioned Research Fellowship in Rice Economics and Statistics. The Research Fellow is expected to carry out a comprehensive investigation of the Economics and Statistics of rice consumption and production in the Federation of Malaya. Intending applicants should have a good Honours degree in Economics or equivalent qualifications. Experience *in handling cereal statistics, particularly rice,* would be an advantage. Subject to University entry requirements being met, part of the research material may be used to obtain a higher degree in the University of Malaya.

The Fellowship is tenable for a period of fifteen to twenty months and would cover the following: (i) An all-in monthly stipend of between M$1,300/- to M$1,800/- (the current rate of exchange of the Malayan dollar is 2s. 4d.); (ii) Return passage for the Fellow (if married, for wife and children below age of 12); (iii) accommodation; (iv) Medical charges in accordance with University regulations; (v) Funds for travelling and field research.

Further particulars and application forms are obtainable from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S.W.1.

Applications close, in Malaya and London, on October 15, 1961.

COMPUTER PROGRAMMERS

Stewarts and Lloyds, Limited, invite applications from candidates with a high degree of logical ability to train as Computer Programmers. They should be under 30 and should have a good educational standard. Preference will be given to Graduates and candidates with Further Education in other fields, *e.g.*, in Accountancy.

Successful candidates *will undergo a training course* before joining the staff working with the I.C.T. 1301 installation at Corby. This computer was *installed in 1958 and is being used on an increas*ing variety of business, technical and production problems. *Trained Pro*grammers will not necessarily be confined entirely to Computer Programming but may also work on Systems Analysis.

Candidates are invited to write, with full details, to :

Manager/Personnel,
Stewarts and Lloyds, Limited, Corby, Northants.

BBC requires Vietnamese *Programme Organiser* (British subject). Duties include planning and production of broadcast programmes, supervision and co-ordination of duties of programme staff concerned with translation and broadcasting of news bulletins, talks, commentaries, and feature programmes in Vietnamese. Essential qualifications include wide cultural and general background, organising ability, sense of news values and definite interest in and knowledge of international affairs with special reference to South East Asia. Experience in news or in production and planning of broadcast programmes and the ability to write for broadcasting would be considerable advantages. Knowledge of Viet Nam and *Vietnamese* or cognate language desirable but successful candidate must in any case be willing to study Vietnamese in order to become reasonably fluent. Salary £1,575 (possibly higher if qualifications exceptionally high) rising by annual increments to £2,000 max. p.a.—Requests for application forms (enclosing addressed envelope and quoting reference 61.G.405 Ec.) should reach Appointments Officer, Broadcasting House, London, W.1, within five days.

AN opportunity exists for a Market Research specialist to participate in the development of an organisation in the field of Industrial Market Research. This will be an extension to the activities of an Engineering Sales Company in Birmingham.

Applicants should preferably have a degree in Economics, and should have actual experience of the conduct of Industrial Surveys. A knowledge of Languages would be advantageous. Replies in confidence to Box 1540.

ECONOMIST / STATISTICIAN

Applications are invited from Honours Graduates for the appointment of Economist/Statistician with the Committee for Scotland and Northern Ireland of the White Fish Authority.

Generally the duties are to undertake economic surveys and research covering the various sections of the fishing industry and to maintain and analyse fishery statistics.

Applications should be made on the prescribed form. Intending applicants may obtain further particulars regarding duties and conditions of service and the form of application from the Secretary/Solicitor, Committee for Scotland and Northern Ireland, 5 Forres Street, Edinburgh.

UNIVERSITY OF ST. ANDREWS

Applications are invited for a LECTURESHIP in ECONOMICS in QUEEN'S COLLEGE, DUNDEE. Preference will be given to candidates specialising in economic theory. Salary scale: £1,050 x £50 to £1,400 (efficiency bar) x £75 to £1,850 per annum; placing according to qualifications and experience. F.S.S.U.; family allowance; grant towards furniture removal expenses.

Applications (six copies) containing the names of three referees, to be lodged not later than September 16, 1961, with the Secretary of the University, Queen's College, Dundee, from whom further particulars may be obtained.

. . . then you would have **ANSAFONE—Britain's foremost telephone answering and recording system.** Think what this would mean. You need never miss a telephone call—day or night! Your customers, for example, can telephone their orders after office hours for prompt attention and routing the following morning. Long and involved reports from your representatives can be sent without distracting staff from more urgent work *and* during cheap rate periods. Calls may be received and recorded without disturbing an important conference. It will enable you and your staff to send messages and instructions with no need to wait for a personal reply; in other words use the telephone as a long distance recording machine!
From these few examples alone it will be obvious how ANSAFONE can increase the efficiency and capacity of your business—but the possibilities are immense. That is why ANSAFONE is fast becoming accepted telephonic practice all over the world. Why wait? You can help yourself, your customers and put your business ahead of your competitors by installing an ANSAFONE system now. ANSAFONE is compact, easy-to-use, and can be rented *for as little as 2d. an hour*, maintenance free.

reasons why Japan should be on your trading map

Reason No. 1:

Japan produces a vast range of quality products under a tremendous industrial boom sparked off by widespread technical innovation and improvement in productivity.

Reason No. 2:

The rate of Japan's economic growth has been and still is the highest in the world, even surpassing that of West Germany, and the introduction into Japan of much more foreign capital is required.

Reason No. 3:

Japan has adopted a policy of gradual liberalization of her foreign trade and new business opportunities arise daily in Japan.

Reason No. 4:

Japan has already freed foreign exchange to a significant degree. The establishment of the Non-Resident Free Yen Account System, under which Yen is freely convertible into the main foreign currencies, will especially facilitate overseas investment in Japan.

Business transactions with Japan promote your business development

Painful Pompey Reported

The Economist . 22 Ryder Street . St. James's . London . SW1

GUIDE TO CONTENTS SEE OVER

A man drives a tractor in the sun—amidst the clamour of the town or in the peaceful isolation of a fresh-smelling field. Construction and agriculture . . . International Harvester has transformed both.
For the man on the site, International tractors, bulldozers, bullgraders, skid-shovels. For the farmer, McCormick International tractors, ploughs, balers, combines. For both, the satisfaction of operating good-looking, reliable equipment that does the job easily and superbly well. A widened by-pass, a new estate . . . a more productive acreage, a faster harvest . . . such are the contributions of the machines that proudly bear the insignia 'IH'—for International Harvester.

INTERNATIONAL

Prudence Please

Bang go the atomic tests now in America, too; but the case for the West to show self-restraint in its nuclear policy remains intact (p. 935). In Washington there are still hopes that reason and restraint may yet rule Soviet policy; the pessimists believe that Russia is driving towards a showdown (p. 983).

Carry on Breathing: an assessment of the effects of fall-out is on p. 946.

The disparate interests of the uncommitted nations at Belgrade are concealed behind the omissions in their declaration (p. 962).

The **Brazilian** genius for compromise has worked again (p. 941). **General Qasim** and the oil companies are in need of a flicker of the same talent (p. 942).

Presidents Nasser and **Bourguiba** have warmly, if provisionally, made it up (p. 944). **Afghanistan** and **Pakistan** have coolly bust up (p. 941).

Publicity Pitfalls

A week before the west German elections, Dr Adenauer's ageless image shines less serenely than it did a week ago; the sealing off of west Berlin has brought home to electors that the Federal Republic's achievements have been bought at a price (p. 937). East Germans, meanwhile, beguiled by stories of coming glories, are more concerned with their present vexations (p. 961).

General de Gaulle has publicised a change of view about the Sahara that might usefully have come earlier (p. 944).

Strong men from the United Nations have, as they pass through the **Congo,** to find a way of keeping this country together (p. 942).

Politics on Probation

Canada's New Democratic party has a challenging leader but the same ideas as the Liberal party (p. 969).

Australia's Labour party has shown signs of returning life by producing an economic programme that plays on the electorate's aversion to unemployment (p. 965).

In **Turkey** old and new parties approach elections under the shadow of the vanished Menderes regime (p. 966).

Kuwait is hauling itself into political conformity by preparing for elections (p. 942).

Italy's politics are as agitated as **Norway's** are restful (p. 945).

Price of Progress

If tensions and economic development are inseparable, the meeting of minds at Oxford last week may help to relieve the one and promote the other (p. 995).

The struggle over the **United States'** appropriations for foreign aid shows how right the President was in attempting, unsuccessfully, to liberate the development loan programme from Mr Passman's grip (p. 984).

HOME

REVERSALS

The Trades Union Congress expelled the electricians' union with a mild pop, probably harmless to its target: the Congress gave lukewarm support to the common market, stronger support to Mr Gaitskell, and by its fiery denunciation of the wage Pause obscured its reaction to the Government's plans to plan. It continues to evade serious issues of union practice (p. 938).

The flow of international funds has about-turned, and causes new anxieties in London; but there is an easy solution (p. 993).

REVOLUTIONS

The first shot in the hot war against the Pause is likely to come from Mr Cousins's lorry drivers, whose claims are less reasonable than they will be made to look (p. 940).

Teachers have refused to see the point of Sir David Eccles's moves this week, which are much more reasonable than they look (p. 940).

REVELRIES

The Liberal Party has prepared its tightly controlled festivities for Edinburgh (p. 942): Labour will go to Blackpool, where family quarrels are unlikely to ruin the holiday as they did last year (p. 941).

REVERIES

The aircraft industry is looking for *dei ex machina* to get its hopes of vertical take-off off the ground (p. 994).

Bath is improving its looks by façade-lifting; but it is not noticeably regaining its youthful vigour (p. 970).

Sanguine Norwegian and other tramp tanker owners have been busily ordering more ships: not so ca'canny Greeks (p. 999).

REVISIONS

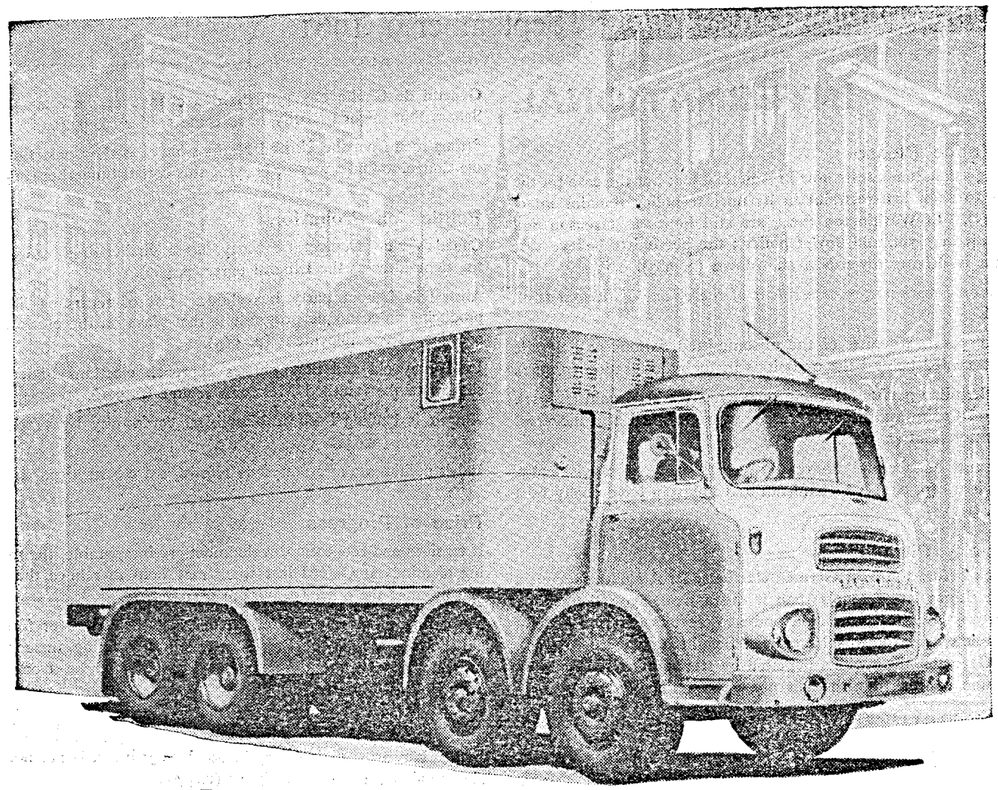
Mr Brooke's ideas on housing in the West Midlands are in the right direction: but he is putting the wrong foot foremost (p. 944).

The removal of another Scotland Yard top 'tec to a bank is not disturbing: but the drain of young constables from below is (p. 946).

Tin speculators have been shaken by the prospect of stockpile sales (p. 995).

Shoppers were less profligate just before the Chancellor's squeeze than some people had thought (p. 996).

REVELATIONS



How to call the turn in the business cycle (p. 991).

British shipyards could learn from the Swedish way—given the will (p. 999).

THE PRESS pages 949 to 960

A sober look into the facts of newspaper life and livelihood which the Royal Commission is now trying to bring to light.

lay on Leyland lay out less

Experienced operators who *ought* to know, say that Leylands cost less to run and last longer. That's what we think too. But don't take our word for it —naturally we're prejudiced—there's a Leyland dealer near you, why not check for yourself?

Take a look at the new Power-Plus diesel—the most economical engine we've produced yet. And that's saying something. Examine the general layout. Check the transmission—engineered throughout to give year-after-year of trouble-free running. Climb into the cab. Easy isn't it? Thump the walls—note the insulation.

That's how Leylands are built—with an efficiency that gives a lifetime of economy. Lay them on now; and, thereafter, you'll certainly lay out less.

A TRIBUTE TO THE **REAL** FOUNDERS OF OUR BUSINESS...

Portraits reproduced by courtesy of the National Portrait Gallery, London.

These explorers into matter — these discoverers of the basics of energy — with their contemporaries and successors here and abroad built and continue to enlarge the scientific foundation of the modern technological world. By sound application of this scientific knowledge, the Kellogg organisation designs and builds complex process plants for modern industry.

Technological knowledge is a dynamic and ever increasing mass of interrelated fact and theory. Understanding and applying these data are the functions and responsibilities of the engineers and scientists at Kellogg House and at the Kellogg research laboratories in America. How well they understand and use this ever increasing reservoir of knowledge is exemplified by the successful operation of the many industrial complexes designed and built by Kellogg. The men at Kellogg, faithful to the scientific trust inherited from our real founders, welcome the opportunity to discuss with you the best application of today's technology for your new plant.

430 enemies

but many thousands of friends

There are up to 430 enemies of good paper production—430 variables which can spoil the consistency of a paper.
At J. A Weir we have some of the best and most modern plant in the country but this alone *is not enough.*
Only craftsmanship, wedded to science, can ensure the perfect paper which is part of our tradition and our job is not to mass-produce thousands of tons but to meet the exacting needs of modern printing in more modest quantity.
An important man in the constant battle against these variables is the Beaterman, for on his skill and not on the machines alone *depends the final properties* of the sheet.
We may have 430 enemies but, thanks to our craftsmen, we have many thousands of friends.

Just for interest you might well enjoy reading 'Talking to Papermakers'. Please let us know if you would like a free copy.

We make it strong and simple

A great deal of thought and research go into the design of Ellison Switchgear in order to obtain that simplicity and robustness so necessary to ensure reliable service and ease of maintenance. Like the circuit breaker contact illustrated, every part benefits from careful thinking plus the traditional craftsmanship for which we have been noted for over half a century.
Trouble-free service without the need for frequent maintenance—these are the reasons why so many of our orders are from customers of long standing. They know that Ellison Switchgear depreciates only in the balance sheet.
We manufacture high and low tension switchboards, heavy duty fuse-switchgear, oil- and air-break circuit breakers and motor control gear. We provide a comprehensive consultancy, after-sales and spares service and are the owners of an A.S.T.A. authorised testing station.

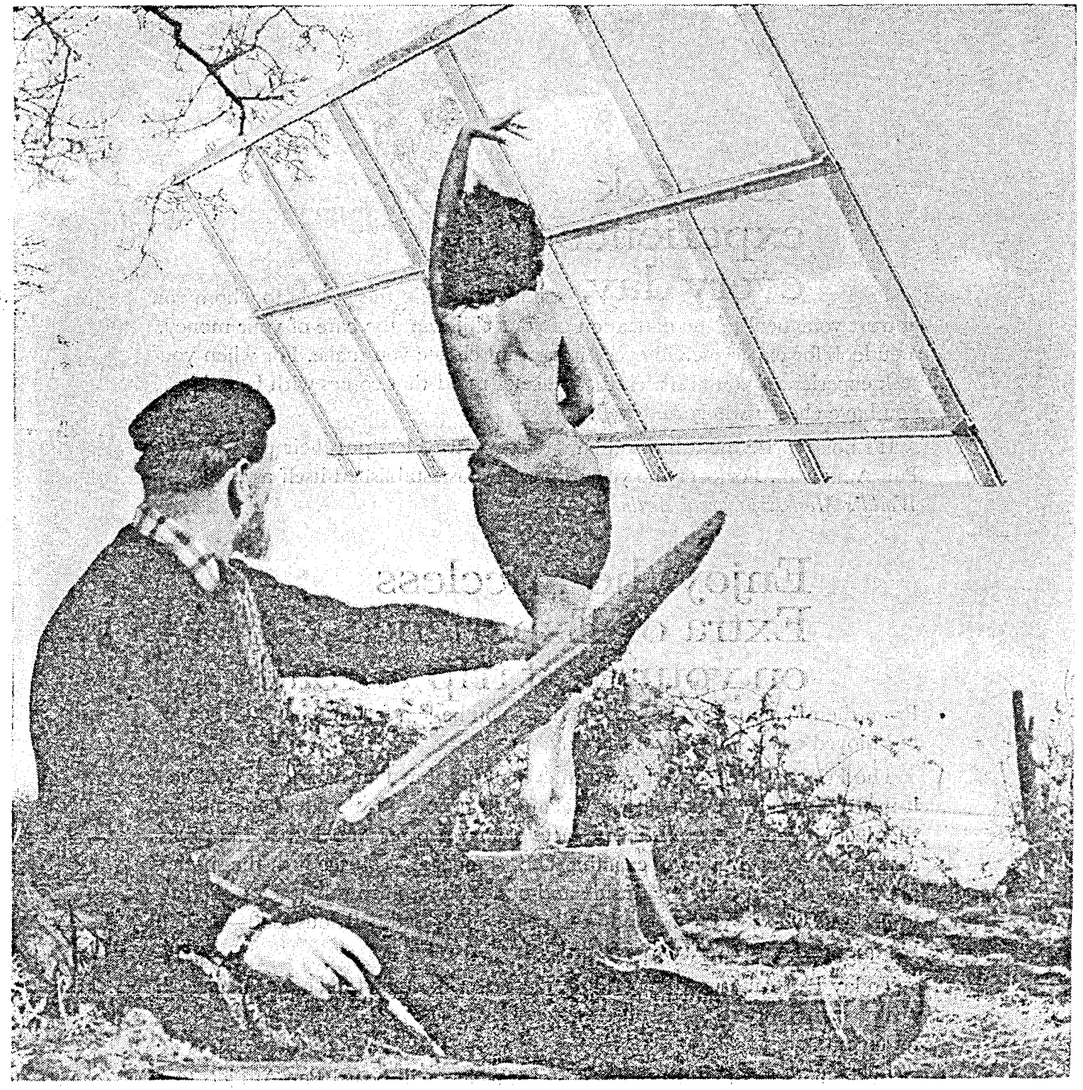
ELLISON SWITCHGEAR
For complete reliability
GEORGE ELLISON LIMITED · PERRY BARR · BIRMINGHAM 22B

You seek experience every day,

you look for it in the people to whom you entrust your health, the education of your children, the care of your money. You look for experience in every important choice you make. For when you seek experience, you also seek the peace of mind that comes with knowing you have chosen wisely and well.

It's no surprise then that so many overseas travelers put their trust in Pan American. For over the years Pan Am has established itself as the *World's Most Experienced Airline.*

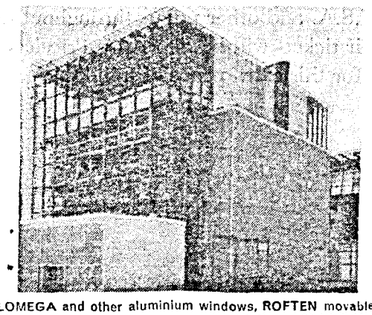
Enjoy the Priceless Extra of Experience on your next trip abroad



From the moment you choose Pan Am—you have a feeling of confidence to be enjoyed every moment of the way.

The Priceless Extra is reflected in everything that Pan Am does. You see it in the expertness and courtesy of Pan Am people on the telephone and in the ticket office. You see it in the faces of Pan Am personnel—veteran pilots and flight crews trained to exacting U.S. standards. You see it in the spotless perfection of your airplane, inside and out. You see it in the gracious flight attendants who serve you. And in the rare wines and delicious food—the banquet catered by *Maxim's of Paris.*

Today Pan Am flies the world's largest over-ocean Jet fleet. No other airline can compare with Pan American's service to 80 countries on all 6 continents.



In the next few months thousands of travelers will board Pan Am jets to the U.S.A. and other points throughout the world. Included in the price of their tickets will be Pan Am's Priceless Extra of Experience. It costs no extra for this extra peace of mind.

PAN AM — World's Most Experienced Airline

Aluminex patent glazing puts light where you want it

Light, strong and virtually maintenance-free even in corrosive atmospheres, Williams and Williams Aluminex Patent Glazing puts daylight just where it is needed—and it goes up so quickly.

A quarter of a million square feet of Williams and Williams Aluminex Patent Glazing was specified for Hinkley Point nuclear power station now under construction. Tested in the Williams and Williams wind tunnel, Aluminex will give years of trouble-free service even on this site where winds up to 108 m.p.h. can be expected.

Under construction for C.E.G.B. by English Electric, Babcock and Wilcox, Taylor Woodrow Atomic Power Construction Company Limited.

Over 80,000 AMF Automatic Pinspotters around the world: AMF has gone worldwide with the machine that revolutionized bowling. Ever since the first fully automated lanes were opened in September, 1951, at the Bowlodrome, Mount Clemens, Michigan, U.S.A., the AMF success story has been repeated on every continent. Over 80,000 AMF Automatic Pinspotters have been installed or contracted for world-wide, and the rapidly-growing international market accounts for over 4,000 of these, with a backlog of orders worth more than $24,000,000.00.

The AMF Automatic Pinspotter record: AMF's impressive list of "firsts" include: U.S.A., September 15, 1951; Canada, August 26, 1957; Puerto Rico, March 29, 1959; Sweden, June 22, 1959; Mexico, November 15, 1959; Venezuela, December 15, 1959; United Kingdom, January 20, 1960; Panama Canal Zone, February 26, 1960; Bahamas, March 10, 1960; Monaco, June 13, 1960; Belgium, August 13, 1960; France, August 29, 1960; Australia, October 14, 1960; Switzerland, October 18, 1960; Bermuda, January 5, 1961; Italy, March 15, 1961; Japan, June 15, 1961; and the Netherlands, June 27, 1961. Wherever Pinspotters and other AMF bowling equipment are in operation, AMF provides sales and service personnel.

AMF Automatic Pinspotters are now installed in over 95% of all overseas U.S. Armed Forces establishments with automatic bowling lanes. One large order equipped *all* of the 160 Army bowling centers in Europe.

AMF Pinspotter assembly overseas has already begun in new AMF plants in England and Australia. AMF also produces overseas, the full AMF line of top quality equipment including bowling lanes, Magic Circle*, Underlane® ball returns, pins, balls and accessories.

AMF International's 40 years of experience in overseas markets: A long history of successful export sales and overseas operations in machinery and other products has enabled AMF to achieve record progress and continuing leadership in the current world-wide expansion of the bowling industry. AMF now has 14 plants overseas producing tobacco and bakery machinery, water treating equipment, nuclear and electrical products, and a wide range of recreation goods.

Let us have the opportunity to show you how an AMF equipped bowling center can be a sound investment for you.

this
aircraft
is
100 miles long

100 miles long, 10 miles wide and 1,000 feet deep, in fact . . . because rigid safety regulations say that ten minutes flying time, ten miles of lateral space and one thousand feet of vertical space shall separate all aircraft all the time they are using the air lanes. Now, multiply the *number* of aircraft that are flying . . . magnify their size . . . increase their speeds . . . and the problem of separation becomes difficult indeed. Obviously, accurate instrumentation, advanced electronics and even more advanced navigational aids are of paramount importance. In these three directions alone, Ferranti are making significant contributions to Britain's progress in the air.

Test of Self Control

KEEP cool, don't be flustered into doing things you may regret: this is what the West has been telling itself since Mr Khrushchev banged his nuclear fist on the table a week ago. In giving itself this sensible advice, the West has been thinking chiefly of Berlin. But the advice applies equally well to another problem: what policy ought the allies to adopt towards nuclear weapons, now that the tests suspended in 1958 have begun again ? It is tempting to conclude that Mr Khrushchev's return to the ritual of explosions, followed by President Kennedy's decision on Tuesday to resume American tests, marks the death of the attempt to keep nuclear weapons under control. The only course now open to the western powers, in the view of those who think so, is to recognise that control is impossible, and to throw themselves with zeal into the task of perfecting their atomic armouries. As often, however, reality is not so satisfyingly dramatic. It is a mark of being flustered to say that there is now no alternative to an unrestrained race for nuclear superiority. There is still a strong case for the West, as an act of unilateral self-control, to try to set some bounds to the development and distribution of these weapons.

Two questions have to be decided. The first is whether Mr Kennedy, having ordered the resumption of tests "which prudent men find essential," is now willing to limit these tests to the briefest series compatible with military necessity. It was inevitable that the Americans would begin testing again sooner or later, if Mr Khrushchev went on banging away and unless Mr Kennedy were converted to pacifism. But, by making known so soon his decision to go ahead, the President has lost some of the international sympathy that came America's way last week. It is hard to see why the third Soviet test (or the tenth, for that matter) should have caused him to jettison the restraint he preserved so admirably through the first two. This sudden lurch away from equanimity has caused surprise even in America, to judge from the report of our Washington correspondent on page 983. Such facts as are available to laymen suggest that Mr Kennedy might well have waited a little longer. Since he has not done so, however, the same facts suggest that the forthcoming series of American tests can, and should, be kept as short as possible.

In tactical nuclear weapons, the Americans are generally reported to be substantially better equipped than the Russians at the moment. In strategic weapons, the West's most pressing need is to make sure that it can deliver its existing stockpile of nuclear explosives through the Russian defences accurately and in sufficient quantities. The implication is that the design and production of the means of delivery need more attention, for the time being, than the testing of warheads. Eventually, of course, changes in the delivery systems will require new warheads ; and, even before then, it will probably be necessary to try out hitherto untested warheads, like that of the Polaris missile, which are being put into service on the scientists' assurance that they will actually go off with the predicted effect. On the face of it, however, and in view of the fact that the scientists have now had a good deal of practice in predicting these things, it ought to be possible to limit fairly stringently the number of tests required for these purposes. Just how many are necessary only the military experts can say. The layman's job is to insist that the decision is a purely technical one ; and to urge the soldiers not to exaggerate out of misguided enthusiasm for the tricks of their trade.

Last Sunday's offer by Mr Kennedy and Mr Macmillan —to refrain from making any more tests in the earth's atmosphere, if Mr Khrushchev would agree to do the same—was a step in the right direction. Mr Kennedy should now go on from there to say that, as soon as the underground experiments "which prudent men find essential" have been completed, he will order a further pause in all testing to see whether Mr Khrushchev has decided that the race is futile. The aim in offering such a pause is not merely to win the good opinion of the uncommitted world. Contrary to what some people seem to have expected, the neutrals were never likely to line up for admission to Nato or Seato just because Mr Khrushchev had started to drop fall-out on their heads; nor was Mr Khrushchev liable to resign from office because Dr Nkrumah admitted to being shocked. There is a better reason why the United States should limit its new programme of underground activities as closely as possible. The testing that is now about to begin will add comparatively little to the West's air of resolution on Berlin; to restrict the tests to the necessary bare minimum, on the other hand, may be the only way of preserving a last flicker of sanity in relations between East and West.

If the Americans give the impression that their experiments are going to go on indefinitely, Mr Khrushchev will presumably feel the urge to make some further show of strength, perhaps by letting off a multi-megaton monster, perhaps by moving troops in central Europe. If and when the negotiators ever meet to talk about Berlin or other matters, they will barely make their voices heard above the din of demonstration and counter-demonstration. On the other hand, if Mr Kennedy proposes a pause for reflection after the current round of testing, it is just possible that his restraint may strengthen the forces of caution inside Russia and weaken the faction that has urged Mr Khrushchev upon his present policy of intimidation. The chances that will happen may not indeed be large; but, unless urgent military necessity dictates otherwise, they should be grasped at.

THE other decision facing Mr Kennedy is at least as delicate. Should the United States now forget its inhibitions about distributing nuclear arms to its allies in Europe—in particular, to west Germany? Dr Adenauer's prompt reaction on August 31st to the news that Russia was resuming tests was to repeat the demand that the west German army should be equipped with the "most modern weapons." At first sight it seems logical to argue that, now the Russians have cast restraint aside, the West has no choice but to give the allied armies in Europe full command over the weapons needed to resist a nuclear attack; the German army, as the biggest available to meet the Russians, naturally has the strongest claim. But a closer look suggests that here, too, there are powerful arguments in favour of caution and delay.

In the first place, any wider distribution of nuclear arms in Germany will undoubtedly make it even more difficult than it is now to come to an understanding about the future of central Europe. At present, the Bundeswehr possesses a number of tactical weapons, some of them of considerable range, capable of firing nuclear warheads, but the warheads themselves remain in the custody of American officers. Whatever else Mr Khrushchev had in mind when he started to put pressure on Berlin, there seems no reason to doubt that one of his motives, as he told Mr Walter Lippmann, was to get general recognition of the frontiers of central Europe before nuclear rearmament went any further. If the west German army is now given more atomic arms, or closer control over their warheads, Mr Khrushchev may find it necessary to respond by making similar provisions for the communist countries near Germany. The governments concerned in the unsettled dispute over middle Europe's frontiers would then face each other with an array of weapons that made the dispute even more dangerous than it is now. It is hard to see how this would promote stability; it might well put off any possible reconciliation in the region into the almost invisible future.

In addition, it is doubtful whether the possession of tactical nuclear weapons, and control over their warheads, is as important for European armies as it might have seemed a year ago. Since President Kennedy took office, he has tried to diminish the importance of these weapons. Like most people, he doubts whether an atomic conflict can be limited to the tactical level without rapidly graduating to an exchange of intercontinental missiles. This is why he has sought to expand the West's conventional forces, and to demote tactical nuclear arms to the point where they become little more than a deterrent to stop the Russians from using the similar weapons they keep behind their lines. If events let him carry this policy through, then it becomes conceivable that an outbreak of fighting in Europe, at least in its first stages, might still be confined to conventional arms. In those circumstances, front-line commanders would not require instant control over atomic weapons; "nuclear capability" need not be distributed more widely than it is now; and the present arrangement for warheads, which keeps them in American hands, should not be amended.

It is not easy, in the present state of the world, to ask your allies to keep their hands off a whole category of powerful weapons; or your military commanders to cut down to the bare minimum the number of devices they want to test. In deciding the future course of his nuclear policy, Mr Kennedy has to try to lift his eyes beyond his immediate military needs to the still more urgent necessity of stopping the crisis from getting any worse. Unless some hitherto unrevealed facts are made public, the West's military needs look as if they could be satisfied by a fairly brief series of nuclear tests, carried out underground and by the United States alone. A look at the wider horizon suggests that, this series having been completed, the western powers should try to refrain from doing anything else that might speed the world down the slope to irrationality—and destruction. This will call for considerable self-discipline; but the effort, if it gives the forces of calmness and moderation a chance to rally, will richly justify itself.

Economics of the Press ▶ pages 949 to 960

The Bonn Succession

The smooth working of the campaign machines in west Germany has suffered a jolt from Berlin

FEDERAL Germany, twelve years old, elects its fourth Bundestag on September 17th; and once more it is Dr Adenauer who submits himself to the electorate for a further term of office. Only a month ago, when the massive Christian Democrat campaign was getting under way, Dr Adenauer's fourth term looked as certain as anything could look. His lieutenants seemed to have little problem before them, beyond that of reassuring the west German electors that Dr Adenauer would take care of the future, while keeping their own courage up by telling themselves that the day was surely near when he would hand over to one of them.

A robust 85, the Chancellor himself was giving more countenance to the first theme than to the second. He had shown in 1959, when he contemptuously changed his mind about accepting the federal presidency, what he thought of the ageing juniors who might be called to take over the substance of power from him. Outsiders who talked to him in June and July got the impression that he viewed the electoral outlook for 1961 with serenity, but was beginning to worry about his chances for 1965.

Naturally this self-assurance did not mean that the Chancellor, any more than his government lieutenants or his campaign organisers, was thinking of leaving anything to chance. This is not his way. The mechanics of Dr Adenauer's last electoral victory, in 1957, have been analysed by Mr Uwe Kitzinger, of Nuffield College, in a study of admirable thoroughness and detachment.* As Mr Kitzinger says:

> The carefully calculated depth-psychology and the sheer dimensions of the CDU's campaign in 1957 represented a new phenomenon in European political style.

Meticulous plans were laid to repeat, and exceed, this performance in 1961. The last general elections saw the Christian Democratic Union attain an absolute majority of the valid votes cast, the first party ever to do so in a democratically conducted general election in Germany. This was not achieved at the expense of the union's principal opponents, the Social Democrats, who also increased both their parliamentary representation and their proportion of the popular vote. The small parties lost strength to the two big ones. The objective in this year's Christian Democrat campaign, as planned, was to go one better and take votes from them all, including the Social Democrats themselves.

The campaign planners had an important domestic political change to take into account. The Social Democrats, shaken by the prospect of perpetual opposition into looking afresh at many cherished concepts, threw overboard a large part of their socialist programme and of their root-and-branch opposition to Dr Adenauer's policy of alliances. They reorganised their leadership in order to offer the electors a progressive alternative to Christian Democratic government in a new, more modern style. They adopted a young, attractive, dynamic chancellor-candidate in the person of the governing Burgomaster of Berlin, Herr Brandt, and proceeded to build their election campaign around his personality. Thus confronted with a new campaigning problem, the Christian Democrats set about meeting it in two ways: first, the systematic destruction of the "image" offered by Herr Brandt (it has become impossible to discuss modern German electoral techniques without using advertising language) by representing him as a nameless adventurer and a doubtful patriot; second, the building up on an overwhelming scale of a "counter-image" of authority, serenity and certainty: Dr Adenauer.

Old Chancellor

Young Pretender

Enlightened Germans, more concerned with the German Federal Republic's own "image" in the world than with either of these conflicting leadership-symbols, have deplored both the ruthlessness of the attack on Herr Brandt's name and character, and the degrading over-simplifications by which, through countless media and at probably unprecedented cost, the identification of national security and well-being with the venerable Chancellor's person has been drummed into the west German voter's head. Whether these methods are in the German national interest is one thing; whether they are effective is quite another. A month ago they seemed to be working very well, and the Adenauer campaign seemed set fair for an increased majority.

AUGUST 13th, the day when Herr Ulbricht sealed off east from west Berlin, introduced a new element into these calculations. Observers from outside may not find it easy to see why it should. The history of the German Federal Republic is the history of a choice: the choice of reconstruction and development in the western part of Germany, with perspectives opened up westward through the European communities and the North Atlantic alliance, in preference to the attempt to restore an all-German state around the old capital, Berlin. The choice made, one would have supposed it to be obvious that west Berlin could have no political function; and, in that case, if the city did not come to terms with the surrounding communist power, whether by Mr Khrushchev's "free city" formula or some other, it could at best be maintained as an enclave. The new wall across Berlin has done no more than bring this home.

Having made such a choice, a west German government could have defended it with composure before the electors. What Dr Adenauer's three administrations have achieved in

* German Electoral Politics. A Study of the 1957 Cam, ign. By Uwe Kitzinger. 1960: Oxford University Press. 381 pages. 45s.

domestic improvement, in the raising of the country's international status, and in the foundation-laying of an integrated western Europe, exceeds the boldest hopes of twelve years ago, and the west Germans know that they would be mad to throw it lightly away. They could have been asked, confidently enough, if they would have preferred to pay the price that would have been required of them if they had put national unification first. Would they have preferred a united, neutralised, isolated Germany to what they have now ?

But the choice has never been put before them in these, or any straightforward, terms. At every step in the process of attaching west Germany to the West, they have been told that this was the best and only way to the reunification of Germany "in peace and freedom." Bonn and the allied governments have alike paid constant lip-service to this objective. The alternate taunting and snubbing of the east German regime, and the attribution to west Berlin of an active part in the cold war, have merely been parts of this make-believe. Now it turns out that the communists in east Berlin possess the power to rope west Berlin off as if it were a reservation for some recalcitrant tribe ; and all the might of Nato can do nothing whatever to hinder them. It is a homely and obvious demonstration of the facts ; but it has served to bring home what Dr Adenauer has never been prepared publicly to admit, that his achievements, too, have been bought at a price.

NOBODY feels certain just what change this discovery has brought in the election outlook. Dr Adenauer may still get his absolute majority ; in that case, the opening phase of the fourth Bundestag, until the succession becomes an active question again, will be plain sailing. The campaign managers are, however, aware of a change in the climate of public feeling. The Social Democrats have adapted the mood of their campaign quickly to the change ; their voters, who were being invited to join the SPD in a bright, jolly future, are now being urged to measure up to a national crisis. "Security tomorrow, too," a typical CDU slogan hammering on the theme of a safe and well-ordered future, became a cracked keynote under the emotional shock of the events in Berlin, with nuclear explosions in full swing again, and with General de Gaulle soberly observing that it is better to use force than to give ground. A new theme was needed. It has been found in the figure of an imperturbable Adenauer standing up to the threats of a bullying Khrushchev ; the German nation is urged to rally round its leader.

Here is the new, unknown factor. Its weight should not be exaggerated. Dr Adenauer is not going to lose the lead ; all that seems to be in doubt is whether he will now retain his absolute majority. Mr Kitzinger, in the study already quoted, dissented from the widely-held view that the gains of the two big parties in 1957 represented a trend towards a two-party system in German politics. There was no reason, he said, to suppose that if the CDU were displaced, it would be by a government of the SPD alone.

Until it is disproved, this must remain the most convincing judgment ; a purely Social Democrat government in west Germany does not appear on the cards. Further, if Dr Adenauer did lose any substantial amount of ground, so that he became absolutely dependent on allies in a coalition, it is the Free Democrats who would be likely to hold the balance. This is a privilege they have long dreamed of ; but, in stating their case to the voters, they have virtually committed themselves not to form a coalition with the Social Democrats. Under Herr Mende's leadership the Free Domocrats have declared themselves willing, indeed eager, to form a coalition with Dr Adenauer's party. They have, however, expressed a decided preference, in that case, for a new chancellor, who might, Herr Mende says, be Professor Erhard or Dr Gerstenmaier ; they would prefer Dr Adenauer to go.

Others, including two of Herr Mende's own predecessors, have had the same idea before. It would be a rash Free Democrat leader who assumed that the mere possession of a slender arithmetical balancing factor in the Bundestag would deliver Dr Adenauer into his hands, or insure him against having the tables turned on him as they were turned on Dr Dehler in 1956. All in all, the odds stay on Dr Adenauer keeping power at Bonn for the present. But it is this that seems to be the matter at issue: not the transfer of power from government to opposition, but whether Dr Adenauer's personal rule is to be brought to an end and a phase of active party politics is to open.

Painful Pompey

Our special correspondent reports from the Trades Union Congress

NOTHING could prevent a feeling of anti-climax at Portsmouth this week after the Trades Union Congress's thumping vote for expulsion of its erring electricians. Despite Mr Foulkes's plea to the delegates that "all our enemies and some of yours" were trying falsely to inflate the importance of this issue, nine out of ten of them took the only honourable course and voted for expulsion. Most of the 735,000 votes that were cast in favour of retaining the Electrical Trades Union within the organisation came predictably from unions on the far left, with the balance made up by a few small organisations whose effectiveness in negotiations is almost entirely created by their alliance with the electricians.

Two comments seem called for at this stage. First, Mr Woodcock's painful indictment of the whole course of ETU tactics in its dealings with the TUC General Council over the past few years fell as heavily on the General Council itself as anywhere else. Mr Woodcock's chorus was the ugly, apt word "fraud," but he made it quite clear that he did not regard it as his council's job to go round looking for little peccadilloes by union leaders and dealing with them. The TUC, he said, needed a "hell of a warrant" to interfere ; his insistence on his regret that he was forced on this occasion to act did not suggest that he is striving hard to get the union movement's constitution rewritten to give the General Council and the TUC more power.

Mr Woodcock is to meet the Minister of Labour next week to discuss the latter's question whether some reform of trade union legislation may not be desirable. There is now an overwhelming case for saying that it is desirable, and that the Government should force it through Parliament next session. When the TUC does not intervene to rectify a fraud committed by a union against any of its members—whether that member be an election candidate or an ordinary rank and file worker who has been subjected to some local persecution that is quite contrary to any rule-book—the Registrar of Friendly Societies should have the right and duty to intervene. The Registrar's weapon should be that any union which does not obey his order to put the matter right should no longer be entitled to the special legal privileges (e.g., freedom from actions for damages when acting in restraint of trade) incorporated in the various present Trade Union Acts.

THIS is the more important because it is still difficult to see that last Monday's action by the TUC against the ETU is going to have any teeth. The second overwhelming impression that emerged at Portsmouth was that most delegates, having sacked the ballot-riggers of the ETU, seemed to feel that it was time to be pals with them again. The delegates regarded it as a sad spectacle when Mr Foulkes and his followers filed up the aisle of the Guildhall to hand in their credentials outside the door. Your correspondent found it even sadder to see the victorious Mr Byrne wandering off alone and unrecognised into the crowd, while press and television thronged around to hear the reactions of Mr Foulkes. But the general reaction of his fellow trade unionists to Mr Foulkes seemed equally to be one of rallying round. There seemed to be no question of challenging the ETU's vital position within the confederation of shipbuilding and engineering employees, and it is hard to see what can be done by the employers' sides of the various joint negotiating bodies on which Mr Foulkes sits with leaders of other unions (he is chairman of the negotiating body for electricity supply).

The hope of those trade union leaders who do see the need for following up the symbolic decision of Congress with some positive action is no doubt that the forthcoming elections for the ETU executive will produce a majority of non-communists. If they do not, and the communists themselves are still in charge of most of the election arrangements, nobody at Portsmouth seemed to want to speculate about what might happen then.

There were, however, signs at Portsmouth that in some other matters the Congress was falling back rigidly into old alignments of right against left. One sign of this was the manœuvring off the General Council of its only communist member, Mr Will Paynter, of the mineworkers. This was done by the traditional device of choosing a delegate from an obscure colliery union to occupy one of the three seats reserved for the miners on the Council, and getting most of the big unions to vote for him. This rather shabby procedure provides the communists with a vaguely substantial "*tu quoque*" in reply to accusations that they fiddle ballots. It seems all the more unfortunate since Mr Paynter has shown himself to be an efficient general secretary of his well-run union, and one who can resist the actions of unofficial strikers without being called a capitalist stooge.

The far left also found itself lined up on its own side of the barriers when the Congress voted on Europe. A motion which would have committed the unions to oppose the start of negotiations was soundly defeated by a show of hands. The Congress equally massively supported the General Council's report, which came down with canny firmness in support of the Government's initiative. But the debate was a much more finely nuanced affair. Sir Alan Birch, for the General Council, opened with a masterly (if slightly schoolmasterly) exposition of the case for negotiating, only slightly marred by a break-down of the microphone and a confession that "we are in the hands of the electricians." He was opposed partly by the extreme left and partly by what an angry delegate described as the "egg-head craft unions"—the draughtsmen, two printing unions, and the actors. As one variant of the usual left-right division, however, Sir Alan was supported (sort of) by Mr Frank Cousins, in a speech of characteristic mandarin obscurity. Mr Cousins, once an ardent European, has climbed stoutly on to the fence, with the intention of eventually getting off it on to which ever side Mr Gaitskell does not. The feeling of this debate was, however, not one of enthusiasm for the common market—except on the part of Mr Edwards of the chemical workers, who had found encouragement dear to a trade unionist's heart in the social provisions of the Coal and Steel Community, and preached the message with true Welsh hwyl. Some continental observers were saddened by the apparent indifference, even ignorance, of the Congress, but they could reflect that here, at least, the TUC seemed to be speaking with the true (and pretty muddled) voice of Britain.

ON Wednesday morning the Congress found a more characteristic and more sectarian voice in its debate on the economic situation. The discussion had two distinct strands—the popular and unanimous denunciation of the Chancellor's wage pause, and the more awkward theme of planning the nation's economy. The wish for a "planned progressive policy" is ritually formulated by each year's TUC. The difference this year was that the Government actually looks like taking the unions at their word and asking for their collaboration on a planning board.

Mr Harry Douglass, opening the debate for the General Council, said that the aim should not be to say to the Government "I told you so," but to ask it to abandon its traditional Conservative objections to planning. As the steelworkers' leader, he has watched the progress achieved by planned expansion in the Coal and Steel Community, and at times he appeared to be arguing more for British entry into the

common market than for national planning. But he, and Mr Woodcock in his summing up of the debate, came down clearly in favour of collaborating—on terms—with the Chancellor. The progress of the debate was, in fact, a fine example of the General Council's technique of combining various subjects in order to secure a satisfactory majority (in this case a unanimous vote), and thus leave its hands free.

The theme of planning ran thin indeed through the speeches from the floor, which were largely from delegates of civil service unions and mostly concentrated on bitter denunciations of Mr Lloyd. Mr Carron of the engineers, Mr Greene of the railwaymen and Mr Cousins of the transport workers kept largely to this theme—with the interesting gloss from Mr Cousins that he would interpret a vote of the Congress as an assurance that other unions would not leave him out on a limb as they did during the London bus strike of 1958. In view of the real possibility that the first strike against the wages pause may be a strike of Mr Cousins's lorry drivers (see below), this could be an intriguing portent of battles to come. But one other battle, at least, is over. With the exception of a racialist swipe against the training of German troops in Britain, the voting on all Thursday's foreign policy and defence motions was exactly what Mr Gaitskell must have wanted. Mr Cousins's own unilateralist motion was defeated by a massive majority.

It is difficult to sum up the implications of this Congress in any consistent form. Despite all the militancy of the wages debate, the approach of the platform to the theme of planning was sufficiently positive for the Chancellor to take it more as an offer of help than as a threat of boycott—although it is unlikely that those who voted had any idea that their action could be interpreted in this way.

But the great disappointment of the Congress is that the General Council continues to turn a blind eye to all major problems that it does not like. Its assumption that the expulsion of the ETU solves all problems of control of fraud in the unions was one sign of this, its belief that planning can proceed sensibly without limiting wage increases is another; yet another was the absence of any indication that the General Council is doing any new thinking about unofficial strikes. The General Council's report contained a few flabby paragraphs on unofficial strikes, mostly devoted to summing up (and indeed slightly watering down) the conclusions already reached in last year's report. These were adopted by the Congress without a word of comment either from the platform or from the floor. It will be hard to have much confidence in the value of the TUC as an active partner in the Chancellor's planning machinery, as long as it continues to turn its blind eye so deliberately on all the most difficult planning subjects within its own immediate sphere of interest.

NOTES OF THE WEEK

LORRY DRIVERS

The First Strike?

THERE is a strong possibility that the first serious strike in opposition to Mr Lloyd's wage pause may come among the 240,000 lorry drivers and other road haulage workers, most of them organised in Mr Frank Cousins's Transport and General Workers' Union, who are employed by Britain's 30,000-odd private enterprise road haulage concerns. Because so many of these men work for such very small firms, their minimum wages are determined by one of Britain's 60 official Wages Councils. In effect, this usually means that they are decided by the councils' independent member or members. Usually the Minister of Labour automatically approves such awards and makes them obligatory for the whole industry. But since July 25th Mr Hare has refused to confirm two other wages councils' awards.

As it would happen, the chairman and chief independent member of the Road Haulage Wages Council is the almost ubiquitous Mr Guillebaud. On July 16th his council made a provisional recommendation—which it will have to reconsider, and then probably submit to the Minister, on September 21st—for a two-hour cut (to 42 hours) in the lorry drivers' basic working week and a 3 per cent increase in their wages. The usual figures are already being bandied about to suggest that this is a very small increase to very lowly paid workers: it will be said that under it the Grade 1 lorry drivers' wage would be raised only from £9 5s. 6d. a week to £9 11s. These figures are misleading. The "working week" in this industry is necessarily calculated on scheduled time away from the garages, including the considerable number of hours spent in transport cafés. Last April the drivers' average working week, on this basis, was 56 hours, which meant that overtime must have brought such a Grade 1 lorry driver's average scale earnings even outside London to at least £12 15s. a week. The new proposals would increase their average earnings by a full 25s. a week (indeed, by considerably more when Sunday working is involved). They would cost the firms immediately concerned about £15 million a year. And the wages of many of the drivers of Britain's one million "C" licence vehicles (and of the lorries owned by the nationalised British Road Services) would be likely to go up in sympathy.

It is therefore virtually certain that the Minister will have to turn this proposal down, if it is submitted to him. The strike that might then break out would have several intriguing features. First, not all of the 240,000 workers are members of a union, and some of those that are might not obey Mr Cousins's call. Secondly, however, some of the scattered employers themselves might not put up a united front of resistance. Thirdly, there might be interesting psychological and political and national effects if the first strike against the wages pause is associated with two such familiar names as Mr Cousins and Mr Guillebaud.

TEACHERS

Poor Arithmetic

THE extraordinary thing about this week's discussions on teachers' pay is that the Minister seems, in effect, to have offered the teachers more than they would get under the Burnham committee's recommendation; but that the National Union of Teachers is now so embroiled in union politics that it refused to accept it. The arithmetic of this contention is simple, although apparently almost completely neglected. The Burnham agreement, which the NUT eventually said it would accept, aimed at a £47½ million a year increase from January 1st next until March 31st, 1964. Over the 2¼ years of the agreement the teachers would therefore get 2¼ multiplied by £47½ million, which equals approximately £107 million.

The Minister has now offered a £42 million a year increase from next January, but without a terminal date. But it is an open secret that he was really indicating that English teachers should be able to get a new agreement from March 31st, 1963, when the Scottish pay agreement runs out. In the first 1¼ years of any such award, English teachers would therefore get 1¼ multiplied by £42 million, which equals some £52½ million. In the next year they would get £42 million (bringing their total in the period to £94½ million) plus the additional increase negotiated for March, 1963, to March, 1964; if this last addition were more than £12½ million (which would be approximately a 3 per cent rise), the teachers would thus get more throughout the whole period than the £107 million under Burnham. The Government's intention is that by March, 1963, it should be operating a planned wage policy, whereby wages would rise in line with national productivity—it hopes at about an average of 3 per cent a year. But any new teachers' agreement reached in March, 1963, would presumably be for a two or three year term, so—in order to cover the whole rise in productivity expected over this period—the teachers could clearly expect more than 3 per cent.

Because the NUT has refused to see this, the Minister will now introduce legislation to implement his scheme off his own bat. If Sir David Eccles were wise he would divide his immediate £42 million a year in such a way that graduate and experienced teachers would gain more even immediately than they would under Burnham—i.e., he would increase differentials above the Burnham figure by more than he cuts the Burnham recommendation for the basic scale. Unfortunately, however, he seems to have decided merely to accept the Burnham recommendations about differentials, and to pile these on top of a basic scale that will run from £570 a year to £1,170, instead of the £600 to £1,200 that Burnham wanted. The sorts of figures he is probably going to impose were portended in a parliamentary answer on August 4th; they would give the head of a grammar school with 600 pupils £2,580 a year, against £2,260 now.

The NUT has said that it will send lobbyists to Westminster against this legislation, but it seems unlikely that it can now successfully call strikes—at least once the implications of the absence of a terminal date have sunk into its members' heads. The National Association of Schoolmasters may go ahead with its threatened strikes, but it is now in a rather curious position; its main complaint hitherto has been that it is not represented on the Burnham machinery, which the Minister himself has now effectively devalued.

BRAZIL

Noble in Compromise

ALTHOUGH it is possibly more perilous to cross a street in Rio de Janeiro than anywhere in the world, the Brazilians are essentially peaceable, with qualities of sanity and tact that usually enable them to circumvent bloodshed. So it has been this time: the compromise of substituting a parliamentary for a presidential system, accepted by Vice President Goulart and by the leaders of the armed services, and the reluctance of Brazilian soldiers to fight one another, have averted what might in a country of more unswerving principle have been civil war. Sr João Goulart (who, in the irreverent Brazilian manner, is always called by his nickname "Jango") was greeted with full military honours and brave good humour when he flew into Brasilia on Tuesday. His flight had been delayed for a day by a pocket revolt among some air force officers who, taking longer than their fellows to accept the military turnabout, were apparently planning to kidnap the vice-president on his way from the south. Brigadier Grum Moss, the air force commander, has since resigned, and Sr Goulart's safe arrival takes the crisis off the boil.

A cooler, and longer, contest now starts. As this issue of *The Economist* went to press, Sr Goulart and his political leaders were still trying to affect new compromises in the choice of a prime minister and cabinet. The most capable of the candidates for prime minister, and the one, it is thought, whom Sr Goulart backs, is Sr Carvalho Pinto, who took over the governorship of São Paulo from Sr Jânio Quadros and was tipped to succeed him as president. If anybody can salvage the reforms that Sr Quadros started, it is probably Carvalho Pinto. But the mediators in Brasilia may decide that the first prime minister under the new system should be a politician who is adept at pleasing all, rather than an administrator who has shown himself handy with an axe.

Untested Jango

Moreover, if Sr Quadros, elected with the largest majority in Brazil's history and blessed with more executive power, on paper, than the President of the United States, felt himself unbearably frustrated after seven months, the outlook for a bold programme of social reform is dim indeed. Sr Goulart is regarded in advance with deep suspicion by the very people whose interests might suffer. Certainly he does not intend to be a mere figurehead, but under the new constitution he will have to work through an executive that is bound to be divided and will probably be sluggishly inclined to leave bad alone. But Sr Goulart's qualities as a national leader, rather than a special kind of labour boss, are untested; other vice-presidents, when unexpectedly elevated, have sprung surprises.

AFGHANISTAN

Unnecessary Break

AFGHANISTAN'S decision to break off diplomatic relations with Pakistan must be regarded as a belated backwash of the border fighting between the two countries in May. A break at that time, in the heat and drama of the moment, would have been more understandable than now. The present dispute between the two neighbours is relatively mild. The Pakistanis closed two of their consulates in Afghanistan last month, after complaining that their staffs were being harassed, and asked for Afghan consulates in Pakistan to be closed down as well. The Afghans, on their side, complained that their consular staffs were being shadowed and harried, and have now made the diplomatic break.

These developments are merely symptoms of a long-standing strain arising out of Afghanistan's recurring claim for a state of "Pashtunistan," to be carved largely out of Pakistani territory. The advantage of "Pashtunistan," if it ever happened, would be that it would give land-locked Afghanistan an outlet to the sea. It has, however, been a lost cause ever since it became clear that Pakistan was likely to endure as a nation state. The underlying tension has acquired cold-war overtones through Pakistan's alliance with the United States; Afghanistan, which styles itself neutralist, is a theatre of competitive assistance from Russia and America. It is to be hoped that the present break will not last as long as the previous one, in 1955, which went on for two years and caused Afghanistan serious trade difficulties.

LABOUR CONFERENCE

Blackpool Unlit?

LABOUR'S diamond jubilee conference from October 2nd to 6th at proletarian Blackpool—where appropriately the lights shine more brightly than at aristocratic Scarborough—is likely to be a comparatively sober affair. The Empress Ballroom cannot hope to produce the dramatic highlights of last year's Scarborough Spa, which is a sad thing for the journalists but a good one for the party and the country.

The final agenda for the conference, published last weekend, again has over one hundred resolutions on foreign policy and defence; but, since Mr Gaitskell and the platform have an assured majority against unilateralism, heat and controversy are likely to centre on the Berlin crisis. No doubt some wild anti-Nato things will be said from the floor, but Mr Gaitskell should have no real reason to be ruffled. The extreme left has lost most of its points of foreign policy pressure at once now that the unions have turned Gaitskellite, Mr Khrushchev has dismayed the nuclear disarmers, and even Pembroke has welcomed the Panzers (although, as the TUC showed this week, German troop training is one subject where the conference may vote cussedly; just conceivably, Polaris bases could be another). Oddly, one other minor flashpoint in foreign affairs for Mr Gaitskell may be the one point on which he thought he had played safe: his lack of policy on the common market will be attacked from both sides.

On home affairs, Mr Gaitskell can regard the agenda with equanimity. Most of the time will be taken up with attacking the Chancellor, the "inhuman" Mr Powell and land speculators. Nationalisation shopping lists are fewer this year—only 12 motions demand them—and there are even three mildly revisionist unofficial resolutions about the concept of public ownership. Abolition of the House of Lords is back in favour, with nine motions in support. A nasty straw in the wind is provided by two resolutions calling for restrictions on immigration.

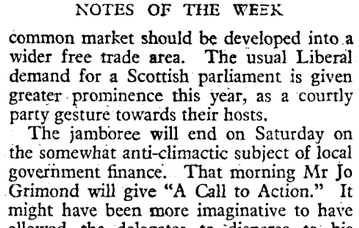
In the elections for the constituency section of the national executive, some hopes have been expressed that Mr Mikardo might lose his place to Mr Healey, Mr Mellish or Mr Mayhew ; but this would require a large turnover of votes from last year, and be a major Gaitskellite triumph. In the women's section of the executive the Gaitskellite Miss Herbison may well come back to displace the moderately leftish Mrs Jeger. The conference is also to be told that the central funds of the Labour party are badly in the red, and the constituencies are to be asked to transfer more money to Transport House but without raising individual membership fees. This looks like a pretty fiddling and ineffective expedient by a party headquarters that urgently needs business-like reform.

LIBERAL CONFERENCE

Edinburgh Unrocked?

THE final agenda for the Liberal party conference, at Edinburgh from September 20th to 23rd, has also been published this week. This agenda is tightly controlled by a central agenda committee, sometimes with greater efficiency than tact. For example, it seems a little too much to list the executive nominees for vice-presidents straightforwardly, and then to prefix Birkenhead's nomination of Mr Graham White (one of the old guard) with the supercilious " The following nomination has also been received." The committee has obviously been at great pains to avoid the label " wishy-washy " becoming attached to its resolutions, but has fallen into the opposite error of making them far too detailed. Thirty-eight lines on the common market is perhaps excusable in present circumstances, but 48 on a five-year plan for industry and 52 on education are far too many, and only muffle the resolutions' effect.

This said, the final agenda promises an interesting conference. First place is given to a call for tax reform, in a motion which includes all the usual ragbag of Liberal ideas ; an interesting amendment from the floor demands a graduated turnover tax with incentives for exports. More revolutionary is the resolution recommending a five-year economic plan aimed at achieving a rate of growth of 5 per cent per year ; here an outraged delegate from Mitcham has tabled the deletion of the obnoxious word " plan " and substituted the anodyne " social objectives." Some controversy is likely over the motion on British agriculture and the common market, which may not dispose of the old struggle between cheap food and agricultural support as decorously as had been hoped. An interesting sign of Liberal revolt is that an amendment from Miss Manuela Sykes, the fire-breathing candidate for Ipswich, demands guarantees for Commonwealth and other producers before Britain enters the market. Mr Moore, another flashing Liberal light, has also tabled an amendment to say that the common market should be developed into a wider free trade area. The usual Liberal demand for a Scottish parliament is given greater prominence this year, as a courtly party gesture towards their hosts.



The jamboree will end on Saturday on the somewhat anti-climactic subject of local government finance. That morning Mr Jo Grimond will give "A Call to Action." It might have been more imaginative to have allowed the delegates to disperse to his clarion, rather than let them drift away into the local twilight.

CONGO

Katanga and After

ONE of the marginal attractions of the Belgrade conference this week was the late arrival of the premier and deputy premier of the Congo, after travelling from Leopoldville in apparent harmony in the same aircraft. Mr Gizenga had gone to Leopoldville to make the journey, and since he was able to show himself there without being arrested, as he had apparently feared, it may now be hoped that he will take up his post of deputy premier in Mr Adoula's new central government.

To that extent, Congolese unity now seems nearer than at any time since the army mutiny brought chaos shortly after independence. But Katanga remains the outsider, and it is still by no means certain that the United Nations takeover of the Congo's richest province has hastened the

At Belgrade : Tito, Adoula, Gizenga

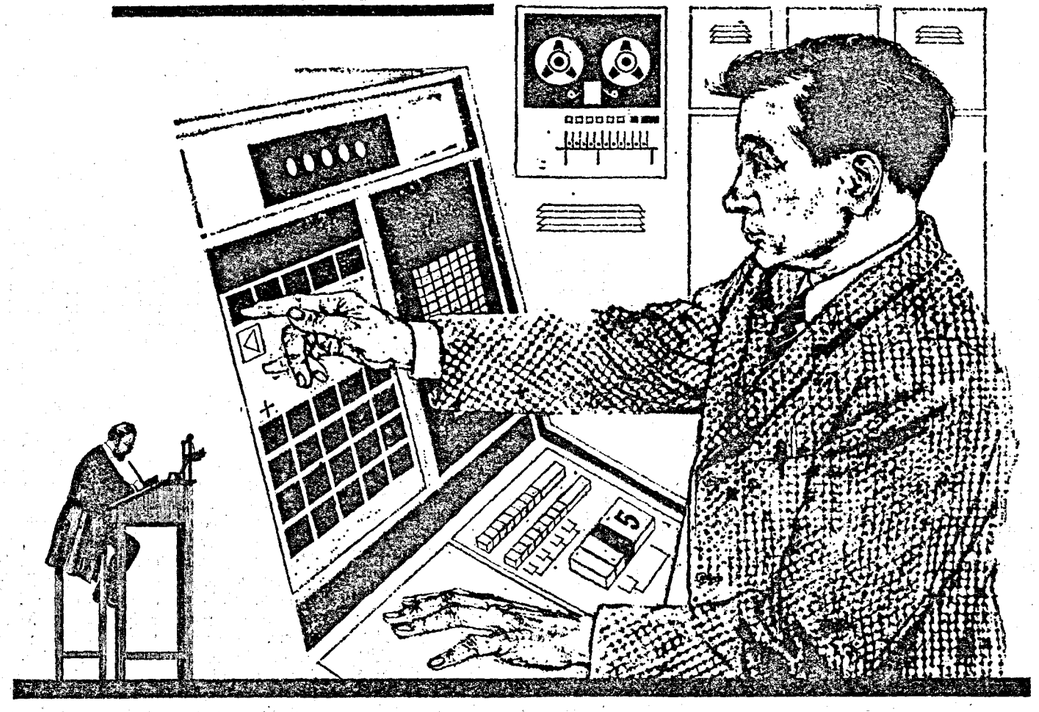
day of its peaceful integration into the Congolese republic. True, Dr Conor O'Brien, who heads the UN mission in Elizabethville, has carried out a text-book *coup d'état* in the province, seizing strategic points and arresting Mr Tshombe's European officers. But there is a significant difference between the usual *coup d'état* and one carried out, as this one was, by Swedish and Indian troops far from their own countries on behalf of a world organisation. A Qasim or a Nasser, if successful, is there to stay; Dr O'Brien and the UN, in any long-term sense, are not. Now that Dr O'Brien has denounced Mr Tshombe's minister of the interior for alleged atrocities and severed relations with the provincial government, the mission he heads is under a strong obligation to find a Katangan premier who will not be overthrown the minute the UN's backs are turned.

Much, on the other hand, will depend on what Mr Adoula and Mr Gizenga do after they are back. The legality of the Adoula government is beyond doubt. But it rests, as do all the UN resolutions on the Congo, on the basis of the Belgian-drafted constitution for a unitary state, whereas a federation would accord better with Congolese realities. If Katanga is ever to pull its weight in the Congo, the central government will probably have to move in a federal direction.

KUWAIT

Grasping the Nettle

WHILST awaiting its Arab League bodyguard, Kuwait is making its own efforts to be less politically vulnerable. Its 67-year-old ruler has declared for a constitution—and in no mealy-mouthed way. By a decree of August 26th he has promised this constitution " on democratic foundations," and elections on November 1st for a constituent assembly. Meanwhile a committee has been formed to join with the supreme council (the present governing body composed wholly of the ruler's relations) to draw up an electoral law.



These are large ideas to fit into a small canvas. Of Kuwait's 320,000 people only 120,000 are Kuwaitis (and 46,000 of these are children). The large foreign population can probably not claim to vote. Nor is it easy to know what political stuff the average Kuwaiti is made of. The sheikhs' monopoly of government has hitherto been possible only because bright young Kuwaitis are so rapidly absorbed into joyful money-making that they have not had the incentive to push opposition far. There is, all the same, a cleavage between the stately pre-oil age men and the live-wire beneficiaries of the ruler's liberal educational policies. All boys who pass their secondary school examinations are enabled to go on to further free education in Cairo, Damascus, Beirut, Britain or the United States. They return as cosmopolitans, charmed still, of course, to be Kuwaitis, but a little pained by things in their country that seem to be out of date. No doubt when candidates are chosen for election grey hairs will still be preferred to bachelors' degrees. Nevertheless Kuwait does seem to be cautiously approaching some form of more widely based government. It may thus set a local example. Bahrainis are watching with lively interest.

IRAQ

Teach Yourself Oil

CONFRONTED by General Qasim's belief that oil questions are simple, the Iraq Petroleum Company has interrupted the resumed talks in Baghdad in order to build up a detailed case for presentation to the Iraqis on how not to do-it-yourself in the integrated oil industry. The heavyweight team representing IPC and its shareholder companies, led by Mr Harold Fisher of Standard Oil of New Jersey, formally conceded a number of the points that had been unwisely allowed to bring negotiations to an

in a changing world

If ten Dickensian clerks with ten pens worked ten hours a day for ten years, how many sums would they have done? Fewer, no doubt, than one modern electronic computer can do in ten hours.
In commerce, in industry, in research and in defence, the computer is performing prodigious tasks today—saving time, saving money, saving valuable manpower.
And Mullard's contribution to this revolutionary development? Principally in the shape of memory cores and assemblies, transistors, valves and other specialized devices, but also to some extent in know-how.
Mullard research and applications laboratories play an important part in satisfying the urgent and critical needs of the designers of modern electronic equipment. Could they also be of service to you? If you would like to find out, please write to us at the address below.

Mullard products used in computers include:
FERRITE CORES · MATRIX ASSEMBLIES
COMPLETE STORAGE SYSTEMS
HIGH SPEED LOGIC AND CORE DRIVING TRANSISTORS
SEMICONDUCTOR DIODES
SPECIAL VALVES · THYRATRONS
COLD CATHODE TRIGGER AND COUNTING TUBES

MULLARD LIMITED MULLARD HOUSE · TORRINGTON PLACE · LONDON W.C.1

MP3879

abrupt halt last April and had been accepted since. In particular the company had agreed to relinquish three-quarters of its unexploited concessions straight away, and another 15 per cent later on—immediately translated by General Qasim as the relinquishing of 90 per cent. But after four meetings, the clash over General Qasim's request for a fifth share in the capital of the operating company has sent the team home —not for consultation, but in order to have three weeks to get out the documents and statistics which, it is hoped, may impress the Iraqis with the difficulties and complications of buying their way into a 40-year-old complex operation owned by a consortium of major oil companies.

General Qasim agreed in a friendly way to the interruption, but the threat in his comment, published in *Ath-Thawrah* on Monday, that further procrastination might lead to " appropriate legislation " shows that he is not in the mood for what he may consider obfuscation, even if this is in the form of a helpful lesson about oil economics. The oil companies believe that they are on strong ground, legal and economic, in refuting the Iraqi claim for participation ; and they are not persuaded that the claim has any moral or other basis. Nor are they prepared, at this stage, to allow that it would be expedient either for themselves, as a form of insurance, or for Iraq as a way of getting more cash. It would mean, they argue, that the group would have less money to reinvest in Iraqi oil development and that the shareholding companies might be tempted to turn to more profitable fields elsewhere.

General Qasim urgently needs money to keep his defence forces going. He also, particularly after the ham-handed business of his claim to Kuwait, plainly feels the need for a resounding diplomatic victory. His demand for participation was given body by the Kuwaiti government's 20 per cent share in its new deal for developing offshore oil with Shell ; the Iraqis are naturally less convinced than the oil companies that their circumstances are altogether different. The fact that the two cases are in fact utterly dissimilar will not count for much in Baghdad's argument. Possibly an escape from the wearisome prospect of attrition might be found in some new deal involving a joint venture of some kind, perhaps in the territories that are to be relinquished by IPC. But, at the moment, it looks as if the government and the companies, with what should be overwhelming interests in common, will meet again later *this month* without reaching any meeting of minds. The oil companies are anxious not to dig in, but miserably uncertain about the possibilities of negotiation.

Help for Birmingham

MR BROOKE has proposed some new measures, including large development schemes at Worcester, Redditch, and Daventry, to cope with the urgent housing problems of Birmingham. At present Birmingham is clearing about 1,000 slums a year, but 3,000 or more dwellings each year become obsolescent. The rate of clearance of people out of the city needs to be speeded up, but *sufficient sites have* not been found to rehouse them even at the present rate. Two years ago Birmingham tried to start a large satellite estate at Wythall, but was beaten back by the claims of the green belt. Now it is to be allowed a much smaller Wythall scheme (600 acres instead of the original 2,400), presumably to give it a breathing space while the schemes for longer-distance dispersal mature.

The minister's new plan is certainly an improvement upon the negative tactics which went before it, but it cannot be called the best possible one. The town development schemes will depend upon effective co-operation between the local authorities, but the sites seem to have been picked almost exclusively with this point in mind. Worcester is keen to expand in order to retain its status as a county borough, which is threatened because it now has too few people ; since the site is a good one the motive need not matter. Redditch also seems to be keen ; but it cannot be logical, after rejecting Wythall because development there would impinge on the green belt, to develop a town of 50,000 people only a few miles further out.

The basic fact is that Birmingham has two separate problems which often get confused. There is, first, the general upsurge of employment and population in the West Midland conurbation, which can best be relieved by a new town (such as the possible one at Dawley which is now being investigated) and by the expansion of such places as Worcester. These schemes ought to include a lot of private enterprise housing and should not need heavy subsidies. There is, second, the special problem of rehousing slum dwellers, most of whom are closely tied to jobs in Birmingham. It would be senseless to send these people to Redditch rather than Wythall. In short, Mr Brooke is now on the right lines, but he has let local politics sway his priorities. There is everything to be said for development at Dawley (which the Minister did not mention) and Worcester ; nothing to be said for Redditch ; and something larger, at Wythall or elsewhere, is needed to cope with Birmingham's immediate housing needs.

NORTH AFRICA

A Stitch Too Late

GENERAL DE GAULLE'S revision of his attitude to the Algerian claims to the Sahara might conveniently have come a little earlier. In his press conference on Tuesday, he stated firmly that France had no interest in the Sahara except that of " free exploitation of the oil and gas which we have discovered or will discover," that no Algerian government could be expected to relinquish its country's claims on the area, and that the Sahara's few inhabitants (" the Sahara, you see, is a desert ") would probably choose to join an independent Algeria. All this is realistic ; it would have been just as realistic if it had been said in July, in time to prevent the breakdown of the Franco-Algerian peace talks and possibly the replacement of the Ferhat Abbas government by a new team of uncompromising militants.

Other elements in General de Gaulle's address were even less encouraging. His remarks about renewed talks with the FLN, and the stress he laid on such ideas as a regrouping of the Algerian population (the partition of Algeria, in fact), suggest that he has despaired of agreement with the nationalists and is preparing to jettison Moslem Algeria as he cast off Guinea. Even if talks do begin again, they are likely to come to grief over the topic of French military bases, particularly that at Mers-el-Kebir. General de Gaulle did not mention it, but he is even less prepared to give Mers-el-Kebir up to the nationalists than he is to surrender Bizerta to the Tunisians ; and the rebels (to judge by a forthright speech by Mr ben Khedda at the neutrals' conference in Belgrade on Monday) are in no mood to allow the French any sort of military enclave in Algeria after independence.

As to Bizerta, General de Gaulle was totally unforthcoming. He repeated his somewhat unconvincing assertions that the base was necessary to western defence and necessarily a French responsibility ; and he showed plainly that he has no idea of the harm he did to France's reputation by the bloody retaliation in July and the French boycott of the General Assembly debate in August.

NEUTRALS

All Africans Together

NOT a dish of herbs but a breakfast of beans and honey gave the flavour to a *tête-à-tête* between President Nasser and Bourguiba in Belgrade on September 1st. This, their first meeting after three years' estrangement, was marked by its simple friendliness, according to the Tunisian weekly *Afrique Action*. Both wanted bygones to be bygones and to work together in future, each promising to write personally to the other should anything seem amiss.

The " non-block " conference in Belgrade has afforded some fine opportunities for heads of state to sort out their affairs. This reconciliation between Cairo and Tunis has only just made a beginning. Between breakfast cup and lip there could still be a slip. The acceptance by President Nasser of an invitation to Tunisia does, however, fill the emotional vacuum the Tunisians have felt since France, as they see it, betrayed them at Bizerta. This is African turning to African as much as Arab to Arab. As Europe ferments its own crises, Africa turns in on itself.

President Sekou Touré's absence from Belgrade does not point to any rift in the lute of the " Casablanca " group of African nations. It appears that he was detained at home by the threat of a crisis over the closing of the Christian missions in Guinea —the result of their director's refusal to allow Christian schools to be integrated into the state school system. Banished and in exile in Dakar, the director, Mgr Melleville, was suspected of trying to get France and Portugal to intervene on his behalf ; hence President Touré's desire to stay at home.

ITALY

A Crisis Postponed

SIGNOR FANFANI'S summer holiday has so far been distinctly unquiet. Not only has he been involved by Mr Khrushchev in the east-west debate—he received a second message from Moscow a week ago—but he has also had on his mind a polite but possibly sinister threat to the stability of his own government.

The threat came from Signor Saragat, whose Social Democrat party helps to give the Christian Democrat government an adequate parliamentary majority. In an article in his party paper on August 22nd, Signor Saragat suggested that the time had come to enlarge the government's majority in a leftward direction ; he said that if the Christian Democrats did not accept the support (not the mere negative abstention) of the Nenni Socialists, his own party would " inevitably " go over to the opposition.

In the convolutions of Italian politics, complicated just now by the repercussions of Italy's involvement in the east-west crisis, Signor Saragat's motives cannot be easily perceived. But he appears to have his eye on the presidential elections next spring, and to be anxious to ensure that President Gronchi's successor owes his position to a broadly-based centre-left majority, and is not, like Signor Milazzo (at present the King Charles's head of Signor Saragat's political writing) in Sicily some two years ago, dependent on the support of the Communists and the extreme Right. Signor Nenni, it seems, would be willing to play his allotted role, provided the government " broke with the Right." The difficulty would lie in getting the right-centre of the Christian Democrats to accept the support of Signor Nenni, whom they distrust and whose ideas they deplore.

Since in July the Socialists abandoned their policy of negatively supporting Signor Fanfani through abstention, Signor Saragat is in more of a key position. Clearly he could cause a serious crisis in the Christian Democrat party. Moreover, the surprising news from Palermo, where the Christian Democrats and the Socialists are about to form a joint regional administration, would seem to strengthen his hand. Signor Saragat seems, however, content to let his crisis ripen slowly. He indicated this week his willingness to wait until the Christian Democrats have decided their attitude to a leftward move at their congress in December. Signor Fanfani's future as prime minister is cloudy ; but, then, it usually is.

NORWAY

Campaign without Heat

NORWAY'S general election on Monday promises to be a quiet affair. The Labour party has been in power for 25 years, and nobody expects it to be unseated. In the 1957 election the party obtained 48.3 per cent of the vote. The opposition is splintered into conservatives, liberals, agrarians, and the Christian People's party. These groups have occasionally sought an accommodation of views to unseat labour, but no firm coalition has resulted yet.

In an affluent welfare society, where there are no illusions about the nation's diminutive power in world politics, passions are not high at election times. Over the years the Labour party has prudently moved to the centre ; it is commonly called " the Royal Norwegian Labour party " by friends and foes alike. The government can claim an impressive growth rate for the economy, ranging in recent years between 4 and 6 per cent a year. It is affluence, not austerity, that provides the Right with the few electoral issues in a quiet campaign. More latitude for private investment, and less taxation, are the chief domestic demands. Liberals and agrarians seek greater freedom from government directed policies in agriculture and fisheries.

The lack of heat about foreign policy points not only to the Norwegians' realistic view of their place in the sun, but also to the degree to which the foreign minister, Mr Halvard Lange, has made Norway's foreign relations his personal domain since he took office in 1946. Some may object to this ; none can challenge it.

The opponents of Norway's Nato commitment can find a home for their views in the recently founded Socialist People's party, which embraces pacificism among other things. Its performance is likely to be miniscule. The one communist member of the Storting draws his electoral support from disgruntled forestry workers in the Hedmark region ; his happy situation is not repeated elsewhere.

Where the common market has appeared as an electoral issue, commercial interests on the Right have chidden the government for its tip-toe approach and have stressed the need for a much bigger market than Norway now enjoys. But with a white paper almost in the press (carefully designed to appear after the election), the government is clearly anxious not to alienate any floating voters. Agrarians and liberals (18 per cent of the vote in 1957) still maintain doubts about the degree of protection they will or will not receive in the common market. The prime minister, Mr Gerhardsen, recently stated that the idea of a wider market was in line with the ideas of the Labour movement : there is little doubt which way Norway will move when the Storting reassembles.

VAPOUR BATHS

THE TURKISH BATH ; with a View to its Introduction into the British Dominions.

By DAVID URQUHART.

Mr Urquhart is a fanatic for the bath. He comes down upon the Western nations with as impetuous a charge as ever did the Mussulman of old. If we will not yield an unconditional surrender, he condemns us without reprieve to a state of hopeless uncleanliness: there shall not be water enough in the wide world to make us clean. He will have the vapour bath,—the Turkish bath,—or nothing. Without this it is in vain that we seek to wash and be clean. Cold fresh water is useless,—salt water " horrid " and " impure " ; sea-bathing a thing to be simply shuddered at ; soap little better than a pernicious invention ; the old familiar tub of our childhood, so dear to the Japanese—who, at any rate, if he does " dabble in dirty water," fulfils one of Mr Urquhart's desiderata in the sociability of his ablutions—is consigned to the limbo of the past as a mockery and a snare,—a mere pharasaic pretence at purification. . . . Mr Urquhart pathetically says that in returning from Turkey he felt as if passing from a refined to a rude condition of society. We humbly allow the truth of his accusations. We confess that we have never had a contortion given to the small of the back, —a *jerk* to our neck by the hands holding the temples,—nor even our heel bitten at the conclusion of the ceremony. . . . We are almost persuaded to shut our eyes to facts, and to believe that Eastern nations are the representatives of the purity of *Eden* ; that they have *no* skin diseases, *no loathsome leprosies*. . . . But it becomes a little too much for even our humbled state of mind to have the taunts of a German cast in our teeth ; to be told by one whose customary ewer is a cream jug, his basin a slop bowl, his towels pocket handkerchiefs, his soap *nil*, that the " dull English " are the worst washed of all nations. Mr Urquhart should beware how he tries us too far.

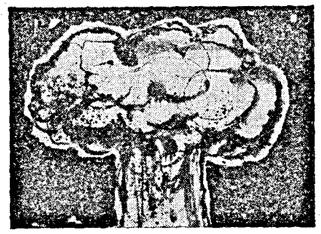
POLICE

Not a Happy Lot

LAST week another Detective Chief Superintendent—the third in two years—resigned from Scotland Yard, in order to head the security force of a bank. Some newspapers have therefore complained that the cream of the Big Five is being disastrously skimmed off by offers of money much greater than the police are willing to pay. This is almost certainly a wrong emphasis. In the first place, the so-called Big Five are not noticeably bigger than their 25 or so co-rankers in the Metropolitan Police who happen not to be, as the Big Five are, detectives as well as Chief Superintendents; and there are some 30 superior posts into which even these exalted officers could be promoted—if they stayed on long enough.

Secondly, all of the three distinguished officers concerned had in fact stayed on some time beyond their normal retirement age, the latest of them ten years beyond it. When they joined the Metropolitan Police, the period of service laid down was 25 years (it has since been increased to 30). All three

Scotland Yard: little room at the top



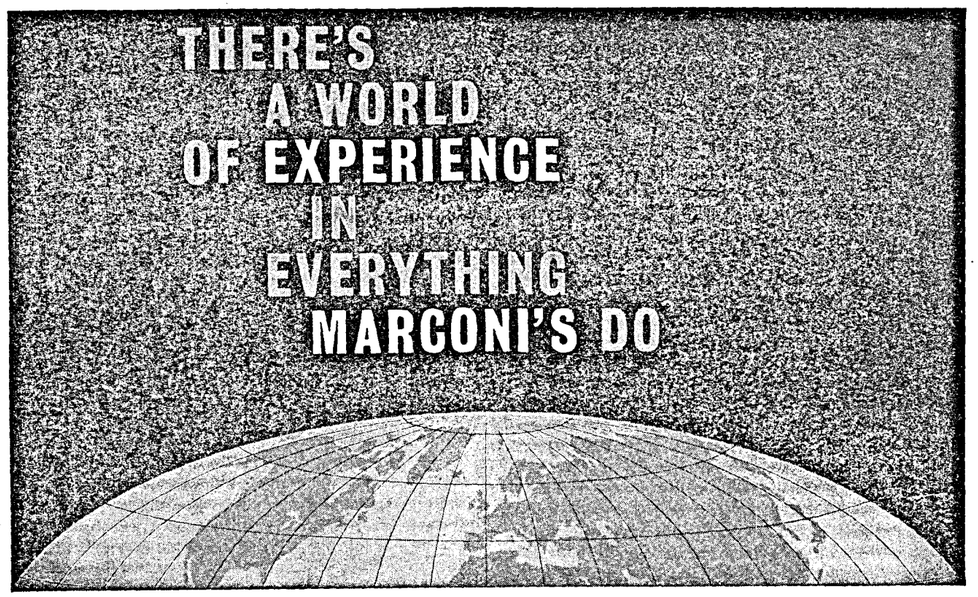
of them served eventually for more than 30 years, partly because they felt too young to retire (at about 50), partly because their pensions are calculated on the last three years of their salary and it was to their financial advantage to stay on—particularly now that increased rates of pay are in force (Chief Superintendents get £2,445 a year). Naturally, an offer from a bank removes the preoccupation with the extra few pounds to be obtained as pension by staying on another two or three years.

On the whole, this turnover at the top is to be welcomed. What is much more disturbing is the continued drain away of young men at the bottom. In the first six months of 1961, despite the recent sharp increase in police pay, another 524 probationer constables and young constables with less than seven years' service resigned from the police forces of England and Wales. It is possible that one of the barriers in London is the feeling that able young men cannot win promotion sufficiently quickly. Since the abandonment of the Police College in its old form and the consequent necessity for everybody to begin as a constable on the beat, able young men have had to work through eight intermediate grades to reach the position of Assistant or Deputy Commissioner.

When the pyramid of responsibility in any public service is as formalised as this, there may be too much of a tendency for promotion to be by conveyor belt—by age and seniority as much as by ability. There is a feeling that brilliant young men are not likely to be wafted sufficiently often into the Commissioner's chair over the heads of their less gifted superiors.

FALL-OUT

Carry on Breathing



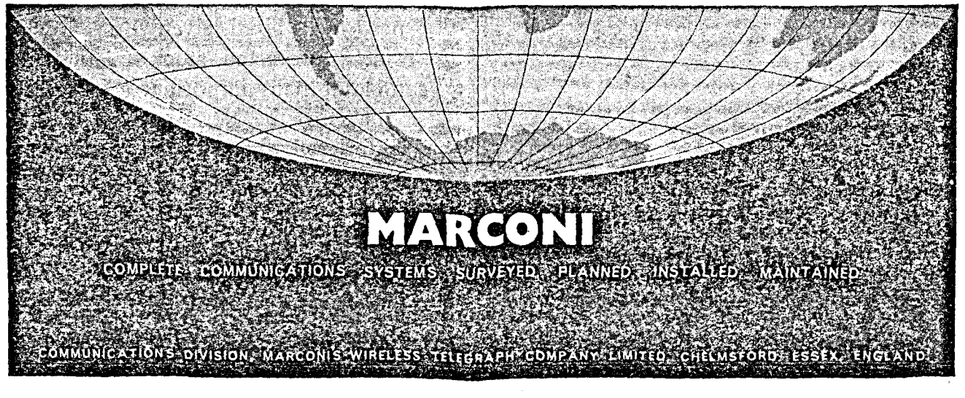
THE Russian and now the American decisions to resume nuclear tests seem to present a more immediate threat to the tranquillity of the world than to its physical health—despite the unanimity of Mr Kennedy, Mr Khrushchev and Mr Macmillan in worrying about pollution of the air. The attitude of responsible scientists towards fall-out has modified considerably since tests were suspended three years ago. During this time it has been found that the radioactive debris thrown up by a test explosion comes down through the atmosphere and is washed into the ground all in a matter of months. It does not, apparently, stay in the stratosphere for as long as the decade that scientists had originally predicted. It follows that earlier calculations about the size of the radioactive reservoir in the stratosphere were greatly exaggerated.

While the scientists have discovered that past tests created less fall-out than they feared, medical views about the danger it presents to health have also undergone a change—though no one would claim that the facts here are either so simple or so easy to establish. Radiation in large doses can kill as surely as a bullet in the heart; but doctors have not known the precise medical effect that small doses might have, especially if sustained over long periods. This is precisely the danger posed by fall-out. The trouble is that the small proportion of strontium 90 contained in the debris (other radioactive forms of strontium and other elements can be ignored, with the possible exception of carbon 14) is likely to be absorbed into bones, mainly into children's bones, and remain active there for the greater part of human life. Would these small doses have a cumulative effect? In the long run, could they be as dangerous as the same amount of radiation received in a sudden massive dose? Was there a level of radiation below which any dose could safely be ignored, just as the body apparently ignores the continuous background radiation it receives all its life from the mildly radioactive planet on which we live?

These questions have taken a long time to answer, since small doses of radiation are exceedingly difficult to measure and their effects even harder to establish. So it was prudent to expect the worst and work on the assumption that any additional radiation would be dangerous, however small the dose. It is still the proper medical view that any increase in radioactivity is objectionable, like any increase in air pollution. But, as research proceeds, there is more evidence to show that the body does shrug off small doses of radiation below a certain "threshold." These conclusions are still tentative, but they have gained sufficiently wide acceptance to be endorsed by the Medical Research Council in its second detailed investigation into radioactive hazards published last Christmas.

Everything depends on how many test explosions are carried out and on the size of the weapons exploded. If tests went on for another century at the pre-1958 rate, then the evidence now available suggests that the difference to the general level of radiation might be no greater than the variations in background radiation that can be observed today in different parts of the country. If the United States and Russia are currently concentrating on the testing of small nuclear weapons for use on the battlefield (and with the American tests under ground) it could be argued—and scientists doubtless have argued—that there is no risk in these tests either to this or any future generation. But if and when Mr Khrushchev tests his blockbusters, it may be necessary to revise these views.

Correction. The reduction in the duties on imports of coffee, cocoa and bananas into the European Economic Community, referred to on page 782 of *The Economist* of August 26th, has been proposed by the European Commission to the Council of Ministers, but no decision has yet been taken by the Council. A decision is, in fact, unlikely until some time after the ministerial meeting with the associated African states later this year.

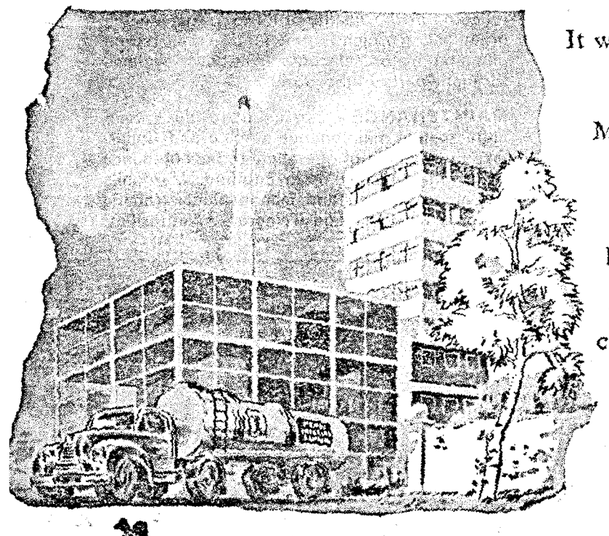


The Post and Telegraph Authorities of more than 80 countries rely on Marconi telecommunications equipment

SURVEYS ★ Marconi's telecommunications survey teams are at work in many parts of the world. Marconi's is the only company maintaining a permanent research group working entirely on wave propagation.

PLANNING ★ Marconi's vast experience is reflected in the quality of its system planning organisation which is constantly employed on planning major telecommunications systems for many parts of the world.

INSTALLATION ★ Marconi's installation teams undertake complete responsibility for system installation, including erection of buildings and civil engineering works as well as the installation of the telecommunications equipment and auxiliary plant.



MAINTENANCE ★ Marconi's provide a complete system maintenance service and undertake the training of operating and maintenance staff, either locally or in England. Marconi's will also establish and manage local training schools for Post and Telegraph Authorities.

The Old World made Hercules . . .

. . . to-day Hercules is helping to build the NEW WORLD

Hercules and the Augean Stables.

It was by meeting the challenges of his age that Hercules of old earned immortality . . . . To-day, Hercules still meets challenges. More—he anticipates them. For in industrial chemistry, research by Hercules Powder Company has produced many a "break-through" leading to better things. Take packaging for instance. Packaging materials need to be sized, given strength when we printed, protected, stuck together. Hercul can claim many important advances in the fields. If the New World is better off better packages, Hercules has a hand i Hercules has some key-words fo successes. Words like Pexol—Kyme Pentalyn—EC—Neolyn. You s know what they

ECONOMICS OF THE PRESS

1947 *"with the object of furthering the free expression of opinion through the Press and the greatest practicable accuracy in the presentation of news, to inquire into the control, management and ownership of the newspaper and periodical Press and the news agencies, including the financial structure and the monopolistic tendencies in control, and to make recommendations thereon."*

1961 *"to consider whether these economic and financial factors tend to diminish diversity of ownership and control or the number or variety of such publications, having regard to the importance, in the public interest, of the accurate presentation of news and the free expression of opinion."*

—Terms of Reference, Royal Commissions on the Press

BRITAIN'S first Royal Commission on the Press concerned itself primarily with the quality of our newspapers; the second is concerning itself primarily with the quantity of them. This is not because its terms of reference differ hugely. Nor is it because the quality of newspapers has obviously and indisputably improved. It is true that what are generally called "the quality papers"—i.e. the ones that cost more, plus or minus the *Daily Telegraph*—have significantly increased their share of total circulation since the first commission reported in 1949, but so have the mass-circulation dailies and Sunday papers: it is the ones in between that have suffered. It is because processes of attrition that had been partly arrested during 15 years of war and postwar controls have since eaten away one national daily and four Sunday newspapers—all papers in between the quality and the mass, bequeathing some of their circulation above and below. One unconventional new daily paper and one conventional new Sunday paper have come into being; but the futures of three of the remaining national dailies are none too certain. The net loss of titles in the national press is significant, the disappearance of provincial newspapers is more severe still; and though new magazines come into being almost as fast as others die, a whole category of general interest text magazines has nearly gone, and a pyramid of mergers has finally engrossed a very large collection of Britain's largest-selling magazines under one ownership. The Press Commission of 1947-49 made no bones about the fact that it was examining the business of newspapers at an abnormal time. No commission appointed today, with even the precise terms of reference set in 1947, could avoid concerning itself now more than then with "the financial structure and the monopolistic tendencies in control."

The press is a business, and a fairly **big one**; today, in parts at least, a declining one. Its commercial fortunes depend on two markets—people buying newspapers and magazines, and advertisers buying space in them to seek those people's attention—and upon its own production costs. During the war, the British people bought far more newspapers; advertisers had not the space or money to cry wares they could not supply; prices of materials and labour rose sharply but newspapers held costs by giving readers less for their money. Since about 1950, by contrast, sales of newspapers have fallen significantly; advertising expenditure has been expanding rapidly; and in offering bigger papers both to hold readers and to

accommodate more advertisements, the press has felt the full cost of giving the reader (nearly) as much in a newspaper as it did before the war. But bigger papers gave the mass-circulation dailies the room to accommodate more nearly the full proportion of mass consumer advertising to which their success entitled them. Thus they clawed back much of the excess of advertisements that in the early postwar years of newsprint rationing had overspilt into the "less popular populars" and some provincial newspapers. Women's magazines, rising in circulation and flamboyance, gained an increasing share of that consumer advertising, too. Finally, came commercial television; and the weaker press could not compete with all three.

This shakeout has not stilled the competition. Today it is becoming sharpest among the mass media—for advertising rather than for circulation, which today for such papers is not marginally profitable in itself. Commercial television is difficult to counter with sheer numbers; rightly or wrongly, many advertisers and some advertising agencies are convinced that its "pulling power" upon any given audience is stronger than the selling message in print. Mass-circulation newspapers, against television, now find it difficult to maintain quite the proportion of mass consumer advertising that they gained in the late fifties. The quality press lives primarily on advertising of kinds that television cannot as yet capture, and perhaps never will. But all newspapers, against this powerful competitor, may be forced towards full-colour sections and advertisements, whether they like the idea or not.

COULD a medium-circulation newspaper, selling say a million copies a day or two million on Sundays, survive in the powerful field? Could a full-scale newspaper be started now and win the circulation and advertising revenue needed to offer a reasonable return on "the cost of entry"? Neither question admits of an absolute answer; but the chances are not high for anyone hoping to enter the popular field. Among the quality press, the chances of both might be better. But there may be limits to the expansion of these papers' total readership—if they are to retain those desirable proportions of the well-to-do that command their relatively high advertisement rates and thus allow them to break even at much lower levels of circulation. Quality newspapers need to grow as the kinds of people who read them grow in numbers—not go out to capture readers who "naturally" would not read them.

It is perhaps not special pleading for a small newspaper to consider this an unhealthy situation; appointment of the fresh Royal Commission demonstrates the public concern. *In posse* if not always *in esse*, the right to inform the public of the facts of the day and to express opinions about them is one of the safeguards of freedom: and a society in which this right becomes increasingly circumscribed for economic reasons forfeits one of the distinctions that set it apart from societies where the same right is curtailed by political power. The very sharp rise in the break-even point of circulation for newspapers in Britain since before the war has social as well as economic consequences. Is there some practical, non-discriminatory interference with economic processes that one could prescribe to roll the break-even point back, and float medium circulation off again into viability?

The Royal Commission may yet find or devise one. But most of the expedients that have so far been publicly advocated fail on one count or the other. If practicable, they are not non-discriminatory; or *vice versa*. Most of them, in one way or another, would aim at reducing the dependence of newspapers upon advertising revenue that is geared to high circulation, and hence the total dependence upon higher circulation: forcing papers either to put up their prices or cut their costs or both. One idea proposed has been a tax upon advertising revenue (such as was imposed, unilaterally, upon the newspapers' main competitor in this year's budget); even possibly a progressive tax. Another such proposal would have a limit set upon the proportion of advertising space allowed in any newspaper. Either, certainly, would devalue increases in circulation and additional pages.

One major difficulty is that the importance of advertising to different newspapers varies sharply; it is, for example, probably larger for the *Daily Express* than the *Daily Mirror*, much larger for most quality papers than for either, and yet larger again for many specialised and technical magazines. The incidence of such a tax would be arbitrary and unpredictable—particularly as circulation already displays some elasticity to price for journals of all kinds. Another possible difficulty is that if newspapers passed the tax on to advertisers this might simply make "space" a generally more expensive commodity, and hence concentrate advertising even more where it pays best; and this might be still in the mass-circulation papers or perhaps outside the press on television. Some variants of this idea propose that the revenue drawn from such a tax should then be distributed among such newspapers as it is considered desirable to support, or that it should be levied on some kinds of advertising and not others: say, display but not "classified ads." Here non-discrimination goes out of the window; we would be back in the process of subsidising approved papers and discriminating against undesirable ones from which Britain emerged over a century ago. And how would who select the papers to support at the others' expense? The idea that the proceeds of a tax should be used to subsidise the price of a small basic supply of newsprint—a subsidy given to all newspapers but obviously benefiting the small far more than the large—is more attractive: but it would not alter the irregular incidence of the tax on, say, quality as against some mass newspapers. Again, it penalises the efficient—in the game as now played—and featherbeds the inefficient.

A similar objection applies also to suggestions that some public corporation should provide printing and distributing facilities on lease to people wanting to set up in the newspaper and magazine business, as ITA does with commercial television. Physically, spare capacity for new publications can now fairly readily be found within private printing houses on commercial terms. The kind of public assistance that advocates of this idea have really in mind, perhaps, is not so much physical capacity as financial backing, such as for example, the state lends through the National Film Finance Corporation to another form of visual mass communication, British film production. But how long could public money be expected to back, say, a newspaper that did not immediately attract enough readers to break even?

WHAT if the Royal Commission cannot find or devise a satisfactory formula—beyond, perhaps, advocating a general advance scrutiny of mergers, in other businesses as well as this one? And the economic processes continue and perhaps sharpen. Commercial television's advertising time may lengthen; it may be joined by commercial radio, which could be particularly dangerous for the provincial press unless some *modus vivendi* is reached by them. There are no inevitabilities here, however; even the ten-year decline in circulation could be a readjustment after an artificial wartime peak, and certainly there have been special factors inhibiting the growth of mass circulations. Total advertising revenue might grow even faster; and television advertising's rate of growth is likely to slacken as its coverage and the number of homes equipped to choose ITA against BBC reaches saturation, unless its rules are changed. A general increase in prices—sufficient to make sales revenue cover at any rate the variable costs of newspaper production—would at least restore liveliness to the competition of the press, though it might accentuate rather than damp down pressure on weak papers. But papers able to secure the right kind of reader in sufficient numbers, or to establish a particularly strong bond with their readers, can still advance or at any rate entrench their positions. Costs—some of them at least—can be cut. This is an highly-mechanised industry, but an old one, employing traditional craft skills; major technological change may be possible.

But it would be unwise for newspapermen to be too inward-looking here, and to ignore that the biggest technological changes in journalism may have already come—outside newspapers. Many people today sigh for photographic and electronic processing of news into type, which can be had. Yet it is arguable that the growing part of journalism, today, is already being processed—and delivered into people's homes—electronically, via the cathode tube. There is absolutely no reason why journalism should always reach its public via printed paper. Technological change in industry comes by supplying an entirely new product to do the job quite as often as it does by making old ones in new ways.

Over the last five years, Britain has seen the development in journalism of an absolutely new kind of challenging interview, of the face-to-face presentation of key personalities direct to the news consumer, of deliberate, if sometimes rather phoney, controversy, of a presentation of science far better than has yet been achieved on the printed page. These have been the positive contributions of competitive television to journalistic technique—plus a general presentation of actuality that, while it is often superficial, does not yet display quite that flaccid and jaded contempt for the reader that the standardised processing and packaging of news and features in many British papers does, from one end of the spectrum of quality to the other. And television offers "quality journalism," for the most part, to viewers in numbers that only the mass-circulation papers have ever matched with print. Against the demise of newspapers, there is this positive extension of mass-communication to set: the growth element in journalism, perhaps serious as well as sensational, is nowadays seeking a second and a third channel.

Yet the printed page, with the chance it gives the reader to take a second look and re-examine fact or argument, has enduring strengths. And there are opportunities still awaiting the newspapers that can exploit these strengths—if only in interpreting and putting into perspective the news that broadcasting showed the reader last night. Greater rewards, indeed, may await the journalists on screen or paper able to catch, as not even "Tonight," the *Daily Mirror* or *The Observer*, perhaps, have quite yet caught, the mood of younger people growing up in a fluid and developing society—the people whose attitudes Mr Raymond Williams has perhaps come nearest to characterising:

> For the one absolute fact about the men and women of the new communities, as of the new kinds of society everywhere in the world, is that they are created in a human image, and not in the image of anybody's version of them. The "telly-glued masses" do not exist; they are the bad fiction of our second-rate social analysts. What the masses, old or new, might do is anybody's guess. But the actual men and women, under permanent kinds of difficulty, will observe and learn, and I do not think that in the long run they will be anybody's windfall.

Readers, Viewers and Advertisers

HOW much attention does the British public pay to the "mass media" that communicate information and entertainment, and is it tending to pay more or less? Statistical answers, of varying quality, are available to these questions, providing one accepts a certain amount of chalk and cheese: but to assess future prospects from the figuring is particularly hard, because special and perhaps temporary factors, over the last decade, have been affecting most of them. The decade has seen a decline in the total circulation of national newspapers, plus an inadequately measured but almost certainly larger proportional decline in that of the provincial press. It is impossible to say how total magazine circulation has changed. The "viewership" of television has grown enormously: radio audiences declined, then levelled off. Attendances at cinemas have fallen drastically. One cannot check the measurements very well from figures of personal spending, since broadcasting, after one's initial investment, seems virtually "free"; but it may be worth noting that expenditure on these forms of communication and entertainment, in total, has been growing less fast than total consumption expenditure in recent years.

It is obvious that most of that growth in viewership represented the rapid spread of television sets into British homes, and the advent of a second channel. The spread is now largely complete: and it cannot be assumed that a third channel, or commercial radio, would give a fillip to public attention to broadcasting comparable to that given by the creation of ITA—though an increase in the permitted hours of television broadcasting might offer another very big once-for-all boost. The downward curve of cinema attendances may level off, though there are no dependable signs of it yet. These mass media compete for people's time with many peripheral forms of recreation, and may not do so always as successfully as some have in recent years. The ubiquitous paperback, for example, can compete with parts of the press: the teenager with half a crown to spend on sophistication may reasonably prefer the Penguin Colette to *Vogue*.

It is less obvious, but probably true, that some once-for-all and some transitory factors have been at work in the steady decline of national newspaper circulation since its peak some ten years ago. The peak circulation for the national dailies, so far, came in 1950, and circulation has fallen off by about 9 per cent since then; while the circulation of Sunday newspapers, since its peak in 1949, has fallen by more than a fifth. The most recent statistics of circulation, it is true, are still disturbed by eddies left where newspapers foundered. These figures suggest that while many readers of defunct journals have been bought or captured by surviving sheets, a few hundred thousand of daily readers and perhaps two to three million Sunday readers, during the last twelve months, may have disappeared without trace. Objectively, it can be argued that these escapers, enjoying the luxury of each Sunday morning with one newspaper the less, have achieved a significant advance in their real standard of living; but this aspect of affluence and social emancipation is not one that any journalist can be expected to overstress.

THAT postwar peak in circulation, in itself, was partly artificial: the 16,828,000 national newspapers bought daily in 1950 and the 30,393,000 bought on Sundays in 1954 had many fewer pages than papers do now, which encouraged some dual readership daily and a great deal of multiple readership at the weekend. Today one daily paper gives the reader as many pages as two or three did then, and some Sunday papers on occasion four times as much—though the amount of editorial matter he gets has not gone up nearly as much. The British adult (who may still buy more separate newspapers than the citizen of any other country) now consumes perhaps 60 per cent more newsprint than in the early fifties. This is not as much as the average in several other countries, and probably still not quite as much as he did himself in the thirties.

Part of this decline in total circulation may be reckoned as merely a readjustment to larger newspapers. Dual readership of dailies and multiple readership of Sunday papers seems certainly to have declined, as the size of each copy became less skimpy. That influence may be largely spent. Another brake on total circula-

tion, in recent years, may have operated because some mass circulation papers, at least, have not found it profitable to try to get extra readers, though the quality press has gone on wooing the readers left as weak popular papers died. This may not be transitory: the shift in the economics of circulation is real, associated with the real shift of public attention to television.

Even so, during that decade of slow decline there was a very slow increase in the country's adult population, with a somewhat larger increase in the number of people at work with incomes of their own. Even accepting that promotion of mass newspaper sales had not, on balance, been exactly fervid, one might have expected some "natural increase" in them.

TOTAL advertising expenditure in Britain, until now, has gone on growing at about 10 per cent per year—fast enough for the advertising revenue of the press, even though its share of the whole has been shrinking, to continue growing too. This year, however, it may have stopped doing so: in the second quarter of 1961 the advertisement revenue of the national dailies and Sundays was nearly 4½ per cent less than in the second quarter of 1960. And some major advertising agencies say that their bookings of newspaper space for next year are now lower than at the same time last year.

The rate of growth of advertising expenditure on television, has slowed down, though it has been much more rapid. Commercial stations have now achieved more than 90 per cent coverage of the country, in terms of population ; and the proportion of households owning television is growing much more slowly as it approaches saturation. These changes, however, are merely the concomitants of achieving full distribution for the product, the visual electronic message. It is clear that advertisers are becoming more selective in their use of television ; they are demanding, in particular, more information about the make-up and actual size of the audiences their messages reach—as against the proportion of a sample of a few hundred sets that is turned on, which is all that they are really told nowadays. The tax imposed on television advertising in this year's budget seems somewhat to have strengthened the advertisers' insistence on better audience research—though its effect on total advertising budgets may equally often have been to weed out those elements in advertising campaigns that seemed weakest in "pulling power"—for example, cinemas and certain newspapers.

The press is still protected by a statutory limitation upon the amount of advertising that television can show during the hours when its audience is largest, and another on total programme time. No programmes, remember, are on view during the hours that most people read their morning newspapers ; some evening papers, which meet the competition more direct, are in the unhappiest state of all. Moreover, it would be stupid to assume that television cannot much further develop its techniques of appeal, both in programmes and in advertising messages. The provincial press, at least, is also somewhat protected, so far, by the fact that commercial radio is not yet allowed to beguile the British housewife. The strength of this as a competitor for certain kinds of advertising is much debated ; but it would penetrate one of the few areas of monopoly in advertising revenue that these papers possess, and any such stronghold is one of the most valuable things any advertising medium can have nowadays. And even commercial radio might not offer as much extra competition as allowing commercial television round the clock would do.

SOME years ago the market for advertising within the British press itself became sharply freer—from which followed the process of attrition that has killed, among the middle sort of newspapers, one national daily, one London evening, four Sunday papers and many provincial dailies and evenings, and has left the future of three other national dailies problematical in varying degrees. Until the end of 1956 rationing of newsprint and agreements not

to compete with larger papers robbed the mass-circulation papers such as the *Daily Mirror* and the *Daily Express* of the share of mass consumer advertising to which the growth of their circulation would otherwise have entitled them. After newsprint and sizes of papers became free, these mass papers were able to accommodate their arithmetical shares. Total advertising expenditure continued to grow, though television began to take much (indeed, to create much) of the increase. So the mass newspapers, and another group of papers given freedom to expand, the women's magazines, regained and increased their share of mass consumer advertising at the expense of the provincial and the weaker national newspapers.

This redistribution of consumer advertising income within the press, with its consequent effects upon the weaker papers, may not be wholly complete, though the *Daily Herald* has been guaranteed a lease of life as an incidental of magazine concentration and the *Daily Mail* may have won its own. But the process has given the mass-circulation newspapers and certain women's magazines the bulk of mass consumer advertising in newspapers, and in so doing concentrated upon these papers the weight of competition for such advertising. This is the kind of advertising—so far, perhaps the only kind—that television can do effectively. And if television should prove to be inherently more effective in terms of buying response, than press advertising of these commodities, then it will be tougher for the mass papers than bowling over straw men has been in the last few years. The large-circulation women's magazines, in spite of their stronghold of colour, seem already to be feeling this.

Even the mass newspapers, so far, are telling their advertisers more about the people who make up their readership than any programme contractor yet can about the people looking at any given programme or commercial "spot." Qualitatively, the press has some effective defences : parts of it indeed rely particularly upon kinds of advertising that so far are virtually unassailable by electronic competition. The quality press relies far more than the mass circulation press does upon the kind of advertisements to communicate which the British press was originally founded—classified commercial announcements, which over the years have diversified into a much wider variety of small "ads." Not even the papers fullest of these, such as the *Daily Telegraph*, could do without a sizeable share of display advertising ; but some also of the display advertising they carry, institutional advertising addressed by companies to companies or "the informed public," also finds little place so far in television time. It happens, too, that during the years when "the unpopular populars" were losing consumer advertising to the mass circulation dailies, the quality papers took advantage of the shortage of technical and professional manpower to build up a largely new kind of "situations vacant" and "careers" advertising on which the organs of mass appeal have so far been largely unable to encroach. Nor have the mass dailies ever benefited as much as the quality press from that amiable—and informative—habit of British business firms (said to have been invented by *The Economist*) of paying to have the annual reports that they have already circulated printed at impressive length in the columns of the newspapers. These forms of advertising

CONTRIBUTION OF ADVERTISING

	Advertising revenue as percentage of total revenue
Specialised trade paper: *Automobile Engineer*	90
Specialised woman's monthly: *Ideal Home*	82
General trade paper: *Flight*	75
Hobbies: *Amateur Photographer*	71
Quality daily: *The Times*	68
Mass circulation woman's weekly: *Woman*	67
Mass circulation daily: *Daily Express*	54

have their own fluctuations—at present slightly down—but they are immune from electronic competition for the moment, as much local advertising is.

These areas of monopoly in the advertising pattern of the quality press—based, essentially, on appealing to a better-heeled cross-section of readers—have been matched by rather an impressive strength in circulation. As against, say, 1937, the quality dailies have rather more than doubled their total circulation, which is not quite as much as the *Daily Mirror* and *Daily Express* together have done. But since 1954 the two mass dailies have added—perhaps one should say found it worth while to add—virtually no extra circulation at all ; the quality dailies have succeeded in putting on nearly a quarter. And the mass circulation Sunday papers which nearly trebled their circulation between 1937 and 1950, have since lost circulation (or let it go). The two established "quality Sundays" (now joined by a promising apprentice) doubled their combined circulation between 1937 and 1950, and since 1950 have roughly doubled it again. It certainly still pays these papers to seek extra circulation and extra pages and their total circulation has grown enough for even their laggards to prosper, though this year, with the *Guardian* printing in London, competition may sharpen for *The Times*.

To consider the market for newspapers, within the broader market of mass communications that compete for the reader's and the advertiser's attention, before considering the industry's costs, is perhaps logical: newspapers live by being paid on both sides. In a rising market, the nature and the economics of newspaper publishing indeed combine to make it sensible to concentrate management's best attention on sales without worrying too much about costs. But in a market that in volume and in rewards may have ceased to grow, closer attention to costs not only pays but is being forced upon newspaper managements.

Cutting to Fit

IT has often been observed that you do not need to invest heavily in fixed capital before bringing out a newspaper: your initial investment, or cost of entry, consists of the expenditure on promotion and operating losses that you incur on the way up to breaking even. That is true : but it does not follow that fixed costs are low in the newspaper business. This is not simply because you have to pay the capital charges, even if somebody else put down the investment for the printing plant in the first place: newspaper production is not a heavily-capitalised industry in relation to its employment or its output. But rather a high proportion of its other costs are fixed costs in the short run at least, which do not vary at all directly with its volume of output—i.e. circulation—and may not vary much with the size of the product—i.e. the number of pages in the paper. These costs include not only administration, and the cost of securing and arranging advertisements, but also editorial salaries, news services, and expenses, plus all the mechanical processes of preparing each edition—composing, block-making, everything up to making matrices in the foundry for casting the cylinders for the presses. Newsprint, ink, the labour employed on printing, warehousing, and carriage to the point where the newspaper reaches the wholesaler, can strictly be called variable costs in newspaper production—plus, arguably, expenses involved in promoting circulation. But the labour costs even in these final processes are none too variable ; and as for promotion costs, if circulation falls for a time those may have to go up.

Some of this industry's costs are high and fixed because of the peculiar nature of the product. One does not often think of Fleet Street as a home of mass production: but how many factories in Britain produce a million of anything a month, let alone manufacture and distribute millions a day and then re-tool each evening to do the same over again with a product redesigned throughout? The final printing of a newspaper is a highly automatic process ; but it has to be tooled up by mechanical and hand methods anew for every issue, according to "instructions" that have themselves to be formulated and arranged by personal collection, assessment and expression of information into different patterns of words each day or night. And much of this processing of information into print, indeed, has to be almost simultaneous, concentrated into a few peak hours for which capacity at all levels must be adequate, with reserves to meet large and unpredictable fluctuations in the basic flow of information and get it into print within a timetable of which the end-points of transport and delivery are rigid. For this is a perishable product of which the value has disappeared entirely in a few hours.

This is not to romanticise what is in many senses a grubby business ; it is simply to isolate the basic nature of this business, from which most of its commercial opportunities and productive problems flow. Demand upon the capacity of this industry may be as peaky as demand for electric power, and the peak load involves organising, assembling and fitting into sequence a dozen different operations, many of them labour-intensive with temperamentally tricky labour, not simply switching in extra generating sets to produce more of a uniform product. Much of the spare capacity required throughout newspaper publishing is human: it is, typically, the man with ample time to sit down and grumble how labour is wasted in other departments. There cannot be many industries whose fixed costs rightly include a significant amount of overtime paid for doing nothing. But daily newspapers are made at night, and to some extent after midnight ; and in all the departments where an edition is prepared for the press, some hands will have to be kept on after midnight, whether or not many late changes are actually made. The costly risks of being beaten with late news by a rival, or of missing a newspaper train, justify considerable insurance premiums of spare capacity, right from the reporters' room down to the warehouse.

Any printing house, whether owned by a publisher or not, will try to utilise its capacity as continuously as possible. A national daily newspaper needs a Sunday to share the presses and may conveniently print an evening paper as well: most provincial houses print weekly newspapers as well as dailies and/or evenings. In preparing any newspaper, again, careful organisation can spread out some of the work beyond the peak hours and the mounting daily timetable. Advertisements and many editorial features can be made ready in advance. The steady increase in the proportion of "background" and sheer entertainment material in many papers enables the use of more prefabricated editorial text ; full-colour printing, in magazines and when it comes, in newspapers, will require much more of the work to be done in advance.

IT will be easy at any one time, therefore, to over-estimate the extent to which labour is wasted in newspaper production. But the circumstances that require spare capacity, as a corollary of efficient operation, are also circumstances that make for intense, concentrated bargaining power at key periods in the hands of trade unions, and enable them to inflate the amount of spare capacity actually carried.

It is not surprising that this urgency of tempo should have made managements, in the past, spend more effort on achieving extra sales than on holding down labour costs; or that the labour in question, trained as it is in a craft tradition, should have contrived to restrict entry into many printing jobs, and to achieve all sorts of special payments bearing little relation to work still actually done. This does not imply that the special intensity of work at awkward times in this business does not deserve special rewards; or that the trade unions always have their managements across a roll of newsprint. Management develops its own mechanisms of defence—for example, the agreement that if the printing of one national newspaper is stopped by union action all other proprietors do not publish that night. But over any longer run it means that standing up to the trade unions in this industry requires not only unity and intestinal fortitude but also deep bank accounts and the readiness to dip into them. Usually, some of these prerequisites are lacking somewhere.

BEFORE the war, when newsprint went as low as £10 a ton, the price that one paid for a newspaper, less newsagents' and wholesalers' discounts (four-tenths of a penny per copy) and the cost of returned unsold copies, rather more than covered the variable costs of producing it. In principle, therefore, there would have come some level of circulation where sales alone, even without advertising revenue, would have covered fixed costs as well and enabled the newspaper to break even. In fact, the "overhead income" of advertising revenue enabled it to break even much lower down the circulation graph than that. A newspaper with only a moderate circulation, however, required a fairly high margin over variable cost (from both kinds of revenue together) to cover its fixed costs; and hence a fairly high rate of advertising revenue per thousand readers. The quality press charged about twice as much per copy without incurring variable costs twice as high, and could economise somewhat on the fixed costs of staffing; its readership, also, contained much higher proportions of people with higher-than-average incomes. With the much higher "milline rates" (that is, the advertising rates per column inch per thousand readers) that this quality of readership commanded, therefore, it could break even at far lower levels of circulation than the popular national dailies (as it still can). The daily paper with no particularly valuable quality of readership to offer the advertiser, however, could not command much more than some basic average rate per thousand readers. Rates that could give a medium-circulation popular newspaper a profit, therefore, offered the chance of very high profits for papers with mass circulations.

In pushing up circulation, a paper's variable costs increase steadily; so does its sales revenue; but its advertisement revenue rises in relatively infrequent steps, as it takes time to establish a dependable higher level and to adjust its rates per column inch upwards. This means that its advertisement revenue, per thousand copies sold, would over the short run not rise with circulation alone—though it would rise if the paper published more pages and was able to fill a rather higher proportion of these with advertisements than it had of the copy with fewer pages. But while sales revenue exceeded variable costs, increases in circulation made some further contribution to profits even during the interim before the paper could jack up its advertising rates. Extra circulation, that is to say, paid in itself; and this made it worth quite heavy expenditure on promotion, free copies of Dickens and the like.

Came the war, and a different pattern of profitability. Newsprint was rationed; circulations were pegged and the size of papers cut to a minimum; returns were abolished and promotion drastically reduced (by the mid-thirties, the proprietors had already agreed to cut out free gift promotion schemes). Operating costs were reduced; staffs were not cut at the outset as much as output, and from this time date some of the feather-bedding agreements that still plague the trade, but gradually conscription whittled them down. The price of newsprint soared; but publishers gave the readers so much less of it for the price that sales revenue still exceeded variable costs. Revenue from advertising was down, but the advertising was spread out more evenly between mass and medium circulations. Newspapers were on the whole highly profitable; when circulations were allowed to rise before the size of papers was increased, the mass-circulation dailies became more so. When newsprint rationing ended, advertising revenue began to be redistributed back to the papers with the biggest circulations. Papers in the middle needed higher "milline rates" to break even; this made them less competitive; so did the fact that they could not afford to increase the number of pages as much.

BUT the opportunity to offer the reader (nearly) as large newspapers as they did before the war, at prices that only slowly caught up with the inflation of prices in general, left the publishers' economics sadly altered. The variable costs of newspaper production have risen since before the war even more sharply than their fixed costs have. There may be nothing much to choose between the increases in earnings achieved by different kinds of printing labour—though productivity in the machine room and the warehouse does appear to have fallen more than in some preparatory stages. But "overhead" wages and salaries have not risen as much as printing earnings. And none of the fixed administrative costs has risen anything like as much as the biggest single element in variable costs—newsprint, which even after a dip is still five to six times as high in price as immediately before the war.

For the popular dailies, at least, sales revenue appears no longer to offer a margin over variable costs (though this may not be true for all of them and is possibly not true for some quality newspapers). This means that in the short run, up to the point where a paper can adjust advertising rates in line with extra circulation, extra circulation becomes a drain on unit profit rather than an addition to it. To the extent that the mass paper can draw in more advertising by offering more pages, it can mitigate this—though the higher cost of newsprint means that the proportion of advertising it will have to put in those extra pages, again, has risen. Since the war, most newspapers have steadily increased the share of their pages given to advertising, and the successful ones now carry more than they did in the thirties. But the advent of commercial television has made them more chary of adjusting advertising rates upwards when extra circulation is achieved.

When marginal revenue from sales does not cover marginal costs, and indirect income from advertising also becomes harder to secure, newspaper managements may well turn their energies inward upon cutting costs. There are limits to the extent to which they can cut their administrative, advertising, and editorial costs. Some of the preparation of newspapers may be spread over even more, reducing the need for spare human capacity—so long as in becoming more "magaziney" papers do not sacrifice the essential quality of their product and their readers' identification with the paper. Technically, there are considerable economies to be had in capital and manpower from various kinds of film-setting, new techniques in the process departments that turn photographs into blocks, and in the composing room and foundry that turn words into, finally, a cast metal cylinder. These are held up partly from the unwillingness of management to take risks in investment in a none too remunerative industry: most implacably, by the opposition of trades unions to what has been nicknamed "the abolition of typesetting" (which rather exaggerates the possibilities, until scanning devices begin to set up the words); and more reasonably, by the fact that in a large circulation paper process, composing and foundry are not a very large element in costs anyway. All these obstacles to change are heightened, perhaps inevitably, by fears on both sides that the business is in decline.

Cutting variable costs, if it could be done, would offer the most immediate rewards in newspaper economics. The price of newsprint has indeed declined slightly in recent years, but is still very high: world demand for it is still rising, and there is an even greater rise in demand for other kinds of paper that can be made out of the same materials as newsprint. The costs of distribution reflect the need for speed more than for economy: the abandonment of some restrictive practices there might bring more competition, but it is hard to see newsagents and wholesalers accepting any lower margins, on a static or a slightly declining total volume of business. Carriage is mainly by rail, which is beyond the scope of newspaper management, though their lorry fleets could be used more economically. The departments where costs vary largely with circulation—the machine room and warehousing—are notoriously among the least efficient in the business. Here as in preparatory departments significant economies might be achieved with certain packing and tying machines that exist already—so long as in sharing the benefits with labour (which is inevitable) the whole return on extra investment is not washed away by demands for excessive manning.

A determined attack on costs to offset declining total business would collide head-on with some of the institutional structure of this business, without offering any absolute guarantee of solving its growing economic problems—any more than the alternative or concomitant, for medium-circulation papers at least, of increasing selling prices, which are still, by most comparisons, low. But the time is coming when both moves may have to be made; simply to maintain circumstances in which large-scale operators can try to expand and maintain a reasonable return on investment. But whether such a change would restore the circumstances in which small-scale enterprise in national newspapers could hope to flourish is much more problematical.

One Newspaper's Economics

"THERE are no average newspapers in Fleet Street," we wrote in these columns some years ago; and we do not think the one in Ryder Street is average either. But while we can generalise with varying degrees of information about the finances of other newspapers, this is one about which we know precisely; and it perhaps behoves us, in this context, to say a little about our own experience.

Between 1938 and 1950 the circulation of *The Economist* grew from 10,412 a week to 45,742. From 1951 onwards it grew more slowly; and in 1958, after an increase in price from the shilling it had cost since 1920 to one and sixpence, there was a small dip in circulation that it took about eighteen months to wipe out. The 1959 sales were higher, however, than the average for 1957; and the rise since has been steeper, so that current sales—some 65,493 a week in the first half of this year—are somewhat higher than the 1951-57 trend would have taken them by now. Roughly 51 per cent of these are sold overseas; roughly 40 per cent of all *The Economist*'s sales are by annual subscription.

The Economist is printed by a firm of periodical printers that is a subsidiary of The Financial News Limited, which in turn owns 50 per cent of the capital of The Economist Newspaper Ltd. (without any control over editorial policy). Printing schedules and prices are a matter of negotiation. As a result costs do not present themselves to this paper in quite the pattern of fixed and variable costs that they do to a daily paper owning and managing its own printing shop. Last year fixed costs of *The Economist* proper made up 45 per cent of total costs, and variable costs about 35 per cent; but the cost of having the paper printed, which obviously includes fixed as well as variable elements, made up roughly the other fifth.

SO far as costs internal to *The Economist* were concerned, revenue from sales rather more than covered variable costs; if the variable, elements of printing had been counted in, it would probably not quite have done so. This does not deter us from seeking to increase circulation. Our rates for advertising give a cost per page per thousand copies sold that advertisers, judged by results, appear to consider competitive with those for any comparable papers and we have no reason to believe that they could not be kept so as circulation rises. Recently, the paper has been able to secure advertising at least in proportion with extra paging; last year, in issues averaging something over 100 pages apiece as against something under 96 pages in 1957, it allotted nearly 50 per cent of space to advertising against under 45 per cent in the earlier year. Advertising revenue, last year, amounted to roughly double our revenue from sales, net of discounts to the trade.

In terms of overheads, this paper differs from most other "journals of opinion," more closely approaching perhaps a quality Sunday paper, because it is an almost entirely staff-written paper, relying little upon contributions from any but our own correspondents or regular "stringers" overseas: its full-time editorial staff in London is large for a weekly. It shares certain services, such as an information library, with The Economist Intelligence Unit, which does economic research for business; but in staffing and operations the two businesses run entirely—and each quite profitably—on their own.

Reluctant Labour

THE trade unions in the newspaper printing industry deal in a commodity of which they control the supply, by regulating and restricting the entry of apprentices; and for which they control the demand, by their ability to insist that an operation needs so many men to perform it. The price they get is a high one: printing operatives are the highest paid group of workers in the country, with average earnings of £19 14s. a week. But printers work at strange, nocturnal hours, with bursts of violent activity, and are heavily concentrated in the expensive heart of London. Their wages would not be in question if they would permit the labour that they give in exchange to be efficiently used. The case against the printing unions is that, either by refusing to allow the use of new technical devices, or by insisting that any new device must be manned by so large a staff that its introduction becomes uneconomic, they have prevented newspaper factories from modernising themselves.

The obstructiveness of the printing unions when faced with new techniques has two main causes. The first is historical: many of their leaders remember the unemployment of the thirties, and dread its return. The second reason is technological: they genuinely fear that new devices will quite literally abolish their only capital, which is their skill.

The craft unions in the Printing and Kindred Trades Federation were set up to safeguard the employment and the earnings of craftsmen expert in newly invented techniques: such unions as the Monotype Casters and Typefounders (902 members) or the Lithographic Artists, Designers, Engravers and Process Workers (14,000 members) now have a genuine interest in preventing the foundation of some hypothetical Union of Photosetters and Klischograph Operators. Simultaneously, the large unions of less skilled workers such as the Paperworkers (149,600 members, mostly outside printing) or the Operative Printers and Assistants (43,500) have by custom and usage succeeded in fencing off specific jobs for their members, so that they too may in some areas have an interest in resisting the introduction of new techniques. The situation is complicated by the fact that there are sixteen unions representing printing workers, each of which may suspect from time to time that one of the others is trying to snatch members, or introduce its members into jobs reserved for another union.

Instances in which the unions have impeded the introduction of new devices are rife. Among the most lively at present is the matter of machines for roping up bundles of completed newspapers for distribution. NATSOPA actually paid for four of its members to try out these machines, and agreed to their introduction in Manchester. But the Paperworkers, whose members do this job in London, apparently insisted that they be manned by an uneconomic staff—whereupon the Newspaper Proprietors' Association said that they would not be installed anywhere if they could not be installed everywhere. Details of this story are disputed *ad nauseam*: the facts remain that these convenient machines that save time and labour are lying around in some warehouse, while men slowly and laboriously tie up the bundles by hand. Equally mysterious is the question of newspaper vans and their manning. In London the Paperworkers insist that each van carries both a driver and a helper who carries the load on arrival at the terminus: but in Manchester, where the vans are driven by members of the Transport and General Workers' Union, there is no helper and the bundles are handled by railway staff. Again, it is as good as impossible to untangle the truth about this costly business (for both drivers and helpers earn night wages and get overtime for hanging around); somebody must be wrong.

The craft unions have practices that are just as damaging. In London the Electrotypers and Stereotypers insist that all men working in the foundry department should be union members who have served their time—so that skilled men are paid skilled rates for sweeping floors. Staffing ratios for some printing and warehousing machines have been fixed so high that the unions cannot find enough men to do the job: instead of allowing the ratio of men per machine to fall (and there is no evidence that the job cannot be done by fewer men), the money that would have been paid to them is distributed to those on the job.

Few officials of printing unions will in private deny that such featherbedding and obstructionism does take place (although they will ritually imply that other unions are worse than their own). They will, however, insist in public and in private that if things are badly run it is the fault of the employers rather than their own. In no other industry can there be found such an undercurrent of contempt when trade union bargainers speak of their opponents, and of frank opportunism when they speak of their own tactics. "When you sit down to negotiate in Fleet Street," a not untypical union leader will confide, "there are a dozen vested interests round the table—and the biggest is management." Newspapers cannot afford not to appear, even for a day; and the biggest papers, better able to stand higher costs, have all too often shown themselves ready to push their weaker competitors to grant concessions. As practical men the union leaders would have to be amazingly selfless not to play on this tendency (and they are, of course, liable for re-election by their members). As believers (to some extent) in the freedom of the press, and in order to keep their members in work, several unions allowed the *News Chronicle* to cut down on its staff shortly before its demise: the lack of ceremony with which its closure was brought about, only strengthened their belief that sweet reasonableness pays no dividends.

Off Fleet Street, the picture of labour relations is perhaps a little brighter—although in the magazine field it is often said that a gravure press manned in Germany or Switzerland by eight men is here, through union insistence, manned by seventeen. But in provincial papers there is certainly less overmanning. Their main complaints concern the lack of skilled men—so that those who are available inflate their basic wage by an undue amount of overtime. And, of course, the rigidity of demarcation rules as to who can do what maddens all who have to do with printing. Here again the unions are disposed to put some of the blame on managements: they claim that, since there are practically no apprentices on Fleet Street and very few in most provincial newspapers, most men have to serve their time with smallish printing firms, whose managers themselves preserve a mystique about their trade. The small printers are, of course, those who would be hardest hit by the introduction of new and capital-intensive production methods: and it is, of course, true that old-fashioned "craftsmanship" will continue to be needed for as long as old-fashioned machines and processes continue to be used.

It may be said that the employers have been unduly soft in resisting past claims, and the unions unduly grasping, at the same time as being traditionalist. But at present a union leader who wants to be re-elected simply cannot go to his members and ask them to accept that a machine hitherto manned by six men should be removed to make room for one handled by two: and he cannot convince them (nor is he likely to be convinced himself) that to save some £80 a week in this way will ultimately make the least difference to the solvency or otherwise of the paper in question. Forecasts that more and more papers will close unless the unions relax their restrictions can only make the unions resolve not to accept any more apprentices for fear that they will not find jobs. At present there is a straight deadlock between the interests of the two parties, and the unions are (in the short term) doing nicely out of ensuring that it stays that way. Only the proprietors can do something to break the log-jam—perhaps by ensuring that any worker losing his job through technical innovation should be compensated for the loss of his one asset. There have been plenty of signs in recent months that union leaders would be prepared to talk seriously about such a scheme—and it could hardly be more expensive than the present extravagant status quo.

When Magazines Merge

WITHIN the last three years, one estimate has it, 409 British magazines have closed down and 530 new ones have been started: there is a continuous process of renewal about this part of the press that there has not been in the British newspaper business for quite 40 years. Nobody suggested a Royal Commission to inquire into the death of magazines: its appointment was provoked by the engrossment of many of them into one ultimate combine. That raised two separate fears: that the number of different magazines, in many fields, would be sharply reduced, and that far too large a share of printed opinion was being concentrated under one control.

The first fear is an obvious economic possibility, where some existing magazines are not earning their keep. Perhaps not even only then. A really cold-blooded "multiple publisher" of magazines, within particular fields of advertising, might be concerned with his combined advertising revenue rather than that of individual papers, and could think of the lot in terms of marginal revenue and marginal cost. Where he is generally under pressure from rising costs, as all publishers are today, he might consider whether closing one magazine, some of the advertising from which, if not all, he could capture in others, would reduce his total revenue as much as it would reduce his costs (including competitive promotion).

But it is worth noting that this may not hold good. There may be an incentive to keep two journals if advertisement rates for one cannot be raised sufficiently by killing the other. Again, the strong reader loyalty that each of two journals in the same field can command may prompt caution in killing either goose: advertisers may feel it is as imperative to advertise in both; and two established papers in a field may deter the always potential newcomer more than one, even a thicker one, would. There are innumerable variants on the economic circumstances of a magazine: there is much room for cross-subsidisation in a combine; and magazine publishers, like other entrepreneurs, are not simply economic men.

Over-mighty control of opinion? It perhaps depends what you mean by opinion. Certain magazines—such as *The Economist*—live by supplying, basically, opinion alone. These have not so far been engrossed, and it may be that publishers in this field, some of whom possess opinions of their own, will generally tend to find one platform enough: so long as, or rather not much longer than, that one can make a profit. "General-interest magazines," in Britain, hardly exist (though one news-magazine plans to begin publishing this autumn); and few of the others, from *Woman* to *Nuclear Engineering*, are concerned with general opinions as such. It is not easy to say that individually these make any very direct contribution to "freedom of opinion" in the general sense—though the opportunity for unpopular technical arguments to find a platform is valuable in every industry, and the plethora of advertisements in the women's magazines, at any rate, is a constant reminder of the consumer's real freedom, in our society, to prefer brightness to whiteness.

When a publisher speaks of any magazines in the respectful tone that indicates a valuable property, it should be added, he is almost certainly talking about one written for women by women. Out of perhaps 2,000 journals published in this country, only 73 come into this category and among those a bare half-dozen matter. Other kinds of magazines make money: personal fortunes have been built on the most unpromising-looking publications and can still be made by a man with no assets beyond the nose for a good title. But it is the women's journals that have changed the pace and the whole structure of magazine publishing. The hand that rocks the cradle also rules the presses. It was to get into this business that the Daily Mirror group bought the dreamy, dozy business of Amalgamated Press roughly two and a half years ago. To block the Mirror's further expansion, Odhams Press bought up both the Hulton and the Newnes magazine publishing businesses. And then the Mirror bought Odhams. The Mirror's Fleetway-Odhams group still owns little more than a third of the magazines written for women but that included every one of the seven key weeklies (now to be reduced to five).

The seven, *Woman's Day, Own, Illustrated, Realm, Weekly, Mirror* and the beldame of them all, just plain *Woman*, are like nothing else in the whole of British magazine publishing. They have mammoth circulations; weekly sales of *Woman* touched 3½ million in its heyday and are currently just below 3 million; the combined sales of all seven are running at around 11 million copies a week. All but one, *Woman's Weekly*, are colour gravure printed, involving the publishers and other printers in considerable investment in cylinder etching and colour printing facilities. When one of these magazines sneezes, the printing industry gets a nasty cold. When two, with a combined circulation of 1½ million, close simultaneously, as *Woman's Day* and *Woman's Illustrated* are doing, pneumonia sets in.

In other sections of magazine publishing, circulations are generally smaller and even the most successful tend to be well below the million mark—the freak exception being the *Radio Times* with 6½ million copies weekly. Medium-sized production runs do not tie up presses over an entire week, as the big women's weeklies do. There is less difficulty in starting a medium-sized magazine and less widespread disruption when one dies. Occasionally a violent change of climate kills off an entire species, as television killed the general illustrated magazines. But other industries expand and they need their specialised trade journals; and trade papers are perhaps multiplying faster than any other kind of periodical.

And the reason? Technical papers serve a specialised readership and unless (and sometimes even when) they are exceptionally bad, these papers can be indispensable both to their readers and to their advertisers. Among the bigger money makers, perhaps, are those with a very large retail audience, such as *The Grocer* and *The Ironmonger*. But any new industry or a new technology means sooner or later a specialist journal serving its interests. As the industry grows, it becomes able to support not one, but perhaps two or three trade papers. There are, for example, not only several general farming papers but one dealing exclusively with farm chemicals.

Trade papers are sponsored by several large groups, notably Iliffe, Tothill, Temple and National Trade Press, and Newnes—a swallowed up in the Fleetway-Odhams group—but this is *par excellence* the field for the small and the new publisher. Even now the Mirror group owns fewer than 8 per cent of the innumerable trade journals in circulation. The majority are produced by small publishing houses with perhaps a dozen periodicals, like the Leonard Hill group founded by its owner and specialising mainly in chemicals. The more specialised the paper, the smaller its circulation must be; some never expect to sell more than 2,000 3,000 copies of a single issue. This does not, however, make the journal any less useful to prospective advertisers—the more esoteric the trade, the more they depend upon it. Sales revenue may be

insignificant, or even nil; quite a number of papers are sent free to a selected, expert audience for advertisements. This kind of journal can be launched by anyone with sufficient knowledge of a given trade and a printer willing to give credit.

The publisher after bigger game—and bigger income—needs a mass market to attract the advertisers out of whom he hopes to make a profit. This means producing a magazine lavish enough to catch the eye and cheap enough not to hurt the pocket; the selling price may not cover as much as a third of the cost of producing the journal. It may not cover even the cost of the paper in a large colour gravure weekly. The consequent degree of dependence on advertising is the reason why next month two magazines selling three quarters of a million and nearly a million copies respectively will cease publication.

THE Daily Mirror group engrossed all seven, fabulously successful, women's weekly papers; fabulously successful, that is, measured just in terms of circulation rather than of costs. These papers all conform fairly closely to the editorial formula laid down by the most successful of them all, *Woman*, and in this may lie their undoing. Not because readers are tired of the formula; but because advertisers have discovered that there is so much duplication of readership they can reach very nearly as many devoted readers by advertising in the two most successful as they would if they advertised in all seven. By paying £4,580 and advertising in the two biggest sellers, a company can hope to reach half the women in the country, after making certain guesses about the number of times each copy passes from hand to hand. By spending another £3,000 and advertising in six papers, the advertiser will on this calculation still only reach another 10 per cent. *Woman's Illustrated* and *Woman's Day* are said to have been losing thousands of pounds a week in spite of their big circulations because they were the smallest of the big seven. Such is the fate of a little frog in a big pond.

If one wants to keep such a magazine going, one way may be to raise its selling price to make it less dependent on advertising; but publishers are wary of price increases that might affect circulation and frighten away even more advertisers. An alternative would be to differentiate the surviving magazines more sharply and write each one, as the trade papers are written, with a different group of readers in mind. One existing women's weekly is not produced in colour, but in ordinary letterpress with a subdued lay-out that flouts every modern theory of magazine production. Yet this button boot among the stiletto heels sells a steady 1½ million copies a week to a devoted readership.

But for what specialised groups among the feminine reading public ought the magazines to aim? Teenagers are one group that comes immediately to mind; but neither the Mirror nor Odhams before the merger seemed to find the formula for attracting these volatile young women once they graduate from the *Valentine* and *Mirabelle* level. Odhams closed the teenage periodical it started: the Mirror keeps its own afloat only with a massive sales effort and lacks the sure touch shown by the National Magazine Company which successfully prints two monthly magazines directed at the teens and early twenties. A year or so ago this would have been attributed to shortage of colour gravure capacity to handle another mass circulation weekly: but the industry is now hoist with an embarrassing surplus of colour printing plant laid down a few years ago in anticipation of a switch to colour among the newspapers that has not yet materialised.

It is not too difficult to guess why no publisher has yet used this new plant to produce a colour teenage weekly. It is hard to see one reaching sales of a million copies a week; and no colour gravure weekly can survive on a smaller circulation than this. Without these sales, it will not get the volume of advertising that it needs to cover more than two-thirds of its costs.

The Mirror group may therefore be chary of tampering too much with the formula of the five mass circulation weeklies that will still be in print after *Woman's Day* and *Woman's Illustrated* have died this month, however much it might want to break out of the circle that ties advertising to mass circulation and mass circulation to the low selling price, which means in turn excessive dependence on advertising. But unless it does break the circle, there is no guarantee that the rot which killed off these two thriving papers will not set in again.

Newsprint

HAS the price of newsprint since before the war risen out of proportion to the prices of other commodities entering into international trade? The current price of newsprint from mills in the UK is £58 5s. a ton which compares with the price in 1938 of £11 5s.—something over five times as high. Over the same period other commodity prices as measured by Reuter's Index have gone up about three times. This comparison, however, can be argued to be unfair: 1938 was a very depressed year for newsprint prices which, from peak levels following World War I had declined almost continuously till in 1938 they were little higher than in 1914. Between the end of 1931 and 1938 the Reuter index showed an increase of about 40 per cent for other commodities: this did not extend to newsprint. A further complication is that the standard weight of paper, on which quotations are based, have changed.

Since rationing of newsprint was finally abandoned in the later fifties, newsprint from British mills has tended to be somewhat higher in price than imported newsprint. As between the two major sources of import supply, Scandinavian newsprint is cheaper than Canadian and both are cheaper than the home price.

In 1960, for the first time, the consumption of newsprint in this country exceeded its pre-war level of 1.2 million tons. Over half of this was supplied by five mills in the UK. The most important of these is Bowaters with an annual capacity in this country of 500,000 tons. Pulp to supply this capacity comes in large measure from the company's groundwood mills which operate to a significant extent on home-grown wood. Bowaters is often thought of primarily as a newsprint producer; yet the emphasis of its policy has been as much on the diversification of products as on the expansion of existing capacity. About 50 per cent of the company's output in the UK is newsprint: the proportion for the group as a whole is 60 per cent. In all upward of 40 per cent of the newsprint consumed in this country is produced by the Bowater Group of companies, and some of their output abroad comes here too.

Following the acquisition of the Imperial Paper Mill in 1960 from the Daily Mirror Group the newsprint capacity of A. E. Reed and Co. was increased by 50 per cent and is now in the region of 180,000 tons a year. The same transaction saw the transfer of the Mirror's 50.24 per cent interest in the Anglo-Canadian Pulp and Paper Company of Quebec. (The only instance of press control of an important part of the newsprint industry is the Daily Mirror Group's interest in A. E. Reed itself.)

The remaining three mills which are small and have not ramified into international connections, between them produce the balance of home output of about 60,000 tons. With the Reed and Bowater Groups supplying 60 per cent of Britain's requirements the industry might be thought to be a far cry from the ideal of perfect competition. Yet there is no evidence of price control. Newsprint is admitted duty-free, allowing full competition from major Scandinavian and Canadian producers. Imports in 1960 were considerably in excess of their pre-war levels, unlike domestic production which still lags behind. For the future, growth in imports seems likely to be proportionate to the growth in consumption.

Can Provincials Prosper?

THE provincial press in Britain tends to be, and is painfully aware of being, underestimated both in its influence and potentiality. It does not, the *Guardian* apart (and the fact that the *Guardian* will be printing in London and using the nationals' distributing facilities from next Monday has finally taken it right outside the purely provincial sphere), possess the reputation of the great American provincial papers or even of those in European towns like Toulouse, Munich or Milan. Yet despite the successful efforts of the nationals to penetrate into every outlying corner of the country, assisted by the establishment of their own printing and editorial offices in Manchester, Glasgow and Edinburgh, some "quality" provincials have hung on since the war, many of them with circulations below the 100,000 mark, to take their share of the growth of prestige advertising, the promotion of the more expensive consumer durables, and the classified advertisements that reflect both the property boom and the shortage of qualified manpower. This kind of revenue is much the same as that which has now brought prosperity to the classier national Sundays.

It is recognised, even by their severest local critics, that if the better provincial dailies were to disappear, life outside London would become distinctly less individual and more barren. No consideration of the economics of the British press as a whole can therefore ignore the primarily social desirability of encouraging this section of the provincial press not merely to survive as reporters of local news but to develop, wherever circumstances (chiefly distance from London) allow the prospect, a distinctive, independent and critical commentary on all national affairs. This is admittedly an ideal rather than a serious aspiration at the moment. The *Scotsman*, since its acquisition by Mr Roy Thomson, is the only paper outside London that has recently (and with limited success) attempted to advertise itself as a national organ of opinion. Both the *Scotsman* and the *Glasgow Herald*, like the *Western Mail* in Wales, have certainly some "national" importance in forming opinion. Of the others, the *Yorkshire Post* is probably the chief organ of Conservative provincial opinion that is recognised in London.

All the provincial mornings tend to suffer in status through their inability to provide a first-class foreign news service (although the *Glasgow Herald* shares, and thereby assists, the *Guardian* service). Costs will probably confine most of the others to agency stories of indifferent quality for the foreseeable future. Taken together, their chief contribution to innovations in the industry in recent years has been in mechanical and technical development. Distance from London has prompted pioneering in teletype-setting and picture wire transmission and, earlier, in telegraphic experiments. The *Liverpool Daily Post* is now giving its readers the doubtful benefits of four-colour printing. By and large, proprietors have been more inclined to invest in machinery (which stands out in any list of assets) than in intangibles like journalistic quality.

THE provincial press is a congerie of varying economic operations: hard and fast categories are difficult to draw. The morning papers are normally tied to a local evening paper (which was traditionally an asset but since commercial television began has in many cases become a liability). Evening papers, some with daily circulations of 200,000 or more, also exist independently. The small daily still persists (as in towns like Leamington Spa, Ipswich and Greenock) with circulations as little as 20,000: a circulation area of 100,000 population is now the rock bottom for daily printing. The vast and indeterminate field of bi-weeklies and weeklies generally depends on a multitude of jobbing printing establishments in different states of solvency, although it is still just economic to produce small "chains" of local papers without other resources or diversification. The owner of one of these (six papers produced in rotation during the week by an editorial and printing staff of 20) admits that the personal effort required is almost certainly too great, and the return on capital too small, for anyone to go into the business now simply for the money.

THE chief provincial operations fall into three categories. First are large groups or "chains" represented by Thomson Newspapers (successors to the Kemsley dailies in towns like Aberdeen, Newcastle and Sheffield), the Westminster Press, Northcliffe and others. This class shades off into organisations like Berrow's in the west midlands (tied in with the *News of the World*) and D. C. Thompson in Dundee whose local daily, the *Courier and Advertiser*, is overshadowed by a Scottish Sunday (the *Post*) and a vast range of magazines and children's comics. Secondly, there are the more localised groups. Some, like George Outram and Company in Glasgow and the *Birmingham Post and Mail*, produce a quality daily and a large-circulation evening paper, and also control a series of local bi-weeklies and weeklies. More typical is the Norfolk News Company in Norwich, which publishes the morning *Eastern Daily Press*, circulation 59,500, the *Eastern Evening News*, circulation 62,000, and eight weekly newspapers with a combined circulation of 80,000, all from the one office. Thirdly, there are the single operations, varying in size from large-circulation evenings like the *Bristol Evening Post* and the Wolverhampton *Express and Star* to the smallest country weekly.

Diversification has a number of merits. The most profitable has been the plunge into television holdings, sometimes, although not necessarily, in the province where the newspapers are produced. The *Birmingham Post, Liverpool Daily Post, Scotsman, Glasgow Herald*, Norfolk News Company, East Midland Allied Press and Berrow's are all in this field, some of them openly to provide a cushion against setbacks in the newspaper industry. So far, however, only one quality paper, the *Scotsman*, together with its wilting evening stable companion (the loss on Scotsman Publications Ltd. was £227,000 in 1959), appears to have been actually sustained by television profits, but others could come to this in leaner times. There are signs that some "chains" are seriously attempting to bring in more collective advertising, and to make small savings by increasing the output of a central service of feature articles. Lower down the scale, local weeklies that are members of consolidated advertising schemes (offering reduced rates for advertisements appearing in perhaps twenty local papers) have their reservations about how far this can profitably be extended. They say they would not contract out of the schemes, but advertisers now asked to pay £300 for a group insertion are apt to shy off on the ground that sums of that order may be better expended elsewhere.

Financially, the past decade has brought several major and significant changes which do not argue for the prolonged survival of the weaker papers either against the development of existing or new advertising media or in conditions of local economic recession. The classic pattern used to be that the evening paper, with two or three times the circulation, kept the morning (or, at least, provided the profits if the morning only washed its own face). This is no longer true. Profits in both morning and evening papers now come less from circulation than from advertising. The Wolverhampton *Express and Star*, not connected with a morning

paper, provides the best available illustration of how the balance has shifted in the evening paper field in the past ten years:

	Revenue		Expenditure (including editorial, distribution, administration)
	Sales	Adverts.	
	£	£	£
1950	292,279	189,350	336,578
1960	502,618	913,751	1,097,828

The morning papers, with their smaller circulations (which are less vulnerable to increases in newsprint prices), are still getting the quality advertisements for the upper income groups without undue pressure, although much more "chasing" has to be done than in the past. They have little direct competition on their own ground. The evenings, on the other hand, are more liable to lose national advertising to television. Some still have to compete with rivals (although competition among evenings is rapidly being reduced to a few large cities): where this competition exists it can be ruinous in terms of distribution costs. Rival papers are known to send special vans fifty miles or more simply to sell an extra two dozen football specials in outlying villages on Saturday nights —simply to prop up circulation. One particularly revealing development has been the distribution agreement in Manchester between the *Guardian* and Thomson evening papers: others would certainly like to do the same, even if they are reluctant to admit it. Even where an evening paper is well established, like the *Bristol Evening Post*, with 95 per cent of its sale delivered to subscribers' homes or on regular order, it is thought that distribution costs will now prohibit the extension of the circulation area on anything like the scale of the past five years.

Although exceptions exist, there is still a strong economic compulsion to keep expensive rotary machines running twice daily. It now appears that Mr Thomson is undertaking a consolidation of this kind in Ulster, selling off the machinery of the morning *Northern Whig* and printing it on that of the evening *Belfast Telegraph*. The potential economies of this kind in other parts of the country are limited. Managements are generally uneasy about wages: some editorial staffs seem to have been cut, but there is a limit to the extent that this can continue without loss of quality in writing and technique. (Certain production and layout specialists, whom the older local journalism simply did not acknowledge, are liable to be expensive to employ.) In the past, the compositors and other production unions tended to force through favourable wage settlements for themselves at the expense of the journalists, or so the managements were apt to claim. The closure of some provincial papers has eased the scarcity of compositors in the provinces. But firms that have to accept nationally-negotiated wages believe that conditions vary so widely that the case for local agreements ought to be recognised by the unions if the smaller and weaker operations are to continue in being at all.

Newsprint has been a serious problem, emphasised by the rising sizes of papers, but the pegging of circulations that is now going on to meet distribution costs may ease this situation. Local papers would like a sliding scale in newsprint prices, just as the Press Association gives preferential treatment in its rates for news coverage to smaller papers. (Even PA rates, however, are an issue in some quarters: the smaller dailies claim that they cannot afford to put on readership because of the higher agency rates.) New machinery is a headache for all but the most prosperous organisations (an example of the kind of calculation involved is the *Birmingham Post's* present plans for capital expenditure of £5 million, including £2 million for new rotary presses). Smaller papers get the cast-offs; there are murmurs in this sphere that manufacturers' prices for the replacement of parts are unnecessarily high and deserve looking into. The larger organisations which customarily occupy good sites in the centre of the bigger provincial cities are awake to the present prospect of realising site values, and plans are under way for movement of plant and offices into the suburbs.

DAILY PAPERS: AN INTERNATIONAL COMPARISON

		Number of papers	Total circulation ('000)	Number sold per 1,000 population	Newsprint consumed per head in 1959 (kg.)
United States ..	1958	1,745	57,370	327	36·0
Australia.....	1957	53	3,655	381	27·9
Sweden.....	1958	128	3,438	464	23·1*
New Zealand...	1957	42	854	383	22·4
United Kingdom	1954	114	29,100	573	22·1
Denmark	1958	145	1,614	357	18·3
France	1956	130	10,733	246	10·6
Belgium	1952	39	3,343	383	10·1
Norway	1958	80	1,298	368	9·8
W. Germany...	1958	473†	16,431†	300†	8·6
Japan	1958	97	36,656	398	7·7**
USSR.....	1958	472‡	31,454‡	151‡	1·6

* 1958.
† Number of papers excludes 690 regional editions but circulation figures include them.
‡ Including specialised daily papers; in 1956 there were 36 such papers with a combined circulation of 5.6 million copies.
** Excluding newsprint substitute Senka amounting to 0·7 kg. per head.

The chief difficulty right down the line is the provincials' vulnerability to advertising changes. The possible creation of a network of commercial radio stations therefore presents a new opportunity to the stronger and prospective disaster to the weaker papers. The *Bristol Evening Post* is an example of a go-ahead local organisation that is ready and anxious to enter the local radio field if the chance comes. Others have made more hesitant noises. If commercial radio is introduced it is liable to mop up a good deal of local shop and similar advertising from the weaker local papers, including the evenings. If the American pattern is a true guide, there will still be an opportunity for the stronger ones to benefit from massive supermarket and other advertisements which the housewife likes to pore over, and to which her attention is drawn by radio advertising. The same is equally true of used car advertisements and consumer durable bargains of all kinds. If the control of commercial radio were to be handed over to the local press wherever it applies, with suitable credentials, for a franchise, the interdependence of the two media for advertising purposes would then be satisfactorily established as far as the press is concerned. (The radio stations themselves would almost certainly need the press's news-gathering facilities.) Certainly those papers that could not get a franchise would suffer heavily.

The question of public policy is whether or not such a drastic rationalisation of the provincial press should be encouraged anyway. The chief merit would be that it would assist in the formation of stable and comprehensive groups, ideally running a quality morning paper, a large-circulation evening paper, and a group of local weeklies, and possessing the major or minor television franchise for the province and the local radio station for the group's big-city headquarters. If the quality provincial press has to be mildly subsidised in order to fulfil a positive social function it may be thought preferable that the spreading of costs should be done in this way, chiefly in the hands of local companies, instead of through the development of more national "chains". Short of a technical revolution the alternative to being kept or cushioned could be, in some fairly distinguished cases, eventual extinction. The survival of the small, independent local weeklies will continue to depend, as it has always done, on situation, accident, proprietorial whim and managerial efficiency, for which no broad prescription can ever be laid down.

THE WORLD OVERSEAS

Triumph and Struggle in Saxony

FROM OUR SPECIAL CORRESPONDENT

From his hotel, decadently abed three hours after the trams have started—in Leipzig they are under way at 4.30 a.m.—the western traveller equipped with a transistor radio can quickly pick up what the regime is aiming at and what it would like everybody to know. The little box that elsewhere nets a medley of voices here catches only two, both east German—the Deutschlandsender and Radio DDR. Should he twiddle the nob in search of another point of view, let alone a few more facts, the listener runs promptly into an impenetrable cacophony. Jamming, the locals say after a sharp look round, has become more violent, especially on the west Berlin wavelengths, since Herr Ulbricht immured east Berlin on August 13th.

And so the aural picture emerges, swiftly and uncontested, of a regime intoxicated by the near prospect both of a peace treaty that will powerfully legitimise the existence of two German states, and of negotiations that will "wholly neutralise" west Berlin. These days all events are being orchestrated by hook or by crook into a triumphant east German state symphony—the presence in the country of Major Titov, the current arch-symbol of communist technical superiority, the neutrals' deliberations in Belgrade, Dr Adenauer's parochial electioneering, and lastly (for once) the Leipzig autumn fair, where co-existing foreigners—notably British Conservative MPs, one with splendid Tory whiskers—are in themselves exhibits along with the consumer goods that both East and West seem to covet, more than anything else, in common.

Subsequent talks with party officials and ordinary citizens confirm this first impression and introduce some interesting details. The east German political leaders, who have not been competitively elected and still have a long way to go to win the hearts of the majority of their subjects, are moving heaven and earth to prove that their Democratic Republic is worthy and capable of sovereignty. Unhappily for the finer arts of wooing, they are perforce still primarily concerned with elementary economic and political security. They have had to promulgate yet another state of emergency to make the most of the last few days of sunshine for bringing in a below-average grain harvest. This week and last, able-bodied town and country folk, and all suitable vehicles, were expected to turn out and lend a hand where hands have fled. The head of the state planning commission, Herr Leuschner, has warned representatives of that dehorned steer, the east German federation of trade unions, that this year's industrial output is so far disappointingly short of the target, particularly in the heavy engineering, electro-technical, and building industries. This lag is affecting in turn the production of many of the comforting props of daily living. For some years yet, Herr Leuschner said, the shops would not be as interesting as the authorities had hoped they would be.

Some east German business men at Leipzig attribute the republic's slow economic recovery as much to the continuing lack of materials of the right quality as to the flight of labour and skill. It is this, they explain, that is largely the cause of the frequent mechanical breakdowns, the delays in delivery, and the ubiquitous shoddiness that is so depressing a feature of the east German scene —the clothes that lose their shape after the first cleaning, the leather bags and brief cases with tawdry metal fittings, the envelopes that hardly hold together through the post, and scores of similar daily irritants. Apparently it is chiefly in the hope of overcoming this shortage of materials that the regime is still by word and deed encouraging trade with the West, while continuing to abuse western politics with a vehemence and misrepresentation that would be funny if it were not downright wicked; many of the younger communists are themselves thoroughly ashamed of it.

An ingenious mosaic depicting Dr Adenauer, Herr Globke and "their nazi generals" on the point of launching an atomic war, with the support of Nato, in order to smash east Germany's "social achievements" and reconquer east Prussia and Silesia, is constantly presented to the public in justification of the regime's interference with their liberties. In addition to the sealing of the frontiers, this includes the further mobilisation of youth, both in the armed forces and in *ad hoc* gangs detailed to settle such matters as the education of "traitors" whose television aerials look westward. Many hundreds of citizens have been sent to prison during the past month for having openly questioned the veracity of the regime's propaganda or the morality of some of its acts. Because of the shortage of labour, sentences are usually short compared with previous practice, and are served productively. Everybody capable of working is being somehow roped in. At Leipzig during the fair you may find that your lift boy is normally a theological student, your waiter a commercial artist. The dearth of willing administrative skill and experience is being felt acutely.

One curious consequence of the wall barring access to west Berlin has been a substantial drop in the number of married women volunteering for part-time work in east German factories. Many have given notice, employers say, because they can no longer spend their earnings on the little extras that were procurable in one way or another only from west Berlin. They are being scolded by the party for such basely bourgeois conduct, and the "workshy" are being warned that they will find themselves being taught to mend their ways in a labour camp. But the majority of the population are co-operating, for the most part meekly, with the regime, being decent to each other, refusing to respond to the party propagandists' frenzied calls alternately to hate and adulation, and hoping gamely that a more magnanimous and stimulating climate will develop with time. They are disappointed that there is in each district only one list of candidates for the "election" next week-end (September 17th) of town and village councils. But the optimists remind themselves that payment even of mere lip service to democratic procedure may be an augury of future grace.

The Non-Aligned Out of Step

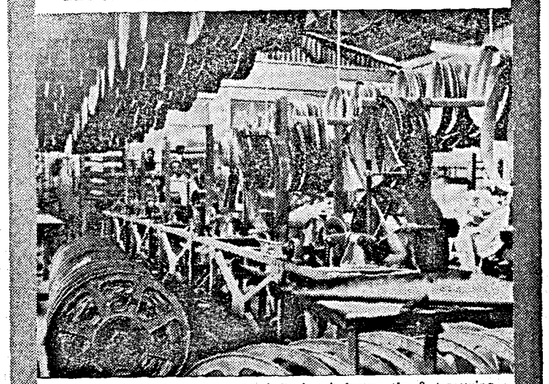
FROM OUR SPECIAL CORRESPONDENT IN BELGRADE

Two motionless hieratic figures, the Emperor Haile Selassie and Archbishop Makarios, brooding of eye and gravely bearded, sat like guardian images on either side of the speaker's stand throughout most of the five gruelling days of the non-aligned countries' summit conference in Belgrade. In the small hours of Wednesday morning, when the young King of Morocco, invoking the Prophet and praising Marshal Tito, formally closed the conference, they were still in their places. But beside the Cypriot president now sat the Congo's new prime minister, Mr Adoula, with the more celebrated Mr Gizenga behind his shoulder. These newcomers had flown into Belgrade in time to make two uneasily contrasting speeches on Tuesday. From ancient majesty, orthodox faith, and taut young nationalism, thus juxtaposed, the Belgrade conference blended its uniquely rich flavour.

As at other summits, personal prestige was here in grave hazard. The heads of states and governments included seven monarchs and princes; revered figures in four religious systems; the secular but also revered prime minister of India, throwing his great weight boldly into the scales to tip them as he saw fit, and among the leaders of revolutionary regimes, two generals and two marshals —one being the be-medalled Indonesian president, who daily tossed his baton upon the round table. Marxist Belgrade respected each older faith. Its Bajrakhi mosque, freshly restored, welcomed robed dignitaries daily and President Makarios found time to preach in the cathedral on Sunday. But there was scant time for secular pomp. Social occasions were abandoned, curtailed or ill-attended as the conference's hardest taskmaster, its five-day timetable, flogged it on through the sticky heat. Apart from Mr Nehru's iron resolve to keep his Moscow appointment on Wednesday, other delegations were also so bent on swift departure that they were in the air only a few hours after the late night closure. And the hard-driven notabilities were observed morning and night by roaming television cameras, ever liable to betray a fidget, a mopping of a sticky brow or too often a doze. By the end, their worn state was plain to see. Jugoslavia's federal assembly hall had become a pressure chamber for the testing of both physical and political stamina.

The Soviet nuclear bangs which, announced on the eve of the conference, became a grimly rhythmic accompaniment to it, did noticeably little to increase the pressure. First reactions were generally sorrowful and some were sharp, but the roar of Russian bombs seemed to fade quickly in the stuffy conference chamber. True, they aptly punctuated Mr Nehru's challenge "not to talk about other subjects . . . while the world goes to its doom," and helped to gain easy acceptance of his proposal to send a special peace appeal to Messrs Kennedy and Khrushchev and the heads of other governments. But the tone of the conference's joint declaration was almost tranquil about nuclear tests, allowing for the possibility that their cessation would be negotiated either separately, or in the tortuous context of general disarmament. If Mr Khrushchev's burst of frightfulness neither greatly alarmed nor greatly alienated many delegates, however, Jugoslavia may be reckoned an alarmist exception; Marshal Tito's last minute insertion into his conference speech of a claim that "we could understand" Russia's motives, after his spokesmen had dubbed the Soviet move as "deplorable" in public and "brutal" in private, has been followed by discreet Jugoslav indiscretions to the effect that Mr Khrushchev needs bolstering against a potential military take-over bid in Moscow.

Although the joint declaration, as read out in the conference chamber at two a.m. on Wednesday, was a hurriedly botched together affair whose rough joinery told the tale of several deadlocks resolved only around midnight, most of its content had been predictable long since. The omissions were its most conspicuous feature. Iran was not mentioned in the catalogue of "colonial" issues; Guantánamo was the only military base named, and with diplomatic restraint at that. The call to countries maintaining foreign bases to "consider seriously their abolition" was made in notably politic language; Dr Nkrumah's demand for a fixed deadline for the final elimination of colonial rule was itself eliminated. The elliptical phrase about the restoration of the rights of Palestine Arabs was the outcome of a tense struggle up to the last minute between the Arab proponents of a flat condemnation of Israel and a still tougher resistant group headed by Burma and Jugoslavia.



The passage on Algeria reflected the precision of the impressively terse speech delivered by Mr ben Khedda, the new and very self-assured Algerian leader whom the conference had suddenly found itself welcoming while his fallen predecessor, Mr Ferhat Abbas, lingered in Zagreb. Mr ben Khedda received the recognitions of his government showered upon him during the conference by Jugoslavia, Afghanistan, Cambodia, Ghana and the Congo as tranquilly as he broke ranks with his fellow Arabs by speech-making in French. (His impregnable indifference in that respect paralleled Mr Nehru's ability, after enduring several harangues on the independence struggle from non-participants, to speak casually of "anti-colonialism, anti-imperialism and all that" and then to add that "all our lives"—pause and brisk look round—"the lives of most of us present" had been spent in that struggle.)

The brevity and vagueness of the joint declaration's reference to the reform of the United Nations secretariat was matched only in the reference to Germany, likewise relegated to the very end. But the vagueness about the United Nations did not conceal any hidden lobby for Mr Khrushchev's troika plan. Mr Adoula's pointed reminder that a veto-ridden troika would have blocked any practical action in the Congo was not really needed to rally the Belgrade conference's massive opposition to Mr Khrushchev's formula.

In contrast, the almost off-hand appeal against any use of force or threats to solve the German or Berlin problems was all that remained after the failure to find any substantial common denominator. Even setting aside Marshal Tito's exceptionally severe strictures on western Germany, there was too much divergence between the proposals Dr Nkrumah brought back from his tour of the Sino-Soviet world, Mr Nehru's stress on solid guarantees for free access to Berlin, Archbishop Makarios's warning that west Berlin must not become a cencentration camp, and other disparate views. No reference to a peace treaty survived to please Moscow's ear, nor any consensus even in principle about facing the reality of a divided Germany, a tricky formula for Arabs who have not faced the reality on their own doorstep. There is no expectation here that even those members of the Belgrade group who stressed the need to recognise reality will in fact themselves recognise Herr Ulbricht at any early date.

The conference's rejection of several ill-considered proposals that were laid before it is clearly to be welcomed. But the net outcome, although balanced enough to protect the Belgrade group from any serious charge of veering toward either block, is rather sadly flat after so much expense of effort. Apart from the personal appeals for peace that are being made in Moscow and Washington, the impact of which cannot yet be assessed, no original initiative emerged from the conference; nor is there any suggestion of a coherent follow-through on a working level. Mr Nehru's warning of public disenchantment if the making of speeches is followed by no constructive action for peace was a necessary irritant, but did not suffice to stem the tide of further oratory—if that is the right word for the conference's main occupation of its time, a succession of readings of prepared texts addressed not to the squirming captive audience of potentates in the conference

How Mitsui Builds World Trade

Developed jointly by Mitsui and Ceylon industry, the fast-growing Associated Rubber Industries, Ltd., in its first year accounted for 50% of the bicycle tire and tube sales in Ceylon.

JOINT ENTERPRISES. The investment of Japanese capital and technical skills in the manufacturing of rubber products in Ceylon is another example of how Mitsui joins with local industry to promote economic growth. As one of the world's largest trading companies, Mitsui knows that joint ventures can save local outlay of foreign exchange and speed industrial development.

DIVERSITY OF PRODUCTS. All of Japan's quality products are available through this big trading company. It maintains close contact with hundreds of leading firms to give you quotations based on an intimate knowledge of the current market.

GLOBAL TRADING NETWORK. There are 40 Mitsui offices in Japan and 73 offices and affiliated companies in trading centres around the world. They can answer your questions. Perhaps Mitsui can lower your cost of doing business with Japan.

the world trades with Japan through MITSUI

MITSUI & CO., LTD.

P.O. Box 822 Tokyo Central Cable: MITSUI TOKYO

London Branch: 2nd Floor, Bucklersbury House, 83 Cannon Street, London E.C. 4

What—no patter of tiny feet, Fortescue?

No, Sir Henry. But this unusual air of peace and quiet in the old School does not denote half term. The little fellows are in class as usual.

Strange. In my day the place was a hubbub of sound from dawn to dusk.

Times have changed, Sir Henry . . . and so have the ceilings. Do you not recall the last Governors' Report which stated that Cullum Acoustic Tiles were being installed throughout? They, as you should know, reduce unwanted noise to a minimum. *Control* sound, in fact . . .

Sound discipline, you might call it, eh, Fortescue!
The very thing for the younger generation.

For *every* generation, Sir Henry. Last year alone, Cullum sold and installed 2,000,000 sq. ft. of acoustic ceiling.

An impressive piece of addition, Fortescue. Cullum Tiles certainly pass every test—both aural and visual—with distinction.

Most advanced jets in international service—starting September 25

Qantas, first with jets across the Pacific, now opens Jet Era 2 with the most advanced, most dependable jetliners in international passenger service. Representing a revolution in jet propulsion principles, these new Boeing 707 V-Jets take off quicker, fly higher and smoother, to provide the ultimate in transonic jet travel. Qantas is proud to be first to bring you this wonderful new advance in international jet transport. The new Qantas 707 V-Jets commence operation on the London-U.S.A.-Australia route September 25, extending around the world in October. Book now. See your Travel Agent or Qantas, corner of Piccadilly and Old Bond Street, London, W.1. (MAYfair 9200)—or any office of B.O.A.C.

QANTAS
AUSTRALIA'S ROUND-THE-WORLD AIRLINE
Qantas, in association with Air India and BOAC

chamber, but to newspaper readers back home. This technique actually made the search for practicable compromises harder by publicly committing the participants to irreconcilably different platforms before they had had any private talk.

The Belgrade atmosphere was harmonious enough. But the group has now to face the question of its own future—and in realistic terms. Although India was far from alone on most issues, there was no hiding Mr Nehru's impatience with his more parochially minded colleagues' resentment over his demands that they should take a broader view. The fear of being dubbed a third block ought not to deter the group from developing workable mechanisms that would have it from drifting apart into purely selfish courses. Nothing is yet officially agreed about a second conference, although a Moroccan invitation has been given, but informal continuing contact through representatives at the United Nations is clearly in many minds. United Nations activities in the Congo and elsewhere have already shown some of the forms of practical service that the non-aligned nations can render to peace if they can subordinate their private interest to that of a greater cause. It is more likely that their unity and sense of purpose will grow through such arduous but invaluable practices than through an over-emphasis on verbal generalities ; and if in years to come the colonial targets that now give them a natural focus dwindle towards invisibility they will need to start clarifying their aims soon.

The spectacular and predominantly Afro-Asian encampment on the bank of the Danube has given Jugoslavia a sizeable fillip and the communist powers a queasy turn—the symptoms of which are the astonishingly twisted reporting of the Belgrade conference in the Russian and Chinese press. The conference need cause the western world no anxiety if the West can see its own interest in not trying to cling to hopeless colonial positions and privileges, and recognises its own hopes for the world in Mr Nehru's remark at Belgrade that " we have to build in our own countries societies of free men, societies where freedom is real." Westerners need to stop either despising or idealising the uncommitted, to see that the voice of Belgrade is neither the voice of God nor of a treacherous siren, but the voice of human beings whose basic interests seem not unreasonably different to theirs. In Serbo-Croat " non-aligned " works out as " non-engaged," and the point about the Belgrade group is that they are otherwise engaged, preoccupied with the natural preoccupations of emerging nations.

The Economics of Mateship

FROM OUR CORRESPONDENT IN CANBERRA

THE Opposition in Australia is showing signs of life. One sign is that its federal executive recently took belated action to dissociate itself from communism in the eyes of the electors. It instructed the Victoria state executive—whose left-wing bias is a liability to the whole party—to enforce the ban on " unity tickets " (that is, how-to-vote cards on which Labour and Communist candidates in union elections appear side by side). Right-wing members of the federal executive, led by the deputy leader of the Opposition, Mr Gough Whitlam, had favoured outright intervention in Victoria to overthrow the pro-communists ; but the leader of the party, Mr Arthur Calwell, fearing that this would cause yet another breakaway, has preferred the milder course of putting the Victorian party on probation, as it were, for a month. The trouble is that this will make less impression on the voters than the more dramatic course of expelling the left-wing leaders would have done ; nor is it likely to win back many votes from the anti-communist, splinter Democratic Labour Party, whose continued strength keeps Labour out of power not only in Melbourne but in Canberra, too.

There was, however, another hopeful sign for the Labour party in its long adversity in the reception given to the speech on the Budget made by Mr Calwell on August 22nd. Here the leader of the Opposition was on a very good wicket, since employers, trade unionists and investors who have burnt their fingers are all united in resenting the " man-made recession " of the past year ; but he was probably surprised to find his lavish election promises seriously discussed in the financial press as statesmanlike utterances. He said that if a Labour government were to be elected in the federal elections in December, it would, in order to restore full employment within twelve months, bring in a supplementary budget in February with a deficit of £A100 million. It would raise pensions and unemployment pay (which, even after the budget increase, is still only £A8 5s. od. a week for a man, wife and three children). It would establish industrial undertakings in competition with private enterprise ; and, undeterred by high Australian costs and excess world tonnage, it would set up a national shipping line in order to save freight charges. These expansionary measures—which would certainly cost more than £A100 million—would not be allowed to plunge Australia into a new balance-of-payments crisis because a Labour government would restore import restrictions.

This programme has a wide appeal, promising as it does ease and comfort in the short run. Behind the double walls of import restrictions and tariffs, manufacturing industry would flourish ; overfull employment would return ; and Australian costs would get more and more out of line with those of the rest of the world. The only trouble would be that the exporter of primary products, on whom almost exclusively Australia depends to earn its living in the world, would be squeezed between the millstones of rising internal costs and world prices until he was flattened out of existence.

The present government, whatever is thought of its policies and their application over the past year, has had this long-term problem in mind ; hence the removal of import restrictions in February, 1960, and hence the credit squeeze in preference to their reimposition. These policies have stabilised the internal price level, but have not succeeded in bringing costs down. There are in Australia too many built-in obstacles to prevent any progress in that direction.

The chief of these obstacles is that Australians will not tolerate any unemployment. The number of registered unemployed is still less than 3 per cent of all those of working age. (The Labour party says these statistics are false because the working population is taken to include self-employed persons, and because not everyone who is unemployed registers. On the other hand they do include married women who merely take jobs from time to time if and when it suits them.) Modest as the percentage is, Australian sympathy is deeply roused on behalf of families who, through no fault of their own, have seen television, washing machine and refrigerator disappear into the repossessor's van, and on behalf of migrants who have left their homes and friends in the expectation of highly paid jobs, and who now find themselves languishing in reception camps on the other side of the world. The very warmth of that sympathy has exaggerated the extent of the recession. It makes it impossible for any government to permit unemployment long enough to cause a worthwhile redeployment of labour into the industries that can use it more usefully ; one of those triennial federal elections is always on the way.

A by-product of this intolerance of unemployment is the ease with which a manufacturer threatened by competing imports can get help from the Tariff Board. Here is another built-in obstacle to a more economic use of Australian resources and a lowering of costs. Another is the extent of monopoly and restrictive practices, against which the government says it wishes to legislate ; but it does not yet know how. Yet another formidable obstacle is the arbitration commission, which has said that it will in future adjust the basic wage annually according to the cost of living, reviewing it in the light of the economy only every few years.

These permanent obstacles make it difficult for any Australian government to deal adequately with the problem of rising costs

and the tendency towards an import surplus—both of which are endemic in an expanding economy. Whatever government is in power the next balance of payments crisis seems likely to bring back import restrictions since, of the other remedies available, a renewed credit squeeze might be more than flesh and blood could stand, and devaluation would be effective only until the arbitration commission had made its annual wage adjustment. The next crisis is certainly some way off. Imports in August for the fourth month in succession are below exports; wool prices have risen in the new season's auctions; stocks are high and the cautious budget has left importers cold. Exporting, however, will become more difficult if rising costs continue slowly to strangle the primary producer. Some of his markets—albeit not to the extent foretold by the minister for trade, Mr McEwen, in his more emotional moments—may vanish behind the common market tariff, and Asia provides an uncertain and largely uncreditworthy alternative. Overseas investment on which Australia relies to close a normally unfavourable trade gap may be diverted to the common market. And meanwhile a larger population will need more imports.

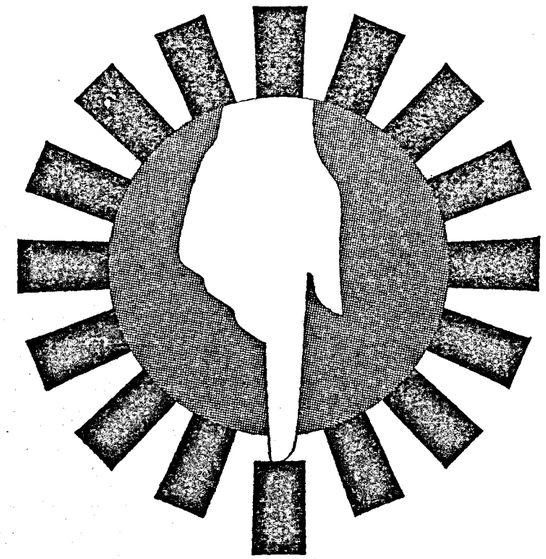
Look beyond the government's successful bombusting, beyond the "slow recovery" foreseen by the prime minister, Mr Menzies, and the old problem is still there. Its seeds lie deep in the institutions with which Australia has saddled itself and in the human attitudes—the very "mateship" so agreeable in itself—from which those institutions have sprung.

Revolutionary Democracy in Turkey

FROM OUR CORRESPONDENT

EVERYTHING that has happened in Turkey since the armed forces seized power on May 27, 1960, has been contrary to what one might have expected. In most revolutions the extremists throw out the moderates, gradually limit the real power to an ever smaller circle and finally install a complete dictatorship. In Turkey the moderates in the revolutionary junta ejected the extremists, then created a 270-man constituent assembly with which they shared power, and now are about to install a parliamentary regime under which there will be no place or function for the junta. Moreover, there have been no summary trials and executions of the deposed leaders. Mr Menderes and his colleagues have been tried at interminable length under the ordinary penal code, and this has proved so ill-adapted to the various crimes of which they are accused that the prosecutor has had the utmost difficulty in proving his main charges. Indeed, the trials have almost had the paradoxical effect of white-washing, or at least grey-washing, the tarnished Menderes regime, and have certainly done much to draw off the venom that had accumulated against the regime in its final days.

At Yassiada the final judgments and sentences will be given on September 15th. Exactly nine days later the election campaign will open. The elections will be held on October 15th. After that the National Unity Committee—the military junta—will hand over power to whatever government emerges from the poll and will itself cease to exist. This is the present programme, and it will almost certainly be carried out unless something quite unexpected happens. One possibility that would upset the timetable might of course be a violent popular reaction to the Yassiada judgment. Strict precautions have been taken against this. Martial law has been extended for three months in Ankara and Istanbul. (This means that the elections will be held under martial law.) Police leave in the Istanbul area has been cancelled. Most drastic, a complete ban on all discussion of the Yassiada trials, and by implication the verdicts, has been imposed. The outcome of the trials is still quite uncertain. Many people believe that there will be no death sentences so close to the beginning of an election campaign; blood and ballot-boxes go uneasily together. But the younger army officers, supported by a number of westernised intellectuals, are still said to be adamant for the death penalty.



The result of the popular referendum on the new constitution held on July 9th was revealing. In a vote that was clearly one of confidence in the revolutionary regime, 38 per cent of the people calmly voted No. The army leaders equally calmly published the result. But the lesson of the referendum was not lost on anybody. It meant (taking into account abstentions) that nearly half the nation were either still attached to the Menderes regime or discontented with the present one. Moreover, as a sort of dummy run for the elections, it contained salutary counsel for the political parties.

Of the four main parties in the field, the best known and best established is the Republican People's party, which ruled Turkey for 27 years between 1923 and 1950. It is led today by Ismet Inönü, Ataturk's former comrade-in-arms; although now 78 and very deaf, he is a man of immense political experience and skill. But unfortunately, despite his unassailable eminence, Mr Inönü is a factor of discord rather than unity. And his party is hopelessly split into rival factions which attack each other continuously with apalling venom. Lacking any comprehensible programme, it has become a sort of pantechnicon containing every shade of political thought from extreme conservatism to the fringe of communism. The divisions which were apparent in the party at the recent general congress, when Mr Inönü had to throw the weight of his personal prestige into the scale to avert a challenge from the former secretary-general, Mr Kasim Gulek, are unlikely to have improved its already diminished electoral chances.

The three other most important parties are the Nation party, which dates back to 1947, the New Turkey party, and the Justice party; the last two were created early this year. If any of these is to have any chance of coming to power, it will have to appeal to the supporters of Mr Menderes's suppressed Democrat party; there are believed to be some 5 million ex-Democrat votes going begging. All these, therefore (and even to some extent the RPP), have been faced with nice calculations of how close to the wind they can sail in promising the followers of Mr Menderes what they want. They thus tend to stand for the very programmes and policies for which the former prime minister and his party were overthrown.

THE Justice party seems to have gone furthest in this dangerous direction. Led by a former general who was retired in the massive army purge of August, 1960, it is a curious mixture of discontented retired army officers and ex-members of the suppressed Democrat party breathing threats of revenge for the May coup. The party appears to be well organised, especially in western Anatolia, the former political stronghold of Mr Menderes. Unless the three "neo-Democrat" parties can merge before the elections—which at present seems unlikely—they are bound to split the former Democrat vote; but it is not impossible, in a completely fair election, and if the RPP cannot pull its political socks up in time, that the three parties will between them win a majority of the seats in the new assembly. If they then formed a coalition government, it would almost amount to a return to power of the Democrat party, without its former leaders.

It is difficult to believe that the Junta, and even more the enigmatic army officers who are breathing down the necks of the members of the junta, would ever permit such a development. General Gursel has given several blunt warnings to the Justice party; but he has got such stout, even defiant, replies, that some people have begun to wonder whether the Justice party has not got some backers even inside the army. It also seems that some members of the junta

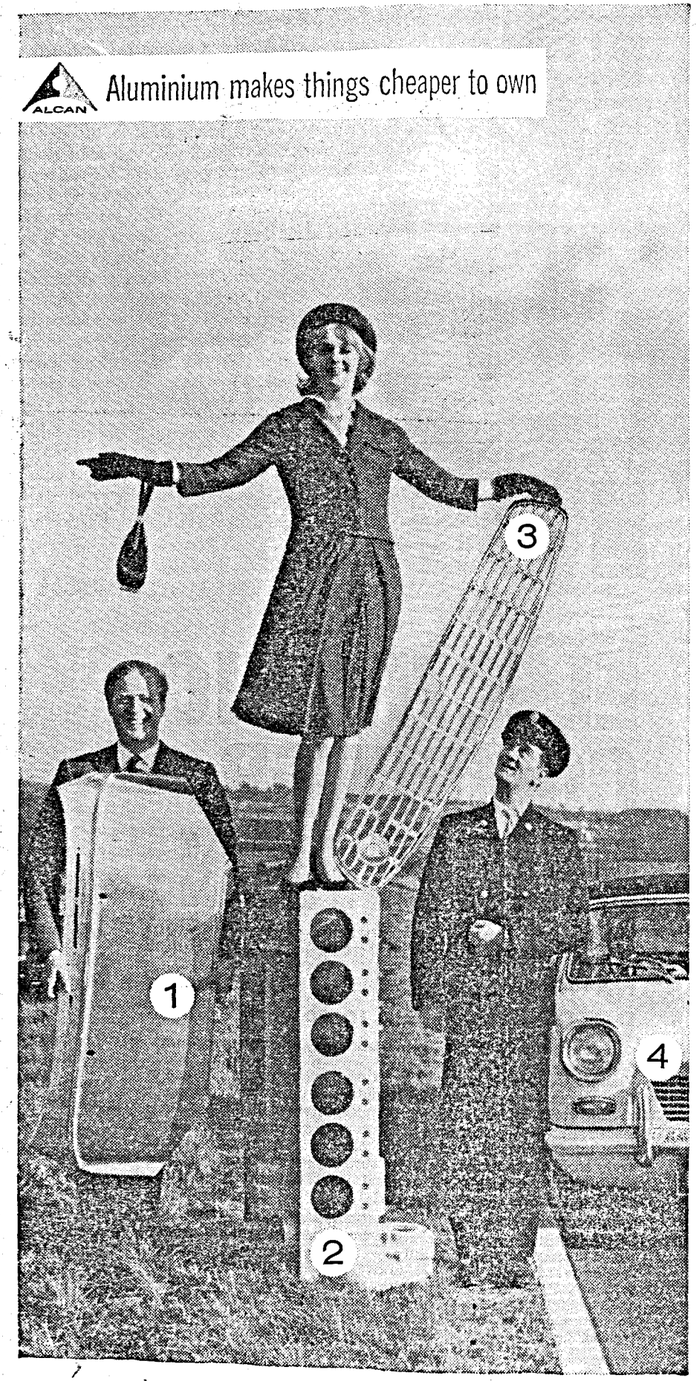
ELECTRONIC COMPUTER EXHIBITION

AND THE ELECTRONIC DATA PROCESSING SYMPOSIUM

NATIONAL HALL OLYMPIA London

OCTOBER 3rd-12th 10·30am to 7pm

October 3rd only NOON - 7pm Saturday 10·30am to 4pm



Visitors to Olympia can see a working demonstration of some of the most up-to-date electronic computers and ancillary equipment in the world. Britain's leading manufacturers will display their latest equipment, and experts on the various stands will be ready to offer information and advice about electronic data-processing of *every sort*. Whatever the size and nature of *your* business, here is an exhibition you cannot afford to miss. If you cannot attend yourself, you should at least send an observer.

THE ELECTRONIC DATA PROCESSING SYMPOSIUM

During the Exhibition a three day symposium will be held. Executives, well versed in computer techniques, will come from a wide range of concerns—both State and private enterprises—to give registered delegates the benefit of their user knowledge and experience. All six sessions will be informal, and a highly useful exchange of ideas and information will result.

For further information contact Mrs. S. S. Elliott, M.B.E., 64 Cannon Street, London, E.C.4. Telephone: CENtral 7771/2.

SEE THE NEW GENERATION OF COMPUTERS AT WORK

Aluminium rides again

—*and again and again*

The ideal traveller. That's aluminium. Always leading the way, especially to cheaper motoring. Cars are lighter because of it. Many commercial vehicles are made of it.

Aluminium's low weight, non-rusting qualities and resistance to corrosion have improved performance and reduced running costs.

Wherever you find it, in gear boxes, pistons, clutch housings, aluminium is hard at work saving fuel, maintenance and money. Wear on tyres, brake linings and engines is far less. All the aluminium in the picture is Alcan. Bon voyage!

1 To help you travel light, this aluminium scuttle panel—fitted between windshield and bonnet—weighs only 6 lb. 5 oz. It was made for the Austin Healey, by Boulton Paul Aircraft Limited.

2 This aluminium alloy crankcase forms part of the famous Gardner 6LW engine used by many well-known commercial vehicle manufacturers. The power-to-weight ratio of the engine is higher—because the engine is lighter. The crankcase was cast in Alcan Enfield alloy L.M.3 by L. Gardner & Sons Ltd.

3 We predict a long life for this aluminium radiator grille. It was made for the T.R.3. Aluminium alloys can be chemically brightened and anodised to give a finish as bright as chrome—but which lasts longer. Similar weather-tight and lightweight grilles are chosen by leading car manufacturers throughout Britain.

4 The Triumph Herald is fitted with a pressure die-cast clutch housing of aluminium. It combines lightness, strength, durability and economy. Birmingham Aluminium Casting (1903) Co. Ltd. made it for the Standard Motor Company, using Alcan Enfield alloy L.M.2. The grille is made of aluminium, too.

Alcan, backed by the finest research and technical facilities, can answer any question on the use of aluminium. Write to: Alcan (U.K.) Ltd., Aluminium Canada House, 30 Berkeley Square, London W.1. Tel: MAYfair 9721.

ALCAN
ALUMINIUM LIMITED OF CANADA

Britain's most widely used aluminium—from Canada

ALCAN

have recently become seriously worried by evidence that the New Turkey party is coming increasingly under the influence of supporters of the Menderes regime. A sign that the junta is determined not to let the aims of the May, 1960, coup be jeopardised by the politicians was given on September 2nd when the constituent assembly passed an extremely severe law proposed to it by the junta; under this law persons convicted of offences against the revolution during the period immediately before and after the elections next month are liable to the death penalty.

Whatever government emerges from the elections it will have on its hands, not only Ataturk's unfulfilled westernising revolution, the bases of which have in recent years been shaken, but also a fearful backlog of neglected economic and social reform. A national government representing the whole country would in these circumstances seem desirable. But with all the party leaders treating each other as deadly enemies, one wonders how it could ever be achieved. In these conditions the ideas of the 14 radical officers dismissed from the junta last November, which can roughly be summed up as a reformist coalition under the ægis of the army, are coming back into fashion. Whether the 14 themselves will return before the election is still uncertain.

The latest move of the National Unity Committee has been to call a round-table conference of party leaders, newspaper editors and intellectuals which deliberated for five days under the watchful eyes of members of the ruling junta. On Tuesday members of the five main political parties who were attending the conference signed (significantly, in the presence of the three chiefs of staff) a joint undertaking to exclude from party polemics Ataturk's reforms, the verdicts at the Yassiada trials, foreign policy and other basic subjects. This agreement sets very definite limits to Turkey's new democracy. Whether this imposed unity turns out to be real or artificial remains to be seen.

Canada's New Party

FROM OUR OTTAWA CORRESPONDENT

When the Canadian Parliament resumed its protracted session on September 7th, the parties were faced with the problem of adapting their political manœuvres to take account of a new factor, the New Democratic Party, which came into existence at a rousing convention held in Ottawa at the beginning of August. This new party replaces the old Co-operative Commonwealth Federation which achieved an honourable record as a minority party of the left without gaining power anywhere except in Saskatchewan. The Canadian Labour Congress has formally espoused the New Democratic Party, and an attempt is being made to attract wider support than the CCF ever got. With the help of the CLC headquarters and affiliating union locals, it seems assured of more solid financial support and a good deal of experience and ability in organisation. But it remains to be seen whether the elaborate arrangements to launch a new party mean much more than a boost for the old CCF.

The most important change may turn out to be the appointment of a new leader. Mr T. C. Douglas, who has been premier of Saskatchewan ever since 1944, has been induced to return to the federal scene. He sat as one of the original small group of CCF members who sat in Parliament from 1935 until 1944. He is a dynamic and wary political leader who is certain to make a considerable personal impact on federal politics. Trained as a baptist minister, he is one of Canada's best political orators and debaters; he has a wider range and greater humour than Mr Diefenbaker, and a crowd-catching appeal which Mr Pearson, the Liberal leader, lacks.

Mr Diefenbaker is said to be confident that Mr Douglas and the New Democratic Party will take votes from the Liberals rather than from his Conservatives. In one sense he is no doubt right. But it is also true that both the Liberals and the NDP are fighting for the votes which Mr Diefenbaker won in 1958, which were not Conservative on any showing, but rather protests against the Liberals' long rule. In this sense both of them must get votes from Mr Diefenbaker if they are going to get anywhere at all: both are working on the assumption that a good many of those who supported Mr Diefenbaker in 1958 are now disillusioned.

Mr T. C. Douglas

The irony, perhaps even the tragedy, of Mr Douglas's entry into the federal arena is that the policies which his New Democratic Party is advocating are almost indistinguishable from those which Mr Pearson has been trying to get the Liberals to adopt. Mr Douglas now says openly that he does not like to call himself a socialist because the word suggests a doctrinaire belief in public ownership for its own sake, whereas he believes in the mixed economy with firm direction from economic planners. Mr Pearson, through his "eggheads' conference" at Kingston a year ago and the formal party rally last January, has been trying to edge the Liberal party onto very much this same ground. It is significant that the NDP regularly parrots his open appeal to the "liberally-minded," with a small "l."

Mr Pearson and Mr Douglas both know that they could agree on a party programme between each other more easily than either can agree with some of their own supporters. But Mr Douglas and his supporters from the CCF and from labour cannot see the Liberal party in Mr Pearson's image: they see it in terms of the powerful business support which helped to keep Mr St. Laurent and Mr Howe in power. They say that both Conservatives and Liberals are fundamentally right-wing parties under the domination of "big business." Their avowed aim is to drive the "two old parties" together in opposition to the new "people's party" of labour and farmers and progressive thinkers.

The result may well be just what Mr Diefenbaker hopes, to divide the opposition vote and return him to power next year. Mr Douglas is quite aware of this danger. His reply is based, essentially, on two grounds. He claims, first, that on a long view the New Democratic Party provides the only hope of saving Canada from the fundamental political conformity of the United States. He finds it tragic that the Democratic-Republican power play provides no outlet for radical thought, and fears that Canada would lapse into the same state if it left the field entirely to Conservatives and Liberals. Secondly, on both short and long-term views, he believes that the Liberals could not beat Mr Diefenbaker. In spite of his respect and liking for Mr Pearson he does not believe he can overcome the public's continued mistrust based on "delayed resentment" at the pre-1957 Liberal record.

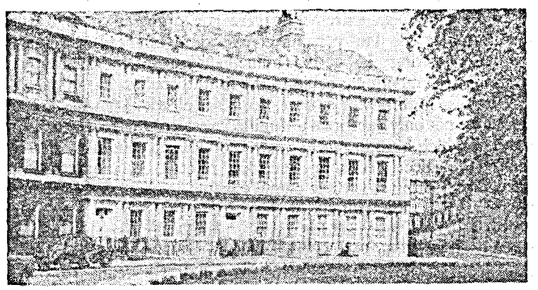
The present indications are that both the Liberals and the New Democratic Party may try to cover so wide a political spectrum that their programmes will be pretty amorphous. Mr Douglas has to consider a basically conservative labour wing just as Mr Pearson has his conservative business wing. This may increase the importance of the leaders' personal appeal, and Tommy Douglas with five feet six of bouncing energy, bubbling humour and shrewd political judgment is a formidable challenger for both Mr Pearson and Mr Diefenbaker.

HOME REPORT

In HOME REPORT members of the editorial staff and local correspondents report on life and happenings in and around Britain.

Georgian Museum

BY OUR SPECIAL CORRESPONDENT



THE City of Bath's official tourist handbook opens with the words: "You will probably fall in love with Bath. . . ." It is no shallow boast. To one who has been long in conurbation pent, the tranquil, funicular splendours of this Georgian museum are irresistible. And swift capitulation to this enchantment has, of course, honourable precedent: Janeites will recall the devotion of the unsentimental Miss Austen to the city; and there were many more famous and infamous persons to whom Bath was the sovereign town of England. The key of its magic for them was the fashion under Beau Nash and the medicinal waters—but fashion is fleeting and antibiotics have taken from the mildly radioactive waters the regard in which they were held by polite hypochondriacs. The hard hearts of today are moved, however, by stone.

It is a miraculous accident that brick-clay cannot be found near Bath, and its building has always been in the serene pale stone on which it stands. It cannot be an accident that the 18th century produced so many architects of genius; nor that many of them chose to work in Bath. Of all of them the Woods, father and son, have left their mark most legibly: in an age when sprawl was the common mode of urban expansion, Bath was planned, with a vision and ruthlessness that would not be tolerated today; and they are to be thanked for it.

North of the city centre round the Abbey, the Woods's monuments, the Circus and the Royal Crescent, make even the rest of Bath look squat and pedestrian. The Crescent is a tremendous semi-elliptical sweep of triumphant grandeur; the Circus is a sustained exercise in formal gaiety—Mozart to the Crescent's Bach. It had, before renovation began in 1953, been blunted, much blackened and decayed by the iconoclasm of 200 years of soot and weather.

There is precedent for philistinism in councils of boroughs of Bath's size (population 81,000): but Bath is not as other cities, and praise is due to its wardens who, in 1953, initiated the rebirth of the Circus when the Historic Buildings and Ancient Monuments Act opened the Treasury's purse. They began by buying two of the Circus's 33 houses. The houses themselves were cheap at £2,800 each; but behind the stained facades were rooms of prodigious size, quite out of sympathy with current needs. They were amenable to conversion into flats, but this work, together with the restoration of the facades, was not cheap: it consumed £10,500 for these two houses alone, towards which the Treasury contributed £1,600, half the cost of restoration (the agreement provides for the other half to be shared between householder and council).

But the results were so good that many of the private owners were moved, or shamed, into applying for the council's and the Ministry's grants for the renewal of their own façades. Unhappily, too few of them were as faithfully preserved as those the council had first bought; and the inlaying, repair and resuscitation of their stone became, in the event, a most costly operation. Eighteen of the Circus houses (of which six, converted into low-rent flats, are owned by the council) have been restored since 1953; the owners of the remaining 15 have so far been unable or unwilling to find the £1,000 which is, on the average, their quarter share of the cost of transformation. The council has spent £53,000;

The Circus, Bath

and it waits, beneficently, with a further £50,000 for the remaining houses.

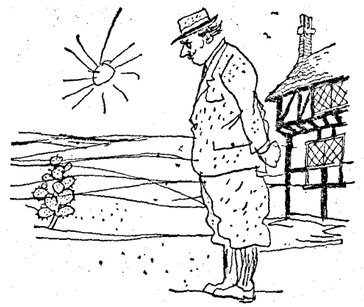
The process is slow; but the results are sufficient justification of long patience. Eventually the entire Circus will be as Wood the Elder designed it (he did not live to see it), and work will begin on the Crescent; and then on the Paragon and Pulteney Street, and Queen Square and the rest of the 140 listed historic rows and individual buildings which make up nearly all this golden city.

MUCH praise is due to Bath for this fettling of its splendid armour against squalor and the hand of the estate-builder: for it is not a rich city. The Pump Room, where the rich once congregated, is sad and bare, mocked by trippers giggling over a glass of the waters (still tasting, as in Sam Weller's day, of "werry old flat-irons"); the Colonnade is empty of fashionable idlers, full of prams and teenagers; and Pulteney Bridge and Milsom Street are affronted with coffee bars. The visitors still come to Bath (it is second only to London as an attraction to tourists), but they are day-trippers; Bath still depends on them, but they are not great spenders.

Bath depends, too, on the presence of the Admiralty, whose 4,700 clerkly landlubbers could not now return to London without the most savage repercussions on the city's economy, which is unbolstered by any serious industrial development. Nobody will hazard a guess at the extent of the Admiralty's bounty; but it is certainly larger than the six per cent which its numbers suggest. Last year's rumours of a return to London shocked the council out of its complacent lack of an industrial policy (there are dangers in this cheerful conservationism), and an attempt is being made to attract to the city light industry of a cleanly and suitable kind. But the employment figures are significant of inbred white-collarism: over 50 per cent of the 33,000 working population is in non-manual employment (and many of them are women—41 per cent against a national average of 34 per cent). Distribution is the city's main occupation, nurtured by such events as the annual Festival, complete with organised orgy. The twin dangers of stubborn shabby-genteelism and raddled coquetry threaten.

In 1947 a plan for Bath was produced by Sir Patrick Abercrombie, a plan of great range and high ambition which provided for quite intensive industrial development. None of that plan ("Bath to be no Georgian museum-piece") has noticeably been executed; its high purpose, 14 years on, has all been dissipated. Love, it is said, is not blind: it sees more and forgives more. True: but even love, even for so noble an object, may wish that it would see to the remedying of its imperfections as it does to the gilding of its perfections.

Parched Prospects



BY A SPECIAL CORRESPONDENT

WHAT may be called the "technocratic fallacy" often crops up when water supplies are discussed. Some time ago a senior officer of the Ministry of Housing and Local Government told a conference that more development should be concentrated in the north of England because water was getting scarce in the south. Presumably he would have advised against ever building a city at Los Angeles—where enough water to service a city of three million people has had to be transported over several hundreds of miles.

The same sort of question, on a much smaller scale, has now arisen in parts of East Anglia. The report of the Ministry's hydrological survey of the Essex Rivers and Stour* makes gloomy reading for those who are hoping to be watering their lawns in Essex ten years hence. It is the first of these reports to conclude that local water resources have been developed almost to the limit, and cannot meet the expected increase in demand.

The population of the area covered (at present about 1,800,000) is expected to increase by 300,000 in the next twenty years, and consumption of water per head will also increase; in addition farmers would certainly use much more water for irrigation, if water were available. The survey concludes that perhaps 36 per cent more water is going to be required in this area by 1980. But, it says, the ground-water resources of the area are already over-used, and water levels are falling in many wells in south Essex. The chief technical possibility lies in the better use of surface water resources through the construction of new reservoirs, and 17 possible reservoir sites are suggested in the report. These could meet about a third of the anticipated increase in demand. Some additional supply could also be obtained by treating more water after use and returning it to the rivers, but the report suggests that this gain (if realised at all) may be offset by failure to build some of the suggested reservoirs, which are bound to encounter many objections from farmers and lovers of the countryside. In sum, the technical evidence clearly indicates that the water supply of much of East Anglia (which is a rather dry region) is already precarious, and that the bulk of any further demands must be met from resources located elsewhere.

This report itself sticks closely to technical facts, and eschews any policy conclusions; but others may easily draw the false inference that the growth of population in

Essex and adjacent parts had better be slowed up. At public local inquiries, the water argument will probably find a place alongside farmers' objections to proposed schemes of development. Yet on every other ground the growth of both population and industry in this region seems very desirable, since East Anglia is the most "underdeveloped" area on London's doorstep, and since a better use of its port facilities would ease congestion around the London docks. Probably, indeed, the population, and hence the water requirements, of East Anglia should grow more rapidly than the Ministry's estimates portend. There is no technical reason why sufficient water should not be brought into the area to meet a greater increase of demand; but there is an obvious danger that the water undertakings will move too slowly to anticipate demand, and that planning authorities will prevent development on spurious technical grounds.

All this has relevance to the new legislation about water which Mr Brooke has promised to introduce in Parliament next session. As Britain's problems of water use and distribution become more complex, the inadequacies of present administrative machinery become more obvious. Large cities like Birmingham and Manchester can go long distances to get the water which they need; but the medley of smaller water undertakings which exist elsewhere cannot operate on this scale and have to rely on local resources. The Ministry's technical advice is excellent, but its efforts at co-ordination, which should include co-ordination between surplus regions and deficit regions (like East Anglia), fall well short of what is needed. The parched prospects of Essex are a sharp warning against further delay.

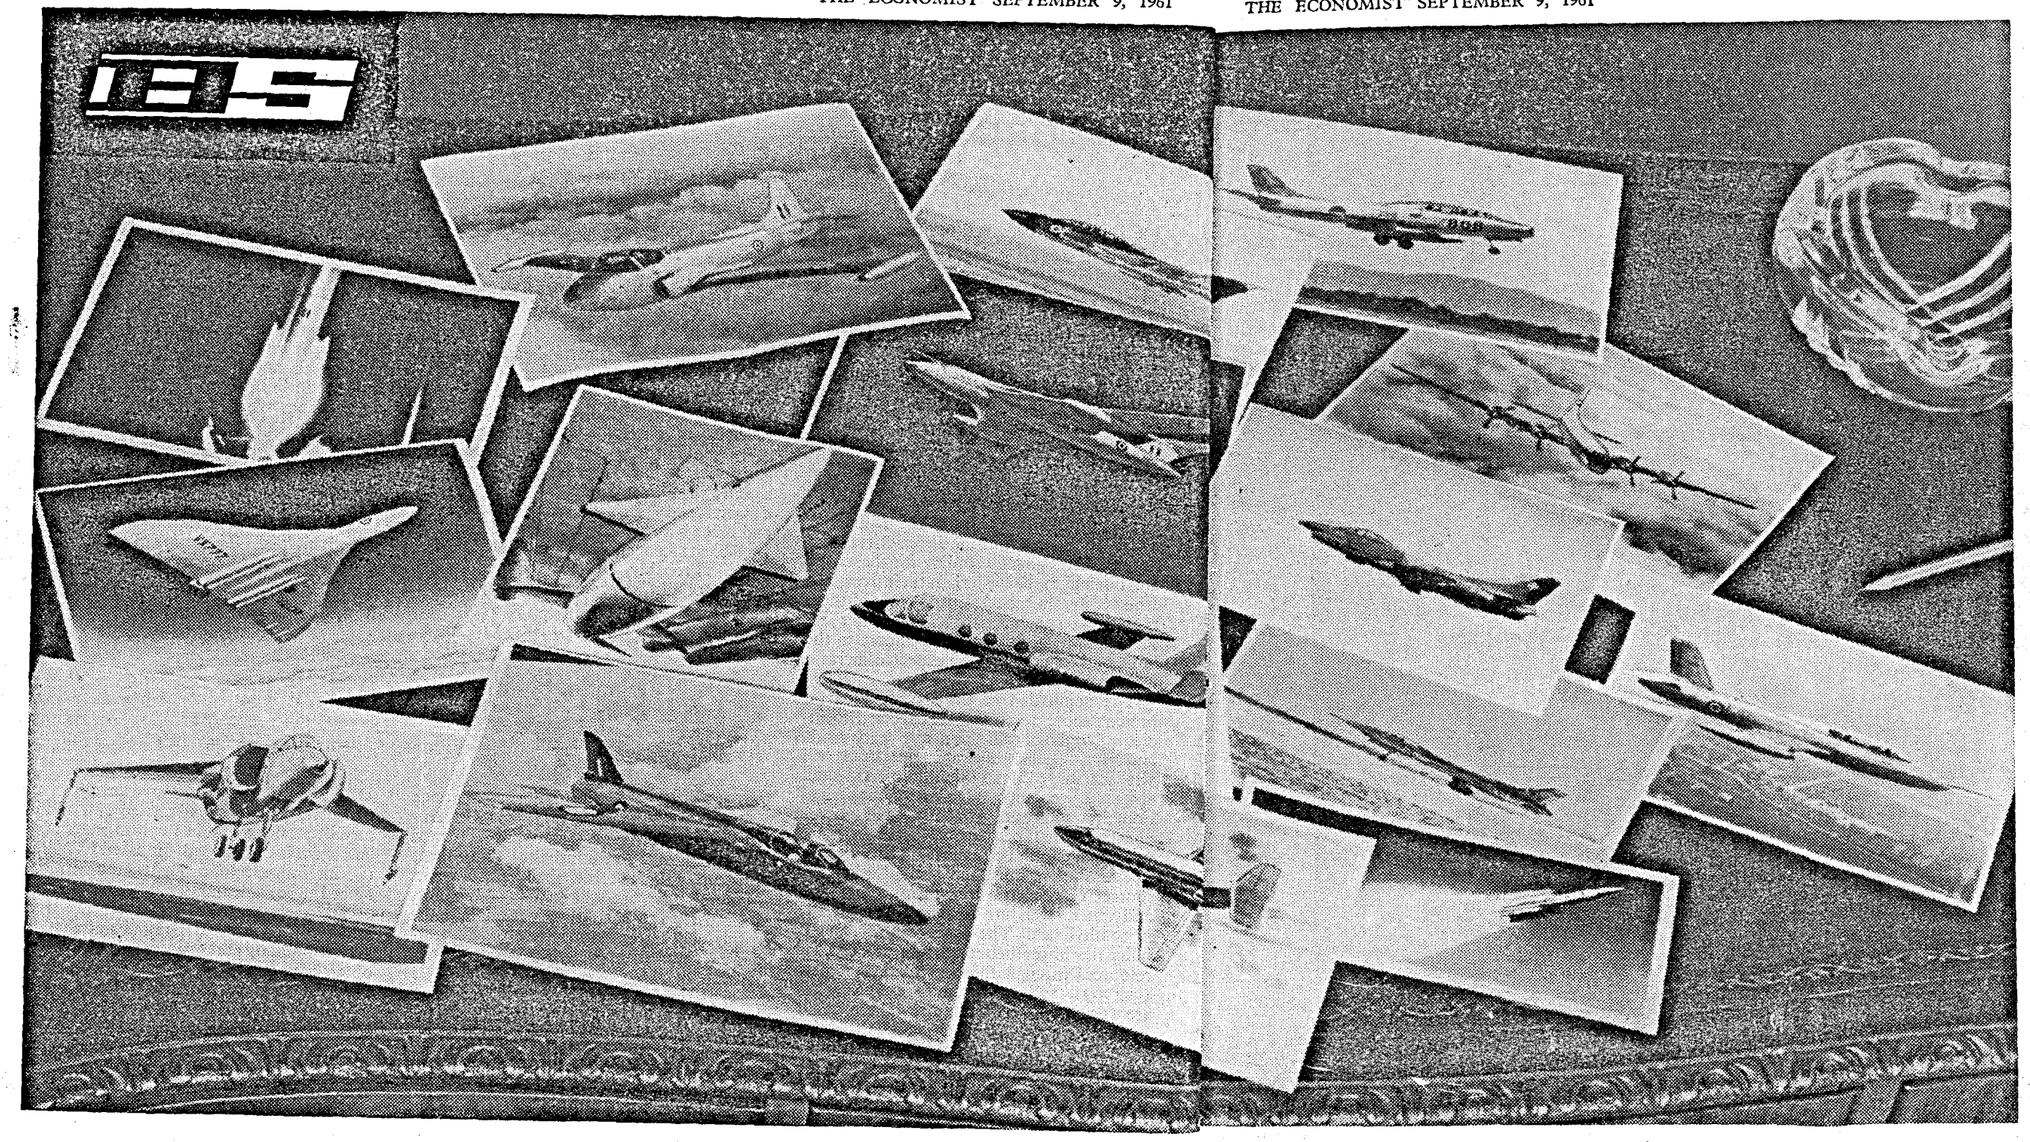
Post-fabricated Pre-fabs

FROM A CORRESPONDENT IN SOUTH YORKSHIRE



TO meet the critical housing shortage just after the last war, the Government erected some 157,000 pre-fabricated houses. Most were asbestos bungalows with an estimated life span of 10 years. Many of them are still standing—but only just. At £150 each they passed into the hands of local authorities five or six years ago: since then, deterioration has been rapid.

The Urban District Council of Hoyland Nether in South Yorkshire has found a way to preserve them. It has provided the pre-fabs with close-fitting jackets of brick, built new chimneys, strengthened floors and added many other refinements, all without displacing the tenants. Each conversion cost about £460: to build a new bungalow with comparable facilities would cost £1,300. Before this "cladding" the weekly rent of the pre-fabs was 14s. 7d. plus 5s. 3d. rates. After cladding tenants pay 18s. 4d. rent and 5s. 9d. rates. The buildings now have a guaranteed life of at least 25 years.

The council's virtue, quite apart from the merits of the scheme, has been its persistence: when it was realised that the plan to clad the 70 pre-fabs could not comfortably be attempted without obtaining a substantial loan, the project was almost strangled. The Minister of Housing and Local Government simply refused to entertain application for loan sanction. The housing committee decided to go ahead and clad one pre-fab; its surveyor drew up plans and the work was carried out, and its members applied again for loan sanction—and again it was refused. It asked its MP to use his influence and, finally, the Minister agreed to see a deputation.

The main props of its arguments were not only financial. It pointed out that its annual building allocation was in the region of 30 houses a year. The pre-fab tenants would have to be re-housed in new buildings, and the housing programme would be set back two years if pre-fabs were demolished. Loan sanction was granted, under the 1958 Housing Act, for £33,050, repayable over 20 years.

The council's 70 pre-fabs are almost completed now; but the speed of work depends on the building labour available. Progress was slow at first because the council kept one bungalow empty, into which it moved a tenant temporarily until his pre-fab was clad. Now, at their own request, tenants stay in their pre-fabs while workmen build around them. Bricklayers work at whatever speed they are able and joiners follow them along the line. No type of work is dependent on the other. Increased rents allow the council to put a substantial amount aside for future maintenance. Hoyland Nether's pre-fabs are now almost status symbols, and the council has had to turn down applications for houses it could hardly give away three years ago.

they make things simpler

Honeywell know how to put simplicity into complex electronics. They have designed electronic computers that work from a language of simple words. They have taken 'the modular' idea from architecture and used it to re-design process controls as simple plug-in units. They have built a range of room thermostats without moving parts... Honeywell's ability to keep things simple and make them work automatically means faster output from offices, greater productivity in factories, more comfort in the home. This is now not simply a success story—it's a world wide tradition.

Planning by Whom?

SIR—Your long article discussing how economic planning should be organised clarifies many of the problems. But in discussing the Chancellor's proposals for a National Planning Office, you remark that the idea seems to have taken root that this should be independent of the Treasury, and comment, "This may well be a *mistake*." I wonder whether you do full justice to the arguments in favour of independence.

The best organisational arrangements clearly depend on the job to be done. If it were merely a matter of a group of experts proposing (as at one point you suggest) an "assumption" about the future rate of growth—together, no doubt, with a breakdown for different industries—this might be as well done inside the Treasury as not. But the truth is that the Government is not well informed about the conditions of supply. The same would indeed probably also be true of any small, self-contained body of economists and statisticians working on their own.

Is not the crux of the problem this? We all feel that the past rate of growth of output, and of productive capacity, could have been better. If this belief is well founded, it follows that there are productive possibilities of which full advantage has not been taken. The first task in organising economic planning, before deciding on the "assumption" about future growth, should then surely be to find out what these possibilities are. This, in turn, would seem to involve rather detailed discussions with the people who formulate industrial plans: as you yourself suggest, not merely general discussions with the leaders of industry in a small top level committee, but more technical discussions than these could be, and on a much wider scale.

Such discussion would not of itself produce results. But it would mean that a plan could be formulated with a much better knowledge of what the reasonable maximum rate of growth was. As French experience suggests, it would also be an important stage in leading firms to make their own decisions in conformity with such an assumption. To help in this regard, also, it is widespread, detailed and technical discussions that seem to be required.

There seem to be several reasons for believing that discussions of this nature could be carried out best if the National Planning Office were partially independent of the Treasury; and thus located, as it were, half-way between the Government and industry itself. First, and perhaps most important, the discussions would only be fruitful if conducted in a spirit of confidence. This alone dictates that the organisation should clearly be shown to be, as far as possible, non-political; and that industry should be as closely concerned as the Government itself in the organisation of planning.

Constitutional considerations also appear to weigh heavily in the same direction. Civil Servants are servants of their Minister, and he is answerable to Parliament for their acts. This necessarily imposes on them considerable restraint and discretion in their dealings with the public. But if planning were conceived as it is suggested above it should be, the Planning Office would not itself be concerned with decisions, but only with making proposals and preparing the way for decisions. The decisions would be partly for the Government to make—but partly, also, for industry. If the work were done by civil servants, they would not be acting in the capacity that most civil servants act in; and the traditions of the civil service—particularly strong perhaps in the Treasury itself—might be a positive hindrance.

These considerations appear to me, between them, very powerful indeed. There is also one minor point. You say in justification of your view that the "expertise" is "already vested in the Treasury." It is true that the Treasury—and the Central Statistical Office—possess the sort of expertise required to make statistical projections of national product. There is, however, no reason why the expertise should not be utilised by a separate National Planning Office—in the same way, indeed, as the Economic Section of the French Ministry of Finance prepares economic projections for the *Commissariat du Plan*. Here, as in other ways, the French system "has arranged," as you say, the "division of power rather well." It might be foolish, without strong reason, to discard what is perhaps the essential feature of that system—the semi-independent and non-political status of the planning organisation.—Yours faithfully, J. C. R. DOW
London, SW1

Filling Those Seats

SIR—Another interpretation of the figures quoted by your air correspondent in your issue of August 19th gives, I think, a more accurate impression of the present low revenue position of the North Atlantic carriers. Firstly, the increase of 87,000 passengers in the first six months of 1961 over 1960 has to be shared between two countries (Canada and United States) and at least twelve carriers, as well as being divided between six separate months of travel. The resulting 1,200 extra passengers per month, per airline, do not yield very much extra revenue when one considers the 47 per cent increase in capacity.

Secondly, about 75 per cent of this increase occurred during the first quarter of 1961, as shown in the accompanying table.

The increase in traffic was obviously due to the "17 Day Excursion fare" (lower than the regular fare by some $120). Hence the increase in passengers is not a true measure of the increase in revenue.

REVENUE PASSENGERS (000's)

	1960	1961	Percentage change 1961/60
First quarter	228·0	293·7	+28·8
Second quarter..	478·8	500·3	+ 4·5
Total six months.	706·8	794·0	+12·3

By concentrating on the six months' comparison, your correspondent conceals an important aspect of the revenue status of the North Atlantic carriers. In spite of the admitted increase in charters, freight and mail business, the major source of the carriers' income remains regular schedule passenger traffic. There is no escape from the conclusion that the North Atlantic carriers are suffering from a "revenue slump."—Yours faithfully, D. J. SOLLY
Montreal, Canada

Rhodesia

SIR—What matters in Rhodesian politics are not the technicalities that your Salisbury correspondent and Major Wall dispute, or the inferences that they draw, but the attitude of the predominantly white electorate to African advancement. For it is on this that the future depends; it is the spirit not the letter of the law that counts. Over the last 14 years I have lived about half time in S. Rhodesia. Three years in India in the '20s, the days of swaraj, and a desk in India Office 1935/6 as PPS during and after the India Act, were educative on colour and sectional politics.

What I find encouraging in the Rhodesias—and I am backing my opinion by currently increasing my interests there—is the steady growth of a liberal attitude among Europeans, *pari passu* with remarkable economic advancement among those Africans in contact with them. This latter can be statistically assessed from bank and Post Office savings, house, land and vehicle ownership, and so forth. The European attitude can be measured by the voting in the 1953 and 1961 referendums when on analogous issues and almost identical opposition arguments, the illiberal vote fell from 40 to 33 per cent. Unlike other African territories that have lately hustled to self-government, the Rhodesias have vast and barely scratched mineral and agricultural resources to sustain and expand under their own competent leadership. It might seem strange how reluctant impatient liberals are to recognise the improvement that is taking place if one was not in a position to observe what a misleading picture emerges from much of the reporting in the British press—and deliberate distortion in sections of it.—Yours faithfully, ARCHIBALD JAMES
Pulborough, Sussex

For Mammon Only?

SIR—With regard to your note on "Church Advertising," may I point out that this is nothing new? The idea was mooted by the Commission on Evangelism and included in its report produced in 1945, *Towards the Conversion of England*. This was a plan dedicated to the memory of Archbishop William Temple. Quoting from the report, the commission says, "Of the eight agencies of propaganda we have mentioned advertising is the only one about which we have obtained expert opinion."

The commission came out firmly on the side of advertising as paragraph 271 of the report will show, and, although not an Anglican, I am disappointed that this recommendation has not been implemented.—Yours faithfully, H. V. ELDRED

London, NW7

Car Exports

SIR—Why should your correspondent Mr Balfour Barwise (August 5th) be so "shocked" that he sees so few English cars in Vienna? Surely he must have read *some* news on the fall in exports of British cars and have seen *some* statistics—for example, the countries of origin of cars imported into the USA. Does he not know what kind of cars are being used for minicabs?

I cannot help but feel that his belief that the majority of people would prefer to buy British cars is a prevailing attitude that has contributed to the fall in our exports that has occurred. In fact there are few places not subject to British Treasury regulations where English cars are imported in excess of other European makes. This is not only because the latter are cheaper but because they are preferred. I wonder if Mr Balfour Barwise has ever driven a European car—or an American one. As he apparently assumes they are inferior it would appear doubtful.

I believe you have postulated the theory recently that if tariff barriers were removed the population of England would become aware of the quality of products available elsewhere and British manufacturers would then, of necessity, be compelled to raise their own standards. Obviously, as evidenced by the high duties that foreign cars now attract, we are fearful of competition on an even footing.

A considerable amount of blame for the fall in our exports has been attached to the labour force in that their demands for higher pay without increased productivity have priced us out of the market. Manufacturers cannot escape some of the responsibility. Not only must our goods be as cheap; they must also be at least the technical equal and as attractive to the customer as those of our competitors if we are ever to regain our previous position in the world's markets.—Yours faithfully,

Hongkong G. J. HATHERLEY

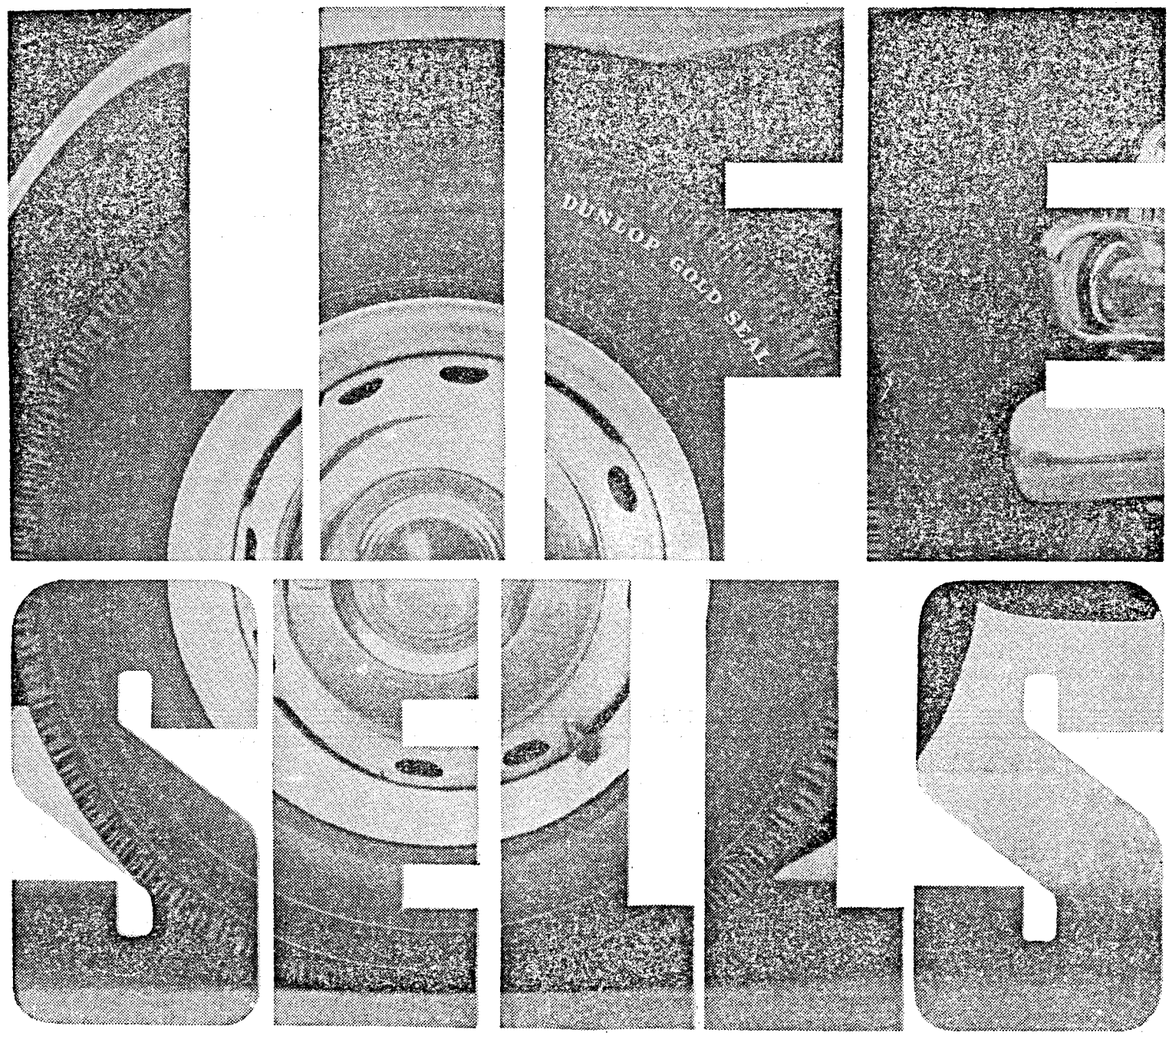
BOOKS

The Fleet was Ready

The Road to War, 1904-1914. Vol. I: *From the Dreadnought to Scapa Flow*

By Arthur J. Marder.

Oxford University Press. 481 pages. 42s.



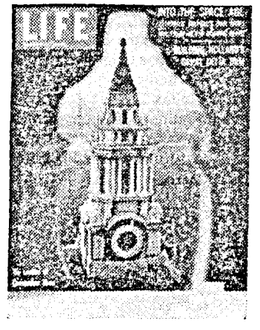
IN THIS important and absorbing book Professor Marder of Hawaii University, the editor of "Jacky" Fisher's letters, carries his study of British naval policy and strategy from 1904, when Fisher became First Sea Lord, up to the outbreak of the first German war. For the first half of the book the stage is dominated by Fisher, who was "in effect, if not in fact, the Board of Admiralty," and was then ruthlessly forcing his sweeping reforms on to a stubbornly conservative and largely obsolete service. Unfortunately his methods produced in the navy a schism which, for the verbal ferocity of the rival partisans, has been equalled only by the feud between Admirals Keppel and Palliser after the battle of Ushant in 1778. In this first period Winston Churchill adhered to the "little navy" group that comprised the radical wing of the Liberal party; but after becoming First Lord in October 1911 his views changed entirely, and from that time onwards we see him on the centre of the stage, working (though not always in harmony) with his naval colleagues to secure what they regarded as an adequate degree of superiority, especially in battleships, over the Germany Navy.

In his summary of this period Professor Marder, though he admits that the scrapping of obsolescent ships was probably carried too far, comes down heavily on the admiral's side. The reforms, he writes, "were the result of years of thinking, and of thinking tested by experience"; and the design of the *Dreadnought*, which made all earlier battleships obsolete, he considers to have been not "a piece of wanton and profligate ostentation," as Lloyd George stigmatised it, but "a stroke of genius." But the author's admiration for Fisher does not blind him to his faults. Quite apart from the violent antagonisms which he aroused, his refusal to accept a Naval Staff organised on the model introduced by Haldane in the War Office, and his unwillingness to reveal the Admiralty's war plans, totally frustrated co-operation with the soldiers. Nevertheless by the beginning of 1910, when he resigned, his chief work was done. But for Fisher, the navy would have been in no condition to meet the German challenge.

Churchill's appointment as First Lord was designed to force the Admiralty to accept a Naval Staff and to make the continental strategy favoured by the soldiers more acceptable to the navy—a purpose in which he succeeded perhaps too well. The showdown came at the historic meeting of the Committee of Imperial Defence on August 23, 1911, from which the "continentals" emerged triumphant. "Amphibious projects" writes Professor Marder "were as good as dead." None the less he considers the years 1910-1914 a period of "tremendous progress"; and it is certainly true that things then went a good deal better between the service departments, and between the admirals and the politicians—especially after Prince Louis of Battenberg had become First Sea Lord at the end of 1912. What is beyond doubt is that our strategy in the first German war was, in the main, the product of the Churchill era at the Admiralty.

Professor Marder has cast the net of research very wide indeed, and the collections of private and official papers to which he has had access have enabled him to throw a great deal of new light on the events and personalities of the period. Perhaps he sometimes takes too much account of the views of certain rather embittered critics of the navy of those days; but in general his comments on admirals such as Beresford, A. K. Wilson and Bridgeman are as fair as his account of the development of British strategy is objective. He states that "there were few really top-notch admirals in 1914," a state of affairs which he attributes mainly to the ascendancy of the *matériel* school over what may be called the "intellectuals"; and he considers Richmond to have been the ablest and most far-sighted of the latter. Yet even Richmond was totally wrong about the likelihood of submarine attacks on our merchant shipping.

For all the weaknesses here discussed, Professor Marder finally concludes that in "the natural geographical advantages, the voluntary principle, the extra sea time, the British naval tradition, the marked edge in numbers of warships, and a great confidence in their ships, seamanship and gunnery" the Royal Navy possessed assets that the Germans could not hope to emulate. Moreover, as the author says, "the Fleet was ready, or, what was almost as valuable, *believed* itself to be ready" when on July 26, 1914, Battenberg, on his own initiative, stopped the intended demobilisation after the Spithead review. If one accepts those conclusions, all the controversies and quarrels which had scarred the preceding decade fall into their proper historical perspective.



LIFE SELLS FOR DUNLOP

The Dunlop Rubber Company have been consistent advertisers in LIFE International since 1947. Their original confidence in LIFE's selling potential has been justified many times over. In their own words:

"The Dunlop Rubber Company and LIFE International have an important thing in common: their customers are spread throughout the world. Throughout the English-speaking world—and beyond, LIFE has carried the message of Dunlop progress and products to a sophisticated and influential customer group in a background which consistently maintains the highest standards."

Spread throughout the free world, LIFE International and LIFE en Español's 5 million readers make up the "sophisticated and influential customer group" which LIFE advertisers find so important. They are equally important to anyone trading in international markets, for they are the trend-makers, the decision-takers, the people who control or influence the buying habits of their own businesses and their own communities.

LIFE can sell for you, too. For more information about LIFE International, its new advertising edition for Europe, and LIFE's Spanish language editions for Latin America—write to Robert H. Garey, European Advertising Director, Time & Life Building, New Bond Street, London W.1.

it was vital in 1944

The Company's task?
To produce ten concrete caissons each as tall as a five-storey building and weighing 7,700 tons: each to be towed across the Channel and sunk at Arromanches to form a part of an artificial harbour equal in size to that of Gibraltar. This was the Company's contribution to Mulberry Harbour—with an unarguable completion date of 150 days from start to finish

it is vital in 1961

For British industry in 1961 D-day is today. The construction of modern factories to a planned construction programme with assurance of completion on time is of vital importance

completion on time

The need for new factories to expand production demands that construction shall be carried out rapidly and economically to a planned programme, and the installation of costly plant and machinery must not be delayed. The resources of the Laing Companies all contribute to rapid and efficient construction through detailed planning, mechanisation, new operational techniques, and the development and use of new materials. Completion on time we regard as an obligation and not as a virtue

Who's Who in the Unions

Trade Union Officers
By H. A. Clegg, A. J. Killick and Rex Adams.
Basil Blackwell. 286 pages. 32s. 6d.

TOP trade union leaders are constantly in the public eye: television viewers are by now well used to the beetle of Mr Woodcock's wise eyebrows, Mr Carron's plump honesty, Mr Cousins's glittering socialist convictions, or Mr Foulkes's swift evasions. But how the unions function at their humbler echelons is to many people wrapped in mystery and suspicion: the authors of this book try to unwrap it.

Their purpose is to show who trade union officers are, to disentangle the knots of incomprehension that bind together in public disesteem the full-time officers, the branch secretaries and the shop stewards, who play their varying parts in the union orchestra. They try, by presenting the facts and by comparing practice in different unions, to provide some sound ideas for reform. This, unquestionably, is a book of worth: perhaps it is unfair to complain that worthiness here—as in so many fields of endeavour—rides hand in glove with dullness. This is not one for the general reader: but no doubt the valuable information it contains will filter through to him as it is pillaged by the commentators.

Perhaps what most strongly makes for dullness is the practical impossibility of generalising about the people who are here examined. Some unions elect, others appoint their officers, lay and professional; some unions grossly underpay their officials, others give them only a bit less than they would be able to earn in outside jobs; officials of some unions are well content with their jobs, others seem to provide sadly little grounds for satisfaction to those who work for them. Voluntary branch secretaries may or may not be paid for the work they do on union business. Shop stewards may or may not lose money through spending time on union work; others may have a handy source of income in unofficial lotteries and other fund-raising devices.

But it is a pity that the authors have failed to humanise this social survey; one would have liked to know just why it is that people are prepared to take on a job entailing so many kicks and relatively so few halfpence. Of course, there are intangible rewards: the union worthies who sit competently on borough councils and benevolent committees all over the country obviously benefit from popular esteem. It is a shame that the book makes no attempt to evaluate the amount of public work outside the unions done by those active within them: some town clerks will gladly admit that the trade unions provide their hardest-working and most co-operative councillors. But it is particularly appropriate that, when asked to say what they thought was the accepted social standing of their job, a large majority of full-time officers and secretaries rated themselves somewhere between a nonconformist minister and an elementary schoolteacher. These two poles of underpaid morality and underpaid didacticism seem specially suited to the general view that trade union officers hold of themselves: the question of payment apart, it is at least questionable whether high moral aims or high didactic purpose are entirely relevant qualifications for those who play a vital role in the national economy.

Late Victorian

In Hard Times: *Reformers Among the Late Victorians.*

By Herman Ausubel.

Columbia University Press. London: *Oxford University Press.* 403 pages. 42s.

THE late Victorian "re-examination of the structure and processes of English society," with which Mr Ausubel is concerned in this book, has received relatively little attention from historians. The balances of mid-Victorian England have been carefully weighed, the conflicts of early Victorian England investigated. Yet the late nineteenth century has been left to specialist writers concerned exclusively with particular people or problems. Part of the interest of the subject lies in the fact that the "re-examination" was one aspect of a bigger revolt, a revolt against accepted values and institutions. It was the revolt more than the re-examination that generated intense moral fervour and converted causes into gospels. "The age of improvement," as it has been called, gave way to a different age in which "improvement" itself was impugned.

It cannot be claimed that Mr Ausubel has been altogether successful in his somewhat ambitious venture. He seeks to collect from many walks of life evidence of dissatisfaction with what was and hope for what might be. The "reformers" he considers are an extremely assorted collection, ranging from temperance advocates to bimetallists, from socialists to home rulers. They had different backgrounds, were of different ages, and not only disagreed with each other but also reached their conclusions in very different ways. The collection is much too assorted to be historically significant, and much of the book is a catalogue rather than an analysis. Moreover by quoting exclusively from "original" sources not used by other writers, Mr Ausubel often fails to benefit from what other writers might have taught him. His authorities are impressive and it is useful to have them so neatly located and annotated, but in several places "secondary" materials would have added to the power and persuasiveness of the history.

What is disturbing is that despite his care for diaries, letters and private papers Mr Ausubel does not liberate the personalities he is discussing. He introduces many of them with stock adjectives, which turn them from people into puppets. We meet one by one "the veteran Chartist leader, Ernest Jones," "anti-democratic George Gissing," "kind-hearted Mrs Gladstone," "zealous John Burns" and a host of others, including Palmerston, "that fierce exponent of an aggressive and meddling foreign policy." One chapter in depth on any one of these persons, reformers or anti-reformers, mid-Victorian or late-Victorian, would be worth a thousand adjectives. The stage is always too crowded for the reader to gather why a particular character behaved in the way he did or why he was what he was. Joseph Chamberlain, Randolph Churchill and William Morris, to take three examples, are discussed briefly without being fully understood: all three are subjects of interesting recent biographies.

On general points Mr Ausubel seems somewhat to over emphasise the "hardness" of these "hard times" compared with what had gone before. He does not note the contemporary critique of "plutocracy," which at the end of the period was as eloquent as the folklore of "depression" or for that matter of "democracy." He discusses the literature of "poverty" that was to culminate in the powerful empirical studies of Booth and Rowntree, but he does not examine the difference between the empirical approach of Booth and the "literary" approach of most of his mid-Victorian (but not early-Victorian) predecessors. He claims that the late Victorians redefined as removable evils all kinds of practices that people in Macaulay's time had accepted as natural, but he does not point out that the idea itself of "removable evils" belongs to an earlier period. His ideas point to a synthesis, but they do not provide it.

The Growth of Vocation

The Young Mr Wesley

By V. H. H. Green.
Arnold. 350 pages. 35s.

JOHN WESLEY has attracted historians for two reasons: first by the fascination of his personality, at once revealed and obscured by the vast corpus of his journals and letters; and secondly, by the extraordinary and continuing success of the movement which he started over two hundred years ago. In this new study Mr Green has concentrated on Wesley's spiritual and intellectual development at Oxford, using as his main source the hitherto largely unpublished early diaries, which cover almost the whole of the period 1725-35.

The result, as Mr Green freely admits in his preface, is "rather unexciting." Wesley and his Holy Club did not make much impact at Oxford, being mocked by the fashionable young men at Christ Church and Merton and gently repressed by the senior members of the University. Even within Lincoln College, where he became a fellow, Wesley's few pupils became steadily fewer because of his "strict notions of religion." He was clearly a poor tutor, imposing his

own beliefs and narrowing the outlook of those he supervised ; and it is evident from Mr Green's gentle and understanding comments that Lincoln is better off today. Yet Wesley's intellectual development, though it was in part at the expense of that of his pupils, is a rewarding study. His reading in these years became progressively more religious to the ultimate exclusion of his early interests in classical literature, history and drama. By 1744, when he gave his last University sermon, he was rebuking the undergraduates of the day not for inadequate reading but for " reading what has no tendency to Christianity." As early as 1735 he told his schoolmaster elder brother Samuel that his chief task should be to instruct his pupils in the Gospel and not in the " beggarly elements of Greek and Latin."

But he did not begin as an anti-intellectual ; he became so as his vocation gripped him. Slowly his intellect was turned exclusively towards his religious purpose—the combating of unbelief by the spread of personal, emotional religious experience. Knowledge for its own sake made no appeal to him. " There are many truths," he told his mother, " it is not worth while to know." The temptation to apply this judgment to the details of his own early life is removed in this instance by the unobtrusive art of Mr Green's work.

Lessons from Japan?

Japan Economic Year Book, 1961

Oriental Economist, Tokyo. 264 pages. 1,500 yen or $7.50.

THE Japanese have a reputation for pushing everything that they have learned from the West to *extremes—whether* in industrial techniques, American journalists' English, or Keynesian economics. Most British industrialists have long ago been forced to stop laughing at them under the first of these heads, and perhaps British economic planners had better do the same under the third. This booklet, which has just arrived in London, illustrates both the case for, and the difficulties of, doing so. " The Japanese Government," the booklet reveals, " at a Cabinet conference held in December, 1960, decided to set the fiscal 1961 target of the nation's real economic growth at 9.2 per cent." It did this after its Economic Planning Agency had forecast that Japan should " continue fair to register an annual gain of 9.8 per cent (actual gain 9.2 per cent when adjusted to price variations) ". Of course, nobody will expect this decimal point target to be exactly hit, and it is easy to laugh at such pedantic figuring. But what is its result?

Its result is that the Government, having had the courage to publish such a ludicrously detailed statement of aim, can then fix the whole of its detailed economic policy into a framework that looks forward to seeking to achieve something like it. The national budget (taxation only 20.7 per cent of national income) is drawn up with this end in view, and without any nonsensical attention to details about above-the-line or below-the-line balancing. So is what this booklet's journalese calls the " annual hike in investments in public undertakings " ; with a deliberate eye on the expectation that national income should double in ten years, five-year plans are mapped out for huge improvements in port facilities, highways and the like. The whole system is also controlled by a range of indirect taxes that have not been thought of here (cf a " restaurant tax ", a " gas-electricity tax ", and a " golf amusement tax ") and by a Bank rate that is apt to be expressed in figures like 7.667 per cent, and to move up or down by 0.1 per cent at a time.

This almost incredibly detailed attention to figures extends into other fields of economic planning. Educational expenditure is adjusted according to which sort of labour (e.g. junior high or senior high or technological school graduates) looks as if it is going to be increasingly or decreasingly needed. Expenditure on official overseas market surveys is " hiked " according to different trends in different overseas markets. Even social policy is apt to be affected by such estimates as that life expectancy figures " in Japan for 1959 were 65.2 years in males and 69.9 in females, an advance of 0.2 and 0.3 respectively over the previous year."

Of course, Japan has some advantages. One is that expenditure on " national self-defence forces " is listed here as less than 2 per cent of national income. Another is that the trade union movement, although more than Cousinsite in its politics (1960 slogan " To hell with the US security pact, and fatter share of improved productivity for labour "), has not succeeded in being an independently inflationary force ; it has achieved only a 22 per cent advance in wages and salaries since 1955 while productivity has increased by 50 per cent. " It is therefore theoretically correct," says the booklet, " for labour unions to have demanded large-scale wage level hikes in the 1961 spring offensives." Finally, these offensives—and this is a major difference from Britain—are met by a rather hair-raising willingness to stand up to strikes. One recent coal-mining strike dragged on for nearly two years before there was successful intervention by the government, with an objective rather more limited than Mr Hare's. " Through Labour Minister Ishida's good offices, the expected bloodshed was fortunately avoided." Last year " the autumn labour struggles—now one of the annual events of the country—were carried out in a very much peaceful and orderly manner." Even so, there were widespread strikes of workers in hospitals. " Taking serious view of the situation, Labour Minister Ishida urged for an early solution and the stationing of emergency personnel even in the time of strikes."

A lot of this is much stronger meat—or poison—than we in Britain would stomach.

But the point to note is that despite it all, or perhaps because of it, the real national income of Japan continues to increase by some 10 per cent a year.

Turkey's Brilliant Past

The Seljuks

By Tamara Talbot Rice.
Thames & Hudson. 280 pages. 30s.

IS IT not strange that of all those to whom Hulagu and Jenghiz Khan and Timur the Lame (Tamerlane)—the great medieval Asian destroyers—are household names, but a few have heard of their more creative contemporaries, of civilised rulers such as the Seljuks Alp Arslan and Alaeddin Kai Kobad I, and of the architectural gems they and their house have left scattered about Persia and large tracts of Asia Minor? This ignorance is not confined to the west. Even in the Ottoman Empire, Turkish history as taught to the Sultan's subjects began with the founder of the Osmanli dynasty, completely ignoring its predecessors of kindred stock in western Asia, those Seljuk princes who embellished their cities from the Black Sea to the Mediterranean with monuments of a highly interesting type of Islamic architecture and, placed between two civilisations, the Iranian and the Arab, had the wisdom to make the best of both.

The modern Turkish Republic has reversed this attitude and has encouraged Seljuk studies ; while the Menderes government, whatever may have been its political faults, did admirable restoration and conservation work on the Seljuk monuments of its Asiatic provinces. It is with this region that Mrs Talbot Rice's volume is concerned, with the westernmost of the Seljuk states, the Sultanate of Rûm (Rome), so called because it was conquered from the Byzantine Empire, which maintained to the end the fiction that it was Roman. The capital of this enlightened kingdom, which flourished from the end of the eleventh to the beginning of the fourteenth century, was Konya, the ancient Iconium, which also became the headquarters of the Mevlevi (" Dancing ") Dervishes.

Mrs Talbot Rice was therefore confronted with the problem of writing—within the limits of the series of which her volume forms a part—a book which, while expert and scholarly on the arts and architecture of the western Seljuks, has also to serve as an introduction to the Seljuks generally. She has solved it extremely well, not least in the lucid division of her subject-matter under various headings. Of the arts she writes, of course, with special expertise.

A feature of the volume that is particularly valuable to the student is Appendix III, which lists and classifies the principal buildings and the leading architects and masons. The well chosen illustrations, together with line drawings and plans in the text, are representative, and wisely include two plates of coins. But the caption of the photograph of the graceful Inje (" Slender ") minaret in Konya somewhat misleadingly describes it as having been " destroyed ". The lightning that struck it in 1901 in fact demolished only the two upper stages, sparing the lowest to suggest today how lovely must have been the whole. The book deserves, too, a less jejune index ; but these are very minor defects in a satisfying and handsomely produced work that should help to place a brilliant period of Turkish history and achievement in proper perspective.

Judging and Judges

The Judicial Decision : *Toward a Theory of Legal Justification*

By Richard A. Wasserstrom.
Stanford University Press. London : *Oxford University Press.* 197 pages. 30s.

Justices Black and Frankfurter

By Wallace Mendelson.
University of Chicago Press, London. 161 pages. 30s.

HOW should a judge decide? What weight should he give to precedent, to notions of justice, to social utility? What is his appropriate relationship to the legislature? These are the questions that have always nagged at anyone taking the trouble to think about the judicial process, not excluding judges. Americans think and write more about the problems because their courts have so much more power, especially the Supreme Court of the United States. But the Wedgwood Benn case suggests that a little thought would not be inappropriate among the judges and lawyers of this country. Even the government might have been happier had the Election Court—bound by no precise precedent—seen its role less narrowly and fashioned some law consonant with the realities of the twentieth century.

Mr Wasserstrom, an assistant professor of philosophy and law at Stanford, has written a metaphysician's book on judging. In abstract terms he seeks the proper basis for decision. He rejects sole reliance on precedent, or at the other extreme on " justice " between the parties without thought of longer-term rules. He arrives at length—laborious length—at this compromise :

> A decision is justifiable if and only if it is deductible from the legal rule whose introduction and employment can be shown to be more desirable than any other possible rule.

It is the kind of book in which the author constantly defines his terms and tells us what he cannot deal with. Wholly missing are the tang and real-life flavour of such explorers in judicial philosophy as Jerome Frank or Thurman Arnold. Mr Wasserstrom is serious, and no doubt he is more careful than those old-time iconoclasts, but he is too pedantic to have much effect on legal thought.

A flaw of a very different kind mars the work of Mr Mendelson, professor of government at the University of Texas. There is no problem of abstraction here ; he deals in great and homely detail with the monumental conflict between the two ablest and most influential members of the Supreme Court. The struggle has raged for more than a decade now Justice Black pushing for absolute judicial protection of individual liberty against governmental restraint, Justice Frankfurter cautioning the court to restrain its libertarian instincts and defer to legislative views. Professor Mendelson's difficulty is simply that he is wholly committed to the Frankfurter view.

Thus Justice Black is taken to task—quite properly—for trumpeting absolutes which he covertly ignores when necessary, for distorting the Congressional will to humanitarian ends, for resolutely supporting fixed economic interests. Justice Frankfurter is portrayed as the man who has no such bad habits ; he is a neutral judge who " has tried to subsume will to law," a follower of Holmes and Brandeis, who leaves law-making to the political branches of government. The author who writes that about Felix Frankfurter is either blind or not looking. Justice Frankfurter has not hesitated to legislate when he deems it necessary—in the field of jurisdiction, for example, as in last term's birth control case. The school segregation decision, in which he concurred, is hardly an example of judicial restraint and deference to the political sphere. If it is wrong for Justice Black to be always on the libertarian side, is it not sad to find Justice Frankfurter—increasingly, these days—always on the side of repressing free speech and belief? The Holmes and Brandeis who fought against the repression of communists in their day might have found it hard to concur in Justice Frankfurter's opinion last June ; he then held constitutional the law requiring the registration and effective suicide of the Communist party. Justice Frankfurter is much more complicated than Mr Mendelson imagines. Unhappily for those who write about judicial philosophy, so are most judges and so is the problem of judging.

OTHER BOOKS

THE DAWN AND TWILIGHT OF ZOROASTRIANISM. By R. C. Zaehner. 371 pages. 50s. Eastern Christendom. By Nicolas Zernov. 326 pages. 42s. The *Weidenfeld and Nicolson* History of *Religion.*

Comparative religion is nowadays a popular choice for courses of the Workers Educational Association and the like, and this handsome series will serve as background reading of Third Programme standard. Its general editor is Professor E. O. James, who has chosen an impressive run of authors from British, American and Canadian universities. Both the volumes here noticed come from Oxford.

Professor Zaehner, in the course of explaining how and why Zoroastrianism held the allegiance of the Persians during both their great imperial eras, shows relationships with Christianity that will excite the non-specialist reader for whom he writes. Dr Zernov is pinned to a slightly encyclopaedic arrangement by the immensity of the period he covers (from the first Pentecost to the testing time that followed the Bolshevik revolution), as well as by Christian predilection for schism. But he works manfully to fit in everything, not forgetting art, for which he provides some very well-captioned illustrations. He is interesting on oecumenical movements from first to last, but unfortunately finds it " too early" to write of events after the second world war, and so does not include the recent heartening request of the Russian Orthodox Church for membership of the World Council of Churches. But he provides the background for it.

THE RATIONALE OF THE STERLING AREA. By A. R. Conan. *Macmillan.* 133 pages. 21s.

This book consists of extracts from the official memoranda on the sterling area given to the Radcliffe committee, prefaced by Mr Conan's comments. His main point is that the official figures give an inadequate and unjustly unfavourable picture of the balance between Britain's external liabilities and assets. His own brave attempt to construct the full balance sheet is subject to important reservations, as he himself admits; but it will serve a purpose if it galvanises Whitehall into doing the job itself.

TROPICAL AGRICULTURE. By Gordon Wrigley. *Batsford.* 291 pages. 45s.

With many photographs, diagrams, charts and tables this book, by someone with wide experience of tropical agriculture, will be particularly valuable to—in the words of the preface—" the Ministers and Civil Servants of the newly independent nations with their important responsibilities not only to encourage agricultural production . . . but also to ensure that this is not achieved at the expense of long term fertility." It covers such subjects as crop ecology, crop culture, crop improvement, crop protection, and the place of cattle in tropical agriculture.

BASIL BLACKWELL

Putting down the white carpet

Astern the creaming wake unfolds . . . a seagull peels off against the breeze and glances down the sky. Aboard the great Cunarder, passengers are lunching as they seldom lunched on land. Many more are dotted about in cocktail bars and on the sports deck, while others are lazing, reading, writing in the spacious public rooms and on the sheltered broadwalk of the promenade deck. Tonight, there will be a choice of film première, orchestral concert or dancing, laced with talented cabaret turns. Entertainment to suit every age and every mood. You enjoy the best of *everything* when you go by Cunard.

Consult your local travel agent or CUNARD LINE, Cunard Building, Liverpool, 3 (Liverpool Central 9201); 15 Lower Regent Street, London, S.W.1 (WHitehall 7890); 88 Leadenhall Street, London, E.C.3 (AVEnue 3010).

from Nov. 1st 1961 to Feb. 28th 1962
The chance of a lifetime! This concession allows 21 clear days ashore excluding days of arrival and departure, and applies to all classes.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Test of What?

WASHINGTON, DC

SOME six weeks ago when President Kennedy told the country about the military and civil defence preparations necessitated by the Berlin crisis, he also promised that

> our *response* . . . will not be merely military or negative. It will be more than standing firm. For we do not intend to leave it to others to choose and monopolise the forum and framework of discussion.

Unhappily, the President seems to have promised more than he could perform. His western allies confabulated weekly but could not even agree when and how to start negotiations and their unusual skill in preventing any leakage of their positive proposals for a Berlin settlement merely led the press to conclude that they had none. Mr Khrushchev, on the other hand, seemed perfectly capable of monopolising the initiative and each time he took the Americans by surprise.

Nobody had warned the President that the Russians might indeed seal off east Berlin and when they did he found nobody had made any plans for that contingency. The idea then went around that, as Mr Khrushchev had now staunched the haemorrhage of refugees from east Germany, however brutally, negotiations would become easier and that the heat would be off till the autumn. Whereupon the Russians made the first of their menacing gestures against the air routes into Berlin and heated up the atmosphere some more. Last week they took the allies by surprise again by announcing that they were resuming tests of nuclear weapons, from motives that are still disputed. Some who peer into the future are now casting round for the most unlikely move that the Russians could make next in order to predict it.

The President and his advisers, however, have to interpret Russian intentions from these events. There is an optimistic and a pessimistic view, though the words are relative. The optimists conclude that Mr Khrushchev is moving at least as much from weakness as from strength—that he is "reacting" just as much as the West is accused of doing—but that in his case he is reacting to President Kennedy's firmness, first shown at Vienna and subsequently by the military build-up. It was a success for the West, the optimists suggest, that the position in east Germany was so intolerable that the world was presented with *pictures* of a soldier jumping over the barbed wire to freedom. A still greater western success was that it was the Russians who resumed nuclear tests.

The optimists argue that this must spring from relative nuclear weakness. The Russians have plainly been waiting since March for the Americans to give up hope of negotiating a ban on tests and to surrender to domestic pressure to start testing again, so that the Russians themselves could test without opprobrium the more sophisticated nuclear warheads in which they have lagged behind the Americans for two years. In the end, as the Americans refused to oblige, the Russians decided to absorb the loss on the propaganda front at once and yield to the pressure of their homegrown militarists that their armoury should be brought up to date, before they were faced with the resolutions against renewed testing which were obviously going to emerge from the meeting of neutrals in Belgrade and from the United Nations in September. The Russians have combined attempts to improve their weapons (desirable because nuclear war might happen as the result of miscalculations over Berlin) with an effort to terrify public opinion both in neutral countries and in the North Atlantic Treaty Organisation. The aim is to bring pressure on the western governments to make a deal over west Berlin which at the Communist Party Congress in October could be represented as—and later developed into—total victory for the united communist camp.

The pessimists insist that no such change of front towards neutral opinion could occur without an upheaval in Moscow. They argue that the Russian inferiority in long-range missiles and warheads has been exaggerated, that the Russians have adequate know-how (especially as they may have been carrying out tests underground) for the powerful warheads on which they rely. Their intent this autumn is not merely to terrorise, but to ram terror home by showing that they are prepared to go to nuclear war over Berlin in the confidence that they will "win," that as world opinion has no atom bombs they will ignore it. This school predicts that pressure on the access routes to Berlin will be increased to flashpoint and that, when the West finally does get the Soviet terms, they will contain a Hitlerian choice between submission and destruction. The aim is to break the will of the western allies once and for all, to demonstrate to the world that Russia's nuclear might is the propellant behind the Marxist historical process: either Marxist history or no history at all.

WHICHEVER interpretation proves right, the White House believes that the Russian moves stem from the steady increase in the President's commitment to bargain only from strength over Berlin. The appointment of General Lucius Clay as the President's "presence" in Berlin is only the latest (though not the least irritating) evidence of this commitment. The build-up of conventional forces, though it cannot improve the West's tactical position (and is already being offset by Russian counteraction), is steeling the American public: for example, civil defence enquiries are soaring and advertisements for fallout shelters are appearing regularly.

The opportunity for propaganda presented by the Russian decision to resume tests was seized by the White House first, by pinning down the responsibility for the failure of the Geneva talks; secondly, by announcing that the United States was not resuming tests immediately; and thirdly, by the Anglo-American appeal to the Soviet Union to respect the world-wide fears about the dangers of radioactive fallout and to confine future tests to underground detonations. This move, perhaps the first really imaginative American initiative since July, was aimed at securing neutral goodwill; had the Russians felt forced to accept it, it would have undercut any plans they might have for a campaign of nuclear terrorisation. In American eyes the intemporate refusal of the Russians proved that such terrorisation was at least part of their plan.

But even in Washington the question is being asked why after the third Russian explosion the President felt forced to order the resumption of American testing when he had only just announced that western armaments were "wholly adequate" and even before

September 9th—the date fixed for a final reply from the Russians—and while Mr Nehru was on the way to Moscow. Admittedly Mr Kennedy has tried to retain some neutral goodwill by confining his scientists—for the time being—to explosions in laboratories and underground. However, no new tests now can affect the present military balance, not even those, urgently desired by the service chiefs, of twenty-nine developed but untested weapons.

The real reasons are threefold. First, there was a danger that the Russians, having completed their programme, might offer to end tests quickly and use this "concession" to extract genuine political concessions on Berlin from the West by means of neutral pressure. Second, there was American disillusionment with the whole reaction of the neutrals to the Russian tests—their fear of offending the Soviet Union by outright condemnation and no sign that they appreciated the American restraint. Though this may inhibit any diplomatic use of Mr Nehru at Moscow, it seems likely that the President decided that neutral goodwill was worth less to him than that of his own people and that he wanted to give a clear indication to the Russians that he was as immune to neutral pressure as they were. The Americans felt that the neutrals had shown that they would fall easily for a Russian offer of a new moratorium on tests, would kow-tow to Moscow and would turn against those whose resistance alone permits neutralism to exist. A third reason may well have been a desire to make sure that all existing weapons in the stockpile were ready to fire immediately.

Whether President Kennedy has smirched the picture of a cool poker player which he had built up so long, the next few weeks will show. Presumably the slow process of getting to grips with the Russians diplomatically, so much slower than recent events, will continue. There is certainly need for a strong new American lead irrespective of the allied disarray. The President is finding his three political uncles in Europe far less unflappable under strain than he had the right to expect. He is pushing his timetable, which is to move from the preliminary probes now taking place in Moscow (designed to find out the meaning of Mr Khrushchev's vague offers—and how much authority he has) to a series of substantive talks after the western meeting on September 14th. The Russians are expected to want a full East-West summit—but there might be an intermediate stage with a presidential envoy—perhaps Mr Stevenson or Mr Harriman. All this presumes that reason and restraint are still in control. This is Washington's determined hope.

Responsibility in Detroit

COLLECTIVE bargaining in the motor industry is always a cliff-hanging story, with neither side getting down to serious business until a couple of days before the date set for a strike. This year has been no exception, but with that date now postponed twice—next Monday is the latest deadline—it looks as if it will also be no exception to the rule that in the end there seldom is a strike; there has not been one against all the manufacturers since 1946. Both this year's postponements were the result of appeals from the President and the Secretary of Labour, anxious to avoid the direct personal involvement in a labour dispute which would be inevitable if there were a strike in such an important industry. But it is doubtful if appeals to the "high degree of responsibility" and the "industrial statesmanship" of the executives of the General Motors Corporation, which is the company selected for a strike this year, and the leaders of the United Automobile Workers would have carried much weight this week if an agreement had not been in sight.

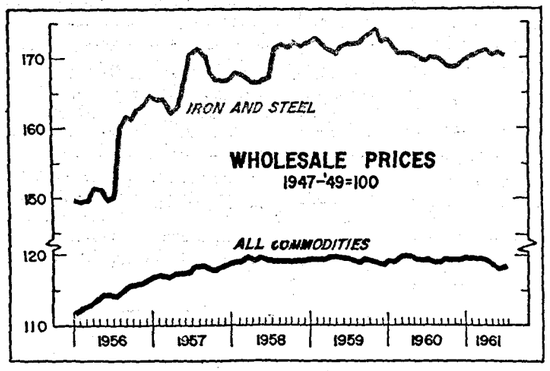
In fact the announcement of the postponement on Wednesday was accompanied by an announcement that agreement had been reached on the monetary aspects of a new contract—which will set a pattern for the other big car companies—although details of such matters as overtime and work rules had not yet been settled. It is presumed that General Motors made some substantial concessions since Mr Reuther, head of the UAW, emerged smiling from the last all-night session. He had declared earlier that his moral responsibility to his 310,000 members at GM would not allow him to accept a "sub-standard" contract from a firm in such a strong financial position. By sub-standard he meant a contract which provided less than the one which he had signed ten days before with the much less well-off American Motors Corporation. If the unconfirmed reports of what he has obtained from GM are true, the company does indeed seem to have come up to the American Motors standard—except as regards profit-sharing which Mr Reuther was not insisting on anyway.

According to these reports GM has improved substantially on the offer which it made two weeks ago. There has been no argument about the wage increase of 6 cents an hour, or 2½ per cent a year, calculated on the basis of estimated annual increases in productivity and therefore non-inflationary. But the company has apparently agreed that adjustments to cover changes in the cost of living should continue to be made quarterly; that workers on short-time should get 65 per cent of their pay for every hour less than forty that they are laid off each week, instead of 50 per cent for every hour less than 36 which was originally offered; and that there should be substantial improvements in unemployment pay, pensions and health benefits. All these are real gains at a time when the automobile workers have been falling below the general level of the affluent society. And with that level about to take another surge upward GM evidently felt that it would be silly to risk a strike which would keep it from selling its new models.

Aid in an Obstacle Race

PRESIDENT KENNEDY fought hard but vainly to persuade Congress to relieve his foreign aid programme from the stringencies of the Appropriation Committee of the House of Representatives. This week's events prove that his evident fear of the programme being mutilated had some foundations. On the day that the Russians announced that they would resume the testing of nuclear weapons, the House appropriations sub-committee on foreign aid, whose chairman is the unsuitably named Mr Passman, recommended scooping another $900 million out of the programme for the current fiscal year. Congress had already reduced the President's foreign aid money by $500 million, but Mr Passman insisted that his additional cut would make "a great day for the taxpayers." Mr Eisenhower said the cut was "incomprehensible, especially in view of present world tensions," and, at the urging of the Republicans, the House of Representatives declined to reduce military aid by as much as Mr Passman wanted, although normally it dislikes to reject the recommendations of its Appropriations Committee and seldom does so.

The appropriations Bill has now gone to the Senate, which is usually generous to foreign aid, and there is hope that the final Bill to be agreed between the two houses, while it will certainly give the President less than he asked for the current fiscal year, may give him more than General Eisenhower got last year. But it is now clearer than ever that authorisation is not appropriation. Moreover, the congressional compromise, under which the President was authorised to lend up to $7.2 billion to less developed countries over a five-year period, is ominously worded. It says that the President's long-range loan commitments will be honoured "unless there is evidence of obvious bad management or the other country has failed to meet its responsibilities." Congressmen have often charged bad management of foreign aid and who knows what a borrowing country's responsibilities might be deemed to include? Also, aid is forbidden to any country unless the President determines that it is not dominated by international communism, and



specifically to Cuba; nor can a loan be used for an enterprise that will compete directly with American business, unless the receiving country agrees to limit that enterprise's exports to the United States to 20 per cent of its output.

These and other conditional clauses were inserted, no doubt, to facilitate the compromise about development loans that the President professed to find "reasonable" and "wholly satisfactory" and Mr Passman, equally no doubt, is only doing his duty as a taxpayers' watchdog. Nevertheless, any Congressman who wants to throw monkey-wrenches into the machinery of foreign aid has several ready to his hand. Is or is not Poland, and perhaps even Jugoslavia, dominated by international communism? How about Marxist teaching in Ghana schools? What enterprise may not be deemed competitive with American business?

Pressed Steel

IF left to itself the steel industry would be on the point of putting up its prices—probably not all across the board but selectively for those products which are in strong demand and for which substitutes are not available. The expected autumn gain in output has come unexpectedly soon and unexpectedly strongly and is unlikely to be checked by anything now that the motor industry has been saved from a strike. On October 1st wages go up by an average of about 8 cents an hour under the settlement which ended the steel strike in January, 1960. This will be the second wage increase under that agreement and there has been no general increase in steel prices for three years.

A few weeks ago spokesmen for the industry were talking quite freely of higher prices but they have become more and more silent as Democratic Senators, the President's economic advisers and finally Mr Kennedy himself have become more and more outspoken about the undesirability of any increase and the lack of justification for it. The government experts calculate that the high levels of activity which are in prospect for some time and the improvements in productivity in the steel mills will together enable the industry to absorb the coming wage increase and still make profits which compare favourably with those earned recently. While the industry contends that these calculations are unsound, it is aware that its comparatively satisfactory profits put it in a weak position not only as regards price increases now but also as regards the fresh set of wage negotiations which are due next year.

The President and his advisers are concerned lest a new round of inflation may be set off by a rise in steel costs, basic to the whole price structure, coming at a time when inflationary forces are already building up as a result of the government's increased spending, the deficit in the Budget and the general upward movement in the economy. But there is in fact little that Mr Kennedy can do, short of imposing direct controls which are hardly possible in peace time, to prevent steel prices going up should the industry's leaders ignore the moral pressure which he is putting on them to their great, if restrained, indignation. Senators, who will certainly start yet another investigation of the industry should there be a price increase, are suggesting that it might be possible for the Federal Trade Commission to prosecute under the 1951 agreement by which the industry undertakes not to act in collusion when changing prices. But the companies will obviously take care not to do that. The only other suggestions are that they might be punished by being broken up into small, more competitive units or by having their prices regulated as are those of public utility companies. But either of these proposals would take years to implement and the inflation would have come and gone long before that.

Schooling the South

LAST week Atlanta set the Deep South an example by becoming its first large city to admit Negroes into its white schools without any display of violence, an accomplishment on which it has been congratulated by the President. Now Galveston and Dallas, both on the fringes of the South, have followed suit and late this week it is hoped that New Orleans will be able to send five more Negro children to four more white schools without any of the disgraceful mob scenes which took place last year when the first four were admitted. Then the white mobs were encouraged by the State Legislature, which met in special session to erect a legal framework which would enable segregation by race to continue in the tax-supported schools.

The keystone of this arch was an Act making it possible for people in individual parishes (as counties are called in Louisiana) to vote to shut their schools rather than comply with orders of the federal courts to mix the races. One tiny rural parish, St Helena's, which is sixty miles from New Orleans, was the first and probably will be the last to try this escape-route. Late last month the Act was declared unconstitutional by a three-judge federal court on the grounds that the device is a "transparent artifice" to deprive Negro children of their constitutional right to attend unsegregated schools and because it involves discrimination by the state, which would be supporting education for children in other parishes. Conceivably it might be constitutional for a state to shut all its schools, but although the court asked the attorney-generals of all the states for an opinion on this matter it did not express any opinion itself.

But the Louisiana judges went further than a federal judge in Prince Edward County, Virginia, another rural area where the tax-supported schools have been shut since 1959 in order to avoid compliance with an order to end the colour bar. Prince Edward's continued defiance—in spite of the fact that it was involved in one of the original cases on which the Supreme Court ruled in 1954—has encouraged segregationists all over the South, yet the judge did not deal specifically with the question of whether the closing of the schools is legal; he preferred to leave this matter, in the first instance, to the State Supreme Court. But he gave the county authorities a hard nut to crack when he ruled that as long as the tax-supported schools are shut the state and local governments cannot help to support a system of private schools for white children. Last year the county and state contributed $300,000 of the $328,151 which these cost. If Prince Edward swallows its pride and reopens the tax-supported schools (in the belief that the only children to attend will be the Negroes who have been deprived of any education) it could continue these contributions, but a dual school system is costly. Otherwise white

zealots will have to shoulder a heavy burden. But by lodging an appeal to a higher court Prince Edward can put off this painful choice though only for a time.

Firms that Run Away

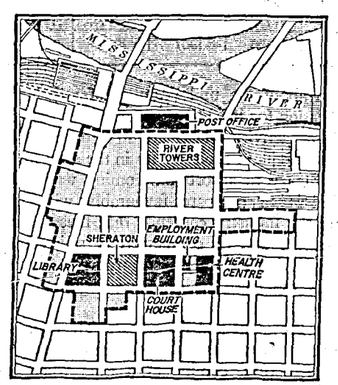
FIRMS that run away from parts of the country where costs are high may have to take their troubles with them if two court decisions are upheld. A number of hard-pressed companies would like to move to areas where wages are low, trade unions are weak and local governments offer attractive concessions. Most of these areas are in the southern and border states, which are desperately anxious for new industries to absorb their unemployed, but the first decision concerned a move of the Glidden Company's Durkee Fine Foods division from Elmhurst, New York, to nearby Bethlehem, Pennsylvania, in 1957. In this case the firm offered new jobs to its workers in Elmhurst, but it refused to recognise their seniority rights in the new plant on the ground that its contract with the trade union had expired. A court of appeals ruled this spring that even so the seniority rights of the workers, who were suing for damages, continued in force and could not be disregarded.

In July, citing this decision, a judge in Detroit held that the Gemmer Corporation, which had decided to move to Lebanon, Tennessee, must offer jobs at its new plant to its old workers, on a basis of seniority. It had refused to do so except for salaried and supervisory staff. In this case, although the contract with the trade union was still in force, it was restricted to operations in Detroit, Michigan. But the judge held that the seniority rights of the workers themselves were not affected. As their average age is 48, they are not likely to find new jobs if their old ones are spirited away. This decision was a blow, not only to the Gemmer Corporation, but also to the taxpayers of Lebanon, who had raised $2.5 million to build the company a fine new plant on the understanding that it would employ local labour. These two cases have encouraged the trade unions, especially the auto-

Twin City Reborn

FROM A CORRESPONDENT IN MINNEAPOLIS

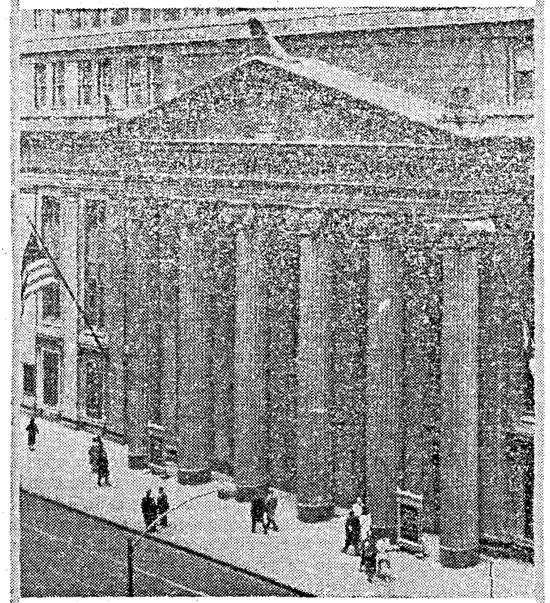
MINNEAPOLIS is a well-favoured city: its residential streets are shaded by lovely elms; its parks are admirable; its boundaries embrace a dozen sparkling lakes. As well as being the industrial hub and regional capital of the Upper Midwest, Minneapolis is its cultural Mecca with its giant University of Minnesota, a symphony orchestra and two art museums. Minneapolis and its smaller twin city, St Paul, lie on either side of the great Mississippi River, at the head of its navigable reaches. The combined metropolitan area contains 1,500,000 people but, although the population of the region is growing, the number of city dwellers is not expected to get much larger.



A few years ago a group of businessmen and civic leaders, watching with dismay as residents and industries fled from the centre to the surrounding suburbs, decided that what was happening in dozens of other American cities was definitely not good enough for Minneapolis. A district along the water front now known as Gateway Centre, where the city began a century ago, had taken on the characteristics of Skid Row and blight was spreading into neighbouring areas. In the commercial heart itself many obsolete buildings had been razed to the ground but the sites remained, like gaps in a mouthful of teeth, unfilled except with parked cars. At the same time, shopping centres were springing up by the score in the suburbs, doing their best to rob the city shops of their trade. One such centre was in fact built, at a cost of $20 million, by the city's largest department store.

To turn the tide, city leaders injected new life into the local planning body. Merchants banded together in a Downtown Council and proceeded to remind residents that the central city possessed hotels, restaurants and entertainment facilities that suburban centres could not hope to rival. Many of the buildings were subjected to a face-lifting operation; they were given new fronts, cleaned of the soot and grime that had hidden them for years and supplied with air-conditioning. New buildings rose on previously vacant plots. Among them was the first skyscraper to go up in Minneapolis since the building boom of thirty years ago. Half-a-dozen multi-storey parking ramps were built to take stationary cars off the streets and the number of open parking lots was reduced. Several of the large hotels announced plans for expansion. Recently, construction was started on a $25 million project which will provide, in a single block, a 17-storey office building, a 13-storey motor hotel and a new parking ramp for 1,000 cars. Public improvements, at a total cost of $18 million, have provided a health centre, a library, a building for the state employment office and a federal courthouse.

THESE public buildings have gone up between the refurbished commercial district and the old Gateway Centre area. In the past, piecemeal efforts had been made to halt the deterioration of this area but they all failed. The construction of a grand new post office and the laying out of a park did not inspire private capital to move in and consultants told the Minneapolis Housing and Redevelopment Authority that only broad-scale clearance and redevelopment would do the job. This is now under way. Seventeen city blocks, once containing cheap taverns and pawnshops and flophouses for down-and-out transients and elderly men living on wine and old-age pensions, are falling to the ground under the wreckers' hammers. The area looks like Frankfurt after its wartime bombings.



The new buildings will start to go up soon for now at last private capital is moving in. Municipal and federal authorities, who between them help to plan and finance such urban renewal schemes, have recently approved a $43 million private project, which will include a new 17-storey Sheraton Hotel, and another $22 million worth of privately-financed construction is under negotiation. The developers hold out the promise of a "city within a city," employing 1,800 hotel, restaurant and shop workers and providing housing for 3,500 people in four high-rent, high-rising blocks of flats overlooking the Mississippi.

The development of the Gateway Centre will mean more than a striking addition of bricks and mortar. Although government agencies will have invested $15 million in the purchase and clearing of blighted land, the taxpayer will receive a sizeable return on his investment; the 17-block area is expected to yield $1,600,000 a year in property taxes compared with only $375,000 before demolition took place.

mobile workers, to apply to the courts to prevent other firms from moving south, particularly from high-cost Michigan.

If firms must take their workers—and their trade unions—with them, or pay heavy damages, the move may not be worth making. How heavy such damages may be was shown just last month when an arbitrator in Philadelphia ordered a run-away manufacturer of blouses to return from South Carolina or pay its trade union and workers damages of $355,000. About half of this was to compensate the union for its prospective loss of dues over the next twenty years. The Glidden Company has asked the Supreme Court to review its case and the Gemmer Corporation is also expected to lodge an appeal. If the Supreme Court upholds these recent decisions the pace of industrialisation in the South, which has been outstripping that in the North, may well slow down. Serious questions will also arise, not only about the ability of officially depressed areas to solve their problems by attracting new industry, but also about industrial mobility in general inside the greatest existing common market.

Pets Galore

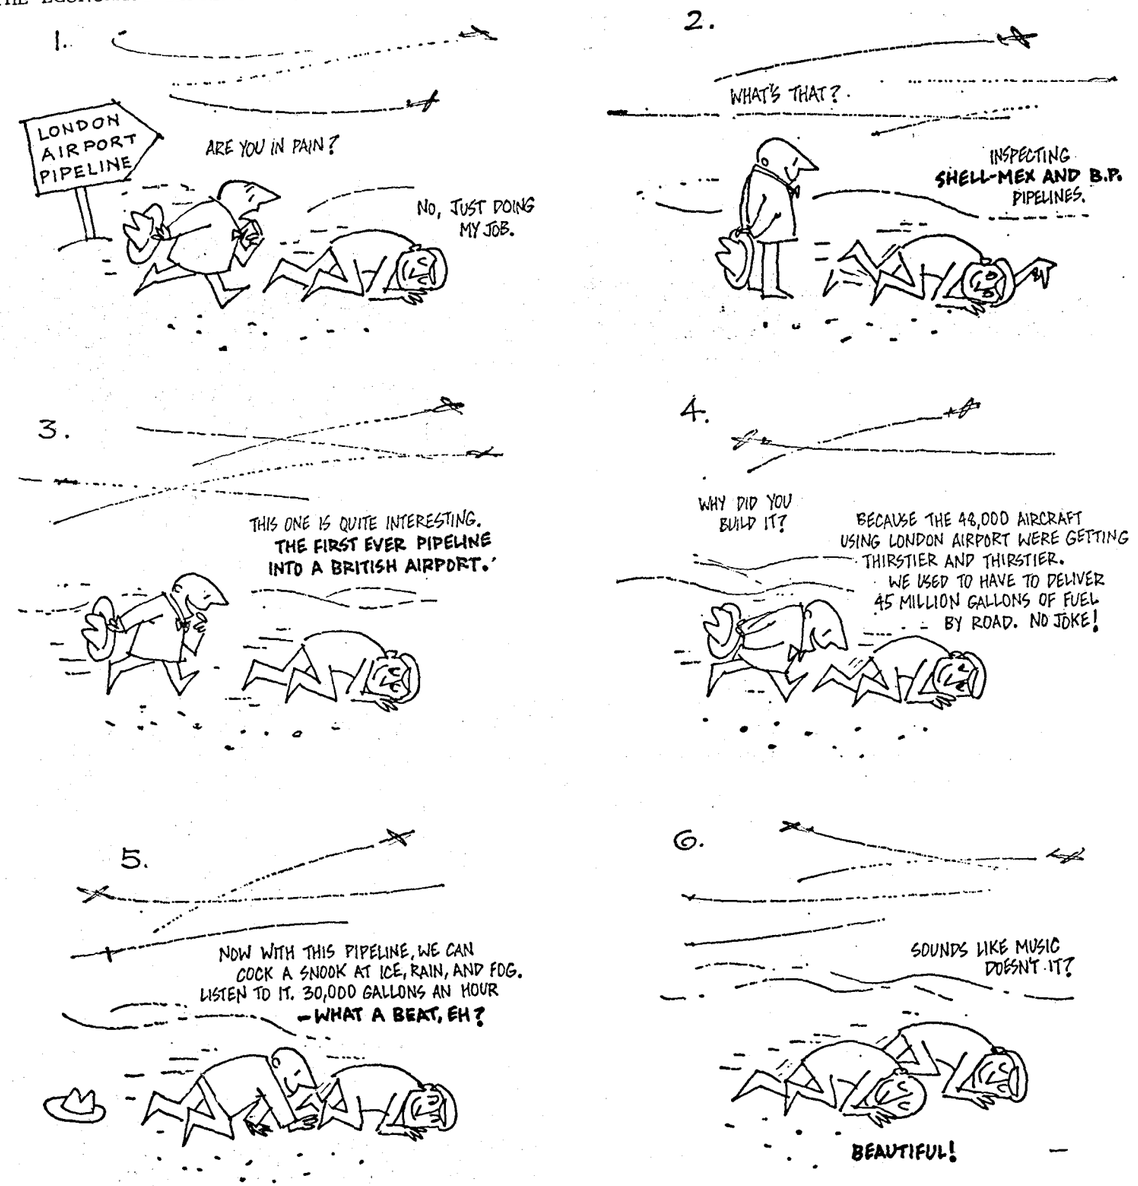
FROM A SPECIAL CORRESPONDENT

DURING the past few years America has taken pets to its heart in a big way. One family in two is reported to have a tame animal, bird, fish or reptile somewhere on the premises and the pet population is indeed increasing by leaps and bounds. It is not unusual nowadays, when visiting a middle-class suburban family, to find a couple of dogs in the garden, a cat curled up asleep in the kitchen, half-a-dozen tropical fish swimming in a plastic tank in Johnny's bedroom, and even a tame and permanently deodorized skunk playing in the garage.

Dogs and cats are still firmly entrenched as the favourites (the Humane Society of the United States claims that there are now 90 million of them in the country) but recently tastes in pets have taken an exotic turn. There are an estimated 22 million parrots, cockatoos, canaries, and other birds singing and screeching in parlours and sun porches across the land and thousands of American homes have apes or monkeys living in them. Recently a chain of supermarkets offered monkeys for sale—housewives could pick one up while doing the weekly food shopping—and some pet shops advertise monkeys "to suit every personality and pocketbook." A number of communities have had to pass laws against owning cobras and rattlesnakes and recently a pet magazine considered it worth while to devote two columns to the selection, care and feeding of a boa constrictor.

The growing popularity of pets has meant, among other things, that there has been an upsurge of business for the purveyors of dog and cat foods and other supplies for livestock, for the owners of pet hospitals and cemeteries and for veterinary surgeons. A number of these are beginning to specialise in their work and there are some who will treat only one breed of animal. Last year owners were reported to have spent over $3 billion on their pets; today pet food outsells baby food and a growing number of drugs and vitamins for domestic animals are being placed on the market.

Should an American dog suffer from halitosis—and one company in the veterinary field claims that 40 per cent of American dogs do, in fact, have bad breath—the owner can obtain a product specially designed to combat this complaint. If he wishes to take the dog on a trip with him, he can consult a 48-page directory listing 6,000 hotels and motels throughout the country which accept guests accompanied by pets. "Reproduction control" products which are now on the market enable him to regulate the number of litters his pet produces and he can eliminate fleas by giving the dog a tablet which is absorbed into its blood stream and poisons the hungry insect. False eyelashes are among the novelty items fo pets which are gaining favour. Glamorous poodles, with coat bootees and jewelled collars, are a fairly common sight on some o the smarter avenues in New York, while plastic raincoats for almo any breed of dog are sold in most pet shops.



The luxury-loving poodle is now the most popular of the 11 breeds in the pedigree dog world of America, having overtaken th beagle last year. And the show business is booming: there wer over 850 officially approved dog shows last year, while a four-da cat fair in Los Angeles, which admittedly was held during Nationa Cat Week, attracted some 108,000 visitors.

Bargain Basement in the Air

IT is an unlucky traveller today who does not qualify, in som fashion, for cut-rates in the air. Since the end of Augus young people betwen the ages of 12 and 22 have been able t fly at half the first-class rate if they are willing to forgo reservation until three hours before flight time. This means, for example that they can fly from New York to Los Angeles for $86 (plu the federal tax) compared with a charge of $171 for first-clas travellers on a jet aircraft and $109 for a coach (economy) flight on a piston-powered aircraft. At the other end of the scal Mohawk Airlines offers a specially cheap "golden age tariff" for grandma and grandpa. Clergymen also qualify for concessions And last month Trans World Airlines led the way—with United and American Airlines following more dubiously—with a coast-to-coast excursion-fare of $198 return on jet aircraft and $175 o piston-powered ones, compared with $277 and $218 respectively. Yet standard fares went up in July for the fifth time since 1958.

All these tempting offers—and there are others such as "fly as you please" plans—represent a desperate effort to fill the growing number of empty seats in the air even if the hair of booking clerks turns grey in the process. Unfortunately for the airlines, the great increase in carrying capacity brought about by the arrival of the jets has coincided with a levelling off in air travel after years during which it was possible to count upon an expansion of about 10 per cent in the traffic every twelve months. (Seats in transatlantic aircraft are going begging as well as ones on domestic routes, but it has not been possible to reach agreement with foreign airlines to try to expand the market by cutting fares.) Capacity is expected to go on growing; so are the already heavy interest charges on money borrowed to pay for new aircraft. A secondary source of distress for the airlines is the increasing preference of travellers for economy flights. In 1955 these accounted for only 35 per cent of the total traffic; now they account for at least 54 per cent. This may be partly due to the recession and hence may be curable, but it also seems true that luxury and space are sought less eagerly on a short jet journey than they were when flights took longer.

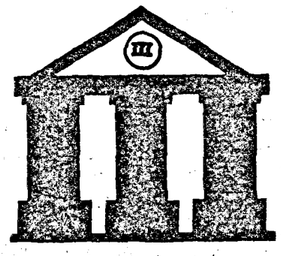
The domestic air carriers lost at least $15 million in the first six months of this year; in 1960 they earned only $1.2 million—the worst record since catastrophic 1948. The industry as a whole earned only about 3 per cent on its investment. But there is more agreement on the problem than on its cure. American Airlines, for example, disagrees both with TWA and with the Civil Aeronautics Board over the likelihood of the coast-to-coast excursion rate bringing in enough really new business to make it worth while. It has more faith in the reductions for young people because, although those in this age group constitute 15 per cent of the population, they provide only about 3 per cent of American's passengers. In any case, all these schemes are purely experimental; if they do not work they will be abandoned. But if none of them work, or do not work well enough, a big wave of mergers, to reduce excessive competition, may become unavoidable.

Three facts worth remembering: (1) Shell-Mex and B.P. built the first ever pipeline into a British airport. (2) With the new pipeline, which can deliver fuel at the rate of 30,000 gallons per hour, Shell-Mex and B.P. Ltd are uniquely equipped to handle every possible demand for aviation fuel at London airport. (3) The Shell-Mex and B.P. Ltd pipeline helps to relieve traffic congestion on the roads to and from the Airport.

SHELL-MEX AND B.P. LTD — BUILD THE FIRST PIPELINE INTO A BRITISH AIRPORT

Three ways to better banking

I



The Bank must offer a comprehensive service to its customers, whether private individuals or big business, and be large enough to satisfy the needs of commerce and industry on any scale.

II

The Bank must have sufficient branches in the U.K., together with facilities overseas so that customers can be provided for when on holiday or away on business.

III

The Bank must offer local knowledge and expertise, and preserve its standard of personal service in the time-honoured Family Banker tradition.

THE THREE BANKS GROUP

If you have business in Britain they would be pleased to place at your disposal their wide experience of International Banking and Commerce.

GLYN, MILLS & CO.	THE ROYAL BANK OF SCOTLAND	WILLIAMS DEACON'S BANK LIMITED
HEAD OFFICE: 67 LOMBARD STREET LONDON, E.C.3	HEAD OFFICE: ST. ANDREW SQUARE EDINBURGH, 2	HEAD OFFICE: MOSLEY STREET MANCHESTER, 2

UNITED STATES REPRESENTATIVE: 63 WALL STREET, NEW YORK

THE BUSINESS WORLD

Calling the Turn

A correspondent describes some new rules for the old game of cycle spotting

EVER since 1920, the National Bureau of Economic Research in New York has put much of its great intellectual resources into collecting and analysing statistics of American business cycles. The tradition, begun by Wesley Mitchell in the twenties and joined by Arthur Burns in the thirties and forties, has been led in the fifties by Geoffrey Moore; and business cycle analysis has taken a big leap forward in the United States during the last few years. The increasing need for expert economic guidance has led successive administrations to take a positive and active interest in this work. At the same time, the electronic computer has made possible sophisticated and up-to-date statistical analysis, so that the indicators can be put to practical current use.

To be ahead of his clients, the economic analyst needs two things—apart from a cool head and a quick eye. First, he must have up-to-date information. Second, the raw statistics must be processed and set against the historical background. These requirements need a certain apparatus. This is provided in the United States by an interesting collaboration between the Government machine and the National Bureau which is outlined in a new collection of papers edited by Mr Moore* summing up the present state of this art and science of watching the cycle and calling the turn.

By the 20th of each month, the Department of Commerce produces for the use of the Administration a report incorporating the latest data for over 300 statistical series, organised in accordance with the National Bureau's analytical system. It is mouth-watering to find that by July 20th, for example, seasonally adjusted figures are available for June (some, of course, provisional) for industrial production, new orders and, indeed, nearly all the principal monthly indicators. This programme depends partly on the prompt supply of figures by industrial firms, partly on the use of electronic computers for their rapid and complex processing.

Throughout its history, the National Bureau's method has been to collect and tabulate statistics, patiently and omnivorously: generalisation is expected to come from observation rather than from theory. The regularities of cyclical behaviour, although far from perfect, justify the bureau's underlying assumption that the business cycle can usefully be treated in the same way as the meteorologist treats a weather pattern. But economic history is essentially an account of human behaviour, which is probably more subject to unpredictable changes than the weather, and the range of business cycle history is much more restricted. The National Bureau's historical data comprise some 26 cyclical peaks and troughs (including 1958-61) which it has been able to detect in the American statistical records from 1854. Each peak and trough is dated to a month—an arbitrary procedure, but necessary for precision in statistical analysis. The cycles have varied in length from eight years to 17 months; in intensity, taking the declines in output during recessions, they vary from fluctuations that could be detected only by a statistical geiger-counter to the vicious drops of 25-30 per cent experienced in 1907-8, 1920-21, 1929-31 and 1937-38.

FROM such diversity, simple accounts of what a business cycle is can hardly be expected. Yet some generalisations seem justified. It has been found, although there are exceptions, that periods of decline are rather shorter than periods of expansion; that an expansion period consists first of a fairly rapid upturn—lasting around six months after the trough—then slows down; that the rate of recovery is quicker after a severe contraction than after a mild one; that a steep decline in the first months after a peak has been passed presages a severe contraction. There is a suggestion, but no more, that cycles are getting shorter.

Perhaps the most intriguing of the National Bureau's techniques is the use of "leading indicators." The records show that certain statistical series tend to change direction in business cycles well before the rest. Ten of these are used by the bureau, and the table shows how they have performed as advance signals of turning points in business activity as a whole. Charts demonstrating the past performance of the leading indicators, showing their turning points several months before output turns, look pretty convincing. But when the forecaster is searching the incomplete current record for signals of an approaching turning point, he is almost bound to find the indicators emitting oracular ambiguities. Some of the snags are indicated in the table. Consider the first

* Business Cycle Indicators. Edited by Geoffrey H. Moore. Published by Princeton University Press 1961 for the National Bureau of Economic Research (to be published in the United Kingdom by Oxford University Press). Vol. I: xxxv+757 pp., $12.50. Vol. II: xvii+179 pp., $4.50. The set $15.00.

two columns, which show what proportion of possible general peaks and troughs each indicator has forecast. As this shows, the two indicators of labour turnover—the rates of accessions (hirings), and of lay-offs (firings)—score highest. These indicators also make a fair showing in the third column, which gives the number of false signals they made—" private cycles " that did not turn out to be reflected in business as a whole. The average lead-time they offer, especially in predicting downturns, is long. On the other hand, these labour turnover indices show considerable ups and downs from month to month which are unrelated to business cycles ; the last column shows that both series call for at least three months' data to confirm that a change in direction has occurred. Moreover, the latest figures in both series run a month behind most of the other leading indicators.

Four other series—new orders for durables, housing starts, liabilities in business failures and security prices—are all fairly efficient at signalling turns in advance. But housing starts suffer from an excess of " private cycles " ; and liabilities in business failures are subject to wide monthly fluctuations, so that a six months' run of data is needed to identify a genuine turning point. New orders for durables (which need a three months' run of data) come out well. In the end, security prices serve as the best single indicator. In 21 cycles, they have successfully forecast 16 peaks and 15 troughs, with an average lead of about six months. They can be followed from the press and are always up-to-date (two months' data are needed) ; they require no seasonal adjustment. Yet even security prices have failed to lead a quarter of the turning points (they missed the 1957 downturn until it happened, the first failure since 1929) and they have had their irrelevant " private cycles." They have also been subject since the war to a fairly consistent upward trend ; so their warning signal for recession, for instance in 1959-60, can be a levelling-off rather than a marked fall.

IT is thus for good reasons that the National Bureau gives strong warnings against using any indicator alone, and regards a combined index of the leading indicators as more trustworthy. But there is a penalty, too, for caution. For instance, the recovery at the beginning of 1961 was not clearly foreshadowed. The latest data available in mid-January—the month before industrial production can now be seen to have reached bottom—showed the combined index of leading indicators still falling ; only security prices, which had been rising consistently since October 1960, and the lay-off rate were giving clear signals of an approaching recovery. It would have been reasonable enough—and platitudinous—to predict recovery within a few months. But to predict it as soon as February would have been art rather than science.

Much discussion among analysts recently has concerned the use of " diffusion indices." These are another kind of leading indicator and the theory behind them is simple and plausible. Turning points do not affect all industries at once. A recovery (or a recession) begins first at a few points and gradually spreads. Thus well before the index of production as a whole turns, production in a steadily increasing proportion of individual industries should have turned. The theory is applied by computing the proportion of the components of a total index which are moving up (or down). Essentially, this is the principle adopted in the " business-test " inquiries initiated by the IFO-Institute in Munich and conducted by the FBI in Britain. But there are, again, considerable uncertainties in interpreting such diffusion indices, and they require heavy computing. The results tend to be erratic. At present, the diffusion indices do not seem to give clear warning signals much before turning points. But they are being regularly compiled and patiently analysed and will no doubt find their place in the analyst's tool-kit.

PERFORMANCE OF LEADING INDICATORS

These leading indicators are the National Bureau's 1960 list. The performance records shown cover 17–20 cyclical turning points (i.e., since about 1920) for numbers 1–7 and 41–48 turning points (i.e., since before 1900) for numbers 8–10.

	Percentage of turning points led		Number of peaks and troughs in "private cycles"(1)	Mean lead in months		Months for cyclical dominance(2)
	Peaks	Troughs		Peaks	Troughs	
1. Average weekly hours in manufacturing	75	55	2	7	3	2
2. Accession rate in manufacturing	100	80	2	15	6	3
3. Lay-off rate in manufacturing	100	90	4	11	5	3
4. New orders received for durables	75	75	2	11	3	3
5. Housing starts	70	70	6	12	5	3
6. Commercial and industrial building contracts	67	50	4	11	1	5
7. Prices of industrial materials	75	40	2	9	1	2
8. New business incorporations	60	75	13	5	4	3
9. Liabilities of business failures.....	70	75	2	12	7	6
10. Index of security prices	75	70	6	5	6	2

(1) Specific cycles in each indicator which turned out to be irrelevant to general business cycles. (2) Number of monthly observations needed to establish a turning point. A large number denotes large irregular fluctuations.

What can historical analogy tell us about the probable course of the present American expansion? First, the expansion came after a fairly gentle and short decline—probably the shortest and shallowest of the four post-war recessions. Precedent thus argues for a fairly slow expansion. The National Bureau's records do not tell us much about the probable duration of the expansion. However, the post-war cyclical pattern, both in duration and amplitude, has been somewhat more uniform than before. The expansion periods have been 37 months (1945-48), 45 months (1949-53), 35 months (1954-57) and 25 months (1958-60). The shortest expansion on record since 1920 was 21 months. Those who are willing to trust historical analogy may feel it unnecessary to do more than glance at the leading indicators before early next year, and their faith may be shaken if the next turning point comes before the end of 1962.

ARE the National Bureau's techniques applicable to the forecasting of short-term economic change in Britain ? Certainly the British post-war economy has been subject to business cycles of a kind: with industrial production peaks in early 1951, late 1955 and mid-1960 and with troughs in mid-1952, mid-1956 and (perhaps) early 1961. There are two important differences from American experience. British recessions have been much milder ; the index of production has only once fallen significantly (in 1951-52). This makes the " troughs " extremely difficult to identify. And the timing of turning points has been determined less by natural reactions of

business and consumers than by sharp changes of Government policy and external events. Who can say how long the boom of 1955 would have continued if it had not first been stimulated by Mr Butler's spring budget and then suppressed by the measures taken in the autumn ? Would recovery have come at the end of 1956—there were faint signs of it—had not Suez intervened? Or at the end of 1957, had it not been for Mr Thorneycroft's measures ? When would the rapid expansion at last set off by Government action in autumn 1958 have come to an end, if the Government had not braked it in the spring of 1960?

So far, British Governments have never felt secure enough to let economic forces take their own course. Nor have they been able to resist the temptation to give the business cycle an upward push when it seemed safe to do so. The economic analyst, consequently, has necessarily tended to concentrate attention on the dominating tendencies of the balance of payments, with a weather eye always directed at the probable reactions of the Government. Government actions are subject to rational analysis, but not—at least, not yet—to the precise statistical analysis that can be applied to the aggregate behaviour of a multitude of businessmen.

For British conditions, probably more interest lies at present in analysing closely some of the more important and faster moving components of the economy than in a system like that of the National Bureau. The recent assessment by the National Institute of Economic and Social Research of its own short-term forecasts (described in *The Economist* of June 3, 1961, on page 1032) exhibited a number of mistakes; but these were not so much mistakes about the timing or direction of changes as about the strength of the forces operating on the economy. For assessing the prospects both for demand and for policy, much more needs to be known of the specific forces which govern short-term changes in both sides of the balance of payments, in wages and prices, in consumer demand for durable goods, in industrial purchasing practices, and in industrial production and employment policies. How quickly, for example, do managements react to different kinds of changes in demand by changing production schedules, employment and buying? The answer determines not only employment and stock levels, but also, very largely, costs and profits. Such questions are not ignored by American analysts. But there is every opportunity in Britain for original and valuable research from a somewhat different approach.

BUSINESS NOTES

STERLING

If Funds Flock Back

STERLING was in strong demand on the first three days of this week, and the rate rose smartly from $2.80\frac{9}{16}$ to $2.81\frac{3}{16}$, its highest this year. The rate fell back a little on Thursday but buying continued at the lower level. Monday's announcement of the August gold figures, showing a net rise in the reserves of £40-£50 million *ex* official transactions, gave formal confirmation to those who needed it that the tide had turned, and this induced a momentary return of optimism to the London stock markets and a widening of confidence in sterling. In the exchange markets, however, these figures were not the predominant influence of the week. The clue to the heavy buying of sterling from France and Germany lies in the date. It is exactly six months since Germany and Holland revalued their currencies and gave sterling what may have been the worst week in its history.

Among the speculative transactions then undertaken were heavy forward sales of sterling short—sometimes for six months ahead and more often for three months, these in turn often being renewed in June. This week operators have had to meet their commitments by buying sterling at a far higher price than that at which they have contracted to deliver it, and the Bank of England has sensibly seen no reason to minimise this loss by checking the rise in the rate. There have also been considerable purchases for commercial transactions, some of which had also been delayed on speculative grounds.

But it seems, too, that money is now beginning to flow to London for short-term investment. Investment dealers abroad have begun to point out the attractions of interest rates at 6½ per cent plus available in London ; and while the differential over other centres is still broadly offset by the cost of forward exchange cover, many operators are likely to feel that there are bigger risks awaiting them than a devaluation of sterling in the next three months. The flow of foreign money to London is not yet large. It has had little apparent effect on the local authority mortgage market this week, where rates have actually hardened a little, bringing seven-day money to 7½ per cent at one time on Tuesday. But the inflow may be about to gather momentum. If it does, the London authorities may declare themselves embarrassed. They have no wish to draw in any large new volume of short-term funds, least of all from the United States. At the same time they will not want to be rushed into a premature first reduction in Bank rate, which would be read at home as a sign that the economic troubles were over. The Bank of England has in fact been keeping the discount market on a significantly tight rein in the last week or two.

There is an easy way out of this supposed dilemma. If the foreign funds do come flocking back, Britain can simply use them to repay, *pari passu*, advance instalments of the credit from the International Monetary Fund. This would avoid any embarrassment to the United States and would give an encouraging demonstration to the conservative Europeans of the use of short-term international credit. The modest net cost in interest involved in incurring new obligations at market rates and prepaying artificially cheap official credits would be well worth while.

One uncertain element in the prospect is the international political situation. The effect of a modern war on investment and finance remains incalculable, which is not surprising when its effect on much more important things is itself incalculable. Some financial operators, like some political and diplomatic operators, still regard a war threat as a war threat, demanding a conventional reaction—go liquid, sell sterling, buy gold. But others in the last few weeks have taken a more realistic modern view, which is bluntly that the right reaction to an unforeseeable consequence is nil. Admittedly, gold has been in demand—private buying has continued in London this week, and the only central banking activity has been selling by the Bank of England to keep the price in check, at around $35.20. But, remarkably through this period of international crisis, sterling has been bought. Moods can change quickly; but at present some people evidently feel that the external political threat is simply too big to be taken into account.

The Basle Holdings

THE reserves rose in August from £876 million to a comfortable £1,245 million, a figure surpassed only at the height of the Korean boom. The rise of £369 million was an artificial result of a complex of official transactions. Britain's drawing on the International Monetary Fund brought in the equivalent of £518 million (leaving £17 million or so to be drawn this month, aside from the stand-by facility of £178 million which is likely to be left undrawn). But "some £200 million" of the IMF credit was immediately used to repay Continental central banks, thus discharging "the greater part" of liabilities accumulated under the Basle arrangements in earlier months. These repayments have played havoc with reserve figures all round, being responsible for the fall of $150 million in the United States gold stock last week, as Continental countries converted repaid dollar credits into gold, but in other cases deflating their holdings of foreign exchange.

The two smaller official transactions affecting Britain's figures were a payment of £10 million on old debts incurred under the European Payments Union, and receipt of £27 million from the advance repayment by France of all its own remaining EPU debts. But France used some funds already accumulated in London for this repayment, and its purchases of sterling during August were significantly less than £27 million. If these are put at £10-20 million, the net rise in the reserves excluding official transactions was £40-50 million. This happens to be almost exactly the same as the net rise in the month following Mr Thorneycroft's 7 per cent Bank rate in 1957.

The intriguing question that remains is what will now happen to the lesser part of the Basle credits. These may possibly total £100 million, though no estimate is very meaningful. For there is now no hard and fast distinction between the remainder of the credits granted by Continental central banks after the March meeting in Basle and funds they keep in London in the normal course of business. At the end of 1960 official holdings of sterling in Western Europe were already as high as £236 million. The course of these holdings in coming months will be determined by normal banking and commercial considerations, in which the high level of London interest rates will presumably be significant, as it was in 1960.

INTERNATIONAL FINANCE

The Jacobsson Plan

THE main issue before this year's annual meeting of the International Monetary Fund which opens in Vienna on September 18th is the plan to supplement the Fund's resources by arranging potential lines of credit from creditor countries; and, as usually happens, it is the creditors who have to be won over. Today this means not the United States but Continental Europe, and notably the Six. Their finance ministers and central banking chiefs met at Bad Godesberg on Tuesday to consider their attitude. They came nearer to a common position, but differences in approach remain. On the conservative wing, the French, and also the Belgians and Dutch, prefer not to commit themselves to specific sums that could be called in credits to the Fund, and maintain that creditors should have a right of veto. The Germans and Italians recommend set figures and are content to leave decisions on the calling of credits in the hands of the Fund.

But the Six did approve in general terms the plan that has been drawn up by Dr Jacobsson, managing director of the Fund, which follows the principles of the Bernstein plan but fits it into the framework of the existing articles. This approval in principle by the Six could turn out to be more significant than their remaining reservations. Thus Dr Jacobsson is likely to point out that the dispute over a right of veto is somewhat unreal, for two reasons. In the first place, no stabilisation credit can be launched in practice without the willing consent of the participating creditors. Secondly, Fund decisions are themselves taken by the Executive Directors who are in turn responsible to national governments. Dr Jacobsson, who has been passing through London this week, went on to Paris; and he at least is not pessimistic.

AIRCRAFT INDUSTRY

Farnborough Clouds

THE clouds that hung over the Farnborough air show this week were not wholly due to the weather; there is bound to be a sense of anti-climax about any exhibition staged with such pomp for so little ostensible result. To gibe at the industry because it has nothing new to show is unfair and unrealistic; when aircraft and missiles take so long to develop, an aircraft industry the size of the British cannot produce fresh designs every year—indeed it has no business to try. But the organisers will have to make up their minds whether to retain Farnborough as a serious trade shop window, which it used to be—in which case an annual exhibition can no longer be justified, when it has to be padded out with service displays using aircraft of no conceivable interest to visiting technicians—or whether to treat it as a mammoth exercise in public relations and concentrate instead on providing a circus for the days when the public is admitted, as to an increasing extent they seem to do. If anything were needed to damp the industry's spirits, it was the knowledge that after months of consideration, Trans-World Airlines had taken the plunge by ordering 20 French-built Caravelle airliners with an option on a further 15. TWA will be the second major American airline to opt for Caravelles and was one of the last big customers still shopping for a medium-range aircraft. One remark frequently repeated during the show was that every project, from Blue Streak to vertical take-off, marks time while the Ministry of Aviation conducts interminable negotiations with potential foreign collaborators who would the industry argues, be more impressed if they saw some evidence that the British government had sufficient confidence in the ideas it was selling to back them to the hilt at home. And indeed it would be wrong to think that this country has nothing to sell or to teach. There was a notable quickening of foreign interest during demonstrations of the Handley Page research aircraft. This machine may not impress the public very much, but it is designed to test the take-off and landing behaviour of a hypothetical supersonic airliner. Observers appalled at the searing speed with which this tiny research machine landed wondered how a full-sized 200 ton airliner could be expected to behave.

Battle Royal

THERE is still one field of aviation in which Britain leads the world—no other country has anything to compare with the two workable vertical take-off engines that are now out of the laboratory and looking at Farnborough for buyers. This, it is only too plain, is a source of embarrassment to the Government which hardly knows what to do with either of them and is caught in the cross fire of a battle royal between the two warring companies that build the engines, Rolls-Royce and the relative newcomer, Bristol-Siddeley.

Vertical take-off means heavy engines, since there must be enough power to lift the full weight of the machine off the ground unaided without the help from aerodynamic lift that comes into play when a normal aircraft accelerates down a runway. Heavy engines mean shorter range or less payload, but the penalty is kept to the minimum, so Rolls-Royce argued, by using a battery of lightweight engines solely for lifting and other normal engines for propulsion. As the lifting engines would never run for long, they could be specially tailored for the role, and the current Rolls-Royce designs are capable of raising 16 times their own weight. This is the most proven system of vertical take-off in the world and as demonstrated in the Short SC1 research aircraft is most impressive, as was obvious when it was first shown outside this country at the Paris air show a few months ago.

It seems, however, to have no future in this country because the RAF dislikes the idea of any front-line machine using large numbers of engines, with the risk of multiplying the opportunity for technical faults. The RAF, therefore, has given its backing to Bristol Siddeley's single-engine system where swivelling ducts are attached to each corner of a central power plant: these give a downward blasting jet at take-off and gradually swing to the horizontal as the aircraft gathers height and speed. The company seems to have made a tactical mistake in not demonstrating this engine in flight at Farnborough. Meanwhile the Ministry is very properly seeking French and German collaboration before designing a strike fighter (*nom de guerre* for a light bomber) around this engine. But what now is it to do with Rolls-Royce? The Rolls-Royce system has apparently no future in this country, yet it works outstandingly well and appeals to some foreign designers, including the brilliant French company Dassault, more than does the Bristol-Siddeley system. Ought the Ministry of Aviation continue to support Rolls-Royce in the hope that the company will eventually find a market that for the moment does not appear to exist? It has done this before with projects like the Rotodyne and lived to regret it. This dilemma, which was visible a year ago, has now become acute and is aggravated by doubts that vertical take-off aircraft of any kind may yet prove too expensive for the country's strained budget. Off-the-cuff guesses by foreign engineers put the price of an effective vertical take-off machine at considerably more than £1 million apiece; even if this is wide of the mark the bill is bound to be higher than that for an equivalent normally-propelled machine.

TIN

Shake-Out

SPECULATIVE buying on the prospect of a shortage of tin exhausted the buffer stock of the International Tin Council by the end of June, shattered the buffer stock manager's "ceiling" price of £880 per ton and forced the cash price up to £994 at the end of last week. The council then canvassed the possibility of releasing tin from the United States stockpile; it has been almost embarrassingly successful, for the stockpile appears to be ready to dispose of as much as 50,000 tons.

The timing, prices and quantities of these sales are not yet clear; the General Services Administration promises that releases will be made "from time to time, in small quantities, on an orderly basis and with due regard to producer and consumer interests." The difficulty for the stockpile and for Congress is to reconcile the interests of consumers in a low price and the interests of such a producer as Bolivia in a high one. The impact of stockpile sales is practically impossible to predict. Wednesday's news brought the cash price of tin on the London Metal Exchange down by £37½ to £935½ and the three months forward price by £30 to £949½ per ton. This was immediately reflected in sharp falls in tin shares, with Tronoh falling by 7s. 9d. to 67s. 6d. With the speculators winded at least temporarily, the market was more orderly on Thursday and on the more sober reflection that the stockpile would aim at securing a good price, cash tin recovered to £956½ and three months forward tin to £966½. The shake-out is salutory. The council is considering the possibilities of raising its floor and ceiling prices and the United States recently indicated that it was prepared to discuss terms on which it might join the International Tin Agreement. Co-operation between the council and the United States, not least on the disposal of the stockpile tin, should promote a less volatile market.

MACHINE TOOLS

Working to Order

SO often in the pillory for slowness in increasing output or exports at times of pressure, the machine tool industry should earn a compliment or two on the latest figures of its performance, especially from the Chancellor. Home orders have fallen this year reflecting the now widespread easing of new demand for capital equipment, though the drop of 17 per cent can be put down partly to heavy ordering of new machine tools by the motor industry in the spring of last year. Meanwhile export orders have been rising almost as sharply as home orders have dropped.

This change in the pattern of ordering has been accompanied by a considerable increase in output. Up to June production so far this year was a third higher in value than in the corresponding months of 1960. Although the industry's total order book has continued to mount, from £105.7 million last December to £113.7 million in June, delivery dates have in consequence tended to shorten. In terms of months' output at current rates of activity, the amount of work represented by outstanding orders has dropped from the equivalent of 12⅔ months to 11¼ months. This has helped to sharpen the industry's competitiveness in export markets.

OVERSEAS DEVELOPMENT

Tense, but No Ill Feeling

THE distinguished practitioners of world development who conferred together at New College, Oxford, last week were mostly rather self-conscious about the Tensions in

PROFITS AND DIVIDENDS

Lower Returns

COMPANY reports in July and August, analysed in the customary way in this office, show a number of interesting features in both profits and dividends. The figures as a whole relate to a notional accounting year that ended about March 31st and so reflect only to a limited degree the further pressure on profits evident through the summer. The profits shown were earned long before, and many of the dividends declared some time before, the Chancellor made his request for dividend restraint. The net ordinary dividend payments of these companies were higher but, as the increase in profits tax cut down equity earnings, the cover on these dividends fell. As industrial profits are more likely to fall than to rise in the coming months, company directors will see the need for restraint; the Chancellor is preaching to a receptive audience.

The rise in trading profits reported in August was in line with the increase in the second quarter of this year, though the rise reported in July was slightly higher. An increase in depreciation provisions and in loan interest, reflecting the installation of new plant and equipment, put a brake on the advance in profits before tax and the increase in taxation was sufficiently big to leave net equity earnings only slightly higher. As more capital has been invested to earn these profits, the rates of return on net assets employed have continued to fall—in both months by about one per cent. The accumulating evidence of this decline is one of the reasons why, despite some recent (but not universal) increases in dividends, ordinary shares have been in the doldrums and are likely to remain so in coming months.

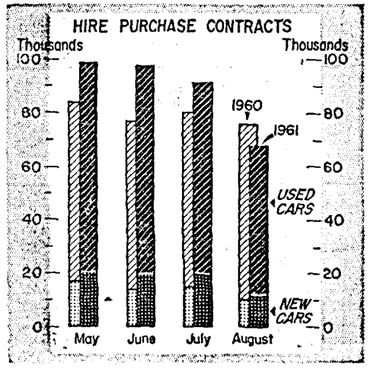
* After deducting non-recurring credits.

Development they were supposed to be conferring on—under the auspices of the Council on World Tensions, Inc. (formerly: World Brotherhood) and the Overseas Development Institute, of London. It had not been made plain, after all, whether tensions were bad or good ; certainly it emerged very quickly that they were an inseparable part of economic development. Yet despite the woolliness of the theme, and an excess of organised activity, most of the participants felt that the week snatched out of an overcrowded working life was worth while. These men who are responsible for planning and carrying through the programmes of economic development have far less occasion than the politicians for meeting their opposite numbers in other countries and their contacts in international agencies ; and the legendary exchange of views does them good.

This conference on tensions was, indisputably, a conference of goodwill: it happened that some notable representatives of extreme wings of thought, of the Ghana-Guinea school on the one hand and of orthodox French finance on the other, failed to turn up. Even so, the conference brought out the continuing, and to many westerners still surprising, force of anti-colonial feeling among Africans. Significantly, however, this applied very little to India, which has now reached a maturity and a poise of its own in the development process. There is much less emphasis on the forms of aid that are deemed to be philosophically acceptable ; the great contribution made by the western aid consortium is generally recognised, and the surveillance exercised by that group is to some extent actually welcomed by Indian planners in that it gives their schemes a stronger weight in the political arena.



Seen in its wider context, the striking fact about Indian development is the head start given by the existing framework of administration and education. These, everyone is now agreed, are the top priorities for Africa, where India itself has an important part to play in helping to provide them. Some observers contend that no real progress will be possible without creation of an international administrative service capable of offering long term contracts and of taking a firm grip on the work at present inadequately done by a score of unco-ordinated and in part competing agencies. The prompt reaction of the Overseas Development Institute itself to the Oxford Conference has been to decide to press ahead at once, by influence, advice and action, towards these practical goals.

SPENDING AND BORROWING

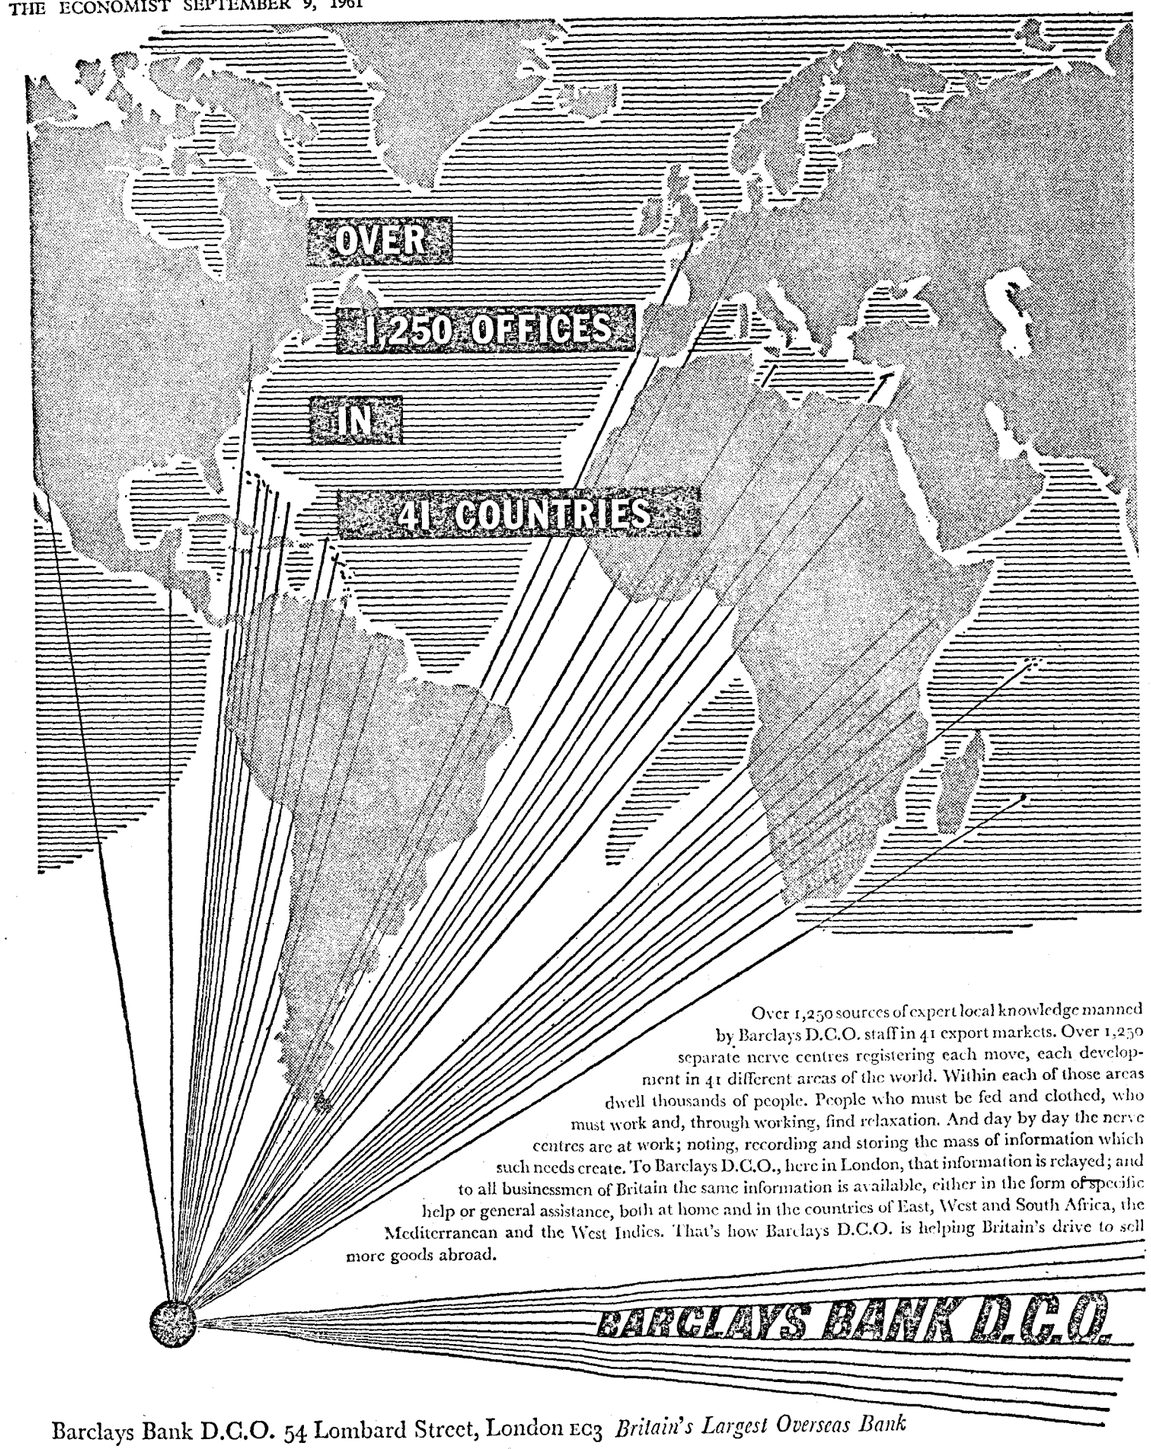
August Backwash

SHOPPERS did not go quite so gay in July as had been first thought. According to the Board of Trade's final estimate, retail sales, seasonally adjusted, rose 3 per cent above the June level instead of the 4 or 5 per cent which the first shot at the figure had suggested. However, it still left July the retailers' best month ever.

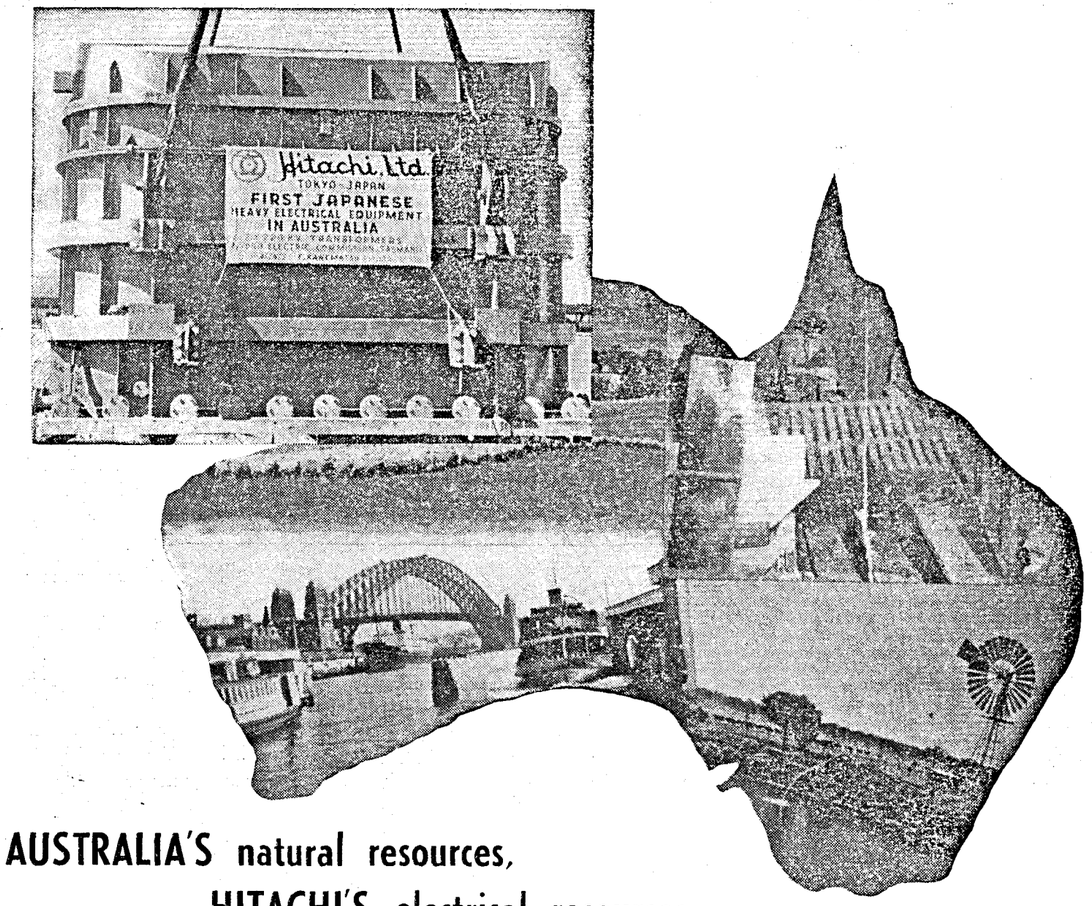
Not all of the 3 per cent rise can be accounted for by anticipatory buying before the Chancellor put up prices. Food sales, which had fallen in June, were back to the high level of May, and their recovery alone pushed up the total index of sales by one per cent. Admittedly off-licences are grouped with food shops, but the 12 per cent increase in their sales over July 1960 does not suggest a big sudden rush to stock up in view of the fact that these sales were already running 8 per cent above last year in the second quarter. Sales by durable goods shops rose to an all-time peak, 9 per cent above their level in the second quarter and 3 per cent above their previous peak in April 1960, after allowing for seasonal factors. Department stores and other general stores also did particularly well. But clothing shops had no benefit from the spending spree ; their trade was still below that in the first quarter of the year.

Naturally credit business also had an artificial stimulus in July. Hire purchase sales of household goods shops were nearly one-fifth higher in July than in June—just about in line with the rise in total business of these shops. Outstanding hire purchase debt rose by a further £11 million to £968 million, passing the previous peak for July, 1960. But for August, always a slack month, the prompt figures collated by Hire Purchase Information, show a substantial fall. Hire purchase sales of new cars fell from some 20,000 to 12,200 and used cars from 70,500 to 55,700. Contracts for new cars were still 1,800 above the figure for August, 1960, but used cars were nearly 10,000 down on the year ; and for the first time since April total car contracts were below those for the same month of 1960, when the April restrictions on hire purchase were followed by a sharp decline in activity.

The fall in new car sales shown by these figures seems more or less in line with the seasonal trend ; but the leading car manufacturers are inclined to think that total sales may have fallen by rather more. This would imply a rise in the proportion of new cars bought on hire purchase, and it is possible that buyers who would ordinarily rely on bank credit found themselves forced to turn back to hire purchase last month. At the same time, admittedly, the leading finance companies tightened their own credit terms. But the rise from 20 to 25 per cent in minimum deposits is unlikely to have been a strong deterrent to purchasers of new cars, most of whom get a substantial credit from a trade-in. At the other end of the market business in the older cars has been hit from a number of directions—the rise from 25 to 33⅓ per cent in minimum deposits, the growing reluctance of finance companies to finance such vehicles at all, and stronger enforcement of the government testing scheme. The structural change in the car market in Britain, involving the effective elimination from the market of the old faithfuls, is still in process.



IN THE MARKETS



Funding the Overdrafts

AS expected the queue of companies coming forward to make rights issues has lengthened in the past week and it may be expected to grow longer in the next few weeks as the banks bring further pressure on companies to reduce their overdrafts. Funding has been the principal object of many of the issues announced this week. Of these by far the biggest came from Thomas Tilling and the Ross Group, both of which had large overdrafts ; Tilling's amounted to £4.2 million at the end of December and Ross's to £3.7 million in the middle of July. The Tilling issue follows hard upon the heels of the placing by one of its subsidiaries, James A. Jobling, of £1½ million in a 7 per cent debenture. If the Tilling ordinary dividend is maintained at 20 per cent its new money is being raised at just over 4½ per cent.

The Ross Group has grown rapidly in recent years and in addition to its fishing interests it has a sizeable stake in frozen food. Its financial year closes at the end of this month and its net equity earnings are estimated at £703,000, against £468,000, to cover the dividend raised from 20 to 22 per cent 1½ times. A similar payment is forecast for 1961-62 when the new shares will rank for dividend. Polycell Holdings will use the proceeds of its issue to reduce bank loans of about £900,000 incurred in building a new factory and the general expansion in business brought about by the "do it yourself" movement.

AUSTRALIA'S natural resources,
HITACHI'S electrical resources . . .
A NEW AND POWERFUL COMBINATION

At the height of this event-filled year*, Hitachi, Ltd. of Japan announces a major first — the introduction, for the first time, of Japanese-made heavy electrical equipment to resource-rich Australia.

Two Huge Hitachi 30 MVA transformers have already been delivered to a Tasmanian port. The three-phase, 50-cycle transformers, of the self-cooling type and rated at 11 kV delta to 230 kV wye with solidly-grounded neutral are, as usual, Hitachi-designed, Hitachi-engineered, Hitachi-manufactured.

Destined for the important Catagunya Power Station of Tasmania's Hydro-Electric Commission, this equipment is another strong link in Hitachi's chain bolstering international natural resources.

* *Another Hitachi "event of the year":*
Fortune magazine's official announcement lists Hitachi, Ltd. as the 17th largest firm in the world (excluding the U.S.) and as the first company of Japan.

Hitachi, Ltd.
Tokyo Japan
Cable Address: "HITACHY" TOKYO

The directors believe that a considerable increase in turnover will occur in the next few years as new products are marketed.

Among other companies planning issues is London County Freehold, whose full report revealed an overdraft of £1¼ million and big commitments. It now proposes to increase its authorised capital. Purnell, the printers, also had an overdraft of over £1 million at its year end and it is engaged on a big development programme, but instead of a straightforward rights issue the new capital it needs may be raised by an issue of convertible loan stock. Two banks also are seeking further capital. The Chartered Bank in announcing an interim dividend of 7½ per cent (against 8 per cent before a one for ten scrip issue) has given details of a rights issue, except the price. The National Bank is proposing to follow the example of other London clearing banks in asking the Courts to sanction the elimination of the uncalled liability on its ordinary shares, which would make them more marketable, and also eligible for trustee investment. At the moment the nominal value of these shares is £5, £1 paid. The bank's chairman, Lord Longford, says that the directors are considering a rights issue "when market conditions are suitable."

Investors' Holiday

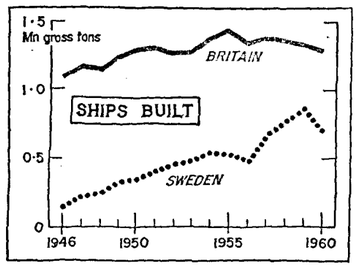
THE London stock exchange has had another quiet week. In contrast with Continental bourses, where the international tension has taken a further toll, most markedly in Germany, London prices have been steady. The equity market was cheered by the gold figures at the beginning of the week, but by Wednesday caution had returned. The international situation was cited as an influence, but the fact is that Britain's domestic economic prospect provides sufficient reason itself for restraint.

In the gilt-edged market the undertone has remained firm, and prices have again been marked up a shade, but the volume of business has been small. The government broker has succeeded in resuming his funding sales in the past few weeks, though the volume of net sales is unlikely to have been large. The market has however been little troubled by trustees. Most of those who were set on switching into equities at the first opportunity had already disposed of their gilt-edged well in advance. There is a trickle of switches from gilt-edged to equities, but transactions of say £500,000 that may cause a noticeable effect in the equity market when spread over a few stocks are hardly noticed in the gilt-edged market, now that there are buyers as well as sellers about.

OIL TANKERS

Surplus Sustained

THERE must be something in the make-up of an oil tanker owner that breeds perpetual optimism. In the first half of a year in which more than 5 million tons deadweight of brand new tankers are due to be added to a world fleet of some 65 million tons, and in which so far there has been not one minute sign of the surplus of tankers disappearing or of tramp freight rates reviving above a marginally profitable level, they have added another 3 million tons to the order books of shipbuilders according to the latest review published by John I. Jacobs & Co., the firm of tanker brokers. Builders of tankers are no doubt grateful for this wholly unexpected spate of ordering (though this is hardly shared by British yards who secured little of the business). Why these orders have been placed is hard to fathom. The greater part has come from tramp tanker owners, principally Norwegian, and for delivery in 1962 and 1963. The Greeks have been notably absent—and they are usually pretty accurate in their soundings of coming trends. Contract prices are not likely suddenly to rise; indeed they could conceivably shrink further still as more and more yards become desperate for immediate work to keep themselves going.



Equally, the portents give no assurance of more profitable employment for oil tankers in the coming few years. Overhanging the market for tramp vessels, apart from the deadweight of new tonnage on the slipways which may well amount to another 5 million tons next year, are the various fleets "in waiting." By June, when world oil movement reached its annual low point, over 4½ million tons of tankers were laid up and a record 2 million tons were busily carrying grain to China and other stations. Allowing for the idle tankers that are not likely to be fit for the open sea again, for existing contracts in the grain trade, and for the possibility of a resumption of the American seamen's strike this autumn, the Jacobs report suggests that the winter revival in oil carryings may squeeze the market a little more this year, though not if it is again suddenly flooded with a large number of laid-up tankers all reactivated at once as happened last December. Beyond the immediate few months, all the pointers remain bearish. Tonnage removed from the world tanker fleet by scrapping, permanent conversion, and losses at sea still remains at less than 3 million tons a year. Oil consumption continues to grow, but the restriction upon American imports and the opening up of oil fields in North Africa augur a slower rate of growth in the ton-mileage of oil moved by sea. The larger oil companies are again chartering tankers on long-term contracts, upon the expiry of contracts placed at the time of the Suez crisis, but at rates that offer very thin profit margins. In their own new building plans, the oil companies are remaining decidedly, and perhaps significantly, more cautious than tramp owners.

SHIPBUILDING

Divided Teamwork

CONTRASTING impressions brought back by the management and trade union members of an eight-man productivity team sent by the shipbuilding industry on a five-day visit to Sweden in October, 1959, appear to have been considerably toned down in the long interval between the public comments of some of the members immediately on their return and the joint report* that has finally emerged. The report bears many signs of the bonelessness to be expected from dual editing, but an overt difference of conclusion is registered only once. On the Swedish shipbuilders' practice of regularly moving men about from one department of a shipyard to another according to the progress of work and their employees' technical competence, the four trade unionists argue, in a bleakly worded footnote, that such interchangeability of labour occurs mainly so as "to avoid redundancies and to relieve bottlenecks, and is not practised promiscuously as contended by the employers' delegation."

This single difference would seem to be crucial. For the principal conclusion drawn by the team as a whole is that the much greater flexibility of Swedish labour, which directly arises from common membership of a single trade union (apart from a few foundrymen) and which enables management to deploy a fairly constant labour force efficiently, is primarily responsible for the high level of productivity attained in Swedish shipyards. Beside the comparatively harmonious atmosphere of management-labour relations in Sweden and the concomitant absence of demarcation arguments, all other possible contributory factors apparently pale into insignificance. The report does not say whether this explains how Swedish yards manage to turn out rather more than half the tonnage of new shipping that British yards produce with a total labour force of one-seventh of that employed in Britain—a contrast that remains unpleasantly sharp after all allowances are made for the wider range of ships built here and the purposeful concentration upon fairly standard cargo carriers and oil tankers in Sweden.

* Shipbuilding in Sweden: British Productivity Council. 5s.

Indeed, in a report supposedly concerned with productivity, the team gives no specific measures of the differing performances of the two industries. No estimate is given of how much higher Swedish shipbuilding productivity is. Given the statistical difficulties in an industry that mainly assembles rather than manufactures, this may be reasonable, although one oil tanker owner has privately calculated that British yards took (in 1959) about 13 per cent more man-hours per ton of steel erected in tanker building than the Swedish, and almost 40 per cent more than German shipyards. Hourly wage costs are higher in Sweden (about 40 per cent more in 1959 according to the report on shipbuilding by the Department of Scientific and Industrial Research last December); and at the time of the team's visit, too, Swedish shipbuilders paid more for their steel. Yet their prices were, and remain, significantly lower—as is plainly evident from their continued success in exporting. While Swedish yards regularly build about two-thirds of their new tonnage for foreign owners, Britain has now become, after Norway, the world's largest net "importer" of new ships.

Relations in the Yards

As the Minister of Transport will doubtless discover in the course of a visit to two of the largest Swedish shipyards next week, there is much to learn from the way in which this compact, highly paid, highly efficient, and steadily expanding industry conducts its operations. But even Mr Marples may come back sharing the doubts the team evidently entertains about the chances of quickly transplanting in Britain (if at all) the kind of relationships between employers and men, formal and informal, that exist in Sweden. For the productivity report recognises that, apart from the immense convenience offered by the absence of a plethora of separate unions, the particular atmosphere prevailing between Swedish shipbuilders and their workmen also springs from the mutual confidence and the recognition of common interest nurtured over the twenty years since the two sides first agreed formally to discuss their industry's problems, as well as from the different statutory framework in that country governing wage negotiation and the arbitration of unsettled disputes. At the lowest level, in the individual shipyard, Swedish management provides, and is prepared to discuss, regular reports on the yard's technical and financial situation at meetings of the yard's "enterprise council" (*anglicé:* works committee). A similar practice showed signs of emerging in British shipbuilding during the war, but many of these yard consultative committees have since lapsed into disuse. The Ministry's shipbuilding advisory committee earlier this year recommended that they should be revived, and the productivity team adds its own (and its only) proposal that the Shipbuilding Employers' Federation and the Confederation of Shipbuilding and Engineering Unions should set up a joint committee to investigate the use of manpower in British shipbuilding.

Neither of these suggestions, for masters and men to get together at the lowest and at the highest level, can work without frank readiness to respond by both sides. The climate created by the deepening recession in shipbuilding and by the publication of three different reports on the industry, written from within and without, in the last nine months ought at least to impart a sense of necessity. British shipbuilders' efforts at modernisation and their devotion to research and development have not emerged very favourably from the two previous study reports. In the latest report, a team of employers and unionists apparently agree that Swedish shipbuilding techniques are not really any more advanced than those already known or practised here. The main difference is in attitudes towards the working of up-to-date methods. Whether Swedish employers deploy their men "promiscuously" or not, British shipbuilders should appreciate that they will only induce a warmer response to change in their men if their own attitude to labour becomes genuinely, and permanently, co-operative.

Atomic Fracas in Sweden

BY A SWEDISH CORRESPONDENT

Conflict between the Swedish Atomic Commission and the Power Board, long brewing, has broken through the barrier of official restraint with the presentation by these two government authorities of their estimates for 1962-63. The Power Board requests altogether £30 million for conventional hydro-electric developments; the Atomic Commission needs £10 million to carry out research and development work which aims at a 100 MW nuclear power station in service in 1967. The commission would then dearly love to progress to more economical stations in the 250 to 500 MW class by about 1975.

But the Power Board is aghast at the idea of having to finance and operate an atomic power station costing £26 million with a capacity of only 100 MW. The board is required by statute to show a return on its investments and, to make such a plant pay, charges would have to be raised by 6 to 8 per cent. The conflict between the two authorities goes deeper than these cost comparisons suggest. Atomic research has proved very costly and the commission has little to show for considerable sums spent on its three reactors, two of them for research. A heavy water-moderated reactor will be put into service in 1963 at a cost of £12 million to provide domestic heating; it is said to be the most luxurious heating since the Roman baths.

The penny-pinching Power Board wears a hair shirt of its own design. Its operations are rationalised in minute detail. Construction costs at its underground power plants have been brought down by paring pennies from its basic cost unit—the removal of a cubic metre of rock. A site engineer who uses a kilo of dynamite more than necessary on a shot has no future with the board. Its construction camps are probably unique in that visitors are expected to pay for their own lunch.

The Swedish Power Board certainly knows the exact cost of power development. It commits itself to building hydro-electric stations to give an annual output of 22,000 million units for an average cost of £83 per installed kW. During the second half of this decade they will be built for £55 per kW. The board builds conventional steam plants at £38 per kW. It does not bother to publish estimates for nuclear plants, but the one under debate will cost something like £242 per kW. It estimates that costs of conventional fuels will not increase appreciably before 1970, but are likely to rise thereafter; lower uranium prices and the exhaustion of the most economical power sites in the north, the board thinks, will make atomic power economic by 1975.

The Atomic Commission does not rebut the board's figures, but insists that cancellations or postponement of the fourth projected reactor would jeopardise the domestic atomic programme by breaking up research and design teams that might never be put together again. The commission refers to recent American and British developments where newly planned nuclear stations are expected to be economically viable before 1970. But the Power Board is adamant. It will not take on R-4 as a commercial proposition. But it is willing to participate in its development to the extent of £3½ million, in addition to the £1.4 million already spent on the preliminaries, provided the project can be classed as a pilot plant apart from its serious business of providing power at the lowest possible rates. Recent Swedish laboratory excursions into the possibilities of thermo-nuclear power raise no excitement at the board's engineering headquarters; its concern is chiefly with finding the cheapest means of moving dirt and excavating rock.

CANADA

The Floating Rate Paradox

When Mr Donald Fleming announced in his June budget that he intended to use the exchange fund to push the Canadian dollar to a "significant discount,"

What's on the I·C·T stands for you?

Flemish as spoken in Wolverhampton

PRI728

Lit by the spluttering, steely-blue flames of welding arcs, the intricate cooling system of a nuclear reactor takes shape in Northern Belgium. For the 11,000th time, in the darkened inspection booth of a factory in the English Midlands, an X-ray negative is presented for close scrutiny, a head bends over it, and a hand writes a curt 'O.K.'

Sixty tons of gleaming aluminium are the link between the Belgian Atom Town at Mol and the English factory at Wolverhampton operated by I.C.I.—Britain's leading chemical company and an expert fabricator of non-ferrous metals. For the nuclear reactor BR2 at Mol, the cooling water needs to be contained in a labyrinth of aluminium pipes, made with perfect precision and faultlessly welded. I.C.I.—no mean contributor to Britain's nuclear projects—undertook the job, confirming the perfection of their work with 11,000 X-rays and sending a special team of welders to install the pipework at Mol. When it's a question of making special assemblies in conventional metals, or supplying special metals such as zirconium, hafnium and beryllium for nuclear engineering projects, I.C.I. speaks a language that is well understood everywhere.

The influence of I.C.I. research and production is felt today in every corner of the globe

Imperial Chemical Industries Ltd., London, S.W.1

PLASTICS

Foaming Up

FOAMED plastics are now one of the fastest-growing sections of the plastics industry, but the attention from major companies that this has brought them has by now made competition as tough as it is with other plastic materials. Monsanto and Shell have both gone into marketing foamed polystyrene themselves, and have pushed the price far down in their efforts to increase sales; Imperial Chemical Industries is just completing a large plant to produce the raw material for polyurethane foam, and du Pont has announced that it will build another by 1963. And in making the foamed polyurethane itself, Microcell, a subsidiary of BTR Industries, started production last month at a plant with a capacity equal to total 1960 sales of this material in Britain.

There are two basic types of plastic foam, soft and the hard; the former, almost entirely polyurethane, is used for upholstery, and the latter, which can be made from polystyrene, urea-formaldehyde, phenol-formaldehyde, polyvinyl chloride or polyurethane again, is employed as an insulating or structural material. The upholstery market seems to be much the bigger of the two; sales of soft polyurethane last year are estimated at about 16,000 tons—twice those of 1959—and are expected to reach 20,000 tons this year. Polystyrene sells best amongst the rigid foams, but its sales seem to be running at only about 4,000 tons a year—though also rising fast. Urea-formaldehyde is the only other rigid foam to sell in quantity. These two have gained their leading position amongst the rigid foams on price. Urea-formaldehyde is slightly the cheaper, selling for 4s. to 5s. a cubic foot; foamed polystyrene costs from 4s. 6d. to 12s. 6d. a cubic foot. Phenol-formaldehyde costs about 12s. a cubic foot with polyurethane selling at about 20s. a cubic foot and pvc still more expensive. Soft polyurethane is cheaper than the rigid variety, costing from 7s. to 9s. 6d. a cubic foot in thick blocks. This makes it a good deal cheaper than rubber latex foam.

POLYURETHANE foam seems to be making most of its progress at the expense of conventional springs and padding for upholstery. It is much cheaper to use a lump of such material than to build up a spring case and cover it with hair, especially if furniture is being made on any scale. A market research survey made by Microcell suggests that 45 per cent of polyurethane went to the motor industry last year and a similar proportion to the furniture industry; but Dunlop, which makes polyurethane as well as foamed rubber under the Dunlopillo trade mark, believes that 80 per cent of the output went into furniture. So far production of rubber foam does not seem to have fallen—output figures are not published—but its growth has been checked by the rise of polyurethane. There is considerable over-capacity for polyurethane foam in Britain now that Microcell has opened its plant—indeed, it seems that there was even some before—but a foaming plant involves a relatively small investment. Hence over-capacity does not worry its makers as much as it does the producers of plastic raw materials.

Rigid foam materials have gained sales partly from the increasing demand for insulating materials, partly at the expense of older insulators, and partly from the development of "sandwich" structures—in which a light but rigid material, such as the foamed plastics or a paper or metal honeycomb, is sandwiched between two sheets of thin material. This produces frameless partitions, van bodies, boat hulls, or almost any structure that needs to be rigid. But insulation is the biggest market, and its potentialities, the plastics industry believes, have scarcely been tapped. Private houses could take far more foamed plastics if these were, for example, combined with plasterboard to produce a ceiling that insulated, instead of adding insulation separately in the loft. Urea-formaldehyde and polyurethane have one property that gives them some special uses for insulation and construction; they can be injected into a cavity in a liquid form, and will foam inside it. Thus they can be injected into the space around a refrigerator, a ship's hold or the cavity of a house wall. Fire resistance is another property that should help phenol-formaldehyde and pvc find uses as insulation despite their higher price; it makes them more suitable for use on ships, for example, or wherever fire risk counts. In structures where strength is important, pvc and polyurethane have the advantage over the other materials. But none can follow urea-formaldehyde and polystyrene into the market for really cheap products.

This industry should not be disappointed with the market for its rigid foams in the next few years, even if it may not make much profit out of them when it has to invest heavily in sales promotion and sell at depressed prices. Sales of the soft polyurethane foam, however, have risen so fast in the last few years that some levelling-off might be expected, especially if the furniture industry remains depressed; but price and comfort should allow this material to dominate the cushioning market.

most observers conjectured that to achieve any worthwhile results the discount would have to be at least ten cents. The immediate response to the announcement was a fall in the Canadian dollar from par (intelligent anticipation had led to a running off in the 1¼ cent premium in preceding days) to a discount of about three cents. And there it has remained in the last ten weeks. The freely fluctuating Canadian dollar remains obstinately stable, even after the Canadian authorities had given public warning of their intention to drive the rate down.

The tactics of the Canadian authorities are admittedly ambivalent. In July, far from following the budget precept of selling Canadian dollars to depreciate the exchange rate, the exchange fund appears to have supported the Canadian dollar to keep it at 97 US cents, and Canada's exchange reserves dropped by $25 million in the month. A three-point discount can hardly be regarded as "significant" in this context; but both the Treasury and the central bank have intimated that the present level of the exchange rate is, in present circumstances, regarded as satisfactory; and no very large volume of official intervention has been needed in either direction. Surprisingly, there appears to have been little effect on the inflow of foreign capital. Although the differential between Treasury bill rates in Canada and the United States has now virtually disappeared, with the yield at 2¾-2½ per cent in both countries, long-term interest rates are still about one per cent higher in Canada, with long-term government bonds yielding around 5 per cent. But in accordance with its budget promise, the Canadian Treasury is keeping pressure off this end of the market by confining new issues to short maturity dates. This week the Bank of Canada marketed a further tranche of 3 per cent one-year bonds, at a yield of 3.29 per cent.

BIDS AND DEALS

Property Links

THE latest property-insurance link involves the Hammerson Property and Investment Trust and the Royal London Mutual Insurance which has agreed to provide this expanding property group with £15 million. Advances will be secured by a 50 years 6½ per cent debenture stock, with no provision for earlier redemption. In addition Royal London will subscribe almost £1 million for a 10 per cent stake in Hammerson's equity in the form of 610,000 "A" 1s. units, which carry one vote for every six units. These are to be issued at 32s. 6d. each, against the current price of 37s. 9d., reflecting a rise of 3s. 3d. since this deal was announced. Shareholders have no reason to be upset with these arrangements, which will be followed by the writing up of all the 1s. units to 5s. units. Discussions about this link were in an advanced stage when the Chancellor

made his request for restraint in the granting of development finance to property companies ; and in keeping with his request funds provided by the Royal London Mutual in the next six months will be used only for commitments entered into before he spoke.

In a straightforward property deal, City of London Real Property has offered to acquire Corinthian Investments on the basis of two CLRP shares for every five 2s. shares in Corinthian. With CLRP at 72s. 9d. this values the Corinthian shares at just over 29s., against a pre-bid price of 24s. 3d. The deal which is worth in all £2,145,000 is subject to certain conditions relating to the tax complications which would arise as a result of the merger.

Transatlantic Tea Bid

JUST over a year ago, a bid by National Dairy Products of America for Typhoo Tea fell through because the Treasury would not permit a bid from across the Atlantic except wholly in Cash. The offer of Beech-Nut Life Savers to acquire all the assets of Joseph Tetley, the tea blenders, for £2¼ million is wholly in cash. Tetley will then go into liquidation with the 5½ per cent redeemable preference and 6½ per cent preference shares being repaid at 21s. and 20s. respectively ; this leaves 28s. for each 5s. ordinary share, quoted at 20s. before the offer was announced. This compares with a 1960 high of 32s. 9d. but it values the shares on a dividend yield of 2.1 per cent and an earnings yield of 3.7 per cent. A large part of Tetley's business in recent years has been in North America, where its tea-bags have been popular, and the chairman reported last January that the introduction of Instant Tea there met with great success although promotion and advertising costs were heavy. The offer, subject to Treasury consent, is recommended by the directors of Tetley who with their associates own more than half the ordinary shares.

MANAGEMENT

Comparisons are Modish

A CENTRE for Interfirm Comparison was set up two years ago by the British Institute of Management and the British Productivity Council to enable firms to compare various measures of their own efficiency with those of other companies in the same industry. By now the centre is working on inter-firm comparisons in twenty industries, including light engineering, pharmaceuticals, footwear and scientific instruments, and it feels that it has been able to convince industry of the security of its methods. A firm's secrets will not reach its rivals. They are merely given performance data in the form of percentages and ratios for "firm A," "firm B," and so on—a system that seems to be secure enough where there are many firms in an industry, but possibly not immune to second-guessing where there are few.

The centre conducts two types of comparison. One compares profitability, taking as the criterion of efficiency the return on the real capital employed in the business ; the other shows how competitors compare in particular aspects of current operations, such as the time taken to make a standard product. The first set of comparisons is applied to the individual departments of each firm. Variations in profitability usually arise from differences in costs, for example the level of stocks, and can reveal where attention should be concentrated.

General conclusions drawn from the centre's investigations are still tentative. But there does seem to be an optimum size for the firm in every industry: beyond that size growth appears to lead to less efficiency rather than greater. The evidence so far certainly does not support the belief that the larger the firm, the greater is its efficiency. The next stage of the centre's work will be to begin comparing British firms with their equivalents on the continent, where comparative studies of business efficiency are already well established. But in Germany, for example, different criteria are employed, and some agreement on methods will first have to be reached as well as on such problems as how to treat differing social security payments. Nevertheless, the centre has already begun a study of one section of the electrical industry in Britain and on the continent. It hopes that the prospect of joining the common market will encourage other British industries to commission similar studies.

OIL

Slower Growth

OIL consumption in Britain increased only half as fast in the first six months of this year as in the first half of 1960. Deliveries of all oil products reached 23,172,000 tons, over nine per cent more than in the same period of 1960: deliveries then had been 18.7 per cent higher than in 1959. Fuel oil deliveries rose by only 9½ per cent in contrast to an increase of 30 per cent ; the switch to oil for electricity generation and in industry became somewhat slower. Feedstock for the chemical industry also failed to maintain the same rate of growth, with deliveries rising by about 12 per cent instead of over 60 per cent. Such a rate of increase could hardly be maintained for long, but the change does reflect the check to the growth of petrochemical and plastics production. Petrol consumption by now seems settled on an increase of around eight per cent a year, with sales of standard grade petrol falling while those of premium grades rise. As the compression ratios of car engines rise, this

trend in the pattern of petrol sales can b expected to continue, although man motorists must be buying petrol of a highe octane rating than their cars need.

The oil industry expects this slowin down in its rate of growth to continue. M Christopher Brunner of Shell-Mex and B told the British Association last week th sales might rise to 58 million tons in 197 from about 43 million tons this year, thoug they had trebled in the twelve years fro 1948 to 1960. Petrol is no longer the large selling oil product. Indeed last year petro accounted for less than 20 per cent of tota oil sales, whereas fuel oil made up more tha 44 per cent. This switch does much t explain the narrowing profit margins of th industry, and the efforts to find new market in, for example, petrochemicals. But so fa these new markets are hardly proving to b any more profitable.

SHORTER NOTES

New Zealand has now become a membe of the International Monetary Fund an the World Bank. Its quota in the Fund $125 million and its subscription to th capital stock of the Bank is $166.7 millio

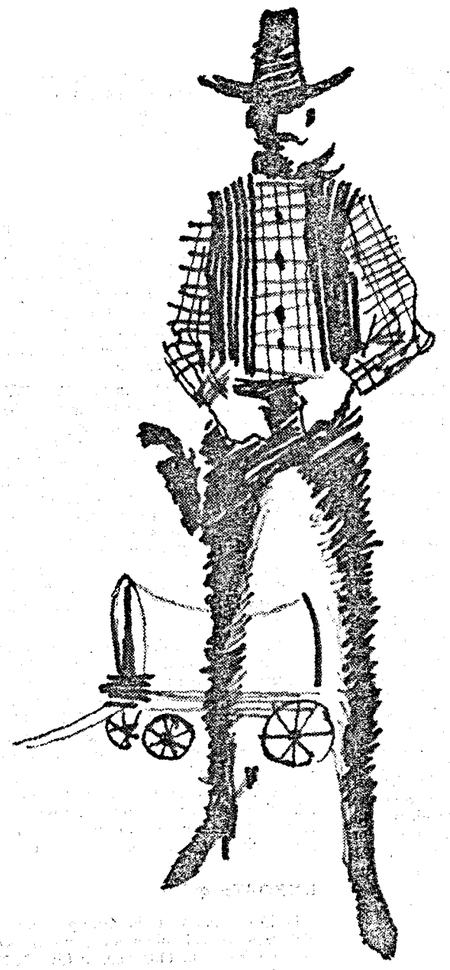
★

Profits of Whitbread for the first half 1961 show a sharp increase from £482,00 to £716,000 after tax of £591,000 again £422,000. The interim dividend of 9 p cent against 8 per cent represents the com pany's usual practice of paying as an interi one-third of the previous year's tot dividend and the directors emphasise th this does not indicate that the total payme for the year will be increased.

★

Mr Prince Littler is to resign from th chair of Associated Television after th annual meeting at the end of this mont Sir Robert Renwick will succeed him.

★



NSU is introducing a new version of Prinz small car. The engine remains th same, but a new and roomier body is fitte that looks like a miniature Chevrolet Corva —only the first of several new Europe rear-engined cars that will share this n unattractive appearance.

When two by two

isn't fast enough

One by one, two by two—the *queue* is the curse of the age. If it were only a question of a few people blocking the pavement outside the local cinema on Saturday evening, then nobody would worry. But to commerce and industry queues present problems which are very serious indeed.

What is a queue? It is a line of people at a ticket office, a cash desk, a works stores counter; a block of vehicles at a traffic intersection or awaiting service at a garage; a covey of aircraft circling unprofitably round a congested airport; a train of trucks idle in a siding; a stack of components waiting to take their place in a production line; a mass of liquid held back by an outlet pipe with too narrow a bore . . .

What can be done about it? Every individual queueing problem has its own peculiarities, which makes it impossible to lay down hard and fast rules. *But mathematicians* have evolved a fairly extensive Queueing Theory which provides a framework for the solution of simpler cases: more complicated queueing and bottleneck problems can be solved economically only by using high-speed electronic computers—by digital methods or by various forms of analog. To all such techniques C-E-I-R can bring to bear great skill and experience.

The solution of queueing and bottleneck problems is only one of the many scientific management services offered by C-E-I-R, the largest computer services organization in the world. At the London C-E-I-R Centre, with its advanced on-the-spot computer facilities, C-E-I-R are handling on behalf of clients a wide variety of operations ranging from routine Data Processing on a regular contract basis to the solution of the most complex industrial and commercial problems. If you have any problem, large or small, which can be solved by logical or mathematical means—then send for C-E-I-R.

COMPANY MEETINGS

FINANCIAL YEAR 1960

INSTITUTE FOR INDUSTRIAL RECONSTRUCTION

ROME, ITALY

For the IRI group the year under review ended with results satisfactory under more than one aspect, while the way was opened to important new developments.

The fact that the overall sales figure increased by more than 25 per cent in a year has underlined the Group's expansionist tendency, which can roughly be measured by the long-term rate of growth of sales over a long period; in fact, over the ten-year period 1951-60 sales rose at an average rate of 14 per cent a year, or two-and-a-half times the rate of increase of national income in the same period.

Among the most noteworthy developments of the year, mention must be made of the laying of the corner stone of the new steel mill at Taranto, which both for its size and technical level will be able to compete successfully on the Italian as well as international markets.

A second satisfactory development during the year was the conclusion of a series of negotiations with outstanding foreign firms in the engineering sector, with a view to initiating new promising ventures in Southern Italy.

Also worth mentioning are the Group's activities in the motor roads sector, in line with the Government's directives in this field. If the new national motor road construction plan, which is now being examined by Parliament, is approved, 3,125 miles of highways are to be built, and about two fifths of the programme is to be carried out by companies of the IRI group.

Finally, among the projects of major importance during the year, the creation of the *Management Development Centre* must be remembered; this is actually a long-term investment programme, bearing in mind the large number of executives required by the IRI companies and the length of time necessary for the training of personnel.

INVESTMENT ●

The IRI Group's investment in new plant last year amounted to Lit. 298,600m. (+20.5 per cent as compared with 1959). In terms of total new investment by firms under the control of the government and of local authorities, the Group's share in 1960 was 65 per cent.

The Group's **manufacturing firms** invested Lit. 80,700m. in 1960, or 20 per cent more than in 1959. The **steel** sector, which took up three fifths of this amount, registered a significant expansion in plant, the start of the new steel mill at Taranto and of other ancillary plants. In the **engineering** sector, investment was nearly twice as high as the year before; of particular interest are the initial work for the construction of a new large factory at Arese by *Alfa Romeo*, the modernisation and extension of plant in Southern Italy and, still in the South, the start of new plants in the electronic products and precision engineering fields. The **shipyards,** too, increased their investment in 1960, mostly for radical modernisation work, which is now under way.

In the Group's services sector total investment rose by 21 per cent or Lit. 217,900m., as against 1959. More than one third of this went into the telephone sector, for new installations. In the **electric power** sector, a contraction of 19 per cent was registered mainly because some construction work planned for 1960 had to be postponed for technical reasons. Instead, **shipping** and **air-lines** greatly increased their investment, as was to be expected in view of the large-scale programmes for renewing the fleet of the major shipping and air-lines. In the event, the shipping companies' investment rose by 164 per cent and the air-line's by 527 per cent. Investment fell somewhat in the motorways sector owing to delays in the official approval of the route for the Florence-Rome stretch of the *Autostrada del Sole*.

OUTPUT ●

All IRI sectors registered considerable increases in output during the year under review. In the **steel** sector (FINSIDER group) pig iron and steel production rose by 29 per cent and 24 per cent respectively. The mechanical and engineering companies, too, made very satisfactory progress, especially *Alfa Romeo* and the companies making railway rolling stock. Good results were also achieved by the electro-mechanical companies and by industrial machinery. Thanks to the programme of FINSIDER and FINMARE, the shipyard sector, too, expanded its activities, although overall prospects are still unfavourable. Expansion was also registered in the cement industry (+38 per cent) with the entry in operation of plants completed in 1959.

Electric companies increased their output by 13 per cent. **Telephone** companies saw a growth in the number of subscribers (+10 per cent), of total long-distance calls (+9 per cent) and of automatic long-distance dialling (+17 per cent). The FINMARE fleet saw an increase of 14 per cent in passengers and 7 per cent in cargoes. *Alitalia* registered further increases of 29 per cent in passenger/km. and ton/km. The **radio and television** sector experienced increases of 6 per cent in the number of radio subscribers and 35 per cent in that of TV subscribers.

SALES ●

Total sales of the IRI companies in 1960 reached the unprecedented level of Lit. 1,306,000m. which exceeds by Lit. 267,000m. the past year's figure. Manufacturing industries contributed Lit. 850,000m. and service industries Lit. 455,600m. Unlike 1959, the past year was one in which sales made better progress in the manufacturing industries than in the services (+21 per cent).

The Group's steel companies achieved total sales in excess of Lit. 400,000m. (Lit. 83,800m. over 1959), followed by the engineering industries with Lit. 217,300m. (Lit. 41,200m. over 1959). The spectacular recovery of shipbuilding sales, which rose by 49 per cent, is entirely due to extraordinary measures to speed up FINMARE's and FINSIDER's shipbuilding programmes. The sector's overall prospects, however, are still unfavourable both in Italy and throughout the world. Among the "miscellaneous" manufacturing firms, the principal expansion was registered in the cement industry (+40 per cent).

Among services, the largest contribution was made by the electric sector with Lit. 148,400m., whereas the largest rise in revenues (+32 per cent) was registered by the telephone companies whose billings reached Lit. 136,000m. Development was also marked in air-line and shipping revenues, which rose by 27 and 22 per cent respectively.

The outstanding feature in the radio and television sector, where revenue rose by 12 per cent, was the further conspicuous increase in the number of television subscribers.

EXPORTS ●

In 1960 exports by the Group's main industrials sectors (steel, shipbuilding and engineering) went up from Lit. 118,900m. to Lit. 121,700m.; the Lit. 2,800m. increment is the result of an increase of Lit. 17,300m. in engineering and steel and of a decline of Lit. 14,500m. in shipbuilding and ship repair (of which Lit. 1,000m. in NATO procurements).

The increase of 11 per cent registered in foreign sales of the steel industry, which alone accounts for 51 per cent of the total exports of the Group, is attributable to *Ilva's* and *Cornigliano's* growing exports of hot-rolled products which, in terms of volume, were 47 per cent larger than in 1959. Altogether 15 per cent of the industry's sales in 1960 went to foreign buyers.

In the year under review engineering exports rose from Lit. 31,100m. to Lit. 42,100m. (+35 per cent) and accounted for 19 per cent (18 per cent in 1959) of the industry's total sales. Electro-engineering products, railway rolling stock and industrial machinery were the principal products involved.

Foreign sales of the shipyards again lost ground in 1960, even more than in the previous year. Exports (Lit. 15,400m.) were hardly more than half the 1959 figure, which was already 18 per cent below that of 1958.

EMPLOYMENT ●

The rise in employment registered in 1960 (+1.8 per cent) was spread over the service, banking and industrial sectors. The highest increase (+4.1 per cent) concerns services, where activity is expanding continuously. Employment rose sharply in the companies concerned: air transport (+24 per cent), telephone (+8.1 per cent) and radio-television (+7 per cent). The slight overall rise in the manufacturing industries reflects a sizeable increase in the steel and engineering companies which made up for and in fact exceeded the reduction in the shipyards, which still carry surplus labour. Employment in the banking sector increased remarkably as a result of a larger volume of activity and the opening of new branch offices.

SOURCES OF FINANCE ●

The Group's overall financial requirements amounted to Lit. 402,000m. in 1960, as against Lit. 326,000m. in 1959, and were met from the following sources: Lit. 159,500m. through self-financing, which rose from 34.7 per cent of total requirements in 1959 to 39.7 per cent in 1960; Lit. 72,500m. through IRI financing, with a drop from 31.8 per cent in 1959 to 18 per cent in 1960; and Lit. 170,100m. supplied directly by the market, representing 42.3 per cent against 33.3 per cent in 1959.

Subscription of shares by minority shareholders amounted to Lit. 42,700m., or 18.1 per cent of the Group's liquid requirements: this is a significant indication of the faith which private capital has in the Group's future. It is of interest to note that the funds obtained from private sources in 1960 exceeded again the amount contributed to IRI by the State (i.e. Lit. 35,000m.).

LONG-RANGE PROGRAMMES ●

Long-range programmes approved as at the year-end indicate the following targets for each sector: (1) Steel—an annual capacity of about 8.7m. tons by 1965, or 94.4 per cent more than in 1960; pig iron capacity is to be expanded to reach 6.5m. tons in 1965, or 186.4 per cent more than in 1960. (2) Mechanical engineering—a structural reorganisation is to be achieved by regrouping activities into four main divisions: motor-cars, electrical engineering, railway rolling stock and machine tools. (3) Shipyard—a radical reorganisation is planned with due regard to the long-term prospects of this sector. (4) Electric power—overall generating capacity of the Group will be expanded by about 3,800m. kWh and the Senn nuclear power station will be completed by 1963. (5) Telephones—the number of telephones installed is planned to rise by 34 per cent (to reach 5.1m.). (6) Shipping—fourteen new ships have been ordered, aggregating about 186,000 G.R.T. (7) Air-line (*Alitalia*)—24 jet aircraft will be in commission by the end of 1962, as against the present figure of only eight. (8) Toll Motorways—the new "*autostrada*" linking Milan to Naples will be opened to traffic by 1963, and work on improving and widening the "*autostrada*" linking Florence with the coast will be completed. (9) Radio and Television—a second television network will enter into operation in the course of 1962.

Investment for the industrialisation of Southern Italy approved as of to-day, for the period 1961-1964, amounts to Lit. 536,000m. or 40 per cent of total investment.

For 1961, total overall investment by the Group is expected to reach some Lit. 413,000m.

ASSOCIATED TELEVISION LIMITED

MR PRINCE LITTLER REVIEWS YEAR OF ACHIEVEMENT AND EXPANSION

The Sixth Annual General Meeting of Associated Television Limited will be held on September 28th at ATV House, Great Cumberland Place, London, W.

The following are extracts from the statement by Mr Prince Littler, CBE, the chairman, which has been circulated with the report and accounts :—

I think this is a suitable year in which to use our Annual Report to review what has happened in this company since its foundation, and also to bring our shareholders, as it were, into our board room atmosphere so that they will understand the thinking which has been behind the policies adopted by your directors and appreciate the very able way your executives have put these policies into operation.

When this company started, very few people had any clear idea of how the operation would expand or what the difficulties would be. I have told you at our previous annual meetings that the most prominent feature in those first three years was the rate at which it was possible to lose money. We also learned something else—how difficult it was to get financial support to replace the money we had lost, and therefore, at this stage, it is some gratification to all of us that the shareholders, who had the courage to invest in difficult times, and who have gone on investing in this company, sometimes at what might appear to be very high prices, still placed their confidence in our ability to make commercial television broadcasting a success.

Our company has always believed in competition and the decision of the I.T.A. to limit our London broadcasting to week-ends is far from our idea of true competition, but, at the time that broadcasting licences were given, we had no alternative but to accept. We believe we should have a competitive seven-day-a-week operation in London where there would be true competition between two commercial stations.

THE PILKINGTON COMMITTEE

This brings me to the subject of the Pilkington Committee. This committee was set up by the Government to review the whole broadcasting position and to lay down recommendations for the future. When the announcement of the formation of the Pilkington Committee was made, we immediately set up a study group to give expression to our own point of view and to give any help we could to the Committee, particularly with regard to the changes which had taken place from the technical and political points of view. Our study group reported that there would not be enough space in the existing television broadcasting bands to enable two competing commercial broadcasting stations to operate in all areas. This fact emerged without any regard to the claims the B.B.C. might make.

Our endeavours to deal with the dilemma of creating competition in the London area became the starting point of the proposals which we made to the Pilkington Commitee on May 2nd.

We confirmed to the Pilkington Committee that we accepted the recommendations of the Television Advisory Committee for the adoption of 625 lines as the British standard. In order to give effect to this we offered, on the days we were not broadcasting in London, to put out a new programme on 625 lines in the UHF band which would carry in addition one hour a day of 625 line colour broadcasting—all at our own expense. Surely this would be a great contribution, and something that would give encouragement to the scientists, the technicians, the script writers, the producers and all the many people who will benefit from an expansion of television broadcasting.

SIX YEARS OF INDEPENDENT TELEVISION

A great battle had raged in the House of Commons about how commercial television would handle a potential audience. Everyone knew that Britain had established one of the finest broadcasting machines in the world—the B.B.C.—with enormous wealth, subsided by licences, not answerable to the House of Commons, and with all the privileges which accrue to a state service. It was for the audience that had hitherto been served by the B.B.C. that commercial television had to compete, and this was the challenge which we took up. And now after six years of television broadcasting I say with confidence that we have discharged our responsibilities and we have given a service which can stand the most detailed examination.

And what else have we as a broadcasting company done? We have endeavoured, and to a great degree succeeded, in giving our public good entertainment. We all know that there is a small sector of intelligent people who think our programmes are bad because they give the public what they want to see and not what the intelligentsia think they ought to see. Television broadcasting is meant to be entertainment, and while we recognise that the standard of taste of a great number of viewers in this country could be higher, we feel it is essential not to get too far ahead of our public, but rather to lift, gradually, the quality of our programmes on a progressive basis.

TELEVISION IN THE MIDLANDS

It is right to refer with emphasis to the importance of that half of our business which stands independently on its own feet as the Midland Television Broadcasting Station for five days a week. Your Board from the outset has always considered the Midlands a self-contained organisation and not an off-shoot of a big operation based in London.

The Midlands is a country all on its own, and with the new power from the Lichfield transmitter, 2,366,000 homes are covered nightly. Great towns like Leicester, Gloucester, Hereford, Shrewsbury, Stoke, Birmingham, Coventry, Walsall, Wolverhampton, Burton, Nottingham, Northampton, Worcester, West Bromwich, Dudley, and many others are spread around in this independent-minded area.

The profits from this area have been most satisfactory. The standard of programmes has been high. The public has been enthusiastic about the entertainment.

PROFIT AND LOSS ACCOUNT

The profit of the Group before taxation is £6,411,899 as compared with £5,388,330 for the previous year, an increase in excess of £1 million. This profit is after charging all expenses including depreciation. From the profit mentioned above taxation absorbs £3,239,810. In view of the results achieved during this period your directors recommend a final dividend of 40 per cent making 60 per cent for the year as compared with 50 per cent for the previous year.

ELSTREE STUDIOS AND OUR TECHNICAL STORY

Many of the great television programmes of the future, not only on British screens but on screens all over the world, will show what will become a famous caption, "An Elstree Programme."

We always planned from the beginning of our contract with the Independent Television Authority, to have an imaginative yet highly functional group of buildings which would give the greatest possible scope to free enterprise television to create programmes of the highest quality.

Now, here at Elstree, on 31 acres, one can see this conception taking shape and, down to the last detail, the organisation has been undertaken by our own executives. A team of experts has worked and striven for the last 18 months to take Elstree through its first stages, and engineers and production people have all contributed to achieve an outstanding result. Only people with great faith in the future of commercial television would have undertaken this vast operation. Now we are ready to give the best programmes to an expanding British television service; to give scope for their abilities to script-writers; to give producers and directors the last word in service, and to actors the best possible facilities.

As far as equipment is concerned, ATV, here working closely with the Pye Group, has not only incorporated equipment which is unique and in advance of that used in any other studio but has adopted modular or "building brick" construction so that when improved components become available the "building bricks" can be replaced by pulling out a unit and plugging in a new and better one. Great emphasis has been placed on the use of transistors wherever possible and all synchronising signal generation, picture selection, and switching is done by transistors. Transistors are commonly used in everyday devices such as portable radios, but their application to television transmission equipment and to apparatus that can accommodate 405, 525, and 625 line signals is quite new.

INCORPORATED TELEVISION COMPANY

Your wholly-owned subsidiary, ITC—Incorporated Television Company, Ltd., is the biggest exporter of British television programmes. ITC is responsible for the production of films which are distributed in the Eastern Hemisphere, including the Iron Curtain countries, and supplies these films to our American subsidiary in the Western Hemisphere. ITC has produced over 1,600 half-hour programmes which have been sold throughout the world.

AUSTRALIA

Every year we have further confirmation of how right was our judgment when we bought our interest in Australia a few years ago.

We have always realised the potential market of the television industry in Australia, and we had this in mind right from the first. Not only are we identified with one of the great radio networks in the Commonwealth, but we are partners in its expansion and in the extension of its reputation in Eastern and Southern Australia.

In addition to that, in so far as the Australian law permits us, we have entered the commercial television field in a substantial way through our organisations there.

OUR NORTH AMERICAN VENTURE

One of the first plans our management had when we started to create programmes for our British audiences was to provide entertainment of a standard which would have a ready market overseas and particularly in the North American continent.

As we reported last year, we bought the other half of the Independent Television Corporation. Having acquired control, we took steps to strengthen the management and reduce the overheads. We are now able to report that these steps have been successful and the operational period to April 30, 1961, has been a profitable one. We would congratulate our American management on their success.

THE LINK WITH MOSCOW

This year your company was responsible for providing "live" programme exchanges with the Soviet Union, and was the first to send back coverage of events in Moscow produced jointly between ATV's production personnel and Soviet Union crews and technicians.

Talks have taken place in Moscow with the U.S.S.R. television organisation and many more programme exchanges are planned for the future.

BRITISH RELAY WIRELESS TELEVISION

Three years ago we took up half a million pounds' worth of convertible loan stock in this company and, as this stock is on the point of being converted into ordinary shares, it is right that reference should now be made to this investment. Since we took up the loan stock, we have taken advantage of our rights to take up shares as if we had been ordinary shareholders in the company. The situation is that, when our stock is converted, we will hold 2,216,025 ordinary shares in the company.

PLANNED MUSIC LTD.

It is now over three years since we started this important subsidiary operation with the purpose of exploiting in the British Isles and certain other countries in the world the American form of background music called Muzak.

During this year, the extension of the services of the Muzak organisation on a regional basis has continued and national coverage has now been attained in England.

GOLDEN GUINEA—AND OTHER DISCS

In 1960-61 Pye Records Limited, of which we own 50 per cent, had a year of continued expansion.

Last year was the first full year of direct to dealer trading, now developed so far that every important record retailer in the country is regularly visited, helped and advised by our records van-man.

Golden Guinea family-priced long playing records too are nationally known as the only range of records that give entertainment to all the family. One outstanding issue during the year on this label was the special presentation set of Handel's *Messiah* on three records issued for Christmas.

IN CONCLUSION

I look forward to another year of progress in programme achievement, technical achievement and export achievement.

GODFREY DAVIS LIMITED

TRIBUTE TO LATE CHAIRMAN

At the Annual General Meeting of Godfrey Davis Limited held in London on August 30, 1961, **Mr C. A. Redfern,** the Chairman, in the course of his comments said:

I would like to say a few words concerning the very real loss our Company has sustained by the death, last week, of its Founder and Chairman, Mr Godfrey Davis, after an illness lasting for over a year and borne with quite astonishing fortitude. He was always a source of great inspiration to those of us who had the privilege of working with and for him and where this Company stands to-day is, to a very great extent, due to his initiative and foresight. We in the Company have lost a devoted colleague and friend. Many of the executives and employees have worked with Mr Davis for a considerable number of years and I suggest we can provide no better memorial to his memory than to continue, with renewed vigour, the work which he commenced and carried on so successfully.

PROFITS MAINTAINED DESPITE DIFFICULTIES

The following is an extract from the statement by Mr Godfrey Davis circulated with the Accounts :

In spite of the difficulties of the past year the profit of the Group, after providing for all charges, including depreciation, but before charging taxation, amounted to £339,170 compared with £337,699 for the previous year. However, this year's figure includes £8,306 transferred from the Hire Purchase Deferred Profits Suspense Account. This reduction in the Suspense Account compares with an addition to that account of £50,777 in the previous year. An interim dividend of five per cent was paid on the ordinary capital and the Board recommend the payment of a final dividend of 10 per cent, making a total for the year of 15 per cent.

Sales of new passenger vehicles through our Ford Distributorship at Neasden were rather lower than in the previous year, which included exceptional sales of the new Anglia introduced in the Autumn of 1959. This was due mainly to the re-imposition of Hire Purchase restrictions in April, 1960. Sales of new commercial vehicles however were well maintained.

In servicing and repairs Neasden had another record year. This was due partly to the additional facilities provided for this service, and partly to the working of the night shift, the introduction of which I referred to in my review last year.

SELF DRIVE HIRE

Although the total revenue for Self Drive Hire was little changed from last year, rising costs reduced profit margins. Compared with other countries in Europe and particularly in America, hire charges here are very low. With ever rising costs I hope that it will be realised that price cutting is no answer to the problem and that eventually charges will have to be raised to a more economic level.

Last year I referred to the re-imposition of credit restrictions, which had such an adverse effect upon the motor car industry. The subsequent easing of these restrictions by the Government to a more sensible basis certainly helped us in the latter part of our financial year; it is to be hoped that the stop and start approach to this problem used in the past will not be re-introduced.

Bad debts amongst our hire purchase customers have been small, and although many contracts have some time to run, I do not think we need fear any serious losses from this source. Last year was a particularly difficult one and the results now before you could not have been achieved without the whole-hearted support of a splendid team of executives and staff. To them all I give my warm thanks for their outstanding efforts throughout the year.

The report and accounts were adopted.

'INTERUNIE'

N.V. INTERNATIONALE BELEGGINGS UNIE

Summary of the Interim Report for the period January 1st to July 31st, 1961, by the Managing Directors.

As may be seen from the figures, your company has, since the beginning of the year, again enjoyed a period of healthy growth.

The issued capital increased from fls. 55,500,000 to fls. 64,643,200, net assets (investments taken at market) from fls. 229,512,917 to fls. 263,010,305, whilst the value per share, including duties, etc. and adjusted for the 5% stock dividend distributed last March, rose from fls. 206·65 to fls. 213·50.

The offer made to holders of "National Beleggingsdepot" and "Amerikabelegging" units to exchange their units for "Interunie" shares and which has been accepted by nearly all those concerned has contributed to this growth.

INVESTMENT POLICY

Price trends on the main European stock markets during the period under review resulted in a certain interrelated adjustment. We have therefore concentrated new investments on stock exchanges outside Holland, thereby further adding to the geographical spread of our portfolio.

This has led us to make our first purchases in France where the favourable economic trends of past years have continued; as the political situation is not yet clearly defined we have been cautious in selecting our commitments.

The total percentage invested in European countries excluding Holland amounts now to appr. 10%, as against appr. 5% at the beginning of the year.

The percentage invested in Dutch securities, which early in 1961 had grown quite substantially to 54·8% because of the steep rise in prices, has been reduced after the revaluation of the guilder and now stands at 47·7%.

We did increase our American holdings from 27·7% to 30·2%; our Canadian holdings are practically unaltered at 4·1%.

Our cash holdings at July 31st are larger than usual with your company at this time of the year.

As far as can be ascertained at this early date it seems that the profit trend will again permit payment of a satisfactory dividend in due time.

The distribution of the company's investments over various countries, as expressed in percentages of total net assets (securities taken at market value), was as follows :—

	31.7.1961 %	31.12.1960 %
Netherlands :—		
International stocks	23·0	28·4
Local stocks	24·7	22·9
	47·7	51·3
U.S.A.	30·2	27·7
Canada	4·1	4·3
Germany	3·6	2·5
United Kingdom	3·2	2·9
France	2·5	—
Belgium	0·4	—
Various other countries	0·1	0·1
Net cash	8·2	11·2
	100·0%	100·0%

SIR LINDSAY PARKINSON & CO. LTD.

A SCRIP ISSUE

The Twenty-fourth Annual Ordinary General Meeting of Sir Lindsay Parkinson & Co. Limited was held on August 31st in London, **Mr A. E. Parkinson,** chairman, presiding.

The following is an extract from his circulated statement:

The Group profit for 1960 before taxation amounts to £356,601, as compared with £308,146 for 1959. Taxation absorbs £157,643 against the charge of £159,905 for 1959.

The Group profit and loss account balance carried forward after providing for the dividends for the year is £596,706 compared with £475,557 brought in.

CONTRACTS AT HOME

The Civil Engineering Department has continued to expand. Since my last statement we have been awarded by the Central Electricity Generating Board the contract for the Site Preparations, River Works and Circulating Water System for the Nuclear Power Station at Oldbury, on the River Severn. The value of this contract is some £2¼ million. We have also secured contracts for work at London Airport in excess of £½ million, and in recent weeks have been awarded by the Ministry of Transport the contract for the final section of the M6 Birmingham-Preston Motorway, valued at just below £6 million.

The further expansion of our Speculative Housing work, which I forecast last year, has been realised, and our activity in this particular field is still growing.

After referring to overseas activities, the chairman continued:

DIVIDEND

An interim dividend of 4 per cent was paid and the Board is able to recommend a final dividend for 1960 of 11 per cent (less tax), making a total of 15 per cent against the forecast of 13¾ per cent. In addition the Board recommends a bonus issue in the proportion of one fully paid new unit for every ten held.

In making this proposal the Board stated, when publishing the preliminary figures, that in the absence of unforeseen circumstances they saw no reason to anticipate that the rate of dividend for 1961 on the increased capital would fall below the total of 15 per cent proposed for 1960. Since that time the Chancellor of the Exchequer has announced his measures for dealing with the economic situation. At this stage the Chancellor's measures would not appear to alter the forecast for the current year, unless further restrictions are imposed before the end of the year.

Our activities have expanded as I anticipated in my last statement, and the value of work in hand is over £24 million, compared with some £20 million last year. Our confidence in the future is indicated by the decision of the Board to recommend a capitalisation issue.

The report was adopted and the proposed scrip issue approved.

MOUNTSTUART DRY DOCKS, LIMITED

IMPROVED RESULTS

The Fifty-ninth Annual General Meeting of Mountstuart Dry Docks Limited was held on September 5th at Cardiff, **Sir G. Leighton Seager, Bart, CBE, DL, JP,** presiding.

The following is an extract from the Chairman's circulated Statement:

Our results show an improvement on the previous year. We were able to secure and handle a much larger volume of work than we did in the previous year, and had it not been for a very considerable loss at Barry, our results would have been very much better. Your Directors, with great reluctance, decided in June of this year to close the Barry Graving Docks, and for the time being no shiprepairing work will be undertaken there. Other forms of employment for our Barry Docks are being considered.

Now that we have pruned as far as we consider to be necessary, we have confidence that our group, embracing as it does a wide range of docks, is in a higher state of efficiency than ever. In the absence of unforeseen circumstances, I hope the improvement of last year will be maintained or even better results achieved in twelve months time.

In view of the improved results for the year, and in the hope that we have turned the corner, the Board has decided to recommend a dividend of 6 per cent, making the total distribution £72,649, as against £65,983, which I hope Shareholders will consider not unsatisfactory.

The report and accounts were adopted.

BANQUE DE PARIS ET DES PAYS-BAS

PARIS

The Annual General Meeting of BANQUE DE PARIS ET DES PAYS-BAS was held in Paris on May 18th with **Monsieur Emmanuel Monick** in the Chair. The following are details of the report presented by the Board of Directors:

REVIEW

In France, 1959 had been devoted to economic consolidation after the monetary reforms of December 1958; 1960 was a year of expansion with stable domestic finances and balanced foreign accounts. In 1959 foreign trade had, in fact, been responsible for counterbalancing the deflationary effect of the monetary alignment. In 1960 the decisive factors in a recovery which went beyond all expectations were investments and the development of domestic consumption. Whereas an expansion of 5½ per cent in the gross domestic product had been estimated in the temporary plan drawn up at the beginning of 1960, the actual rate was more than 6 per cent.

All the major sectors of the economy contributed to this result.

The favourable trend evidenced by the economy in France and in numerous other countries could not but have a positive effect on the results of the Bank, all of whose departments operated at a high level of activity throughout the year.

DOWTY

GROUP LIMITED

CHELTENHAM

Extracts from Sir George Dowty's Statement to Shareholders

CONTINUED EXPANSION OF PLANT AND RESOURCES

Boulton Paul Aircraft Limited an important new member company.

New factories at Ashchurch, Coventry and in Malta.

Development of Dowmatic Transmission for wide range of vehicles.

Further successes in overseas markets for mining equipment.

	Year 1960-1961
Group Profits	£2,525,668
Taxation	£1,196,454
Available Profits	£1,329,214
Capital and Reserves	£11,088,485

Dividend for year: 9½% Net

PROFIT AND DIVIDEND

The Balance Sheet as of December 31, 1960 shows total assets of NF.2,758,723,914.84.

The net profit of the year amounts to NF.18,835,406.74 as compared with NF.15,334,431.62 in 1959 and enables us to propose a net dividend of NF.5.50 per share of NF.50 par value or NF.11 per consolidated share of NF.100 par value, and to carry forward the sum of NF.235,804.18.

The report, the accounts, and the proposals put forward by the Board of Directors were adopted.

TOWN AND COMMERCIAL PROPERTIES

ANOTHER YEAR OF EXPANSION

The annual general meeting of Town and Commercial Properties Limited was held on September 7th in London.

The following is an extract from the circulated statement of the chairman, **Mr R. C. Yablon, LLB**:

I am pleased to report a second year of expansion, during which the gross assets have increased from £3,961,113 to £5,773,564.

The profits before provision for taxation have increased from £72,771 to £88,540 leaving a sum of £58,645 after provision for taxation. At the time of making the Rights Issue in November last your Directors paid an interim dividend of 6 per cent, and forecast a final dividend of 5 per cent on the increased capital. In the light of the improved profits your Directors feel confident in recommending a final dividend of 7½ per cent.

Mr Yablon commented on proposals to convert the existing shares of 2s. each into shares of 4s. each, and the making of a free scrip issue of one new 4s. share for every four shares held, and said that in the absence of unforeseen circumstances the Directors proposed to recommend a dividend of 6½ per cent on the increased capital of £1,357,500 for the current financial year, which was equivalent to 16¼ per cent on the present issued capital of £543,000.

An assurance was given that in view of the large balance of unissued capital, namely £642,500, no further issue would be made in such a manner as to affect the control or nature of the business without the members' prior consent in General Meeting.

Referring to the closer association with the Legal & General Assurance Society, the chairman said that the Society had acquired an equity of approximately 10 per cent in the issued share capital of the Company and had made provision for long-term finance amounting in all to approximately £4,000,000.

He continued: During the year under review your Company acquired control of the Burtol Group, but the major benefits are not expected to accrue until the year 1962/63.

The total cost of developments now in hand, inclusive of sites, amounts to a sum in excess of £2,500,000. Your Company has sufficient sites and projects now in hand to provide a flow of developments over the next few years. With adequate long-term finance to cover the substantial development programmes in hand and with the consequent rising income, your Board looks to the future with confidence.

COMBINED ELECTRICAL MANUFACTURERS

ATISFACTORY RESULTS OF MERGER

The first annual general meeting of Combined ectrical Manufacturers Limited was held on gust 31st in London, **Mr Anthony M. Browne** airman) presiding.

The following is an extract from his circulated tement for the period ending March 31st, 61:

Combined Electrical Manufacturers Limited is formed a year ago to amalgamate Hackidge and Hewittic Electric Company Limited d Switchgear and Cowans Limited together th their respective subsidiaries.

The products of these various companies—ansformers, A.C. and D.C. Switchgear and ectifiers—are in a great measure complementry and required in connection with the Electric upply Industry. Bertram Thomas, however, so have an important output in storage equipent known as "Tilt Racks" and supplied to many branches of industry.

The Directors are satisfied with the results of the merger. For Shareholders there are the added advantages that the risks and opportunities are spread over a wider sphere of the industry.

The total dividend of 12½ per cent is as forecast. We estimated that the combined profits would be at an annual level in the neighbourhood of £700,000. Allowing for the varying periods of the different Companies the annual rate works out at approximately £675,000. The difference between the estimated and achieved figures is due to a combination of factors. Some large equipments which were planned for output in March could not be completed in time. The transference of production to the new factories at Thanet (New Switchgear) and Hulme (Bertram Thomas) which took place in the last months of the period under review had some temporary adverse effects on production.

The figures show that your Companies have completed a successful trading period although conditions have been difficult owing to the reduced profit margins and the mounting cost of research and development which it is necessary to undertake. Only by improved organisation, higher productivity and increased turnover from all factories can the financial results be improved or maintained and our efforts are being concentrated in achieving these objectives.

The value of orders secured and anticipated in the Group are very satisfactory enabling us to plan for an increased output which, barring unforeseen circumstances, we should be able to achieve.

Under the present national and international circumstances, it is more than usually difficult to make a forecast. Nevertheless we look forward with confidence to the results of the present year.

The plant supplied by our various Companies continues to give good service and the names attached to our products stand for excellence in operation and in service given at home and in all parts of the world. Repeat orders which have always been a regular feature in the history of our Companies continue to form the greater part of our order books. A good proportion of export business has also been maintained.

The report was adopted.

COMPANY AFFAIRS

Bowater Paper

CONTINUING pressure on profit margins, to which Sir Eric Bowater referred at he last annual general meeting of Bowater 'aper, is clearly reflected in the first half igures for 1961. In his comment on them, Sir Eric shows that the increase in sales and n total profits above those for the first half of 1960 is attributable to new projects brought into production and to the expansion of the group's overseas interests, which in the first half of this year contributed as much as 75 per cent of the group's earnings. The group, it would appear, is still not able to make full use of capacity and intensive competition between the paper-makers is forcing margins down.

Sir Eric sees a "definite improvement" in North America and a less definite one in this country; but he says that immediate prospects in this country are difficult to assess until the effects of the credit restrictions become apparent and until Britain's future relations with the common market and the Commonwealth are more clearly defined. But neither here nor in North America does Sir Eric look for "any substantial upturn in trading conditions in the

Net profit/sales, per cent.	4·3	3·7	2·9

remaining months of 1961." The group continues to press ahead with development projects, notably on the Continent. Immediately, these will add something to capacity and possibly to sales but not much to earnings. Sir Eric does not expect the 1961 trading surplus to be quite so high as last year's. It is not surprising that the directors have left the interim dividend unchanged at 5 per cent; on last year's total payment of 13¾ per cent the £1 shares having fallen by 5s. 9d. to 49s. yield 5.6 per cent.

Carreras

IN the year to June 30th Carreras, which now takes in the British interests and some of the overseas interests of Rothmans, added to its share of the tobacco and cigarette market, especially in filter-tipped brands. Some benefits arose from the reorganisation and re-equipment programme and from the establishment of closer links between Carreras and Rothmans, which include an agreement under which Carreras manufactures products for Rothmans' export trade. The increase in the manufacturers' price for cigarettes came too late to have much influence on the latest results, which show that the gross profit of £2,608,000 is well in excess of the forecast of £2,275,000 made at the time of the Carreras-Rothmans integration. Of this profit, well over £500,000 was contributed by Rothmans. None of its profits was included in the 1959-60 figure of £1,774,000 but, as that included profits from the Rock City Company in Canada and the 1960-61 figure does not, it is clear that Carreras's own interests earned more. Presumably, this partly reflects more economical production at the new factory at Basildon; Carreras's older Arcadia works have been sold and the profit on this transaction is reflected in the transfer of £1,373,000 to capital reserve.

The directors have raised the dividend on the ordinary and "B" ordinary shares (which now control 50 per cent of the votes) from 8 to 9 per cent. In doing so, they have borne in mind the Chancellor's request for restraint but they believe that a small increase is justified in view of the level of profits available for distribution in the past few years. But for the Chancellor's appeal, they say, the dividend would have been higher. Certainly the cover of 2½ times on the 9 per cent dividend provided by net profits of £1,260,000 against £833,000 would have justified at least 10 per cent. In looking at the yield of nearly 4¼ per cent offered by the 2s. 6d. "B" shares at 4s. 10½d., therefore, investors may conclude that there is something more tangible to come.

Great Universal Stores

THE prompt response of the directors of Great Universal Stores to the Chancellor's call for dividend restraint inevitably overshadowed the impact of the somewhat disappointing profits earned by GUS in the year to March 31st last. As the chairman, Mr Isaac Wolfson, points out, this was a most difficult year following the reimposition of hire purchase controls. The point, however, that shareholders should not overlook is that while the controls were in force for the whole of the financial year, trading results in the second half of that year were not as satisfactory as in the first half and that on March 31st GUS was crediting a deferred profit from earlier HP contracts to the trading surplus, which points to a marked contraction in HP transactions.

As a result of hire purchase controls GUS had to switch part of its higher-priced hire purchase business into a wider range of lower priced goods where margins of profit are no doubt much smaller. Thus while Mr Wolfson, somewhat surprisingly, says that all the group's various divisions made "sound progress" last year, he singles out particularly the mail order and multiple stores sections of the business. These changes in trading are reflected in the group balance sheet where "other instalment debts" show a net rise of over £3½ million to £29 million, while the total hire purchase debt has fallen by almost £2 million to £42½ million, shown after a provision for deferred profits of £19.4 million on March 31st.

So far in the current year sales and profits are above those for the same period last year and Mr Wolfson is clearly confident about the prospects for the year as a whole. His confidence is backed by a healthy balance sheet with cash holdings in this country amounting to £11½ million (compared with overdrafts overseas of £2½ million) and a cash flow of the order of £9¾ million a year. Slightly firmer as a result of this statement the 5s. "A" shares at 49s. 9d. yield 3.8 per cent on the unchanged dividend of 37½ per cent.

Davy-Ashmore and Wellman Smith Owen

THE mergers between Davy and United and Power Gas, to form the Davy-Ashmore group, and between Wellman Smith Owen and Incandescent Heat had much the same purpose: to add to the diversity of products and to form groups that were more capable of handling "package" orders from their principal customers—the steel, metallurgical, and chemical industries. Both groups did well in the year to March 31st. Davy-Ashmore's profits rose from £2,353,000 to £3,991,000, and would have been even higher but for some exceptional non-recurring charges. WSO's trading profits rose from £1,779,000 to £2,114,000. WSO left its dividend unchanged at 25 per cent in keeping with the Chancellor's request, but is making a one-for-seven scrip issue; DA's 27½ per cent is 2½ per cent more than the forecast at the time of the merger. Both groups have sufficient liquid balances to cover their commitments, so long, Mr D. F. Campbell, the retiring chairman of Davy-Ashmore points out, as customers do not demand excessive credits.

Both have plenty of orders on hand—WSO's order book amounts to over £11 million and DA's work-in-progress to £29 million—and both can look forward to satisfactory trading results in the current year and probably in 1962-63 as well. In each case, benefits from the mergers should then emerge more clearly than they did in 1960-61. Until, in fact, the latest phase of development in the British steel industry is completed, investors should have little to worry about. Indeed, this is reflected in the yields: 3.9 per cent, covered 2¼ times, on Davy-Ashmore at 140s. 6d. and 3.5 per cent, covered 2¼ times, on Wellman Smith Owen at 36s.

But, as Mr Campbell points out, capital goods producers are engaged in a business with a long term cycle and both have to look beyond the immediate future. This has led WSO to sign agreements with Voest of Austria on the LD oxygen process for steel-making and with Schloemann of Germany on the manufacture of rolling mills; Sir Peter Roberts, the chairman, says that

APPOINTMENTS

UNIVERSITY OF GHANA

DEPARTMENT OF AGRICULTURAL ECONOMY

Applications are invited for the following osts:

(a) SENIOR LECTURER or LECTURER ith special interest in Agricultural Economics nd Farm Management.
(b) SENIOR LECTURER or LECTURER ith special interest in Farm Mechanisation or oil Conservation.

Salaries: Senior Lecturer: £G1,750 x £G75 -£G2,200; Lecturer: £G1,050 x £G50—£G1,400 £G75—£G1,850; £G1,900. Non-Ghanaians a additional 20 per cent. Entry at appropriate ssition. Appointment normally five years in rst instance.

Outfit allowance £G60. Car allowance: £G150 a. Family allowance for non-Ghanaians for ch child in West Africa £G50 p.a. or, if nder age of 21 and being educated outside est Africa, £G100 p.a. (maximum five hildren). Part furnished accommodation at harge not exceeding 7.5 per cent. of salary. S.S.U. policies maintained if already held, r superannuation on similar basis.

Passages for appointee and family on appointment and normal termination. Annual leave ith three overseas return passages in every our years for non-Ghanaians and one every three years for Ghanaians.

Applications, with full details of qualifica-ons, experience, etc., and naming three referees, o be sent before October 9, 1961, to the Assistant Registrar (London), University of Ghana, 15 Gordon Square, London, W.C.1, rom whom further information may be obtained.

COMMONWEALTH ECONOMIC COMMITTEE invites applications from Economists with wide experience for appointment as SECTION OFFICER. Salary according to experience in scale £1,781-£2,483. Improved experience allowance. Non-contributory superannuation scheme (F.S.S.U.). Five-day week. Duties include preparation of regular and occasional reports on trade, production, etc., of Commonwealth Commodities or on specific economic questions; supervision of professional staff in section.—Applications, giving curricula vitae, qualifications, names of referees, etc., to Secretary, Commonwealth Economic Committee, Marlborough House, Pall Mall, London, S.W.1.

UNIVERSITY OF GHANA

DEPARTMENT OF ECONOMICS

Applications are invited for posts as

SENIOR LECTURER AND LECTURER IN ECONOMICS

For one appointment special interest in Economic Theory required, and for the Senior Lecturer considerable teaching or research experience essential.

Salaries: Senior Lecturer: £G1,750 x £G75—£G2,200. Lecturer: £G1,050 x £G50—£G1,400 x £G75—£G1,850; £G1,900. Non-Ghanaians an additional 20 per cent. Entry at appropriate position.

Appointment normally for five years in first instance.

Outfit allowance of £G60. Car allowance £G150 p.a. Family allowance for non-Ghanaians for each child in West Africa £G50 p.a. or, if under age of 21 and being educated outside West Africa, £G100 p.a. (maximum five children). Part furnished accommodation at charge not exceeding 7.5 per cent. of salary. F.S.S.U. policies maintained if already held, or superannuation on similar basis.

Passages for appointee and family on appointment and normal termination. Annual leave with three overseas return passages in every four years for non-Ghanaians and one every three years for Ghanaians.

Applications (six copies) with full details of qualifications, experience, etc., and naming three referees, to be sent before September 23, 1961, to the Assistant Registrar (London), University of Ghana, 15 Gordon Square, London, W.C.1, from whom further information may be obtained.

THE EDINBURGH SCHOOL OF AGRICULTURE

Applications are invited for the post of ASSISTANT ADVISORY OFFICER, FARM BUILDINGS.

Salary Grade IV—£718-£993.

The appointment is eligible for Superannuation.

Candidates should hold a degree in Agricultural Economics or Agriculture or Economics. Post-graduate study or especial interest in Work Study is desirable. The post has been created to further the study of labour and power organisation in farming.—Particulars and application forms may be obtained from the Secretary, Edinburgh School of Agriculture, West Mains Road, Edinburgh, 9, with whom applications should be lodged within two weeks of this advertisement.

J. A. JOHNSTON, Secretary.

For other appointments see page 1019

AREA POLITICAL EDUCATION OFFICER required for political party organisation. Applicants should be University graduates, preferably between 25 and 45. Commencing salary according to experience and qualifications, not less than £750.—Write to Conservative Political Centre, 32 Smith Square, London, S.W.1.

MIDDLESEX COUNTY COUNCIL

Education Committee

Ealing Technical College, St. Mary's Road, Ealing, W.5

Principal: Dr. O. Lee Pickard, B.Sc.(Econ.), B.Com., F.I.O.M.

APPLICATIONS are invited for appointment as SENIOR LECTURER in a Division of Marketing to be established in the School of Business at Ealing Technical College; duties to begin as soon as possible although the College is prepared to wait a reasonable time for the right person to allow existing commitments to be discharged.

The Division will specialise in marketing education and will be one of the first of its kind in the country. The initial staffing envisaged is one Senior Lecturer, one Assistant Lecturer and two Research Assistants. The senior appointments will not be made until a Senior Lecturer has been appointed and is available to advise on the remaining appointments.

The successful applicant for this post should have at least five years' experience in marketing or marketing research, a good degree and/or professional qualification of high standing, and preferably have contributed to the serious literature of the subject. Permission will be given for consultancy work to be undertaken.

Salary:—

Senior Lecturer, £1,588-£1,801 per annum (under review).

Assistant Lecturer and Research Assistants, £738-£1,201 per annum (under review).

In the case of Assistant Lecturer and Research Assistants additions may be given for industrial experience (up to £330 above the minimum), training and study (up to £120 above the maximum) and for qualifications (£165 above the maximum).

Application form and further information on application to the Principal (F.S.U.E.). Closing date two weeks from the date of this advertisement.

Previous applicants please do not re-apply.

C. E. GURR, M.Sc., Ph.D., Chief Education Officer.

THE CENTRE FOR BUSINESS RESEARCH, newly established in the University of Manchester, invites applications for one or more posts of SENIOR RESEARCH OFFICER. Candidates should have a good honours degree including economics or statistics, experience in industry or commerce, and an interest in research. Salary in the range of £2,000-£3,000, according to qualifications and experience.—Apply by letter to Professor B. R. Williams, The University, Manchester 13, from whom further details may be obtained.

AN opportunity exists for a Market Research specialist to participate in the development of an organisation in the field of Industrial Market Research. This will be an extension to the activities of an Engineering Sales Company in Birmingham.

Applicants should preferably have a degree in Economics, and should have actual experience of the conduct of Industrial Surveys. A knowledge of Languages would be advantageous. Replies in confidence to Box 1540.

BUSINESS AND PERSONAL

THE CHARTERED INSTITUTE OF SECRETARIES

Employers requiring the services of Chartered Secretaries to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute (Dept. E), 14 New Bridge Street, London, E.C.4.

TOP CITY MEN prefer good secretaries introduced through STELLA FISHER BUREAU, 436 Strand, W.C.2.

ANY PORT IN A STORM—but only one sherry. Regardless of the weather, it's EL CID, the superb Spanish Amontillado that pleases the most discerning palates.

THE ENCOURAGEMENT AND PROTECTION OF INVESTMENT IN THE DEVELOPING COUNTRIES. This conference is intended to cover the legal and commercial aspects of public and private investment in the developing countries. To be held at the Waldorf Hotel, Aldwych, London, W.C.2, on September 28-29. Those taking part include The Rt. Hon. Reginald Maudling, The Rt. Hon. Lord Shawcross, Sir Duncan Cumming, Sir Percival Griffiths, Mr. William Clark, Mr. F. J. Pedler.—Further information from Federal Trust, 10 Wyndham Place, London, W.1. Tel.: PADdington 6670.

HOW MUCH FOOD can you get from packeted soups? SHOPPER'S GUIDE (15s. p.a.) shows their highest percentage of protein to be under one-tenth of adult needs.—Write Consumer Council, Orchard House, Orchard Street, W.1.

EDUCATION AND COURSES

Woolwich Polytechnic
London, S.E.18

EVENING B.SC. (ECON.) DEGREE COURSE

Applications are now being considered for admission to this Course. Students interested should write NOW for further information, to attend for enrolment on Tuesday, September 19th, at 6 p.m.

PROSPECTUS OBTAINABLE FROM: The Secretary, Woolwich Polytechnic, Thomas Street, London, S.E.18.

EXPERT POSTAL TUITION

for Examinations—B.Sc.(Econ.), Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus and or advice, mentioning examination or subjects in which interested, to the Secretary (G9/2).

KINGSTON TECHNICAL COLLEGE

DEPARTMENT OF COMMERCE, LANGUAGES AND PROFESSIONAL STUDIES

BACHELOR OF SCIENCE (ECONOMICS) DEGREE UNIVERSITY OF LONDON

Applications are invited for the course commencing September, 1961. Forms and full details can be obtained from the Principal, Kingston Technical College, Fassett Road, Kingston-upon-Thames, Surrey.

B.Sc.(ECON)

LONDON UNIVERSITY

U.C.C., founded in 1887, successfully prepares students for this Degree (obtainable without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal posts.—Prospectus, giving details of Courses for other London Degrees, G.C.E., Law Exams., etc., from Registrar, University Correspondence College, 29 Burlington House, Cambridge.

SECRETARIAL TRAINING, especially for university graduates and older students. Six-month and intensive 14-week courses.—Write Organising Secretary, Bevis, 159 Holland Park Avenue, W.11. PARK 4684.

WOOLWICH POLYTECHNIC

DEPARTMENT OF COMMERCE AND MANAGEMENT STUDIES

The next six-months full-time POST-GRADUATE COURSE IN INDUSTRIAL ADMINISTRATION will commence on:

Monday, January 8, 1962

Minimum Entrance Requirements: Age 25 years, University Degree in Science or Engineering or other equivalent qualification and suitable industrial experience.

Applications will also be considered from ex-officers with a Staff College or Technical background.

For further details and application form, write to:

The Secretary,
WOOLWICH POLYTECHNIC,
Thomas Street,
London, S.E.18

TUITION FOR B.Sc. ECONOMICS

Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the two examinations for London Univ. B.Sc.Econ. (three if entrance is included) at moderate fees. 1,431 Wolsey Hall students passed London Univ. B.Sc. Economics exams. 1950-60. Tuition also for G.C.E., Law, Statistical, other exams. —Prospectus (mention examination) from E. W. Shaw Fletcher, C.B.E., LL.B., Director of Studies, Dept. P.17.

WOLSEY HALL, OXFORD

negotiations further to expand WSO's interests in oxygen steelmaking are proceeding. Both companies have experience in handling overseas contracts, most notably in the recent past in the consortium engaged on the Durgapur project in India, and both will have to look overseas for an increasing amount of their business. Hence the pace of advance in the undeveloped countries and the prospect of Britain joining the common market are vital to both. Each seems to be prepared for the challenge; but neither underrates the competition. Nor should investors do so in looking beyond the next two or three years.

Unigate

"Drinka Pinta Milka Day" urge the hoardings and the television commercials and milk consumption in this country goes on rising. But this extensive campaign by the National Milk Publicity Council cannot be run on the cheap and Unigate which handles more than one quarter of all milk produced in this country has supported the encouragement of more milk drinking at "a considerable expense," according to the chairman, Mr G. Ivor Price. It has eroded still further the low profit margins; in the year to March 31st last the group's pre-tax profits of £6.2 million represented a return of only 3.2 per cent on sales of £197 million. This return should improve in the future as further economies emerge from a fuller integration of the two large dairy constituents of Unigate, the United Dairies and Cow and Gate companies.

Partly as a result of this merger the group last year spent in excess of its substantial cash flow of £4.4 million. The chairman says that this may continue for two or three years but "subject to many reservations" the group is unlikely to need fresh capital. At the year end, capital commitments amounted to £2.2 million, compared with £1.8 million a year earlier, while net liquid assets had almost halved to £1.2 million. It seems improbable therefore that the group will be able to delay indefinitely the raising of additional capital. Large profit retentions will still be needed and in the face of a 10 per cent increase in net profits the Unigate directors have held the ordinary dividend at 14 per cent, now covered just over twice. For the future the chairman looks for steady progress rather than spectacular results; the market seems to share this view, for the 5s. shares now stand at 16s., compared with 22s. 6d. a year ago, and yield 4.4 per cent.

Triplex

The fall in Triplex's sales from £11,551,000 to £9,421,000, trading profits cut from £1,707,000 to £946,000 and net income cut from £798,000 to £460,000 in the year to June 30th seem sufficient to justify the reduction of the ordinary dividend from 15 to 12½ per cent. Yet the dividend is covered nearly twice by earnings and 15 per cent would have been covered just over 1½ times. Moreover, the group is not short of liquid resources; it has deferred some of its developments but even so it has completed the main extensions to its buildings and is ready to install new plant at short notice whenever it is needed.

The dividend decision may therefore reflect some anxiety about the future. The really sharp fall in sales and earnings occurred in the first half of the financial year; in the second half there was a fairly steady improvement in sales, though they remained below those in the corresponding period of 1960. Sales of laminated glass fell particularly heavily with the decline in car exports to North America and, despite some improvement, the laminating plant is working at only a fraction of capacity. A rebound in profits to the 1959-60 level would require a sharp pick-up in car sales at home and in North America. This looks unlikely now, and though a slight improvement in sales and more economic production may lead to improved profits, they do not seem likely to be much higher than those in 1960-61. Investors should not assume that the dividend will be brought back to 15 per cent; currently the 10s. shares at 30s. 9d. yield 4 per cent.

Murex

Following the doubling of Murex's profits in 1959-60 there was some disappointment that they showed such a small advance from £1,334,000 to £1,337,000 after a bigger depreciation charge in the year to April 30th. The full accounts show that even this small increase resulted from a substantial advance in interest on short term deposits; gross profits, like net profits, would otherwise have shown a slight fall. The new chairman, Mr H. J. Penn, says that the group's sales, mainly of metallurgical products, rose by 9 per cent to £11¾ million and that higher costs were only partly offset by improved operating techniques. Moreover, the company suffered small stock losses from a fall in wolfram prices.

Capital expenditure at Rainham and Waltham Cross in 1960-61 amounted to £550,000 and was designed to promote further economies in manufacture. This expenditure was well within the cash flow of £683,000, but the building up of stocks by £840,000 cut liquid assets from £980,000 to £540,000. At the year end, capital commitments amounted to £141,000 and the chairman is confident that the cash flow will remain adequate to finance the capital expenditure programme unless there is a marked fall in business. So far in the current year demand has been satisfactory but the ten-year record shows that the group's results are subject to marked fluctuations. A lot will depend on the level of activity of the group's main customers including steel, engineering, machine tools and chemicals. At 40s. 6d. the £1 shares yield 6.4 per cent on the 13 per cent dividend, covered 2½ times, and this seems to discount the short-term uncertainties.

London Stock Exchange

FIRST DEALINGS:	Aug. 21	Sept. 4	Sept. 18
LAST DEALINGS:	Sept. 1	Sept. 15	Sept. 29
ACCOUNT DAY:	Sept. 12	Sept. 26	Oct. 10

Despite the immediate implementation of Russia's decision to resume nuclear tests, the stock market remained unperturbed over the week to Wednesday. Before the weekend, markets were largely featureless as the quietest account of the year drew to a close and price movements of industrial equities were small and the level of business was low. The new account also opened quietly, though prices rose slightly toward the close on Monday following the news of the rise in the gold reserves. This, together with the continued strength of the pound contributed to a more definite improvement on Tuesday, when the *Financial Times* index rose 2.7 points, the best daily rise since August 4th. On Wednesday, most prices held firm, but there were some irregular movements in those of market leaders and companies in the news. The *Economist* Indicator showed a net rise of 4.3 points to 370.7 over the week.

The gilt-edged market has been firm throughout the week. There has been a fair demand for medium and long dated stocks and some investment buying of these maturities. Savings 2½ per cent 1964-6 gained ¼ to 82, and Conversion 5¼ per cent 1974 gained ⅜ to 89½. Prices have been helped by the strength of sterling, but there have been few changes in short and undated stocks. War Loan 3½ per cent gained only 1/16 to 53 7/16 over the week.

Interest in bank shares revived after the weekend, and Barclays gained 3s. 3d. to 72s. 6d. xr. Brewery shares have been generally steady, and following good interim results Whitbread "A" gained 2s. 9d. to 29s. 9d. Wall Paper deferred showed the best improvement among building shares and gained 7s. 6d. to 127s. 6d. Stores shares continued to gain ground, especially Marks and Spencer "A" which rose 3s. 9d. to 103s. There has been no decided trend in engineering and steel shares. Most of the movements have been small, with the exception of Davy-Ashmore, which gained 1s. 3½d. to 140s. xd following the chairman's statement. Among motor shares, Leyland showed a net loss of 2s. 3d. to 89s. 3d., while Jaguar "A" gained 2s. 10½d. to 80s. 4½d. The announcement of lower profits for the first half of the year from Bowater caused its shares to lose 4s. 3d. to 50s. 6d. over the week, and paper shares generally have been depressed. Shipping and oil shares drifted lower, and Shell lost 2s. 9d. to 116s. 3d. Most textile shares improved slightly, and West Riding Worsted gained 2s. to 70s. 6d.

Tin shares, after some selective interest immediately after the weekend slumped heavily last Wednesday, as a result of the sharp fall in the metal price. Tronoh lost 6s. 9d. in the day, making a net loss of 8s. to 67s. 6d. xd over the week.

Money and Exchanges

EXCHEQUER RETURNS

For the week ended September 2, 1961, there was an "above-line" deficit (after allowing for sinking funds) of £27,299,000 compared with a deficit of £37,892,000 in the previous week and a surplus of £1,953,000 in the corresponding period of last year. There was a net deficit "below-line" of £52,854,000 leaving a total cumulative deficit to date of £442,683,000 compared with £473,513,000 in 1960-61.

THE MONEY MARKET

Keeping its bid unchanged at £98 6s. 6d. at last Friday's Treasury bill tender the syndicate of discount houses received 48 per cent of its application against 39 per cent at the previous week's tender. The average rate of discount was virtually unaltered at £6 14s. 0.50d. per cent. Total applications, after the previous week's sharp rise of £30 million, fell back by a similar amount to £380 million. The offer of £250 million was fully allotted.

Credit has been almost consistently short in the money market and the authorities have given varying amounts of special help. But this has not been sufficient to keep houses from borrowing at the Bank of England. On Friday of last week five or six houses were forced to borrow a moderate amount at Bank rate and on both Tuesday and Wednesday penal borrowing was again necessary, though for very small amounts. Business in bills has been on a small scale, with the clearing banks continuing to buy November bills at 6 19/32 per cent.

In New York the three months bill rate recovered slightly (after last week's sharp fall) from 2.310 to 2.392 per cent.

(1) For a rough conversion to basis of June, 1947, multiply throughout by 1·534. (2) The interim index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. (3) For a rough conversion to basis of June, 1947, multiply throughout by 1·561. (4) In general males under 21 and females under 18 years of age. (5) Surveys made twice a year; annual figures relate to October survey. (6) Index revised and rebased on 1958=100 (see *The Economist*, January 7, 1961, page 59). (7) Revised series. (8) The series has been revised by the Chamber of Shipping to reflect a more up-to-date pattern of tramp shipping movements and uses the average freights in 1960 as the basis of comparison; 1958 and 1959 figures on the old basis of 1952=100 have been linked to 1960=100 by multiplying by 1·348, freights in 1960 being considerably lower than they were in 1952. (9) April, 1960.

APPOINTMENTS

Union Carbide Europa S.A.

Genf

UNION CARBIDE

bietet einem energischen Herrn zwischen 28–35 Jahren sehr gute Aufstiegsmöglichkeiten mit Wohnsitz in Genf auf dem Gebiete der

INDUSTRIELLEN MARKTFORSCHUNG

Der Bewerber sollte eine abgeschlossene Hochschulausbildung als Volkswirtschafter, Physiker, Chemiker oder dergleichen haben. Einige Jahre Erfahrung im industriellen Verkauf oder in der Marktforschung sind erwünscht. Darüber hinaus muss der Bewerber ausserordentlich gute Kenntnisse der englischen und deutschen, sowie gute Grundkenntnisse der französischen Sprache aufweisen.
Bewerbungen in englischer Sprache mit Angaben über Ausbildung und Erfahrung, etc., sind erbeten an Personnel Manager, Union Carbide Limited, 8 Grafton Street, London, W.1.

Younger Executive & Technical Appointments Division

MSL

have been retained to advise on this appointment.

ASSISTANT TO EUROPEAN AREA MANAGER

who will manage the small London office (5 staff) of a large U.S. company (turnover approximately $150 million) with business interests in Great Britain and on the continent. This office, which is registered as a limited company, imports processed natural products for direct sale or use as intermediates by associated companies; exports finished products; and acts as a co-ordinating centre for information concerning the European associates and subsidiaries of the U.S. company.

Candidates should have controlled a small sales office and have experience of sales correspondence, import and export documentation; they should be able to interpret statistical returns and accounts; and they should welcome the possibility of promotion to a position on the continent or in the U.S.A. Preferred age 28 to 38. Initial salary £1,500 to £2,000. Please write briefly to T. E. Watson stating age and relevant experience and mentioning reference S.4635.

No candidate's identity will be disclosed without his permission.

MANAGEMENT SELECTION LIMITED
17 Stratton Street, London, W.1

ECONOMIST/STATISTICIAN

Applications are invited from Honours Graduates for the appointment of Economist/Statistician with the Committee for Scotland and Northern Ireland of the White Fish Authority.
Generally the duties are to undertake economic surveys and research covering the various sections of the fishing industry and to maintain and analyse fishery statistics.
Applications should be made on the prescribed form. Intending applicants may obtain further particulars regarding duties and conditions of service and the form of application from the Secretary/Solicitor, Committee for Scotland and Northern Ireland, 5 Forres Street, Edinburgh.

GENERAL MANAGER IN ITALY

A General Manager is required by SICAR S.p.A. to take full charge of paper, board and packaging interests in Italy, which it is intended to expand by 1964 to a total investment of about £10 million. The holder of this appointment will be resident in Italy.

SICAR is a partnership between La Centrale Finanziaria of Milan and the Reed Paper Group of London, whose technical skills are fully available to the company.

The appointment demands a man of proved ability with several years' experience in General Management with particular emphasis on the financial and commercial control of a manufacturing and marketing business. Experience in the paper and packaging industry would be an advantage, but would not be essential for the man who is capable of mastering quickly the technical aspects of the business. A good knowledge of the Italian language is essential.

Please write, giving brief details, to: J. S. McGavin, Group Personnel Officer, REED PAPER GROUP, Larkfield, nr. Maidstone, Kent, quoting reference GM/54.

UNIVERSITY OF EDINBURGH

Applications are invited for the post of ADMINISTRATIVE ASSISTANT/SENIOR ADMINISTRATIVE ASSISTANT in the Office of the Secretary to the University. Salary is on either of the scales £850 x £50–£1,300 per annum, or £1,250 x £50–£1,850 per annum, with placement according to experience and qualifications. The post is subject to superannuation, and the University pays an allowance of £50 per annum in respect of each fully dependent child.
Candidates should possess a good honours degree. The post affords opportunities for training in all aspects of University administration. A statement giving full particulars is available on request. Applications (three copies), with the names of two referees, should reach the undersigned not later than September 11, 1961.
CHARLES H. STEWART, Secretary to the University.

CENTRAL ELECTRICITY GENERATING BOARD NORTH EASTERN REGION OPERATIONAL RESEARCH SCIENTISTS

Applicants are invited for two appointments in the Operational Research Department, North Eastern Region of the Central Electricity Generating Board at Leeds.

The applicants should have a good degree in mathematics, statistics, economics or science, and be capable of original and constructive thought. Some previous experience of Operational Research is desirable but training is available for suitable applicants without previous experience.

The posts offer a wide scope for the application of operational research techniques to the problems of the economic operation of the Board's power stations and transmission systems. The extensive computer facilities of the Board are available for the solution of these problems and the successful applicants will be required to co-operate with the Board's Computing Services on problems requiring computer time.

The salary for the two posts will be within the range of £900–£1,500 per annum, Grades 11 to 7, Class BX of the National Joint Board Agreement depending upon qualifications and previous experience.

Forms of application may be obtained from the Assistant Regional Secretary (Personnel), Central Electricity Generating Board, North Eastern Region, Whitehall Road, Leeds 12, to whom they should be returned to arrive not later than September 25, 1961.

ASSISTANT IN STATISTICAL SECTION

(female)

Leading cigarette manufacturers in London offer a progressive appointment for lady with interest in and ability to interpret figures. A degree is desirable but not essential and training in economics, statistics or mathematics would widen the prospects. An attractive salary, according to age and qualifications. Excellent working conditions, staff restaurant, five-day week, generous bonus, etc.

Apply in writing to Miss Tuson, *Gallaher Limited, Granite House*, 97-101 Cannon Street, London, E.C.4.

For further appointments and other classified advertisements see page 1012

FERRANTI LIMITED — COMPUTER PROGRAMMERS

There is a vacancy at our Wythenshawe Laboratories for a Computer Programmer of degree standard (preferably maths. or physics) to join an expanding team undertaking interesting work connected with the application of digital computers to the control of industrial processes. Previous programming experience or a knowledge of numerical analysis would be an advantage.

The Laboratories are modern and situated on the fringe of rural Cheshire, but within easy distance of Manchester.—Apply in writing to the Women's Personnel Officer, Ferranti Ltd., Shadowmoss Road, Wythenshawe, Manchester 22.

money is

A SOURCE OF INNOCENT MERRIMENT

We can scarcely think of a more agreeable sentiment, but it's also true that money can be the source of more money—which is why people invest and why we're in business.

Investing in the Japanese market is an easy way to put your money to work reproducing itself. To find out where in Japan it will work hardest, you need facts and figures, and that's where Yamaichi comes in.

Besides our regular weekly and monthly publications, industry-wide surveys, and other English-language pamphlets and brochures, Yamaichi puts out a continuing series of Special Reports on leading individual corporations. They give in concise form the major activities, plans, production, sales, and profit records, and other detailed data the wise investor wants to know.

If your money means more to you than innocent merriment, you will do well to consider taking a stake in Japan's booming economy. Yamaichi is waiting to help you.

Mr Dillon's Brief for Vienna

Britain's Economic Problem

The first of two articles by Sir Robert Hall, who was Chief Economic Adviser to the Government until his retirement this year

GUIDE TO CONTENTS | SEE OVER

The Economist . 22 Ryder Street . St. James's . London . SW1

Coal is well worth its salt -to Cerebos

"Common" is an unkind word when applied to salt. This amazing mineral, essential to life itself, deserves an adjective as noble as its many virtues. It serves many vital purposes in industry, but its major duty lies in the home. Here Cerebos Table Salt, refined to a dazzling white purity, conjures from even the most insipid dish a mouth-watering flavour, adds a sharper delight to even the spiciest food. A meal without Cerebos salt might nourish the body, but it would certainly never delight the palate.

The men who make the big decisions at Cerebos—controlling company of the majority of domestic salt-processing firms in Britain—choose *coal* to heat their giant boilers. They choose coal because coal gives them the maximum heat for the minimum cost; because coal, mechanically stoked, is smokeless, and because coal, the home produced fuel, is reliable. Our coalfields can supply all the needs of British industry for generations to come.

When it is your duty to make decisions about fuel, remember Cerebos. They've proved that coal is well worth its salt. Follow their example—and you'll get the same palatable proof.

Some key facts and figures about the boilerhouse at Middlewich, Cheshire and Greatham, West Hartlepool

Boilers:	8 water tube
Method of firing:	Chain grate stokers
Steam pressure:	180 and 160 p.s.i. respectively
Steam temperature:	490° F. and 450° F. respectively
Max. continuous rating:	110,000 and 73,000 lbs. of steam per hour respectively
Annual fuel consumption:	39,000 tons of coal

SOLID FUEL—
more heat at less cost—and it's British
PROGRESSIVE INDUSTRY IS GOING FORWARD ON
COAL

INTERNATIONAL

The Line to Moscow

One side of an imaginary telephone conversation on a private line between the White House and the Kremlin. Mr Kennedy's task should be to make clear to Mr Khrushchev which are the vital interests in Berlin that the West cannot give up, at any price, and which are the marginal ones that it might, for a consideration (p. 1039).

In eastern Europe, particularly in **Poland,** there are fears of war (p. 1048), as there are in the West. But the anxiety for negotiations in both East and West has still to overcome the desire of each side not to make the first move—and the reluctance of **President de Gaulle** (p. 1047). This is related to his internal struggle to control the French armed forces (p. 1066).

The **west German** election campaign has come to life since August 13th. A theme to be detected in all parties is that Dr Adenauer may not remain chancellor for long after the elections (p. 1065).

Two Kinds of Neutral

The **Belgrade neutrals** have a chance to turn their wish for peace to practical account when the United Nations Assembly meets next week. The West should align itself with their desire for a strong and unaligned UN (p. 1043).

By conceding the French contention that Bizerta cannot be handed over while the Berlin crisis lasts, **M. Bourguiba** has resurrected his own unique brand of pro-western neutralism (p. 1049).

Two Kinds of Peacemaker

Time will show whether the UN's coup in the **Katanga** contributes to the stability of the Congo, or the reverse; the means employed by the peacemakers have been a shock (p. 1047).

The formation of an Arab force to take over from the British in **Kuwait** is a triumph for the Arab League, but it is too early to regard the future of the Sheikdom as settled (p. 1068).

Africa: Pride and Prejudice

Ghana's constant assertions of the black man's dignity show an unnecessary lack of self-confidence (p. 1050).

The success of the **Uganda** constitutional conference will depend on a deal with the proud Baganda (p. 1068).

The British Government has agreed to talk once more on **Northern Rhodesia's** constitution, to Sir Roy Welensky's fury. It would be a pity if Africans attributed this success to violence instead of to Mr Kaunda's patient leadership (p. 1049).

America: Arms and Argument

What sort of war is the present military build-up of the United States preparing for (p. 1073).

The victory of Mayor Wagner in New York is also a victory for President Kennedy (p. 1074).

Local issues in the automobile industry are delaying final signature of a wage settlement, which is nevertheless a triumph for Mr Reuther (p. 1074).

While bank mergers are in a muddle (p. 1081), book mergers have put the publishing industry on a sounder basis (p. 1082).

The Treasury's latest refunding has several unusual features (p. 1077).

HOME

ILLS

Wasting Sickness

In the first of two articles Sir Robert Hall (lately Economic Adviser to the British Government) analyses Britain's recurring economic predicaments (p. 1041).

The chronic economic problems of the Isle of Man practically defy constructive analysis (p. 1045).

Growing Pains

America is prepared to bargain hard in Vienna for moderate improvements to the International Monetary Fund (p. 1085).

Investment trusts are tackling difficulties in their attempts to extend their appeal to smaller savers (p. 1086).

Headaches

Some of Mr Cousins's men drive fuel tankers: their striking could cause much national pain (p. 1047).

Teachers' unprofessional—indeed frankly amateur—plans for "industrial" action may hurt them more than the Government (p. 1050).

Supersonic aircraft could cause more discomfort than is realised (p. 1098).

CURES

Placebos

Mr Hare's specific for the ailments of trade unions seem to depend on Mr Woodcock's writing a prescription (p. 1048).

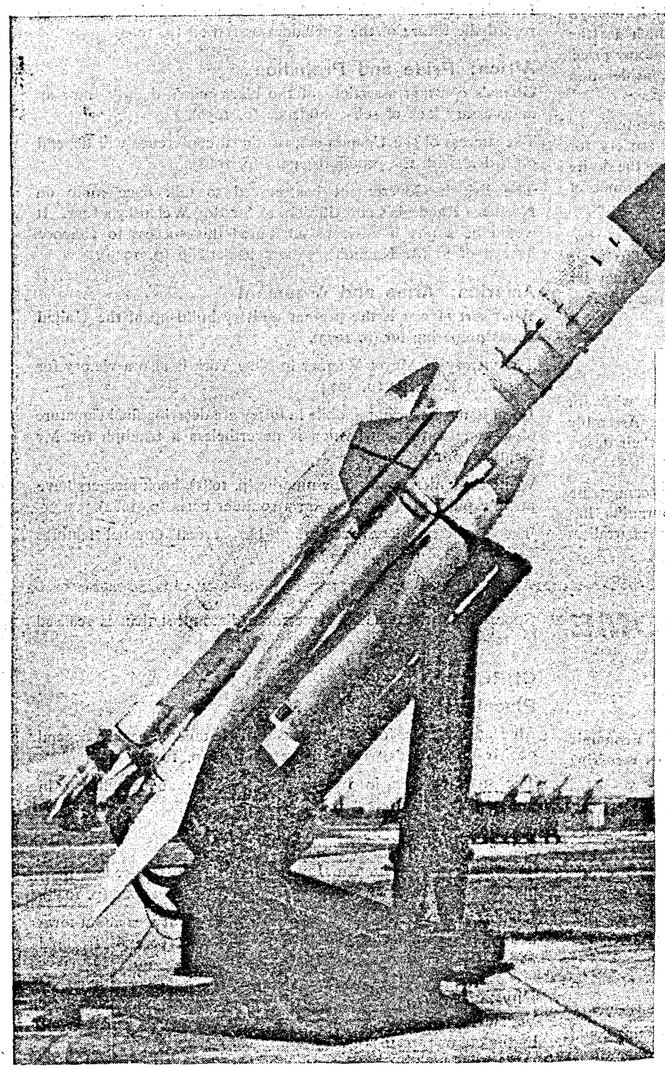
The snap election in Ireland seems to be about nothing in particular (p. 1062).

Pills

The hasty incarceration of Lord Russell and his co-sedentarians may do the cause of law and order more harm than good (p. 1048).

Under some more palatable sugar, another Labour idea about town and country planning contains the same old core of freehold nationalisation (p. 1053).

Physicks



Vauxhall's new Victor should recapture some of the ground lost by the old one (p. 1094).

Does more mechanisation in the mines mean a smaller chance of an increase in coal prices? (p. 1089).

Detailed contents on page 1039

BRISTOL/FERRANTI **BLOODHOUND** MARK 2

CHOSEN BY SWEDEN AND SWITZERLAND ENTIRELY ON TECHNICAL MERIT

In open competition with the best weapon systems available in the West, and strictly on technical and operational merit, the Bristol/Ferranti Bloodhound Mark 2 has been chosen by Sweden and Switzerland. This powerful, accurate and air-transportable weapon system has also been ordered by the Royal Air Force as the basis of Britain's anti-aircraft defence.

Bloodhound Mark 2 is a second-generation missile system and is the logical development from Bloodhound Mark I.

Bloodhound Mark 2 has:

- **Long range**
- **High and low altitude coverage**
- **Extended performance in all aspects of anti-aircraft defence.**
- **Latest anti-jamming techniques and C.W. Radars.**

Bloodhound system management by Bristol Aircraft Ltd. Radars and electronics by A.E.I. Ltd. and Ferranti Ltd.

J. Walter Thompson announces the publication of *Western Europe* — a digest of marketing statistics

This digest has been prepared by the British Market Research Bureau, an associate company of J. Walter Thompson.

Most of the statistics in this volume have been collected from published sources; others have been supplied by JWT offices and associated offices throughout Western Europe.

This is the first time that this digest has been made generally available. Previous editions (the first appeared in 1954) have been circulated only to clients of JWT and BMRB.

Western Europe includes all European countries outside the Iron Curtain • It emphasizes population and production statistics, consumption and standard of living indicators, and international trade statistics • It gives corresponding figures for the United States, wherever possible • It is spirally bound, 215 pp, 11 x 9½ ins.

For copies of *Western Europe* (price 30/- post free), or for any further details, please write to The Librarian, British Market Research Bureau Ltd., 47 Upper Grosvenor Street, London, W.1. Tel: Hyde Park 8121.

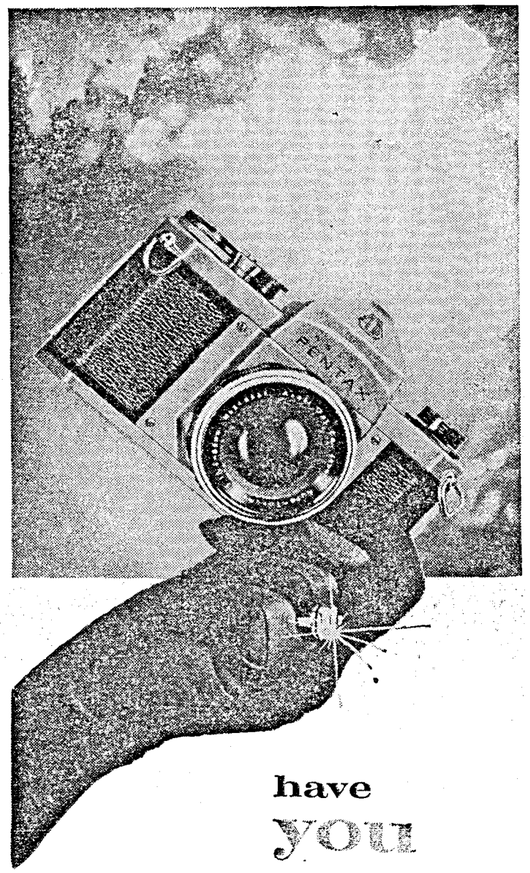
How to keep a World intact

A plea by America's wisest authority on Russia—in The Observer this Sunday

TO READ George F. Kennan's book, "Russia and the West", is to feel that you are listening to a very wise man. Once U.S. Ambassador in Moscow, he not only knows Russia extremely well, but—what is quite as rare—can see his own country clearly. His last chapter was described by Sir William Hayter (himself an ex-Ambassador to Russia) as "the most sensible stuff on foreign policy that I have read for many years". And a Yugoslav Minister is reported as saying that it should have been read by everyone at the Belgrade Neutrals' Conference.

It is this last chapter, "Keeping a World Intact", that The Observer is printing this Sunday.

Mr. Kennan's basic theme is "the absurdity of the idea that outright war would be a suitable means of protecting the Western Community from the kind of challenge with which Russian Communism has confronted it". He claims that outright war has never been an instrument of Soviet policy; warns us against hoping for 'absolute' harmony or 'absolute' anything; pleads that we leave a few problems for our children to solve.



A sane, calm, eloquent voice, and a new one. You can listen to it in The Observer, this very Sunday.

WHICH WAY FOR THE UNIONS?

The second instalment of Kenneth Harris's long and frank conversation with Lord Citrine also appears in The Observer this Sunday.

This Sunday make it

THE OBSERVER

BEHIND THE DUNLOP SYMBOL

What does Dunlop sell? Tyres. That's true. But tyre valves, too... millions of them each year... the rubber lining for a complete reservoir ... two hundred different kinds of rubber mouldings for the aircraft industry... basketball boots... disc brakes... conveyor belting... And these are only a few of the thousands of products marketed by Dunlop, in 1960 to the sum of £275 million. A record turnover, and the product of steady growth. The organisation behind the new Dunlop symbol is one of the most enterprising and progressive in the world.

DUNLOP SYMBOL OF PROGRESS

THE BUDD COMPANY . . .

Leader in solving electronic design problems with plastics

Example: Continental-Diamond Fibre plastics measure up to the particularly demanding specifications for printed circuit panels in the TIROS I weather satellite now circling the Earth in outer space. The satellite was developed for the National Aeronautics and Space Administration by Radio Corporation of America.

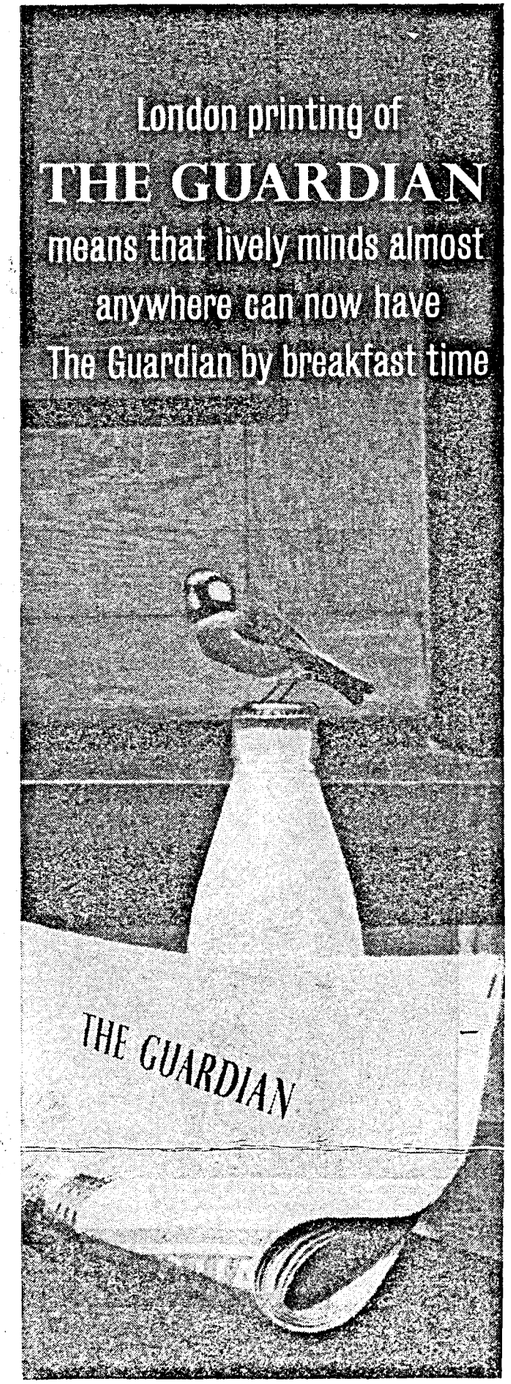
Many other problems in space age developments and diverse electrical and industrial applications are being solved by plastics created by Budd's subsidiaries, CDF in the U.S.A. and La Fibre Diamond in France. These laminated and molded plastics are meeting unprecedented requirements for electrical insulation strength, lightness and heat resistance. Many other plastics—in the form of sheets, rods, tubes and tapes—play an important part in improving a wide range of products and lowering their cost. This pioneering in plastics closely complements Budd's skills. These skills in engineering . . . metallurgy . . . tooling . . . welding . . . research . . . testing . . . production and progressive development for international industry, help place Budd high among the world's 250 largest industrial concerns. Write for our Annual Report. The Budd Company, Phila. 32, Pa., U.S.A.

INTERNATIONAL Budd DIVISION

GRIFFITHS
Protective Paints

— offer a complete service to industry

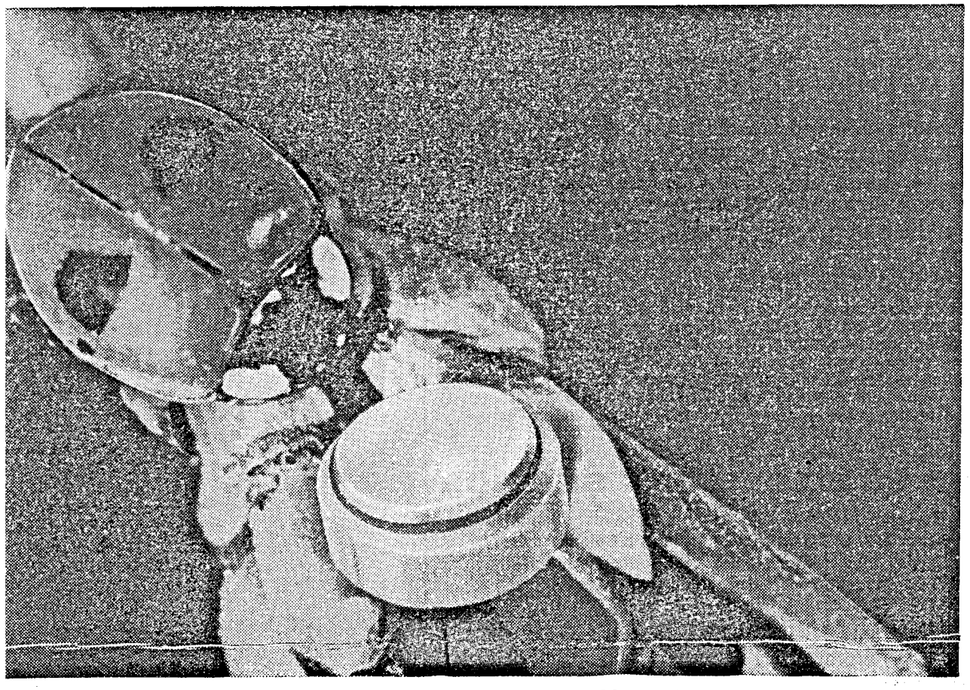
Prime costs vary little between one type of protective paint and another, but a considerable saving can be made in maintenance costs by reducing the frequency of application. The most effective anti-corrosive system can only be arrived at by a careful consideration of the prevailing conditions, and by selecting the most efficient paint to use under those circumstances. Griffiths Brothers maintain a staff of technically competent and experienced Representatives who will investigate your Protective Paint Problem on site and offer you advice backed by our Technical Research Organisation.



COLOUR ADVISORY SERVICE

The complete service in protective paints offered to industry by Griffiths Brothers includes a Colour Advisory Service which, at no extra cost, brings you all the benefits of a balanced decorative scheme.

The following leaflets in our "TECHNICAL ADVICE" series are available to you on request:-



No. 1 Surface Preparation of Steelwork
No. 4 Zinc Sprayed Steel
No. 5 Painting Galvanised Iron or Steel
No. 6 Polyurethanes

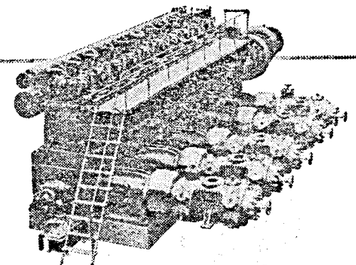
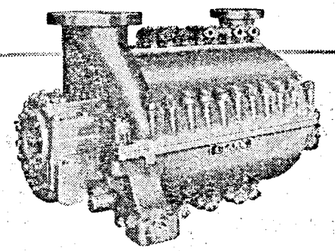
Mallory are at home in many fields



Mallory are the only firm to specialise in powerful miniature batteries. Some are as small as a ladybird; many are not much larger. Yet they can push a signal across more than 400,000 miles of space; have helped the airborne recovery of a satellite from orbit; made 'invisible' hearing aids more than a dream; fostered the trend towards pocket-size radios, tape recorders, paging systems . . . All this could be achievement enough. But remember the transmitter swallowed like a pill?—essentially a Mallory battery. A substitute pacemaker for the human heart?—also Mallory. A battery driven wristwatch that runs for more than a year; self adjusting camera shutters and lenses; illuminated novelties of many kinds—these and more are Mallory powered. Mallory ploneered miniature cells for field transmitters during the war. Uniquely dependable and long lived, they can be of great help to all manufacturers who plan to make their products smaller and retain full power.

Mallory Batteries Limited, Crawley, Sussex
Sales Office: 33 Duke Street, London W1



MALLORY *miniature batteries for powerful applications*

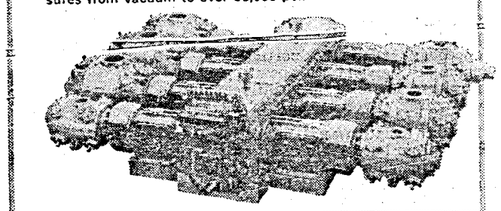
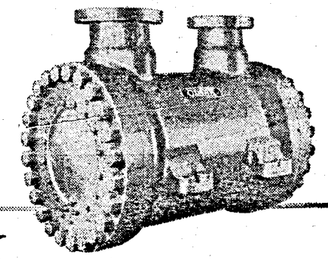
In Canada, Mallory Battery Co of Canada Ltd, Toronto 4

Models TRA and TLA Gas-Engine-Driven Compressors—2-cycle, turbocharged. Ideal where large blocks of horsepower are required. They offer maximum power per unit of floor space, as well as excellent fuel economy. Model TRA is available with 6, 8, and 10 cylinders, 1100 to 1800 bhp. Model TLA is available with 5, 6, 8, and 10 cylinders, 1700 to 3400 bhp.



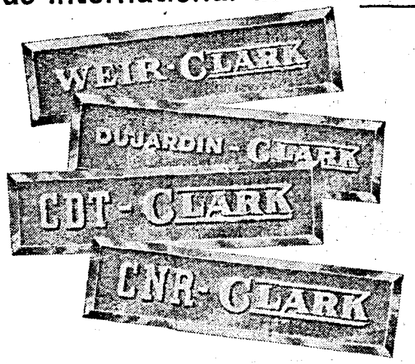
RECIPROCATING



Type HS Horizontally-Split Centrifugal Compressors are highly dependable multi-stage units used extensively in petroleum processing. Seven case sizes are available in capacities ranging to over 150,000 cfm. Up to ten stages of compression in a single case. Cooled or uncooled types available to meet process requirements.

CENTRIFUGAL

Models CLBA, CLRA, CJA, CMB, CMA and CFA Motor-Driven Compressors for heavy duty process applications. These balanced/opposed compressors are built in seven stroke sizes—6", 8", 8¾", 11", 14", 17" and 19". Available with 2 to 10 compressor cylinders depending on model chosen. Pressures from vacuum to over 36,000 psi.



Type VS Vertically-Split Centrifugal Compressors are multi-stage units designed for extremely high pressures—to over 5,000 psig. Four case sizes have a capacity range from 200 discharge cfm to 20,000 suction cfm. Barrel-like outer case provides maximum strength. Inner case is horizontally split for easy accessibility.

CLARK COMPRESSORS

as international as the world-wide petroleum processing industry

Wherever petroleum is processed, you will find Clark compressors on the job or readily available. The complete line of Clark centrifugal and reciprocating compressors, with motor and gas engine drives, are manufactured in the U.S.A. and under license in Europe. Regardless of where manufactured, all Clark units and components are identical and completely interchangeable. Whether they carry the name plate of Clark (U.S.A.), Weir-Clark (Great Britain), Dujardin-Clark (France), CDT-Clark or CNR-Clark (Italy), they are the same efficient Clark compressors, designed and built to provide a lifetime of dependable service with minimum maintenance. All are guaranteed by Clark. For complete performance and application data, write to the offices listed below:

Exercise for etymologists

Minty have 'cross-bred' a bookcase with a dresser and christened the offspring the *book-dresser*. There are five book-dressers in the Minty Contour range, and each embodies the essential advantages of both parent pieces. There *may* be a more apposite appendage than the portmanteau name we've given to this new kind of furniture. The following details could easily inspire you to think of one.

Finished in hard, waxed, English elm, all Contour book-dressers have their tops in common: a glassed-in compartment for your best books; open adjustable shelves for your folios or paper-backs. What goes underneath is a matter for self-expression.

Contour One has a drawer, a writing flap that *doesn't wobble*, and a sliding-door cupboard that might well reveal reading type refreshment. *Contour Two* has the cupboard only. *Contour Three* has four sensible drawers, and the same non-flappable flap. Behind the drop door of *Contour Four* is a space that's positively cavernous in its dimensions. And if your library grows and grows like Alice, *Contour Five* fits comfortably alongside any of the others and takes the overspill. Prices from £36.10.0—or on deferred terms if you prefer.

You can see and buy book-dressers at your nearest Minty Centre. If, however, for any reason you can't call, Minty will be glad to send you a catalogue and details of post ordering. Write to Dept. E.16, Minty Ltd., 44-45 High Street, Oxford.

Consider the
VICKERS HOVERCRAFT
when thinking about
transportation

FACTS

The ten ton-version of the Vickers Hovercraft is under construction. This, the smallest version, will be capable of modification to suit the operating requirements of the purchasers. It will have the following characteristics:

Speed 60 knots.

Pay-load 27 people or 4,420 lb. of freight or a combination of these.

Range 100 miles.

Maximum economy is found over journey stages which are too short for aircraft.

The operating height enables it to travel over water, ice, snow, floods, and unobstructed land free of steep climbs or declivities.

With its robust construction and high degree of manoeuvrability the Vickers Hovercraft is designed for maximum safety.

FORECASTS

ECONOMY
Apart from its great saving on jetties, airstrips, pilots and ground crew, operators will find the Vickers Hovercraft considerably more economical than flying.

USERS
The first operators will be firms using the Vickers Hovercraft to establish fast communication services. Oil companies—particularly those engaged in off-shore drilling—will find the Vickers Hovercraft invaluable for transporting men and stores between bases and rigs.

LOCATIONS
Effective over ice as well as water and being unaffected by marsh or sandbanks, the Vickers Hovercraft will be equally at home among lakes, fiords, rivers and estuaries.

VOLUME CC - NUMBER 6160

Calling KREmlin 1961

Our clairvoyant wire-tapper, plugged in to the (regrettably) still non-existent private line between the White House and the Kremlin, records Mr Kennedy's possible first call:

GOOD MORNING, Mr Khrushchev; or rather, good afternoon. The sun that I see rising over the Capitol has already passed its peak in Red Square. In America we have a saying, "The same sun shines on us all." It is this awareness of our common interests that makes me want to talk to you about Berlin. Your Mr Gromyko and my Mr Rusk are first-class negotiators, no doubt, but before we can tell them to go and negotiate, which is a complicated business like building a house, you and I ought to do a little digging on the site, as it were. Things can be said in a private conversation—certain assurances offered, intentions explained, hints dropped—that would be out of place, not to say downright embarrassing, at a formal conference. You remember that in the last war, when we fought on the same side, Mr Churchill and Mr Roosevelt used to write to each other privately for just the same reason. After all, I am a Former Naval Person, too.... Did your simultaneous translator get the joke?

When you spoke to the people of Stalingrad on September 10th, you said you appreciated that they were "anxious about the international situation." So are the Americans. Even my nuclear physicists, I see from reports of the recent international science meeting in Vermont, are beginning to wonder whether they ought to build shelters for their families against the kind of bombs they themselves have been busily producing for years. What worries people everywhere is not the possibility that either you or I have actually decided that another world war would be tolerable. They credit us with more common sense. The real danger is that, in our argument over Berlin, each of us will keep on taking one more step towards what my advisers insist on calling the "crunch" (not a lovely word, you will agree) in the belief that he will thereby deter the other fellow from taking the next step.

Somewhere along the road a step that was designed to be merely penultimate is liable to turn out to be ultimate. To prevent such a miscalculation, you and I obviously have to come to an agreement that will let each of us hang on to our essential interests in central Europe—even if it means giving up some of the things we would like to achieve were the risk not too great. Can we work out such an agreement?

I think we can. You told Mr Walter Lippmann, when you talked to him in April, that you insisted on signing a peace treaty with east Germany now because you wanted to consolidate Herr Ulbricht's regime (and the east German boundaries) before nuclear rearmament went too far in central Europe. Now, personally, there is nothing I would like better than to un-consolidate Herr Ulbricht—one moment, please. I am simply expressing a point of view—and, what is more to the point, most east Germans seem to feel the same way. But this is something I put in the category of things I would like to achieve if the risk were not too great. The West's essential interest, as I have said several times, is to guarantee the right of west Berlin—which, unlike east Germany, clearly is our responsibility—to live the kind of life it wants.

As I hinted to Mr James Reston of the *New York Times* in the interview I

gave him early this month, I am not particularly bothered what form the guarantee on Berlin takes, so long as it is solid in substance. In other words, I am perfectly willing to negotiate a new agreement defining Berlin's rights, in place of the old occupation arrangements, and if Herr Ulbricht wants to sign his name at the bottom, why not? Perhaps I can go further. To prove that I am serious when I say that the preservation of west Berlin is vital to us, but the undermining of east Germany is not, I am willing to call a halt to all those harassments that have been practised against east Germany from the city in the past. In a private conversation like this I can spell out what I mean: radio propaganda, the passage of undercover agents, and so on. (*Cracklings on the line.*)

What guarantee have you that I will keep my word? A very simple one. The western powers will be perfectly well aware that if they try to use Berlin to stir up trouble for Herr Ulbricht, you can make life there difficult for them again. It is what my diplomatic pundits call a "self-enforcing agreement."

Moreover, it looks as if we can come to an understanding about the way a new agreement on Berlin would be enforced. I think the United Nations might well be invited to take a hand. (This was another hint I gave to Mr Reston; I hope you are a reader of the *New York Times.*) Of course, you will have to accept a certain number of western troops in Berlin as part of, or in addition to, the UN presence; this is the only way we have of making our link with the city manifest. But I can see no reason for not getting as many countries as possible to share the responsibility for Berlin. You have said, at various times, that the west Berliners can have whatever social system they prefer, that all countries can have free access to the city, and that the UN can keep an eye on Berlin's future. The time now seems ripe for spelling this out, clearly and unmistakably, on paper.

DOES all this mean that I am recognising east Germany, you ask? Let us be frank. You must know how difficult it would be for me to recognise Herr Ulbricht's government, in so many words, tomorrow. It is perfectly obvious what effect this would have in the Federal Republic (*an explosion at the other end of the line, rendered by the translator, rather helplessly, as "revanchists . . . provocateurs . . . extremists"*) and the West can no more afford to risk west Germany's defection than you can afford to risk east Germany's; rather less, as a matter of fact, because west Germany is a positive asset to us, whereas to you, east Germany . . . well, let it pass. But bear a couple of points in mind.

One is that it would already be a considerable step towards recognition if Herr Ulbricht signed the proposed agreement on Berlin; other similar steps might be found later. The second is that most people in the West still have their memories, which nag them with thoughts of the troubles that might come from having a reunited, still more powerful Germany in the middle of Europe—especially if it came to be armed with nuclear weapons. Thus, while we shall continue to say that Germany ought to be reunited one day, if the Germans want it, because we believe in self-determination, it is not something we shall fight a war for. It is, in fact, something to be settled peaceably between the two parts of Germany—with the help of the ex-allied powers, certainly; but we are resigned to moving no faster in that direction than the two parts of Germany themselves move. And that seems to be not fast at all.

EVERYTHING depends on what your motive is in bringing the Berlin crisis to a head. If, as you told Mr Lippmann, your aim is to win acknowledgment of east Germany's existence, and of the post-war frontiers of Germany, I think a bargain can be struck. You keep east Germany; we keep west Berlin. This may not be what we would ideally like, but, stuck as we are in Berlin in an outpost behind your lines, we are in no position to pursue the ideal. If, however, your real aim is to seize possession of Berlin, then both of us are in for trouble.

So far it has been my turn to offer accommodations in order to keep the peace. Now it is your turn. Your foreign office and mine have exchanged four notes between August 23rd and September 8th about the air corridors to Berlin. Perhaps your objective in raising this matter is simply to remind the West that the right of passage along the air corridors, like everything else affecting Berlin, needs ratification by the east Germans. As I have already suggested, we can accept this. But if you go on to interfere by force with the access routes to Berlin—or, worse, try to capture Berlin outright—a conflict is quite inevitable. The decision between war and peace might not even be entirely mine. The local commanders in Germany, some of them controlling nuclear arms, would naturally fight back; and, as you yourself told Mr C. L. Sulzberger on September 5th, "it is untimely to say that in the event of war atomic weapons would not be used."

Do not count on American public opinion to prevent this. The Americans know, as though by instinct, that if they hand over Berlin without a struggle their influence in the world will be at an end; and so they are in a remarkably militant spirit. When Mr Joseph Alsop and Mr Jules Feiffer say the same thing, as they have done about the neutrals' attitude to the present crisis, you can take it that American opinion is solid. At the moment I speak for the forces of moderation in my country, possibly like you in yours. Some of my scientists are even urging me to build a thousand-megaton bomb to make your hundred-megaton one look unimportant. I don't know if your nuclear experts ever frighten you, Mr Khrushchev, but, by God, mine terrify me.

It has been said that your true purpose in Berlin is to break the will of the western alliance once and for all by proving that it will not fight back in any circumstances. The western powers did not try to humiliate Russia in 1948, when they had a nuclear monopoly; I do not believe that Russia is foolish enough to try anything of the kind now, when the nicely poised balance of nuclear power makes the dangers infinitely greater. Mr Khrushchev, think of your power stations, your newly built cities—and your people—gone into thin air before you can say "miscalculation." Neither of us can achieve total victory in Europe without this happening. The only way to prevent it is for each of us to separate in our minds those objectives that are vital to us from those that are merely marginal—and do business on that basis. (*Sounds of animation, and a voice saying, "Molodoi paren no tolkovyi!"*)

Britain's Economic Problem

Sir Robert Lowe Hall, *who was best known to economists before the war as the Hall of the Hall and Hitch study of pricing policy, and as the author of "The Economic System in a Socialist State," left his fellowship at Oxford to become a wartime civil servant in* 1939. *After a brief return to Oxford, he became Director of the Economic Section of the Cabinet Office in April* 1947: *he held that office until* 1953, *when his title was changed to Economic Adviser to the Government, a post from which he retired this year. For fourteen eventful years, under eight Chancellors from two political parties, he has therefore been, in effect, the top professional economist in the Treasury. When his retirement was announced,* The Economist *asked him to set down his views on the economic problems before this country. He has done so in two important and thought-provoking articles. The first appears below; the second will be published next week.*

THE British economy has now enjoyed almost twenty years of full employment, about fifteen after the war and early post-war phases. It has turned out to be much easier to maintain than almost anyone expected, but has been accompanied by the emergence of new problems to which we are still trying to find solutions. The most insidious of these problems may prove to be the freedom that the new order seems, at first sight, to have given us to change our attitudes towards the conditions in which we have to make our living. Full employment, whether by full planning in socialist economies or by Keynesian technique elsewhere, has taken a great deal of the edge off the less pleasant aspects of prewar advanced economies. If we do not want to struggle, we can get along very comfortably by a moderate conformity. In democratic countries, the sanction for the maintenance of this happy state appears to the populace to be ultimately that of votes, since most elected Governments believe that their own survival depends on its maintenance.

We must now ask what use we are making of this freedom, which has so much lightened the burden of the economic problem. The thesis of these two articles is that we in Britain are in danger of using it in ways which may lead to a deterioration in our economic survival value, compared to that of countries which are making more conscious efforts. Those who think that this is a fanciful idea should reflect that it is inherently probable that species in an easy position should deteriorate unless they are stimulated in good time, and that votes in the past have not had any biological significance—or more often an adverse than a favourable one. Is there not a danger that we will undermine our happy state and leave our descendants with something that will seem much less attractive to them than our own inheritance appears to us?

It has become increasingly evident that in a number of ways the economy is not doing what is wanted of it. The objects of economic policy can be stated in various ways, but almost all formulations would include an acceptable rate of growth and a reasonably stable price level as well as full employment. It is clear that we have not grown as fast as we would have liked; our increasing standard of living has been accompanied by constantly recurring difficulties with the balance of payments, and inability at the same time to spend as much as we would like overseas both in defence (which has also been cut at home) and on assistance to underdeveloped countries. The conflict between what we want and our means of getting it is perhaps a perennial one. But comparisons between the growth of the national income here and in a number of other countries, and comparisons also of balance of payments experiences, have led to a widespread feeling that there is something wrong with our own progress. As for the price level, our record can only be described as lamentable, whether it is judged by our performance in the past or by what every Government since 1945 has asserted, with very little contradiction, to be desirable policy.

Why Price Inflation Matters

The problems created by full employment can be seen most plainly in this last failure, in the movement of prices. Many people, of course, deny this. It is often asserted that prices which rise at the rate experienced in postwar Britain, or even faster, are not really a misfortune at all. We could, it is said, easily adapt our organisation and institutions to a steadily rising price level; our growth is impeded by the spasmodic attempts by the Government to reduce demand, partly in the hope that this will reduce cost inflation. The balance of payments could be dealt with by a floating exchange rate or a series of devaluations.

The reasons for preferring price stability are somewhat complex and, while no single one is conclusive, I believe that the balance of argument is very nearly so.

The arguments can be classified roughly into three groups. First there is the social one, that damage is caused to those with fixed incomes, that pensioners lag behind and so on, situations which have a strong element of social injustice. Secondly, there is the distortion caused to effort and enterprise by the need to adjust calculations to an inflationary situation, and the constant opening up of opportunities of speculative profits not related to production as such. And, thirdly, there is the effect on international trade of exchange uncertainty, which suggests that those countries which do not attempt to stabilise their exchanges are parasitic on those which do. It is true that international stability is not necessarily secured, and may be impeded, if every country is seeking complete internal price stability. But, as a practical matter, the problems so created are very small compared with those which result from countries which are unable to control their price level.

In the case of the United Kingdom, there is little doubt that most people would like stable prices. Every Government feels that it must state that this is one of its policy objectives—and that we have an international responsibility, because of the reserve position of sterling, to maintain its external value. It is evident that the steady upward pressure on our prices contributes a great deal to our difficulties with the balance of payments, since our competitive position in export markets is constantly threatened. No doubt delivery dates, the quality of our exports, and service to customers overseas all play a part. But none of these can be put in a separate

compartment from the level of prices. If these are not fully competitive, exporters will prefer the home market, which in most cases is "less trouble," i.e., even when there is the same profit margin at home and abroad, the home market is preferred. In these circumstances, a direct conflict emerges between the objectives of full employment and of the desired balance of payments surplus. Government, in planning the load on material resources, tries for the exports and the imports thought to be consistent with this surplus—i.e., enough capacity is left after meeting estimated home demands for the exports required. But the inducement to sell in the home market is greater than to sell in the export market, so that exports are somewhat restricted and imports somewhat stimulated. The capacity thus left over produces the appearance of under-utilisation of resources, and the further this goes the more pressure there is on the Government to expand home demand.

Thus a position in which prices are rising faster than those of our competitors will be biased, under a full employment policy, towards a balance of payments deficit. If, on the other hand, prices are lagging behind those of competitors the export market is attractive and the economy will tend towards a higher level of employment, and a greater balance of payments surplus, than that which was planned. The most striking example of this in recent years has been Germany, which has combined rapid expansion and a balance of payments surplus with increasingly full employment because her export prices were so attractive. The notion constantly put about by those in favour of expansion at all costs, that a large home market helps exports by reducing overheads, is only true for conditions in which expansion can take place without raising costs, that is for conditions of general under-utilisation of resources.

The problem, then, is to combine price stability, or at any rate as much price stability as is enjoyed by our competitors, with a high level of employment. For short periods in 1950, in 1953-54, and in 1958-59, this seemed to be within our reach. But all hopes proved illusory. Why?

Cost Push or Demand Pull?

The processes by which prices are determined are complex, but in most sectors of the British economy the main determinant is direct costs, plus an allowance for overheads (including profits) which is fixed on a notional or estimated output. If the output assumed for calculating this allowance cannot be sold, the first reaction is usually to reduce production so that a fall in gross profits is associated with under-employment of resources. With full employment, profits are not affected by wage increases, and the fortunes of capital and labour are thus linked together: the conditions in which there is a high demand for labour are also the conditions in which wage increases can be passed on. Other components of prices, such as the cost of imports and indirect taxes, are passed on in the same way: but these can move, and in the postwar period have moved, in either direction, i.e. they do not give a consistent upward trend to the price level as has been the case with wages and salaries.

Faced with this situation, both Labour and Conservative Governments have said more or less continuously that stable prices can be secured only if costs (by which has been meant primarily wages and profits) do not increase faster than the average increase in productivity which can be expected over a period, and they have called for restraint in increases in wages, salaries and the addition to costs made for capital or gross profits. While accepting that it is the responsibility of the Government to prevent excess demand, all these statements and appeals have rested on the view that so long as the Government takes responsibility for full employment, there is no automatic mechanism which will determine the size of wage increases negotiated collectively, and that these over a period will mainly determine other wage increases. Price stability and full employment, and by inference exchange stability and a satisfactory balance of payments, can be attained together only if the outcome of collective wage bargaining is kept within the limits imposed by long term productivity increases. The workers as a whole will lose nothing by such limits, since increases in money incomes beyond the growth of productivity will be quickly offset by price increases.

This view, which has come to be called the "cost-push" view of price inflation, is contrasted with that which said that the cause was excess demand and the remedy therefore lay in the control of demand. As in so many controversies, each side has tended to gloss over its own weak points and to exaggerate those of the other. Both sides agree that the limitation of aggregate demand is a necessary part of any policy for stable prices, but the "restraint" school of thought deny that there is one and only one level of employment consistent with each possible rate of cost inflation, and think that a higher and more stable level of employment, and at any rate a much more stable level of prices than we have had, could be obtained with restraint than without it. With the passage of time the number of adherents of extreme positions has diminished and a large body of opinion now thinks that some form of wage policy other than leaving wages to free collective bargaining is necessary, if full employment and stable prices are to be combined. In this connection, the OEEC Report on the problem of rising prices is extremely significant since it is very nearly an agreed document, by highly respected economists from a number of western countries who can certainly not be regarded as all belonging to any particular school of thought.

The essential thing about such a price and wage policy is that money wages should not increase faster than the average increase in productivity over the whole economy, taken over a period long enough to eliminate the effect of changes in the level of capacity at which the system runs: and that prices should be lowered when costs fall and only increased to the extent that costs have risen. This would, of course, entail steady price reductions in industries advancing rapidly and price increases in those where little or no change in productivity can be made. One could choose any machinery for wage and price determination as long as it conformed to this basic condition.

The Changes Needed

The difficulties in the way of formulating the details of such a policy are formidable, and include agreement on workable definitions of the terms, and the treatment of wage differentials. But they are not insuperable and are as nothing compared to the difficulties of getting the policy accepted at all. This would require considerable changes in the attitude of employers, who would have to become more competitive about prices and less competitive about "poaching" labour through open or concealed bidding up. On the part of organised labour, the change would be nothing less than revolutionary, since it is largely held together at present by the belief that wage increases take place at the expense of employers and that the first duty of a trade union is to make the best wage bargain it can. While there are circumstances in which there is some degree of truth in these propositions, they are least likely to be true when the Government is committed to full employment. For short periods, particular groups can get ahead at the expense of the community; for longer periods at the expense of pensioners; and permanently at the expense of those with fixed money incomes. But in the process the country has balance of payments troubles, activity and growth are both erratic, and the value of sterling (and the sterling assets of underdeveloped countries) diminishes.

It is only too easy to list the immense difficulties in the way of a rational policy for prices but the most formidable are the myth that wage increases take place at the expense of profits (or variants such as that they can compensate the workers for a change in the incidence of taxation) and the belief that the British system of collective bargaining is the best in the world. Nobody can work out in advance the details of a better system, though something can be learned from the experience of other countries such as the Netherlands. Some pessimists implicitly assume that we are now incapable of the necessary changes in attitude, in which case we must give up full employment or stable prices or much of the market mechanism. But the problem will not go away because we find the difficulties of a solution too much for us. Our history ought not to let us think that we cannot adapt ourselves to new situations: we rate ourselves too low if we accept a counsel of defeat, without even trying to do better.

As the Government has often pointed out, this is a problem which cannot be solved by Government alone. But a radical change in national habits of thought can hardly be brought about without a very strong lead and this can only be given by the Government.

This would require both determination and compromise. The determination would be needed first to avoid the continual temptation to overload the economy, brought about by the relentless pressures to increase Government expenditure and to reduce taxation, so evident in the House of Commons and almost everywhere else. This would mean setting the target for full employment rather lower than we have done in the postwar period and recognising that excess demand will wreck any policy. Unemployment figures much below 1½ per cent of the working population are probably meaningless as a guide to policy and most of our problems would be much easier if we tried to keep between say 1½ per cent and 2½ per cent and took the lower limit as a warning.

Second, there would have to be a clear statement about the rate of increase in money wages which would be consistent with reasonably stable prices—a figure that could start from recent trends and be varied at intervals if the trend changed—and a determination to state plainly, in specific cases as they arise, that settlements which exceeded or fell short of this figure were against the national interest, unless there were very strong reasons for exceptional treatment, connected with the supply of labour of particular kinds. It is clear, both as a matter of economic analysis and from experience, that unless public opinion can be mobilised against settlements of any importance which exceed a desired level, the forces making for bringing other settlements up to the highest one will be too strong to resist for very long. The statement that a particular settlement is against the national interest would bring with it other consequences, and in particular would remove the idea that the Government's duty is to mediate between the parties to a wage dispute, another survival from the past. It ought to think about the national interest.

No one can tell in advance whether this kind of policy would succeed, but it is certain that we shall not find out unless we try. Next week's article will continue the argument from this point.

Where Next for Neutrals?

The lessons of the Belgrade conference have yet to be learned by both the "non-aligned" and other countries

NEXT Tuesday, two weeks after they parted in Belgrade, the representatives of the non-aligned countries will come together again in New York to face a more testing challenge. At Belgrade, from September 1st to 6th, their governments insisted on their right to participate in solving the world's gravest problems of war and peace. Mr Nehru urged that the United Nations Assembly, which is about to meet, should give absolute priority to the present crisis in great power relations. If it does, will the Belgrade group be ready with an agreed initiative, or will it merely repeat its appeal to Mr Kennedy and Mr Khrushchev to meet again?

The assembly will ring, no doubt, with proposals that may be represented as echoes of Belgrade—proposals for a world disarmament conference; for more Asian and African representation in the UN organs, and for the seating of the Peking government; for larger UN development funds and other measures to assist the poorer countries; and for action in support of anti-colonial causes. These were, indeed, agreed at Belgrade. But they were not newborn there, nor do they bear directly at all on the great power tension of the moment.

The Belgrade group's task in regard to that tension is, according to Mr Nehru, to induce the powers to follow the path of peace; according to the Jugoslavs, to narrow the gap between the powers; according to Cairo, to dispel the lack of confidence between them. Admittedly, President Sukarno of Indonesia, to loud applause from Peking, pooh-poohed the whole crisis; he was not only over-ruled, but was given the fittingly ironic job of carrying the conference's peace appeal to Washington. His colleagues generally accepted the task as defined above. What was lacking in their attitude was any clear indication of what more the non-aligned countries could, should or would do about it. Perhaps U Nu of Burma came closest to a definite prescription. He foresaw that, as well as trying to bring about a "cooling-off," the group, or rather individual members of it, might provide a necessary "catalyst of some kind."

What kind? Neither on the conference floor nor off it did Belgrade yield any answer. But there would be a very practical role, which only non-aligned countries could play, if some bolstering of Berlin's position by a UN "presence" were to be agreed. The Belgrade declaration's very vagueness about Germany might be a help here. If Dr Nkrumah had succeeded in getting into it a call for recognition of both German states, the whole position of the non-aligned group might have been too compromised in favour of Soviet policy to permit of the group playing a useful role in any German accommodation. As it is, both Bonn and east Berlin, in the end, were able to find some satisfaction in the declaration.

This was not the only curious feature about the world reaction. While the Bonn government was declaring itself "not dissatisfied," many American newspapers were expressing bitter disappointment, particularly with the conference's failure to condemn Russia for resuming nuclear tests; and

here Marshal Tito was the object of their sharpest cuts. But the Peking press named Marshal Tito as one of the chief "spokesmen of US imperialism" at the conference. Peking was little more discreet in its expression of its obviously intense anger at Mr Nehru's and U Nu's efforts to lift the conference out of its familiar rut of anti-colonial speechmaking into positive action for peace.

The unofficial American reaction seemed as ingenuous as the official Chinese one was disingenuous. Only the most naïve observer could have expected the Belgrade group to swing in favour of the West, even under the brutal impact of the Soviet test resumption. Most of its members had long been on record as supporting Peking's claim to the Chinese seat at the UN; as sympathising with the Algerian, Angolan and other anti-colonial struggles; as tending to brand the whole West with at least some degree of complicity in colonial repression and racialist domination; as indifferent to German, and particularly to west German, grievances; and as suspicious about the likely impact on themselves of new western economic groupings. Nothing of this was new to anybody who had followed the Belgrade countries' earlier utterances at UN meetings.

MR NEHRU and others were right to urge the conference to escape from total obsession with colonialism and imperialism; their courageous efforts did save it from being merely a repetitive and competitive talkfest, in which those who had least to boast of as shapers of "new nations" were liable to talk loudest. But a matching candour is also required in the western world. The western public does sometimes need reminding that colonialism, although dying, is not yet dead; and that true understanding between the West and formerly dependent Asia and Africa is still blocked not only by the survival of colonial rule and repression, but also by race prejudice, misuse of economic power, and a whole complex of "white" attitudes arising from seeming inability to

take seriously the fact that the basic psychology of emergent peoples is not cast in a European mould.

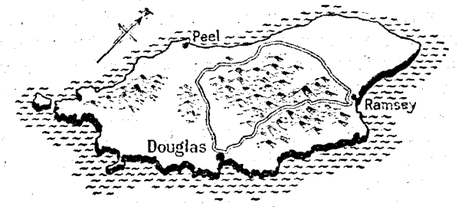
It is too easy to overlook this, and to pass from disappointment at the apparent failure of Afro-Asian neutralists to condemn Russia to the conclusion that they are perversely one-eyed, "ungrateful," and responsive only to toughness as now practised by Mr Khrushchev. There is in fact no evidence that the Soviet bomb blasts swung the Belgrade conference towards a timorous wish to "appease" Russia. The varying attitudes shown at Belgrade on the German question had been fixed long before the Soviet resumption of nuclear tests. The demand for American-Russian negotiations had been voiced by the same group at last year's UN assembly. Although the Russians and Chinese have made what they could out of the conference, in a tortuously selective way, they have in general been cautious and cold to it. Not only did Mr Khrushchev receive Mr Nehru's representations in Moscow with great reserve; to the communist powers, which claim that their ways should be a guiding light of all underdeveloped nations, the mere sight of such nations converging on, of all places, heretical Belgrade, and setting themselves up as an independent world force, is repugnant and infuriating.

For Mr Khrushchev, Belgrade's most specifically annoying aspect must have been its firm rejection of his bid for the total paralysis of the United Nations through an extended veto system. The Belgrade consensus favoured a stronger, not a weaker, UN mechanism. In the General Assembly that opens on Tuesday, battle will be joined on this issue; and it is first of all here that a closer western working relationship with the non-aligned powers looks possible. If the West can finally abandon the idea of retaining a dominant position within the UN, and align itself with the non-aligned in the effort to increase the organisation's effective peace-keeping capacity, it will both narrow the gap that divides it from emergent Asia and Africa, and help the non-aligned countries to find their own identity in the pursuit of positive common aims. It will also be doing something worth while in itself.

Old Mancunian

The *Guardian's* brave new venture in London raises all the problems, qualitative as well as quantitative, that the thriving "quality" press in Britain now faces

IT was midnight in Vienna some years ago, and a cluster of editors were discussing how they planned their newspapers, when the doyen of them all could bear it no longer. "Planning?" he burst out impatiently, "I don't know what you mean. We get the news and put it in. We have some ideas and write some leaders. And that's the *Manchester Guardian*." No doubt, in his deflating way, the late and inimitable A. P. Wadsworth was much understating the forethought that then went into the making of his famous paper. But certainly the process which, since then, has first deleted Manchester from the paper's title and now, this week, added London to its imprint reflects a formidable new exercise in planning by both the business and editorial departments. Its object has been, by a characteristically Mancunian combination of imagination and down-to-earth calculation, to make the *Guardian*, which was already national (and international) in its reputation, national in its distribution and appeal, too.



By starting to print in London as well as in Manchester (using ingenious, if still erratic, two-way teletypesetters) the *Guardian* not only enlarges greatly its own catchment area, but also hopes to catch the tide that has been running strongly in favour of the so-called quality newspapers. True, that tide may temporarily have passed one flood, in terms of advertisements if not of sales. Certainly, with national distribution the *Guardian*, sold for 4d. should lift its circulation of 235,000 well ahead of the 260,000 of *The Times*, at 5d.; the intenser rivalry between them will be worth watching.

But will the *Guardian* put on the extra 100,000 or so that may be needed, with the supporting revenue from advertisements, to make the new and costly venture really worth while financially? That is the first hazard; no doubt the hard-headed sums have been done.

The second hazard is quite different; it is editorial, and belongs not only to the *Guardian*. Can a paper like it or, say, *The Times* (or even, in its own smaller way, *The Economist*) become, not all things to all men, but more and more things to more and more men, and still be itself? *The Times*, at any rate, may opt to stay itself, if it can; to consolidate something like its present circulation, if it can, at a higher price of, say 6d. And the *Guardian's* editor, Mr Alastair Hetherington, believes both that his paper is going to keep its own traditional, detached, peculiar and nonconformist vantage point in Manchester and that, while embracing all the useful contemporary means of presentation and communication (editorially as well as technically), the paper will keep its character intact. He and his managerial colleagues deserve every congratulation on their essay to translate a great newspaper into modern terms (as all of us in the Press must try to do). But are they going to be able to say, with the same unmistakable meaning as A. P. Wadsworth did, "That's the *Guardian*"?

Island Entyre of Itself

The Isle of Man is a victim of changing holiday tastes and its own situation: its tourist-based economy is static, and if schemes now afoot are unsuccessful, the island's future is gloomy

DONNE, of course, was talking of a different Man. The "island entyre" to which this article refers lies in the geographical centre of the Irish Sea, a richly scenic 36 miles by 10 with a bare 56,000 inhabitants, and the focus of the holiday attentions of half a million Scots and Scouses from across the water between May and September. Nor is it part of the main: its nominal ruler is the Queen, but with its bicameral legislature (the oldest in Europe) it enjoys political, but not economic, autonomy. Its government is conducted by the Lieutenant-Governor (whose powers are wide), his partly-appointed Legislative Council (composed of such ancient arbiters as two Deemsters and the Lord Bishop of Sodor and Man) and the wholly elected House of Keys. The Keys propose, Legco disposes or at least delays as it sees fit; and when bills eventually come to be signed both houses sit together as the Court of Tynwald to do it. Only in its foreign policy need the island bow to Whitehall: but with few exceptions and additions legislation is in practice taken over unchanged from the United Kingdom.

The £4 million government revenue of the Isle of Man is derived, as in that less happier land across the sea, from the three main sources of customs, excise and income tax; but customs and excise income derive in turn largely from an arrangement with the United Kingdom called the Common Purse, whereby, in return for levying identical duties on identical goods, the island receives a *per capita* pay-out from the Treasury (still called "The Imperial Government" in the island) without having to go to the trouble of separate collection. Only beer is the subject of a differential duty.

Contributions to the island's economy from the Common Purse amounted to £2.3 million in 1960. Of the rest, the greater part came from income tax. The sum of £785,000 was extracted reasonably painlessly (the standard rate is 4s. 6d.) from the 6,000 Manxmen and "comeovers" fortunate enough to earn more than £530 in 1959. Tax allowances are generous as well as tax rates: a married man with £2,000 a year, two children and a dependent relative is eligible for allowances in excess of £1,100. Richness is encouraged in other ways, too: death duties and surtax are not countenanced as ways of collecting revenue, and earned income is more heavily taxed than unearned (on which the standard rate is 3s. 6d.)—although with the intention of encouraging investment in, rather than parasitism on, the island.

Private income derives almost solely from the brief summer when the isle, like Prospero's, is full of noises, sounds and the sweet music of cash registers giving delight and hurting not. It is then that the comeovers flock from "Across" with their camp followers into the 180 hotels and boarding houses in the main town of Douglas. They are the lifeblood of Man—not only for what they spend but for what they earn; the petty, transient traders from Across contributed more than half the income tax and four-fifths of most other revenue to the island's exchequer in 1960.

Winter is a hard time in the island: Man's economy, tourism apart, is not strong. Until recently its industries were confined to brewing, kippering, confectionery and small ventures in woollen goods and carpets. Fish and wool (most of the fish comes from Scottish ships rather than the all but moribund Manx fleet) are the island's only raw materials; but there is a highly mechanised agriculture the main products of which, mutton and cattle, are exported in some quantity to the United Kingdom. There are now, in addition, tiny specialised industries producing such esoteric things as fibreglass for TT motor cycles and plastic mouldings—products which (since transport costs are high) sensibly depend for their ultimate value largely on the work that has gone into them. There are also several firms doing sub-contract work for United Kingdom companies—little of it very profitable.

THE attractions of the island as an industrial development area have proved somewhat smaller than its lures as a holiday resort. In an effort first to find out why no major industrialist has thought the low taxes and pleasant climate worth his while, and then to discover some means of making it worth his while, the Governor last year appointed a one-man

commission of inquiry—a Liverpool production engineer, whose *Survey* (printed, significantly enough, in Liverpool) was published last summer. Its prognosis is gloomy.

A reserve (about 1,500 in an average winter) of unemployed men and women is not, he commented, a sufficient inducement to the immigration of prospective industrialists: and the quality of the Isle of Man's labour is not, in any case, to be boasted of, for while its productivity is described by most established firms as fair to middling, its ability to take advantage of promotion is, as one of them put it, "middling to maggots." Nor is it a stable labour force. Of those already employed, up to a third regularly desert their employers in the summer to go "on the comeovers"; many more do night work of the same sort and refuse to do overtime for their regular employers. This seasonal fluctuation is not surprising. Manxmen have been brought up to believe that the tourists are a bounty from the Almighty; their regular wage rates are lower and their cost of living higher (by 25 per cent) than those of the United Kingdom, but even the least skilled of Manxmen can overcome these twin hardships in the season, when a conductor on one of the horse trams which crawl along the Douglas promenade will earn upwards of £16 a week.

The lack of "officer material" is less easily understandable and more serious. The Manxman's development as an executive is limited by the lack of institutions on the island capable of guiding and nurturing his native skills. More technical education could only lead, however, in the absence of opportunity to use it, to the increased drain of population which is the spectre of Manx life. As a result, new industries will continue to bring with them their key personnel. The dilemma might be resolved by a programme whereby Manxmen sent to the United Kingdom for higher education at Manx government expense would be bound to return to the island for a term of years after their training.

The *Survey* found, too, that the quality of industry in the island is hardly higher than the men it so grudgingly employs, being feeble in the face of competition, dangerously complacent, undernourished as to markets, paltry of organisation and tardy in settling its debts—this last an all too common failing of the island's businesses and even of its government departments. All these diseases are traced to basic maladministration, and the suggestion was made that an industrial officer, with exceptionally wide powers, should be appointed to deal with industrial policy. This, at least, has now been accomplished, and the appointment is already bearing fruit in the changed attitude of some prospective immigrant firms.

The information the firms get, however, is not greatly encouraging. Power and transport charges are high, the insular market is hostile to Manx goods (the Manxmark, which is not a form of currency but merely the equivalent of the BSI's Kitemark, has done little to make it friendlier) and the transfer of capital is difficult. But, on the other side, labour relations are good (there has been no strike since 1918), finance from island sources is freely available, taxes low, allowances good; and factories and houses can be quickly provided. Nevertheless last year eight of fifteen firms gave it as their considered opinion that if they had their time over again, Manx would not be their choice of development area.

SOME industries should find considerable inducements to development in the island. But they will have to be highly specialised (electronics, plastics and cigarette manufacture have been suggested) and the most hopeful move may be towards the establishment of self-contained production units of existing United Kingdom firms whose expansion at home is hindered by lack of space. In the past three months several new ventures have been started, some to exploit indigenous materials (such as prawns and scallops), others more conventionally industrial. Whether any of them is enough to close the gaps in the Manx economy is open to question.

The main industry must naturally continue to be tourism; but even this is declining as more Britons manage to go really foreign for their holidays. A liberalisation of the licensing laws (Sunday opening was introduced only two years ago) and the plan for a full-scale casino (presently suspended by the Legislative Council) may bring about a temporary revival, but it is clear that some other way of making a living will have to be found if the island is to maintain its jealous independence. Its independence (some would say its insufferable insularity) even stretches to a general reluctance to follow the United Kingdom into the common market—perhaps in the hope that such exclusiveness will bring to the island all the benefits to be derived from EEC without the concomitant obligations. Pursuit of this course, shortsighted as it is, may eventually lead to some good, however, for Manx could not exist for long outside a British tariff barrier and would be forced to apply for full integration in the United Kingdom in order to survive. Or possibly supplication might be made, as an underdeveloped area, to the United Nations. It is either that or a return to a pastoral existence, sans trade, sans tourists, sans industry, sans everything.

The Economist

SEPTEMBER 14, 1861

THE WAR'S TRUE CHARACTER

It is true enough that it was the aim of the Republican party which elected Mr Lincoln to prevent slavery from spreading into the unsettled Territories, unless by the deliberate resolve of those Territories when erected into States. It may be true that the success of the North, if complete and unconditional, would enable them to confine slavery within the 15 States which have already adopted it, and *might* thus lead to its eventual extinction,—though this is rather probable than certain. It is no doubt honourable to Mrs Stowe, and to that earnest and devoted abolition sect of which she has in Europe been the stirring mouthpiece,—that they are determined to make the present disastrous civil struggle an anti-slavery conflict and to convert what was a war for political supremacy into a war for negro emancipation. If they can do so—if they can thus educe good out of evil, without resorting to means which look very like doing evil that good may come—we shall rejoice most earnestly at the beneficial result. But it is to say the least something premature to require that we should from the outset have recognised in the contest a character which, even up to the present hour, *they have failed to imprint upon it.* Unprejudiced spectators have repeatedly deplored as the inherent weak point of their cause that there was no distinct or noble moral purpose stamped upon it. We have heard abundance of misty declaration about patriotism and freedom on both sides,—and not more definite on one side than on the other; but it has been impossible to say what great principle was in reality at stake. And there is really something staggering in the audacity which now demands our sympathy for the Northerners on the ground of that very moral grandeur in their cause, *the absence of which* has prevented our sympathy from being enlisted on their side. Let the conflict once become avowedly and honestly and irretrievably a war for the extinction of Slavery, and we suspect the enthusiasm and excitement of Great Britain would rival that of the Americans themselves.

NOTES OF THE WEEK

CONGO

Law of the Jungle

SIR ROY WELENSKY is right. Congo politics became subject to the law of the jungle fourteen months ago when the Belgians left, the army went berserk, and Mr Tshombe, followed by other provincial leaders, proclaimed the independence of his bit of the country. The larger jungle that is world opinion has long acknowledged this, and seen and feared the dangers of a central African civil war in which the several armies might be supported by several different outside powers. That, after all, was why the world sent the United Nations to keep the peace and to set the Congo on its feet again.

What gave the world a shock on Wednesday was the unexpected sight of its own supra-national force in action, and the discovery that the spectacle was not so unlike that of other denizens of the political jungle in action at other times and places. Given the existence of the United Nations, and the existence of crises which the national powers cannot handle on their own, the emergence of this new power has long been on the cards. It is the sight of it in violent action that has jarred.

If this leads to harder and more realistic thinking about how the international organisation is to work in other crises—there is one coming in Berlin—so much the better.

It is the degree, not the kind, of force used by the UN that has caused the shockwave. The UN army in the Congo has brushed with Congolese soldiers before; indeed, more than eighty UN soldiers have lost their lives in such actions. But Wednesday's battle, resulting in more than 40 Congolese dead on the streets of Elisabethville, was of a kind that, naturally, has deeply disturbed many people, whatever they think of the arguments for deposing the *de facto* government of Katanga. This is so in spite of the immense patience shown by the UN until now (in the face of Mr Gizenga, Dr Nkrumah, Mr Khrushchev, Mr Tshombe, Mr Munongo, Sir Roy, *et alii*); in spite of the fact that, by all accounts, the Katanga forces shot first on Wednesday; of the danger that did exist of civil war; of the undoubted ability of Mr Hammarskjöld and his lieutenants to justify every major UN action in the Congo by reference to the mandates they had, in due form, received.

But was the UN right politically? Katanga has at least as much right to assert its independence as have, say, Wales and Nyasaland; this does not mean that Mr Tshombe had the mandate to do it, and the speed of his collapse suggests that he had not. The relations between the various parts of the Congo (at best an artificial creation) have yet to be finally settled. The point is that when the settlement is made (be it through a central government, a federation, or a confederation) it must be made to last. Jungle law was bound to reign in central Africa as long as the Congo's major source of wealth was detached from the rest of the country, by, as most Africans believed, white manipulation. Peace was bound to be broken as long as the war against the Baluba tribesmen continued in Katanga.

Will dragging Katanga back into the Congolese fold change any of this? It is on the answer to this question that judgment of the UN's action will finally be based. On balance, and in spite of the hard feelings, the chances of creating a Congo strong enough to stand on its own feet seem better today than they have looked at any time since the UN went in on July 15, 1960. But the time to proclaim success will not come until the Congo has a government in power strong enough, representative enough, and stable enough to keep out jungle law and offer no temptation to foreign predators. It will then be time for the UN to withdraw and balance the books of the whole operation.

WAGE PAUSE

Tanker Load of Trouble?

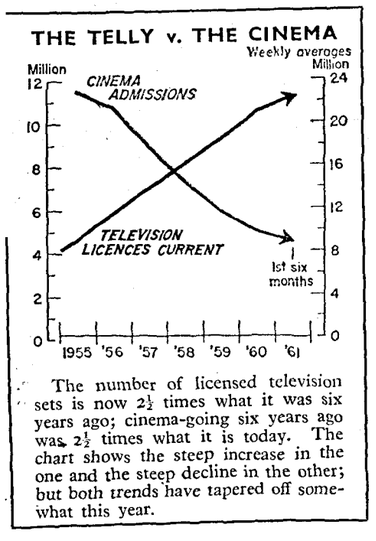
IT seems increasingly likely that the first major battle against the wages pause will be fought by Mr Cousins's lorry drivers some time after the next meeting of the Road Haulage Wages Council on September 21st. Two other wages councils have been asked by the Minister of Labour to reconsider wage awards submitted to him after the Chancellor's economic statement on July 25th. This week the bigger of them—that dealing with 100,000 industrial and staff canteen workers—responded to Mr Hare with a flat "Won't." The council's members said that they formulated their original recommendation on June 9th, even though they did not submit it to him until after July 25th; and that by yielding to his pressure they would destroy the "confidence and goodwill" on which wages councils depend. In other words, the council did not see why it should incur the odium of enforcing the pause, and threw the responsibility back squarely into the lap of the Government. Presumably Mr Hare will respond by refusing to make the canteen workers' award statutorily obligatory for all employers; but canteen workers do not seem well-placed to strike.

The Road Haulage Wages Council formulated a provisional recommendation for a wage increase for its lorry drivers on July 6th, and it meets next Thursday to decide whether to submit it to the Minister. If it withdraws its provisional recommendation, Mr Cousins's men (and, in Scotland, the Scottish Horse and Motormen's Association) might strike immediately. If it decides to send on the recommendation to the Ministry—and the council's chairman is Mr Guillebaud—there might (on the analogy of the canteen council) be a postponement of nearly two months while Mr Hare goes through the procedure of sending letters back to it. But all through this period Mr Cousins would be beating up his drums of war.

Although this wages council's recommendations apply directly only to the 240,000 workers employed by private haulage concerns, the wages of workers in many kinds of road transport are by custom moved in accordance (eventually) with them—and Mr Cousins will not hesitate to call any lorry drivers he can command out in support. In particular, he believes that he has got the system of petrol and fuel-oil distribution tightly under his control. Although the largest industrial consumers often get their deliveries of petroleum products by water or rail, a national strike of Mr Cousins's men on the petrol and fuel oil lorries probably could seriously damage industrial production, as well as threaten to immobilise the private motorist.

Should this happen, the Government would be almost bound to call in the military to maintain deliveries; it would be unlikely to allow a relatively small group such as the tanker drivers to seize the whole country by the short hairs in the course of a dispute about a wages council award that did not directly apply to many of them. But if the soldiers appeared, would other unions call their members out in sympathetic action? Or would they once again leave Mr Cousins stranded on a lonely limb? There are still lots of "ifs" and "buts" in all this, but it may be the issue which British politics and industrial relations this winter are going to be largely about.

BERLIN



Ides of September

MID-SEPTEMBER was the time when, as it seemed a few weeks ago, circumstances would at last be ripe for the West to propose negotiations on Berlin. Mr Llewellyn Thompson, the American ambassador in Moscow, has made his sounding of Russian ideas on the subject, and has sent his report to President Kennedy. The western foreign ministers were considering this report in Washington

while *The Economist* was going to press. The west German election, before which it was thought it might be indelicate to say anything about negotiations, takes place this Sunday, September 17th. The General Assembly of the United Nations, where the foreign ministers of the United States, Russia and Britain (though not, apparently, of France) will find themselves within easy conversational range of each other, convenes on Tuesday. All the cues have come on time ; but the proposal to negotiate has not. Apparently the rest of the West has not yet convinced the French government that the proposal should be made.

Last Sunday's speeches by Mr Khrushchev in Stalingrad, and Mr Gomulka in Warsaw, showed that the leaders of the communist world, like most of their counterparts in the West, are aware of their people's worry about war. Of the statesmen principally concerned with the Berlin problem, only the Canute-figure of General de Gaulle now stands motionless against the rising feeling that there ought to be negotiations. Whether or not the ideas for a solution put forward on page 1039 are ever discussed with Mr Khrushchev therefore depends on two things. One is the ability of the United States and Britain either to shift General de Gaulle from his present attitude or else to by-pass him. The other is the willingness of Mr Kennedy and Mr Khrushchev to stop qualifying their offers to negotiate with the condition that the other side must make the first move.

As Mr Kennedy told his visitors from Indonesia and Mali on Wednesday, a chance to break the deadlock is provided by the presence of Mr Rusk and Mr Gromyko at next week's General Assembly. Both Mr Kennedy and the Soviet government have now indicated their readiness for a discussion of the Berlin question between the two men. Their talks may lead on to further meetings, if possible with France taking part, if necessary without. Last year's summit meeting was delayed by the forces opposed to negotiation, including General de Gaulle, so long that when it was finally held in Paris it was too late to do any good. This year, too, time is beginning to look a little short.

The number of licensed television sets is now 2½ times what it was six years ago; cinema-going six years ago was 2½ times what it is today. The chart shows the steep increase in the one and the steep decline in the other; but both trends have tapered off somewhat this year.

COMMUNIST BLOCK

Polish Fears

The Warsaw pact powers have responded to Mr Khrushchev's bomb-rattling by openly alerting their conventional forces. After a two-day meeting in Warsaw on September 8th and 9th, the military committee of the pact announced that "practical measures" were to be taken for the "further strengthening of the defences of the Warsaw treaty states." After the meeting, the Bulgarian defence minister said that the pact's armed forces were in a complete state of readiness, while Mr Gomulka told the Poles that all members of the pact must strengthen their defence forces.

Whatever the military significance of all this, it is no doubt intended to play a part in Mr Khrushchev's war of nerves against the West. Whether it will have done eastern European nerves any good, is hard to say. The resumption of Soviet nuclear tests seems to have caused a wave of uneasiness, particularly in Poland, where it has plainly caused profound disquiet. There has been heavy buying of foodstuffs and other goods by people who, in Mr Gomulka's scathing words, "have not shown proper backbone." Since the Soviet resumption of tests, first the foreign minister, Mr Rapacki, then the defence minister, General Spychalski, and finally, last Sunday, Mr Gomulka himself, have made speeches justifying the Soviet action and assuring the Poles that there will be no war.

It is easy to understand the sensitivity of the Poles, who suffered so much from the Germans in the last war and who are now taught to fear that Bonn intends to win back the territories east of the Oder-Neisse line. For the Poles the present crisis over Germany is intimately linked with the integrity of their own frontiers. When Mr Gomulka told his audience last Saturday *that no German invaders would again* step on Polish soil, and that only a German peace treaty would "sanction, fully and finally" the Oder-Neisse frontier, he was listened to as a national, not a party, leader. It is perhaps just because a war about Berlin would make much more sense to the Poles than to most other people, that they are so afraid it may happen.

HANDLING DEMONSTRATORS

Heavy Hand

THERE is nothing intrinsically illiberal in imposing one-week or even two-month gaol sentences on willing martyrs who refuse to agree that they will abide within the law about obstruction of the highway and other matters; the 300-year-old statute of Edward III used against Lord and Lady Russell and other nuclear disarmers last Tuesday is a perfectly sensible power for the authorities to have. But it is a power that should always be used with reluctance—against any political demonstrators, let alone against 89-year-old ones—and according to coolly calculated rules of discretion. Generally speaking, it should be used against pugilists rather than Quakers; in cases where a breathing space might give time for tempers or excitements that could lead to violence to cool; or, sometimes, when its use might prevent a minority from causing a lot of law-abiding citizens some grave inconvenience (graver, say, than the blockage of traffic through Parliament Square on a Sunday afternoon). But it is a less sensible weapon when its main effect is that the authorities seem to be challenging nonagenarians and teenagers to a game of chicken.

Wednesday's action by the police commissioner, in using the Public Order Act of 1936 to ban any meeting at all on Sunday by Lord Russell's campaigners in central London, was in a sense a logical follow-up to Tuesday's court proceedings. Quite apart from the point that there will also be a Battle of Britain rally in London on Sunday, it therefore seems less open to criticism in itself. It should have the considerable advantage of enabling the police to move away bystanders who would otherwise come just to gawk. But, inevitably, the campaigners have said that they will defy the ban and they claim to be confident that more than 10,000 people will invite arrest by thronging into Trafalgar and Parliament Squares. The propagandists who think they are now running the march do not automatically inspire credibility, and it is impossible to guess how many people really will turn up and in what mood. But if the whole procession does prove to be more than a bedraggled trickle, the police's task will not be made any easier by the practical threat that is obviously raised by Tuesday's "martyrdoms": that the demonstrations might now fall clumsily into the hands of purely political elements attached to Lord Russell's campaign (the sort of people who shouted "Hitler" and "Fascism" at the remarkably good-tempered magistrate on Tuesday), and of callow tenagers organised by second-team demonstration marshals, while the movement's more Gandhi-like leaders sit in Brixton gaol.

TRADE UNIONS

Mr Hare's Buck

MR HARE and Mr Woodcock kept a rigorous silence after their meeting this week, divulging between them only the not very amazing fact that the affairs of the Electrical Trades Union had come under discussion. But obviously the question of union elections rated more than a passing mention: there is a strong rumour that Mr Hare suggested that one of the best services

the TUC could render to its members would be to draw up a set of model rules for their conduct. This would relieve the Government from the political embarrassment of appearing to "interfere" by new legislation with the unions' autonomy at the same time as it is fighting them about the wages pause ; but it would also lay on Mr Woodcock the immense difficulty and embarrassment of preparing model rules which many of the 180 constituent unions of the TUC would regard as a personal insult. So the TUC seems unlikely to accept any such invitation in full, but it will no doubt say that the Government must not interfere either.

It is rumoured that one right-wing union leader, after last week's debate at Portsmouth on the ETU, was heard to boast that such a state of affairs could not arise in his own union, since he had sensibly done away with elections altogether. Apart from this rather extreme case, another thumping absurdity was brought to light this week with the invalidation of an election in the Amalgamated Engineering Union in which a left-wing personality had been fighting to unseat a right-wing member of the union's executive. The election was apparently declared void on the grounds that "undue influence" had been used on behalf of the left-winger, in the form of recommendations in his favour from local eminences in the union. An election in which canvassing is ruled out is surely worse than no election at all ; this rule may do much to explain why over 90 per cent. of the AEU's membership often does not turn out to vote. But such are the traditions with which the TUC would have to contend if it were itself to try to draw up a model code.

It is now crystal clear that the proper course is to legislate to allow the Registrar of Friendly Societies, or some other official, to vet the rules of all registered unions. He need not and should not impose complete uniformity, nor say that all unions must at once adopt one particular system of satisfactory arrangements for having the votes counted by an independent body (such as the system operated by the National Union of Mineworkers). But he should issue annual reports about which of the various systems he considers to be the best ones to move toward, and meanwhile have the power to make inquiries and issue regulatory orders when and if ever he finds that any union has committed a fraud upon its members (in election procedures or any other matter). Mr Hare should regard it as his duty to introduce such legislation in the next session of Parliament.

BRITAIN AND EUROPE

Mr Heath's Team

TO the accompaniment of rumblings from Accra, where some of the Commonwealth finance ministers, assembled from Tuesday to Thursday, once more

Negotiator : Sir Pierson Dixon

voiced their misgivings about the possible effects of British membership of the common market, the Government has named the members of the team that will negotiate with the Six. Mr Heath has, of course, already been chosen as the minister who will lead it and be, when the chips are down, the responsible man ; this is his great chance in a career that was judged bright by everybody even before he started upon it. Now Sir Pierson Dixon, ambassador to Paris since last year, and until then British representative at the United Nations, has been named official head of the delegation. Sir Pierson Dixon will remain ambassador, but most of his day-to-day duties will be carried out by the British minister in Paris, Sir Anthony Rumbold, a senior diplomat. The deputy head of the team will be, imaginatively, Mr Eric Roll of the Ministry of Agriculture (who, before the war, was professor of Economics at Hull). Other leading members will be Sir Roderick Barclay of the Foreign Office, Mr. G. R. Bell of the Treasury, Sir Henry Lintott of the Commonwealth Relations Office, Sir William Gorell Barnes of the Colonial Office, and Mr G. H. Andrew of the Board of Trade.

The list is, on balance at any rate, very encouraging. In Paris Sir Pierson Dixon has at least had the opportunity to fathom the French mood ; at the UN he earned himself the reputation of a skilled, though a tough, negotiator. Not less important, Mr Eric Roll's fertile mind and his wide and detached international experience are already providing an abundant flow of ideas on the central question of agriculture ; and most of the other men named are distinguished by European sympathies and background. Sir Henry Lintott, for example, was from 1948 to 1956 deputy secretary-general of the Organisation for European Economic Co-operation. At home, and crucially, another good European now, Sir Frank Lee, Joint Permanent Secretary to the Treasury, will co-ordinate the work of the departments. He will be responsible to Mr Heath, who in turn is responsible to the Prime Minister himself.

Though the British team has been chosen, the Six have not yet decided how to negotiate and who shall do it. The Commission examined the British application when it met on September 6th, but the comment it is passing to the Council of Ministers does not, apparently, go far. There are reasons for this caution. But it does not seem designed to give the Commission the prominent place it desires in the talks or to help to get the negotiations going with the needed speed. The six governments, by contrast, have clear, though various, views about both the form and the location of the talks, which will no doubt be expressed when the Council of Ministers meets on the 25th. The French want the talks to be conducted by the governments rather than the commission—in Paris. Everyone else prefers Brussels, but the French have often had their way in the past.

NORTHERN RHODESIA

Open Door

MR KAUNDA and Sir John Moffat, the liberal leader, can offer themselves mild congratulations. Their visits to London and the Colonial Office during the past fortnight seem to have borne fruit, though it is still far from ripe. After meetings between Messrs Macmillan, Sandys and Macleod at the beginning of the week the Colonial Office announced on Wednesday that while it was not prepared to negotiate under the threat of violence, it would be ready, once order had been restored, to consider "any representations within the area where divergences of view persist" over the proposed Northern Rhodesian constitution.

This seems to mean that the government is prepared to modify the objectionable obstacles to an African nationalist parliamentary majority. Sir Roy Welensky, believing that it does, has protested. Even so, the more militant of the Africans may feel that it would be risky to drop the policy of violence now, just when it seems to be getting results. But it is to be hoped that this will be seen as a real success for Mr Kaunda's resolutely pacific leadership, and do something to efface the damage done to his image by Mr Macmillan's unfortunate letter of August 30th, which blamed him for encouraging disorder. Mr Kaunda has in fact done more than anyone else to try and minimise the consequences of African exasperation at the shufflings of the British government's Rhodesian policy, though the local authorities have done their best, by restricting his movements, to make his efforts barren. If the Prime Minister now admits that Mr Kaunda is the most reasonable leader he is likely to get to deal with, this is only justice, and not a moment too soon. What would be sensible, and in their own best interests, would be for the United Federal party in Rhodesia to admit the same.

TUNISIA

Bourguiba Rides Again

AMID general astonishment, especially in Paris, Mr Bourguiba has climbed down from the limb he so conspicuously straddled two months ago when the Bizerta

Appointments, Business and Personal notices and other Classified Advertisements pages 1111 and 1112

conflict erupted. The Tunisian president, it is true, has never been a believer in ultimacy, the fallacy that the eleventh hour ever arrives. All the same, it is remarkable that he has felt himself strong enough to concede a crucial point to the French, switch off the clamour of his own public opinion, dare the displeasure of his recently wooed and won non-aligned associates, and, in short, resurrect bourguibism, the only genuine brand of pro-western neutralism known to exist, which was thought to have died with the Tunisian demonstrators at the battle of Bizerta in July.

Reasons for his change of direction (announced at a press conference on September 8th) are not hard to guess. As long as the quarrel with France lasts Tunisian schools, one of the country's few resources, will have difficulty in finding teachers of the requisite quality. No rent will be paid for use of the Saharan pipeline that passes through Tunisian soil. At Belgrade Mr Bourguiba cut a less impressive figure, and found the neutralists less helpful, than he had hoped. He may even have begun to feel that there is no point in encouraging his own extremists by playing their game. *Le Monde* further suggests that he does not want to be the only Maghreb leader on bad terms with France at a time when the Algerian negotiations may be reopened, and when the King of Morocco has publicly stated that his relations with Paris are excellent.

So on the strength of a message reported to have been sent from Paris, and General de Gaulle's public statement of September 5th that the French had never contested Tunisian sovereignty over the Bizerta base, which they would one day have to leave, President Bourguiba has felt able to admit the French contention that Bizerta cannot be handed over while international tension lasts—which he equates with the Berlin crisis. Such an admission makes it very hard to understand what the fighting was about.

TEACHERS' UNIONS

Striking Out?

THE National Union of Teachers is a body whose policy now seems fated to blow hot and cold. The times when it is most likely to blow hot are after some meetings of its emergency committee and full executive (such as the one that took place last weekend) and especially after a larger delegates' conference (such as the one that called for strike action last June 17th, and will now convene again on October 7th). The balance of power at these conferences now lies surprisingly far to the left; as in other unions, it is the left wingers who turn up most frequently at the meetings where delegates are picked. The cooler winds have hitherto blown from the union's top leadership and from the rank and file. The first source can no longer be relied upon as a tempering force. Sir Ronald Gould and his senior lieutenants are undoubtedly bitterly hurt, not so much at the details of Sir David Eccles's latest pay offer (which are better than most teachers think, see *The Economist* of last week) but at the way that Sir David has overridden the "free negotiating machinery" of their Burnham committee. Sir Ronald will have no truck with those who have pointed to the mounting inconsistencies of Burnham: which are, first, that it has been a lop-sided piece of collective bargaining machinery so long as the chief paymaster (the Government) has not sat on it, and, secondly, that the form of its membership has increasingly given too much weight to the interests of the large number of young women who will serve as teachers for only a few years, and too little to the interests of those who serve a lifetime in the profession.

Sir Ronald Gould
(See page 1054)

As a result of these varying resentments, NUT members are now being urged into a "plan" of protest action that looks weirdly unprofessional, not just in the snob sense but in the sense of being inexpert. The first demonstration is scheduled to be a general one-day school strike when Parliament reassembles (October 24th) so that thousands of teachers can turn up as lobbyists at Westminster; no doubt this—and similar action planned by the National Association of Schoolmasters for next week—should be easily organisable but what good is a one-day stoppage meant to do? It is proposed, secondly, that teachers should refuse to co-operate in the school meals service after November 1st; compulsory bans on extra-mural activities of this sort are bound to be differently interpreted by different people, and thus cause strains in staff relations between keen NUT members and the rest. Thirdly, it is hoped to take more extended strike action in particular local areas; but if these are to be backed by union funds three quarters of teachers must agree in a referendum, and it is by no means certain that that percentage of support can be secured.

EIU Quarterly Economic Reviews
covering 57 countries or groups of countries
Out next week:
MIDDLE EAST OIL AND THE ARABIAN PENINSULA
The report covers: developments in oil output, the relations between the oil producers and local governments, and moves towards new agreements; pipeline construction and other ancillary developments; the circumstances of Iraq's claim to Kuwait, and regional reactions to it; a review of current developments in Saudi-Arabia, Bahrain and the other Gulf States; constitutional developments of Aden Colony and the Federation of Arab Amirates.

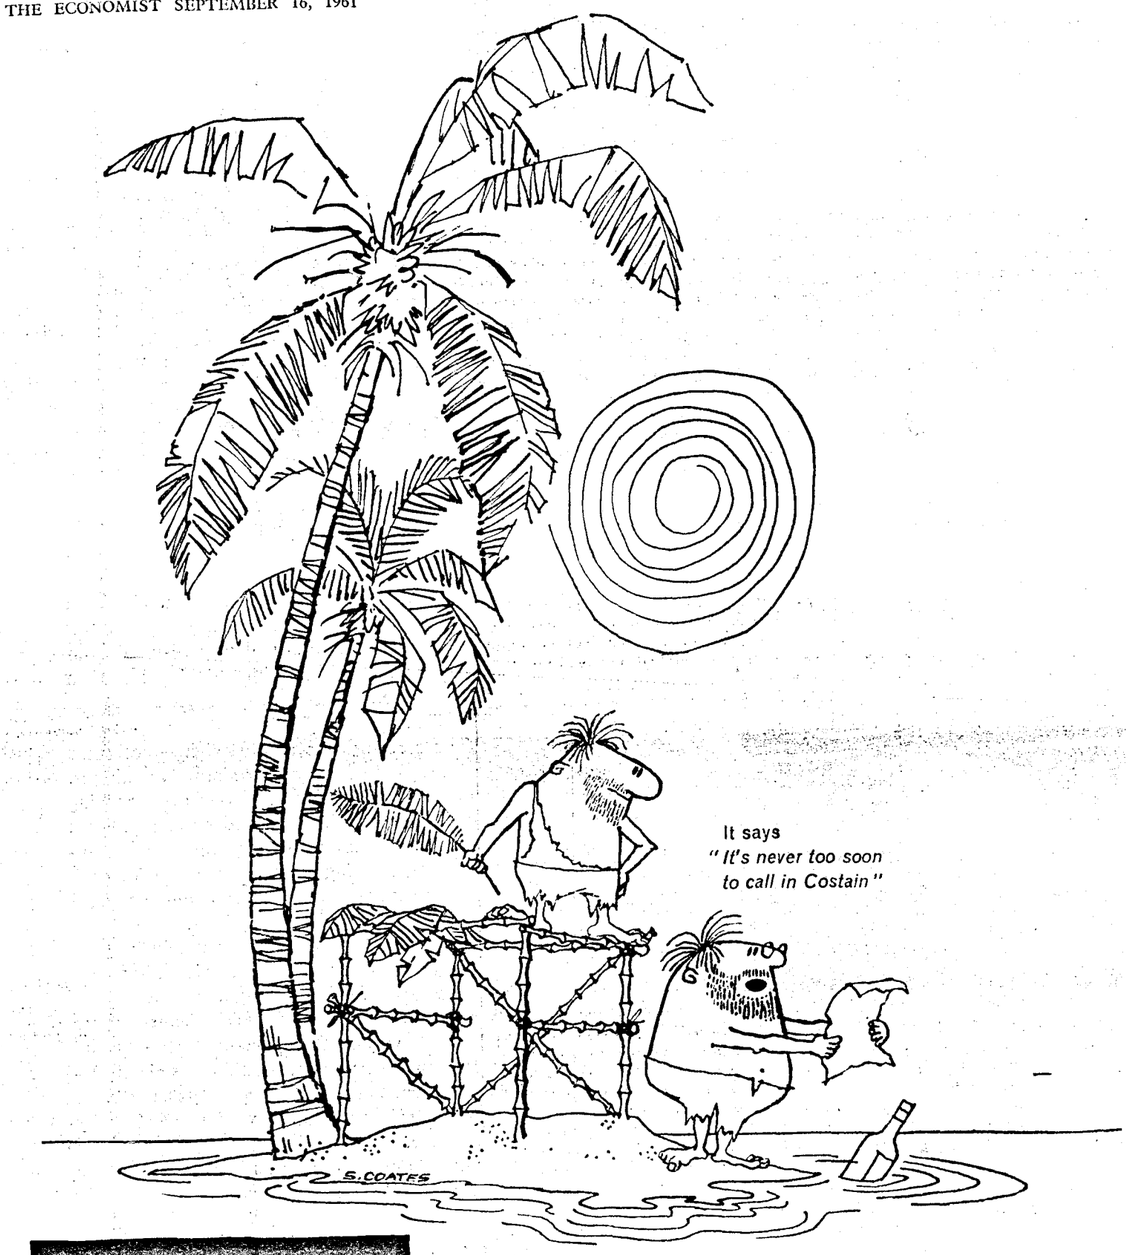
GHANA

More or Less Equal

AFRICANS, trying to prove themselves as good as anyone else, sometimes prove themselves as bad. Ghana, which started it all, is in just such a situation. Its president, Dr Nkrumah, has once again asserted the black man's international status by acting—along with Mr Nehru—as peace messenger from Belgrade to the Russians last week. Mr Modibo Keita, of Mali, has been in Washington this week proclaiming the African presence. Dr Nkrumah has been fêted in a dozen communist capitals; as many Commonwealth finance ministers have made the trip to his own capital to be the guests of his finance minister and to discuss (as a matter of primary importance) European economic alignments. The Osagyefo has enjoyed plenty of dignity.



This is all to the good. African politics must for some years to come centre around the claim to negro dignity first successfully staked by Dr Nkrumah himself when he led Ghana in independence in 1957. The irritation, for the rest of the world, lies in the fact that Dr Nkrumah and his people do not yet seem to have grasped the extent of their global acceptance. They fear colonialism, although, in their own land, it is long buried. For Ghana itself the most damaging international manifestation of this lies in the sort of language used by the government-backed Accra *Evening News*. This newspaper has been raising its voice in anger at foreign (including British) criticism of Ghana; some sizzling passages from its editorials indicate a lack of self-confidence that no Ghanaian need feel.

A similar lack of self-confidence is evidenced by the degree of legislative force used by the Ghana government to crush the strike of railwaymen and dockers that began ten days ago in protest against an "austerity budget" that severely raises the level of taxation. The budget itself was the result of urgent economic planning: Ghana cannot continue to spend as lavishly as it does on prestige projects (like airlines and aid to other African countries) as well as support the Volta River power and aluminium scheme, without placing a strain on its economy and the standard of living of its people. This the Ghanaian government can do if it wants. People overseas have to understand the pressing psychological reasons behind such economics, and behind the tempers that flare up when outsiders sound sceptical, or when dockers appear to hold up progress.

NORWAY

Labour's Mishap

"PROPORTIONAL representation does not produce stable majorities." This psephological maxim must be receiving fresh consideration in Oslo after the unexpected result of Monday's general election. In the 1957 election, the Norwegian

The newspaper you read has never mattered more

The more the world demands understanding, the more difficult it becomes to understand. At this moment, when so much depends upon your newspaper, can you do with anything less than The Times itself?

The Times equips you to understand because The Times reports the news straight—not made agreeable by omissions or entertaining by additions. It reports the news completely. Short of attending every session of Parliament and every significant law case in person, reading every important government report, or being present at every major news event, you cannot find out more about the world each day than by reading The Times.

The Times reports the news accurately. The account you read in The Times today is a historian's record tomorrow.

Upon this structure of facts The Times throws the light of every shade of opinion. You will find the opinion of The Times itself conveniently labelled as such. You will also find, on its letter page, a most vigorous and varied exchange of views by other people.

If you take the world seriously, you should take The Times.

Read THE TIMES tomorrow

system of PR gave Labour a slim, but absolute, majority, with 78 seats in a Storting of 150; the four non-socialist parties got 71 seats between them and the Communists one. This week, Labour got only 74, the Communists none at all, the four parties of the Centre and Right 74; but the newly formed leftish Socialist People's party with 2.3 per cent of the votes, won two seats and now holds the balance—though only in a limited sense. Mr Gerhardsen, the prime minister, was left to decide whether to form a minority government or to seek an alliance with, say, the Liberals or the Agrarians. It is unlikely that he will seek accommodation with the SPP, which was partly formed by those who were ousted from the Labour party for their views: their platform opposed the Nato connection and called for unilateral disarmament by Norway.

The bargaining position of the two SPP members is in fact much less potent than the bare figures suggest. The four non-socialist opposition parties—Conservative, Christian People's, Agrarian, and Liberal—have never been able to form a coalition among themselves, and it is even more unlikely that they will either find a common cause with the SPP on domestic policy, or embrace its particular brand of pacifism.

Despite this, the election has given the government a nasty shock. In a quiet campaign, many local Labour organisations approached the election in a complacent mood born of Labour's twenty-five years in office. Mr Gerhardsen has admitted that the party now needs to take a good look at itself. Like the Irish MPs in the House of Commons at the turn of the century, the two SPP members will be thorns in the flesh. There will be some hot words in the next Storting.

MONTY

Principled in Peking

LORD MONTGOMERY in Chinese company cannot fail to alarm. His dinner companion in Peking a few days ago was his military co-equal, Marshal Chen Yi, the Chinese foreign minister, and in a warm glow of soldierly recollections the field-marshal put his name to three principles designed to ease world tensions. If the New China news agency has quoted them aright, these were:

> There should be only one China, whom everybody recognises; there should be two Germanies, whom everybody recognises; and all armed forces everywhere should withdraw to their own national territories.

Lord Montgomery's "principles" are not all equally contentious, but they all, at the moment, suit the communist book. To find a parallel, one must perhaps imagine Marshal Chen Yi, as a guest of the British Government, coming out at a Guildhall banquet for the reunification of Germany by means of free elections, the neutralisation of eastern Europe and, say, the recognition of Formosa as an independent republic.

General Eisenhower's former deputy is, of course, entitled to his views; it is his choice of a forum that is puzzling, perhaps to his hosts as well as to his fellow countrymen. If the Chinese are puzzled, however, they may be trusted not to let on. The views of a celebrated western commander are valuable property, even though his three principles can, if one is sufficiently ingenious, be interpreted in more ways than one.

TOWN PLANNING

New Garb Nationalisation

THE latest fusillade of Labour ideas about the planning of new development comes from a group report sponsored by *Socialist Commentary*. It is an excellently written report with some persuasive minor suggestions. The group contends that nothing effective will be achieved until one ministry takes over the central planning of communications and industrial location as well as land use; and until regional authorities are set up to pick out major sites for development (including 12 larger new towns in south-east England) and to preserve a broad backcloth of countryside in place of the present rather finickety green belts. These ideas make very good sense so long as it is recognised that any authority planning industrial location must understand industrial, as well as purely social and aesthetic, requirements.

The controversial core of the report, however, is the old panacea of the nationalisation of all freeholds in land, dressed up in new garb. It would take effect through the imposition of a "life" (maximum 80 years) upon every building, after which it would revert to the planning authorities on payment of 50 per cent compensation for the site value and nothing for the building; the authorities could then grant new 80-year leases or where appropriate extend a building's life. Politics apart, one snag with this scheme is that it would amount to planning for the next generation but one, rather than for the 20-year period with which the group is concerned. Many old buildings would presumably be given a short life, but even so twenty or more years would often elapse while buildings rotted away in the absence of any incentive to keep them up. Moreover the suggestion that owner-occupiers should get full market compensation for both land and buildings—a palpable political sop—would probably ruin the scheme anyway. One cannot set up effective planning on the basis of being relatively beastly to every landlord and soft-hearted to every other houseowner.

The scheme might work better with undeveloped land, where the planning authority would compensate owners at existing use-value plus an incentive bonus, and issue the developer with a new 80-year lease. This arrangement avoids some of the pitfalls in the official Labour plan, but in general neither plan offers a really workable solution to the problem or how to plan and encourage (or at least not discourage) development effectively without inflating land values. Someone on the Left should investigate a simpler two-part solution: wider public ownership in redevelopment areas and new towns, coupled with the inclusion of land in a general tax on capital gains.

BIRTH CONTROL

No Longer Taboo

NEARLY twenty years ago, when a committee was appointed to make the first large-scale study of family planning in Britain, on behalf of the Royal Commission on Population, its members were convinced that only doctors could interview the women (preferably their patients) because the questions were so intimate. "Clearly, to attempt house-to-house questioning on a national scale was to foredoom the enquiry to failure." An article in the current issue of *Population Studies* reminds us of these apprehensions in giving the results of a new inquiry, undertaken by the Population Investigation Committee, in collaboration with Social Surveys (Gallup Poll)—and successfully carried out by exactly this method of house-to-house questioning.

Some 2,350 married people were interviewed and of these, only 13 refused to give their opinions. The attitude towards birth control varied, as one would expect, according to age. Half of those married in the nineteen-twenties expressed "full approval," this proportion gradually increasing to 70 per cent of those married in the nineteen-fifties. Among recently married non-manual (that is, professional, commercial, etc.) workers the proportion expressing approval was as high as 78 per cent (compared with only some 60 per cent of the youngest manual workers). Protestants, of course, were much more likely to express full approval than Roman Catholics. Even so, nearly 42 per cent of Roman Catholics who were recently married expressed approval, compared with only 17 per cent of their oldest co-religionists.

Those who express approval or disapproval of birth control in principle are not necessarily one hundred per cent in favour of, or opposed to, practising it. Of all those giving information on the subject, 70 per cent of the recently married have at one time used birth control; subdivided into the approvers and disapprovers of the principle, the proportions are 82 and 30 per cent. Eventually both figures will be bigger, because some of the recently married start to limit their families only after the birth of one or more children. Birth control, it should be pointed out, was used throughout the survey in the widest sense, only sterilisation and abortion being omitted—i.e. besides the use of mechanical means, it included restricting intercourse to the "safe period," or abstaining altogether, or prolonging lactation. The extent to which the different methods are used will be the subject of a later article in *Population Studies*. But this one already shows the extent to which the taboo on discussion of the subject has broken down among younger married couples today.

LETTERS

Kenya

SIR—In your issue of September 2nd you discussed the present situation in Kenya. The two essential matters, you said, which called for an early response from London, were Mr Kenyatta's status and the acceleration of the process of reaching independence. It is difficult to see why you should have had even a quiver of worry on either score. African nationalism in Kenya is totally victorious. Since you wrote, it has become clear that Mr Kenyatta will walk in glory into the Legislative Council within, at the most, a few weeks, and that *uhuru* will be granted during next year.

However, you referred in passing to other matters which were, you said, delicate but of less importance. The matter of the personal security, the livelihoods and the lives of the European farmers in Kenya is neither so delicate nor so unimportant that it cannot be mentioned. I realise that, on more than one occasion, you have drawn attention to it, and I am grateful. Now, however, these farmers, who are still British citizens, are facing disenfranchisement, financial ruin and individual despair; and it is essential that they should not be forgotten, particularly by the Government whose policies have brought them to this plight.

There are two aspects of their forthcoming fate which all of us here in Britain would do well to ponder. First, it was announced at the end of August that some British farmers had formed an organisation to help others who, as a consequence of Kenya's economic collapse, cannot realise their assets, to raise enough cash to emigrate to Southern Rhodesia or South Africa. The secretary of this organisation said that it refused to acquiesce in the economic trapping of any European in Kenya. This is only, after all, to exercise a fundamental human right which, to our loud applause, East Germans exercised until August 13th—the right to leave a country in which life is being made unbearable.

The African political leaders' reactions were significant, though hardly helpful. Mr Mboya warned would-be emigrants, "We shall hunt you out"; Mr Shikuku, the secretary of KADU, called for the immediate expulsion of the organisers, as prohibited immigrants, but not, of course, for the expulsion of those whom these organisers want to help. After all the African leaders, just like Herr Ulbricht in East Germany, want to be certain of a supply of skilled labour. But *The Economist*, I am sure, would agree that they ought not to have it on these terms, and that it ought not to consist of British ex-servicemen, their wives and their children.

Second, there is the Land Freedom Army, a terrorist body which was belatedly proscribed a few weeks ago. It preserves, and in practice is likely to extend, the outlook and customs of Mau Mau. It numbers, according to my latest information, some 1,500; these have now joined, *en bloc*, KANU's Youth Wing. One of its aims, after *uhuru*, is to stage "war criminal" trials of those who opposed Mau Mau.

These are facts which I have stated. They cannot be denied by anyone in authority, in Britain or in Kenya. We have watched this tragedy unfolding for many months past. Against the vast background of revolutionary change in Africa, it may to most people seem small. I see it as crucial, not only for the British minority in Kenya; it concerns us here in Britain. These are not strangers. These are our brothers; they went to school with us, they soldiered alongside us. We owe them a simple, basic human loyalty. The real challenge in this situation is to ourselves. If we are so devoid of any sense of moral responsibility, so callous and so lacking in compassion towards people to whom we should be linked by these strong ties, it is impossible to resist the conclusion that we are heading very rapidly for a long radio-active darkness, and that this is what we have earned.—Yours faithfully,

JOHN CONNELL

London, SW1

Teachers' Pay

SIR—Since you had apparently proved to your own satisfaction that teachers would get more money from Sir David Eccles than under the Burnham Committee's proposals, I fully expected you to change horses, attack the Minister and urge immediate acceptance of the Burnham recommendations.

The fact that you did not do so suggests that perhaps the prospect is not all that real. Anyway, I hope you will pardon our scepticism, particularly in view of the reply given by Sir David Eccles to the Burnham Committee. The Minister was asked if he would be prepared to sanction the full £47.5 million increase when the "pause" came to an end. He said no. Most teachers would naturally prefer to have the £5.5 million bird in their hand rather than the two in the bush Sir David now offers.

Some of us still recall that in 1956 Sir David encouraged teachers to go to the Burnham Committee for salary increases in order to save his Superannuation Bill, only to tell the leaders of the Burnham Committee, once the Bill had been passed, that it had gone too far.

Will any of your readers be so naive as to believe your assertion that the reason why Sir David is threatening legislation to impose a £42 million increase is because the NUT obstinately refuses to see that the Minister wants to give them more than the increases negotiated through Burnham? And why in a responsible journal like *The Economist* is it necessary to bring in cloak and dagger references to "open secrets," etc. This is an "open secret" that the Minister shares with you alone. I assure you it has not been shared with us.—Yours faithfully,

RONALD GOULD

General Secretary, National Union of Teachers

London, WC1

Northern Rhodesia

SIR—In a report, "Question Mark over Northern Rhodesia," (*The Economist*, September 2nd) reference was made to "27 dead and hundreds arrested" in the events of the past month.

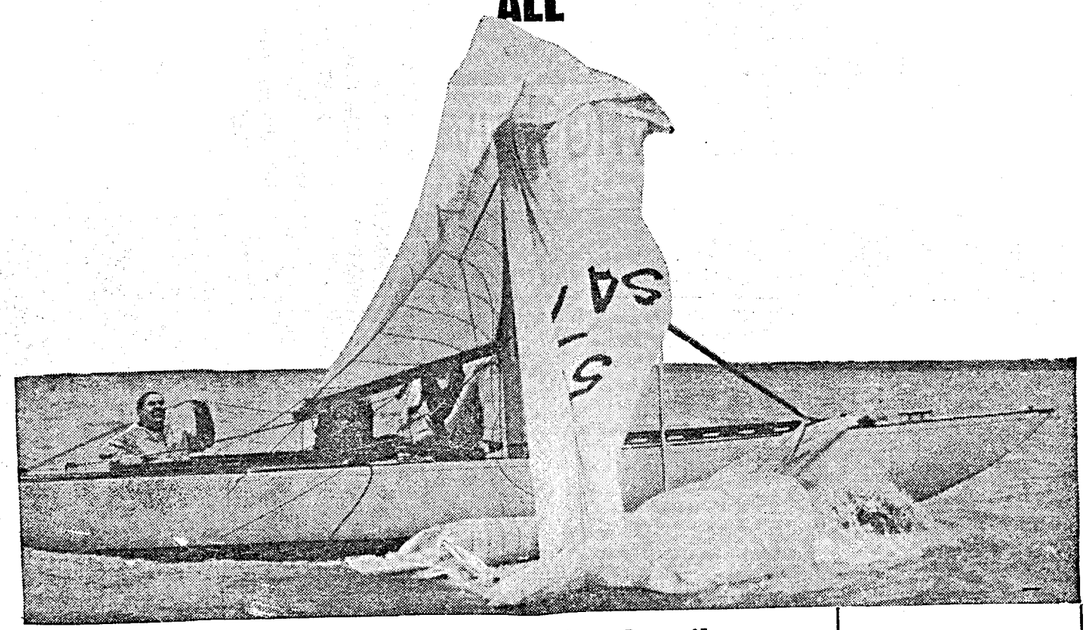
Action by the Northern Rhodesia Police against the present campaign of violence has resulted in the shooting of 18 people in security operations and the conviction of 650 (550 of them members of the United National Independence party) for intimidation, arson, sabotage and other crimes of violence.

Your readers are entitled to know that of the "27 dead" referred to by your correspondent, 9 (eight members of the Northern Rhodesia Police and one prisoner) were drowned when their boat capsized in the Zambesi River.—Yours faithfully,

L. F. G. ANTHONY

High Commission for Rhodesia and Nyasaland

London, WC2



World Oil

SIR—Mr Levy is at it again, upholding the *status quo* in the muddy economics and politics of oil. Mr Levy's obvious game of brinkmanship is complete, with stockpiling, emergency powers and alternative bases to sustain the chastity-belts of the "Seven Sisters," as Mr Enrico Mattei would affectionately call the established oil companies. If such an internationally vital industry couldn't (or shouldn't to paraphrase Mr Levy) stand a mild shake-up of liberal thought, then it is neither "international" nor "established." By being so uncompromising, Mr Levy and his "integrated" oil industry defeat their own security, let alone "the security of world oil supplies." Logic and eloquence cannot promote a concept of corporate trusteeship over world oil for purposes other than private gain. It is alarming that such a vital commodity should depend on a drive for private growth. One hears endless needling of the producing countries, their assumed instability, their misbegotten argumentation, the personal ambition of this or that bureaucrat; but little is frankly projected of the dangerous mentality of the oil industry's princes.

OPEC is not designed solely for regulating prices and production. If it does then it too perpetuates the *status quo*. These producing nations have yet to boast a single native refinery or fertilizer plant, a solitary service organisation and nothing but a few miserable tankers.

The present limitations of native capabilities in the producing areas for wider responsibilities in the world oil trade are neither an economic nor a logical reason for the continuation of the industry's overlordship. Those limitations are as much the guilt of native autocratic waste as of the industry's

THE WEEKEND IS THE MOST NATURAL BREAK OF ALL

A broken mast—a natural break! Occurring, happily, at the weekend—an even more natural break . . .

. . . in fact the most natural break of all. When work is a world away. When people build castles in the air and a bungalow down the street . . .

. . . when half the ITV homes in England and Wales watch ABC Weekend Television. Welcoming ABC as a natural part of the weekend break: with time to relax and ponder what they see. This is the best time of all to show your commercials in the North and Midlands with 15 million ABC viewers in weekend mood. Men who buy well,

buy DICTAPHONE TIME-MASTER

REGD. TRADE MARK

Men who value quality and service are the men who buy Dictaphone Time-Master, because the transistorised Time-Master is the quality dictating machine. It's a precision instrument designed to save time for a man whose time is valuable.

Dictating with Time-Master is as easy and pleasant as normal dictation to a secretary, but it is much more convenient and time saving. No matter where your secretary may be, you simply speak, and, immediately your thoughts are on *permanent* record. Time-Master has these unique advantages because only Time-Master has the DICTABELT record.

The Dictabelt recording is permanent and visible, ensuring complete safety from accidental erasure. Reproduction is crystal clear and placefinding is instantaneous.

Dictaphone Company Limited, 17-19 Stratford Place, London W.1. Tel.: HYDe Park 9461.

Branches throughout the British Isles

The words DICTAPHONE, TIME-MASTER and DICTABELT are registered trade marks.

Visit Dictaphone on Stand 112 Business Efficiency Exhibition, Olympia—2-11 Oct.

purposeful indifference. An urgent start should be made, not so much in the timid suggestion of Mr Levy's interdependence, as in fuller recognition by the industry of the existence of human and other resources capable of systematic regional integration. How can an internationally conscious oil industry delude itself that a place like, say, Abu-Dhabi is a contractual entity? The marginal existence of millions in the Middle East amidst the background of an obsession for industrialisation, and of the fantastic affluence of a few irresponsible patricians, with their waste and indulgence, explain the insecurity of oil supplies and prices—not the machinations of the Matteis, the inner fury of the Tarikis, the dumping of the Russians and the monkeying of the independents. The lust for continued power and overlordship on the part of the "established" is contributing more for messy prospects than they or Mr Levy acknowledge.

Mr Levy echoes the industry's chapter and verse on the assumed oil investment risks. Prodigal in statistics, he nevertheless failed to show how much of this risk was tax money, how little of it was mobilised outside the phenomenal profits in the host countries. If there is an investment risk, why not spread a bit among the disgruntled kinsmen of the "host" nations, to other Arabs and Latins, in regions where political frontiers are recent accidents of history? Implicit in the national responsibilities of the "established" oil industry is the ability for political statesmanship too—not just mercantile articulation. The advocates of their brand of interdependence in the global oil trade can exercise endless manipulation of facts and thought. They can also play a little game of brinkmanship. But the hardest part the princes of the industry have yet to perform is to wriggle off sharp hooks of their own making. As Abu-Bakir, Islam's first Khalifa and foremost layman once said: "Princes are the most unhappy of men, both in this world and the next."—Yours faithfully,

OMAR HALIQ

Düsseldorf

The National Health

SIR—In their letter in your issue of September 2nd, Professor and Mrs Jewkes suggest that our national health service should be included among those British institutions whose workings might well be re-examined.

The Acton Society is arranging a colloquium at the end of November when it is intended that a small body of invited people should discuss the financing of the service, the extent to which it is practicable to inject private money and the probable effects of such a procedure. The number of people taking part in our discussions will be severely restricted, but if any of your readers have any original contributions to make to us we should be glad to have the opportunity to consider them. We hope to publish a summary of the discussions after Christmas.—Yours faithfully,

B. PHILIP ROWNTREE
Chairman, The Acton Society Trust
39 *Welbeck Street, London, W1*

BOOKS

Whitehall and Imperialism

Africa and the Victorians

By R. Robinson and J. Gallagher with A. Denny.
Macmillan. 503 pages. 45s.

"IF we could acquire the Dominion of the whole of that Continent it would be but a worthless possession." Until late in the seventies, Mr Mother-Country's assessment of Africa in 1840 was still that of Whitehall. Yet in the last twenty years of the century, "against all precept and prejudice, against the experience and trends of previous expansion," Egypt was occupied, a huge tropical African empire acquired, and a major war fought to restore imperial supremacy over the Transvaal. Why this should have happened is an old problem. In the main, it has been "explained" by three factors, singly or in combination: The late Victorians succumbed to an access of imperialist enthusiasm; their businessmen sought to relieve a surfeit of capital and a deficiency of markets in a new continent; and increasing rivalry among the powers magnified the weight of every move overseas on the delicate scales of the European balance.

Whatever the importance of these elements, others must, at least in the British case, be brought into the sum: the collapse of African governments under the strain of previous western influence (as in Tunis, Zanzibar and Egypt); the growth, encouraged by British agencies, of local communities that became expansive in their own right (as in southern Africa); and the changed relationship of Africa to the long-term aims of British strategy in Europe, the Mediterranean and the east. Given such various components, the problem of motive can be resolved only if some unified field of study can be found where "all possible incentives to African empire may be assembled without becoming indistinguishable in their effects." This the authors of this fascinating book find in "policy-making" in Whitehall. Of course, ministers and their advisers could not completely control the process of expansion; nor were they fully aware of all the forces at work or of their own unconscious assumptions. But, for all these shortcomings, "official calculations," the authors argue persuasively, "throw most light on the deeper reasons for imperial expansion in Africa."

So, after an incisive review of the traditions of Victorian statecraft, they proceed to "the humbler tasks of chronology." Their patient reconstruction and brilliant analysis of the official mind groping its way to policy decisions in South Africa and Egypt, on the Niger and the Zambesi, is an exciting exercise of the historian's art.

What are the authors' conclusions? No new sustained or compelling impulses towards African empire emerged in the eighties. Businessmen saw no future in Africa except in the south, while politicians were as reluctant to expand and administer a tropical African empire as Parliament was to pay for it. African lobbies were "usually too weak to be decisive"; nor were ministers interested in empire for empire's sake. As the policymakers saw it, their advances were prompted by different interests and circumstances in different regions. But, in all those north of Rhodesia, the "broad imperative" was the safety of the routes to the east, though admittedly in Nyasaland and on the lower Niger a reluctant government "acted to preserve existing fields of trading and missionary enterprise from foreign annexations." The late Victorians "moved into Africa not to build a new African empire but to protect the old empire in India," because they believed that British power depended almost as much on the possession of India and preponderance in the east as on the British Isles. Before 1880, the safety of the routes to India had been preserved without large African possessions. After 1880 nationalist crises in Africa itself—the outcome of earlier decades of European influence—and the interlocking of these crises with rivalries in Europe forced Britain

> to regain by territorial claims and occupation the security which could no longer be had by influence alone. . . . From start to finish the partition of tropical Africa was driven by the persistent crisis in Egypt.

In southern Africa, on the other hand, the government tried, in the hope of conserving imperial influence (and the safety of the Cape route to India), to satisfy the demands for more territory pressed upon them by self-governing colonials. But the exploitation of the Rand raised the enemies of the imperial connection to political preponderance and killed the hope that British immigrants and businessmen would, in the normal course, engulf the republicans. Prisoners of their colonial friends, the Unionists tragically attempted to restore imperial paramountcy by war.

This is not just another piece of research. The authors have not been satisfied merely to present new material but have thought hard about it. Their political judgment is as shrewd as their expression of it is witty, and they have produced a contribution to late Victorian history that will prove to be of seminal importance.

Potted Palms

The Age of Churchill, Vol. I: *Heritage and Adventure, 1874 to 1911*

By Peter de Mendelssohn.
Thames and Hudson. 627 pages. 42s.

THIS book has been sniffed at by the pundits both for being just a *réchauffé* of all the other books about (or by) Winston

Churchill and his family up to 1911 (it is the first of three no doubt equally capacious volumes); and for getting this or that bit wrong in the rehash. The whole sprawling enterprise does indeed sit rather awkwardly between all the books it is derived from and the full-dress biography, based upon real research into all the material, that Sir Winston now deserves. But it is not fair to blame Mr de Mendelssohn either for not writing a different book or for writing this one at all.

Bulk apart, it is mostly lively and readable and often illuminating, especially for readers who have known only the grand old man. It may be a pity that some will now read this book instead of those it pots, but many would not read them anyhow now. And, to give Mr de Mendelssohn his due, the book is much more than warmed-up other books. It is put together with some eye to perspective, and reflects the author's lifelong and passionate interest in the real Churchill, as distinct from the legendary one, in the man not the myth.

This first volume does point itself towards the really relevant questions about the young Churchill : how the child or, rather, the thrusting youngster, bumptious, ebullient and dogged, impertinently self-confident and quick-witted, sensitive and as sharp as a needle, was father of the man we boast about ; and how much it meant to the momentum of his persistent ambition to be son of his own so similar father, who was rejected, broke down and died long before the age at which, by time's revenge, Sir Winston himself came at last into his own.

Sociology Renews Itself

Ideology and Society.

By Donald G. MacRae.
Heinemann. 243 pages. 25s.

THE history of sociology in this country is a curious one. As Professor Shils has pointed out, modern sociology really started in Britain. "The sober attempts of a small group of dourly noble reformers and administrators in the nineteenth century, to find out the 'real condition' of England, were the first of their kind in history." By the end of the century, an outstanding tradition of British social inquiry seemed firmly established. Yet while sociology gathered impetus in Germany, France and the United States, in this country its study marked time for nearly fifty years, apart from the valiant effort of a few lone pioneers at the London School of Economics. In the first section of this collection of essays, Mr MacRae tries to explain why the spirit of inquiry of Bentham, Mill, Spencer and Booth should have become so muted until recently. The explanation is not easy—perhaps one factor which Mr MacRae neglects is the peculiar historic link between British sociology and the fortunes of pragmatic socialism. All this has now radically changed, and he goes on to discuss the prospects for sociology in this country as the doors of Oxford and Cambridge are at last opening (but simultaneously the ad-men are also moving in).

Mr MacRae's second section covers a wide range of topics from the impact of advertising on sociology to that of Darwin on social theory. He does not regard advertising as basically sinister, but as a necessary instrument in a mass consumption society, and as such a subject of serious study for sociologists ; this applies also to the wealth of information gathered by advertisers.

The third group of Mr MacRae's essays is mainly political. It includes his already well-known essay "The Bolshevik Ideology," in which he puts forward a masterly sociological critique of Marxism, timely today when so many younger sociologists have oddly come to regard neo-Marxism and sociology as synonymous. Altogether his book is bursting with life and vigour, and is clearly and entertainingly written for the layman as well as for the professional. What Mr MacRae shows is that sociology is a serious subject and not just a newly discovered exciting game for journalists.

Reza Shah's Legacy

The Modernisation of Iran, 1921-41

By Amin Banani.
Stanford University Press. London: *Oxford University Press.* 202 pages. 40s.

THE dates of this book's title, which suggest that it is a period piece, are offset by the photograph on its dustcover. This shows a primary school classroom of today—girls with boys, and all eyes alight with intelligence and hope. Its message is that the book includes contemporary, if not everlasting, topics.

The body of the book is about Reza Shah's deeds for his country. These were for a time obscured by the megalomania, greed and ill-temper of his last years ; but he began in different vein, and though much that he did was impatient and shallow, he had the great merit of galvanising a stagnant country into practical activity. Before he made his bound out of the army and onto the Peacock Throne, a minority of the intelligentsia (of whom thumbnail sketches are supplied) had dreamed of, thought of, and talked of things to do ; he did them. They are briefly described in well-documented chapters on the army, the courts, the land, education and economics. The last, which the author admits is not his usual field, is less good than its fellows.

Twenty years have passed since Reza Shah died (or fifteen if one deducts the ill-starred years of allied occupation). Why is it that Persians today are coming into a heritage so little better than then? In an outspoken and thoughtful conclusion, the author analyses whether the delay is due to foreigners, or to the Persians' besetting sin of moral resignation, or to searches in the wrong direction—a too material direction—for the secrets of success.

Persian by birth, he is at present an assistant professor at a university in the United States. (Incidentally, his book, coming from a dollar source, is by English standards too expensive for its content ; the only justification for such a price is that dispassionate books on Persia are rare.) It is a pity that a Persian who thinks as lucidly and writes as candidly as he does should work outside Persia ; but there are few attractions at home for young men who see their work judged less often on its merits than on irrelevant considerations such as envy or social prejudice, and who have to watch their elders avoiding action out of unwillingness to risk consequences. Until public opinion, or some new Reza Shah, creates openings at home for men of energy, what have the children on the dustcover to look forward to, unless to sampling communism?

Economic Theory Applied

Equilibrium and Growth in the World

By R. Nurkse. *Harvard University Press.* London : *Oxford University Press.* 393 pages. 60s.

PROFESSOR HABERLER and his editorial colleague have performed a very useful service in bringing together this selection of papers, lectures and book reviews by the late Professor Nurkse. They are not, of course, all equally good, and some of them have a much smaller impact now than when they were first published. The best of them, however are extremely stimulating and demonstrate afresh the loss caused by his untimely death two years ago.

Although he wrote some papers in the field of pure theory (such as the papers on capital movements and on inventory cycles included here), Nurkse's main forte lay in the application of theory. His exposition was always clear and simple as, for instance, in his paper on "Domestic and International Equilibrium," which sets out the impact of Keynesian economics on the theory of international monetary relations. But when he used the theory to attack particular problems, he also displayed great gifts for getting to the core of the matter and putting it in terms of one or two simple pieces of economic analysis.

Curiously enough, the work that perhaps did more than any other to secure him his reputation was not published under his name. From 1935 to 1947 he worked for the League of Nations, where he was the main author of "International Currency Experience," which appeared in 1944. This survey of the inter-war period is one of the best books ever written in the field of international monetary economics.

Nurkse spent nearly all the years after 1947 at Columbia University. Here he devoted himself mainly to the economics of development and wrote "Problems of Capital Formation in Underdeveloped Countries," which had a considerable impact. The topics discussed include the notion of "balanced growth" to which he later returned in various lectures that comprise over a quarter of this posthumous collection.

He regarded the theory of comparative costs as rather unhelpful in understanding the relation between trade and growth. Without denying its validity, he preferred a more dynamic approach. In the nineteenth century, he argued, trade was an engine of growth. The expansion of western European industry was transmitted to the recently settled areas by the growing demand of industry for primary products, and the export of private capital to build railways and provide other overhead capital was part of this process. Conditions have now changed, however, and, except for oil, the demand for primary products lags behind the expansion of industry because of economies in the use of raw materials, the development of synthetic materials and so on. The incentive for private foreign investment in the poor countries is also less than it was. Comparative costs might suggest the development of simple export manufactures there, but such industrialisation is difficult as the experience of India in selling textiles demonstrates. Hence industrialisation for the home market must play a large part in the development of such countries. Because the expansion of home markets is a limiting factor, the growth of industry and agriculture and of different types of industry must be balanced, in the sense that the pattern of production matches the pattern of demand from the growth of income which is generated. Power and transport facilities have to be built ahead of demand in order to make industrialisation possible, but in industry itself suppliers and customers must expand together.

This view, which downgrades the contribution of international trade to growth, is not without its critics. Professor Cairncross, for instance, in a recent lecture, has argued that it is rather exaggerated. However, it must not be supposed that Nurkse was as dogmatic as a brief summary might suggest. These lectures really amount to a restatement of Nurkse's earlier views on the subject, and it is clear both that he was not maintaining balanced growth to be necessary in all circumstances and that he was not much of a protectionist.

The longest part of the book is a splendid paper published in 1956 on the relation between domestic investment and exports in Britain in the decade after the war. Britain's main export achievement and hope lay in the engineering and metal industries, industries which are particularly important for domestic growth. When there were balance of payments difficulties the quickest and easiest way to meet them was to check the growth of domestic capital formation, not merely in order to reduce the domestic absorption of output but also because this made possible a shift of resources to exports, which did not require difficult inter-industrial mobility. If, however, such occasional shifts at times of pressure are not to reduce the long-run accumulation of capital, an expansion of the capital goods industries becomes an important aim of policy.

Nurkse's analysis of these problems, which is coupled with a more general exposition of the "absorption approach" to balance of payments problems, shows the

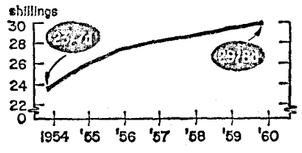
uthor at his best. He does not flourish any unnecessary technicalities but uses economic theory as it should be used. This is the sort of stuff that students should be fed if they are to have a balanced diet; so this book will serve their teachers well, besides being of value to those concerned particularly with growth and trade.

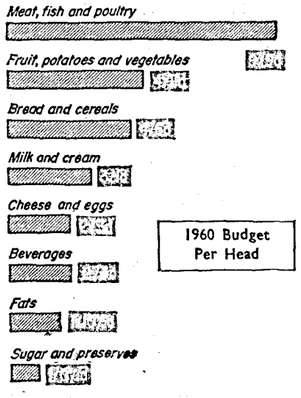
Ever Present Challenge

Canada and the Canadians

By Alistair Horne.
Macmillan. 343 pages. 30s.



A RECURRENT theme in this latest book about Canada is "the potent natural forces—of geography, population, climate, economics and communications—that have traditionally threatened to tear Canada in fragments and draw the fragments towards the United States." Canada has indeed paid a high price to create and maintain its identity, but to say that its geography runs strictly vertically and not horizontally and that its existence is "counter to the laws of nature" is to neglect the indisputable natural geographic fact of the east-west St Lawrence axis—the historic backbone of Canada—and the strength of the rivalry between the St Lawrence gateway into the North American hinterland and competing gateways in the south and north.



After two years of study and 20,000 miles of variegated travel, the British author concludes that, in the long run, Canada's only answer to the danger of subdivision is more people. Deeply impressed with the challenge of the vast wilderness that is the setting of the "shreds and patches" of population stretched out along the artificial United States border, he writes of "so much uninhabited land that, under modern technology, could be inhabited"; but what of the limitations imposed by such problems as the need for export markets to absorb the technically possible products of the rocks, rivers and forests of Canada's empty spaces? Notwithstanding such gaps and a number of mistakes, such as uranium from Alberta, that have slipped through uncorrected, the analyses of economic and political problems are enlightening, as are the lively descriptions of Canada's widely diversified regions.

Sandwiched in with analysis and description is some shrewd advice to prospective immigrants, based on the experience of past immigrants, with many of whom the author has discussed their problems. The complaint that there is no culture in Canada is examined in an admirable chapter on the arts and letters, while culture in the wider sense epitomised by the "pub," for which the homesick Briton pines, finds its characteristic Canadian expression in the summer cottage by a lake. A discerning discussion of Canada's relationships with Britain, the Commonwealth and the United States concludes that "Canada has become the keystone of the whole Commonwealth."

British Eating Standards

WHAT THE HOUSEWIFE SPENDS
Weekly per head of household

Each year the National Food Survey selects a sample of nearly 10,000 households in each of which the housewife keeps a record for one week of all food bought. The chart, illustrating some of the findings of these surveys, shows that over the last six years the average amount spent on feeding a person at home has risen by a quarter, or just under four per cent a year. Rather more than half this increase reflected higher prices.

For every £1 spent on household food, an additional 2s. 6d. is spent on food eaten in canteens, restaurants and hotels. When all supplies are considered, the table shows the extent to which eating habits have changed since before the war. Last year people ate more poultry, vegetables, eggs and coffee than ever before but less fish, butter and flour than before the war.

WEEKLY CONSUMPTION PER HEAD
(ounces unless otherwise stated)

	Prewar	Highest during 1954–59	1960
Meat	33·85	35·75 (1957)	35·32
Fish	7·92	6·88 (1958)	6·51
Poultry	1·10	2·50 (1959)	2·89
Fruit	38·15	40·06 (1959)	39·39
Potatoes	55·97	69·42 (1955)	65·39
Vegetables	37·05	40·03 (1959)	41·35
Flour	59·85	57·60 (1954)	51·29
Milk, liquid (pints)	3·24	4·98 (1954)	4·84
Cheese	2·71	3·08 (1957)	2·98
Eggs (number)	3·87	4·60 (1959)	4·72
Tea	2·86	3·11 (1956)	2·95
Coffee	0·22	0·58 (1959)	0·65
Butter	7·60	6·15 (1958)	5·57
Margarine	2·68	5·63 (1954)	4·68
Sugar	31·66	35·54 (1958)	34·55

Recognising that there is no such thing as a typical Canadian (unless it be a leisurely North American who makes a garden) the author sums up this new nation as a people engaged in the exhilarating business of creation and endowed with the special freedom given by space, a nation that thinks and acts bigger than it is and has, in international affairs, attained a maturity beyond its years and influence beyond its numbers.

The Islamic World

A Short History of Islam

By Sayyid Fayyaz Mahmud.
Oxford University Press. 734 pages. 35s.

UNDER the impact of scientific materialism and secular nationalism, religious distinctions have lost much of their sharpness. Yet a certain fellow feeling still links the states that formed the medieval Islamic world just as it does those which formed medieval Christendom. Islamic consciousness remains particularly strong in Pakistan, where it provided the motive for the formation of the nation. Pakistani scholars are therefore led to study the world of Islam, not like their medieval predecessors as the only civilisation worthy of profound study, but as one which influenced and was influenced by other comparable cultures.

In consequence they feel the need to present a synoptic view of the history of the Muslim states as a whole. One such work, "A Modern History of the Middle East and North Africa," by Dr S. M. Imamuddin, of Dacca University, appeared last year; this year this even more comprehensive study, covering the whole Islamic world, and printed in Karachi, has been published by the Oxford University Press. With so vast a subject, the sections are necessarily condensed to the absolute minimum; and the attempt of an individual scholar to treat the history of every Muslim state that has appeared on the stage of history inevitably results in some inaccuracies and excessive generalisation. Nevertheless, Sayyid Fayyaz Mahmud has made a very creditable attempt, and his book can be recommended to non-Muslims as well as to Muslims who wish to gain such a general view of the history of Islam as can be presented in a volume of even these dimensions.

Natural Law and South Africa

The Foundations of Freedom: *With Special Reference to South Africa*

By D. V. Cowen.
Oxford University Press. 258 pages. 30s.

PROFESSOR COWEN believes that black and white can live together provided there are certain safeguards. He would like a Bill of Rights built into a rigid constitution of legislation subject to judicial review if it infringes the Bill of Rights. He would also have commissions, whose duty it would

be to receive petitions and to take active steps against discriminatory practices. There would be a federation of the four provinces of South Africa, thus providing a further division of power; the Federal Lower House would be elected on a very wide suffrage, probably adult suffrage; the Upper House—and it would be a true Upper House with real powers—would be elected by proportional representation.

Professor Cowen would agree that in the last resort constitutions cannot provide security unless they represent some reality in the will of the people. But he would go on that they can, all the same, be effective up to a point; it did after all take some years of manoeuvre to overthrow even the mild entrenchment of the old South Africa Act. Here there is little with which anyone who has followed events in South Africa, and has a nodding acquaintance with those in the United States, will disagree with him. Perhaps he does not attach enough importance to the danger that the judiciary may operate in the interests of a class; he is bound to be influenced by the fact that in South Africa the judiciary has always been (in British eyes) enlightened. But judges are not always enlightened; one would not care to see penal reform at the mercy of a Lord Chief Justice. Nevertheless, Professor Cowen's arguments are cogent, and had the constitution he outlined taken the place of that which was adopted in 1910, things might have been very different.

But this is hindsight; the agreement of 1910 was reached in terms of what was politically possible at the time. And what is politically possible today? Professor Cowen speaks (on page 191) of a government wishing to summon a "national convention" and suggests that it would be "realistic" to make it "equally representative of white and non-white opinion." But no legally constituted South African government is likely to do any such thing; nor, by the time white South African opinion is ready for it, does it seem likely that black African opinion would respond.

The last part of Professor Cowen's book is profoundly interesting in a different way. He refers to Maritain's distinction between those who believe in natural law and those who do not. He himself believes firmly in the Greek idea that there is a natural moral law which man in his imperfect way is struggling to discover. This concept, prolonged by the thought of St Augustine and St Thomas Aquinas, began to crumble with the individualism of the Age of Reason and the idea that law was only a kind of contract; he reasserts its validity. That there is absolute moral force behind law has become a difficult thought for many modern minds. But is it true that an Act of Parliament can make it right to steal? Not, perhaps, if the proposition is stated like that. But it is surely open to Parliament to make a law that would so alter the nature of property that "stealing" became a meaningless term. Societies have had very different ideas of what is moral and what is not; some have held that on his brother's death a man ought

to marry his widow, while others have held that this is incestuous; some have tolerated sodomy and others abhorred it. But though there is variety of opinion over sexual behaviour, there are other wide fields over which there is agreement: it is unusual, for instance, not to deprecate the murder of parents or of a guest. On the other hand, there is surely some element of contract in all society; insofar as a person accepts the standards of a society, it is because he admits that he belongs to it. There are certain assumptions that constitute an implicit contract. That is why most of the world feels that South African society as at present constituted is unjust. Laws are imposed by a section of the population on a larger section which does not feel that this is its society, which does not subscribe to the contract. Surely there is truth in both ideas, natural law and contract; to exclude one or to assert it absolutely is to proceed to opposite extremes of error.

Anyone interested in South Africa or in politics should read Professor Cowen's book; his theses are stated with exceptional clarity; he is always fair and he is always interesting.

OTHER BOOKS

CAPITAL IN MANUFACTURING AND MINING: *Its Formation and Financing.* By Daniel Creamer, Sergei P. Dobrovolsky and Israel Borenstein. National Bureau of Economic Research. *Princeton University Press.* London: *Oxford University Press.* 398 pages. 60s.

This is the fifth volume to be published in a large-scale inquiry into trends and prospects in capital formation and financing in the United States. In this study, from the admittedly inadequate data that exist, Messrs Creamer and Borenstein have evolved what they consider usable records of stock of capital in mining and manufacturing at selected dates back to 1880. They find that, in both sectors, the ratio of capital to output, based on constant prices, rose markedly from 1880 to 1919 and then declined just as markedly. The effect of the changing importance of particular industries is examined and a number of hypotheses put forward to explain the trends.

The data on financing are even less adequate than those on the stock of capital, extending back only to 1900 and relating only to corporations. It is, therefore, with great caution that in the second part of this volume, Mr Dobrovolsky set out his findings on the relative importance to investment of "internal" and "external" funds—that is to retained income and to funds obtained through new capital stock issues and loans.

FEDERALISM AND ECONOMIC GROWTH IN UNDERDEVELOPED COUNTRIES. By U. K. Hicks, F. G. Carnell, W. T. Newlyn, J. R. Hicks and A. H. Birch. *Allen & Unwin.* 185 pages. 25s.

This symposium is based on papers presented to a small working party conference which met at Exeter in September 1959. The aim of this conference was to bring together anthropologists, political scientists and economists in a discussion of the special problems of emergent countries that have adopted, or are about to adopt, federal constitutions, and which are at the same time bent on accelerated economic development. The four main papers are accompanied by comments and well edited reports of discussion. Mrs U. K. Hicks has written introductory and concluding essays. The book makes a valuable contribution to awareness and understanding of these problems. It also provides an interesting example of the co-operation of different disciplines on a common theme.

OIL IN THE MIDDLE EAST. By Stephen Hemsley Longrigg. *Oxford University Press* for *Royal Institute of International Affairs.* 2nd edition. 414 pages. 35s.

Brigadier Longrigg remarked at the end of his first edition, in 1954, that a book on oil "is superseded before it reaches its public." But he so arranged that book that addition is a simple matter. His second edition is identical with the first until page 261, and thereafter consists of chapters or sections, dated 1953-60, on each producing territory and land of transit. These provide the treasury of information on production, negotiation of rights, quality of oil discovered etc. that one has come to expect of this writer. The two major changes revealed are the one well known—the immense rise in output of the 1960s—and the other less often proclaimed—the degree to which new finds and increased production remain in the hands of "the majors," and of governments already rich from oil. Is it by chance, or through the geological skill of the old hands, that nowhere except in the Kuwaiti-Saudi Neutral Zone has there been a discovery of real commercial significance. Brigadier Longrigg has no room for comment of this type, but gives all the facts on which to base it.

TRENDS IN BANK CREDIT AND FINANCE. *Martinus Nijhoff.* 181 pages. 16 guilders.

This is the collection of lectures at the 1960 international banking summer school at Noordwijk, Holland. The main emphasis at this school was the finance of medium-term credits and industrial financing. Dr Klaus Dohrn, a director of the German Kreditanstalt fuer Wiederaufbau, gives an interesting description of the way his own institution provides foreign loans; and the problems of "Financing an International Concern" are discussed by Mr P. F. S. Otten, president of Philips Lamps.

TROPICAL AGRICULTURE. By Gordon Wrigley. *Batsford.* 291 pages. 45s.

This book, which we mentioned last week, will not be available until September 21st.

HOME REPORT

In HOME REPORT members of the editorial staff and local correspondents report on life and happenings in and around Britain.

Ireland's Snap Election

"WHAT we call the 'spirit' of politics is more surely changed by a change of generation in the men than by any other change whatever." Bagehot's dictum should surely apply to the Irish election which will be held on October 4th. It will be the first in forty years in which the electors will not have the incentive of voting for, or against, Mr de Valera. His *Fianna Fail* party, which has been in office since 1957, will be led by Mr Lemass who succeeded to the premiership when Mr de Valera was elected President just over two years ago. The principal opposition party, *Fine Gael*, will be led by Mr James Dillon who took over its leadership about the same time.

It would be attractive to point to the differences between the two men who are now on their own for the first time. Mr Lemass is a Dubliner and, having been the patron of a tariff-protected industrialisation, draws much of his strength from the capital. Mr Dillon was Minister for Agriculture in the two inter-party governments of 1948-51 and 1954-57 and has always been the champion of an increased farm output for export and a critic of protective policies which increase costs. As the son of the last leader of the Irish Party at Westminster (and the grandson of one of the leaders of the 1848 rebellion), he belongs to an older element in Irish politics than Mr Lemass, whose career began in the 1916 rising.

But neither 1848 nor 1916 is particularly relevant to the coming campaign. Past elections have depended largely on whether people voted for or against Mr de Valera—which in its turn often depended on their view of the civil war of forty years ago. The line of division in Irish politics is vertical, not horizontal. Each of the major parties numbers farmers, professional workers and trade unionists among its members. The issues of the election do not lie along the lines of capital *v.* labour nor (yet) of city *v.* countryside.

Indeed it is remarkably difficult to find any true issue. The decline of population shown in the recent census will be held against the government, but it is increasingly acknowledged that no party has a specific against emigration. There is rather a feeling, based on the expansion of the national income and of exports in the last two years, that things are getting better. Partition, like emigration, is a Bad Thing; but voters know what has been happening to linen and shipbuilding and they realise that if Belfast should unexpectedly return to the fold, the immediate problems would be almost as intractable as those raised by a sudden end of emigration. The *Sinn Fein* party, which supports the actions of the illicit Irish Republican Army over the border and won four seats (which they did not take) in 1957, is again in the field. But IRA is widely regarded as wrongly directed and incredibly inefficient. It is symbolic that one of the *Sinn Fein* members, elected because his brother had been killed in a border raid, will not be standing again because he has gone to work in England. Lastly, both main parties support the application to join the Common Market, though it is probable that *Fine Gael*, with its eye on the farmers, is rather the more enthusiastic.

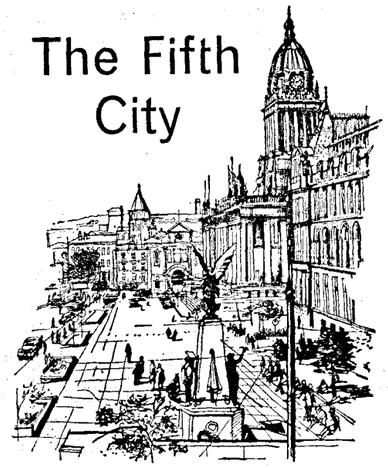
In the absence of issues, it would appear that Mr Lemass should romp home. He can afford to lose seats while Mr Dillon must win many, never an easy business under proportional representation. But it is not as simple as that. The new *Dail* will be

James Dillon: farmers' friend.

Sean Lemass: tariffs for industry.

smaller by three seats, so an overall majority will be that much more difficult to retain. Again, the *Fianna Fail's* triumph in 1957 did not come from a great increase in its votes, but from an abstention of *Fine Gael* voters whom Mr Dillon hopes to woo back. Mr Lemass's standing is high in the cities but it is doubtful if he inherits Mr de Valera's hold over the small farmers. On the other hand, it is generally only in the cities, and particularly in Dublin, that seats change hands. Neither side has won two elections running since the war, but Mr Lemass should do so this time.

HE may well, however, have lost ground in the last month. The summer witnessed a wave of wage demands which were encouraged by the government's refusal to fight a threatened bus strike. The most serious dispute concerned the electricians employed by the Electricity Supply Board, who went on strike. Power supply being threatened, Mr Lemass recalled the *Dail* for a special session. The legislation which was put through in a day did not, even in its original form, come near the expectations of drastic action which this show of energetic government aroused. Anticlimax was intensified by a series of government amendments which made the bill of no account whatever. In the event, the strikers got a bit extra and the legislation was never used; but the sudden reversal of policy in the course of an afternoon damaged Mr Lemass.



State of the Parties at Dissolution

Fianna Fail	76
Fine Gael	41
Labour	12
Independents	9
Sinn Fein	4
Farmers	3
Other Republican ...	1

One seat, held by Fianna Fail, vacant

Since then, there has been a new wave of demands which, if they are settled along the lines of the ESB dispute, will certainly lead to heavy imports and worsened payments in 1962. The dissolution of the *Dail* at a rather earlier date than was expected, and the short time allowed for electioneering, suggest that Mr Lemass is conscious of the need for a new mandate. He is certainly right in this: the great need of the country in the next few years is for higher investment, a maintenance of consumption within present limits and greater attention to unspectacular matters such as the marketing of exports. The change of a generation has meant that the election will be fought against the background of the Common Market instead of the now tattered scenery of the civil war.

The Fifth City

FROM A CORRESPONDENT IN LEEDS

LEEDS, now the fifth largest city in England, was the only big city to record an actual rise in population within its own boundaries, as distinct from in a city-and-suburbs, in this year's census. Its influx of 5,000 was modest enough, but it brought its population up to 510,000, just nicely above Sheffield's 494,000 (a fall of 19,000) —inevitably a matter of some importance to West Riding loyalties and pretensions.

Surrounding Leeds, the West Yorkshire conurbation and its fringes, too, have grown in the past decade, although not by any means at the pace of the West Midlands or the London region. Leeds's own growthmanship may be attributed chiefly to past success by the city fathers in extending the city limits when other municipal imperialists (despite dreams of grandeur and the population factor that enters into local government salaries) failed to annex new territories of their own. But now even Leeds seems to have lost its expansionary urge: it is not affected by present local government reorganisation schemes and the corporation has expressed no desire to extend its authority in recent years. Half a million looks like being the peak.

While Sheffield lives on steel, Leeds lives on diversity. This, rather than the "muck makes brass" cliché (although both muck and brass are distributed impartially and regularly in the city), accounts for Leeds's stable prosperity, broadly based on clothing, shopping, engineering, the professions and several other "service" trades. In most of these trades the familiar pattern of unfilled vacancies running above the level of those seeking jobs in the city has been visible for some time.

Unemployment in Leeds is now 0.6 per cent of the working population, half the national average. Labour is at a premium: the engineering and building trades are crying out for skilled workers, overtime is commonplace and shift systems are the rule.

This scarcity of labour is one reason why some Leeds industrialists say they cannot expand further. But there are others. Most of the land which might be developed industrially is owned by the corporation, and firms would much prefer freeholds to the leases that they would have to be content with from the city. Commercial redevelopment is, in fact, a thorn in the flesh of owners of properties in the congested city centre. The corporation has ambitious plans for the centre but they are not expected to be revealed before the end of the year, and in the meantime property owners complain that large areas are stagnating because nobody will buy or sell until the corporation's intentions are known.

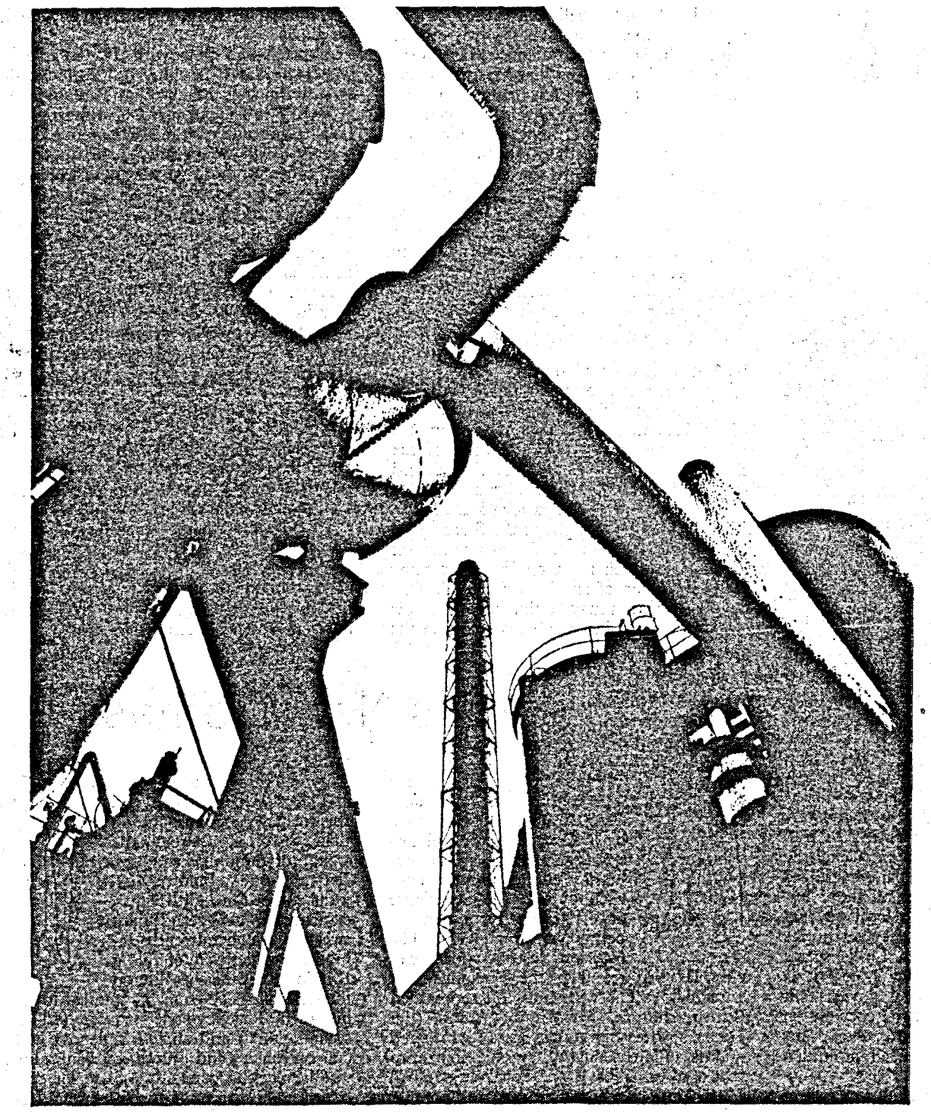
THE Jewish population of Leeds, originally attracted by the clothing trade, is, at 25,000, surprisingly large. But outbursts of racialism are fortunately almost unknown. When, some weeks ago, an official of the British National party in the city alleged that he had been attacked by a group of Jews, the report astounded Jews and gentiles alike. Even at the height of the Stern Gang outrages in the late 1940s Leeds was the one big city in which neither window breaking nor persecution of any kind occurred. One important reason may be that Jewish people are to be found in all spheres of life in the city, instead of being restricted to any single social class.

A prominent Jew with Leeds associations is Sir Keith Joseph, MP for the North-east division of the city and Parliamentary Secretary to the Ministry of Housing and Local Government. Sir Keith is one of his party's bright young men, and tipped for high office. But still greater glory would fall on Leeds if a Labour government were elected: it would then be the seat both of Britain's Prime Minister and of its Foreign Secretary. Mr Gaitskell is MP for Leeds South and Mr Healey for Leeds East.

Local politics, always fluctuating, are now in an intriguing position. The Tories have taken seven seats from Labour in the past two years, but six of these were in 1960 and only one this year. In consequence, Labour has managed to hold a workable majority of 14 on a council of 112, and it now believes that the Tories have shot their bolt locally. In recent council by-elections in two wards, Beeston and Roundhay, the Tories were returned with considerably reduced majorities.

Leeds looks comfortable, even well-to-do: its corporation spends more than £20 million a year. It is content, but should not become complacent. The biggest city in Yorkshire could even find that populations sometimes outstrip resources.

Emperor's New Clothes



THE Savoy Hotel can seldom have seen anything like it: to be invaded by a disparate throng of distinctly bourgeois appearance before lunch must have been outside the experience of even that monument to bourgeois grandeur. The occasion last Monday was only less bizarre than the *afficionados* it attracted. That despot of embattled British *couture*, Mr Hardy Amies (the Queen's dressmaker, it was whispered —thus unfairly diminishing his image to that of a seamstress in the Royal Mews), had fallen into partnership with a popular tailoring empire, Hepworths of Leeds, to rescue the British gentleman from the solecism of the British non-bespoke suit.

Reduced to stifled embarrassment by the self-knowledge that comes with the company of better-dressed people, the press (for such was the throng) drew bitterly at its hand-tailored cigarettes and watched the launching of a new British Line—not a maritime but a sartorial venture designed to illustrate that we, poor snivelling, coughwracked and mothbitten we, are basically athletic in shape, tapering continuously from our natural-sloping, cleancut shoulders through our full chests to our plain (trouser) bottoms, shaped over our shoes. With these fine feathers, something of a Guards bearing, a feeling of confidence, poise and masculinity could invest us all.

The shock, in the event, was rather one of recognition than surprise. From the welter of drainpipe trousers, Italian (type) bumfreezers, jeans, American lightweights, ex-army greatcoats and giant sweaters which currently inhibit the athleticism of young Britain, Mr Amies has filtered the least offensive elements; added to them his own Regency-style trouser ("like a second skin") and an inflexible rule about cuff-buttons; and produced an almost wholly pleasing whole, free of major eccentricities and disarming to both casual (jeans at the Savoy) and formal (high collar at the beach) factions. Rich, but not gaudy: and so little costly as to be within the compass of the most anti-Establishment of purses.

Small as the achievement may sound, it is a triumph of ingenious compromise. If it catches the imagination of the "multiple" trade (and, more important, if it remains unresponsive to the grosser proclivities of multiple customers), Mr Amies's line may mitigate the uniform drabness of the urban male. But apparel oft proclaims the cringing animal within. Steaming faintly in a damp, baggy-kneed, amorphously-jacketed, down-at-heeled and disreputably mackintoshed rush-hour mob, one is not sanguine of the eventual domination of the *haute couture des hommes*.

THE WORLD OVERSEAS

German Politics Come Alive

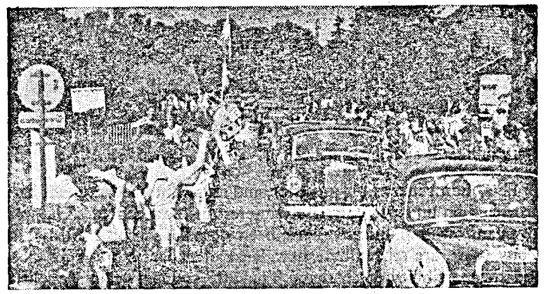
FROM OUR BONN CORRESPONDENT

IF they really mean what they are saying either in public or in private, a majority of the 741 deputies who will be elected to the Bundestag on Sunday is resolved to force Dr Adenauer into retirement; and this whatever the result of the polling, and sooner rather than later. Even Dr Adenauer's press chief and confidant, Herr von Eckardt, who is standing at Cuxhaven for the Christian Democratic Union under streamers inscribed "The Chancellor's faithful Eckardt," assured inquiring constituents on September 8th that it was not his eighty-five-year-old master's intention to lead the government for the whole of the next legislative period. Dr Adenauer, the faithful state secretary remarked warily, would make way for the present Vice-Chancellor, Professor Erhard, "after a certain time." He, Herr von Eckardt, did not think it would be wise to change the leadership immediately after the election.

Dr Adenauer himself has not yet said anything along these lines. But straws in the wind point engagingly to an impending change at the Palais Schaumburg. Keen observers claim to have discerned that Herr Erhard significantly omitted all mention of Dr Adenauer in the course of an election speech at Kiel last week. Other prominent Christian Democrats—notably Herr Gerstenmaier, the president of the Bundestag, and Herr Krone, the benign leader of the parliamentary party—have gently but publicly reprimanded their chief for having remarked that Mr Khrushchev had staged the Berlin crisis with the express purpose of helping the Social Democrats to oust the Adenauer regime. More obscure but equally restive, party members have been questioning in private the chancellor's future adequacy so unsparingly that the Social Democrats are merrily putting it about that the moment the election is over the Christian Democratic Union will send their veteran leader packing.

Previous occasions have seen mutinous talk in the Christian Democratic Union expire in a whimper—memorably, the talk of the disappointed Herr Erhard and his associates in 1959, when Dr Adenauer unexpectedly reversed his decision to exchange the chancellorship for the presidency. But this late summer's discontent is probably more purposeful, since, whatever Dr Adenauer himself may intend, the party can scarcely be counting on him as an indispensable election asset in 1965. That the Social Democrats are concentrating their fire on the Chancellor—"the old man can no longer grasp the situation," as Herr Brandt has put it—goes without saying. Their first condition for taking part in a national coalition—increasingly talked of as necessary as Mr Khrushchev intensifies his pressure against the West—would be Dr Adenauer's retirement. And the Free Democrats, who may hold the balance after the 17th, have stated that they would prefer to join a government headed by Herr Erhard, Herr Gerstenmaier, or Herr Krone. They might, they have been saying, accept Dr Adenauer for a while, but certainly not for long. All in all, it looks very much as though Dr Adenauer's 13-year-old reign is drawing to a close.

The candidates and the empty chair.



This almost incredible prospect, and its sombre background, hav provoked an unexpectedly lively interest in the election. The we Germans, who politically have been complacent or fatalistic fc many years, are stirred by a new sense of danger, and of the nee and the possibility of change. They are suddenly talking politic and parties, reassessing the validity of long-held ideas and alleg ances. Some 37.5 million of them are qualified to vote on Sunda Of these, 55 per cent are women. Just over three million, c roughly one in ten, are persons between the ages of 21 and 2 who will be voting for the first time. Only six parties are puttir up candidates in all of the ten federal states (Länder). These a the Christian Democratic Union, the Social Democrats, the Fr Democrats (more or less national liberal), the All-German par (an amalgam of the disintegrated right-wing German and Refugee parties), the neo-Nazi German Reich party (which is virtual neither seen nor heard outside Lower Saxony), and the Germ Peace Union, a new party under whose banner many of the pacifis nuclear disarmers, neutralists, communists, and fellow-travelle are rallying. In the last Bundestag the Christian Democrats he 287 seats, the Social Democrats 182, the Free Democrats 44, a the German party 6.

With so little to choose between their policies, the three maj parties are all conspicuously parading their distinctive personaliti in the hope of dispelling the verbal confusion and winning t voter's confidence with the simple image of a steady gaze and strong jaw. Seemingly every tree and post in the country has be commandeered by the Christian Democratic Union for displayi portraits of Dr Adenauer and Herr Erhard as the only begette of prosperity and security; a sticker attached since August 13 adds that that is why Mr Khrushchev is trying to tumble the The features of Herr Brandt, the Social Democrats' forty-seve year-old alternative to Dr Adenauer, are almost as ubiquitously evidence. Any deficiencies in his party's output of printed perso publicity has been made good by Herr Brandt's recent appearanc on television as Burgomaster of Berlin in the hour of danger accompanied now by Vice-President Johnson of the United Stat now by President Lübke of the Federal Republic, and now ev by none other than his fearsome antagonist, the present chancell

The Free Democrats have a highly presentable leader in H Mende, a forty-four-year-old former soldier of distinction and ready and amiable speaker. They are also making as much u as good form allows of the association with their party of t much-respected ex-president Heuss. (A tactless poster showi

Professor Heuss and the colonel together in the flesh and "in spirit," had to be withdrawn early in the campaign.) The German Peace Union, too, are circulating as widely as their resources permit a portrait of their leader, Dr Renate Riemeck, a forty-year-old professor of philosophy given to invoking the spirit of Dr Albert Schweitzer.

Hesitating voters have not been without advice from what strictly should be impartial quarters. Last Sunday a pastoral letter, read from the pulpit in all Catholic churches, urged qualified voters to turn out in force on polling day and to support whichever local candidate had committed himself to defending the traditional usages of the Christian Sunday and the sanctity of marriage. The Federation of Trade Unions has called on members to vote for "sound democrats," and to let the splinter parties well alone. The sound democrat, it seems, is identifiable by his interest in

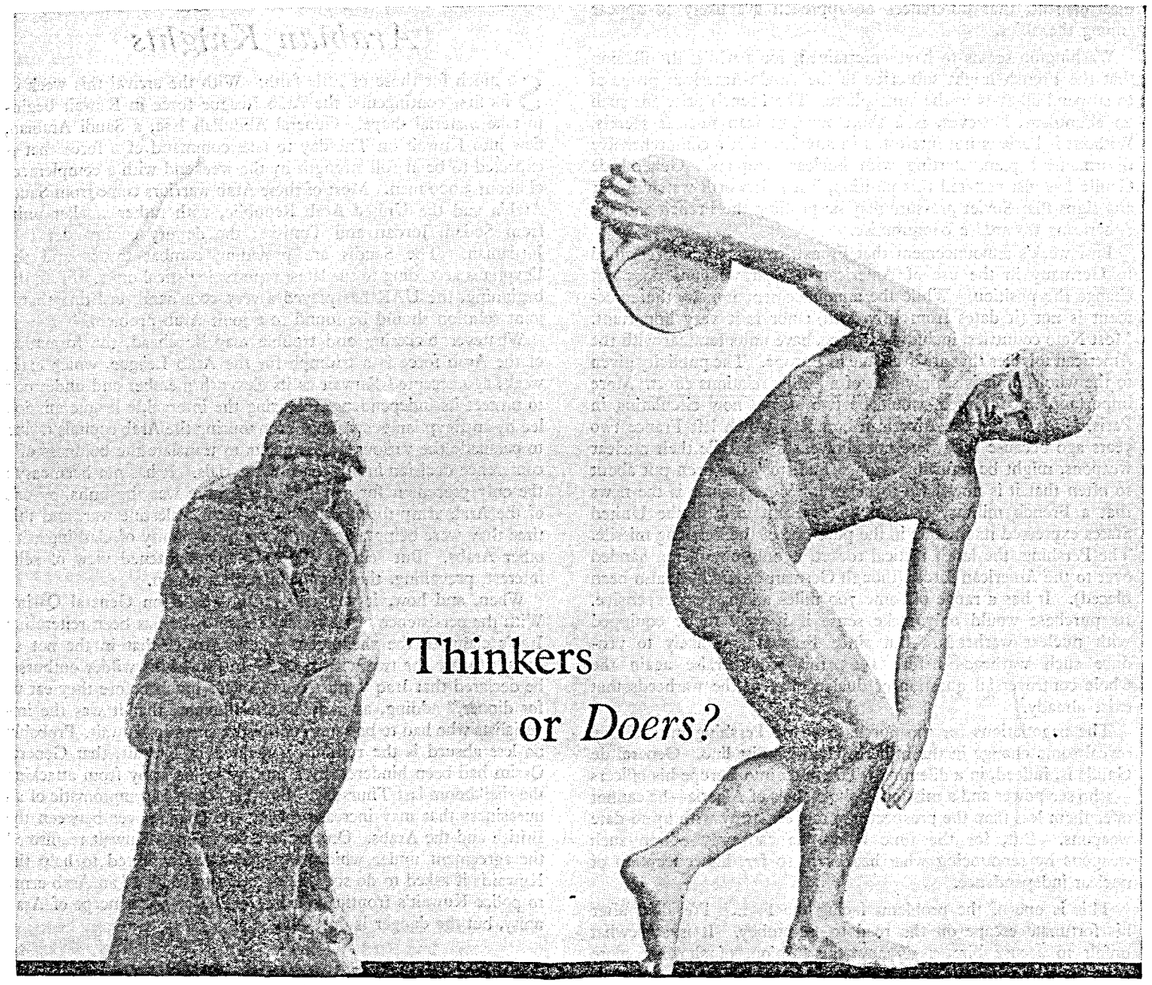
Election tour in Schleswig-Holstein

German unity, in preventing dangerous concentrations of economic power, and in the promotion of rent control and higher insurance benefits. From east Berlin, the central committee of the proscribed west German communist party has advised former members to vote for the German Peace Union.

A public opinion poll taken by the Emnid institute between July 31st and August 14th—before, that is to say, the Berlin crisis had shaken people's thinking—recorded that the Christian Democratic Union had the support of 31 per cent of those questioned, the Social Democrats 26 per cent, the Free Democrats 6 per cent, the All-German party 4 per cent, other parties 2 per cent and that 31 per cent had not made up their minds. In a similar poll concluded on September 9th, four weeks after Herr Ulbricht had sealed off east Berlin, 44 per cent of those expressing an opinion said they would vote for the Christian Democratic Union, 39 per cent for the Social Democrats, 11 per cent for the Free Democrats, 3 per cent for the All-German party, and 1 per cent for the German Peace Union. But 29 per cent were still undecided. Thus Dr Adenauer's absolute majority still looks problematic, and the prevailing feeling is that he may not get it. There is not long to wait now for the figures that matter.

A World Seen from Paris

FROM OUR PARIS CORRESPONDENT



MIRACLES do not solve problems, though they may postpone them. General de Gaulle, returning to Paris after his narrow escape on the road to Colombey on September 8th, has found a somewhat altered situation. Despite such a timely reminder that circumstances are still "exceptional" and that the use of article 16 is therefore, justified, the parliamentary offensive against his special powers did not quite fizzle out. The protests of the farmers have temporarily faded into the background. But Algeria still figures high on the general's current agenda; and so does Berlin. General de Gaulle probably sees a link between the two in the dual problem that dominates the life of the Fifth Republic: the part to be played by the armed forces in the national life of France, and their distribution between Africa and Europe.

As soon as the first shock of the abortive attempt wore off, attention in Paris turned to the armed forces. Would the army have moved to fill the political vacuum if the general had been killed? Less hypothetical is the question of the attitude of the officers' corps. Poujadist plotters in south-west France, or the fascist fringe in the capital can provide auxiliaries, thugs or assassins, but they are not taken seriously as contenders for supreme power. On the other hand, have the arrests of Generals Vanuxem and de Crèvecoeur and of Colonel de Blignières really beheaded the French branch of the underground *Organisation de l'Armée Secrète*? The OAS is a hydra, fed by the Algerian war. It is in Algeria that its effective leaders—General Salan and his colonels—though sentenced to death, carry on their activities. They could not have remained uncaught and unharmed for so long if the undoubted sympathy of the European population were not reinforced by some complicity in the armed forces. That complicity may be based on the solidarity of the profession, but it has been strengthened recently by General de Gaulle's theory of "disengagement" from Algeria and his decision to move some units back to France because of the Berlin crisis.

HEREIN probably lies one reason why the French government shows no haste to resume negotiations with the Russians. General de Gaulle, in his press conference on September 5th, provided two clues to the French attitude. One was his own "sorrow" that France no longer has at its disposal the resources that it used to command in its days of glory. There is no hurry for a conference where one is to play second fiddle. The second reason was his belief that concessions will merely whet Mr Khrushchev's appetite, and therefore that the best plan is simply to wait and see. It is, moreover, a lucky coincidence that the crisis, while it lasts, has some advantages for the French government.

The international tension enables Paris to plead that it must hold on to Bizerta. It also enables General de Gaulle to tell his officers that their real mission lies in Europe. The 11th Light Infantry Division—including shock troops—was brought back from Algeria at the end of July. The 7th Armoured Division is now following suit. Others may follow. This does not mean that all officers share General de Gaulle's order of priorities. It is whispered in Paris that the sick leave of General Olié, chief of staff of national defence, is not unconnected with disagreements over troop movements. Rumour has it that two possible successors to General Olié have turned down the post and that several hundred officers have handed in their resignations in recent months. There is, obviously, no enthusiasm in the army for the transfer to Europe, but the Berlin crisis enables the government to present this alternative with a sense of urgency.

It was thought, at first, that the French government's reluctance for talks with the Russians was mainly inspired by its close ties with Bonn. Yet its attitude remained unchanged even when Dr Adenauer had come round openly to negotiations. The French do not have, or at any rate do not feel, the same reasons as the Germans for keeping in line with Washington. Nevertheless, there is something less than unanimity in Paris about the lengths to which opposition to a conference ought to be carried. The French representatives in the allied councils will insist that stiff terms be put to Mr Khrushchev and that nothing be conceded without getting something in return, but if the present American soundings are found satisfactory (which is doubted), they will not oppose a conference at the highest level. General de Gaulle, it is said here, will be a reluctant climber, not an absentee. It is, however, on the road to the summit, particularly if it is widened to include

Both! Wimpey is a world of contrasts. Thinkers *par excellence*, for example, at the Wimpey Laboratories, where the quality of their work for Consultants, Local Authorities and Governments, has gained an international reputation. Doers too, are Wimpey—Europe and the Commonwealth's biggest building, civil, mechanical and electrical engineering contractors. Big enough to take a £20 million dam in their stride, and flexible enough to build a private house. Wimpey are world-wide yet Wimpey remain local. Wimpey are mechanised, with plant costing £12 million, yet Wimpey are people—over 26,000 efficient, on-the-spot, friendly, good-at-their-jobs people. So if you want Thinkers or Doers, for a small job in Sunderland or a dry dock in Karachi—or are thinking of a more substantial future for yourself—get in touch with Wimpey.

disarmament, that differences of approach are likely to appear among the allies.

Washington seems to have entertained, for a while, the illusion that the French might subscribe to the Anglo-American proposal to suspend all tests in the atmosphere. The French price for such an alignment, however, is a share in American nuclear secrets. Without it Paris is not interested in anything but a comprehensive disarmament plan, starting with nuclear weapons. General de Gaulle has just restated this position, but it is worth watching for any signs that Soviet pressure may be pushing the French and the Americans towards a compromise.

Last week's announcement that French troops are to be trained in Germany in the use of American nuclear weapons does not change the position. While the announcement is new, the agreement is not (it dates from July 27th); nor is it very important. Most Nato countries, including France, have units familiar with the American missiles that are available in Europe. The publicity given to the whole affair is simply part of a public relations effort. More important, if confirmed, would be two stories now circulating in Paris. One is that the American bombers, which left France two years ago because they were not allowed to stockpile their nuclear weapons, might be returning soon. The story has been put about so often that it is now hard to believe. More serious is the news that a French military mission on a recent visit to the United States expressed its interest in the purchase of the Pershing missile. The Pershing, the latest tactical rocket, is only now being handed over to the American forces (though German orders have also been placed). It has a range of some 700 miles and is very expensive. Its purchase would only make sense if it were to be equipped with nuclear warheads. But since France is unlikely to produce such warheads before 1965 this would raise again the whole controversial question of dual control of the warheads that exist already.

The negotiations for the purchase of the Pershing missile may reveal some change in the hitherto rigid gaullist line. General de Gaulle is, indeed, in a dilemma. To attract into Europe his officers —who see power and a mission in the djebels of Algeria—he cannot offer them less than the prospect of a modern army with up-to-date weapons. But, for the time being, he can only obtain such weapons by renouncing what has been, so far, his conception of nuclear independence.

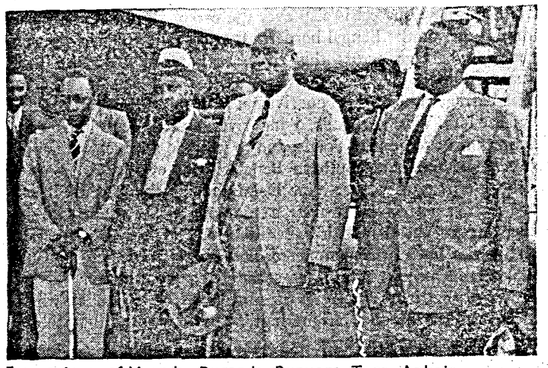
This is one of the problems facing the French President after his fortunate escape on the road to Colombey. It is somewhat unfair to accuse him, as is now the fashion, of showing more courage in the hours of crisis than foresight during the intervals between. The charge is based on a misunderstanding of the gaullist conception of power. General de Gaulle has never hidden his distaste for the parliamentary turmoil, party strife, and indeed the interplay of articulate political opinion in any form. He feels himself in his element when the circumstances are "exceptional," when all power is concentrated in his hands. If the system does not work, it is because of the army's refusal to fit into it and to perform, dutifully, its important role. The story of the last forty months can be described as a continuous effort by General de Gaulle to transform the armed forces—through promotions and dismissals, promises and threats—into an obedient instrument of the civil power. His escape from assassination has given him another opportunity. The popular mood is favourable, at least for the moment. Documents seized by the police should enable them to pursue the purge of the officers' corps, instituted after the abortive coup in Algiers in April. The international situation makes it easier to proceed with the army's transference to Europe. But time will not have a stop. If the present respite is not used more successfully than earlier ones were, the conviction will grow that the Fifth Republic must drag on from "miracle" to "miracle," much as the Fourth did in between its government crises.

Arabian Knights

So much for those of little faith. With the arrival this week of its first contingents, the Arab League force in Kuwait begins to take material shape. General Abdullah Issa, a Saudi Arabian, flew into Kuwait on Tuesday to take command of a force that is expected to be at full strength by the weekend with a complement of about 3,000 men. Most of these Arab warriors come from Saudi Arabia and the United Arab Republic, with rather smaller units from Sudan, Jordan and Tunisia; the deputy commander is a Jordanian. The Saudis are providing combat troops and the Egyptians according to the latest reports, logistical units. From the beginning, the UAR has played a very cool hand, insisting that a joint solution should be found to a joint Arab problem.

Whatever bickering and trouble may lie ahead, the formation of the Arab force is a triumph for the Arab League, which eight weeks ago accepted Kuwait as its eleventh member and undertook to protect its independence. During the interval, a league mission led by an Egyptian general has been touring the Arab capitals trying to persuade the various governments to translate the boldness of a conference decision into men and materials. It has not been easy; the only precedent for a united Arab force was the unhappy one of the Arab army that fought and lost the Palestine war, and this time they were being asked to face the possibility of clashing with other Arabs. But self-respect, and an enlightened view of self-interest, prevailing, the joint venture has begun.

When, and how, it will end must depend on General Qasim. With the persistence of a scratched record, he has been reiterating Iraq's claim to the sheikhdom and his belief that in the not so distant future the two will be one. In one of his wilder outbursts he declared that Iraq "must eat them for lunch before they eat us for dinner," adding, as a quick afterthought, that it was the imperialists who had to be eaten, not his kinsmen in Kuwait. Probably no less absurd is the rumour, generated in Kuwait, that General Qasim had been hindered by a mutiny in his army from attacking the sheikhdom last Thursday. But this report is symptomatic of an uneasiness that may increase during the change-over between the British and the Arabs. On Sunday, the ruler of Kuwait reaffirmed the agreement under which the British are expected to help the Kuwaitis if asked to do so. The getting together of an Arab army to police Kuwait's frontier is a fine boost for the concept of Arab unity, but the danger is only fended off.



Planning Uganda's Future

FROM OUR CORRESPONDENT IN KAMPALA

LANCASTER HOUSE could not accommodate everyone who would like to attend the Uganda constitutional conference, booked to open next Monday, September 18th. It is a measure of the intricacy of Uganda's problems that a comparatively small territory is sending to London one of the biggest delegations ever seen at this type of meeting, and still there are protests from people who have been left out. Some of the most important delegates, however—the representatives of the Buganda kingdom—have been reluctant to appear at the conference table.

The object of the conference is straightforward enough. It is to work out a constitution under which Uganda can achieve internal self-government, and then full independence, as quickly as possible and so keep up with its East African neighbours. Mr Benedicto Kiwanuka, the chief minister, has set his sights on "uhuru" in 1962. But to achieve an agreed constitution and an acceptable timetable will require the most careful balancing of competing interests.

The proposals to be put before the conference by the Secretary of State will probably follow the main outlines of the Munster Report (see *The Economist*, July 1st, page 26), which suggested that the future constitution should be democratic, but should provide a guaranteed status for the traditional rulers; and that the constitution should be a mixture of unitary and federal systems, with direct government for the districts, semi-federal status for the Kingdoms of Toro, Ankole and Bunyoro and a federal relationship between Buganda and the central government. These suggestions have met with fairly general approval in Uganda.

Four princes of Uganda: Buganda, Bunyoro, Toro, Ankole.

There is still some anxiety about the exact position of the traditional rulers, and Mr Macleod has therefore invited the Kabaka of Buganda, the Omukama of Bunyoro, the Omukama of Toro, the Omugabe of Ankole and the Kyabazinga of Busoga to pre-conference talks in London; but the rulers will probably accept their constitutional role gracefully. The district councils have mostly agreed with the report and the three kingdoms are reasonably happy with the degree of autonomy offered them by the semi-federal arrangement.

The Buganda problem is less tractable. Talks between the Governor of Uganda and the Kabaka's ministers are rumoured to have reached agreement on most difficult points, except that of the financial relationship between Buganda and the future Uganda government. Understandably, this is a sore point just now, when the financial administration of the Kabaka's government is under criticism from the Protectorate government, which has approved its current estimates only on a six-months' basis and on condition that there will be reforms. Points like this will assume more or less importance according to how badly the Buganda leaders want to bring their kingdom into the future Uganda.

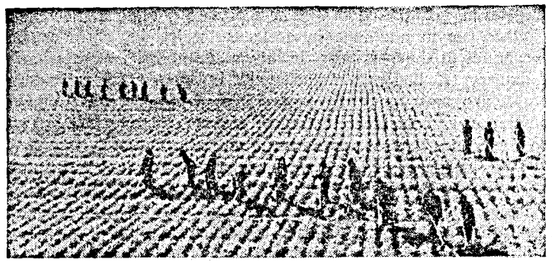
The signs are that the Baganda have realised that they must sooner or later come to terms with the rest of Uganda. Naturally the present holders of power do not want to lose their positions in the process—which might well happen if the kingdom were to have free elections. Hence the Munster concession allowing the Lukiko (the Buganda parliament) to act as an electoral college, to select Buganda's representatives for the central legislature, on condition that the Lukiko is democratised first. This condition may now be avoided by a bargain struck between the Lukiko constitutional committee and the Uganda People's Congress, the opposition party in the present Uganda Legislative Council. The precise terms of the deal are not yet known, but it is probable that Mr M. A. Obote, the UPC leader, has conceded the Lukiko's right to choose the Buganda members in the future Legislative Assembly without itself undergoing a drastic change. The UPC has bid surprisingly high for Buganda's alliance, considering the good prospects it already has of winning the next general election.

Whatever the effect on the fortunes of the political parties, the alliance does provide an immediate way for the Buganda delegates to get to London. The Kabaka's government had left it rather late to undo the intransigence which its whole course of conduct in the past year, including the abortive "secession" of January 1st, had encouraged in the Lukiko. On August 29th the Lukiko most pointedly ignored the subject of the London conference, and its sanction for the Buganda delegates to attend the conference was not given until the last minute. Now that Buganda has decided to join the conference, the initial bargaining will be harder; but it should be easier to agree on a constitution in London with the Buganda delegation present, than to settle the constitution without the Baganda and afterwards sell it to them.

Two emotive issues may make agreement in London especially difficult. One is the long-standing quarrel between Bunyoro and Buganda about the "lost counties," said to have been taken from Bunyoro and given to Buganda after the wars of the 1890s. The second is the question of the head of state. The Munster Report recommended putting this problem into cold storage, by the appointment of a governor-general, but this solution may no longer be acceptable to judge by the unfriendly reception given to the announcement that Sir Walter Coutts is to succeed Sir Frederick Crawford as Governor of Uganda in November. Some politicians claim that the appointment of another governor is an anachronism at this stage.

But even such difficult problems as these need not be insuperable, provided that the delegates really want to find a settlement. The composition of the delegation is on balance favourable to a happy outcome. After all, no one—not even the most diehard traditionalist—stands to gain by indefinite delays.

Peking Hesitations



FROM OUR HONGKONG CORRESPONDENT

THIS year's convocation in Peking of the National People's Congress is now nearly six months behind its normal schedule (March). This is not surprising. In past years of difficulty, the politburo has always managed to suppress its basic democratic instincts and, by discreet procrastination, to protect the national "parliament" from heretic suspicions that there might be problems which the party was unable to resolve.

True, this is already a record delay. But then all the indications are that record difficulties are bedevilling the politburo. The food problem grows worse. The cutback in industrial development and production is humiliating and will require a deal of patient rationalisation. Cholera has been belatedly reported in the south—allegedly "not true cholera," but some variety of disciplined, party-line cholera. The fraternal differences of opinion with the Kremlin over dogma and status have seemingly led to unworthy Soviet reprisals in Chinese spheres of authority. There are even firm and plausible reports of differences inside the politburo, between Comrade Mao's academic following and Comrade Chou En-lai's planners, over the wisdom of continuing ideological disputation with the Russians when current economic difficulties all stress China's vital dependence on Soviet aid.

According to the planning chairman, Li Fu-chun (reputedly Chou En-lai's goad) at the last National People's Congress (held on time in March last year), investment in capital construction for 1959 totalled 31.7 billion *yuan*, while planned investment for 1960 was set at 38.5 billion *yuan*. Authoritative and conservative calculations here reckon the total investment in capital construction for 1961 at not more than 16 billion *yuan*. This remarkable decrease, even allowing for a billion *yuan* one way or the other, is vivid statistical confirmation of the strains and stresses which the party's original targets for industrial growth imposed on the national economy.

The changes in the communes—"small freedoms" decentralisa-

tion and, above all, the prudent paring down of large units—all reflect the ideas of Chou En-lai, who, in the days of the co-operatives, publicly proclaimed his personal doubts about the intelligence of merging small co-operatives into unwieldy agglomerates. These revisions, indeed, represent a revival of the so-called "tidying-up" restraint imposed on Chairman Mao and his theoreticians at Wuchang in December, 1958.

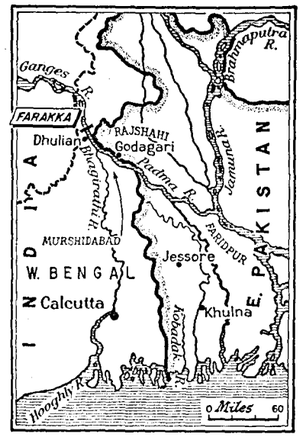
No workers may be recruited from the countryside for industrial work for the next three years. All available urban labour has been diverted to the farms. It is estimated that in the last four months more than eight million people were abruptly removed from factories and towns to agricultural work. Altogether, it is believed that 20 million people were transferred from non-agricultural production to the farms between mid-1960 and April, 1961.

Some experts here insist that China's grain production last year did not exceed 170 million tons. Chou En-lai said in November that the grain total would be less than the officially claimed 250 million tons of 1958 but more than 1957's 185 million tons. There are suggestions that the real production figure in 1959 (when 270 million tons was the official claim) did not in fact exceed 200 million tons.

The only hard target that has been mentioned so far is "the doubling of grain production by 1970." To achieve that distant miracle, the mechanisation of agriculture is supposed to be promoted in three stages over a 10-year period, the critical stage falling in the 1965-67 period of the third five-year plan. According to the latest claim by the Peking *People's Daily*, there were 79,000 agricultural tractors in operation in China in 1960, an increase of 20,000 over 1959 and of 33,670 over 1958, when the communes were introduced.

Chou En-lai seems to have been guilty of an indiscretion at the beginning of the year, when he warned visiting Japanese industrialists that they should prepare for pending Chinese contracts by July, because the politburo, he claimed, would then have before it, at an unprecedently early date, the blueprints for the third five-year plan (1963-67). It seems a reasonable deduction that the meeting of the National People's Congress has been delayed because these blueprints are not yet ready or acceptable.

The sustained doubts about agricultural production, explicit in further imports of grain from Canada and new inquiries in Australia, could well hold up the most careful and prudent plans. If food supplies are uncertain for 1962, even conservative industrial plans for 1963 and later could seem unreal to the most trusting democrat in the National People's Congress. The politburo planners may well be reproaching the theoreticians for injudicious doctrinaire disputation with the Russians, whose aid on Russian terms remains essential. But the theoreticians, in turn, must be insisting that the planners' blueprints do at least outrange India's new plan and also that they do not make a sour joke of Mao's inspired leadership by wretched contrast with Mr Khrushchev's glowing 20-year prospectus.



A New Indo-Pakistani Dispute

FROM A CORRESPONDENT IN CALCUTTA

A NEW Indo-Pakistani dispute has cropped up which could become a serious source of discord, as the Indus waters dispute was until it was settled through the mediation of the World Bank. The new quarrel is also over the use of river waters; those of the Ganges on the Bengal border. It arises from India's decision to build a barrage across this river, at Farakka, near the East Pakistan frontier.

The barrage project was conceived at least ten years ago, in order to resuscitate West Bengal's dying river system, and thus save Calcutta port; to control floods, and to provide a direct water link between northern and southern Bengal. But even after Farakka had been chosen as a site, New Delhi shelved the plan until last year when, as if woken up by a sudden jolt, it announced its decision to go ahead with it expeditiously. By now many of the preliminaries have been completed, and efforts are being made to complete the project within the scheduled eight years.

It is said that it was political pressure from West Bengal, where the barrage scheme has aroused great expectations, that forced Delhi to take the long delayed decision at last. The greater pressure, however, appears to have come from the World Bank, which has been taking an active interest in the development of Calcutta port. One of its missions has warned the Indian government that unless economic development is encouraged through the immediate improvement of Calcutta port and city and the adjacent industrial belt, the country's whole economic programme will encounter serious difficulties. The Bhagirathi-Hooghly river, which serves Calcutta port, is gradually silting up, and its navigability is already poor for the greater part of the year. The salinity of the river is also already increasing owing to the action of the tides, and this is a danger to the health of Calcutta's three million people, who have no other water supply. These dangers can be counteracted only by increasing the flow of the river by means of a barrage such as the one planned at Farakka.

Below Farakka, the Ganges branches off into the Bhagirathi-Hooghly flowing through Indian West Bengal and the Padma through East Pakistan. If India diverts 30,000 to 40,000 cusecs (cusec = cubic foot a second) of water into the Bhagirathi-Hooghly by a feeder canal, as it proposes to do, the flow in the Padma would be affected to a corresponding extent. Pakistan contends that this would impede its current drive for self-sufficiency in food by affecting its new irrigation projects, especially in the south-western zone which depends entirely on the Padma. In this zone the present irrigation and drainage facilities are poor, and droughts and floods still do serious damage. The Pakistan government's multi-purpose Ganges-Kobadak scheme is designed to irrigate two million acres of this land with Ganges water.

When President Ayub Khan of Pakistan wrote to Mr Nehru protesting against India's unilateral decision to implement the

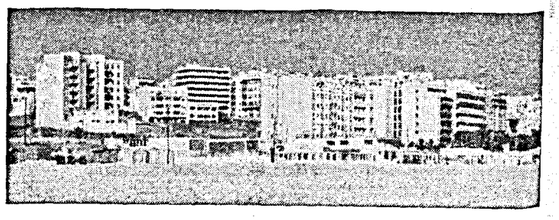
Farakka barrage project, he suggested that a ministerial conference should be held immediately. The Indian prime minister, however, suggested that a meeting of water resources experts should first take place so that ministers could later discuss the matter more usefully. Accordingly, hydraulic experts from both countries have already met several times; at the last meeting the Indian delegation was taken on a tour of the East Pakistan areas which the Ganges-Kobadak scheme is to serve. At the next meeting of the experts, Pakistan will be required to substantiate its case with fuller information. But the chief Indian delegate has already declared that India sees no reason to alter the project site; that Godagari is not suitable as an alternative site (this with reference to the Pakistani suggestion that Godagari, on the section of the Padma that follows the frontier, should be chosen as the site for a barrage constructed as a joint venture for the benefit of both countries); and that the Ganges-Kobadak project has been drawn up in too imprecise a manner for any scientific assessment of the actual requirements of water to be made. It is not expected that the next meeting of experts will produce a different outcome.

Subsequently, India's deputy minister for irrigation and power, Mr Jaisukhlal Hathi, stated in parliament that an Indo-Pakistani ministerial meeting is now contemplated to discuss the "distribution of the waters of the eastern rivers," and that India always keeps it in view that its Farakka barrage project should not affect Pakistan's "reasonable interests." This was followed by a declaration by Mr Nehru that notwithstanding the proposed negotiations with Pakistan, the carrying out of the barrage scheme will on no account be suspended or stopped. It remains to be seen whether Pakistan will be satisfied with the restatement of India's good intentions, or whether it will choose to make some other move if the outcome of the proposed ministerial meeting is not to its liking.

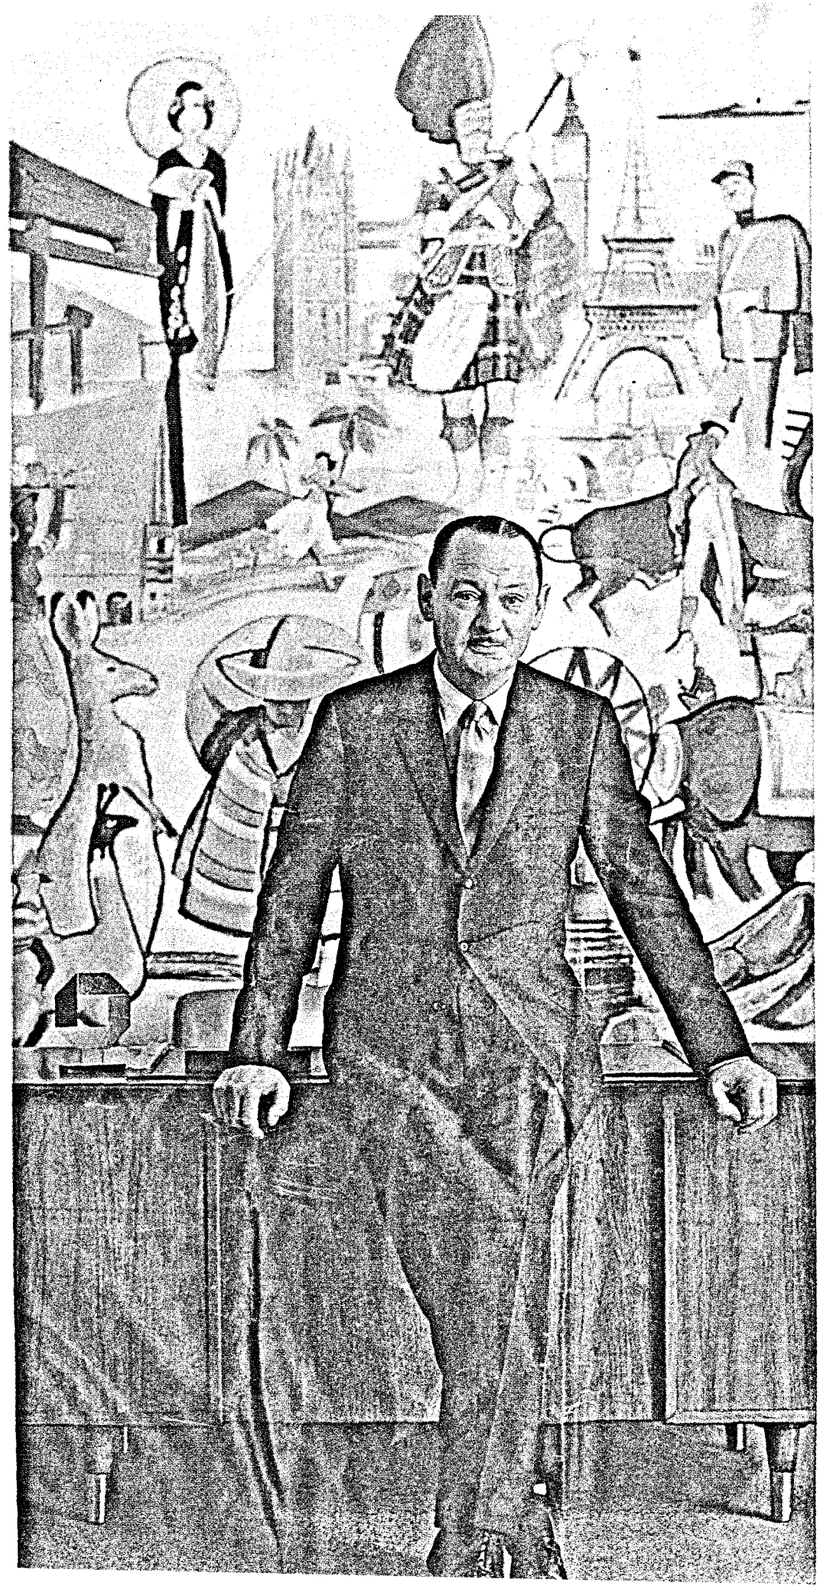
Nothing Tangible for Tangier

FROM A MEDITERRANEAN CORRESPONDENT

FOR the last 18 months Tangier has been sliding downhill into what, for Tangerines, is an unfamiliar abyss of economic normality and conventional morality. After years of economic and financial privilege, and uninhibited sin, Tangier has found it difficult to adjust itself to present-day realities. It has wilted; and the only people who are pleased are the expatriate residents, who do not have to make a living out of the place, and who are delighted to have space to park their cars.



Tangier in its days of privilege and prosperity was a cow that could be milked by Rabat. Now, as just another Moroccan town, full of complaining business men and unemployed working men and working girls, it is fast becoming a liability. As if to rub salt into the wound, across the way, stable humdrum Gibraltar has never had it so good. In an attempt to arrest the downward slide and to restore confidence in Tangier's future, King Hassan II recently paid a visit and made a speech. To show the importance the King attached to the occasion, the royal party made a special effort and arrived only an hour late; and to show the importance they attached to the visit, the people of Tangier turned out in large numbers and gave him a warm welcome.



The King spoke of his "primordial concern" for Tangier, and listed as evidence some measures that have already been taken. The compulsory routing of northern Morocco's imports and exports through Tangier has, it is true, brought goods and produce in transit which used to go through the Spanish port of Ceuta; but the cynical say that the main practical effects of this diversion have been to put up the prices of imported goods and to delay the delivery of exports. The special incentives offered to investors in approved local projects like sugar refineries and textile mills look fine on paper, but the number of applications received has not yet reached double figures. In addition 2 million dirham—about £150,000—has been allocated for what, in effect are relief works designed to mitigate the rising unemployment.

THE Tangerines hoped for something tangible from the King's visit—something immediate, like a reduction in the property and business taxes. This they did not get. They got some dazzling promises: a brand new harbour, a king in residence for two months every summer, a shipyard, and, best of all, a free port zone. In a few years, someone said, Tangier (pop. 180,000) would be a city of a million people.

Work is in progress on this new free port zone, an area of reclaimed land near the Yacht Club. The King announced that reclamation was to be accelerated. But nobody knows yet just how (or, indeed, when) the free port is going to work, or what arrangements there will be, if any, about freedom from the prevailing currency restrictions within the free port area. The depth of water on the flanks of the reclaimed land is only enough for small coastal vessels. There are no facilities for oil bunkering or piped supplies of water as there are at Ceuta and Gibraltar. The prospects of building up a genuine entrepôt trade are, therefore, still vague, though there are, as always, ill-disposed people who talk of a smugglers' base just clear of the frontiers of the future integrated Europe. Plans for the new port and the shipyard are more nebulous still. There is talk of a breakwater to keep out the east wind which has frustrated Tangier's development as a port since the days when the British acquired the place, and within 20 years gave it up again, in the seventeenth century. There are rumours of Russian and Czechoslovak experts preparing plans for a yard where ships, which now have to be purchased abroad, will be built and repaired.

Few people in Tangier take these plans and promises seriously. It is not that they doubt the King's desire to help, for, like many other people, Tangerines in the know have been much impressed with the transition of the play-boy prince into a conscientious ruler. But the grocer's bill cannot be paid with long-term plans, and the worries of the trading community in Tangier are pressing. It is estimated that about 800 foreign firms, as well as all the commercial banks, have closed down or left in the past year and a half. Some have remained in the hope that the tide would turn. These people listened politely and hopefully to the King's speech, and then set their private spy systems to work to find out what substance lay behind the words. Now they, too, are beginning to realise their assets and pack their bags.

If World Business is your concern talk to the people at Chase Manhattan

World business is truly Senior Vice President Alfred W. Barth's background.

Years of experience here and abroad have given the administrative head of Chase Manhattan's International Department an intimate knowledge of the opportunities, the problems and the personalities involved in world business today.

Moreover, the Bank's International Department is staffed with area specialists—men thoroughly grounded in the commerce and customs of the world's most important business centers.

And in the most important business centers of the world there's a Chase Manhattan Overseas Branch or Representative to locally implement the financial planning performed by the International Department for good customers engaged in world business.

Why not talk to the people in Chase Manhattan's International Department about your world business interests? Write to International Department, The Chase Manhattan Bank, 1 Chase Manhattan Plaza, New York 15, N.Y.

able airfields, could both get off and get through. This robust faith is not undermined, but the assumption that the Russians have built up their anti-aircraft defences mainly with ground-to-air missiles, possibly with atomic warheads. The implication from the recent tests that the Russians are now developing an anti-missile missile (presumably usable against aircraft) has, however, caused a cool wind to lift a few papers on Air Force desks. Yet so certain that the bombers will get through is the Air Force that it is keeping up its pressure for the $8 billion programme of supersonic B-70 bombers which was put on a research basis by the Administration last February. More cautious strategists thank heaven that the allied retaliatory power is not now concentrated in bombers but is dispersed between aircraft and missiles over two continents and seas. The Navy has six atomic Polaris-firing submarines at sea, with three to join the fleet in a few months (and twenty building); it has six aircraft carriers with atomic weapons always on station. Even 100-megaton bombs do not alter these facts; but they make any massive conventional war seem unlikely.

It is another example of the confusion of thinking in the Defence Department that, abetted by congressional disbelief, it slighted civil defence for so long. It does so no longer; and even Congress has begun to consider its role in modern war—leaning towards the strategic dispersal of Representatives and Senators on their grassroot pads. Civil defence is now being reorganised, but little can be done that has any bearing on the current dangers. The immediate object is to find places for 40 million in shelters against fall-out, mainly in urban areas, which, it is calculated, might save a quarter of the inhabitants or up to 12 million lives. In safe rural areas shelters would save most lives. But the count will not be finished till December, 1962, and originally it was proposed to take no action "until we know what we have and would want." Now existing shelters are to be strengthened and supplied with food, medicines and equipment; it has been asserted, without authority, that 20 million people could be given this limited protection by next January. Meanwhile, thousands of private citizens are ordering concrete and ventilators, and digging. Some people may call all this bluff, but it is costing dollars and effort and doing something important to American psychology. This is the cost to Mr Khrushchev of his recalcitrant toughness when President Kennedy attempted to reason with him in Vienna.
