COMMERCE

"For Commerce, though the child of Agriculture, fosters his parent
Who else must sweat and toil and gain but scanty fare."
William Blake.

VOL. CIV. No. 2651 BOMBAY, 3rd FEBRUARY 1962 PRICE Rs. 2

IS DR. B. C. ROY UNREASONABLE?

FOR some time past, there have been differences of opinion between the Centre and Dr. B. C. Roy, the venerable Chief Minister of West Bengal, on the economic development of the State, in general, and the improvement of Greater Calcutta, in particular. Reports had appeared in the daily Press towards the close of 1961 that the West Bengal Chief Minister was trying to get foreign aid for specific projects by having direct talks with the Governments of some Western countries, particularly the U.S. Questions were raised in the last session of the Lok Sabha on this subject and the replies given by Mr. Morarji Desai refuted the allegations in the Press. The Union Finance Minister made the point that Dr. B. C. Roy had done nothing, during his tour of foreign countries last year, that was contrary to the rights of the Centre. While this remark has silenced the overzealous critics of Dr. B. C. Roy, the fact remains that the latter has his differences with the Centre in regard to the State Governments' rights for prospecting for mineral wealth, its exploitation and processing. He has even gone to the extent of seeking legal remedy under the Constitution of India to restrain the activities of the National Coal Development Corporation in the Raniganj area of Bengal.

The West Bengal Chief Minister is not alone in this respect. The Government of his neighbouring State, Assam, has withheld the issue of licences for prospecting for oil deposits by Oil India Ltd., on the ground that the Centre has reduced the royalty on oil. The development of Panna diamond mines has been virtually shelved, owing to differences of opinion on a variety of issues between the Centre and the Government of Madhya Pradesh. The latest position in regard to the dispute over the ownership of Singareni Collieries in Andhra Pradesh is not clear; the State Government owns 58.32 per cent of the paid-up capital and the Centre 40 per cent. The latter has been contending that it would invest further amounts in the development of these collieries only if it were given the controlling interest and authority of the Company. The dispute between Mysore and the Centre over the ownership of Kolar Gold Mines also still remains unsolved. This dispute differs from the rest, in that the Mysore Government's contention is that, if the Centre is not prepared to pay a subsidy on gold mining at a rate which is equivalent to the difference between the price of the yellow metal in India and the international price, the Centre is welcome to have the ownership of the mines, after paying appropriate compensation to the State. Thus, the Ministry of Mines and Oil, presided over by Mr. K. D. Malaviya, is in conflict not only with the three foreign oil companies operating in this country but also with State Governments. Dr. Roy now shares the view held by this journal for a long time that Mr. Malaviya and his Ministry are following a "dog-in-the-manger" policy, though he, too, is guilty of this charge, albeit in regard to development of power in his State.

The Centre and the States are being governed by one party—the Indian National Congress. The conflict between them on the ownership, and participation in the development, of mines may, therefore, appear to many as an unpleasant feature of Indian politics. It may even create the impression that the sense of unity among the members of the Indian Union has suffered a serious setback. This impression may be reinforced by the unanimous decisions taken by the inter-State conference on coal mining and allied problems at its second session held at Calcutta last week-end and by the screaming headlines given to them by a section of the daily Press. One, however, need not be unduly depressed by such events. There is no federation of States in the world where there are no differences of opinion and conflicts between one State and another and/or between the federal Government and the State Governments. It is quite a common feature of democratic Governments in countries of continental size. It must be remembered, in this connection, that State Governments in India are answerable to their respective legislatures and that members of these legislatures have to keep their constituencies pleased and contented. In doing so, they have, however, to bear in mind the larger interests of the country as a whole. They must not make demands that would impair the country's ability to compete effectively in world markets or to produce goods at the lowest possible cost for domestic consumers.

On a careful analysis of the pros and cons of the demands made at the inter-State conference on coal mining last week, we find that no great harm will come to the country if they are accepted by the Centre, subject to certain suitable safeguards. Indeed, they may even prove better for the country, as we shall presently show. The conference under reference was attended by the official spokesmen of as many as six States—West Bengal, Bihar, Orissa, Andhra Pradesh, Madhya Pradesh and Assam. At the very outset, they were all agreed that the Central Government's overall right and responsibility for planning production, pricing and movement of coal were unquestionable. They did well to reaffirm thus their faith in, and realisation of the need for, central planning and central direction to implement the Plans. Among their demands

Centre. It will be conducive to the promotion of a certain amount of competition among public sector projects through appropriate publicity to their operations and discussions in Parliament and State Legislatures alike. It would also provide opportunities for Ministers and officials in States to get the experience of running industrial projects and, thereby, for building a large reservoir of trained managerial personnel for the public sector. Again, the benefits of decentralisation in the shape of quicker decisions, prompt action, closer control over production and marketing, intimate relationship and direct contact with workers are not of insignificant nature. The question of financial control will, of course, be of a greater magnitude than if operated through one centralised Corporation, but it is feasible to tackle it through special arrangements with the State Governments concerned. The latter must be ready to co-operate with the Centre in this matter and to allow a Central organisation to exercise the necessary supervision and periodical audits. Since the Central Government will be a part investor in the collieries owned and managed by the State Governments, Parliament must have the right to review and debate on the working of these projects once a year. And the use of such right must not be regarded as an encroachment on the rights of State Governments or State Legislatures.

SINDRI'S PERFORMANCE

THE capacity for producing nitrogenous fertilisers, such as ammonium sulphate, urea, ammonium sulphate-nitrate, ammonium phosphate, ammonium chloride and calcium ammonium nitrate, is now predominantly concentrated in the public sector. It will be seen from the table in this article that four public sector units, namely, Sindri Fertilisers, Nangal Fertilisers, F.A.C.T. (Kerala) and Mysore Chemicals and Fertilisers, account for about 90 per cent of India's aggregate annual capacity in terms of nitrogen (N). And it is again these four public sector units that account, as of 1961, for about 90 per cent of the aggregate production of 137,000 tons (N) of nitrogenous fertilisers. In spite of the additional capacity (about 282,000 tons in terms of N) that has been licensed in the private sector for the third Plan period in pursuance of a liberal interpretation of the Industrial Policy Resolution of 1956, the public sector will account for two-thirds of the proposed aggregate additional capacity of 856,000 tons. If all this additional capacity comes to be installed during the third Plan period, the overall position will be that the public sector will account for 72 per cent of the entire capacity (existing *plus* additional) for producing nitrogenous fertilisers. In view of this dominant role which will continue to be played by the public sector in the field of fertiliser production, it is of the utmost importance for the public to know whether that sector will be able to acquit itself creditably.

The occasion for raising this doubt has arisen for the second time now—after 10 months from the date of publication of the Estimates Committee's report on Sindri Fertilisers and Chemicals Ltd.—with the availability, this week, of the Tariff Commission's reports on the fixation of fair retention price of ammonium sulphate produced by the Sindri unit. The "hush-hush" way in which the deterioration in Sindri's performance in recent years has been dealt with is hardly calculated to allay the doubt. It may be recalled, in this connection, that the Estimates Committee itself had this to say in March 1961:

"It is a matter of regret that, though the Estimates Committee had fairly detailed discussions with the representatives of the (Commerce and Industry) Ministry and the (Sindri) Company on 9th November 1960 regarding the reasons for shortfall in production, none of them referred to the expert investigation carried out in the matter. On a request from the Committee subsequently, a copy of the Report (submitted by Dr. Hussain Zaheer, a Director of the Sindri Company, in April 1960) was made available."

Again, the absence of any reference, in the Estimates Committee's report, to the report (December 1959) and the Supplementary Report (November 1960) submitted by the Tariff Commission suggests that the Estimates Committee was not made aware of the Commission's findings and recommendations. What is no less surprising is that the Government's Resolution (dated 16th January 1962), from which the following paragraphs are taken, has not referred to the Tariff Commission's original and supplementary reports:

"Sindri Fertilisers and Chemicals Ltd. approached the Government of India early in 1958 for an increase in the retention price of ammonium sulphate produced by them from Rs. 280 per ton (which was the price fixed from 15th January 1957), on the ground that substantial increases had occurred in the annual expenditure of the Company owing to reasons beyond their control, such as higher royalty levied by the Rajasthan Government on gypsum, increase in the freight charges of gypsum and coal, higher price of coal, etc. The fixation of retention price of Sindri during all these years had been done purely on *ad hoc* considerations and after discussions amongst the parties concerned, namely, the Sindri Company, the Ministry of Commerce and Industry, the Ministry of Food and Agriculture and the Ministry of Finance. It was, therefore, felt that the determination of a fair retention price should take into account the estimated cost of production, having regard to the "norm" of performance which could be expected from a plant of this type and the cost of imported fertilisers. The Tariff Commission was, therefore, asked in March 1959 to enquire into the production costs at the Sindri Fertiliser Factory and furnish a report to Government, which would, *inter alia*, include a specific recommendation in regard to a reasonable retention price to be allowed to the Company for its ammonium sulphate by the Central Fertiliser Pool.

"The Commission, on conclusion of its enquiry, recommended that the fair price of ammonium sulphate produced at Sindri may be fixed at Rs. 300 per ton with retrospective effect from 1st April 1959 and upto 31st March 1962, this price being exclusive of local taxes, if any.

"The Government of India have accepted the recommendation of the Tariff Commission in regard to the fixation of the retention price of ammonium sulphate produced by the Company..."

In the above paragraphs of the Resolution, the Government has not referred to the significant fact that the Tariff Commission, in its original report of December 1959, had recommended a retention price of Rs. 282 per ton for the 1959-62 period. Nor has it referred to the fact that it was in the Commission's supplementary report, called for by the Government in October 1960, that the retention price of Rs. 300 per ton (which includes a 10 per cent return on capital employed) had been recommended. By not mentioning these facts, the Government has all but suggested that the Commission's enquiry was a single operation, carried out in one stage. The supplementary report was in fact occasioned by the later advices from Sindri which were to the effect that production in 1959-60 was only 285,000 tons in terms of ammonium sulphate, as against the 300,000 tons assumed by the Commission in its original report and that the figure of an average production of 320,000 tons assumed for the three years 1959-60 to 1961-62 would not be realised. The revised estimate of average production suggested by the Board of Directors of Sindri for the purpose of recalculating the previously recommended retention price was 285,000 tons. While the Commission, in its supplementary report, accepted this figure of 285,000 tons as the basis for estimating the works cost and the fair ex-works price (retention price), it did so with some obvious reluctance, as witness the following passages in that report:

"We enquired why even as late as November 1959 the representatives of the Company had not informed us about the correct position regarding the steep decline in the output. Had this been done, there would have been no occasion for our estimates, which were based on data furnished by the Company, going wide of the mark. The Managing Director told us that apparently the authorities of Sindri at that time had underrated the seriousness of the trouble.

"In the original reference to us, Government had directed that we should take into account the estimated cost of production, having regard to the *norms of performance which could be expected from a plant of this type*. In fact, we had kept that in mind in determining the prices in our last report and criticised Sindri for not working to standard norms of performance. For these reasons, we have not accepted the claim for price increase on account of higher consumption of raw materials like coal and gypsum.

Aggregate Capacity and Production of Nitrogenous Fertilisers (1961)

Name of factory	Annual capacity (Tons)		Production (Tons)	
	Ammonium sulphate (In terms of N)	Other nitrogenous fertilisers (In terms of N)	Ammonium sulphate (In terms of N)	Other nitrogenous fertilisers (In terms of N)
Sindri Fertilisers ..	70,000	47,000	56,800	19,320
Nangal Fertilisers ..	..	80,000	..	32,400
F.A.C.T. (Kerala) ..	10,000	2 750	10,000	2,200
Mysore Chemicals and Fertilisers	1,320	..	800	..
Sahu Chemicals (Varanasi) ..	..	10,000	..	3,000
By-product of coke ovens ..	13,400	..	12,400	..
Total ..	94,720	139,750	80,000	56,920

"The report of Dr. Zaheer also brought out the fact that, while the fall in output had been due to the poor coal supplied, the inefficient working of the S.W.G. generators was, in the main, due to bad maintenance, and working conditions were probably affected by inadequate control over blending of coal particularly at night. These inefficiencies could not all be described as beyond the control of an efficient management and increases in cost resulting from shortfall in production, due to such inefficiencies, cannot be made good by raising the fair price to be fixed.

"For these reasons, we have decided only to make a recalculation of the price on the basis of the revised estimate of production of Sindri."

The above observations contained in the Tariff Commission's supplementary report are as good as strictures on the Sindri management. There are, of course, some other findings in the Commission's original report—findings which do not reflect creditably on the Sindri factory which had enjoyed the benefit of cheap loan finance from the Government of the order of Rs. 7 to 8 crores and was given a fair margin in the price paid by the Fertiliser Pool from time to time without meticulous calculation of the actual cost of production. First, the Company has provided in the aggregate a sum of only Rs. 12.7 crores as depreciation on its ammonium sulphate plant upto 1958-59—a provision which is lower by about Rs. 2.3 crores than the figure of depreciation computed for the first and second shift allowances under income-tax rates. Secondly, the Sindri Company has been carrying a large inventory year after year. At the end of 1958-59, this amounted to nearly Rs. 4.5 crores worth of stores, of which only a quarter would represent the principal raw materials required for the production of fertilisers. Thirdly, there has been a considerable increase in general labour cost due to the very large increase in the number of personnel employed since 1954-55, although the level of sulphate production has been, more or less, maintained at an even level near the rated capacity. Fourthly, Sindri has not introduced standard costing for correcting inefficiencies or improving performance. Of course, the poor quality of raw materials like coal and gypsum supplied to the Sindri factory is an extenuating circumstance in this connection, for these raw materials have not always conformed to standard specifications, but it is not all.

To these disquieting findings may be added the remarks of the Estimates Committee based on Dr. Hussain Zaheer's report. The clinkering trouble affecting production of gas, according to that report, had started only after 1954, when the coke ovens of the Company were commissioned. The problem had continued on an increasing scale for five years and affected not only the output but also the life of the generators themselves. But it was only in 1960 that a technical enquiry was carried out by Dr. Hussain Zaheer and remedial measures were suggested. The Estimates Committee could not, therefore, help asking the very pertinent question why the Sindri management had kept quiet so long without looking into the condition of the plant and allowed it to deteriorate so markedly. It has also recorded that, during the period 1956-58, gas production was sought to be maintained at a high level by operating the plants for longer periods without giving adequate time for annual overhaul and running maintenance, thereby further deteriorating the generators which had already been badly corroded. This, according to the Committee, has been somewhat of a costly mistake contributing to the loss in production and earnings, on the one hand, and avoidable damage to the plant, on the other. It is, therefore, no wonder that, with such sins of omission and commission, the Sindri Company (which has involved a total capital outlay of Rs. 36.5 crores, as of 1958-59) has come in for severe criticism on the ground that, even after a decade of existence, it has not been able to build up substantial reserves and give a reasonable return on the capital employed. As of 1958-59, its reserves were not even Rs. 2 crores, as against a paid-up capital of about Rs. 17 crores. The inadequacies and inefficiencies on the side of technical, general and financial management at Sindri are certainly not flattering to the public sector. Unless the Government is in a position to ensure efficient technical management and run an industrial enterprise on financially sound and prudent lines, it is a matter for serious consideration whether it can safely undertake the creation of additional capacity for fertiliser production on the scale mentioned in the opening para of this article. Cannot a bigger role be assigned to the private sector which may be in a position to secure foreign capital and technical collaboration and deliver the goods at a lower cost to the taxpayer?

MARKET GOSSIP

THE share markets are hesitant. The bulls are on the defensive, but, at the same time, the bears are not aggressive. The latter seem to be content with making small and quick profits. Consequently, fluctuations are narrow. Apparently, they have no profound faith in the astrological predictions about the outcome of *Ashtagraha*. In fact, there are some who have been discretely going long in certain active scrips in the hope that bear-covering and replacement buying by bulls after 4th and 5th February would give them an opportunity to pocket a tidy amount. These operators have, of course, assumed that none of the evil forebodings of astrologers would materialise. The prospect of T.T.K. joining the Cabinet after the elections is, however, not so lightly dismissed. His observations at Madras last weekend on the economic policies of the Government have been read with avidity in market circles. They clearly suggest that, given the opportunity, he would add to the economic controls that are already in force and these in turn would reduce the profit-margins all round. If nevertheless they have had no sustained bearish impact on equity prices, it is because of a desire to wait and see. The general feeling, however, is that, until the next Central budget is out of the way (which will be some time in May next), there can be no bull market of any significant size and duration. This is not to say that a share here or a share there may not shoot up or slump as a result of developments that may affect the merits of individual scrips.

A.V.B. Plant at Durgapur

The four workshops, two machine shops and one forge shop of the heavy engineering factory of A.V.B. at Durgapur will go into production on Tuesday the 6th inst., immediately after the inauguration of the factory by Dr. B. C. Roy, Chief Minister of West Bengal. The inaugural function, though it is a formal one, is of considerable importance in that it not only marks the beginning of a new era in the manufacture of cement-making machinery, steam-raising plant, pressure boiler plants, and heavy equipment for mining and other industries but also sympolises a major example of Indo-British collaboration. The factory is the joint venture of three "leaders" in industry—(a) Associated Cement Companies Ltd., the pioneers in cement and cement-making machinery industries in India; (b) Vickers Ltd. of Britain, the world-famous builders of ships, aircraft and heavy industrial and mining machinery, and (c) Babcock and Wilcox, another well-known British firm engaged in heavy mechanical engineering business.

The A.V.B. factory at Durgapur is a giant enterprise. Built at a cost of over Rs. 10 crores, it has an annual capacity to manufacture 6,500 tons of boilers, ancillary equipment and pressure vessels and 2.230 tons of cement-making, general mining, coal mining and other general machinery. In terms of value, the production, it is stated, will work out to about Rs. 5 crores annually which will be markedly higher, if the Company's plea for large-scale expansion is conceded by the Government. It is proposed to manufacture, by further utilisation of plant and machinery and the addition of a few machine tools and by working three shifts, 12,000 tons of boiler plant and pressure vessels, exclusive of 4,000 tons of bought-out components, in addition to the 2,230 tons of cement and general machinery (excluding imported specialised items). Evidently, the Company has been prompted to think of this expansion by the first orders for the supply of its products—four Babcock radiant type boilers (fired by automatic spreader-strokers) worth Rs. 2 crores ordered by the Maharashtra State Electricity Board and a similar type boiler worth Rs. 50 lakhs received from Korba in Madhya Pradesh. The Company is also expecting to secure a huge order for eight 60 M.W. high pressure boilers worth Rs. 12 crores.

On the face of it, the prospects for the A.V.B. plant at Durgapur are very bright. The products turned out by the plant are assured of a ready market. What is more, the cost of production may be expected to be economic, inasmuch as the factory is equipped with up-to-date machinery and enjoys the advantages of varied and extensive knowledge of the three aforesaid firms of repute. Again, the management is in sound and efficient hands. Even so, it may require another three or four years for the Company to pay any dividend. The Chairman of the A.C.C., therefore, told the shareholders at the last annual meeting that the question of issuing A.V.B. shares to the shareholders of the A.C.C. would be considered only when the A.V.B. Company was in a position to pay a dividend.

Speculation in Oilseeds

By no stretch of imagination can one understand the reasons which prompted the Forward Markets Commission to permit the resumption of futures trading in groundnuts without ceilings and special margins. Nothing has happened during the last three months to justify the removal of curbs on hedge trading. If anything, the supply and demand position has worsened since the ceilings were imposed last time, that is, in the beginning of November 1961. It is true that the new crop has started moving in fairly large quantities of late, but this is only a seasonal phenomenon. What is important is the fact that the initial expectations of a bumper crop have not materialised. The latest trade estimates of the crop, for instance, place it at no more than 2.5 million tons in kernels, as against 2.8 million tons expected three or four months ago. Spot prices have been ruling higher. Thus, Khandesh quality is now being quoted at about Rs. 47, as against only Rs. 45.50 in the beginning of November. It may be recalled that the speculators had taught the F.M.C. a hard lesson, following the removal of restraints in June last, necessitating their reimposition. The F.M.C., at any rate, seems to be not in a mood to learn from experience.

In saying this, we are not unmindful of the fact that the F.M.C. has imposed some new restrictions on trading in futures. But these are not going to be effective. Some even go so far as to say that they are farcical. Take, for instance, the maximum price rise of Rs. 5.50 per 250 kgs. fixed by the Commission. Even during normal times, it is rarely that the groundnut contract goes up by above Rs. 5.50 a week, or Rs. 22 within a month of four weeks and by about Rs. 49 in two months. In effect, therefore, this restriction means that speculators will have sufficient freedom to rig up prices. It is true that some of the interested parties, including a delegation of the Bombay Oilseeds Exchange, had been pleading for the removal of ceilings and for more freedom for speculation. In doing so, the trade has displayed its shortsighted approach to the problem of prices. Heavy speculation in a commodity like groundnuts will adversely affect the overall consumer prices and the cost of living. In the long run, such a situation is likely to attract more and more of irksome controls and irrational tax burdens. All those who believe in a healthy system of private enterprise within the framework of democracy should, therefore, refrain from activities that will eventually reduce the area of freedom. It is no exaggeration to say that economic conditions in India are by no means favourable to hedge trading in commodities. This is particularly so in the case of groundnuts, the production of which has failed to keep pace with the rise in domestic demand and the export needs. The theoretical justifications for hedge trading no longer hold good. According to competent observers, hedge trading has, of late, been only of negligible importance to genuine industries and export trade. Will the Government arrange for an impartial expert study to find out whether hedge trading as is now being carried on serves the interests of genuine industry or speculators? The result will be quite revealing.

Aid-India Consortium Meeting

There seems to be no genuine cause for disappointment over the outcome of the Aid-India Consortium meeting held at Washington on Tuesday this week. It is true that, contrary to expectations, the meeting did not result in the gap in the foreign budget of the third Plan being filled. It is calculated that there will be a shortfall of about $375 million in the first two years of the third Plan, the gap being the difference between the estimated requirements of $2,600 million and the aid offers aggregating $2,225 million made by the Consortium in June 1961; some had even anticipated that the Consortium would vote the aid required in the remaining three years of the third Plan as well. But it will be wrong to attribute, as is done by some, the outcome of the Washington meeting to political pressures and prejudices against India. For all that the Consortium has done is to postpone a decision till May next. May be, it would like to see what efforts are made by India to raise internal resources in the budget for 1962-63, which is due to be presented some time about the middle of May. Whatever it is, the significant point is that it has unequivocally recognised that "further external assistance will be required in 1962-63 beyond that already committed, if the momentum of expansion is to be maintained." Perhaps the postponement might have even been prompted by the need to give sufficient time to rope in countries other than the existing members of the Consortium (U.S., U.K., Canada, France, W. Germany, Japan, World Bank and International Development Association). The official statement issued by the World Bank says: "At the suggestion of other members of the Consortium, the Bank agreed to continue to seek to interest other nations in participating in the financing of India's development." It is gratifying to learn that Italy, Belgium and Austria have already expressed their desire to participate at the Consortium meeting scheduled to be held in May next.

Viewed thus, there is no justification in the criticism made in a section of the domestic Press—to the effect that India has been discriminated against Pakistan by the Consortium members. This criticism stems from the fact that these countries have unanimously agreed to make additional commitments ($625 million) sufficient to meet the full requirements of $945 million for the second (1961-62) and third (1962-63) years of Pakistan's second Plan. But it must be remembered that, in June 1961, the members had committed aid amounting to just $320 million and that, too, for only one year, namely, 1961-62, whereas, in regard to India, the total aid commitments were as much as $2.225 million (Rs. 1,059 crores), which covered more than 85 per cent of the estimated foreign assistance requirements of $2,600 million for the first two years and two-fifths of the total requirements ($5,500 million) for the whole of the third Plan. It will be recalled that, when this was done, the Press in Pakistan accused the Consortium members of excessive generosity to, and partiality for, India.

Further, one wonders if there is any ground for supposing that there has been deliberate delay on the part of Consortium members in following up the aid offers for the first year, as well as in transforming the offers of aid for the second year into definite commitments. The World Bank statement does admit that some delays had been experienced in the early part of the year 1961-62, but feels confident that the total allocation of funds for agreed purposes during the year will come close to the figure indicated in June 1961, namely, $1,295 million. It may be noted here that the interval between the date of aid authorisations and the date of actual release has been rather long, thereby greatly handicapping the planning and execution of quite a number of projects. But the gap has been due as much to the procedural delays in the release of funds by the aid-giving countries as to the red-tapism and lack of high level efficiency in administration at both Central and State levels in India. In view of this, as also considering the coal shortage and transport bottleneck, it is not surprising that the third Plan industrial projects in the public sector have not gained sufficient momentum yet. Before seeking more liberal foreign assistance, the planners and the powers-that-be will do well to demonstrate to the aid-giving countries the fact that they have chosen right projects, given the right priorities, taken care to avoid wasteful expenditure, and are adopting rational economic policies.

More on I.C.I.'s Bid for Courtaulds

A battle royal is being fought between the I.C.I. and Courtaulds in Britain. It was well and truly joined last week when the Board of Courtaulds came out with a sharp counter-attack on the I.C.I. In the course of a statement issued last week, the Board not only expressed confidence in the present and future earning capacity of Courtaulds but cast grave doubts about I.C.I's ability to maintain its profits. In fact, Mr. C. F. Kearton, a Deputy Chairman of Courtaulds, went to the extent of saying that I.C.I's profits for 1961 would be 25 per cent lower than that for 1960, whereas Courtaulds' profit would be down by only 5 per cent. He asserted that it was his Company and not the I.C.I. that was "the growing and dynamic company." The I.C.I., according to him, far from being able to show higher profits, was entering a period of difficulties and declining profits from which Courtaulds had already emerged.

This confident assessment of the prospects for Courtaulds is based on an impressive array of statistics published as part of the "financial statement on current and future prospects" being mailed to the 180,000 stockholders of Courtaulds. The Board of Courtaulds estimates that the profit of the Company for the year ending 31st March 1962 would be £17.5 million, as against £18.7 million in the previous year and would rise to £23 million in 1962-63 and £28.5 million in 1964-65. The Courtaulds' Board, at its first Press conference held after the news of the I.C.I. take-over bid was out, categorically stated that it was strongly opposed both to merging the man-made fibre divisions of I.C.I. and Courtaulds and to the terms of the I.C.I. bid, namely, four £1 ordinary shares of I.C.I. for five Courtaulds' £1 ordinary shares. It dismissed the I.C.I.'s philosophy as unsuitable for selling man-made fibres and said that Courtaulds' shareholders were being offered a "depreciating currency" because the I.C.I.'s shares were bound to go down in value.

Courtaulds' profit estimates for the future are, however, at variance with the pessimistic note struck by the Chairman earlier and the pruning of the interim dividend. Explaining this discrepancy, Sir Alan Wilson, Chairman-designate of Courtaulds, said that the decision to cut the interim dividend was made when the Company was undergoing rationalisation by closing factories and cutting down unproductive work. It was, therefore, a "political decision," taken in order to give the impression to workers that the shareholders were also feeling the pinch. He, however, frankly admitted that, in the light of subsequent developments, it was "clearly a mistake."

Behind the conflicting claims and attacks and counter-attacks lies a basic difference in approach of the two firms to the problem of man-made fibre industry in Britain. Both recognise that there are defects in the synthetic fibre industry which require to be removed. But they differ as to the best way of doing it. The I.C.I., in order to protect its massive investments in man-made fibre industry, wants to move forward closer to the consumer, gaining the technical advantages, which it believes, are inherent in vertical integration. Courtaulds, on the other hand, would prefer to produce only a part of its basic chemicals and buy a large portion in a competitive market at the cheapest prices.

Will the shareholders of Courtaulds, to whom the I.C.I. has made a direct approach with the share exchange offer, take the assessment of the future prospects and profit projections of their Board at their face value and reject the I.C.I. offer? In the face of conflicting assessment of the prospects for their Company, it is indeed a difficult decision that the shareholders of Courtaulds will have to make. What are the factors that will govern their decision? Our London contemporary, The *Economist*, has ventured to make the following observations on this question:

"In coming to their decision, however, shareholders will not be swayed by nuances in an economic and technical argument about the best method of tackling the problems of the synthetic fibre industry. Their course of action will be determined, first, by the prices that I.C.I. and Courtaulds can command in the stock market and, secondly, by the impression they have gained in the past and during the present struggle of the quality of the *top* management of the two concerns. What will happen to the

EQUITIES RECOVER AT CLOSE

UNDERTONE QUIETLY STEADY

(From Our Own Correspondents)

BOMBAY, 1st *February*

THE share market, after a weak and hesitant start on Thursday, 25th January, picked up strength in Saturday's brief session on account of bear covering and scattered bull support. The recovery gathered momentum on Monday, thanks to speculative support prompted by the meeting of the Investment Committee of the L.I.C. on Wednesday and improved conditions in the money market. There was also scattered investment buying. The upward trend in values was, however, arrested on Tuesday when, following emergence of selling and lack of buyers who were apprehensive about the effects of the eight-planet conjunction, equities suffered a setback in values. The declining trend was accelerated yesterday on the news that the response of the L.I.C. to offers made by brokers was not good. There was again a partial recovery today induced by short-covering and renewed bull support. The undertone of the market at the time of writing was quietly steady.

A feature of trading in the share market during the week was that a few scrips which usually keep on the sidelines caught the fancy of operators. Two such scrips were Minerva Mills and Orissa Cement. Since the quotations for these shares went up (on Tuesday, 30th January) by more than 10 per cent over their previous clearing rates, the bulls were obliged to pay interim margins of Rs. 5.75 on Minerva Mills and 60 nP on Orissa Cement, while bears had to pay margins in respect of Shivrajpur Syndicate (Rs. 2.38 on Saturday) and B.R. Cotton (Rs. 4.50 on Monday), because their prices fell below 10 per cent of the previous clearing rates.

In the steel section, Tata Steels fluctuated between Rs. 140 and Rs. 138.25 and finished at Rs. 139.25 today, as against the last week-end close of Rs. 139.75, a fall of 50 nP. Indian Irons moved narrowly and closed at Rs. 24.50, same as last week. Mukand Irons met with moderate support and gathered 25 nP to Rs. 27.50.

Textiles presented a mixed pattern. Centurys moved down from Rs. 586 to Rs. 576 in the earlier sessions but recovered thereafter to touch a high of Rs. 594 yesterday. Today, they fell back again to Rs. 584.50 before finishing at Rs. 589.50. The net gain over the week was Rs. 3.50. Simplex attracted support and hardened by Rs. 6 to Rs. 167. Khataus put on Rs. 3.75 to Rs. 468.75. Morarjees were better by Rs. 2 at Rs. 392. New Greats advanced by Rs. 3 to Rs. 253, Shreeniwas by Rs. 3.50 to Rs. 285.50 and Svadeshis by Rs. 3 to Rs. 288. Standard Mills, on the other hand, receded by Rs. 9 to Rs. 1,101. Central Indias eased by Rs. 10 to Rs. 149. Tata Mills shed Rs. 3 to Rs. 79. Phœnix and Dawns dropped Rs. 2 each to Rs. 231 and Rs. 151.50, respectively. Gokaks lost Rs. 4 to Rs. 216.50 and Elphinstones Rs. 3 to Rs. 116. Bombay Dyeings receded from Rs. 68.50 last week-end to Rs. 67.90, but rose to finish at Rs. 68.25 today. The net loss over the week was 30 nP.

Among sugar shares, Belapurs encountered selling and declined, in the course of the week, from Rs. 252 to Rs. 246.50; they were quoted lower still at Rs. 241 at one time on Monday, 29th January. Walchandnagars eased from Rs. 59 to Rs. 53.50, Maharashtra Sugars, however, improved by 50 nP to Rs. 182.50. Phaltans were steady at Rs. 115, in spite of the disappointing result for the year ended 30th September 1961.

Cements were irregular. Associated Cements improved fractionally from Rs. 159.50 last week-end to Rs. 160. Orissa Cements rose by 68 nP to Rs. 17.92. But Digvijays came in for selling and declined by Rs. 2.25 to Rs. 186.75.

Shipping shares were subdued. Scindias lost 16 nP to Rs. 13.12 and Great Easterns 8 nP to Rs. 12.72. Among automobile shares, Premier Automobiles fell by Rs. 5 to Rs. 144. Hindustan Motors receded by 32 nP to Rs. 20.20.

In the rayon section, National Rayons declined by Rs. 4 to Rs. 535. Gwalior Rayons eased by a rupee to Rs. 52.50 and Indian Rayons by Re. 1.50 to Rs. 96. South India Viscose, however, attracted support and improved by 50 nP to Rs. 184. Baroda Rayons were quiet at Rs. 56.

Chemicals generally tended to look up. Amar Dyes strengthened by Rs. 5 to Rs. 336.25. Indian Dyestuffs hardened by Rs. 3.75 to Rs. 505. Colour Chems gathered Rs. 5 to Rs. 445. Poly-Chems were better by Re. 1.25 at Rs. 216.25. But synthetics eased by Rs. 2 to Rs. 219. Alembics shed Re. 1.25 to Rs. 241.25. Tata Chemicals lost 8 nP to Rs. 19.60.

Among engineering shares, Telcos were subjected to selling and declined from Rs. 352.50 last week-end to Rs. 349.50 today, a net loss of Rs. 3 over the week. Larsen and Toubros softened by 25 nP to Rs. 40. Asian Cables eased by Re. 1 to Rs. 101.50. Brady Engineerings lost a like amount to Rs. 94. Kamanis decreased by 88 nP to Rs. 16.24. T. Maneklals, however, spurted by Rs. 5 to Rs. 505. New Standard Engineerings put on Rs. 2 to Rs. 212. Alcock Ashdowns were steady at Rs. 329 and Cooper Engineerings at Rs. 182.80.

Among miscellaneous industrials, Bombay Burmahs encountered selling and declined from Rs. 642 to Rs. 633.50 today, before recovering to finish at Rs. 637.50. The net decline over the week was Rs. 4.50. Voltas receded by 50 nP to Rs. 295. West Coast Papers eased by Rs. 2 to Rs. 174. Wimcos shed Rs. 3.50 to Rs. 306.50. Shivrajpur Syndicate lost Re. 1 over the week to Rs. 41. Hindustan Levers, on the other hand, attracted support and hardened by Re. 1 to Rs. 58. Ceat Tyres firmed up by Rs. 2 to Rs. 202.50. Chemcoats gathered a rupee to Rs. 126. Killicks improved by 50 nP to Rs. 90.50. Premier Tyres were steady at Rs. 146.

* * * *

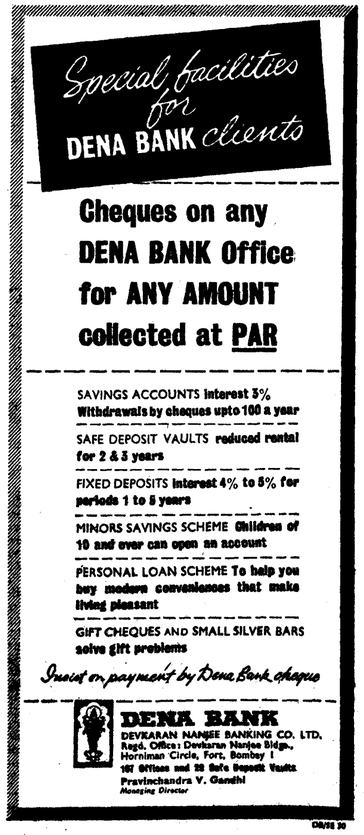
Calcutta Stock Exchange

CALCUTTA, 31*st January*

Apprehensions that Mr. T. T. Krishnamachari would if he were to become the next Finance Minister introduce statutory price control which at a time when industrial costs were mounting would reduce the return to investors affected the sentiment of operators on the Stock Exchange during the week under review. Anxiety about foreign aid prospects also restrained activity, as on the continuation of substantial aid depended imports of the urgently-needed raw materials and spares for industries. The turning down by Mr. Nehru of Mr. Kennedy's offer of mediation in regard to Kashmir only strengthened the bears. Even the report that the Aid-India Club members were not inclined to increase the aid to India led to increased selling offers. For it was realised that the success of the third Plan was closely linked with increased flow of machinery and raw materials from abroad. The deepening crisis of wagon shortage for coal movement has led to big industrial consumers making their own arrangements to bring coal by the costlier motor transport, thereby raising cost of production. The decline in the volume of business during the week should be attributed to lack of sufficient funds. Large funds are lying blocked in the several recent new issues, and the prospects of more bank credit despite relaxation in the margin of advances do not look bright.

Coals were featureless, as it is now becoming clear that there is no ready solution for the wagon shortage, which, coupled with shortage of explosives, is hampering production. Earlier in the week, however, Seebpores at Rs. 48 recorded the impressive gain of Rs. 2.25 on interested buying. Raneegunges were quiet at Rs. 15.12, while East Indians were fractionally better at Rs. 33.

Although quietness marked activity in jutes, there were a few features on interested buying. Influential support led Dalhousies to move up to Rs. 121 from Rs. 105 previously. Fort Glosters lost Rs. 10 at Rs. 365. Birlas fluctuated between Rs. 30.12 and Rs. 30.87. Nuddeas at Rs. 65.35 put on nearly two points. Kamarhattis were forced down by Rs. 2 to Rs. 141, but Ganges attracted support to rise from Rs. 12.56 to Rs. 12.94. Alliances at Rs. 93 added 50 nP, as did Kanknarahs at Rs. 77.50.



Engineering shares were dull, thus reflecting the coal crisis. The news that the Durgapur merchant mill, which was recently inaugurated, had to stagger production due to want of ore only added to the uncertainty created by inadequate transport. Indian Irons opened at Rs. 24.50 and, after being higher at Rs. 24.84, closed at Rs. 24.70. Texmacos, after declining to Rs. 20, recovered to Rs. 20.15. At Rs. 146, Indian Standard Wagons recorded a further gain of Rs. 10, following anticipations of more satisfactory results. The steadiness of Britannia Engineerings around Rs. 13.44 followed the rights issue. Profit-taking reduced last week's gain in Guest Keen Williams to Rs. 39.87.

Sugars eased following the uncertainty of U.S. purchases. Ramnugercanes gave way from Rs. 29.50 to Rs. 28.19 and Dyer Meakins from Rs. 42.50 to Rs. 41.00.

Teas were better following better auction results. Hantaparas were higher by Rs. 5 at Rs. 130. Huldibaris at Rs. 29.94 recording a fractional gain. Grobs were lifted at Rs. 10, as against Rs. 9.50 previously. Methonis were unchanged but steady at Rs. 18.81.

Several features were recorded in miscellaneous industrials. At Rs. 155, Rallis, for which the taxable dividend has been raised from 4 to 8½ per cent, maintained the recent improvement. Kesoram Industries gradually improved from Rs. 31.44 to Rs. 33.37. Associated Batteries, for which the taxable dividend has been declared at 15 per cent, as against 25 per cent and 40 per cent in the previous two years, realised Rs. 34.12, as against Rs. 34.62 earlier. Dunlop Rubbers recovered from Rs. 39.94 to Rs. 40.19, while National Pipes at Rs. 29.25 recorded a fractional loss. Philips Indias rose by 12 nP at Rs. 36.62. Martin Burns were unchanged at Rs. 31.62. Electric Constructions being fractionally higher at Rs. 13.44. Metal Boxes eased from Rs. 58.25 to Rs. 57.75. Aluminium Corporations hardened from Rs. 17.19 to Rs. 17.44.

Madras Stock Exchange

MADRAS, 31*st January*

Barring sugars and coffees which continued to rule depressed, the Stock Exchange depicted a steady trend during the week under review. Business actually put through was, of course, restricted. Three new scrips, namely, South India Viscose, Dalmia Cements and Mettur Chemicals, were included in the forward list, with effect from Monday the 29th inst. There was some improvement in textiles on professional interest. Teas were better on encouraging advices from auction centres. Rubbers were maintained in sympathy. Miscellaneous industrials elicited good enquiries.

Among textiles, Tirmurtis were marked up by Rs. 6 to Rs. 143. Coimbatore Cottons and Dhanalakshmis rose by Rs. 2 each to Rs. 220 and Rs. 260, respectively. Coimbatore Spinnings hardened by a rupee to Rs. 72. Radhakrishnas gathered 25 nP to Rs. 39. Madurais fell initially from Rs. 42.35 to Rs. 42.15, but rallied subsequently to Rs. 42.50. South India Viscose, however, fell by Rs. 2 to Rs. 185. Lakshmis declined by 75 nP to Rs. 164.75. Travancore Rayons lost 38 nP to Rs. 43.12.

In the tea group, Blue Mountains put on 18 nP to Rs. 2.61. Periakaramalais declined by 3 nP to Rs. 3.33, after fluctuating between Rs. 3.65 and Rs. 3.23. Chembras picked up 2 nP to Rs. 3.37. United Nilgiris were fully maintained at Rs. 22.50, following the announcement of an interim dividend of 7½ per cent for the year ending March 1962. Highlands were steady at Rs. 13.75, as also Nonsuchs at Rs. 23.62 and Parksides at Rs. 25. Woodcotes were quoted at Re. 1.65. The Company is proposed to be wound up as members' voluntary liquidation. Among coffees, Consolidateds and Coffee Lands fell by 40 nP each, the former to Rs. 16.50 and the latter to Rs. 14.75. Cowcoodys shed 5 nP to Rs. 3.80. In the rubber section, T.R. and Ts improved by 12 nP to Rs. 10.62. Midlands were held firm at Rs. 10.80 and Travancores at Rs. 13.12. But Cochin Malabars lost 15 nP to Rs. 7.23.

Among miscellaneous industrials, Tube Investments rose by Rs. 2 to Rs. 282. Aluminium Industries were higher by 10 nP at Rs. 23.50. Among chemicals, F.A.C.Ts improved by 5 nP to Rs. 8.10. Mettur Chemicals strengthened by a like amount to Rs. 15. In the cement group, Dalmias hardened by 10 nP to Rs. 12.25. India Cements were quoted at Rs. 5.75 *ex-right*, as against Rs. 6.12 *cum-right* last week-end. But Western India Plywoods fell by Rs. 2 to Rs. 218.

INDIA CEMENTS LTD.

The Controller of Capital Issues has given consent to India Cements Ltd. for the issue of capital of Rs. 1,25,55,250. The Directors have decided to increase the capital by issue of 2,500,000 equity shares of Rs. 5 each, out of the unissued portion of the authorised capital of the Company and 11,050 equity shares of Rs. 5 each forfeited, and lost in conversion under the Displaced Persons (Debts Adjustment) Act of 1951, vested in the Company, making in all 2,511,050 equity shares of Rs. 5 each.

The date of the offer will be 28th February 1962. The shares will be offered for subscription at par for cash, under Section 81 of the Companies Act, to all holders of the equity shares in the proportion of 5 new equity shares of Rs. 5 each for every 9 such shares held by them, as on the 28th inst. Only Rs. 2.50 nP per share is payable on application, and the balance as and when called. The last date for acceptance of applications, along with the remittance, will be 12th April 1962.

NEWS IN BRIEF

COAL deposits, estimated at 1,000 million tons, are reported to have been found in the Mirzapur district of Uttar Pradesh.

One out of every eight people in Bombay has seen Circarama, the unique cinema spectacle which takes the viewer on a 22-minute colour film tour of the United States. The number of people who have attended exceeded half million.

A Rs. 2-crore project has been drawn up for the modernisation of Mormugao harbour in Goa. The project envisages the improvement of wharfs and mechanisation of some berths handling iron ore. The annual export of iron ore from Goa has been to the extent of 6.5 million tons, with Japan accounting for about 60 per cent.

The Tariff Commission has taken up for investigation the question of continuing protection to the plastics (phenol formaldehyde moulding powder) industry beyond the current year. In this connection, the Commission has prepared questionnaires for producers, importers and consumers.

Two firms engaged in the manufacture of marine diesel engines, one from West Germany and the other from Denmark, have offered to collaborate with the Government in the manufacture of these engines in India in the public sector. Both parties have agreed to find the necessary foreign exchange for plant and machinery by way of long-term loans.

The Umrer and Kamptee areas of the Nagpur district, which were prospected by the Maharashtra State Directorate of Geology and Mining, have revealed deposits of coal to the extent of 370 million tons—300 million tons in Kamptee and 70 million tons in Umrer—the coal being partly A grade and partly B grade.

The foundation-stone of an electrical factory at Chandigarh was laid on the 1st inst. by Mr. V. K. Krishna Menon, Defence Minister. The factory will manufacture specialised cables and other equipments required by the armed forces. Initially, the factory will have about 200 workers, but it will be expanded further, providing employment for 800 persons.

The Government of India has decided not to license any further capacity for soda ash and sulphuric acid, as their licensed capacity has already touched the third Plan target. It has also decided not to import any more light soda ash, in which the country has become self-sufficient. Import of heavy soda ash of 72,000 tons per annum by the glass industry will, however, be permitted for some time.

The Government of India has reconstituted the Copyright Board, with Mr. P. Satyanarayana Rao, Chairman, Andhra Pradesh Law Commission, as the Chairman. The other two members of the Board are Mr. B. N. Lokur, Secretary, Union Ministry of Law, and Mr. A. K. Ghosh, Joint Secretary, Union Ministry of Scientific Research and Cultural Affairs. The Chairman and members of the Board will hold office for a period of three years.

The Railway Board has sanctioned the construction of a duplicate broad-gauge line between Lakheri and Bayana on the Nagda-Mathura section of the Bombay-Delhi trunk route on the Western Railway. This duplicate line will be 116.75 miles in length. The project, involving 80 million cubic feet of earthwork and extension of 260 bridges, is estimated to cost about Rs. 10 crores. The work is being taken in hand immediately and is expected to be completed in about three years' time.

The foundation-stone of India's first zinc smelter, being established by the Metal Corporation of India at Udaipur in Rajasthan, was laid by Mr. Manubhai Shah, Union Minister for Industry, last week. The smelter, with its electrolytic zinc refinery, will have a capacity of 18,000 tons of metal annually. It will also turn out about 80 tons of cadmium, besides a large quantity of sulphuric acid and superphosphate as by-products. It is learnt that the Government of India is considering the possibility of setting up another bigger zinc smelter and refinery, with a capacity of 50,000 tons per annum, using both indigenous and imported ores. The site of the new project, estimated to cost Rs. 15 crores, is yet to be decided.

The new P.A.S. (para-Amino Salicylic acid) plant, put up by Pfizer Private Ltd. at Darukhana, Bombay, was declared open by Mr. Homi J. H. Taleyarkhan, Minister for Public Health, Small Savings and Tourism, Government of Maharashtra, last week. The new plant has a capacity to produce 60 tons of P.A.S. and its salts annually from raw materials such as meta-aminophenol and potassium carbonate. The P.A.S. and its salts, Isonlazid and streptomycin, are used for effective curative treatment of tuberculosis. It may be recalled that Chas Pfizer & Company acquired Dumex in India (as also in Pakistan and Ceylon) in 1958. Besides the factory in Bombay, Pfizer has another manufacturing plant located at Chandigarh in the Punjab which manufactures basically oxytetracycline and tetracycline.

The workers of the Rourkela Steel Plant received their first bonus for the month of December 1961 along with their normal monthly wages this month under the Hindustan Steel Bonus Scheme. The scheme came into force on 1st December 1961. The bonus has been received by all the units in the production, maintenance and service groups. The coke oven earned the highest percentage of bonus—28 per cent of the basic wage for the production personnel and 25 per cent for the maintenance people. In the steel melting shop the production and maintenance groups got bonus at the rate of 14 per cent and 13 per cent, respectively, of their basic wage. The production personnel of the tar distillation plant and the blast furnaces earned a bonus of seven per cent and the maintenance and service unit of six per cent.

The Directorate of Marketing and Inspection of the Union Ministry of Food and Agriculture, which has its headquarters at Nagpur, has opened regional offices in Delhi, Bombay, Calcutta and Madras, for maintaining closer liaison with State Marketing Departments in the northern, western, eastern and southern regions, respectively. Important commodities graded under *Agmark* for consumption within the country are ghee, edible oils, creamery butter, eggs, rice *atta*, cotton, *gur* and *jaggery*. The commodities graded primarily for export are tobacco, sunn hemp, essential oils, wool and bristles. While grading is voluntary in the case of commodities consumed in the country, it is compulsory for those meant for export. The Directorate of Marketing and Inspection carries out regular surveys of marketing of agricultural produce on an all-India basis and builds up information to facilitate development work. It tenders advice on all aspects of marketing to various Ministries of the Government of India, the State Government, the Indian Council of Agricultural Research and Commodity Committees in the Ministry of Food and Agriculture. The Directorate also keeps liaison with international organisations, such as F.A.O. and E.C.A.F.E.

From Abroad

The U.S. Government has announced three loans aggregating $79.6 million for financing Pakistan's Five-year Plan. This is part of the $945-million long-term credit offered by the Aid-Pakistan Club and the World Bank last week.

British exports in 1961 aggregated £3,682 million (valued f.o.b.), imports £4,399 million (valued c.i.f.), and re-exports to £158 million (valued f.o.b.). While exports were 3½ per cent higher than in 1960, imports were lower by 3½ per cent.

Pakistan and Yugoslavia have signed a barter deal, under which the latter will construct 160 tube-wells to fight waterlogging and salinity in West Pakistan at a total cost of Rs. 100 lakhs. The amount involved will be paid back by exporting Pakistan jute to Yugoslavia.

Britain's capital aid to Colombo Plan countries since 1950 has aggregated £175 million, exclusive of the outstanding commitments of a further £82 million. Of this, India accounted for over £120 million, almost the whole of this assistance being in the form of credits for the second and third Plans.

Exports from Sweden during the year 1961, as compared with 1960, were higher by 7 per cent at Kr. 14,170 million, while imports rose by just one per cent to Kr. 15,117 million. Consequently, the adverse balance of trade declined markedly from Kr. 1,733 million in 1960 to Kr. 947 million in 1961.

Japan has agreed to participate as a member of the Development Centre, a new aid organisation proposed to be created by the Organisation for European Economic Co-operation and Development (O.E.C.D.). The move is likely to pave the way for Japan's entry into the O.E.C.D., which consists of the U.S. and Canada besides the former O.E.C.C. countries.

Pan American Airways has increased direct jet service between California and Tokyo to three flights a week. Jet Clippers leave Los Angeles and San Francisco on Tuesdays, Thursdays and Saturdays and Mondays. Direct flights from Tokyo are made non-stop in nine hours and 35 minutes. In addition to three-times-a-week direct service, the Company has daily jet flights between California and Tokyo via Honolulu.

Total inland revenue duties in Britain reached the record level of £3,209 million during the financial year 1960-61, as compared with £2,984 million in the previous year. The principal inland revenue duties in force during the year under review were income-tax, surtax, profits-tax, estate duty, and stamp duties. Net receipt of income-tax rose again to touch a new record of £2,429 million. There was also a record net receipt of surtax at £190.

West Germany took an increasing part in the progressive integration of the world's share markets last year. The net value of purchases of West German shares by foreigners was DM 949 million in the first three quarters of 1961, as compared with DM 693 million in the whole of 1960 and only DM 209 million in the whole of 1958. West German purchases of foreign shares amounted to the net value of DM 169 million, as against DM 732 million in the whole of 1960.

West German aid to the less developed countries amounted to DM 18,300 million between 1950 and 1961. It comprised DM 9,700 million raised from public funds and DM 8,600 million which came from private sources. Almost DM 175 million were spent for the training of students and workers from developing countries between 1956 and 1960. The major part of this amount—DM 144 million—was used for training activities in the developing countries themselves.

Industrial wages in West Germany rose more than in any other country throughout the world between mid-1960 and mid-1961, the actual rise being 11.8 per cent. Next came Sweden with 9.4 per cent, France with 8.1 per cent, Finland with 8 per cent, Britain with about 7 per cent and the Netherlands with 6 per cent. A survey of the Federal Economics Ministry shows that the overall rise of wages and salaries in West Germany between 1960 and 1961 also topped similar increases in other countries throughout the world. Wages and salaries in the country went up by an average of 10.5 per cent, against 9 per cent in Sweden, between 4 and 6 per cent in most countries of Western Europe, and 3 per cent in the U.S.

An Aberdeen (Scotland) factory, Aerated Foods Ltd., is now exporting an "instant tea" powder which is claimed to make tea comparable with the best natural brews. The powder is already in use in Britain, and exports now go to Canada, Denmark, Finland, the Lebanon, the Netherlands, Norway, Switzerland, Syria, and the U.S. Before processing, a perfect brew is made from a blend of Assam and Ceylon teas. The brew is then frozen by accelerated freeze-drying equipment. Careful control of temperatures prevents the loss of any of the aromatic oils or constituent parts of the tea.

PERSONAL

MR. Nathanael Vining Davis, President of Aluminium Limited of Canada, has arrived in India on a short visit.

Mr. Madanmohan R. Ruia and Mr. Jehangir P. Patel have been elected President and Vice-President, respectively, of the Cotton Buyers' Association, Bombay, for the year 1962.

Mr. Sarabhai Kashiparekh has been elected President of the Gujarat Chamber of Commerce for the curent year. Mr. Chandrakant Jagabhaiwala will be the Vice-President.

Mr. John Christie of the Commonwealth Development Finance Company Ltd. arrived in New Delhi on Monday this week to discuss with the Government of India the question of financing private sector projects.

Mr. M. A. Fiennes, Chairman and Managing Director of Davy-Ashmore Ltd., has arrived in India on a three-week tour mainly to visit the country's main steel plants.

Prof. C. N. Vakil, until recently Director of the U.N.E.S.C.O. Research Centre in India and a former Director of the School of Economics of the Bombay University, has been appointed a member of the Central Board of Directors of the Reserve Bank.

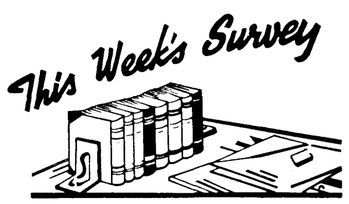
Miss E. M. Allden, Managing Director of the Plus Gas Company Ltd., a British firm of anti-corrosion specialists, is scheduled to arrive at New Delhi on the 21st inst. to explore the prospects for establishing a manufacturing company in India. Her visit to India is part of a nine-week tour of the Commonwealth and other Far East countries.

The following have been elected members of the Committee of the Indian Merchants' Chamber, for the year 1962: Messrs Babulal Bubna, Charandas V. Mariwala, Dhirubhai G. Kapadia, D. M. Desai, Col. J. D. Kothawala, J. V. Bhagat, Madanmohan R. Ruia, Madhusudan M. Amersey, N. C. Javeri, Soonderdas Morarjee, Vasant R. Dalal and Viren J. Shah.

Mr. John J. Jewitt (Sr.), Managing Director of Thos. R. Ellin (Footprint Works) Ltd., of Sheffield, will visit India shortly in the course of an extensive tour. He will be in New Delhi from 14th to 18th February and, on his return from the Far East, in Bombay from 11th to 16th March. Mr. Jewitt's visit is in connection with the export promotion of his firm's products, which include pipe wrenches, hacksaw frames, punches and chisels.

Mr. F. N. Lloyd, Chairman of F. H. Lloyd and Co. Ltd., of Wednesbury, Staffordshire, accompanied by three members of his firm, arrived in New Delhi last week. F. H. Lloyd and Co. are the consultants to the Indian Railway Board for the steel foundry being set up at Chittaranjan, West Bengal. They are also helping in the training of Indian personnel to manage and supervise the locomotive manufacture at Chittaranjan.

Nineteen industrialists have been elected members of the Committee of the Millowners' Association, Bombay, for 1962. They are: Messrs. Krishnaraj M. D. Thackersey, Neville N. Wadia, G. D. Somani, M.P., Ramnath A. Podar, Radhakrishna Ramnarain Ruia, M. L. Tapuriah, S. P. Jain, Arvind N. Mafatlal, Naval H. Tata, Babulal Bubna, F. H. Kemple, C. H. Campbell, Chandrakant Mulraj Khatau, J. J. Ashar, A. N. Haksar, Pratapsinh Mathuradas, Gopikisan Piramal, N. D. Sirur and Kudilal G. Seksaria.



TROMBAY POWER EXPANSION

THE Tata Hydro-Electric Power Supply Company, Ltd. brought into commercial operation, in June 1960, the third 62.5 M.W. unit at its Trombay thermal station, thereby completing its planned programme of system capacity expansion. Thanks to this expansion, the Trombay station's total power generation rose to 1,028 million units in 1960-61, as compared with 720 million units in the previous year. But it was soon realised that, in spite of this addition to the generating capacity of the Tata system and the anticipated supply to it of Koyna power to the extent of 115 M.W. in progressive stages by December 1962, there might arise a critical power shortage in the Bombay-Poona region by 1964 or 1965, unless new generating sources were created betimes. Thus, it came about that Tatas reviewed the projected capacity of the Tata-Koyna-Railway grid *vis-a-vis* demand and energy forecasts right upto 1975 and sent a report to the Maharashtra Government in October 1960.

The report foresaw an energy shortage in 1965 and a capacity shortage a few years later. Tatas, therefore, came forward with a proposal to install a fourth unit, with a rated capacity of 125 M.W., at the Trombay station. The State Government, too, reacted favourably to the proposal, in refreshing contrast to the obstructionist tactics adopted in the early fifties by the then Bombay Government when Dr. Jivraj Mehta was the Minister-in-charge of this industry, and that was as good as a green signal to Tatas to go ahead with the preliminaries. With the State Government's support thus assured, Tatas began exploring the possibility of obtaining a loan from the U.S. Development Loan Fund for the foreign exchange component, constituting some 70 per cent of the estimated total cost of Rs. 12 crores of the proposed fourth unit. Presumably this D.L.F. assistance is now assured, and that probably explains the Maharashtra Government's formal announcement, on the 29th idem, that it has permitted the Tata Hydro-Electric Company to put up a fourth thermal unit of 125-137.5 M.W. capacity at the Trombay station. The State Government deserves to be congratulated on its prompt move to meet the anticipated power shortage in the Bombay-Poona region—a shortage which is already being caused to some extent by the delay in the availability of Koyna power. If everything goes well, this fourth unit is likely to be commissioned by the end of 1964, bringing the total installed capacity of the Trombay station to 325 M.W. There are already doubts in knowledgeable circles whether even this capacity will be sufficient to meet the power needs of the fast developing Bombay-Poona area.

But, if things are to go well with the Tatas project, it is not only the prompt availability of the D.L.F. loan that will matter but also the extent to which equity shareholders are enthused in the expansion project. As the Tata Group of electric companies is bound by law (the Electricity Supply Act) to a return on the capital base of 6 per cent (Reserve Bank rate *plus* 2 per cent), the most relevant question is whether and when that law is going to be amended. From what the Union Minister for Irrigation and Power said at the recent annual meeting of the Federation of Electricity Undertakings of India, it may be inferred that this will be done after the General Elections which are not far off. It is to be hoped that his assurance will not turn out to be a case of many a slip between the cup and the lip. Any such amendment, incidentally, will facilitate the implementation of the expansion projects which the other licensees, besides the Tata group, have in mind.

BLUE-BOOK ON CAPITAL GOODS

Mr. Manubhai Shah, Union Minister for Industry, told the seventh meeting, held at New Delhi last week, of the Standing Committee of the Central Advisory Council of Industries that the requirements of capital goods were substantially more than the foreign exchange resources available. And he added that the Government could not also expedite approvals for the import of equipment and machinery at the expense of supplies of raw materials and components needed to maintain production in the existing units. But he admitted, at the same time, that part of the delay in the disposal of applications for import of capital goods was purely procedural. It is this procedural delay that is now sought to be remedied by the proposed Blue-book on Import Policy, as distinct from the usual Red-book published every six months to indicate, besides the overall import policy, the extent of import that could be allowed in a particular half-year period to the established importers in respect of various groups of products. As the Red-book does not give an entrepreneur a clear idea as to what specifically are being manufactured in the country or could be got manufactured with some effort, not unoften he finds, after he has made preliminary arrangements with his foreign collaborator for the supply of plant and machinery, that the Development Wing of the Commerce and Industry Ministry asks him to delete certain items of machinery, which are already being manufactured or could be got manufactured indigenously, before it can give him an import licence. The entrepreneur, who has by then spent much time, finds that he has to spend some more time in the process of "correspondence and negotiations" with indigenous firms for settling important matters like price, delivery and performance guarantee pertaining to machinery items. All this means "delay" in early implementation of his project, and the foreign collaborator-*cum*-supplier also adopts, at times, an unhelpful attitude because he knows that a part of his order will be supplied by others.

But all this delay, as also the inconvenience to the entrepreneur and his foreign collaborator, can be avoided, if, at the very initial stage, the entrepreneur is in a position to know the Government's import policy in respect of those items of plant, machinery and equipment which are being manufactured in fairly good quantities or could be got easily manufactured with a bit of effort within the country. It is this relevant information that will be contained in the proposed Blue-book on Import Policy. This book, besides indicating the import policy, will contain the following features:

(i) Names of specific plants, machinery and equipments which are regularly manufactured in the country on a commercial scale.

(ii) Such plants, machinery and equipments or portions thereof as could be got manufactured indigenously against drawings supplied by the foreign collaborator.

(iii) Details regarding the range of indigenous production of various items of machinery and also the names and addresses of manufacturers for each of these.

As the country proceeds with its industrialisation, it will, of course, be necessary to revise the Blue-book from time to time in the light of experience and progress. There is no doubt that the Government's proposal to bring out this Blue-book for the guidance of the entrepreneur is very well conceived. The Development Wing, too, is learning from experience, and its present effort to expedite licensing procedures in the interests of more expeditious execution of industrial projects in the private sector is certainly commendable. It only needs to be added that the Blue-book must fulfil the promise of being fully informative and authoritative.

AUTOMATIC LOOMS

The conditions governing the licensing of 10,000 automatic looms which the Central Government decided to permit, in December last, as part of the programme of expanding the weaving capacity of the cotton mill industry during the third Plan period have just been announced. The conditions are as follows:

1. Licences will be granted only to those parties who have a matching spinning capacity of 25,000 spindles. The capacity may be in the form of surplus spinning capacity in the existing spinning or composite mill, or, alternatively, an equivalent capacity should have been recommended by a State Government in favour of the applicant from out of the regional quota of the State concerned.

2. The maximum number of automatic looms that will be allotted to any one applicant is fixed at 500.

3. Seventy-five per cent of the cloth produced on automatic looms shall be compulsorily exported for a period of five years; the export quota will be fixed on this basis.

4. In case of shortfall in export performance, the licensee shall be under an obligation to pay a penalty calculated at the rate of 10 nP per yard (0.9144 metre) and to execute a bond, supported by a bank guarantee, for the amount of the penalty calculated for five years.

5. Applications for automatic looms should be addressed to the Union Ministry of Commerce and Industry, New Delhi, simultaneously endorsing a copy of the applications to the Director of Industries of the State Government concerned and the Textile Commissioner, Bombay.

The aforesaid conditions are as stringent and onerous as those indicated when the Government first announced its decision in December 1961. The only modification is the time limit of five years put on compulsory exports. This is in response to the plea made by the Indian Cotton Mills Federation. But the Government does not seem to be inclined to accept the suggestion of the Federation pertaining to a provision for set on and set off. The Federation had stated that, in one year the mills might export more and in another less, so that the total obligation calculated at 75 per cent of each year's production was fulfilled in the span of five years, or the total obligation of 50 per cent of each year's production was fulfilled in a span of eight years. Further, the licensing procedure is so framed that practically no existing spinning or weaving mill will be able to avail itself of the allotment of automatic looms. Inquiries made in mill circles reveal that only new mills which have obtained, or will obtain, allocation of spindles from out of the quotas (aggregating two million) of the various States will be entitled to secure licences for installing automatic looms.

Would it not have been better, if some of the mills which are working efficiently, which are situated in ports like Bombay, Madras and Calcutta, and which have been taking keen interest in export business had been allotted as many automatic looms as possible? Would it also not have been sensible, if the Government had not pinned down mills to the condition of exporting three-fourths of the production of automatic looms, especially in the context of the growing competition in world textile markets? Actually, as the main aim of the Government in giving permission to install these automatic looms is to promote exports, it should have confined their allocation only to mills in port towns and preferably to existing mills rather than new ones. Setting up new mills will take much longer than expansion of existing mills or replacement of ordinary powerlooms with automatic looms. Mills in port towns, it is common knowledge, are in a better position to compete in world markets than mills in the interior. It is surprising that the Government is still not prepared to face the facts squarely. Enough damage has already been done and, unless the Government retraces its steps and follows a realistic textile policy, conditions in the cotton mill industry will continue to be none too happy and may even deteriorate.

COCOA PROBLEMS

Although cocoa production in India is very negligible and not on a commercial scale, the developments that occur in the spheres of production and trade elsewhere are not without significance to this country, for it imports every year a million pounds of cocoa and cocoa products valued at about Rs. 15 lakhs. And the quantity of imports may be expected to increase in the coming years as a result of the growing popularity of cocoa as a beverage and the expanding consumption of products prepared out of cocoa. In view of this possibility, it is, indeed, heartening to learn that world cocoa prices have drifted downward lately. The currently ruling rate in the London market is 167½s. per 50 kilos, as against 187½s. a month ago and the highest of 217½s. touched towards the close of November 1961. The downward trend is likely to persist in the coming months also, notwithstanding the fall in world cocoa bean output (from 2,628 million lbs. in 1960-61 to 2,537 million lbs. in 1961-62), on the one hand, and the continuously rising consumption (from 2,011 million lbs. in 1960 to 2,464 million lbs. in 1961), on the other. For stocks are heavy, with all the consuming countries said to be still holding vast quantities of last year's crop in store.

The falling trend of cocoa prices has, naturally enough, caused much concern among the principal producing countries, especially Ghana, Nigeria and Brazil, which together account for two-thirds of the aggregate world output. The estimate of the 1961-62 cocoa crop in Ghana alone is as much as 875 million lbs., the figures for Nigeria and Brazil being 410 million lbs. and 390 million lbs., respectively. One of the proposals that is now being actively considered once again pertains to what is known as a producers' price stabilisation scheme for cocoa. A delegation from Brazil, led by Sr. Taveira, head of Cacex, the foreign trade department of the Bank of Brazil, went specially to Accra last week to discuss plans for such a scheme with the representatives of the Ghana Government. The outcome of these discussions, however, is not yet known.

Most manufacturers in the leading consuming countries are known to be opposed to the proposed price stabilisation scheme, but it has received varying degrees of support from the Governments of Britain, the U.S. and the Common Market countries. It may be noted here that the C.M. countries form the world's largest market for cocoa beans, taking about 34 per cent of world imports in recent years, the total quantity actually imported by them during the year 1960 being 291,300 tons. Imports into the U.S. and the U.K. were 245,700 tons and 97,500 tons, respectively. Meanwhile, the draft agreement to stabilise cocoa prices, prepared by the F.A.O. Cocoa Study Group, and the new proposals advanced during the meeting of the Group's Executive Committee held at Rome in October last are currently under the consideration of the Governments of both producing and importing countries. The viewpoints of the Governments on these proposals as well as on the "Model Ordinance" prepared by the Committee will be examined at the plenary session of the Group scheduled to be held in May 1962.

PRODUCTIVITY DRIVE IN BRITAIN

In a bid to boost productivity in industry, the British Productivity Council is planning to launch a nation-wide campaign to focus attention on the need for higher productivity and to spotlight every possible way of increasing productivity and reducing costs. The B.P.C., like the National Productivity Council of India, is an independent body, on which leading employers' organisations and trade unions are represented, which is devoted to the promotion of interest in methods of raising productivity.

The B.P.C. has announced that 1962 will be observed as a National Productivity Year in Britain. The observance will start in November next for which preparations will be made from right now. The objects of the National Productivity Year are: (1) Stimulation of more active interest in better methods of production and their proper use in industry and the community as a whole. (2) The promotion of discussion, research and co-ordination in industry. (3) Supply of industry with a clear picture of the scope and value of services already in existence to help them. (4) Encouragement and promotion of as concentrated and purposeful a contribution as possible towards the solution of the problems which confront industry. (5) Establishment of a system of regular discussions which will allow such co-operative action, whenever desirable, to continue after the National Productivity Year comes to a close.

Different types of organisations such as professional bodies, trade unions, research organisations, universities, technical colleges, etc., are being invited to participate in the Productivity Year. As part of the programme, arrangements will be made for inter-firm visits and trips abroad to study methods of productivity improvement in other countries.

It is significant that this year's Chairman of the British Productivity Council, which is organising the campaign, is Mr. Harry Douglass, President of the Economic Committee of the Trades Union Congress, the national centre of the British trade union movement. According to Mr. Douglass, the current trend towards levelling off of productivity in British industry is disturbing to a degree. It requires to be reversed if for no other reason than at least for securing higher wages for workers. His comment on the need for increased productivity, though it reflects no higher purpose than the interest of workers, brings out the basic correlation between productivity and incomes. Charteristically, he adds:

"I want that process (the levelling off) to be reversed. If it is not reversed. I cannot get high wages for my people, shareholders cannot get decent dividends, and the employers will have a much more difficult job.

"We may have a quarrel among ourselves afterwards as to how to share out the results of the productivity, but that has nothing to do with this Council. We are brought into close harmony when we talk together on the subject.

"I believe that dividends and wages do move together, whether you like it or not, and I would not be unduly disturbed, if the people who supply the money and brains were to get something out of it."

With the increase in *per capita* productivity during 1962 officially estimated at only 2½ per cent, it is clear that wage increases, if they are to avoid acceleration of the inflationary pressures already strong in the economy, should not exceed 2½ per cent. The Chancellor has repeatedly stressed the need for limiting wage increases to the rate of increase in productivity. The only economically sound way of getting higher wages is, therefore, by raising productivity. The interest which the British trade union leaders take in the drive for increased productivity is worthy of emulation by labour leaders in India, too.

U.S. TRADE POLICY

Far-reaching and potentially radical changes in American commercial policy are envisaged in the Trade Expansion Bill, submitted to the U.S. Congress by President Kennedy last week. The Bill, which seeks to empower the President to reduce or eliminate import duties on a wide range of goods, is expected to supersede the Reciprocal Trade Agreement Act (R.T.A.A.) which is due to expire in June next. The R.T.A.A., which was initially passed in 1934, has entrusted Presidents with powers to bargain with foreign countries for lower tariffs. It no doubt has helped reduce U.S. tariffs by about 60 per cent. But the array of "peril points" and "escape clauses" under the Act has, of late, whittled down its effectiveness as an instrument of effective policy and, instead, has served to buttress protagonists of tariff protection. President Kennedy and his "new frontiers men" have realised that the R.T.A.A. has outgrown its utility and is insufficient to meet the challenges of the sixties.

One of the major challenges confronting the U.S. on the trade front is the European Common Market. It is true that the U.S. itself extended enthusiastic support to the formation of the Common Market in Europe, induced, at least to some extent, by the political implications of a united Europe as a great bulwark against the spectre of international communism. In fact, but for this support, the Six would not have probably dared to go ahead with the scheme. The Common Market, at any rate, has been growing at a much faster pace both in respect of reducing internal tariffs and the evolution of a common external tariff. Besides, while the U.S. itself is concerned over its huge deficit in balance of payments and weakness of the dollar, American capital is flowing steadily into the Common Market, in a bid to circumvent the new tariff walls in Europe. The U.S. has at last started feeling the pinch. The prospect of the U.K.'s entry into the Common Market has further enhanced the urgency of devising measures to safeguard American trade interests. Europe, it may be noted, is America's largest trading region, accounting for a third of its total exports. So the U.S. can ill-afford to remain a silent spectator or unconditional supporter of the revolutionary changes taking place in the field of European trade. Out of the total U.S. exports of $20.3 billion in 1960, Western Europe accounted for $6.3 billion, as against $3.7 billion to Canada, $3.6 billion to the Far East and $3.4 billion to Latin America.

It is no wonder then, that the Trade Expansion Bill has primarily the Common Market in view. The President has asked the Congress for two basic kinds of authority for the next five years to enable the U.S. negotiators to "talk trade with the Common Market in

(Continued on next page)

hoarded wealth in ancient india

From early Buddhist literature one learns that wealth was hoarded underground in brass jars or buried under a river bank. The nature and amount of the wealth thus hoarded was registered on gold or copper plates.

The tendency to hoard wealth doubtless arose from the lack of opportunities for investment. The *Dharmasastras* for instance allowed only men of the Vaishya community to lend money on interest. Frequent invasions by neighbouring kings and the resultant fear of the future made people believe that there was nothing safer than burying their gold or silver.

Times have changed. Today the saving habit has many incentives—savings help not only the individual but also the nation. And many opportunities exist for profitable investment with reliable and streamlined institutions like the Union Bank of India.

The Union Bank prides itself on its unique *personalised service*, under which every depositor is treated as a Very Important Person.

The Union Bank Helps People

SERVICES OFFERED: Current, Savings Bank and Cumulative Deposit Accounts; Fixed Deposits and Three-year Cash Certificates; Inland Bills, Demand Drafts and Telegraphic Transfers; Letters of Credit and Guarantees; Foreign Bills and Remittances; Loans, Overdrafts and Cash Credits; Sale and Purchase of Government Securities and Shares and Safe Custody; Standing Instructions accepted; Credit Reports and Trade Information; Safe Deposit Vaults; TELEX contact with countries all over the world.

THE UNION BANK OF INDIA LIMITED
Registered Office: Apollo Street, Fort, Bombay 1. 61 branches all over India

THIRD PLAN MAKING SLOW PROGRESS

INDUSTRIALISTS FAIL TO MAKE THE POINT

From Our Special Correspondent

NEW DELHI, 30*th January*

DELHI LETTER

A BRIEF interlude in the long holiday from economic affairs enjoyed by the members of the Government concerned with them was witnessed last Saturday when the Standing Committee of the Central Advisory Council for Industries met and was given an account of the progress recorded in industry and the immediate outlook. Mr. Manubhai Shah sought to paint the picture in rosier colours than was warranted by the facts; he said that industrial production in 1961 should be almost 14 per cent higher than in 1960, if the jute and cotton textile industries were excluded. The actual increase last year, according to earlier indications, was of the order of 8 per cent, as compared with an increase of 12 per cent in 1960; with a possible decline in sugar production in the current year due to a large surplus and in the absence of other industries capable of showing a substantial expansion of output, the prospects for 1962 are rather dim. If the acute coal shortage now facing the textile industry in Western India spreads to other areas also, as it well may if the present policy of drift continues, some setbacks are only to be expected. There is, however, ground for the hope that, when the elections are over and the members of the Government settle down to their tasks, vigorous measures would be taken to solve this major problem of coal production and transport on which the future of the economy so largely depends.

Stock Argument

No sensitive observer watching current setbacks, many of which were preventable with greater co-ordination of efforts and realistic policies, can avoid a feeling of exasperation at Mr. K. C. Reddy's remark that such difficulties were inevitable in a developing economy. This has now become the stock reply of all Ministers to complaints of inadequate fulfilment of targets, especially in the transport, power and fuel sectors. There is some point in the explanation given by the railways that troop movements to Goa upset coal transport schedules but that is not the whole story; it appears that some State Governments have not yet made arrangements for the building up of coal dumps; the north Indian cold wave was another factor. But the planning of wagon loadings and movements has not been quite satisfactory; coal loadings on Sundays is not as good as on week days and distribution arrangements already worked out last year have not been followed. There is also the larger question of coal output in adequate quantities for which a fresh approach seems needed. And even if all these matters are satisfactorily tackled, there will remain the problem of power breakdowns, for which the only solution is speedy execution of third Plan schemes.

Power to Get Higher Priority

At the meeting of the Standing Committee, Mr. Manubhai Shah gave the assurance that higher priority was being given to power even at the risk of delaying some of the industrial projects; foreign exchange, he added, would also be provided for raw materials and components to maintain production but that applications for import of capital goods would be held up till suitable methods of financing them were found. With the current uncertainties regarding foreign aid, the chances of an early favourable response to these applications cannot be rated high. Suspension of additions to installed capacity will show its effects later; meanwhile, industrial expansion depends on the growth of indigenous machinery manufacturing capacity and supply of capital goods from the public sector units.

The report of the progress made in these directions which was placed before the Standing Committee was satisfactory only in part. Mr. Shah claimed that about Rs. 200 crores worth of machinery was being manufactured already and that there has been successful development of the system of machine building through consortia of firms delivering complete plants. He reiterated the assurance that the Government would be prepared "to support any well conceived scheme of machinery manufacture and diversification by making available the necessary foreign exchange for the import of components, etc., against the various credits." This was, however, followed by the somewhat tall order that the aim should be to have at least 90 per cent indigenous content by the third year of production because prolonged import of components will not be possible.

Public Sector Projects

The success of the industrial part of the third Plan will turn on the execution of the public sector projects which are to provide the basic materials and machines. Three of them are expected to commence production this year; they are the H.M.T. watch factory at Bangalore, photo film unit at Ootacamund and the fertilizer unit at Rourkela. But, otherwise, there has been no great progress; many projects on which work started towards the end of the second Plan—the Heavy Machine Building Plant, Foundry Forge, Coal Mining Machinery and Drug units—are yet to take shape. A contract for the import of machines for the Heavy Machine Building Plant has been completed; detailed working drawings for the shops and other units of the second stage of the project have been commissioned and negotiations for supply of plant and machinery for this stage are continuing. Production in this unit seems unlikely to materialise until the end of the third Plan period.

With regard to the Foundry Forge, the Heavy Engineering Corporation has only concluded a contract with Czechoslovakia for a detailed project report of the first phase; the plant will not be completed until the commencement of the Fourth Plan. A detailed project report has been received for the Heavy Machine Tool Building Plant (target for completion is the middle of 1965). Preparation of sites, arrangements for supply of water, training of technical personnel and other civil works, including housing, have to be taken up in the meantime. The general impression conveyed by these reports is one of slowness in execution due to various difficulties.

Supply of metals is likely to ease when steel output expands and aluminium is produced in larger quantities to make it an effective substitute for copper, especially in the electrical industries. Chemicals depend less on imported products and export promotion measures may provide sufficient foreign exchange to obtain some of the basic materials and intermediates. The Basic Chemical and Intermediate Plant near Bombay is expected to commence production by 1963, though only a survey of the plant site has been completed so far and designs and estimates have been received. For the second and third Heavy Electrical plants to be set up in Andhra Pradesh and U.P. preliminary work of acquisition of land, etc., is yet to be taken up.

It is clear from all this that the third Plan in the public sector in industry has not gained sufficient momentum yet. The Standing Committee does not appear to have applied itself to the problems of expediting the pace of development in this sector, perhaps because the non-official members, who could have taken up the matter, were too preoccupied with their own difficulties of imports, coal and transport. They raised the question of fair prices in relation to the Government's policy of reducing the prices recommended by the Tariff Commission for the private sector and secured the assurance that the question will be re-examined if sufficient evidence was provided to prove that the prices fixed were inadequate to give a fair return. Also, the cotton textile industry has received renewed promise of provision of foreign exchange for its modernisation programme; Mr. Shah said that the industry would be given some amounts out of the various credits that may be available to finance equipment and that the import requirements of the textile machinery manufacturing industry would be "fully met" on a top priority basis.

At a meeting of the Development Council for sugar industry which closely followed the Standing Committee's session, it was pointed out that internal consumption was showing signs of increase after the removal of controls and that it might go up to 25 lakh tons in the current season. Secondly, the failure of the U.N. Sugar Conference at Geneva to arrive at an international agreement on sugar export quotas is interpreted as a favourable factor for India as there will now be no limitations on our sugar exports. Mr. Rajwade, Chairman of the Council, hinted at "some streamlining" of costs but did not elaborate this point; there seems to be a proposal to export raw sugar, which may be one way out of the difficulty of minimum cane prices for factory consumption but not a proper solution to the problem, since it will put off for ever the rationalisation of the price of the finished product which can have a better market and must be exported to enable full working of existing installed capacity in the industry and of more to be added.

About 8.5 lakh tons of additional sugar manufacturing capacity remains to be licensed and, in view of the existing surplus, this will not be immediately licensed. This decision gives enough time to sugar machinery manufacturers inside the country to develop and cater fully to the requirements of the modified programme of expansion. The present time may not be politically propitious for discussing the question of changing the basis of cane prices and fixing them according to sugar content or quality standards but sooner or later the issue has to be faced.

SURVEY

(*Concluded from previous page*)

practical terms," namely, (1) a general authority to reduce tariffs by 50 per cent in reciprocal negotiations, and (2) a special authority to reduce or eliminate all tariffs on those groups of products, where the U.S. and the Common Market together accounted for 80 per cent or more of world trade. The proposed concessions, under the provisions of the General Agreement on Tariffs and Trade, will have to be extended to the rest of the world. If this is not what is intended now, the President's measure cannot be considered to have moved any step further towards his objective of freer trade. The result will be just the contrary. President Kennedy, of course, is not unaware of the needs of other countries, particularly the developing countries. This is evident from the additional special authority he has asked for reducing or eliminating all duties and other restrictions on the imports of tropical agricultural and forestry products "supplied by friendly less-developed countries" and "not produced in the U.S. in significant quantity." The implication of this particular provision of the Bill is not quite clear, in the absence of full details. If concessions are granted to developing countries in respect of agricultural products only, they can never hope to send their manufactured goods to the U.S. and Europe, which constitute the world's biggest markets. The Press reports on the subject are also not clear as to whether the proposed concessions on agricultural products are intended to be on a reciprocal basis.

Irrespective of the merits of the Bill, its passage through the Congress and the Senate is not likely to be smooth. A section of industrialists and trade unions is not likely to accept the new changes at their face value. In order to overcome the opposition, the President has agreed to retain "peril point" and "escape clauses" to safeguard those industries which are likely to be adversely hit by the import liberalisation, although they are on a much less rigid fashion than in the Reciprocal Trade Agreements Act. An entirely new measure, trade adjustment assistance, has also been envisaged, seeking to provide businessmen adversely affected by imports with technical information and with tax benefits and loans for modernisation and diversification. In order to assuage the workers, the President has conceded most of their demands. Accordingly, a readjustment allowance will be given to unemployed workers up to 65 per cent of their normal weekly wage for 52 weeks, along with training assistance to develop new skills, and with financial assistance for moving into other parts of the country. Thus, the U.S. has shown its willingness to accept structural changes, both in respect of capital and labour, in order to keep pace with the changes in the world. This is bound to encourage productive efficiency and thereby promote exports.

LONDON LETTERS

STRENGTHENING THE LIFE-LINE

A NEW EXPORT CREDIT SCHEME

(From Our Own Correspondent)

LONDON, *27th January*

"ALL I ask is the constant realisation of the truth that Britain must export to live... far more people must become export-minded ... I keep under constant review... the help that Government can give to exports...," thus observed the Chancellor of the Exchequer once again, talking this time to the industrialists of Birmingham and leading up to the Treasury's attention to "the availability of credit and its cost." In any other export-minded country, the Government would have stepped in long ago and made sure that their exporters were not handicapped in the race to sell abroad by lack of enough credit. However, that is not the British way and, for over a year, the Treasury, which would rather shut up shop than do anything it could possibly induce business to do for it somehow, somewhen, has been trying to cajole those great financiers, the banks and the insurance companies to find the money for big export schemes (over £100,000 and usually in the millions) in the important field of medium-term credits—that is, in the field between the short-term credit of up to five years which the banks handle in the ordinary course of business and the really long-term proposition of fifteen years which is about the shortest period the insurance companies like to look at.

E.C.G.D. Guarantee

The direct contribution of the Government to the new scheme was made last April when the Export Credits Guarantee Department undertook to guarantee credits up to fifteen years. Six months earlier, the E.C.G.D. had undertaken to guarantee beyond its normal terms where this was necessary to meet foreign competition, but the new step involved bringing in not only the banks, who would cope with the first five years' financing, but the insurance companies who would have to carry everything beyond that.

At last, the Treasury has succeeded in pulling in both parties to make the scheme work, first by getting them to put up a reasonable sum and, secondly, by making them agree to a reasonable and fixed charge for interest. The novelty about the British scheme is its success in making private finance do things it would not normally do in order to avoid the Government taking what other countries would regard as quite normal Government responsibility.

As for the interest the banks' tranche (five-years) is to be at 5½ per cent and the insurance companies' tranche (5-15 years) at 6½ per cent. At current money rates, this is 1½ per cent less than exporters are paying and only with a Bank Rate of 4½ per cent would the terms become commercial. However, the Treasury no doubt expect that money rates will fall a good deal further and there is a great advantage to an exporter in knowing exactly how much his accommodation is going to cost over the whole period of the credit. But the lenders are not going to gain from this sort of business until money rates drop at least 1 per cent.

The E.C.G.D. guarantees on medium-term credit about £100 million a year. The insurance companies will put up under the new scheme £100 million, but, if one makes the assumption that the average medium-term credit is 7½ years and the insurance tranche is, therefore, one-third (being the excess over five years), then the total finance available is £300 million, which plus down payments, would finance business up to a total of, say, £400 million. But this is the total and the annual volume of new business would be of the order of £100 million, that is no more than the total which E.C.G.D. already finances and much of which would be overlapped by the new arrangements. Thus, nothing more than a beginning has been made, a scheme exists, but the essence of it all—the real money—will have to be dragged out of the insurance companies to a much greater extent, unless, of course, the Government recognises the need to participate.—*All Rights Reserved.*

U.K. AND COMMON MARKET

LONDON, *20th January*

This is the time of year given over traditionally to the Chairmen of the great banks to voice their thoughts on the economy in the guise of a review of the past year. For two of them, the Chairman of Barclays, Mr. Anthony Tuke, and the Chairman of Lloyds, Sir Oliver Franks, it is the last speeches they will make in that capacity; the former is retiring on the principle borrowed from the Latin poet Horace "When your horse is getting old, be wise and turn him out to grass in good time, lest in the end he stumble...," and the latter has decided to go back to Queens College, Oxford, whence he was winkled out to become this country's Ambassador to America before he joined Lloyds Bank.

Sir Oliver boldly declared he would spend no time on reviewing the past year which repeated "the same dreary pattern we have seen before: another run on sterling; a series of measures to meet the crisis; the reduction of the economy to stagnation." He looked ahead instead to the Common Market and to the development of this country's competitive and export capacity in which its economic future lies. The commercial and tariff arrangements necessary to line up the U.K. with the Common Market are seen by Sir Oliver as a sort of bargain basement; it is the political issues which he regards as fundamental: "the view that the world is tending towards large regional divisions, that the great nations are on a Continental scale and that we can no longer go it alone effectively. If we are to exert our full power and leadership, we need to do it in a wider community, and, by history and geography, we are part of Western Europe."

"Nor," he added, "do I believe that these political considerations involve separation from the Commonwealth. If we have any genius in political affairs, it lies in conjunction... in the ability to avoid the 'either—or' and to find the way to 'both—and' ... the issues about butter, meat or wheat ... are not in the end what the negotiations are about, even though they may take the most time and appear the most controversial." Then he went on to attack the view that the U.K. is not competitive with Western Europe, that our home markets would be flooded with Continental goods, unless we sought refuge in a devaluation of sterling. This was the most important part of his survey and it was interesting to find that the Chairman of Barclays, whose review was more concerned with matters of direct concern to bankers, when he touched on the Common Market regarded this as an additional stimulus to the U.K. "which will open up new opportunities of expanding our business, if we are prepared to work for them.... I feel confident," he added, "that our economy will gain from the new association." And, of course, he made the proviso that the Commonwealth links should not suffer.

Sir Oliver pointed out, as evidence of Britain's strength when joined to the continental countries, that, even if our rate of economic growth has lagged behind that of Western Europe, our "stagnation" has provided a higher standard of living than the "dynamism" of the Common Market countries. (That incidentally is what worries the Labour Party which fears that U.K. standards may get depressed.) But the future, of course, is important and Sir Oliver was not pessimistic about the balance of payments, for, he noted, "imports tend to outstrip exports when the economy is being run almost at capacity." Therefore, if home demand can be kept reasonably restrained and if our favourable invisible balance can be encouraged by a moderating of Government expenditure overseas and by a reduction on our short-term borrowing interest rate liability—and all the present trends are that way—then Sir Oliver sees every prospect of the U.K. retaining the economic leadership of Western Europe.

(Delayed in Transit)

Radar coverage and short-wave radio communications for vessels using the Port of London are being extended with the current expansion of the Thames Navigation Service to enable speedier movement of ships in and out of the port. Radar is to cover a larger part of the river than at present, and a constant radio watch for the whole 50 miles between the Port of London and the sea is to be provided. Shore communications between an operations room and all docks and tug and pilot stations are also to be completed. This will enable a pilot or tug skipper to be in touch with the movement of anything on the river, day or night and in any weather conditions.

'But can I sell my product there?'

Of course he can—with the help of Voltas! Whatever the size of his business, and wherever its site, the enterprising Indian manufacturer can depend on Voltas to distribute and sell his products efficiently, economically. For Voltas is everywhere in India! With its vast network of branches, agencies, sales depots and warehouses, Voltas touches every market in every part of this great country. The effective Voltas system of distribution is designed to answer fully the needs of both producer and consumer, and in the process to serve the larger interests of the nation.

Briefly, Voltas' activities comprise

- **Marketing and Distribution of goods:** Representing leading manufacturers, both foreign and Indian, Voltas supplies a wide range of goods—Electrical, Mechanical, Air Conditioning and Refrigeration, Textile and Paper Machinery, Agricultural and Construction Equipment, Machine Tools, Pharmaceuticals, Chemicals, Bulk Vitamins, Plastic Raw Materials, Processed Foods.
- **Manufacture and Development:** Air Conditioners, Water Coolers, Switchgear, Farm Implements, Drilling Machinery...and the list is growing!
- **Service:** Voltas after-sales service is a by-word in India. Voltas sales are fully backed by its nation-wide service and spare parts organisation.

For taking products to their markets VOLTAS IS THERE

BANKING IN EUROPEAN COMMUNIST COUNTRIES

CONTROLLING STATE ENTERPRISES IS THE MAIN FUNCTION

BANKING and financial statistics, which provide valuable insight into the functioning of the economic systems of the free world countries, are among the least publicised aspects of communist economies. One plausible reason for this black-out of vital information is the intention of communist countries to prevent the free world from enlarging its insight into their economies, for political or strategic reasons. Although there has, of late, been some relaxation of controls on the flow of financial data from the communist countries to the outside world, official economic and financial statistics pertaining to them contain numerous and significant gaps.

In view of the lack of reliable information about the subject and the widely prevalent curiosity about the way financial and monetary systems are functioning in Communist countries, a study of finance and banking in countries of the Communist bloc in Europe made by Dr. Kurt Wessely, of the Austrian Institute for Economic Research, published in the monthly *Economic Letter* of the *Creditanstalt-Bankverein*, Vienna, throws some revealing light on certain dimly-lit aspects of this branch of economics.

Commenting on the reluctance of Communist countries to publicise financial data, Dr. Wessely points out that the excessive caution shown by communist countries is itself a reflection on the significant role money plays in Communist economies. Dr. Wessely gives the following extract from the blue-print for the new party programme of the Soviet Communist Party, in support of this opinion: "During the building of the communist society, the budget will preserve its important role in distributing national product and income. The money and credit system will become increasingly stabilised. The foreign exchange rate of the rouble will go on rising due to its growing purchasing power. Its position in the international sphere will be further strengthened."

Functions of Money Compared

Dr. Wessely begins his article by making a comparison between the functions of money and the methods of its creation and regulation in the communist and free countries. In the free economies of the West, creation of money and credit is now, as a rule, no longer limited by gold and foreign exchange holdings. It is usually entrusted to separate and autonomous agencies. These agencies are not strictly bound by any objective criteria in taking their decisions. The velocity of circulation of money—the decisive factor in determining the volume of money—is not subject to any direct Government intervention. In a communist economy, by contrast, money not only performs a different function, but its creation and supply are, at least in theory, closely tied to the total amount of goods and services produced and available. More precisely, the volume of money is to be the exact counterpart of the amount of work performed by the society in producing the goods and services of the national economy. The amount of work done by the society is thus reflected, at any stage, in the actual purchasing power of the population and the volume of money at its disposal, regardless of the effect on production of the work performed. Changes in money supply-velocity or circulation being assumed as stable due to cashless transaction between State enterprises in the East European countries, therefore, indicate changes in the volume of output. If they occur unexpectedly, they may be looked upon as certain evidence that output or the amount of work performed by the society does not correspond to what has been planned or expected. Together with changes in price level, such data would, therefore, permit conclusions as to the functioning or malfunctioning of the entire economy.

This, in Dr. Wessely's opinion, is the main reason why the countries of the Eastern region while publishing data on production and plan fulfilment, refrain from revealing money equivalents and statistics of public finance. Further, as prices are fixed and manipulated—the State having the additional device of skimming off purchasing power whenever it wishes—a comparison of price levels in communist and democratic countries can produce only a very generalised picture. It does not, for instance, provide any reliable information on the extent of inflationary tendencies in the economies of communist countries.

The control over currency and the entire economic activity, which constitutes one of the principal tasks of banking in the Soviet Union and East European countries, including Yugoslavia, has greatly strengthened the influence of banking system on their national economies. Despite the existence of some specialised credit institutions in the Soviet bloc, Soviet banking is strictly centralised, having been made an organ and an integral part of the centrally directed economy as well as the Ministry of Finance. These functions are performed by the banks on the one hand, through their participation in the process of supplying State enterprises with the credit required and, on the other, by providing a sufficient amount of cash. In Yugoslavia, however, there are certain deviations from this pattern due to the system of decentralised economic planning prevailing in that country.

Different Principles

As instruments of a planned economy, the banks are not guided by the principles of a free economy in carrying out this double function, but act in strict accordance with the tasks imposed upon them by the economic plan. This means that the banks can take or influence decisions on economic policy only within narrow limits. Such independent decisions are taken occasionally as, for example, in those cases when only the amount of the loans to be extended for certain objectives is fixed by the planning authorities, but the choice of the projects (e.g. for housing construction or trade promotion) is left to the bank. Yet the scope for independent banking activity is exceedingly small throughout the communist countries. Even in Poland, where non-socialised small shops play a more important part than elsewhere in Eastern Europe, loans to such small private enterprise amounted to no more than 30 million zlotys in 1960.

Apart from such few instances of genuine bank credits, which are generally based on savings and deposits, the granting of loans in Eastern bloc countries is confined only to implementing measures already decided upon by the economic plan and is entirely detached from the basic banking requirements for any loan in the West, namely, security and interest. To authorise such a loan means nothing else but to release public funds to State enterprises in accordance with the investment quotas laid down for the plants concerned in the production plan.

Control Job

The banking system can perform its comprehensive control job only because the financing of State enterprises is, for all practical purposes, supervised and directed by the banks to which all plants are bound to deliver their earnings—a process greatly facilitated by the generally adopted system of cashless transfers. In this way, enterprises are left entirely without funds for net investments—these having to be financed through the State budget—and even replacement investments are made subject to approval by the banks. The latter rule has, however, been somewhat relaxed in recent years, enterprises now being permitted to set up funds from operating surpluses which may be drawn upon for decentralised investments. This method of financing is stimulated by charging a higher interest on investment funds. The relaxation of centralised investment planning and the transfer to the lower organs of the economy of the authority to decide upon investment have, however, resulted in some disturbances to investment activity, so that the fundamental controversy regarding centralised investment control *versus* limited autonomy of State enterprises in regard to financial matters has not been decided one way or the other. But even if the idea of financial autonomy for State enterprises should in future be applied more extensively than hitherto, the influence of the banking system on the economies of the East European countries will remain far stronger than is the case in any Western country where even nationalised enterprises are equipped with separate capital resources and given a financial responsibility of their own.

Government receipts from the economic activity of State enterprises plus revenue from the turnover tax imposed on the population are becoming an important part of budgetary revenues. For instance, of the total receipts of the Rumanian State budget for 1959, 35 per cent came from the profits of State enterprises and 23 per cent were contributed by the turnover tax. The funds thus obtained are utilised to redistribute the national income according to plan and, more particularly, to finance State enterprises by way of the banking system. The banks in East European countries thus perform functions only remotely resembling those in a free economy. The communist State "exploits the function of money as a payments medium for controlling the activity of socialised enterprises." In this way, the payment of funds to the enterprises by the banks is made dependent upon plan fulfilment. By demanding repayment of the loan upon maturity, the bank spurs the enterprises to fulfil the economic plan, for, unless the target fixed for the enterprise is reached, the enterprises concerned will find themselves unable to raise the funds required for paying back the bank credit.

Two Main Branches

Since this control job is clearly distinct from the function of creating money and credit, the banking system in all communist countries is naturally divided into two main branches: the Central State bank, on the one hand, and the banks, or specialised credit institutions, for the financing and controlling of investments, on the other. In foreign trade, the State bank acts not only as foreign exchange bank to the extent that such an institution can be said to exist in a communist country, but also keeps the accounts in clearing transfers. This applies both to clearing transactions with Western countries (where the national banks also fulfil the same task) on the basis of bilateral clearing agreements as well as to clearing transfers within the Communist countries resulting from trade among the Communist countries which, in principle, is conducted through clearing arrangements providing for immediate payment upon presentation of export documents. Payments arising from trade with Western countries may, however also be effected in freely convertible currencies or in gold—an alternative frequently resorted to by the Soviet Union.

There are also in some East European countries foreign trade banks, not to be confused with State banks which may also maintain relations with foreign commercial banks. They serve domestic purposes such as the distribution and control of foreign exchange for capital goods import, but may also themselves finance such imports. Their activity thus represents only a special field of the general activity of investment banks. Of the latter, there are usually two kinds, investment banks for general investment purposes as defined by the Ministry of Finance and agricultural banks for agricultural loan and credits. Finally, there are savings banks which are as much centralised as the other categories of banks and, in some countries, there exist a number of specialised credit institutions as well.

Banking in Yugoslavia

Yugoslavia, which is outside the Soviet orbit, needs special mention, as the banking system in that country has different characteristics. According to Dr. Wessely, banking and other sectors of the economy in Yugoslavia are approaching the standards of a free economy. That country combined its entire money and banking systems into one central bank upon nationalisation. By a decree issued in 1954, subsequently amended, the central bank was split up into several divisions, national bank, Jugo bank, investment bank, agricultural bank, etc., thereby introducing the system of specialised banks accepted throughout the Eastern bloc. Besides these credit institutions, which remain centralised, there exist "communal banks" and co-operative savings banks. While the steps towards further decentralisation initiated at the start of 1961 have not affected the basic structure of the Yugoslav banking system and, consequently, the features it has in common with banks in other East European countries, they have, in fact, brought about a number of changes. In accordance with the broader functions given to the so-called communes (economic and administrative self-governing bodies of the lowest order), the field of activity of the communal banks was considerably enlarged, with the result that these have become the actual commercial banks of the country. This process went on at the expense of the Jugo bank and the national bank which, however, were given increased authority for controlling monetary and economic development. While Yugoslavia no longer has a centrally planned economy, the control over the dinar exercised by the banking system continues undiminished as it does in other East European countries.

WORLD BANK LOAN TO AUSTRALIA

The World Bank has made a loan equivalent to $100 million to the Commonwealth of Australia for financing a part of the Snowy Mountains hydro-electric power scheme. In a separate transaction, the Commonwealth of Australia has issued $30 million of 5¼ per cent twenty-year bonds, due 15th January 1982. An underwriting group headed by Morgan Stanley & Co. is publicly offering the issue at 98¼ per cent. Proceeds of the new issue will be applied, together with other funds, to repayment of $38 million of maturing Australian bonds on 1st February 1962. The total cost of the project is estimated at $222 million. It is expected that the equivalent of $189 million will be needed for local expenditure, and the remaining $33 million will be required for imported equipment and services. Contracts for all major works and for the generating plant and equipment are being awarded after international competitive bidding.

The World Bank loan is for a term of 25 years and bears interest at the rate of 5¾ per cent annually, including the 1 per cent commission which is allocated to the Bank's special reserve. Amortisation will begin on 15th September 1966.

HONGKONG AND SHANGHAI BANKING CORPORATION

The net profit (after providing for taxation, etc.) of the Hongkong and Shanghai Banking Corporation for the year ended 31st December 1961 amounted to HK$43,315,459 (£2,707,000), including dividends received from subsidiaries. It is proposed to write off HK$5,000,000 (£313,000) to Bank premises and to pay a final dividend of 10s. per share, leaving HK$2,340,534 (£146,000) to be carried forward. These figures are subject to audit. The group accounts will be published at a later date.

Notices

THE BENGAL PAPER MILL COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT A General Meeting of the members of the abovenamed Company will be held at the Registered Office of the Company at 14, Netaji Subhas Road, Calcutta, on Monday, the 26th day of February 1962, at 2.45 p.m., to consider and, if thought fit, to pass with or without modification the following resolutions, namely:

1. (*As a Special Resolution*)—That each of the existing Ordinary Shares of Rs. 25 each in the capital of the Company be subdivided into five Ordinary Shares of Rs. 5 each.

2. (*As an Ordinary Resolution*)—That (a) it is desired to capitalise the sum of Rs. 9,00,000 part of the amount standing to the credit of General Reserve and accordingly that the Board of Directors be and they are hereby authorised to capitalise the said sum of Rs. 9,00,000 and to apply such amount in full 1,80,000 unissued Ordinary Shares of Rs. 5 each in the capital of the Company and to distribute such 1,80,000 shares credited as fully paid-up to and amongst the holders of the Ordinary Shares of Rs. 5 each in the capital of the Company on the Register of Members at the close of business on the 26th day of February, 1962 in the proportion of one new Ordinary Share of Rs. 5 for every five Ordinary Shares of Rs. 5 each then registered in the name of such holders of the Ordinary Shares and (b) the said 1,80,000 shares be allotted on terms that the same shall rank *pari passu* in every respect with the Ordinary Shares of the Company previously in issue, and (c) the draft of the Agreement providing for the allotment of the said new Ordinary Shares under the said capitalisation submitted to this meeting and signed in the margin by the Chairman thereof by way of identification be and the same is hereby approved and the Board of Directors of the Company be authorised to affix the Common Seal of the Company to the duplicate engrossments of such Agreement as and when the same shall have been signed on behalf of the members holding such Ordinary Shares of Rs. 5 each in the Company on the 26th day of February 1962 by some person to be appointed by the Board in that behalf under Article 119-C of the Articles of Association of the Company.

3. (*As a Special Resolution*)—That every two Ordinary Shares of Rs. 5 each in the capital of the Company be consolidated into one Ordinary Share of Rs. 10.

4. (*As a Special Resolution*)—That the capital of the Company be increased from Rs. 1,00,00,000 to Rs. 3,00,00,000 by the creation of 12,60,000 Ordinary Shares of Rs. 10 each ranking *pari passu* in all respects with the existing Ordinary Shares in the Capital of the Company and 74,000 unclassified shares of Rs. 100 each.

5. (*As a Special Resolution*)—That the Company do raise money by the creation and issue of unsecured Convertible Loan Stock of the nominal value of Rs. 30,00,000 on the following terms and conditions, namely:—

   (i) the Stock will carry interest at the rate of 6¼ per cent per annum (subject to tax);

   (ii) The Company will redeem the Stock at par on the 31st day of December 1970;

   (iii) the Stock will be in units of Rs. 250 each and be offered in the first instance to the holders of the Ordinary (equity) Shares of the Company and to the extent the Stock is not subscribed by them be disposed of in such manner as the Board of Directors of the Company think most beneficial to the Company;

   (iv) each holder of the Stock shall be entitled by not less than one month's notice in writing to the Company given within the periods hereinafter mentioned to convert each unit of Rs. 250 of the Stock held by him into:

   (a) 10 Ordinary (equity) Shares of Rs. 10 each between the period of the 1st July 1963 and the 31st December, 1964;

   (b) 9 Ordinary (equity) Shares of Rs. 10 each between the period of the 1st January 1965 and the 30th June 1966;

   (c) 8 Ordinary (equity) Shares of Rs. 10 each between the period of the 1st July 1966 and the 31st December 1968;

   provided that no such right of conversion shall be exercisable by any holder of the Stock after the 31st December 1968;

   (v) The Ordinary (equity) Shares into which the Stock will be converted as aforesaid will rank *pari passu* in all respects with the then existing Ordinary (equity) Shares of the Company except that the Ordinary (equity) Shares so converted will not be entitled to any dividend declared on the Ordinary (equity) Shares by the Company for the year during which the conversion has taken place but so nevertheless the holders of the Stock will receive the interest due on the Stock in respect of such year.

6. (*As a Special Resolution*)—That the Regulations contained in the printed document submitted to this meeting and for the purpose of identification subscribed by the Chairman hereof be approved and adopted as the Articles of Association of the Company in substitution for and to the exclusion of all the existing Articles thereof.

By Order of the Board,

H. P. DHANUKA,

Director.

Registered Office:

14, NETAJI SUBHAS ROAD,

CALCUTTA.

Dated this 25th day of January 1962.

Note:—(a) The Transfer Books and Register of members of the Company will be closed from the 20th February 1962 to the 26th February 1962, both days inclusive.

(b) A member who is entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and vote in his stead. A proxy need not be a member of the Company.

(c) An Explanatory Statement pursuant to Section 173 of the Companies Act, 1956 has been sent to the Shareholders.

THE ELGIN MILLS COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT THE Share Transfer Books of the Company will be closed from 8th to 28th February, 1962, both days inclusive.

By Order of the Board,

Per Pro THE BRITISH INDIA CORPN., LTD.,

R. P. MATHUR,

Dy. Secretary,

Secretaries & Treasurers.

SUTHERLAND HOUSE,

KANPUR,

Dated 22nd January, 1962.

U.K.'S IMPORTS OF INDIAN COTTON YARN

MILLOWNERS RIGHTLY OPPOSE PLEA FOR CEILING

THE discussions on the possibility of inter-industry agreement on cotton yarn exports from India to Britain, held at Bombay last week (23rd and 24th January) between the representatives of cotton textile interests of the two countries, ended inconclusively. The only outcome of the discussions was the recognition, by both sides, of the fact that more thought would have to be given to arrive at a mutually satisfactory solution which would take into account the British industry's difficulties, on the one hand, and India's need for earning more foreign exchange, on the other. It was, however, agreed to resume the talks "in the near future." The British Cotton Board delegation was led by Sir Cuthbert Clegg, while the Indian Cotton Mills' Federation was headed by its Chairman, Mr. Bharat Ram, and included Mr. Neville N. Wadia, Chairman of the Cotton Textiles Export Promotion Council and Mr. Krishnaraj M. D. Thackersey, the erstwhile Chairman of the Federation. The respective viewpoints expressed by the two delegations, as set out in the brief Press note issued by the Federation, may be summed up thus:

British delegation: Increasing imports of cotton yarn have been causing great anxiety to the British industry. The actual total imports during the calendar year 1961 are estimated at 45 million lbs., as against 14.6 million lbs. in 1958, the year when restrictions on yarn imports into the United Kingdom were lifted. An inter-industry agreement for a voluntary ceiling on exports of Indian yarn to Britain is imperative. Such an agreement would considerably help the British industry in carrying through its plans of reorganisation.

Indian delegation: The difficulties of the British industry are fully appreciated. But it is necessary to point out that India is running an increasingly adverse balance of trade with Britain and that it is important for India to step up its foreign exchange earnings through larger exports of cotton yarn and piecegoods.

Commendable Attitude

The Federation's Press note does not indicate whether the Indian cotton textile interests are agreeable to an inter-industry pact for a voluntary ceiling on yarn exports. It is, however, understood that the consensus of opinion among textile interests is not to agree to such a pact at all. If this is true, it is certainly a commendable attitude, for the grounds on which Britain is seeking limitation on imports of yarn are untenable. There is no excuse for a country which has full employment and record high standard of living and which has been a supporter of multilateral trade, to resort to the device advocated by Lancashire millowners. Even the position of the spinning units in the U.K. does not warrant the measures now advocated.

May be, cotton yarn imports (from all sources) into Britain have risen from about 15 million lbs. in each of the years 1957 and 1958 to 47 million lbs. in 1961 (on the basis of the actual inflow during the first half of the year), but the actual increase has not been so appreciable as to cause any serious damage to the British textile industry. For not only has the production of yarn in Britain not suffered any setback but the financial position of the spinning sector has actually improved. The quantity of yarn spun during the calendar year 1961 is estimated at 696 million lbs. which is well above the output of 596 million lbs. in 1960 and 631 million lbs. in 1958. In view of the upward trend of production and of the reasonable levels of prices, the earnings of the British spinning units have registered a notable rise. An independent analysis of trading results of 23 spinning mills for the year 1961, prepared by Messrs. Frederick W. Tattersall Ltd. of Manchester, reveals that the average profit per company during 1961 was higher at £46,050, as compared with £34,058 for 1960, and average dividend was 18.62 per cent, as against 17.74 per cent.

Even the rise of 32 million lbs. in cotton yarn imports in the past three years (from 15 million lbs. in 1957 and 1958 to 47 million lbs. in 1961) has been accounted for not so much by Indian yarn as by yarn manufactured in other countries. The estimated imports of cotton yarn from India to Britain during 1961 are shown by the U.K. Cotton Board as 13.0 million lbs. which represent an increase of just 7.4 million lbs. as compared with the figure for 1958, whereas, over the same period, imports from "other countries" have gone up markedly from 4.5 million lbs. in 1958 to 27.9 million lbs. in 1961. It is worthwhile to mention here that, as against the Cotton Board's estimate of Indian cotton imports into Britain, the official statistics published in India put the figure at 4.7 million lbs. for 1960, as compared with 5.0 million lbs. for 1958. Mention may also be made of the significant expansion in yarn imports into Britain from some non-Commonwealth countries such as Spain. From a mere 590,000 lbs. of cotton yarn in 1959, Britain's intake in 1960 from Spain rose to as much as 11.2 million lbs. in 1960, though it declined slightly to 9.7 million lbs. in 1961. How then can British textile circles say that imports of Indian cotton yarn into their country are jeopardising the interests of the domestic spinning sector?

Ceiling Not Justified

The plea of the British cotton interests for a voluntary ceiling on exports of Indian yarn to the U.K. is also not justified from the point of view of the ability of British cotton to compete on equal terms. It has already been shown that imports have had no adverse effect on the financial results of British spinners. Besides, the latter have vastly increased their efficiency in recent years. As a result, the average production of yarn per worker in Britain is as high as 3,753 lbs. (1960), which is much more than the average of 2,250 lbs. in India. If, however, the British industry is unable to stand competition through reduction of prices, it is because of the fantastically high level of wages and various other perquisites enjoyed by the mill workers. An important reason for this state of affairs is the realisation of workers that other modern industries offer better prospects and stability of employment than the cotton industry. Surely, the textile industry in Britain, or, for that matter, in any other developed country in the West, cannot expect to ensure an ever-rising high standard of living for labour, while the working class in the rest of the world does not get two square meals a day.

It is common knowledge that the textile industry in Britain (and a number of other countries) is functioning very largely on the basis of raw cotton imported from abroad. It would be better, as this journal has repeatedly stressed, if these countries were to concentrate more on other industries and provide an outlet for the textiles produced in India and other developing countries which are more advantageously situated in the matter of supply of raw cotton, manpower and other requirements of production. In that event, the developing countries would be able to utilise a large part of the foreign exchange earnings from textiles for the import of more machinery and equipment produced in the Western countries. It is to be hoped that this vital consideration will be fully recognised at the International Cotton Textile Committee meeting now being held at Geneva to work out a long-term arrangement to replace the current short-term arrangement which is due to expire at the end of September next.

BONUS FOR BOMBAY MILL WORKERS

The Millowners' Association, Bombay, and the *Rashtriya Mill Mazdoor Sangh*, the representative union of textile workers, have decided to refer the issue relating to payment of bonus for the years 1959, 1960 and 1961 to a Board of Arbitrators. The proposed Board will consist of two members whose names have been agreed to by the parties but will be announced as soon as the consent of the persons concerned is obtained.

It will be recalled that a pact was entered into by the Association and the *Sangh* for the payment of bonus covering the period 1953-57. It was subsequently extended to the year 1958. During this period, the Bombay mills distributed well over Rs. 12 crores as bonus and over 200,000 employees benefited by this payment.

For the first time in the history of the Bombay cotton mill industry, a major issue like bonus is sought to be settled through voluntary arbitration.

FREE WORLD COTTON CONSUMPTION

NO CHANGE EXPECTED

DESPITE less favourable prospects in many of the major consuming countries, cotton consumption in the free-world in the current (1961-62) season would not be much different from the last season's total. This prediction is made by the International Cotton Advisory Committee, Washington, in its latest (December 1961) monthly review of the world cotton situation. According to the I.C.A.C., if this prediction were to prove correct and assuming that the crop would equal current estimates, production and disappearance of cotton during the 1961-62 season would be roughly in balance, and there would be only minor fluctuations in end-season stocks on 31st July 1962.

If consumption were to remain unchanged during 1961-62, it would be the third consecutive year in which free-world cotton consumption was maintained at the 1959-60 level as the following figures indicate:

(In million bales)

	1959-60	1960-61	1961-62
U.S.	9.0	8.3	8.8
Other free-world countries	22.1	22.9	22.3
	31.1	31.2	31.1

Although the aggregate free-world consumption is expected to be maintained at last season's level, changes are likely to occur in the geographic pattern of consumption. These will undoubtedly have some bearing on the outlook for the export trade in cotton. The cotton textile industry of Western Europe and Japan is heading for a period of reduced activity, thanks to the recurrence of the cycle of stocks, and demand for import of cotton is, therefore, likely to decline, particularly if there is any reduction in stocks in importing countries. In the U.S., on the other hand, with the economy in high gear, cotton textile production is moving upwards and consumption during the 1961-62 season is officially estimated at 8 million bales, an increase of 500,000 bales compared with the 1960-61 consumption of 8 million bales. In Canada, too, the recovery evident in 1960-61 is expected to continue and consumption is expected to be higher than in the past few years.

Trend in W. Europe

In Western Europe, as noted above, all indications are that cotton consumption will recede from the record 1960-61 level. Textile production is currently exceeding offtake and there has been a significant build up of stocks of both yarn and cloth in many countries. There is general complaint about the level of prices and mill margins. Manufacturers are, however, faced with the problem that if textile production is cut back entailing, as it would, some reduction in labour force, recruitment would, become difficult when the textile cycle turns upward again. So far the U.K. is the most affected and, in that country, curtailment is often resorted to. On the Continent, the continuing general expansion in the general economy in most countries has served to maintain retail sales at a high level, which is ground enough for anticipating that any reduction in cotton textile production will be quite modest, though manufacturing profits will naturally feel the impact of much lower prices. A further reason for the less favourable textile situation in W. Europe is the reduction in textile exports from some countries and the continuing rise in imports.

In Asia, in the opinion of the I.C.A.C., it looks as if total consumption will remain at the 1960-61 record level, although it might show divergent trends in individual countries. Thus, recent developments indicate lower consumption in Japan. The rate of curtailment in cotton yarn production in that country was already stepped up in November last and yarn production might be further cut in 1962. Considering this trend, cotton consumption during 1961-62 might decline by a quarter of a million bales. In India, on the other hand, demand for cloth continues to be strong and fluctuation in mill activity may be usually attributed to other factors, namely the supply of cotton and textile prices. The crop during 1961-62 is expected to be considerably lower than in the previous year but opening stocks on 1st September 1961 were higher. Based on the target for cotton

PUBLIC DEPARTMENT

CAPACITY OF COTTON INDUSTRY CONTINUES TO SHRINK

GOVERNMENT AID CONSIDERED INADEQUATE

From Our Special Correspondent

MANCHESTER LETTER

MANCHESTER, 23rd *January*

SYMPTOMATIC of the present situation in the Lancashire cotton industry is the decision of David Whitehead and Sons, the Rawtenstall spinning and weaving group, to switch its Lower Mill to four-day working. Notices have now been posted indicating that the management intends to adopt this course next week. The official statement says that the Company is adopting this measure to bring production into line with present order books.

This reflects the general unsatisfactory rate of business throughout the cotton trade, a situation which has persisted for at least six months past. Whereas during most of 1961 the mills had a sufficient backlog of orders to keep machinery well engaged, since the autumn the quantity of contracts held has been so small that employers have been faced with the problem of whether to continue producing for stock or to curtail output.

"A Great Shock"

Mr. R. W. Hill, Secretary of the Rawtenstall Weavers' Association, said that the Company's decision has come as a great shock. It was very disquieting, he added, that a company which had been so progressive in the installation of modern equipment should have taken such a step.

Immediately prior to the Christmas holidays there were scattered indications of more business being about in cotton goods and it was hoped that the uptake would improve early in 1962. So far, however, these anticipations have not been fulfilled and, according to authoritative sources, no improvement in orders has yet been achieved.

The trade continues to be depressed as it was during most of 1961 and very few attempts of arranging additional business have been recorded. When operations have taken place the profit margins available for producers have been much lower than during the past year.

Disruption by Price

Representations made by Lancashire textile traders and the sharp outcry about imports have invariably stressed the volume of goods arriving from foreign sources in direct competition with local products. That prices is just as vital, and can often prove to be the real disrupting element, has been stressed by Mr. Mario Ludwig, Director of the International Cotton Federation, in a paper presented during a discussion on marketing, organised by the Textile Institute.

"Quite often it was not so much the actual volume of imports that has ruined the market and forced mills to close down, but the excessively low level of prices at which these imports were offered or sold," Mr. Ludwig declared. "Sometimes it is sufficient merely to make and offer at an excessively low price to panic the market or to stop business altogether." The price factor is particularly important in an industry like textiles, where profit margins are notoriously narrow, he went on. Many mills in Lancashire were closed not because they did not have enough work as such, but because they did not have enough profitable work.

Swiss Example

As an instance of how action can be taken to curtail arrivals by price rather than volume, Mr. Ludwig described how Switzerland tackled the problem. This has been done by introducing a system of price supervision and price certification over textile imports from Japan and other low-cost producing countries. It applies to imports of grey cotton cloth, woollen cloth, knitwear and made-up goods, all of which can only be secured through an import licence.

The Swiss Government refuses to issue a licence when the import price for cotton cloth is 10 per cent lower than the price for equivalent goods produced in Switzerland. The percentage is 12 for woollen cloth and 20 for knitwear and made-up goods. The domestic price is the current market price, including a reasonable profit; the import price is that given at the Swiss border, plus duty and transport from the border to the destination. "Experience, so far indicates that the system acts as a deterrent."

Ability to put things in a nutshell is a gift not given to all. The author of the annual report of the Manchester Chamber of Commerce, however, has that facility, especially as regards the section headed "Textile Trade Matters." His summary of the situation in Lancashire provides an apt commentary on the position in 1961. "The industry has certainly maintained its reputation for rapid change," the report says. "Whilst twelve months ago there were voices raised in protest that the reorganisation scheme had gone too far, there are now feelings that further streamlining is desirable."

The hesitancy on the part of the industry reflected in the smaller total of application for re-equipment grants than had been anticipated, follows lack of confidence created by grave doubts about the continuance of the voluntary undertakings with Eastern Commonwealth countries. The extensions subsequently gained, it is pointed out, were secured only at a price —that of increasing the basic quotas for retaining imports during 1962 for the three supplying countries from 367 million to 422 million square yards.

"This, in itself, represents about a third of the home industry's production. If imports from other sources continue at the same level, the total entry into the home market for retention will not be far short of 50 per cent of home production. These, surely, are not conditions to create confidence," the report continues, "and all sections of the industry are united in believing that Government action instead of inter-industry agreements is necessary to restrict imports to a level which will enable Lancashire to have what all other textile industries of the world have retained—the bulwark of a sound home market."

Containing Yarn Imports

Spinning firms in Lancashire have been particularly sensitive to the substantial imports of cotton cloth which have entered the British market during the past year or two. They claim—not without justice—that they face the double pressure of direct yarn arrivals and a reduction in purchases by those weavers who are in turn suffering under the large-scale inroads of foreign cloth.

Relief, however small, would be welcomed and the disclosure at the Cotton Board conference that the Indian millowners were ready to discuss some voluntary undertaking covering yarns was an encouraging feature. The deputation, which has now begun negotiations both in India and Pakistan on the subject, will be thoroughly supported by the industry at home. Its composition, comprising topline personalities of the spinning trade, assures it of a suitable reception in advance.

If the terms arranged for a ceiling on yarn imports are reasonable from a Lancashire view-point, the journey will have been well worthwhile, as it creates a precedent for future emulation in other areas. India's shipments of cotton yarn to this country have lately comprised nearly one-third of the total quantity imported. The share of Pakistan has been negligible, but in view of the keen determination being shown by that country to stimulate exports, the Lancashire delegation will do well to secure limitations at this stage.

Inadequate Aid

"Too little and too late," is a phrase which has gone down into history as describing a period of war-time inadequacy which could well have cost this nation dear. It is now being used, with almost equal effect, by many of those who regard the Government's lagging aid to the cotton industry as inadequate in the current circumstances, particularly after the apparent willingness of the Treasury to provide so much finance for reorganisation.

Mr. Roger Lee, Chairman of the Lancashire Cotton Corporation, gives the phrase an airing in his annual review, saying that, as a result of the tardy support of the Government, the capacity of the industry has continued to shrink, even after the vast elimination accomplished by the redundancy scheme. Orderly planned production has been disrupted, he adds, with unfortunate results on the regularity of employment and the efficient lowering of costs. The Corporation itself has not been backward in modernising its plant and equipment as substantial sums have been spent since the war. A bill of practically £10,000,000 has been incurred in financing such projects over the past 15 years.—*All Rights Reserved.*

WHY IT PAYS TO LOOK FOR THE TRADE-MARK

TIMKEN®

REGISTERED TRADE-MARK

ON ALL THE BEARINGS YOU BUY OR USE

If the trade-mark "Timken" is on the bearings you buy, you know you're getting the uniform, high quality that gives long, trouble-free bearing performance in automobiles, machine tools, farm equipment, railroad equipment—wherever wheels and shafts turn. And when you buy Timken tapered roller bearings you're also assured of bearing engineering service you can't get anywhere else.

"Timken" is the registered trade-mark of the world's oldest and largest manufacturer of tapered roller bearings. It identifies the bearings, steel and rock bits made by The Timken Roller Bearing Company and its subsidiaries and divisions the world over. Specify Timken bearings when you build or buy equipment, use them for replacement too. The Timken Roller Bearing Company, Canton, Ohio, U.S.A. Cable: "TIMROSCO". Timken bearings manufactured in Australia, Brazil, Canada, England, France and U.S.A.

SUGAR PRODUCTION FALLS, BUT GLUT CONTINUES

EAST U.P. MILLS URGE RELIEF MEASURES

ONE of the principal features of the Government of India's sugar policy for the current season, as readers are aware, pertains to fixation of output quotas for every individual mill, the quotas being 10 per cent below the quantity produced in 1960-61. Forming part of the scheme is the imposition of a penalty as high as Rs. 29.12 per cwt. (double the rate of prevailing excise duty) on any factory producing sugar in excess of its quota. This penalty has acted as a strong deterrent to mills that desire and are in a position to produce sugar in excess of their quotas. The figures relating to actual sugar production during the first two months of the season (that is, November and December 1961) speak for themselves. The total production in the two months amounted to just 590,000 metric tons (including the 56,000 tons produced prior to November 1961), as compared with 779,000 tons in the corresponding period of 1960-61, representing a fall of as much as 24 per cent. In view of such a sharp drop, a section of sugar circle apprehends that the sugar output for the whole season will be considerably less than the 10 per cent cut enforced. It may be noted here that the Union Minister for Food and Agriculture had declared in Parliament that the cut of 10 per cent in sugar production during the 1961-62 season would in effect amount only to a reduction of 4 per cent in the overall output, since the cut did not apply to certain categories of sugar mills.

Besides the heavy penal levy, there are said to be other disquieting factors, too, which are handicapping sugar production. According to a resolution adopted at a conference of the East Uttar Pradesh group of sugar mills, held at Gorakhpur recently, the mills have to pay large amounts by way of interest to banks due to large carryover. Many of the banks are chary of supplementing their advances against sugar of 1961-62. Consequently, the mills, it is stated, are finding it extremely difficult to meet their day-to-day commitments such as payment of cane prices, salaries and wages to workers, and purchase of other materials of daily consumption. Further, attention is drawn to the quota restrictions imposed by the North Eastern Railway against movement of sugar to Assam and West Bengal and the "utter failure" of broad-gauge railways at transhipment points to lift their full normal quota from the N.E. Railway which have blocked sugar movement and are creating more complications for the sugar industry. What is worse, the U.P. Government's intensive drive to realise interest on arrears of cane price, commission payable to cane co-operative marketing societies and penal interest on unpaid cane purchase tax by issuing recovery certificates for realising the arrears as arrears of land revenue is also telling heavily on the East U.P. factories.

Severe Crisis

The cumulative effect of all these factors is that the factories are left with no alternative but to stop crushing cane. Indeed, it is said that the East U.P. sugar mills are in the grip of a severe crisis. The resolution adopted at the Gorakhpur conference said:

"The sugar industry in East U.P. is the weakest in the country financially. This has been confirmed by the Tariff Commission (1959) and Sugar Wage Board. The industry has a very heavy carryover of the last year's production and the prices of sugar have come down below Rs. 36 per maund, as against a sale price of Rs. 38.96 adjusted to Tariff Commission schedule, with no future sales in hand. This fall in prices has not only wiped off the return on capital ensured by the Tariff Commission but is less than the cost of production by over a rupee per maund. All the sugar factories in East U.P. have not only suffered huge losses but they are also faced with the problem of the disposal of their stocks lying in their godowns. They have no local market and are situated at a distance from consuming centres which make them suffer from freight disadvantages. They are low production units and the export loss is the heaviest on them. Then they have to carry out the decisions of the Wage Board."

On behalf of sugar mills, a number of suggestions have been put forward with a view to alleviating the difficulties. One of them pertains to the withdrawal at least of the additional excise duty levied in 1958 for restricting sugar consumption on account of shortage, now that there is plenty of sugar available in the country. The U.P. Government was requested to direct the cane societies to waive the interest due on arrears of cane prices and commission, and to implement its assurance of not charging any interest up to 31st March 1962 on arrears of cane purchases in the last season which had encouraged the mills to carry on crushing till July 1961 beyond their contractual liability in order to crush all the cane available even at the cost of lowest recovery. The Government was also requested to link the realisation of cane purchase tax with despatches of sugar, as well as to reduce the current rate of tax.

The aforesaid suggestions seem to be quite justified and deserve to be implemented, if only because the industry has not been given the latitude to readjust the cost of production to the realisable value of sugar. The price of sugarcane is fixed and so also the emoluments to workers. Cost of transport and the quantum of taxation, too, are outside the influence of sugar manufacturers. The movement of sugar is also regulated by the Government, so that, even if any of them want to cut their loss of selling their sugar stocks by reducing their prices, they cannot do so. In view of all this, the decontrol of sugar industry is virtually a farce. Indeed, a manufacturer cannot even completely shut down his operations for a year, because of his commitments to workers and canegrowers the fulfilment of which will be neither easy nor less expensive than keeping the factory going. There can be no better example than that of the sugar manufacturer as a man bound hand and foot, being asked to win a swimming contest. If such a person were pushed into the swimming pool, the outcome would be obvious.

Serious Repercussions

If the Government persists in its present policy for long, there would be, sooner or later, many fatal casualties in sugar industry. The weaker units would first curtail production, in the spirit of "come what may." If there were to be no response even to such acute distress signals, they would finally shut down their operations. Such an eventuality will not be in the interest of either the workers or the canegrowers or the investors. The Central and State Governments, too, will get less by way of taxation and the whole economy will suffer thereby.

Although the production of 590,000 metric tons of sugar upto the end of December 1961 was, as already stated, appreciably lower than the output of 779,000 tons in the same period last season, there need be no fear of shortage of sugar. The mills' godowns are already bursting with heavy unsold stocks of the 1960-61 season. Further, even the lower production of sugar so far this year is well above the offtake. The quantity actually despatched during the first two months of 1961-62, for instance, was 405,000 tons (including 31,000 tons despatched for export), that is, 185,000 tons less than production. It is, however, 82,000 tons more than the quantity lifted in the corresponding months of the previous year, but this increase is small. It is thus evident that the offtake of sugar from factories has not gone up to any significant extent, despite decontrol.

The reasons for this state of affairs are not far to seek. Apart from transport bottlenecks, inadequate financial resources, expectations of a cut in excise duty at any time, to all of which a reference was made in this journal on an earlier occasion, there has been no reduction in the retail price of sugar. The offtake will definitely rise markedly if the Central Government lowers the excise duty and if adequate and timely transport facilities are ensured to move sugar freely from one place to another. When movement of sugar is accelerated, less funds, as this journal has ere now stressed, will be required to finance production and stocks, creation of additional godown space will be unnecessary, there will be larger employment, and Governments will get more revenue in the end. Why is the Government not adopting these obvious solutions, though it knows all about them? Red-tapism, sluggishness and Ministers' preoccupation with the forthcoming elections seem to be the only answers. Democracy is, of course, more expensive than Communism. But it becomes prohibitive, if it is characterised by socialist planning where a licence is required even to buy a pin.

OUTLOOK FOR WORLD SUGAR TRADE

Certain interesting statistical projections in regard to the pattern of world sugar economy in the coming years have been made by the Food and Agriculture Organisation, in the course of a special study the results of which were published recently. These projections point to "ample scope" for the continued expansion of world trade in sugar. It will be necessary, according to the F.A.O., to produce 105 million tons of sugar, in order to enable the world to have the average European *per capita* consumption of 35 kg. This quantity is 60 million tons more than the current rate of output. It is estimated that, even if two of the three most populated countries of Asia (that is, India and China) were to have a *per capita* consumption of only 10 kg., some 75 million tons would still be needed to feed the rest of the world at an average level of 35 kg. per head. The estimated world requirement, it may be noted, is reckoned at a lower rate than the consumption rates ranging from 50 to 55 kg. prevailing in a few prosperous countries in Europe.

Whatever be the basis on which the aforesaid conclusion of the F.A.O. has been arrived at, it has to be stressed that the trend of sugar consumption will be influenced, to a considerable extent, by the price factor, not to speak of the rate of population growth and the pace of improvement in the living standards of the masses in the vast majority of underdeveloped countries. Recognising this fundamental point, the F.A.O. says:

"An important factor in boosting world sugar trade and consumption in most countries has been the downward variations in prices over the last three decades. . . . In countries like India, where sugar consumption has not improved very much over the years, sugar prices, too, do not show any downtrend. On the contrary, sugar consumption in India has been more or less static in recent years, and retail prices throughout the period since the Second World War have been appreciably higher as compared with the pre-war levels. In contrast, where sugar consumption has been rising rapidly in most cases, retail prices have fallen below the pre-war levels."

There is a fallacy in the F.A.O.'s reference to *per capita* sugar consumption in India which is taken as 5 kg. This figure pertains only to white sugar and excludes brown sugars such as *gur* and *khandsari*. These substitutes are widely consumed, especially in rural areas, in view of the fact that their prices are lower than those of the factory-made white sugar. Including *gur* and *khandsari*, the *per capita* consumption of sugar comes to about 14 kg. There is, however, no denying the fact that, if the present markedly high prices of white sugar are reduced to reasonable levels, its consumption is bound to rise significantly as has been clearly brought out by the F.A.O.'s analysis of the recent trends in world sugar trade.

SUGAR PRODUCTION AND STOCKS

According to the Indian Sugar Mills Association, the total sugar production during the month of December 1961, the second month of the season 1961-62, was 417,000 metric tons, as against 486,000 tons in the same month last season, bringing the total production for the season 1961-62 upto 31st December 1961 to 590,000 tons (including 56,000 tons produced prior to November 1961 for the current season), as against 779,000 metric tons in the corresponding period last season.

The offtake of sugar from factories during December 1961 was 203,000 tons, which included 21,000 tons despatched for export, as against 169,000 tons (including 12,000 tons despatched for export) a year before. The total despatches during the first two months in the 1961-62 season amounted to 405,000 tons (including 31,000 tons despatched for export) as against 323,000 tons (including 21,000 tons despatched for export) in the same period last season.

The total closing stocks of sugar with the factories as on 31st December 1961 was 1,330,000 tons, as against 1,007,000 tons on the same date last season.

INDIAN IRON ORE IN THE WORLD PATTERN

NEED FOR DEVELOPING MINES NEAR COASTAL AREAS

By V. C. Saptarshi

MINERAL resources are located geographically by nature. No country is self-sufficient in regard to mineral resources as required by modern industries. The history of industrial growth also shows that only a few countries are endowed with the right combination of minerals essential for industrial purposes. Thus, geographic distribution of minerals leads to interdependence between countries and ultimately to international trade in minerals. In 1950, due to ever-growing demand for cheap steel, six countries in Europe felt it essential to combine their resources of iron ore and coal and established the "European Coal and Steel Community."

India is potentially rich in mineral resources but does not yet possess the right combination for her full industrial progress. Deposits of copper, zinc and lead are still being explored and developed.

India's mineral wealth includes many minerals of which there is an exportable surplus. These are iron ore, manganese ore, bauxite, mica, ilmenite and magnesite.

The National Mineral Policy is fairly well established with the growing importance for State participation in the exploitation of minerals such as coal, iron ore, copper and diamond. However, a mineral export policy on a long-term basis needs immediate attention. This should be well assisted by other factors such as freight concessions, minimum royalties, port charges and other facilities necessary to have the export prices of ore to be competitive in the world mineral market. Various undeveloped regions in the world are being explored for minerals and, if India does not establish her export market for minerals on a long-term basis in the near future, it may be too late and a great loss to the economy.

India's Position

Recent surveys for world iron resources by the United Nations' experts show that India, Brazil, U.S.A. and U.S.S.R. have large deposits or sources of iron ore. Out of the estimated world sources of 85,000 million tons, India's share is 21,000 million tons. Next to India, China, Korea, Malaya and Japan in Asia, have substantial iron ore reserves. The estimated Chinese reserves are to the tune of 4,200 million tons.

This is a very important observation and there are regions still unexplored which will ultimately add to the world reserves of iron ore.

Except Jammu and Kashmir, Uttar Pradesh, Madras, Kerala, West Bengal and Assam, every State of the Indian Union is producing iron ore. The major production of iron ore is in the States of Orissa and Bihar. The State of Maharashtra contributes approximately 2 per cent of the total production. In 1960, the production of iron ore reached a peak figure of 10.68 million tons. Indian steel plants consumed 7.23 million tons of iron ore, as against 5.68 million tons in 1959. India exported 3.4 million tons of iron ore worth Rs. 170 million in 1960, as compared with 2.5 million tons worth Rs. 120 million in 1959.

The estimated reserves of coking coal in India are between 350 and 500 million tons. Apart from iron and steel works, railways consume a large quantity of selected grade coal. Compared to iron ore resources of India, the coking coal reserves are poor. Ultimately steel production in India will be limited by the coking coal reserves, unless there are technological improvements to use non-coking coal and other fuels. The coal areas of India are localised in the States of Madhya Pradesh, Eastern Maharashtra, Bihar, Andhra, Orissa and Bengal. It is interesting to note that the large iron ore reserves in India are in the vicinity of coal. This geographic pattern of iron ore and coal will ultimately govern India's location of iron and steel works.

The estimated demand for steel by the end of the third Five-year Plan is about 10 million tons. With the expansion of existing steel plants and the addition of a new steel plant at Bokaro, it is hoped that the steel demand of India will be met. The iron ore required will be 20 million tons, while an additional 10 million tons will be available for export.

The Limiting Factor

Steel production is the basis of modern industries. Even though the country is rich in high grade iron ore resources, steel production is limited by coking coal and in this respect it is worthwhile to study industrially advanced countries like Sweden.

Sweden exported 19 million tons of iron ore in 1960, while steel production was limited to 3 million tons. Latin America, which is comparatively underdeveloped, exported more than 25 million tons of iron ore in 1960. The total coal production in Latin America in 1960 was hardly 8 million tons. Every effort is being made to increase steel production in South America, but, ultimately, it will be limited by the availability of either coking coal or fuel and the reducing agent which can be successfully utilised for the production of iron and steel.

India enjoys a unique position because of her iron ore deposits rich in quality and quantity. After supplying high grade iron ore to her own steel plants, it can still export iron ore to Asian and European countries for years to come.

The old pattern of colonial exploitation is being replaced by foreign collaboration in Africa, Latin America and other countries to ensure the supply of raw materials at a minimum distance from the iron and steel production centres. It is also observed that no purchaser of ore can afford to depend on a single source of supply as the supplies are likely to be affected in underdeveloped countries due to national mineral policy.

India is already committed in the third Five-year Plan to export 10 million tons of iron ore. Provincial susceptibilities should not be allowed to hinder national export policy and hold back grant of mining leases. There is a tendency to establish processing plants without any respect to the economics of production and availability of other necessary and adequate raw materials.

In the comprehensive picture of world mineral resources and their development, it is essential that India must also occupy her legitimate place. Her export trade in manganese ore is already affected. Therefore, a close study must be made of the necessary means and methods, so that India does not lag behind other producing countries. From such a study it would be apparent that India cannot afford to neglect the development of the international mineral production and marketing if she wants to be an important iron ore exporter in the world. The following paragraphs would indicate the developments taking place in the respective countries:

Important Countries Exporting Iron Ore

(Tons)

Countries	1957	1958	1959
Goa	2,678,408	2,427,808	3,627,863
France ..	14,085,265	15,041,047	19,697,439
Sweden ..	17,191,000	14,576,000	15,224,177
U.S.S.R. ..	10,602,500	11,730,800	13,233,600
Brazil ..	3,494,006	2,786,412	3,925,454
Chile ..	3,025,456	3,580,523	4,193,300
Venezuela ..	15,331,377	15,325,626	16,400,000

Important Countries Importing Iron Ore

(Tons)

Countries	1957	1958	1959
Belgium-Luxemburg.	15,762,572	16,546,142	17,836,735
Czechoslovakia ..	4,895,000	5,081,000	6,268,000
Germany (Federal) ..	18,820,236	16,693,767	19,719,971
Poland	5,820,000	5,659,000	6,115,000
U.S.A.	33,651,000	27,529,895	35,613,259
Japan	9,315,844	7,493,525	10,274,816

Latin America

"The potential in Latin America is inestimable because it is still geologically uncharted for the most part. Sound economic development of these mineral areas would be to the ultimate advantage of the Western world." (Thomas M. Ware, President of International Minerals and Chemical Corporation—Conference of Inter-American Industries, Chicago, Illinois, U.S.A. July 1961).

The high grade iron ore reserves of Latin America are very large and the potential of medium grade deposits will not be used for a long time to come. It is worthwhile to note that only a small portion of the total area of South America, where iron ore deposits are likely to be found, has been properly evaluated.

Brazil: Commercial deposits of iron ore have been located in the State of Noto Grosso, State of Bahia, State of Ceara and territory of Amapa. However, iron ore deposits of the greatest importance are located in an area of 7,000 sq. kilometres, known as the Quadrilatero Ferrifero, in the South Central part of the State of Minas Cerais. The Minas Cerais deposits contain estimated reserves of 16 billion tons of hematite ore and high grade hematite ore (66-68 per cent) are more than one billion tons. The domestic consumption of Brazil is about 5.2 million tons. Brazil expects to double its production partly for its domestic consumption and partly for export. The ore is sold in the United States, U.K., West Germany and Japan. For soft ore an approach is being made to Poland and Czechoslovakia. Transportation facilities are being provided from Minas Cerais to the coast and it is expected that, after the development of railroad, the soft grade ore will flow into Western Europe and even to the Soviet bloc countries. Ultimately, Brazil will be in a position to market 10 to 15 million tons of iron ore per year by 1965.

Venezuela: Next to Brazil, Venezuela has the known largest iron ore deposits in South America. The important ore deposits of Venezuela are found in the State of Bolivar and south of the river Orinoco. The ores are similar to the Lake Superior region in the United States. Recently, the Venezuela Government, with the assistance of private companies, have developed various areas having proved reserves of one billion tons of high grade ore and probable reserves of 3 billion tons. Bethleham Steel Company of the U.S. has a subsidiary company operating at El Pao and the United States Steel also has organised a subsidiary company—Orinoco Mining Company—to mine deposits at Cero Bolivar, 60 miles south-east of El Pao. Venezuela iron ore reserves exceed 4,000 million tons. Most of the exports are to the United States.

Chile: Since 1954, Chile has been very active in prospecting for iron ore deposits. The various deposits located are given below:

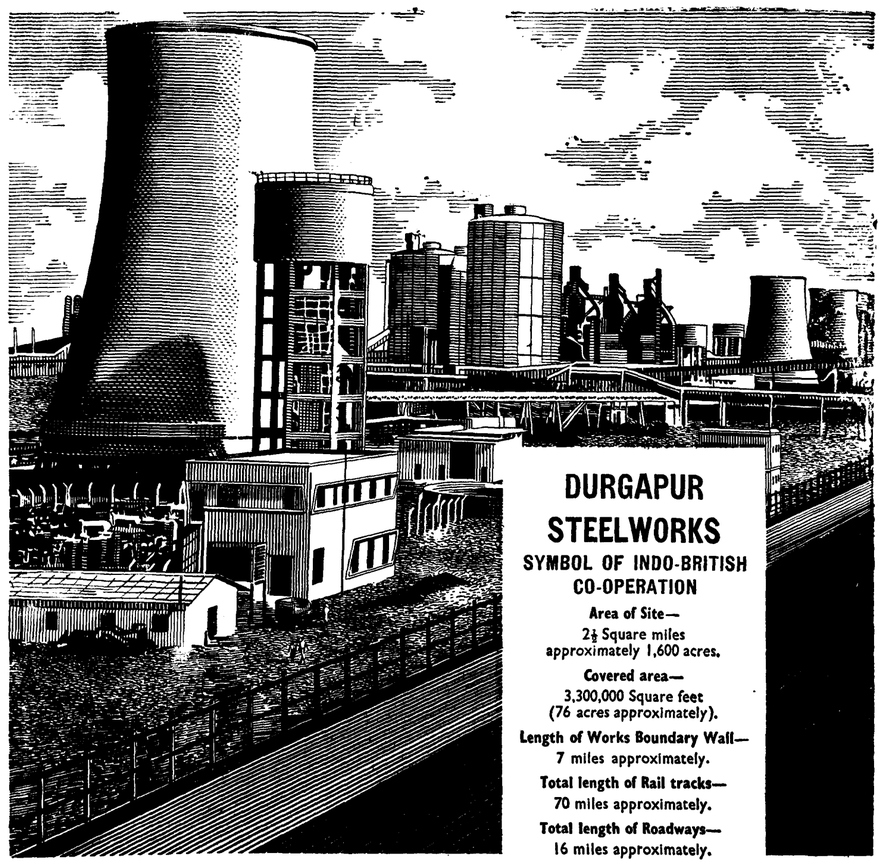
Province	*Location*	*Reserves* Million tons
Atacama ..	Algarrabo and other places.	200
Coquimbo ..	El Tofo, Romeral and other places	
Anto Fagesta ..	El Laco	1,000
Arauco ..	"	500

The producton of iron ore in Chile in 1958 was 3.7 million tons. The Chilean ore is in great demand, though it is away from the steel market, because of the low cost of production and richness of ore. The production may reach 5 million tons in the near future. The ore is being exported to the United States, West Germany and Japan. The Compania, Santa Fe, announced that it will develop the El Laco to produce 7 to 10 million tons of 60 per cent iron ore per year. Chile is now exporting about 4 million tons of iron ore per year and the exports are to Japan and European countries. The country's domestic consumption is half a million tons.

Peru: This is one of the important countries in South America which is partially prospected for iron ore and is expected to double its production in the near future. Peru's known iron ore resources are about 800 million tons and recently 200 million tons or more have been located in other areas. The iron ore deposits found in the Marcona area are mined from open pits and transported to a distance of 27 miles to the port of San Juan.

Acari deposits in the Andean foothills have been developed by the Peruvian company financed by American interests. The combined production capacities of the above two companies will reach 6 million tons per year within the next five years.

It is interesting to note that the iron ore deposits in Venezuela, Chile and Peru and some of the Brazilian deposits are situated on the coastal regions. This geographic condition enables the deposits to be competitive in price as it minimises inland freight. In 1960, Brazilian ore was quoted at $4.50 per ton f.o.b. Brazil, Venezuela, Chile and Peru have plans to increase the production and export of iron



This giant Steelworks has been built by the combined efforts of British and Indian engineers. It is already contributing substantially towards the progress of national industries and transport.

ore in the world market. Other countries such as Argentina, Columbia and Bolivia have resources enough to satisfy their own economy.

Africa

The Continent of Africa covers an area of 11,262,000 sq. miles, with a population of about 200 million people with 40 political divisions. In 1960, 16 territories with 85 million population became independent. Four-fifths of Africa's population were under European rule in 1954. By 1961, three-fourths were to be living in independent States.

Independent African States are willing to deviate from their old rulers, but circumstances do not permit them to change their trade pattern. British colonies will continue to associate with Britain and French Community States with France and Europe. However, recently Ghana indicated to leave the Commonwealth and Guinea has already opted to stay out of French Community States.

Yet very little is known regarding the mineral resources of this vast continent. Further, British, European and American capital investment in African States is inevitable as the Continent has immense potential as a market for raw materials. More than a million tons of iron ore per year is produced in Africa, with the Union of South Africa taking the leading position. The others are Algeria, Liberia, and Morocco. Iron ore deposits are also known to exist in Northern Rhodesia and Southern Rhodesia.

Angola: A joint venture of the Portuguese, Germans and Danes have decided to export iron and manganese ore at Casinga worth 40 million dollars from 1963 from port Mocamedes. The political situation in Angola is, however, very unfavourable and developments are likely to be postponed.

Mozambique: An Anglo-American Corporation of South Africa is negotiating with a Japanese firm to sell one million tons of iron ore per year from the adjoining Swaziland deposits. The export will be possible if the railroad to Swaziland border is extended. The ore to Japan will be exported from port Lourenco Marques of Mozambique.

Southern Rhodesia: Messrs. Kobe Steel Works carried out extensive prospecting operations on hematite deposits near Queque and it is learnt that the results are promising. If these deposits are proved, the ore will be exported to Japan.

Sierra Leone: Sierra Leone Development Company shipped iron ore to Europe and the United States of America. The Company started planning an expansion in capacity to 2 million tons per year and, before 1965, it is due to produce 3 million tons per year. Another iron ore deposit at Tonkolli will require £30 million to develop and five years to go into production. This area is also expected to yield 3 million tons of iron ore per annum. The reserves are 400 million tons of iron ore, with more than 65 per cent Fe.

Libya: A Swiss-American Combination has decided to exploit iron ore in the region of Fezzan. The estimated reserves are 2 to 3 billion tons and as such high capital investment is expected. The grade of the ore is 44 per cent Fe and an expenditure of 40 million dollars will be required for full development.

Liberia: Liberian American Swedish Minerals Company's joint venture for mining operation of iron ore have decided to develop Mount Nimba iron ore deposit. This project will call for investment of about 200 million dollars. Twenty-five per cent of the output will be exported to the United States and the remainder has been put under long-term contract principally with German steel firms. With the development of Nimba deposits, the total iron ore production should reach 5 million tons per year.

Mauritania: Iron ore deposits of estimated reserves of 150 million tons on the edge of Sahara has been located. The contents of the ore are 63 per cent Fe. For the development of the deposits, finance of the magnitude of 66 million dollars is expected from the International Bank for Reconstruction and Development, the French Government and other resources.

Cameroon: The Bureau of Mines of Overseas France announced discovery of iron ore deposit, with potential reserve of 100 million tons. The deposit is located near Kribi.

Gabon: Development of iron ore deposits in Mekambo and Tchivango continued in 1960 with reserves at Mekambo estimated at 200 million tons containing about 60 per cent Fe and Tchivango reserves of 80 million tons with 43.5 per cent Fe.

It will be observed from the foregoing account that various combines are interested in developing resources in the coastal countries of Africa. The object is to assure a guaranteed supply of raw materials on long-term basis for the steel works in Europe.

Known coal resources of Africa are not encouraging but important coal deposits are located in Morocco, Union of South Africa, Rhodesia and Belgian Congo. The development of the African countries can be accelerated, provided the countries with varied mineral resources and geographically well situated form an economic community for mutual benefit.

Japan

Japan is the most important consumer of Indian iron ore and has produced a record level of 22.1 million tons of steel in 1960. Japan's share in the world output was 6.5 per cent. The domestic iron ore production is more than 2.5 million tons per annum. This industrially advanced country in the East is dependent on foreign resources for iron ore. Japan's big six steel producers are planning to invest £1,400 million for their expansion plan before the end of 1965. Malaya, Philippines are also important suppliers of iron ore to Japan. During the next ten years, Japan is expected to import 45 to 50 million tons of iron ore a year.

India is already committed to supply iron ore to Japan from Kiriburu and Bailadila for which Yen credit has been granted. The Japanese steel mills, in view of their expansion plans and lack of adequate domestic resources of iron ore, have shown interest in overseas iron ore deposits in Australia, Africa, Latin America and Alaska. It imported from North and South America 2.824 million tons of iron ore in 1960. A delegation was also sent to Australia (in May last) to investigate the export of iron ore, in view of the recent relaxation on exports by that country. Japan has also contacted the Union of South Africa and Canada.

It will be interesting to note that Goa, which produces more than 5 million tons of iron ore per year, has entered into an agreement with Japan for the supply of 4 million tons of iron ore per year, while the total Indian exports of iron ore in 1960 were 3.4 million tons.

China

China's steel production (crude) in 1960 was 18.50 million tons. This is 5.5 million tons more than the 1959 production. This increase in production is attributed to giant integrated steel plants in Ansham in Paotow, in inner Mongolia and Wuhan in Central Asia. It is also said that the Chinese iron and steel industry has developed medium-sized mills which have contributed a great deal to the pig iron production.

U.K.

The domestic iron ore production is more than 14 million tons and is further assisted by imports of iron ore from various countries. The steel production in 1960 was 24.7 million tons which was 20 per cent more than in 1959. The U.K.'s share in the world production of cast steel was 7.2 per cent. The British production is expected to achieve 27 million tons in 1961.

In the event U.K. is accepted as a member of the European Economic Community, the steel prices will be governed by the European Coal and Steel Community. The existing steel prices are controlled by the Iron and Steel Board, which are cheaper than Continental steel. As a member of the E.C.S.C. (Economic Coal and Steel Community), the producer cannot discriminate between the member-consumers. The steel prices in the U.K. are, therefore likely to go up. With the substantial increase in the cross-frontier trade in Europe, which was over 9 million tons in 1960, the U.K. steel industry is bound to take a larger share in this trade.

Western Europe

It was a well-known fact that divided Europe with different geographic boundaries and tariff restrictions could not progress. In 1947, the U.S. offered the Marshall Plan and insisted that the European nations co-operate with one another for their needs. In 1950, the Foreign Minister of France proposed a plan to unify coal and steel industries of Western Europe. His proposal would place the entire coal and steel production of France and Germany under a joint high authority with an organisation to open participation by other European countries. Six European Governments signed a treaty on 18th April 1951 for the establishment of a European Coal and Steel Community. The six countries are the Netherlands, Belgium, Luxemburg, Italy, France and West Germany. This was essential as European steel producing countries were interdependent for both raw materials and markets. In eight years, the steel production in the six member-countries had reached 73 million tons in 1960. In 1957, the Common Market was ratified under the treaty of Rome and all the members of the E.C.S.C. became members. The application of the U.K. is under consideration and the main opposition to British membership comes from France whose own colonies and French community member-countries produce the same raw materials that are exported by the Commonwealth. However, it is quite certain that ultimately the U.K. will be accepted as a member of the E.E.C. It is also learnt that Sweden, which is a member of the European Free Trade Association, is intending to become a member of the E.E.C.

The leading producers of iron ore in Europe are France, Federal Republic of Germany, Luxembourg, Sweden, Norway, Poland and Spain.

Indian exports of iron ore to Western Europe fell from 330,000 tons in 1953 to 73,400 tons in 1959 due to high prices of Indian ore.

U.S.A.

Steel production in 1958-59 was affected by recession and strike. However, production improved in 1960 which was 90 million tons of steel. Further, there is a definite improvement in demand and heavy spending on Defence programme is bound to reflect on steel production. The imported European steel in U.S.A. is still competitive in price and rising cost of steel production in the United States is a problem which the steel industry is facing. The U.S.A.'s peak production of iron ore in 1957 was 106 million tons, while imports in that year were 33 million tons. In 1959, U.S.A. imported 35 million tons of iron ore.

It is interesting to note that the Japanese firms have shown some interest in the iron concentrates on the western coast of the U.S. The Japanese firm of Mitsubishi has signed a contract with the Kaiser Steel Corporation for supply of one million tons of iron concentrates (61 per cent Fe) for the next ten years. Similarly, Standard Slag Company will also supply 4 million tons of iron concentrates to Japan over a period of the next ten years. The U.S. has a total of 9.000 million dollars investments in Latin America, and further investment in Africa by the U.S. is inevitable, as the Continent is still unexplored and has immense potential for supply of raw materials.

U.S.S.R.

The U.S.S.R. is rich in iron ore reserves and new regions are being explored. In 1959, Soviet Russia produced 59 million tons of steel and more than 92 million tons of iron ore. The U.S.S.R. is also exporting iron ore to other Communist countries of Eastern Europe, while importing coal from Poland.

Recently, iron ore deposits with 300 million tons of reserves were located about 250 miles from Moscow. The ore is between 58 and 69 per cent Fe. It is planned to produce 16 million tons per year from this deposit from 1965. The Russian Minister for Geology and Conservation of Mineral Wealth announced the reserves of Krusk Anamoly deposits. This is considered as the largest iron ore deposits in Russia. The reserves are 30 billion tons of high grade iron ore. It is planned to produce 60 million tons of iron ore from these deposits in 1980.

After reviewing the general trend of iron ore production in various countries, it is quite obvious that every effort is being made to explore and increase production of iron ore. Recent surveys carried out by the United Nations on the requirement of pig iron in the world indicate that the world needs of pig iron will be 384.3 million tons in 1972-75. On this basis, the world will need 824.6 million tons of iron ore in 1972-75. As against this, the world's total iron ore production in 1959 was 432 million tons. Thus the demand for iron ore within the next 10 to 15 years will be twice what it was in 1959.

Another point that emerges from this survey is that Japan, which is the principal buyer of Indian iron ore, is making every effort to obtain iron ore from all over the world. Latin America, North America (including Canada), South Africa, Australia, Philippines and Malaya. Brazil in Latin America is making efforts to sell low grade ore in East European countries, while North African and West African countries are establishing their markets in Europe and North America. Goa,

THE AMERICAN ECONOMY: PROSPECTS FOR GROWTH THROUGH 1975

PART I: THE GROWTH POTENTIAL ANALYSED

By Dr. Dexter M. Keezer

ECONOMIC ADVISOR, McGRAW-HILL PUBLISHING CO., INC., NEW YORK

THIS is the story of the American economy over the next 15 years. It is a story of growth.

Historically, our economy has continued to grow, despite ups and downs and a disastrous depression in the 1930's. And even though our economy began the 1960's at a somewhat less than "soaring" pace, the American economy will grow and attain the long-run growth potentials for 1965, 1970 and 1975 set forth in a study by the McGraw-Hill Department of Economics.

This study of growth makes two main points about the American economy between now and 1975:

1. The substantial growth potential of the U.S. economy as a whole.

2. The extraordinary potentials for growth of a number of individual industries and industrial fields.

The recording of these potentials is not a forecast of the position of the general economy or any industry at a particular time during the period covered. It must be expected that business in general and individual industries will continue to have ups and downs rather than move in the straight lines of growth which are presented here for the period as a whole. The study also assumes, of course, that wise business and public policies are pursued and no untoward circumstances arise.

Our study begins with the growth of the United States economy as measured by the gross national product—total output of goods and services—since 1900. During the past 60 years, the gross national product has increased at an average rate of about 3.1 per cent per year. (This is the rate of real growth after adjustment for price changes.)

In 1960, out of our total population, nearly 67 million people were at work. Their average output, measured in 1960 market prices, was $3.65 per manhour, and they worked an average of 39.7 hours per week during the 52 weeks of the year. This average includes weeks when people were on vacation or part-time work, as well as weeks when they worked overtime (including the long hours put in by farmers).

The result was a gross national product in 1960 of $503,000 million.

Of this total output of goods (as shown in Chart I), about $54,000 million was purchased by the business community. Nearly $100.000 million was spent by the Government (Federal, State and Local). The rest of the national product, about $350.000 million, was purchased by consumers (housing is included in consumer expenditures).

How much will our gross national product increase in the future? As in the past, this will depend: (1) on the size of the market to be served; (2) on the labour force available; and (3) on the resources and skills that the labour force can put to work. It will depend largely on the productivity (output per manhour) that our labour force can achieve. Obviously, the total market for goods and services is going to grow considerably, inasmuch as the expected growth in population over the next 15 years is 31 per cent, with total population reaching 235 million in 1975.

However, the relative increase in the key working age group, 22-64, is expected to be smaller than for the population as a whole. The labour force will grow from 73 million to nearly 95 million, but not quite as fast as the total population.

From 1930 to 1960, hours of work declined about two hours per decade. For the period 1960 to 1975, we project a similar downward trend in hours of work. The average workweek is expected to decline from about 40 hours in 1960 to 38 hours in 1970 and to 37 hours in 1975.

From 1930 to 1960, productivity increased, on the average, about 2.5 per cent per year. We have done better than this during the 15 years since the end of World War II. With continued improvements in research, education and capital goods during the 1960's and 1970's, we may hope that average national output per manhour, the key factor in projecting growth, will increase at a rate of 2¾ per cent per year, midway between the rate of the last 30 years and the post-war rate. If the labour force increases as expected (a dependable forecast since most of the people who will make up the labour force in 1975 are already born) and if output per manhour increases 2¾ per cent per year, the gross national product will grow from $503,000 million in 1960 to $630,000 million in 1965, $771,000 million in 1970 and to about $940,000 million in 1975. (All in 1960 prices.)

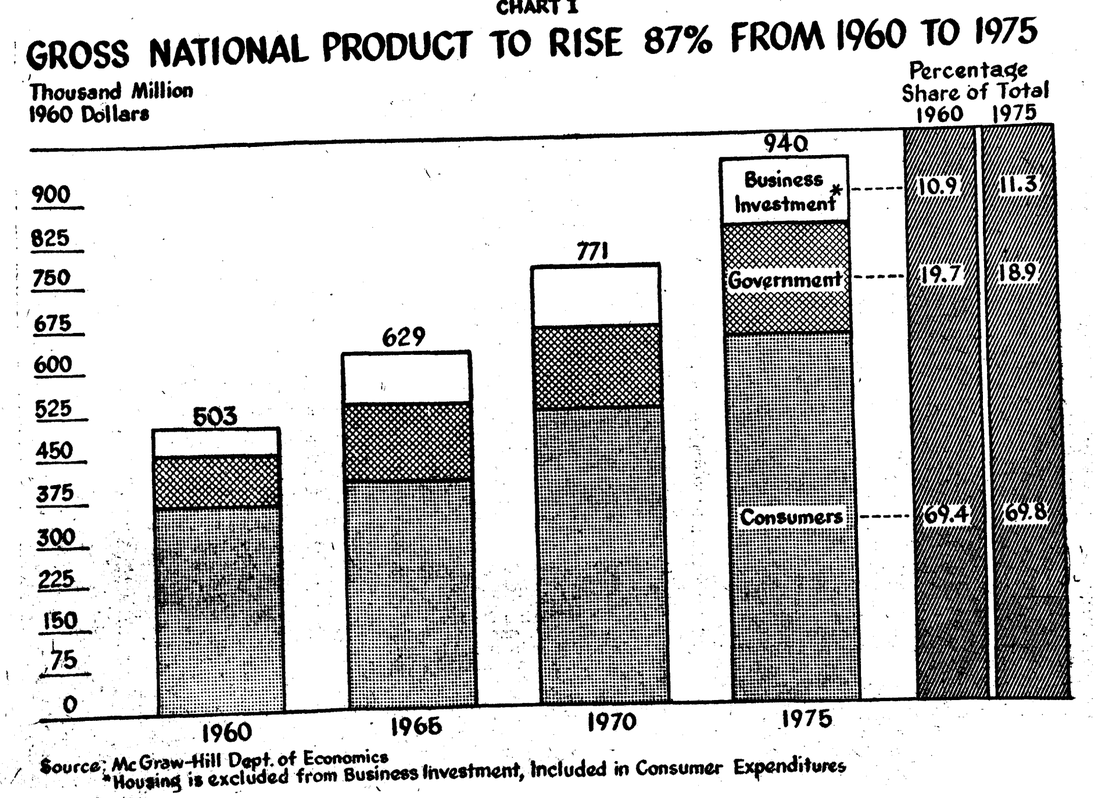
As Chart I shows, in 1975, the distribution of our national product will not differ greatly from what it was in 1960. If defense needs are relatively lower, as we hope they will be, the Government's share of the economy will be slightly less and the business and consumer sectors of the economy will account for a somewhat bigger percentage of the total.

The gross national product of $940,000 million in 1975 will be produced by 88.8 million workers who will work an average of 37.0 hours per week for 52 weeks and whose average output, measured in 1960 market prices, will be $5.50 per manhour.

Of this total output of goods and services in 1975, about $106,000 million will be purchased by the business community, about $178.000 million will be bought by Government (Federal, State and Local), and about $656.000 million will be purchased by consumers (housing is included in consumer expenditures).

(To be continued)

CHART I



ON ACHIEVING SUCCESS IN EXPORT TRADE

NEED FOR REORIENTATION OF POLICY

By Chinoobhai C. Javeri

THERE is a growing recognition that the country must boost its exports for the successful implemeniation of the third Plan. During the second Plan period, the total exports were to the tune of Rs. 3,063 crores, against the estimated figure of Rs. 2,965 crores, exceeding the target by Rs. 98 crores. In the draft outline of the third Plan, the aggregate foreign exchange receipts on account of exports have been taken as Rs. 3,700 crores. The country must, therefore, export on an average Rs. 740 crores annually, as against Rs. 613 crores in the past, that is to say, Rs. 125 crores more per year than during the second Plan period. With the right effort, this target is not impossible to achieve. We have the men, the skill and the material but we lack initiative, drive and enthusiasm. There is, however, no place for complacency, because world markets have become highly competitive. Every country, throughout the globe, is striving and manœuvring to increase its exports to earn more foreign exchange.

There is also a burning desire among the underdeveloped countries to industrialise, in order to meet the growing needs of their population. Consequently, imports are either restricted or banned by them. At the same time, regional trading groups, such as the European Common Market and the Outer Seven, have emerged. The proposed entry of the U.K. into the European Common Market will give a serious setback, at any rate in the immediate future, to our export trade. Thus, a new phase has entered in the pattern of international trade.

Measures for Consideration

All these factors stress the need for reorientating the country's export policy and to strengthen the export promotion drive for which the following measures may be considered for early implementation:

1. The first and foremost step to be taken is to create a surplus of exportable commodities not by curtailing domestic consumption which will lead to runaway prices, since the *per capita* consumption in the country is already low, but by increasing overall production and checking the rise in prices. These measures are vitally important, particularly in view of the unprecedented growth of population.

2. Since most of the Indian products are priced out of the world markets, because of the high cost of production and their qualities being not standardised to inspire confidence among foreign buyers, India is losing ground in export markets. Is it the high cost of production or the manufacturers' expected high margin of profit which they earn in the local market that renders Indian prices non-competitive? All export promotion measures will fail, unless this question is tackled and the cause of the basic weakness of Indian prices are thoroughly investigated and promptly remedied by taking timely and appropriate measures.

3. In view of the drift in the demand for goods in the world markets and the scope for expansion of export in India's traditional items being limited, India must diversify the export base, commodity-wise, as well as destination-wise.

The diversification should not be haphazard and at random. The whole process should be thoughtfully planned out and systematically built up from strength, maintaining service, integrity and continuity of supply. One of our major drawbacks is lack of service and discontinuance of supply when the local market is favourable.

Quality Control

4. Quality control and pre-shipment inspection schemes for export commodities, wherever warranted and as recommended by the *Ad Hoc* Committee on Quality Control, may be introduced with caution. The machinery for regulating them may be set up in consultation with trade and industry.

Nevertheless, since there is demand for cheaper varieties of goods, having no quality standard, it will be unnecessary to prescribe quality control for all goods. What is paramount is that the goods supplied should be according to approved samples and specifications. However, the buyers, if they so desire, could ask for pre-shipment inspection on their own.

5. Since quite a number of exportable items now attract excise duties and the list is increasing every year, the existing cumbersome and complicated procedure for claiming rebate should be revised and simplified to promote exports. Moreover, wherever practical, particularly in the case of standard goods, the condition regarding identification of goods for grant of rebate should be waived, so that exports could be effected from ready stocks held outside the factory. After all, no excisable goods could be removed from a factory before paying excise duty.

6. Since the results of the existing incentive schemes have not come up to expectation, the Government would do well to revise and improve upon them in the light of the experience gained. Abnormally high incentives neither prove economical nor serve the intended purpose. Instead, it might be expedient if imports are linked with exports and, where this is not feasible or the normal incentives are deemed inadequate, fiscal incentives may be granted. A scheme for each item has to be worked out in detail separately.

Currency Retention Scheme

7. The Currency Retention Scheme, so widely advocated, would not be advisable, as it not only adversely affects a large number of indigenous industries, but also leads to irregular imports. Besides, it causes uncertainty and introduces an element of speculation resulting in wide price fluctuations. Instead, the Government would be well advised to grant incentives to actual exporters and not solely and largely to manufacturers as is being done at present. It is the exporters who have contacts, take risk and sell for export; and, unless they get due incentives, there is no inducement for them to boost exports. Besides, it is a known fact that manufacturers do not pass on the incentive advantage by reducing the price proportionately. Their interest in export trade is that of an opportunist. They withdraw from it whenever the local market is more remunerative. In fact, they do not take pains to promote exports.

The proposed change in the incentive scheme will go a long way towards achieving the object of boosting exports.

8. Transfer of Export Promotion Licences, upto one stage, should be permitted, in order to facilitate and regularise imports of small quantities economically under the scheme.

9. Bilateral Trade Agreements should be concluded with different countries in order to develop trade with them. A comprehensive study of the products of different countries, particularly of the underdeveloped ones, should be undertaken, so that the products which India needs could be imported against those which they require and we can export.

10. The pattern, composition and distribution of trade and industry are undergoing vast changes throughout the world. We must, therefore, move and march with the times and cater to exports by adjusting ourselves to changed conditions and by adopting progressive methods of sale-techniques. Both the manufacturers and exporters should send out their representatives abroad frequently to established, as well as new, markets actually to sell their goods and to assess the modes and methods adopted by competitors in the field. Trade Delegations should also be sent to different countries by rotation to study market conditions and explore fresh avenues for boosting exports.

11. India should participate in international exhibitions and, to ensure concrete results in the shape of orders for goods, there should be a proper follow-up which is sadly lacking today. Permanent exhibition emporia for display of Indian goods should also be opened in countries which are potential markets for Indian goods.

12. The Commercial Attaches and Trade Commissioners appointed abroad should be very competent and up-to-date with a good economic background. They should be given special training in international trade and commerce before they are posted abroad. A complete overhaul of the present set-up and appointments is, therefore, called for. Adequate and competent staff may also be provided to cope with increasing volume of work. Fresh appointments should be made in the newly independent countries which are potential markets for developing our trade with them.

In Australia, not only are the appointees trained in foreign languages and associated with the work of export drive but the support and assistance of private enterprise is sought to provide specialised training suited to the needs of their posts. It is a policy worth emulating.

13. From past experience, it is evident that the Rupee Payment agreements have not actually either promoted exports or saved foreign exchange as expected. The general experience is that there have been irregular imports and the prices paid thereon generally high due to absence of competition. On the export front, the re-sale of Indian goods at lower prices in India's traditional markets have disrupted India's regular export trade with those countries. These methods and tactics have done harm and damaged the country's regular foreign trade. In the light of these facts, the Government would be well advised to review and revise these agreements by providing suitable safeguards.

14. Intensive and intelligent propaganda campaign should be launched throughout the country to foster export-consciousness and a spirit of sacrifice through austerity. The people should be impressed how exports are indispensable for the economic development of the country and for the fulfilment of the third Five-year Plan. Radio, cinema, posters, postage stamps, etc., may be used as vehicles for this purpose.

15. To promote export of light engineering goods for which there is a growing and potential market in foreign countries, it is imperative for manufacturers to advertise their products, issue catalogues in the language of the country where they are exported and maintain after-sales service.

16. The Export Risks Insurance Corporation should streamline and make their credit guarantee schemes effective by increasing their scope and reducing the premium rates.

17. To make the Export Advisory Council meetings more effective, it is desirable to turn them into a forum for constructive discussion and practical solution of problems and difficulties. The discussions may be held in groups separately allocating more time. The existing constitution and composition of the Council may accordingly be revised.

Technical Men

18. While there should be rapid modernisation of the existing industries, top priority and encouragement should be accorded for starting export industries. At the same time, in order to run the industries efficiently and competently, a large cadre of technical men should be trained.

19. Unless power and transport are adequately provided in the third Plan, the progress of any scheme of industrialisation is bound to be hindered and retarded by lack of these facilities.

20. From both political and economic points of view, it would be expedient if Indian industrialists participated in the industrialisation of underdeveloped countries even in a small way to foster goodwill and trade relations which form the basis for promoting foreign trade. It would further provide markets for selling Indian machinery and earn precious foreign exchange when the profits of those industries are remitted to India. It would be also politic for Indians residing in foreign countries to start small and large-scale industries.

To conclude this article. Although the road of export promotion that leads to the promised land of plenty and prosperity lies through difficult terrain and is littered with formidable obstacles, the journey has got to be undertaken. In order to travel through it successfully, proper tempo and right spirit have to be generated, all our ingenuity and resourcefulness have to be pressed into action with a sense of duty and steadfastness of purpose, and the incentive schemes and measures have to be reviewed and revised from time to time to keep pace with the changing conditions. In fine, the real export promotion work has got to be done in India.

Why risk buying them something which others may have thought of, too . . . ?

RAMTIRTH (HINDI MONTHLY)

Editor: Yogiraj Shri Umeshchandraji
Published every month by Shri Ramtirth Yogashram — Bombay
MORE THAN 160 PAGES PER ISSUE
THE MAIN IDEA BEHIND THIS MAGAZINE IS TO DEVELOP THE PHYSICAL, MENTAL AND MORAL ASPECT OF THE COMMON MAN
Annual Subscription Rs. 5/- only. Single Copy 65 nP. only.

UMESH YOGA DARSHAN

(First Part)

In Four Languages: English, Hindi, Gujarati and Marathi
(Author: Shri Yogiraj Umeshchandraji)

An excellent and highly readable book written by Shri Yogiraj Umeshchandraji is one of the best known treatises on the true meaning of Yoga. A best guide to methods of intestinal exercise and control, the book contains over 108 descriptive photographs of various Asanas explained according to the Age, Season, Country and Time.

It is one of the excellent volumes published so far depicting different aspects of Yoga, and containing different photographs of Asanas and Neti Dhoti Functions. It also contains Yoga Therapy, Diet Therapy, Chromopathy, Psycho Therapy and many other Therapies. It also contains many an important remedy for various diseases. The book is best of its kind and useful for all men and women, healthy and unhealthy, and hence should be preserved in all libraries and homes.

Price: Rs. 15/- Plus Postage Rs. 2/- extra.

YOGASANA CHART

A Chart printed on art-glazed papers and fully illustrated with attractive pictures is also available from here. You can perform Asanas shown therein at your home, which will keep you fit and healthy.
Price: Rs. 3/- including Postage to be sent by M.O. only.

YOGIC CLASSES

are also regularly conducted in the morning and evening at Shri Ramtirth Yogashram. Yogic and natural treatment are given for diseases. Diseases are also remedied.

RAMTIRTH BRAHMI OIL Special No. 1 Registered

An invaluable hair tonic for the prevention of dandruff and falling hair, RAMTIRTH BRAHMI OIL is manufactured scientifically with many precious ingredients, which cool brain, improve system, and let sleep sound. Most ideal for body massage. It is useful to every one in all seasons.
Price: Rs. 4.50 for big bottle and Rs. 2.25 for small. Available everywhere.

NEW PUBLICATIONS

Company Law in India (Principles and Practice), by Dr. K. B. Rohatgi, First Edition (1961). Published by Metropolitan Book Co. Private Ltd., 1 Faiz Bazar, Delhi. Pages: 870. Price: Rs. 25.

COMPANY Law in India has undergone a thorough change in the last 14 years. The report of the Bhabha Committee formed the basis of the Companies Act 1956. The said report had taken almost all the suggestions made by the Company Law Amendment Committee of England, headed by Cohen and by whose name the report came to be known. The Committee had also studied the amendments made in the English Act as a result of the Cohen Committee Report. The 1956 Indian Companies Act completely revised the 1913 Act regulating company promotion and management. The said Act further introduced stringent provisions regarding submissions of various informations to the Registrar, failure of which meant prosecution and penalties. To a certain extent the Companies Act became an independent penal code in respect of company offences.

Within the period of one year the Government found that the elaborately amended Act was weak in certain respects and that advantage was being taken by people of the loopholes. It, therefore appointed Mr. A. V. Viswanatha Sastri, a former Judge of the Madras High Court and the former Chairman of the Income-tax Investigation Commission, to study the entire aspect and suggest further amendments. This report is known as the Sastri Committee Report. As a result of the said report the Government further amended the Companies Act.

The amendments mostly relate to prohibition of appointing more than one of the following categories of managerial personnel, namely, managing director, managing agent, secretaries and treasurers, and manager; Government's power to direct special audit; seizure of documents of the companies by the Registrars; when a private company is deemed to be a public company; conversion of a public limited company into a private company; restrictions on the power of companies to contribute to political parties; and penalty where no penalty has been prescribed elsewhere in the Act.

These amendments have been properly studied and a lecture-type commentary has been written by Dr. Rohatgi on the entire Company Law. This book is bound to be useful to businessmen, shareholders, and students, especially those doing research on company law. Almost all important case law on the subject has been included. The book in addition contains detailed notes on certain provisions applicable to private companies, registers, books and documents to be kept by companies, matters relating to approval of the Central Government, forms, and the Companies Act 1956. The book also contains notifications and Rules under the enactment and thus enhances its utility. It is, by any standard, a good book.

The Economics of Small-scale Industries—A Case Study of Small-scale Industrial Establishments of Moradabad, by Dr. Baljit Singh. Asia Publishing House, Bombay. Pages: 144. Price: Rs. 12.

The Research Programmes Committee of the Planning Commission initiated a series of investigations of small-scale industries in the country to study their capital-intensity and one such study was the survey of small-scale industries in Moradabad. The field survey conducted in 1954-55 must have certainly helped the planners in formulating their policies, but the results published in 1961 for the general public reduces the document to merely one of statistical importance. Moradabad is significant in so far as 3,800 establishments existed in the city alone, employing nearly 15,000 workers; of the units, 70 per cent belonged to the group of metal industries and employed 77 per cent of the workers. The Lucknow University, under the direction of Dr. Baljit Singh, undertook the survey and the analysis as given in the 41 tables published in the volume out of more than 200 tables prepared, indicate the care bestowed. The field investigation consisted of (1) a census of all small-scale establishments in the town, (2) an intensive survey of sample units and (3) sample survey of dealers and traders.

The survey points out, it is interesting to note, that if optimum investment is defined as that size at which gross output per unit of capital is the largest, the optimum does not lie in the smallest size with an average employment of 2-4 workers per day; more often than not it is reached with an enterprise employing 5-9 workers. Further the capital intensity in the sense of unit of capital employed is not the lowest in the smallest size of establishments. Thus the superiority and economy of the small-scale sector does not lie in the smallest and uneconomic size of establishment but is often to be found in enterprises working with 5 to 10 workers.

The report has been conveniently arranged in eleven chapters. The brassware industry which forms the nucleus of the study has been specifically dealt with. The student of economics will be particularly interested in the last two chapters dealing with the problem of marketing and credit and the conditions of stagnation and depression in the industry. The reasons for the units working at less than full capacity are mainly inadequacy of demand and lack of finance. The suggested improvements, fourteen in number, may read as so many repetitions from other studies, but since these are the real problems faced by the small-scale industry, bear recounting. Since the survey was completed, several measures, both on the technical side as well as in regard to finance, have been initiated in the country. A fresh assessment may be really helpful at this stage.

The Eastern Economist Annual Number 1962 and India in 1961. Edited by E. P. W. da Costa. Published by the Eastern Economist Ltd., United Commercial Bank Building, Parliament Street, New Delhi. Pages: 254. Price: Rs. 10.

The latest Annual Number of *The Eastern Economist* is entitled "India and Europe Divided" and carries the sub-title: "An Essay on Competing Patterns of Development." A stimulating thinker in his own right, Mr. da Costa has sought to expose, in the nine-page politico-economic prologue of this Annual, the hollowness of "forms," smashing quite a few "icons" cherished in either part of Europe. But "forms" and "systems," whether they be of politics and economics or of religion and social organisation, continue to have some utility and it is, therefore, arguable whether one can go to the bitter end, thoroughly exposing their hollowness. Not, indeed, that Mr. da Costa has indulged in any such nihilistic intellectual exercises. Far from it, for he has stopped discreetly at a safe point—safe alike to the iconoclast and the reader. His obvious purpose is to provoke further thinking in India, as is his wont, and that is admirably served by the following passage, for instance:

"Indian conceptions in regard to the vitality of the two systems, represented by the blocs in Europe, are often basically mistaken. Both Capitalism and Socialism have ceased to have the theoretical form which they were given by their preceptors, Adam Smith and Alfred Marshall, on the one side, and Karl Marx or Lenin, on the other. Capitalism is vigorous on its own account and now maintains a constantly rising standard of living of the 'proletariat.' Under the Welfare State it is helping to abolish even the class struggle. It can survive without colonies and, indeed, is presently surviving on its own affluence. Socialism, for more reasons than one, is no longer the monolithic State driving private enterprise and the free forces of the market out of existence. It continues to borrow tools and 'incentives' from the capitalistic world. In the last analysis, both Western and Eastern Europe rest upon affluence created by technology, scientific management and markets. There is less power in 'systems' of thought than ever before."

The economic expansion witnessed in both the wings of Europe during the last decade has lent support to the above conclusion. Part B of the Annual, with its abundant statistical data, provides a comparative study of economic development in Western and Eastern Europe. The Annual contains, as usual, reviews of progress in different sectors of the Indian economy in 1961 and strikes the moderately optimistic note that, so long as the strain is taken on the foreign exchange front, the internal buoyancy of the economy will carry it over without serious mishap. There is here an underestimation of the effects of crucial shortages of essentials for maintaining the pace of industrial growth necessary to reach the third Plan targets.

The Principles and Practice of Co-operative Audit, by O. R. Krishnaswami. Maraimalai Publishing House, Madras-13. Pages: 282. Price: Rs. 5.50.

The Co-operative Movement in the country has been given a tremendous boost in the last few years and one of the effective steps taken to ensure quality, along with the increase in the size and number, is to organise training institutions all over the country to impart instruction in the philosophy of co-operation and in the mechanics of organisation and administration. These specialised institutions which number over 80 for different categories of personnel, have suffered from lack of suitable text-books; though good text-books are otherwise available on subjects like Book-keeping, Auditing, Rural Economics, etc., they do not provide for the specialised requirements of co-operative institutions which have their own peculiar features. The author has attempted to provide one such text-book on the *Principles and Practice of Co-operative Audit*. In Part I he has dealt with, in detail, the general audit and in Part II he has brought out the important aspects of co-operative audit, the distinction between co-operative and commercial audit and several guiding points for the auditors in the co-operative field. Audit of co-operatives is largely a statutory function of the Registrar of Co-operative Societies and, therefore, carried out by departmental personnel. They are guided by the circulars and instructions which have a large bearing on the co-operative legislation in the State. As Mr. J. C. Ryan in the Foreword points out, the author has based the portion relating to co-operative audit on the provisions of the Acts, Rules and By-laws in force in the Madras State and the instructions issued by the Registrar of Co-operative Societies. As rightly pointed out by him, this text-book will, therefore, serve as a guide to the societies and staff in the Madras State. At the same time, taking into account the stage of co-operative development in other States, these principles and practices indicated should be of considerable guidance to their staff too. The author has dealt with the subject quite ably, thanks to his experience both as an auditor and as a teacher in the co-operative training institution.

Your Guide to Industrial Law, by James Mackil, Assistant Secretary, Association of Planters of Kerala, Kottayam-4 (Kerala State). Pages: 250. Price: Rs. 12.50.

Industrial law includes the various enactments dealing with employers and employees and their conditions of service and other matters related to them. These enactments have been made by the Union and State Governments. There are very few good books on the subject, and still fewer ones dealing with the day-to-day problems of employers and employees.

The trade unions, like the I.N.T.U.C. in our country, have published some pamphlets to guide individuals and trade unions. However, on the employers side, not many books have been published. James Mackil's book, *Your Guide to Industrial Law*, fulfils this need. It is a book that every employer should possess.

This book is the outcome of the practical knowledge gained by the author as a lawyer and as the Assistant Secretary of the Association of Planters of Kerala. In his foreword, the Hon'ble Mr. T. K. Joseph, Judge of the High Court of Kerala, says: "The author has made it easy for a layman to grasp the law on almost all aspects of labour legislation in the country. The book discloses deep study by one familiar with the practical application of the law on the subject."

The book deals with several topics in the form of questions and answers. The questions deal with how to draft a show cause notice, how to serve a show cause notice, formalities to be adopted in an enquiry, the method of recording the enquiry, selecting delinquent workers for disciplinary action, lock-out, strike, gratuity and the problems relating to it, etc. There are about 227 issues thus answered. All these answers are based on decided case law. The author has based his answers or opinions on the judgments of the Supreme Court of India, various High Courts, Tribunals and Courts.

The book will be found very useful to all managements, big or small, labour and welfare officers, lawyers, trade unions and others interested in industrial matters.

Capital: Annual Review of Trade, Commerce and Industry, 1961. Edited by George Barrell. Published by W. H. Targett & Co., Ltd., 5 Mission Row, Calcutta. Pages: 164. Price: Rs. 5.

Capital's annual numbers have always been notable for the articles contributed by authorities in different fields. The latest annual number maintains this reputation. The very first article in it is by Sir Theodore Gregory who highlights "the curious mixture

of ideology and pragmatism in the third Plan document" and questions some of that Plan's financial assumptions. Mr. G. D. Birla, in his article, discusses the factors retarding Indian exports and pleads for a review of official incentives. Mr. Geoffrey Tyson, a former Editor of *Capital*, brings out the continuing value of London as a base for Indian business operations in Europe. Here is some thought for the growing number of businessmen in this country who think that, in the new economic set-up emerging in Western Europe, Brussels or Frankfurt offers a better base than London for establishing and developing new contacts on the Continent. In his long article, Dr. P. S. Lokanathan, Director-General of National Council of Applied Economic Research, spotlights the defects in Plan models in the context of statistical deficiencies and urges the use of resources budgeting. How capitalism, without colonies, is meeting the Communist challenge is the theme of a thought-provoking article by Mr. Neil McInnes, another former Editor of *Capital* Mr. G. L. Mehta's article on the role of Indian Investment Centre, Mr. M. R. Masani's on road transport and Prof. B. R. Shenoy's on deficit financing in the third Plan are also noteworthy among the other contributions. The reviews of developments in such industries as jute, tea, cotton textiles, sugar and coal are quite authoritative. In all, there are 35 articles and reviews in the Annual on subjects of current importance, and these constitute a rich and varied fare.

Far Eastern Economic Review 1962 Yearbook. Editor: Dick Wilson, 209, Windsor House, Hongkong. Distributors in India: Wheelers Distributors Private Ltd., Eruchshaw Building, 249, Dr. Dadabhai Naoroji Road, Fort, Bombay 1. Pages: 224. Price: Not mentioned.

This *Yearbook* comprehensively highlights the economic trends in the East and South Asian region during the calendar year 1961 and the prospects for the current year against the background of important political and social changes. The *Yearbook* begins with an interesting review of plans, population and prices in the region as a whole by the Editor. There are separate reviews of each of the 128 countries or territories. All except a few minor ones are divided into seven standard sections—politics, economy, finance, trade, agriculture, industry, and power and transport. The first section covers all major non-economic developments, embracing foreign policy and international events, as well as social landmarks and such strictly political matters as elections and Government changes. The second section gives a bird's eye-view of economic trends. It is also the section in which the countries' long-term plans and the larger objectives of their economic policies are normally treated. In every case, the information is illustrated, where appropriate, by tables, charts and pictures. An attempt has been made to set out some recent figures of China's trade from the statistics of partner countries. Also included in the *Yearbook* are monthly economic indicator tables for each country or territory.

A.I.C.C. Economic Review—Patna Congress (1962) Number. Chief Editor: Sadiq Ali and Editor: Hartirath Singh. Published by the Economic and Political Research Department, All-India Congress Committee, 7, Jantar Mantar Road, New Delhi. Pages: 224.

This Special Number of the *A.I.C.C. Economic Review*, like its predecessors published at the time of Congress Sessions, contains an impressive collection of articles by eminent professors in India and abroad as well as by newer and younger writers. There are in all 42 articles, many of which are in the nature of research contributions on a variety of subjects. Particular mention may be made of the articles by Prof. P. R. Brahmanand ("Savings and Capital Formation in the Indian Economy"), Prof. Shyam Nandan Sinha ("Price Policy in Public Undertakings"), Shriman Narayan ("Role of Education in the third Plan"), W. Mellor ("Increasing Production in Indian Agriculture") and J. B. Condliffe ("The Location Problem"). The Special Number has a certain research and academic flavour. This is in keeping not only with the tradition of the A.I.C.C. Research Department but also with the need to discuss the problems of India's mixed economy—problems which are puzzling to orthodox economic theorists.

TRENDS IN REAL AND MONEY WAGES

FINDINGS OF LABOUR BUREAU

NO comprehensive and authoritative survey has been made of recent trends in real and money wages in Indian industry as a whole; at present information on the subject can be gleaned only from the reports of various Wage Boards set up for the cotton, jute, cement, sugar and plantation industries and the Board for the iron and steel industry will add to it. Besides wages determined on the principles of minimum and fair wages as interpreted by these bodies, collective bargaining, conciliation and adjudication have helped to increase remuneration for labour, especially through bonus payments which cannot be excluded from calculations of the real benefits to workers. The annual *Economic Survey* does not attempt to indicate, much less measure, these trends and their effects on the economic situation; it only takes note of employment figures. The Census of Manufactures gives the size of the wage bill in relation to the numbers employed in each industry and for the organised sector as a whole, but, unless these data are further processed, no useful conclusions can be drawn from them. The Reserve Bank's periodical analysis of the finances of 1,001 joint-stock companies throw some light on the size of the wage payments and total cost of amenities from year to year, but how much of the increase is due to larger numbers of workers or to additions to the remuneration to each worker will not be clear from these figures. For example, salaries and wages rose by Rs. 17.6 crores in 1957 (6.8 per cent), 12.1 crores in 1958 (4.4 per cent) and 24.2 crores in 1959 (8.4 per cent). Employees' welfare expenses increased from a total of Rs. 24.5 crores in 1957 to Rs. 26.6 crores in 1958 and Rs. 29.2 crores in 1959. The trend in the sectors not covered by the Reserve Bank surveys could not have been very different. To what extent the increase per worker has been justified by increasing productivity or neutralised by rising cost of living are other issues requiring investigation.

The third Plan does not contain any assessment of the progress made so far as a result of the provisions for fixation and revision of wage rates except to say that they have not proved effective in many cases. The Bonus Commission may, however, have something to say on the rewards obtained by industrial labour in recent years.

Meanwhile, in an article in the current issue of the *Labour Journal* the Labour Bureau, Simla, has made an attempt to examine the movement of minimum wages in India during the Plan periods "to find out how the workers in the organised and unorganised sectors have fared in the employment market." After pointing out that there has been no direct legislation for wage fixation and that wages and allowances have been the subject-matter of adjudication, the article states: "It appears from the analysis of awards and agreements that there was no significant movement in the total emoluments received by workers in most of the major industries. The dearness allowance showed, however, fluctuations as they were in most cases, linked directly with the cost of living index number."

While the basic wage did not show any significant upward movement (except to the extent to which some wage board awards recently provided for merger of a part of dearness allowance in wages), D.A. varied from 50 per cent of emoluments in the sugar industry to 76 per cent in cotton textiles. In Bombay, total emoluments in cotton textiles increased by 34 per cent, or one-third, between 1951 and 1959. Larger increases recorded are comparatively insignificant, since they relate to areas where an industry was not having an important position—like jute in Andhra (100 per cent) and sugar in West Bengal (34 per cent). There was a fall in the level of wages in the cotton textile industry everywhere in 1954 and 1955, but otherwise it has risen in all centres as compared with 1951, except in Sholapur which has recorded a fall of 19 per cent in 1959 as compared with 1951. A major development was the Central Wage Board's recommendation that three-fourths of the D.A. in the first half of 1959 should be merged with basic wage and that the rest should remain linked to the cost of living.

In the jute industry, there has been a 6 per cent increase in total emoluments in West Bengal (where it is concentrated), as a result of three tribunal awards in 1948, 1951 and 1955. In the coal industry, the award of the All-India Tribunal raised total daily wages from Re. 1.25 in 1947 in Bengal and Bihar to Rs. 2.62 in 1967—an increase of 110 per cent. In the engineering industry, the Fifth Industrial tribunal increased wages of unskilled workers by Rs. 10 in 1958, an increase of about 16 per cent. In the sugar industry, the increase is of the order of 5 per cent in U.P. and 7 per cent in Bihar by 1959. Gold mining in Mysore and mineral oil in Assam are two purely local industries for which figures are given. Over a wide range of other organised industries, the survey has not attempted to measure the changes.

In the unorganised sector, over which State Governments have the main responsibility for implementation of a minimum wage policy, measures have been taken to extend area-wise and occupation-wise the statutory provisions but the results of enforcement are not impressive. It is stated that, in Andhra Pradesh, there has been no upward movement except in the case of oil mill workers. In Assam, plantation workers received nearly 89 per cent more at the end of the last decade than at the beginning. For Madras, the review has this to say: "The trends in Madras reveal a rise in the minimum up to 83 per cent to bring, on the one hand, the minimum wages in the various employments on a uniform level and, on the other, to maintain the differentials more or less at the same level between the rural industries and some of the mechanised industries like tanneries and transport... The trends thus show an attempt effectively to implement the Act in employments for which the wages were originally fixed in earlier years of the first Plan period."

In the case of Uttar Pradesh, "the situation observed is singular... the quantum of wage fixed has shown no improvement." The character of the minimum wage fixed there is said to be indicative of a desire on the part of the State authorities not to get involved in the complications of fixation and implementation. While West Bengal shows a pattern similar to that of Madras, with certain exceptions and a lower rate of increase, Mysore, Orissa and Rajasthan have nothing substantial to show. They all seem to have begun late and in a limited way. This is, perhaps, disheartening to those who expected quick results through legislation—like the Labour Bureau—but State Governments who are in earnest about industrial development in their own areas have probably remained unwilling to take risks and, except in cases of obvious incompetence, their attitude may represent a triumph of commonsense over doctrine.

CONFERENCE ON RURAL UNEMPLOYMENT

The first of the three regional conferences to deal with rural unemployment and underemployment in the context of the rural works programme proposed in the third Plan for agricultural lean seasons was held in New Delhi this week.

The conference was attended by representatives from Punjab, Jammu and Kashmir, Himachal Pradesh, Rajasthan, Madhya Pradesh, Gujarat and Uttar Pradesh to review the experience gained of projects started during the last lean season and draw up the programme for 1962-63 for these States.

The second conference to be held at Calcutta beginning on 2nd February will discuss the programme in respect of Assam, West Bengal, Orissa, Bihar, Tripura and Manipur while the conference at Hyderabad will discuss the programme of Madras, Kerala, Maharashtra, Mysore and Andhra Pradesh. All these conferences will be attended by representatives of the Planning Commission and of the Ministries of Food and Agriculture, Community Development and Cooperation and Labour and Employment.

(Concluded from next column)

in publication only confirms such suspicions. Though the Scheme was launched as early as 1949, the authorities have been taking shelter under the plea of teething troubles to explain all shortcomings. The result is that the Corporation had no spur to efficiency; its dependence on State Governments gave it a further excuse for its poor performance. When the new parliamentary committee on State undertakings is set up, the Corporation may come under its purview, provided, of course, no attempt is made again, to exclude it from its scrutiny.

EMPLOYEES' STATE INSURANCE

WHAT HAS HAPPENED TO DR. MUDALIAR'S REPORT?

THE recent doubling of the rate of employers' special contribution towards the Employees' State Insurance scheme from 1¼ per cent to 2½ per cent is to take effect from the next financial year and is expected to bring in additional revenue to the Corporation of Rs. 343 lakhs. What it signifies can only be understood in the context of the growth in the activities of the Corporation since its establishment. The Corporation is now a ten-crore enterprise; its receipts in the current year have passed that mark and its total investments now amount to Rs. 20.46 crores. Though conducting operations on this scale, the Corporation has not, perhaps, attracted enough public attention. It now covers about 1.7 million industrial employees all over the country and proposes to extend its benefits to another 700,000 in the course of the next year. Gradually, the Corporation has been extending medical care to the families of employees covered by it; from 573,000 family units eligible for such care at the end of March 1961, the number is expected to increase to 1,522,000 family units. This is the major reason for, the deficit expected next year on the basis of the existing level of contributions, though an increasing incidence of sickness is also cited as an additional reason. At present, the scheme does not operate in Gujarat and Jammu and Kashmir but a beginning will be made in the former, with Ahmedabad, in 1963.

The increase in the employers' contribution now announced was not unexpected. In December 1956, the Central Government issued a notification indicating its intention to raise employers' special contribution from 1¼ per cent to 3½ per cent of the total wage bill in the implemented areas and from ¾ per cent to 1¾ per cent in the non-implemented areas. This is the first time that the actual increase will be notified for the implemented areas alone, following the unanimous recommendation of a special sub-committee (on which employers also were represented), to that effect; the committee had also suggested that the question of further revision be reviewed annually. It did not recommend any increase in the non-implemented areas. This surcharge will avoid the need to draw upon its investments in the next year, except to the extent of Rs. 127 lakhs, depending on rate of implementation of the extension schemes. The employees' contribution remains at about 2½ per cent of the wage.

The E.S.I. scheme depends for the administration of medical benefits on State Governments; the Corporation is paying only the cash benefits directly. For the provision of medical care which is the State Governments' responsibility, the Corporation advances to them money for capital construction on hospitals, etc., and shares current expenditure on maintenance at ¼ when medical benefits are extended to families and at ¾ when not so extended. The Corporation disbursed a sum of Rs. 347 lakhs by way of cash benefits in 1960-61 and reimbursed State Governments for their running expenses of hospitals to the sum of Rs. 249 lakhs. The rate of sickness benefit paid per employee has been steadily rising in recent years and it varies considerably from State to State, depending on the frequency of sickness and its duration. Apart from endemic and epidemic diseases in each area, there is also the question how far certification is liberal or restrictive.

The best investment for the funds of the Corporation will be in hospitals; reservation of beds in existing hospitals does not provide adequate facilities for the insured and deprives the rest of the public of facilities to which it is entitled. But the Corporation is still far from its goal of establishing hospitals exclusively for all insured persons. The Mahatma Gandhi Memorial Hospital in Parel, Bombay, which is expected to open shortly, is the largest of the existing ones, with 300 beds and plans for addition of another 300 in the course of the year. Another hospital has been completed in Bangalore and two others, one at Madras and another at Kanpur, will be soon ready. But the Corporation has much to do to simplify and rationalise its procedures; little is known of the report of Dr. A. L. Mudaliar who was appointed to enquire fully into the working of the scheme. There have been reports to the effect that it is highly critical of the present system of administration of the benefits and the failure

(Continued in previous column)

THE CONTINUING COAL CRISIS

REMEDIAL MEASURES NEEDED ON THE PRODUCTION FRONT

IT was estimated in the latest Annual Number of *Commerce* that coal production in 1961 would be no more than 56.4 million tonnes. This estimate, based on the January-September 1961 figures, does not seem to have been wide of the mark, for the figure of coal output for October 1961 (4.29 million tonnes), just available, reflects a fall, as compared with 4.59 million tonnes in the preceding month. The most disquieting trend in the last year was the steep decline in the monthly rate of coal raisings from the peak of 5.52 million tonnes in March 1961 to the level of 4.16-4.60 million tonnes. The rate of monthly production since April 1961 has been practically the same as that in the comparable period of 1960, whereas it ought to have been higher by about a third or 1.5 million tonnes so as to conform to the planned rate of progress under the third Plan. Judging by the trend of production since April 1961, it looks as though the coal industry's performance in the first year (April 1961-March 1962) of the third Plan will be virtually the same as that in the last year of the second Plan. The current coal shortage which is affecting industrial production in several parts of the country is thus the result not only of transport bottlenecks but of the lower rate of production.

The bottlenecks in rail transport have, of course, been very much there for the past one year. Several instances of underutilisation of industrial capacities in the wake of coal shortages caused by movement difficulties have been reported from time to time in the Press. Some of the latest instances of coal shortages affecting production are provided by the industries in Jamshedpur and Calcutta, both of which are close to coal-producing areas, not to mention Ahmedabad, a distant centre of consumption, where only the closure notice of cotton mills could force the railways to sit up and take some emergency measures for rushing coal supplies. In Jamshedpur, three major industrial enterprises have been hit by the coal shortage. The Wire Rod Mill of Indian Steel Wire Products in that industrial city has been shut down since 15th January last for want of coal. It may be recalled that the same mill was closed for two weeks each in November and December last for the same reason, resulting in a total loss of 4,000 tons in production of different categories of wire and wire products. The number of wagons supplying coal to the mill dropped from an average monthly requirement of 90 to 46 in December. Secondly, the Tinplate Company in Jamshedpur has had to resort to transport of coal by road, and this has meant an increase in cost from Rs. 10 per ton to Rs. 25. And the T.I.S.Co. for its part, has been forced to draw about 10,000 tons of coal from the reserve stock since October to make up for shortfalls in supply.

Transport Bottlenecks

In Calcutta, medium and small-scale industries have again been facing a crisis because of scanty supply of coal in recent weeks. Even the limited supplies of coal now available are stated to be of inferior quality. According to the Howrah Manufacturers' Association, the coke or coal supplied from the dumps contain dust, rubble and sweepings and the proportion of dust is found to be as high as 30 per cent sometimes. Moreover, the total coal requirements of member-firms are satisfied only to the extent of 50 per cent quite often. All these hurdles, according to the Association, may cause the closure of many firms temporarily.

In so far as transport bottlenecks are partly responsible for the present plight of coal consumers, the Union Government is reported to be considering some measures to alleviate, if not wholly remedy, the critical situation. The Railway Board, for instance, is reported to have agreed to provide daily 6,925 wagons for coal loading, as against its present target of 6,535 wagons. It is even stated that the Board is thinking in terms of raising the daily number of coal wagons to 7,271 before the end of this year. Whether the Board will be able to implement its intentions is, however, not quite certain, if past experience is any guide. Another step which the Government is reported to be considering is related to the facilities required for accelerating the pace of coal transport by road. Already, a Working Group in the Planning Commission has been charged with the task of examining the question in the light of existing conditions pertaining to roads and bridges and of the availability of trucks and diesel oils. The Government is also stated to be agreeable now to moving coal in block rakes and half rakes for the use of big industrial consumers who have their own siding facilities.

On the production side of coal industry, there are several factors responsible for the lower rate of raisings. There is, firstly, the power shortage. It has been estimated by the coal industry that its additional requirement of power would be 21 M.W. from the D.V.C. source. But the Government has disappointed the industry, for it has proposed to utilise the additional power generated by the D.V.C. for meeting the needs of such bulk consumers as the Calcutta Electric Supply Corporation, the Bihar Government, etc. It is feared that, if the coal industry's power requirements are not fully met, output will be reduced and expansion curbed, for rationing of power will restrict the use of modern machinery. If less coal is thus produced, its supply to thermal power stations will be affected, and there will thus be less power for industries, including coal. All this will be vicious circle. If such a vicious circle is to be overcome, the latest suggestion advanced by Mr. N. Stenhouse, President of the Associated Chambers of Commerce of India, should be seriously considered by the authorities. The suggestion is that a short-term plan of about three years should be drawn up by the Government to solve the threefold problem of transport bottlenecks, coal famine and power scarcity by reallocation of resources as and when necessary.

Study Team Set Up

It is a heartening development that the Government has just set up a team to assess the power needs of coal industry in the third Plan. This team is expected to report within a month from now. It will assess the power requirements, colliery-wise and year-wise, examine the present position in regard to power supply and suggest measures to augment it to meet the future needs, year by year, in the third Plan period. The team is also expected to recommend revised allocations to various consumers of D.V.C. power, keeping in view the requirements of coal mining. The main task of the study team will be to review measures for matching power supply with the programme of increasing coal production in the private and public sectors in various parts of the country. If the team's recommendations are made in time and turn out to be satisfactory and they are implemented in an equally satisfactory and prompt manner, the vicious circle referred to earlier will be broken at least at one point on the production front. The process of eliminating the vicious circle will, however, call for further measures, such as provision of adequate rail transport, supply of explosives, imports of parts and components for coal machinery, upward revision of coal prices (to which industrial consumers are not likely to raise any serious objection), prompt allocation of foreign exchange sanctioned by the World Bank, more scientific coal grading procedures, and so on. If Mr. Stenhouse's suggestion for an energetic three-year plan covering coal production, transport and power finds favour with the authorities, the coal crisis, which has come about both on the production front and on the transport side, may well be brought near a more permanent solution. Dr. B. C. Roy's recent plea that coal raising in the public sector should not be the exclusive responsibility of the National Coal Development Corporation and that the State Governments, too, should have the right to open up virgin areas is hardly relevant in this context, for the current problems facing the coal industry are largely common to both the sectors—public and private—of that industry.

COAL GRADING ENQUIRY COMMITTEE

The Government of India has just set a Committee of experts for examining the procedure for sampling and grading of coal. This step is a sequel to the coal industry's representation that the recent downgrading of collieries by the Coal Board has been unscientific and that it has resulted in a reduction of sales realisations by collieries. The Committee is expected to submit its report within two months.

SAVING METAL AND SPEEDING PRODUCTION

NOTABLE ACHIEVEMENTS BY A BRITISH FIRM

THE annual cost of corrosion in Britain is £600 million, and £4 out of every £10 spent by farmers on machinery replacements is due to damage by rust. Faced by figures like these, the Plus-Gas Company of Britain (1-11 Hay Hill, London S.W.3.), developed their now famous Formula "A" Dismantling Fluid (Rust Remover), a non-acid and harmless liquid which is used throughout industry for freeing seized parts. Its achievements have been spectacular: a colliery company saved £6,000 in one year by using it on rusty scraper chains; an outboard motor was restored to working order after eight years under water and two on a scrap heap. In cold storage plants, Formula "A" is used to free "vilter" flanges, heavily corroded by ammonia; it is the only known chemical which will loosen the blades and casing studs of large turbines without damaging them.

There is also a Formula "B," which is of special value as a coating for stored machinery or components in transit, especially in tropical climates. It forms a tough but elastic film, which does not crack when the coated metals expand with rises in temperature; and, being both harmless and soluble in oil, it need not be removed from oil-immersed moving parts (except plain bearings) on re-assembly. Formula "B" is unaffected by temperatures up to 100°F (38°C) and will penetrate to the heart of a wire rope, or roller driving chain, protecting it inside and out against corrosion.

A few years ago, the discovery of ancient metal implements, remarkably preserved by tannins in the soil surrounding them, suggested a method of halting corrosion which had already begun and led to the development of Plus-Gas Formula "E." This fluid combines with the oxides on corroded metals to form an insoluble tannate film, which halts further corrosion by rendering the metal inert. At the same time, it creates a smooth and burnished surface which bonds well with paints and increases their covering capacity. Furthermore, since Formula "E" is non-acid and non-toxic, it is easier and safer to use (as well as being a good deal cheaper) than phosphate or phosphoric acid anti-corrosion compounds.

And, finally, the new Formula "C" Cutting Oil, whose low surface tension allows it to penetrate the intergranular crevices of metals being machined and also to establish a permanent film of fluid between tool and workpiece. This ensures an exceptionally clean cutting action, while "build-up" on the edge of the cutting tool is greatly reduced. In the precision boring of minute aluminium gear wheels at a factory near London, a tool which was normally re-ground after every 20 operations can now complete more than 200 without re-grinding. In another process, the oil penetrates between small components, stacked in dozens for simultaneous cutting. Wastage in the form of parts damaged during physical separation after machining (formerly up to 50 per cent) is thus avoided.

Formula "C" is equally suitable for the milling, boring, grinding, tapping, turning, hobbing and broaching of stainless or high tensile steels. Machines can be run at higher speeds, while breakdowns and damage to workpieces are reduced. In addition, a film of oil remains on the surface exposed by machining and protects it from the corrosion to which it is specially vulnerable.

AUTOMATION IN BRITISH COAL MINES

Automatic coal mining, with coal being cut and loaded at the face by remote control, may be introduced in the East Midlands, Britain's top coal division. At the most productive colliery, Linby, near Nottingham, a remote-controlled 'walking" roof support machine—an automatic pit-propping device—will be tried out next month at the coal face.

Already, a remote-controlled coal cutter, operated by a radioactive gamma-ray probe, is being tested at New Lount Colliery, Leicestershire, and later this year the two methods will be combined at Britain's first unmanned coal face in a colliery yet to be selected. "Fully automatic remote-controlled mining within five years is not unreasonable," says Mr. Wilfred Miron, Chairman of the East Midlands Division of the National Coal Board. He continues: "It will mean that narrow seams, at present unworkable, can be exploited, and it will mean also a big recruiting drive for skilled technicians."

DEVELOPMENT OF DAIRY INDUSTRY

PROJECTS FOR INCREASING MILK SUPPLY UNDER WAY

THE *per capita* consumption of milk is at a very low level in India, as in other low-income countries. The present average *per capita* consumption of milk, including milk products, is estimated at no more than 4.90 oz. per day, as against 4.76 oz. per day in 1951. Admittedly, this is a very unsatisfactory state of affairs, considering the fact that, for a balanced diet, the minimum requirement of milk is considered to be 10 oz. per head per day. During the third Plan, it is proposed to increase the total availability of milk from about 22 million tons (at the end of second Plan) to 25 million tons. But even at the end of the third Plan, the daily *per capita* consumption of milk is not likely to exceed 5.1 oz. or just half of the minimum nutritional requirement. What is more, there is no uniformity in consumption levels in the various units of the Indian Union, the variation being rather perceptibly wide. The consumption of milk in the Punjab, Rajasthan, and U.P. is at a relatively higher level than in other States.

The major obstacle in the way of the development of dairy industry is the generally low productivity of Indian livestock. According to the Livestock Census of 1956, the total number of cattle was about 159 million and buffaloes 45 million, constituting together a fourth of the world's bovine population. These figures exclude those for sheep (39 million) and goats (55 million). The average milk yield, however, is low, the average per lactation of cows being only 400 lbs. and of buffaloes about 1,100 lbs., as compared with 5,000 lbs. or more in Western countries.

Progress

The dairy industry, however, has made some progress during the last two Plan periods, and is expected to expand further during the third Plan. The major objective of the dairy programme continues to be the development of projects with greater emphasis on expanding milk production in rural areas linked up with plans for the marketing of surplus milk in the urban centres, largely through co-operative societies. The dairy schemes account for an outlay of Rs. 36 crores in the third Plan, as compared with Rs. 17.44 crores in the second Plan and Rs. 7.81 crores in the first Plan. It may be noted here that the actual expenditure in the second Plan fell short of the outlay by about Rs. 5 crores. The growth of the dairy industry in the second Plan was slow, owing to the difficulty in importing plant and machinery for its development. The Plan originally envisaged the establishment of 36 dairy plants for the supply of milk to large consuming centres, 12 rural creameries and seven milk products factories for the utilisation of surplus milk in milk pockets, expansion of 12 dairies, etc. At the end of the second Plan, 28 milk supply schemes were either completed or at various stages of implementation. Only two milk product factories, one at Amritsar and the other at Rajkot, and three rural creameries—one each at Barauni, Aligarh and Junagadh—were being set up, with foreign aid. The other major dairy projects put into operation during the second Plan were two units each for the manufacture of infant milk foods and matted-milk foods and one large-scale unit for sweetened condensed milk. There were 2,257 co-operative milk supply societies and 77 milk supply unions in the country as at the end of 1958-59, the latest period for which data are available.

The programme for the third Plan period is outlined in the third Plan report as follows:

"During the third Plan, two plants, with a capacity of about 900 tons, will start the production of infant milk foods, three units with a total capacity of 5,300 tons per annum will produce condensed milk and one unit will manufacture 470 tons per annum of milk beverages. 55 new milk supply schemes will be taken up in cities, with population exceeding 100,000, and in growing industrial townships. In order to utilise economically the milk available in certain milk pockets where there are no ready markets for the disposal of fluid milk at remunerative price, rural creameries for the production of butter, ghee, cheese and other by-products, such as casein, lactose, milk powder, etc., will be undertaken. It is proposed to establish eight such rural creameries, four milk product factories and two cheese factories for developing the rural milk pockets. Production of balanced rations through the use of various agricultural wastes and by-products, such as wheat and rice brans, bagasse molasses, decorticated cake, etc., can go a long way in making available cheaper feeds for the cattle. It is proposed to establish four cattle feed compounding factories in the close vicinity of large milk supply plants.... In order to give an impetus to dairy programmes, arrangements have to be made for the manufacture of dairy equipment and machinery within the country. Fabrication of dairy equipment, specially for small units, should be encouraged so as to popularise dairying as a local industry in the rural areas. Four firms have already been licensed for the manufacture of dairy equipment. These will start production during the third Plan."

Maharashtra

The Maharashtra State has played a leading role in the establishment of dairy projects, its major show-piece being the Rs. 6-crore Aarey Milk Colony. By the end of the second Plan, the State Government had entered the field of milk distribution in Bombay City, Poona and Nagpur. It is expected to organise such schemes of milk distribution in eight more towns in the State during the third Plan period. The Greater Bombay Milk Scheme continues to be the most important single scheme in this State. Approximately, nine per cent of the total population and 38 per cent of the urban population of the State lives in Greater Bombay. Colonisation of cattle in the old city has been completed, having rehabilitated 16,000 city cattle at the Aarey Milk Colony. About 3,000 maunds of milk is produced daily under control. With the starting of the Milk Colony at Aarey, approximately 176,000 of cattle, valued at Rs. 17.5 crores, have been imported into the city since 1949. The scheme is entirely self-supporting, covering interest, depreciation and all over-head charges. In fact, it yielded a profit of about Rs. 15 lakhs, exclusive of profits on skim milk powder, amounting to Rs. 23.5 lakhs, during 1960-61. Aarey distributes about 5,000 maunds of milk (whole toned and double toned) daily. A second dairy at Worli, with the U.N.I.C.E.F. aid was commissioned last November at a cost of about Rs. 3 crores. With the present dairy equipment installed at the Worli Dairy, the quantity of milk handled is about 3,000 maunds per day and, with the expansion programme to be completed by November 1962, this dairy is expected to handle about 10,000 maunds of milk per day. Thus, between Aarey and Worli Dairies, the Bombay Milk Scheme would be handling about 13,000-15,000 maunds of milk per day, covering almost the entire demand for milk in the City, by November next. There is a further possibility of increasing the handling capacity to about 24,000 maunds a day to meet the eventual increase in city's requirements in terms of whole, toned and double toned milk.

The supply of milk to consumers in the Bombay City is expected to go up still further, when the proposed second milk colony is completed at Vankas in Dahanu taluka, 100 miles from Bombay. It will rehabilitate about 10,000 milching animals, besides giving facilities for the housing of 5,000 dry and 5,000 calves and young-stock. The colony is expected to supply about 2,000 maunds of milk per day which will be chilled at the colony and brought by road tankers to Bombay.

Besides the Greater Bombay Milk Scheme, pilot milk schemes have been put into operation at Poona, Nagpur, Nasik, Kolhapur and Sholapur. They are handling in all about 534 maunds of whole milk and 86 maunds of toned milk per day. Similar schemes are also proposed to be started shortly at Amravati, Aurangabad and Akola. In the course of the next two years, full-fledged dairies, with proper pasteurising and bottling plants on the lines of Aarey and Worli, are expected to be set up at each of the abovementioned places. Another noteworthy feature of the dairy programmes in Maharashtra is the arrangement made for providing training in dairying. A two-year diploma course in dairy technology was started at Aarey from July 1960 onwards. In addition, a three-month regional in-plant training course for technical personnel has also been started at Aarey by the Government of India in collaboration with Denmark and the F.A.O. The fourth course under this arrangement, it may be recalled, was inaugurated by the Prime Minister of Denmark, Mr. Viggo Kampmann, a fortnight ago.

Several major dairy schemes are under way in other States as well. The Kaira Co-operative Milk Union, Anand in Gujerat, continues to supply 1,050 maunds of pasteurised milk daily in rail tankers to the Aarey Colony (Maharashtra), and manufactures large quantities of butter, ghee, condensed milk and skimmed milk powder. The Union's dairy factory has been expanded recently to produce cheese, tinned cream and baby foods. The Gujarat Government has recently set up a statutory Board for the purpose of running its dairy projects. Andhra Pradesh is expected to establish a large dairy project at a cost of Rs. 4 crores. The project will cover about 1,200 sq. miles of the delta region of the State, with Hyderabad and Vijayawada as the terminals. An important project in Madras is the Coimbatore Co-operative Milk Supply Union which has already put up a pasteurisation plant. Another Rs. 30-lakh milk-processing plant is proposed to be put up at Erode, besides a Rs. 41-lakh plant at Madurai. The new dairy at Belgachia (Calcutta) is one of the major plants in West Bengal. The Haringhata dairy which handles about 1,400 maunds of milk and toned milk daily has colonised about 5,000 milch animals. Kerala will have three major pasteurisation plants, one each at Trivandrum, Calicut and Ernakulam. The other State Governments have also on hand several dairy schemes. Most of the schemes have received technical and/or financial help from countries like the U.S., Canada, New Zealand, and the Netherlands, as also such international agencies as the F.A.O. and the U.N.I.C.E.F.

Private Sector

Special mention deserves to be made here of some of the important private sector ventures in the field of dairying. The Food Specialities Ltd., a subsidiary of Nestles, has put up a plant for the manufacture of milk products at Moga in the Punjab at a cost of Rs. 55 lakhs. The plant, which went into production in last October, has an annual capacity of 4,000 tons of condensed milk, 1,000 tons of baby foods and powder milk. Again, the Umrich Cheese and Chemicals Ltd. will establish a cheese factory at Bangalore in collaboration with Denmark. The plant, which is expected to cost Rs. 1 crore, will produce about 300 tonnes of cheese and 171 tonnes of butter annually.

The dairy industry in India is faced with several problems, such as scattered and small-scale milk production, inadequate transport facilities of the right type in most parts of the country, dependence on imported plant and machinery required for milk collection, processing and manufacturing and absence of organised marketing. Perhaps, a still more crucial problem is shortage of technical and skilled personnel. Some efforts, of course, are being made to solve this problem. The National Dairy Research Institute, which has recently been shifted from Bangalore to Karnal (in the Punjab), is being expanded with full-fledged research divisions in dairy husbandry, technology, bacteriology, economics, etc. The Bangalore sub-station of the Institute is also being expanded. The number of dairy personnel required during the third Plan is estimated at 2,830, including 625 degree holders, 975 diploma holders and 1,230 other categories of personnel. In order to meet this increasing demand, it is proposed to increase the facilities for the course in Indian Dairy Diploma at Bangalore, Allahabad, Anand and Aarey and in the B.Sc.(Dairying) at Karnal. Besides, the Agricultural Institute at Anand will be equipped to provide training courses upto the graduate level in dairying. The F.A.O. regional training programmes will also be continued. It is also proposed to organise tutorial workshops for teachers at various dairy training centres along with other refresher courses, for different categories of technical personnel.

INDO-FRENCH WATCHES

The distinction of being the first watch-manufacturing unit in the country in the private sector goes to Indo-French Time Industries Ltd., Bombay, (Managing Director: Mr. J. H. Parikh). The first batch of watches, assembled by this unit, was released on Saturday last at a function, presided over by Mr. Y. B. Chavan, Chief Minister of Maharashtra. The new watches, styled *Zephyr*, are being sold at a modest price of Rs. 52 each. The Company proposes to introduce in the market full lever watches costing about Rs. 100 each by March next. In the first year, the new plant will manufacture about 90,000 watches. Production is proposed to be stepped up progressively to 300,000 watches by the end of a five-year phased programme. To begin with, activity will be mainly of an assembling nature, using imported components. Later, progressive manufacturing programme will be implemented. In the first year itself, the value of the components manufactured in India, including the cost of labour, will be about 40 per cent of the unit price. It is claimed that, by the end of the next five years, only about five to ten per cent of the value of the watch will represent imported components. The Company has commenced operations in its office in the City, with an initial complement of over 30 skilled workers. But it will soon have a fully air-conditioned factory at Goregaon, an industrial suburb of Bombay. The total capital cost of the project is estimated at Rs. 40 lakhs.

The Company has secured financial and technical collaboration of a French consortium of watch manufacturers, Messrs. S.E.D.I.M. The financial participation of the French consortium is to the extent of 50 per cent. Their contribution will be in the form of complete plant, machinery, tools, dies and other equipments. Besides, the French collaborators will make available to the Indian company complete technical know-how. Two Indian technicians have already been trained in France. Besides, a French engineer has arrived in Bombay to train other personnel. An important feature of the collaboration agreement is that it does not involve the payment of any royalty to the French consortium.

It may be noted here that there is already one public sector unit engaged in assembling and manufacture of watches. This unit, which commenced operations last year, is functioning as an adjunct to the Hindustan Machine Tools, Bangalore, and has secured the collaboration of a Japanese firm, the Citizen Watch Co. In a message of good wishes sent to the Indo-French Time Industries, Mr. Manubhai Shah, Union Minister for Industry, disclosed that so far four schemes (including the existing two units), with a total annual capacity of 1.3 million watches, had been sanctioned by Government. All the units, according to Mr. Shah, have secured foreign collaboration. Their manufacturing programmes are so planned that they will be able to import their machinery at once, and manufacture indigenously practically all the watch components within five years, except hair spring and gems of small value. In addition, six small-scale units have also been established in the country.

Besides watches, India has made notable progress in the other branches of the horological industry as well. The number of clocks produced in India at present is about 75,000 annually. There are five major clock manufacturing units. The striking feature in the production of clocks is that most of the units are producing practically all parts of clocks and are working without any foreign collaboration. In addition to pendulum clocks, electric clocks are also manufactured. One or two firms have undertaken the manufacture of lever type of clocks. Nine schemes for the manufacture of time-pieces with an annual capacity of 950,000 units have been approved. One of them has already started production and their time-pieces are now in the market. One more unit has also started manufacture of components and their products are expected to come in the market shortly. Other schemes are in different stages of implementation. Foreign technical collaboration is obtained by five of the firms, two from Japan, one from Czechoslovakia, one from France and one from Switzerland. In addition, about 12 schemes have been sanctioned for the manufacture of time-pieces in the small-scale sector.

INDIAN OXYGEN'S DIVIDEND WELL COVERED

SALES AND PROFIT HIGHER

NOTWITHSTANDING the limitations arising out of power cuts suffered by some of the major consumers, sales of the diversified line of products of the Indian Oxygen Company Ltd. (Chairman: Sir John Keith Douglas Brown, Calcutta) have continued their upward trend, reaching a level of Rs. 756.58 lakhs, during the year ended 30th September 1961, which is higher by Rs. 111.06 lakhs, or about 17 per cent, than that attained during the preceding year. Improvements in the sale of all products were instrumental in attaining this impressive total. Sales of dissoved acetylene, which were a little disappointing during the previous year, increased quite satisfactorily during the year under review. Spectacular increases were recorded in the sale of argon gas as well, the plant for the production of which went into operation during 1960-61. Substantial increases were also recorded in the sale of gas user equipment, electrodes, electric welding equipment and equipment needed for the administration of medical gases.

A higher turnover has naturally brought about a rise in the gross profit which has improved by Rs. 13.56 lakhs to Rs. 152.51 lakhs. Although this is a fair increase, it must be noted that the pace of growth has been relatively lower. Further, the profit-margin is also lower, the proportion of gross profit to sales being only 20.2 per cent of the sale, as against 21.5 per cent previously. The reason for this decline, in the opinion of the Chairman, lies primarily in an increase in works cost which today is an all too familiar trend throughout the Indian economy. Here is what Sir John Brown has to report to the shareholders in this connection:

"Persistent shortage of power in several regions where the Company operates contributed significantly towards these increased costs. Calcium carbide, which, as stated by me last year, is now procured almost wholly from indigenous sources, continued to give unsatisfactory yields and also remained in short supply, leading to multiple transfers of our stocks between consuming points at heavy additional cost. The result of this was an appreciable increase in the cost of production of dissolved acetylene, which has not been compensated by any increase in selling prices."

Provision for depreciation has increased by Rs. 7.85 lakhs to Rs. 44.96 lakhs but that for taxation has been reduced slightly by Rs. 2.61 lakhs to Rs. 36.25 lakhs. After these essential provisions, there has been a rise of Rs. 8.32 lakhs to Rs. 71.30 lakhs in net profit. This, together with Rs. 13.78 lakhs brought forward from the previous year's account and certain readjustments, such as Rs. 2.50 lakhs received as a refund of tax on profits for an earlier period and Rs. 8.00 lakhs as the amount rendered surplus in the tax provision account on the finalisation of the relative assessments, makes available for appropriation a sum of Rs. 95.58 lakhs. Out of this the Directors have credited Rs. 13.00 lakhs (Rs. 12.00 lakhs) to the statutory development rebate reserve, Rs. 0.52 lakh (Rs. 0.15 lakh) to the fixed asset replacement reserve and Rs. 25.00 lakhs (Rs. 21.00 lakhs) to the general reserves. Figures in brackets represent the transfers effected during the previous year. It will be noted therefrom that the amounts ploughed in are more than those a year ago. From the balance, an ordinary dividend has been proposed at 15 per cent, subject to deduction of tax. Although no change has been recommended in the rate of dividend, it is to be noted that such is payable on an enlarged number of shares and absorbs at Rs. 39.00 lakhs, Rs. 9.00 lakhs more than during the year 1959-60. The carry forward is also substantially higher at Rs. 18.07 lakhs than Rs. 13.78 lakhs brought in.

The above salient features of the operations of the Company during the year under review are presented in the table below with corresponding figures for the previous three years thrown in juxtaposition for the sake of comparison.

The issue of rights shares, which was completed during the year, has raised the issued share capital of the Company, as at 30th September 1961, to Rs. 260.00 lakhs and has also led to the creation of a share premium account, the amount to the credit of which stands at Rs. 48.00 lakhs. Inclusive of this and the amounts transferred during the year, reserves and surplus aggregate Rs. 229.05 lakhs or nearly 88 nP per rupee of the share capital. Loans, secured and unsecured, stand at Rs. 166.83 lakhs and current liabilities at Rs. 274.33 lakhs, giving a total indebtedness to outsiders of Rs. 441.16 lakhs. On the assets side, fixed assets with a book value of Rs. 683.93 lakhs inclusive of Rs. 88.74 lakhs worth of additions during the year, have been depreciated to Rs. 392.71 lakhs and on adding Rs. 82.58 lakhs as cost of capital work in progress, yield a total net block of Rs. 475.29 lakhs. Investments have remained unchanged at Rs. 4.46 lakhs. Current assets, loans and advances total Rs. 451.06 lakhs, the surplus over liabilities being just Rs. 10 lakhs.

(In lakhs of rupees)

The various developmental and expansion activities initiated a few years ago were continued during the year under report. Efforts, however, were not only confined to increasing the sales of industrial oxygen and dissolved acetylene in cylinders, but the Company continued to make substantial progress on the engineering side of its business as well. This will be clear from the full text of the Chairman's statement published on pages 164 and 165 of our last issue. Suffice it to record here his remarks on the outlook for the Company. These are as follows:

"It is too early in the new financial year to give any firm indication of the likely trend of profits this year. Sales so far compare favourably with the corresponding period in the previous year and, having regard to the continuing development of the metal using industries, we would expect this progress to be maintained. At the same time, we found that, in the second half of our last financial year, our activities were affected by power shortages, and I fear that this is a feature which will, unfortunately, recur for some years yet. We have also to bear in mind the increase in the cost of production to which I have referred earlier in this statement. Nevertheless, we have no reason to fear that our profits will not be maintained and indeed, it would be reasonable to expect some modest increase. At the same time, I must again point out that the extent of our existing foreign exchange liabilities and the prospects of our having, within the next few years, to shoulder further loan liabilities, demand from shareholders the exercise of a degree of patience. Our prosperity is, I would repeat, tied up with the growth of important sectors of the country's expanding industry and I am confident that, organised as we are on the basis of technical competence, service to our customers and personnel who have the welfare of the Company and its growth at heart, our performance in the years ahead will be found not wanting."

The Rs. 10 fully paid share of the Company is currently quoted at Rs. 39.25 *cum-div.* On an *ex-div.* basis, the yield works out to 2.7 per cent, free of tax.

KAISER ALUMINUM DURING 1961

The Kaiser Aluminum and Chemical Corporation has reported an increase in both sales and earnings for the year 1961. The actual net sales aggregated $424,045,000, as compared with $406,574,000 in 1960, and earnings amounted to $24,038.000, as against $22,771,000. The earnings per common share rate from $1.20 in 1960 to $1.27 in 1961. The 1961 sales were the second highest in the history of the Company. The year 1961, according to Mr. D. A. Rhoades, President of the Company, was one of progressive improvement, with activity rising from a low first quarter to a peak level in the fourth quarter. A number of factors contributed to this improvement, including rising domestic shipments of mill fabricated aluminum products and a higher rate of shipments to overseas markets. These factors, together with further cost of reduction effort during the year, helped to offset the mid-year wage increase and the industry price reductions which became effective just prior to the fourth quarter.

DALMIA IRON AND STEEL IMPRESSES

HANDSOME AMOUNT ADDED TO RESERVES

THE judicious policy of modernisation of its existing plant and the use of the latest automatic equipment in the field in future resulting in larger production at lower costs per unit, should richly reward the Dalmia Iron and Steel Limited (Managing Director: Mr. Ghanshyam Kejriwal, Rajgangpur, Orissa). In fact, the Company had made significant all-round progress during the year ended 30th September 1961. During the year, production in tons of grinding media went up from 3,642 to 3,879, of steel castings from 815 to 927 and of spun pipe from 13,755 to 15,207, while sales in value rose from Rs. 41.04 lakhs to Rs. 45.10 lakhs, from Rs. 28.09 lakhs to Rs. 30.83 lakhs and from Rs. 60.26 lakhs to Rs. 67.18 lakhs, respectively. The total sales turnover showed considerable improvement from Rs. 129.39 lakhs to Rs. 143.11 lakhs. But what is more significant is the rise in gross profit from Rs. 19.87 lakhs to Rs. 33.11 lakhs.

This has been due to the economies of large-scale production. The increase in production was attained at a lower total cost of Rs. 112.44 lakhs as compared with Rs. 115.20 lakhs in the previous year. With the rise in production, manufacturing and operational expenses have naturally increased from Rs. 57.48 lakhs to Rs. 62.04 lakhs. But this increase, apart from representing lower costs per unit, is more than offset by a decline in the cost of raw materials from Rs. 57.72 lakhs to Rs. 50.40 lakhs. Consequent upon the better performance of the Company, the Directors have made a higher provision for depreciation of Rs. 10.50 lakhs against Rs. 8.10 lakhs in the previous year and set apart Rs. 1.50 lakh for taxation against *nil* in the past. The net profit shows an increase of roughly Rs. 10 lakhs at Rs. 21.11 lakhs, and the Directors have ploughed back to reserves as much as Rs. 11.50 lakhs, that is, more than 50 per cent of the net profit, as against Rs. 4.25 lakhs a year before. They have also succeeded in maintaining the dividend at 10 per cent, subject to tax, on a capital double the size of that in the previous year.

The following comparative table brings out the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 30th September			
	1961	1960	1959	1958
Sales proceeds	143.52	129.78	66.14	10.50

* Subject to deduction of tax.

While the Company's performance in 1960-61 should impress the investor, the outlook for the Company is bright, in view of the large expansion programme on hand. Considering the considerable gap between the demand and supply of spun pipes in the country, the Company's plant for which went into production in the first week of December 1958, the Directors had decided in 1960 to expand the plant by installing two more spinning machines. In their report accompanying the balance-sheet for the year ended 30th September 1960, they had, however, stated that these two additional centrifugal casting machines could not be obtained by them due to various technical difficulties. They had, however, added that, after reviewing the working of the latest machines of this type abroad, the Managing Director had reported that these machines were capable of giving 200 to 250 per cent more production than the existing ones with less rejection, and that the Company was, therefore, trying to procure the necessary import licences for such equipment to increase its capacity then of 14,400 tons of pipes to 50,000 tons in the first stage. They had also said that the Company was negotiating for technical collaboration and financial participation with the leading spun iron pipe manufacturers in the world to attain the newly licensed annual capacity of 75,600 tons. In their latest report they state that sometime back a team of highly placed executives of one of the largest manufacturers of spun cast iron pipes in the world visited the Company's works and evinced keen interest in their proposal for the collaboration. Negotiations are under way in this regard, and the Managing Director is likely to go abroad soon to negotiate and conclude final terms.

In addition to this project, the Company holds industrial licences to expand the present installed capacity of the grinding media plant from 3,000 tons to 6,000 tons per annum and of steel castings from 1,500 tons to 3,600 tons a year. In this connection, the General Manager of the collaborator, Messrs. Les Fonderies Magotteaux S.A., Belgium, visited the works in November 1961 and has reported that, in its own interests, the Company should further mechanise the existing plant along with the extended capacity in order to reduce the cost of production and streamline the process. The total estimated expenditure on further mechanisation and expansion of the grinding media and steel casting combined, as per this suggestion, is now about Rs. 70 lakhs. The programme would be completed, we are told, within 12 months after the licences to import the necessary machinery are received.

The wage bill from the current year onwards will be higher by Rs. 2.75 lakhs as per the terms of a fresh agreement signed with the labour union.

The Company has tentatively arrived at an arrangement with its Belgian collaborator to export its products of steel castings and grinding media to the neighbouring countries on a commission basis. The foreign firm has agreed to divert a considerable portion of its export inquiries and orders to the Company.

The financial position of the Company is as satisfactory as that of a company with large capital expenditure could be. It will take some time for the Company to build up its reserve position, which stands now at Rs. 17.65 lakhs, to supplement its subscribed and paid-up capital of Rs. 80 lakhs. Its indebtedness to outsiders amounts to Rs. 77.35 lakhs, in addition to a loan of Rs. 39 lakhs from the Industrial Credit and Investment Corporation of India. Against this, current assets, loans and advances total Rs. 115.59 lakhs and investments Rs. 0.12 lakh. The current assets alone aggregate Rs. 111.14 lakhs and safely cover the short-term liabilities. The gross block increased during the year from Rs. 112.18 lakhs to Rs. 125.47 lakhs and has been written down to Rs. 97.54 lakhs. It is shown in the balance-sheet at Rs. 98.30 lakhs, inclusive of the expenses on construction in progress of Rs. 0.76 lakh.

The Rs. 10 fully paid ordinary shares of the Company are being currently quoted on the Bombay Stock Exchange at Rs. 11 *cum-div.* On an *ex-div.* basis and at this rate, they offer a yield of 6.3 per cent per annum, free of tax.

VOLTAS LIMITED

NOTICE

THE SEVENTH ANNUAL GENERAL MEETing of VOLTAS LIMITED will be held at Bombay House, Bruce Street, Fort, Bombay, on Monday the 26th February 1962, at 4.00 p.m., to transact the following business:

1. To receive and adopt the Directors' Report and Audited Balance Sheet and Profit and Loss Account for the year ended 31st August 1961.
2. To sanction the declaration of a dividend.
3. To appoint a Director in place of Mr. J. D. Choksi who retires by rotation and is eligible for re-appointment.
4. To appoint a Director in place of Mr. B. Reinhart who retires by rotation and is eligible for re-appointment.
5. To consider and, if thought fit, to pass the following resolution as Ordinary Resolutions:

"(a) RESOLVED that, subject to the approval of the Central Government being obtained, Mr. S. K. Handoo be and is hereby reappointed with effect from the 1st January 1962 as Managing Director and General Manager for the period and at the remuneration and with the benefits and upon the terms contained in the draft Agreement submitted to this Meeting and for identification signed by the Chairman thereof, which Agreement is hereby specifically sanctioned with liberty to the Directors to alter and vary the terms and conditions of the said re-appointment and/or Agreement without increasing the remuneration mentioned therein and in such manner as may be agreed to between the Central Government and the Directors.

(b) RESOLVED that, subject to the approval of the Central Government being obtained, the terms of remuneration of Mr. R. F. S. Talyarkhan, Joint Managing Director and Joint General Manager, as set out in the Agreement dated the 14th May 1959 executed with the Company, be modified and varied with effect from the 1st January 1962 as indicated below:

Basic Salary: Rs. 4,500 per month all other terms of employment remaining unchanged.

(c) RESOLVED that, subject to the approval of the Central Government being obtained, the terms of remuneration of Mr. P. Gregori, Director and Deputy General Manager, be modified and varied with effect from the 1st January 1962 as indicated below:

Basic Salary: Rs. 3,750 per month. (Scale Rs. 3,250-100-4,250.)

Reimbursement of entertainment expenses incurred for business purposes not exceeding Rs. 3,000 per annum,

all other terms of employment remaining unchanged."

6. To consider and, if thought fit, to approve and adopt the Regulations contained in the document to be submitted to the Meeting and for the purpose of identification subscribed by the Chairman thereof, as the Articles of Association of the Company, with such modifications, if any, as may be agreed to at the Meeting and to pass the following resolution as a Special Resolution pursuant to Section 31 of the Companies Act, 1956:

"RESOLVED that the Regulations contained in the document submitted to this Meeting and for the purpose of identification subscribed by the Chairman thereof, be and are hereby approved and adopted as the Articles of Association of the Company, in substitution for, and to the exclusion of the existing Articles thereof."

7. To appoint Auditors and to fix their remuneration.

Notes:

(a) The relative Explanatory Statements pursuant to Section 173 of the Companies Act, 1956, in respect of the Special business under items 5 and 6 set out above are being posted to the Shareholders with the Notice.

(b) A MEMBER ENTITLED TO ATTEND AND VOTE IS ENTITLED TO APPOINT A PROXY TO ATTEND AND VOTE INSTEAD OF HIMSELF AND A PROXY NEED NOT BE A MEMBER. THE PROXY SHOULD HOWEVER BE DEPOSITED AT THE REGISTERED OFFICE OF THE COMPANY NOT LATER THAN FORTY-EIGHT HOURS BEFORE THE COMMENCEMENT OF THE MEETING.

(c) The Transfer Books of the Company will be closed from the 16th January, 1962 to the 5th February, 1962, both days inclusive.

(d) If dividends on shares as recommended by the Directors are passed at the Meeting, the payments will be made to those shareholders whose names are on the Company's Register on the 5th February, 1962. The payments will be made on and after the 5th March, 1962.

By Order of the Board of Directors,
S. K. HANDOO,
Managing Director.

BOMBAY, 12*th December* 1961.

Registered Office:
19, GRAHAM ROAD,
BALLARD ESTATE,
BOMBAY 1.

NEW PRODUCTS AND PROCESSES

Heat Exchanger for Refineries

A COMPLETE "Fin Fan" air cooled heat exchanger, used in refineries and chemical plants to cool hot liquids and gasses passing on to other processes or into storage tanks, will be one of the exhibits shown by a British firm at the Chemical and Petroleum Engineering Exhibition at Olympia, London, from 20th to 30th June. It consists of two bundles of extended surface (finned tubes) 30 ft. (9.14 m.) long which are supported at intervals of not more than 6 ft. (182.88 cm). and give a total cooling surface of 80,000 sq. ft. (7,432.2 sq. m.). They are supported on standard type steel structure. Two fans, each driven by a single speed electric motor coupled to a right angle speed reducer provide forced draught. Steel plenum chambers divided into two compartments ensure even air distribution over the fin tube bundles.

Automatic Glass Tube Plant

One of the most difficult processes in glass making—the continuous production of glass tubing—is being carried out with previously unattained accuracy on a new plant at a factory in Britain, with the aid of automatic temperature control equipment. By means of the automatic control equipment, tubing is manufactured continuously without human intervention at a speed of up to 22 miles per hour. The tubing is hauled off by a tractor mechanism which rotates it five revolutions while it is being pulled past air-cooling vents. Temperatures of the glass melting tank and the tube-making forehearth are held constant to within ½° C. at 1,200° C., which represents a precision of 0.04 per cent. Such closeness of control is vital to obtain the correct viscosity of molten glass and hence a continuous flow of molten tubing from the feeders without it either caving-in or breaking.

Radial Ventilators

Ventilators and blowers, whether they are only a part of a big mechanical equipment or serve for ventilating mine shafts, have become quite indispensable pieces of equipment. An Austrian firm has succeeded in designing and manufacturing radial ventilators with efficiency rates ranging upto 87 per cent (efficiency rates of usual types: 60-68 per cent). The new ventilators have a diameter of the impeller of 50 cm. and more. Carefully designed controls secure optimum efficiency rates over a big range of performance. The new ventilators have, moreover, a very low current consumption. The ventilators are used, among others, for steam boilers, thermo power plants, nuclear power plants, in chemical mining, iron and steel, cement and magnesite industries, etc.

Welding Plastics

Soviet technical institutes in Moscow have collaborated in developing a range of ultrasonic welding machines for plastic materials which can be used both for spot-welding and for pressure-welding. One model, designated the PUT-5A, can make from 15 to 100 spot welds per minute. The inventors claim that one advantage of the technique is that with ultrasonics, energy can be directed to almost any area of a component, making it suitable for working in hard-to-reach spots. Using the machines, various components are being produced such as nylon propellers and vanes, as well as polyethylene tubes 10 mm. in diameter and with a wall thickness of 0.7 mm.

Small Coal Cutter

What is claimed to be the smallest and cheapest coal mining machine yet produced is available from an American company. It is intended for what the Americans call "narrow seams"—18 inches to 8 feet thick. The machine weighs only 200 lbs. and costs $1,095. This makes its use feasible in the one and two-man "pick and shovel" mines. It operates on two horse-power and will undercut a seam to 4½ feet. The machine cuts a line of horizontal holes at the bottom of the exposed coal face. Explosives can then be used to knock down the undercut coal.

Glass Fibres Strengthen Plastics

The great strength of fabrics made of glass fibres "has literally made glass fabrics the backbone of the plastics industry," according to Hess, Goldsmith and Company, a leading American textile manufacturing firm. Some experts estimate that glass fibre as a reinforcing agent has increased the usefulness of plastics 300 per cent. When glass fabrics and plastics are bonded together, they make a material that is stronger than steel and also proof against corrosion. The weight range for a square yard of glass fabric extends from one ounce to two pounds.

2,000 Cans a Minute

The American Can Company, has developed a new machine that can make aluminium or tin-plated steel cans at speeds more than three times that of the machines in general use. The machine uses a new manufacturing principle to turn out cans at speeds up to 2,000 a minute, or 120,000 an hour. This means that in an eight-hour day the machine can produce a total of nearly 1,000,000 cans. The maximum speed on present can-making machines is 600 a minute. The new machine makes cans from a continuous ribbon of metal sheet, forming the ribbon into a tube, welding the sides, and automatically cutting them into proper size.

Quick Copies

A coin-in-the-slot document copying machine for use by the public has been installed in the lobby of a U.S. office building. The user inserts the document to be copied and drops two 25-cent coins in the slot. These set the machine in operation, the original and one copy being produced in 25 seconds. The copier is intended for the use of businessmen who do not have enough work to justify their own office machine.

Heat Resistant Paper from Glass Threads

Production has started in East Germany of an acid resisting, non-inflammable form of paper made entirely of glass threads. These threads, 3 to 6 mms. long and 3/1,000 of a mm. thick, are treated basically like cellulose in a paper-making machine. The new material is heat resistant up to 1,272 degrees Fahrenheit. It will be manufactured for use as insulating material in the electrical industry.

New Machines for Manufacturing Felt and Coir Yarn

A mechanical engineering firm of Austria has developed, after many years of research work, a fully automatic machine for the production of coir yarns which is now being turned out in series. Apart from machines for spinning coconut fibres the firm has started producing needle felting looms which can be used for the manufacturing of all types of felt. The new equipment is claimed to have many interesting new structural features.

Thickness Indicator

An instrument that can be used to continuously measure the thickness of wire, rod, steel and non-ferrous strip, and other materials produced in a continuous fashion, has recently been developed by a German concern. The material to be measured, which may be stationary or moving, is gently gripped between feelers that are held in position by springs. Movement of the feelers indicates a change of thickness and this is recorded on a dial. Calibration of the instrument is accomplished using a smooth rod of known thickness.

X-ray Cardiograph

A phase X-ray cardiograph which simultaneously produces an electro cardiograph and an X-ray photograph of the heart has been designed by a group of Moscow medical specialists. The new device makes it possible to judge objectively the size of the heart, the blood in the auricles and ventricles, and the volume of the blood ejected into the vessels. Using the device it is possible to penetrate into the depth of the heart and to get to know the laws governing the physical and chemical changes in the cardiac muscle. This will enable doctors to diagnose cardiac diseases in good time. The phase X-ray cardiograph is now undergoing clinical tests.

Cylindrical Grinding Machine

A range of fully automated cylindrical grinding machines with automatic conveyor and work loading mechanisms has been developed by the Newall Engineering Co., England, to meet mass production requirements in industries such as those manufacturing motor cars or automotive components. The machines can be tailor-made to suit individual requirements and linked together to perform a wide variety of high precision plunge grinding applications. The series has a work length capacity of either 18 in., 24 in., or 30 in., provides facilities for swinging a 12 in. component, and will grind a maximum diameter of 7 in. The machines have been designed on a unit construction principle to give advantages in conservation of floor space and cost economy. While a number of machine characteristics and mechanisms are identical, and the hydraulic and electrical control systems are virtually uniform, selection can be made from a number of unit assemblies—offering straight or angular approach of the wheel head—in combinations to suit the grinding applications required. The elimination of table traverse, with its associated hydraulic mechanism, has enabled a reduction of some 30 per cent in the working area required compared with a conventional type grinder of similar capacity. A further important feature of the design is that controls may be fitted either to the front or at the side of a machine, giving considerable flexibility in the locating of automatic handling devices and conveyor systems. Fully automatic control of component size and machine operating cycle is obtained through two-stage electro-pneumatic control equipment which also ensures repeatibility of size to close tolerances.

INDIAN IRON ORE IN THE WORLD PATTERN

(*Concluded from page* 208)

which is very insignificant in area as compared with the rest of India, had an export target of 4 million tons, while the Indian target is only 10 million tons per year to be reached by the end of the third Plan.

India is also endowed with iron ore resources along her coastal line and these require attention for export market. In Maharashtra, the district of Ratnagiri adjoining Goa should be fully explored for iron ore reserves. In the State of Mysore, iron ore deposits at Apsarkonda, Kotebari, Kodachadri and Yellapur-Bisgod near the coastal line were recently prospected by the Board of Mineral Development. If adequate road transport and port facilities are provided, it will be possible to export at least 2 million tons per year.

The Government of India's decision to develop Paradip port and Sukinda iron ore mines is very appropriate and timely. These deposits are comparatively closer to the coast than other deposits in Orissa and can be used for export market.

In order to increase iron ore production in India, it is also necessary that the various State Governments and private mineowners should be encouraged to develop the deposits by modern mechanised methods and the National Mineral Development Corporation should localise their activities to Kiriburu and Bailadila as far as iron ore is concerned.

India shares one-fourth of the world's known reserves of iron ore. In the interest of export trade and to be competitive in international market, it is essential to develop coastal iron ore deposits, providing them with adequate road transport and port facilities. The stress on road transport springs from the fact that rail transport is already heavily loaded. The bottlenecks in coal transport have affected the coal-consuming industries located all over the country. Further, the development of the coastal iron ore deposits can be carried out with the help of heavy road transport, as there will be only short hauling distances to the ports.

READY FOR SALE:

THE MADRAS STOCK EXCHANGE OFFICIAL YEAR BOOK

1960-61

(Ninth Year of Publication)

(Revised and brought up-to-date. Balance Sheets and other particulars received upto 20th December, 1961 incorporated. Details of some important new issues made by Companies during the year 1961 included.)

Over: 1,140 Pages

Price—**Rs. 12.50.** Packing and Postage **Rs. 2.50.**

Compiled by:

MADRAS STOCK EXCHANGE LTD.

322/323, Linghi Chetty Street, MADRAS-1.

BETTER DEMAND FOR MONEY

(From Our Own Correspondent)

BOMBAY, 31*st January*

The tempo of activity in the money market has improved. There is more demand for funds than a week ago, while the supply of funds has shrunk further. In the inter-bank section, almost all banks, including some of the Exchange banks, are borrowers. Some of them are said to be resorting to the Reserve Bank for accommodation. Nevertheless, the inter-bank rate remains unchanged at 4½ per cent. The rate is virtually nominal, as lenders are few and far between.

There has been no change in the short-term money rates either. These are as follows:

	Per cent.
Notice money from public:	
3 days or more	3
Term deposits:	
(i) 3 to 30 days (inclusive)	3
(ii) 31 to 60 days (inclusive) ...	3½
(iii) 61 to 90 days	3¾
(iv) 91 days and over but less than 12 months	3¾
(v) 12 months	4

The 91-days' Central Treasury Bill rate has, however, gone up a little from 2.520 per cent to 2.525 per cent per annum, although the amount tendered was just equal to that invited, namely, Rs. 2 crores. Tenders for a similar amount are invited for the next week also. Only Rs. 5 lakhs worth of 91-days' Intermediate Treasury Bills were sold during the period 24th to 27th January, as against Rs. 47 lakhs in the previous week. Their sales are being continued at the selfsame rate of 2.456 per cent per annum.

In the week ended 26th January 1962, notes in circulation declined by Rs. 4.99 crores. Notes held in the Banking Department rose by Rs. 5.79 crores. Consequently, the total notes issued experienced only a minor increase of Rs. 80 lakhs.

The foreign assets held by the Reserve Bank suffered a fractional fall of Rs. 43 lakhs to stand at Rs. 137.83 crores, of which Rs. 126.86 crores were held in the Issue Department and Rs. 10.97 crores in the Banking Department.

Deposits of banks with the Reserve Bank have fallen by Rs. 2.44 crores to Rs. 80 crores. Deposits of others have also fallen by Rs. 5.66 crores. Among deposits of Governments, while those of the Centre have staged a marked rise of Rs. 16.52 crores, those of other Governments have shrunk by Rs. 5.08 crores. A good part of the increase in the Central Government's balances is due to an advance by the Reserve Bank; its loans and advances to governments, for instance, have risen by Rs. 7.87 crores. Other loans and advances have also gone up, albeit by a small amount of Rs. 1.41 crore, of which Rs. 87 lakhs are under advances to scheduled banks against usance bills.

The scheduled banks' statement for the week ended 19th January 1962 shows a substantial rise of Rs. 18 crores in deposits, raising the total to Rs. 1,989.81 crores, a level which is about Rs. 5 crores higher than the notes in circulation in the corresponding week. Inter-bank borrowings are up by Rs. 1.83 crores. Bank credit has gone up by Rs. 7.01 crores, bringing the total to Rs. 1,308.99 crores. Investments also have increased by Rs. 4.48 crores and total cash by Rs. 5.10 crores. Only money at call and short notice has gone down by Rs. 1.28 crore, but borrowings from the Reserve Bank have gone up by Rs. 1.26 crore.

The bulk of the increase in the deposits of scheduled banks as noted above has been on account of the State Bank of India, its exact share being Rs. 14.57 crores. With this increase, the deposits of this premier public sector institution stand at Rs. 544 crores. There has hardly been any change in its advances, while its cash and investments have gone up by Rs. 3.02 crores and Rs. 4.12 crores, respectively.

The only notable feature of the week in the Gilt-edged market has been the Reserve Bank's presumption of outright purchase of the very near dated maturities, viz., 3½ per cent 1963 and 3 per cent 1963-65. It is a buyer of the former at Rs. 99.95 and of the latter at Rs. 98.65. The only significance of this development is that the Bank is buying these securities to facilitate their repayment when they fall due next year. It is true that the 3 per cent 1963-65 loan gives an option to the Government to repay in 1965. But the Government is unlikely to exercise this option, as such will have a significant impact on the pattern of yields on Government securities as a whole. Accordingly, this loan is as good as a 1963 issue from the point of view of repayment. As interest was due in the third and fourth weeks of January 1962, the Reserve Bank had stopped selling 4 per cent 1980 and 1981 loans in recent weeks. Now that consideration is over, the Bank has resumed the sale of these loans, for which there is always a steady demand from provident funds. The Bank's selling rates for these loans are Rs. 99.20 and Rs. 98.50, respectively.

Among other Central Government securities, there has been a fall of 10 nP in 3 per cent 1970-75 and 3½ per cent 1966, while 3½ per cent 1969 has improved by 5 nP. The State loans are quiet, with substantial decline in prices in almost all the 4½ and 4 per cent loans.

In the foreign exchange market, banks' selling rate for spot dollars has gone down by 25 nP. over the week, to Rs. 476. Their buying rate for spot T.T. has also declined by a like amount to Rs. 472.50. Abroad, the pound sterling has gained to some extent *vis-a-vis* both dollars and the Continental currencies. Spot sterling in the New York Exchange market is currently quoted at 281.240-281.270, an increase of 0.010 cent over the week. Three months' forward has also improved from 279.430-279.460 to 279.480-279.510 cent per pound.

GOLD BETTER, SILVER LOWER

(From Our Own Correspondent)

BOMBAY, 30*th January*

The bullion market continued to rule firm during the first three sessions of the week under review but developed a sagging tendency on Monday which gathered momentum yesterday and today, though there was a slight recovery towards the close. The initial persistent firmness was due to three bullish factors: (*a*) hopes of a possible relaxation in margin restrictions when business is permitted in the next (*Jeth*) settlement; (*b*) active buying by upcountry interests in view of excellent offtake there; and (*c*) expectations regarding a marked fall in arrivals of contraband gold as a result of increased vigilance by the Customs. The upward trend was accelerated by nervous short-covering. On Monday, however, both gold and silver suffered a setback in values, which followed liquidation by tired bulls, while fresh buying inquiries were scattered. There was also profit-taking at higher levels. The decline continued yesterday and today, thanks to heavy arrivals and slackness in demand at upcountry centres. A recovery was no doubt in evidence later today, but it was not marked enough to make up for the losses in silver, so that the closing rates were below those prevailing on Tuesday last week, whereas gold was a shade better.

Offtake of both gold and silver during the week was lower than in the previous week, the daily average rate being 5,000 tolas and 6 bars, respectively, as against 8,250 tolas and 7 bars. The daily average arrivals of gold were smaller at 6,600 tolas, as against 8,500 tolas, while those of silver were higher at 26 bars, as against 22 bars. The floating stocks in the City are reported to be around 80,000 tolas of gold and 1,000 bars of silver.

The adjustment rates fixed today were Rs. 118.50 per 10 grams of gold and Rs. 212.40 per kilogram of silver. The corresponding rates for Tuesday last week were Rs. 117.75 and Rs. 212.65, respectively.

The *Fagun* (22nd March) settlement in gold began at Rs. 119.60 on Wednesday the 24th inst., as against the previous close of Rs. 109.30 and moved up to touch a high of Rs. 121 on Saturday. After receding to Rs. 118.85 yesterday, the settlement recovered to Rs. 119.85 today before finishing at Rs. 119.70.

Ready gold continued to be at a discount under the forward throughout the week. The actual discount which had declined from Re. 1.30 on Tuesday last week to 45 nP on Monday the 29th inst. increased again to 80 nP yesterday and 95 nP today. The spot rate advanced from Rs. 118 to Rs. 120.30 on Saturday and, after easing to Rs. 118.40 today, rose again to close at Rs. 118.75.

In silver, the *Fagun* (23rd March) settlement was well supported early in the week, the quotation rallying from Rs. 214.25 to Rs. 215.25 on the 27th inst. Thereafter, the settlement encountered selling and retreated to Rs. 213.60 yesterday. It, however, improved to Rs. 214.05 today; the closing was Rs. 213.90.

Ready silver was quoted today at Rs. 212.40, as against Rs. 212.65 on Tuesday last week, the highest and lowest levels touched being Rs. 213.75 (Saturday) and Rs. 212.15 (Monday). The discount under the forward when the market closed today was Re. 1.50, same as last week.

The world price of gold in the London bullion market, which had gone down from $35.16¼ to $35.15¾ per ounce last week, staged a recovery this week, the latest available rate being $35.16⅝. The sterling price, however, remained unaltered at 250*s.* 1¼*d.* There was a rise in silver prices, ready improving by 1¼*d.* to 86¾*d.* and the forward by 1¼*d.* to 87¼*d.*, but silver in New York was unchanged at 103.75 cents.

The following table shows the trend of prices during the week under review:

	31-1-62 (closing)	High	Low	23-1-62 (closing)
	Rs.	Rs.	Rs.	Rs.
GOLD				
Ready (.99 fine)	118.75	120.80	118.40	118.00
Forward: *Fagun**	119.70	121.00	119.85	119.80
Sovereign	97.00	97.00	96.75	97.00
SILVER				
Ready (.996 fine)	212.40	213.75	212.05	212.65
Forward: *Fagun*†	213.90	215.25	213.55	214.15
London—				
Silver Ready	86¼*d.*	86¼*d.*	85¼*d.*	85¼*d.*
Silver Forward	87¼*d.*	87¼*d.*	86¼*d.*	86¼*d.*
Gold	250*s.* 1¼*d.*	250*s.* 2¼*d.*	250*s.* 1¼*d.*	250*s.* 1¼*d.*
New York—				
Silver	103.75 cents	—	—	103.75 cents

* 22nd March settlement. † 23rd March settlement.

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.7 tolas). London and New York quotations are per ounce.

LINSEED DULL

(Messrs. A. Bradley and Co.)

CALCUTTA, 29*th January*

In the absence of buyers and in sympathy with other seeds, the linseed market has been rather lifeless during the week and prices have shown a slight decline. Arrivals from upcountry are a bit better than the week before, and they have been absorbed by the mills.

The oil market is dull. Small business has been reported during the week for ready delivery.

The oilcake market is quiet again. Prices have declined somewhat in the absence of enquiries.

Ready/February is quoted at Rs. 32.25 per maund.

COTTON FUTURES LISTLESS

(From Our Own Correspondent)

BOMBAY, 31*st January*

Barring minor fluctuations caused by occasional bouts of buying and selling, the cotton futures market depicted a quietly steady trend during the week. While reports of the possibility of tightening of the cotton control measures already in force and the news of the closure of textile mills in Ahmedabad owing to shortage of coal, coupled with apprehension that the F.M.C. might intervene should futures prices were to rise unduly acted as a restraining influence, the tight supply position, delay in issuing the P.L. 480 allocation by the U.S., keen demand for ready cotton and lower stocks of raw cotton exerted a bullish influence on the market. The pull of these opposing forces tended to keep futures prices steady. The I.C.C. March contract, which had closed at Rs. 689 on the 23rd inst., after fluctuating between Rs. 690 and Rs. 686, finished at Rs. 688 today, showing a net decline of Re. 1 over the week. The market virtually ignored the efforts now being made by the Textile Commissioner to secure rigid enforcement of the cotton control order.

In the spot section, good demand was noted for all popular styles, especially Co2, L.147, 197/3 and Moglai varieties. Spinners freely purchased good quality Digvijay and Vijay at advancing prices due to fear of deterioration in the quality of these cottons in some tracts. New crop Laxmi also attracted buyers.

Export demand for Bengal *Deshi* was subdued. It was officially announced on the 24th inst. that the ceiling against the recent Bengal *Deshi* export quota (shippers' share) had been reached and that no further applications would be entertained.

Sustained mill interest was reported in Sudan cotton, both lower and higher grades. There was keen demand for East African cotton also early in the week but interest faded subsequently on news that the first consignment of East African cotton that arrived in Bombay was of inferior quality. A revival of interest was, however, noted towards the close of the week. There was the usual interest in Pakistan cotton.

The following are the latest available quotations—in rupees per candy of 784 lbs.—from the spot market at Sewri:—Bengal *Deshi* 670; Vijay 995; Digvijay 1,100; Khamgaon 1,185. Pakistan AC134 1,230; Busoga (UNUG) 1,371; BP 52 FAQ 1,375; Sudan P4L 1,381.

Firm conditions continued to prevail in the Karachi cotton futures market during the week. The NTRG January contract advanced from Rs. 82.05 last week-end to Rs. 84.20, prior to expiry on 25th January. The March contract attracted sustained support, thanks to the switchover of purchases from the January contract, and advanced from Rs. 80.05 last week-end to Rs. 82.60 but receded at close to Rs. 82.05.

Cotton futures in Liverpool receded during the week in quiet dealings characterised by limited turnover and narrow price movements. Lower New York advices and slackness of local trade and mill demand imparted weakness to the market. Both the American and American type contracts eased. Sudan contracts, however, ruled quietly steady. The following are the latest available quotations: in pence per lb. from Liverpool:

American cotton one inch Staple contract: March 24.55; May 24.90; July 25.00; October 24.55.

American cotton mixed growth contract: March 24.95; May 25.30; July 25.40; October 24.95.

Sudan: January, March, May 32.00.

New York cotton futures market ruled easy during the week. Reports of heavy ginnings and reduced entry into the loan programme influenced speculative selling which resulted in a decline in prices. Spot prices, however, ruled firm, thanks to good spinner demand.

The following are the latest available quotations from New York; as compared with those a week and a fortnight ago.

(In cents per lb.)

	30-1-62	22-1-62	16-1-62
New York spot ...	35.55	35.50	35.50
March	34.00	34.24	34.24
May	34.67	34.80	34.82
July	34.81	35.01	34.99

YARNS IRREGULAR

(From Our Own Correspondent)

BOMBAY, 31*st January*

A distinctly irregular trend was in evidence in the yarn market during the week under review. Thus, art silk yarns were steady, while staple fibre yarns ruled easy and cotton yarns remained dull. The steadiness of art silk yarns was due to good buying enquiries from weaving units which had obtained quotas of indigenous yarn for the current quarter (0.48 kg. per loom per shift). Imported yarns, however, were quiet in the absence of supplies, in view of the high premium of import licences, on the one hand, and reduction of export promotion incentives, on the other. Staple fibre yarns drifted downward on account of easy advices from consuming centres. Business put through in cotton yarns was restricted and values moved narrowly. Operators welcomed the reported rejection, by the millowners, of the British Cotton Board delegation's plea for a voluntary ceiling on cotton yarn exports from India to Britain. The discussion between the British delegation and the Indian millowners' spokesmen ended inconclusively on the 24th inst.

Amilon (20/1) February delivery advanced by Rs. 67 to Rs. 3,128. April contract spurted by Rs. 65 to Rs. 3,270. Spot National Rayons 150 Bt. cones 1st grade rallied from Rs. 10.93 to Rs. 11.68. 120 Bt. cones 1st grade was done at Rs. 12.90. Centurys 150 and 120 Bt. cones 1st grade were quoted today at Rs. 11.24 and Rs. 12.65, respectively. Among imported yarns, 120 Japan was unchanged at Rs. 1,818, as also 150 Japan at Rs. 1,929, 120 Italy at Rs. 1,818 and 150 Italy at Rs. 1,680.

Staple fibre yarn (40 x 1) February delivery dropped Rs. 11 to Rs. 737. April position receded by Rs. 13 to Rs 747. Spot Kohinoors eased by 20 nP to Rs. 8.80. Citys shed 26 nP to Rs. 8.67 and Hinds 21 nP to Rs. 8.05.

In the cotton yarn section, prices were more or less unchanged at last week's levels.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	31-1-1962	23-1-1962
	Rs.	Rs.
Art silk yarn—		
20/1 Amilan (100 kg.)—		
February ..	3,195.00	3,128.00
April ..	3,270.00	3,205.00
120 Japan (per 100 kg.)	1,818.00	1,818.00
150 Japan (per 100 kg.)	1,929.00	1,929.00
120 Italy (per 100 kg.)	1,818.00	1,818.00
150 Italy ..	1,680.00	1,680.00
Nat. Ray. 150 Bt. I ..	11.68	10.93
Staple fibre yarn (40 x 2)—		
February ..	720.00	737.00
April ..	734.00	747.00
Kohinoor (per kg.)	8.80	9.00
Cotton yarn (per bundle of 10 lbs.)—		
10s Modern ..	18.75	18.75
20s Century ..	21.50	21.50
30s Madura ..	—	26.75
40s T. T. Corin ..	32.87	32.87
60s Finlay ..	66.00	66.00
80s Finlay ..	84.00	84.00

NEW GROUNDNUT CONTRACT WITHOUT CEILING

(From Our Own Correspondent)

BOMBAY, 31*st January*

The Forward Markets Commission has given permission to the Oilseeds Exchange to commence trading in new groundnut contract May 1962 tomorrow. The new contract will not be subjected to any ceiling or special margins. Two restrictions, however, have been imposed, with a view to controlling speculation. One of them is the fixation of a weekly price range (between Monday and Saturday) of Rs. 5.50 for upward movement. The other restriction is that the members of the Exchange are required to keep net long or short positions to the extent of 5,000 metric tons on behalf of their clients.

The January contracts in groundnuts, groundnut oil and cottonseeds went off the board today. The due date rates fixed by the Board are Rs. 215 (ceiling) for groundnut (exclusive of a penalty of Rs. 5) and Rs. 108 for cottonseed (penalty of Rs. 2) per 250 kgs., and Rs. 16.75 (penalty 40 nP) for 10 kgs. of groundnut oil.

The oilseeds market ruled easy during the week under review. Groundnuts encountered selling pressure, following larger arrivals from Kathiawad and Nizam and decline in mustard. Castorseeds suffered a sharp setback, in distinct contrast to the firm trend noted last week, when prices had touched peak levels. The setback is attributed to large arrivals from Andhra Pradesh, where the current crop was reported to be quite sizable. Linseeds drifted downward, as the new crop was expected to come to the market shortly. Cottonseeds declined in sympathy.

Groundnut Nizam bold fell by Re. 1.25 to Rs. 46. Oil railway receipts eased by 50 nP to Rs. 19.15. Oil ex-mill lost 45 nP to Rs. 19.40. In private trading, April 1962 contract was quoted at Rs. 219, that is, Rs. 4 above the ceiling level.

Castorseed March 1962 contract was marked down from Rs. 177.62 to Rs. 172.87. Madras small dropped Rs. 3 to Rs. 34.75. Oil Commercial fell by 85 nP to Rs. 14.30 and B.S.S. by 70 nP to Rs. 15.

Linseed March 1962 contract declined by 84 nP to Rs. 39.41. Bold ready was quoted lower at Rs. 42.87, as against Rs. 44. Linseed oil shed 10 nP to Rs. 18.90.

Cottonseed January contract lost Re. 1.25 to Rs. 108. April settlement shed a like amount to Rs. 109.25.

The following table shows the closing prices of oilseeds and oils on Wednesday, the 31st January, as compared with those of the two previous weeks:

	31-1-1962	23-1-1962	17-1-1962
	Rs.	Rs.	Rs.
Groundnut			
January 1962 ..	215.00	215.00	215.00
Nizam bold ..	46.00	47.25	46.75
Khandesh quality ..	46.87	47.62	47.25
Oil ex-mill ready* ..	19.40	19.58	19.40
Railway receipts* ..	19.15	19.65	19.35
Oil January 1962 ..	17.65	17.65	17.65
Castorseed			
March 1962 ..	172.87	177.62	177.12
Ready Madras ..	34.75	37.75	36.75
Ready Kanpur ..	35.50	35.13	35.50
Oil B.S.S.† ..	15.00	15.70	15.75
Oil commercial† ..	14.30	15.15	15.00
Linseed			
March 1962 ..	39.41	40.25	39.47
Bold ready ..	42.87	44.00	42.50
Oil ready† ..	18.90	19.00	18.80
Cottonseed			
January 1962 ..	108.00	109.25	106.00
Ready ..	36.00	38.50	38.00
Kandi seed ..	24.50	24.50	24.00

* Rates include excise duty but exclude sales tax.
† Rates include both excise duty and sales tax.
N.B.—All quotations for futures contracts are per 250 kilograms, except linseeds the yields rates are per 40 kilograms. Spot quotations of seeds are per 20 kilograms and oil per 10 kilograms.

PEPPER RECOVERS

(Messrs. Parekh and Co.)

BOMBAY, 31*st January*

Malabar black pepper, after having established a new low level of Rs. 287.50 for garbled and Rs. 283 for ungarbled improved during the week to Rs. 297 and Rs. 290, respectively. The improvement followed pressure of covering by exporters who were reported to have sold a fair-sized quantity to New York for January shipment at about the parity of $0.32 to $0.32½.

Arrivals from the interior during the week proved to be light, as the growers preferred to hold back and store their stocks in their backyards rather than bring them to terminal markets and hand over to the traders to keep in trust, if the same found difficult buyers at the asked price. In view of the foregoing when the market looked steady, the bulls also came out to lend their shoulders in order to excite the foreign buyers who were so far doing mostly selective buying. February and March delivery, after touching Rs. 295 and Rs. 299, improved to Rs. 309 and Rs. 314, respectively, though the turnover on the floor remained thin. Calicut moved between Rs. 270 and Rs. 280. Dealers in general have no faith in the present level of prices, as these rates cannot be maintained at this time of the season unless demand either from inland or from overseas countries expands to keep pace with arrivals.

Prices in Singapore are reported to be barely steady, the latest quotation being Str.$170 for white and Str.$137½ for black. Effervescence in the market is slowly cooling down, as Indonesia prefers to negotiate with the Dutch on the question of West Irian, though the situation is still fluid.

Spot in New York, after going down to $0.34½, improved to $0.35½. Dealers there are adjusting their selling rates according to the higher or lower offers from Malabar, other origins like Singapore being out-priced, as the major stockholder there is the Semi-Government Agency of Indonesia. The reports regarding their selling policy are conflicting.

The future of pepper depends primarily upon the buying policy of New York and secondarily on the purchase programme of Russia and other East European countries.

Ready pepper in Bombay is nominally quoted at Rs. 160 per 50 kilos.

TEAS WELL SUPPORTED

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, 23*rd January*

A total of 338,000 kgs. of tea was offered in sale No. 4 held today. Quality in general showed a further slight improvement. The market met with good but irregular demand. Plain low medium and medium brokens were well supported and were quoted steady. Corresponding fannings met with strong inquiry, these selling at prices up to 10 nP above last. Good mediums, although sold readily, were easier by 10 to 20 nP. Highgrowns were irregular. The best liquoring teas advanced with quality, while those below best were occasionally easier. Clean black leaf descriptions continued in demand at dearer rates. A small quantity of unorthodox descriptions on offer sold at prices above last. Whole leaf grades were in less demand than last week and tended easier.

The quotations per kg. were:

	1962	1961
	Rs.	Rs.
Low mediums	3.85-4.15	4.60-4.90
Mediums	4.15-4.85	5.00-5.35
Good mediums	5.00-5.70	5.35-5.80
Nilgiri B.O.P.	5.60	9.90

The average price realised in sale No. 4 was Rs. 5.24 per kilo, as compared with Rs. 4.79 a week ago and Rs. 5.23 in the corresponding sale last year.

In dust sale No. 4 held on 25th inst., 324,000 kgs. were on offer. A useful selection of dusts was on offer. The market met with good demand. Plain and low medium teas, particularly those with clean leaf appearance, were well competed for and sold at fully firm to dearer rates. Mediums and good mediums were also fully firm and frequently dearer. There was good inquiry for highgrowns which were sold at around last rates. Residual, fibrous and powdery descriptions were in less demand and were much easier, these being the weakest feature of the sale. Powdery C.T.Cs were neglected, while others in this category sold readily and were fully firm. C.T.C. and legg-cut types met with strong demand and were sometimes dearer.

The average price realised in dust sale No. 4 was Rs. 5.24 per kilo, as against Rs. 4.79 a week ago and Rs. 5.23 in the corresponding sale last year.

Colombo: In this week's export sale, there was strong demand. Highgrowns were well supported and sold at dearer rates, while mediums were irregular. Lowgrowns advanced by 5 to 10 cents. At the offgrade sale, there was good demand for brighter liquoring dusts which were dearer, but others were irregular and easier.

London: *North Indian and other growths*: In Monday's sale, there was good demand. Best liquoring descriptions were well competed for at fully firm to dearer rates. Colourey medium and plain teas are quoted steady. Thin liquoring teas, however, met with less support and were easier. On Wednesday, the market continued on Monday's trend.

Ceylon and South Indians: A total quantity of 24,642 packages was offered in Tuesday's sale, of which 8,316 packages were from South India. There was good demand for Ceylons which were dearer. The best South Indian teas were firm, but the poorer descriptions were neglected.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire as follows:

"*Sale No. 5*: 449,000 kgs. offered. Good but irregular demand. Plain low medium and medium 10 to 20 nP easier. Good medium steady. Best liquoring irregular, but generally higher price with quality orange pekoe strong."

STEADY DEMAND FOR TEA

(From Our Own Correspondent)

CALCUTTA, 30*th January*

The continued steadiness in demand for both export as well as internal consumption is suggestive of the poor attention buyers accorded in the early months of the current season in anticipation of a decline in prices. Export bookings were satisfactory. The keener demand in the sales held in London, where prices of best teas of Assams and dooars rose, also indicated the need of stockists for replenishment.

The maintenance of steady prices, as well as the existence of keen demand, encourages the hope that the season is likely to close with only a reasonable quantity to be carried forward. Since a large quantity is still remaining to be offered, it is expected that sales would have to be continued farther than usual, and hence the gap between the closing of the season and beginning of the new will be narrow. As a result, the accumulated demand over the period, when there would be no auctions would be much less than last year. While the season's final export figures and the country-wise break-up of these would be awaited with interest, trade circles apprehend that India is exporting less to the traditional markets such as the United Kingdom, Australia, the United States and Canada, where other producing countries are offering keener competition. It is to be hoped that the recent discussions the Export Promotion Council of the Tea Board held here with the President of the Tea Association of the U.S., Mr. Gardner Barker, who is also President of Thomas J. Lipton Inc., would lead to the Board taking increased interest in the U.S. market. India's share in U.S. tea imports was only 21.5 per cent in 1960, as against 35.3 per cent ten years ago.

India's attempts to find new markets for tea has significantly succeeded as exports to those countries with which India has bilateral trade agreements have been increasing. This should not give place to any complacency since India's exports to the principal markets have been declining in recent years during which period many new producers have appeared on the scene. India, Ceylon, Pakistan, Indonesia, Japan, Malaya, Uganda, Kenya, Tanganyika and Nyasaland were the major producers about a decade ago but many other countries, both in the East and the West, such as Argentine, Indo-China, Formosa, Communist China, and the U.S.S.R., encouraged by the success in experimental growing, have now large areas of land under tea. Also, sales campaigns being conducted by many producing countries have been vigorous and aggressive. Ceylon's campaigns have met with commendable success; thus encouraged, that country has planned to produce instant tea for the first time in the world. A West German firm is helping Ceylon to put up a factory, and Ceylon expects to send samples of instant tea to the world by the middle of this year.

Changing times require changing promotional methods. Trade circles feel that India's Tea Board should be able to pay greater attention to study consumption habits abroad, and to improve propaganda. The prospects of a fall in the *per capita* tea consumption in the U.K. and a rise in that of alcoholic drinks is a situation that has to be seriously taken note of. The U.K. is India's principal buyer of tea, and it is a matter of concern that, although exports to that destination in recent weeks have risen, the total exports up to now in this season have been below the comparative previous figure.

In the internal sale held in the last week, dusts on offer aggregated 25,661 packages which met with strong general demand. Keen demand was noted for legg-cut teas which fetched handsome prices. Orthodox teas eased by 10 nP but powdery teas were firm. In C.T.Cs, fibrous as well as liquoring teas were in good demand, but the plainer teas eased. The quotations per 1 kg., inclusive of excise duty, were: good Assam dust Rs. 6.50 to Rs. 7.00, medium Assam dust Rs. 5.60 to Rs. 6.10, legg-cut dust Rs. 4.60 to Rs. 5.20, medium Assam dust Rs. 4.20 to Rs. 5.00, and plain orthodox dust Rs. 3.80 to Rs. 4.40.

Rates for leaf offerings amounting to 410 chests were irregular.

Strong demand was in evidence during yesterday's export sales, when offerings aggregated 62,341 packages. Clean black fannings met with keen competition and provided the strongest feature. There was also a strong demand for tippy teas, with Darjeeling and whole leaf grades being taken at firm rates. Orthodox B.O.Ps were absorbed at firm rates, but a few poorer liquoring Assams eased. Similar fannings were, however, dearer, with bright liquoring Assam O.Fs rising impressively. Prices of plain brokens gained by 15 nP, with their fannings showing an even higher rise. Steadiness marked the trend in "tea for price." Best C.T.Cs were irregular but the teas possessing autumal quality were much favoured. A gain was recorded in medium and secondary teas, and B.Ps received much greater attention. The quotations per 1 kg. inclusive of excise duty were: best Assam C.T.C. fannings Rs. 5.80 to Rs. 6.30, best Assam C.T.C. B.P. Rs. 5.70 to Rs. 6.10, medium Assam C.T.C. B.P. Rs. 5.30 to Rs. 5.50, medium Assam C.T.C. fannings Rs. 5.20 to Rs. 5.50, plain fannings Rs. 4.00 to Rs. 4.50, clean plain pekoe Rs. 4.00 to Rs. 4.20, and plain B.P. Rs. 3.70 to Rs. 3.90.

JUTE GOODS RALLY

(From Our Own Correspondent)

CALCUTTA, *30th January*

Thanks to fresh support from overseas buyers jute goods recorded an impressive recovery during the week under review. Fibre prices, however, were unchanged, though mills bought large quantities and exceeded the minimum quota. Rains affected fibre movements during the week, and a decline in imports in mofussil trading centres was also reported. These did not, however, strengthen prices, as stockists were anxious for business even at rates discounted liberally. In view of the comparatively good business done with overseas markets, it was expected that stocks with mills at the end of this month, details in respect of which would be released in a week or two, would be lower despite the greater number of looms in work as compared with December 1961. The news that in December burlap consumption in the United States jumped up by two million yards to 72 million yards, which was the same as that for December 1961 and which was the highest for any one month since March, was enthusiastically noted, as the increase was interpreted by trade circles as denoting the come back to burlap from substitutes. It is expected that progress in this regard will be maintained, as in the market there is now better regard for the need to stabilise prices at reasonable levels.

The average monthly consumption in the U.S. during 1961 was only 65 million yards, as against 71 million yards in 1960. This was due to lower offtake from March to November when prices were very high. The increase in U.S. stocks to 237 million yards at the end of December, as against 219 million yards at the end of November, despite increased consumption, has been due to higher purchases in recent weeks. Since U.S. buyers continue to be active, stocks at the end of the current month should show a further increase. It is usually in the first quarter of the year that consumption in the U.S. records the highest monthly average for the year. The fact that, of the 72 million yards consumed in December 1961, same as in December 1960, piecegoods deliveries were higher at 17.3 million yards, as against 16.7 million yards in December 1960, the balance being made up by bag cut-up was favourably noted, as this swing was presumed to have stemmed from the more reasonable price levels.

The Buffer Stock authority was registered this week, and has thus come into being on paper. As to when it would begin operations, is difficult to state. Prices in certain areas are certainly below the minimum levels as determined by the Government of India. Inasmuch as nearly three-fourths of the produce has left farmers' hands and are with both mills and stockists, there is apparently the need for a fresh examination as to who will benefit from the emphasis on the maintenance of floor prices. It is a commonly known fact that, thanks to the high level of prices early in the season, cultivators have earned much profit. For most of them, the disposal of the remainder of the crop lying with them would be adding to profits. They are interested in the early disposal of the balance, as they do not like to be bothered with any storage problem. Further, in a few weeks' time, they would have to begin preliminary work for sowing; at that time they naturally do not like their attention to be diverted to marketing. To such a state of affairs is attributed the availability of fibre below minimum prices in the mofussil. Further, it should be remembered that the quality of the fibre still remaining in the hands of cultivators is very poor and it should be realised that such fibre can on no account realise the level of prices for the better variety earlier in the season. The anxiety of middlemen or stockists for business even at prices lower than the floor is also significant.

The feeling in mill circles is that too much noise is being made by the Government to the need to maintain fibre prices at above Rs. 30 a maund basis bottoms, without giving due consideration to the fact that good quality fibre is hardly available and most of what is available is the poor variety which is only fit for the manufacture of heavy goods. During the week, arrivals were about 600,000 maunds, as against 1 million maunds in the previous week. However, the quota for this week was 1 million maunds and purchases by mills even exceeded this figure. Naturally stocks in the bazaar stand depleted. It will be interesting to examine the trend of fibre arrivals in recent months. In this season upto December, arrivals in Calcutta and mills' stations aggregated 3,443,250 bales (3,204,850 Indian and 238,400 Pakistani), representing an impressive increase of 736,850 bales over the corresponding previous figure. Arrivals of Indian fibre increased by 767,600 bales, while those from Pakistan declined by 30,750 bales. Considering such a satisfactory figure was recorded in July-December 1958 when the harvest proved to be a bumper crop, trade circles anticipate that this year's crop would surpass their earlier estimate. Much inspired by the then bumper crop, the State Trading Corporation entered into export commitments early in 1959 but, since shortage subsequently loomed large, prices rose. The S.T.C.'s commitments were not fully covered by purchases. When forced by its buyers, the Corporation had to purchase fibre from the market at very high prices thus entailing heavy losses in fulfilling commitments. It is to be hoped that this memory is fresh in the minds of the authorities. India has only inferior quality fibre now remaining to be marketed and this can be consumed by mills in India only. It is necessary that mills should have a sizable carry-over to the next season. For, in all probability, the next season's crop would be smaller, and the stocks that are being built up now can be utilised by mills in an attempt to keep satisfied the expanded market for goods.

With the continued resistance of foreign buyers to accept offers at the reduced E.P.C. rates, a further fall in prices was the feature in the Pakistani fibre market. Overseas buyers indicated that they would be prepared to enter into commitments at £3 to £4 a ton below the new E.P.C. rates. Sellers were anxious for business, but, in the face of Government's stern warning against violation of the E.P.C. rates, had to be content with rejecting counter-offers, thus aggravating their financial difficulties. The superior grade of fibre had buyers at the higher rate, but there was not much on offer. It was believed that the higher grade was being kept away from overseas interests in order that the lower grades should also realise the E.P.C. rates. There was the fear that, in view of the rapid fall in loose jute prices, there would be less enthusiasm to sow the same acreage as in the last season. Accumulation of heavy stocks in the interior has been caused by scarcity of wagons. With cross bottoms at Rs. 22 a maund, opinion is that prices have already touched the cost of production level. Any further decline would find the grower in difficulties.

This week's rather heavy rains in Calcutta and its surroundings should give a start to preparation of land for sowing. Weather pandits have forecast a few showers in the next month. The possibility of an early sowing is, therefore, bright. During the week, prices were maintained as follows: February-March delivery: Assam bottoms Rs. 30.00 a maund, daisee bottoms Rs. 32.00, and northern bottoms Rs. 29.50. Mills' purchases in the agencies are being hampered by the shortage of wagons. On behalf of the Jardine group of mills' agencies, it has been pointed out that even the distribution of available wagons is faulty. It is to be regretted that, at a time when Government desires that purchases should be stepped up in the interior areas, the Jardine group of agencies have had to withdraw from the market due to the faulty distribution of even the available wagons. The result has been, says the memorandum presented to the Jute Commissioner by these agencies, a pronounced decline in fibre prices in these markets. The buffer stock agency is supposed to buy from the areas where prices have fallen, but, with the haphazard handling of the transport facilities by the railways, it is to be wondered how that agency would be able to lift fibre. If only mills can get the number of wagons to meet their full requirements, they are themselves prepared to buy as much jute as offering. The I.J.M.A. has issued a quota of 1 million maunds for the week ending 3rd February.

On Wednesday last, the goods market opened under steady conditions resulting from good demand accumulated over the holiday during the previous day. A significant feature was that mills were able to do business in forward goods up to September. Overseas demand was sizable and Government was also in the market. Covering business took place on a good scale, and ready hessian 40" 10 oz. hardened from Rs. 54.50 to Rs. 55.25 and ready B. twills from Rs. 123.75 to Rs. 124.75. Overseas buyers were content to follow these rises and, on Thursday, hessian 40" 10 oz. gained to Rs. 55.75 and B. twills to Rs. 127.50. Activity in the futures market was keen. The week-end was greeted by good business in hessian with buyers on behalf of the Argentina and the United States, in respect of which covering business was also done. As a result, hessian 40" 10 oz. firmed up to Rs. 56.00. On the other hand, there was a decline in the interest shown in heavy goods and apart from some business in D.W. floors and Liverpool twills there was no other activity. That explained the fall in the price of B. twills to Rs. 125.75. Prices declined during yesterday's trading, as inquiries were few and far between. B. twills eased to Rs. 124.75 and hessian 40" 10 oz. to Rs. 55.25.

METALS HARDEN

(From Our Own Correspondent)

CALCUTTA, *30th January*

Higher advices from the London Metal Exchange and the New York futures market, coupled with the continued tightness in the supply position thanks to the delay in imports of the virgin metal against permits, resulted in further hardening of prices of copper scrap. Electrolytic copper opened at £230 a ton on the L.M.E. and gradually rose to close £4 higher, on balance, at £234. Although stocks were comfortable in London and it was thought that in the U.S. supplies would be in excess of demand, the rise was attributed to the possibility of a copper strike in the U.S. in the near future. Note was taken that in the U.S. production reached the highly satisfactory figure of 1,136,000 tons last year representing an increase of 5 per cent over 1960. In the U.S. demand during the week was good, with customs smelters registering satisfactory sales. In Calcutta, berry scrap was fully steady at Rs. 549.25 per 100 kgs. and utensil scrap at Rs. 505.75.

Tin in Calcutta maintained the improvement at Rs. 1,616.00 per 100 kgs. If the fall in the London price was not reflected here it had been due to acute shortage. Fresh arrivals in the near future were, however, anticipated. In London, the quotation opened at £947½ a ton and, after hardening to £950½, closed lower on balance at £945. The weakness followed increased offerings at Singapore as the price began improving ten days ago when the floor and ceiling prices were raised from £730 and £880 a ton to £790 and £965 respectively by the International Tin Council. Although dissatisfaction was expressed in Malaya at the new price range, since producers there had asked for the floor to be fixed at £800 and ceiling at £1,000, the immediate reaction in the Far Eastern markets indicated enthusiasm. It was therefore inferred that the new range provided for greater profits than expected. A section of the trade was inclined to think that, at the new range, production would rise satisfactorily. It was, however, felt that the future course of price for tin would depend upon what action the U.S. Congress took with regard to disposals from the huge strategic stockpiles.

Lead in Calcutta was quiet at Rs. 124 per 100 kgs. Stocks were comfortable. In London, the price hardened from £58½ a ton to £58¾. It was noted that the rise was fractional. World supplies being in excess of demand there was little prospect of the price improving. The forthcoming meeting of the Lead-Zinc Study Group is expected to examine the problem of excess supply. The U.S.S.R.'s production has significantly increased. Electrolytic zinc in London was at one time higher at £69¼ a ton, against opening of £68¾, but closed at £68¾. The rise was due to increased buying in the last week when the price had declined. However, the keenness of the Russians to sell affected sentiment. In Calcutta, demand was subdued due to the paucity of copper supplies for alloy making.

SUGAR DEPRESSED

(From Our Own Correspondent)

HAPUR, *29th January*

Sugar was depressed during the week on poor demand for inferior small crystal. Factories in easy U.P. represented to the State Government that they would stop crushing operations because of uneconomic working and mounting unsold stocks. The factories in west U.P., however, attracted heavy cane supplies but were experiencing shortage of coal. Sugar stocks, too, were increasing resulting in storage difficulties. Week-end prices of sugar here were: wholesale Rs. 106.50 per bag; retail 97 nP per *seer*: mill delivery per maund E29 Simbhauli Rs. 37.75; D29 Amroha Rs. 35.56; Dhampur Rs. 36.37.

Sugar in the Muzaffarnagar market was also depressed on account of lack of buying interest by the consuming areas of Gujarat, Delhi and Punjab and selling pressure from mills led to a fall in prices upto 37 nP a maund during the week. Buyers were hesitant to make fresh commitments in a market bereft of support. While bold crystal was fetching a premium of 87 nP to Re. 1.06 per maund, inferior sugar was quoted at Rs. 2.50 per maund lower than the previously controlled prices. Week-end mill delivery prices were: A29 Iqbalpur Rs. 40.10; Mansurpur Rs. 40.16; B29 Shamli Rs. 39.70; Mawana Rs. 39.72; C29 Deoband Rs. 30.09; Dhampur Rs. 37.25; D29 Deoband Rs. 38.54; Merrut Rs. 37.50 Bijnore Rs. 35.37; E29 Shamli Rs. 37.75; Simbhauli Rs. 37.75.

Khandsari was quietly steady, thanks to revival of demand from Punjab, Rajasthan and neighbouring areas. Arrivals were also small due to inclement weather. Wet quality prices ranged from Rs. 25 to Rs. 29 and dry Rs. 29 to Rs. 32.75 a maund. *Khandsari boora* ranged from Rs. 35 to Rs. 36 a maund.

Gur, after recording some gains, ruled quiet, as demand was reported only at lower prices. Loading to South was mostly restricted, but, towards the week-end, there was an offtake of twelve wagonloads to South Gujarat. Daily arrivals dropped to an average of 1,500 maunds, due to rains and fresh arrivals would be delayed further due to continued cloudy weather. Stockists, however, had entered the market here as well as in mofussil markets of Gulaothi and Siana. Despatches during the week were also reported to Bengal side and latest prices here were: *pansera* best Rs. 14.25; *dara* Rs. 14; *balti* Rs. 14.25 a maund. *Shakker* was steady at Rs. 17 a maund on good demand in face of poor arrivals.

Gur was bullish during the week on good buying on speculative support. But latest prices were slightly lower than best of week on profit-as against the highest of the week at Rs. 14.35, on Saturday and week's opening of Rs. 14.58. Forward Markets Commission has been requested to sanction future trading in *gur* baisakh. Preparation of land for sugarcane sowings is in full swing and actual sowings would begin shortly.

BUFF CALF FIRM

(From Our Own Correspondent)

MADRAS, *29th January*

Arrivals of E.I. tanned cow hides were on the usual scale, and clearance by shippers and local merchants was good at unchanged prices. Demand from the U.K. persisted for lower selections in cow hides at slightly improved levels which were still below internal market. Cow calf market and buff hides ruled steady. Buff calf remained firm due to oversold position.

There were several inquiries for tanned goat skins for all average weights and tanners have been active in the raw centres anticipating better prices in the not distant future. Present levels seem low enough for overseas leather dressers to operate economically and E.I. tanners will have to guard themselves against putting up prices in the raw market which in turn would increase their costings and enhance their asking prices. Demand for suede selections seem reviving and it is upto the tanners to develop the volume of export without enhancing the price levels, making it uneconomical for the importers and dressers. Tanned sheep skins remained dull throughout.

The following are the ruling prices per lb. for all round parcels in the local market:

		Rs.
Tanned cow hides	8/8½ lbs.	2.30 to 2.40
Tanned buff hides	12/14 lbs.	1.90 to 2.00
Tanned cow calf	1½/2 lbs.	3.60 to 3.80
Tanned buff calf	1½/2 lbs.	3.25 to 3.50

Notices

SHREE KRISHNA GYANODAY SUGAR LIMITED

Registered Office:

11, Clive Row, Calcutta-1

NOTICE

THE TWENTY-SEVENTH ANNUAL GENERAL Meeting of the Shareholders of Shree Krishna Gyanoday Sugar Ltd. will be held at the Registered Office of the Company at 11, Clive Row, Calcutta-1, on Tuesday, the 13th February 1962, at 4.00 p.m., to transact the following business:

1. To receive and adopt the Directors' Report and the Audited Accounts for the financial year ended 31st July 1961.
2. To declare Dividends for the year ended 31st July 1961.
3. To elect a Director in place of Shri A. C. Bhabhra, who retires by rotation, but, being eligible, offers himself for re-election.
4. To appoint Auditors for the current year and to fix their remuneration. Messrs. Singhi & Co., Chartered Accountants, the retiring Auditors, being eligible, offer themselves for re-appointment.
5. To appoint a Director in place of Shri M. R. Sonthalia, who retires having attained the age of 66 years on 6th July 1961, and in this connection to consider and, if thought fit, to pass with or without modification, the following ordinary resolution by way of special business of which a special notice as required under Section 281 of the Companies Act, 1956, has been received by the Company and is hereby given by the Company to its members:

"RESOLVED that pursuant to the provisions of Section 281 and other applicable provisions of the Companies Act, 1956, Shri M. R. Sonthalia, who has attained the age of 66 years, be and is hereby appointed a Director of the Company and it is hereby specifically declared that the age limit for Directors prescribed under Section 280 of the said Act shall not apply to him."

The Share Transfer Books of the Company will remain closed from 6th February 1962 to 13th February 1962, both days inclusive.

By Order of the Board,
S. K. JAIN,
Secretary.

CALCUTTA,
10th January, 1962.

N.B.—1. A member entitled to attend and vote at the meeting is entitled to appoint another person as his proxy to attend and vote instead of himself and the proxy need not be a member.

2. Explanatory note as required under Section 173 of the Companies Act has been forwarded to the Members of the Company with the Notice.

THE SOUTH KARANPURA COAL COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT AN Annual General Meeting of THE SOUTH KARANPURA COAL COMPANY LIMITED, will be held at the Registered Office of the Company, Chartered Bank Buildings, Calcutta, on Wednesday, the 28th February, 1962, at 11 a.m., for the following purposes:—

1. To consider and approve the Audited Accounts of the Company for the year ended 31st August, 1961, and to receive the Directors' and the Auditors' Reports thereon.
2. To appoint Directors in place of the Retiring Directors.
3. To appoint Auditors and fix their remuneration.

AS SPECIAL BUSINESS

4. To consider and, if thought fit, to pass the following resolution which will be proposed as a Special Resolution.

"THAT in conformity with Article 97 of the Articles of Association of the Company and Section 309 of the Companies Act, 1956, authority be and is hereby accorded to the continuance of a payment to the Directors of the Company of a commission (to be divided between them in such manner as they shall from time to time determine) of 1 per cent of the net profits of the Company in each financial year over the period of five years extending upto and including the financial year of the Company ending 31st August, 1966."

The Share Transfer Register of the Company will be closed from 16th February, 1962 to the 28th February, 1962, both days inclusive.

By Order of the Board,
BIRD & CO. (PRIVATE) LIMITED,
Secretaries and Treasurers.

CALCUTTA, *25th January*, 1962.

Notes:—(*a*) A member entitled to attend and vote at this meeting may appoint a proxy to attend and vote in his stead. A proxy need not be a member of the Company.

(*b*) The relative Explanatory Statements pursuant to Section 173 of the Companies Act, 1956, in respect of the Special Business set out above are being sent to shareholders.

BURMAH-SHELL REFINERIES LIMITED

NOTICE IS HEREBY GIVEN THAT THE Register of the Company's 5¼ per cent Debentures 1965-69 will be closed for transfers from 14th February 1962 to 28th February 1962 both days inclusive.

R. N. CHETTUR,
Secretary and Treasurer.
State Bank of India,
Agents for Burmah-Shell Refineries Ltd., for the management of the Debentures.

STATE BANK OF INDIA,
MUNICIPAL LOANS SECTION,
APOLLO STREET, FORT,
BOMBAY, *1st February* 1962.

COTTON

(Concluded from page 202)

yarn production in the third Plan, total consumption in India during 1961-62 should rise to 4.8 million bales (of 478 lbs.), as against 4.65 million bales in 1960-61.

In South America, further improvement in cotton consumption is expected in Argentina, while a large crop and extensive promotion campaign is expected to contribute to the maintenance of a high level of textile production in Brazil.

Taking the free world as a whole, the I.C.A.C. concludes that prospective increases in cotton consumption in the U.S. and East Asian countries would more or less offset the expected decline in Western Europe and Japan and free-world cotton consumption would, therefore, roughly equal to 1960-61 level of 31 million bales.

MARKET GOSSIP

(Concluded from page 191)

price of I.C.I. shares when its latest profits are published remains to be seen. But Courtaulds' Directors are, in effect, asking the shareholders to reject completely the comparative images of I.C.I. and Courtaulds managements in the past as any guide to the future. They are also asking shareholders to forget and forgive the cut in the interim dividend, which they now openly admit was an absurd mistake. At this late stage in the day, can Courtaulds' Directors, able and fierce as some of them have proved themselves in the latest bout of in-fighting, create a brand new image, and will the Courtaulds' shareholders perform the *volte-face*?"

Meanwhile, the President of the Board of Trade, Mr. F. J. Erroll, seems to have had second thoughts on his earlier stand that the Government was powerless to intervene in the matter. He was expected to make a statement on the question in the House of Commons last week. The fact that the statement was postponed (it has not been made upto the time of writing) was taken as an indication of the likelihood of Government intervention by the appointment of a fact-finding committee. The British Cabinet would appear to have rejected Mr. Erroll's earlier plan to have an independent inquiry.

NEW KEY INDUSTRY IN PRIVATE SECTOR

THE advantages of foreign capital participation and technical collaboration in the industrialisation of an underdeveloped country are fully and impressively reflected in the A.V.B. Works at Durgapur, one of the largest new heavy engineering units in the private sector, which was formally inaugurated by Dr. B. C. Roy, West Bengal's Chief Minister, on Tuesday this week. Elsewhere in this issue appears a detailed account of the project, giving particulars of its three partners and of the types of plant and machinery that will be turned out in its works. It will be noted therefrom that, in this project, two world-renowned British industrial giants are the partners with A.C.C., India's largest cement company and a pioneer in the manufacture of cement machinery. The capital invested by the two British companies has added to India's domestic savings mobilised by the A.C.C. and mitigated to some extent the shortage of foreign exchange. These are only the initial contributions to India's foreign exchange budget. As the works go into full production in another 24 to 30 months, India's dependence on foreign countries for supply of plant and machinery needed by its three basic industries, namely, cement, power and coal, will be reduced to a significant extent. As years roll by, it should even be possible for the A.V.B. to earn foreign exchange by exporting a part of its production. All these constitute advantage number one of associating foreign capital and know-how with this capital goods producing industry.

The second advantage is the transplantation in India, by overnight as it were, of the processes and techniques developed over a period of decades of expensive research, trial and error in Britain and elsewhere. This gain to India became apparent as one toured the huge workshops of the factory and the administrative building. The design and layout of the workshops are modern, neat, spacious and scientific. The machines installed are the latest and best types available in the world. Not all of them are British-made, as they include American and German makes too. A large number of foreign technicians are training Indian workers in the use of these machines and in turning out products which require a high degree of precision and skill. Both Indians and foreigners are working together and it will not be long before the former do most of the jobs themselves. The foreign technicians averred that the Indian youths were quick in learning this skilled job. The management has already under operation a scheme for training a sizable number of apprentices. The architecture of the administrative building stands favourable comparison with any in the western world. The whole building is air-conditioned and furnished on modern lines to provide all possible comforts for those who work in it. The factory and office building, as well as the care and attention given to train the staff and operatives in the latest methods of work, warrant the expectation that, in due course, that is, after the teething troubles are over, the productivity of this factory at Durgapur should compare favourably with that of corresponding units in the West. It is to be hoped that the representatives of Vickers and Babcock and Wilcox will keep a close watch on the performance of this unit and see that it does not lag behind its foreign confreres.

This statement might seem to be stressing the obvious. But it is necessary to do so for two good reasons. First, the Indian market for plant and machinery will be a sellers' market for a long, long time to come not only because of the industrialisation drive under the Five-year Plans but also because of chronic scarcity of foreign exchange, necessitating drastic restrictions on imports. Accordingly, even the fear of competition, let alone actual competition, as a spur to hard work and efficiency will be absent. Secondly, being a producer of capital goods, the aim should be to keep their costs as low as possible not by sacrificing quality but by raising productivity. It is needless to add that the ability of Indian manufacturers to compete abroad is determined, among others, by the cost and quality of the machinery employed as well. The foreign collaborators in Indian industrial projects have a special obligation to the people, in general, and investors, in particular, in this respect. They can also derive better satisfaction—moral as well as material—and acquire an immense sense of pride, if they help the projects with which they are associated to attain a high level of efficiency in production, marketing and management by insisting on the adoption of proper standards by their Indian partners and by giving all the assistance necessary for training the Indian engineers and workers in their respective fields.

The third advantage of foreign participation is expansion in the scope for employment. It is true that, in works of the nature of A.V.B., the chances for large-scale direct employment will be practically *nil* once the stage of construction and development of basic facilities is over. But the employees of the Works will be skilled workers, foremen, engineers of all sorts, accountants and managers, that is, persons with sizable incomes, who, in turn, will provide work for quite a large number of local people. Transport, communications, banking, insurance, education, medicine, retail marketing, domestic servants, and such other service occupations, generated by a modern community, will offer scope for gainful employment for a sizable number of both men and women.

Foreign participation serves also as a source of ideas through establishment of industrial units that are good models for others. In this respect, too, the Durgapur Works of A.V.B. are a classic example, even though only the first phase of their development has been completed. The workers—high and low, office and factory alike—are assured of comfortable conditions not only in the place of their work but also in that of living. Neat, well-ventilated, commodious houses with all modern facilities are provided for all the workers of A.V.B. Arrangements are being made to take care of their health, recreational and social needs through the provision of a dispensary, schools and playgrounds for children, clubs, and sports ground. A singular feature of the A.V.B.'s part of Durgapur area, to which pointed attention was drawn by Chairman Dharamsey M. Khatau in his welcome speech, is the effort made to make it a garden town, by retaining as many trees as possible, thus providing shade during the hot season, which is rather long in that part of the country, and retaining at the same time the natural beauty of the area. In this respect, the organisers of A.V.B. have displayed commendable foresight and provided a refreshing contrast to those of the Durgapur steel town—a public sector enterprise—where all trees have been mercilessly cut and mowed down, giving one the impression of a desert town. Another feature of the A.V.B. Works is the liberal provision made for training apprentices and housing them in a comfortable hostel. If the cleanliness that one saw in the residential and factory areas on the day of inauguration were maintained throughout the year, it would be an ideal industrial town, free from filth and open drainages which make the old Durgapur town and the railway station a disgusting place.

It is surely too early to speak, with any degree of certainty, about the production and financial results of this vast enterprise. Apart from the fact that the attainment of production to the full rated capacity will take two to three years, this engineering industry differs

from others in one important respect. It is not a producer of goods on a mass scale such as automobiles, tractors, trucks or iron and steel. It has to produce heavy plant and machinery of varying designs and types, as well as intricacy, each piece costing several lakhs or even crores of rupees. Much preparatory work and designing will have to be done before steps are taken to execute in order. This is a point which is liable to be overlooked by critics in judging the performance of a factory of this type. As it is, the A.V.B. Works are assured of enough orders, but their implementation will depend on the ready availability of raw materials, stores, etc., a good part of which may have to be imported until such time as plans for producing them in the country fructify. Another prerequisite for the success of the factory is the provision of adequate transport and communication facilities. Drawing attention to this point, Mr. Dharamsey Khatau said in his speech:

"In deciding on locating this industry at Durgapur, one of the most important considerations was that of transport. We would, therefore, like to emphasise the importance of the new 'Express Highways' between Durgapur and the Port of Calcutta being completed as soon as possible. It was on the assumption that this road would be available that we located our industry at Durgapur and for our products, such as cement-making machinery, steam-raising plant, heat-exchangers, pressure-vessels, this question of transportation of large pieces of machinery is of vital importance. Now that Durgapur is developing into what I am sure will be one of the main industrial centres of India, it is essential that, apart from this question of road transport, more attention should also be given to improve the postal, telegraph and telephone facilities here."

The fulfilment of the aforesaid conditions is the responsibility of both the Central and West Bengal State Governments. It remains to be seen how soon and how well they will carry out their part of the job.

PRACTICAL PLANNING

IF planners in India are striving to learn from the planning experience of other countries and are responsive to newer and more constructive ideas, they will find the brochure pertaining to regional planning*, recently published by the Organisation for Economic Co-operation and Development, quite rewarding reading. One of the first lessons that they can usefully learn from the author's discussion of the problems of practical planning is that planning is not an exact science and that it has not left the field of political pressures, hunches and guesswork. Plans based on such advanced techniques as inter-industry schemes, linear programming methods, operations research and advanced-econometric methods may be excellent statistical exercises. If, however, such plans are usually discarded, it is because of the failure of the authors to take into account the practical decision-making process as it exists in Government. Practical planners, on the other hand, would not concentrate only on logical sequences, ignoring the characteristics of the individual decision-makers. What they should do at the very outset is driven home to them in the following sentences:

"One of the first investigations which the practical planner must make is to assess the types of individuals with whom he is dealing, so that he can determine their prejudices, the nature of their jealousies, the effect of having come from different backgrounds and the holding of a variety of opinions.... He must understand their reactions to certain types of planning and administrative operations and goals, and their attitudes towards the use of certain kinds of tools for the implementation of plans. If the plannner proceeds in ignorance of the characteristics of the human decision-makers, he is bound to fail with respect to having his plans translated into actuality.... Whatever the plan, no matter how well conceived, how logical and how suitable for direct action it may be, there will always be questions and objections as well as support. It is to the advantage of the practical planner, early in the operation, to try to anticipate the nature of these objections and to understand their causes as well as the reasons for the support."

*Designing and Administering a Regional Economic Development Plan with special reference to Puerto Rico. By Alvin Mayne. Published by O.E.C.D., 2, rue Andre-Pascal, Paris 61e, France.

There are also other considerations germane to practical planning. For instance, measures which can be introduced directly by the executive require different treatment from those which require authorisation by the legislature. Consideration must also be given to the allocation of responsibility among the various departments of the executive agencies, for plans which cut across a variety of executive agencies but which do not contain elements of co-ordination are bound to fail. Again, it would be useless to design a development plan which requires the operational authority to articulate it, if powers necessary are not available for use by the administration. Nor would it be useful to create a plan which cannot operate without legal changes that are not feasible.

The overall financial feasibility of any plan is also an important consideration. But more important is the recognition by a practical planner that decision-making with respect to allocation of resources, by both Government and private enterprise, is a continuing process. If the planner feels that the current method of decision-making pertaining to resources allocation is not adequate, he should develop the strategic and tactical measures whereby the decision-making techniques called for by the development plan can gradually replace existing decision-making operation. Mr. Mayne's advice here is that the strategy of the take-over must be "subtle and virtually unnoticed," for "a head-on collision between the existing and proposed decision-making apparatus will generally spell failure for the newer technique."

These requirements of practical planning are neither simple nor common place. Planners in India, at every level, may recall from their own experiences during the last ten years that these vital requirements have, quite often, not been fulfilled. While, by and large, planners in this country have been shrewd and practical enough to pay particular attention to the role of leadership on the part of the chief executive (Prime Minister Nehru) in formulating the objectives and the desires of the people, they have not quite succeeded in strengthening his pragmatic propensities and correspondingly weakening his doctrinaire predilections. Nor have they been quite successful in meeting some of the other requirements. They have themselves admitted their errors of omission and commission in the final report on the third Plan (*vide* leading article entitled "The Decade's Balance-sheet" in *Commerce* dated 12th August 1961). While it is hardly necessary to recapitulate them here, one cannot help noting that India's planners have only partially answered to Mr. Mayne's description of "practical planners."

Of course, one has to be charitable in one's criticism of the performance of India's planners who have had the unenviable task of reconciling, or trying to reconcile, conflicting objectives. For instance, there has been all along a conflict between short-range objectives and long-term goals. When planners are under pressure to develop programmes which will show immediate results and raise the level of living of the present generation, it sometimes happens that such shorter-range measures not only prejudice the achievement of longer-range goals but also turn out to be ineffective themselves. Mr. Mayne has given an example here from the experience of Puerto Rico. There, according to him, measures to alleviate the immediate hardship in the coffee areas in recent years have led to a price support programme, which is beginning to require increasingly large funds without solving the problem and is merely delaying a radical adjustment which will have to be made in the light of the rapid development of the rest of the economy. But, then, the present is bound to be too much with us even while recognising that the future is equally or even more important. This dilemma has been confronting India's planners also. Mr. Mayne's reference to this problem is contained in a footnote he has appended at the appropriate place. This is as follows:

"The author had an opportunity to discuss alone with Prime Minister Nehru for several hours the second Five-year Plan of India. When the author expressed the view that the second Plan was correctly oriented, in that it focussed on the longer-run development of capital investment, instead of alleviation of the hardships of the present generation, Nehru replied, 'but it is the present generation which elected me.'"

Like the Irishman who asked, "What has the future generation done to me that I should sacrifice for its sake?", the present generation will continue to demand relief and betterment. The conflict between short-term objectives and long-term goals will thus continue. It will require all the ingenuity of a planner to effect a practical reconciliation of the two conflicting objectives.

Another source of conflict with respect to the objectives usually results from the opposition of regional to national objectives. It may be in the interest of the national objectives to try to concentrate on particular areas which can most fruitfully be developed. But, in the development of a particular region, it may be difficult to obtain special assistance from the national Government for the exclusive benefit of that area. This kind of conflict is there in an acute form in India, for it is a country of diverse regions. But it certainly redounds to the credit of India's planners that, in river valley development, for instance, they have sought to reconcile regional objectives with national objectives. If their efforts at such reconciliation have met with only partial success so far, it is because some regions, even though they are homogeneous in their natural characteristics, cut across the boundaries of more than one State. Thus, even in regional planning, there has arisen the problem of reconciling the conflicting objectives of the States concerned. One can readily sympathise with the Indian planners who are called upon to resolve, in a practical manner, the inter-State conflicts and, at the same time, reconcile regional objectives with those of the nation as a whole. The latest addition to the planner's problem in this respect is provided by the conflicting objectives of the Centre and of some States like West Bengal and Assam in the matter of mineral development.

The practical planner in India, as elsewhere, has also to contend with another major conflict in objectives, namely, the conflict between the economic, social and physical planning objectives. For example, if a plan's prime and, possibly, only objective is rapid economic growth, it will involve a type of planning designed to concentrate the human, physical and economic resources available to the Government in a certain rigid and authoritarian manner. Such a development, according to Mr. Mayne, will cause great difficulty in creating a priority system and stand in the way of an automatic system of allocation of resources. It may be useful to quote, in this context, the conclusions of Dr. Otmar Emminger (Member of the Directorate of the Deutsche Bundesbank) whose lecture on economic growth under the auspices of the University of Madrid had also been published by the O.E.C.D.:

"Economic growth... has assumed particular importance. But it cannot have absolute priority over all other...objectives. Growth is not an end in itself; the pursuit of growth is purposeless, if it means no more than simply competing for the high statistical figure.

"Growth is only as important as the very real economic, social and political purposes which it must, and indeed can, serve to fulfil. What we are interested in is not just economic growth in purely statistical terms but rather: *What extra goods are produced? For what purpose? For whose benefit? At what cost? or At the price of what sacrifice?* The *quality* of economic growth is at least as important as its *quantity*."

While planners in India swear by a growth-oriented economy in theoretical and statistical terms, they have to operate, by and large, through democratic channels and, thus, are not oblivious of the human objectives and qualitative aspects of growth. Although this much can be said in fairness to them, it is by no means clear how far they have reconciled the conflicting objectives mentioned by Mr. Mayne. This is a matter calling for closer and deeper study.

Two other conflicts faced by the practical planner are all too evident in India. One of these is that the objectives for the individual are frequently in conflict with the objectives for the economy as a whole. Mr. Mayne's view on this issue is that "the desire to give maximum individual liberty would frustrate all types of economic and social planning and the probable long-run development of the economy." This question continues to be hotly debated in this country, and it has led to the formation of the Swatantra Party. It is also related to the other conflict, namely, that pertaining to the relative roles of the public and private sectors. In regard to these twin conflicts in India, much can be said, and is being said, on both sides. As of today, there is no finality about the debate. One can only hope that planners in India will constantly strive to be pragmatic and operate its mixed economy in such a way that individual freedom is substantially preserved.

MARKET GOSSIP

THERE has been a smart recovery in share markets, with equities recording sizable gains. Bear covering and hurried replacement buying by some bulls are mainly responsible for this improvement. On Thursday, there was some profit-taking by bulls and fresh buying support showed signs of exhaustion. Nevertheless, the closing rates, as on that day, were substantially higher than those a week before. The much-feared *Ashtagraha* has passed off, belying all the astrological forebodings. Mr. T. T. Krishnamachari has made a statement that he is not in favour of imposing fresh direct taxation and that a part of the additional funds required for the Plan can be raised by plugging the loopholes through which tax is being evaded and by improving the efficiency of tax collecting machinery. Both the events have helped to revive the bullish fervour. While it is possible that, despite all the reiterations of his faith in aggressive socialism, T. T. K. may be forced by circumstances not to repeat the mistakes he made in the fiscal policies in 1956 and 1957, it is better to bear in mind that he is a person who thinks that he is cleverer than others and who has immense confidence in his sense of judgment. He is also one of those who believes that consistency is the virtue of an ass. Anyway, whatever the share markets may think of him now in the light of his interviews to a section of the daily Press, there is a considerable amount of uneasiness among businessmen at the prospect of his becoming a leading member of the Union Cabinet after the elections.

Larsen and Toubro

The shareholders of Larsen and Toubro Limited as well as Press representatives had the opportunity last week-end to see the Company's Powai Works in suburban Bombay. It should have been an exhilarating experience to the visitors to feel the dynamism of expansion and diversification in the works. The lines of manufacture so far undertaken by Larsen and Toubro are indeed impressive in their range. These include electrical switchgear and motor starters, petrol dispensing and metering pumps, equipment for chemical, pharmaceutical and dyestuffs industries and distilleries and breweries, sulphuric acid and superphosphate plants, dairy machinery and equipment, drilling equipment and diamond bits, lubricated taper plug valves, sheepsfoot tamping rollers for soil compaction, portable belt conveyors and hand scrapers, aluminium capsules, cups, vial caps, milk caps and milk strips, and crown corks. With such diversified manufacture, the Powai Works are now responsible for an annual output of goods worth Rs. 2.5 crores. An idea of the tempo of production in the Works can be obtained from the management's estimate that the output will be of the order of Rs. 5.0 crores in 1963-64. In view of this continuous expansion that is taking place in the Company's operations, the management has also rightly decided to increase the equity share capital from the present Rs. 110 lakhs to Rs. 165 lakhs by a fresh issue for Rs. 55 lakhs.

Another noteworthy venture which Larsen and Toubro have recently launched is Utkal Machinery Limited in collaboration with three renowned West German firms. This associate company, which will involve a capital outlay of Rs. 3 to Rs. 4 crores, is to produce, at its works near Rourkela, a wide range of heavy engineering plant, including blast furnaces, steel works plant, pig casting machines, sintering plant and ropeways, coke ovens and by-products recovery plant, low temperature carbonisation and gasification plant, chemical plant and equipment for fertiliser, refinery and petro-chemical installations and plant and equipment for production of pulp, paper and cardboard. This unit, which is expected to go into production after a few months, has a production target to the tune of Rs. 5 crores a year in the near future. With an enterprising and imaginative board of directors headed by Mr. H. Holck-Larsen, the ever-expanding Larsen and Toubro Limited and its various subsidiaries are destined to achieve a great deal in the field of engineering industry—electrical or non-electrical.

Cotton Textiles at Geneva

What will be the pattern of world cotton textile trade in the coming years? For the answer to this poser, one has to await the outcome of the International Cotton Textiles Conference now in session at Geneva—the Conference began on 29th January 1962—though, broadly speaking, it can be said that gone are the days of free trade in textiles. The Geneva Conference, it will be recalled, is being held under the auspices of the G.A.T.T. with the objective of ensuring a long-term arrangement for the orderly development of trade in textiles (by which is meant the prevention of the so-called "market disruption" in the developed countries of the West) to succeed the one-year short-term arrangements worked out at Geneva in July last, and in force since October 1961. The short-term arrangements, it will be recalled, provides for a voluntary ceiling on the imports of cloth into developed countries to the levels reached during the twelve-month period ended June 1961. Exporting countries are expected to observe these ceilings, if an importing country considers such a restraint necessary to prevent market disruption. The arrangements cover 64 categories of cotton textiles—yarns of different kinds, a wide range of piecegoods, apparel, bed, pillow and table covers, etc., hosiery, towels and napkins, and all other cotton textile items.

The discussions at the Geneva Conference are mainly on the basis of the report prepared by the Technical Sub-committee of the Provisional Cotton Textiles Committee which was constituted after the July meeting. The sub-committee—it was set up in October last to work out details of a long-term arrangement—concluded its series of meetings nearly a month ago when it agreed on a number of points for inclusion in a long-term agreement. The details of this committee's findings are, however, not available. The discussions at the Conference are also based on the various proposals put forward by the different delegations. Of particular importance are the Japanese and American proposals which are summed up below:

Japanese proposal: Cutbacks of exports to an importer-nation complaining of market disruption should be geared to the export levels of a year previously. This arrangement will be for over three years, with the cutback for the first year amounting to the export level of the previous year. In the second year, the cutback will again be to the level of a year earlier, but with a 5 per cent increase. The increase for the third year will be 10 per cent of the previous year's level. A fresh arrangement for dealing with any further market disruption will have to be worked out after the three-year period, but quotas should be completely eliminated after 30th September 1965.

U.S. proposal: This is a modified extension of the temporary arrangements under which countries whose markets are disrupted by "low-cost" imports can ask the "offending" exporter nation to hold down its exports to a level not lower than that for the year ended June 1961. Allied to this proposal is what is called a growth formula which links the quantity of textiles allowed to enter a country to the growth of consumption there and the expansion of home industry. A side issue that is reported to have emerged and a subject of considerable excitement among the exporting countries is the plan, now being considered by the U.S. Tariff Commission at President Kennedy's request, for the imposition of a fee at a rate of 8.5 cents per lb. on cotton used in cotton products imported into the U.S. This proposal springs from the agitation by U.S. textile manufacturers that the subsidy of 8 cents on U.S. cotton exports but denied to domestic consumers places them at a disadvantage in competing with imported cotton goods.

Whatever be the conclusions reached at the Geneva Conference, this much can be said and that is that world trade in cotton textiles will be subjected to some sort of quota restrictions in the coming years. It is, however, necessary to reiterate, even at the risk of repetition, that such quota restrictions are unjustified and beset with dangerous consequences. If, however, the Geneva Conference were to decide in favour of a quota scheme, the size of quotas allotted to the different exporting countries should be determined in a rational and realistic manner. So far as India is concerned, it would be wrong to treat it on a par either with Japan which has a well developed economy and a modern textile industry or with the tiny Colony of Hong Kong the textile exports from which consist largely of goods imported from China. For the foreign exchange needs of India for implementing the Plans are pressing to a degree and, since the scope for exporting goods other than the traditional items such as cotton textiles, jute goods and tea is very limited, the importance of maintaining as high a level of cotton textile exports as possible is urgent.

Viewed thus, the U.S. move to impose a fee on cotton used in the manufacture of products imported into that country will adversely affect textile exports from India, inasmuch as the American example may be emulated by the other importing countries as well under other pretexts. The leader of the Indian delegation to the Geneva Conference, Mr. T. Swaminathan, I.C.S., certainly did well to oppose the move stoutly. He is reported to have said: "The imposition of a fee will provide double protection for domestic (U.S.) producers and be contrary to the principles of the G.A.T.T., because it will amount to the application of a tariff without going through G.A.T.T. procedures." It was Mr. Morio Aoki, Japanese Minister to G.A.T.T., who led the attack on the U.S. plan. Mr. Morio Aoki observed: "The plan will have wide and far-reaching restrictive effects on imports (into the U.S.). If the plan is carried out, the very basis on which the long-term arrangement has been considered will be entirely changed." Indeed, he made it clear that, should the U.S. go ahead with the imposition of the fee, Japan would be unable to accept any long-term arrangement.

Meeting Loss on Exports

While the textile millowners and exporters in India are anxiously awaiting the outcome of the Geneva Conference, the Cotton Mills Federation has announced its decision to collect from mills Rs. 2 per bale (of 180 kg.) of Bengal *deshi*, Mathia, Mungari and Oomra cottons consumed by them for the purpose of financing exports of cloth and yarn. Hitherto, only imported cotton was subjected to such a levy. The decision, it is said, has been taken in consultation with the Textile Commissioner. The Press note issued by the Federation says:

"In the case of long-staple Indian cotton not subject to a ceiling price, or having a ceiling price per bale of Rs. 601 and above, the mills are required to pay Rs. 10 per bale consumed. The rate of levy in regard to other Indian cotton consumed is Rs. 5 per bale. Moneys on this basis will have to be paid to the Federation by the mills for all the Indian cotton consumed by them from 1st January 1962. For the year 1962, they should pay a deposit of Rs. 5 per bale on the quotas of Indian cotton issued to them in 1961. After receiving the deposit from the mills, the Federation will recommend to the Textile Commissioner to release the sanctioned quotas of cotton to them. The Federation has requested its constituent associations to impress upon the mills the need for complying with the scheme which is intended to expand India's export trade in cotton textiles and thus enable the country to earn foreign exchange on a bigger scale."

The Press note does not mention anything about the method of utilising the funds thus collected. Apparently, the Federation has not finalised its scheme of financing cloth and yarn exports. The system of levying a cess on raw material for the sake of promoting the exports of finished goods is certainly a novel experiment and is better than any scheme of compulsory exports. It may not be out of place to refer here to the latest joint efforts of the Government and millowners in Pakistan to boost exports of cotton textiles. The Government has fixed an export target of 80 million yards for 1962 and secured an undertaking from the millowners to export specified quantities of cotton piecegoods. The scheme, which will be implemented by the All-Pakistan Textile Millowners' Association, is as follows:

The export target is to be split among mills in accordance with the number of looms in each unit. The export quota of each mill will be divided into four equal parts and the mills will be required to fulfil the quarterly quota before the expiry of each quarter of the year. Each mill will deposit with the Millowners' Association a cash security or bank guarantee at 25 paisas per yard of its quarterly quota. The Association will be entitled to forfeit security in the event of any mill not fulfilling its export quotas. Where a mill declines to give cash security or furnish bank guarantee within the specified period, the name of the mill will be communicated to the Association, which will pass it on to the Ministry of Commerce. The Ministry may, then, blacklist the mill for the purposes of import licences.

The above scheme can be worked successfully in Pakistan, because most of the mills there are new units, so that the scheme can be applied to the whole industry. The position in India is, however, different. India can compete effectively in world markets only if the industry is (*a*) enabled to produce, through modernisation and rationalisation, quality textiles at economic costs, and (*b*) accorded tax relief, particularly on exports. Similarly, the exporting mills must be given priority in the allocation of cotton and other raw materials, as well as stores.

Planting Rubber in Andamans

It is not the Rubber Board but Mr. K. M. Philip, President of the Indian Rubber Industries Association, who has to be congratulated on the decision of the Board to undertake rubber plantation in the Andaman islands. For it was Mr. Philip who first mooted the idea more than eight years ago. He had then stated that land in the Andamans, with evenly distributed rainfall and climate more or less akin to the fertile rubber areas of Malaya, was extremely suited for rubber cultivation. Somehow, the authorities did not give thought to the idea. Thanks, however, to the severe stricture by the Estimates Committee that the Government and the Board have not taken effective steps for promoting expansion of rubber production, the Board has now proposed to send a team of officials to the Andamans for preparatory work in connection with growing rubber in an area of 2,000 acres. The move, though belated, is to be welcomed. To the extent rubber is grown in the Andamans, the gap between actual requirements and supplies will be reduced, resulting in saving of foreign exchange. An idea of the gap can be had from the estimates made by the Working Group. These place the shortfall in natural rubber at 9,300 tons in 1965, 57,000 tons in 1970 and 108,000 tons in 1975. The anticipated deficit in 1975, according to the Estimates Committee, will entail imports involving a foreign exchange of over Rs. 40 crores at the current price level. What is more, it is claimed that Andamans rubber will be cheaper than even synthetic rubber, if properly managed.

In view of the continuously expanding requirements of rubber, it is to be hoped that the Rubber Board will implement the programme to grow rubber in the Andamans as speedily as possible. Such speedy, effective implementation could be ensured, if, as Mr. Philip has urged, the Board, instead of itself embarking on rubber cultivation, were to entrust the task to the large and well-experienced planting interests in the private sector, which alone would be able to exploit fully the opportunities on a scientific basis by investing money and know-how. It will, of course, be necessary to provide them with sufficient financial assistance. An interesting suggestion which Mr. Philip has thrown, in this connection, is that the Government can lease the land on a crop-sharing basis, rather than on outright sale basis, so that it can also have a share in the profit.

International Wheat Agreement

The International Wheat Council has started a five-week conference of its member-countries at Geneva, with the object of extending the existing agreement, due to expire on 31st July next. India, being an importer of wheat, is vitally concerned about decisions of the conference. It has sent a delegation to the conference, with Mr. H. Lal, Director General of Food, as the leader. Under the existing Agreement, which came into force in 1959, importing countries have given an undertaking to buy a certain percentage of their requirements each

EQUITIES RALLY

TEXTILES SPURT

(From Our Own Correspondents)

BOMBAY, *8th February*

THE share market cast off the gloom that enveloped it during the past few weeks and put on a cheerful appearance during the week under review. The recovery in values noted on Thursday last (the 1st inst.) gathered momentum in the subsequent sessions. In fact, despite fears about the *Ashtragraha* which, however, failed to materialise, the market showed signs of strength on the very first day of the week, namely, Friday the 2nd inst., which was also the last day of the previous settlement. In spite of end-of-account considerations, equities staged a smart rally, thanks to persistent short-covering and sustained bull support. The absence of any adverse developments following the conjunction of the planets on 4th-5th inst., the fading of the jitters caused by the news of T.T.K.'s unopposed election to the Lok Sabha, encouraging corporate news such as higher production of pig iron and steel by both T.I.S.Co. and I.I.S.Co. in January and the announcement of a number of attractive right issues and/or bonus issues accelerated the upward trend of the market. Although the *budla* charges in the last settlement were quite normal, indicating that the technical position of the market was healthy, in the case of some scrips the carry-forward charges payable by bulls were actually considered low. This suggested that the market had become rather oversold, a realisation that imparted additional strength to it. As a result of these factors, the market staged an impressive rally over a wide front. The firmness of the market persisted almost till the close today. Most of the scrips touched their highest level of the week today. Despite some profit-taking, several scrips in both the cash and forward lists showed handsome gains over the week. Three new shares, two textiles and one engineering, attracted interim margins on Wednesday, since their prices had gone up by more than 10 per cent from the previous clearing rate. The rates of margins were: Apollo Mills 17 nP per share, India United Mills 94 nP per share and Larsen and Toubro Rs. 2.20. The margins are payable on Saturday the 10th inst.

Steel shares were well fancied. Reports of higher production by T.I.S.Co. and I.I.S.Co. in January, as compared with the previous month, prompted replacement buying and bear covering in steel shares. Tata Steels rose from Rs. 139.25 last week-end to Rs. 143 today, the highest level of the week, before finishing fractionally lower at Rs. 142.75, showing a net gain of Rs. 3.50. Indian Irons, which had closed at Rs. 24.56 last week, steadily improved to touch Rs. 25.50 today, although the close was a shade lower at Rs. 25.45, a net rise of 89 nP over the week. Mukand Irons were a firm feature, rising from Rs. 27.50 last week-end to Rs. 28.50 at close today. The quotation was even higher at Rs. 29.25 on Tuesday. The firmness of the scrip was attributed to the decision of the Company's Directors to issue 100,000 new equity shares of Rs. 10 each at par to the existing equity and deferred shareholders.

Textile shares were well supported and registered impressive gains. Centurys firmed up on keen bidding from Rs. 589.50 last week-end to Rs. 622 today before winding up Rs. 4 lower at Rs. 618. The net gain over the week was Rs. 28.50. Standard Mills spurted by as much as Rs. 68 to Rs. 1,169. Swans and Finlays rallied on dividend hopes by Rs. 35 and Rs. 20 to Rs. 440 and Rs. 370, respectively. Kohinoors advanced from Rs. 307.50 last week-end to Rs. 321 today but finished lower at Rs. 318. The net gain over the week is Rs. 10.50. Simplex too put on a like amount to Rs. 177.50. Morarjees hardened by Rs. 19 to Rs. 411; Phoenix picked up Rs. 17 to Rs. 248. Elphinstones were marked higher by Rs. 11 to Rs. 127. Gokaks firmed up by Rs. 12.50 to Rs. 229. Khataus were quoted Rs. 13.75 higher at Rs. 482.50. Shreeniwas jumped up by Rs. 11.50 to Rs. 297. B.R. Cottons and Podars strengthened by Rs. 8 each to Rs. 86 and Rs. 159, respectively. Bombay Dyeings rose from Rs. 68.20 last week-end to Rs. 69.60 today, the highest level of the week. The close was, however, lower at Rs. 69.30, showing a net rise over the week of Re. 1.10.

Barring Maharashtra Sugars, which eased on selling pressure, sugar shares too were quoted a little higher. Belapurs rose from last week's closing rate of Rs. 246.50 to Rs. 250.50 today, but declined by Re. 1 to close at Rs. 249.50, a net gain of Rs. 3 over the week. Walchandnagars spurted by Rs. 3 to Rs. 156.50 and Phaltans by Re. 1.50 to Rs. 116.50. Maharashtras, however, declined by Rs. 6.50 to Rs. 176.

Among cement shares, A.C.Cs rose by Rs. 2.40 to Rs. 154 *ex-div.* as against Rs. 160 *cum-div.* last week-end. Digvijay Cements jumped up by Rs. 11.25 to Rs. 198. Orissa Cements gained 44 nP to Rs. 18.36.

Shipping shares, too, fared better. Scindias improved by 30 nP to Rs. 13 *ex-div.*, as against Rs. 13.12 *cum-div.* last week. Great Easterns put on 68 nP to Rs. 12.68 *ex-div.*, as against Rs. 12.72 *cum-div.* last week-end. Among automobile shares Premier Automobiles were quoted at Rs. 142.50, as against Rs. 144 last week. Hindusthan Motors rose by 76 nP to Rs. 20.96.

Rayon shares, too, shared the general improvement in values. National Rayons met with sustained buying and spurted from Rs. 595 last week-end to Rs. 565.50 today, before closing at Rs. 563.50. Baroda Rayons firmed up by Rs. 5 to Rs. 161, Gwalior Rayons by Rs. 2.50 to Rs. 55, and South India Viscose by Rs. 7 to Rs. 191. Indian Rayons, both old and new, however, met with selling and declined by Rs. 2.50 and Rs. 2 to Rs. 93.50 and Rs. 53, respectively.

Chemical shares scored handsome gains. Indian Dyestuffs leaped up by as much as Rs. 50 to Rs. 555. Amar Dyes by Rs. 26.25 to Rs. 362.50. Poly-Chems by Rs. 18.75 to Rs. 235 and Colour Chems by Rs. 60 to Rs. 505. There were rumours that the last mentioned scrip will be transferred to the forward list in the near future. Synthetics hardened by Rs. 14 to Rs. 233, and Alembics by Re. 1.75 to Rs. 243. Tata Chemicals were done at Rs. 19.20 *ex-right*. The Company has obtained permission to issue 503,920 equity shares of Rs. 10 each at a premium of 50 nP. Existing shareholders will get one right share for every five shares held.

Engineering shares ruled firm. Telcos advanced steadily from Rs. 349.50 to Rs. 355 today, the highest level for the week, before closing a rupee lower at Rs. 364, showing a net rise of Rs. 14.50 over the week. Alcock Ashdowns marched forward by Rs. 26 to Rs. 355. Larsen and Toubros and T. Maneklals attracted good support on reports of right issue; the former went up by Rs. 4 to Rs. 44 and the latter by Rs. 95 to Rs. 900. New Standard Engineerings were marked up by Rs. 10 to Rs. 222. Mahindras advanced by 44 nP to Rs. 19.76. Brady Engineerings and Asian Cables were done Rs. 9 and Rs. 4.50 higher at Rs. 103 and Rs. 106, respectively.

Miscellaneous industrials were generally quoted higher. Bombay Burmahs attracted speculative support prompted by reports that the Company had obtained licence to manufacture industrial laminates and advanced from Rs. 637.50 last week-end to Rs. 665 today, the highest level of the week, but closed Rs. 2.50 lower at Rs. 662.50. The net gain over the week was Rs. 25. Hindustan Levers registered an impressive gain of Rs. 12 to Rs. 70, following the announcement of the bonus issue in the ratio of 12 shares of Rs. 10 each for every 25 of the existing shares. Voltas too were well favoured, thanks to the optimistic note struck by the Chairman about the future of the Company, and advanced by Rs. 14 to Rs. 309. Premier Tyres put on Rs. 3.50 to Rs. 149.50. Wimcos were done Rs. 7.50 higher at Rs. 314. West Coast Papers gathered Rs. 6.50 to finish at Rs. 180.50.

Madras Stock Exchange

MADRAS, *7th February*

The Stock Exchange turned distinctly firm towards the close of the week, after remaining dull earlier. Textiles elicited good support from investors. Teas rallied on hopes of better export prospects. Coffees and rubbers moved up in sympathy. Although trading in the sugar section was dull, select scrips ruled steady. In the miscellaneous section, chemicals, cements and engineerings put on a cheerful appearance.

Among textiles, Buckinghams attracted good attention and advanced by Rs. 5.50 to Rs. 259. South India Viscose rose by a like amount to Rs. 190.50. Cannanores and Coimbatore Spinnings firmed up by Rs. 3 each to Rs. 176 and Rs. 75, respectively. Bangalore Woollens and Coimbatore Cottons put on a rupee each, the former to Rs. 240 and the latter to Rs. 221. Travancore Rayons hardened by 38 nP to Rs. 43.50 and Lakshmis by 25 nP to Rs. 165. Madurais, however, fell by Re. 1.25 to Rs. 41.25, reflecting disappointment of operators over the dividend for 1961 which has been just maintained at the previous year's level of 15 per cent, taxable. Among teas, Periakaramalais strengthened by 17 nP to Rs. 3.50. Blue Mountains picked up 11 nP to Rs. 2.72. In the coffee group, Consolidated Coffees rose by 25 nP to Rs. 16.75, Cowcoodys by 22 nP to Rs. 4.02 and Ouchterlony Valleys 15 nP to Rs. 3.60. Among rubbers, T.R. and Ts improved by 13 nP to Rs. 10.75. Cochin Malabars were higher by 4 nP to Rs. 7.27. Among miscellaneous industrials, F.A.C.Ts spurted by 30 nP to Rs. 8.40. Aluminium Industries gathered 20 nP to Rs. 23.70, India Cements 12 nP to Rs. 5.87 and Ashok Leylands 10 nP to Rs. 9.10.

Calcutta Stock Exchange

CALCUTTA, *7th February*

The confluence of planets nullifying the earlier mundane fears ushered in a modest recovery on the Stock Exchange during the week under review. In the past two weeks, it will be recalled, apprehensions of the approaching doom had led to a sizable withdrawal of funds. Large-scale activity was, however, absent, thanks to the squeeze in bank credit following the advent of the busy season. Trading was tempered by caution, originating from fears of increased indirect taxation in the forthcoming budget, which might push up industrial costs. Further, some new issues and rights issues mopped up funds. The announcement of an increase in production and despatch of saleable steel in IISCO works for January led to an improvement in sentiment for Indian Irons on Monday, despite the fall in output of pig iron and steel ingots and the shortage of suitable railway wagons holding up despatches of finished stores. Although the prospects of increased assistance by the aid-to-India Consortium were considered to be bright, the postponement of its meeting to May checked sentiment. The shortage of imported raw materials and spares, coupled with the acute wagon shortage hampering movement of coal, indigenous raw materials and finished products, it was feared, would adversely affect the working results for the current accounting period.

STATE BANK OF BIKANER

RETURN TO DIVIDEND LIST

THE results of the State Bank of Bikaner (General Manager: Mr. Balwant Singh, Bikaner) for the year ended 31st December 1961, the second year of its functioning as a subsidiary of the State Bank of India, are highly encouraging. The Bank has earned a handsome profit of Rs. 7.10 lakhs, which compares favourably with Rs. 2.12 lakhs for 1960. In 1959, it will be recalled, there was a loss of Rs. 2.96 lakhs. The notable rise in profit has enabled the Bank not only to return to the dividend list after a lapse of two years but also to add a sizable amount out of its published profit to reserves, thereby following the convention recommended by the Governor of the Reserve Bank of India. The actual rate of dividend is, however, lower than that distributed in 1958, being 6 per cent subject to tax, as against 5 per cent tax-free. The allocation to reserves is Rs. 2.35 lakhs, as against Rs. 50,000 for the previous year, and bonus to staff absorbs Rs. 1.75 lakh, as compared with Rs. 1.50 lakh in 1960.

The profit of the Bank for the year 1961 would have been higher still had it not been for the appreciable increase in interest payments and other expenses, the former rising by Rs. 10.10 lakhs to Rs. 45.87 lakhs and the latter by Rs. 6.36 lakhs to Rs. 47.83 lakhs. But these increases have more than been made good by the improvement of Rs. 15.29 lakhs to Rs. 75.10 lakhs in interest and discount earned and of Rs. 5.15 lakhs to Rs. 22.38 lakhs in commission and exchange.

The progress made by the Bank in the past four years is indicated in the following statement:

(In lakhs of rupees)

	For the year ended 31st December			
	1961	1960	1959	1958
Interest and discount earned	75.10	59.81	63.61	62.15
Commission and exchange	22.38	17.23	15.73	15.09
Interest paid	45.87	35.77	37.75	38.15
Expenses	47.83	41.47	47.42	34.96
Depreciation	2.12	1.91	1.16	1.03
Profit	7.10	2.12	—2.96	0.02
Provision for taxation	Nil	Nil	..	3.25
To reserves	2.35	0.50	..	2.00
,, bonus to staff	1.75	1.50	..	1.83
Dividend	3.00 (6%)*	Nil	..	2.50 (5%)†
Carry forward	0.12	0.12	..	0.02

	As on 31st December			
	1961	1960	1959	1958
Paid-up capital	50.00	50.00	50.00	50.00
Reserves	14.85	12.50	27.00	27.00
Deposits	1,578.63	1,364.97	1,316.34	1,253.69
Borrowings from banks	Nil	0.08	1.40	65.00

Advances	62.0	56.4	60.5	56.3
Investments	34.7	40.0	46.1	43.0
Cash	13.1	13.4	12.9	15.2

* Subject to tax. † Tax-free.

The higher earnings of the Bank must be attributed to the continued expansion of the Bank's business which is reflected in the perceptible rise in advances. The total of advances as on 31st December 1961 stood at Rs. 9.80 crores, as against Rs. 7.70 crores a year before. The Bank was thus in a position to meet the enhanced credit requirements of its clients, it was because of the marked increase in deposits, from Rs. 13.65 crores to Rs. 15.79 crores. Thanks to such an increase, the Bank did not resort to any borrowings from other banks. Since the pace of rise in advances was larger than that in deposits, the credit ratio of the Bank as at the close of 1961 was substantially higher at 62.0 per cent, as against 56.4 per cent a year before. While deposits are higher by Rs. 213.66 lakhs, investments show a rise of only Rs. 1.66 lakh, so that the investments ratio has declined from 40.0 per cent to 34.7 per cent. The cash ratio has also declined, albeit slightly, from 13.4 per cent to 13.1 per cent, though the actual cash is higher at Rs. 206.79 lakhs, as against Rs. 183.52 lakhs. The ratio of liquid assets to deposits is, however, still substantially high at 47.8 per cent.

Including the sum of Rs. 2.35 lakhs added from out of the 1961 profits, the Bank's total reserves now stand at Rs. 14.85 lakhs, whereas the paid-up capital is unchanged at Rs. 50 lakhs. Consequently, the ratio of reserves to capital has gone up from 25 per cent to almost 30 per cent.

A special feature of the year's working was the commencement of foreign exchange business by the Bank. The Bank continues to handle Government business under an agreement with the State Bank of India. Currency chests of the Issue Department of the Reserve Bank were established at 20 centres during the year 1961, thus bringing the total number of currency chests established so far to 34. The Bank opened seven new branches at Bilara, Degana, Jetaran, Nawa, Sirohi, Taranagar and Kaushalpuri (Kanpur Industrial area). All these branches except Kaushalpuri (Kanpur) office are situated in Rajasthan and were opened under the approved expansion programme of the State Bank of India. Licences for opening branches at six more centres in Rajasthan have been obtained from the Reserve Bank and it is expected that these branches will be opened in the current year.

Steel shares were well fancied. Reports of higher production by T.I.S.Co. and I.I.S.Co. in January, as compared with the previous month, prompted replacement buying and bear covering in steel shares. Tata Steels rose from Rs. 139.25 last week-end to Rs. 143 today, the highest level of the week, before finishing fractionally lower at Rs. 142.75, showing a net gain of Rs. 3.50. Indian Irons, which had closed at Rs. 24.56 last week, steadily improved to touch Rs. 25.50 today, although the close was a shade lower at Rs. 25.45, a net rise of 89 nP over the week. Mukand Irons were a firm feature, rising from Rs. 27.50 last week-end to Rs. 28.50 at close today. The quotation was even higher at Rs. 29.25 on Tuesday. The firmness of the scrip was attributed to the decision of the Company's Directors to issue 100,000 new equity shares of Rs. 10 each at par to the existing equity and deferred shareholders.

The unloading tank wagon facilities for crude oil brought from Ankleshwar, installed at the Burmah-Shell Refineries, Trombay, were formally inaugurated on 31st January. The new facilities, provided at a cost of Rs. 13.5 lakhs, will enable Burmah-Shell to receive 900 tons of crude daily.

A manufacturing licence to establish aluminium plants using the bauxite deposits of Kolhapur district and electric power from Koyna has been given to Messrs. Tendulkar Industries. Another party has also taken interest in establishing an aluminium plant in the Kolhapur district.

The Tariff Commission has taken up for investigation the question of continuing protection to the non-ferrous metals industry beyond 1962. The scope of the Commission's inquiry covers copper rods (other than electrolytic), copper pipes and tubes, lead sheets (other than sheets for tea chests), zinc sheets, zinc strips, brass pipes and tubes and brass rods.

The Government of India has sanctioned a loan of Rs. 2.5 crores to the Rajasthan Government for financing expenditure on the Rajasthan Canal Project during 1961-62. The total loans advanced since 1957-58 to the State Government for this project, including the current loan, amount to Rs. 19.29 crores.

The Government of India has granted as many as seven licences, under the Industries (Development and Regulation) Act, 1951, for establishing new undertakings or effecting substantial expansion of the existing industries for manufacture of goods in Maharashtra. Two of these licences are for new undertakings and the remaining five for substantial expansion. Among the important lines that will be covered by these undertakings are those for the manufacture in Greater Bombay of parachlon (technical), carbon resistors and syroflex capacitors and fluorescent tubes and street lighting.

The Central Co-ordination Committee on Vocational Guidance and Employment Counselling has strongly recommended that occupational employment information should be made a part of the school syllabus and be imparted to high school students during their regular class periods. The Committee has also suggested that "Career evenings" should be organised in schools to enable parents to discuss and plan out suitable careers for their children. Further, it has suggested that a vocational guidance week may be organised by employment officers either separately or along with technical training week.

The project report prepared by the National Mineral Development Corporation for the exploitation of diamond deposits of Ramkherya area in Panna district of Madhya Pradesh has been approved by the Government of India. The scheme is estimated to cost Rs. 46.2 lakhs with a foreign exchange component of Rs. 27.9 lakhs. The annual output of diamonds from the area is estimated at 12,500 ratties. The Corporation has prepared another project report for Majhgawan area in Panna. The scheme is estimated to cost Rs. 90 lakhs with a foreign exchange component of Rs. 29 lakhs. The annual production of diamonds from this area is estimated at 30,000 ratties.

The Government of India has decided to encourage foreign collaboration for the development of poultry industry in the country. It is considered desirable to set up composite plants, including a commercial hatchery, a breeding farm, a feed manufacturing unit and a poultry processing plant. The Government has already sanctioned one such collaboration programme with an American concern, with an authorised capital of Rs. 25 lakhs on a 50 : 50 share basis. Under this particular scheme, it is proposed to set up two poultry farms, one in Bombay and the other in Calcutta. It is expected that these two farms will produce about 500,000 breeding stock of egg-laying and meat-type strains of poultry for further multiplication in the country.

Inter-Governmental discussions between the delegations of the Government of India and the Swiss Federal Council, which commenced in New Delhi on 19th January 1962, for the examination of the working of the existing agreement relating to air services, has concluded. The two delegations have reviewed the operating programmes of the Swissair and Air-India International. Swissair is at present entitled to operate three weekly frequencies through India, two via Bombay and one via Calcutta. Air-India International operates three weekly frequencies through Switzerland. It has been agreed that this level of operations will be continued for the year 1962. The delegation has also agreed on procedures to be adopted for implementing the provisional agreement to air services between the Government of India and the Swiss Federal Council, which has been concluded at Berne in 1949.

The Motor Transport Workers Act 1961 has come into force with effect from the 1st inst. in the States of Rajasthan, Andhra Pradesh, Assam, Kerala, Mysore, Orissa and the Punjab and in the *Union Territories* of Delhi, Himachal Pradesh and Andaman and Nicobar Islands. It will be extended to West Bengal from 1st March and to Madras, Maharashtra and Uttar Pradesh from 31st March. In Madhya Pradesh, it became operative from 26th January 1962. The Act seeks to regulate hours and limitations of employment (eight hours in a day and 48 hours in a week) with daily intervals for rest, weekly rest, provision for medical facilities, canteens, rest rooms and uniforms, wages and leave of workers employed in motor transport undertakings.

The construction work of the Diva-Panvel-Uran-Apta line (Maharashtra) on the Central Railway was inaugurated on the 1st inst. by Mr. Jagjivan Ram, Union Minister for Railways. The new line, 69.92 km. in length, will, for the first time, open to railway traffic the backward districts of Ratnagiri and Kolaba in the Konkan area with Bombay City. The scope of the project, as sanctioned by the Railway Board, covers the construction of a broad-gauge line between Diva and Apta (41.54 km.) and a branch line from Panvel to Uran (28.38 km.). Estimated to cost Rs. 395 lakhs, the line is expected to be completed in about three years. A novel feature of this project is the use of the pre-stressed concrete girders in the place of conventional steel girders, for the first time on the Central Railway. It will eliminate the considerable difficulties and expenditure involved in preserving steel works from severe corrosion, commonly experienced in the coastal belt. The project will serve, among others, the organic chemical and intermediate plant, near Apta, proposed to be set up by the Government of India.

From Abroad

The U.S. Government has banned all imports from Cuba, besides maintaining the ban on exports to that country imposed last year. Exports of certain foodstuffs and medicines, however, have been exempted from the order.

The Government of Spain has decided to grant refunds of taxes on a number of export items, the actual refund varying from 3 to 10 per cent of export prices. The products include meat, milk, butter, cheese, chocolate and certain other food preparations and ceramic and glass products.

PERSONAL

MR. Velji Lukhamsey and Mr. Devji Rattansey have been elected President and Vice-President, respectively, of the Grain and Oilseeds Merchants' Association for the current year.

Mr. J. C. Finlay, until recently General Manager of the Burmah Oil Company, in Burma, has been appointed General Manager of the B.O.C. (India Trading Ltd.). He will also take over charge as Managing Director of Oil India Ltd.

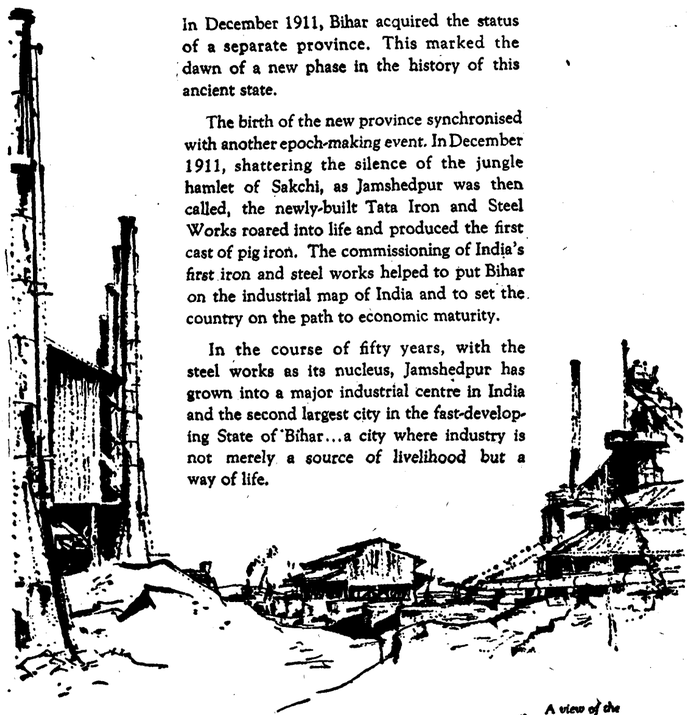
Mr. B. Venkatappiah, I.C.S., a Deputy Governor of the Reserve Bank of India, has been appointed Chairman of the State Bank of India *vice* Mr. P. C. Bhattacharyya who will succeed Mr. H. V. R. Iengar, I.C.S., as the Governor of the Reserve Bank of India with effect from 1st March 1962. Mr. D. G. Karve, Vice-Chairman of the State Bank, has been appointed a Deputy Governor of the Reserve Bank.

Japan's new Lockheed-designed monorail will be in full operation next year at Nikko, 80 miles from Tokyo. Built by the Nihon-Lockheed Monorail Co., the new high-speed monorail is already in the initial construction stages. The initial "jet-styled" monorail train consists of two 43-foot-long lightweight cars capable of carrying up-to 120 passengers each at 75 m.p.h. The cars are 10 feet wide.

A central institute for co-ordinating work in various branches of scholarship relating to Asian countries has been established at the University of Heidelberg in West Germany. It is staffed by university professors concerned in all aspects of Asian study. Special facilities are offered to citizens of Asian countries to carry out research on Asian culture. In addition to this new institute, Heidelberg University also proposes to establish a Collegium Internationale to bring together students from all parts of the world.

Official Bills providing for the denationalisation of banks and industrial firms in Syria have been presented to the Syrian Constituent Assembly by the newly-formed Government. They are aimed at virtually repealing the measures taken by President Nasser before the region was separated from the United Arab Republic. The employees of the firms concerned will, however, be entitled to a 25 per cent share in cash in the net profits, as against 10 per cent in cash and 15 per cent in the form of social services. They will also have the right to nominate two representatives on the Boards of Directors.

important beginnings



In December 1911, Bihar acquired the status of a separate province. This marked the dawn of a new phase in the history of this ancient state.

The birth of the new province synchronised with another epoch-making event. In December 1911, shattering the silence of the jungle hamlet of Sakchi, as Jamshedpur was then called, the newly-built Tata Iron and Steel Works roared into life and produced the first cast of pig iron. The commissioning of India's first iron and steel works helped to put Bihar on the industrial map of India and to set the country on the path to economic maturity.

In the course of fifty years, with the steel works as its nucleus, Jamshedpur has grown into a major industrial centre in India and the second largest city in the fast-developing State of Bihar...a city where industry is not merely a source of livelihood but a way of life.

EXPORT CREDIT INSURANCE

EXPORT credit insurance is very much in the news now. In a bid to boost exports, many countries are giving their exporters finance and facilities on terms more attractive than those offered at any time in the past. Britain seems to have decided to match and even surpass other countries in granting the easiest possible credit terms to exporters. It has succeeded in persuading banks and insurance companies in that country to co-operate in a scheme to provide finance for British exporters for periods upto 15 years in the case of capital goods export covered by the guarantees of the Export Credit Guarantee Department. (For details *vide Commerce* dated 3rd February 1962, page 198.) The U.S. Government, which had till recently not directly involved itself in export credit insurance, has now entered the field to give a powerful stimulus to exports. Under a plan, just announced, through the Export-Import Bank, the Federal Government, in association with the recently-formed Foreign Credit Insurance Association (F.C.I.A.), having a membership of 57 leading insurance companies in the U.S., will insure exporters against financial losses resulting from extension of credit to customers in friendly overseas nations. According to the plan, the Export-Import Bank and the F.C.I.A. will share commercial risks on a 50-50 basis, whereas political risks, which might involve negotiation between Governments, will be covered by the Bank alone. A ceiling has, however, been put on the liability of the F.C.I.A. which will be limited to one million dollars a year; losses beyond this figure will be indemnified by the Bank.

This is the first time that the U.S. Government has undertaken to insure export credit. The plan has originated from President Kennedy's attempt to improve U.S. balance of payments by encouraging exports. Two advantages claimed for it are (1) it would make exporters more disposed to extend credit to customers abroad and (2) it would enable them to obtain more finance from commercial banks.

Although the U.S. credit insurance plan represents just a beginning and is modest, as compared with the highly refined schemes in force in Britain or Germany, the fact that the Government has associated itself with a scheme of export credit insurance, which had hitherto been done in the U.S. by individual insurance companies on a relatively small-scale, indicates the importance credit insurance has come to assume as an export aid.

Liberalisation of terms and extension of the period of coverage of export credit have naturally attracted attention of the International Union of Credit Insurers Berne Union), an organisation of credit insurers which aims at avoiding competition in offering long-term credits on capital goods. At a meeting held last week at Munich, the members of the Berne Union discussed at length the terms of payment for world trade. The members reaffirmed that a period of six months was the "extreme limit" appropriate for consumer goods. As for capital goods, it was noted that credit for more than five years was being conceded in particular cases, such as large development projects in developing countries. While appreciating the motives underlying these special cases, the members of the Berne Union expressed concern about the effect such practices might produce on international credit competition. In their opinion, it made no difference whether the credit granted was in the form of supplier credit or financial credit tied to exports from the lending country. Feeling anxiety over the consequent threat of a credit race, which would be beyond the powers of the Union to restrain, they recalled that the Berne Union had, in January 1961, expressed the hope that progress would be made in establishing some system of international co-ordination between Governments. It is noteworthy in this connection that the hope expressed by the Union is taking shape. A committee of experts from the six Common Market countries is reported to have evolved a procedure to prevent cut-throat competition among themselves in the provision of export credits. The committee has called for compulsory prior consultation by the organisations responsible for export finance in member-countries before deciding the conditions for granting export credits over a period of more than five years, which is the limit laid down by the Berne Union. The Committee's plan is expected to be approved by the Six soon. All members are said to have approved it in principle, except Italy, which is yet to give its formal approval. The fact that the Six are already near agreement on a procedure of prior consultation on export credit indicates that, given the will, it is possible to work out agreements to avoid a credit race outside the framework of the Berne Union.

UMBRELLA RIBS INDUSTRY

Till the beginning of the last World War, the domestic demand for umbrella ribs was met by imports, particularly from Germany, Japan and the U.K. Thereafter, the industry took firm roots in the country. Today, the industry is manufacturing about 900,000 dozens of umbrella ribs per year, as against about 100,000 dozens early in the fifties. Mr. Atta, President of the Umbrella Ribs Manufacturers Association, disclosed at the annual meeting of the Association, held at Calcutta, on Monday this week, that the existing capacity of the industry was sufficient to meet the entire demand of the country. If this claim is true, Mr. Atta's plea to Government not to issue any fresh licences for umbrella rib units is quite justifiable. Presumably to avoid even the establishment of small units, he urged the Government of India to issue necessary instructions to States in this connection. This measure is quite urgently needed to avoid wastage of resources in terms of reduntant uneconomic capacity.

Apart from fulfilling the needs of domestic demand, the industry has made a good showing on the export front. In fact, export of unbrella ribs amounted to about Rs. 69,000 in 1959. But it fell to Rs. 63,000 in 1960. And for the ten months ended October 1961, export aggregated no more than Rs. 40 lakhs. The declining trend in exports is mainly the result of scarcity of raw materials. Mr. Atta made particular reference to the scarcity of the chief raw material, namely, wires. No licences for imports of wires are now being given. This has apparently adversely affected the development of the industry. Indigenous capacity for wires has, no doubt, been developed in the country. But this is only for round high tensile spring steel wires. But producers of ribs in this country depend on another variety, namely, flat high tensile wires. Mr. Atta, in this connection requested the Government of India to permit rib producers to import the specific type of wire needed by them until capacity was developed in the country for this type of wire. Mr. Atta also complained that the high tensile wire now produced in India was being sold at a price twice as high as the imported product. In order to fix fair prices for indigenous wires, he wanted the Government to refer the question to the Tariff Commission. Mr. Atta's pleas regarding the chief raw material deserve to be sympathetically considered by the authorities.

FOOD-FOR-PEACE MISSION

The United States has exported, or programmed for export, some 15 billion dollars worth of surplus agricultural commodities under P.L. 480 since 1st July 1954. The quantity involved in the series of transactions with a large number of countries has aggregated 112 million tons so far, mostly of foodgrains. By sharing its agricultural abundance with other countries, especially the poorer ones in Asia and Africa, through sale, at concessional rates, for foreign currencies and through grants and donations, the United States has used food effectively to the cause of international goodwill and to make this food-for-peace programme of Bikaner effective in the future, the Kennedy Administration has just recommended to Congress that Public Law 480 be amended to allow shipments of dried beans and other commodities not owned by the Government. President Kennedy has also proposed a new section in this law to authorise the utilisation of U.S. donations to meet a lapse programmes of food assistance. In this connection that the amount remembered in this connection that the proceeds already promised to contribute to the worth of food toward a $100-million Food Bank to be operated by the Agriculture Organisation of the United Nations.

STATISTICAL OUTLINE OF INDIA 1961

Compiled by the

Department of Economics and Statistics, TATA INDUSTRIES PRIVATE LIMITED, BOMBAY

with 95 tables covering all the key factors of the Indian Economy ranging from National Income and Population to Foreign Trade and Industries.

Price Rs. 3/-, Postage Extra.

VORA & CO. PUBLISHERS PVT. LTD.

3, Round Building, Bombay-2.

Another significant step taken by the Kennedy Administration in recent weeks to render the food-for-peace programme more effective is to send Mr. George McGovern, Director of that programme, on a world-wide mission to review the progress of U.S.-supported food-for-peace projects in different countries. Mr. McGovern, who is heading a study group which includes, among others, Mr. Arthur Schlesinger, Jr., Special Assistant to President Kennedy, has been in Bombay this week in the course of a 13-day tour of India. As the biggest single beneficiary of the food-for-peace programme—as much as 14 million tons of wheat alone have arrived in India so far—this country has been rightly accorded the pride of place in Mr. McGovern's itinerary. It is expected that the study group will have sufficient time to appraise broadly the progress of the various projects grant-aided or loan-financed from out of the sale proceeds of agricultural commodities supplied to India.

That grants and loans aggregating Rs. 300 crores have so far been spent on or committed to a whole range of development projects in the fields of irrigation, power generation and so on, is itself a satisfactory record, for that amount represents three-fourths of the total availability, as grants and loans, from out of the sale proceeds (Rs. 570 crores) which have accrued as of 31st October 1961. But, by the time supplies under the current P.L. 480 Agreement with India are completed sometime in 1964, the total availability of grants and loans will have reached the enormous total of Rs. 892 crores. Surely, the rate of ulilisation of these funds would need to be stepped up so that the expected economic development might come about more fully during the third Plan period itself. It is here that the possibilities of launching some countrywide labour-intensive projects in the related fields of agricuture and irrigation should be more energetically examined by American and Indian authorities alike. As projects of this kind can provide more rural employment, create social assets of a reasonably durable character and also increase agricultural production in the short-term, the pilot labour-intensive schemes proposed by India's planners would have to be completed at the earliest to facilitate the evolution of country-wide projects. From what Mr. McGovern said at his Press conference this week at Bombay, it could be inferred that such labour-intensive projects are likely to be liberally and readily assisted by way of grants out of counterpart funds.

WORLD BANK AND AFRICA

The latest move of the World Bank to set up a new department of operations for Africa is to be widely welcomed. Africa has ceased to be the "Dark Continent" by which name it used to be described until recently, inasmuch as a number of independent nations have emerged with a burning desire to improve the living standards of the teeming millions. Inhabiting a total area of 30,289 kilometres (almost one-fifth of the aggregate world area) are about 250 million persons (one-twelfth of the total world population), the living conditions of the vast majority of whom are none too happy. The aforesaid move of the World Bank certainly signifies the awareness, on its part, of "the rapidly developing responsibilities for the Bank and its subsidiary, International Development Association, in connection with the emerging independent countries of Africa." The proposed Department of Operations, we are told, will begin functioning on 2nd April next, headed by Mr. Pierra-L. Moussa of France. It will deal with all independent member-countries of the Bank, excluding South Africa and the United Arab Republic. The present Department of Operations for Europe, Africa and Australia will be renamed

(after 2nd April 1962) the Department of Operations for Europe, but will continue to handle matters relating to Australia, New Zealand, South Africa and the dependent territories of European countries in Africa and elsewhere, while U.A.R. matters will still be handled by the Department of Operations for South Asia and the Middle East.

With the establishment of a separate Department of Operations, the World Bank assistance to African countries may be expected to rise markedly from the present low level. Out of the aggregate loans amounting to over $6,062 million granted by the Bank so far, the share of Africa (other than South Africa and United Arab Republic) comes to no more than $614 million, the number of loans being 29. The country-wise breakdown of loans in million U.S. dollars, the figures in brackets giving the number of loans, is as follows: Algeria and Sahara 60.0 (2); Congo 120.0 (5); East Africa 24.0 (1); Ethiopia 25.5 (5): French West Africa 7.5 (1); Gabon 35.0 (1); Kenya 14.0 (2); Mauritania 66.0 (1); Nigeria 28.0 (1); Rhodesia and Nyasaland 146.6 (5); Ruanda-Urundi 4.8 (1); Sudan 74.0 (3); and Uganda 8.4 (1). Sudan is the only country in Africa which has obtained an I.D.A. credit of $13 million.

While the World Bank is striving hard to accelerate the economic development of its member-countries, it is encouraging to hear that that the financial position of the Bank continues to grow stronger and stronger. The first half of the current financial year (July-December 1961) witnessed a notable increase of $49.9 million to $851.7 million in reserves (including the special reserve of $206.6 million). The increase is attributable largely to higher net earnings aggregating $34.9 million and partly also to loan commissions of $15 million. The high level of earnings was due to the fact that the gross income of the Bank was well above expenses, being $89.9 million (exclusive of loan commissions), as against $55.0 million (inclusive of $47.6 million for interest on the Bank's funded debt, bond insurance and other expenses).

The World Bank made 19 loans together amounting to $399.9 million during the first half of 1961-62, bringing the total number of loans to 311 in 59 countries and raising the gross total of loans signed to $6,190.4 million. By 31st December 1961, as a result of cancellation, repayments and sales of loans, the portion of loans signed still retained by the Bank had been reduced to $4,477.4 million. Disbursements on loans were $240.9 million, making total disbursements $4,560.6 million as on 31st December. The Bank sold or agreed to sell the equivalent of $84.8 million principal amounts of loans, the total amount of such sales as on 31st December 1961 being $1,097.9 million, of which all except $69 million were without the Bank's guarantee. Repayments of principal received by the Bank amounted to $47.7 million, bringing the total repayments to $956.4 million, including $486.2 million repaid to the Bank and $470.2 million repaid to the purchasers of borrowers' obligations sold by the Bank. On 31st December 1961, the outstanding funded debt of the Bank was $2,425.6 million, reflecting a net increase of $197.1 million in the past six months. During the period, there was a gross increase of $321.1 million in borrowings.

During the first six months of the fiscal year, the Dominican Republic was readmitted as a member of the Bank with a capital subscription of $8 million. Laos (capital subscription $10 million), New Zealand ($166.7 million), Nepal ($10 million) and Cyprus ($15 million) became members of the Bank. The subscribed capital of the Bank as at the end of December 1961 amounted to $20,445.3 million.

MADRAS PORT TRUST

The total quantum of trade handled by the Madras Port Trust rose by 10 per cent to 3.04 million tonnes in 1960-61 over the previous year, according to the latest annual Administration Report of the Port Trust. The increase in trade was accounted for exclusively by imports from foreign countries, which went up by about 27 per cent to 1.36 million tons. This was the result mainly of larger intake of Government stores, iron and steel goods, raw cotton and sulphur. Exports, however, suffered some setback, having declined by 13,000 tonnes to 861,074 tonnes. The fall in exports was quite marked in the case of oilcake, iron ore, tanned hides and skins, twist and yarn and raw tobacco. There was, of course, a modest increase in the exports of such items as cattle feed, scrap and mica.

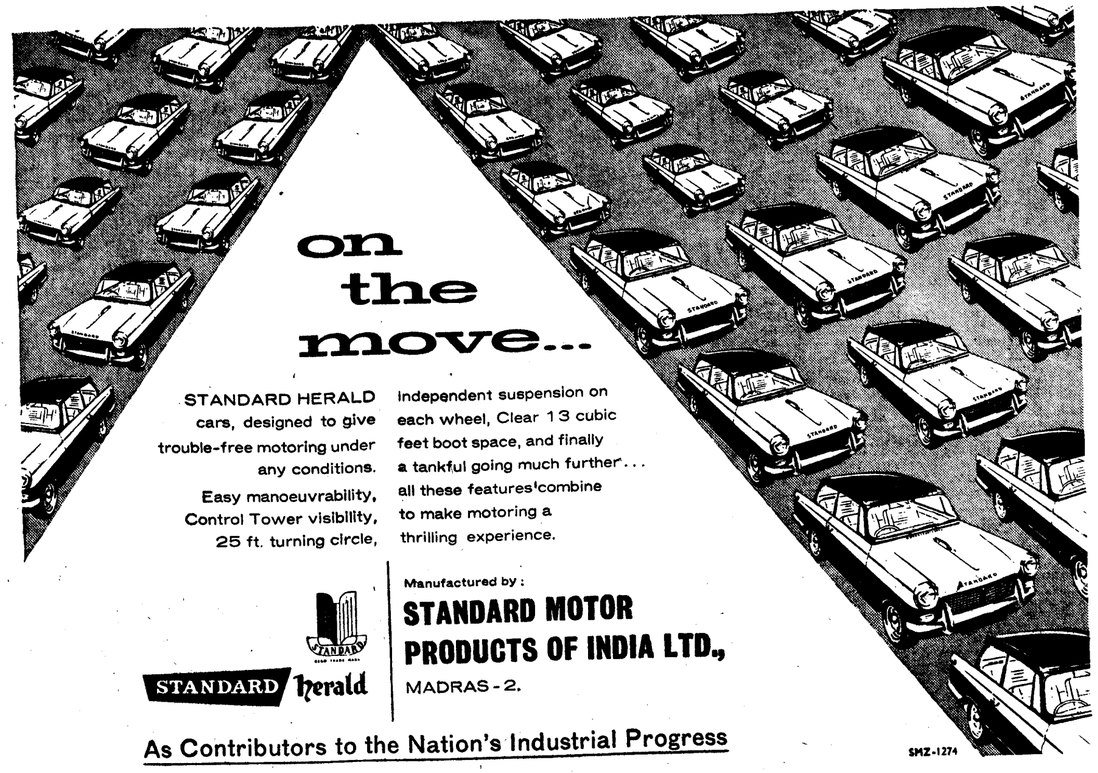
The following table shows the total volume of imports and exports (including coastal trade) through the Madras port in 1960-61, as compared with the previous year:

(In tonnes)

	Imports		Exports	
	1959-60	1960-61	1959-60	1960-61
Foreign trade	1,072,172	1,359,995	874,044	861,074
Coastal trade	768,848	767,857	47,784	49,501
Total	1,841,020	2,127,852	921,828	910,575

The actual net profits for the year amounted to Rs. 300 lakhs, as compared with Rs. 293 lakhs as in the revised estimates for 1960-61 and Rs. 228 lakhs actually realised during the previous year, resulting in an increase of Rs. 72 lakhs over the previous year. The figures exclude the sum held under "suspense" and contributions from Revenue Reserve Fund and Pilotage Fund. The net expenditure amounted to Rs. 191 lakhs, as compared with Rs. 168 lakhs in the previous year. These figures exclude the amount held under "suspense" and contribution to Renewals and Replacement Fund, General Insurance Fund and Capital Account. After excluding from the gross expenditure, contributions to Renewals and Replacement Fund (Rs. 21,60,900), contribution to General Insurance Fund (Rs. 1,00,000), contribution to Capital (Rs. 1,87,00,000), interest on loans (Rs. 25,43,861), repayment of debt (Rs. 1,57,402) and debit to "suspense" (Rs. 1,26,412), the actual working expenses amounted to 54.58 per cent of the receipts compared with 63.33 per cent in the previous year. The decrease is chiefly due to more receipts.

The Port Trust has been able to show fairly good progress in respect of the implementation of capital works. Particular mention may be made of wet dock stage I, part A. Under the scheme, an ore berth, along with 3 Nos. quay cranes, tracks, fenders, etc., was commissioned in September 1960. The cost of the project was Rs. 48 lakhs. Besides, a Rs. 23-lakh coal berth was also completed in November 1960. The part B of the project has also been proceeding apace.



CREDIT CONTROLS IN BRITAIN

BANK CHAIRMEN'S SHARP COMMENTS

By W. T. C. King
EDITOR OF *THE BANKER*, LONDON

AFTER the year in which Britain resorted to exceptionally strong measures of disinflation, the chairmen of the big banks have in their annual statements been paying more attention than usual to the repercussions of official policy upon the business of banking itself. One of the most striking features of the Chancellor's July measures, as I pointed out in this correspondence at that time, was that they brought into play virtually every available monetary weapon simultaneously, as well as the powerful new fiscal weapon for imposing a 10 per cent surcharge on practically all indirect taxes. The Bank rate, it will be recalled, was sharply increased to a penal level, rising from 5 to 7 per cent; a new call was made on the banks to make "special deposits" at the Bank of England, so as to squeeze their liquidity directly; an informal directive required the banks to make a tight grip on their advances and to be "particularly severe" on certain types of borrowers; and a broad hint was dropped that the banks should not attempt to ease the pressures on their liquidity and on their advances by further realisations of investments. Whilst the bankers are at least as well aware of the need for strong disinflationary action as most other sectors of the community, and have indeed generally applauded the courage of the Chancellor's toughness, some of them have evidently felt some sense of injustice at the special intensity of the measures exerted through the mechanism of deposit banking as such. This feeling springs first from the disappointment that although the monetary authorities have armed themselves with their new device for direct regulation of the banks' liquid assets, they still deem it necessary to interfere with the freedom of the banks to decide for themselves the disposition of their other assets.

Control Over Bank Advances

The technique of the informal qualitative control over bank advances, which had been developed during World War II and in the succeeding dozen years by the device of "requests" to the banks, had evident disadvantages that had come to be generally recognised, especially after 1955 when quantitative requests were added to the qualitative ones. To comply with such requests, as they always tried to do, the clearing banks, which were the ones most directly concerned, were obliged to put restraints on competition between themselves and to reach a variety of understandings for uniformity of practice which inevitably had stultifying effects, in the course of time, on their initiative and engendered a general sense of frustration. But this policy, even though it might succeed, at this cost, in keeping a hold on the lendings of the banks directly concerned, was virtually bound to fail in its real object of restraining the total volume of lendings from all sources. The appetites of the would-be borrowers refused accommodation at the clearing or Scottish banks created profitable opportunities for other types of lenders, so that the "directive" over the principal banks became one of the causes of a large growth in the activities of other financial institutions, many of them likewise taking deposits from the public and paying for them much higher rates than the clearing banks, under their traditional gentleman's agreement, allow on deposit-account balances. These disadvantages of control of advances by "directive" were clearly recognised not only by the Radcliffe Committee in its report but also by the evidence given to the committee by the authorities themselves. It was, indeed, for this very reason that a search was made for "alternative" means of control; and the alternative put up by the Bank of England for consideration was the special deposit scheme for direct control over liquidity. The Bank did not, indeed, regard this plan with any great enthusiasm, but thought it preferable to the advances control; and when advances were in fact decontrolled in mid-1958, actually before the appearance of the Radcliffe report, the plan the Bank had prepared for the committee was brought forth and made a "standby" weapon. At this stage it was generally understood that the authorities expected to be able to avoid any return to "quantitative" requests; and if, in the end, the special deposit device had to be used when next a restraint on credit was needed, it was thought that the resultant control exerted through liquid assets on the volume of deposits would be judged sufficient. The Radcliffe report seemingly confirmed these assumptions and also have the Bank's one further reassurance: it emphasised that direct controls over bank advances could not be justified except at moments of emergency, and then only for a brief period, and it also argued that, if direct controls were judged necessary over bank liquidity for any length of time, the authorities should consider the imposition of corresponding controls over other financial institutions.

Discriminatory action against the banks, it showed conclusively, was not only unjust and undesirable, but if sustained for long was bound to be both wasteful and ineffective. It is against this background that the comments made by some of the bank chairmen in the past month need to be viewed. The sharpest comment of all came from the new chairman of the Westminster Bank, Mr. D. A. Stirling, who pointed out that when the financial restrictions were put before the banks, they undertook to comply "on the assumption that corresponding restraints would be respected by other deposit-takers and credit-givers." Mr. Stirling did not specifically contend that these other institutions had in fact failed to restrain their activities since the Chancellor's July measures (the hire-purchase companies have indeed suffered a sharp contraction in their credit lines at the banks, and have also sharply stiffened their lending terms because of losses sustained through the phase of easy lending), but he went on to complain about unfair competition experienced by the banks in recent years. Where the borrowers of deposits from bank customers are commercial companies, as distinct from bodies such as the Trustee savings banks (most of whose funds are lent direct to the Government), the balances, of course, remain in circulation and return to the banking system, but the non-banking borrowing concerns, Mr. Stirling complained, held very large deposits, and were "neither required nor even expected to observe the same limitations as the banks in employing those deposits." It would seem reasonable, he thought, "that they should bear some share of the onerous part played by the banks as victims of first resort in these too familiar financial crises." And he "awaited with interest" the "revelation" of proposals to this end mentioned by the Treasury in its Radcliffe evidence more than four years ago.

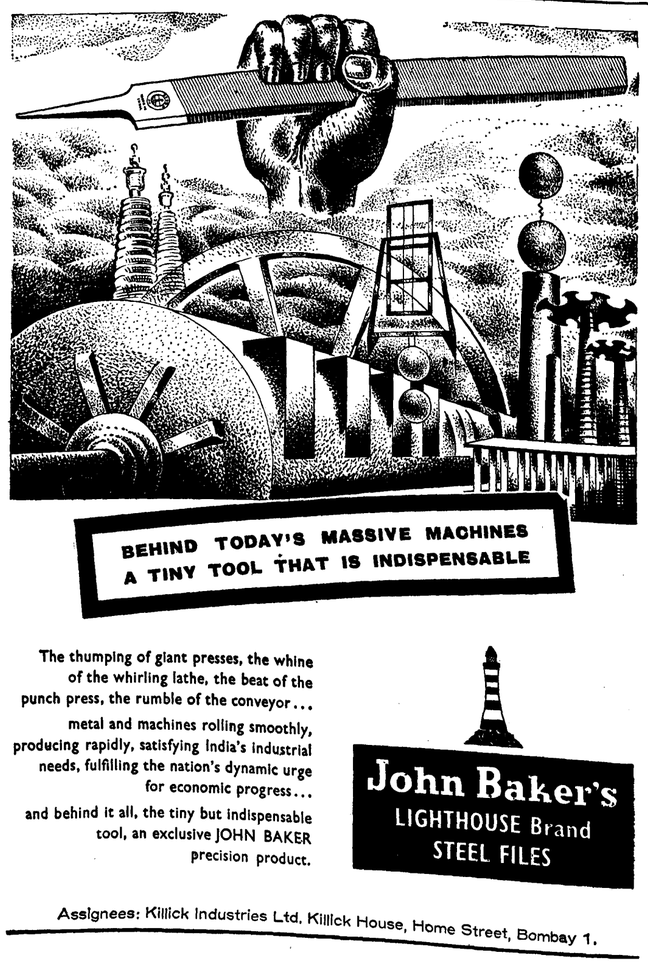
Much the same point was made by Sir Harold Bibby, in his farewell speech as Chairman of Martins Bank, who thought that parallel controls were needed on other deposit-takers "no matter what fresh legislation this may entail." This comment is, however, an oblique acknowledegment that the problem is one of great complexity, because of the many different types of financial institutions involved and because of the very great variations, both in size and in mode of operations, that exist even within each category of apparently broadly similar concerns.

One wonders whether the banks would really welcome in the end the very large extension of the apparatus of bureaucratic power that would be needed if the authorities were to be required to try to put precisely the same degree of restraint on each and every lender. The Radcliffe Committee, while not attempting to give a final answer to this question, seemed to think that the best way of avoiding the dilemma would be to rely mainly on the interest-rate for credit control and to eschew all forms of direct control altogether, except perhaps for rare and brief action in an emergency, when rough justice would have to suffice; but the corollary, it thought, of that line of argument was that too much should not be expected of monetary controls in any case.

Most bankers would endorse that last point (and Mr. A. W. Tuke, the retiring Chairman of Barclays Bank, came near to making it explicitly), yet relatively few of them have nowadays any real faith in control by the interest-rate—least of all when it takes the form the Radcliffe Committee had most in mind, manipulation of the long-term rate. As for the penal increase in the Bank Rate, Lord Monckton, of the Midland Bank, emphasised that the temporary relief it could give might be "dearly bought"; Mr. Tuke considered it a "dubious expedient"; Sir Eric Carpenter, of Williams Deacons, thought that such shock tactics underestimated the delicacy of the money mechanism ("far more likely to be dislocated than corrected by a jolt"); and Sir Harold Bibby, in effect, arguing just the reverse, thought that 7 per cent nowadays was perhaps only as effective as 5 per cent would have been ten years ago.

Banking Business in 1961

Though the bankers have some grounds for disliking the new shape that monetary policy assumed last year, and though some of them may specifically criticise the 7 per cent Bank rate, the business of banking prospered exceptionally in 1961 and much of the gain was directly attributable to the very high level of short-term rates. Bank profits had shown a record increase, to a new high point, in 1960, and at the end of that year it had seemed improbable that such a level could be long sustained. But in fact they rose a good deal further, if not as fast as in 1960. The disclosed profits of the big Five banks for 1961 showed increases ranging from 7 to 19 per cent, with the aggregate disclosed profit at £24,250,000, 12¼ per cent more than that for 1960 and roughly 100 per cent more than for 1957. The year's gain was mainly attributable to three factors. The rise in the Bank Rate to 7 per cent in July carried the year's average rate (in spite of the reduction to 6 per cent by early November) to its highest for 40 years, at 5.67 per cent, and thus raised earnings from advances, bills and short money more sharply than the interest outgoings on deposits (since the time deposits represent less than two-fifths of the total). Secondly, the delay in launching strong disinflationary measures allowed advances to go on rising, so that the year's average amount outstanding was even higher than the previous year's peak, in spite of the sharp contraction from last August until the year-end. Thirdly, and contrary to most expectations early in the year, there was a further rise in the average level of deposits as well as in the rate of banking turnover.



The thumping of giant presses, the whine of the whirling lathe, the beat of the punch press, the rumble of the conveyor... metal and machines rolling smoothly, producing rapidly, satisfying India's industrial needs, fulfilling the nation's dynamic urge for economic progress... and behind it all, the tiny but indispensable tool, an exclusive JOHN BAKER precision product.

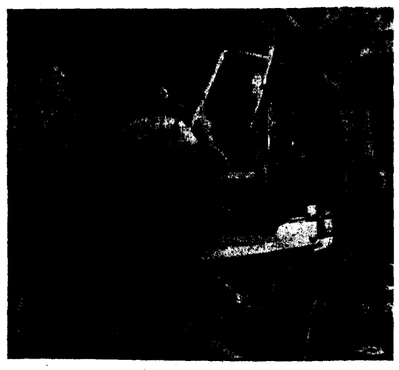
6' spindle ram-type horizontal mill and boring machine

THE REAL POWER OF AVB

Vast Technical Resources... Modern Workshops...



No. 14/36 combination turret lathe installed in the AVB light machine shop

Immensely rich in experience and technical knowledge, with modern workshops equipped with some of the world's most up-to-date machine tools...here is the *real power* of AVB. The essential combination to generate *real industrial power.*

This real power and potential of AVB will give added impetus to the continued and large-scale expansion of industry...by providing the finest facilities for the manufacture of high pressure steam-raising plant and pressure vessels and heavy machinery for the cement-making and mining industries.

Among the modern machine tools in the AVB workshops are

1. **6' ram-type horizontal mill and boring machine.** This machine has a vertical movement of 14' 6" and a horizontal movement of 20' and is the largest of its kind in India.
2. **Numerous capstan and turret lathes** upto 36" diameter swing and central lathes upto 42" diameter.
3. **28/60 vertical model hydrotel milling machine** with 360° profile milling equipment.

AMERICAN LETTER

PRESIDENT'S ECONOMIC PLANS WELL RECEIVED

TRANSPORT COMPANIES SEEK MERGERS

From Our Special Correspondent

NEW YORK, *30th January*

PRESIDENT Kennedy has just outlined his economic plans to the Congress and to the people of the United States. Business and industrial quarters have noted with satisfaction that these plans included a balanced Federal Budget, but it is a record one, $92,500 million. Tax receipts are envisaged at about $93,000 million.

In some parts of the U.S., business has been hampered by severe weather for some days now. While it was clement on the Eastern seaboard such as New York and Boston, bitter cold gripped three-fifth of the nation. There was heavy snow in the Middle-West, even in San Francisco and Los Angeles. Retail sales were off, naturally, but fuel stocks were reduced, heating oil prices went up and electric power output reached a new high.

Steel production was also affected adversely and so were communications of all categories. Outside of the weather, national defence is the over-riding consideration of investors because of the emphasis of "national survival" being placed in messages by the White House to the Congress. Bigger outlays for weapons, as proposed, have suggested greater emphasis on heavy industry than before.

Perhaps, one of the most outstanding economic developments is in the field of organised labour. It is the shorter work week for the same wage *plus* increased fringe benefits. Even President Kennedy, who is certainly not anti-labour, deplored some of the recent contract settlements on these lines since they do not make for greater productivity. Because of the lagging growth rate, the U.S. has been losing ground in the world markets.

Workers Get Rs. 25,000 A Year

Wages in the U.S. have also reached record high levels. Wages of about $100 a week, or $5,200 a year, are now the average for some factory workers. Last year for the first time, the seven million employees in durable goods industries such as steel, autos, appliances, machinery and furniture achieved the $100 a week status. Pay-scales were rising in these categories and they averaged $104.39 a week in December. Longshoremen working steadily can make as much as $150 a week.

The overall trend of the U.S. economy is still up. The gross national product is now running at the rate of about $540,000 million. This is the highest on record in dollar terms. Prices have remained relatively stable which is somewhat of an achievement. Personal incomes are climbing and money is being spent quite freely. Competition is keen.

Mergers

The merger trend of companies continues. The basic cause is the cost-profit squeeze which is more easily adjustable on a broader than on a smaller scale. This is a reasonable argument and it applies to nearly all branches of business. Opposed to this development are the anti-trust laws of the U.S., particularly the phase of lessening competition. As stated in previous despatches, the U.S. Justice Department has been engaged in a crusade to stop bank mergers on such grounds.

The actions in this respect did not get very far in the courts. The most spectacular mergers now under consideration are those of Eastern Air Lines and American Air Lines, and of New York Central Railroad and of Pennsylvania Railroad. The former would create the largest aid line company in the U.S. superseding United Air Lines. New York Central and Pennsylvania are now the two largest railway systems in the U.S. and their combination would make a super-system of rail transportation serving the Eastern two-thirds of the U.S. There are loud grumblings at this point from the trade unions about these two proposed transactions for fear that the consolidations would result in layoffs of men and women.

Yet, the economics of the transportation industry are such that even with Government subsidies profit-margins are either so thin or non-existent that fusions of companies are inevitable. Transportation fares and freight rates have been rising continually over the years but traffic has declined.

Road Transport

This is not the fault of anyone factor in particular. The private automobile, perhaps, has been the biggest element in this country. Another one are the trucks. Modern lorries actually resemble railroad box-cars. One steel company in the Pittsburgh area which I visited said they now prefer to transport their products by trucks rather than rail. The reason is that freight cars are shunted from line to line and sometimes they are held for a day or two before a connection is made to the desired destination. By contrast, trucks go through with only minor stops, especially if there is a crew of two and one can takeover while the other sleeps. This is facilitated by the expanding network of roads.

In the long run, it would seem too unreasonable to assume that transportation is headed toward nationalisation in this country—just like the postal service. The latter was private enterprise at one time, too, but the economics did not add up. As a precedent, one small city in the South of the U.S. provides free omnibus transportation to its citizens. This comes out of general tax revenue. The step was taken because companies holding previous bus franchises just could not make both ends meet.

Experiences in other countries are analogous. In Yugoslavia, persons holding jobs get 50 to 75 per cent reductions in transportation fares. School children in many countries enjoy the same privileges. It is a tug of war—private enterprise, economics and the greatest good for the greatest number of people under prevailing social concepts. This influences contemporary thinking in many fields, even including medicine.

Employment Situation

There was not much change in the employment picture last month. There was a slight increase in unemployment, but nearly all of the decline in jobs was in agriculture which is seasonal and natural. The unemployment rate remained at 6.1 per cent of the labour force. By numbers, the jobless were a little over 4 million. This compared with total employment of 66.5 million, of which non-agricultural employment was 62 million persons.

As the year progresses, fears are mounting about a new steel strike in the middle of the year. There is much prodding from Washington for management and labour to arrive at new contract terms without a shutdown. Obviously, a strike would not be in the national interest, but considerations of national interest do not always prevail not even in times of national emergency as shown in the past.

Labour matters are assuming ever greater importance. They are becoming a part of the national conscience. It seems to me that, subconsciously, they are a part and parcel of a private enterprise defence mechanism against communism and the labour laws in existence within the Soviet orbit. One of the latest moves has been the activation of the Commission on the Status of Women by the President. Mrs. Eleanor Roosevelt is the chairman and works under the jurisdiction of the Department of Labour. It is an all-embracing endeavour of economic significance and, as Mrs. Roosevelt told me, "perhaps of world-wide importance." The Commission was established last month to focus attention on women's achievements and problems.

In closing, it may be said that, out of the 50 U.S. States, the legislatures of 47 States and Puerto Rico meeting in 1961 introduced some 5,000 bills in the field of labour legislation. More than 750 acts were passed in such fields as workmen's compensation, unemployment insurance, discrimination, industrial relations and minimum wages.—*All Rights Reserved.*

THE AMBIGUOUS BIRTH

A WHITE PAPER ON INCOMES POLICY

(*From Our Own Correspondent*)

LONDON, *3rd February*

LONDON LETTER

HAS a policy died this week or has one been born? At the end of March, the wages pause, which has led to so much controversy, to a slowing down of postal communications, to discontent in the public services and now to a weekly day of transport chaos, is to come to an end. No matter what happens before that date, the Government have decided that their prestige depends upon it not being advanced by a day. But from that day, they are inaugurating something which no one has ever tried before and from which a Labour Government persistently shied—a wages policy. Yet what is one to think of a wages policy at whose birth the General Secretary of the Trades Union Congress attends in the guise of the bad fairy to declare the infant as "highly provocative . . . I doubt if employers or arbitrators will be able to take much notice . . . if they try . . . the result will be to intensify the resentment of the workpeople at Government attempts at intervention in wage settlements."

The policy, published in the form of a Government White Paper, is entitled "Incomes Policy," but all it has to say on the subject of profits and dividends is that the same principles apply as to wages, that continued restraint is necessary, and that the co-operation of those responsible is required. The Trades Unions regard this skimping treatment as further cause for resentment and, if the answer is that the Chancellor can only deal with profits in the aggregate (by exhortation and ultimately through taxation), the Unions reply that the Chancellor should equally keep out of wages policy.

Planning

But the wind of planning is blowing through Conservative circles—the progressive men understand that the Government is held to account for the health of the economy, therefore, the Government is responsible for policy and that intelligent responsibility involves a degree of planning. This progressive wing intends, therefore, to plan the economy on the basis of private enterprise, opposing the Socialists henceforth only on the matter of public ownership. The Government is concerned to increase the rate of growth of incomes, but this can only be done in step with the long-term rate of growth of productivity. Inflation can only be countered by relating national spending to earning; hence the determination of the Treasury to achieve an incomes policy. The Chancellor has failed to get the Unions to agree to such a policy and he has decided to go it alone aware of all the difficulties. The Unions have agreed to be associated in the National Economic Development Council and there they will be able to comment and advise on the Government's policy, but it will be a long time before the Council, in the matter of wages, agrees to do anything but differ.

The basis of the incomes policy is the rate of increase of national productivity. The Government estimate this for 1962 at only 2-2½ per cent: that then is the overall limit for wage increases after the end of March—a figure already derisorily described as 6d. in the pound. "It follows," says the White Paper, "that there is no scope in 1962 for more than strictly limited increases in wages and salaries." The following criteria, which in the past have been used to judge the reasonableness of a wages claim, are no longer to be considered valid: (i) a rise in the cost of living; (ii) an increase in profits or productivity in the industry; (iii) shortage of labour in the industry; and (iv) rises in wages in comparable industry.

The guiding light to arbitrators is to relate wage increases to increases in *national* productivity and it is obvious at once how hard it will be to fight demands for increases where (ii) above applies. Will workers whose productivity has gone up, whose industry is making more profits, accept that their wages should rise no more than those of workers in stagnant industries? Just because the national level of productivity has not risen more? This White Paper is the biggest shock labour has had from the Government—bigger than the pay pause which was a temporary policy. Clearly some major battles lie ahead.—*All Rights Reserved.*

VTY-23

this is the time to think about air conditioning

and this is the time to think about Carrier and Voltas

—now, while the surveyor collects data about a construction site.

Too early? Not at all. Before the architect prepares his design he must know what plans the landlord has for his new building.

Plans to air condition it, for instance.

Why Carrier and Voltas?

Because they bring maximum engineering experience and skill to every air conditioning project. Carrier in the field of manufacture of equipment. Voltas in the field of engineering, installation and service.

PLACE OF GERMAN MARK IN WORLD MONETARY SYSTEM

NEED TO FIX CORRECT EXCHANGE RATES URGENT

By Erich Achterberg
FRANKFURT, WEST GERMANY

IN the actual monetary system, some vulnerable points apparently exist, besides a number of highly change-resistant factors. The German Mark has been in the second group for some years, a fact that was widely recognised long before the revaluation of March 1961. The almost unprecedented progress in the "hardening" of the German currency, however, took no less than twelve years. After the monetary reform of 1948, the value set upon the Mark did not even reach one-fifth of the parity declared. But within eight years, the missing four-fifths were recovered and, in 1956, the value of the Mark was already above the par of exchange. Moreover, the upward trend of the domestic price level was still far behind similar trends in foreign countries, and, additionally, there was an unexpected upsurge in the country's productive capacity. A growing surplus in the German trade balance was the result, followed by a surplus in the balance of payments. In order to keep down the surplus, artificial means had to be used, e.g. advance payments for defence material supplies, more or less emphatic appeals for capital exports, premature repayment of debts and readily granted development-aid to Afro-Asiatic countries. But when all this did not help, it was decided to lower the rate of exchange; the value of the dollar was lowered from 4.20 DM to 4.00 DM as a measure of "revaluation." It is true that the same result could have been obtained by another method, i.e., by adapting home-market prices to the foreign price level. A perceptible rise in German prices would have stimulated foreign imports and kept down the country's exports which had been going up at a fabulous rate. But this method was out of question for two reasons: first, a considerable rise in prices did not seem advisable for political considerations on the domestic level, even if such a rise had been supported by the central economic bodies; second, the major part of German industry had already specialised on export trade to such an extent that any drastic measure touching potential sales on foreign markets would have been considered unacceptable. To revaluate the Mark was the easier and less rigorous measure, notwithstanding the strong objection that had been voiced by nearly all branches of German economy and the violent struggle of several years that had preceded its introduction. Even the Deutsche Bundesbank only complied under strong outside pressure.

Earlier Measures Fail

The German case is, however, not an exception. The disequilibrium in the balances of payments that distorts the par of exchange not only affects the deficit countries but the surplus States as well. For the latter, surplus-running Germany was a classical example in the last few years on account of the unceasing influx of gold and foreign currencies caused by a persistent surplus in the country's balance of payments. At the end of 1960, the monetary reserves of the Deutsche Bundesbank reached 32 billion DM, an almost sensational figure in the history of the German Central Bank; of this amount, 12.3 billion DM was in gold. The highest gold reserve figure ever reached by the former Reichsbank (before World War I) was only of 2.53 billion Marks, not including, however, the gold coins in circulation. But it would be difficult to maintain that Germany's currency was unsound in those days. However, the enormous influx of foreign currencies caused a no less enormous inflation of the country's gold reserves; if full play had been given to the following excessive liquidity, there may have been an upward trend of the price level which would have helped to reduce the surplus. But as a higher price level and an overheated boom were just the things one wished to avoid, the Bundesbank had to apply the brakes. The Federal Bank raised the discount rate as well as the prescribed minimum rate for reserves, the rediscount quotas were reduced and other braking measures were applied. The Bank was successful to a certain degree, as liquidity on the money market went down and interest began to go up. But there was also an effect which had not been anticipated; instead of falling, the temperature of the boom kept on rising.

When eventually an effort was made to find out why the adopted measures had failed, it was discovered that, in draining the abundance of capital in the country, a flood-gate for capital from abroad had been opened. In the same measure as the German credit basket was lifted out of reach, foreign countries readily offered to step in with their funds; besides, the rising interest rates for the new German loans attracted so many foreign buyers that some of these loans went out of the country, thus becoming "unvoluntary" foreign loans. So the afflicted Central Bank once again had to throw around the wheel: "expensive money" was off the agenda and "cheap money" became the slogan of the day. That is where we are now. Time will show the outcome, an internal rise in price—as on a similar occasion in the past—or a definite benefit from revaluation, that is, higher imports and lower exports.

Insufficiency of Monetary Order

But shall we eventually have to draw the conclusion that Germany's monetary and economic policy had been unskilfully pursued? Or shall we have to say that the deficiencies of the whole international monetary system were brought to light by the present conditions? As Germany is not the only country having to deal with a surplus in its balance of payments, while some other countries are facing a never-ending deficit, one easily thinks that something must be wrong in the structure of the world's monetary system. Even from central bank circles various opinions recently have been voiced on the many problems of the international monetary situation.

In the annual report of the Bank of the Netherlands, the view was held that a final solution to the problem of international payments could never be found in the expansion of measures aiming at the temporary settlement of balance of payment deficits. All measures taken should rather lead to a general effort towards supporting the settlement of deficits and surpluses without jeopardising the other aims of national economic policy.

In a mid-year weekly report of the Swiss Central Bank, the remarkable fact was disclosed that the credit balance of a foreign bank (probably the Federal Reserve Bank of New York) had been increased against assignment of gold. Referring to this report, the *Neue Zurcher Zeitung* (foreign edition, No. 185 of 8th July 1961) voiced the opinion that there is a limit to the efficiency of close co-operation between the central banks. However valuable it may be, co-operation alone would never be sufficient to restore the monetary equilibrium. To restore it is not so much a question of creating or expanding international institutions, but a question of adapting national economic policy to the balance of payments situation and of better co-ordination in the economic and balance of payments policy of the individual countries.

These two opinions not only show that the insufficiency of the present international monetary order is recognised in many circles; they also show that nobody likes to say what he would prefer to have in the place of the present system. They all agree that some measures should be taken—but what measures? Should they follow the German example of revaluation? Should they aim at a better ensured dollar rate of exchange? Or should they prepare the creation of an entirely new system which could efficiently replace the former gold standard? The claims voiced by the Netherlands and Switzerland—early settlement of deficits and surpluses in the balances of payments, on the one side, and adaptation of national economic policy, on the other—were already satisfied in the former gold standard through the automatic regulation of the influx and efflux of gold. The countries were compelled to pursue a national economic policy, that is to expand or restrict in order to equilibrate their balance of payments and to ensure the parity level of their currency.

It would be wrong to say that the international central banks never gave a thought to the problem how to restore the easy monetary policy that had been followed for some years before 1914. They certainly did think about it, and it is a fact that the central banks have made a great effort to restore convertibility, though on the assumption that it would be sufficient in itself to balance the situation.

Until the end of 1958, almost any newspaper article, address or speech of a Central Bank Director, Minister of Economic Affairs or Minister of Finance, as well as almost any *communique* of an international conference on monetary problems, wound up by claiming emphatically that convertibility must be restored; then all disagreeable distortions of exchange rates as well as balance of payments disequilibria would automatically disappear. Now we know that they have been too rash in praising convertibility as a universal remedy as neither of the above two aims was reached. The European Payments Union which had been created to pave the way for free convertibility was "quasi"-buried alive; the convertibility which had been adopted by resolution eventually became the last formal relic of the European Payments Union and now only deserves the name of "quasi"-convertibility. The European exchange rates still do not correspond to facts, and deficits and surpluses in the balance of payments continue as before. The German revaluation was no more than a small step in the long balancing process. Immediately after the revaluation, the following comment was published by one of the outstanding experts on the background of the problem:

"In foreign countries, a more substantial revaluation rate had been expected. But having accepted the—not yet legal, but moral—obligation to make substantial current contributions to development-aid, that is contributions for which an export surplus is almost essential, a higher rate was entirely out of question. Nor was it considered advisable to cut down the German trade volume right from the beginning; the intention merely was to skim off the export surplus on account of its inflationary effect. Besides, there were the experts holding the view that it could not be our task to do the whole job of removing the effects caused by the inflationary activity of other countries by ourselves."

No Real Progress

The last sentence of the above comment could as well have been from a German Minister's speech, a 1958 report of the Bundesbank or a 1957 report of the Bank Deutscher Lander. The same ideas were also expressed in many of the statements that were made in those years. But this is of minor importance; the only matter that counts is that no real progress towards the solution of the international monetary dilemma has so far been made, neither through the "quasi"-convertibility of 1958 nor through the revaluation of 1961. Moreover, it is quite easy to explain why the convertibility of 1958 must be called a "quasi"-measure: first, it has remained only a half-way step in most countries, a "foreigners' convertibility," as it was called; second, it cannot exert an irresistible pressure on the import and export of gold, that is on the expansion or contraction money circulation and their influence on economic activity and economic policy. The internal economic trend follows special, formerly unknown rule—a fact that very strikingly comes up when comparing Europe to the United States and Canada. But notable dissimilarities also exist on the European level, as it may be seen above all from the continuing surplus in the German balance of payments, on the one side, and the British deficit, on the other. The hope that the German revaluation would be followed by a devaluation of the sterling has unfortunately not been fulfilled. One really has to say "unfortunately," however unpleasant this may sound to the ears of those who stick to the old point of view when judging the monetary problem, as monetary stability is not always tantamount to stability of buying power. This is one of the great lessons we have been taught in recent times. It will not be possible to reform the international monetary conditions unless this fact is generally accepted. Former inflations in Europe, particularly the German inflation between 1918 and 1923, seem to have impressed for ever the idea on people's minds that the diagnosis of inflations can be read off only from the marks reached by the rising dollar exchange rate.

There are still far too many who think that a decline in the internal buying power is inevitably linked to a rise of the dollar rate. But this is not true: internal buying power may also go down, and very considerably too; for this, America is a classical example.

According to recent research findings, the buying power of the U.S. dollar went down by no less than 59 per cent between 1939 and 1959, while the foreign dollar rate remained unchanged. Another example; in 1933, when Germany did not follow America in devaluating her currency, the foreign exchange rate went up and the dollar rate was lowered from 4.20 RM to 2.48 RM, but, in spite of this measure, German buying power went down. This clearly shows that exchange rate stability has nothing to do with buying power stability. The view expressed in scientific opinion given before the German revaluation that exchange rates should "for ever" remain unchanged only applies to the case of unwanted stability in prices and buying power (which is the same thing), or, if nothing is done against the secular downward trend of buying power (which is not a very bad thing) or the actual considerably more rapid decline of this power (as in the United States). But in the recent declarations of statesmen and central bank officials, this view is not shared. So there is some hope that the German revaluation is a warning to these circles to give some thought to the still entirely unsolved problem of monetary stability.

Towards New Conceptions

What really is the basic structure of the present international monetary system? It mainly rests on the International Monetary Fund in Washington—the Bretton Woods system, as it has been called after the place where it was set up—on which an agreement was reached in 1947 after discussing various proposals. The system is based on exchange rates to be fixed by the members themselves, on the condition that any major change of these rates is submitted to the Fund for approval. This already shows that the once established foreign exchange rates should be maintained for the longest possible time. But there are further provisions: the exchange rates should not only be maintained but "defended." The Fund's resources permit the "stretching" or "magnifying" of reserves—a principle that was reinforced by a considerable expansion of the Fund's resources in 1959. As the further details of the Fund's structure may be taken for granted, there is no need to go on with the description. The International Monetary Fund undoubtedly is a system of rigid exchange rates, just as the former gold standard has been; this, however, involves the need to pursue a national economic policy of flexible prices and flexible buying power which corresponds to the fluctuating economic activity, that is, to the periodical ups and downs in production, consumption, sales and employment. Gold, the regulating agent of the past, which served as a control on economic fluctuations promoting virtually stable exchange rates, has not yet disappeared, it is true; but it is also true that a great deal of its regulating power has been absorbed by the Bretton Woods system.

If this system had developed into a real substitute for the former gold standard, balance of payments disequilibria could never have reached the proportions reported for the period between the two world wars—certainly not after the Marshall Plan, the great helper in distress, had fulfilled its task of restoring the "viability" of the recipient countries. At present, mainly two schemes which should lead us out of the dilemma are under discussion: in the first, a further reinforcement of the present system is proposed; it may be linked to a reform of the International Monetary Fund by expanding its powers. Besides, special weight is given to the claim for internationalised currency reserves. The second scheme is based on the aim to replace flexible prices by flexible exchange rates. In other words, the method used in the present system is to be reversed by ensuring the stability of prices and money value through flexible rates of exchange. There are only few who already are in favour of such an experiment, though their list includes the names of some experts of very high standing, such as Mr. Haberler (Boston) and Mr. Hahn (Paris).

German Revaluation

To turn to the subject of German revaluation. The indecision which prevailed when the level of the new rate for the DM was discussed undoubtedly is a flaw in this measure. A low rate was finally accepted for several reasons. But the rate problem would never have emerged if flexible rates had already existed. In such a system, exchange rates are of secondary importance—though by no means unnecessary—and, therefore, the need to discuss revaluation or devaluation may never arise. Perhaps there is a chance to get out of the situation caused by the already mentioned "quasi"-convertibility. But flexible currency conditions cannot be created overnight. So it may be advisable to begin with wider "exchange margins."

Except the advocates of another reform of the Bretton Woods system, there are many experts who do not see the need of basic changes in the actual procedure. Undoubtedly they even represent the majority. To those who only had to deal with the first method for decades, a complete switch from rigid to flexible rates must seem a leap in the dark and a risky step one hesitates to take. But by expanding the Bretton Woods system on the assumption of insufficient international liquidity, additional buying power would be created in all countries, although we are still unaware of the influence it may have on monetary value. We only know that there will be some influence—otherwise all reform programmes would have to remain ineffective.

Another Problem

Besides, there is another problem which has not yet been raised in this article: currencies are not and never were of the same standard. There was, and still is, a group of currencies which is much more important than the rest. In the nineteenth century, the leading position was held by the sterling, but, in the twentieth century, the dollar has caught up in rank. As these two are the "principal" currencies, most of the other currencies "joined" them, as the saying is, which means that any change in the relation between those "leaders" and gold was almost inevitably followed by a similar change in the "secondary" currencies. The question is bound to arise whether a change in the world's monetary system necessarily involves a modification of the principle of "predominate" currencies: does a new "leading" currency (perhaps the German Mark or the Netherlands Guilder that was revaluated at the same rate) take the place of the old predominating national currencies? This is, however, not a question requiring immediate investigation, as it refers to the still secondary issues of the German and Dutch revaluations. Nevertheless, it is a fact that the German revaluation has caused sensation, all the more since it is still too early to form a clear picture of the wider issue of the German measure. Besides, one of the reasons for this sensation is linked to the question whether the revaluation of the DM should be considered a crucial point in international development.

We still cannot see where we are going, but the real meaning of the decision of the German Federal Government is that any automatic adjustment of imbalanced payments through gold movements is now beyond discussion and that the system of the International Monetary Fund no longer represents a safeguard against excessive imbalance. Therefore, the loss of individual sovereignty, which is normally required by international systems, will be replaced by higher sovereignty as the only basis for correct parity rating. But what are the correct parities? If a straightforward answer cannot be given to this question, a way must be shown that leads to fairly correct exchange rates. The revaluation of the German Mark was only a first small step towards the solution of the difficult parity problem. The present article may have thrown some light on the great complexity of this matter which rather belongs to the international system than forms a subject for national decisions.

A NEW UNIT OF I.F.C.

A new Industrial Development Bank Services Department has been established in the International Financial Corporation with Mr. A. G. El Emary, formerly Governor of the Central Bank of Egypt and President and General Manager of the Alexandria Commercial Company, as its Director. The new Department will be responsible for planning financial and technical assistance to help in establishing or expanding privately owned and managed industrial development banks. In this field, the I.F.C. now act not only on its own behalf but also on behalf of its parent institution, the World Bank, as well as for the Bank's other affiliate, the International Development Association. The I.F.C.'s initiatives may lead to an I.F.C. investment in a development bank, to World Bank loans or I.D.A. credits for a development bank, or to a combination of these.

Under a recent change in its charter which enables the I.F.C. to invest in capital stock or shares, the Corporation commenced investing in the equity of development banks. In December 1961, it converted part of two loans to two Colombian development banks into capital stock. The conversions were in the amount of 7 million pesos each in Corporacion Financiera Colombiana de Desarrollo Industrial of Bogota and Corporacion Financiera Nacional of Medellin. These transactions marked the first time that the I.F.C. has acquired equity investments. In the development bank field, the I.F.C. will be pursuing an interest of long standing in the World Bank itself. The Bank has attached great importance to the role development banks can play in assisting the industrial development process. These intermediary institutions provide a means of reaching many medium-sized industrial enterprises which neither the Bank nor the I.F.C. could assist directly. The Bank has so far lent $116 million to private development banks in six countries. The Bank has given advice in the establishing of new development banks in Austria, Ceylon, Republic of China, India, Iran, Malaya, Pakistan, Thailand and Turkey, and in the reorganisation of existing banks in several other countries.

I.F.C. INVESTMENT IN PERU

The International Finance Corporation has announced the completion of financial arrangements for an investment of $2.4 million in Cemento Andino S.A., of Peru. These and additional investment funds will enable the Company to undertake an expansion and improvement of its manufacturing operations at a cost of approximately $3.4 million. The principal security-holders in Cemento Andino are a Peruvian group headed by the Rizo Patron family. North American shareholders and debenture-holders in the Company are represented by the investment banking houses of Lehman Brothers and Lazard Freres & Co. The I.F.C. investment of $2.4 million will be represented by unsecured notes bearing 7¼ per cent interest, payable in dollars, and maturing between 1968 and 1973. The I.F.C. will also receive the right to subscribe to shares of the Company's common stock.

BANK PROFITS

Canara Bank

The working of the Canara Bank Limited for the year ended 31st December 1961 has resulted in a net profit of Rs. 21.24 lakhs (subject to audit), after making the usual and necessary provisions, including taxation. This compares favourably with the net profit of Rs. 20.30 lakhs for 1960, arrived at *before* providing for taxation. With the last year's carry forward of Rs. 45,000, a sum of Rs. 21.69 lakhs is available for distribution. The Directors of the Bank propose to set apart Rs. 6.70 lakhs for statutory reserves, which, inclusive of Rs. 6.30 lakhs under share premium account, now stand at Rs. 63 lakhs, Rs. 0.62 lakh for payment of 5 per cent dividend to preference shareholders (Rs. 0.62 lakh last year); Rs. 5.40 lakhs for payment of 15 per cent dividend to equity shareholders (Rs. 5.40 lakhs last year); Rs. 4.50 lakhs for contingencies (Rs. 3.50 lakhs inner reserves last year); and Rs. 4.00 lakhs for bonus to staff (Rs. 3.10 lakhs last year), thus leaving Rs. 0.47 lakh to be carried forward (Rs. 0.45 lakh last year). The deposits of the Bank at Rs. 37.56 crores as on 31st December 1961 show an increase of Rs. 6.74 crores over last year's figure (+21.9 per cent). Total advances at Rs. 20.39 crores stand improved by Rs. 3.76 crores (+22.6 per cent). As usual, the liquidity has been well maintained, the ratio of total advances to deposits being at 54.3 per cent.

Bank of Rajasthan

The net profit (subject to audit) of the Bank of Rajasthan Ltd. for the year ended 31st December 1961 amounts to Rs. 3.50 lakhs, as against Rs. 3.36 lakhs for the year 1960. A sum of Rs. 71,000 (Rs. 67,716 in the previous year) has been added to reserves under Section 17 of the Banking Companies Act, Rs. 52,336 (Rs. 23,423) to general reserve fund, Rs. 87,000 (Rs. 1.10 lakh) for income-tax and Rs. 49,345 (Rs. 41,000) to bonus to staff. The Directors have proposed a dividend of 10 per cent subject to tax (same as last year). The balance carried forward to next year is Rs. 1,485 (Rs. 3,274). The income-tax and super-tax have been fully provided and the reserves are now equal to the paid-up capital. The deposits of the Bank as on 31st December 1961 aggregated Rs. 624.04 lakhs, as against Rs. 536.26 lakhs a year before, and liquid assets (cash, bank balance, deposits with banks, and investments) amounted to Rs. 413.25 lakhs, as against Rs. 317.33 lakhs.

Indian Overseas Bank

The net profit (subject to audit) of the Indian Overseas Bank Ltd. for the year ended 31st December 1961, after providing for contingencies and expenses, amount to Rs. 43.81 lakhs, as against Rs. 46.42 lakhs for 1960. Including the sum of Rs. 1.92 lakh (Rs. 1.76 lakh in the previous year) brought in from the previous year's account, the amount available for distribution is Rs. 45.72 lakhs. The allocations are: Provision for taxation Rs. 18.50 lakhs (Rs. 18.50 lakhs); transfer to reserve fund Rs. 9.00 lakhs (Rs. 9.50 lakhs); and provision for bonus to staff Rs. 5.50 lakhs (Rs. 5.50 lakhs). The Directors propose to recommend to shareholders payment of dividend at 14 per cent subject to tax (same as last year) Rs. 10.50 lakhs. The amount carried forward is Rs. 2.23 lakhs (Rs. 1.92 lakh).

Indian Bank

The Indian Bank Limited has reported a profit of Rs. 40.38 lakhs for the year ended 31st December 1961, as against Rs. 40.32 lakhs for 1960. The provision for bonus to staff is Rs. 7 lakhs (same as last year). The transfer to reserve fund is Rs. 5 lakhs (*nil*). The provision for taxation is lower at Rs. 18 lakhs, as against Rs. 23 lakhs in the previous year. A final dividend of 5 per cent taxable and a bonus of 2½ per cent taxable is to be paid, making a total distribution of 15 per cent, taxable, same as that distributed in the previous year.

THE AMERICAN ECONOMY: PROSPECTS FOR GROWTH THROUGH 1975

PART II: THE QUICKENING PACE OF TECHNOLOGICAL CHANGES

By Dr. Dexter M. Keezer

ECONOMIC ADVISOR, McGRAW-HILL PUBLISHING CO., INC., NEW YORK

AMERICAN industry is spending more and more on research and development. Thus, the pace of technological developments is quickening. McGraw-Hill surveys on the dollar volume of research and development performed by industry indicate that these expenditures totalled $9,600 million in 1960, more than double the 1955 figure of less than $4,800 million. The estimate of all other research and development carried out by Government, universities and foundations adds up to another $3,000 million in 1960.

In the past 15 years, total research expenditures have grown from less than $2,000 million per year to nearly $13,000 million, and, by 1970, it is estimated that total research and development expenditures will reach $23,000 million per year. Of this amount, $3,000 million—or 13 per cent—will be for basic research as compared with $1,000 million—or 8 per cent—in 1960. (See Chart II.)

The result of all this research and development work has been to create new products and new industries.

For example, in the past decade output of plastics is up 300 per cent; electronics production is up 240 per cent; aluminum output has increased 200 per cent. Even companies in such well-established fields as food processing have close to 30 per cent of present sales in product lines developed since 1950.

Impact of Research

It is still too early to say how the great upsurge of research and development will be reflected in specific industrial products. Research on the present scale is something new for any economy, and many companies have only begun to explore its possibilities. Furthermore, experience has shown that about seven years may pass before the impact of a research discovery is fully reflected in business sales or capital expenditures.

But we know that industry is now working on hundreds of new products and new processes that will show up dramatically during the 1960's and, undoubtedly, many of the advances in chemistry, electronics and metallurgy that will occur in the effort to conquer space will also find industrial applications.

Here are some estimates based on recent McGraw-Hill studies on research and development:

(1) Total expenditures on research and development will increase by about 85 per cent from 1960 to 1970.

(2) Sales of new products will double in the five-year period 1960-65, and triple in the 10 years 1960-70.

(3) By 1963, new products—not made in 1959—will account for 15 per cent or more of total sales of the electrical machinery, machinery, instruments, and transportation equipment industries. In consumer goods, about 10 per cent of 1963 sales—and even more of 1965 sales—will be in new products.

What are these new products that will make these trends come true?

Revolutionary Products

Some of them are already under development—products so revolutionary they will radically change the way an American family lives: wall-size television screens, all plastic homes, for example. During the sixties, consumer products of this type will go into mass production. Still newer products are passing from the research stage to the development stage every day.

Even more spectacular advances are taking place in the design and development of new capital goods. The electric power industry expects that a substantial number of its plants will be atom-fuelled by 1970. By then, the building industry hopes to use complete prefabrication techniques. And many metal products may be produced by direct reduction of ores, powder metallurgy and continuous casting techniques.

The greatest impact of new products and new processes, for an expanding market, will thus be felt about 1965—reflecting the step-up in research spending that began in the mid-1950's. And the effects will spread through every field—manufacturing, mining, construction, agriculture and distribution trades—as we move toward 1975.

In the factory, more and more of the work will be handled automatically. In some plants, electronic computers will direct the complete production operation. In others, better conveyors, more powerful motors and new devices for turning and positioning heavy pieces will make it as easy to move heavy metal parts from station to station as it is to move lighter products today.

Agriculture and Construction

Outside the factory, the wonders of mechanisation and electronic controls are being extended to such laborious fields as agriculture and construction. More food will be grown on less acres (hectares) as chemistry improves crop yields, and bigger multi-purpose machines get in the harvest more quickly. The food processing plant of the 1970's—complete with electronic controls—may get its raw materials directly from the harvesting machines in one continuous operation.

As construction machines get bigger, they will haul into place factory-made sections of walls and floors—for giant office buildings as well as apartment houses. Other machines will reshape ground and pour concrete for huge sections of dams and highways with great speed and minimum labour.

In all types of buildings, the use of new materials such as prestressed concrete, glass blocks, and plastic pipe will permit greater prefabrication and less on-the-site labour.

Construction and agricultural machines will be in ever-increasing demand to replace scarce labour. So output of tractors, farm implements and earth-moving equipment will show considerable gains.

(To be continued)

COTTON INDUSTRY DEPUTATION TO PRIME MINISTER

TEXTILE IMPORT PATTERN CHANGING

From Our Special Correspondent

MANCHESTER, *30th January*

THE Lancashire cotton industry wants to take its troubles direct to the Prime Minister. The intention is an industry-wise deputation—millowners, unions and merchants—to tell Mr. Macmillan of the growing concern in the industry about short-time working and the closing down of further mills, in spite of the high hopes with which Lancashire embarked on the ambitious Government-assisted programme of "streamlining" and mill modernisation. Union leaders representing 170,000 spinning and weaving workers decided in Manchester to ask Lord Rochdale, Chairman of the Cotton Board, to make the approach to Mr. Macmillan.

MANCHESTER LETTER

Mr. Alderman Harold Chorlton of Rochdale, President of the United Textile Factory Workers Association, said that Lord Rochdale had indicated his readiness to lead a deputation provided it was on an industry-wide basis. "This is a very serious industrial question, not a political one," said Alderman Chorlton. "We feel that the fate of the Lancashire cotton industry is in the Government's hands." Referring to support from other sections of the industry, he said: "Everybody has agreed so far."

There would be a meeting of all sections to frame a co-ordinated policy before a deputation went to see the Prime Minister. "Since 1959 circumstances have arisen which no one envisaged," said Mr. James Milhench of Oldham, the Association Secretary.

The cotton industry's worries centre on the large-scale imports of low-cost cotton textiles from overseas still entering Britain. So far it has had little success in persuading Government Ministers—including Mr. F. J. Erroll, President of the Board of Trade, on a recent visit to Manchester—that further Government action is needed to put the industry back on its feet by way of a Government-imposed brake on the level of these imports. The industry's case is that confidence in the industry will continue to be undermined until there is a definite assurance about the future and that in the present state of uncertainty millowners cannot be expected to embark on modernisation programmes costing millions of pounds.

Plainer Than Plain

Another attempt by Lancashire's well-meaning Members of Parliament to get more sense out of the Government on their attitude towards the cotton trade was met last week by stonewalling and a few deft deflections—to use a cricketing metaphor. The Parliamentary Secretary to the Board of Trade echoed "his master's voice" in failing to give the industry any comfort.

The facts are clear enough. Mr. Anthony Greenwood's opening speech was supported by an admirable array of figures to prove the damage caused to the trade by excessive imports and as a result the complete absence of confidence among employers and employed. He quoted indiscriminately from trade union and millowning sources to implement his point, but to little avail.

If any lingering doubts still existed that something might be done at Government level, even after Mr. Erroll's calm disinterestedness last month, they must be dispersed now that his Parliamentary Secretary has said from the floor of the House of Commons: "It really is not possible for the Government to assure to any industry a given proportion of the market in this country. They cannot give an assurance that imports will not be allowed to exceed a level which would endanger that level."

What any Government can or cannot do is always a moot point. Suffice it to say that, in this same context, the recently concluded extensions to the voluntary inter-industry pacts specifically guarantee India, Pakistan and Hong Kong 85 per cent of the British home market!

During the debate, "international trade policies" and "our national commitments" were dragged out again by the Government spokesman as the scapegoats for evading action on Lancashire's behalf. Unfortunately, he was interrupted in the course of a remark which seems to sum up the official attitude. He was saying: "We must devote our resources to those matters in which we can compete most successfully—" Who mentioned the word "expendable?" Later the statement was made that the Government gave industry the opportunity to become competitive and then "it is up to industry itself to decide how much of the market it is able to win and to hold."

Meanwhile, the prevalence of short-time working becomes more apparent from week to week; adverse publicity arising from such announcements made by leading firms damages the prospects of obtaining labour when it is required, and the number of mills closing down on a permanent basis show signs of increasing.

Imports in 1961

The sting in 1961's overseas trade returns came in the tail. Not until the final two months of the year was there any sign that the disconcerting state of trade in Lancashire was having any effect on the activities of those merchants who were spending so much time in acquiring supplies from abroad.

First in November, and then more noticeably last month, the import figures fell sharply. Compared with December 1960, the volume of cotton grey cloth arrivals in the same month a year later showed a slump from 52,120,000 yards to 30,879,000 yards. Total December imports of all types of cotton cloth at 41,765,000 yards were the smallest since August 1959, and were almost exactly half the quantity absorbed in the peak month of January 1961.

It is necessary thus to preface our comments on last year's overseas trading results by underlining the latest position, as otherwise a somewhat false impression might be gained while scrutinising the following table; this shows a further deterioration in the overall export-import position in every section:

(Cloth in thousand square yards; Yarn in thousand lbs.)

	Cotton cloth		Rayon, etc., cloth		Cotton yarn	
	Exports	Imports	Exports	Imports	Exports	Imports
1949 ..	903,578	348,800	160,708	51,600	82,061	1,980
1950 ..	822,473	286,920	189,568	55,280	70,986	14,480
1951 ..	864,375	376,640	217,206	99,240	65,481	31,720
1952 ..	710,813	179,680	149,794	29,280	35,722	7,280
1953 ..	709,905	98,640	176,826	44,400	41,920	3,360
1954 ..	637,378	267,167	175,256	67,331	40,431	10,721
1955 ..	554,504	299,470	133,747	65,415	35,563	14,019
1956 ..	474,150	306,173	120,822	74,249	35,822	16,794
1957 ..	455,760	418,252	111,239	73,400	37,636	14,727
1958 ..	383,818	386,638	84,168	47,145	26,771	14,635
1959 ..	347,637	537,145	63,724	37,764	22,920	21,512
1960 ..	327,090	727,707	54,355	58,419	21,113	38,648
1961 ..	286,660	731,026	48,894	60,825	14,658	43,723

Exporters of man-made fibre yarns were commended 12 months ago as being the only section to make progress. Congratulations can again be extended to them for achieving a slightly larger gain than in 1960. Total shipments last year were 53,485,000 lbs., as against 48,458,000 lbs. and earnings from this source rose from £18,531,000 to £21,230,000.

India remains the chief customer, although taking some 2,500,000 lbs. less at 5,387,000 lbs., while South Africa, Australia and China all imported more than 4,000,000 lbs. Other countries to acquire over 2,000,000 lbs. of British man-made fibre yarns included New Zealand, the Irish Republic, Sweden, Switzerland, Portugal and Syria. Another fall, however, must be recorded in the offtake in man-made fibre cloth, the total being some 5,000,000 yards lower at 48,894,000 yards.

BEST TODAY—STILL BETTER TOMORROW!

PROSPECTS FOR IMPORT OF U.S. COTTON BLEAK

REDUCED SUPPLIES MAIN REASON

MUCH store has been set by imports of U.S. cotton to make good the deficiency in domestic production in India during the current season (1961-62). But recent reports in the Press that U.S. might not have much cotton to spare are disturbing to a degree. For, if U.S. cotton is not available in adequate quantities under P.L. 480, this country will have to turn to alternative sources of supplies. This will mean additional strain on the country's balance of payments because imports from countries other than the U.S. should be paid for in foreign exchange unless special payments agreements are concluded with them as is the case with Pakistan. Even if it were possible to conclude such agreements, it would inevitably involve much delay and cotton imported under such agreements would not be available for consumption by mills for quite some time. This explains the current firmness of cotton prices which, in spite of strict controls, are ruling, in some cases, above the statutory ceilings.

Mills and importers have for quite some time been eagerly awaiting the issuance by the U.S. of the purchase authorisation for a substantial quantity of cotton under P.L. 480. The delay itself had caused concern and had given rise to the suspicion whether there was some hitch in the programme. India had no doubt impressed upon the U.S. Government the urgent need for allocating a substantial quantity of cotton to this country. In fact the U.S. Secretary of Agriculture, Mr. Freeman, when he visited this country last September, had promised to do his best to supply as much cotton as possible. The main difficulty of the U.S. is said to be lack of adequate stock. Although cotton production in the U.S. during the current season is expected to be not less than last season's (in fact the final estimate issued in December last placed the crop at 14.31 million bales of 478 lbs. each, as against 14.27 million bales harvested in the previous season), the lower carryover stocks at the beginning of the season and the higher mill consumption of cotton anticipated during the current season have reduced export availabilities. Thus, while opening stocks on 1st August 1961 were lower at 7.2 million bales, as compared with 7.6 million bales at the beginning of last season, mill consumption is expected to rise by half a million bales from 8.3 million to 8.8 million bales.

Commercial Exports

The U.S. authorities will, naturally, reserve sufficient cotton for domestic consumption and will also earmark substantial quantities for commercial exports. In view of the decline in production in Mexico and Egypt, the two main competitors of the U.S. in world markets, the prospects for commercial exports from the U.S. are bright. U.S. cotton will consequently have a ready sale in foreign markets, possibly at higher prices.

Apart from India there are also other claimants for P.L. 480 cotton, such as Indonesia, Burma and some Latin American countries. These considerations perhaps explain the reluctance of the U.S. authorities to make any firm commitments in regard to P.L. 480 cotton supply to India. This makes import planning all the more difficult for this country. For, as pointed out earlier, if the U.S. is to be counted out as a major source of imports there is the problem of finding a satisfactory alternative source, which is by no means an easy task. The importance of U.S. as a source of imports is evident from the following table:

Cotton Imports

(In bales of 392 lbs. each net)

Variety	1961-62*	1960-61	1959-60
American	256,659	641,675	411,302
Sudan	45,614	84,109	128,353
Egyptian	32,627	85,901	207,746
East African	70,584	147,492	170,448
Pakistan	12,047	2,624	33,451
Others	10,918	39,871	22,665
Total ..	428,449	1,001,672	973,965

* 1st September 1961 to 20th January 1962.

Note.—1961-62 figures are in bales of 180 kilograms (396 lbs.)

Viewed against this background, the need for rational and equitable distribution of the indigenous production becomes all the more urgent. The introduction of the varietal distribution of cotton in addition to the quota system is aimed at ensuring the distribution of cotton to each and every mill according to its past consumption. While it remains to be seen whether the scheme will succeed in rationing out the available quantity of cotton to mills according to their needs, the fact remains that better distribution of available cotton is no solution to the problem of the inadequacy of supplies in relation to the demand. The Government should, therefore, give immediate consideration to this urgent problem and look for alternative sources of supply early enough so that the textile industry would not be starved of cotton should P.L. 480 authorisations fall short of expectations.

"ADONICUM"—A NEW COTTON

Between 1937 and 1960, the Indian Central Cotton Committee spent about two lakhs of rupees for the improvement of the yield and quality of the inferior cotton grown in the 'Mungari' tract of Andhra Pradesh and Mysore. The efforts have now been amply rewarded by the evolution and recent release of a new strain—"Adonicum." It is expected that the growers will realise an extra annual income of about Rs. 72 lakhs when the new strain spreads over its entire potential area of one lakh acres.

'Mungari' is the trade name by which the coarse short-staple cotton grown on the light, red soils of Rayalaseema district of Andhra Pradesh and in the continguous areas of Bellary and Chitaldurg districts of Mysore State, is known. 'Mungari' means 'early season.' It is grown both as a pure crop and also as a mixture with *setaria* or groundnut. Despite its inferior quality, it found favour with the growers owing to its high yield and ginning outturn and earliness. Its existence, however, led to the undesirable malpractice of its adulteration with the medium-staple Hingari (*rabi*) cotton. With a view to overcoming this, the Indian Central Cotton Committee, as early as 1937, launched a scheme, in collaboration with the State Department of Agriculture, for upgrading the quality of the inferior local 'Mungari.' As a result, a new strain, Rayalaseema-1, was evolved and released for general cultivation in 1950. This strain was on a par with the Hingari cotton in staple length but was slightly late in maturity compared to the local Mungari, which hindered its progress in the tract.

Efforts were, therefore, continued to isolate still superior varieties which would combine earliness also. These efforts resulted in the evolution of a new strain, 3930-A, later named as 'Adonicum' which proved to be outstanding in quality and yield as compared to the local 'Mungari' possessing at the same time the required earliness. Extensive trials were conducted with this new strain, which was a derivative of crosses involving Jarilla, Northerns, Cocanadas and *cernuum cottons*, on the Government Farms and on cultivators' holdings representing the entire tract in Andhra Pradesh and Mysore. It was also tested in mills for evaluation of its spinning qualities. The data obtained from the tests conclusively proved its superiority over the local Mungari in all the economic characters as would be evident from the following table:

	Mungari	*Adonicum*
Yield of seed cotton (in lb./acre)	369	440
Ginning outturn ...	31	34
Staple length in inch ...	16/32 to 22/32	29/32
Spinning value (H.S.C.)	8-10s	30s
Average blow-room loss	10.1	6.7
Acre cash value (Rs.)	166	238

It will be observed from the above that the cultivation of the new strain Adonicum in place of the local Mungari is estimated to fetch an additional income of Rs. 72 per acre owing to its better yield and quality. The trials also proved that it was equally adapted for cultivation as a pure crop or as a mixed crop with *setaria* and groundnut. In view of its superior attributes, the Indian Central Cotton Committee, at its meeting held in February 1961 recommended its release for general cultivation in place of the existing strain H.420 and Local Mungari in the Mungari tract of Andhra Pradesh and Mysore which extends over an area of about a lakh acres. Accordingly, steps are under way for the multiplication and distribution of the pure seed of this strain in Andhra Pradesh and Mysore.

COTTON *vs.* MAN-MADE FIBRES

Although cotton textiles suffered competitive losses in 1961, the industry has some "proven evidences of strength" upon which it can draw in making plans for the future. This is the conclusion reached by Mr. M. K. Horne, Jr., Chief Economist of the National Cotton Council of the U.S., in a report to a joint meeting of the Council's Programme Committees. Mr. Horne enumerated these evidences as (1) cotton's long-time performance in the domestic market, (2) an expanding market overseas, and (3) the fact that the U.S. seriously needs to foster exports. During the five years from 1955 to 1960, according to Mr. Horne, cotton began holding its own against the entire field of competing fibres and materials and this was something that had never happened. Nothing had happened in 1961, the Council's Economist emphasised, to indicate that the U.S. could not restore and continue this record of rising competitive strength in cotton.

The U.S., in his opinion, had the great problem of defending its currency and must therefore encourage exports. Cotton had a decisive role to play in this. In most years, cotton was the biggest single export commodity which earned about $980 million in foreign exchange during the fiscal year ended 30th June 1961 and $826 million in the previous year. During the period 1953-55, man-made fibres spun on the cotton system expanded their market from 8.8 per cent of the size of the cotton market to more than 13 per cent. Then cotton held firm competitively for five years, making gains against rayon which offset its losses to other man-made fibres. In 1961, however, the man-made fibres rose from 12.8 to 14.9 per cent in one of the biggest competitive shifts ever experienced. From January to December, while cotton consumption rose less than 20 per cent, that of rayon on the cotton spinning system increased almost 50 per cent.

If cotton had held the same share of this market against rayon in December, as it had held at the first of the year, according to Mr. Horne, cotton consumption in December 1961 would have been at an annual rate nearly 200,000 bales higher than it actually was. In two years' time, rayon's relative price had come down to 6.5 cents, as against Middling 1.1/16" cotton and 8.5 cents against Low Middling 1.1/32" cotton. These changes were the combined result of price declines for rayon and price increases for cotton.

WORLD PRODUCTION OF MAN-MADE FIBRES

World output of the main textile fibres, cotton, wool and man-made fibres advanced by about two per cent in 1961, corresponding to the annual growth rate of world population. While cotton and wool represented only fraction-variations on the previous year's crops, world production of man-made fibres, up by six per cent, set a new record at 3,520,000 metric tons, as against 3,300,000 tons a year before. Global output of synthetic fibres, which continues to have the fastest growth rate in the man-made fibres industry, aggregated 820,000 tons last year, an increase of 16 per cent on the preceding year's output.

These estimates have been prepared by the Economic Department of the Comité International de la Rayonne et des Fibres Synthétiques, Paris, in advance of the Second World Congress of Man-Made Fibres, scheduled to be held at London in the first week of May next. In the year under review, the patterns of the expanding output of man-made fibres varied from country to country. The following quarter-by-quarter tabulated analysis relates to the U.S.A., Japan and the 16 man-made fibres producing countries of Western Europe, which together account for over 75 per cent of world output:

(In thousand metric tons)

	Quarter			
	1st	2nd	3rd	4th
Synthetic fibres				
1960 ...	155	165	158	161
1961 ...	170	184	185	198
Cellulosic continuous filament				
1960 ...	214	210	203	204
1961 ...	203	201	202	213
Cellulosic discontinuous fibres				
1960 ...	282	277	257	264
1961 ...	267	273	284	310

World output of cellulosic continuous filament was up by a fraction over five per cent in the last quarter of 1961 as compared with the third quarter; reversing a down-turn in production in the first half of the year. As will be seen from the table, the output of cellulosic discontinuous fibres climbed steadily throughout the year.

FIRE — MARINE — ACCIDENT

A PASSENGER FROM CALCUTTA WRITES:

. . . Just a line to thank you and KLM for looking after us so well prior to our departure from Dum Dum, and during the flight to London. The service on the plane was excellent and the hostesses charming . . .

This extract is from an unsolicited letter. a photocopy can be obtained from KLM, Calcutta.

For that extra personalised service, there's nothing like flying "the Golden Circle"

to EUROPE
by KLM DC-8 JET

Departure : Calcutta Tuesday night
Departure : New Delhi Saturday night
Excellent connections from Amsterdam to the U.K.
Arrival : London, the next day—afternoon.
Also choice of 5 KLM DC-8 flights a week ex Karachi.

Sincerely yours

KLM

LINKING SUGARCANE PRICE TO QUALITY

EXPERT COMMITTEE SUGGESTS REALISTIC AND PRACTICAL SCHEME

IT is regrettable that high level bodies like Development Councils should keep on postponing decisions on vital issues unnecessarily and without any valid reason whatever. One such instance is provided by the Development Council for Sugar Industry. At its meeting held at New Delhi on 29th January, the Council considered the report of the special committee on linking of cane price to quality and, though it was generally in favour of the scheme suggested in the report, it deferred the decision until July next when the Council is expected to meet again. The reason adduced for the postponement seems to be the desire to await the comments of State Governments and the Indian Sugar Mills' Association. But one wonders whether this consultation could not have been done earlier. It may be noted here that the Committee had finalised its recommendations at its meeting held as early as on 11th September 1961, that is, within six weeks of its appointment on 2nd August 1961. The Council could have met shortly after that and circulated the report of the Committee to the interests concerned for study and comments. Had it done so, it would have been in a position to come to a decision on the report and frame its recommendations at its meeting last week. This, in turn, would have enabled the Government to frame its policy in time before the cane sowing season starts.

The Special Committee, it may be recalled, was presided over by Sardar Lal Singh and consisted of Mr. R. P. Nevatia, Mr. M. J. Edwards, Cane Commissioner of Uttar Pradesh, and Director of the National Sugar Institute, Kanpur (Member-Secretary). The terms of reference of the Committee were (1) to determine the basis for fixing the minimum price of cane for payment of cane price on the basis of quality and (2) to work out the details for the organisational set-up and staff required and the source from which the cost of such organisation would be met.

The Scheme Outlined

The scheme which the Committee has formulated for determining the price of sugarcane appears to be quite a realistic and practical one. Briefly summed up, it is as follows:

A floor price must be fixed for sugarcane (regardless of quality) covering the average cost of cultivation, harvesting and transport and, as far as possible, a minimum margin of profit. The difference between the present minimum statutory price (fair price) and the floor price should be reasonable, so as to ensure adequate incentive to the farmer to raise high quality sugarcane.

The implementation of the scheme is to be carried out in a phased manner on a regional basis, so that, by the end of the third Five-year Plan (1965-66), work in all the sugar factories in India towards the payment of cane price on quality basis will have been undertaken.

To start with, a region may be immediately selected in the South where the local existing conditions are favourable and difficulties less. In the North also, a region may be selected, taking the factories preferably in Tarai Area where preparatory work to implement the scheme will be taken up as early as possible. A target of two years may be fixed normally in the region to complete all the necessary preliminary work to create favourable conditions for payment on quality basis and, in the third year, actual payment on quality basis should start.

To execute the work, an independent and impartial implementation machinery should immediately be set up comprising staff at the headquarters, regional offices and units.

During the implementation phase, intensive publicity and propaganda work should be carried out for which the Government should initiate proper machinery in collaboration with the State Governments, Press Information Bureau and other concerned organisations just of the type and magnitude that has been done for popularising metric system and educating the public about it.

Constitution of Central, State and local boards to handle various issues and advise the Government is esential and should be considered.

The system of testing the quality of sugarcane, as contained in an appendix attached to the report, consists of the following steps:

A minimum of four minutes crush of any factory forms the minimum testable quantity of cane required for the purpose of test. Where the minimum testable quantity is the supply of one individual grower, it can be tested individually; otherwise, it will have to be tested groupwise on village level. For weighing and unloading cane, the sugar mills have to provide well developed marshalling yards, the control of which being done by the cane societies and the factory staff. All the vehicles belonging to a particular lot have to be weighed in continuation on one weighbridge. The particulars of the growers also have to be recorded on a card. After weighment, the vehicles have to be kept standing in a line for placing them at the cane carrier together and the group card will be sent to the errand boy at the cane carrier. This can be arranged by the factory staff itself. The main part of the system of testing is the feeding of the cane lots in the cane carrier continuously one after the other without intermixing. The demarcation and classification of cane lots in the cane carrier is done with the help of a segment wheel with a fixed pointer or automatic electronic instrument and light signalling device. The various samples of juice are analysed for brix, pol and purity and the data recorded. For this purpose, the factories have to provide separate independent laboratories near the crushers.

Java Ratio Modified

The system recommended by the Development Council for Sugar Industry for finding out the sugar percentage cane with the help of the Java Ratio, the Committee feels, did not take into account the variation in the Java Ratio with the variation in the fibre content of cane. The task of calculating the price of cane by the Java Ratio method is also found to be too laborious and time-consuming. In view of this, the Java Ratio method has been modified to a simpler one, namely, calculation of cane price on the basis of pol percentage first expressed juice. The weighted average for all the cane lots tested in a week is then calculated for determining the price on quality basis.

The implementation of the scheme naturally entails expenditure. The Committee has done well to urge the Central Government to make available the requisite funds out of the excise duty collections for meeting the expenditure. Evidently, the Committee has ruled out the three other alternatives for financing the scheme: (*a*) an increase in sugar price, (*b*) apportioning between States' and Centre's existing levies, and (*c*) sharing of expenditure equally by cane growers, factories, and Central and State Governments. The total cost for working the scheme is estimated at one naya Paisa per maund of cane which means an increase of 10 nP per maund in the price of sugar. It is considered not possible to charge this extra amount to the sugar price. Nor is it considered possible to apportion the incidence of cost to the State levies, in view of the States' need for resources to implement development programmes. It is further felt that the cane growers will not like the idea of expenditure being recouped from them or through a reduction in cane price. Since the changeover from the existing system of paying cane price from weight basis to quality basis is a *must* in the interest of the industry and the larger interest of the national economy, the Committee has asked the Central Government to accept this expenditure for quality assessment and adopting the system as inevitable. Other grounds on which this plea is based are:

"In order to promote export of sugar on competitive rates, it would be absolutely necessary to bring down the cost of production of sugar in which the cost of raw material, that is, sugarcane, played an important role. The Chairman observed that there was no other agricultural commodity or industry which was so heavily taxed as sugar in India. Excise, cane cess and commission alone amounted to as much as the price of cane that the grower got for his sugarcane; or in some areas, the yearly taxes on the above account came to as much as the price of land on which the sugarcane was grown. Total levies come to the tune of about Rs. 13 per maund of sugar, of which the excise duty alone accounts for Rs. 10.69 per maund. If the incidence of cost for quality assessment, which works out to about 10 nP per maund of sugar, were met at least in the initial years out of the excise funds, it would be less than 1 per cent of the total excise revenue from sugar. This would be also amply compensated in the long run due to consequent increased productivity."

The changeover from the present system of paying cane prices to a new one linked to quality will, of course, be confronted with certain difficulties, particularly opposition from uneducated cane growers and other vested interests. But the difficulties are not insurmountable. What is wanted is, as the Committee has rightly stated, a firm policy decision. To quote the Committee:

"Statutory enforcement for adopting the system of payment of cane price on quality basis has to be made. Necessary legislation should be brought about to meet the exigencies. Where the State enactments stand in the way of implementation, the Governments concerned should consider necessary modifications in these enactments to suit the requirements of the scheme. The position may again be reviewed after three years of the implementation of the scheme on an all-India basis."

The need for a firm policy decision and bold steps is vital, because it is the opposition from cane growers and other vested interests that has all along been the stumbling block for doing away with the outmoded, irrational cane price policy. It may be recalled here that the late Mr. Rafi Ahmed Kidwai mooted the idea of introducing a system for payment of cane price on the basis of recoverable sugar content as far back as in October 1953. The idea was widely supported by the sugar delegation to Australia and Indonesia, and later by Mr. Kidwai's successors, Mr. A. P. Jain and Mr. S. K. Patil. But no significant progress has yet been made in implementing the scheme, thanks to political considerations.

Viewed thus, the Lal Singh Committee must, indeed, be complimented on having strongly urged statutory enforcement of the new scheme. The importance of the scheme lies in the fact that it will curb the tendency among cane growers to increase the crop in bulk at the expense of quality. It will be pertinent to quote here what that reputed Dutch sugarcane expert, Dr. C. Van Dellowijn, said some years ago:

"Sugarcane in India is paid on the basis of weight irrespective of quality. In a crop containing 10 per cent recoverable sugar, the remaining 90 per cent is made up of water and fibre, plus a negligible amount of other organic and inorganic compounds. Under the system in force, a uniform price is paid for cane whether it contains 6 or 12 per cent of recoverable sugar. Thus, the same price is paid for water and bagasse as for sucrose. This system explains the attitude of the cane grower. He is expected to grow more cane regardless of quality and, consequently, he grows more cane. He prefers, for instance, high cane yielding varieties even if canes with lower tonnage but better quality would yield more sugar to the acre. Payment on the basis of cane weight is a primitive system, which has been gradually abandoned by all progressive cane countries."

The foregoing observations underline the importance of the system of paying for cane on the basis of quality. By adopting the system, Australia, which had started with the same Coimbatore varieties that are being raised in India, has improved the quality of cane to such an extent that, today, the Australian sugarcane is the best in the world, containing on an average about 15.3 per cent sugar and giving an average sugar recovery of 13.7 per cent, as against less than 10 per cent in India. Needless to say that, unless the sugar yield per acre is substantially raised, the stability and even economic existence of many a unit, especially in North India, may, as the Committee has clearly warned, be in grave jeopardy.

SUGAR INDUSTRY IN MAHARASHTRA

Both employers and employees in the sugar industry in Maharashtra are keen on implementing the recommendations of the Central Wage Board. This was the consensus of opinion at the meeting which the State's Minister for Law and Labour, Mr. Shantilal H. Shah, had with the representatives of sugar factories and of the recognised unions of workers in the industry, at Sachivalaya on the 2nd inst. Matters connected with the labour problems in the industry were generally discussed at the meeting. Twenty-seven sugar factories, including co-operative sugar factories, and 13 unions of workers and two representatives of the central organisation of sugar factories attended the meeting. Mr. G. D. Patil, Deputy Minister for Planning, Industries and Labour, was also present. It was stated at the meeting that most of the factories, including factories in the co-operative sector, had already entered into an agreement with their employees.

NEW INSECTICIDE TO FIGHT SUGARCANE PESTS

Details of a new insecticide developed by the Shell group of companies for controlling pest in sugarcane, rice and maize crops have been announced in London. The insecticide, called "Telodrin", is claimed to be "the most efficient and versatile yet discovered." It is anticipated that there will also be large demand for Telodrin to deal with the wide variety of pests which attack cotton and tobacco crops. More than 400 field trials have been carried out in 65 countries over the past four years, and it has been proved that there are few insect pests against wthich Telodrin is not highly effective, either in the soil where the pests attack plant roots, or on the plant while they feed on the fruit or foliage. Telodrin, like other chlorinated hydrocarbon insecticides such as D.D.T., acts on the insect's nervous system and is effective merely on contact. As in the case of certain other insecticides, Telodrin can be incorporated with fertilisers during manufacture for use in the soil. Used this way, only a quarter of the dosage rate normal for other soil insecticides is required.

PUBLIC SECTOR IN GENERAL INSURANCE

BOMBAY MUNICIPALITY'S BIAS IN FAVOUR

GENERAL insurers in Bombay are very much exercised over a recent directive of the Bombay Municipal Corporation, which is now under the control of the Congress Party, that insurance of buildings constructed on plots let out by the Corporation or the Improvement Trust against risks of fire should be placed with the Indian Insurance Companies' Pool. As 75 per cent of the business of the Pool, which was formed by mutual agreement by insurance companies to write Government insurance business, is allocated to the Government-controlled "Oriental" group, private insurers would get only 25 per cent of it if this business were to go to the Pool, as now directed. At present, the lessees have freedom to insure with private companies which accept such business on an individual basis. Insurers point out that there has not been a single instance of an insurance company having failed to pay the claims that had arisen or to discharge other obligations under the terms of the contracts. They, therefore, fail to understand why the municipal authorities should now choose to alter the existing arrangement. They fear that such a course will lead to the diversion of business which had, for years, remained on the books of private insurance companies, to the Government-controlled group via the Pool.

Subtle Move

Apart from expressing resentment at this subtle way of strengthening the public sector companies at the expense of private companies, insurers maintain that such business does not fall within the defined province of the Pool. They are understood to be consulting legal opinion as to whether, under the agreement, the Pool had the authority to accept such business. If the agreement is not explicit on the point and it could, therefore, be interpreted in such a way as to authorise the Pool to accept such business, insurers point out that the agreement should be so amended as to permit the present system to continue, as it was never their intention to give such business to the Pool. The Indian Insurance Companies' Association, Bombay, has, therefore, advised the Pool to desist from accepting such business. If, however, the latter decides to accept such business, in spite of protests from the insurers, the Committee of the Association has asked the Pool to convene a general body meeting of the Pool members to examine the question thoroughly.

Meanwhile, the Association is taking up the matter with Mr. Y. B. Chavan, Chief Minister of Maharashtra, as the Corporation's directive must presumably have been issued at the instance of the Maharashtra Government. A deputation consisting of the representatives of the Association will wait on the Chief Minister to explain to him the position and to request him to see that the Corporation's directive is withdrawn and the *status quo* restored. It has also approached the Indian Merchants' Chamber and the Property Owners' Association to represent the case of private insurers to the Government. It is highly significant that the City Municipality has taken this step when it is under the control of the Congress Party and not when it was dominated by the Communist Party. Has this anything to do with the drive for "aggressive socialism" which the party in power resolved to carry on at its Patna session?

Thin End of Wedge

Far more important than the loss of business are the possible repercussions of this step elsewhere. The insurers fear that the move is the thin end of the wedge and that not only will municipal authorities in other cities be tempted to follow suit but also that their other business, too, might be diverted to the public sector companies through such subtle methods. Insurers concede that the Municipal Corporation has the right to insist on adequate coverage for risks of fire on buildings constructed on its lands. But it should not interfere with the rights of the lessees to insure with the companies of their choice. They are even prepared to go so far as to concede that they have no objection to the Corporation preparing an approved list of insurers, whose policies are acceptable to it, and insisting on the buildings being insured with them only. But the demand that the business should be placed exclusively with the Pool, they point out, cannot be justified on any ground, least of all from the point of view of satisfactory insurance cover, unless it be to deprive the companies in the private sector of their legitimate business.

MARINE INSURANCE IN BRITAIN

1961 was a bad year for marine insurance in Britain, according to Mr. H. M. MacDiarmid, retiring Chairman of the Institute of London Underwriters. Reviewing the trend of marine insurance during the past year, Mr. MacDiarmid, in his speech at the annual meeting of the Institute, held recently at London, observed: "I think most of us will find there has been a sad deterioration in our figures (of marine insurance) and this is certainly true in the hull section of our accounts... "The 1959 underwriting year was singularly free from major casualties—in fact, it was so unusual as to lead many to the false belief that we had at last turned the corner. It followed that the temptation to be more lenient in rating, with one market being played off against the other, led to the unhappy consequence of our being left with inadequate premium for the risks we were running. The following year, 1960, after an easy opening, proved to be a good deal worse than average, through the heavy casualties which were sustained in the closing months and in the early part of 1961—and this latter year has certainly kept up a disturbingly hot pace."

Hull insurance, Mr. MacDiarmid pointed out, was operating on so narrow a margin of profit that it only needed a few total losses of high value to put the business considerably in the red. With the many safety devices adapted to ships, it was disheartening, Mr. MacDiarmid added, to read of so many collisions and strandings which seemed to be as numerous as ever. Explosions in engine rooms were still causing anxiety. He conceded that, in insuring ships with complicated machinery, insurers should expect accidents of this nature but the number of such accidents gave rise to the suspicion that there must be a certain amount of negligence and that there were still ships manned with inexperienced engineers.

Dealing with cargo insurance, Mr. MacDiarmid observed: "Internationally, we talk about freedom of insurance and yet each year sees fresh barriers put abroad to restrict free enterprise. This increasing wage of nationalisation of insurance, which impedes the merchant and therefore cannot be helpful to him, has already had its effects on our cargo accounts and we see prominent signs of it in the uneconomic rates which are still being quoted in the scramble for the business which remains outside these barriers."

As regards the European Common Market, the retiring President observed that British insurance would be facing intensified competition within the area. In the principal insurance markets, new branches and agencies were being established by Continental insurance companies which were eagerly seeking to secure a share in business which is already insufficient to satisfy their own markets. Mr. MacDiarmid disclosed that, having regard to these changes facing British insurance, a joint committee was at present studying the various matters affecting insurance business in the Common Market countries.

EXPORT CREDIT INSURANCE IN U.K.

Business declared under the British Export Credits Guarantee Department's "commercial" insurance scheme in the fourth quarter of 1961 was, at £197,500,000, a record for any quarter. Business declared during the year 1961, at £712,000,000, was also a record, showing a £17,500,000 increase on the previous year. After increasing, in the first quarter of 1961, British exports remained practically static for the rest of the year, so that this increase in the business done by the Export Credits Guarantee Department to record levels in the fourth quarter (and for the year as a whole) represents, in the main, greater use of the department's facilities by British exporters, together with various extensions of those facilities announced in the course of the year. These extensions are part of the general Government-sponsored effort to increase exports, and so strengthen the balance-of-payments position.

INDUSTRIAL **IBCON** CONSULTANTS

The industrial consultancy services offered by the group fall under the following headings:-

IN THE PLANT:— PLANT CAPACITY AND LAY-OUTS • PRODUCTION PLANNING AND CONTROL • STORES ORGANISATION AND CONTROL
FUEL AND STEAM UTILISATION • RAW MATERIALS CONTROL • QUALITY CONTROL • TRANSPORT
MECHANICAL HANDLING • QPERATIONAL RESEARCH • VALUATION OF PLANT AND BUILDINGS

ON LABOUR:— METHOD AND WORK STUDY • JOB EVALUATION • INCENTIVES • PERFORMANCE CONTROL • WAGE STRUCTURES
TIMEKEEPING SYSTEMS • PERSONNEL RECORDS • HUMAN RELATIONS • COMMUNICATION

IN OFFICES:— MANAGEMENT CONTROLS • MANAGEMENT ORGANISATION : EXECUTIVE AND CLERICAL • WORK MEASUREMENT
INCENTIVES • BUDGETARY CONTROLS • LAYOUT, COMMUNICATIONS AND EQUIPMENT

AND:— THE SETTING UP AND TRAINING OF THE CLIENT'S OWN INDUSTRIAL ENGINEERING DEPARTMENT
MARKET RESEARCH • PLANNING FOR MODERNISATION AND EXPANSION OF INDUSTRIES
TECHNOLOGICAL STUDIES IN RAW MATERIALS, PROCESS AND PLANT PERFORMANCE

THE MYSORE SUGAR COMPANY LIMITED

CRISIS OF SURPLUS STOCKS THREATENS SUGAR INDUSTRY

CHAIRMAN, MR. V. VENUGOPAL NAIDU'S SPEECH AT ANNUAL GENERAL MEETING

THE Twenty-eighth Annual General Meeting of the Mysore Sugar Company, Ltd., was held at the registered office of the Company at Bangalore on Wednesday, 31st January 1962, under the chairmanship of Mr. V. Venugopal Naidu. Moving the adoption of the report and the accounts, the Chairman made the following speech:

"LADIES AND GENTLEMEN,

"It gives me very great pleasure to welcome you all to this the twenty-eighth annual general meeting of the shareholders of the Mysore Sugar Company, Ltd., and to place before you the report of the Directors and the audited statements of accounts for the year ended 30th June 1961. Copies of these have been sent to you in advance and, with your permission, I shall take them as read.

Crisis of Overproduction

"Before reviewing the working of the Company, I feel it necessary to say a few words about the present position of the sugar industry. It is a matter for gratification that the upward trend in sugar production that was recorded during the year 1959-60, following the introduction of certain incentive measures, was well-maintained during the year 1960-61 when sugar production in the country increased further by 5½ lakh tons and reached a record figure of 29.8 lakh tons, which represents more than 55 per cent increase over 1958-59 production. For this striking performance, you will agree that the industry is legitimately proud of. However, this has led to certain unexpected problems and has landed the industry in a crisis of overproduction. The offtake has remained stagnant at about 20.5 lakh tons for the last four years and consequently a large part of the sugar produced is lying with the factories. The rapid progress the industry has made within the last two years, and, at the same time, the position in which the industry finds itself at present, is evident from the fact that, as against a stock of only 1.5 lakh tons with which the 1959-60 season opened, the stock at the commencement of the 1961-62 season has reached an alarming figure of nearly 12 lakh tons which is enough to meet more than half a year's consumption. The immediate problem, therefore, is the profitable liquidation of this enormous surplus. Thanks to the strenuous efforts of the Government and the industry, it was possible to export about 3 lakh tons to foreign countries. But exports depend upon several international factors. You have recently read in the newspapers about the failure of the International Sugar Conference.

"The real and lasting solution to the problem, therefore, lies in creating increased demand for internal consumption by breaking the consumer resistance to the commodity due to the price factor. As I reported to you in my last speech, the *per capita* consumption of sugar in India is only 11 lbs. Even now it is the same. In the prevailing cost structure of sugar, the industry is not able to take the initiative but, as is being rightly emphasised by the Indian Sugar Mills' Association, only the Government can help to stimulate increased consumption by reducing the present high rate of excise duty so as to make the price of sugar cheaper to the consumer. This will not seriously affect the revenue from this source, as what is lost by a reduction in rate can, to a great extent, be made up by an increase in consumption.

Cane Price

"An equally important point made out by the Indian Sugar Mills' Association is about a reduction in cane price. The incidence of cane works out to about 70 per cent of sugar cost before adding tax and any reduction in cane price will go a long way in reducing the cost of sugar produced, thereby making sugar available to the consumer at cheaper rates and also giving a fillip for exports. It is earnestly hoped that these aspects of the matter are receiving the serious consideration of the authorities and that the industry will see a bright future before long. The Sugar Development Council, which met recently in Delhi, has also taken note of these aspects.

"The working of your Company for the year 1960-61, I am glad to say, proved to be favourable so far as production of sugar was concerned. Your factory started crushing on 1st July 1960 and continued to work up to the 5th April 1961, covering a fairly long season of 267 days, as against 213 in the previous season. The quantity of sugarcane actually crushed during this period was 3,95,963 tons, which is the highest quantity crushed so far. Production of sugar amounted to 39,049 tons. Towards the end of the crushing season the factory had to face a serious shortage of water and this affected the recovery. Although production was high, sales lagged behind and dropped to 26,730 tons, from the previous year's record of 37,719 tons, because of the restricted releases by the Central Government. The effect of this is reflected in the fall in the turnover by Rs. 119 lakhs, from Rs. 429 lakhs during 1959-60 to Rs. 310 lakhs during the year under review, and also in the unusually large closing stock of 13,790 tons of sugar.

Purchase Tax on Sugarcane

"While on the subject of cane price, I would like to refer to an allied matter. The Government of Mysore have recently substituted the cess on sugarcane by a purchase tax, as the cess legislation was held to be invalid. But in this changeover, the burden to the industry has gone up. While the old rate of cess, at Rs. 6 per ton of cane, was itself the highest in India, the burden has now been further increased by 62 nP per ton and the additional cost to your Company on this account is expected to be over Rs. 2 lakhs per annum. When cane price, wage scales and excise duty are common for all factories, there is no reason why the tax on cane should not also be uniform for all sugar-producing units. A representation has, therefore, been made to the State Government requesting for a reconsideration of the matter.

"The working of our Distillery was quite satisfactory, with a record production of 8,57,817 gallons of 100 per cent alcohol. The scheme for raising the installed capacity to 12,00,000 gallons has been completed. Our own production of molasses is inadequate to achieve full production and arrangements have been made to acquire additional molasses from Pandavapura Sahakara Sakkare Karkhane Ltd., so as to augment production to meet the growing demand for alcohol. Negotiations are also being carried on with other factories.

"Turning now to the financial results of our operations, I must say that we have fared well considering the adverse factors that we have had to contend with. As you would have observed from the statements in your hands, the operations have resulted in a gross trading profit of Rs. 38,91,681, as against Rs. 42,36,042 in the previous year. The fall in the earnings is mainly due to the lower release of sugar for sale. The profit would have been higher but for a loss of nearly Rs. 5 lakhs on our export quota of 3,992.2 tons. The earning from the Distillery has continued to be steady at around Rs. 3½ lakhs, though the farm operations have resulted in a deficit of Rs. 1,24,639.

Impact of Wage Board Award

"A new burden thrown on the industry is the cost of implementing the award of the Central Wage Board for Sugar Industry in fixing increased scales of wages for different categories of employees, as from 1st November 1960. The extra cost on this account will be a recurring additional expenditure which will go to increase the cost of production of sugar by a sizable amount. Two other items of expenditure, referred to in the Directors' report and to which I wish to draw your attention, are the payment of Rs. 2,15,000 on account of additional bonus to employees for the year 1958-59 and provision of Rs. 10,07,175 for payment of deferred price for sugarcane on an interim basis.

"The net profit after deducting all expenses and charges and depreciation of Rs. 8,20,560, but before providing for taxation, stands at Rs. 20,07,166, as against Rs. 27,10,166 in the previous year. Including the balance of Rs. 1,15,228 brought forward from the last year's account, the amount that is available for disposal is Rs. 21,22,394. A provision of Rs. 11,00,000 is required for taxation and your Directors recommend payment of dividend to shareholders at 30 per cent, subject to deduction of tax, which will absorb Rs. 6,53,784. It may be mentioned here that, though the profits are lower this year, your Directors wish to maintain the dividend at the last year's level of 30 per cent. The stores depreciation reserve has been augmented by the addition of Rs. 50,000 and, at the same time, your Directors have thought it prudent to bring down the book value of stores and spare parts by a corresponding amount so as to provide for depreciation and obsolescence of old and unserviceable articles.

Disturbing Trends

"From what I have said it must be apparent to you that the outlook, at any rate for the immediate future, is uncertain. With a view to arrest further increase in sugar output Government of India have revised their policy and ordered a 10 per cent cut in production during the current season, on pain of levy of penal excise duty on excess production beyond the reduced target fixed for each factory. The late announcement of restriction on production has created another problem for us as the cane has already been grown and as we have already contracted for purchase of the normal quantity of cane. This question is now being pursued with the State Government.

"Another disturbing trend is the present slump in sugar prices following the removal of control on the price, movement and distribution juncture, when costs are actually moving up due to the Wage Board award, the incidence of export loss, etc., it is of the utmost importance to maintain suitable price level by eliminating unhealthy competition among the factories, which has begun to set in. Unless this trend is effectively checked, by the concerned factories entering into an understanding for following a common sales policy, great harm is bound to result. However, one happy feature of this decontrol seems to be in the direction of increased internal consumption.

Modernisation

"In my last speech I had made a brief reference to our application for a licence to expand our capacity to 3,000 tons. Taking into consideration the existing and the already licenced capacity and the overproduction of sugar in the country, the Government of India announced recently their decision not to issue licence for any new factory or for increasing the capacity of any existing factory. Hence we do not see any hope of securing a licence for expanding our production in the near future. Therefore, the question of modernising some of our equipments and replacing others with the object of improving efficiency and obtaining higher percentage of sugar recovery, as a means of bringing down the cost of production, is engaging the immediate attention of your Directors.

"The scheme for the manufacture of cellulose acetate for use in the manufacture of raw films and plastics, for which the Government of India has granted an industrial licence in favour of your Company, has reached an advanced stage of implementation. Requisite agreements with well-known foreign collaborators for supply of the necessary equipment are being concluded and applications for foreign exchange loans have also been submitted to the appropriate credit institutions. The details connected with the new company to be formed for undertaking the manufacture of this new product are being worked out. At the same time, measures are also under consideration for taking up the manufacture of acetic acid/acetic anhydride to feed the new industry. This project will be financed entirely by your Company and will form part of its activities. Here also necessary agreements have been signed with a well-known Swedish firm for supply of requisite machinery and know-how. The required foreign exchange loan is being obtained from the Commonwealth Development Finance Company. Ambitious as these schemes are, your Directors do not wish to stop here. They are now thinking of going a step further. It is too premature for me to disclose anything further and you will, no doubt, pardon me for this.

Supply of Bagasse to Mandya Paper Mills

"The Paper Mills project near Mandya, with which we are tied up for supply of our bagasse in return for substitute fuel, is coming up fast and all possible facilities have been extended to them. We have already started supplying bagasse to them and it is expected that the Paper Mills will go into production very soon. The nature of arrangements entered into with the Paper Mills being of a novel type, which is the first of its kind in India, certain unexpected problems, and difficulties have naturally arisen, the solution of which call for utmost co-operation and understanding between both the parties. I do hope that the authorities of the Paper Mills will appreciate the spirit of co-operation on our part and reciprocate.

Bonus Shares

"The question of issue of bonus shares was referred to in my last year's speech as also in the speeches of earlier years. This matter has been thoroughly examined in the light of the present sugar position. I have, at some length, explained to you the difficult position of the sugar industry. A decision in this regard will be taken at the opportune time.

"In conclusion, it is my pleasant duty to acknowledge the valuable guidance and co-operation which I have received from my colleagues on the Board. To all our employees, from the General Manager downwards, who have continued to serve the Company loyally and efficiently, the thanks of the management are due. We are also thankful to the large body of our canegrowers who form the very backbone of our industry. Above all, we are grateful to the Government of Mysore and particularly to our Chief Minister, for their abiding interest in the well-being and progress of the Company."

The report and the accounts for the year 1960-61 were adopted and a dividend of 30 per cent, subject to deduction of tax, was approved. Mr. V. T. Krishnamoorthi and Mr. K. V. Shankara Gowda were elected as Directors in place of the two retiring Directors.

With a vote of thanks to the chair, the meeting terminated.

T. HANUMIAH,
Secretary.

BANGALORE,
1st *February* 1962.

Note: *This does not purport to be a report of the proceedings of the general meeting.*

A.V.B. WORKSHOPS INAUGURATED

A NEW CHAPTER IN INDUSTRIALISATION

THE inauguration of the A.V.B. workshops at Durgapur by Dr. B. C. Roy on 6th February marked the opening of a new chapter in industrialisation. For A.V.B., equipped with some of the most up-to-date machine tools in the world, is one of the largest engineering units in Asia. The construction of this modern major industrial plant and housing colony on a 700-acre site has been completed in just two years—a truly remarkable achievement and in itself an outstanding example of industry and planning.

An outstanding example of international collaboration, A.V.B. brings to India the varied and extensive knowledge of three leaders in industry—The Associated Cement Companies Ltd., Vickers Ltd. and Babcock & Wilcox, Ltd. These famous enterprises have joined together in establishing in the industrial heart of the country a large and modern heavy engineering works to make cement-making machinery, steam-raising plant, pressure boiler plants and heavy equipment for mining and other industries. It will be no exaggeration to say that the establishment of A.V.B. reflects the confidence of the industrial nations of the West in the industrial future of India.

Shareholders

The project, it may be recalled, was formally approved by the Government of India and the A.C.C.-Vickers-Babcock Limited was registered in January 1959 in the State of Bombay, with a nominal capital of Rs. 10 crores. A.C.C's share of the paid-up capital is 49.8 per cent; the two British Companies, Vickers Limited and Babcock & Wilcox Limited each hold 24.9 per cent, while 0.1 per cent each is held by Killick Industries Limited, E.F. Dinshaw Limited, Tata Sons Private Limited and Mulraj Khatau and Sons (Private) Limited.

A brief picture of the three principal shareholders of the Company will form a fitting background to the growth of A.V.B. to take the A.C.C. first. Over the past quarter century, the Associated Cement Companies Limited has been in the forefront of the cement industry in this country. Formed in 1936 through a merger with ten other companies, A.C.C. has grown from strength to strength over the years, by increasing its productive capacity, by widening its area of operations and by undertaking the manufacture of cement-making machinery.

Today A.C.C's sixteen cement works are spread all over the sub-continent, in addition to which A.C.C. operates collieries at Nowrozabad and Kotma in Madhya Pradesh, a refractory factory at Katni in Madhya Pradesh and a heavy engineering works at Shahabad in Mysore.

In addition to Portland cement, A.C.C. now manufactures portland blast furnace slag cement, Silvierete white cement, low heat cement, oil-well cement, water-repellent cement as well as high alumina refractories and special mortars like ACCOSET-50 and ACCOCID.

Vickers Ltd.

The activities of the Vickers group of companies in the field of engineering are diverse and widespread, with the group being known by most people as builders of ships and aircraft and as manufacturers of heavy engineering equipment. Vickers now have three shipyards and have built many famous ships, ocean liners, tankers and naval vessels of every type and size.

Since the beginning of aviation, Vickers have been famous as aircraft constructors. The name Vickers is recalled with the mention of the first turbine-engine airliner, the 'Viscount' of which well over 400 are in service in all six Continents. Shortly to be seen in airline service are the 600 m.p.h. VC-10 and BAC-111. In the field of general engineering, Vickers are acknowledged specialists in the manufacture of cement-making machinery, a large mine winders and heavy hydraulic presses. Vickers have been associated with India for more than a century, particularly in the supply of rolling stock, ships and aircraft and cement-making machinery.

Babcock and Wilcox Ltd.

Babcock and Wilcox Limited have long associations with India. Since before the turn of the century, they have supplied boiler installations for her power stations and industries.

The fundamental business of Babcock and Wilcox is heavy mechanical engineering. Their product range includes the largest of nuclear power plants and boilers of all kinds and capacities for industrial heating and processing, marine boilers, welded pressure and containment vessels for the oil, chemical and other industries.

The engineering history and achievements of the Company are impressive. These include the pioneering development of fusion welding for the fabrication of pressure vessels to the highest safety codes; the design and construction of the whole of specialised steam-raising plant and other equipment for the world's first full-scale atomic power stations, right from the pioneering days of Calder Hall and the building of Europe's largest conventional power-station boilers.

The real power and potential of A.V.B. lies not only in the vast technical knowledge and experience at its disposal, but also in the up-to-date equipment and machine tools installed in its workshops.

The manufacture of A.V.B. products will by carried out in four 700' long workshops, two 400' long machine shops and one 200' long forge shop, all designed on the most modern lines. Built into their structure are 13 electric overhead travelling cranes, the biggest of which have a lifting capacity of 70 tons each. The shops have been designed to allow for progressive expansion in the future, so that it will be possible to lift single pieces weighing about 200 tons in the heavy fabrication bay without necessitating any structural alterations. The works comprise a structural plating shop, a tube shop, two vessel shops, an X-ray bay, a test room, a stores building and the works offices.

Modern Machine Tools

Among the modern machine tools is a 3,000-ton vertical hydraulic plate-bending machine, capable of bending 5-inch thick steel plates employed in the manufacture of high pressure boiler drums, atomic heat exchangers, and pressure vessels required for the fertiliser, chemical and oil refining industries. This equipment will make it possible to manufacture steam-raising equipment in the high pressure range for the first time in India.

The many boring, milling and turning machines include a 22 ft. vertical borer, which is one of the largest of its kind in India. Among the pressing equipment are a 1,000-ton heavy duty dishing and flanging press and an 800-ton plate edge curving press.

Fusion Welding

Considerable welding equipment, including automatic welding equipment of the latest type, has been installed, so that the most modern fusion welding technique for steel may be employed in the manufacture of A.V.B.'s.

Cement-making Machinery

Through the manufacture of cement-making machinery equal to the world's best, A.V.B. will help increase the production of cement for which the Government of India has set a target of 15 million tons per year to be reached by the end of third Five-year Plan. Orders have already been received for cement-making machinery which will be manufactured by A.V.B. according to the designs developed by A.C.C. and Vickers, whereas specialised items will be manufactured according to the design of the Fuller Company of America.

Industrial Steam-raising Plant

The scope of A.V.B.'s contribution through the manufacture of steam-raising plant for Thermal power stations and industry is likely to be very substantial; for it must be remembered that power is the basic need of an industrial nation.

To ensure that industrial steam-raising plants give optimum performance, it is necessary to 'tailor-make' them to suit varying local conditions and the type of fuel to be employed and, in certain cases, to make supplementary use of waste product as fuel. This

REPORT OF THE AUDITORS

TO THE STATE BANK OF INDIA:

We, the undersigned auditors of the State Bank of Bikaner, appointed under Section 41 (1) of the State Bank of India (Subsidiary Banks) Act, 1959, do hereby report to State Bank of India upon the Balance Sheet and Accounts of the Bank as at 31st December, 1961.

We have examined the above Balance Sheet of the State Bank of Bikaner as at 31st December, 1961, and the Profit and Loss Account for the year ended upon that date with the Accounts relating thereto of Head Office and with the Branch Returns duly certified by the Managers, which have been incorporated in the above Balance Sheet and Profit and Loss Account, and report:

(i) that, in our opinion the Balance Sheet is a full and fair one, containing all the necessary particulars and properly drawn up so as to exhibit a true and correct view of the affairs of the Bank, according to the best of our information and the explanations given to us and as shown by the Books of the Bank

(ii) that, where we have called for any explanation or information such explanation and information have been given to our satisfaction;

(iii) that, the transactions of the Bank which have come to our notice have been within the competence of the Bank;

(iv) that, the Returns received from the branches of the Bank have been found adequate for the purpose of our audit; and

(v) that, the Profit and Loss Account shows a true balance of Profit for the year covered by such Account.

M. L. SHARMA & CO.,
Chartered Accountants.

CAMP: BIKANER, 22nd *January*, 1962.

NON-ELECTRICAL MACHINE BUILDING INDUSTRIES

THIRD PLAN PROGRAMMES AND TARGETS

IN 1961, India produced machinery and equipment worth about Rs. 200 crores. The details pertaining to the different machinery manufacturing industries are given in Table I at the bottom of this page. In spite of the striking progress revealed by this table in different lines, the fact remains that this country has been very much dependent on imports. In 1961 alone, for instance, India imported Rs. 250 crores or more worth of industrial plant and machinery. There is thus a big gap between current requirements and indigenous manufacture. The gap, though likely to be considerably narrowed in future, may well continue to be there for a fairly long time in spite of an estimated annual production of about Rs. 500 crores of machinery, machine tools and equipment by the end of the third Plan (*vide* Table I). For, even after the country reaches this magnitude and range of production in the third Plan period, imports of specialised, latest and difficult items and types of machinery, machine tools and equipment will have to continue. As Mr. Manubhai Shah, Union Minister for Industry, has rightly said, national self-sufficiency in these products is a far cry, for obsolescence plagues the modern advancing technology too much.

All this, however, does not detract from the magnitude and importance of the third Plan's machinery manufacturing programmes approved for both the sectors—public and private. These programmes, alongside of the progress registered so far, have been recently reviewed at the seventh meeting of the Standing Committee of the Central Advisory Council of Industries. The picture, as it emerges from the official review, is provided in the following paragraphs devoted to the different industrial machinery and equipment manufacturing industries other than electrical.

Paper Making Machinery

Paper making plant till recently was not manufactured in the country, and there were only two firms manufacturing some items and spares on a jobbing basis. Now 21 more firms have been licensed by the Government, envisaging a total installed capacity of paper machinery valued approximately at Rs. 29.93 crores per year. The T.E.L.Co. is already in a position to fabricate and supply a complete plant, subject to their securing firm orders in this respect. Messrs. Utkal Machinery are going ahead with the construction of their factory and are reported to be in a position to supply one plant of 50 tons per day capacity by the end of 1962. Messrs. Bertram Scott have already a workshop in Calcutta and are also reported to be in a position to supply one plant of 50 tons per day capacity by the end of 1962. Messrs. Black Clawson (India) have reported that they have practically finalised orders for 3 complete plants and are expected to finalise orders for 2 more complete plants shortly. Messrs. Rohtas and Papco have each already produced a small-scale plant. Paper Mill Plant and Machinery Ltd. have reported that they have also supplied one 5-ton plant and that another 5-ton plant is in an advanced stage of production. Another manufacturer, namely, Messrs. Eastern Paper Mills, Calcutta, is at present mainly engaged in the production of mill-board/grey-board plant and they have so far supplied five plants.

Sugar Mill Machinery Industry

The sugar mill machinery industry may now be considered to have been successfully established. This industry has achieved really spectacular progress during the last five years and it has now reached a stage where it is now possible to meet the requirements of complete sugar factories for the whole country. There are at present seven manufacturers of complete plants and 18 other firms which are specialising in the manufacture of various equipments of the sugar factories against orders. Six major machinery manufacturers who are fabricating machinery in collaboration with reputed foreign parties have formed themselves into two consortiums for the purpose of fabricating and supplying complete sugar factories. Another unit has also been recently licensed in collaboration with a well known U.K. firm for the production of mill turbines, gears, besides the other sugar mill machinery. Two complete plants fabricated by the indigenous machinery manufacturers, after their trial operations during March and April 1961, are going into actual production from the 1961-62 season. Two more indigenous plants are expected to go into trial operation during the year 1961-62. So far allotment of 12 plants for the season 1961-62 and for the season 1962-63 have been completed. In other words, the capacity of the machinery manufacturers have been completely covered till the end of 1963. The present-day capacity of this industry can take care of about 12 new standard plants per annum and the equivalent of 9 standard plants by way of expansions and replacements. The foreign exchange content of a complete plant of 1,000/1,200 tons capacity, valued at Rs. 84 lakhs, is now only of the order of Rs. 16 lakhs. It is expected that when the turbines, gearings, reduction gear units and brass tubes are indigenously available, the requirements of foreign exchange would considerably be reduced and would perhaps be Rs. 10 lakhs or even less.

Cement Machinery

Until very recently the manufacture of cement machinery was only confined to the requirements of replacement of parts of the existing cement factories in their own workshops and the production also was very meagre. However, at present, in addition to the four units which were already there, there are three more units which have been set up for the manufacture of complete cement plants in collaboration with reputed foreign firms. The delivery of complete cement plants is expected from the year 1962 onwards and, with the progress now made, there would be a capacity of fabrication of 9 plants per annum. According to the present-day prices, it is estimated that, on an average, a cement plant on the wet process with a capacity of about 600 tons per day would cost between Rs. 1.3 and Rs. 1.5 crore, involving a foreign exchange component of Rs. 40 to Rs. 50 lakhs. Two more parties, namely, Messrs. Walchandnagar Industries Ltd., Bombay and Messrs. Buckau Wolf New India Engineering Works Ltd., Pimpri have shown interest in manufacturing cement machinery in collaboration with Skoda and Krupp respectively.

Boiler Machinery

There are at present 8 licensed manufacturers producing boilers of different ranges from 600 lbs. per hour to 75,000 lbs. per hour. It is only the scheme of Messrs. A.V.B. that is specially licensed to take up the manufacture of boilers required for thermal power stations also. There is also a proposal to take up the manufacture of high pressure boilers in the public sector. Messrs. Texmaco will be supplying boilers fabricated indigenously to the co-operative sugar factories. Messrs. Indian Sugar and General Engineering Corporation Ltd., who are collaborating with Messrs. John Thompson, have also accepted orders for the supply of boilers to the various sugar factories and the production from this unit has already been started. The production from A.V.B. scheme at Durgapur is expected to start by the end of 1962.

Textile Machinery

The number of firms which have been licensed to manufacture the different major items of cotton textile machinery (complete) at present is as under:

Item of machinery	*No. of firms licensed under the Industries Act (as on 1-1-1962)*
Spinning	9
Weaving preparatory ...	3
Looms	12
Processing and finishing ...	22

The Government has granted licence for the manufacture of special type of art silk looms, both plain auto-types and automatic pirn winders. Regarding woollen machinery, one firm has been licensed for the manufacture of worsted spinning machinery, and this has already gone into production.

There are at present three firms engaged in the manufacture of modern jute mill machinery for spinning and preparatory section with a licensed capacity worth Rs. 350 lakhs per year. One firm namely, Messrs. Oriental Electric and Engineering Company, Calcutta, is now producing modern weaving section machinery, namely, broad looms and their installed capacity is 144 machines valued at Rs. 72 lakhs per year. Another firm, Messrs. Lagan Jute Machinery Co. (Pvt.) Ltd. Calcutta, has already been licensed for manufacture of one-mack automatic weaving machine with installed capacity of 1,080 machines per year on triple shift basis. It may be mentioned that it would be possible for the units which are now engaged in the manufacture of spinning machinery to switch over to the manufacture of weaving machinery, once the modernisation of the spinning section has been completed.

Coal Mining, Oil and Other Mining Machinery

The Coal Mining Machinery Project being set up at Durgapur in technical collaboration with Prommash-expot of U.S.S.R., initially conceived for a capacity of 30,000 tons of coal mining machinery items per annum valued approximately at Rs. 15 crores, will now be developed for a capacity of 45,000 tons valued at Rs. 24 crores. The plant is scheduled to be completed during the latter half of the third Plan. In addition to the above, manufacture of haulages, coal cutters and conveyors required by the coal mines has also been developed in the private sector. At present, there are five sizable units in the private sector, licensed to manufacture these items. These five units are expected to produce coal mining machinery valued at about Rs. 1.5 crore by 1965-66. It has been estimated that, to meet the needs of the new washeries as well as the replacement requirements of the existing washeries, there will be a demand for coal washery equipment valued approximately at Rs. 5 crores per annum. Accordingly, steps have been taken to create capacity for the manufacture of coal washery equipment. Two units in the private sector have already been licensed for the manufacture and installation of complete coal washery plant. These units, which are in collaboration with a leading U.K. and a U.S.A. firm, respectively, will also undertake to do a turn-key job. These two units are likely to be in a position to deliver two or three complete coal washeries per year. The first indigenous coal washery could be put into operation by 30th June 1964, provided firm order in this respect is placed by January 1962.

Structural Fabrication and Cranes

This industry is, perhaps, the oldest organised industry in India. It has so far progressed steadily and at present there are as many as 158 firms producing steel structurals with a total installed capacity of about 4 lakh tonnes per annum. In addition, some more schemes have been licensed/recommended for licence (about 140 units) under the Industries (Development and Regulation) Act 1951. Thus, the projected capacity comes to about 7.5 lakh tonnes per annum. The need for electric overhead travelling cranes and dockside cranes has increased immensely, due to rapid industrial activity in the country. The industry has progressed steadily, and today the existing installed capacity comes to approximately 12,000 tonnes per annum by 7 firms, while the capacity licensed/approved is in the neighbourhood of 9,000 tonnes per annum, making a total of about 21,000 tonnes per annum. At present, indigenous crane manufacturers are heavily booked with orders and they are finding it impossible to cope with the country's total requirements. It is, therefore, imperative that further capacity in the manufacture of Heavy E.O.T. and Port Cranes is created as quickly as possible.

Tractors and Earth-moving Equipment

The agricultural tractors industry may be said to have just come into the picture, although a licence under the Industries (Development and Regulation) Act, 1951 had been issued in favour of a firm in Madras as long ago as 1955. In 1959, the firm, one in Bombay and the other in Faridabad, were licensed for the manufacture of tractors in 12/18 D.B.H.P. range for a capacity of 1,250 numbers each. The following firms have since been licensed for capacities indicated against each:

Eicher Tractor Corporation of India Ltd., Faridabad—2,000 Nos. (for tractors in the 12/18 and 20/30 D.B.H.P. range.

Tractors and Bulldozers(P) Ltd., Baroda—2,000 Nos. (for tractors in the range of 35 D.B.H.P. and above.

Tractor and Farm Equipment Ltd., Madras—3,500 Nos. (for tractors in 20/30 and 35 D.B.H.P. and above.

Mahindra and Mahindra Ltd., Bombay—3,500 Nos. (for all three ranges).

Ghaziabad Engineering Ltd., New Delhi—3,500 Nos. (upto 35 D.B.H.P.).

Of the above, Messrs. Eicher Tractor Corporation have gone into production since September 1960 at the rate of about 50 tractors a month (in the 26/27 D.B.H.P. range). They have also started producing agricultural implements to go with the tractors manufactured by them. Messrs. Tractors and Bulldozers are expected to go into production by the middle of this year. Messrs. Tractor and Farm Equipment Ltd. are taking steps to import their plant and machinery at an early date. In the case of Messrs. Mahindra and Mahindra Ltd. their collaboration with Messrs. David Brown of U.K. has fallen through and the party has finalised their negotiations with the International Harvester Company of U.S.A. In principle, the change of collaboration has been agreed to. Besides the above, one independent unit has also been licensed for the manufacture of tractor-drawn agricultural implements, namely, Messrs. Marshall Sons Company (India) Ltd., Calcutta, for a capacity of 200 and 400 Nos. of ploughs and cultivators respectively. It has now gone into production. To encourage the manufacture of tillers, which are also sometimes called "walking tractors" the following three firms have been approved for the capacities indicated against each:

	Per annum
East Asiatic Co (I) Ltd., Bombay	24,000
Testeels Ltd., Bombay	1,200/6,000
Engineering Developments (P) Ltd., Calcutta	1,200

As for earth-moving machinery, the following firms have been licensed for the manufacture of specified items: Hindustan Motors Ltd., Calcutta; Tata Engineering and Locomotive Company Ltd., Jamshedpur; Tractors and Bulldozer (P) Ltd., Bombay; Automobile and Agriculture Industries Corporation, Bombay; and Farm Equipment Co., Kanpur. All these firms have been licensed recently and some of them are yet in the process of taking effective steps. It may be said that the industry is yet in its very early stages. The targets have been tentatively laid as under for 1965-66:

Crawler tractors	500 Nos. per annum
Dampers and scrapers	500 " " "
Shovels	100 " " "

As for the roller industry, its target is fixed at 700 machines per annum by 1965-66. Messrs. Jessop & Co., Messrs. Britannia Engineering Company, and Messrs. Agrind Fabrications (all from Calcutta) have been licensed for the manufacture of 8/10 tons capacity road rollers for capacities of 150/200 Nos., 120 Nos. and 144 Nos. respectively. Both Messrs. Jessop & Co. and Britannia Engineering Company have recently been permitted to increase their capacities from 200 Nos. to 380 Nos. per annum and 120 Nos. to 300 Nos. per annum, respectively. Besides the above, a firm in Bombay, namely, Messrs. Kamani Engineering Co., has proposed to undertake the manufacture of a chassis on which, when a standard agriculture tractor like Ferguson would be mounted, the whole machine would become a road roller of 4/5 ton capacity. Very recently a firm in Madras—Messrs. Garlick & Co., has been licensed for the manufacture of smaller sizes of vibrating type of road rollers for a capacity of 100 Nos. per annum.

Chemical Plant and Solvent Extraction Plants

There are about 60 firms licensed for chemical machinery manufacture, a very large number of which are already in production with a total licensed capacity of Rs. 16 crores per year. These units, on full implementation of their schemes, are likely to be in a position to supply complete plants, as indicated below:

Sulphuric acid plant	12 plants per year
Superphosphate plant	9 "
Caustic soda plant	2 "
Nitric acid plant	2 "
Bleaching powder plant	1 "
Chlorine plant	1 "
Carbon disulphide plant	1 "
Fertiliser plant	1 "

Besides the above complete plants, these units will also supply numerous individual items of chemical machinery like pressure vessels, distillation stills, crystallisers, neutralisers, vacuum pans, evaporators, etc. As regards nitrogenous fertiliser plant, only one party has so far been licensed for the manufacture and supply of a complete plant. However, even at present, firms like Simon Carves, against their own designs and drawings, are getting approximately 40 per cent of the plant fabricated by different Indian firms of their choice.

(*Continued on page 258*)

TABLE I. *Production of Machinery and Equipment in 1961 and Third Plan Targets*

Industry	Production 1961 (Rs. crores)	Tentative estimated production 1965 (Rs. crores)
A. *Industrial machinery and equipment other than electrical:*		
Paper-making machinery ..	0.40	7.00
Sugar mill machinery	4.50	16.00
Cement machinery	1.10	8.00
Boiler machinery	0.63	30.00
Textile machinery:		
(i) Cotton art silk and woollen textile machinery ..	11.20	25.00
(ii) Jute mill machinery ..	2.54	2.70
Coal mining, oil and other mining machinery and equipment:		
(i) Coal mining, oil and other mining machinery etc. ..	0.30	15.00
(ii) Coal washeries	Neg.	
Structural (fabrication) and cranes:		
(i) Structurals	25.00	100.00
(ii) Cranes	1.50	15.00
Tractors and earth-moving equipments:		
(i) Agricultural tractors and implements	0.20	15.00
(ii) Earth-moving machinery and equipments ..	Nil	17.50
(iii) Road rollers	2.00	3.00
Chemical plants and solvent extraction plants	2.36	20.00
Power driven pumps	3.40	5.00
Diesel engines	8.50	30.00
Printing machinery	0.07	2.00
Dairy machinery	0.19	2.57
Gear industry	0.13	2.10
Building and construction Machinery	1.50	4.00
Tea processing machinery ..	1.80	2.25
Machine Tools	12.00	45.00
Compressors	2.50	5.00
Industrial flour mill machinery.	Nil	0.30
Ceramics and refractory ..	0.08	0.60
Rayon plants	Nil	4.00
Weighing machines	0.85	1.50
Locomotives, wagons and railway equipment:		
(i) Locomotives	13.00*	Programme not yet fixed
(ii) Railway wagons ..	12.40	20.00
(iii) Coaches	2.90†	5.70
(iv) Railway stores and equipment	21.64†	61.50
Conveyors and other material handling equipment	2.60	8.70
Steel plant machinery	Nil	5.00
Total ..	135.29	479.42‡
B. *Electrical machinery and equipment:*		
Electric motors	9.96	25.00
Transformers	10.68	20.00
Switch gear and control gear ..	5.00	15.00
Cables and wires	31.61	78.00
Heavy electrical machinery and equipment	Nil	25.00
Total ..	57.25	163.00
Grand Total (A & B)..	192.54	642.42‡

* Pertains to 1959-60.
† Pertains to 1960-61.
‡ Excluding Locomotives.

NEW PRODUCTS AND PROCESSES

Cheap Method of Iron Production

A METHOD of producing small quantities of iron cheaply has been developed in Mexico. A gas, consisting mainly of carbon monoxide and hydrogen, is prepared first. The gas is then heated to 1,500 degrees Fahrenheit and mixed with 20 per cent of its volume of air pre-heated to the same temperature. The mixture is burned to produce a gas at 2,000 degrees Fahrenheit, which is then passed through a bed of iron ore contained in a reaction chamber, to reduce it to sponge iron. Conversion of ore to sponge iron (85 per cent) takes place in 3½ hours. Low grade material as well as expensive concentrates can be used and costs for installing plant of this type are considerably lower than those for blast furnaces.

Ready-mixed Resin

A ready-mixed epoxy resin with an indefinite "pot life" has been developed by an American manufacturer. The epoxies usually have to be mixed on the job and used quickly since the hardener begins to work on the plastic at once. The new ready-mix has what the company calls a "molecular sieve" to keep resin and hardener from contact. The "sieve" is a fine powder which absorbs and holds the hardener. The treated powder and resin can thus be mixed and supplied in the same tin. To use, heat or moisture is applied to drive the hardener out of the powder particles. The mixture is then stirred for a few minutes to make contact between hardener and resin and the epoxy is ready for use.

Heat Resistant Wrapping Papar

The development of a special kind of wrapping paper which is heat-sealing and will keep in aromas yet keep out moisture, fat and light has been announced by a Swiss company. Made in four separate layers—paper, a plastic material, chlorinated rubber and another, harder plastic—its chief usefulness will be in the packaging of foodstuffs, pharmaceutical preparations and materials, such as photographic paper, that are sensitive to light.

New Refractory Material

Two new grades of refractory material have been developed in Hungary. They consist of an expanded perlite base with a ceramic bond, and have been given the name 'Rioporit.' One type can be used advantageously at 900°C, while the other will withstand heat even as much as 1350°C. Both varieties have a heat insulating property, claimed to be superior to similar Hungarian and foreign refractories. At the same time, their manufacture is cheaper, while their strength—despite their inferior gravimetric density—is much higher than that of any similar refractory material. Owing to its low gravimetric density, the finished product is more economical than any other material, as an equal grade of effective insulation can be obtained with a thinner layer.

Plastic Foil Production Line

Operation tests have begun in Hungary with a new-type plastic foil production line designed by the experts of the Budapest Machine Planning and Technical Office. It is capable of rolling the soft mass of material fed into it, down to a finished product of, say, 0.1 mm thickness and the thickness of the foil is electrically controlled. The work is forwarded automatically into the pattern printer, into the control table and finally past the coiling equipment. The finished printed coils can be lifted off at the end of the production line ready to be packed. Human labour is eliminated except for the preparatory aggregates, the composition of the material according to the specification required each time, and for filling the mixer.

Vacuum Process for Steel Melting

New equipment for melting steel by the vacuum process, the largest of its type in Europe, has been installed at a Sheffield steelworks. It is capable of producing ingots of up to 30 inches in diameter and 20,000 lbs. in weight. The vacuum process produces ingots of low gas content, giving freedom from hairline cracks, a high degree of cleanness and a greatly improved distribution of the constituent elements giving improved mechanical properties at the centres of large forgings. The plant will be used for the production of forgings and rolled products in tool and die steels. It will also be of particular importance in the production of super quality steel rolls used for cold strip and foil rolling which the company export all over the world. The process involves the use of consumable steel electrodes produced by conventional means. The electrodes are in the composition ultimately desired in the finished steel product and are remelted in a water cooled copper crucible under vacuum by striking an arc between the bottom of the electrode and a steel pad in the bottom of the mould using a high amperage, low voltage, direct current.

'BEHAR' the dependable name in FIRECLAY & SILICA Refractories

For over 25 years "BEHAR" REFRACTORIES are being used by leading Iron and Steel Works, Cement and Glass Factories, Tea Industries, Sugar and Cotton Mills and other Industries in the country.

Colour Printing on Textiles

A machine for colour printing on textiles, built by a Lancashire firm, Woods Engineers (Ramsbottom) Ltd. comprises two colour units, running in tandem, which can either print in eight colours on both sides of the material (Duplex) or in sixteen colours on one side. Each unit has eight printing stations arranged around a circular bowl 8 ft. (243.84 cm) in diameter and 5 ft. 3 inches (160 cm) in width. Maximum textile width which can be accommodated is 4 ft. 8 inches (142.24 cm). For Duplex work the material is first printed on the reverse side on one bowl and then on the face side on the other bowl. For 16-colour printing on the face side the material is passed round the two bowls in succession. To convert from one printing style to another the connecting drive between the two units must be adjusted.

High Speed Paper Feeder

A British firm, which is now a member of the Crabtree Group of companies, has developed the style 3 machine for feeding a continuous stream of paper sheets on to their standard folders, without the delays involved in normal pile feeding. Different variations of the model can accommodate many sheets sizes including Crown, Medium, Double-Demy, Double-Royal and Quad Crown. The machine comprises two platforms arranged above one another and linked by a cylinder at the back. On the top platform there is a single setting guide for different sizes and, when this has been adjusted, the sheets are loaded on to the feed station and spread down in fan formation. They are then fed on belts to the cylinder, which is surmounted by spring-loaded detecting fingers for maintaining an even flow of fanned paper to the lower platform; the fingers have rubber wheels between them to minimise the effects of friction. On the lower platform there is an assembly with two built-in paper-holding wheels. The rear wheel exerts heavy pressure on the bulk of sheets at the back, whilst the forward one exerts lighter pressure on the others in front. This ensures that sheets are not blown back on top of the ones beneath it. The sheets are automatically separated for delivery to the folder by a perforated suction wheel which comprises a carbon shoe to eliminate lubrication and soiling of material. The supply of air is controlled by a quadrent at the side of the machine by which the angle of the air stream can be altered. A sensitive feeder finger, linked to the progression of single sheets, controls the movement of the belts carrying the whole pile forward.

Oil as Carrier for Injections of Solids

Experiments in techniques which could lead to more economic working of blast furnaces, together with increased control over quality, have started at the Ebbw Vale, Wales, Works, of Richard Thomas and Baldwins, Ltd. Believed to be the first of their kind carried out anywhere in the world, they involve the use of oil as a carrier for injections of solids such as fine coal, flue dust and powdered limestone. The materials are mixed with oil and then injected into the furnace at the tuyeres through a modified version of the stainless steel lances used for oil injections. This method is considered to be less costly than other systems on which experiments have been carried out elsewhere.

It has long been the aim to use coal in blast furnaces but charging raw coal at the furnace top leads to single "clogging" of the burden so that gases cannot pass through it and control over the furnace is lost completely. For this reason coke was chosen as a substitute for charcoal as a fuel for the modern blast furnace.

By adopting the injection technique, the furnace operator will be able to substitute a proportion of the coke charger with coal. Low grade and cheaper coals can be used instead of the high grade and expensive coking coals which are becoming increasingly difficult to obtain.

Lime addition at the tuyeres is attractive because it offers the possibility of immediate control over the constitution of the slag, which in turn affects the quality of the iron topped. The present method of regulating slag quality is by the addition of limestone at the furnace top, which means that it takes at least 12 hours to become fully effective.

Cutting Textile Label

A Dutch firm markets a new type of fully automatic machine for cutting textile labels. The machine and its ancillaries were designed in particular for hot-cutting printed and woven labels made from thermoplastic synthetic yarns such as acetate silk and nylon. In this way hot-cut labels are given a selvedge which cannot fray, which results in a considerable saving in time and material when the labels are sewn in. Other possible applications of the machine are cutting and pinking all kinds of woven and printed textile labels and cutting ribbon and tape. By means of a simple printing device that can be supplied as an accessory, size numbers, code numbers, prices, etc. can be printed on the labels as they are cut. For the above jobs the machine can cut labels and ribbon from 10 mm to 95 mm wide to lengths of from 30 mm to 200 mm. The dimensions of the compactly designed and easy-to-operate machine are: height 500 mm (19¾"), width 500 mm and depth 250 mm. Complete with accessory equipment, it weighs approximately 100 kg. (220 lbs.).

FAIR PRICES FOR CAUSTIC SODA AND ALLIED PRODUCTS

TARIFF COMMISSION'S RECOMMENDATIONS

THE Government of India has accepted the recommendations of the Tariff Commission regarding fair ex-works ceiling prices for caustic soda, chlorine and hydrochloric acid. It has, however, modified the proposal in regard to the selling price for bleaching powder. Accordingly, the revised prices (per 50 kgs. ex-works) are Rs. 36 for fused solid caustic soda (technical grade conforming to I.S.I. specification), Rs. 31 for lye (100 per cent NaOH content), Rs. 41 for caustic soda flakes, Rs. 21.85 for liquid chlorine, and Rs. 9.70 for hydrochloric acid. The price of bleaching powder has been fixed at Rs. 28.50 per 50 kgs., as against Rs. 30.15 recommended by the Commission. Ceiling prices for caustic soda solid and flakes will be *pro rata* higher for every one per cent purity above 96 per cent NaOH to provide for the sale of rayon grade caustic soda. These prices are for purchases ex-factory either directly or through agents or distributors of the manufacturers and are exclusive of all levies, Central or State. They have become effective from the 1st inst. and will be valid upto the end of December 1964.

The producers of caustic soda are not satisfied with the revised price structure. While they have been awaiting a marked rise in prices in view of increasing cost of production, the new prices are either only slightly higher than the previous levels or even lower in some cases. Thus, ex-works selling price of caustic soda lye has been raised by just 6 nP to Rs. 31 per 50 kgs. The price of fused solid caustic soda has been stepped up apparently by 8 nP to Rs. 36 and that of flakes by 24 nP to Rs. 41. But, while their old prices were fixed on the basis of 95 per cent purity, the revised prices are based on 96 per cent purity, which is more than neutralises the increase. While the price of liquid chlorine has been increased by 5 nP to Rs. 21.85, that of hydrochloric acid has been reduced by 91 nP to Rs. 9.70. It must be admitted that the fixation of the price of a commodity like caustic soda is very difficult in view of the conflicting objectives, namely, the need for giving incentives to the development of the industry and the claims of consumers for lower prices.

Objectives of Pricing Policy

The broad objectives of the pricing policy is outlined by the Tariff Commission as follows:

"(a) Existing units must maintain production at the highest possible level consistent with proper maintenance of plant and machinery; (b) while low cost units should be given sufficient inducements to expand, the high cost units should be encouraged to make the best of their resources to expand and reduce their costs; (c) chemical caustic soda units, the cost of production of which is higher than those units operating the electrolytic process have nevertheless been allowed by Government to expand their annual capacity from 6,710 tonnes in 1958 to 34,300 tonnes in 1961. An additional capacity from 3,190 tonnes is likely to be commissioned in 1964. The third Plan has laid down the following relative shares of caustic soda, process-wise, by 1965-66: chemical caustic soda 50,000 tonnes and electrolytic caustic soda 350,000 tonnes. Since expansion of production of chemical caustic soda is being allowed under official sanction, our prices must be such as will not impair its capacity for production, provided the units are run efficiently.

"(d) Chlorine is a joint product in the electrolytic process of manufacture of caustic soda. Although offtake of chlorine has improved substantially in recent years, its production will shortly rise to a level which will leave a burdensome surplus with several producers. In the circumstances, positive encouragement should be given to establish more industries based on chlorine. For this purpose, it is desirable to maintain the price of chlorine at a sufficiently low level and the incidence of short realisation, if any, from chlorine will have to be loaded, for sometime to come, on caustic soda. (e) Since it is desirable in the national interest to economise in fuel and mild steel sheets for packing solid caustic soda, the difference between prices of liquid and solid caustic soda should be such as will not only prevent diversion of production to fused caustic soda, but also stimulate production and consumption of liquid caustic soda. (f) The importance of avoiding an undue rise in the price of a basic industrial raw material like caustic soda cannot be overemphasised. Having regard to the interests of the consumers, on the one hand, and the need on the other to secure maximum output of the industry, the prices of the next few years have to be determined on a balance of considerations."

Ex-works Prices of Caustic Soda

(Value in rupees per tonne)

	Mettur	Dhrangadhra	Tatas	
			Electrolytic	Chemical
Production (in tonnes) ..	7,600	38,000	4,210	6,540
Raw materials	105.22	61.95	67.16	387.78
Power and fuel	209.68	120.58	459.44	147.85
Other conversion charges ..	102.98	97.02	177.13	100.33
Depreciation	80.85	102.60	94.69	98.23
Packing	52.62	57.58	51.55	51.55
Cost of unutilised chlorine ..	40.92	130.11	9.15	..
Total ..	652.27	569.84	859.12	785.24
Less credit	136.35	122.65	265.83	22.11
Total works cost ..	515.92	447.19	593.29	763.13
Contingencies	20.00	20.00	20.00	20.00
Return	80.88	109.80	121.21	138.72
Fair ex-works price per tonne ..	616.80	576.99	734.50	921.85
Fair ex-works price per 50 kgs. ..	30.84	28.85	36.73	46.09

The Commission has worked out fair ex-works prices for the various units on the basis of their cost studies. Caustic soda, it may be noted here, is a protected industry (*vide* page 1050, *Commerce* dated 2nd December 1961). The costs of production, however, shows wide divergence from unit to unit, depending on the size, location, process of manufacture adopted, etc. As regards the cost of salt (the main raw material for electrolytic caustic soda), the units which own salt works or have salt at the site are at an advantage. This explains the reason for the low cost of raw materials for Tatas and Dhrangadhra and, to some extent, for Mettur. As regards, power, Mettur and Dhrangadhra (not to mention other units in the south like Travancore-Cochin Chemicals) have the advantage of a low tariff on power. The cost of coal for generation of power by Tatas and D.C.M. is high and this accounts for the high incidence of cost of power and steam in their case. A scrutiny of the figures of costs of the several producers also indicates that units using mercury cells have potentialities for production of caustic soda at low cost. In their case, caustic soda in 50 per cent NaOH concentration is obtained from the cell house itself and is marketable without further processing, whereas in the case of producers, who use diaphragm cells, weak liquor (8 to 11 per cent NaOH concentration) has to be evaporated and made into thick liquid (of 50 per cent NaOH concentration) in order to make it a marketable product. Though the initial cost of investment for mercury cells is higher than that for diaphragm cells, the conversion charges in the latter process upto the stage of producing 50 per cent NaOH concentration are higher. The only apparent disadvantage would seem to be that mercury, which is essential for the mercury cell process, is imported and might, in an emergency, prove to be bottleneck unless the concerned units resort to stock-piling. Marked divergence in the figures of depreciation is mainly attributable to factors, such as, age of plant, capacity and output, type of equipment installed, etc. Similar variations are reflected in the capital employed computed for each unit for the reason that in addition to the variations in the amount of net block for the several units, working capital element is also different depending upon the cost of production of the units concerned.

Apart from the works cost of the products, the Commission has provided margins for contingencies and fair return on capital. As regards the margin for contingencies, it has maintained it at Rs. 20 per tonne for caustic soda in its three forms, lye, solid and flakes, and also for bleaching powder. The margin is only Rs. 10 per tonne each for hydrochloric acid and liquid chlorine. The Commission considered an alternative, namely, that of incorporating a suitable escalator clause to take care of probable increases in the prices of materials and other elements of cost. But it has rejected the proposal on the score that it will be administratively very difficult, if not impossible, to adjust the escalator clause periodically. In respect of the return on capital employed. the Commission considers 12 per cent as adequate at the current level of taxation on profits, interest on borrowings, bonus, etc. According to the Commission, some units will be able to earn more than the 12 per cent return. The Commission has urged such units to conserve the surplus earnings and plough them back for rehabilitation of their machinery, modernisation or expansion of capacity, or for diversified utilisation of chlorine within the unit itself. The capital employed has been estimated in each case here as equivalent to the average net value of assets *plus* the working capital assessed at an amount equal to five months' cost of production exclusive of depreciation. The plea of the industry for a rehabilitation allowance has been rejected by the Commission, as in the case of soda ash industry.

The initial product of caustic soda is a lye form of the chemical which is processed further to produce fused solid caustic soda or caustic soda flakes. Since sales take place mostly in the form of solid caustic soda, it is treated as the base for the purpose of fixing prices for other forms. The table in column one bottom shows how the fair ex-works price of fused solid caustic soda is arrived at in respect of some of the major representative units. The average ex-works selling price of fused solid caustic soda is worked out by the Commission at Rs. 35.71 per 50 kgs., which is lower, as compared with the then-prevailing price of Rs. 35.92. The Commission, however, has fixed the price at Rs. 36, "lest a cut in price should act at the present juncture as disincentive to further flow of capital to the industry."

Bleaching Powder

The fixation of price in respect of bleaching powder deserves a detailed examination. Three units, namely, Mettur Chemicals and Industrial Corporation Ltd., Rohtas Industries Ltd. and Tata Chemicals Ltd. were producing bleaching powder in 1958. Of these, Tatas discontinued production of bleaching powder in 1960. Rohtas Industries which produced bleaching powder intermittently to meet local demand is not likely to utilise its capacity for bleaching powder in future. Thus, Mettur remains virtually the only unit at present producing stable bleaching powder on a regular commercial scale. Its annual productive capacity based on a stream efficiency of 85 per cent works out to 8,400 tonnes for stable bleaching powder. The Company operates its old unstable bleaching powder plant only to the extent necessary for disposal of sniff gas from its liquid chlorine plant. Its production since 1958 was as follows:

(In tonnes)

	Stable	Unstable	Total
1958	3,768	1,787	5,555
1959	3,308	1,239	4,539
1960	5,393	283	5,676
1961 (January-June) ..	3,167	Nil	3,167

Licences for establishing additional capacity for bleaching powder to the extent of 28,500 tonnes a year have been issued. The Development Wing has, however, stated that as foreign exchange for these projects has not so far been released, it is difficult to forecast when these schemes would materialise. Particulars of licences granted are as follows: D.C.M. Chemicals Works, Delhi, for 10,160 tonnes per annum (stable), Bangur Bros., Berhampur, for 8,280 tonnes per annum, Dhrangadhra Chemical Works Ltd., Sahupuram, for 10,060 tonnes (high test hypochloride).

The Commission has worked out a fair selling price for bleaching powder at Rs. 26.30 per 50 kgs. packing, but has recommended the maintenance of the price at the previous level, that is, Rs. 30.15 per 50 kgs. as, otherwise, the existing unit may not have sufficient incentive to expand its production. The Government, however, has felt that the incentive suggested is on the high side and fixed the price, instead, at Rs. 28.50 per 50 kgs.

INDO-BULGARIAN TRADE

Talks between a trade delegation from Bulgaria and the officials of the Government of India have come to a close with the conclusion of a protocol indicating new schedules of goods available for trade between the two countries for the year 1962. The protocol was signed by Mr. Dragan Draganov, leader of the Bulgarian delegation, and Mr. B. N. Adarkar, Joint Secretary, Union Ministry of Commerce and Industry. In the course of the discussions, the two delegations reviewed last year's trade and the steps to be taken to develop trade between the two countries to a comparatively higher level during 1962. The volume of trade during 1961 is estimated to be about Rs. 2 crores both ways.

The commodities to be imported into India will continue to include capital goods and machinery items, steel materials, chemicals and other industrial raw materials, fertilisers, machine tools, cable, bleached wood-pulp, etc. Exports from India, on the other hand, will be rolled steel products, cotton and woollen fabrics, leather footwear, tinned fruits and juices, tinned fish and prawns, coir products, wood screws, diesel engines, air compressors, spectacle-frames, rubber goods, asbestos manufactures, coke-oven by-products, railway wagons, jute manufactures, linoleum, sports goods, handicrafts, chemicals, deoiled cakes, drugs and medicines, tanned and semi-tanned hides and skins, etc., apart from other traditional goods like tea, coffee, spices, cashew kernels, essential and vegetable oils and mica.

INSECTICIDES INDUSTRY

CAPACITY EXPANDS, BUT OUTPUT LOW

AMONG the number of chemicals that are employed, either alone or mixed, to destroy or check the growth and multiplication of insects and other pests on agricultural crops, seeds, timber, textiles, hides and skins, etc., insecticides and fungicides are the most important. There was slow but steady progress in the manufacture of pesticidal chemicals and formulations during the second Plan period. The capacity established for pesticidal formulations was adequate to meet the country's entire demand, but actual production remained low, on account of insufficient imports of technical materials. Indigenous production of pesticidal chemicals is confined at present to benzene hexachloride, D.D.T., copper oxychloride, ethylene dibromide and zinc phosphide. The output of these chemicals has also not been adequate to meet full internal demand. Imports have, therefore, been made, from time to time.

The figures of production of pesticidal chemicals and their formulations are given in the table below:

(In tonnes)

	1957	1958	1959	1960
B.H.C.	1,886	3,129	3,069	3,891
D.D.T.*	810	2,114	2,575	2,821
Copper oxychloride	155	600	398	595
Ethylene dibromide	13	25	14	11
Zinc phosphide	..	..	..	105
Organo mercurials	..	..	..	8
Pesticidal formulations:				
Solid	N.A.	18,121	21,224	22,681
Liquid	N.A.	1,517	1,852	1,929

* Production figures relate to financial year instead of calendar year.

From the above table, it is clear that, while production of B.H.C.; D.D.T. and all pesticidal formulations have been gradually increasing, the output of ethylene dibromide and copper oxychloride has not been steady, owing to shortage of copper and bromine. Besides B.H.C. and D.D.T., there are other important technical materials, such as endrin, chlordane, heptachlor, parathion, malathion, ED/CT mixture, 2: 4-dichlorophenoxy acetic acid, 2: 4: 5-trichlorophenoxy acetic acid, M.C.P.A. and thiocarbamates, which are used in large quantities for the control of insect pests. With a view to achieving self-sufficiency in agricultural chemicals, schemes for the manufacture of some of these have already been approved and production is expected to commence during the course of the third Plan. The raw materials necessary for their manufacture will be mostly available from internal sources, but those which are non-indigenous will be imported. The required foreign exchange will be earned by export of the chemicals and their formulations.

The following table gives targets of demand, capacity already in operation, capacity under implementation and the gap, which has yet to be filled, steps taken to fill the gap have also been indicated in the footnotes:

(In tons)

	Targeted demand by 1965-66	Capacity already in operation	Capacity under implementation	Gap between demand and capacity so far approved
Chlorinated Hydrocarbons—				
B.H.C.*	15,000	3,000	2,700	8,400
D.D.T.†	6,000	2,800	..	3,200
Endrin, chlordane heptachlor, etc.‡	900	Nil	800¶	100
Organo Phosphates—				
Parathion	500	Nil	700	Nil
Malathion	500	Nil	190	310
Fumigants—				
Ethylene dichloride for ED/CT mixture	7,500	Nil	3,620	3,880
Ethylene dibromide	250	106	360	Nil
Calcium cyanide	200	Nil	Nil	200
Fungicides—				
Copper oxychloride	2,000	2,284	Nil	Nil
Ditho carbamates	250	Nil	2,500	Nil
Seed dressings—				
Organo mercurials	100	46	45	9
Weedicides—				
2:4-D; 2: 4:5-T; M.C.P.A. and others	1,500	Nil	1,562	Nil
Rodenticides—				
Zinc phosphide and others §	750	100	150	500

* Hindustan Insecticides Ltd., Alwaye, is planning for a unit with a capacity of 3,000 tons.
† Hindustan Insecticides Ltd., is planning for expanding the capacity of Alwaye and Delhi units by 1,800 to 1,900 tons.
‡ Terms of collaboration are still under consideration.
§ Formulations or technical material equivalent to 200 tons of parathion will be exported to pay for the imported raw material.
¶ One of the units will operate three shifts to cover the gap.
One of the units is planning to operate three shifts to reduce the gap to just 300 tons.

Most of the schemes envisage foreign collaboration. The imported plant and machinery is being arranged against foreign capital participation and the collaborators are also assisting in arranging exports of a part of the output to pay for imported raw materials.

The formulating capacity approved at present far exceeds the availability of "active" materials/chemicals. This explains the temporary ban imposed on further licensing of "scheduled" formulating capacity.

The State-wise distribution of formulating capacity in terms of technical materials is indicated below:

(In tonnes)

B.H.C.: Maharashtra 4,790; Kerala 2,000; W. Bengal 1,640; Madras 1,000; Rajasthan 170; Gujarat 10. Total 9,600.

D.D.T.: Maharashtra 1,864; Kerala 1,485; W. Bengal 480; Madras 375; Rajasthan 62; Delhi 1,320. Total 5,586.

Copper oxychloride: Maharashtra 1,950; Kerala 1,324; W. Bengal 53; Madras 252; Gujarat 3. Total 3,557.

Lindane: Maharashtra 31; Kerala 1; W. Bengal 1; Madras 24; Rajasthan 3; Gujarat 2. Total 62.

Chlordane: Maharashtra 104; Madras 60; Gujarat 6. Total 170.

Endrin: Maharashtra 199; Madras 36; Rajasthan 5; Gujarat 1. Total 241.

Aldrin, dieldrin, etc.: Maharashtra 86; Madras 96; Rajasthan 8. Total 190.

Parathion: Maharashtra 91; Madras 120; Gujarat 3. Total 214.

Malathion: Maharashtra 39; W. Bengal 15; Madras 134; Rajasthan 25. Total 213.

Others: Maharashtra 689; Kerala 142; W. Bengal 200; Rajasthan 110; Gujarat 1; Mysore 10. Total 1,452.

It will be seen from the above that there has been concentration of formulating capacity in certain regions in the country. This means transportation of large quantities of formulated materials to consuming centres. The demand of pesticidal formulations, however, is distributed more or less evenly, over the length and breadth of the country. In view of this, the Small-scale Industries Organisation is planning to put up one or two small-scale formulating units in each State. The ultimate total capacity of these new units will be around 3,000 tons per annum in terms of technical materials.

CAMERA INDUSTRY IN JAPAN

PRODUCTION AND EXPORT CONTINUE TO RISE

PERHAPS, not many people in the world love photography better and are more particular about the cameras they own than the Japanese. Furthermore, the Japanese are born with highly dexterous hands. These two traits—the love of photography and manual dexterity—have raised the Japan-made cameras to the world's top level in a short time. The industry enjoyed prosperity in 1960, as production and exports increased and domestic sales remained strong.

Japanese camera manufacturers did not attain their present technical level, which is the highest in the world, in a single day. Only through constant research work was this feat made possible. The highly automated camera industry is turning out cameras of high quality and attractive design at competitive prices. Since American news cameramen acknowledged the superior quality of "made-in-Japan" cameras during the Korean War, Japanese cameras have been steadily securing a firm niche in the international market.

Distinctive Features

What, then, are the characteristics of Japanese cameras? The distinctive features of Japanese cameras seem to reflect themselves most clearly in the penta-prism single-lens reflex camera. As far as single-lens reflex cameras with focal planes are concerned, the Japanese camera industry holds an unchallenged position in the world. While the high performance achieved by Japanese cameras is primarily due to superior lens, it must be remembered that the mechanical excellence of the shutter and the body is also an important contributing factor. Now that the quality of sensitised materials, as well as camera lens, has been improved considerably, the performance of the shutter becomes highly important in evaluating the performance of cameras. In 1958, a shutter with a speed of 1/2000 second was manufactured for the first time, and recently it has become possible to manufacture shutters with a speed of 1/3000 second. Lens shutters for 35 mm. single-lens reflex cameras have also been developed. Wink-return shutters, which fully open up to allow a peep at the finder image after exposure, have also been adopted. Even the single-lens reflex cameras using lens shutters have been provided with the quicker instant-return mirror system like focal plane cameras. Incidentally, the instant-return mirror system for single-lens reflex cameras was designed for the first time in Japan.

As for the "electric eye" shutter mechanism, the Japanese camera industry has cultivated a unique and original sphere. Japanese EE lens shutters can move at speeds ranging from 1 second to 1/1000 second. The provision of built-in exposure meters has come into vogue lately. They are either semi- or fully-automatic. Most of them are light-sensitive cadmium sulphide light meters which are operated with mercury batteries. They are not commonplace as yet in the United States or West Germany, although a very few German and Swiss camera makers have adopted this system. These meters are effective in taking the pictures of low-illuminated objects. At present 35 mm. cameras provided with lens shutters are attached with very bright lens such as F:0.95.

Speaking of camera lens, Japan is the producer of the world's brightest lens. It has succeeded in post-war years in manufacturing glass of high refractive index and low dispersion containing rare earth elements such as lanthanum and thorium and at the same time glass of low refractive index and high dispersion. Today, the Japanese optical industry is capable of offering more than 100 different varieties of optical glass. The use of electronic computers has made immense contributions toward great progress in lens designing. It has helped shorten the time and work required for designing and also honing the accuracy of lens. Zoom-lens 8-mm. movie cameras with "electric eyes" are another field in which the Japanese camera industry takes great pride.

According to the Ministry of International Trade and Industry, the production of still cameras, 8-mm. and 35-mm. movie cameras and lens has gone up quite markedly in recent years, as is evident from the following figures:

Production (in units)

Year	Still cameras	Movie cameras	Lens
1956	1,306,700	..	72,000
1957	1,545,200	51,000	345,000
1958	1,385,100	204,000	557,000
1959	1,844,000	278,000	582,000
1960	1,859,000	594,000	690,000

The 1960 production of cameras, projectors (alide and movie), lenses and accessories was valued at $91.7 million, an increase of 21.5 per cent over 1959. The most significant increases were shown by movie cameras, mainly 8-mm., up 127.8 per cent to $19.4 million; 8-mm. movie projectors, up 44.2 per cent to $4 million; and interchangeable lenses, up 37.5 per cent to $7.7 million.

Japan's domestic sales of cameras, lenses and projectors aggregated $41.3 million, slightly higher than the $39.3 million in 1959. Single-lens reflex cameras were most popular. It is estimated that roughly 12 million cameras are being used in Japan today. Japanese cameras still monopolise the domestic market, because their design and prices are suitable to the Japanese. Imports of foreign cameras are on the uptrend, but they share less than one per cent of the Japanese domestic market. On the customs clearance basis, they amounted to $270,000 in 1953, $227,000 in 1959, $487,000 in 1960 when imports of cameras were liberalised.

Exports

The Japanese camera industry is exporting slightly more than 40 per cent of its total production. Exports of cameras, projectors, lenses, accessories and parts in 1960 increased by 36 per cent over 1959 to a total value of $39.8 million. The biggest market for Japanese still cameras is North America, and for 8-mm. movie cameras, Europe. Exports of 8-mm. movie cameras, still cameras and lens during 1960 went to the following areas (percentage share in the total): Asia 12.7; Europe 25.8; North America 41.8; Central and South America 5.1; Africa 8.1; and Oceania 6.5.

In the export of cameras, Japan and West Germany have been constant rivals. West Germany is still a bigger exporter of cameras, but the gap between the two is narrowing down. German and Japanese camera exports except for 8-mm. movie cameras and interchangeable lens, amounted to 1,736,578 units (DM. 142,916,000) and 611,461 units (DM. 54,708,000) respectively, in 1958, but rose to 1,960,245 units (DM. 170,496,000) and 710,846 units (DM. 68,104,000), respectively, in 1960.

PRICING OF PETROLEUM AND PRODUCTS

DEPENDENCE ON IMPORTS OF REFINED ITEMS UNPROFITABLE

By V. S. Swaminathan

THE spokesmen of Burmah-Shell and Stanvac are expected in Delhi soon to try to settle the dispute between the Government and the oil companies over the prices of petroleum products. Also, the Assam State authorities are perplexed at the way the price of crude oil of Naharkatiya and Moran fields was fixed by the Central Government without their knowledge. It is, therefore, of interest to review the factors leading to pricing of crude oil and refined petroleum products.

The price of any commodity is governed by many considerations. They include: (1) seller's costs, embracing raw materials and supplies required in producing and marketing his goods, labour, transport charges and taxes; (2) competition not only from sellers of the same kinds of goods, but from those of alternative goods; (3) value to the buyer not only in terms of utility, but in æsthetic and other satisfactions; (4) political factors such as Government limitation on production, import or export, price control or subsidy; and (5) customers' ability to pay and general economic conditions.

Economics of Oil

In addition, the price of crude oil is profoundly affected by characteristics more or less peculiar to it. Thus, while more and more petroleum is discovered in more and more parts of the world, not all places are geologically favourable for its occurrence. Yet petroleum products are used world-wide, so much so that crude oil has long been an item of international trade. Indeed, oil is the chief commodity, in point of tonnage and value, carried by the world's merchant fleets, and transportation is often an important ingredient in oil pricing. Again, oil is expensive to store. Its amount in surface storage at any time, while very large, is equivalent to market requirements of only a few weeks or months. Moreover, oil must be kept moving because of the vast quantities consumed daily, and relatively limited storage possibilities in terms of days' supply. Hence a figurative "oil pipeline" from producing fields to markets must be kept constantly filled. This includes pipelines, tankers, refineries, oil barges, tank trucks, tank cars, etc.

Furthermore, oil, being a natural resource, is exhaustible. Oilmen, therefore, must continually find new supplies not only to replace those used but to provide reserves to meet the growing requirements of the future. And searching for oil, notwithstanding the march of science and technology, is still an unpredictable undertaking. Also, the costs of finding new oil vary widely. Last but not least, a long period usually elapses between the discovery of a new oilfield and the arrival at market of the finished products derived from that crude oil. The financial and operational planning must, therefore, be on a long, forward scale.

Origin of Posted Prices

Petroleum became a fairly widespread article of commerce way back in the mid-nineteenth century, when its principal use was as an illuminant. Refiners who distilled lamp oil from it were competing with whale oil, coal oil and tallow candles. There were thus certain reference points for the value of lamp oil, and this set a ceiling on the price of the raw material (crude oil) from which it was made. When more petroleum was produced in the United States, the price of crude oil fell to $1 a barrel, and the price of kerosene likewise declined. This meant that millions of people who could not previously afford lamp light now enjoyed its blessings. To a lesser extent, crude oil was also used as a source of lubricants. With the mass production of motor cars in the United States, gasoline passed kerosine in volume of output around 1915. Gasoline rose in price as its demand went up and the price of kerosine went down. Today, literally thousands of useful products (including petrochemicals) are derived from crude oil.

And, over the years, there developed in the U.S. oil industry a practice of posted prices. In other words, any refiner or agent requiring crude oil posted a price at which he was willing to buy oil from a specified field from any operators in that field. It is possible to speak of the price of crude oil only in the broadest sense, for crude oils vary widely in their properties, and their geographical location affects prices. In general, ownership of land in the U.S. and Canada includes the surface and any minerals it may contain. Broadly speaking, the United States was the world's leading exporter of oil until 1931. As a consequence, the U.S. Gulf prices, i.e., prices on the U.S. coast of the Gulf of Mexico from which great quantities of oil were shipped both to the American East Coast and into the world markets came to be regarded as the reference point for oil prices generally throughout the world.

In the late 'twenties, oil began to flow increasingly from Venezuela, and, by 1931, this country's oil exports surpassed those of the United States. However, since this new source of export was about the same distance from the principal markets as was the U.S. Gulf Coast and since the latter still remained a large source, U.S. Gulf prices continued to be the most important reference in virtually all world markets. These quotations provided a conveniently, widely published set of prices. In recent years, however, Venezuelan prices have moved independently from those in the U.S. Gulf. Yet another natural reference point emerged with the Middle East becoming an important exporter of oil. In 1950, Socony Mobil instituted the posting of prices at which it would sell crude from this prolific region. This practice was soon adopted by other companies operating in the Middle East. Sales of oil, crude or products, are customarily made at prices f.o.b. the ports of shipment, with the purchaser himself arranging and paying for transportation. This practice is one of the reasons that the freight rates are usually a significant component of the laid-down cost of oil in a market.

Limits Over Prices

The largest purchasers of crude oil are, in the main, the integrated companies engaged in all branches of the oil business. These major corporations also market oil products, competing among themselves and with others to maintain or enlarge their shares of retail trade. There are lower and upper limits to which the price can go. If some of the buyers were willing to cut the posted price for crude oil while their competitors were agreeable to pay more, the former would soon find that they were short of products to sell and that their market position was being undermined. This economic fact of life constitutes a brake on downward crude oil price movements. Also, there are economic ceilings on the prices of products made from crude oil, and hence on the raw material. For instance, if the price of heavy fuel oil got too far above that of coal, it would lose the market position to the solid fuel. Again, the price of domestic heating oil cannot get out of line with that for natural gas.

TABLE I: *Exports of Crude Oil and Products*

(1,000 barrels a day)

Year	U.S.A.	Venezuela	Middle East	Total
1938	532	508	245	1,285
1946	420	1,029	542	1,991
1956	430	2,317	3,107	5,854
1960	202	2,675*	4,725*	7,602*
Per cent of total				
1938	41	40	19	100
1946	21	52	27	100
1956	7	40	53	100
1960	3	35	62	100

* Provisional

TABLE II: *Crude Oil Prices per Barrel*

(Value in U.S. dollars)

	*West Texas Sour Crude 32°	Tia Juana Medium, 26°	Arabian at Ras Tanura	34° Sidon
3rd February 1953 ..	2.36	2.20	1.71	2.25
3rd January 1957 ..	2.86	2.40	1.93	2.65
4th February 1959 ..	2.71	2.55	2.08	2.45
14th September 1960..	2.71	2.30	1.80	2.17

* West Texas crude oil price is at the well. Add 31 U.S. cents for gathering and transport to U.S. Gulf Coast refineries and export terminals. Venezuelan and Arabian crude oil prices are f.o.b. shipping port.

Today, Western Europe is the largest consumer of oil and products outside the United States. Until 1932, its oil needs were met by exports from the U.S., largely as finished items. Then Venezuela became the chief source of European supply until about 1948. Later, the Middle East crude oil began to displace that of Venezuela. With the phenomenal expansion of Europe's refining capacity, oil shipments have shifted in a large measure from finished products to crude oil.

Western European consumers have often complained that the price of crude oil laid down in their countries is too high, because the Middle East price is 'tied' to prices in the Caribbean-Gulf of Mexico area where crude oil bears a higher cost of production. Governments in the Middle East, however, have protested that the posted price is too low, since it is tied to the Western Hemisphere prices *minus* the freight cost that would be necessary to bring Middle East oil into the Western Hemisphere (American) market; they say that the freight discount is artificially excessive, inasmuch as Middle East oil actually moves chiefly to Europe rather than to the U.S. The facts are a ceiling is put on the laid-down cost to European consumers by actual or potential competition from alternative supplies, i.e., crude oil from North Africa or the Western Hemisphere; refined products imported into Europe from the New World or coal. Other competitive factors include the possibility of transporting natural gas from the Sahara across the Mediterranean and the emergence of the Soviet bloc as an oil exporter. On the other hand, the posted price of Middle East crude oil is prevented from getting unrealistically low by two factors. The first is that several of the Middle East Governments have royalties which, if they choose, they can take in kind, that is, oil, rather than cash, and if there were buyers willing to pay more than the posted price, these Governments could themselves sell this oil, thus demonstrating its actual value. The second factor is the enlightened self-interest of the operating companies in the Middle East. From normal commercial motives, they want to realise as much as they can from the sales.

Causes for Price Variations

What are the main forces that bring about price variations? In a nutshell, the answer is the interplay of supply (or potential supply) and demand. Those whose business is wholly or mainly in the crude oil end of the industry will be under mounting financial pressure to turn more of their commodity into cash. So here and there some of them will be willing to sell at less than the prevailing posted prices. Similarly, newcomers wanting to enter a market where others are already well established may offer oil below prevailing postings. If such conditions become widespread and persistent, the posted price becomes unrealistic; it ceases to be the true 'going' price. In time, say, by a series of trial-and-error moves, postings should fall to a point reflecting actual conditions.

Conversely, when demand is strong and refiners and brokers are eagerly bidding for crude oil for conversion into products for consumers, postings will tend to rise. In addition to these market influences, oil companies engaged in international trade are subject to other pressures. The countries in which they do business have different and opposing interests—some are large exporters who may obtain a great share of their Governmental revenue from oil. Some import crude oil, but also export refined products. Some import all their finished prducts, and some a combination of crude oil and refined products. Countries exporting crude oil naturally prefer to see its price high rather than low. Oil importing nations, just as understandably, want to buy oil as cheaply as possible.

Table I gives exports of crude oil and products from the U.S., Venezuela and the Middle East over a period of years. They represent over 80 per cent of all crude oil and products entering international oil trade. In Table II are given the representative crude oil prices per barrel.

The question to the fore in India is why, if discounts are available on crude oil, they are not equally available on the products made from it? The simple answer is the level of posted products prices in the Persian Gulf (from which private companies operating in India obtained the bulk of their products) already reflect the lower market value of the crude oil sold there. This is brought out by the movement of crude oil and finished product postings in the Persian Gulf in recent times.

The average posted price of main products at Abadan, weighted to match the 1960 pattern of refinery output in the Persian Gulf, has fallen from $3.23 per barrel in June 1957, when postings were first introduced there, to $2.60 after the November 1961 changes in postings. This fall of 63 cents a barrel in average product posting compares with a decline during the same period in the posted price of a typical light Arabian crude oil from $2.08 per barrel to $1.80, a decrease of 28 cents per barrel. These figures illustrate that the posted prices for finished products have fallen more in recent years than those for crude oil. However, the discount off the posted prices for crude oil negotiated between buyers and sellers have brought the movement of both into closer relationship. In fine, the discounts available off crude oil postings have already been reflected in the postings for products.

There are other factors making for divergence between the posted prices of crude oil and products. Thus, the market for crude oil is quite different from that for refined products. Whereas the demand for crude oil is literally worldwide and current surplus productive capacity exerts pressure on the price level in all open markets and long-term contracts are entered into for very big volumes of crude petroleum, international trading in products is more localised and dealings are on a much smaller scale. Moreover, the demand-supply position differs as between individual refined items. Kerosine and gas/diesel oils are in tight supply in the Persian Gulf and rising demand for middle distillates everywhere precludes any discounts off standard prices. By contrast there is excess gasoline. Hence cuts have been made in the posted prices of motor spirit, and also of Bunker 'C' oil, in the Persian Gulf and the Far East.

India, it is estimated, will need to import a total of around 2.2 million tons of products this year (1962), of which some 75 per cent would be middle distillates, inclusive of over a million tons of kerosine. Since it is understood that private refineries with a coastal location have some spare capacity, it would be good business and good morals to utilise this capacity. True, there will be more motor spirit to be disposed of. Here, again, operators of these refineries, with their international affiliations, are well placed to export it.

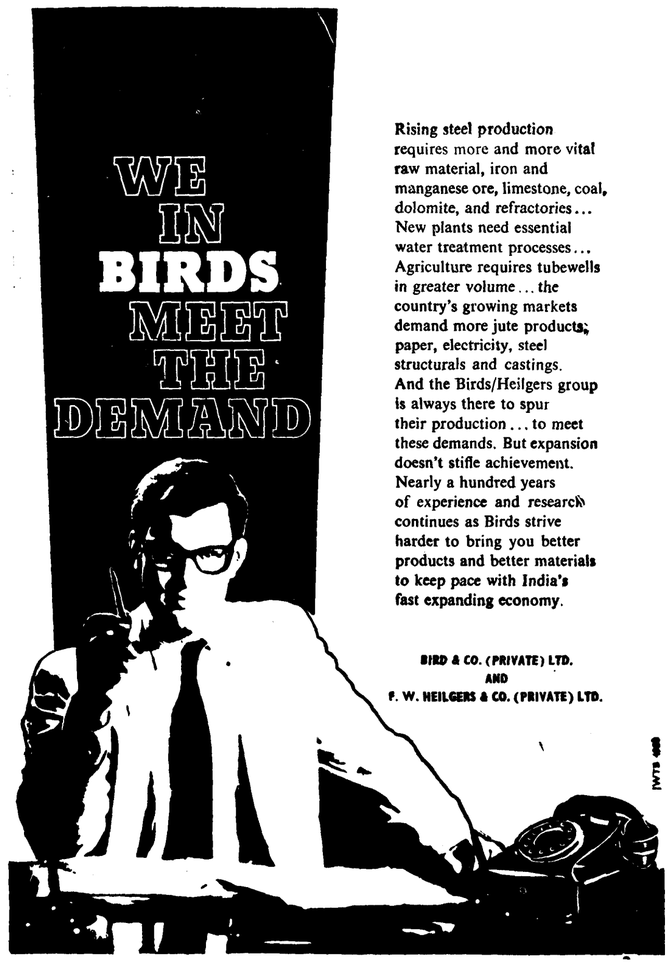
Centre-Assam Dispute

Lastly, though Oil India Ltd. is not a party in the dispute over the royalty issue between the Centre and Assam, it is affected by it. Indeed, this dispute has even wider economic repercussions. Under the agreement between the Central Government and Oil India, Assam will get 10 per cent of the well-head value of the crude oil as royalty, but the well-head value will be determined after deduction of transport cost of the crude oil. Under this new arrangement, the price of crude oil produced at Nahorkatiya and Moran areas has come down from Rs. 72 to Rs. 48 a ton, and the royalty due to Assam from Rs. 7.2 to Rs. 4.8 a ton. This is inevitably hurting Assam's much needed development programmes. At the same time, it desperately behoves India to explore for and produce oil from her own territory. Here time is of the essence. Assam would have performed an act of statesmanship had it permitted Oil India to start its seismic surveys and drilling operations in the new concession while talks towards settling the dispute between it and the Centre were proceeding. As things have turned out, Oil India geologists, geophysicists and drillers have to stand idly by for another ten or eleven months before they can start work.

WORLD CONSUMPTION OF SYNTHETIC LUBRICANTS

Current world consumption of synthetic lubricants is probably still well below 20,000 tons a year. Estimates for the United States put the amounts used in 1960 at about two million U.S. gallons, or roughly 7,000 tons. This compares with a total of some 750,000 gallons produced there in the period December 1951 to February 1955. To place these figures into perspective, it may suffice to recall that last year's total consumption of lubricants in the United States was about 1,700 million U.S. gallons, and in the Free World as a whole over 3,600 million U.S. gallons or, say, 12 million metric tons.

Raw naphtha liable to Central excise duty under item 6 of the Central Excise Tariff has been exempted from so much of the Central excise duty in excess of 5 per cent *ad valorem*, provided the material is intended for use in the manufacture of fertilisers.



Rising steel production requires more and more vital raw material, iron and manganese ore, limestone, coal, dolomite, and refractories... New plants need essential water treatment processes... Agriculture requires tubewells in greater volume... the country's growing markets demand more jute products; paper, electricity, steel structurals and castings. And the Birds/Heilgers group is always there to spur their production... to meet these demands. But expansion doesn't stifle achievement. Nearly a hundred years of experience and research continues as Birds strive harder to bring you better products and better materials to keep pace with India's fast expanding economy.

BIRD & CO. (PRIVATE) LTD.

PAPER FOR THE PLANS

Paper means progress—to us it also means business. The throbbing pulse of India's industrialization can be felt as the country races towards the "take-off" stage. The Third Plan is the threshold that offers this exciting view of vital economic activity.
We at West Coast Paper Mills, with new expansion plans in hand, endeavour to keep in pace with the country's progress.
From our plant at Dandeli, during the year 1960–61, we manufactured 17,084 tons of writing and printing and 8,583 tons of Kraft paper resulting in a net saving in exchange of Rupees 4 crores to the National Exchequer.

VOLTAS' SALES TOUCH A FRESH PEAK

HANDSOME RISE IN PROFIT—DIVIDEND RAISED

"OUR financial position is strong and our growth and diversification continue along healthy lines. We may look forward to the future, therefore, with confidence and optimism." These were the observations that Mr. J. D. Choksi, Chairman of Voltas Limited (Managing Director: Mr. S. K. Handoo, Bombay), had made while assessing the outlook for the Company in his statement accompanying the accounts for the year ended 31st August 1960. It is gratifying that the observations have proved literally true during the Company's financial year ended 31st August 1961. As a matter of fact, the Company scaled some new heights. If the previous year's results were excellent, the performance during the year under report is *par excellence*.

In sales and profits, the Company has established new records. Earnings from sales and services have spurted from Rs. 1,986.46 lakhs to Rs. 2,572.59 lakhs and gross profit from Rs. 129.48 lakhs to Rs. 150.58 lakhs. Consequently, the net profit is considerably higher at Rs. 77.11 lakhs, as compared with Rs. 63.80 lakhs in the previous year. The rise in the Company's earnings would, indeed, have been more marked but for a simultaneous sharp rise in the costs of sales and services from Rs. 1,590.74 lakhs to Rs. 2,106.58 lakhs. This sizable increase in costs has reduced the percentage of net profit before taxes to net sales from 6.14 in 1959-60 to 5.4 in 1960-61. Viewed in the light of the continued restrictive import policy of the Government, the performance of the Company, which is primarily an importing house, must be said to be very encouraging.

Despite the appreciable improvement in profit, all that the investor has been paid is a dividend of 14 per cent, subject to tax, as against 13 per cent, taxable, paid in the preceding two years. This gives a net return of 9.8 per cent on Rs. 100 each, as against 9.1 per cent in the preceding two years and 9 per cent in 1957-58. Although the Company has been able to return on his investment a net dividend of 9 per cent in the past four years, the investor has had sufficient reason to expect a better deal from the Directors, when, during this period, the gross profit of the Company has nearly doubled from Rs. 83.24 lakhs to Rs. 150.58 lakhs.

Among essential provisions, taxation gets Rs. 6.50 lakhs more at Rs. 66.50 lakhs and depreciation about Rs. 1 lakh more at Rs. 6.97 lakhs. The allocation to development rebate reserve of Rs. 1.82 lakh has been practically maintained at the previous year's level. The Directors have ploughed back again over one-third of the net profit, Rs. 31.63 lakhs, to be precise, as against Rs. 25.87 lakhs in the preceding year, to reserves and provisions. Against this, they have transferred and written back Rs. 6.59 lakhs (Rs. 13.14 lakhs in the previous year) from reserves and provisions and excess provisions of the past. Gratuity has been provided at Rs. 14.99 lakhs, as against Rs. 14.68 lakhs a year before. The dividend absorbs Rs. 35.70 lakhs, as against Rs. 33.15 lakhs previously, leaving Rs. 3.79 lakhs to be carried forward, as against Rs. 4.25 lakhs brought in.

To put it in a nutshell, the net income per share (after taxes) amounted to Rs. 26.29. The net worth of the shareholder's equity is Rs. 132.55. The percentage of net profit after taxes to the shareholder's average equity works out to 22.64. Nearly 80.13 per cent of the Voltas rupee was spent on the costs of sales and services, 9.61 per cent on staff, 4.82 per cent on sales and administration, 0.27 per cent on depreciation, 2.58 per cent on taxation, 1.38 per cent was distributed to the investor and 1.21 per cent was retained in business.

The following table brings out the salient features of the Company's working in the past four years:

(In lakhs of rupees)

	For the year ended 31st August			
	1961	1960	1959	1958
Sales and services	2,572.59	1,986.46	1,712.21	1,966.40
Other income	16.96	15.99	2.89	3.42
Closing stocks	680.18	802.43	654.99	782.95
Cost of sales and services	2,106.58	1,590.74	1,345.87	1,625.32
Other expenses	304.12	281.80	260.88	261.35
Gross profit	150.58	129.48	108.63	83.24
Depreciation	6.97	5.68	4.41	5.65
Taxation	66.50	60.00	51.50	46.50
Net profit	77.11	63.80	52.72	31.09
Transfer from reserves and provisions and excess provisions written back	6.59	13.14	8.60	4.97
To reserves and provisions	31.63	25.87	14.05	4.48
Development rebate reserve	1.82	1.69	0.89	0.85
Provision for gratuity	14.99	14.68	12.15	8.08
Dividend	35.70	33.15	33.15	22.05
	(14%)*	(13%)*	(13%)*	(9%)
Carry forward	3.79	4.25	2.27	1.09

* Subject to deduction of tax.

The Directors report that the main contributions of the record sales turnover in the year came from the mechanical, agricultural and construction equipment, and air-conditioning and refrigeration divisions, though, generally, most divisions improved their previous performance. Out of the total sales, 36.5 per cent consisted of indigenously manufactured products. In 1954-55, the first year of the Company's operation, this percentage was 7.2. The first ever 22 kV switchboards of the fully drawn out pattern in the country were designed, engineered and manufactured by the Company during the year. This is expected to result in a saving of foreign exchange to the tune of 40 to 45 per cent of the cost involved. In addition to switchboards, commercial production of Joy-Voltas diamond core drills, Voltas-Smit diamond bits and electric starters commenced during the year. The Company made substantial contribution to providing equipment for priority projects under the second Five-year Plan. Satisfactory progress was made by the companies formed in India in association with foreign manufacturers, in which the Company was interested as a shareholder and distributor. The new factory of Roche Products Ltd. at Balkum has commenced operations and its pharmaceutical factory at Tardeo expanded. Merck Sharp and Dohme of India Ltd. has under construction a new factory near Thana and has increased production substantially at its temporary factory in Bombay. The formalities connected with the establishment of a Carrier air-conditioning factory were near completion. The exploratory talks carried on with Messrs. Brown, Boveri and Co., Baden, Switzerland, for the manufacture of a part of their products in collaboration with the Company in India have, however, come to an abrupt end on account of Brown Boveri's decision to buy a controlling interest in an existing local electrical manufacturing concern. The existing distributorship agreement, held by the Company and its predecessors for over 27 years, was also terminated. The Company has under contemplation a possible alternative scheme to fill the gap caused by the loss of the Brown Boveri business.

Commenting on the need for conserving foreign exchange and promoting indigenous development, the Chairman, Mr. J. D. Choksi, states that the Company has made substantial progress in the field of local manufacture. Many of the Company's divisions have achieved a position where more than 50 per cent of their business is in products of Indian manufacture, as, for instance, pharma division (94 per cent), machine tools (54 per cent), textile millstores (63 per cent) and air-conditioning (52 per cent). A programme for transfer and expansion of the Company's facilities and lines of manufacture from the restricted area of Chinchpokli to the new Thana unit, where 120 acres of land had been acquired for the Company by the Government of Maharashtra, has been worked out. Referring to the number of obstacles that lie athwart the manufacturing field, the Chairman observes:

"A manufacturing licence granted today by the Government does not commit the Government to import essential components and raw materials provided in the phased programme submitted in the licensee's application for manufacture. Consequently, every manufacturer today, who has to rely on even a small amount of imported components and raw materials, lives in constant dread of his requirements being cut substantially, if not banned altogether. This is hardly an inducement to start new enterprises. Even while one appreciates the Government's difficulties in the matter of foreign exchange, some way must be found, if the country is to progress into ever-widening fields of industrial activity. We for our part would prefer to see a stricter control over the grant of licences for new manufacturing units which depend, to some extent, on imports of components and raw materials, rather than have these licensed in the first instance and then come to grief later for want of essential components or raw materials which can only be imported."

Mr. Choksi sums up the outlook for the Company thus:

"In spite of severe import restrictions leading to the belief in some quarters that 'import houses have had it', we are firmly convinced that there will always be room for a flexible, well-balanced and well-organised import organisation in India's economy. We refuse to consider our trading activities as a thing of the past or on the wane. On the contrary, we plan to consolidate and expand our position in this field. We hope to retain our pre-eminent position as importers and distributors and and at the same time to strengthen our industrial base within the country. New fields, new products and an ever-widening horizon with increasing pursuits and increasing activities—that is what sums up Voltas. We look forward to the future with well-founded confidence."

The Company's share capital was increased in December 1956 by an additional issue of 105,000 fully paid-up shares of Rs. 100 each to finance the increase in the volume of business transacted then. Thereafter, the capital has been unchanged at Rs. 255.00 lakhs. Bank borrowings have increased during the year from Rs. 250.22 lakhs to Rs. 354.68 lakhs and unsecured loans have gone up from Rs. 15.99 lakhs to Rs. 23.19 lakhs. The capital-borrowings ratio is thus much on the high side, and one wonders why the Directors should not raise the capital further. The capital is backed by reserves and surplus aggregating Rs. 84.02 lakhs. The total liability of Rs. 1,394.09 lakhs to outsiders is comfortably covered by current assets, loans and advances amounting to Rs. 1,612.96 lakhs. Investments are shown at Rs. 20.97 lakhs, as against Rs. 15.42 lakhs previously. The gross block increased during the year from Rs. 107.46 lakhs to Rs. 129.76 lakhs and is written down to Rs. 99.12 lakhs.

The Rs. 100 fully paid ordinary shares of the Company are currently quoted at Rs. 300 *cum-div*. At this rate and on *ex-div*. basis, the yield works out to 3.3 per cent per annum, free of tax.

ASSOCIATED BATTERY DISAPPOINTS

FINANCIAL POSITION, HOWEVER, STRONG

The working results of Associated Battery Makers (Eastern) Ltd. (Managing Director: Mr. H. R. Gregson, Calcutta) for the year 1959-60 did not quite come up to the expectations of the shareholders, those for the year ended 31st August 1961 will no doubt be looked upon as disappointing. For, notwithstanding a slight but promising increase of Rs. 11.91 lakhs to Rs. 218.14 lakhs in sales, resulting chiefly from the appreciable increase in the demand for all categories of products, the gross profit has declined by a further Rs. 6.82 lakhs to Rs. 53.04 lakhs bringing the total fall since the year 1958-59 to Rs. 12.89 lakhs.

Referring to this sad aspect of the Company's operations, the Managing Director, Mr. H. R. Gregson states, in his statement to the shareholders, as follows:

"Like other manufacturers, we have to adjust ourselves to transport, fuel and other difficulties, coupled this year with the electrical supply shortage which prevailed for several months in the Greater Calcutta area, but I am pleased to report that these were successfully overcome without undue dislocation of production and despatches.

"The frequent additions in excise and import duties make it difficult to maintain reasonable costs, and many items of indigenous or imported raw materials were affected by the 1961 Budget increases. In this connection, we have always endeavoured to market our products to the general public at prices which bear direct comparison with those prevailing in the U.K. and other Western markets for similar quality products. It is regrettable, however, that some basic materials which are coming into production in India, with the welcome saving in foreign exchange, are marketed at prices sometimes twice, or even more, than the landed cost, including quite high customs duties, of similar imported materials. This actuates against maintenance of low costs, despite efficient manufacturing methods, and, in turn, adds to the difficulty of obtaining export business. In this respect also, the price of State Trading Corporation lead, as allocated to us from time to time on rupee payment, is 15 per cent to 20 per cent above the world price at which manufacturers in other countries can purchase. However, during the past year important economies in production were introduced which helped, to some extent, to offset the high cost of certain materials. Our modernisation programme should further assist towards such economies."

Provision for depreciation has decreased slightly by Rs. 0.32 lakh to Rs. 7.47 lakhs and that for taxation by Rs. 2.19 lakhs to Rs. 21.58 lakhs. Consequently, the net profit shows a less precipitate fall than the gross profit of Rs. 4.31 lakhs to Rs. 23.99 lakhs. To this has been added Rs. 8.73 lakhs brought forward from the previous year and Rs. 1.13 lakh as a write back from reserves and provisions, raising the balance available for appropriation to Rs. 33.85 lakhs. From this the Directors have transferred Rs. 7.91 lakhs to various reserves and have proposed an ordinary dividend of 15 per cent, subject to deduction of tax, absorbing Rs. 17.70 lakhs. The carry forward is Rs. 8.24 lakhs as against Rs. 8.73 lakhs brought in.

The vissicitudes in the fortunes of the Company during the past three years, that is, ever since its shares were offered to Indian investors, are presented in the comparative table given below:

(In lakhs of rupees)

	For the year ended 31st August		
	1961	1960	1959
Sales	218.14	206.23	226.72
Income from other sources	1.69	5.99	0.52
Consumption of raw materials, stores and spare parts	103.73	97.62	113.14
Expenses and charges	63.06	54.73	58.16
Gross profit	53.04	59.86	65.93
Provision for—			
Depreciation	7.47	7.79	5.38
Taxation	21.58	23.77	27.49
Net profit	23.99	28.30	33.06
Transfer from reserves and provisions	1.13	1.05	0.33
Transfer to reserves	7.91	5.70	20.83
Dividends (gross)	17.70 (15%)	19.30 (25%)	20.00 (40%)
Carry forward	8.24	8.73	4.38

It will be observed from the foregoing table that, during the past three years, the Company has retained in business as much as Rs. 34.44 lakhs out of the earned profits and, this, together with the increase of Rs. 68.00 lakhs in the issued share capital and Rs. 28.63 lakhs credited to the share premium account, has strengthened the Company's capital base appreciably. The share capital as at 31st August 1961, consisting entirely of equity shares, stands at Rs. 118.00 lakhs, with a supplement of Rs. 96.86 lakhs in reserves and surplus. Current liabilities, provisions and unsecured loans aggregate Rs. 52.07 lakhs. Inclusive of the addition of Rs. 8.87 lakhs during the year, the fixed assets are valued in the Company's books at Rs. 102.25 lakhs and have been well written down to Rs. 45.89 lakhs. Capital goods in transit cost Rs. 2.80 lakhs. Investments have changed but a little during the year and, at Rs. 20.41 lakhs, consist of Rs. 20.25 lakhs in shares of a subsidiary company, Rs. 8,000 in unquoted debenture bonds, and the balance, namely Rs. 7,750, in Government securities. Current assets, loans and advances total Rs. 197.83 lakhs and cover current liabilities by nearly four times.

During the year, Chloride and Exide Batteries (Eastern) Ltd., the entire share capital of which is held by the Associated Batteries, experienced the same fate as its holding company, inasmuch as the gross profit declined from Rs. 1.75 lakh to Rs. 0.97 lakh, despite an increase in sales from Rs. 179.44 lakhs to Rs. 180.90 lakhs. After providing Rs. 10,222 (Rs. 10,323) for depreciation and Rs. 62,541 (Rs. 21,223) for taxation, the net profit of the subsidiary is lower at Rs. 24,135, as against Rs. 1.43 lakh a year ago. The decrease in net profit has naturally brought about a reduction in the rate of ordinary dividend from 12 per cent subject to deduction of tax to 4 per cent subject to deduction of tax. This absorbs Rs. 60,000, as against Rs. 1.80 lakh previously, leaving a carry forward of Rs. 1.71 lakh.

As regards the future, it is best to reproduce here what the Managing Director has said in his report to shareholders. He says:

"Competition in our industry has continued to be keen. However, the greater use of road transport and the increased production programmes for vehicles and equipment of all types, including electrical industrial trucks, should provide a steady increase in overall demand over the next few years. The programme of development in railways, including railway electrification and diesel locomotives, in telephones and telecommunications, and in general electrification throughout the country, should also mean increased demand for our heavier products. Subject to reasonable transport, fuel, and other conditions prevailing, the outlook would appear to be promising, and your Company is taking necessary steps to meet this widening range of demands."

Currently the Rs. 10 fully paid share of the Company is quoted at Rs. 34.50 *cum-div* and fetches, on the *ex-div* basis, a net return of 3.1 per cent per annum.

(*Concluded from next column*)

The construction of the factory for Ralli Chemicals was started during the year ended 31st August 1961 and arrangements for the supply of raw materials were completed. An expenditure of Rs. 1.07 lakh was incurred during the year. The factory is expected to be completed soon and will go into production by the end of spring this year.

Boehringer-Knoll, an associated company, which started trading in November 1959 and allowed Rallis India to market its products, traded at the expected levels of turnover and profitability last year. The activity of this Company is increasing gradually and would rise fast when the factory, now under construction, goes into production towards the middle of this year.

The financial position of Rallis India is as good as it can be, after all the reverses it had to suffer in the early 'fifties. Its paid-up capital of Rs. 300 lakhs comprises equity of Rs. 225 lakhs and preference of Rs. 75 lakhs, both in shares of Rs. 100 each. The reserves and surplus, on the other hand, are no more than Rs. 19.78 lakhs. Borrowings from banks have increased sharply from Rs. 51.57 lakhs to Rs. 123.95 lakhs. Current liabilities and provisions have also gone up from Rs. 91.61 lakhs to Rs. 127.57 lakhs. All this is presumably due to the big programme of industrial activity on hand. Along with the proposed dividends, the liability to outsiders amounts to Rs. 274.64 lakhs. As against this, current assets (excluding investments), loans and advances total, Rs. 428.95 lakhs. The aggregate holdings, at cost, in the subsidiary units amount to Rs. 97.57 lakhs. And there are other investments at Rs. 20.50 lakhs. The gross block increased during the year from Rs. 70.39 lakhs to Rs. 71.08 lakhs and has been written down to Rs. 35.06 lakhs.

The Rs. 100 fully-paid ordinary shares of the Company are being quoted at Rs. 155 *cum-div.*, and, at this rate and on the *ex-div.* basis, give a yield of 3.7 per cent per annum, free of tax. The Company is now well set on the road of progress and, given normal economic conditions, should be able to show a steady improvement in its profit and dividend.

RALLIS INDIA MOVES FORWARD FURTHER

DIVIDEND BETTER

A SHIFT in activities from commodity trade to industrial enterprise which has been gradually but steadily carried out during the past four years and more, has reflected itself in increasing progress by Rallis India Limited (Chairman: Mr. Badridas Goenka, Calcutta). During the year ended 31st August 1961, the Company experienced a further rise in sales turnover from Rs. 18.08 crores to Rs. 19.09 crores and in gross profit from Rs. 52.13 lakhs to Rs. 58.45 lakhs. This has enabled the Company to step up the dividend on the equity capital, which it started paying in the previous year, after a lapse of eight years, from a mere 4 per cent, taxable, to 8.5 per cent, subject to tax, giving a net return of 5.5 per cent on a share of Rs. 100. This would hardly satisfy the investor who had patiently stuck to his holding in the Company ever since the offer of its capital to the public over a decade ago. But the Directors have possibly done all that they could, as all the income of the year has attracted tax liability, with the result that they have been obliged to provide as much as Rs. 24.33 lakhs for taxation against Rs. 7.11 lakhs in the previous year. This has brought down the net profit to Rs. 30.12 lakhs from Rs. 41 lakhs a year before. The provision for depreciation at Rs. 4 lakhs is almost equal to that made last year. The equity dividend takes away nearly Rs. 10 lakhs more than in the preceding year, the total amount absorbed being Rs. 19.13 lakhs. Reserves and provisions get a little more at Rs. 7.14 lakhs as compared with Rs. 6.17 lakhs in the previous year. The carry forward is Rs. 4.36 lakhs against Rs. 4.49 lakhs brought in.

The following table compares the Company's working in the past four years:—

(In lakhs of rupees)

	For the year ended 31st August			
	1961	1960	1959	1958
Sales proceeds	1,909.01	1,808.43	1,519.55	1,728.08

Ordinary	19.13	9.00	..	..
	(8½%)‡	(4%)‡		
Carry forward	4.36	4.49	2.54	—32.48

* Gross dividend for the six years ended 31st August 1960.
† Gross dividend for 1952-53 and 1953-54.
‡ Subject to tax.

The progress made by the Company's subsidiary units in the industrial field is as follows:

Ralliwolf worked throughout the year to a limit, imposed on its capacity by the import of such materials and components, which could not be yet made or produced in the country. However, the proportion of indigenous components in the completed tools was increased considerably during the year. The Company earned a net profit of Rs. 3.15 lakhs during the year ended 31st August 1961 against Rs. 1.43 lakh in the previous year. It declared a maiden dividend of 5.4 per cent, subject to tax. This has not been reflected in the accounts under review of the parent company, as it was declared after the close of its financial year. The plans for expansion are ready for execution.

Rallifan Limited had a difficult time during the year ended 31st August 1961, as the working resulted in a loss of Rs. 5.07 lakhs, against a small credit balance of Rs. 0.35 lakh in the preceding year.

Inclusive of the arrears of depreciation, Ralli-Hoyland Limited made, during the year ended 31st August 1961, a loss of Rs. 1.41 lakh against Rs. 2.55 lakhs in the previous years. The loss was minimised, as, since May, the Company reached a profitable level of production and has been earning modest profits thereafter.

Teddington Chemical Factory Ltd., the most important among the subsidiaries, earned during the year ended 30th April 1961 a net profit of Rs. 15.33 lakhs, as against Rs. 12.23 lakhs in 1959-60. The interim dividend was stepped up from Rs. 80 to Rs. 100 per share and a final dividend of Rs. 20 was also declared.

During the year ended 30th June 1961, the Hemlatha Textiles Limited reported an increase in its turnover from Rs. 56.72 lakhs to Rs. 68.20 lakhs and in the profit from Rs. 1.14 lakh to Rs. 4.42 lakhs.

The wholly-owned W. T. Suren and Company Limited earned a net profit of Rs. 0.17 lakh during the year to 30th April 1961, against Rs. 0.56 lakh in the previous year. It reduced the dividend from 13 per cent to 5 per cent, subject to tax.

(*Continued in previous column*)

AUTOMOBILE PRODUCTS FARE WELL

OUTLOOK PROMISING

CONSIDERING that the Automobile Products of India Ltd. (Managing Agents: Messrs. Technical Services (Private) Ltd., Bombay) is in the midst of a fairly large expansion and development programme involving, as it usually does, sizable capital expenditure and formation expenses, in addition to a certain amount of dislocation of production, the results reported by the Company in respect of the year ended 31st July 1961 ought to appear quite satisfactory. Sales of vehicles, parts and sundries have maintained the progress achieved first in the previous year, increasing further by Rs. 126.26 lakhs to Rs. 440.51 lakhs or a little over 40 per cent. As could be expected, the various items of expenditure have risen in conformity with the increase in sales but to a far lesser extent. The gross profit, therefore, shows a rise of Rs. 5.07 lakhs to Rs. 22.76 lakhs.

In view of past losses, which stand adjustable against current profits, the remuneration payable to Managing Agents has been made to the minimum possible extent as provided by the terms of the agreement with them and claims Rs. 50,000, as against Rs. 45,950 previously. Provision for depreciation, including the amount written off licences, patents and drawings, has been raised by Rs. 2.09 lakhs to Rs. 11.76 lakhs. Because of unabsorbed development rebate in respect of previous years and the debit balance to the profit and loss account, no provision for taxation has been found necessary and made. In the previous year, a provision of Rs. 1,200 was made for the Company's overall tax liability. On making these essential provisions, the net profit shows a welcome improvement from Rs. 7.55 lakhs to Rs. 10.50 lakhs. For the first time during the past four years, the Directors have been able to transfer Rs. 13.90 lakhs to the development rebate reserve, of which Rs. 3.62 lakhs pertain to the year under review and the balance to the preceding years. In order to bring the written-down value of certain assets in the Company's books fully in conformity with the requirements of Section 350 of the Companies Act, it has been found necessary to credit a further sum of Rs. 2.17 lakhs to the depreciation account. As a result of these appropriations and taking into account the loss of Rs. 9.18 lakhs brought in from the previous year and certain minor credits amounting to Rs. 13,640, there is a net loss of Rs. 14.62 lakhs (as against Rs. 9.18 lakhs) which has been carried to the balance-sheet.

The progress made by the Company during the past four years is presented synoptically by the following comparative table:

(In lakhs of rupees)

	For the year ended 31st July			
	1961	1960	1959	1958
Sale	440.51	314.25	199.03	168.07
Other income	1.26	1.97	0.54	2.59
Closing stocks in trade	20.28	25.22	23.14	27.98
Service parts, components, tools, spares and stores purchased and consumed	322.51	234.32	148.66	124.83
Salaries, wages and benefits	43.40	32.51	23.31	21.11
Other expenses	48.14	33.78	24.79	21.05

Net debits (—) or credits (+) relating to prior years	—2.04	—1.44	+0.50	+1.25
Transfer to reserves	13.90	...	...	...
Carry forward	—14.62	—9.18	—15.28	—5.71

A perusal of the Company's balance-sheet as at 31st July 1961 reveals that the share capital, consisting of Rs. 33.00 lakhs in preference shares and Rs. 39.46 lakhs in equity shares, is backed by reserves amounting to Rs. 30.03 lakhs. Of this, Rs. 13.90 lakhs are to the credit of development reserve rebate, Rs. 0.23 lakh to that for guarantee claims, Rs. 0.90 lakh to the development reserve, while Rs. 15.00 lakhs stand to the credit of the capital reserve created for the first time during the year. The situation which led to the creation of this reserve have been explained by the Directors as follows:

"In pursuance of a new policy with regard to the automobile industry in the country, particularly relating to the manufacture of commercial vehicles, which was enunciated by the Government of India, it was thought advisable to negotiate with the Premier Automobiles Ltd. and surrender the licences issued to the Company for the manufacture of Meadows diesel engines, and to negotiate with Henry Meadows Limited, England, for termination by mutual consent of the licence granted by them. As a result, the Company entered into an agreement under which the Premier Automobiles Ltd. agreed to pay a sum of Rs. 24.00 lakhs as consideration for this purpose. A sum of Rs. 15.00 lakhs was payable on signing of the agreement and this amount has been received and taken into the capital reserves."

Loans both secured and unsecured amount to Rs. 150.49 lakhs, in addition to current liabilities and provisions of Rs. 143.76 lakhs. During the year, the Company acquired new assets worth Rs. 44.15 lakhs, bringing the total fixed assets (worth in the Company's books) to Rs. 166.35 lakhs. These have been written down to Rs. 122.04 lakhs and, with the inclusion of Rs. 5.18 lakhs representing the cost of machinery and gauges in transit, they yield a net block of Rs. 127.22 lakhs. Current assets, investments, loans and advances aggregate Rs. 254.91 lakhs. The debit balance to the profit and loss account yet to be recouped is, as aforesaid, Rs. 14.62 lakhs.

During the year, the Company imported machinery worth Rs. 25.00 lakhs for the manufacture of engine components for the Lambretta scooters. The machinery was, in the usual course of things, expected to be received before the end of 1960, but, owing, unfortunately to the inability of suppliers in Italy to maintain the schedule, were received only towards the end of the year under review and could be installed and production commenced by December 1961. In addition, machinery valued about Rs. 3.00 lakhs was also imported for the manufacture of heavy duty brake blocks for heavy commercial vehicles. The plant has been commissioned and has commenced in the current financial year. It is expected that this would lead to an increase in the production and sale of Firestone break linings manufactured by the Company.

ASIAN CABLES CORPORATION

Since the Asian Cables Corporation's first cable plant for the manufacturing of VIR and CTS cables was commissioned in October 1961 and formally inaugurated on 6th November 1961, the factory has been progressing in a continued balanced manner. All the departments are working in right earnest. The production is expected to be in full swing within the next two to three months. The Company has installed most modern manufacturing and testing equipment which will be capable of producing many varieties of cables, including special types of cables. The present production of cables indicates that the cables produced will stand all relevant tests and, in the opinion of the representatives of the collaborating firm, Enfield Cables Ltd., U.K., who have witnessed the working of the plant, the cables manufactured by Asian Cables are equally good in quality and workmanship as compared with the cables manufactured by any English cable manufacturer. There is no doubt about the Asian Cables being equal in quality to C.M.A. grade.

Enfield Cables Limited has sent a team of experts specially deputed to push the Project No. II of the Company for the manufacture of paper insulated power cables and magnet wires, where also they will be collaborating jointly with the Phelps Dodge Copper Products Corporation of the U.S.A. The team has closely watched the working of all the departments of the factory and has expressed full satisfaction about the products manufactured in the factory, especially about the insulation of cables. The drawings, designs and the layout of the various machineries for the project No. II have been worked out by these experts and it is expected that, except for unforeseen circumstances, the plant will go into production in 1963.

The Company intends to manufacture paper insulated power cables of all varieties including 11 kV and 33 kV. It may be noted that, at present, no factory in India is manufacturing 22 and 33 kV power cables. It is thus believed that Asian Cables will be the pioneers in the manufacture of these voltage grades of cables in India. The Company has also on its programme the manufacture of L.T. plastic cables for which the buildings are already constructed and the necessary machineries are ordered. The foreign exchange required for importing the machinery for P.V.C. cables is financed by the Industrial Credit and Investment Corporation of India Ltd., Bombay. The Government has already issued the necessary import licence also. The P.V.C. plant is expected to go into production by the end of this year. The Company, in conjunction with some other local cable manufacturers is also going ahead with the setting up of a rod rolling mill.

U.S. KAISER STEEL'S SALES

The U.S. Kaiser Steel Corporation's sales figures for the year 1961 were the highest in the Company's history, net sales aggregating $265,973,000, an increase of 28 per cent over the 1960 figure of $207,116,000. Net earnings were $17,103,000, or $4.23 per share of common stock, after provision for dividends on preferred and preference stocks. This compares with a net loss of $8,216,000 or $3.49 per share of common stock for 1960. Loss carryovers, aggregating approximately $16,000,000 based on Federal income-tax returns for 1959 and 1960, have been fully utilised in determining the provision for Federal taxes on income for 1961.

COMPANY MEETINGS AND DIVIDENDS

SHREE KRISHNA GYANODAY SUGAR LTD. Twenty-seventh Annual General Meeting, Calcutta, 13th February 1962. Dividend: Re. 1.00 per ordinary share, subject to deduction of tax. Transfer books remain closed from 6th to 13th February 1962, both days inclusive.

ASSOCIATED BATTERY MAKERS (EASTERN) LTD. Annual General Meeting, Calcutta, 20th February 1962. Dividend: 15 per cent or Re. 1.50 per share, subject to deduction of tax. Transfer books remain closed from 6th to 20th February 1962, both days inclusive.

BHOPAL SUGAR INDUSTRIES LTD. Annual General Meeting, Sehore (Madhya Pradesh), 22nd February 1962. Dividend: 15 per cent or Re. 1.50 per ordinary share, subject to deduction of tax, payable on and after 1st April 1962. Transfer books will remain closed from 11th to 24th February 1962, both days inclusive.

VOLTAS LTD. Annual General Meeting, Bombay, 26th February 1962. Dividend: 14 per cent or Rs. 14.00 per share, subject to deduction of tax, payable on and after 5th March 1962. Transfer books were closed from 16th January to 5th February 1962, both days inclusive.

BOMBAY OXYGEN CORPORATION LTD. First Annual General Meeting, Bombay, 27th February 1962.

ANGELO BROTHERS LTD. Fifty-fifth Annual General Meeting, Calcutta, 27th February 1962. Dividend: 22½ per cent or Rs. 2.25 per ordinary share (includes a bonus of 10 per cent or Re. 1.00 per share), subject to deduction of tax. Transfer books will remain closed from 12th to 27th February 1962, both days inclusive.

STATE BANK OF INDIA LTD. Seventh Annual General Meeting, Bombay, 27th February 1962.

ELGIN MILLS CO., LTD. Annual General Meeting, Kanpur, U.P., 28th February 1962. Dividend: Re. 1.75 per share, on ordinary and vendors shares, subject to deduction of tax. Transfer books remain closed from 8th to 28th February 1962, both days inclusive.

SOUTH KARANPURA COLLIERIES LTD. Annual General Meeting, Calcutta, 28th February 1962. Dividend: *Nil*. Transfer books will remain closed from 16th to 28th February 1962, both days inclusive.

SHREE CHANGDEO SUGAR MILLS LTD. Annual General Meeting, Bombay, 2nd March 1962. Dividend: 20 per cent or Rs. 2.50 per share, subject to deduction of tax, payable on and after 1st April 1962. Transfer books will remain closed from 13th February to 2nd March 1962, both days inclusive.

BARODA RAYON CORPORATION LTD. Third Annual General Meeting, Udhna (Surat), 10th March 1962. Dividend: *Nil*. Transfer books will remain closed from 12th February to 10th March 1962, both days inclusive.

INDIAN WOOD PRODUCTS CO., LTD. Taxable final dividend of 20 per cent or Rs. 2.00 per share (this makes a total dividend of 30 per cent Rs. 3.00 per share for the year along with interim dividend of 10 per cent or Re. 1.00 per share), for the year ended 30th September 1961.

EASTERN INVESTMENTS LTD. Taxable ordinary dividend of 14 per cent or Rs. 14.00 per share, for the year ended 31st December 1961.

ASHOK LEYLAND LTD. Taxable dividend of 6 per cent for the nine months ended 30th September 1961. The Company has changed the accounting year from December to September. Transfer books will remain closed from 16th February to 9th March 1962, both days inclusive.

T. STANES & CO., LTD. Taxable interim dividend of 12½ per cent or Re. 1.25 per ordinary share, for the year ending 31st March 1962. Transfer books will remain closed from 10th to 19th March 1962, both days inclusive.

UNITED NILGIRI TEA ESTATES CO., LTD. Taxable interim dividend of 7½ per cent or Re. 0.75 per ordinary share, for the year ending 31st March 1962. Transfer books will remain closed from 1st to 10th March 1962, both days inclusive.

INDIAN BANK LTD. Taxable final dividend of 7½ per cent or Rs. 7.50 per share (includes a bonus of 2½ per cent, Rs. 2.50 per share), for the year ended 31st December 1961. This makes a total dividend of 15 per cent or Rs. 15.00 per share, for the year 1961.

MADURA MILLS LTD. Taxable dividend of 15 per cent or Rs. 2.25 per share, for the year ended 31st December 1961. The dividend for 1960 was also 15 per cent.

CANARA BANK LTD. Taxable dividend of 15 per cent or Rs. 7.50 per share (15 per cent for 1960), for the year ended 31st December 1961.

TATA CHEMICALS

Tata Chemicals Ltd. has received the consent of the Controller of Capital Issues to issue 503,920 equity shares of Rs. 10 each, for cash at a premium of 50 nP per share, to the existing shareholders of the Company in the ratio of one new share for every five shares held; and 5,000—6¼ per cent (taxable) 'A' mortgage debentures of Rs. 1,000 each, for cash, at par privately, including to the existing shareholders. The debentures will be payable to the registered holders only.

SYNOPSES OF COMPANY REPORTS

Shree Changdeo Sugar Mills Ltd.

(*Managing Agents*: Messrs. A. H. Bhiwandiwalla & Co. (Bombay) Private Ltd., Bombay.)

22nd *Annual General Meeting*—2nd March 1962.

Proposed dividend (taxable) equity	7,50	7,50
	(20%)	(20%)
Carried forward	96	62

N.B.—Adjustments represent the balance brought forward from the previous year.

* This includes Rs. 21,824.81 being refund of tax for the assessment year 1950-51.

Extracts from the Directors' report: The factory started crushing on 8th November 1960 and ended on 24th April 1961. The year under report shows an improvement in all the departments. Cane crushing increased from 99,017 tonnes of last year to 1,20,987 and the factory produced 1,41,145 bags of sugar as against 1,11,717 produced last year. The Company's cane supplies were well maintained and the factory obtained 76,590 tons (58,817), from the members under the Company's scheme and other cultivators and 44,398 tons (40,200) from own farms. The average yield from farms improved from 42.20 tons per acre to 45.27 tons per acre and the average recovery of sugar from cane rose from 11.40 per cent of last year to 11.62 per cent. The working of the plants was more efficient as the Company's stoppages for machinery breakdown were considerably reduced and production of bolder grain sugar also increased.

The Company has raised a sum of Rs. 10,00,000 by issuing debentures to the Life Insurance Corporation, which amount was received after the close of the year.

Current Season: The Company's farm crops this year seem to be in a better condition and yields would have been even higher if it had received adequate rainfall. There were some late heavy rains in October, which had a beneficial effect on the cane. Upto 7th January 1962 the Company has crushed 53,980 tons and has produced 57,925 bags.

The production for the current season will be lower than last year as the Company is restricted by the Sugar (Regulation of Production) Act, 1961 through which factories have been asked to produce 10 per cent less than last year. Under the circumstance, the factory's production has been fixed provisionally at 12,881 tons.

Accounts in brief as at 30th September 1961 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	37,50,000	Gross block	89,49,268
Reserves and surplus	25,44,361	—Depreciation	64,04,061

,, ,, ordinary	2,62	2,94
	(15%)	(22½%)
Carried forward	2	93

N.B.—Adjustments represent the balance brought forward from the previous year and other credit items.

* This includes Rs. 2,002 transferred from unclaimed dividend account; Rs. 50,000 transferred from dividend equalisation revenue account and Rs. 1,115 being final realisation from Indian Sugar Mills Association in respect of 1957-58 and 1958-59 export sales.

† Preference dividend is calculated at Rs. 6.33 per share and includes additional dividend for the year ended 30th September 1960 at Re. 1.33 per share.

Extracts from the Directors' report: The recovery of sugar from cane fell from 10.11 per cent to 9.16 per cent this year. Although the factory crushed 96,695 tonnes (72,608) or 33.19 per cent more, it produced only 87,623 bags or 19.5 per cent more than the previous year. There was a longer crushing season of 112 days (99) but unfortunately the quality of cane was unsatisfactory, as the crops did not receive adequate water due to insufficient rains.

The Company also suffered heavy losses through exports. The Government of India increased our export quota from 1,515 bags to 8,063 bags and this Company suffered a loss of Rs. 2,23,340 against Rs. 81,450 in the previous year. Out of our quota 6,090 bags were exported to the U.S.A. and realised Rs. 64.49 per bag against Rs. 27 per bag on exports to other countries. The amount is subject to final adjustment from Indian Sugar Mills Association.

Current Season: On account of better monsoon this year, the condition of the crop has improved considerably, so the Company can hope for a better recovery than what it had last year. The Government of India promulgated an Ordinance by which the factories had been asked to produce 10 per cent less this season. However, as this factory falls below the minimum permissible production, its production will not be affected and it shall be allowed to manufacture the same quantity as it did last year, i.e. 8,762.9 tonnes.

Meanwhile, the Company is carrying out the expansion of its plant from 750 to 1,250 tons crushing per day. The Company has during the year purchased a new Pan of 30 tons capacity from Messrs. Protos Engineering Co. Ltd. which is being installed. It has also placed further orders for 3 bodies of quadruples and for a multi-jet spray condensor which should be available by next season. With this machinery it is hoped to produce a better and larger grain of sugar than in the past. The Company has erected three second-hand centrifugal machineries and a new *Economiser* which will not only save fuel but also give more steam.

Accounts in brief as at 30th September 1961 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	30,00,000	Gross block	53,19,384
Reserves and surplus	17,09,851	—Depreciation	31,84,793
Other liabilities	40,18,598		
		Net block	21,34,591
		Petrol pump and live stock	7,334
		Block in progress	2,36,440
		Current assets	62,25,440
		Investments	54,030
		Cash	69,714
	Rs. 87,28,449		Rs. 87,28,449

* Paid-up capital consists of 12,500 five per cent. tax-free redeemable cumulative preference shares of Rs. 100 each fully paid (redeemable at the option of the Company after 7th January 1970 upon six months' notice) and 1,75,000 equity shares of Rs. 10 each fully paid.

Bombay Oxygen Corporation Ltd.

(*Managing Agents*: Messrs. Ruia Chinai & Co. Private Ltd., Bombay.)

First Annual General Meeting—27th February 1962.

Extracts from the Directors' report for the period from 3rd October 1960 to 31st December 1961:—

Incorporation of the Company: The Company was incorporated on 3rd October 1960. 1,50,000 Equity Shares of Rs. 100 each had been issued. Out of this 73,500 Equity shares of Rs. 100 each were offered to the public for subscription at par. The Directors have pleasure in reporting that the issue was oversubscribed.

Accounts: It will be observed that a sum of Rs. 3,44,826 has been transferred from the profit and loss account to the "Expenses During Construction Account" and is shown in the balance sheet. Profit and loss account shows a surplus of Rs. 1,12,662 after providing Rs. 98,400 for taxation. The directors recommend that this surplus be carried forward to next year's account.

Progress of Project: Two Oxygen producing plants are received and the balance two have been shipped and are expected by the end of the month. The Acetylene plant will be shipped during this quarter. The electrical equipments and steel fabrication for the plants are ordered locally.

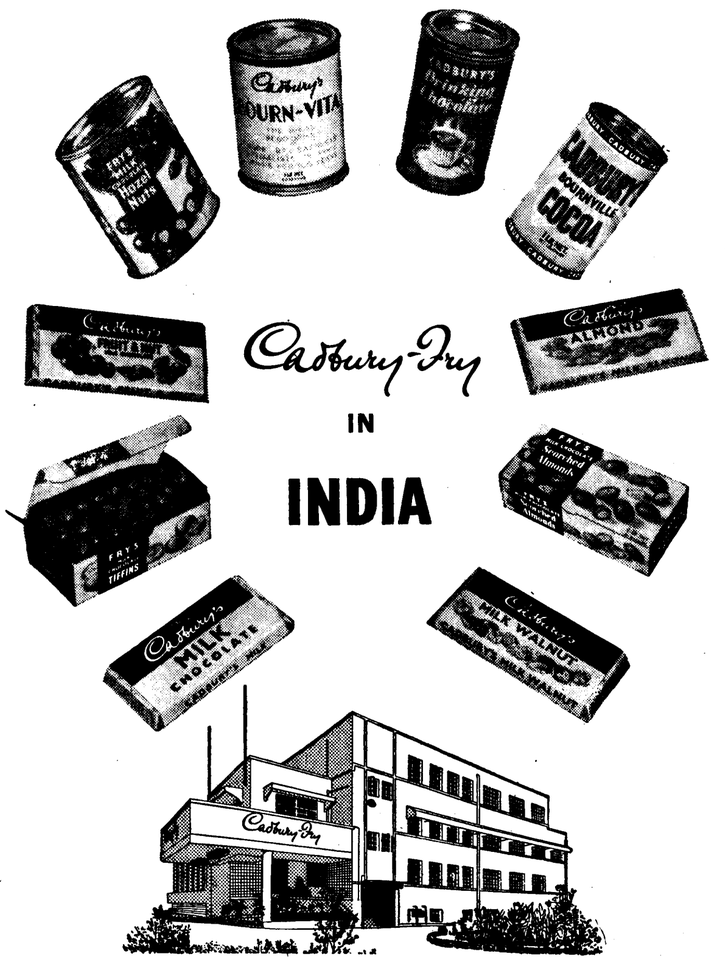
The Company has taken possession of the land at Nahur allotted to it by the Government of Maharashtra. The land measuring about 4 acres will be sufficient for the present for the four Oxygen plants. Contract for the construction of the building for the plants has been given and the work is in progress. It is expected that the contractors will be able to erect the buildings within six months as provided for in terms of the contract.

Managing Agents: With the approval of the Central Government, Messrs. Ruia Chinai & Co. Private Limited, Bombay have been appointed as the managing agents of the Company for a term of ten years commencing from 10th February 1961.

Accounts in brief as at 31st December 1961 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	75,20,000	Block	12,29,816
Reserves and surplus	1,12,662	Block (expenses)	5,792
Other liabilities	5,75,752	Current assets	12,63,829
		Cash	51,57,447
		Expenses during construction	3,44,826
		Miscellaneous expenditure	2,06,704
	Rs. 82,08,414		Rs. 82,08,414

* Paid-up capital consists of 400 equity shares of Rs. 100 each fully paid up and 1,49,600 equity shares of Rs. 100 each, Rs. 50 per share called up.



ENGINEERING

(*Concluded from page 249*)

Besides these, in the field of solvent extraction plant, 8 units have been licensed for the manufacture and supply of continuous type of solvent extraction plants with an aggregate capacity of 40 to 45 complete plants per year, which, in terms of value, will be equivalent to Rs. 4 crores per year. Most of these firms have already commenced manufacture and have also delivered a number of complete plants. Furthermore, in the public sector it has already been decided to set up one heavy plate and vessel works with a capacity of 40,000 tons per year and an actual turnover of 30,000 tons of machinery by 1965-66. In terms of value, this production will be worth approximately Rs. 6 crores. It is expected that a second plate and vessel works will also be established in the public sector besides the one mentioned above during the third Plan period—although this might come up a little later after the first unit.

Power Driven Pumps

The production of power driven pumps since 1956 has been as follows:

	Nos.
1956	46,881
1958	75,656
1959	85,067
1960	104,329
1961	114,565

A number of firms has increased the range of their production by undertaking the manufacture of bigger sizes. The largest size that is now being manufactured is one having 24" delivery diameter. Some of the firms which have come into the field have also undertaken the manufacture of specialised pumps, such as submersible type of pumps, petrol dispensing pumps, pumps requiring fractional horse power for their operation and pumps required for sugar, paper and cement industries, multi-stage and axial flow pumps.

Diesel Engines

A significant development of the industry is that the industrial offtake for the engines (for use on road rollers, air compressors, stone crushers, etc.) has been gaining momentum against the background that engine production prior to 1955 was entirely for agricultural use only. The first prototype of the 200 h.p. engine has already been developed in one of the indigenous establishments and regular production of this type is likely to commence by this year. It is hoped that this would be extended to engines upto 650 h.p. by the middle of 1962.

Printing Machinery

So far only one firm, namely, Britannia Engineering Co., Titagurh, has started manufacture of flat bed machines in collaboration with Messrs. Dawson, Payne and Elliott, U.K. Their licensed capacity for the manufacture of these machines is 240 Nos. per year, valued at Rs. 77 lakhs. Few more schemes for the manufacture of printing machinery, such as rotary presses, proof presses, platen presses and cylinder machines and stereotype equipment from (*a*) Messrs. Ramakrishan Machinery Corporation, Coimbatore, (*b*) Printers House Pvt. Ltd., New Delhi, (*c*) Oriental Electric & Engineering Co., Calcutta, and (*d*) Sahu Jain Ltd., Calcutta, for a total capacity of 1,088 Nos. have been approved by the Government. In Government's opinion there is still much to be done in the field of printing machinery, particularly for rotary presses and platen presses.

Dairy Machinery

The target of capacity for dairy machinery during the third Plan period has been fixed at Rs. 2.5 crores per year. Four firms, namely, Messrs. Larsen & Toubro Ltd., Bombay, Messrs. Alfa Lava (India) Ltd., Bombay, Messrs. Vulcan Trading Co., Ltd., Bombay, and Messrs. A. P. V. Engineering Co., Ltd., Calcutta, have been recently licensed to manufacture a wide range of dairy machinery. The total licensed capacity of these firms would be of the order of Rs. 2.57 crores. More schemes are coming in.

Gear Industry

At present there are two firms, namely, Messrs. Deepak Industries Ltd., Calcutta, and David Brown Greaves Co., Ltd., Bombay, which are manufacturing worm reduction gears. Their licensed capacity is for 1,800 and 2,900 units, respectively, per annum (valued approximately Rs. 18 lakhs and Rs. 26 lakhs, respectively). The former firm has recently been licensed to increase the capacity by another 4,200 Nos. per annum (Rs. 42 lakhs approximately). Five more schemes for the manufacture of worm, spur, bevel, helical and P.I.V. reduction gears by (*a*) Messrs. Essential Engineering Co., Bombay, (*b*) Messrs. Communication and Power Equipment Company, Bombay, (*c*) Messrs. Indian Standard Metal Co., Ltd., Bombay, (*d*) Messrs. Elecon Engineeriny Co. (P) Ltd., Gujarat, and (*e*) Messrs. Mcneill & Barry Ltd., Calcutta, have also recently been approved. There is still scope for a Central Gear Cutting Project for the manufacture of all types of gears from 14" to 60" and above.

Building and Construction Machinery

The industry has already made very rapid progress and more and more schemes are progressively being licensed. At present, there are 23 units licensed under the Industries (Development and Regulation) Act, with an aggregate capacity of Rs. 6.31 crores worth of machinery per year, out of which a fairly large number of units are already in production. The principal items of machinery for which they have been licensed are stone cusher, concrete mixer, concrete vibrators, asphalt mixer, roller pan mixer, bitumen boilers, weight batcher, pressurised concrete equipment, bitumen pressure distributors, continuous hot mix plants, etc.

Tea Processing Machinery

In the field of tea processing machinery manufacture, our country is at present, more or less, self-sufficient, inasmuch as import of tea machinery is practically nil. There are at present 16 units licensed for the manufacture and all of them, except one which is very newly licensed, have gone into production. It may be of interest to state in this connection that not only the country produces practically the entire range of tea processing machinery but also their quality is deemed to be very good. One of the licensed units is also producing a special type of tea roller which has been designed and patented by the Indian Tea Association.

Machine Tools

The machine tool industry has made great progress in the past few years. The production of machine tools which was Rs. 1.5 crore in 1956 increased to Rs. 10 crores in 1960. Production in 1961 has shown a further rise and is estimated to be of the order of Rs. 12 crores. Simultaneously the demand for machine tools has also increased considerably due to rapid industrialisation going on in the country. As a result of this, the import of machine tools has also gone up despite increased indigenous production. The major contribution towards increase in the machine tool output during 1961 has been that of Messrs. Hindustan Machine Tools, Bangalore. It has doubled, during 1961, its manufacturing capacity to 2,000 machine tools per year. Plans for the expansion of Praga Tools Corporation, Hyderabad, another public sector unit, have also been finalised. This firm is setting up a new machine tool unit with Polish collaboration. Messrs. Kirloskar Bros. have commenced manufacture of Vertical Turret Lathes. Messrs. Godrej & Boyce are manufacturing Power Presses and Press Brakes of their own design. In addition to these units, a large number of new units have been licensed during 1960-61 to undertake the manufacture of diversified types of machine tools. This has been possible as a result of the liberal licensing policy. In the private sector, the largest manufacturers, Messrs. Mysore Kirloskar Ltd., have embarked upon an expansion programme. The other two major units, Messrs. Investa and Messrs. Cooper, have set up new machine tool units at Chinchwad during 1961. In addition to the three major units mentioned above, other fresh entrants in this field have been Messrs. Godrej Ex-Cell-O India Ltd., Messrs. Kirloskar Bros Ltd. and Messrs. Godrej and Boyce Ltd. In order to make the country more and more independent of imports, the Government has also decided to set up a Heavy Machine Tool Plant in the public sector.

Compressors

So far, about 12 firms have been approved for the manufacture of compressors upto 500 cfts. capacity; of these, 7 firms are for the manufacture of small compressors upto 100 cft. and the rest for those above 100 cft. capacity. Eight firms have been in production during the course of 1961 and the remaining are expected to go into production by the end of 1962. Besides the above types of compressors, which would meet most of the types required in the country, there are also heavy duty compressors which are required for use in petro-chemical industries, fertiliser and iron and steel plants and large industrial undertakings. The requirements of these types of compressors are estimated to be of the order of Rs. 2.5 to 3 crores in value per annum.

Industrial Flour Mill Machinery

Roller Flour Mills are necessary to produce *maida* and *sooji*, which cannot be manufactured by the domestic type of flour mills. At present, only one party has been licensed to produce six numbers of flour milling plants in the country. Accordingly, there is stated to be good scope to create further capacity in this field.

Ceramics and Refractory Machinery

At present, there is very meagre capacity in the country for the manufacture of ceramic machinery. The scheme of Messrs. Shri Badri Narain, Patna, has been licensed for the manufacture of various types of ceramic machinery worth Rs. 40 lakhs per annum. In view of the huge estimated demand (Rs. 30 crores worth), it is considered that there is very good scope for establishing new capacity in the field.

THE
UNITED COMMERCIAL
BANK LTD.
HEAD OFFICE: CALCUTTA
•
Paid-up Capital - Rs. 2,00,00,000
Reserve Fund - Rs. 2,35,00,000
•
• 140 BRANCHES IN INDIA
• FOREIGN BRANCHES in Pakistan, Burma, Malaya, Singapore, Hong Kong and United Kingdom.
• AGENTS IN OTHER PLACES.
• PROVIDES FIRST-CLASS INTERNATIONAL BANKING SERVICE.
G. D. BIRLA, Chairman — S. T. SADASIVAN, General Manager

Rayon Plants

Recently, three schemes have been licensed by the Government for the manufacture of complete rayon plants. The entrepreneurs are Gwalior Rayon, Rasiklal Jiwanlal Chinai and Swadeshi Cotton Mills. These units are licensed for an aggregate capacity of three continuous filament rayon plants per year, which in terms of value will be equivalent to Rs. 6 crores per year approximately.

Weighing Machines

Substantial progress has already been achieved in the field of manufacture of weighing machines in the country, in as much as beam scales upto 72" size, platform scales upto 2 ton capacity and weighbridge upto 500 tons capacity are already being produced and their import on quota basis is banned.

Locomotives, Wagons and Railway Equipment

The T.E.L.Co. produced 104 metre-gauge steam locomotives in 1959-60 and the Chittaranjan Works 170 broad-gauge locomotives in that year. The requirement of steam locomotives is falling and the Railway Board has arranged with T.E.L.Co. for the manufacture of 350 metre-gauge locomotives only during the third Five-year Plan period. The third Plan programme for Chittaranjan has not yet been fixed, but being planned. There is a programme of manufacture for complete electric traction locomotives at Chittaranjan, obtaining their electrical requirements from the Heavy Electricals Ltd., Bhopal. Proposals for the manufacture of diesel locomotives are under Government's consideration. Project reports have already been received from three leading Indian concerns which are prepared to manufacture diesel locomotives in collaboration with foreign firms.

At present, there are 13 firms manufacturing wagons of all types with an annual installed capacity of 187,900 tons, namely, 23,500 Nos. in terms of 4-wheelers. These more firms, Messrs. Britannia Engineering Company, Ltd., Mokana, Messrs. Modern Industries, Sahibabad and Messrs. Britannia Building Iron Company, Calcutta, are expected to come into production.

The Integral Coach Factory, Perambur, has been manufacturing broad-gauge/metre-gauge passenger coaches at the rate of 200 per year, which has just been stepped up to 400 coaches per year.

There are about 20 mechanical manufacturing firms producing items of railway stores and equipment. The percentage of imported stores to the total purchases made by the Railway Board has now come down to 25 per cent.

Conveyors and Other Material Handling Equipment

Conveyors of different types are being manufactured indigenously by about 14 firms which have been approved for this. These are generally manufactured against specific orders. At present there are five units manufacturing conveyor belting with an annual capacity of approximately 2,429 tonnes. Three more units have recently been licensed for 1,560 tonnes.

Steel Plant Machinery

The Heavy Machine Building Project being set up at Hatia (Ranchi) will have a capacity of 80,000 tons of machinery per year in two stages with a first stage of 15,000 tons. This plant is being planned to produce machinery and equipment primarily for the iron and steel industry, besides possessing adequate capacity to meet also the requirements of mineral oil industry and manufacture of general engineering items like heavy cranes, excavators, oil drilling rigs, crushing and grinding equipment press and forge equipment, etc. This plant is expected to be completed by December 1964.

A.V.B. WORKSHOPS INAUGURATED

(*Concluded from page 247*)

calls for vast experience, careful analysis and the employment of special designs to obtain the maximum economy and performance, as well as excellent manufacturing facilities.

A.V.B. offers all these to world standards. The industrialist can rely on A.V.B. to supply a fully integrated installation, comprising the steam-raising plant itself and a wide range of equipment from the fuel handling and preparation plant to the dust handling and ash disposal plant. He can also be confident of obtaining the finest after-sales service.

Under the third Five-year Plan, the installed power generation capacity in the country is proposed to be stepped up from 5.8 million kw. to 12.8 million kw. A substantial portion of this additional power is proposed to be obtained by installing thermal plant for which the Government have set a target of Rs. 35 crores of equipment per year by 1966.

In this field also A.V.B. can draw on the vast technical knowledge of its British partners and the manufacturing resources available in its own shops to supply the finest equipment.

It will thus be seen that the importance of A.V.B. to the country is tremendous and far-reaching. By providing in India the world's finest facilities for the manufacture of machinery or cement-making, mining and industrial steam raising, this new enterprise will make possible the expansion of several Indian industries through the years to come, starting from this memorable week, when history has been made in the heaven following the conjunction of eight planets.

MONEY RATES UNCHANGED

(*From Our Own Correspondent*)

BOMBAY, 7*th February*

Conditions in the money market are rather stringent. Demand for funds has increased further, whereas the supply has not only not improved but actually shrunk. Consequently, borrowers are finding it difficult to obtain their credit requirements fully. It is reported that several banks continue to borrow from the Reserve Bank. There has, however, been no change in inter-bank rate which stands at 4½ per cent, as well as in the short-term money rates. The latter rates are:

	Per cent
Notice money from public:	
3 days or more	3
Term deposits:	
(i) 3 to 30 days (inclusive)	3
(ii) 31 to 60 days (inclusive) ...	3½
(iii) 61 to 90 days	3½
(iv) 91 days and over but less than 12 months	3½
(v) 12 months	4

While money rates are unchanged thus, the 91-days' Central Treasury Bill rate has increased further from 2.525 per cent to 2.540 per cent per annum. The increase has occurred, though the amount tendered was equal to that invited, that is, Rs. 2 crores. For the next week also, tenders for a like amount are invited. The 91-days' Intermediate Treasury Bills sold during the period 31st January to 3rd February amounted to Rs. 12.75 lakhs, as against Rs. 5.00 lakhs in the previous week. Their sales are being continued at the same rate of 2.456 per cent per annum.

There was a rise of Rs. 13.08 crores in notes in circulation during the week ended 2nd February 1962, in contrast to a drop of Rs. 4.99 crores in the week preceding it. But the notes held in the Banking Department declined by Rs. 13.59 crores, so that the total notes issued were lower by just Rs. 51.57 lakhs.

The foreign assets held by the Reserve Bank were slightly higher at Rs. 138.02 crores, as against Rs. 137.83 crores a week before. The entire rise was accounted for by balances held abroad (in the Banking Department) which rose from Rs. 10.97 crores to Rs. 11.16 crores, while the rupee securities held in the Issue Department were unchanged at Rs. 126.86 crores.

The other changes in the Banking Department of the Reserve Bank as shown by the statement for the week ended 2nd February 1962 are a drop in deposits of Central Government (Rs. 57.31 lakhs), other Governments (Rs. 154.70 lakhs) and banks (Rs. 441.00 lakhs), a decline of Rs. 88.90 lakhs in bills payable, a rise of Rs. 43.51 lakhs in deposits of others and an increase of Rs. 118.90 lakhs in other liabilities. On the assets side, cash declined by Rs. 13.59 crores, loans and advances by Rs. 3.65 lakhs, and investments by Rs. 105.27 lakhs, while other loans and advances went up by Rs. 9.83 crores, advances to scheduled banks against usance bills alone rising by Rs. 7.48 crores.

A further increase of Rs. 8.76 crores to Rs. 1,998.57 crores in deposits is disclosed by the scheduled banks' statement of affairs for the week ended 26th January 1962. Inter-bank borrowings, however, have gone down by Rs. 5.17 crores. Bank credit has increased by Rs. 6.45 crores, bringing the total to Rs. 1,315.45 crores. Investments have also increased by Rs. 7.86 crores, borrowings from Reserve Bank by Rs. 1.08 crore and total cash by Rs. 11.88 lakhs, whereas money at call and short notice has declined again by Rs. 3.77 crores.

Of the rise of Rs. 8.76 crores in the deposits of scheduled banks, the share of the State Bank alone was of the order of Rs. 2.77 crores. Investments of this institution rose by Rs. 8.20 crores and advances by Rs. 1.52 crore, while cash declined by Rs. 3.89 crores and other assets by Rs. 2.45 crores.

The gilt-edged market is ruling quiet. The quotations for all Central Government securities are same as those prevailing a week ago, excepting 3½ per cent 1974 which has lost 5 nP to Rs. 99.45. 3 per cent 1970-75 is done at Rs. 90.10, 3½ per cent 1966 at Rs. 99.60 and 4 per cent 1972 at Rs. 100.30. Among State loans, 4 per cent 1963 Madras, Bihar, Hyderabad and Madhya Bharat loans have risen by 25 nP each and Madhya Pradesh by 35 nP. But 4½ per cent 1972 Uttar Pradesh has softened by 25 nP. 4 per cent 1967 Madras has also eased by 10 nP. The Reserve Bank of India has announced two dates (8th and 16th February) for the presentation of Government promissory notes of the loans the interest on which falls due for payment during February and March 1962.

Both the banks' selling rate and their buying rate for spot T.T. in the foreign exchange market have suffered a further fall of 25 nP this week, the former to Rs. 475.75 and the latter to Rs. 472.25. Abroad, the pound sterling has firmed up *vis-a-vis* the dollar and the Continental currencies. In the New York market, spot sterling is currently quoted at 281.370-281.400 cents, as against 281.240-281.270 cents, a week ago, and three months' forward at 279.580-279.610 cents, as against 279.480-279.510 cents.

GOOD CLEARANCE IN HIDES AND SKINS

(*From Our Own Correspondent*)

MADRAS, 5*th February*

There was no material change in the local hides and skins market last week. Clearance of stocks in the inland trade was good. Arrivals of buffalo and cow calf met with ready sales at firm prices, as the quantities were small. Export demand for cow hides were meagre due to the price resistance of importers. Shippers were unable to meet the overseas asking levels, thanks to the firmness in the raw centres in North India.

In the tanned skins section, prices of goat skins ruled firm. Here also, E.I. tanners are unable to buy raw stocks economically and produce tanned merchandise at export levels. Competition in the primary raw stock centres between tanners and exporters of raw skins is fierce. Demand for tanned sheep skins was slow and shipment business was poor. Tanners have been offering lower prices to attract business but importers seem to wait for prices to decline further and do not give a chance to the shippers to book business by making reasonable counter-bids.

In the tanned skins London public sales last week, good parcels of goat skins, which were not many, realised current c.i.f. prices; other sorts fetched lower prices. Demand for tanned sheep skins was indifferent and clearance was meagre.

Shipments during January last were 1,101 bales tanned cow hides, 150 cow calf, 2 buff hides, 438 buff calf, 252 goat skins and 252 sheep skins to U.K. ports; 43 cow hides, 4 cow calf, 29 buff calf, 557 goat skins, 207 sheep skins to the Continental ports; 1 cow hide, 22 buff hides, 133 buff calf, 150 goat skins, 1 sheep skin to U.S.A. ports and 5 goat skins and 115 sheep skins to Japan. It will be noted that the volume of shipments in most sections has been well below the average during last year.

BULLION DULL

(*From Our Own Correspondent*)

BOMBAY, 7*th February*

The bullion market put on a dull appearance during the major part of the week under review. Fresh business was restricted and values moved narrowly. The daily average offtake continued to be low, being 4,400 tolas of gold (5,000 tolas in the previous week) and 6 bars of silver (same as last week), while arrivals were quite large—6,800 tolas (6,800 tolas last year) and 26 bars (same), respectively. Early in the week, the market tended to move up on rumours that stricter vigilance would be exercised to check smuggling. A leading Calcutta operator was reported to have lent good support. The rise gathered momentum on Monday, thanks to the seizure of about 1,400 tolas of gold at Dum Dum airport (Calcutta) and buying by option dealers. Further, some parties who had sold short in anticipation of lower prices were obliged to square-up at advancing rates. Yesterday, however, the market developed a sagging tendency on reports that offtake at consuming centres was poor. There was also unloading by some tired bulls. Today, gold was quietly steady due to scattered short-covering, while silver encountered selling on reports of heavy arrivals.

The adjustment rates fixed today were Rs. 119.40 per 10 grams of gold and Rs. 212.60 per kilogram. The corresponding rates for Wednesday last week were Rs. 118.50 and Rs. 212.40, respectively.

More than 200,000 tolas of gold worth about Rs. 2.8 crores were seized by the Customs and Central Excise staff during the calendar year 1961, according to an official Press release. The quantity seized in 1960 is put at 93,000 tolas valued at Rs. 1.2 crore.

In gold, the *Fagun* (March) settlement advanced from Rs. 119.70 last week-end to Rs. 120.85 on Monday the 5th inst. After declining to Rs. 119.90 yesterday, the settlement recovered to Rs. 120.45 today before finishing at Rs. 120.40.

Ready gold began the week at Rs. 118.75, same as the previous close, and, after rising to Rs. 120.05, drifted lower to Rs. 119.25 today. The closing was Rs. 119.65 at which rate the discount under the forward was 75 nP, as against 95 nP on Wednesday last week.

The *Fagan* (March) settlement in silver improved from Rs. 213.90 to Rs. 214.60 on Monday the 5th inst. Subsequently, the settlement eased and touched Rs. 213.70 yesterday. After rising again to Rs. 214 today, it finished at Rs. 213.90.

Ready silver continued to be at a discount under the forward, though the actual discount declined from Re. 1.50 to Re. 1.30. The spot rate rallied from Rs. 212.40 to Rs. 213.10 yesterday and, after easing to Rs. 212.40 today, it closed at Rs. 212.60.

The world price of gold in the London bullion market softened from $35.16.3/8 to $35.16.1/8 per fine ounce. This sterling price also decreased from 250s. 1½d. to 249s. 11½d. Ready and forward silver shed 1d. each to 86½d. and 87½d., respectively. Silver in New York, however, was unchanged at 103.75 cents.

The following table shows the trend of prices during the week under review:

	7-2-62 (closing)	High	Low	31-1-62 (closing)
	Rs.	Rs.	Rs.	Rs.
GOLD				
Ready (.99 fine)	119.65	120.05	117.95	118.75
Forward: *Fagun**	120.40	120.80	118.75	119.70
Sovereign	96.50	97.00	96.50	97.00
SILVER				
Ready (.996 fine)	212.60	218.10	211.80	212.40
Forward: *Fagun*†	213.90	214.60	213 80	213.90
London—				
Silver Ready	86½d.	—	—	86½d.
Silver Forward	87½d.	—	—	87½d.
Gold	249s.11½d.	250s. 1½d.	249s.11½d.	250s.1½d.
New York—				
Silver	103.75 cents	—	—	103.75 cents

* 22nd March settlement. † 23rd March settlement.

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.7 tolas). London and New York quotations are per ounce.

COTTON FUTURES STEADY

(*From Our Own Correspondent*)

BOMBAY, 7*th February*

Listless conditions continued to prevail in the cotton futures market during the week under review. Business done was mainly of a jobbing nature. Prices, however, ruled steady. The Jarilla March contract, which had closed at Rs. 688 last week-end, fluctuated between Rs. 688 and Rs. 690 and finished at Rs. 689.50 today. The commencement of new crop movement from Gujarat had no adverse repercussions on the Bombay market as the effect of this was more than offset by the receding prospects for getting U.S. cotton in the context of a fall in indigenous production and rising mill demand. In fact, some operators were doubtful whether the Government would at all succeed in getting P.L. 480 allocation for any substantial quantity of U.S. cotton. They also wondered whether the supply position of cotton being what it is, the Forward Markets Commission would give permission for trading in the next settlement.

Operators noted the statement made by Mr. K. C. Reddy, the Union Minister for Commerce and Industry, at Surat on the 1st inst., that the ceiling prices for cotton would not be revised in the middle of the season but that the question would be considered at the time of the formulation of the cotton policy for the 1962-63 season.

In the spot market at Sewri, there was sustained mill buying in such popular varieties as Co2, L.147, 197/3, Vijay, Digvijay, Kalyan and Surti early in the week. But towards the close of the week, attention of spinners turned to upcountry markets. Nevertheless, prices ruled firm. About 26,000 oales of Vijay cotton are reported to have arrived at terminal markets till last week-end. Crop movements from Kalyan, Wagad and Kalagin areas are expected to begin shortly.

In the import section, since the possibility of getting U.S. cotton in sufficient quantities remains uncertain, mills were eager buyers of all available lots of foreign cotton. Latest reports indicate that further efforts are being made to secure U.S. cotton if not under P.L. 480, at least under deferred payment or barter deals. Sudan cotton was very much in demand. The announcement by Sudanese authorities that there will be no change in the rate of export duty on cotton during the current season has removed the uncertainty about the export duty which had made mills reluctant to enter into large commitments.

Selected Egyptian varieties were in demand. East African cotton also attracted attention. The Uganda Lint Marketing Board has advised shippers to settle the outstanding commitments for new crop East African cotton in view of the drastic downward revision on the crop estimate.

The following are the latest available spot quotations—in rupees per candy of 784 lbs.—from Sewri: Bengal *Deshi* 680; Ganganagar 751; Khamgaon 980; Vijay 1,070; B.P. 52. 1,370; Busoga (UNUG) 1,400; Sudan XG5S 1,420; G5S 1,381; Egyptian Menoufi 1,825; Karnak 151 1,870; American 1,275.

Karachi cotton futures market ruled firm during the week under review. The March contract continued to attract good buying support and rose from Rs. 82.05 last week-end to Rs. 82.65. The May contract firmed up from Rs. 79.50 to Rs. 80.19.

Liverpool cotton futures market was subdued during the week. Business was small and price movement narrow, reflecting lack of demand from local spinners owing to the continued lethargy in the yarn and piecegoods market and absence of outside interest. Both the American and American type contracts receded in routine dealings. Sudan cotton contracts in Liverpool also eased, thanks to lower advices from Khartoum. The following are the latest available quotations—in pence per lb.—from Liverpool:

American cotton one inch staple contract: March 24.50; May 24.85; July 24.95; October 24.50.

American cotton mixed growth contract: March 24.90; May 25.25; July 25.35; October 24.90.

Sudan: March, May, July 31.75.

Listless conditions prevailed in the New York cotton futures market during the week. Buying interest was lacking in view of the absence of any encouraging developments. The uncertainty about the export subsidy rate continued to restrict business. Futures values remained unchanged at last week's level.

The U.S. Department of Agriculture is reported to have told the American Cotton Shippers' Association, which had requested a speedy announcement of the export subsidy, that there were three problems that must be resolved. First, it must determine the type of export programme it will have. (This might involve a subsidy or a sales programme from C.C.C. stocks. The latter involves the need of increasing supplies held by the C.C.C.—or limiting the volume of exports.) Secondly, it must determine the price at which cotton will be competitive abroad and fix the subsidy, if there is one, or the sales price if the programme goes in that direction. Thirdly, it must determine the difference to be applied to the minimum loan of 31.88 cents for the "average of the crop" in order to determine the price of the export basis, middling one inch. An early decision was promised in order that exports in the current and the new season can be stimulated.

The following are the latest available quotations from New York, as compared with those a week and a fortnight ago.

	(In cents per lb.)		
	6-2-62	30-1-62	22-1-62
New York spot	35.55	35.55	35 50
March	34 05	34.00	34.24
May	34.65	34.67	34.80
July	34.88	34.81	35.01

ART SILK YARNS SPURT

(From Our Own Correspondent)

BOMBAY, *7th February*

Barring cotton yarns which ruled quietly steady, the yarn market depicted a distinctly firm trend during the week under review. The firmness was due to sustained buying by weaving units and renewed bull support. Art silk yarns met with keen demand. In spite of the high premium of about 212 to 215 per cent, imported yarns attracted buyers. Staple fibre yarns too, rallied, thanks to buying support in the wake of absence of selling. Cotton yarns lacked buyers, though prices were unchanged.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	7-2-1962	31-1-1962
	Rs.	Rs.
***Art silk yarn*—**		
20/1 Amilan (100 kg.)—		
February	3,312.00	3,195.00
April	3,407.00	3,270.00
120 Japan (per 100 kg.)	1,872.00	1,818.00
150 Japan (per 100 kg.)	1,956.00	1,929.00
120 Italy (per 100 kg.)	1,872.00	1,818.00
150 Italy	1,763.00	1,680.00
Nat. Ray. 150 Bt. I	12.30	11.68
***Staple fibre yarn* (40 × 2)—**		
February	743.00	726.00
April	753.00	734.00

COTTON TEXTILE PRODUCTION

The production of cotton textiles (mill sector) during the month of December 1961 is provisionally placed at 76 million kg. (168 million lbs.) of cotton yarn and 397 million metres (434 million yards) of cotton cloth. The total production for the whole year is estimated at 861 million kg. (1,899 million lbs.) of cotton yarn and 4,699 million metres (5,139 million yards) of cotton cloth. At the end of December 1961, the composite mills of the cotton textile industry held an estimated stock of 163,000 metric bales of cotton cloth as unsold and 201,000 bales of cotton cloth as sold but not lifted.

The following table compares the supply position of mill yarn and cloth during the year 1961 with that for the previous year:

	Cloth (million yards)		Yarn (million lbs.)	
	1961	1960	1961	1960
Opening stocks	617.3	410.6	21.1	9.0
Production	5,139.0	5,052.0	1,899.0	1,737.1
Imports	5.0	5.0	0.5	0.5
Total supply	5,761.3	5,467.6	2,110.6	1,746.6
Offtake for internal consumption	4,587.4	4,160.3	2,068.0	1,702.7
Offtake for export	580.0	690.0	27.3	22.8
Total offtake ..	5,167.4	4,850.3	2,095.3	1,725.5
Closing stocks (at the end of December)	593.9	617.3	15.3	21.1

PEPPER RECEDES

(Messrs. Parekh and Co.)

BOMBAY, *7th February*

Last week's improvement in black pepper was extended during the earlier part of the week, the highest being Rs. 300 for ungarbled and Rs. 308 for garbled. February delivery was upgraded to Rs. 322 and March was sought after by bulls at Rs. 326. The persistent rise was due to light arrivals from jungle and continued buying by one of the Indo-American firms at New York. The firm is reported to have been sending bids almost every day at higher price with a view to creating bullish feeling among dealers and growers. In a rising market, the growers usually become reserved and bring down smaller quantities. The improvement in India, however small, immediately reflects on New York where the dealers quote higher for spot for exciting the grinders. This is how the chain of reactions in pepper spark off. The Indo-American firm, having studied the characteristics of the foreign markets, prefers to bid higher for making the sellers stiffer and the buyers more anxious to cover. Most of the New York dealers except the said Indo-American firm are sitting on the fence. The firm is reported to have bought several small parcels at prices ranging from $0.32 to $0.35.

Later in the week, however, the market eased under pressure of selling forward by hedge sellers who are having good return on their investment. February delivery on the ring was shaded to Rs. 308 and March to Rs. 313. Ungarbled eased to Rs. 295 and garbled to Rs. 302. The proximity of due date for February was also responsible for the present easiness following liquidation by weak bulls. Calicut is quoting Rs. 285. New York, after touching the highest at $0.37 for spot, was down to $0.36½.

Singapore was reported to be quiet with business poor, owing to high parity and under the hangover of holiday feeling in view of the Chinese New Year.

The market is likely to go down as soon as the New York dealer is withdrawn, as further demand from Russia and East European countries is not expected for some time to come.

There are unconfirmed reports that New Delhi is considering the question of fixing export quota for communist countries in order to checkmate any possible future move on the part of these buyers to re-sell Malabar pepper at lower price to New York.

Ready pepper in Bombay is nominally quoted at Rs. 165 per 50 kilos.

OILSEEDS STEADY

(From Our Own Correspondent)

BOMBAY, *7th February*

The oilseeds market ruled distinctly steady during the major part of the week under review, though a sagging tendency was in evidence towards the close. Groundnuts were firm, thanks mainly to bullish crop reports, encouraging advices from Saurashtra, and firmness of soyabean oil in world markets. Castorseeds put on a cheerful appearance. A leading firm lent sustained support to castor oil. Today, however, castorseeds drifted lower due to selling, while foreign enquiries for castor oil were lacking. Linseed and cottonseeds were fully steady.

Business in groundnut May 1962 contract commenced, as was stated last week, on Thursday, the opening rate being Rs. 229.50. The contract rose gradually and touched Rs. 238 before closing at Rs. 237 today. Nizam bold hardened by Re. 1.25 to Rs. 47.25. Oil ex-mill moved up by 35 nP to Rs. 19.75 and railway receipts by 30 nP to Rs. 19.45.

Castorseeds March 1962 contract went up from Rs. 172.87 to Rs. 175.37, but drifted lower to Rs. 172.75. Madras small rose by 50 nP to Rs. 35.25. Commercial spurted by 60 nP to Rs. 14.90 and B.S.S. by 40 nP to Rs. 15.40.

Linseed June 1962 contract picked up 9 nP to Rs. 38.87. Bold ready improved by 63 nP to Rs. 43.50. Linseed oil was maintained at Rs. 18.90.

Cottonseed April 1962 contract rallied from Rs. 109.25 to Rs. 110.10, before closing at Rs. 109.25. Both non-white and Berar gathered 50 nP to Rs. 20.90.

The following table shows the closing prices of oilseeds and oils on Wednesday, the 7th February as compared with those of the two previous weeks:

	7-2-1962	31-1-1962	23-1-1962
	Rs.	Rs.	Rs.
Groundnut			
May 1962	237.00	219.50	
Nizam bold	47.25	46.00	47.25
Khandesh quality	47.62	46.37	47.62
Oil ex-mill ready*	19.75	19.40	19.85
Railway receipts*	19.45	19.15	19.55
Oil January 1962	17.65	17.65	17.65
Castorseed			
March 1962	172.75	172.87	177.62
Ready Madras	35.25	34.75	37.75
Ready Kanpur	34.00	33.50	35.12
Oil B.S.S.†	15.40	15.00	15.70
Oil commercial†	14.90	14.90	15.15
Linseed			
March 1962	39.25	39.41	40.25
Bold ready	43.50	42.87	44.00
Oil ready†	18.90	18.90	19.00
Cottonseed			
April 1962	109.25	109.25	110.50
Niger seed	36.00	38.00	38.50
Kardi seed	25.00	24.50	24.50

* Rates include excise duty but exclude sales tax.
† Rates exclude both excise duty and sales tax.
N.B.—All quotations for futures contracts are per 250 kilograms, except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

IRREGULAR DEMAND FOR TEAS

(Messrs. Forbes, Ewart and Figgis (Private) Ltd.)

COCHIN, *30th January*

A total of 449,000 kgs. was offered in export sale No. 5 held today. Quality showed a general improvement. There was good but irregular demand. There was selective demand for highgrown B.O.Ps, which were sold well, following improved quality when they were often 50 nP to Re. 1 dearer. Similar fannings, however, were irregular. Good medium B.O.Ps. were about steady, but their fannings tended to be easier. Medium, low medium and plainest kinds came to an easier market, following less export interest, and prices were irregularly 10 nP easier and sometimes more. Black leaf brokens were about steady, but their fannings were slightly lower in price. Teas of unorthodox manufacture met with good support and sold at around last rates. There was better demand for whole leaf grades, which were dearer.

The quotations per kg. were:

	1962	1961
	Rs.	Rs.
Low mediums	3.85-4.05	4.65-4.95
Mediums	4.10-4.65	5.00-5.40
Good mediums	4.85-5.70	5.40-5.80
Nilgiri B.O.P.	5.75	10.60

The average price realised in sale No. 5 was Rs. 5.11 per kilo, as compared with Rs. 5.24 a week ago and Rs. 5.16 in the corresponding sale last year.

In dust sale No. 5 held on the 1st inst., 260,000 kgs. were on offer. There was fair general demand. A strong feature of the sale was the demand for clean, grainy exportable types which were much dearer. Browner types were irregular and often lower, while milled and residual kinds were considerably easier. The better C.T.C. teas sold well at around last rates, but powdery sorts in this category were easier. Legg-cut and C.T.C. types sold readily at firm to dearer rates. Highgrown teas sold well and were often dearer.

The average price realised in dust sale No. 5 was Rs. 4.16 per kilo, as against Rs. 3.96 a week ago and Rs. 5.12 in the corresponding sale last year.

Colombo: Just over 6¾ million lbs. were offered and the market opened to less general demand, despite improved quality. Highgrowns were irregular and often lower except for the best and where quality showed distinct improvement. Low mediums were barely steady, while useful mediums were firm to 5 cents dearer. Improved Uvas were dearer, whereas small leaf lowgrown B.O.Ps. and B.O.P.Fs. were up to 5 cents easier.

London: North Indian and other growths: In Monday's auction, there was good demand with coloury Assams firm to dearer, but thin liquoring teas below 3s. per lb. were neglected. Plain broken pekoe is quoted at 3s. *Ceylon and South Indians*: In Tuesday's sale, offerings amounted to 26,166 packages came from South India Teas from Ceylon met with strong competition, particularly those with good liquors which were dearer. There was good demand for South Indians. Useful liquoring kinds, meeting a strong market, were dearer, while the remainder, particularly the plainer kinds, tended easier.

As we go to press Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire as follows:

"*Sale No. 6*: 448,000 kgs. offered. Selective demand. Low medium, medium and good medium brokens much easier. Similar fannings irregularly easier. Best liquoring good enquiry, and generally higher. Unorthodox much weaker and lower."

TEA BETTER

(From Our Own Correspondent)

CALCUTTA, *6th February*

Good demand for tea was in evidence during last week's internal auctions. Prices were steady. The steadiness was due to the approach of the end of the season and the buyers' need to complete purchases. Such a trend was also in evidence in the auctions of Colombo and London held last week and stemmed from the same cause. Although quality teas were steady, the general demand weakened during yesterday's export sale.

Tea bookings were satisfactory during the week. A reduction in the tea freight rates to U.S. ports, effective from 29th January, was earlier announced. The new rates are: $32.50 net per cubic metre to the U.S., North Atlantic, South Atlantic and Gulf Ports, and 230s. net per cubic metre to Canadian Atlantic ports.

The terms and conditions for tea gardens to get long-term loans for replanting, replacement and extension of acreage from the sum of Rs. 5 crores placed at the disposal of the Tea Board by the Government of India would have been more attractive if only the interest to be charged was lower. At the rate of 7 per cent, a garden will have to pay interest which will be almost equal to the principal, allowing for the gain in interest from repayment in instalments. Government loans and National Savings Certificates fetch much less interest. Another criticism is in respect of the condition that the loan will be granted to gardens in four or five instalments only. It is not understood why this condition has been detailed. Gardens are to give as security charge on their fixed assets and, if only the loan is granted in one lump sum, it will save the industry from much clerical labour and also will lead to better planning of the expenditure.

The tea industry has been asked to increase production, both by intensive methods and by expanding acreage. Recent trends have indicated that world production is increasing, so also consumption. However, India's share in the latter has been lower than certain other producing countries, including Ceylon and East Africa. The industry has time and again represented that the export duty weakens its competitive power in world markets. With the result, the Indian export duty has worked to the advantage of other competitors. Indian exports to the U.K., Australia and the U.S. have palpably fallen, while India has been able to find new markets in some East European countries, thanks to the bilateral trade agreements. India's promotional campaign in the Middle East has also been a success. It is pointed out that India is the principal supplier to the U.K. and has had a considerable share in efforts to increase British consumption of tea spread over a long period. If the benefits from these efforts cannot be maintained and can be passed on to India's competitors, there is the fear that India's success in the Middle East and the East European markets may also be threatened in time to come by the more aggressive sales campaigns of other producing countries. It is necessary that Indian tea's position in new markets should be maintained. This demands statesmanship, and the trade would at once point what else this can be excepting the total abolition of the present unwieldy export duty.

It will be remembered that the export duty affected considerably the fortunes of Indian jute goods in world markets immediately after World War II. Much foreign exchange was lost to the country by Government's delay in abolishing the duty. Permanent harm was also done to the jute industry inasmuch as certain markets were irrevocably lost to other countries as well as to substitutes. A more or less similar position has now developed for the tea industry. If the example of jute goods is any lesson, no further time should be lost in completely doing away with the export duty, point out trade circles.

In this connection, it is well to recall the timely remarks of Mr. G. A. Whittaker when he recently addressed the annual meeting of the Tea Traders Association. Mr. Whittaker said that China's monopoly in world trade of tea was annexed by India and Ceylon to whose advantage the Chinese export duty worked. This was just a decade before the outbreak of World War I. Both Ceylon and India benefited from this monopoly which was at its climax immediately following World War II. This opportunity was apparently taken to impose an export duty. Africa has taken advantage of this, and has been increasing its tea acreage in the last one decade. It is able to sell all that it produces in world markets since there is no extraneous burden on cost of production. Thus, while Africa has claimed a major share in the increase in world consumption, India's share has been unsatisfactory. In fact, total exports from India have shown a tendency at constancy.

In the internal sales held here during the last week, dusts on offer aggregated 26.601 chests which met with good demand. Non-wither legg-cut teas were the strongest feature, and prices appreciated impressively. Demand for orthodox tea strengthened as the sales progressed; however, these had opened 10 nP easier. Bright liquoring C.T.Cs invited keen competition, but the poorer teas were irregular, the leafy teas showing a loss of 20 nP. Fibrous C.T.C. teas were, however, steady. The quotations per 1 kg. inclusive of excise duty were: good Assam C.T.C. dust Rs. 6.50 to Rs. 7.00; medium Assam C.T.C. dust Rs 5.50 to Rs. 6.10; legg-cut Doars Rs. 4.60 to Rs. 5.20; medium Assam dust Rs. 4.30 to Rs. 5.10; and plain orthodox dust Rs. 3.90 to Rs. 4.60

An irregular trend was in evidence in the prices of leaf on offer amounting to 628 packages.

Yesterday's export offerings amounted to 74,269 packages which met with less general demand, although quality teas were in the forefront. Darjeelings were absorbed readily, the flavoury teas being higher. Other teas in this category eased in an irregular trend. Tippy teas were fully firm, with whole leaf grades recording a small gain. Among C.T.Cs, the best teas eased up to 20 nP, while mediums and secondary grades were firm. Demand for Dooars and Assam B.O.Ps were selective. Autumnal teas were favoured but poorer liquoring Assam B.O.Ps eased, leading to withdrawals. However, fannings were fully steady and were a strong feature. Plain brokens eased by 10 nP but fannings of these were dearer. "Teas for price" eased. The quotations per 1 kg. inclusive of excise duty were: best Assam C.T.C. fannings Rs. 5.80 to Rs. 6.30; best Assam C.T.C. B.P. Rs. 5.70 to Rs. 6.10; medium Assam C.T.C. fannings Rs. 5.20 to Rs. 5.50; medium Assam C.T.C. B.P. Rs. 5.30 to Rs. 5.50; plain fannings Rs. 4.00 to Rs. 4.50; clean plain pekoe Rs. 4.00 to Rs. 4.20; and plain B.P. Rs. 3.60 to Rs. 3.90.

JUTES QUIET

(From Our Own Correspondent)

CALCUTTA, *6th February*

Quiet conditions marked activity in both raw jute and goods markets during the week under review. However, fibre prices in Calcutta were maintained at the minimum levels, while the earlier firmness in mofussil markets reduced the discount for the mesta varieties and tossa was hardly available at the minimum rate. On the other hand, hessians were maintained at the opening level, whereas heavy goods fell by three points, as business passing was inadequate. After the recent heavy buying, the U.S. kept out of the market during the week. There was also not much support from Argentina. It was, however, thought, these two countries would again enter the market for substantial quantities. Meanwhile, the U.S.S.R. availed the opportunity to cover some of its requirements. There has so far been no settlement of the labour troubles in Dundee and production there continues to be low. British buyers will need to make up for the loss of production in Dundee by lifting more goods from India and Pakistan. Fibre consumption in Dundee has evidently fallen, and that explains the diminution of British interest in Pakistan fibre.

Although the strike by labourers in the jute trade ended a week ago and the congestion of wagons loaded with jute in Cossipore eased, the transport situation for movement of fibre has not improved. In view of the congestion at Cossipore all bookings to that station had to be cancelled and this in the face of the keenness of cultivators to dispose of the remaining portion of their produce led to larger discounts. It is difficult to see how prices in the mofussil can be maintained without the railways being able to allot wagons promptly. It is apparent that the railways are finding it difficult to cope with the bumper crop. Movement by motor transport is costly and will increase costs of mills. Trade circles think that electrification of the Sealdah division of the Eastern Railway, the work in respect of which is in progress, will go a long way towards easing the transport problem. However, electrification is not expected to be completed before the 1964 jute season. Until such time it is suggested that the Government of India should be able to reduce the various taxes on motor transport. If the cost of motor transport can be reduced, this will also ease the coal situation, thus removing the obstacle for increased production of coal and helping industries to get over the existing power shortage.

Selling pressure in the futures market led to easier conditions in ready goods on Tuesday last. B. twills lost from Rs. 124.75 to Rs. 122.75 and hessian 40" 10 oz. from Rs. 55.25 to Rs. 54.75. There was some covering business done in hessian, but the volume was inadequate to maintain prices. Interest from overseas countries was also paltry. The news of Russian order for heavy goods led B. twills to recover to Rs. 123 on Wednesday, while, despite some due date covering, hessian 40" 10 oz. declined to Rs. 54. It was thought that U.S. buyers were biding for time. On Thursday, however, short-covering in hessian led to drive away dullness, pushing up hessian 40" 10 oz. to Rs. 54.50. However, there was no business in sacking, and that accounted for the fall in B. twills to Rs. 121.

FOR SECURITY AND SERVICE

BANK WITH

STATE BANK OF TRAVANCORE

(Subsidiary of the State Bank of India)

Head Office: **TRIVANDRUM**

With 94 Branches mostly spread all over the industrially fast developing State of Kerala and having Agency and Drawing arrangements with all the 1,175 Branches and Sub-Offices of the State Bank of India and their Subsidiaries, the Bank can handle Banking Business of every description—Foreign as well as Domestic.

Contact your nearest Branch for further details.

T. R. KRISHNASWAMI

At this stage, interest was shown in B. twills on Government account for March delivery, but, apart from this, there was nothing doing on Friday, when B. twills lost to Rs. 120.50. Hessian 40" 10 oz. was unchanged at Rs. 54.50. Over the week-end, these prices were maintained. Although there were more inquiries from overseas countries yesterday, prices did not improve. Hessian 40" 10 oz. was quoted at Rs. 52.35, while, following some business in Liverpool twills and grainsacks, B. twills improved to Rs. 121.50.

Fibre prices were unchanged. Since arrivals were less than the weekly purchase quota of mills, prices in the interior firmed up. The accumulation of wagons in Cossipore following labour strike had entirely stopped further bookings from agencies. With the end of the strike, pressure on wagons has increased. The mills are now more interested in forward fibre than quick shipment jute. The quotations ruling in Calcutta are: February-March delivery—Assam bottoms Rs. 30 a maund, Daissee bottoms Rs. 32 and northern bottoms Rs. 29.50. Despite lower arrivals in the Narayanganj market, the resistance of overseas buyers to accept offers at E.P.C. rates continued. The gap between E.P.C. rates and buyers' offers has naturally widened.

COPPER AND TIN HARDEN

(From Our Own Correspondent)

CALCUTTA, *6th February*

Following higher advices from overseas markets and pressure on supplies, copper scrap and tin hardened during the week under review. The indication following the meeting in Washington last week of the Aid India Consortium that it was likely the promised aid for the forthcoming financial year would be increased was cheerfully noted in the hope that imports of base metals would be increased. Accordingly, the further meeting of the Consortium fixed for May is looked forward with interest. Trade circles appreciated the view that, without a substantial increase to this allocation, the import programme for industrial raw materials, including non-ferrous metals and spares, could not be maintained and the realisation of installed capacity for many an industry depending on imports would not be possible.

During the week, tin on the London Metal Exchange rose to as high as £951 a ton (spot) from the opening of £943. It would thus be seen that the London price, after remaining static at around £940 in the last two to three weeks following the raising by the International Tin Council of the floor and ceiling prices from £730 and £880 a ton to £790 and £965, respectively, was now well on the way to reach the new ceiling. At first, it appeared as though the L.M.E. quotation would not reach the ceiling. However, this presumption is now in the process of being negatived following the indication that the U.S. Government would not permit releases from its strategic stockpiles at a price lower than £1,000 a ton. As these reserves had been built at prices averaging above £1,000, it was not expected of the Congress to grant the Government permission to release simply to prevent the world price from rising further. Further, it was feared that, although Malayan production was expected to rise in this year, such a rise would not offset the expected increase in world consumption. The steady rise in the world price in 1961 followed acute shortage. Subsequently, the International Tin Council realised that production could not be increased without raising the Buffer Stock Manager's prices. The new price range has been considered to be below their anticipation by Malayan producers. Tin in Calcutta gained by a few points. Demand was good, and the metal was in short supply.

Copper scrap remained fully steady. Spot copper on the L.M.E. opened at £234 a ton and, after being higher at £236½, closed at £234½. Three months opened at £232 and rose to £233½ before closing at £233½. The firmness in both the delivery positions followed renewed fears of threats to production in Chile and the remote possibility of an immediate change in the political situation in the Congo. Also, stocks in London stood depleted following heavier despatches abroad for refining. Having regard to the comfortable world supply position in copper, the L.M.E. quotation was not expected to move up.

The London trend in zinc, on the other hand, was easy. The spot price opened at £68½ a ton and closed lower at £68¼. The three months' position eased from £70 to £69½. Lead in London opened at £58¼ a ton for spot and £59½ for three months and eased to £58 and £59¼, respectively. The quotation here was unchanged at Rs. 124.

FOODGRAINS EASY

(From Our Own Correspondent)

HAPUR, *5th February*

Quiet to easy conditions were witnessed in foodgrains prices during the week ended 5th February. The easiness was attributed to last rains which has very much brightened *rabi* crop prospects. Business during the week was poor due to *Ashtagrah*. Wheat prices sought lower levels at Rs. 17 a maund, for *dara* quality and upto Rs. 18.50 for better farm produce. Daily arrivals of wheat in open market were poor but consumer demand was being met through sales of wheat at Rs. 15.25 a maund at fair-price shops in ration, the quantity of which has been recently increased by State Government in all the big cities of U.P. Local wheat stock with trade is placed around 12,000 maunds, but Central Government stocks of wheat here were reported heavy due to storage facilities in silo-*cum*-elevator and other masonary godowns.

Rice prices also drifted lower on increased arrivals of *Mainpuri* quality and slack seasonal demand. Arrivals during the week aggregated about

2,000 maunds and week-end prices were: *nanapari sela* Rs. 19.50; *gadda kutcha* Rs. 19; *ramajwayan sela* Rs. 20.50; *raimania sela* Rs. 22; *basmati sela* Rs. 26 to Rs. 28; superior Rs. 30 to Rs. 34 a maund. Gram prices declined fractionally to Rs. 16 a maund as crop prospects were fairly good here as well as in Punjab due to last rains. Stocks were, however, fast declining thanks to good demand. Barley and *bejhar*, prices hovered around Rs. 13 and Rs. 13 to Rs. 13.50 a maund, respectively. Maize arrivals were still heavy and stocks too were high. As stockists were anxious to sell prices drifted lower to Rs. 12 to Rs. 13.25 a maund. *Bajra* was quoted lower around Rs. 14.75. Prices of other grains were steady: *Methi* was quoted at Rs. 27, *juwar* at Rs. 13.25, *guwar* at Rs. 14.25 and oats at Rs. 12 a maund.

In pulses, peas and *arhar* prices were subdued, thanks to improved crop prospects. It was, however, reported that, although losses in peas standing crop would be made good, damage to *arhar* was irreparable. New *urd* and *moong* that reached here from outside the State were lifted at higher prices by consumers. Week-end prices (in rupees per maund) were: peas *dara* 13.25, farm 14.25, peas *dal* 14.75, *arhar* 15.50, *arhar dal* 19, *urd* 22 to 24.25, *moong* 18 to 21, *massoor* 15.50 to 17.50, *urd dal* 25 to 28, *moong dal* 21 to 24, *massoor dal* 19.25, *moth* 16, *moth dal* 19. Stocks were approximately: peas 10,000; *arhar* 15,000 maunds.

SUGAR PRICES DECLINE

(From Our Own Correspondent)

HAPUR, *5th February*

Sugar mill delivery prices of inferior small crystal drifted further lower on poor buying support in face of increasing stock positions. The factories were reported to be in the midst of crisis due to accumulation of stocks and slack demand. This crisis was more acute in case of factories manufacturing inferior crystal. Factories in east U.P. had also urged the Government to delay releases so that these stocks might be lifted. Week-end prices here were: whole sale Rs. 106.50 per bag; mill delivery per maund Simbhauli D29 Rs. 37.75; Amroha Rs. 36; Bijnore Rs. 35.25; Meerut Rs. 37.25; Dhampur C29 Rs. 37.12; Shamli B29 Rs. 39.50.

Sugar prices were bearish during the week in the Muzaffarnagar market, thanks to absence of demand from Punjab, Gujarat and Saurashtra. Crushing during the week was in full swing and mills were anxious to liquidate their stocks. Some of them offered more discounts, but buyers were reluctant to commit themselves as offtake in the spot section was discouraging. It was further expected that February quota might be delayed by a fortnight or that the quantity will be reduced so that prices may recover and mills find time to sell off their stocks. Since September after decontrol 9 lakh tons of sugar has been released and this accounted for the comfortable supply position. Only inferior quality sugar was not in demand but superior crystal was still commanding premia from 19 to 75 nP a maund above former controlled prices. Week-end prices were: A29 Mansurpur Rs. 40.22; Lhaksar Rs. 39.48; B29 Khatauli Rs 39.59; Shamli Rs. 39.50; Buland Rs. 39.37; Rohana Rs. 38.97; C29 Deoband Rs. 38.97; Dhampur Rs. 37.12; Bazpur Rs. 36.25; D29 Sharanpur Rs. 37.25; Seohara Rs. 36.44; Sakoti Rs. 36.75.

Khandsari prices hardened as arrivals were poor due to inclement weather and demand of the commodity was good from Punjab and Rajasthan. East U.P., Gujarat and M.P. also attracted some demand. Prices were: *khandsari* moist Rs. 25 to Rs. 29; dry Rs. 30 to Rs. 32.50; crystal Rs. 30 to Rs. 32.75.

After ruling quiet, *gur* prices improved. Arrivals dropped to an average of 1,000 maunds daily due partly to adverse weather and also due to *Ashtagraha*. Loading by railway was not available except on Sunday when ten wagons loads was despatched to Gujarat. Total arrivals here during the current season aggregated 3.65 lakh maunds, as against 4.05 lakh maunds in the corresponding period of last year. *Gur* arrivals are likely to mount now, thanks to clear sunny weather. New cane sowings too have commenced. Week-end prices were: *pansera* best Rs. 14.50; *dara* Rs. 14.12; *balti* Rs. 14.12; *shakker* Rs. 17 a maund.

Gur futures were bearish during the week. *Gur fagun* after having opened at Rs. 14.35 last Monday, touched the highest of the week at Rs. 14.40 the same day and then eased, in subsequent sessions, to Rs. 13.82. It declined to Rs. 14.04 due to profit-taking.

LINSEED FIRM

(Messrs. A. Bradley and Co.)

CALCUTTA, *5th February*

Generally firmer tendency has prevailed and there has been an all-round advance in the prices of seeds and oil; arrivals from supply centres have slowed down and the prices quoted by them are somewhat higher than local prices. Crushers are in the market daily but very small business has been reported during the week.

The oil market has firmed up again; local buyers are showing interest due to the steadiness in seeds and other vegetable oil markets; sellers, however, are reserved.

The oilcake market is steady; local demand is better and stocks are limited. The latest quotation is as follows: Ready/February Rs. 32.75 per maund.

Notices

THE PHALTAN SUGAR WORKS LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Thirtieth Annual General Meeting of THE PHALTAN SUGAR WORKS LIMITED will be held on Friday the 2nd day of March, 1962, at 4-30 p.m. (S.T.), at the Registered Office of the Company, Sangli Bank Building, 296, Bazargate Street, Fort, Bombay-1, to transact the following business:

§.—The reserves of Straw Products Ltd. include a non-distributable amount of Rs. 63,49,854 brought about by revaluation of land, buildings, plant and machinery in the year ended 31st December 1955.

N.—Ctive New Investment—Dividend for 1959 includes additional dividends of 9 nP for the year ended 31st March 1955 and 37 nP for the year ended 31st March 1956.

M.—Managed by the Board of Directors.

N.B.—Dividends paid since 31st March 1959 are shown as taxable.

A.—Associated Battery Makers (Eastern) Ltd. The effective dividend for the year 1960 would work out to 16.36 per cent approximate, as the final dividend of 10 per cent was paid on the increased capital of Rs. 112 lakhs, whereas the interim dividend of 15 per cent was on a paid-up capital of Rs. 80 lakhs only. X. B. Ex-Bonus.

MARKET GOSSIP

(*Concluded from page 227*)

year from exporting member-countries. The present price range is $1.50 to $1.90 a bushel. It is a moot point whether the Agreement has functioned well during the last three years. The fact remains, however, that, since 1959, supply and demand position of wheat has changed for the better. This may be partly because of smaller output in major wheat producing countries and partly to larger imports from countries like China.

Three years ago, the volume of *surplus stocks* held by the leading exporters (the U.S., Canada, Australia and Argentina) was increasing, while import demand was lagging behind, partly because of larger domestic production in Western Europe and partly due to *per capita* decline in bread consumption in the highly industrialised countries. Today, conditions are somewhat different. Stocks of the four *leading exporters*, according to the latest review of the world wheat situation by the Wheat Council, went down by 10 million tons to 53 million tons during 1960-61, the first substantial reduction since 1956. This decline was the result of lower production in both exporting and importing countries, following bad weather. During 1961, world wheat crop (outside Russia and China) declined by 14 million tons, with a sharp drop of 10 million tons in North America alone. At the same time, world trade in wheat and flour reached a record level of 42 million tons in 1960-61 (an increase of 10 per cent over the previous year), thanks mainly to larger imports from China. The Wheat Council forecasts that, in 1961-62, the volume of trade will increase further, with a still further decline in stocks.

It may be because of the better prospects for the demand for wheat that exporting countries are now pleading for an increase in the floor and ceiling. Canada, for instance, is said to be asking for a price range of $2 to $2.10, as against the

All preference shares are taxable unless otherwise stated.

***These shares carry the right of a preferential dividend at the rate of 8 per cent (of which only 5 per cent cumulative) per annum. In the event of a winding-up these shares have a preferential claim to repayment of capital.

† Only 7 per cent of the 10 per cent dividend is cumulative.

†† In addition to the fixed cumulative dividend of 5 per cent these shares carry the right to receive a non-cumulative dividend of 3 per cent per annum and also to participate in further dividend of 2 per cent per annum rateably with ordinary shares. They have a preferential claim to repayment of capital and arrears of dividend.

††† These shares can be redeemed at Rs. 105 at any time by special resolution.

Capital and dividend unconditionally guaranteed by the Dunlop Rubber Co., Ltd.

C—Cumulative. R—Redeemable. T.F.—Tax-free. R.O.—Redeemable at option.

(f) Participating preference shares. (g) Redeemable at Rs. 105 at any time on 3 months' notice. (h) Redeemable after 30th September 1966 at Rs. 125. (i) Redeemable at par after 9th November 1955 on 6 months' notice. (j) Redeemable after 28th July 1955 on 6 months' notice. (k) Participating upto 9 per cent. (l) Redeemable at par after 31st March 1952 on 6 months' notice. (m) Rank pari passu with ordinary shares after 6 months' notice. (n) Redeemable at any time at Rs. 115 on one month's notice. (p) Redeemable at par after 20th December 1954. (q) Redeemable at par after 17th June 1956. (r) Redeemable at par after 1st October 1956 on 3 months' notice. (s) Participating to 9 per cent. (t) Free of Income-tax upto 6 nP. in the £. (u) Redeemable at par on 3 months' notice. (v) Redeemable at par on various dates. (w) Redeemable at any time 5 years after the date of issue at a premium of Rs. 10 per share on 3 months' notice. (x) Redeemable after ten years at a premium of 5 per cent on 6 months' notice. (y) Partly paid.

RUPEE COUNTERPART FUNDS

METHODS of utilisation of rupee counterpart funds now accumulating under American aid programmes have long needed a review and it is likely that the current discussions between Mr. McGovern, Director of the U.S. Food-for-Peace Programme, and the Government of India will provide an opportunity for a reappraisal of the policies which have been pursued all along. Some time ago, when Mr. Douglas Dillon, Secretary of the U.S. Treasury, appeared before the Senate Foreign Relations Committee, he advocated a change in the system of loans repayable in local currency granted by the Development Loan Fund and proposed that, in future, they should be repaid exclusively in dollars. He then observed:

"An important reason for this change is that the United States is rapidly acquiring large accruals of local currencies from various programmes, most importantly from the sale of agricultural surpluses under Public Law 480. There is danger that continued large accruals of local currency

to solve the problem, though this year the prospects for the success of the President's farm programme are not bright.

Besides the philanthropic part of the surplus disposal for school children and relief schemes, India has recently been buying more under the barter pact, in exchange for manganese ore; this accounts for some stability in the amount of counterpart funds accruing to the U.S. and kept by the Government. This may have some effect on the Budget, because these funds are now directly taken to reduce the deficit on capital account, instead of through Treasury Bills as before when the State Bank of India was investing in them. The change is, however, one of nomenclature and does not affect the basic character of the accounting.

FERRO-ALLOYS

THE third Plan had originally laid down a target of 200,000 tons, in terms of annual capacity and production, for alloy, tool and special steels, excluding electrical and spring steels. Such steels are usually categorised as "alloy steel" which, in addition to the common constituents of steel, contains other elements (such as chromium or nickel, molybdenum, tungsten or vanadium) added to it with the object of achieving particular physical characteristics. *In view of the growing requirements* for these steels (which are almost entirely imported now) in the context of expanding and diversified industrial production, the authorities are stated to have revised the target capacity therefor to 375,000 tons per year and actually licensed an aggregate capacity of 300,000 tons so far. But, according to the expert opinion of some scientists in the National Metallurgical Laboratory (Jamshedpur), even the revised target capacity may not be quite sufficient. It is stated that, if the capacity for such steels is to be proportional to the third Plan's targeted capacity for steel ingots, it would have to be as much as 500,000 tons. The relevant point here is that, with greater production of ordinary steel, the demand for alloy steel will also correspondingly increase.

If thus the demand for alloy steel increases, so will the demand for ferro-alloys which feed the alloy, tool and special steel industry. Hence the need for establishing a ferro-alloy industry which can produce different grades of ferro-alloys required in alloy steel production. But, at present, only ferro-silicon and standard high-carbon grade of ferro-manganese are being commercially produced in the country. Although there are substantial indigenous resources for the industrial-scale production of ferro-chromium, ferro-titanium, ferro-vanadium, ferro-phosphorus, etc., they are yet to be exploited. It is, therefore, good to know that the National Metallurgical Laboratory at Jamshedpur is setting up a heavy pilot plant, with a capacity of one ton per day, for studying indigenous raw materials and their suitability for the production of standard grades of ferro-alloys. The significance of this development could be seen from the following observations of Mr. Jehangir Ghandy, Director-in-charge, T.I.S.Co., at a four-day international symposium on ferro-alloys, inaugurated on the 12th instant, at the National Metallurgical Laboratory:

"The growth of the ferro-alloy industry in India has been slow and quite disproportionate in relation to the projected development in alloy, tool, special and stainless steel industry. . . . It is noteworthy that the laboratory is commissioning a heavy pilot plant for the production of ferro-alloys based on the use of indigenous raw materials. This submerged arc ferro-alloy furnace is the first of its kind in the East and will be extremely useful to the ferro-alloy industry in evolving suitable smelting techniques, assessment of power consumption and other economies of production for industrial installations. . . . The tempo of research has to be maintained to ensure progress in the ever-changing pattern of smelting technology not only of ferro-alloys but also of specialised alloy steels in which the former find application."

Already, the Laboratory, it is gratifying to know, has achieved some substantial results in the field of research pertaining to ferro-alloys which are indispensable in steel-making generally. The alloys and metals which have been produced in the Laboratory's successful experiments so far are ferro-titanium, carbon-free ferro-chrome, chromium metal, manganese metal and chromium-manganese alloy. The Laboratory has also undertaken studies for the production of ferro-vanadium from vanadium pentoxide which is itself produced at another pilot plant. The experience gained in the production of different ferro-alloys on a small scale, it is said, has helped the Laboratory in setting up the unit for pilot smelting of ferro-alloys.

As for three other ferro-alloys, namely, ferro-silicon, ferro-manganese and ferro-tungsten, the Laboratory is in the picture only in respect of the last two. Ferro-silicon is already produced chiefly at the Mysore Iron and Steel Works which will soon have an expanded capacity of 20,000 tons per year. But it is estimated that the total requirements of this ferro-alloy by the end of the third Plan will be 40,000 tons per year. Ferro-manganese is now produced by a number of units. It is expected that, by the end of the third Plan, there will be an aggregate installed capacity of 225,000 tons of this ferro-alloy to cater to domestic and foreign markets. The National Metallurgical Laboratory is in the picture in respect of ferro-manganese through its research on the utilisation of low-grade manganese ores and through its work relating to the possible production, in future, of ferro-manganese in a low-shaft furnace pilot plant. As for ferro-tungsten, the Laboratory has already initiated a project for its production from the tungsten ore deposits of Degana in Rajasthan.

It would appear from the foregoing review of research achievements that the National Metallurgical Laboratory, unlike some other national laboratories, has fully justified its existence. Its success todate seems to be the result not only of the dedicated work of its scientific workers but also of the abiding and practical interest taken in its activities by the T.I.S.Co. But all its good work will not find extensive commercial application, if cheap electric power is not made available to any future ferro-alloy plant. The reason is simple. It is that the electric smelting techniques being evolved by the Laboratory will mean high power requirements. Since electric arc smelting will considerably ease the production of high quality ferro-alloys, their large-scale manufacture will necessarily have to be based on it. The ready availability of cheap power on the scale required is, therefore, vital for the success of ferro-alloy industry.

WORLD REFINERY EXPANSION

THE tremendous growth in oil demand since 1950 in the free world has been reflected in a corresponding growth in crude oil production as well as in refining capacity. The free world's crude oil supply in 1961 was of the order of 950 million metric tons, including imports from the Communist world, and may well exceed 1,000 million tons this year. The aggregate annual crude refining capacity has also simultaneously expanded; as at the beginning of the current year, this is more than 1,100 million tons, as compared with about 500 million tons in 1950 (*vide* Table 1). There are firm projects on hand in 51 countries, excluding the United States and Canada, for providing an additional refining capacity of about 185 million tons a year, of which 50 million tons will represent the capacity for completion in 1962. These projects, both for new plants and for the expansion of existing ones, number 105 in all, calling for an estimated investment of the order of £1,300 million in the next two or three years. Even with the addition of this capacity, there will be no overall over-capacity as such, for refineries are built to cater to needs for some years ahead and oil demand is expected to rise by about 50 million tons annually in the near future.

A noteworthy change that has come about in the free world's refining capacity is that North America (U.S.A. and Canada) now accounts for rather less than half of the free world's capacity, as compared with its two-thirds share in 1950. A major expansion, as will be seen from Table 2, is now taking place in the Eastern Hemisphere and, to a lesser extent, in Latin American countries. When the 105 firm projects (73 new refineries and 32 expansion projects) are completed within the next two or three years, they will raise the capacity in the free world outside North America by about one-third of the capacity now in existence. The present scale of expansion, according to the *Petroleum Press Service* of February 1962, is by far the biggest that has so far occurred. A remarkable feature of this expansion is that as many as 18 countries, where there are as yet no full-scale refining facilities, will have them for the first time. These countries are Switzerland, Malaya, Thailand, South Korea, New Zealand, Algeria, Tunisia, Libya, Kenya, Ethiopia, Ghana, Nigeria, Southern Rhodesia, Panama, El Salvador, Costa Rica, Nicaragua and Jamaica. With the completion of the projects on hand, there will scarcely be, it is stated, a country in the world with annual oil sales of the order of one million tons or more without oil refining facilities.

Another change that has come about in the last decade is the trend towards building refineries in oil consuming areas. The fact to be noted here is that, whereas, in 1950, oil producing/exporting areas accounted for nearly two-thirds of the refining capacity in the free world outside North America, their share in the rising total is now reduced to 36 per cent and, according to the *Petroleum Press Service*, will decline further as time goes on. This decline is being caused by the rapid expansion that is taking place in refineries in Europe (particularly in Italy and West Germany) and in Japan.

Perhaps the most striking feature of the expansion under way is that State oil enterprises are in the picture on a big scale in a number of countries. As much as 42 million tons of the projected additional refining capacity of 185 million tons are to be provided by these State enterprises. In Italy, for instance, the State-owned E.N.I. has on hand two new projects for a total refining capacity of 7 million tons. Spain will have one more project in the public sector, with a capacity of 1.1 million tons, Yugoslavia one of 1.2 million tons and Iraq one of 1.3 million tons. The public sector in India will have three new projects (Nunmati, Barauni and Gujarat) with an aggregate capacity of 4.5 million tons. Three new projects in Tunisia, Morocco and Ghana will be joint Government-E.N.I. enterprises, responsible for an aggregate capacity of 3.25 million tons. Wholly State-owned new projects in other countries are: Mexico (one of 2.5 million tons capacity), Colombia (one of 2.25 million tons), Brazil (two of an aggregate capacity of 2.5 million tons), Chile (one of 2 million tons), Iran (one of 5 million tons). Thus, wholly State-owned new refinery projects in several countries will account for an aggregate capacity of about 30 million tons. To this may be added the figure of 12 million tons by way of additional capacity projected by the already existing State oil enterprises in Finland, Yugoslavia, Egypt, Mexico and Argentina.

In spite of this increasing importance of State enterprise in the field of oil refining, private enterprise will continue to account for the larger part of expansion. It may be noted here that the major oil companies will be providing 63 million tons of additional capacity under their new and expansion projects and the smaller private oil concerns of various nationalities as much as 77 million tons. If the cost of refinery construction is taken, on an average, to be £7 for every ton of new annual throughput capacity, it will be found that the projects of State enterprises account for only £320 million, whereas those of private enterprise account for as much as £980 million of the entire planned investment on expansion. There can, however, be no gainsaying the fact that the leading international oil groups are being increasingly challenged by State enterprise in several non-Communist countries outside North America.

TABLE 1: *Free World's Refining Capacity*
(Million metric tons annually, at beginning of years shown)

Areas	Absolute capacity		Per cent of total	
	1950	1962	1950	1962
North America:				
U.S.A.	335	505	63.6	45.0
Canada	16	51	3.0	4.6
Outside North America:				
Producing/Exporting—				
Areas (*a*)	112	203	21.3	18.1
Europe (*b*)	44	225	8.5	20.0

MARKET GOSSIP

Equities Subdued

EQUITIES are gradually losing ground for want of fresh buying. In the past few weeks, several scrips in the cash list have shot into prominence by staging impressive gains, thereby imparting a buoyant look to the share markets. But this appearance is deceptive, because almost all the counters in the forward list have tended to move down. The advance made in the cash section is due to encouraging reports about the performance and programmes of individual companies. Some have gone up in expectation of bonus issues or right issues at attractive rates. Some others have marched forward on reports of better profits for 1961 and possibility of enhanced dividends. There is a growing feeling that companies with substantial reserves may be tempted to capitalise a part of them and issue bonus shares while the going is good, in view of the widespread fear that the new Government to be formed at the Centre after the elections might either enhance the tax on capital gifts to shareholders or make such issues unattractive through other means. The fear that the next Central Government might be more anti-rich and anti-private sector than the present Government has been is responsible for the lack of support to the leading speculative counters at the current price levels. The fear, however, has not become so dominant as to encourage bears to depress the market.

Every one of those who are interested in the share markets is now waiting to see the character of the next Central Government. No one doubts that the Congress Party will be returned with sufficient majority to form a strong Government in the Centre and all the States. There are many who think that even Mr. Krishna Menon would win the contest, despite the united opposition to him, spear-headed by the distinguished and highly respected leader Acharya Kripalani. The movement of share markets after the elections will be determined by the appointments to the Union Cabinet. Presently, there is a general misgiving that the next Government will be more leftist than the present one has been since the exit of T.T.K. towards the close of 1958. But the crucial questions, the answers to which will shape the post-elections trend of share markets, are: "Who will be the next Finance Minister? If T.T.K. is not, what will he be in the Cabinet? Will he be given a position from which he can influence the vital elements of India's economic policies?"

T.T.K. Amuses

Meanwhile, many are amused at the tone and manner of T.T.K.'s speeches and statements. The one general comment that this writer has heard is on these lines: "T.T.K. talks as though he is certain of being appointed again as the Finance Minister, or as one who will be the chief architect of the next 'socialist' Government. He also talks as if he would have served the cause of socialism better than his successor had he continued to be in charge of Finance. Surely, this amounts to casting aspersions on the ability, wisdom and strategy of Mr. Morarji Desai, in particular, and his Cabinet colleagues, in general. No one else in the Congress Party seeking re-election to the Lok Sabha has made such damaging statements on the economic policies of the Government as T.T.K. has done. Does the fact that he chose to refrain himself from discharging his responsibilities as a member of the Lok Sabha for four long years entitle him to speak in a vein that amounts to a condemnation of his ex-Cabinet colleagues? Does not such a performance amount to a breach of party discipline? Even Prime Minister Nehru has not castigated any of his colleagues as this ex-Minister has done."

A question that one is provoked to address to T.T.K. is as to why he kept himself aloof all these days, despite the irresistible call of duty to the country and his party. If he felt that his successor was not following the right fiscal policies, he ought to have said so either in Parliament or in the meetings of his party. He did nothing of the sort. It is an unfair practice, unfair to his ex-Cabinet colleagues and to his party, to talk the way he has done on the eve of elections, when Mr. Morarji Desai or his supporters cannot reply in the interest of unity of the party.

Inter-bank Agreement

The inter-bank agreement on interest rates is in the melting pot at the time of writing (Thursday evening). Whether it will be allowed to lapse or sustained after 28th February 1962 will have been known by the time this issue of *Commerce* is in the hands of readers. The six months' notice given by five medium-sized banks for freedom to quote their own rates for term deposits, if their demand for a ½ per cent lead over the present ceiling rates cannot be conceded, expires at the end of this month. A meeting of chairmen and general managers of leading banks is scheduled for Friday the 16th inst., to take a final decision on this request of medium-sized banks and its outcome will be known early on the next day. Informal talks behind the scenes have not produced any agreed solution, as there are sharp differences of opinion. It would not, therefore, be a surprise to us, if the voluntary agreement were to yield place to a rate-war among banks. The only factor that might keep the members of the agreement together is the fear of more controls by the Reserve Bank, with the ultimate possibility of nationalisation in the third tranche of socialism in India.

The case of medium-sized banks for special treatment is already well known. To recapitulate it briefly. They say that uniform rates of interest under the agreement have worked against them, as the bigger banks had a greater pull over depositors. If a concession of ¼ per cent could be shown to small banks on the basis of their deposit resources, nothing would be lost by making another categorisation, namely, medium banks and big banks, on the same basis and allowing the former to offer ¼ per cent more than the existing ceilings. This, of course, implies that the small banks should be allowed to quote ¼ per cent higher than the big banks. It would appear that the small banks are not unhappy at this prospect, because their rates of interest on deposits would then be quite competitive not only with those offered by the other banks but also by other institutions.

The big banks are mightily opposed to the demand of the medium-sized banks for a variety of reasons. An uncharitable motive attributed by some cynics is that, as one or two of the big banks themselves want to see this agreement ended, the initiative taken by the said banks gives them an opportunity to get their objective fulfilled without having to take the blame for it. All that they have to do is to refuse a compromise. Among the other reasons mention may be made of the following:

1. Interest rates on deposits are already high; any further increase would make the cost of money uneconomic and reduce the profit-margin of banks which is none too high, having regard to the need for (*a*) building up their reserves and (*b*) opening more branches.

2. It is unnecessary to increase the rate of interest on deposits in order to attract them, because interest is only a marginal source of income for depositors. Deposits in banks are not investments but only funds kept for a temporary period, pending availability of more lucrative outlets.

3. Efforts should be made to obtain more deposits by spreading banking habit. This will require opening of more branches, offer of efficient services of both banking and non-banking, such as investment advice, arrangements to make periodical payments and safe deposit vaults. Since all this will add to the working expenses of banks, no excessive price for deposits should be paid.

4. If the cost of deposits goes up further, the banks will be compelled to raise their rates of interest on advances. This, in turn, will raise the cost of production in the country and aggravate price inflation. The organisations representing trade and industry will raise a hue and cry, asking the Government to interfere. Thus, the politicians will be given a very good excuse to get more controls imposed on banks.

5. An increase in the rates of interest on deposits will, in course of time, compel the Government also to pay higher rates of interest on its borrowings. In order to finance this addition to its cost, the Government will find it necessary to raise the rates of taxation also.

6. The argument that banks will have to pay more on their deposits in order to compete with joint-stock companies and other institutions that need money is not tenable. On the contrary, it will only lead to a vicious circle. Since the industrial and trading companies will have to pay higher rates of interest on their borrowings from banks, they will be tempted to offer still higher rates of interest to those who are willing to leave their savings with them. In any case, the quantum of money seeking such sources of high interest rates cannot be very large; at best, it will only be a fraction of deposits now being held by banks.

7. Higher deposit rates will be injurious to small banks themselves, because they will have to pay more than the big banks and, in order to do so, they will have to carry bigger risk-bearing advances. Such a position will place them, in great difficulties and even lead to the failure of some, when steps are taken from time to time to rectify imbalances in the economy which are inevitable in countries like India trying to make rapid progress in industrialisation.

8. There will soon come a time when higher interest rates paid by small and medium-sized banks will act as a drag on their growth, for that practice will be regarded as stigma of inferiority status. It is possible that a subtle propaganda will be carried on by their competitors among the depositors to the effect that, if a bank were to offer higher interest rates, something must surely be wrong with its stability. When this impression comes to prevail, depositors will get scared about keeping their funds in banks offering attractively high interest rates, and readily forgo the differential, in order to ensure the safety of their funds by keeping them with big banks.

9. There may be some justification for the existing ¼ per cent differential in favour of small banks, but none whatever in favour of medium-sized banks which are operating all over India and which have registered a rapid rate of growth in deposits in recent years. In addition, they have the benefit of regional loyalties of depositors in their principal area of operation. If their present demand were to be conceded, it would amount to giving them an excessive advantage over the big banks. Further, the associates of the State Bank, who are already canvassing custom by pointing to the mighty backing of the invincible State Bank of India, will steal a march over even the big banks, not to mention the medium-sized banks.

10. The introduction of deposit insurance has placed a handicap on big banks but given an advantage to small- and medium-sized banks. To give them another weightage in the form of higher interest rates would be too much.

Despite all these overwhelming arguments against an increase in interest rates on the lines suggested by the five medium-sized banks, there are, however, some among the big and bigger medium-sized banks who are in favour of a compromise. They feel that a quarrel among banks will only be an invitation to the Government and the Reserve Bank to intervene and fix the ceiling on interest rates. They further feel that, if the inter-bank agreement were to collapse, there would be unhealthy competition for deposits and the principal beneficiaries will be the foreign banks operating in India. Since these banks have to pay pretty high rates of interest on funds brought from abroad and since they have a bigger margin of profit in view of the large volume of foreign bills handled by them, they would not hesitate, it is contended, to pay 4½ to 5 per cent for six months' to 24 months' deposits. The compromise-minded bankers would, therefore, prefer to settle the dispute by permitting the medium banks to pay ¼ per cent more than the present ceilings.

India Has To Beg For Cotton

The prospects for getting P.L. 480 cotton from the United States still remain uncertain. Representation made by India that a quantity of not less than 700,000 bales (of 400 lbs. each), should be supplied to India to tide over the crisis that has developed from the sharp drop in internal production of cotton is yet to bear fruit. Obviously, the U.S. Government has not made up its mind and is still assessing the quantity of cotton it can export under P.L. 480 and the size of the allotment to India.

In the meantime, the domestic crop position has deteriorated since December last when this country had indicated the size of its requirement of U.S. cotton. The crop is currently estimated at no more than 4.4 million bales, as against 4.8 million bales estimated in December and the last season's outturn of 5.4 million bales. There has thus been a drop of one million bales in production this season. This setback to production has rendered the anticipated requirement of foreign cotton an underestimate. The total requirement of foreign cotton for the current season was estimated at 1.2 million bales, of which 700,000 bales were expected to be supplied by the U.S. It was therefore thought that only 500,000 bales of cotton would have to be imported from the sterling area countries either under special rupee payment agreements or by payment in pound sterling. All this calculation has to be revised now.

Reports suggesting the likelihood of the U.S. not being able to supply the quantity asked for by India are, therefore, disturbing to a degree. For, if the U.S. cotton is not available in adequate quantities, this country will be faced with the problem of having to find alternative source of supplies. It is, of course, suggested in some quarters that, should it prove difficult to get P.L. 480 cotton, U.S. cotton may be imported in exchange for manganese ore. It is not known whether this suggestion is acceptable to the U.S. If it is not, the only alternative is to look for other sources. This, however, is not going to be easy, in view of the acute shortage of foreign exchange and the difficulty of concluding special payment agreements or barter deals with the suppliers.

Some of the countries mentioned as possible sources of imports are Russia, Sudan, Egypt, East Africa and Pakistan. Mill interests do not seem to favour importing cotton from Russia, because the mills in India are not familiar with spinning and weaving Russian cotton. Samples of Russian cotton received for trial purposes in the past are said to have been found to be irregular in staple and sub-standard in quality. It is also felt that Russia cannot be depended upon to ensure continuity of supplies, as it might cut off supplies at any moment should China or other Communist countries require cotton any time. This speculation apart, India's favourable balance of trade with the Soviet bloc has yielded place to an adverse balance. Accordingly, the question of finding the wherewithal to pay for Russian cotton also has become a difficult one.

The sharp reduction in production in Egypt and East Africa has reduced the chances of increasing imports from these two countries also. Output of cotton during the current (1961-62) season in Egypt has declined from the last season's level of 10.6 million kantars to as low as 6.5 million kantars. East African cotton crop has also suffered a sharp setback and private estimates at present place it at no more than 200,000 bales (of 400 lbs. each), one of the lowest crops on record for many years.

Sudan, on the other hand, is considered to be a promising source of supplies. With a bumper crop estimated at nearly one million bales (of 420 lbs. each) as against a mere 385,442 bales in the previous season, that country is in an ideal position to supply cotton to India. But, unlike in the case of Egypt and Pakistan, with which India has rupee payment agreements, Sudan has got to be paid for in pound sterling, unless of course, cotton is imported in exchange for specific commodities such as textiles and tea. There is no

HESITANT TREND IN SHARES

SUPPORT SELECTIVE

(From Our Own Correspondents)

BOMBAY, *15th February*

THE buoyancy noted on the Stock Exchange last week has proved a short-lived affair. Although nothing has happened to change the sentiment for the worse, from the trend of the market during the past three days it appears as though operators regarded last week's rise in equity values as overdone. The peak levels reached on Thursday last attracted profit-taking with the result that prices staged a decline on the very first day of the week under review, namely, Friday the 9th inst. Subsequent sessions witnessed the emergence of fresh selling and a certain amount of bear pressure which accelerated the downward trend. Short-covering and scattered buying forthcoming at lower levels, however, prevented a further fall in prices. Nevertheless, today's closing quotations were generally lower than those a week ago. Although the general picture was thus one of easiness, there were quite a few bright spots in both the cash and forward lists. This was because selected scrips attracted support prompted by either news of bonus issues or anticipation thereof.

Two shares, namely, India United (Ordinary and Deferred) and Poly-Chem attracted interim margins on Friday the 9th inst. as their quotations had gone up by more than 10 per cent of their previous clearing rate. Tata Oils attracted margin on Saturday the 10th inst. for the same reason. Four more shares, namely, Elphinstone, Dawn, Phoenix and Amar-Dye came under margin on Monday, as their prices had gone up by more than 10 per cent over the previous settlement rate. India United (Deferred) attracted margin for the second time in the week on Monday as their price had risen by more than 5 per cent over the previous interim margin *havala* rates. One more share, namely, Alcock Ashdown, attracted margin on Tuesday because its quotation rose by more than 10 per cent over the last settlement rate. This, however, could not halt the upward trend of the scrip which rose yesterday by more than 5 per cent over the interim rate of Rs. 362 fixed on Tuesday and attracted a further margin of Rs. 11.50 for the second day in succession. Two other shares, B. R. Cotton and Maharashtra Sugars, attracted margin yesterday, the former because its quotation rose by more than 10 per cent over its last clearing rate and the latter because its price declined by more than 10 per cent as compared with its last clearing rate.

Steel shares, in sharp contrast to last week's firmness, encountered selling. Tata Steels opened at Rs. 142.50, as against the previous close of Rs. 142.75, and, after rising to Rs. 142.75 again, receded to Rs. 140.25 at close today, a net loss of Rs. 2.50 over the week. After opening lower than the previous close at Rs. 25.35, Indian Irons receded to Rs. 25 today, before finishing at Rs. 25.05. The net loss over the week was 40 nP. Mukand Irons commenced the week's trading at Rs. 28.10 and, after improving to Rs. 28.25, eased to Rs. 27.75 today, a loss of 75 nP over the week.

Textile shares generally experienced a fall in demand, though selected shares found buyers. Speculative favourites like Standard Mills, Centurys and Kohinoors came under selling pressure. Standard Mills were marked down by Rs. 28 to Rs. 1,141. Centurys opened at Rs. 616, Rs. 2 lower than the previous close, and steadily declined thereafter to touch Rs. 602 today before winding up at Rs. 606.50. The net loss over the week was Rs. 11.50. Kohinoors were subdued early in the week but attracted support later, although they again relapsed towards the close. From Rs. 317.50 early in the week, this scrip rose to Rs. 327.50 on Monday but eased to Rs. 317 at close today. Khataus eased by Rs. 7.50 to Rs. 475. Podars were marked down by Rs. 6 to Rs. 153. Gokaks lost a like amount to Rs. 223. Simplex, after having commenced the week at Rs. 176.50, succumbed to selling, declining to Rs. 171 today, before closing Re. 1.50 higher at Rs. 172.50. The net loss over the week was Rs. 5. Finlays were quoted Rs. 4 lower at Rs. 366. Central Indias shed Rs. 4.50 to Rs. 149.50. Swans weakened by Rs. 2.50 to Rs. 437.50. Morarjees, B. R. Cottons and Elphinstones shed a rupee each to Rs. 410, Rs. 86 and Rs. 126, respectively. Bombay Dyeings, however, attracted good support and improved from Rs. 69.30 to Rs. 70.30 today, before finishing at Rs. 69.70, a net gain of 30 nP over the week. A few other textile scrips too found buyers. Prominent among them were Phoenix and Dawn of the Ruia group of mills, which firmed up by Rs. 10 and Rs. 6 to Rs. 258 and Rs. 165, respectively. Modern Mills spurted by Rs. 17 to Rs. 84. Tata Mills, too, gained 80 nP over the week to Rs. 82. The most conspicuous feature of the textile section was the sharp rise over the week of Rs. 62.50 in Mafatlals to Rs. 1,050. On Saturday, the 10th inst. the quotation for the scrip was as high as Rs. 1,100, as against Rs. 987 two days earlier. This rise was due to rumours that the Company would soon issue bonus shares.

Sugar shares were subdued. Belapurs, after rising from Rs. 250 early in the week, to Rs. 251, slumped to Rs. 247.50 at close today, as against the last week-end rate of Rs. 249.50, a net decline of Rs. 2 over the week. Maharashtra Sugars encountered heavy selling on news that the Directors had decided to postpone the bonus issue and reacted by Rs. 12 to Rs. 164. Phaltan Sugars eased by Rs. 3 to Rs. 113.5. Walchandnagars shed Rs. 4.50 to Rs. 152.

Cement shares depicted a divergent trend. A.C.Cs and Dalmia Cements were subdued, while others attracted buyers and firmed up. A.C.Cs declined by Re. 1.75 over the week to Rs. 152.25, as against last week's closing rate of Rs. 154. Dalmia Cements eased by 8 nP to Rs. 13.16. Digvijays, on the other hand, rose, on good support, by Rs. 3 to Rs. 201. Orissa Cements gained 92 nP to Rs. 19.28. Bagalkots and Jaipur Udyogs put on 12 nP each to Rs. 8.12 and Rs. 13.12 respectively.

Scindias, in the shipping group, eased by 40 nP to Rs. 12.60. Great Easterns were neglected at Rs. 12.68, same as last week. Among automobile shares, Premier Automobiles encountered selling and receded by Rs. 2.25 to Rs. 140.25. Hindustan Motors shed 48 nP to Rs. 20.48.

Rayon shares drifted lower. National Rayons were subjected to bear pressure and slumped from the week's opening rate of Rs. 560 to Rs. 544.50 today. The close was, however, a shade higher at Rs. 547. Nevertheless, the net loss over the week was Rs. 16.50. Baroda Rayons encountered selling and eased by Rs. 10.50 to Rs. 150.50. Gwalior Rayons shed Re. 1.30 to Rs. 53.70. South India Viscose lost a rupee at Rs. 192. Indian Rayons, however, attracted special support and firmed up by Rs. 5.50 to Rs. 99.

Chemical shares, barring a few, were quoted lower. Indian Dyestuffs were marked down by Rs. 7.50 to Rs. 547.50. Poly-Chems eased by Rs. 5 to Rs. 230. Colour-Chems suffered a sharp setback, declining by Rs. 20 to Rs. 485. Synthetics eased by Rs. 17 to Rs. 216. Tata Chemicals lost 40 nP to Rs. 18.80. Alembic Chemicals, however, spurted by Rs. 32 to Rs. 275 on news of a bonus issue to be followed by a right issue. Amar Dyes, too, firmed up by Rs. 5 to Rs. 367.50.

Engineering shares presented a mixed pattern. Telcos came in for some selling and declined from Rs. 364 last week-end to Rs. 354.50 today, before closing at Rs. 355, a net loss of Rs. 9. Cooper Engineerings and Larsen and Toubros shed Re. 1 each to Rs. 182 and Rs. 43, respectively. Texmacos were quiet at Rs. 20.36. Premier Constructions were marked down by Rs. 5.25 to Rs. 191. New Standard Engineerings declined by Rs. 2 to Rs. 220. News of right issue, in the ratio of one equity right share at a premium of Rs. 2.50 for every two held, imparted strength to Mahindras which firmed up by Re. 1.48 to Rs. 21.24. T. Maneklals spurted by as much as Rs. 80 to Rs. 980, thanks to speculative buying based on reports of a right issue. Alcock Ashdowns evoked sustained support on rumours of a bonus issue by the Company and firmed up by Rs. 8 to Rs. 363.

Among miscellaneous industrials, Bombay Burmahs evoked selling. After opening at Rs. 660, as against the previous close of Rs. 662.50, the scrip steadily lost ground, receding to Rs. 651.50 at close. The net loss over the week was Rs. 11. Hindustan Levers, after last week's firmness induced by the announcement of the bonus issue, eased by Rs. 2.50 to Rs. 67.50. Voltas slumped by Rs. 7 to Rs. 302. West Coast Papers came down by Rs. 2.50 to Rs. 178. Wimcos shed Rs. 4 to Rs. 310. Shivrajpur Syndicates eased by Re. 1 to Rs. 43. Anil Hard Boards receded by Rs. 3.75 to Rs. 236.25. A rise of Rs. 5.50 to Rs. 155 distinguished Premier Tyres from the rest.

Calcutta Stock Exchange

CALCUTTA, *14th February*

The reported belief of Mr. T. T. Krishnamachari that direct taxation need not be raised further, coupled with improved prospects for foreign aid, accelerated the steady recovery on the Calcutta Stock Exchange during the week under review. The postponement of the Security Council meeting on the Kashmir question, which was soon followed by a deterioration of the political situation in Pakistan, encouraged the hope that the Kashmir question would not stand in the way of India's request for larger foreign aid. Good corporate news such as higher dividend for Elgins in the textile group and the proposed rights issue by Hindustan Lever in the miscellaneous group encouraged optimism. Those who had kept away from the market earlier impelled by the evil forebodings from the confluence of the planets staged a come-back, and long-term investments were a feature of this week's trading. All this led to an impressive recovery, and it is to be seen whether this would be sustained. The remote possibility of official action to push up raw jute prices lent more support for jute shares, as the opinion that prices for the inferior fibre were above costs appeared gaining ground. Jute mills are determined to increase production commensurate with demand and the hope that they would be able to recoup their earlier losses is becoming brighter and brighter. The uncertainty as to a uniform rise in the retention prices for steel continued to keep down speculation in Indian Irons, while other engineerings benefited from replacement buying. Coals and sugars continued their sluggishness, as a solution to the accumulating stocks with producers, though entirely for different reasons, was still not in sight. Teas responded to selective inquiries as auction results continued to be encouraging. Replacement buying forced up several miscellaneous industrials.

Very few transactions were recorded in coals, where Burrakurs hoovered around Rs. 17.50. Ranigunges were quiet at Rs. 15, while Western Bengals at Rs. 9.56 recorded a very small gain. Borreas maintained Rs. 23.31, but Standards shed from Rs. 13.81 to Rs. 13.31, and Pench Valleys from Rs. 16.12 to Rs. 15.62.

Among textiles, following the higher dividend of 17½ per cent as against 11¼ per cent previously, Elgins met with sustained buying interest to lift the rate from Rs. 24.44 to Rs. 25.75. Bowreahs were a strong feature and at Rs. 40 recorded the handsome gain of Rs. 2.50. Dunbars also met with investment buying, and the rate gained from Rs. 34.62 to Rs. 35.37 but closed at Rs. 35.10. Cawnpores improved from Rs. 9.81 to Rs. 10.31 while Bharat Commerce, after being higher at Rs. 28.37, skidded to Rs. 28.25 which was, however, 25 nP higher on balance.

Jutes were prominent, following optimism in regard to working results for the current accounting period. Fort Glosters were one of the strong features, and rose to as high a rate as Rs. 407 cord the handsome gain of Rs. 6.50 at Rs. 209. Kinnisons at Rs. 168 recorded an eleven-point rise. Champdanies picked up Rs. 6 at Rs. 131, with Kanknarrahs advancing from Rs. 83 to Rs. 93.50. Fort Williams had buyers at Rs. 24.25, as against Rs. 23.19 a week ago. Kelvins firmed up by Rs. 18 to Rs. 195. Dalhousies finished Rs. 3 higher at Rs. 127, with Unions recording as high a rate as Rs. 192 as against Rs. 170 previously. Ballys put on Rs. 19 at Rs. 273, and Kamarhatties spurted from Rs. 144 to Rs. 155. Deltas changed hands at Rs. 171, as against Rs. 162 a week ago. Hukumchands were marked higher at Rs. 30.

Among engineerings, Burns were a strong feature and rose from Rs. 537 to Rs. 546. Guest, Keen, Williams were higher at Rs. 42.50, Britannia Engineerings strengthened from Rs. 12.62 to Rs. 13.44. Kumardhubis were better at Rs. 8.12. Indian Irons closed lower on balance at Rs. 25.20, after being higher at Rs. 25.44. Likewise, Texmacos eased from Rs. 20.65 to Rs. 20.45, but at one time the rate was higher at Rs. 20.80.

Several features were recorded in miscellaneous industrials on interested buying. Electric Constructions, in respect of which dividend has been maintained, were Re. 1.25 higher at Rs. 15.75. Sustained interest stemming from the news of the investment rights issue saw East Anglica Plastics rise to as high a rate as Rs. 34.37 after opening at Rs. 25.75. Kesoram Industries were steady at Rs. 25. At Rs. 37.62, National Insulated Cables put on a fractional gain. Martin Burns were steady at Rs. 32.75 as were Metal Boxes at Rs. 62.25. Indian Aluminiums were unchanged at Rs. 37.75.

Among paper mills, Titaghurs met with keen support and the rate at Rs. 42.75 recorded the very impressive gain of Rs. 7.31. Ballarpores were fractionally better at Rs. 37.50. Bengals were maintained at Rs. 109. India Pulps were firm at Rs. 17.12, while Seshasayees were quiet at Rs. 8.75.

Madras Stock Exchange

MADRAS, *15th February*

Firmness noted on the Stock Exchange last week gained further momentum during the major part of the week under review, thanks to selective support extended by both investors and professional operators. Textiles ruled distinctly steady in anticipation of better working results of textile mills. Teas were well fancied on encouraging advices from auction centres. It may be noted here that, for the first time since the introduction of automatic margin scheme on the Exchange, an interim margin was made applicable to Blue Mountain tea shares, when the

NEWS IN BRIEF

THE Import and Export Promotion Advisory Councils, for the first time since their constitution, will have joint sittings at New Delhi, commencing from 5th March next, for a customary review of the export and import policies.

A solvent extraction plant, with a capacity of 100 tons a day, built at a cost of Rs. 25 lakhs, has been inaugurated at Calcutta by Dr. B. C. Roy, Chief Minister of West Bengal. This private sector plant, besides extracting oil from rice bran, is also suited for extracting oil from oilcakes.

The Bhilai Steel plant has just reached its rated capacity of steel production. The production during January last was 85,300 tons, which is the highest monthly production figure so far and is above the average rated capacity of the plant of one million tons of steel ingots per year.

The Indo-Pakistan trade agreement, which is to expire on 31st March next, has been extended to 31st March 1963, with additions to the list of commodities to be traded between the two countries. The additions include the export of gypsum, guava seeds and coal from Pakistan while coffee and coffee beans are to be imported from India.

The Government of Madras proposes to carry out a district-wise survey of the village leather industry with a view to formulating a comprehensive programme of development of this industry. As a preliminary step, questionnaires are being issued to the various blocks in the districts for collecting relevant data pertaining to the present condition of the industry and the scope for its future development.

The Government of India, on the recommendation of the Forward Markets Commission, has granted recognition to the Indian Exchange Ltd., Amritsar, in respect of forward trading in *gur* for a period of three years ending 10th November 1964. It is the sixth forward market in *gur* recognised under the Forward Contracts (Regulation) Act, 1952, the other five centres being Hapur, Meerut, Muzaffarnagar, Agra and Delhi.

An agreement has been signed by the representatives of the Kerala plantation labour and the management on the question of gratuity. According to the agreement, gratuity at the rate of 15 days' wages for every year of service, subject to a maximum of 12 months' wages, will be paid to employees in plantations in Kerala State, who have completed ten years or more of continuous service. The agreement will remain in force till statutory provision for payment of gratuity is made.

Five railway tank wagons of petrol and four tank wagons of light diesel oil produced by India's first State-owned Gauhati (Nunmati) refinery were despatched to Nepal on the 9th inst. The refinery, which was commissioned on 1st January last, has so far produced 19 lakh litres of petroleum and 1,850 tons of light diesel oil. This is the first time that petroleum products refined in India from Indian crude oil are sent outside the country.

Two hundred rural industrial estates are expected to be established throughout the country during the third Plan period, according to Mr. Shriman Narayan, Member, Planning Commission. The outlay in each of these rural estates will be Rs. 3 lakhs and each estate will try to manufacture articles mostly consumed in the rural areas. These estates will be located in smaller towns and villages in order to provide employment as well as opportunities for technical training to the rural people.

The 740-foot-high Bhakra Dam—the main component of Bhakra-Nangal project in the Punjab—is nearing completion, and only one per cent of the total quantity of 5.4 million cubic yards of concrete remains to be placed in the dam, and appurtenant works. The concreting of the central spillway section will be completed by the middle of March next. Civil works for the left bank power house have been completed and all the generating units, with an installed capacity of 450,000 kw., have been commissioned.

The Oil and Natural Gas Commission has begun commercial production of Ankleshwar oil with effect from 15th inst. Sixty tank wagons carrying 1,200 tons of crude oil, to be refined at the Burmah-Shell and Stanvac Oil Refineries in Trombay, have been despatched. An oil special will leave every alternate day carrying Ankleshwar crude oil. The production from the Ankleshwar well will be stepped up gradually at the rate of 100 tons a day every month until it reaches a total of 1,500 tons per day by the end of this year. The trial production will save the country an annual foreign exchange of about Rs. 3.5 crores.

The Central Warehousing Corporation will be opening warehouses at Raipur, Jabalpur, Nagpur, Burdwan, Rajkot and Vijayawada during the course of this month. With these the Corporation will have a total of 58 warehouses spread all over the country, as against 27 at the end of 1959-60. All the Corporation's warehouses were started in hired accommodation to begin with and the Corporation is now accelerating its construction programme so that the warehouses may function in new godowns specially constructed for storage of agricultural commodities. Construction has already been approved at 42 centres in the country with a total storage capacity of 185,000 tons. In addition the Corporation is constructing two cold storages and acquiring existing well-constructed warehouses at two centres.

From Abroad

An official Bill which seeks to double Government guarantees on exports from £15 million to £30 million has been introduced in the Norwegian Parliament, the Storting, in a fresh bid to promote exports.

In the event of completion of an American refinery unit at the Sodom Plant of the Dead Sea Works, production of bromine in Israel is expected to go up from the hitherto 4,000 tons to 9,000 tons annually.

Poland reported an adverse trade balance of 731 million Zlotys (about £66 million) in 1961. Exports during the year aggregated 6,018 million Zlotys (£547 million), while imports accounted for 6,749 million Zlotys (£613 million).

The name of the Technical Co-operation Mission to India (T.C.M.) has been changed to the United States Agency for International Development Mission to India (U.S.A.I.D.). The mission remains a part of the American Embassy.

The State-owned Petroleum Corporation of Ceylon entered into an agreement with Petrol Export of Rumania on the 7th inst. to buy Rumanian petroleum products worth Rs. 3.5 million (£262,500). Rumania will use the money to buy raw materials from Ceylon.

The World Bank has given a loan of $47 million towards the Volta river dam project in Ghana. The loan will help finance construction of a dam and hydro-electric power project on the river at Akosombo, *plus* a transmission system to supply power to Southern Ghana.

Consumption of refined tin in the U.K. during 1961 was 21,623 tons as against 22,787 tons in 1960, according to the British Bureau of Non-ferrous Metal Statistics. Exports during the same year accounted for 9,848 tons while the stocks at the end of the period aggregated 6,378 tons.

Steel production in France has gone up by 1.7 per cent from 17.28 million tons in 1960 to 17.58 million tons in 1961, while the investment accounted for a rise of 40 per cent, from NF 1,255 million to NF 1,750 million. The iron and steel exports went up from 5.05 million tons to 5.36 million tons in the same period.

The British Leyland Motors has secured an order for Leyland trucks worth about £70,000 from Poland. The order has been signed by officials of Motoimport, a Polish Government buying agency, in London. Negotiations for the order, which is for specially designed long-distance Albion lorries, began at the 1961 Poznan Fair.

Under a new five-year trade agreement between Austria and Czechoslovakia, an increase of £2.25 million in each direction of their trade is envisaged for 1962. Trade exchanges will increase by 20 per cent to over £22 million this year, with Austria exporting mainly steel, machinery and chemicals in exchange for fuel, instruments and cars.

Economic and trade officials from 22 Japanese diplomatic establishments in Western and Eastern Europe are expected to hold a four-day conference in Rome with effect from 13th inst., according to the Japanese Foreign Ministry announcement. The main subject of the Conference is to centre round the measures that Japan has to take to cope up with the fast expansion of the European Common Market.

A team of Pakistani officials is expected to visit Europe in the near future to report on the possibility of making alternative shipping arrangements to those of the Conference Lines. The need for such a step has arisen as the Conference Lines rejected Pakistan's request not to increase the freight rates. It will be recalled that during September last they decided to increase the freight rates on East-bound and West-bound trades by 12½ and 10 per cent, respectively.

Income-tax reductions amounting to Sch. 1,000 million (£14 million) have been announced by the Finance Minister of Austria. The reductions will not, however, take effect before 1st July 1962. The partial reform of direct taxation will involve various concessions to the lower and medium-income groups with annual incomes not exceeding Sch. 150,000 (£2,000). Tax reliefs will also be granted to the lower income groups in the form of higher basic allowances, as also families and children's allowances.

Pakistan has extended invitation to French interests to undertake oil prospecting. A Pakistani official team headed by Mr. Musarrat Hussain Zuberi, which had been abroad for six weeks, has returned with an assurance from the French Institute of Petroleum that the latter would enter into an agreement for oil exploration subject to a favourable report by consultants. Oil prospecting has so far been undertaken by British and American interests during the last three decades. Recently work has also been entrusted to Russians who have initiated efforts in some areas of West Pakistan.

PERSONAL

MR. O. Akenfosile, Communications Minister of the Federation of Nigeria, arrived in New Delhi on the 13th inst. on a week's visit to India.

Dr. Robert C. Swain, Vice-President of the American Cyanamid Company and Director-General of Cyanamid International, arrived in Bombay last week, specially to attend the inauguration of Lederle's antibiotic fermentation plant at Bulsar.

Mr. M. A. Qadeer has been appointed Additional Member (Staff) in the Railway Board, *vice* Mr. B. Majumdar who retired recently. Mr. B. D. Gaur, till recently Engineer-in-charge, Brahmaputra Bridge Project, has taken over charge from Mr. Qadeer as Director of Establishment, Railway Board.

for all interior construction and decoration the wise choice is JOLLYBOARD

the modern material

JOLLYBOARD—India's leading hardboard—is ideal for use in department stores, factories, offices and modern homes. It's strong, light, durable and highly decorative. It can't crack, split or come apart.

ECONOMICAL TOO—
JOLLYBOARD is very economical. It's not only surprisingly low priced, but also saves up to 50% of your money in labour and painting costs.

Remember the name JOLLYBOARD ...it's your guarantee of quality!

AN IMPORTANT JUDGMENT

THE Supreme Court has delivered a judgment of some importance holding that the State is as much liable for the wrongs committed by its employees in the course of their work as any private employer. There has been some ambiguity in the legal position hitherto, because the Indian Constitution (in Article 300) and all other constitutional laws before it had, in effect, laid down that the State's liability was the same as that of the East India Company before 1858, except that certain acts of State were exempted from its scope. Over a century, however, the courts, in applying the law to specific cases, have differed in some respects and thus introduced some uncertainty in the law. In view of this, the President of India took the initiative and referred the question to the Law Commission which in its first report, in 1956, drew up proposals for an enactment defining the liability as in all respects equal to a private employer's, except in the matter of political, defence and police functions. But no action has been taken so far on the report: the present ruling arose in a case from Rajasthan where a Government-employed driver had caused the death of a pedestrian. The Supreme Court was merely reaffirming the law as recognised in India, but it has done so with the judicial authority at its command and in an unequivocal manner, pointing out that the doctrine that "the king can do no wrong" had never been applied in this country and that it is inappropriate to a Republican India and in the context of expanding activities of the Government keen on promoting a socialistic welfare State.

In this case, the question did not arise as what cases will be governed by exemptions, if any, for acts of State. This may prove a source of conflict in future court decisions. Moreover, several existing laws lay down that all actions done in good faith in implementing their provisions cannot be called in question in any court of law; negligence in performance is not considered to be lack of good faith. To provide for these matters, the Law Commission had suggested a law on the model of the Crown Proceedings Act of 1948 enacted in Britain. Such a law has now become even more necessary, as a result of this latest pronouncement by the Supreme Court. Meanwhile, there is reason for satisfaction that the State has not been given a privileged position by the highest tribunal in the land. Public opinion must make itself felt and demand reform of the laws which give entrenched positions to officials, to save them from the consequences of their delays or other kinds of injuries caused to citizens whose lives and activities are being increasingly regulated.

PROPOSED GUJARAT REFINERY

The third Plan has made a provision of Rs. 30 crores (with a foreign exchange component of Rs. 15 crores) for a two-million-ton public sector oil refinery in Gujarat. This unit, with its location near Koyali north of Baroda, is to refine the crude oil produced in Cambay/Ankleshwar regions of that State and will be the third to be set up in the public sector. It has been assured of external credit and technical assistance to a large extent, thanks to the allocation of Rs. 10 crores out of the Soviet credits already promised for the third Plan. Things have, therefore, got going pretty quickly now and an Indo-Soviet contract for the preparation of a project report and working drawings for the proposed refinery has been concluded this week between the Oil and Natural Gas Commission and the Tjazhpromexport of the U.S.S.R. Under this contract, the Soviet organisation is to supply the project report within a period of 8½ months. It is envisaged that the refinery will be built in two stages, each of one million ton capacity, and that the first stage will be completed during the second half of 1964 and the second stage in the first or the second half of 1965. The Soviet organisation is expected to deliver during 1963-64 equipment and material for the first stage of construction.

The Government Press note, which has briefly described the special features of this contract, seems to convey the idea that they are of particular benefit to the Indian side. One such feature is that the Indian side has been made responsible for the designing of a number of units within the refinery and that it will also, in due course, be responsible for preparing the working drawings for some of the units initially designed by the Soviet organisation. There is also a provision in the contract for the association of a team of Indian engineers—civil, electrical, mechanical and chemical—with the design to be prepared in the U.S.S.R. And the third special provision is that Indian equipment and material should be used to the maximum extent possible, so as to enable Indian engineers to undertake increasing responsibility for the designing and execution of refinery projects in the future. These provisions are *prima facie* commendable in that they are calculated to enhance the technical competence and knowledge of Indian engineers.

But the Press note under reference does not throw any light on the type of management contemplated for the refinery. If the implication is that the Oil and Natural Gas Commission itself will manage it, it will be a departure from the type of company management represented by the Indian Refineries Limited which has been constituted as a wholly Government-owned company to construct and operate the Nunmati Refinery and the Barauni Refinery in the public sector. In that case, it will also represent an addition to the purely oil exploration and exploitation functions which the Commission has been hitherto discharging. It will, then, mean that the Commission, for the first time, will be combining in itself three stages of the oil industry—prospecting, commercial production of crude petroleum and refining of that crude. Such a thing does not obtain in East India where Oil India Private Limited (which is jointly owned by the Government of India and the Burmah Oil Company/Assam Oil Company) discharges the exploration and production functions and will supply crude to the Nunmati and Barauni refineries. Since there is no mention about the Indian Refineries Limited in the present Indo-Soviet contract covering the proposed Koyali refinery, it may be presumed that the Oil and Natural Gas Commission itself will construct and operate that refinery. If this presumption is not correct, the Government should clarify the position.

CONCEPT OF MIXED ECONOMY

Mr. Arthur M. Schlesinger, Jr., Special Assistant to President Kennedy, who is currently on a study tour of India, is one of the leading liberal thinkers of the United States. He has already published three volumes of his projected four-volume history of the Roosevelt "New Deal" Administration under the general title: *The Age of Roosevelt*. Some of his observations, based on his research into and analysis of the New Deal programme of the Roosevelt Administration, have some relevance to the Indian context too. This is what he said at the Bombay University last week:

"The great tradition of American liberalism has been empirical rather than ideological, concrete rather than abstract, experimental rather than dogmatic... The great triumph of American liberal pragmatism was the invention of the mixed society (economy)... A generation ago... the dogmatists of the right and the dogmatists of the left shared the belief that society had to choose either *laissez faire* or communism; that there was no middle way. But Franklin Roosevelt and the New Dealers rejected dogma, spurned ideology and did what the absolutists had said was impossible; they created a mixed society (economy), in which the State had power enough to bring about economic stability without having the power to abolish individual freedom."

Here is some food for thought to India's socialist planners as well as votaries of free enterprise. While both claim to subscribe to the concept of mixed economy, they are by no means agreed on what the relative roles of private enterprise and public enterprise should be. Perhaps, they could usefully accept the solution offered by Mr. Schlesinger, in his inaugural address at the Seminar on Public Enterprise at the Osmania University on the 9th instant, as it has been generalised from historical experience. Said the distinguished American visitor:

"When the creation of social overhead capital is the issue, then the public sector is going to play a critical role. But, when the maximisation of production and innovation is the issue, then the private sector must play the dominant role... When economy becomes the issue, then the public sector acquires new importance."

Since India is not yet a *fully* developed economy in which the public sector can be expected to direct a greater share of resources into things like education, medical care and social welfare, the immediately relevant issue here is in what proportion public enterprise and private enterprise can be mingled so that society will not be dominated by either sector to an *excessive* degree and, what is more important, the optimum rate of economic development can be ensured. If these objectives are to be realised in a harmonious and expeditious manner, social inventiveness and political astuteness will be required to a greater extent than has been the case so far in this country. But such social and economic maturity can come about only if dogma is rejected and ideology spurned by either side.

COAL TRANSPORT BY SEA

The Federation of Indian Chambers of Commerce and Industry has submitted a note to the Neogy Committee on Transport Policy on the question of diversion of coal movement from the all-rail route to the rail-cum-sea route. In this note, the Federation has taken the line that the expediency of diverting movement of coal through the sea route has arisen primarily because of inadequate transport capacity by rail and that this must obviously last until the railways are able to reinforce their capacity adequately to meet the demand. It has expressed the further view that, on the long-term basis, the quantum of traffic carried by any method of transport should be determined by relative freight rates and service characteristics. Even from the short-term point of view, the Federation does not favour the shifting of the incidence of any subsidy for coastal shipping to consumers of coal. The implication of all this seems to be that the Federation has all but rejected the idea of any permanent dependence on coastal shipping for transporting coal to consumers in southern and western India.

If this is the implication, it is quite regrettable, for it does not recognise the need for assigning, on a long-term basis, some substantial bulk cargo to coastal shipping. It has always been the demand of coastal shipping that, for its bare survival, it should have sufficient bulk cargoes. Thanks to the coal transport crisis, coastal shipping, though not fully prepared for the emergency movement of coal, has come into its own. It can add to its fleet and prosper only if this coal cargo and some other kinds of bulk cargo are assured to it on a long-term basis. If the Federation is not happy over the element of subsidy involved in coal movement by sea, it should not have, on that account, suggested, by implication or otherwise, that coastal shipping would have to be ruled out as a permanent means of coal transport to any extent. It should have, on the other hand, taken note of the fact that coasting trade even in Britain is subsidised in different ways and, on that basis, pleaded for continued encouragement to coastal shipping in India.

When the Federation says that even the present subsidy granted to coastal shipping should come out of the General Exchequer, it seems to be against the small cess on all coal levied mostly for the purpose of that subsidy, although it does not say it in so many words. To subsidise coastal shipping rates is to subsidise the consumers of sea-borne coal. Likewise, there is a case for the logical extension of this subsidy facility to consumers of coal obtaining their supplies by road transport which, like transport by coastal shipping, is costlier than rail transport. Both these kinds of subsidy can be met from the proceeds of the additional cess on coal. The incidence of this cess on the entire quantity of coal consumed is very little and cannot, therefore, be said to add substantially to manufacturing costs in all the consuming industries. If the Federation wants even this relatively small subsidy to be paid out of the General Exchequer, how will it react to a possible upward adjustment of the coal freight rates in general on the railways? There is no need to wait for an answer, for the Federation has already, in its memorandum to the Neogy Committee, taken the stand that no such enhancement in freight rates is called for. That this is an unrealistic stand is brought out on page 294 of this issue. Representative organisations of industry should not forget that the costliest ton of coal is not the one which has to be transported at a slightly higher cost but the one which cannot be had in time and on a regular basis on account of transport bottlenecks. But this does not mean that efforts need not be made to reduce the dependence on costlier means of transporting coal. The aim should be to do away with the movement of coal by road transport as early as possible by increasing the capacity of railways, so that coal-based industries situated in the coal belts of India may not be deprived of locational advantages.

TRAINED WORKERS FOR TEXTILE INDUSTRY

A study of the educational and training requirements of workers in the textile industry, made by the National Employment Service of the Union Ministry of Labour, has underlined the need to organise a systematic programme for providing training to workers directly recruited in the various production processes. This arrangement, according to the study, will not only ensure proper manning of machines and occupations but will also contribute substantially to an improvement in efficiency of production. The study is based on a survey made by the National Employment Service, with the co-operation of five leading textile mills in the country, three from Delhi (the Delhi Cloth and General Mills, Birla Cotton Spinning and Weaving Mills and the Swatantra Bharat Mills), one from Bombay (Century Cotton Spinning and Weaving Mills), and one from Madras (Buckingham and Carnatic Mills) and financed by funds made available by the Ford Foundation through the Directorate of Manpower, Ministry of Home Affairs.

The study estimates that, assuming that the present pattern of employment in the industry will not undergo any drastic change in the near future and that, on the basis of the normal turnover, the intake will be 10 per cent of the existing labour force, the textile industry will require about 46,500 production process workers every year to replace natural wastages and retiring workers. There are 130 textile occupations connected with processing, accounting for about 56.8 per cent of the total employment in the industry. Of this, 66 occupations are available to those who can just read and write, 45 to those who have read upto the primary standard, 14 to those who have passed the middle standard and 5 to matriculates. Of the 130 occupations, 60 are open for direct recruitment while the rest are to be promoted from lower jobs. Of the 60 occupations where direct recruitment takes place, in-plant training is considered necessary for 52, while institutional training is required for 17 occupations out of the 60. The following table shows the position at a glance:

Duration of training	No. of occupations	% of total employment
In-plant training :		
No in-plant training required ..	8	0.45
1—3 months	19	6.67
3—6 ,, ...	20	31.03
6—12 ,, ...	13	0.55
Total ..	60	38.70

As regards educational requirements of workers in production processes, there is general agreement among employers that literates are to be preferred, although illiterates could be tolerated, even for occupations requiring relatively low skill or no previous experience. Generally speaking, all machine operatives, including their helpers and auxiliary workers, are required to be literates, preference being given to those possessing primary, middle or even matriculation standards in some cases.

A survey of the training facilities available in the five mills referred to at the outset shows that, in two of them, there are regular apprenticeship courses of about three months' duration in which middle and matriculate workers directly recruited are given practical training. In the other three units also, there is some sort of apprenticeship scheme, but the in-plant training in them is not standardised. An analysis of (1) the different types of workmen employed in the industry, (2) the operations performed by them, (3) the sources of recruitment and the channels of promotion, (4) the educational level considered necessary and desirable and (5) the minimum technical training required for each occupation suggests that, in future, illiterate persons are not likely to be employed in the textile industry. Taking a long-term point of view, the authors of the study are of the view that employers should take advantage of the progress being made in the educational field and encourage the entry into the industry of educated persons in increasing numbers, so that the prospects for improving efficiency and productivity would be better. This is best done by creating adequate training facilities for young persons who could be absorbed in the industry after training. The existing facilities should be expanded by organising, on an individual or co-operative basis, appropriate training schemes.

Mention may be made, in this connection, of a model training scheme initiated by the Advance Mills of Ahmedabad recently. The objects of the scheme are to train systematically and scientifically young persons in the art and method of weaving fault-free cloth, to make future weavers quality, production and safety-conscious and to inculcate in them team spirit. The training school of the mill was opened at Ahmedabad last week, by Mr. S. R. Vasavada, the well-known I.N.T.U.C. leader. The period of training will be of six months, during which the youngsters will be given training in all aspects of weaving, in addition to cleaning, oiling and maintenance of looms and their mechanism, in actual loom-shed conditions. If this example of the Advance Mills is emulated by other mills, the textile industry will be able to solve the problem of shortage of skilled workers in a short period, provide an opportunity for moderately-educated unemployed youths and better the chances of enhancing the productivity per worker.

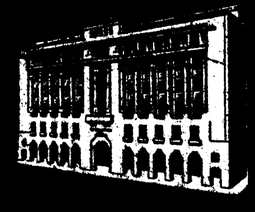
General Manager



THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

Applications are invited on the basis of a Prospectus copies of which are available from the Registered Office of the Company, and from the brokers and bankers hereunder named. A copy of the Prospectus, having attached to it the documents required by Section 60 of the Companies Act, 1956, has been delivered for registration to the Registrar of Companies, Delhi.

Consent of the Central Government has been obtained to this issue by an order of which a complete copy is open to public inspection at the Registered Office of the Company. It must be distinctly understood that in giving this consent, the Central Government do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinions expressed with regard to them.

A Licence has been obtained from the Central Government for establishing a new industrial undertaking at Ranchi (Bihar State) of which a copy is open to public inspection at the Registered Office of the Company. It must be distinctly understood that in granting this licence the Government of India do not take any responsibility for the financial soundness of this Undertaking or for the correctness of any of the statements made or opinions expressed in regard to it.

Certificate for Commencement of Business No. T. 3362 dated 27th July 1961 has been issued by the Registrar of Companies, Delhi. (The Company is incorporated under the Companies Act, 1956.)

Applications have been made to the Delhi and Calcutta Stock Exchanges for permission to deal in Preference and Equity shares of the Company.

The Subscription List will open at the commencement of banking hours on 26th February 1962 and will close at the close of the banking hours on 7th March 1962 or sooner as the Directors may decide, but in no case will the list close before the close of the banking hours on 28th February 1962.

Face value of Preference shares is Rs. 100 each, and of Equity shares Rs. 10 each. Preference shares carry a fixed cumulative preferential dividend of 9.3 per cent. free of Company's Income Tax but subject to deduction of tax at the prescribed rate. The Preference shares shall be liable to be redeemed at par at the option of the Company wholly or in part at any time or times, after the expiry of 12 years but not exceeding 15 years, from the date of issue, at six months' notice. Shares are being offered at par. No shares will be issued for consideration other than cash.

TERMS OF PAYMENT

The amounts payable in respect of each share comprising the present issue are as follows:—

	Preference Rs.	Equity Rs.
On application	50	5
On allotment	50	5
	100	10

APPLICATION AND ALLOTMENT OF SHARES

Applications must be for 50 Equity shares or multiples thereof, or for 5 Preference shares or multiples thereof, and in all cases must be accompanied by a remittance of the amount payable on application.

Applications for shares should be made on the printed form accompanying the prospectus and must be completed in accordance with the directions contained therein and delivered before the closing of the Subscription List to any branch of the Bankers to this issue, mentioned in the Application Form.

OBJECTS

The Company was incorporated on the 28th December, 1960 with the objects mentioned in its Memorandum of Association, and particularly to undertake the manufacture, *inter alia*, of Ball Bearings, Roller Bearings and Tapered Bearings and to deal in the same.

PROSPECTS

Ball and Roller Bearings have extensive use in industrial field. They are used to overcome friction and as such are essential components of all moving machinery and appliances. India's annual demand for Bearings at the end of third Five-year Plan is estimated at fifteen million. The Company has obtained a Licence from Central Government under the Industries (Development & Regulation) Act, 1951 for manufacture of 2.5 million Ball and Roller Bearings per year. It will concentrate on precision Bearings required for Electric Fans, Fractional Horse-power Motors, Machine Tools etc.

The plant is expected to be installed during 1962, and full capacity is expected to be attained by 1964. Orders for major part of the plant have been placed.

Bearings are a high priority item for industrial purposes. The Company will, therefore, make substantial contribution of foreign exchange to the country by way of saving on import of Bearings and, depending upon domestic requirement, by exporting its products.

High Carbon Chromium alloy steels which form the main raw material for Bearings are currently imported but their manufacture is expected to commence in the country.

Government of India have issued an Import Licence of the value of Rs. 50 lacs to the Company for import of equipment from U.S.A. under D.L.F. credit No. 157 and has agreed to issue another Import Licence of the value of Rs. 15 lacs on the same basis. With modern equipment and proposed technical collaboration with the Fafnir Bearing Company of U.S.A. the Directors expect that the Company's products will be of a premium quality.

TECHNICAL COLLABORATION

The Company has negotiated with the Fafnir Bearing Company of New Britain, Connecticut (U.S.A.) for obtaining technical know-how and the right of use of their patents etc. Fafnir is one of the leading manufacturers of Balls and Bearings in U.S.A. and its collaboration with the Company will be of great help in achieving high quality and efficiency standards.

It is envisaged that Fafnir will assist in installation of the plant, and will supply know-how for manufacturing and quality control etc. during the course of the collaboration. It will also train Company's personnel and will send its experts to the Company's facilities when needed. The Agreement will in the first instance be for ten years.

It is contemplated to pay to Fafnir a royalty of 4% of net sales and initial engineering fee of Rs. 4 lacs. Government of India has approved the payment terms.

LOCATION OF THE FACTORY

The factory will be located at Ranchi in Bihar. The Company has purchased about 28 acres of land in village Ratu, at a distance of about seven miles from Ranchi on Ranchi-Daltonganj Highway. Power and water will be available at the site. The site has been selected having particular regard to climatic requirements for a Bearings factory.

MINIMUM SUBSCRIPTION

The minimum subscription on which the Directors will proceed to allot shares is Rs. 41,95,000, being the full amount of the public issue.

FINANCIAL REQUIREMENT

The requirement of funds is estimated to be approximately as follows:—

	Rs.
Cost of land, buildings, plant etc.	1,19,30,000
Preliminary and Issue expenses, underwriting commission, brokerage, financing expenses, etc.	3,30,000
Working Capital	64,00,000
Provision for contingencies ...	5,00,000
Total ...	1,91,60,000

SOURCES OF FINANCE

The financial requirements are proposed to be met as follows:—

	Rs.
Share Capital—	
Already subscribed	24,00,000
Present issue	51,00,000
	75,00,000
Loan from Industrial Finance Corporation	60,00,000
Cash credits, etc. from Banks ...	32,00,000
From current earnings	25,00,000
Total ...	1,92,00,000

The Industrial Finance Corporation of India has sanctioned a long-term loan of Rs. 60 lacs secured by mortgage of fixed assets of the Company, on its usual terms.

The amount represented by 'current earnings' comprises of part of the provision for Depreciation and Development Rebate, and the surplus for the initial years over which the capital outlay will be spread.

PROFITS

On the basis of costs and realisations as far as they can be estimated at present, the Directors are of the opinion that in the absence of any adverse circumstances, the Company should have sufficient earnings after providing for Depreciation, Development Rebate and the dividend on Preference shares, to pay reasonable dividend on Equity shares and to build reserves for future development.

TAX BENEFITS

According to present tax laws the Company shall be entitled to benefits in respect of Development Rebate, and shall enjoy tax holiday for five years in respect of profits upto 6 per cent on the capital employed under Section 84 of the Income Tax Act, 1961.

The shareholders shall also be exempt from tax on dividend paid from the Company's profit exempt under Section 84 and from Wealth Tax on their holdings for five years under Section 5(1)(xx) of the Wealth Tax Act, 1957.

Shareholders which are companies shall also be exempt under Section 99(1)(iv) of the Income Tax Act, 1961 from payment of super tax on dividends received from the Company.

INTEREST OF THE DIRECTORS, PROMOTERS

Shri Bharat Ram, Shri Charat Ram, Shri Shri Dhar, Shri B. S. Agarwal and Shri T. R. Gupta are Directors and members in one or the other of the constituent companies in the Managing Agency firm. Shri Bharat Ram is a member and Shri Charat Ram, Shri B. S. Agarwal, Shri T. R. Gupta and Shri Shri Dhar are members and Directors of India Hard Metals Private Ltd., who had incurred expenditure on the formation of the Company and on other matters and have been reimbursed by the Company. The Company has purchased about 28 acres of land at Ratu (Ranchi) from Maharaja Chintamani Saran Nath Shah Deo, a director of the Company. The aforesaid Directors are thus interested to the extent indicated.

UNDERWRITING COMMISSION AND BROKERAGE

A commission of 2½ per cent of the face value will be paid to the Underwriters in respect of the Preference shares underwritten by them.

Brokerage will be paid to recognised brokers, and to Banks in respect of applications bearing their stamps at the rate of 1 per cent of the face value of Equity and Preference shares offered to the public and allotted. Brokerage at the same rate will be paid to the underwriters in respect of such Preference shares as they may be required to subscribe for in terms of the underwriting arrangements.

(*Concluded from column 3*)

peg for hanging the railways' claim for a leading role in opening up the economic life of areas hitherto inaccessible. A still smaller project in the far south, linking Manamadurai with Virudhunagar was, fittingly enough, launched at the same time, with the Madras Chief Minister being present to take his share of the credit. In both cases, preliminary surveys had begun more than half a century ago. Also a few days ago, the Deputy Minister for Railways inaugurated in his own constituency the Salem-Bangalore line. It may be that the railways are now in earnest and will not drop these schemes after the elections as they have done before; Mr. S. V. Ramaswamy has even given an assurance of completion of the Virudhunagar line in 18 months. He also went on to talk about master plans for the future, which are deferred for want of funds (not presumably for lack of capacity for executing them). This, he said by way of apology for constructing mere metre-gauge lines when broad-gauge was considered more economical; Mr. Ramaswamy is reported to have declared that, as and when the need arose, M.G. will be converted into B.G. and he did not omit to mention that the Salem-Bangalore line will be due for review on this score in the fifth Plan period. After such demonstration of concern for the convenience of the public, it would be pointless and even churlish to inquire whether industry is being well served by the railways.

U NYUN'S ENTHUSIASM FOR ASIAN COMMON MARKET

RAILWAYS VIGILANT WHERE POLITICALLY EXPEDIENT

From Our Special Correspondent

NEW DELHI, 13*th February*

DELHI LETTER

PRELIMINARY moves by the E.C.A.F.E. to commit its Asian member-countries to the pursuit of closer economic relations, with a view to establishing eventually an Asian Common Market, are likely to create a dilemma for most of them. They have already done so at least for the Government of India. It appears that, following the report of the working group headed by K. B. Lall, the Executive Secretary of the E.C.A.F.E., U Nyun, has circulated a draft declaration on regional economic collaboration, suggesting that it should be accepted by the countries before the end of this month to facilitate further steps being taken. According to reports, the proposed declaration contains a provision for the setting up of permanent machinery to work out the details of future economic collaboration; for this, however, it is necessary that at least ten countries should agree to the draft. Apparently, the Lall Committee's inquiries had elicited a good response to encourage U Nyun to pursue the matter further; his personal enthusiasm for the idea could not have been wholly responsible for the present move. It is, therefore, reasonable to assume that a sufficient number of Governments will be willing to explore the possibilities further by creating separate machinery, working in close co-operation with E.C.A.F.E., for drawing up a specific programme.

The idea is bound to receive considerable support and encouragement from Western countries for two major reasons. They have little to fear from a regional bloc of this kind, since it can hardly be inward-looking; dependence on Western countries for markets, capital aid and supply of machinery and capital goods is sufficient guarantee of their adopting a constructive approach to problems of inter-regional trade. At the same time, if closer relations lead to expansion of intra-regional trade and mutual assistance for development, there will be less pressure on the industrialised countries for opening their markets for exports of the underdeveloped areas and there will be fewer complaints about adverse terms of trade or decline in commodity prices. The present mood of fear of Western integration moves can give place to confidence in these countries in their ability to organise self-help. Similar moves in Latin America have received much sympathy, though African moves have created some scepticism, partly because of the greater backwardness of the economies of the countries, the divergence of political interests between the Casablanca and Monrovia powers and the split created among them by the association of some of the African countries with the European Common Market. In the E.C.A.F.E. region, on the other hand, Japan and, to a lesser extent, India can provide assistance to the others for development in various ways, introducing an element of complementary relationships.

India is still undecided and hesitant in its attitude to the present moves. This is partly due to the lack of dynamic leadership in economic affairs which has affected decisions on internal policies also; but it is understandable that there should be some reluctance in agreeing to proposals which may add to embarrassments in dealing with India's neighbours. Unfriendly critics in Pakistan, and now in Nepal, are only too ready to seize upon any pretext for sowing seeds of distrust; in economic arrangements which do not sacrifice India's essential national interests, they may find more to criticise and mislead public opinion in their own and other countries. Co-ordination of planning policies as discussed by the Asian Planners' Conference in New Delhi last year may mean, for example, that some projects are distributed in the region; when there are rivalries and sometimes conflicts even among several States for the location of industrial projects within their respective areas and there are not enough to go round, it may be difficult for India to forgo any of them in favour of other countries who may be less favourably placed in the matter of technical personnel and in the capacity to put them to the best use. Other questions also arise; for instance, there may be demands for pooling of foreign exchange earnings and of external aid and for their equitable distribution among the member-countries. These arrangements, which are now bilateral, in spite of co-operation under the Colombo Plan, have at least the merit of making the givers responsible for the choice of projects and recipients.

In any concrete proposal for the establishment of a regional trading bloc, the need for a common currency cannot be overlooked. Obviously, the rupee with its equivalent counterparts in the neighbouring countries, has a pre-eminent position which must be recognised by the latter. The difficulties are obvious if one goes a little beyond the generalities of co-operation and co-ordination and faces the actual issues involved.

There will be a natural preference in India for conserving the existing goodwill in Burma, Ceylon, Malaya and Indonesia rather than for new measures which may create differences. But this cautious approach has to be balanced against the possibility of inviting reproach for not showing enough enthusiasm for regional relations. Undoubtedly, more can be done to promote larger trade within the region and India has been quite willing to consider its implications. The trouble is that there has been no one at the helm who can show an imaginative grasp of the problems and inspire confidence abroad in India's determination to adopt a helpful and sympathetic attitude to the expectations held by our Asian neighbours. The image of Nehru has no economic counterpart and this is as much a regional as a domestic problem.

On the immediate issue of committing this country to the draft declaration circulated by the E.C.A.F.E., the general elections may be an inhibiting factor just now. But, in principle, India is already morally committed to closer Asian collaboration and, if the initiative for a start is taken by other countries, there will be no doubts about the need for a favourable response. If and when proposals are made for a common currency, single market or customs union, the problems can be faced and solved according to the circumstances then prevailing. Other developments like Britain's entry into the European Common Market will determine some future trade patterns; for example, if any of the Asian nations agree to the "associated status" offered for some developing countries, cleavages will widen as in Africa and collaboration in planning become more difficult because of the preferential position accorded to the manufactured goods of the European countries *vis-a-vis* exports from Asian neighbours. That there are many imponderables is no argument for withholding a bold declaration of support for any moves for closer relations, with, of course, the minimum reservations dictated by the prevailing circumstances.

Railway Celebrations

It is a moot point whether the railways are doing all they can to move all the coal offered to its proper destinations; it is arguable that the authorities are not bestowing the attention required on these matters though emergency measures after an alarm was sounded staved off a crisis in Ahmedabad. But they have been quite prompt on their contribution to the General Elections; within four weeks of the polling dates, commencement of work on many new railway lines has been celebrated with a fanfare of trumpets. The importance of the particular projects is not in question but the timing of the inauguration and the sounds accompanying it show that, where it is politically expedient, the railway authorities can be quite vigilant. The small rupees four-crore project linking north Konkan with Bombay provided Mr. Jagivan Ram a

(*Continued in column 1*)

AMERICAN LETTER

ECONOMIC TRENDS ENCOURAGING

SOME IMPROVEMENT IN BALANCE OF PAYMENTS

From Our Special Correspondent

NEW YORK, 10th February

THE outlook for business in the United States in the immediate future is still very good indeed. Most indicators are pointing upward. There are only two major questions—what price upturn and how long will it last?

The price can be measured in terms of higher Government spending which comes out of taxation or deficit financing. The duration depends on monetary as well as psychological factors, such as how secure individuals and businesses feel under prevailing circumstances. That is a chief determinant factor in spending plans.

People borrow when they feel their future income is secure. There has been an advance in the demand for loans recently which denotes confidence. Consumers are spending more freely and are borrowing more freely.

Commercial and industrial loans by banks have been rising substantially since mid-1961. The business loan total at the year-end was about $1,000 million higher than 12 months previously. It has been rising since, and all the recession losses have been recouped.

Wages Rise

The factory work week rose recently to the highest in the past two years and so did average hourly earnings. Weekly earnings of production workers were boosted to $95.82 and the universal $100-a-week level has become a near-reality.

This gain in earnings was accompanied by only an infinitesimal rise in prices which accounts for the greater spending power and greater spending by consumers. For the immediate future, this trend is likely to continue.

Employment has held up fairly well, despite the lag which always occurs after the holiday season and the layoffs which take place when harvesting is concluded in the northern part of the country. The rate of unemployment in relation to the labour force, which was more than 6 per cent at the end of 1961, has now declined below that level.

Business spending for plant and equipment is likely to rise to an annual rate of close to $37,000 million in the first quarter of this year. This would be higher than in the past four years. Being one of the sustaining factors of overall business activity, outside of Government spending, it suggests continued improvement in overall conditions in the near future.

The Usual Enigma

Agricultural policy in the U.S. represents the usual enigma. The year 1961 produced a record for crop yields. Despite lower acreages planted and drought in some areas, the output of all crops planted was just 2 per cent lower than the previous high of 1960. This showing was achieved in the face of the lowest number of acres harvested since the Department of Agriculture began keeping records in 1909.

The troublesome surplus problem is still there. It will continue to be so. Production methods have become so efficient in this country that surpluses seem to be inevitable, while millions of people in the developing countries are on a starvation diet.

The U.S. balance of payments is still a cause for grave concern. Commercial exports *per se* show a healthy favourable balance. But, if overseas defence expenditures are added, as also the invisible tourist spending and several other factors, such as a transfer of funds to countries where deposits are dawing higher interest rates than here, the U.S. is losing on balance—in prestige, in gold and in bank deposits.

There has been an improvement in the U.S. balance of payments. Last year, the deficit was less than $2,000 million, as compared with between $3,000 and $4,000 million in the three prior years. Some factors in this picture are uncontrollable such as foreign purchases of U.S. securities. At the latest count, non-Americans have invested about $7,000 million here. This is just about double the figure for 1950. Continental European investors now hold the largest share of the total, accounting for some 35.6 per cent. The United Kingdom's share has slipped to 32.5 per cent. Previously, the U.K. represented the largest group. Canada accounts for 28 per cent.

While foreign investments here have doubled in the last decade, U.S. investments overseas have trebled and they are nearly five times as large as the stake of overseas investors here.

Aid to India

A fifth meeting was held under the chairmanship of the International Bank for Reconstruction and Development by the Consortium of Governments and Institutions interested in development assistance to India. The meeting was attended by representatives of the Governments of Canada, France, West Germany, Japan, the U.K., the U.S. as well as by representatives of the International Development Association. Observers were present from the International Monetary Fund and of Austria. The purpose of the meeting was to review the action taken by members in June 1961 for commitments of $1,295 million in support of activities for the first year of India's third Five-year Plan covering the period from April 1961 to March 1962.

While some delays had been experienced in the early part of this year, it now appears that the total allocation of funds for agreed purposes during the year would come close to the figure indicated in June last. Due note was taken at the Washington meeting of the encouraging expansion of India's economy and the economic progress which has been made.

Moreover, the Consortium recognised that further assistance would be required in 1962-63, beyond that already committed, if the momentum of India's expansion were to be maintained. To that end, the Consortium will meet again in May 1962. At the suggestion of members of the group, representatives of the World Bank agreed to "continue to seek to interest other nations in the financing of India's development."

As a practical matter, the meetings offset and overcame some of the antagonism of members in the U.S. Congress caused by India's recent action against Goa and by statements made by some leaders of India which were not considered "neutral" by some Washingtonians in the East-West struggle.

United Nations News

In addition to all the political difficulties facing the member-nations of the U.N., in addition to all the divergencies of view in economic matters, the greatest shadow overhanging the world organisation is financial insolvency. The Soviet bloc members have refused to pay their dues. Other countries have not the funds to pay their full share. Special expeditions such as in the Congo, where troops from India are prominent, have turned out to be costly. Nations which did not agree failed to pay their special assessments for these ventures in what looks like a deliberate attempt to wreck the U.N. The word "wreck" perhaps overstates the case, since the U.N. is a useful sounding board and can be used for propaganda purposes.

The latest proposal is for a bond issue to make up the U.N. operating deficit. There is nothing in the charter to back up such an issue. There cannot possibly be any reassurances for repayment. Yet, President Kennedy said at his Press conference this week that the U.S. would carry the major burden just because it does not want to see the U.N. die, as the League of Nations died.—*All Rights Reserved.*

ISRAEL ε DEVALUED

The Government of Israel has consulted the International Monetary Fund on a major reform of its foreign exchange system which became effective from 9th inst. It includes a change in the par value of the Israel pound, in which the Fund has concurred, from I£1.80 to I£3.00 per United States dollar. The previous par value was established on 13th March 1957, but even at that time the exchange system contained several multiple currency practices and it became increasingly complicated by subsequent adjustments. Beginning from 9th February, however, all Israeli multiple currency practices are eliminated, with the exception that a free market may be retained for certain capital transactions.

The Israeli exchange reform is intended to strengthen the country's basic balance of payments position and eliminate internal price distortions. The new par value expressed in terms of gold and in terms of the U.S. dollar of the weight and fineness in effect on 1st July, 1944, is as follows:

.296 224 grams of fine gold per Israel pound; 105.000 Israel pounds per troy ounce of fine gold; 3.000 00 Israel pounds per U.S. dollar; 33.333 3 U.S. cents per Israel pound.

LONDON LETTER

FORECASTING THE ECONOMY

PLANNING COUNCIL FORMED

(From Our Own Correspondent)

LONDON, 10th February

THE composition of the National Economic Development Council has now been announced. It is headed by three Ministers: the Chancellor of the Exchequer, the President of the Board of Trade and the Minister of Labour. There are two representatives of the nationalised industries—the head of the Railways and the head of the Coal Mines—six industrialists, all of whom have been selected personally without formal reference to their Trade Associations and there are six Trade Union representatives who have yet to be named by the T.U.C. The retiring Chairman of Lloyds Bank, Sir Oliver Franks, inevitably reappears here together with the economists of the Council on Prices, Productivity and Incomes (which is obviously going to die as the new N.E.D. Council goes into action)—both of these are independent members. Presumably, one can also count as independent the economist pulled out of the steel industry who is the official Director of the Planning Office of the Council. We shall thus have a full Council of twenty members, with a strong conservative bias, but, at the same time, a bias weighted in favour of practical industry and not academic economics.

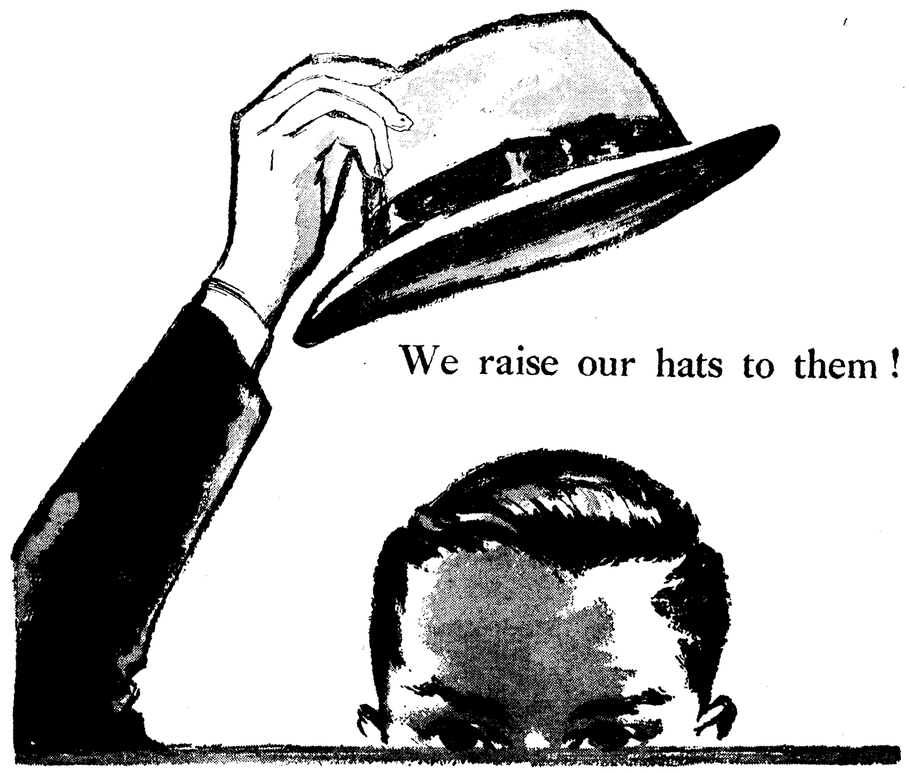
One of its first tasks will undoubtedly be to forecast the economy and it will almost certainly tackle, either directly or by implication, the Government's White Paper on income policy, because this economic document was proposing to gear the National Economy to an estimated productivity rise of 2 to 2½ per cent. In other words, the Government, through the Chancellor, was saying that the national wealth and income will rise by this amount and that every measure which can possibly affect it must be dominated by the magic figures of 2 to 2½ per cent. Now, Dr. Beeching, who is charged with running the Railways, has already offered the railway workers a 3 per cent rise and the workers are standing out for something more. Dr. Beeching is well aware of the strength of their case, taken on its individual merits, and he is going to find the N.E.D. Council a magnificent forum for pushing his view that, if the railways are to be more efficient, the wage bill per head—though not necessarily in total in the long run—must go up. This is quite contrary to the Chancellor's policy. The railway chief will be strongly supported by Lord Robens, the Labour head of the Coal Board. Both these men are tackling industries which are facing strong competition and know that serious rationalisation is the necessary cure and yet both are expected to hold together the industries on their present ramshackle structures, without rationalising them and at the same time running them more efficiently! Both want to pay more money to less men to do a smaller and better job.

Optimistic Forecasts

The first assessment of the economy which the Council will be able to publish will be read with especial interest, but it is already thought likely that it will also present a more optimistic picture to the country than the Government has so far done. Of course, in the back rooms of the Labour Party, there is a conviction that the Government are playing a deep game in maintaining such strict reins on the economy at present. The Government want, it is muttered, to hold the economy back, in order to let it have a brief exciting forward spring neatly timed to coincide with Britain's entry into the Common Market and a General Election. Fought under those conditions, the Government would hope to stride back comfortably into office and it would not matter if there was a recession very soon after that.

But the National Institute of Economic and Social Research, which may also find its work redundant if the N.E.D.C. proves to be a lively body, is already forecasting a much higher rise in national income than the Government have done. Their report, which contemplates a rise of over 3 per cent will be good ammunition to those industries who want to get higher pay rises than the Chancellor would approve. The background to this more optimistic forecast is as follows: first of all, exports would seem to be improving strongly, if not spectacularly, and are

(Continued on page 308)



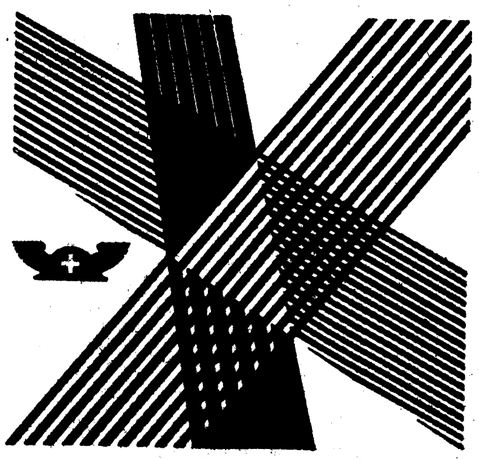
We of Remington Rand today raise our hats to the Remington service mechanics of the early 1900's. When called out on a job they were often away from home for months at a time. Transportation was crude and when journeying into the interior by bullock cart they had to face the dangers and hazards of jungle and desert.

Not so today! Remington Rand has been continually growing through the years, and there are now 30 fully staffed branches strategically placed throughout India. This complex organisation has been set up to ensure that a Remington Rand service engineer is always available at short notice, no matter how remote the area.

Our motto — PROGRESS WITH THE TIMES! Our factory at Howrah is the largest of its kind in Asia. As India grows commercially and industrially, the demand for typewriters and other office equipment grows correspondingly. Negotiations are under way to double our present output so that we may contribute further to the prosperity of the New India.

Remington Rand of India Limited

3 COUNCIL HOUSE STREET, CALCUTTA-1 RR/IP/72



Swiss Industries Fair Basle
31st March - 10th April 1962

Why is this exhibition worth your visit? Because:

Times are past when the Swiss were known mainly for milking cows and blowing the alphorn. To be precise: some still do milk cows, and some still do blow the alphorn. But many, many others have taken an interest in entirely different occupations, long ago.

They construct turbines higher than a stately house and design tiny watches that keep good time by fractions of seconds. They make powerful machines, helpful tools, useful precision instruments. They weave enchanting textiles and create jewellery of breathtaking beauty.

All these marvels—and a wealth of others—are presented at the exhibition of Swiss craftsmanship: in 21 halls, Swiss industry puts its quality products on view. For information, booklet, catalogue... and for advice on how to get to Basle, simply call

SOME THOUGHTS ON BANKING DEVELOPMENT

PLACE OF SMALL BANKS IMPORTANT

By B. K. Dutt

MANAGING DIRECTOR, UNITED BANK OF INDIA, LTD.

I HAVE chosen this subject because I feel that the matter of organising the banking system on proper lines has assumed the greatest possible significance. When planning guides every aspect of economic life, the banking system cannot remain out of it. For, it must lubricate and cater to all sorts of economic activities, and what is most important, must stimulate, or at least indicate, the directions in which it can contribute to progress.

We all possibly know that almost all over the free economy there are central banks, whose functions, in addition to their primary duty of maintaining the value of money, are in consonance with the Government policy, to assist improving the level of employment and living standard of the people. From this, it essentially follows that, if the institution of banking has to have a purpose for existing and expanding, the constituent units, of which the commercial banks are the most important, must strive to bring about the fulfilment of the objectives enjoined upon the banking system through and under the lead of the Central Bank.

Inertia Still Rules

Insofar as we, in this country, have missed this basic thought in the past and insofar as we have failed to adjust ourselves to the requirements of the nation, the banks have not succeeded in living up to the purpose. In saying so, I do not, in any way, minimise the performance of our banking system. I would rather say that, in various spheres, banks can claim to have done a lot. Hurdles notwithstanding, they have done very well in very many directions. What I want to emphasise is that, in view of the voids that the society has to contend with, a reappraisal of the entire outlook is imperatively called for. But, when we come to think of it, we are, more often than not, carried away by what we have seen being practised very close to us, I mean the system of banking pursued in the U.K. That upto 1947 we did so and tried to transplant the British model in India need not be much regretted; but to the extent that inertia rules our thought even today is something that has to be reckoned with.

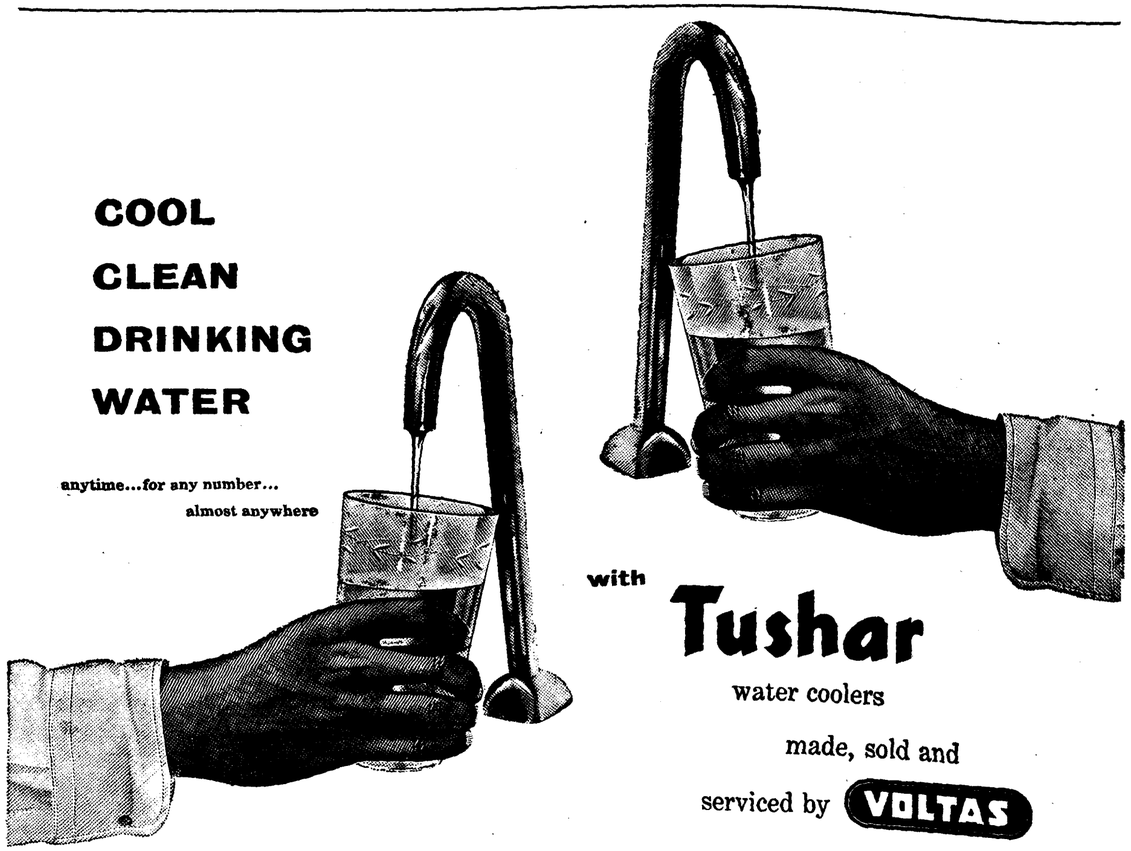
Despite her ancient heritage, India is still a new nation, politically speaking, making the most precious experiment in regard to social order in an economy that did not have the opportunity of seeking its own goal during the past centuries. For such a nation, the essential security would lie in the degree of her achievement in the material field *vis-a-vis* the masses. Her ancient heritage and her way of life cannot afford to suffer a tremendous shift in favour of an altogether materialistic outlook. An important aspect of economic consolidation in the Indian context is that, along with the bigger industries, which are essential for achieving economic salvation and maintaining national integrity, a strong base with a vast proportion of self-employed members of the community must be built up. It is, indeed, recognised in all quarters that a strong and large base of the self-employed is essential for successful functioning of democracy.

The ideal of spreading economic benefits of development as widely as possible can only be achieved by activising the largest number of people in one or other spheres of productive enterprises, in every little community and locality throughout the country. Naturally, therefore, it is necessary that banking facility should not only be distributed and scattered to fit into this pattern, but should also be varied and diversified.

The important question then is: what should be the pattern of banking development? Whether we should have only a few big banks or whether there shall be banks of various sizes —big, medium and small. It is often said that smaller banks can hardly render any effective service to the economy but, on the other hand, tend to become a drag on the banking system as well as on the economy as a whole. I have always been advocating the cause of the smaller banks and am convinced about the need in our economy for good smaller banks which are capable of rendering useful service towards economic development. If an objective assessment is made of the past peformance of the small banks, it will be found that, in certain respects, they have creditably served the needs of the small man and can claim the credit of having established quite a number of businessmen and industrialists who, but for such assistance, would, perhaps, have not been there as active units in our economy today. It is true that a number of smaller banks have failed owing to mismanagement or misadventure. But such features are common in every walk of life and in every sphere of activity in every country and in every age. If there has been a malady, the approach should be to treat the malady rather than to kill the patient.

While, therefore, there is a need for the bigger banks to expand their service to big business in different areas through branch offices, there is also a need, from the social point of view, for trengthening the existing smaller banks and encouraging establishment of new banks in different areas with a view to reaching banking facility to the small man, endeavouring to self-employ themselves through economic enterprises and help initiating them to the idea of self-employment.

The small enterprise is quite often deficient in financial management. Their banking requirement, therefore, is not only a quantum of finance, but also includes appropriate financial guidance and advice. Each case has to be weighed and assesed individually according to its own condition. The bigger banks, as they are organised, cannot satisfy in full the needs of the small business which can hardly be categorised into set patterns.



The most important aspect in this regard, I feel, is that of enthusing the people towards finding means of self-employment rather than clamouring for fixed-pay jobs. This can only be done through constantly propagating the idea of self-employment and assisting the newcomers with prompt and adequate financial assistance and guidance.

You are all aware that this year a Deposit Insurance Corporation has been established to insure deposits of every bank upto the specified limit. Although the scheme does not fully meet the requirement, it is to be hoped that, before long, it will be reviewed and its functional inadequacy removed. If that is done, the most serious deficiency in the banking system—that is, latent absence of an atmosphere of confidence and trust—will be removed and a climate will be brought about where banking habit will be stimulated and banking development fostered. In such a climate, the smaller banks will have an opportunity of making further progress and occupying their rightful position in the pattern of banking development.

Bank Profits

There would yet remain an important question to be tackled. I refer to the profitability of banking business. Bank profits are somewhat different from the profits of the ordinary business or industrial undertakings. Profit in a bank serves as a cushion against which losses arising from taking risks of newer types of business have to be absorbed. It thus becomes essential that the spread between operating cost and operating earning of banks is made wide enough to leave them a reasonable margin as cushion. The present-day margin, which, before tax, is nearly 0.6 per cent of the total resources, is rather too low for this purpose. As I have already pointed out, the banks will have to take more calculated risks than they have done so far. In order that they may do so, there is an urgent need that this margin should be extended.

This suggestion might appear rather queer, inasmuch as it is common knowledge that, during the last year, all the banks have made good profits. It must, however, be remembered that, although quantitatively the profit was much better last year than during the previous year, it was mostly the result of double-shift working of the advances. On an average, the bank advances veered around 70 per cent of the deposit which is rather on the high side. But such may not be the case for ever. If not during the third Plan period, it may be soon after, this ratio will have to come down. The basic requirement for wider spread of the profit-margin, therefore, cannot be overemphasised.

Cost of Deposits

The rates of charge on certain services rendered by the banks will have to be reviewed and revised. I shall not go into a detailed discussion on that aspect here. I would, however, mention one important point which requires urgent consideration. Recently, there has been an upward trend of interest rates on bank deposits. This is an item which takes up the largest quantum of bank earnings. I am of the firm conviction that there is, today, ample scope for reducing bank cost under this item. Bank deposit is not an investment; it is money temporarily held pending future investment or spending. Interest, therefore, is not a major consideration in attracting bank deposit. Interest is only a marginal inducement. Deposit is not as sensitive to the rate of interest as it is to the availability of banking facility and the quality of service. There is ample truth in the saying that the safety of bank deposits and the rate of interest vary inversely. Personally, I am of the view that the rates of interest on bank deposits have reached a stage where they must receive urgent consideration. The whole matter deserves proper assessment from the perspective of the basic function and attributes of bank deposits.

The State Bank of Bikaner has transferred to the reserve fund from its profit for 1961 the sum of Rs. 2.25 lakhs and not Rs. 2.35 lakhs as was stated in the review of the Banks' results for the past year published in *Commerce* dated 10th February, 1962. The difference of Rs. 10,000 represents the amount credited to the staff welfare fund.

The net profit of the Indian Overseas Bank Ltd. for 1961 is Rs. 43.81 lakhs, as compared with Rs. 44.66 lakhs for 1960. The figure of Rs. 46.42 lakhs shown as net profit for 1960 in *Commerce* dated 10th February 1962 includes the 1959 undistributed surplus of Rs. 1.76 lakh and is, therefore, not comparable with the net profit for 1961.

BOILERS

AND PRESSURE VESSELS

Marine Boilers are now being manufactured by us in India In addition to locomotive and vertical boilers, air-receivers etc. By this new addition to our range of products, we march in step with India's progress towards self-sufficiency.

Illustrated below is one of the Marine type Boilers made by us—Working Pressure 200 lb. per sq. inch; Heating Surface 1530 sq. ft; Evaporation 7250 lb. per hour.

THE EAST INDIA DISTILLERIES AND SUGAR FACTORIES LTD.

The Board of Directors of The East India Distilleries and Sugar Factories Limited, at a Meeting held in Madras on 6th February 1962, recorded their profound regret at the death of Mr. C. R. Srinivasan, Chairman of the Board, and appointed Mr. G. N. Noel-Tod, O.B.E., previously Vice-Chairman and Managing Director, to be Chairman and Managing Director, until the approach of the time of his retirement from service in India will necessitate another appointment.

Mr. Noel-Tod's service with the Group extends to nearly thirty years. He is a Director of a number of other companies in India, including Kirloskar Oil Engines Ltd., Kirloskar Electric Co. Ltd., Hercules Insurance Co. Ltd., W. J. Bush Products (Private) Ltd. and the various companies in the E. I. D./Parry Group.

LANCASHIRE AND GENEVA CONFERENCE

BRITISH DELEGATION'S STAND CRITICISED

From Our Special Correspondent

MANCHESTER, *6th February*

MANCHESTER LETTER

AN easy way to earn popularity has always been to criticise the Government of the day and nowhere is this more evident than in the industrial sphere. The Lancashire cotton trade has increasingly exemplified this mood during the controversy over imports—not without considerable justification. According to the latest information received from Geneva, where international talks on world trade in textiles are taking place, it is even more obvious to Lancashire traders how the British Government lags behind its counterpart in the United States, although it remains to be seen how far words will be eventually translated into deeds. The American Administration in the current negotiations has put forward a strong case on exactly the lines which Lancashire traders would unhesitatingly support, but this attitude is being opposed by representatives of the Eastern producing countries.

The American Under Secretary of Labour has put on record his Government's belief that the expansion of world trade in cotton goods depends, first, on the establishment of safeguards against particular market disruptions and, secondly, on an equity of open markets to prevent the flooding of some as a consequence of undue restrictions in others. On broad terms, this policy echoes the more definite proposal submitted by the British cotton industry to the Government delegation urging that an undertaking should be secured that, by 1970, every "Western" country or economic community should take at least 10 per cent but not more than 20 per cent of its domestic requirements of cotton products from low-wage countries.

No Brief Submitted

This proposal, first disclosed at last October's Cotton Board conference, was, however, not included in the brief submitted to the earlier conference by the British Government delegation, according to the latest quarterly report issued by Sir Alfred Roberts, Secretary of the Cardroom Workers' Amalgamation, one of the three major Lancashire cotton trade unions. In view of the reasonable nature of this plan for greater equalisation of imports between the more highly industrialised countries, it is not surprising that Lancashire traders are exceedingly disappointed with the apparent ineffectiveness of the Government's efforts on their behalf. "It would appear, in fact, that the United Kingdom delegation did little more than attempt to secure a safeguard that we should not have to increase our imports under any future arrangements that might be made," comments Sir Alfred. Hitting the nail on the head, he goes on:

"This negative attitude towards our fundamental problem becomes understandable when it is pointed out that the British delegation was attempting to represent the interests of this country and of Hong Kong—interests which are quite incompatible on this issue."

Cloth Price Variations

Rising prices can normally be expected to accompany accelerating demand; such was the case two years ago when the industry in Lancashire was passing through the hectic phase of reorganisation and widespread machinery scrapping. At that time, there was a regular upward movement in selling rates, which producers were able to justify, owing to the exceptionally heavy purchasing by distributors. Looking back, it can be seen that this represented abnormal overbuying with subsequent depressing results.

The peak in recent values can now be observed in retrospect as having been reached in the first quarter of last year. Subsequent movements have been steadily towards lower quotations and, by the end of 1961, the price of cotton cloth had been adjusted to the level ruling some 18 months earlier. The only reliable index covering cloth quotations is that published by the Board of Trade, the basis being the annual average of 1954, which is established at 100. Variations in the index number for both cotton and rayon cloth since the beginning of the reorganisation scheme are shown in the following table:

1959	Cotton cloth	Rayon cloth	1961	Cotton cloth	Rayon cloth
January ..	91.8	100.6	January ..	108.4	122.0
April	87.0	100.6	February ..	108.7	122.0
July	87.3	100.6	March ..	108.7	124.4
October ..	93.0	101.0	April	108.2	124.4
December ..	96.8	108.0	May	108.0	124.4
			June	107.8	124.4
1960			July	107.2	124.4
			August ..	106.7	124.4
April	102.6	118.9	September ..	105.6	124.4
July	104.0	114.2	October ..	104.2	124.4
October ..	108.5	119.3	November ..	102.0	124.4
December ..	108.0	122.0	December ..	102.9	124.4

The absence of change in the index number given for rayon fabric is a notable factor, particularly in comparison with the steady decline in cotton cloth rates which have, of course, suffered from the pressure of imports. On the same basis (with 100 representing the 1954 average), the change in the index number for raw cotton has been 73.6 at the end of 1959; 75.9 a year later and 74.5 in December 1961.

On the other hand, the quotation for cotton yarn in December 1959 was 93.8 in relation to the 1954 level; 101.9 twelve months later and 94.0 in December 1961. Spun rayon yarns also showed a reduction last year, the index being 95.0 in December, as compared with 100.5 at the end of 1960 and 97.8 twelve months previously.

New Ventures

Installation of new machinery within the past few months at Mutual (Filaments Division) Ltd., a subsidiary of Mutual Mills Ltd., Heywood, Lancashire, one of the foremost spinners of man-made fibres, has made the Company one of the biggest producers of false twist for outerwear, in Great Britain. Among other new ventures which the group is undertaking is the provision of specialised yarn for weaving and in particular for jersey wear. About a dozen weaving firms are now sampling these yarns and experiments are proving their worth to users. "The success of Amatalon yarn has ben tremendous," a spokesman of Mutual (Filaments Division) Ltd., said and added: "Output has already been raised substantially by the introduction of the new machines and we are hoping for further gains later in the year."

Specialised filament yarns are in sustained demand and Mutual products are sold for several months ahead. Also breaking new ground is the English Knitting Co. Ltd., another subsidiary of Mutual Mills Ltd., which produces ladies" knitwear. This Company is pushing the sale of nylon knitted goods. Its products are being extensively distributed through mail order houses and chain stores.

Technicians for Nigeria

Key posts in a new Nigerian cotton mill being built at Kaduna by a £1,000,000 company backed by the Nigerian Government are to be filled by technicians from Lancashire. Mr. Edward Seroussi, Managing Director of Nortex (Nigeria) Limited, which is erecting the 13,000-spindle, 300-loom mill, has made arrangements in Manchester with officials of Ashley Associates Ltd., the executive selection firm retained to advise on the appointment of ten senior staff men at the mill. Stating that: "Lancashire men have the right background to start our venture," he said: "They have the cotton trade in their blood and their ability has been proved through the years. Once we had decided to recruit our management from Lancashire, it seemed obvious to secure advice from selection experts operating in Manchester, in the heart of the cotton trade."—*All Rights Reserved.*

COURTAULDS NEGOTIATE AN EXPORT DEAL

A report from London states that meetings have been taking place in Rome between Mr. Frank Hearton, a Director of Courtaulds, the man-made fibres organisation for which the Imperial Chemical Industries Company have made a take-over bid, and Mr. Vlas Kentsov, head of a Russian State-controlled buying agency. Courtaulds hope that the talks will result in their securing what is believed to be a £7 million contract to provide plant and machinery for a man-made fibres factory in Latvia.

RAMTIRTH (HINDI MONTHLY)

Editor: Yogiraj Shri Umeshchandraji

Published every month by Shri Ramtirth Yogashram — Bombay

MORE THAN 160 PAGES PER ISSUE

THE MAIN IDEA BEHIND THIS MAGAZINE IS TO DEVELOP THE PHYSICAL, MENTAL AND MORAL ASPECT OF THE COMMON MAN

Annual Subscription Rs. 5/- only. Single Copy 65 nP. only.

UMESH YOGA DARSHAN
(First Part)

In Four Languages: English, Hindi, Gujarati and Marathi

(Author: Shri Yogiraj Umeshchandraji)

An excellent and highly readable book written by Shri Yogiraj Umeshchandraji is one of the best known treatises on the true meaning of Yoga. A best guide to methods of intestinal exercise and control, the book contains over 108 descriptive photographs of various Asanas explained according to the Age, Season, Country and Time.

It is one of the excellent volumes published so far depicting different aspects of Yoga, and containing different photographs of Asanas and Neti Dhoti Functions. It also contains Yoga Therapy, Diet Therapy, Chromopathy, Psycho Therapy and many other Therapies. It also contains many an important remedy for various diseases. The book is best of its kind and useful for all men and women, healthy and unhealthy, and hence should be preserved in all libraries and homes.

Price: Rs. 15/- Plus Postage Rs. 2/- extra.

YOGASANA CHART

A Chart printed on art-glazed papers and fully illustrated with attractive pictures is also available from here. You can perform Asanas shown therein at your home, which will keep you fit and healthy.

Price: Rs. 3/- including Postage to be sent by M.O. only.

YOGIC CLASSES

are also regularly conducted in the morning and evening at Shri Ramtirth Yogashram. Yogic and natural treatment are given for diseases. Diseases are also remedied.

RAMTIRTH BRAHMI OIL Special No. 1 Registered

An invaluable hair tonic for the prevention of dandruff and falling hair, RAMTIRTH BRAHMI OIL is manufactured scientifically with many precious ingredients, which cool brain, improve system, and let sleep sound. Most ideal for body massage. It is useful to every one in all seasons.

Price: Rs. 4.50 for big bottle and Rs. 2.25 for small. Available everywhere.

DEVELOPMENT OF HYBRID COTTON

LET IT NOT GO THE WAY OF SEA-ISLAND

THE failure of the Sea-Island cotton development scheme, which was initiated with much fanfare and publicity, to yield the desired results has imparted special significance and urgency to the efforts now being made by the Indian Central Cotton Committee to step up the production of hybrid cotton. For it is the second of the two ways in which the Committee seeks to bring about self-sufficiency in cotton of the staple length range 1.3/16" and above, the other being development of Sea-Island cotton. Imports of cotton into India in a normal year can be broadly divided into two categories: (1) cotton of staple length 1.1/16" and above but below 1.3/16" and (2) cotton of staple length 1.3/16" and above. There are many suitable strains of Indian cottons which could replace foreign cotton of the first category. Cambodia cotton grown in Madras and Indo-American 170-CO2 and 134 CO2M grown in Gujarat and Maharashtra are instances of such cotton. The development of suitable strains to replace the second category of imported cotton has been engaging the attention of the Indian Central Cotton Committee for quite some time now. The Committee has sought to do this by (1) development of Sea-Island cotton and the expansion of the area under this cotton and (2) evolution of suitable hybrid strains, having a staple length of 1.1/4". Since the first scheme has not met with success, as noted at the outset, it is worth examining the progress of the other scheme. It may be noted, in this connection, that the Sea-Island cotton development scheme has not been a success not because of any inherent defects in it but because of faulty implementation. Delay in the appointment of an adequate number of supervisory and advisory staff and lack of proper promotional effort resulted in the cotton being sown in a negligible area, although adequate quantity of seed was available to cover a bigger area. Further, thanks to lack of proper publicity and educative effort, the crop came to be regarded as a waste land crop, whereas, in fact, it requires the best land and utmost care for the protection of the plants from pests and diseases.

In order to promote the development of hybrid cotton, the Indian Central Cotton Committee initiated in July 1959 a pilot scheme in Mehsana, Sabarkantha, Kaira and Ahmedabad districts of Gujarat. The object of this scheme is to explore the possibility of cultivating, on a commercial scale, the first generation of hybrid of a cross between an Indo-American cotton, B.C. 68, and the fine, long-staple Sea-Island variety S.I.V. 135. During the first year of the scheme, the two parent types were raised on Government farms and about 108 lbs. of hybrid seed were produced by crossing them. These seeds were distributed to farmers in the above districts which were sown over an area of 101 acres during the 1960-61 season. Climatic conditions were quite favourable in all the four districts and the hybrid crop was consequently good. Yields averaging about 1,163 lbs. of seed cotton (*kapas*) per acre were obtained. In the districts of Kaira and Mehsana, where sufficient care was bestowed on the crop by farmers, the yield was exceptionally good, having been as high as 1,656 lbs. and 1,382 lbs. of seed cotton, respectively. The crop yielded 77 bales of lint in all.

Technological evaluation of the samples from this cotton carried out at the Technological Laboratory of the Committee, the Laboratory of the Ahmedabad Textile Industries Research Association and by two textile mills indicated that the cotton had outstanding qualities. It had a fibre length of 1.24" and a spinning capacity of 80s to 100s. It was adjudged as comparable to Sudan G.2S cotton in length, fineness and strength. It fetched a price of Rs. 2,000 per candy (784 lbs.). It was, however, found that, despite its length and fineness, this cotton needed improvement in maturity and appearance. In spinning, it was found to be too wasty in the blow room and during carding and combing processes. It was also excessively neppy. While these defects could be rectified to some extent by exercising better care at the time of picking and ginning the *kapas*, the maturity of cotton still needed improvement to reduce neppiness. It is expected that, through suitable agronomic treatments, the maturity could be improved so as to raise the cotton to the level of imported Sudan cotton in spinning performance and yarn characteristics.

While phenomenal progress has been made in the commercial exploitation of hybrid vigour in crops like maize, very little has been done in this direction in the case of cotton due mainly to the difficulty in producing hybrid seed. To overcome this, two methods, which would facilitate mass production of hybrid cotton seed, are adopted. The first method is to locate male sterile lines which combine other requisite characters to impart hybrid vigour to the offspring when crossed and the second is to explore the possibility of inducing male sterility through suitable chemicals which possess gametocidal properties. Both these methods are being tried and positive results are yet to be obtained, although there are indications that certain chemicals like F.W. 450 might prove useful in inducing male sterility in cotton.

Until positive results are achieved from the above methods, recourse has to be taken to the conventional method of hand pollination for production of hybrid cotton seed. To ascertain how far this method is workable in practice, the economics of producing hybrid seed were worked out under the Committee's scheme during 1960-61. The results indicate that the average cost of production of one lb. of hybrid seed varied from Rs. 25 to Rs. 45. Making due allowance for the fact that, during the year, there was excessive shedding of crossed flowers and bolls due to the prevalence of stormy and cloudy weather at the peak period of crossing and very low temperature during January, the cost is likely to be less in a normal year. Even at the higher rate, the cultivation of hybrid cotton is a profitable proposition. Steps are, however, being taken to reduce the cost of production of hybrid seed.

It is evident from the foregoing account that the scheme of hybrid cotton development has made a promising start. But initial triumphs and enthusiasm are not enough, if the scheme is to succeed ultimately, as has been so conclusively proved in the case of the Sea-Island cotton. Past experience should enable the Central Cotton Committee and Departments of Agriculture of State Governments to avoid the mistakes made while implementing the Sea-Island cotton experiment. If its lessons have not been well learnt by the administrators concerned, the hybrid cotton development scheme will prove to be one more instance of wasted effort and infructuous expenditure.

NEW CROP COTTON

If the trend of arrivals of new crop is any indication, the Indian cotton crop during the current (1961-62) season will be not only very much smaller than in the previous season but also a late one. A leading firm of cotton merchants estimates the current season's crop at no more than 4.4 million bales (of 400 lbs. each), as compared with the last season's 5.4 million bales. Arrivals till the end of January aggregated 1.9 million bales, which are equal to only 43 per cent of the total crop, as against 2.82 million bales or 52 per cent of the crop, during the corresponding period of last season. The following table gives the area-wise breakdown of new crop arrivals.

(In '000 bales)

Area	1961-62		1960-61	
	Crop	Arrivals per 31-1-62	Crop	Arrivals per 31-1-61
Punjab/U.P./Rajasthan ..	980	892	762	666

Adverse weather has been chiefly responsible for the sharp decline in production. Upto the end of December 1961, one could justifiably hope that the late crop, which had been developing very well, would, to some extent, make up for the quantitative gap left by the crop failure in Berar. But, unfortunately, the weather in January played havoc. Prolonged cold spells damaged the maturing crops in Andhra and Gujarat, while it completely killed the cotton plants, in Madhya Bharat areas, where they were already sub-standard. In Madras, prolonged drought has hampered the development of young plants.

Ever since its inception many years ago QUALITY has been the watchword of NICCO. NICCO has indeed set a tradition in the manufacture of Wires & Cables of standard quality which are confidently used in all industrial & other installations.

THE AMERICAN ECONOMY: PROSPECTS FOR GROWTH THROUGH 1975

PART III: THE GROWTH POTENTIAL OF PRODUCERS' GOODS INDUSTRIES

By Dr. Dexter M. Keezer

ECONOMIC ADVISOR, McGRAW-HILL PUBLISHING CO., INC., NEW YORK

THE many changes in technology developing in the United States will create higher demand for capital goods. Capital spending will be greater than in an economy that was simply producing the same goods by the same methods—even in increasing quantity. In addition to increasing capacity, the rapid pace of technical improvements will call for continuous modernisation of plants and equipment.

To keep pace with the growth, we have indicated, in previous articles for population and gross national product, that manufacturing capacity will need to increase 85 per cent by 1975. Electric power companies must triple their generating capacity. Railroads, aircargo lines and truck operators will need equipment to handle about 90 per cent more freight.

All this means a substantial growth in future requirements for plant and equipment.

But, in addition, there will be the tremendous demands for modernisation of existing plants to keep up with research developments.

Businessmen answering a recent McGraw-Hill survey revealed that it would cost $95,000 million to replace all obsolete facilities with the best plant and equipment. So, over the long run, replacement and modernisation expenditures may account for half of all capital expenditures.

As Chart III shows, needs for new capacity and needs for modernisation may result in as much as $48,000 million per year of business capital expenditures in 1965, $58,000 million in 1970 and $70,000 million by 1975, as compared with about $36,000 million for 1960.

Machinery

Machinery production, measured by the *American Machinist/Metalworking Manufacturing* magazine's index (1957 equals 100), may reach 130 by 1965 and 215 by 1975, compared with 102 in 1960. Electrical machinery output may rise, according to this magazine's index, to 155 in 1965 and 255 in 1975 from 114 in 1960. By 1975 in one special field—electrical distribution equipment—manufacturers will be selling three times the dollar volume they achieved in 1960, according to the latest estimate by *Electrical World* magazine.

There is also a great potential growth in the field of industrial instruments and controls. Production may increase 140 per cent by 1975, with electronic controls leading the group.

Another field with especially strong growth prospects is office machinery. Sales of office machines are likely to more than triple by 1975. Two factors promise continued rapid growth in this field, where sales have doubled every ten years: (i) more complex research problems will call for widespread use of electronic computers in Government and industry, and (2) clerical workers will be replaced by machines in many dull, routine jobs.

Chemicals

Bright growth prospects for the chemical industry indicate a large demand for chemical process equipment. Makers of such equipment will also benefit from the trend toward greater utilisation of by-products and chemical wastes in such industries as steel, petroleum, pulp and paper.

And the need for chemical processes to utilise low-grade mineral ores and improve the qualities of other natural materials such as lumber and textile fibres, will add to the market for equipment of this type.

For these reasons, production of chemical process machinery may triple by 1975.

Replacement Demand

A high rate of obsolescence promises to create large demand for new types of metal-working machinery. About 60 per cent of our present machines are at least ten years old. A large number of these tools are obsolete by today's high speed standards, and an equally great modernisation job lies ahead for foundries and metal-forming plants. Similarly, with textile machinery, big changes are expected during the next 15 years that will obsolete much of the equipment in spinning and weaving mills.

The high cost of labour for the mining industries seems bound to add to the demand for highly automatic mining machinery. For example, there will be a substantial increase in underground installations of continuous mining equipment.

Manufacturing, mining and construction all provide for a rapid increase in sales of materials handling equipment—to move things any distance from a few feet (metres) to several miles (kilometres)—without human muscle. Output of materials handling equipment will more than double by 1975.

Transportation

Faster distribution of goods will require more transportation equipment. Since the trend is toward moving a greater share of freight by highway or by air, we may expect substantially higher output of trucks, trailers and air cargo planes.

Railroads' chief need is for modernisation. A combination of new freight cars and modern freight yard equipment can reduce operating costs up to 50 per cent. Therefore, we may expect railroads to spend large sums for better freight cars, centralised traffic control systems and automatic retarder yards.

Need for Highways

In addition to a large private demand for capital goods, we may expect increased spending on public works. The growing population will require us to increase our elementary and high school capacity by about 75 per cent by 1975 and to more than double our hospital facilities. Greatest of all is the need for highways. To accommodate the more than 100 million vehicles on our roads in 1975, expenditures on streets and highways must more than double during the next 15 years.

ASSESSING CAPACITY OF SUGAR INDUSTRY

SOME LATEST DEVELOPMENTS

ONE of the important decisions taken by the Development Council for Sugar Industry at its recent meeting at New Delhi is that appropriate steps be taken for undertaking a review of the industry's installed capacity as at the end of the current season (1961-62). The decision is in accordance with the recommendation made by the Special Committee. This committee, it will be recalled, was set up at the twelfth meeting of the Council held at Mandya (Mysore) on 21st July 1961. It was presided over by Mr. L. G. Rajwade, Chairman of the Council, and consisted of Mr. K. P. Jain (Chief Director, Sugar), Mr. S. S. Puri (Department of Co-operation), Mr. K. Vyasulu (Planning Commission), Mr. R. P. Nivetia, Mr. M. J. Edwards, Prof. J. M. Saha and Mr. P. K. Ray (Secretary of the Council).

The findings of the proposed review of the industry's capacity will be of special significance in that they will form the basis for the future expansion and development of the sugar industry. As readers are aware, the Government has suspended since early last year the issue of licences for any additional capacity against the third Plan target, in view of the problem arising from the surplus stocks. The target of installed capacity was originally fixed as 3.5 million tons, representing a rise of 1.3 million tons as compared with the capacity of 2.2 million tons (calculated on the basis of 120 working days and an average recovery of 10 per cent) in actual operation at the end of the second Plan. Out of this additional capacity, licences covering a total capacity of 450,000 tons only have so far been approved. In terms of daily cane crushing capacity, the licences approved cover 35,953 tons—18,400 tons through the establishment of 19 new sugar mills and 17,553 tons through the expansion of 49 existing units. Of the new units, as many as 15 are co-operative mills. The State-wise distribution of the additional capacity licensed against the third Plan target as well as against the first and second Plan targets and the progress made in implementation are given in the table at the bottom of the page.

Study Suggested

The Committee appointed to consider the quantum of reassessing the installed capacity of the sugar industry held its first meeting on 25th January 1962. The consensus of opinion was that, in the context of the present situation where licensing of additional capacity had been suspended, a reassessment of capacity was not easy, nor, perhaps, capable of yielding useful results immediately. The Committee, however, considered it desirable that a study should be made of the installed capacity on the basis of three years' average cane crushing capacity, duration and recovery, commencing from the close of the 1961-62 season and including this season.

Wide Variations

It is common knowledge that the capacity of a sugar factory is usually expressed in terms of the quantity of cane it can crush in a day. Since, however, the requirements of sugar have to be taken for purposes of formulating development programmes, it becomes necessary to convert the daily cane crushing capacities of factories into annual sugar production capacities. Such an assessment will naturally have to take into account, in addition to the cane crushing capacity, two other relevant factors, namely, (a) number of days a factory works in a year, as sugarcane is a seasonal crop, and (b) the recovery per cent of sugar from cane. While the daily cane crushing capacity is fixed, the duration and sugar recovery are subject to fluctuations not merely from season to season but also from factory to factory. The targets of installed and production capacities are, therefore, only approximate and not precise. The targets of installed and production capacities fixed in the first two Plans, were on the basis of an average duration of just 120 days and 10 per cent recovery for the country as a whole. But, actually, the average all-India duration of the season during the second Plan period was much higher than 120 days, varying from region to region. Similarly, in the case of recovery, different States showed different levels. The extent of variations during the past ten years will be evident from the table below:

		Northern Region	Western Region	Southern Region
1.	*Duration*			
	(i) Maximum	164	164	189
	(ii) Season	1960-61	1960-61	1960-61
	(iii) Minimum	83	112	84
	(iv) Season	1953-54	1953-54	1953-54
2.	*Sugar Recovery*			
	(i) Maximum	9.88	11.70	9.92
	(ii) Season	1957-58	1953-54	1952-53
	(iii) Minimum	9.41	11.12	9.16
	(iv) Season	1960-61	1951-52	1956-57

Apart from weather which influences the size and quality of sugarcane crop, the fluctuations in the industry's performance was also determined by the incentives given by the Government to sugarcane growers and the millowners. It will be remembered that even as the second Plan was in progress quick steps were taken to increase the crushing capacity as well. It is not surprising, therefore, that sugar production in 1960-61 was as high as 2.98 million tons, though the production target was only 2.25 million tons.

The question of computing sugar production capacity for the purpose of determining the third Plan target was examined in detail by a special committee of the Development Council in October-November 1959. The Committee made two suggestions. One, the averages of duration and recovery for the seasons 1957-58 and 1958-59 should be accepted as providing a fair basis. Two, the sugar mills in different States must be grouped into three broad regions (Northern, Western and Southern) in accordance with similarity of climate and other considerations. The suggestions were approved by the Council and finally intimated to the Planning Commission which accepted the same and incorporated it in its development programme for the third Plan.

Even the assessment of capacity on the revised basis is, however, considered in some sugar circles to be not correct, inasmuch as the number of working days is on the low side *vis-a-vis* the actual results. In support of this view, the wide gap between target and actual output in the 1960-61 season is mentioned. It is, therefore, urged that the capacity of the industry should be reassessed in the light of increased durations in more recent years, that is, 1959-60 and 1960-61. Apropos this plea, a special note prepared by the Development Council says that it will not at all be correct to accept the figures of these two years for assessing the sugar production capacity of the industry on the ground that the seasons under reference reflect peak performance, induced mainly by the liberal incentives provided by the Government for maximising output. A rational approach, according to this note, will be to take the average performance over a period, say, during the second Plan period which included three very good years (1956-57, 1959-60 and 1960-61) and two lean years (1957-58 and 1958-59). Although it can be argued that the average gives a slightly higher figure, it should be acceptable, says the note, for a slightly higher figure will take care, to some extent, of the increased cane supplies likely to be available in factory zones as a result of development schemes in progress. It is further pointed out that the average figure of sugar recovery for the second Plan period as a whole should be taken into account. The position in regard to the duration and recovery on the basis mentioned earlier and the basis taken by the Development Council is as follows:

	Duration (No. of days)		Recovery (per cent.)	
	Average of second Plan	Figure taken previously	Average of second Plan	Figure taken previously
Northern Region	138	116	9.6	9.7
Western Region	143	130	11.5	11.3
Southern Region	145	130	9.5	9.5

The cane crushing capacity is specified in terms of cane crushed in a day, that is, per 22-24 hours' operation. For computing the annual sugar production capacity, therefore, the following formula is suggested:

Sugar Production=Duration×Sugar Recovery×Capacity×22/24.

The annual production capacity of the sugar industry, calculated on this basis, as also on the basis recommended by the Development Council earlier for the third Plan, works out as under:

	Capacity in operation during 1960-61	Total capacity still to be established
No. of factories	174	209
Total daily cane-crushing capacity specified in Industries Act licences (000 tons)	186	255
Capacity as assessed on earlier basis (000 tons)	2,208	3,088
Reassessed capacity on the basis of 1958-61 average with capacity to 22 hours working (000 tons)	2,345	3,229

TABLE I—*Additional Capacity Licensed in First and Second Plans*

(Crushing tons of cane per day)

Agricultural Situation In India

A monthly journal presenting a factual and integrated picture of the agricultural and food situation in India, against an appropriate background.

This journal, issued by the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, have as its regular features:

- A monthly newsletter surveying the latest development in the field.
- Authoritative special articles on topics of current interest.
- Extensive information on events and trends in India and abroad.
- Reviews of production and prices of various commodities.
- A comprehensive statistical section.

Commanding a wide and influential readership in India and abroad, *Agricultural Situation in India* is an invaluable guide to students of agricultural economics, business executives and administrators.

Annual subscription .. .. Rs. 24.00 or 37 sh.

Available from:
1. The Manager of Publications, Civil Lines, Delhi-8.
2. The Secretary to the High Commissioner for India, "India House," Aldwych, London, W.C.2.

INDIAN LABOUR JOURNAL

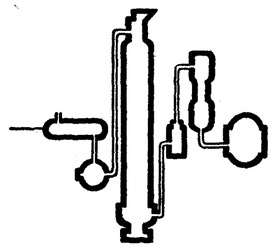
Issued monthly by the Government of India, Ministry of Labour and Employment, Labour Bureau, Simla, contains up-to-date information relating to labour in India, e.g., summaries of reports and enquiries; Labour legislation, summaries of important awards, legal decisions and collective agreements, labour news from States covering labour welfare and living conditions, statistics of industrial disputes, absenteeism, employment—service, wages and earnings, cost of living, retail and wholesale prices, trade unions, etc. In addition to these, the quarterly issues of the journal contain special articles on subjects of labour interest.

Rates of Subscription: Rs. 24 per annum and Rs. 2 per copy.

Available from:
The Manager of Publications, Civil Lines, Delhi-8.

TATA-JOHNSON

NEW RESOURCES FOR THE INDIAN PULP & PAPER INDUSTRY



TATA-KMW
Pulp & Paper Machinery
MADE IN INDIA

You can now obtain your pulp and paper machinery here in India—with a high indigenous content and incorporating the latest developments in the field.

Tata-Johnson produce pulp and paper machinery for large scale mills. Technical know-how is provided by Sweden's AB *Karlstad Mekaniska Werkstad*, KMW, century-old experts, AB *Kamyr*, and AB *Rosenblods Patenter*, as well as the Cellulose Development Corporation (Celdecor), pioneers in modern methods of pulping bagasse and agricultural residue.

Machinery designed by these leading firms is manufactured at TELCO's well-equipped Jamshedpur works.

Tata-Johnson have on their staff pulp and paper specialists with international experience who now work in very close co-operation with the TELCO works engineers.

LEVELS OF WAGES AND COMPETITIVE CAPACITY

IS JAPAN A LOW-WAGE COUNTRY?

DIFFERENCES in national wage levels are not merely of academic interest. In so far as such differences affect the competitive capacity and international trade patterns, they influence national tariff policies and figure prominently in discussions of international trade problems. Although the myth of cheap labour has been exploded as having no substance from the economic or ethical point of view, the argument of "unfair competition," based on the allegedly low level of wages, is still being advanced by manufacturers in some advanced countries in support of the demand for tariff protection against import of goods from less developed countries. What the advocates of tariff protection against goods of "low-wage countries" ignore is that the general level of wages in a particular country is usually determined by the level of productivity in that country. Countries that enjoy high productivity per worker tend to have high wages, while, conversely, countries where the average worker's output is low tend to be low-wage countries. The wide divergence between wages in different countries broadly reflects the differences in productivity levels. That it is not wage levels *per se* that determine success in international competition is proved by the fact that, generally speaking, the industries that effectively compete in foreign markets are also the ones that pay relatively high wages.

What is it then that constitutes an international competitive advantage? It is, according to Prof. Irving B. Kravis of the Pennsylvania University, "low labour costs," which is the resultant of a combination of wage and productivity factors and which reflects an industry's ability to produce more goods at cheaper prices. The efficiency and natural advantages of some industries in some countries permit them to achieve labour costs that are lower than those in comparable industries in other countries. The great value of international trade lies in the fact that certain industries in certain countries are able to produce certain goods at relatively cheaper cost because of inherent natural or cultural advantages. The plea for the equalisation of such competitive advantages by the erection of tariff barriers is economically unsound and morally indefensible. In the words of Prof. Kravis, "no sound policy can be based on the principle of eradicating all foreign economic advantages and reducing economic competition to a sports contest in which appropriate handicaps are assigned to all entrants. By this criterion, laws should be passed to exclude beautiful women from the stage and screen and intelligent men from the professions. In each case, those favoured by nature have an 'unfair' advantage over others who are eager for an equal chance of success."

Unfair Advantage?

Japan is one of the countries most frequently cited as having an unfair advantage over other countries in international competition by virtue of the comparatively low level of wages in that country. In fact, this was one of the key points raised at a recent conference of the U.S.-Japan Joint Committee on Trade and Economic Problems. Is there any truth in the statement that Japan is a low-wage country? An article in the latest issue of the *Oriental Economist*, a Japanese economic monthly, sets out to answer this question by a comparison of wage levels in Japan and some of the industrially advanced countries of the West.

In international comparison of wage levels, according to the authors of the article, the foremost consideration to be borne in mind is that wages, as a whole, are generally determined by productivity. It is, therefore, only natural that the average wage in the U.S., with its higher productivity, should be higher than that in Japan. The real question, therefore, is whether the wage level in a country is unreasonably low or not in relation to the levels of productivity and national income in that country. A comparison of the *per capita* national income and wages in Japan with those in the leading industrialised countries of the West shows that *per capita* national income and wages are higher by 8 and 9 times, respectively in the U.S., 2.9 and 3.8 times in the U.K., 2.4 and 3 times in W. Germany, 1.6 and 3.2 times in France and 1.4 and 1.7 times in Italy. Table I on this page illustrates this position.

The apparent low level of wages in Japan illustrated by the above cable is explained by the fact that labour productivity in Japan, despite its swift increase in recent years, has not yet reached the level that obtains in Western countries, except in specific sectors of the economy such as iron and steel and textiles. The extremely low level of productivity in a large section of agriculture and small industries also partly accounts for the low level of wages. The authors of the study, however, claim that the Japanese wage level, low though it is low, as compared with that of advanced Western countries, is still reasonably high in relation to the level of national income and productivity.

Composition of Wages

A pertinent point that should be taken into account when comparing wages is the composition of wages. In Japan, it is pointed out, workers generally receive big, year-end bonuses in addition to monthly cash pays and are also entitled to many fringe benefits (sub-wage) such as housing, welfare services, retirement allowance, etc., which make real wages higher than that suggested by money wages. Table II on this page gives the percentage ratios of fringe benefits to the cash pay in Japan with comparisons for other countries.

The differences in such fringe benefits is partly attributable to the differences in social structures. For instance, the social security system in Japan is not so complete, nor so developed, as in major Western countries. At the same time, in Japan, the family allowance is included in cash pay and is not classified as "subwage," as is the case in certain European countries, France and Italy, for example. Generally speaking, more than 20.0 per cent of the cash pays in Japan's textile and coal industries are earmarked for welfare facilities but the percentage of such welfare facilities, in money term, is lower as the scale of industries becomes smaller. Taking such differences into account, it can be reasonably concluded, according to the authors of the study, that, in real terms, wages in Japan are not so low as is suggested by wage statistics, thanks to the large outlay on welfare facilities in Japan, though this may be smaller than in W. European countries. Even here, however, in real terms, the wages of Japanese workers, when they are in service, are actually higher than wages in Western European countries, if account is taken of the fact that old age compensation and allowances to bereaved families are the most important obligatory social security allowances paid by employers in Western Europe.

TABLE I: *International Comparison of Wages and Per Capita National Income*

Countries	Wages (1960)		*Per capita* G.N.P. (1958)	
	In U.S. cents	Comparison (Japan = 100)	In U.S. dollars	Comparison (Japan = 100)
Japan	25.9	100.0	258	100.0
U.S.	229.0	884.2	2,095	812.4
U.K.	74.8	288.8	680	263.6
W. Germany ..	62.1	239.8	775	302.7
France	42.3	163.3	819	319.9
Italy	37.0	142.9	432	168.8

Notes:—Wages in the manufacturing sector in all countries per hour. The wage in the United Kingdom in October, in Italy the average of March, June and September.

TABLE II: *Ratios of Sub-wage to Cash Wage* (1955-57)

Countries	Pays in kind	Obligatory security aid	Housing and social insurance aid	Direct pays	Welfare facilities	Total of sub-wages

India	40.8	58	70	0.8

Money Wage and Real Wage

Again, the actual purchasing power of wages is of crucial importance in a comparison of the level of wages. Money wages, simply calculated on the basis of the official exchange rate, does not provide a correct basis for such comparison. For a study of the actual purchasing power of wages, it is necessary to take into account the fluctuations in food prices as the actual purchasing power of wages increases or decreases as food prices decline or rise. Food wage, calculated by dividing wage per hour by food prices, gives a better comparison of real wages. A comparison of food-wage ratios in some major countries with that in Japan (*vide* Table III) shows that the differences in the level of real wages in these countries and Japan are not so sharp as suggested by money wages.

Differences in the methods of determining wages and the wage structure should also be taken into account in making international comparisons of wages. What is particularly noteworthy in the Japanese wage system is the vague definition of the average wages in Japan, as compared with the average wages in Western countries. Actual wages in Japan differ widely according to the kind and scale of industry as well as the job. These differences between Japan and other countries are not so conspicuous in coal mining and electric power generation and distribution as they are in carpentry, printing and furniture making. Wages also vary according to the scale of enterprises, although the type of occupation, the age and sex of workers may be the same.

Japanese wages are based on the age-grade (long-service) wage system. As a result, workers generally get larger pay, regardless of the type of occupation as they stay longer in service. Such being the case, the Japanese wage level is found to be lower by international comparison for the lower age-group, but the gap is narrowed when the comparison is made between the wages of older workers. In Japan, workers in the age-group 40-60 are getting wages which are 1.8 times those received by workers in the age-group 20-30. There is almost no such difference, in W. Germany, for instance, among Western countries.

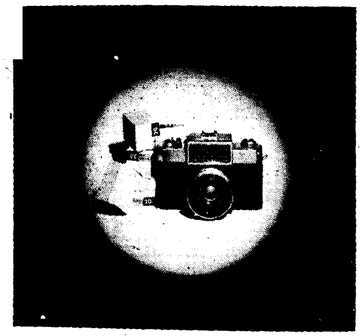
Competition in Textiles

Japanese competition in foreign markets is most severe in textiles. Japan's competitors point out that the low level of wages in Japan is one of the principal reasons for the high competitive capacity of Japanese textiles. Dealing with this question, the authors of the study under review points out that, although the average standard wage level in Japan's textile industry undeniably falls in the lowest-bracket group, it is necessary to bear in mind that the welfare and security facilities in Japanese textile industry are liberal and that the labour force consists mostly of young female workers. Hence the actual wages in Japanese textile industry are not so low as is indicated by the average wage figures. Two outstanding reasons that explain the present wage level in Japanese textile industry are (1) excessive competition in production and sales by small factories and (2) slow pace of modernisation and rationalisation. The rate of wage increases in the textile industry and the share of value added to production distributed to workers as wages have, however, been high as compared with other key industries such as machinery, electric machinery, and transportation equipment.

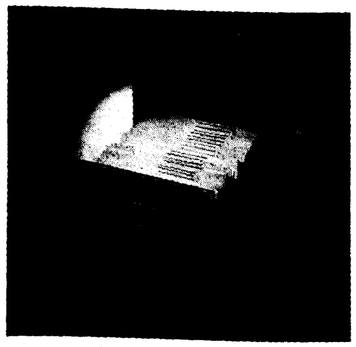
In conclusion, while admitting that the wage level in Japan is comparatively low considering the high level of industrial progress in the country, the authors of the study points out that Japanese wage level may be considered reasonable, having regard to the specific characteristics of its economy such as overpopulation, excessive dependence on agriculture and the existence of numerous small industries of low productivity.

HOUSING IN INDIA

The Government of India has sanctioned loan assistance amounting to Rs. 4 crores for the year 1961-62, to 14 State Governments, which asked for it, under the Middle Income Group Housing Scheme of the Union Ministry of Works, Housing and Supply. This assistance is intended to assist persons in the income range of Rs. 6,001 to Rs. 15,000 per annum to build houses for themselves. The amount will be advanced by the Life Insurance Corporation of India direct to the State Governments. The loans will carry interest at 5 per cent per annum from the date on which they are drawn by the States, and will be repayable in 25 annual equated instalments. The State Governments will, in turn, advance loans to the eligible at an interest rate of 5½ per cent per annum.



一台のカメラ輸入に
十以上の書類が必要



Or putting the above in English, importing even one camera from Japan takes a good deal of paperwork. Your Mitsubishi Bank man has the knowledge and the modern facilities behind him to help you eliminate much of this or at least speed it up. He and the Mitsubishi Bank have built a reputation over the past 67 years on their ability to give you all the banking services necessary for successful import-export operations. From paper work to market assessment and credit ratings, the Mitsubishi Bank handles all import-export and everyday banking matters quickly, expertly.

TRANSPORT POLICY ISSUES

F.I.C.C.I.'S MEMORANDUM TO NEOGY COMMITTEE

THE Committee on Transport Policy and Co-ordination, otherwise known as the Neogy Committee, was appointed in July 1959. It was asked to recommend a long-term transport policy having regard to the various economic and other relevant factors, to define the role of the various means of transport in the next five to ten years and to suggest a suitable mechanism for co-ordinat on of the various means of transport. The preliminary report of this Committee, it may be remembered, was submitted in February 1961; it confined its attention to the problem of rail-road co-ordination only and did not touch the problems of coastal shipping, inland water transport and other means of transport. The questions posed and the issues raised in that report are still being answered by sections of the public. The latest memorandum is the one submitted by the Federat on of Indian Chambers of Commerce and Industry. At this rate, it looks as though the Committee will take another year or two for completing its labours and drawing up the final report. Both the Committee and the interested sections of the public do not seem to have been moved by a sense of urgency in regard to the transport question. If the Committee has received all the expected memoranda by now, it should avoid further time-consuming oral inquiries and complete its labours with expedition so that a more coherent transport policy might come into force during the remaining four years of the third Plan.

Any such transport policy cannot possibly ignore the need for *freer* road transport which can effectively *supplement* rail transport. How this need can be fulfilled has been realistically answered by the Federation. According to it, regulatory measures for achieving rail-road co-ordination should be viewed with great caution and circumspection. Although in some tracts, where the roads are exactly parallel to the railway routes, traffic may tend to divert to road services for reasons of economy of time or money, or both, it would not be advisable to boost one form of transport at the cost of the other by regulatory methods which place needless restrictions on an individual consumer's choice of transport. Logically, therefore, the Federation has ruled out the alternative of possible integration of rail-road services into one single unit. This is what its memorandum says emphatically in this connection:

"Integration of the two services is not a practical proposition, and it will lead to endless complications. The rating policies of the two systems of transport basically differ. There are inherent advantages of services in both forms—rail and road—and in order that their integrity may be preserved and taken advantage of by the users according to their choice, the two organisations should be kept separate and distinct and not integrated. Both forms of transport should retain their initiative and financial structure for the development of their individual transportation characteristics."

It is against this background that the Federation has answered the various questions posed by the preliminary report of the Neogy Committee. At the outset, the Federation has answered the question whether railways, road transport and all other means of transport can be treated as commercial undertakings and enabled to compete with each other on equal terms. The Federation's reply is quoted *in extenso* below:

"Railways are a nationalised undertaking and a public utility service and cannot, therefore, be classed as a purely commercial enterprise. They are, however, to be kept economically and financially fit and sound to be able to discharge their various statutory obligations, namely, (i) maintenance of unremunerative lines; (ii) maintenance of strategic and defence communications; (iii) financial obligation to contribute to Central Revenues; and (iv) maintaining economically cheap and efficient services throughout the country. They have a financial obligation towards Central Revenues, and to that extent, therefore, railways, though not conventionally a commercial organisation, are a quasi-commercial organisation in essence.... The road transport organisations, except where they are nationalised in respect of passenger traffic, are essentially commercial concerns freely competing with each other, with or without detriment to the railways. Railways have their own rating structure based generally on the principal of 'what the traffic can bear'. This is because of the monopoly position enjoyed by the railways. On the other hand, road transport operators require to base their rates to suit their individual economy and meet the competition from each other and from the railways. The conditions of service are different, and it is obvious, therefore, that railways cannot jump into the field of free competition against the other forms of transport. All other forms of transport may run on purely commercial lines."

The Federation has taken the line that the railways cannot be relieved of their statutory obligation to provide certain essential services, even if they be uneconomic. At the same time, it has recognised their obligation to contribute to Central Revenues. In the light of this stand, it should have logically recognised the need for some enhancement in the rate of railway freight on low-rated commodities, such as coal, foodgrains and raw materials, in the event of a possible diversion of high-rated traffic to road. Since the railways have their obligation to contribute to the Central Revenues, some upward adjustment of freight rates on bulk commodities might become inevitable. The Federation's stand that no enhancement in such freight rates is called for seems to be neither realistic nor fair to the railways which are expected to forgo some high-rated traffic in favour of road transport.

The Federation, however, has rightly rejected the idea of possible nationalisation of long-distance road transport services on selected routes for the purpose of securing co-ordination between rail and road services on these routes. It has likewise rightly rejected the idea of entrusting the railways, in any circumstances, with the operation of road transport services as an integral part of railway operation. There is much to be said in favour of the Federation's plea that the road services should first be developed to their fullest capacity in view of the increasing needs for transport facilities. But it has also recognised that any such development would depend on the improvement and expansion of roads, provision of bridges and, above all, availability of particular types of vehicles, trailers, spare parts, etc. Its idea that a long-term policy for transport should wait till both road and rail services reach the stage of "full and final" development is, however, not quite comprehensible. If anything, the need is already felt for the evolution, here and now, of a long-term transport policy which will provide for the fullest development of road transport, without any fear of nationalisation of goods transport services.

NEW BRITISH LOW-POWER ATOMIC REACTOR

The Atomic Energy Authority of Britain has just brought into operation a low-power experimental atomic reactor, called "Hero," to complement the work of the prototype advanced gas-cooled reactor (A.G.R.). Built in 27 months, "Hero" has cost £1,250 000. It is a graphite-moderated reactor in which the core assembly can readily be dismantled and rearranged, thus permitting a variety of different core geometrics or arrangements of fuel and graphite to be studied. The fuel material is the same enriched uranium oxide as in A.G.R. but half is canned in stainless steel and half in beryllium.

The overall size of the reactor core is the same as the core of the A.G.R. but since "Hero" operates at very low power, experimental work can be carried out unhindered by problems of residual radioactivity. Electric heating circuits will enable its core to be heated to 500° C., thus reproducing the conditions of temperature at which the advanced gas-cooled reactor will operate. This will enable accurate estimates to be made of the operating characteristics, at full working temperatures of A.G.R. power stations.

"Hero" will be used initially to obtain the information on physics required to check designs and to get the best performance out of the A.G.R. Later, it will be used to study the nuclear physics of A.G.R. power stations, to enable them to be designed for operation to produce electric power at the lowest cost.

The Atomic Energy Authority has also announced that the A.G.R. will begin its engineering trials soon. It will be tested under conditions of full gas flow and at working pressure and temperature, before the introduction of its nuclear fuel.

DECISIONS ON SACHDEV COMMITTEE'S REPORT

The Government of India has just taken decisions on some of the recommendations of the Sachdev Committee which reported last year on the power requirements of Bihar and West Bengal, including the D.V.C. area, during the third Plan. One of the decisions is to set up a team of officers of the Union Ministry of Irrigation and Power, Planning Commission and the Central Water and Power Commission for assessing power requirements during the fourth Plan period. This team is expected to suggest the preliminary steps which would have to be completed well in time before the fourth Plan is launched.

As for the more immediate power requirements of Bihar and West Bengal during the third Plan period itself, the Government's decisions on some of the appropriate recommendations of the Sachdev Committee are as follows:

(i) For South Bengal, the installation of an additional 75 M.W. unit in the Durgapur coke-oven power station has been approved. In addition, six 1.5 M.W. packaged generating sets will be procured and installed in the State.

(ii) The Calcutta Electric Supply Corporation has been permitted to install an additional 50 M.W. generating set in Calcutta. The possibility of further augmenting the installed boiler capacity of C.E.S.C. is also being explored.

(iii) The shortage of power towards 1965-66 in the North Bengal region will be met by the proposed installation of an additional unit of 9 M.W. at the Jaldhaka Project, undertaken by the West Bengal Government.

(iv) For North Bihar, the Government has approved of installation of two 50 M.W. thermal units at Barauni, in place of the 30 M.W. units originally included in the third Plan.

(v) For the South Bihar region, the Committee has recommended that against the third Plan scheme of extension of Pathratu Thermal station by 5 units of 50 M.W. each, the possibility of installing three numbers of 100 M.W. units should be explored. This suggestion is being pursued with the Russian authorities who are to supply the plant for this powerstation.

The Government of India has also accepted the priorities laid down by the Committee for allotment of power in the event of unforeseen breakdowns, necessitating load-shedding in the West Bengal, Bihar, and D.V.C. systems. The high priority consumers, which will get power before other industries, are: railway traction, coal production, iron and steel production, including alloy steel, aluminium smelting and electro-metallurgical industries, fertilisers, electro-chemical industries, defence equipment, cement, food products, water works, hospitals, broadcasting and street lighting. The next priority has been accorded to copper smelting, rolling etc., mica-mining and processing, steel re-rolling, steel fabrication, paper mills and chemicals, jute mills, and all domestic and commercial services. Other primary and secondary industries have been given third priority for allotment of power in case of shortages due to breakdowns in the power systems.

AUTOMOBILE AND ANCILLARY INDUSTRIES

The illustrated loose brochure, recently brought out by the All-India Automobile and Ancillary Industries Association (Brabourne Stadium, 87, Veer Nariman Road, Bombay-1), is as informative as it is attractive. It consists of about 200 pages, most of which are occupied by the advertisements of automobile and ancillary industries. The story told in this publication pertains to the development of the automobile ancillary industries which, as of 1960, have been responsible for an aggregate component production of Rs. 9 crores in the organised sector and Rs. 5 crores in the small-scale sector. These figures do not include the value of tyres, tubes, batteries and ball bearings produced in that year. There are, at present, as many as 57 automobile ancillary manufacturers in the organised sector alone. The present state of the ancillary industries, as described in the brochure, shows that they are widening their horizons and that they are poised for dynamic expansion.

VC-10, BIGGEST JET AIRLINER

The biggest jet airliner to be built in Europe, the Vickers VC-10, was shown in its pre-flight stage to journalists at the Vickers plant at Weybridge, near London, on 7th February, 1962. The airline has a wing span on 140 ft and a length of 158 ft. It is due to make its first flight in May, and is now in the stage of having flight test equipment installed.

The VC-10 is powered by four Roll's-Royce Conway turbo-jets, each giving a thrust of 21,000 lb. The Super version will have even more powerful engines. The power units are arranged in pairs on each side of the fuselage at the rear, completely separate from the tail, and the swept-back wing is set well back along the fuselage. The advantages of the design are that the wing is "clean" in aerodynamic terms and can lift the aircraft off the ground on comparatively short runways.

In the standard VC-10 for BOAC, there will be seating for 135 passengers, and in the Super version for 163. The plane will cruise at 600 m.p.h., with a range of over 4,000 miles.

NUCLEAR ENGINEER TEAM TO BRITAIN

An eight-man team of Indian nuclear engineers is now in Britain studying the procedure for evaluating tenders for atomic power plant. The team is from the Atomic Energy Establishment at Trombay, and their training in Britain has been arranged under the Colombo Plan. Since their arrival in November, they have been studying with the Central Electricity Generating Board in London, attached to the design branch. The team consists of three electrical engineers, three mechanical engineers, one civil engineer, and one chemical engineer. They are studying the tender papers for the Dungeness and Sizewell reactors in Britain. They learn by preparing their own tender assessment and then comparing it with the Board's evaluation.

CENTRAL RAILWAY

The latest issue of the Central Railway's regular publication, *Facts and Figures*, seeks to bring out the salient aspects of that railway's working in the year 1960-61. It was a record year for passenger as well as goods earnings, the former aggregating Rs. 25.17 crores (as against Rs. 23.13 crores in the previous year) and the latter Rs. 54.4 crores (as against Rs. 48.88 crores). And it was also a record year for net earnings which came to Rs. 29.78 crores. The booklet is notable for its description of the Central Railway's schemes and projects under the third Plan.

NEW PRODUCTS AND PROCESSES

Floating Blanket

A SCREEN which is claimed to reduce evaporation losses of petroleum products from a fixed roof storage tank has been developed by Nayler (Petroseals) Ltd., England. Known as the "Nayflex/Girco" floating blanket, it will be shown resting on a liquid in a small cone roof storage tank at the forthcoming Chemical and Petroleum Engineering Exhibition, Olympia, London, from 20th to 30th June next. The blanket membrane, woven from specially treated nylon fabric, is attached to an aluminium periphery, fitted with buoyancy chambers. A specially treated nylon edge seal, which is fitted on the outer edge of the periphery, is said to maintain a perfect fit against the tank shell as the blanket rises and falls with the movement of the liquid. The blanket is assembled inside the tank; the aluminium periphery is erected first, after being passed through the bottom manhole in separate units, followed by the membrane. Erection is very easy and can be done without any specialised help. The blanket is fully antistatic and is a conductor of electricity. It is claimed that the use of the blanket greatly reduces the fire hazard, particularly when used on tanks containing jet fuel.

Lining-up Table

A new lining-up table for formes up to 30 x 40 inches (76.2 x 101,6 cm) is now being marketed by Stephenson, Blake and Co., England. It has a flat cast-iron imposing surface, measuring 43 inches deep by 58 inches wide (109 cm x 147,3 cm) on which the forme is arranged for locking in the chase. On either side of the imposing surface there are parallel geared bearers which move on teeth running alongside two side rule scales, each marked with inches and cms. The left-hand scale is fixed and the right hand one is adjustable for various chase thicknesses. A beam, housed in the bearers, runs on a geared track which carries a squaring mechanism for traversing across the width of the table. The bearers and the square all incorporate adjusting screws and locking devices. The cross beam and the surface of the table are scored with datum lines so that the forme can be centred correctly before being locked to the back stops by adjusting the screws threaded through two locking plates at the front of the table. There are three back-stops; two are for use with standard chases and the other is specially designed for Heidleberg chases.

Anisotropic Reinforced Plastics

A plastic material reinforced with glass fibre which can be tailor-made to suit the direction of maximum stress in the components into which it is fabricated is now in production. Its manufacture is based on a new method of producing the basic glass fibre, claimed to offer considerable simplifications over systems currently in use. Fibres are drawn directly from a moving furnace through draw-plate holes in its base. They are wound on "fishing reel" drums whose axes are parallel to the motion of the furnace. The fibre is wound on to the drum as the furnace moves back and forth and its density depends on the speed of this motion. During the drawing operation, the fibre is coated with a binding resin and when the drum is full, a ribbon of fibre in which all the threads run in the same direction is cut off and is ready for manufacture into components. An even stronger material can be made by winding on to a metal sheet which is rotated through 90 degrees at intervals to give a criss-cross grain. The bonded glass fibre is used to produce plastics piping which is, for instance, twice as strong and rigid in transverse section as longitudinally. The product is corrosion- and moisture-proof and has good insulating properties.

Pure Zinc from Vapour

A method of obtaining pure zinc from contaminating cadmium vapours, given off when zinc ores are reduced and volatised in a smelting blast furnace, has been evolved by the National Smelting Company, London. The vapours are first condensed in a stream of molten lead and the "amalgamated" lead resulting is distilled under vacuum to produce cadmium-bearing zinc vapour which is then led to a vessel containing cooled metallic zinc. The vapour becomes partly condensed by contract with the solid and liquid zinc runs off to be collected in another vessel. The liquid is heated, cadmium-rich vapour is given off, and becoming impoverished in cadmium, the liquid is converted to pure zinc.

Quick Soda

If powdered sodium bicarbonate is injected into a stream of carbon dioxide at 500 to 700 degrees Centigrade it is converted into sodium carbonate and this is the basis of a new process from Rumania for producing cheap soda and, as a by-product, pure carbon dioxide gas. A vertical reactor is used, and the transporting carbon dioxide gas is heated to about 650 degrees Centigrade. Sodium bicarbonate is introduced into it, and the gas is given enough velocity to carry the soda crystals then formed upwards against gravity to be collected and separated in a cyclone. Claimed to reduce capital costs by 50 per cent, another advantage is that the plant becomes operational 30 minutes after start-up, compared with the 35 hours of the traditional process.

Typist's Cover-up

An aid for the harassed typist is an American coating which can be applied over a mis-struck letter to save erasing. The coating is a liquid applied by a tiny brush. It dries immediately, so that the proper letter can be struck in place of the wrong one. The principle is similar to that of erasing paper which also covers the letter, but the liquid is said to be cheaper. It, however, works on white paper only.

FOR RAIL PASSENGERS

DOES YOUR LUGGAGE CONTAIN JEWELLERY, PRECIOUS STONES, WATCHES, SILKS, SHAWLS, CAMERAS, MUSICAL INSTRUMENTS OR OTHER "EXCEPTED ARTICLES"?

If so, you are advised that when you entrust such articles to the care of the Railways for carriage and the value of such articles in any one package exceeds Rs. 500, you should

(1) Declare their value in writing at the time of booking, and

(2) Pay a percentage on the value so declared over and above the normal freight charges,

failing which the Railways will not accept liability for the loss, destruction, deterioration of or damage to such articles. The articles named above and many others you will find listed as "Excepted Articles" in the I.R.C.A. Coaching Tariff No. 18.

The Station Master of the nearest station will give you detailed information if you contact him.

CENTRAL AND WESTERN RAILWAYS

TRADE PROBLEMS OF ASIA

E.C.A.F.E. COMMITTEE MEETING REVIEWED

AT the fifth session of the E.C.A.F.E. Trade Committee, held at Bangkok in the closing days of January last, representatives of the Asian countries expressed unanimous concern over the widening gap between their export earnings and their growing import requirements. They affirmed their conviction that in spite of the usefulness of loans and grants, the foreign exchange cost of development must ultimately be paid out of increased export earnings. But, while in the region as a whole the total value of exports had increased, plans for economic development and industrialisation had necessitated an even greater outlay of foreign reserves for the import of capital goods, raw materials and machinery. The result was a further deterioration in the region's already unfavourable balance of payments position, and an ever-widening gap between the industrial economies of Europe and America, on the one hand, and the primary producing countries of this region, on the other. The situation was further aggravated, according to a number of delegations, by a general decline in the prices of such commodities as tea and rubber, rising freight rates, tariff barriers and agricultural protectionism in the developed countries and a strong competition in the sale of manufactured and semi-manufactured goods from the region.

Alluding to the joint "declaration on promotion of the trade of less-developed countries," adopted by the ministerial meeting of the G.A.T.T. at Geneva in November last, the E.C.A.F.E. Committee reminded all industrialised countries of the imperative need for taking early and concrete action for reducing and progressively eliminating trade barriers. The G.A.T.T. declaration, it may be recalled, laid down that aid was not a substitute for the trade of the less-developed countries and that, in the final analysis, economic development would have to be paid for from the export earnings of those countries. The Governments of the major industrial countries, therefore, had a particular responsibility to help them find export markets and should take early and concrete action to remove trade barriers. There was a general feeling among the members of the Trade Committee that, despite the plea by the G.A.T.T. and other international bodies, "little had been done by the advanced countries to open their markets to products from the region." Representatives of the industrially advanced countries, who participated in the deliberations of the Committee, however, assured them that their Governments were taking steps to implement the G.A.T.T. declaration, thus contributing to a long-term solution of the trade problems of the E.C.A.F.E. region.

Regional Trade Blocs

The impact of regional trade arrangements on the trade of the less-developed countries was another important subject that came up for discussion at the session. Several speakers observed that they were not opposed in principle to such regional groupings, provided they were outward-looking and duly safeguarded the interests of third parties. It was, however, pointed out that the many products of the associated territories of the European Common Market in Africa, which were largely the same as those produced by the E.C.A.F.E. countries, enjoyed duty-free access to C.M. countries, "so that, in effect, non-member States in Asia were discriminated against." These handicaps would be most keenly felt in Commonwealth countries, for which the U.K. had been the major export market and one in which they had traditionally enjoyed preferential treatment. The growing tendency in Europe to attain self-sufficiency, as evidenced by the protective agricultural policy of the Common Market would, it was held, inevitably have ill-effects on the trade of other regions, their contributing not only to their economic unviability, but also to their political instability, jeopardising still further the balance of world trade. The solution to these problems, according to the majority of speakers, would be "a broad-based, liberal policy involving a minimum of preferences and tariff discrimination and the extension of most-favoured-nation treatment to the products of all primary-producing countries." It was suggested in this connection that the E.C.A.F.E. should undertake an expert study of the problem and also appoint a representative to the European Common Market for consultation on matters of concern to this region.

The tone of replies by the representatives of the U.K. and the Common Market countries to the foregoing representations was, indeed, conciliatory. The member for the United Kingdom, for instance, assured the Committee that his country was fully conscious of its responsibilities to the rest of the world. And he urged the countries of the region to bear in mind not only the difficulties, but also the real opportunities which the Common Market offered. There were liberal influences at work in the world, he said, and, if their potential was developed, the future would not be gloomy. Speaking on behalf of the European Economic Community, the French delegate declared that regional economic integration could help promote the development of not only the participating countries but also international trade as a whole. It was too early to predict the outcome of the current tariff negotiations, he said, but the tendency was to reduce and not to increase the common tariff. He sought to reassure the Committee that the Common Market had no intention of pursuing a policy of self-sufficiency in agriculture, and reiterated its concern for the interests of non-member States and its constant readiness to discuss, in a spirit of mutual co-operation, any outstanding issues which might arise.

U.S. Trade Policy

The U.S. spokesman, Mr. Clarence I. Blau, expressed the view that satisfactory levels of trade could be achieved "by developing a world trading community based on liberal trade policies, and by recourse to multilateral action to solve outstanding problems." Referring to the Trade Expansion Bill presented to the Congress by President Kennedy, Mr. Blau stressed that there was no desire to orient the U.S. trade exclusively towards Europe and that "the benefits of this action (tariff reduction) would be extended to all countries in a position to export the items concerned." He added that reduction of tariff barriers between the U.S. and the Common Market would lead, in course of time, to the evolution of the two greatest markets in the world and bring them "into areas of liberal trade," a development that would have "great benefits for the countries of the E.C.A.F.E. region." On the question of commodity problems, the U.S., he observed, would actively try to ensure price stability for raw materials and was ready to co-operate in a case-by-case study of commodity market problems, in addition to examining the possibility of providing finance to compensate for short-term fluctuations in commodity prices.

The Committee also considered several other related trade problems, including shipping and freights. Recognising the need for increased shipping facilities and reduced freight rates, the Committee felt that progress in the right direction had been made over the past three years by the development of consultative machinery in the countries of the region between the conference lines and the ship users. It recommended that such negotiations be expanded, on the lines of the shippers' councils in European countries, and that freight study units be set up to examine the problems raised by recent increases in freight rates. It also noted that several countries of the region were adopting measures to improve and expand their port facilities as a further means of developing trade.

Commercial Arbitration

The report of the recent E.C.A.F.E. Working Party on Commercial Arbitration was also adopted and the Committee endorsed the experts' suggestion that a centre for promotion of commercial arbitration be established within E.C.A.F.E. to disseminate information on arbitration, and to help the countries of the region to develop their own arbitral facilities. The Committee also endorsed a proposal for the organisation of a third Regional Seminar and Training Centre in Trade Promotion in 1964, as a regional project under the United Nations Expanded Programme of Technical Assistance. It was felt that the first two centres in trade promotion had been of practical benefit not only to the seminar participants but also to their respective countries. More countries of the region were urged to avail themselves of these facilities. Finally, the Committee requested the Executive Secretary of E.C.A.F.E. to continue to exchange information on trade activities with the other United Nations regional economic commissions in Europe, Africa and Latin America.

UNDER SECRETARY 19 FEB 1962 PUBLIC DEPARTMENT 297

Undaunted by the various disadvantages confronting them, the E.C.A.F.E. countries have been making earnest efforts to step up their exports. Almost all the speakers representing the countries of this region noted that their countries had taken several measures last year to meet the needs of the world's markets by improving the quality of their products, providing a wider range of goods for export as well as by standardising and simplifying export procedures. Although some Governments had to resort to import controls to reduce the drain on foreign exchange, the general tendency had been to liberalise import policies. Steps were also being taken to strengthen regional co-operation in matters of trade.

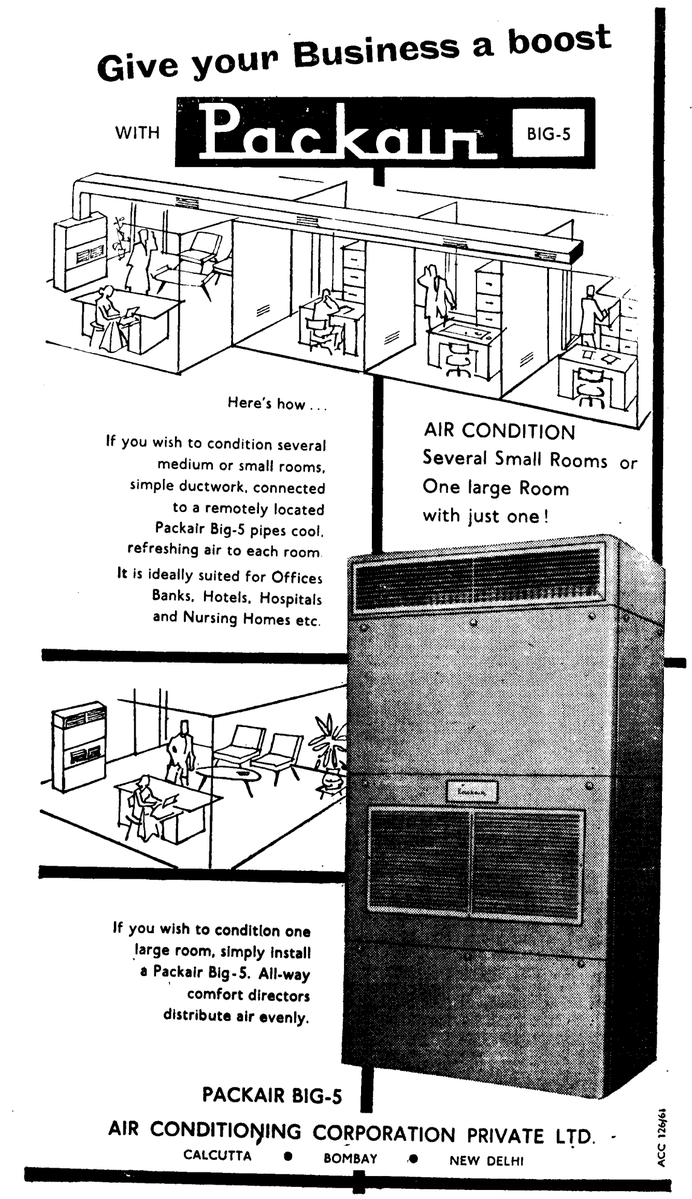
Trends in Trade

The E.C.A.F.E. Secretariat, it may be noted here, has prepared a review of trade developments during 1960 and the first half of 1961, the latest period for which data from all the countries are available. According to this review, the total value of exports in the E.C.A.F.E. region in 1960 (U.S. $11,676 million) increased 10 per cent, as compared with the previous year, thus continuing the upward trend in the value of these exports evident since 1959. All countries of the region recorded increases in their exports, with the exception of Burma, Laos, Indonesia and British Borneo. The value of exports during the first half of 1961 (U.S. $5,560 million) declined by 2 per cent, as compared with the corresponding period of 1960, and the majority of countries experienced a decline in their export earnings. During 1960, the total value of imports of the region was U.S. $13,609 million. This represented a rate of expansion of 16 per cent over the previous year and considerably outstripped the rate of expansion of exports during the period, namely, 10 per cent. Imports during the first half of 1961 amounted to U.S. $7,494 million and, as compared with the corresponding period of 1960, increased by 11 per cent, a rate of expansion that was less rapid than that for the whole of 1960.

The adverse balance of trade of the region increased from U.S. $1,057 million in 1959 to U.S. $1,933 million in 1960, a deterioration of 83 per cent. This deterioration continued in the first half of 1961 when the adverse trade balance at U.S. $1,934 million exceeded that of the corresponding period of 1960 by U.S.$902 million, a deterioration of 87 per cent. The total gold and foreign exchange assets of 14 countries of the region rose from U.S. $5,253 million in 1959 to U.S.$5,877 million in 1960, an increase of 12 per cent. By June 1961, however, the total reserves of these countries suffered a decline of U.S.$67 million from their level at the end of the previous year.

Total earnings of the region's eight major primary commodities rose from U.S.$2,606 million in 1958 to U.S.$2,972 million in 1959. They rose very slightly to U.S.$2,993 million in 1960. The factors responsible for this were a one per cent decline in the receipts from rubber and a 6 per cent decline in the receipts from rice. The average prices of rice, tea, tin and copra declined in 1960, as compared with 1959. In the early part of 1961, the price of jute rose sharply. The price of tin rose considerably in the second quarter of 1961. The prices of cotton and rice showed a modest improvement in the early part of 1961, as compared with the price level of the previous year. Copra prices continued to be depressed. Rubber suffered the sharpest decline. During the first eight months of 1961, the decline was 21 per cent. Terms of trade of the primary producing countries of the region, as a whole, however, improved appreciably in 1960 as compared with 1959, and this improvement was maintained during the first quarter of 1961, but there were noteworthy variations within this general picture.

The Indo-Yugoslav Trade Agreement has been extended upto 1964 and a fresh schedule of goods available for trade has been added, under a protocol signed at New Delhi last week, between a visiting Yugoslav delegation and representatives of the Government of India. The protocol seeks to raise the total value of trade between the two countries to Rs. 26 crores in 1962—double that of last year.



RECENT TRENDS IN CORPORATE DIVIDENDS

AN ANALYTICAL STUDY

By Dr. Raj K. Nigam and N. D. Joshi

USUALLY, the various studies on financial trends pertaining to the indigenous joint-stock companies available in our country have given greater attention to corporate savings and reserves than to corporate dividends; in this way, forces responsible for internal growth and strength of corporate bodies have been studied in great detail, whereas the trends in the rate of return on capital in different industrial channels and the flow of capital into alternative channels of investments remained less marked out. In fact, there is at present no exclusive study on corporate dividends for recent years in the country. The present paper provides a macro-analytical study of equity dividends and of the interplay of the forces which shaped the dividend policies of the joint-stock corporate bodies in the country during the period 1947-57.

In a wider sense, the importance of the study of dividend trends lies in the assessment of the impact of equity dividend distribution and profit retention policies on the growth of companies and industries and on the dispersal of ownership of industries, and in the appraisal of the influence of dividend declarations on the course of security prices on the stock markets. While these appraisals could be made with relative ease, a probe into the real intentions and motivations underlying the dividend rates announced by company managements is a pretty difficult task. It is not possible to undertake such an investigation with the help of financial data available in the published annual accounts of companies. For this, one has to be well equipped with factual information relating to financial, managerial and family interconnections between the persons who constitute the policy-making elite of the corporate world and their decisions and doings at various points of time over a long period which made deep impacts and impressions upon the corporate and business fields. This knowledge is necessary for a really deep study of dividend trends, as the decisions relating to dividends, reserves and other financial policy-oriented matters are often taken by company directors of big corporate groups for certain reasons or in the light of certain future plans, glimmerings of which are difficult to be seen. The present paper does not aim at making such readings. Its scope is limited to bring out only broad, interesting and instructive trends from a baffling mass of dividend data collected for over 300 representative companies for a period of 11 years, viz. 1947-57. The authors of this paper have recently studied the following important aspects of the corporate dividend policies adopted by company managements in the country and, of these, the attention of the readers is particularly focussed on the second item, viz., the relative attractiveness and stability in dividend returns noticeable in the nine major industries of the country:

(i) The pattern of equity dividends in the case of representative companies belonging to major industrial groups which, through the mechanism of stock exchanges, exercise a wholesome influence over the investment climate in the country;

(ii) the relative attractiveness and stability in dividend returns noticeable in the nine major industries covered in this study;

(iii) the changes in the relative positions of dividend leaders and the laggards; and

(iv) the relative degree of influence of the various financial criteria normally taken into account in the formulation of dividend policies over the levels of dividend rates by certain representative companies.

Share of Dividend

However, before coming to the main stream of the subject of this paper, it may be mentioned, in passing, that, in a relatively underdeveloped industrial economy like ours, dividends form only a small proportion of the total payments made to various factors of production in the national economy. It is very naturally so, as the expanse and scope of corporate activities in the country is yet limited and the country still continues to be predominantly agricultural. But, notwithstanding the smallness of the quantum of dividends distributed by the companies, their importance is steadily increasing, what with the increase in the number of industrial security holders or investors. Apart from this widening circle of investors drawn not only from the rich sections of the society but also from the middle classes, the corporate dividends, even with their small and apparently inconsequential size, can sometimes become a crucial factor in creating such an adverse investment climate that the expansion and growth of industries may be halted and the processes of industrial development brought dangerously close to the brink of a complete standstill and breakdown.

It is estimated that, during the two years 1956 and 1957, on an average, about Rs. 88 crores were paid to the investors and entrepreneurs in our country annually on their contributions to the share capital of the companies, which averaged around Rs. 1,192 crores. The average total annual net earnings of the companies during the same period came to Rs. 133 crores, out of which, after payment of Rs. 88 crores as dividends, Rs. 45 crores were the built-in savings of the companies. It is estimated that, out of the total amount of dividend distributed, about two-thirds of it was received by 'individual' income-tax assessees and the institutional or corporate bodies assessed to tax received one-third, namely, Rs. 23 crores out of the Rs. 70 crores. These figures give only a broad pattern of the distribution of dividend; the full implications of dividend distribution can be brought out with a detailed breakdown of block shareholdings by persons.

Five Ratios

Table 1 in this article gives the estimates of global national income, national income pertaining to the private sector and the corporate sector, total dividends paid, total corporate savings and paid-up capital during the period 1951-57.

As regards the coverage and selection of sample of companies for this paper, it may be mentioned here that the selection of companies for our study has been made bearing in mind three main considerations. First, all those companies, the ownership of whose shares was widely distributed and which were well known for their operations, were to be included. Secondly, the companies for which data were available for the entire period under review in the foregoing two sources were to be selected. Thirdly, to the extent possible an attempt was to be made to strike a regional balance among the companies selected for the study. For the sake of convenience, the optimum size of the sample for the study was fixed at 336 companies. Excepting coal, sugar, tea, cotton, iron and steel industries in which case the paid-up capital of the selected companies worked out to nearly one-third of the paid-up capital of all companies at work belonging to these groups, in the other four industries, namely, jute, cement, paper and coffee and rubber plantations, the coverage works out to above 50 per cent and more. The coverage of the selected companies is still better on the basis of the ratio of their paid-up capital to the paid-up capital of those public companies which are quoted on the stock exchanges.

The analytical study in this paper relates to the following five dividend ratios and financial indicators: (i) the average percentage dividend returns on paid-up capital; (ii) the average yield; (iii) the coefficient of variations of return on capital employed; (iv) the growth of free reserves (excluding taxation and depreciation), and (v) profits before tax as ratio of turnover.

Dividends on Paid-up Capital

To take the average dividend returns on the paid-up capital first. A study of these ratios for the entire 11 years period under study shows that the plantation companies—tea and coffee and rubber—gave the highest returns among the nine industrial groups covered in this study. The average dividend return on paid-up capital for the whole period for the tea industry, represented by 108 tea companies, worked out as 16.3 per cent and for the coffee and rubber plantations, represented by 26 companies, as 12.7 per cent. In the case of cotton textile companies, this ratio, on the average, worked out as 10.4 per cent, as against 9.9 per cent for the jute companies. The sugar companies gave a return of 9.5 per cent on the paid-up capital followed by the coal companies giving an average return of 8.7 per cent, the iron and steel (including engineering) companies yielding 8.6 per cent, the paper companies 7.3 per cent and the cement companies 6.9 per cent. As against the foregoing average returns on the equity capital, which show the gains of the investors, though by no means the entire gain as a part of it accrues in the form of appreciation in the value of shares, a study of the average dividend during the last three years, namely 1955-57, can provide some broad indicators to the probable future course of dividends. The short-term analysis discloses that the plantation companies continued to be the most attractive field for investments for the investors, giving a ratio of 15.1 per cent (tea) and 15.7 per cent (coffee and rubber) on the paid-up capital. During this short three-year period, the average return for sugar companies worked out to 11.6 per cent and for cotton 11.1 per cent. For iron and steel (including engineering) companies and paper companies, the returns averaged 10.9 per cent and 10 per cent respectively, followed by 8.6 per cent recorded by the coal companies, 8.1 per cent by the cement companies and 5.4 per cent by the jute companies. It may be mentioned here that dividend rates for the jute companies worked out to a lower figure, as, in 1956, the jute industry as a whole experienced a very critical time. During this year, despite the managements' endeavour to hold the dividend line, the rates of dividend distribution had to be drastically cut down due to the low levels of net profits or due to losses. Table 2 gives the average percentage returns on paid-up capital for 1947-57 and 1955-57. It also gives average dividend returns for the first Plan period 1951-55 and for the first two years of the second Plan, namely, 1956 and 1957.

Average Dividend Yields

An inter-industry comparison of the average dividend yields for the entire period of the study, namely, 1947-57, discloses that coffee and rubber gave the highest average yield of 9 per cent, followed by 6.5 per cent observed in the case of tea companies. It may be recalled here that the average dividend on paid-up capital for the same period worked out higher in the case of tea companies (16.3 per cent) than that for coffee and rubber plantation companies (12.7 per cent). The gap between the dividend yields of the companies belonging to the two plantation groups is wider than that seen in the dividend returns. This wide gap in the average yields is due to the wide fluctuations in the prices of shares of tea companies and to the steady tone in the prices of shares of other plantations. From the yield point of view, after the two groups of plantation companies, sugar companies come next (6.4 per cent), followed by paper companies (6 per cent) and by cotton textile companies (5.9 per cent). In the case of the other four of the nine industrial groups studied in this paper—jute, coal, iron and steel and cement companies—the average yields during the period 1947-57, came to between 4.0 per cent and 4.6 per cent.

The foregoing order of industries, according to average dividend yields for the entire period, is somewhat changed during the last three years of the period under study, namely, 1955 to 1957. The order of industries, during the 1955-57 period, was as follows:

Coffee and rubber (9.2 per cent), sugar (7.7 per cent), paper (6.4 per cent), cotton (5.8 per cent), tea (5 per cent), iron and steel (4.9 per cent), cement (4.1 per cent), coal (3.9 per cent) and jute (3.3 per cent). Table 3 shows, apart from giving the average dividend yields for the periods 1947-57 and 1955-57, the average yields for the full span of the first Five-year Plan and the first two years of the second Five-year Plan.

It may be mentioned here that the figures of yield compiled in this study are not strictly comparable to those published by the Reserve Bank of India in their monthly bulletins for several reasons. First, the coverage of industrial securities is different in the two studies. Secondly, the figures of yield compiled by the Reserve Bank of India are weighted proportionally to the market value of the share capital of the companies, whereas figures in this study are the unweighted averages. Thirdly, the Reserve Bank of India figures of yields are calculated on the monthly average market quotations while in our study they are calculated on the basis of the average of the highest and lowest market prices of the industrial shares during the calendar year. Lastly, the average yields in our study have been calculated from the frequency distribution tables relating to dividend yields and hence some extra weightage has gone to the class intervals at the extremes, particularly the top stratum. This treatment is likely to raise the average level of yields.

Return on Capital Employed

A comparative position of profitability and stability of the nine industries based on the return on capital employed is depicted in Table 4. For this, the data have been taken from the Reserve Bank's studies on company finance which however are not available for the first four years of our study, namely, 1947-50. The computation of these ratios in respect of the companies covered in this study would have required a reference to the primary sources, namely, annual company accounts which were not readily available. Notwithstanding the incomparability of the data relating to returns on capital employed given here, some idea of the inter-industry profitabilities on the basis of capital employed *vis-a-vis* dividend returns and dividend yields can be had.

In Table 4, gross profits as percentages of sales and of capital employed have been given which bring out the comparative profitabilities of the principal industries. The coefficient of variation for return on capital employed brings out the relative stability of profits in the various industries. In this respect, the high coefficients reveal a greater degree of unstability, whereas the lower ones show a state of stable conditions.

Growth of Reserves

The influence of reserves over a period of time indicates the extent to which investors could expect cash and stock dividends from the companies. In the years of smaller profits, a portion of money from these reserves is pumped out into the dividend pipelines, whereas, in other years, when the reserves swell up out of proportion to the paid-up capital, stock dividends or bonus shares are issued to the investors. In Table 5, the growth of reserves during the period 1950-55 and 1955-57 has been calculated on the basis of the Reserve Bank data relating to 750/1,001 companies. The table shows a stronger reserves position in the cement, iron and steel, coffee and rubber, tea and paper industries than that in the other industries. Over the three-year period 1955-57, the percentage increase is observed to have been substantially higher in the iron and steel and cement industries as compared to the other industrial groups.

Table 6 gives indices of capital formation at the beginning and end of the first Five-year Plan and in 1957. The index represents the movement in the quantum of paid-up capital and free reserves and surplus of the companies.

Regularity in Dividend Payments

Apart from the study of the average dividend returns and yields, we have also attempted to show the extent of regularity in dividend payments by the companies covered in this paper. This has been studied from two angles. First, an attempt has been made to show the number of companies under the various industrial groups which paid dividends for a majority of the years to which the study relates. Secondly, it shows the number of companies which paid dividends towards the closing phase of the period that is, during 1955-57. In columns 5 and 6 of Table 7 relevant figures in this regard are shown.

Dividend Payment During the Two Plan Periods

With the advent of the planning era all the economic variables are bound to reflect the impact of the deliberate directions of economic activities towards attainment of the targets chalked out in the two Plans. Table 8 gives dividend payments as percentages of paid-up capital, average market values, net profits and net worth at the beginning of the first Plan and during the first two years of the second Plan for various industries. Iron and steel, cement, paper, sugar and coffee and rubber plantation industries seem to have stepped up dividends over the two Plan periods. Excepting the last industry all the other industries show a higher rate of return on the market value of the shares during the said period.

Note: This paper is an adaptation from the forthcoming publication entitled *Corporate Dividend Trends during the period of Industrial Growth and Planned Economic Development in India*—1947-57 by the authors of this paper. The views expressed in this paper are the personal views of the authors and the Department of Company Law Administration is in no manner committed to them. The responsibility for the accuracy of the data is also that of the authors. The authors were assisted, in the preparation of this paper, by their colleague Mr. N. Natarajan, Investigating Officer attached to the Research and Statistics Division of the Department.

ELGIN MILLS' DIVIDEND BETTER

RESERVES, TOO, CONSIDERABLY STRENGTHENED

HIGHLY impressive working results have been achieved by the Elgin Mills Company Ltd. (Secretaries and Treasurers: Messrs. The British India Corporation Ltd., Kanpur) in respect of the year ended 30th September 1961. Over and above the increase of Rs. 44.16 lakhs effected during 1959-60 and of Rs. 57.32 lakhs in the year immediately preceding, the Company has been able, in the course of the year under review, to push up the sales further by no less than Rs. 181.78 lakhs to Rs. 581.54 lakhs thus virtually doubling its turnover within a short span of just three years. Other income, on the other hand, has declined slightly by Rs. 2.87 lakhs to Rs. 15.24 lakhs, due mainly to the decrease in the incentives received under the export promotion scheme. Even then, the total income from all sources shows a handsome gain of Rs. 178.92 lakhs to Rs. 596.78 lakhs or 42.8 per cent over the previous year. A major portion of this rise has, however, been neutralised by an increase in the various expense items. Cost of raw materials and stores consumed has gone up from Rs. 225.50 lakhs to Rs. 352.38 lakhs and that of services and employee benefits from Rs. 97.63 lakhs to Rs. 133.78 lakhs owing to the increase in the number of employees from 6,670 to 8,030 and the implementation of the recommendations of the Wage Board for the cotton textile industry. Other expenses also show a significant rise from Rs. 37.67 lakhs to Rs. 51.22 lakhs. Though the gross profit has improved by Rs. 23.19 lakhs to Rs. 86.68 lakhs, it has actually been earned at a somewhat lower rate, being 14.9 per cent of the sales as against 15.8 per cent previously. It is needless to add that the disproportionate rise in expenditure has been instrumental in lowering the profit-margin.

As regards appropriations, the provision for depreciation is higher by Rs. 3.92 lakhs at Rs. 9.57 lakhs and that for taxation by Rs. 7.25 lakhs to Rs. 31.75 lakhs. Despite these heavier essential provisions, the net profit has improved quite substantially by Rs. 12.18 lakhs to Rs. 41.25 lakhs or over 41 per cent. Out of this profit and together with the balance of Rs. 0.89 lakh brought forward from the previous year and Rs. 6.06 lakhs written back from past provisions, the Directors have credited Rs. 4.93 lakhs (Rs. 1.24 lakh) to the development rebate reserve, Rs. 10.00 lakhs (Rs. 18.00 lakhs) to the rehabilitation reserve and Rs. 20.00 lakhs (*nil*) have been transferred to the general reserve. The total amount ploughed back out of the profit for the year under review thus amounts to Rs. 34.93 lakhs, as against Rs. 20.04 lakhs during the previous year. Even then, there are left enough funds to enable the Directors to recommend a higher dividend on both the ordinary and vendors shares at the rate of Re. 1.75 per share of Rs. 10 each, as against Re. 1.15 per share, subject to deduction of tax in both the cases.

The rapid strides made by the Company during the past four years to re-establish its reputation as one of the leading cotton textile units in Northern India are fully presented by the following comparative table:

(In lakhs of rupees)

	For the year ended 30th September			
	1961	1960	1959	1958
Sales	581.54	399.76	355.60	298.28

* Subject to deduction of tax.
† Subject to tax—dividends declared for two years ended September 1959-60.
‡ Proposed but not declared.

The substantial improvement in operating results for the year was possible, primarily because of the satisfactory working of both the units of the Company and the higher standard of efficiency achieved during the year. In order to attain a still greater efficiency and a better trading position, a programme of renovation and modernisation of both the mills has been planned and already implemented to some extent. The total expenditure on new buildings, plant and machinery, etc., during the next five years is estimated at Rs. 1.35 crore and for this purpose a long-term credit has been arranged with the Company's bankers. Commitments for capital expenditure subsequent to the close of the financial year under review approximately amount to Rs. 26.50 lakhs. It is expected that, with the installation of new plant and machinery, the Company would be able to produce even better quality of cloth which should further improve its position with regard to the export of cloth to the various countries where its products already enjoy an established market. In addition to this scheme for renovation and modernisation, the Company has plans for setting up an entirely new spinning unit and its application to the Central Government for allotment of additional capacity, has been supported by the State Government, with a recommendation for an allotment of 12,000 spindles over and above the 10,348 spindles recommended for balancing purposes.

Though total sales have shown a vast improvement over the previous year, the Company's performance on the export front has been less satisfactory. Export earnings which had amounted to Rs. 1.25 crore a year ago have now declined to a little over a crore of rupees. This was due primarily to the quota restrictions imposed in the U.K., which happens to be the principal export market for the Company's products, and the keen competition from Japan, Hong Kong, Pakistan and some European countries.

With the heavy plough back of profits and the recovery, with the accrued interest thereon, of the secured loan advanced to the subsidiary Shree Madhav Mills Ltd., now under liquidation, the Company's financial position, as at 30th September 1961, has no doubt vastly improved, but it has yet to clear some of the entanglements into which it was drawn a few years ago by Mr. Haridas Mundhra. Out of the issued share capital of Rs. 78.20 lakhs, consisting of Rs. 11.00 lakhs in 8 per cent cumulative preference shares of Rs. 100 each, Rs. 4.20 lakhs in 5 per cent 'B' preference shares, and Rs. 63.00 lakhs in ordinary and vendors shares of Rs. 10 each, more than 76 per cent, Rs. 59.84 lakhs to be precise, is held by the ultimate holding company, the British India Corporation, and its subsidiaries. The share capital is supplemented by reserves and surplus amounting to Rs. 176.56 lakhs. Secured and unsecured loans, reduced by Rs. 24.62 lakhs during the course of the year, stand at Rs. 52.93 lakhs, while current liabilities and provisions aggregate Rs. 107.46 lakhs.

On the assets side, the gross block, with a book value of Rs. 236.09 lakhs, has been well written down to Rs. 67.96 lakhs and, with the inclusion of Rs. 4.16 lakhs as the cost of buildings and machinery in the course of construction and erection, gives a net block of Rs. 72.12 lakhs. Though investments are worth in the Company's books Rs. 86.28 lakhs, it is to be noted that a large portion of them, namely, Rs. 61.16 lakhs, are in the shares of a subsidiary company (Shree Madhav Mills Ltd.) now under liquidation. Of the balance, Rs. 23.77 lakhs are in the shares of Calico Processors Ltd., the financial position of which is also none too happy, with part of its funds invested in Shree Madhav Mills in liquidation. Excluding these investments, current assets, loans and advances are Rs. 256.75 lakhs in the aggregate, exceeding the liabilities to outsiders by Rs. 96.36 lakhs.

The present market quotation for the Rs. 10 paid-up ordinary shares of the Company is Rs. 25.62 *cum-div.* On an *ex-div.* basis, the net return on the investment works out to 5 per cent per annum.

HINDUSTAN LEVER

DIVIDEND SAME—BONUS ISSUE PROPOSED

IN just four days, Monday to Thursday, in the week ended 10th February, Hindustan Levers soared on the Bombay Stock Exchange from Rs. 59 to a new peak so far of Rs. 72. Last year, this scrip had touched a low of Rs. 37, then advanced steadily to Rs. 60.50 to round off the year at Rs. 59. Thus, in one year, the shares have appreciated by almost 100 per cent. Indeed, it is a big leap for a Rs. 10 fully paid share. What is more amusing is that these shares are being fancied by investors even at the current high levels, though, at the highest level made so far, they offer a yield of only 2.6 per cent per annum, free of tax, which is far too low in comparison with 5 per cent that one can obtain on long-term deposits with banks or 6.5 to 7 per cent available on preference shares of first rate companies.

The question may be asked whether dividend is the only consideration for investment in equities. Obviously not. Dividend is only one of the various considerations that an investor weighs before locking up his funds in an ordinary share. Indeed, unlike in the past, it has not been the primary consideration for some time now and that is why we find that new issues are oversubscribed at present a number of times the amount asked for, even as many as 116 times, as was the case recently with Indian Carbon. The history of economic development of the industrialised nations of the world gives ample proof of the fact that, in a growing economy, growth prospects, which ultimately result in a substantial capital appreciation, are more important than all other considerations for an investor in selecting his investments. A steadily increasing block account, a healthy and expanding reserves position, growing profitability, a reasonable return and a sound management are the other considerations that one must bear in mind before buying such equities. The fancy for Hindustan Levers, recognised now as a "blue chip," is explained by the fact that they meet all these demands of the investor.

During the year ended 31st December 1961, the Company has, however, earned a lower net profit of Rs. 225 lakhs, as compared with Rs. 250 lakhs in the previous year, after providing Rs. 193 lakhs as against Rs. 208 lakhs a year ago for taxation. This setback in profit is presumably due to the continuing cost inflation which was quite a conspicuous feature of the results for 1960. If anything, the increase in excise duty on toilet goods and *vanaspati* in the last budget must have aggravated the cost inflation during 1961. Nonetheless, the Directors have confidently recommended that the dividend be maintained at Rs. 2.60 per share, subject to tax, to which level it was raised in the previous year from Rs. 2.40 for 1959.

The chief reason for the sudden rise in the market value of the Company's share is the proposal of the Directors to capitalise a part of the Company's reserves and issue bonus shares in the ratio of 12 new shares of Rs. 10 each for every 25 of the existing shares, subject to the consent of the Controller of Capital Issues. This move has been made, in order to bring the issued and paid-up capital of the Company, currently at Rs. 5.57 crores (of which Rs. 3.29 crores was raised by way of capitalisation of reserves in the past), into closer relationship with the capital employed in business, which, as at the end of 1960, stood at Rs. 10.06 crores. The proposed capitalisation will raise the paid-up capital to Rs. 8.24 crores. This means that the authorised capital itself will have to be increased, as all of it has been issued. It may be noted here that 90 per cent of the capital is being held by Unilever Ltd., London. The Company's total reserves and surplus, as at the end of 1960, stood at Rs. 4.49 crores, of which Rs. 2.31 crores were accounted for by development and development rebate reserve. For 1961, the profit available for appropriation, including the surplus brought forward from the previous year, amounts to Rs. 2.49 crores. The dividend will absorb Rs. 1.45 crore, leaving more than Rs. 1 crore to be retained in the business.

The new ordinary shares will rank *pari passu* with the present issued ordinary shares, except that they will not rank for dividend in respect of the year ended 31st December 1961. The aggregate fractions arising from allotment will be sold and the net proceeds distributed amongst the ordinary shareholders entitled to them.

At the time of writing, the ruling market quotation for the Company's share is Rs. 68.50. At this rate, the ex-dividend and ex-right quotation is Rs. 47 approximately. If it is assumed

(*Continued on next page*)

FINANCIAL POSITION OF ANGELO BROS. STRONG

RETURN TO SHAREHOLDERS SLIGHTLY LOWER

A SHARP drop in the sales turnover and yet maintenance of the gross profit at the previous year's high level are the highlights of the working of Angelo Bros. Ltd. (Managing Agents: Messrs. Turner Morrison and Co. Ltd., Calcutta) during the year ended 31st August 1961. Net proceeds from sales have come down with a bang from the previous year's peak level of Rs. 201.13 lakhs to Rs. 161.51 lakhs, the lowest level recorded in the past six years. The gross profit of Rs. 18.81 lakhs, on the other hand, has been fully maintained at the previous year's level. This sounds a rather strange phenomenon. But what has done the trick is a decline in factory costs, almost of the same magnitude as in the sales turnover, from Rs. 174.29 lakhs to Rs. 134.47 lakhs. The wage bill of Rs. 7.63 lakhs and other expenses of Rs. 3.49 lakhs are almost the same as in the preceding year. Among essential provisions, taxation gets Rs. 1.30 lakh more at Rs. 8.60 lakhs, while depreciation is allowed at Rs. 0.99 lakh against Rs. 1.03 lakh previously. After allowing for Managing Agents' commission of Rs. 1.79 lakh (Rs. 1.83 lakh previously), the net profit works out lower at Rs. 7.43 lakhs, as compared with Rs. 8.64 lakhs a year before. A direct consequence of these reduced net earnings is the lower total distribution per share to the investor of 22.5 per cent, as against 25 per cent in the previous year, which reflects the cut in the bonus from 12.5 per cent to 10 per cent. Reserves have received a paltry sum of Rs. 0.81 lakh, as against Rs. 1.17 lakh in the previous year. The carry forward is Rs. 2.09 lakhs against Rs. 2.23 lakhs brought in.

The following table compares the Company's working in the past four years:—

(In lakhs of rupees)

	For the year ended 31st August			
	1961	1960	1959	1958
Sale proceeds (net)	161.51	201.13	171.90	177.91
Other income	2.90	3.88	1.93	1.78
Factory costs and other charges	134.47	174.29	149.35	157.25
Salaries	7.63	7.49	7.19	6.66
Other expenses	3.49	3.93	3.39	3.29
Gross profit	18.81	18.80	10.89	12.47
Depreciation	0.99	1.03	0.97	1.05
Taxation	8.60	7.80	5.40	6.85

Net profit	7.43	8.64	3.16	3.37
To reserves	0.81	1.17	0.33	0.08
Dividend	3.75	3.75	3.75	3.75
	(12½%)*	(12½%)*	(12½%)*	(12½%)
Bonus	3.00	3.75	2.35	0.70
	(10%)*	(12½%)*	(7½%)*	(2½%)
Carry forward	2.09	2.23	2.25	2.89

* Subject to deduction of tax.

The Directors attribute the fall in turnover to lack of demand. Although it was officially estimated to be one-third smaller than what it was in the preceding year, the 1961 Bysaki lac crop caused supply to exceed demand, which was reduced by the absence of Chinese buyers, to such an extent that the gap between internal prices and the minimum export selling rates imposed by the Indian Lac Exporters Association could not be effectively bridged by the Association's levies and buffer-stock operations. Consequently, the minimum price scheme came under ever-growing strain, which, to some extent, inhibited buying interest in other major overseas trading centres. The Association's remedy was to introduce early in August a flexible price control, but the Government refused to permit its operation. These disturbances of the normal trading pattern were reflected in a poorer volume of exports and, although the Company fully retained its share

(*Concluded from previous page*)

that the Company will be able to maintain the dividend on a paid-up capital raised by 48 per cent, the yield at the current market price is 3.9 per cent, tax-free. The assumption is, of course, valid, for even the current year's profit is sufficient to provide more than full cover. With the Company's activities steadily expanding, its net profit, too, should grow, other things remaining the same. A net yield of 4 per cent—it will be slightly more for those small investors whose rate of taxation is less than 30 nP in a rupee—is, of course, in keeping with current ideas for blue chips. But it leaves little room for covering unforeseen risks. Further, it will be quite a long time before another bonus issue comes along and that, too, provided the tax on bonus shares is not raised to the level that was obtaining under T.T.K.'s dispensation or to its neighbourhood.

of the market, the year's sales were the smallest since the 1954-55 season. Reduced consumption of the Company's products was common to all overseas markets, with the notable exception of the U.S.A. which bought 10 per cent more than in the preceding season, in the face of growing competition from synthetic shellac made in West Germany. That competition, undoubtedly deriving advantage from the weaknesses in Calcutta, was resisted by the Company successfully. The situation obtaining during the year was, therefore, materially different from what it had been in the previous season, when the Indian Lac Exporters' Association maintained export prices at the preceding year's level and, except for a short period prior to the arrival of the Bysaki crop, overseas buyers were able to obtain their requirements at this level.

The Directors point out in their report that competition from shellac made in West Germany is being met again this season, though the Company is still handicapped to some extent by minimum export prices set at about 8 per cent lower than the old ones and to a greater extent by an export duty imposed by the Government. The Directors anticipate, however, that the operational efficiency of the Company and the merits of its products, well known all over the world, would counteract these adverse factors substantially. Till the middle of January this year, trading results were reasonably satisfactory, but, as the situation is still fluid and liable to change, the Directors have not forecast the volume of final trading profits for the current year. The policy of effecting improvements in production lines and techniques, without interfering with output, was followed during the year under review and is being pursued this year.

Out of its authorised capital of Rs. 50 lakhs in equity shares of Rs. 10 each, the Company has issued Rs. 30 lakhs, two-thirds of which represents capitalisation of profits. Moreover, 79,930 shares were allotted as fully paid up pursuant to a contract without payment being received in cash. As against this, reserves and surplus stand at the impressive level of Rs. 43.49 lakhs, of which general reserve alone amounts to Rs. 26.37 lakhs. Current liabilities and provisions amount to Rs. 38 lakhs, and are very comfortably covered by current assets, loans and advances of Rs. 92.80 lakhs, which include cash and bank balances of Rs. 7.51 lakhs. Investments have come down from Rs. 7.45 lakhs to Rs. 5.48 lakhs, but include 5,000 shares of £1 each fully paid-up in the subsidiary company, Angelo Bros. (England) Ltd., which are shown at a nominal value of only one rupee. The gross block increased during the year from Rs. 37.09 lakhs to Rs. 40.23 lakhs, and is very conservatively written down to Rs. 13.22 lakhs. Thus, the financial position of the Company is considerably strong.

The Rs. 10 fully paid ordinary shares of the Company are currently quoted in Calcutta at Rs. 23.19 *cum-div.*, and, at this rate, offer, on *ex-div.* basis, a yield of nearly 3.9 per cent per annum, free of tax, only on the dividend of 12.5 per cent, subject to deduction of tax, and of nearly 7.3 per cent per annum, free of tax, on the total distribution of 22.5 per cent, inclusive of the bonus of 10 per cent, subject to deduction of tax.

able to supply customers from stock. Write giving full details to No. 892, PUBLICITAS, Apartado 398, Barcelona, Spain.

BARODA RAYON CORPORATION

Satisfactory progress is reported to have been made by the Baroda Rayon Corporation (Managing Agents: Messrs. Gaekwad Chinai and Company Pvt. Ltd., Surat) during the year ended 31st December 1961 in the construction of factory buildings and the erection of machinery. In addition to 277 acres of land already purchased, the Company has acquired, during the year under report, further 42 acres bringing the total acreage of its lands to 319. Though delayed slightly, due to natural causes, the construction of buildings continued satisfactorily and is now nearing completion. The buildings have been so constructed as to provide accommodation for the additional machinery which will be installed under the Company's expansion programme. So far as the erection of machinery is concerned, the entire plant and equipment has reached the factory site and erection work is in full swing under the supervision of Japanese technicians. Judging from the speed at which work is progressing, it can confidently be expected that the factory would go into production by the end of the second quarter of the current year.

During the course of the year, the Company issued further 1.40 lakh ordinary shares of Rs. 100 each at a premium of Rs. 5 per share. Of this, 1,26,000 shares were subscribed for by the existing shareholders, while 10,720 new equity shares have been reserved for allotment to the Japanese collaborators against the supply of machinery required for the expansion plan referred to later in this review. As regards the 3,239 shares remaining unapplied for, the Directors have obtained permission to dispose them of in small lots in the open market. The amount received in excess of the face value is to be credited to the share premium account.

Following the above equity issue, the share capital, as at 31st December, 1961, stands at Rs. 475.46 lakhs after accounting for allotment and instalment money in arrears. This is backed by Rs. 6.30 lakhs in the share premium account and Rs. 4.11 lakhs as surplus. The amount withdrawn against the long-term loan of Rs. 2.43 crores, sanctioned by the Industrial Finance Corporation, stands at Rs. 158.00 lakhs while current liabilities amount to Rs. 5.59 lakhs. Fixed assets at cost are placed at Rs. 594.49 lakhs, while current assets, loans and advances aggregate Rs. 26.03 lakhs. A balance of Rs. 23.17 lakhs stands to the debit of the expenditure during construction account and will be adjusted, on completion of the factory, to the cost of the various assets. Miscellaneous expenditure yet to be recouped amounts to Rs. 5.77 lakhs.

The Company has already secured a licence for the expansion of its capacity from 5 million pounds to 6 million pounds per annum and is awaiting the relevant licences for the import of plant and machinery. Looking to the shortage of raw materials, it has been thought advisable to put up a plant for the manufacture of rayon grade *caustic soda* also. Necessary applications have been made and a favourable reply from the Government is awaited.

Notice

ORIENT PAPER MILLS LIMITED

Registered Office:

Carried forward	8	27

N.B.—Adjustments represent the balance brought forward from the previous year and other credit items.

* This includes Rs. 6,437 being credit adjustments relating to previous year.

† This includes Rs. 23,050 being excess provisions for bonus and free maintenance on completed orders written back and credit adjustments relating to the previous year of Rs. 15,818.

‡ Dividend on the increased ordinary (equity) capital of Rs. 60,93,400.

§ Dividend for 1960 was on a paid-up ordinary capital of Rs. 30,46,700.

Extracts from the Directors' report: The directors consider that the results of working of the Company for the year under review are satisfactory. The results could have been still better if the Company had been able to overcome the acute shortage of basic raw materials, which it has been experiencing for some time now. ... In order to reduce the foreign exchange requirements for essential raw materials a plant to manufacture paper covered and cotton covered copper wires with a capacity of 240 tons/annum was installed and is now working satisfactorily.

The Company's products continued to enjoy the popularity and demand created by continuous efforts to produce goods of the highest quality. The Company's 1960-61 sales totalled Rs. 186.97 lakhs net, an increase of about 41 per cent over the 1959-60 sales figure of Rs. 118.69 lakhs. The year was one of significance not only in record sales and improved earnings but also in developments undertaken to strengthen and broaden the base of the Company's business. A separate Unit to manufacture *Distribution Transformers* was set up at Vizagapatnam (Andhra). Land has also been purchased to set up a separate Unit to manufacture a wider range of *Switchgears* and *Lifts* at Budge Budge in the suburbs of Calcutta. Negotiation for setting up a factory to manufacture *poly-phase* and *single-phase house-service meters* in technical collaboration with VEB Electro Apparate Werke, of East Germany was also finalised. The factory will be located in Hyderabad. While making virtually no contributions to 1960-61 earnings, these developments are of potential significance to the Company's business for the years ahead, and as a result of which, it may confidently look forward to continuing improvement in profits and the Company's sustained growth in new fields as well as established markets.

Transformers: At present this Company has the distinction of being one of the largest manufacturers of *Power* and *Distribution Transformers* in India. During 1960-61 the production recorded an increase of about 47 per cent from the previous year's figure. During the same period, production in the country rose by about 36 per cent. Apart from the increase in production, the Company has successfully produced *Transformers* rating upto 5,000 KVA. 66KV. In order to meet the increasing demand for high capacity transformers, necessary arrangements are now being made to increase the capacity of the works to produce transformers upto 15,000 KVA, 132 KV.

A separate Unit to manufacture *Distribution Transformers* has been set up in the Industrial Estates, at Vizagapatnam, Andhra Pradesh, under the name and style of Andhra Pradesh Electrical Equipment Corporation. Due to shortage of raw materials this unit could not be put into operation during November-December, 1961 as had been previously contemplated. The unit is now expected to go into full production by March, 1962.

Switchgears: The production in this section during the year rose by about 53 per cent. In accordance with the decision taken last year, a suitable site has been selected in the Budge Budge area, a suburb of Calcutta, to set up a separate unit for the manufacture of *Switchgears* and *Lifts*, with foreign Technical Collaboration. Construction work has already started and production in the new factory is expected to commence during the latter part of 1962.

As a result of heavy competition, especially, from the small scale sector, demand for motors continued to be unsatisfactory. To offer a wider range of motors to the market the manufacture of slipring and totally enclosed motors has been taken up in technical collaboration with Tokyo Shibaura Electric Co. Ltd., of Japan. A scheme to manufacture Fractional Horse Power Motors is also engaging the attention of the Directors.

Lifts, Hoists and Cranes: The phased manufacturing programme of Lifts under the technical collaboration of Messrs. Schindler & Co. Ltd., Lucerne, Switzerland, is progressing satisfactorily. The number of lifts installed during the year under review was 57 as compared to 45 during the previous year. The demand for lifts is good, and the Company expects an increase in lift installations during the current year. An Industrial Licence to manufacture *Cranes* and *Hoists* has also been obtained and negotiations to extend the existing Technical Collaboration Agreement with Schindler & Co. Ltd., to cover these items are in an advanced stage.

Future Prospects: It is encouraging to note the targets fixed by the Government for Electricity Generation and the production of Electric goods during the third Five-year Plan. The target for electricity generation by 1965-66 has been fixed at 12.7 million k.v., almost double the 5.7 million kw. fixed for 1960-61, 1965-66 targets for Motors and Transformers upto 33 KV. are 2.5 million h.p. and 4.0 million KVA respectively against 800,000 h.p. and 1.35 million KVA for 1960-61. These targets, as will be seen, hold a very promising future for the Electrical Engineering Industry. This Company has in the past tried to keep pace with this expansion and it is with a stronger determination that it looks forward to a challenging future.

Accounts in brief as at 31st October 1961 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	61,10,300	Gross block	46,46,941
Reserves and surplus..	15,25,374	—Depreciation ..	15,86,138
Other liabilities ..	1,23,13,983	Net block	30,60,803
		Block-in-progress ..	4,69,197
		Current assets ..	1,63,41,160
		Investments	24,651
		Cash	48,971
		Miscellaneous expenditure ..	4,875
	Rs. 1,99,49,657		Rs. 1,99,49,657

* Paid-up capital consists of 6,09,340 equity shares of Rs. 10 each fully paid up in cash. This also includes Rs. 10,900 being amount paid up on shares forfeited.

South Karanpura Coal Co., Ltd.

(Secretaries & Treasurers: Messrs. Bird & Co. (Private) Ltd., Calcutta.)

Annual General Meeting—28th February 1962.

Working Results:

	For the year ended 31st August (In thousand rupees)	
	1961	1960
Sales	37,77	37,73
Closing stock	1,06	10

	(Nil)	(21½)
Carried forward .. .. —	1,54 +	20

N.B.—Adjustments represent the credit balance brought forward from the previous year.

* Loss after providing for depreciation.

Extracts from the Directors' report.—Raisings and Despatches: 192,666 tonnes of coal were raised and 187,082 tonnes despatched compared with 192,482 tonnes raised and 191,226 tonnes despatched during the previous year.

Results during this period have been very poor due to difficult geological conditions underground, the extreme shortage of explosives, irregular transport and power shortages.

In addition there were 4 statutory increases in wages during this period which were not compensated adequately by an increase in the selling price.

Accounts in brief as at 31st August 1961 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	17,50,000	Gross block	48,97,038

* Paid-up capital consists of 1,75,000 ordinary shares of Rs. 10 each fully called up in cash.

† Reserves are shown after deducting the debit balance of Rs. 1,54,124 as per Profit and Loss Account.

Ultramarine and Pigments Ltd.

(Chairman: Mr. N. S. Iyengar, Bombay.)

Registered Office: Kamer Building, Cawasji Patel Street, Bombay-1.

First Annual General Meeting—23rd March 1962.

Extracts from the Directors' report for the period from 25th October 1960 to 31st December 1961.

Incorporation of the Company: The Company was incorporated on 25th October, 1960 with the object of carrying on the business as manufacturers of and dealers in Ultramarine Blue and Ultramarine Colours.

Capital: The issued capital of the Company is Rs. 15 lakhs divided into 15,000 equity shares of Rs. 100 each. Out of this, the Industrial Credit and Investment Corporation of India Limited, Bombay, were allotted 1,500 equity shares of Rs. 100 each. The balance, after deducting the amount subscribed by the signatories to the Memorandum, subscribed by the Directors and friends, was offered for public subscription. The issue was oversubscribed just over three times. The shares are now fully paid-up and are listed on the Bombay Stock Exchange.

The Industrial Credit and Investment Corporation of India Limited have granted to the Company a foreign exchange loan of about Rs. 4.70 lakhs to meet the cost of capital equipment to be imported from abroad and a Rupee loan of Rs. 2.30 lakhs to cover a portion of the indigenous equipment. Out of the foreign exchange loan, a sum of Rs. 2.14 lakhs (approximately) has been withdrawn.

Land: The Company have bought a piece of land admeasuring about 4.34 acres in Ambattur Village, Saidapet Taluq, near Madras City, for construction of factory and administrative buildings. The Government of Madras have passed necessary orders for the acquisition of an adjoining piece of land admeasuring about 4.25 acres, which will be very useful for further expansion.

Services: The Madras State Electricity Board, Madras, has sanctioned power to the factory at Ambattur upto a load of 200 KVA. The quantity of water available from the well in the factory premises will be sufficient to meet the requirements of the factory. There is ample facility for the discharge of effluents.

Factory: The construction work of the factory is in advanced stage and the main factory sheds are expected to be ready within the next few weeks.

Machinery: A major portion required for the first phase of production has been already shipped and some of the consignments have been cleared and transported to site. It is expected that shipment of the remaining items will be completed during the first quarter of 1962. Erection of machinery will commence shortly. Most of the indigenous equipment has been ordered and are either ready or under fabrication.

Raw Materials: Necessary licences for the import of raw materials have been obtained and consignments are under clearance or afloat. Large quantities of indigenous raw materials have been sent to the Overseas Collaborators and bulk trials are at present being conducted in Germany.

Accounts in brief as at 31st December 1961 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital* ..	14,81,250	Gross block —Depreciation ..	5,72,958
Reserves and surplus..	2,159		1,306
Other liabilities ..	3,19,386	Net block ..	5,71,652
		Current assets ..	6,19,000
		Investments	1,000
		Cash	3,978
		Expenditure during construction ..	7,48,413
		Miscellaneous expenditure ..	1,06,618
	Rs. 18,02,795		Rs. 18,02,795

* Paid-up capital consists of 15,000 equity shares of Rs. 100 each. Calls unpaid amount to Rs. 18,750.

COMPANY MEETINGS AND DIVIDENDS

ELECTRIC CONSTRUCTION AND EQUIPMENT CO., LTD. Annual General Meeting, Calcutta, 26th February 1962. Dividend: 10 per cent or Re. 1.00 per ordinary share, on the increased capital. Transfer books remain closed from 12th to 26th February 1962, both days inclusive.

PHALTAN SUGAR WORKS LTD. Thirtieth Annual General Meeting, Bombay, 2nd March 1962. Dividend: Rs. 9.00 per ordinary share, subject to deduction of tax, payable on and after 9th March 1962.

ARUNA SUGARS LTD. First Annual General Meeting, Madras, 7th March 1962. Transfer books will remain closed from 1st to 10th March 1962, both days inclusive.

ASHOK LEYLAND LTD. Thirteenth Annual General Meeting, Ennore, Madras, 12th March 1962. Dividend: 6 per cent or Re. 0.30 per ordinary share, for the period nine months ended 30th September 1961. The Company has changed the accounting year from December to September. Transfer books remain closed from 12th to 16th March 1962, both days inclusive.

ULTRAMARINE AND PIGMENTS LTD. First Annual General Meeting, Bombay, 23rd March 1962. Dividend: *Nil*. Transfer books will remain closed from 26th February to 23rd March 1962, both days inclusive.

MADURA MILLS CO., LTD. Annual General Meeting, Madurai, 28th March 1962. Dividend: 15 per cent or Rs. 2.25 per ordinary share, subject to deduction of tax. Transfer books will remain closed from 1st to 28th March 1962, both days inclusive.

RAVALGAON SUGAR FARM LTD. Taxable dividends of 10 per cent or Rs. 5.00 per share, on ordinary shares and 7 per cent or Rs. 3.50 per share, on deferred shares.

BELSUND SUGAR CO., LTD. Taxable ordinary dividend of Re. 0.75 per share, on the increased ordinary capital, for the year ended 30th September 1961.

KIL KOTAGIRI TEA AND COFFEE ESTATES CO. LTD. Taxable dividend of 25 per cent or Re. 0.50 per ordinary share (Dividend for 1960 was also 25 per cent taxable), for the year ended 31st October 1961.

INDUSTRIAL CREDIT AND INVESTMENT CORPORATION OF INDIA LTD. Taxable dividend of 6.50 per cent or Rs. 6.50 per ordinary share (Dividend for 1960 was Rs. 5.75 per share, taxable), for the year ended 31st December 1961.

KUMERGODE ESTATES LTD. Taxable ordinary dividend of 17½ per cent or Re. 0.35 per share, for the year ended 31st October 1961. The dividend for 1960 was 20 per cent or Re. 0.40 per share, taxable.

EAST INDIA DISTILLERIES AND SUGAR FACTORIES LTD. Taxable final dividend of 14 2/7 per cent along with the interim dividend of 7 per cent taxable, the total dividend for the year ended 30th September 1961, amounts to 21 3/7 per cent which is the same as that of the previous year.

MORE STRINGENCY IN MONEY

(From Our Own Correspondent)

BOMBAY, 14th *February*

The much-feared *Ashtagraha* having passed off without any adverse effects on the economy, there has been a revival of activity in the markets all over the country by merchants who had suspended their business as a matter of caution. Consequently, the demand for credit from banks has picked up and this in turn has led to a sizable improvement in turnover in the short-term money market. The stringency in the market noted last week became even more perceptible this week. The inter-bank call money rate moved up to 4¾ per cent today, after remaining unchanged at 4½ per cent during the preceding days of the week. Almost all the big banks in the private sector are said to be in the Reserve Bank. Only, their borrowings from the lender of last resort have not yet reached levels where the rate of interest is six per cent. They are still within the limits which attract the basic bank rate of 4 per cent or the next slab of 5 per cent per annum. If, however, the present pace of demand for funds is maintained, it will not be long before the inter-bank rate crosses the 5 per cent level.

Indicative of the growing tightness of the money market is the further rise in the average rate of 91-days' Government of India Treasury Bills sold under the weekly tender system. This rate was 2.545 per cent per annum, as against 2.540 per cent in the previous week and 2.525 per cent a fortnight before. In other respects, the Treasury Bill results showed nothing new. The amount invited, offered and accepted was the same, namely, Rs. 2 crores. The sale is being continued and so also that of 91-days' Intermediate Treasury Bills which yielded Rs. 15 lakhs this week, as against Rs. 12.75 lakhs in the past week.

A big rise of Rs. 41.12 crores in notes in circulation is disclosed by the Reserve Bank's statement for the week ended 9th February 1962. Since notes held in the Banking Department have also gone up by Rs. 6.68 crores, the total notes issued have registered a rise of Rs. 47.80 crores to stand at Rs. 2,052.56 crores. As there has been a fall of Rs. 2.02 crores in rupee coin, the expansion in total notes issued has been balanced by an addition of Rs. 50 crores to rupee securities. There is no change in foreign securities held in the Issue Department, but balances held abroad have gone down by Rs. 1.55 crore, with the result that the total of foreign assets is lower by that amount at Rs. 136.45 crores.

The significant variations in the Banking Department of the Reserve Bank in the week under reference are: a decline of Rs. 18.16 crores in the deposits of the Central Government, practically no change in the deposits of banks, a reduction of Rs. 45.24 crores in investments, and an increase of Rs. 9.77 crores in other loans and advances. Of this increase, Rs. 7.90 crores have occurred under advances to scheduled banks against usance bills which have now reached a total of Rs. 25.75 crores, an increase over Rs. 1.5 crore as compared with the position in the corresponding week of 1961.

The scheduled banks' statement for the week ended 2nd February 1962 discloses a marked rise of Rs. 18.55 crores in bank credit, bringing the total to Rs. 1,334 crores, an increase of Rs. 108 crores as compared with that (Rs. 1,226 crores) a year before. There has only been a fractional increase of Rs. 80 lakhs in deposits and a decline of Rs. 74 lakhs in inter-bank borrowings. Borrowings from the Reserve Bank show an addition of Rs. 11.22 crores, the total being Rs. 30 crores. This figure is, however, still some Rs. 29 crores less than that a year before. Investments are practically unchanged, but total cash has contracted by Rs. 5.82 crores. Money at call and short notice has also declined by Rs. 2.10 crores.

The statement of the State Bank of India for the week ended 2nd February 1962 reveals an increase of Rs. 1.71 crore in deposits, a rise of Rs. 5.22 crores in advances, a decline of Rs. 2.82 crores in cash and a modest rise of Rs. 98 lakhs in investments.

The Gilt-edged market has been ruling quiet, with hardly any turnover. Almost all the securities are unchanged in value over the week.

In the foreign exchange market, there has been a slight improvement in the value of the rupee *vis-a-vis* the U.S. dollar. The banks' selling rate for ready T.T. on New York has been lowered by 25 nP over the week to Rs. 475.50 per 100 dollars. Their buying rate, however, remains unchanged at Rs. 472.25 per 100 dollars. Abroad, there has been a slight improvement in £ sterling in terms of the U.S. dollar, with the rate. New York on London rising by 0.160 cent in spot and 0.100 cent in three months' forward. At the time of writing, the spot rate is quoted at 281.530-281.560 cents and three months' forward at a discount of 1.850 cent.

SUGAR PRICES QUIET

(From Our Own Correspondent)

HAPUR, 12th *February*

Sugar prices ruled quiet with inferior crystal prices declining in absence of buying support. Factories in West U.P. were attracting good cane supplies and week-end prices were: wholesale Rs. 106.50 per bag; retail 97 nP to Re. 1 per seer; mill delivery per maund E29 Simbhauli Rs. 37.75, D29 Amroha Rs. 36, Bijnore Rs. 35, Dhampur Rs. 36.12.

Divergent trends were witnessed in sugar prices in Muzaffarnagar market during the past week and, while bold quality prices improved by about 19 nP a maund on brisk demand from Gujarat and Saurashtra, inferior quality prices drifted lower in the absence of buyers to make bulk purchases. Reports that releases this month would be delayed also pushed up bold crystal prices. Inquiries from Punjab were lacking as markets in that State had accumulated heavy stocks and week-end prices were: A29 Mansurpur Rs. 40.22; Lakhsar Rs. 39.60; B29 Khatauli Rs. 39.66; Shamli Rs. 39.70; C29 Deoband Rs. 39.03; Lhaksar Rs. 37.22; Mansurpur Rs. 38.66; D29 Deoband Rs. 38.41; Amroha Rs. 36; Modinagar Rs. 37.44; Kashipur Rs. 35.37; E29 Kashipur Rs. 35.87; Shamli Rs. 37.40; Mansurpur Rs. 37.66.

Sugar prices improved slightly in the Kanpur market during the week following inquiries from Bengal, Assam and Saurashtra. Approach of the festival *Holi season* also induced optimism and prices tended to stabilise at lower levels. Latest prices were: D29 Rs. 102 to Rs. 103.50 per bag.

Khandsari prices stayed steady as arrivals were lower due to inclement weather and demand from Punjab and Rajasthan was fair. Latest prices are: inferior Rs. 25 to Rs. 29; superior Rs. 30 to Rs. 32.50; crystal Rs. 30 to Rs. 32.75.

Despite poor arrivals at an average of 1,000 maunds due to cloudy weather, *gur* prices ruled quiet as loading was restricted and demand too was slack. Offtake during the week was ten wagon-loads to Gujarat. Arrivals would now mount, thanks to better sunny weather, and were 2,500 today. Local stock has mounted to 5,000 maunds and week-end prices were: *pansera* best Rs. 14.62; *dara* Rs. 14.25; *balti* Rs. 14.37. *Shakkar* prices improved to Rs. 17 a maund as arrivals were poor in face of good demand from Rajasthan.

After early steadiness *gur chaku* prices declined 25 nP a maund in the Muzaffarnagar market during the week owing to booking restrictions. Prices ranged from Rs. 14.50 to Rs. 15.75. *Pansera* was in demand from Punjab and quoted at Rs. 14.25 to Rs. 14.75 a maund while *rusket khurpa* prices fell 50 nP a maund.

Gur futures ran down sharply on bear pressure and *gur laguns* was on Monday quoted at Rs. 13.80 and *baisakh* Rs. 14.60, as against last week's opening at Rs. 14.04 and Rs. 14.94, respectively and lowest touched in mid-session at Rs. 13.78 and Rs. 14.53, respectively. Sowings of new cane crop have begun and unless some Government measures were adopted to check increase in area, cane sowings would further increase.

SHORTLIVED SPURT IN GOLD

(From Our Own Correspondent)

BOMBAY, 14th *February*

Barring some excitement in the gold section on Monday this week following the seizure of some 16,000 tolas of contraband gold by the police in a modern flat at Colaba (Bombay city), the bullion market has been listless, with only a fractional gain in prices over the week. This raid on smuggled gold caused a shortlived furore and the price of the yellow metal jumped up by a little over a rupee in both forward and spot positions. Subsequently, however, a good part of this improvement was wiped out, due to profit-taking. It was soon realised by the operators that the seizure of a sizable quantity was actually an index of heavy arrivals of contraband metal and that stocks of such metal awaiting disposal must be pretty heavy. This inference, it is needless to add, is drawn from the assumption that what is seized by the customs authorities is only a fraction of the gold illegally brought into this country.

Another factor that had a bullish effect on the market was the report, as yet unconfirmed, that the Sea Customs Act would soon be amended in such a way that the sale of smuggled gold would become extremely difficult. If, however, this is all that is contemplated, it should not have any significant effect on smuggling, because, even now, no foreign gold is being sold in the form in which it is brought into this country. Such gold is actually remelted and converted into pieces that are not distinguishable from those already in circulation.

In the first three days of the week arrivals of gold more or less balanced with those of the offtake, but, subsequently, they tended to exceed the offtake. In silver, however, the arrivals were far in excess of the offtake throughout the week. The daily average arrivals were 9,500 tolas of gold and 29 bars of silver, while the offtake was 7,000 tolas and 13 bars, respectively.

The following table shows the trend of prices during the week under review:

	14-2-62 (closing)	High	Low	7-2-62 (closing)
	Rs.	Rs.	Rs.	Rs.
GOLD				
Ready (.99 fine)	119.90	121.35	119.85	119.65
Forward: *Paguna**	120.65	121.80	120.40	120.40
Sovereign	96.50	96.50	96.25	96.50
SILVER				
Ready (.996 fine)	212.85	213.00	211.20	212.60
Forward: *Paguna†*	213.25	214.80	212.40	213.90
London—				
Silver Ready	85½d.	86d.	85½d.	86½d.
Silver Forward	86d.	86½d.	86d.	87¼d.
Gold	249s. 8d.	249s. 10½d.	249s. 8d.	249s. 11¾d.
New York—				
Silver	103.00 cents	103.50 cents	103.00 cents	103.75 cents

* 22nd March settlement. † 23rd March settlement.

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (35.7 tolas). London and New York quotations are per ounce.

COTTON FUTURES LISTLESS

(From Our Own Correspondent)

BOMBAY, 14th *February*

Trading conditions in the cotton futures market during the week remained practically unchanged from last week. Turnover was small and price movements narrow. Inspite of fairly large arrival of new crop from Gujerat area and reports of the likelihood of an import quota for U.S. cotton, the Jarilla March 1962 contract ruled steady at around Rs. 690 per three quintals. As the March contract has almost finished its active career (the delivery period will start in a fortnight's time) traders' attention has naturally turned to the prospects for trading in the next settlement. With the supply position of cotton being what it is, it remains to be seen whether the Forward Markets Commission will give permission for commencement of trading in the August 1962 contract. Meanwhile, the East India Cotton Association is reported to have decided to make certain changes in the terms of the hedge contract for the August 1962 settlement and has circulated among members certain amendments to its bye-laws to give effect to these changes. The amendments pertain to tendering differences invoicing back rate and penalty. The amended by-laws are to be made applicable to the August 1962 contract only.

In the spot market at Sewri, spinner interest centred round good quality Co2, L.147, Laxmi, Vijay, Digvijay and Kalyan. Prices ruled firm. Mill interest in Bombay are reported to have decided to use the good offices of the Millowners' Association for exchange of cotton between themselves. Some mills might wish to exchange cotton, which they secured under the variety-wise distribution of cotton but which they are not in a position to use, with other mills who could use them. Such exchanges, it is pointed out, will help both the parties to the exchange.

The Textile Commissioner is reported to have decided to appoint nominees through whom mills can take delivery of cotton. Mills will, of course, be allowed to make purchases from the usual sellers but delivery can only be effected through one of the nominees not connected with the mills so that a more effective check could be exercised on cotton prices. The functions of the Committee will be:

(i) To ensure that the cotton is delivered within the variety-wise quota of the mill, (ii) to see that the cotton conforms to its description mentioned in the purchase contract and (iii) the price paid is within the ceiling.

There was moderate demand for Bengal *Deshi*. Exporters were expecting a fresh quota for 50,000 bales of Bengal *Deshi*.

Among foreign cotton, Sudan cotton was in the limelight. Bombay, Ahmedabad and Southern mills evinced keen interest in this cotton. Shippers were offering Sudan cotton freely, thanks to the bumper crop in that country during the current season. Prices consequently tended to recede. Usual interest was reported in East African, American and Pakistan cotton. No official announcement regarding import of U.S. cotton under P.L. 480 has been made till the time of writing. Obviously, the Government has not yet succeeded in securing the requisite allocation from the U.S.

The following are the latest available quotations—in rupees per candy of 784 lbs.—from the spot market at Sewri:

Bengal *Deshi* 680; Khamgaon 860; Digvijay 1,130; Laxmi 1,120; L.147 1,170; Sudan P.4L 1,300; G4S 1,480; American 1,351.

Further rise in future values was recorded in the Karachi cotton market during the week, thanks to buying induced by firm domestic demand and export enquiries. The N.T.R.G. March contract rose from Rs. 32.65 last week-end to Rs. 33.85. The May contract firmed up from Rs. 30.10 to Rs. 30.40.

A plea for raising cotton production in Pakistan to 2.3 million bales (of 400 lbs. each) by 1964-65, as compared with the 1960-61 output of 1.62 million bales, was made by Mr. Hamid Dawood Habib, Chairman of the Karachi Cotton Association, in his speech at the twenty-ninth annual meeting of the Association held at Karachi recently. According to Mr. Habib, 2.3 million bales of cotton was necessary by 1964-65 to meet the requirements of the domestic textile industry and also to retain Pakistan's "traditional share" of world market in cotton.

Analysing the trend of exports of Pakistan cottons, the Karachi Cotton Association, in its latest annual report, points out that the loss of foreign export markets for Pakistan cotton had been due mainly to reduced export availability of cotton and the inability of the country to assure continuity of supplies to buyers. In recent years, Japan and Hong Kong, two of the major traditional buyers of Pakistan cotton in the Far East, had been progressively reducing their imports of Pakistan cotton, despite strong trading interests between these countries and Pakistan. The Communist countries had also slackened their interest in Pakistan cotton during the past year and imported only 48,213 bales, compared with 130,233 bales in the previous season. It is significant, adds the report, that not only has the volume of cotton exports been declining from year to year but the number of foreign countries importing Pakistan cotton, which stood at over 20 only a few years ago, has fallen to about half that number.

Barring the March 1962 contracts, which receded on commission house selling and switchover of purchases from the near to the distant positions, the Liverpool cotton futures market ruled steady during the week. A limited volume of hedge selling and liquidation was absorbed in short-covering. Outside interest was lacking. Sudan contracts were subdued. Values were unchanged. The following

are the latest available quotations—in pence per lb.—from Liverpool:

American cotton one inch staple contract: March 24.45. May 24.85; July 24.95; October 24.50.

American cotton mixed growth contract: March 24.85; May 25.25; July 25.35; October 24.90.

Sudan cotton contracts: March, May, July 31.75.

Cotton futures in New York suffered a setback during the week. Slow dealings in the spot market and uninspiring news from the export front imparted weakness to the market. Uncertainty about the export subsidy rate adversely effected turnover.

The following are the latest available quotations from New York, as compared with those a week and a fortnight ago.

(In cents per lb.)

	13-2-62	6-2-62	30-1-62
New York spot	35.55	35.55	35.55
March	33.51	34.05	34.00
May	34.24	34.65	34.67
July	34.60	34.88	34.81

ART SILK YARNS STEADY

(From Our Own Correspondent)

BOMBAY, 14*th February*

The yarn market ruled steady during the week under review, barring staple fibre yarns, which encountered some selling. There was sustained support for art silk yarns, following reports of larger demand for rayons, both in the domestic and export markets. Export of art silk and synthetic fabrics during the month of January was substantially higher at 4.13 million metres (valued at Rs. 40.19 lakhs), as against 2.99 million metres (Rs. 28.43 lakhs) in the previous month. Amilan, however, turned subdued towards the close on profit-taking. Cotton yarns were well maintained.

Among foreign art silk yarns, 150 Japan firmed up by Rs. 28 to Rs. 1,984. *120 Japan rose by* Rs. 2 to Rs. 1,874. 120 Italy too gained a like amount to Rs. 1,874. 150 Italy was steady at Rs. 1,763. Among indigenous yarns, National Rayons 150 Bt. cones, however, shed 27 nP to Rs. 12.03.

Staple fibre yarn (40 x 1) February settlement eased by Rs. 9 to Rs. 734. April settlement lost Rs. 7 to Rs 746. But spot Kohinoors were maintained at Rs. 8.93.

In the cotton yarn section, ten counts Moderns were steady at Rs. 18.25, 20 counts Centurys at Rs. 21.50 and 60 counts Finlays at Rs. 84.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	14-2-1962	7-2-1962
	Rs.	Rs.
Art silk yarn—		
20/1 Amilan (100 kg.)—		
February	3,820.00	3,812.00
April	3,827.00	3,407.00
120 Japan (per 100 kg.)	1,874.00	1,872.00
150 Japan (per 100 kg.)	1,984.00	1,956.00
120 Italy (per 100 kg.)	1,874.00	1,872.00
150 Italy	1,763.00	1,763.00
Nat. Ray. 150 Bt. 1	12.03	12.30
Staple fibre yarn (40 x 2)—		
February	734.00	743.00
April	746.00	753.00
Kohinoor (per kg.)	8.93	8.93
Cotton yarn (per bundle of 10 lbs.)		
10s Modern	18.25	18.25
20s Century	21.50	21.50
40s T. T. Corlin	32.37	32.37
60s Finlay	66.00	66.00
80s Finlay	84.00	84.00

OILSEEDS FIRM

(From Our Own Correspondent)

BOMBAY, 14*th February*

The hope of the trade for a fresh quota for H.P.S. groundnut has materialised. The Government of India released, on Thursday last, a quota of 18,500 tons of H.P.S. groundnut kernels for export during 1962. This is in addition to the export quota of 20,000 tons released in the beginning of last month, which had already been exhausted. Exports under the present quota will be allowed by all shippers, including established shippers and co-operative societies, against registration of contracts in the form of cable offer and cable acceptance on 'first-come-first-served,' basis. It is, however, stipulated that contracts entered into earlier than 13th February 1962 will not be eligible for consideration under the quota. Shippers have also been asked to furnish a bank guarantee upto 10 per cent of the f.o.b. value of the contracts. Despite these rather stringent conditions, the trade has welcomed the new quota. Although the current world prices for H.P.S. are out of parity with domestic prices, shippers appeared to be confident of utilising the entire quota within the next two months.

Another important development of the week has been the permission granted by the Forward Markets Commission to commence hedge trading in groundnut oil in May delivery, with effect from Friday the 9th inst. While granting permission, the Commission has stipulated that the maximum increase in a price should not exceed 50 nP per 10 kgs. per week and that no member should have net long or short outstanding position of more than 1,250 metric tons at the end of any trading day. Business in cottonseeds of July delivery has also been permitted with effect from Friday on the condition that trading will be prohibited on any day when the increase in price is Rs. 2 higher than the closing price of the previous day.

Meanwhile, the Bombay City Civil Court has refused interim injunction asked for by some traders operating in the local exchange, in order to restrain the Bombay Oilseeds and Oil Exchange Ltd. from enforcing penalties imposed in respect of January 1962 contract. It may be recalled that a penalty of Rs. 5 per 250 kgs. was imposed on seller-members of the Exchange, who failed to fulfil their contracts in respect of January 1962 groundnut contract. The issue will, however, come up for hearing on 2nd April 1962. The Court, in the meantime, has directed issue of a notice to the Attorney-General of India since the plaintiffs have challenged some of the by-laws of the Exchange having statutory force.

The oilseeds market ruled distinctly firm during the week under review. Groundnuts were buoyant on speculative support. Castorseeds staged a smart rally, reflecting the operator's optimism regarding export prospects for castor oil. Linseed and cottonseeds looked up in sympathy.

Groundnut May 1962 contract spurted from Rs. 237 to Rs. 239.87 by Friday; at this level, trading was suspended, the quotation having gone up above Rs. 5.50 over a week. Trading in the contract was, however, resumed on Monday, at Rs. 240 and rose subsequently to close today at Rs. 243. Nizam bold put on Re. 1.25 to Rs. 48.50. Oil ex-*mill* rose *from* Rs. 19.75 to Rs. 20, before closing at Rs. 19.80. Oil May contract, however, were quoted slightly lower at Rs. 20.45, as against Rs. 20.50 on the opening day (Friday).

Castorseed March 1962 contract firmed up by Rs. 3.25 to Rs. 176. June 1962 contract closed at Rs. 174.25, as against Rs. 172. Madras small improved by 25 nP to Rs. 35.50. Oil commercial rose from Rs. 14.90 to Rs. 14.95, after fluctuating between Rs. 14.80 and Rs. 15.

Linseed March 1962 contract forged ahead from Rs. 39.25 to Rs. 40.37. June 1962 contract picked up 19 nP to Rs. 39.06. Bold ready hardened by 50 nP to Rs. 44 and Linseed oil by 10 nP to Rs. 19.

In the cottonseed section, April 1962 contract moved up by 25 nP to Rs. 109.50. Whites picked up 5 nP *to* Rs. 20.25. Both Berars and non-whites, however, shed 15 nP to Rs. 20.75.

The following table shows the closing prices of oilseeds and oils on Wednesday, the 14th February as compared with those of the two previous weeks:

	14-2-1962	7-2-1962	31-1-1962
Groundnut	Rs.	Rs.	Rs.
May 1962	243.00	237.00	219.50
Nizam bold	48.50	47.25	46.00
Khandesh quality	48.50	47.62	46.37
Oil ex-mill ready*	19.80	19.75	19.40
Railway receipts*	19.60	19.45	19.15
Oil May 1962	20.45	—	—
Castorseed			
March 1962	176.00	172.75	172.87
Ready Madras	35.50	35.25	34.75
Ready Kanpur	34.25	34.00	33.50
Oil B.S.S.†	15.40	15.40	15.00
Oil commercial†	14.95	14.90	14.80
Linseed			
March 1962	40.37	39.25	39.41
Bold ready	44.00	43.50	43.87
Oil ready†	19.00	18.90	18.90
Cottonseed			
April 1962	109.50	109.25	109.25
Niger seed	36.00	36.00	33.00
Kardi seed	25.00	25.00	24.50

* Rates include excise duty but exclude sales tax.
† Rates exclude both excise duty and sales tax.
N.B.—All quotations for futures contracts are per 250 kilograms, except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

MALABAR PEPPER STEADIER

(Messrs. Parekh and Co.)

BOMBAY, 14*th February*

Malabar black pepper during the week ruled steadier in wake of *vague rumours* that Russia was in the market. However, nothing definite is known so far. New York is reported to have bought stray lots at $0.35. Whenever prices were improving there were sizable arrivals. Conversely, arrivals proved poor when prices were lower. As such, poor arrival is no criterion as to the size of the production. Bulls, however, are now talking of lower crop. But the knowledgeable sources put the production of Malabar black for the year 1961-62 at 28,000 tons. Some of the New York bulls are said to be buying in the expectation that the freight rate from India to New York may be increased in the near future. But, New Delhi is reported to be against any increase in the freight rate on the exportable commodity as it means higher cost and lesser export.

Holders of Spot in New York are revising their prices according to the change in the asked price from India. Spot moved from $0.35 to $0.37 to close at $0.36½.

Singapore is out of the picture as the prices there are higher.

The important event of the week is the news of the signing of the contract between Indonesia and Russia establishing commercial shipping relation between the two countries. Under the contract, eight Russian ships would call at the Indonesian ports monthly. This is likely to encourage more direct export of Lampong pepper to Russia. This may adversely affect the export of Malabar black to U.S.S.R.

Ready ungarbled improved from Rs. 295 to Rs. 305 while garbled is quoted higher from Rs. 304 to Rs. 312½. February delivery is quoted at Rs. 320 while March at Rs. 326. Calicut is quoting round about Rs. 300.

Unless America continues to buy regularly and aggressively the present rise in the prices may prove a passing phase as, with the withdrawal of foreign buyers, the holders and the growers are likely to get panicky and may come out to press sales, if not now, after a month or so in view of the proximity of the new season in Sarawak.

Ready pepper in Bombay is nominally quoted at Rs. 170 per 50 kilos.

HIGHGROWN TEAS FARE WELL

(Messrs. Forbes, Ewart and Figgis (Private) Ltd.)

COCHIN, 6*th February*

348,000 kgs. were offered in sale No. 6 held today. Quality of low medium and medium teas, in some cases, showed a slight decline over last week, whilst teas from the Nilgiri district were fully maintained. The market met with a selective demand. Low medium and medium brokens were in less demand and sold at much easier rates, whilst similar fannings were better supported, though these sold at irregularly easier rates. There was less inquiry for good mediums also which were easier, particularly their broken grades. There was good demand for highgrowns, the best liquoring kinds under this category often selling at higher rates than last. The lesser sorts, however, were irregular and tended easier. C.T.C. types and legg-cut types met with weak inquiry and sold at much lower rates than last. Whole leaf grades met with irregular support. A small selection of tippy teas on offer, however, met with good support and sold well.

The quotations per kg. were:

	1962	1961
	Rs.	Rs.
Low mediums	3.85-4.05	4.80-5.05
Mediums	4.10-4.65	5.10-5.35
Good mediums	4.85-5.50	5.40-6.20
Nilgiri B.O.P.	5.60	10.90

The average price realised in sale No. 6 was Rs. 5.13 per kilo, as compared with Rs. 5.11 a week ago and Rs. 5.35 in the corresponding sale last year.

275,000 kgs. were offered in dust sale No. 6 held on 8th inst. A useful selection of dusts was on offer. The market met with a good demand. Plain and low medium descriptions met with fair support and were easier by 10 to 20 nP. Milled descriptions and Wynaad types met with less *inquiry and* were easier. Mediums and good mediums, particularly those with clean leaf appearance, were well supported and are quoted steady. There was useful demand for highgrowns which sold at around last rates. Clean black leaf descriptions suitable for export met with good inquiry and were a strong feature of the sale. C.T.C. types and legg-cut types were irregularly easier whilst there was better support for C.T.Cs which were steady.

The average price realised in dust sale No. 6 was Rs. 4.02 per kilo, as against Rs. 4.16 a week ago and Rs. 5.18 in the corresponding sale last year.

Colombo: There was a strong demand. Improved teas from Western districts met with active demand and were considerably dearer. Uvas and better mediums were substantially dearer. Lowgrowns and "price teas" met with less support and were easier. Gulf types declined by 15 to 20 cents. At the offgrade sale brighter liquoring offgrades and dusts came to a dearer market whilst others were irregular and lower.

London: *North Indian and other growths*: There was no sale on Monday. On Wednesday the market met with fair general demand. Except the plainest descriptions, others generally sold at dearer rates.

Ceylon and South Indians: In Tuesday's sale 28,078 packages were offered of which 10,042 packages originated from South India. The market met with good demand. Ceylons were dearer with the exceptions of thin and plain liquoring kinds. There was selective demand for South Indian teas with the better liquoring kinds selling at firm rates. The poorer descriptions met with less support and were neglected.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire as follows:

"*Sale No.* 7: 376,000 kgs. offered. Strong general demand. Prices fully firm to dearer except for plain and medium brokens which are irregularly easier."

TEA IN GOOD DEMAND

(From Our Own Correspondent)

CALCUTTA, 13*th February*

The increased interest shown in yesterday's export auctions was due to the fall in shipments for direct participation in U.K. auctions, a usual feature heralding the eve of the end of the season. However, shipments from Calcutta auctions would continue to be heavy for a few weeks more. In the last week's auctions held in London, a feature which attracted attention here was the good demand for African teas. The steadiness in London in quality teas in the offerings of North Indian, South Indian and Ceylon teas was attributed to the need of bidders to build up their stocks. Good demand was also in evidence in the internal sales held here in the last week.

With increased competition in export markets and higher production, the industry has been urging Government to resume internal propaganda to increase consumption. Government has, however, been pointing out that as much tea as possible should be exported even at the cost of domestic consumption. There is no paucity of overseas demand for quality teas, but inferior teas can only be mostly consumed within the country, and indications are that there is a sizable surplus of the latter. Viewed against this background, the proposed formation of a new company by Messrs. Tata Sons Ltd. and Messrs. James Finlay Ltd. to package and market tea in India is a timely and praiseworthy effort. The first tea packaging plant of the new company will be located in South India. The Tatas enjoy a pre-eminent position in the marketing of consumer goods such as soaps, hair oils and other toilets, and cooking medium, while James Finlays are the largest producers of tea in India. It is to be hoped that a combination of these experiences would result in increasing internal consumption of tea.

The trade would very much desire that some effort is made to make instant tea in India. Ceylon has already proposed to set up, with W. German help a plant to produce instant tea which is likely to prove popular in foreign markets. Tatas can also make an effort in this direction. India's promotional campaigns in foreign countries should be stepped up and time-saving devices being in constant demand in this atomic age, instant tea is likely to have good prospects. Reports from the United States indicate that instant tea is assured of good patronage there.

Another happy development, which is of more importance than efforts to increase internal consumption, is the willingness of U.S. business *men* to increase their offtake of tea from India, provided prices and quality are satisfactory. This reflects the intention of tea retailers in the U.S.A. to start an intensive promotional campaign among the young for drinking more tea. However, India's share in U.S. imports of tea has been falling in recent years and the vacuum has been filled in by more enterprising producing countries, which have been able to offer tea to the U.S.A. at lesser prices than India. Such being the case Indian tea should be made attractive price-wise so to enable U.S. businessmen to buy more tea from India. The trade here points out that, if only the export duty is abolished, India can capture several markets abroad, and the increased foreign exchange which the tea industry can offer to India's development would be a sufficient compensation to the exchequer for its loss of revenue.

The need for a sympathetic hearing of the industry's demand for lessening the tax burdens on it was once again stressed by Mr. I. F. Morriss, Chairman of the Indian Tea Association, in his speech at the meeting of the Surma Valley branch of the Association at Silchar. Stating that Cachar gardens lacked incentives to improve their properties, he drew attention to the distressing fact that the survey being conducted by the I.T.A. had already shown that, in three out of the last five years, the Cachar district as a whole had worked at a loss. If one of the biggest companies in Cachar had been compelled to discontinue its membership of the I.T.A. for economic reasons, the general state of the affairs of the tea industry in the district can easily be imagined. The least that was called for of the Government, declared the I.T.A. Chairman, was to leave the industry alone for, say, five years, meaning a tax holiday for a limited period in order to give time for the industry to rehabilitate itself.

The doubling of the excise duty in Cachar a year ago served as the last straw on the proverbial camel's back. This was done after a year in which the crop had declined by one-fourth. The State Government also contributed its own share to the distress of the industry by increasing the district's wages, unilaterally when the wage board was examining the question. Considering all these Mr. Morriss could not help concluding that Government could be moved only when irreparable damage was done to the industry and a list of casualties of gardens could be produced to the satisfaction of Government.

In the internal sales held last week, dusts on offer aggregated 27,130 packages. There was a good general demand. Demand for orthodox teas strengthened as the sale progressed; these had, however, opened 10 nP lower. Legg-cut teas were in strong demand and the bright liquoring teas recorded a modest addition to prices. C.T.Cs were irregular, but the small and bright liquoring teas received greater attention to push up prices. The quotations per 1 kg., inclusive of excise duty, were: good Assam C.T.C. dust Rs. 6.50 to Rs. 7.00, medium Assam C.T.C. dust Rs. 5.50 to Rs. 6.10, legg-cut dust Rs. 4.60 to Rs. 5.30, medium Assam dust Rs. 4.40 to Rs. 5.30, plain orthdox dust Rs. 4.00 to Rs. 4.80.

Leaf on offer, amounting to 690 chests, was irregular.

Export offerings during yesterday's export sales, amounting to 73,761 chests, met with good demand. A strong feature was the best C.T.C. broken teas, prices of which gained. However, similar fannings lost by 15 nP with the exception of a few selected autumnals which hardened. Medium C.T.Cs eased by 15 to 20 nP, with secondary grades selling well at 10 nP below last week's rates. Medium B.O.Ps were supported at higher rates. Good orthodox Assam fannings eased by 20 nP and, in some cases, more. Legg-cut teas met with good support. Darjeelings were subjected to a number of withdrawals. Whole leaf grades were in better demand, with cheaper varieties recording a gain. Tippy teas were steady. Plain brokens gave way by 19 nP. While similar fannings were irregular. Cleanly sorted grades were firm, but the poorer sorts eased. The quotations per 1 kg., inclusive of excise duty were: best Assam C.T.C. fannings Rs. 5.70 to Rs. 6.30; best Assam C.T.C. B.P. Rs. 5.80 to Rs. 6.40; medium Assam C.T.C. B.P. Rs. 5.20 to Rs. 5.40; medium Assam C.T.C. fannings Rs. 5.10 to Rs. 5.40; clean plain pekoe Rs. 4.10 to Rs. 4.30; plain fannings Rs. 3.90 to Rs. 4.40; and plain B.P. Rs. 3.60 to Rs. 3.90.

JUTE GOODS LOOK UP

(From Our Own Correspondent)

CALCUTTA, 13*th February*

Although business in jute goods during the week under review was just normal only, prices of sacking constructions recorded a modest recovery. Hessian was just firm. Fibre prices in Calcutta were maintained at the minimum level, but offers of inferior varieties from stockists at below these levels were on the increase. Subsequently, however, quotations recovered to quote higher than the lowest rates. The firmness in heavy goods followed the announcement of stock figures with mill's as at the end of January, according to which these constructions increased by 1,600 tons. The market was apparently anticipating a larger increase. Hessian at 16,600 tons showed the insignificant rise of 500 tons, but miscellaneous constructions at 13,200 tons accounted for the biggest increase of 2,500 tons. In all, stocks totalled 60,200 tons showing a net increase of 4,600 tons. Considering the increased tempo of production, such a small increase showed that demand for goods in January was satisfactory. Note was taken of the possibility of Dundee mills resuming working overtime very shortly. Workers had refused to work overtime in order to press their demand for higher wage packets. They had demanded an increase in their wages by 10s. a week per head, and the possibility of the industry accepting this demand has been hinted. In other words, the cost of production in Dundee is likely to increase, and this is a favourable point for the Calcutta industry as prices of goods here are likely to be maintained at the current levels.

Current levels of prices for goods and fibre admit of reasonable profits for mills. However, if there is a glut in supply of goods, it is natural that prices would fall, thus placing mills in a difficult position especially because they are straining too hard to make good the earlier losses incurred when fibre prices were very high. Although cultivators have nearly completed marketing of their produce and are busy with work connected on the eve of sowing for the forthcoming season, stockists have yet plenty to offer. They are keen for business even at prices lower than the minimum levels, and this keenness shows that they are desirous to sell as much as they can before prices fall further. Such a background explains the plea put forward by the Bengal Jute Dealers' Association in an effort to get mills to unseal all the remaining sealed looms. Demand of jute goods for overseas and internal consumption has no doubt happily increased, but any imbalance between supply and demand should be avoided. The increased stocks of goods with mills as at the end of January shows that mills are over-producing compared to the propensity to consume. Considering that mills have been permitted by the Indian Jute Mills Association to unseal as many of the unsealed looms as they can and keep them in operation up to the end of March, production would be higher in this month as well as in March.

For the week ended 10th February, the purchase quota *issued to mills was 750,000* maunds. Arrivals were much lower than this quantity, and that explains for the subsequent improvement in prices by about Re. 1 per maund. It is now about three weeks since arrivals have started falling. The maintenance of this trend only goes to confirm the earlier belief that cultivators have nearly exhausted marketing of their produce. Such a position leads to the poser as to who would benefit from any measure to support prices. Good quality jute such as *tossa* is hardly available, and most offers are for *mesta*. Since mills have considerable stocks of the latter, they are more interested to buy forward than responding to ready offers. This has led to difficulties for stockists, and that explains for their offers at below minimum prices despite efforts by Government to maintain prices at Rs. 30 per maund basis *Assam bottoms*. However, current stocks in the market are not affected by forward deals of mills, since sellers are disinclined to cover now in the agencies in the anticipation of making a profit subsequently. Bare contracts claim some short-covering, but the quantity is insignificant considering the stocks in the market. This position has led to the large increase in offers of ready fibre at below minimum prices.

The elections will be over within the next three weeks. It has been allowed to be let known widely that Government is committed to take measures in order to maintain prices at not lower than the minimum prices. However, there is the apprehension that such a policy is a result of election strategy rather than born of economic realism. Considering that most of what is left with stockists is of poor quality fibre, nothing can prevent their prices from falling further. It is apprehended by stockists that the falling trend in prices would receive further momentum immediately the elections are over. That explains their anxiety to dispose of as much of their holdings as possible even at lower rates before the tide of the falling trend reaches its climax. It is realised that maintenance of the minimum prices cannot be justified if cost of production is taken into consideration. However, Government in its exuberance to ensure that cultivators make a reasonable profit is committed to Rs. 30 a maund as being a fair price. The play of actual economic realities has seriously questioned Government's assertion, to its discomfiture, as Rs. 30 is rather high a price for the poor quality fibre.

The fibre market in Calcutta and the agencies remained weak during the week under review. Mills showed a greater preference for middles and other higher qualities, which commanded a premium above the minimum prices. *However, sellers were willing* to offer these against acceptances of *mesta* even at below the minimum price. The recurrence of rain so soon after the recent showers has raised optimism in regard to the forthcoming crop being much earlier than usual. That accounts for the anxiety of sellers to do as much business as possible now. Mills, which have plenty of *mesta*, can afford to slow down their purchases; in which event, sellers' anticipations of prices would receive a further setback. The shortage of goood quality fibre can be corrected only with the new season's jute. Quotations in Calcutta were: Assam bottoms Rs. 30 a maund, Daissee Rs. 32, and northern bottoms Rs. 29.50, all against February-March delivery. In Pakistan, market conditions continue to be weak. Buyers anticipated a further reduction in E.P.C. prices. The financial position of balers has been strained and they are reluctant to add to their stocks. This accounts for the drop in loose jute prices, despite lower arrivals. Since work in connection with preparation of the ground had started, it is apprehended that, if current dullness continues, a lesser area would be sown. However, now that Dundee mills are likely to work overtime, chances of revival of overseas interests are considered bright. Despite the hint by the Pakistani Jute Association, the Government has shown no desire to cut down E.P.C. rates further. If demand revives, a quick rise in prices is anticipated now that arrivals are lower.

In the goods market here on Tuesday last, business passing was so little as to bring down prices Ready hessian 40" 10 oz. was pushed down from Rs. 52.35 to Rs. 52.00 and B. twills from Rs. 121.50 to Rs. 121. On the following day, with B. twills at Rs. 123 and hessian 40" 10 oz. at Rs. 52.50, prices recovered as the increase in stocks at the end of January, details in respect of which were announced on that day, fell below market anticipations. Despite increased production, stocks rose only marginally, and that shows that demand for goods had been satisfactory. Such a reasoning led to revival of activity in the futures market, on Thursday. Overseas inquiries showed that demand was keen in the immediate delivery position leading to the belief that buyers in overseas countries were delaying to enter into commitments against replacement of stocks on the belief that prices would be more favourable very shortly. Such a position, it was thought, bodes well for the future. For, increased interest from overseas countries is in store. On Thursday last, ready B. twills gained to Rs. 124.75 and hessian 40" 10 oz. to Rs. 52.25. Friday was a holiday here on account of *Sri Panchami*. Over the week-end, conditions were steady. There was keen activity in the futures market and this led ready B. twills to record a handsome gain at Rs. 126.50. Ready hessian 40" 10 oz. was firm at Rs. 52.25. Prices for heavy goods eased during yesterday as, although there were several overseas inquiries, business passing was small. B. twills closed lower at Rs. 125, but following more interest in the futures market hessian 40" 10 oz. was unchanged but firm at Rs. 52.25.

FIRM UNDERTONE IN SEEDS

(Messrs. A. Bradley and Co.)

CALCUTTA, 12*th February*

Owing to continued scarcity of supplies the undertone of the seeds market has been firm throughout the week under review; only small business has been reported, with buyers and sellers reserved.

The oil market remains steady due to local buyers, in sympathy with groundnut and mustard oils. Sellers are reserved as stocks are limited.

The oilcake market is unchanged, local demand is good, but stocks in the hands of millers are limited.

The latest quotation is ready/February Rs. 32.00 per maund.

A Correction—Due to a typing mistake the quotation for linseed in our report of the 5th February is shown as Rs. 32.75 whereas it should read as Rs. 31.75 per maund.

METALS STEADY

(From Our Own Correspondent)

CALCUTTA, 13*th February*

Prices of copper scrap and other base metals were well maintained during the week under review. The shortage of copper scrap became more acute, and there was hardly anything available. Unless more virgin imports against actual user licences are received in the near future, present working in the manufacturing industries will be affected. There is no doubt that supply of copper, both from imports and indigenous production, is running short of consumption. It will be remembered that, although in the last year, imports of copper increased by 10,950 long tons to 63,650 tons, there were instances of manufacturing industries consuming non-ferrous metals

MARKET GOSSIP

(Concluded from page 275)

reason why a special payment arrangement should not be negotiated with Sudan. Knowledgeable circles are of the view that efforts in this direction are worth making, because Sudan cotton is popular with Indian mills.

Natural Vs. *Synthetic Fibre*

In spite of the steady inroads made by man-made fibres in recent years, natural fibres still continue to be the premier textile fibre in the world. Their share of the world fibre consumption has, however, been steadily declining. Last year, according to the F.A.O., cotton and wool accounted for 76 per cent of the fibres used in apparel manufacture. Four years ago, that is, in 1958, they accounted for 80 per cent. The share of man-made fibres in world fibre consumption has correspondingly increased, from 20 to 24 per cent, during the same period. The success of man-made fibre in the field traditionally held by natural fibres has been most marked in industrialised countries where there has been a marked increase in the *per capita* consumption of man-made fibres, while the *per capita* consumption of natural fibres has declined. World *per capita* consumption of synthetic fibres has gone up from 0.16 kilogram per head in 1958 to 0.27 kilogram in 1961. *Per capita* consumption of cotton and wool has also increased during the same period, but less than proportionately, from 3.31 kilograms to 3.38 kilograms in the case of cotton and from 0.46 kilogram to 0.47 kilogram in the case of wool.

The F.A.O. estimates that world consumption of cotton, wool and man-made fibres in 1961 rose by a little over 1.6 per cent, as compared with the previous year, to 15.4 million tons. Consumption of cotton increased marginally by 9,000 tons, whereas that of wool declined by 11,000 tons. The consumption of natural fibre thus recorded a net drop of 2,000 tons in 1961. In contrast to these small variations, there was an impressive increase of 267,000 tons in the consumption of rayon and other synthetic fibres, so that the aggregate fibre consumption during 1961 was higher, as noted above, by 265,000 tons, over the previous year.

Consumption of natural and synthetic fibres in India also reveals an identical trend. The *per capita* consumption of cotton, the F.A.O. estimates, declined from 2.2 kilograms in 1958 to 2.1 kilograms in 1959, and of wool from 2.1 kilograms to 2.0 kilograms. The *per capita* consumption of rayon and other synthetic fibres, on the other hand, was unchanged at 0.04 kilogram and 0.1 kilogram, respectively, in 1959, the same as in the previous year.

Although *per capita* consumption of cotton, wool, rayon and other man-made fibres has not been worked out separately, according to the F.A.O., *per capita* consumption of all fibres in India recorded a slight decline in 1960. It was 2 kilograms in 1960, as against 2.1 kilograms in 1959 and 2.2 kilograms in 1958. The fall in *per capita* consumption, in spite of a rise in total consumption of all fibres *from 866,500* metric tons in 1959 and 891,000 metric tons in 1960, was due to the increase in population which had risen from 397.5 million in 1958 to 402.7 million in 1959 and 438 million in 1960.

Will the natural fibres be able to hold their own against synthetics? They possibly might. But it is a stiff fight that they will have to put up. For new and better synthetic fibres are being successfully developed in countries like Japan, Britain, Italy and the U.S. One of the latest synthetic fibres, called B.H.S., produced by Courtaulds of Britain, the world's largest man-made fibre manufacturers, is said to be flame-resistant, easily washable, anti-crease and cheaper than nylon and terylene—the two leading synthetic fibres. The same group put on the market three years ago the first British acrylic fibre called Courtelle, which has proved a remarkable success in Britain and has captured a good market on the Continent of Europe. Courtelle's popularity is growing and, according to Mr. C. F. Kearton, Deputy Chairman of Courtaulds, "it is going to make the sheep useful for mutton and nothing else." This is, of course, rhetoric and need not be taken to be literally correct. But it does indicate that the natural fibre wool will in future be faced with keener competition from its synthetic counterpart.

ROUND THE EXCHANGES

(Concluded from page 276)

quotation touched Rs. 2.80 (on Thursday the 8th inst.), which was higher by 10 per cent over the last settlement rate. There was sustained improvement in coffees and rubbers as well. Sugars, which had been neglected for several weeks, elecited some support during this week. In the miscellaneous section, cements and engineerings put on a cheerful appearance. On Wednesday, however, almost the entire list of shares in the forward section languished for want of enquiries. *Short selling*, however, was conspicuous by its absence.

Among textiles, Coimbatore Spinnings advanced by Rs. 6 to Rs. 81. Coimbatore Cottons rose by Rs. 3 to Rs. 224. Lakshmis moved up by a rupee to Rs. 167. Bangalore Woollens too gained a like amount to Rs. 242. South India Viscose spurted from Rs. 190.50 to Rs. 194 before closing at Rs. 191.50. Buckinghams strengthened by 50 nP to Rs. 259.50. Rayalaseemas were fully steady at Rs. 163 *cum-div.*, following the news that the Directors of the Company have maintained the dividend for 1961 at the previous year's level of 15 per cent, taxable. The Company, it may be noted here, has secured Government sanction for the issue of 7,446 equity shares of Rs. 100 each as bonus in the proportion of one for three shares held as on 14th March 1962. Travancore Rayons rose initially from Rs. 43.50 to Rs. 44, but declined to previous week's closing subsequently. Cannanores were maintained at Rs. 176, as also Coimbatore Pioneers at Rs. 292 and Dhanalakshmis at Rs. 261. But Madurais, which had improved from Rs. 41.25 to Rs. 41.37, fell to Rs. 40.62, with a net loss of 62 nP.

In the tea section, Kil Kotagiris put on 15 nP to Rs. 5.10 *cum-div.* The Company has announced a dividend of 25 per cent, taxable, for the year ended October 1961, which is the same as that distributed in the previous year. Chembras scored a gain of 12 nP to Rs. 3.60. Periakaramalais were held firm at Rs. 3.60. Highlands were unchanged at Rs. 13.75. Parksides at Rs. 25 and Peermades at Rs. 22. Blue Mountains went up from Rs. 2.72 to Rs. 2.80 earlier in the week, but gave way to Rs. 2.67, *following the operation of* the interim margin on the scrip.

Among coffees, Consolidateds came in for good support, with the quotation increasing by Re. 1.45 to Rs. 18.20. Coffee Lands moved up by Re. 1.25 to Rs. 15.50. Ouchterlony Valleys improved from Rs. 3.75 to Rs. 3.93, but declined later on to close at Rs. 3.92, albeit with a net gain of 17 nP. *Kumergodes were steady* at Rs. 4.30, although the dividend has been scaled down from 20 per cent, taxable, for the year ended October 1960 to 17.50 per cent, taxable, for 1960-61.

In the rubber group, Midlands hardened by 10 nP to Rs. 10.90. Cochin Malabars picked up 3 nP to Rs. 7.30 ; the scrip was still higher at Rs. 7.32 earlier during the week. Malankaras changed hands at Rs. 16.90 and T.R. and Ts at Rs. 10.75.

A feature of trading in the sugar section was the improvement in Cauverys from Rs. 104 to Rs. 107. East India Distilleries rose by 38 nP to Rs. 36 *cum-div.* The Directors of the Company have declared a final dividend of 14-2/7 per cent, making a total of 21-3/7 per cent for the year ended September 1961, same as in the previous year. Deccans, however, were featureless at Rs. 10, as also Mysores at Rs. 55.50 and United Breweries at Rs. 82.25.

BHARAT BALL BEARING CO., LTD.

One of the more important new projects that have been sponsored this week is the ball bearing project by the Shri Ram Group. It will be undertaken by a new company, the Bharat Ball Bearing Company Ltd., which will set up a plant for manufacture of ball, roller and tapered bearings at Ranchi in Bihar.

The Bharat Ball Bearing Company Ltd., has an authorised capital of Rs. 2 crores. Paid-up capital for the project will be Rs. 75 lakhs, consisting of Rs. 55 lakhs in equity and Rs. 20 lakhs in preference shares. The latter will carry a fixed cumulative dividend of 9.3 per cent per annum, subject to statutory deduction of tax. The public issue consists of all of the preference shares and of Rs. 26,95,000 worth of equity shares. The remaining equity shares have already been subscribed or committed for privately. The Company has obtained a licence under the Industries (D. & R.) Act 1951 for manufacturing 2.5 million bearings annually.

Bearings are an essential component of all moving machinery and their use has been increasing considerably of late. The requirement of bearings at the end of the third Five-year Plan is estimated to be 15 million per year, against the existing production of not more than 2.5 million by a single unit in the country. Some more manufacturing units have been licensed and the Company is one of the leading producers. It proposes to specialise in precision type bearings for fans, fractional horse-power motors, machine tools, etc., which offer an expanding field.

The gross outlay on the project will be Rs. 2 crores, out of which land, buildings and plant will account for about Rs. 1.2 crore. Imported equipment will amount to Rs. 65 lakhs for which the Company has been given import licences under the United States D.L.F. Credit. Orders for bulk of the equipment have been placed. Equipment is expected to arrive by April 1962 and the Company is hopeful of commencing the plant by July 1962. The work of development of land and *construction of buildings is already* in hand. The Company expects to start profitable operations from the very first year and to commence payment of dividends from 1964.

The financial plan of the Company consists of Rs. 75 lakhs in share capital, Rs. 60 lakhs in long-term loan, Rs. 35 lakhs in cash credits from banks, etc., and the balance from current earn*ings, consisting* of the provision for depreciation, development rebates and retained profits. The Industrial Finance Corporation of India has sanctioned a loan of Rs. 60 lakhs for the project, repayable in 15 years.

The Company's shares will be listed on Delhi and Calcutta Stock Exchanges.

Shri Ram Group possesses the necessary experience for undertaking a project of the type proposed. Their success with development of sewing machines and electric fans (without any foreign technical collaboration) has given them adequate production engineering know-how for the manufacture of intricate articles calling for high precision and endurance qualities. Nevertheless, the Company has negotiated for technical collaboration with the Fafnir Bearing Company of New Britain, U.S.A., who are one of the largest integrated manufacturers of ball bearings in the United States. The Government of India has already approved the terms of collaboration. Fafnir have agreed to supply technical know-how, allow the use of their patents for a fee, and train Bharat Ball Bearing's technical personnel. The Company will also have the benefit of Fafnir's *continuing research during the period* of collaboration.

WEEK'S STOCK EXCHANGE TREND

MARKET REPORTS

(Concluded from page 305)

reporting idle capacity due to shortage of raw materials. This was not surprising since the 1961 requirements of copper had been estimated at 85,000 tons. Domestic production in 1961 was 8,300 tons and, as such, supplies fell short of demand by 13,050 tons. Imports during this year have so far been poor, and it is to be hoped that much larger imports will be made. Recent trends in world markets have indicated that there is no shortage as such in copper. The tightening of the supply position on the London Metal Exchange recently was attributed to shipments abroad for refining. The London quotation opened at £234½ a ton during the week and, after being higher at £234¾, receded to £234½.

Spot tin opened at £954 a ton in London and gradually declined to £947½, thanks to profit-taking. It will be noticed that the new ceiling of £965 has not been reached. Every time the price moved up, it had been followed by a reaction. Considering that the ceiling has been fixed below the anticipated levels, it is expected that shortage would continue as before. Increased production in Thailand and Malaya is anticipated, but world consumption is also expected to rise. It would be remembered that the price pierced the ceiling in 1961 as demand was good and the Buffer Stock Manager had nothing to sell. If demand for this metal continues as steady as at present—and there is every chance that it will—and the U.S.A. were to refrain from releasing its stockpiles, chances are that, later in this year, the new ceiling would be pierced as in the past. In which case, the International Tin Council would be compelled to consider the demand of producers to raise the ceiling to £1,000 a ton. If India imports a higher quantity now, it will stand to gain. The price in Calcutta was firm around the previous rate. Spot lead in London eased from £57¾ to £57 a ton and spot zinc from £68¼ to £68 a ton.

WHEAT FIRM, RICE QUIET

(From Our Own Correspondent)

HAPUR, 12th *February*

Steady to firm conditions were witnessed in foodgrain prices during the week under review and, although *rabi* crop prospects were bright, dwindling stock position was the main influencing factor as there is still about two months for new wheat crop to reach the market. Wheat prices here recorded gains of about 75 nP a maund during the week to be quoted on Monday at Rs. 17.50 a maund for average quality and upto Rs. 19.50 for better farm produce. Daily arrivals in open market were nominal and as stock with trade has run down to about 8,000 maunds, sales of imported wheat through fair-price shops in ration has checked further rising trend in prices but quality offered through such shops was reported poor. But as sales on such shops has been liberalised, petty consumers are not in difficulty to meet their demands. Wheat crop prospects were bright thanks to last month's rains.

Rice prices, however, ruled quiet as arrivals of *mainpuri* quality were good and demand was slack. The week-end prices were:—*mainpuri sela* Rs. 19.75; *gadda kutcha* Rs. 19; *ramajwayansela* Rs. 22; *raimuniasela* Rs. 23; *basmatisela* Rs. 26 to Rs. 28; superior Rs. 30 to Rs. 34 a maund. Gram prices improved fractionally to Rs. 16.25 a maund for Punjab variety. Demand was fairly good and consequently local stock declined to 5,000 maunds. Crop prospects, however, were bright here as well as in Punjab. Barley continued unchanged at Rs. 13 and *bejhar* Rs. 13 a maund for inferior and Rs. 13.50 for *moongia* superior quality. With small stocks left with trade, demand of these coarse-grains was slack and crop prospects were good. Maize was still much in demand and as arrivals were now poor local stocks have declined to 20,000 maunds and prices were steadier at Rs. 13 to Rs. 13.50 a maund according to quality. *Bajra* prices drifted lower to Rs. 14.75 in the absence of buying support and other sections were quiet at *methi* Rs. 27, *juwar* Rs. 13.25, *guwar* Rs. 14.25, oats Rs. 11.62 a maund.

TANNED SKINS IMPROVE

(From Our Own Correspondent)

MADRAS, 12th *February*

Arrivals of stocks, from the tanneries, of E.I. tanned hides and calf were of moderate volume, and offtake by shippers and local dealers was satisfactory at unchanged prices. There was insistent demand for lower ends in cow hides, both for shipment and for inland trade and prices ruled firm, especially for light and medium weights. A small quantity of heavy weight cow hides run selection seems to have been sold to Iron Curtain countries. Shipment business with U.K. remained pretty difficult on account of price. Some importers have been reported to have lightened their holdings by making sales at lower prices cutting into their commission, which is no doubt unsatisfactory. Demand for cow calf and buff hides was good and for buff calf poor.

There was some improvement in the tanned skins market. U.S.A. buyers were keenly interested in secondary marks of goat skins in heavier averages and the Continental buyers in top marks medium and heavy weights. There were several inquiries for middle class sheep skins from the Continental importers, though the demand for Prime and Semi-prime sheep skins was dormant. Prices in the raw centres do not show signs of easing and E.I. tanners have been following the market to keep their tanneries running.

In the German Tanned Skins Public Sales which commence today, about 90,000 goat skins and 50,000 sheep skins will be available for sale.

Notices

EASTERN INVESTMENTS LIMITED

NOTICE IS HEREBY GIVEN TO THE MEMbers of the abovenamed Company that an Annual General Meeting of the Company will be held at the Registered Office of the Company, Chartered Bank Buildings, Calcutta, at 4-00 p.m., on Monday, the 12th March, 1962, for the following purposes:—

1. To consider and approve the Audited Accounts of the Company for the year ended 31st December, 1961, and to receive the Directors' and Auditors' Reports thereon.
2. To declare the Dividends recommended by the Directors.
3. To appoint Directors in the place of retiring Directors.
4. To appoint Auditors and fix their remuneration.

The Share Transfer Registers of the Company will be closed from 5th March, 1962, to 12th March, 1962, both days the inclusive.

By Order of the Board,
BIRD & CO. (PRIVATE) LIMITED,
Secretaries.

CHARTERED BANK BUILDINGS,
CALCUTTA, 31*st January*, 1962.

Notes:—(*a*) A Member entitled to attend and vote at this meeting may appoint a proxy to attend and vote instead of himself. A proxy need not be a member of the Company.

(*b*) The Dividends, if declared, will be paid on or after 26th March, 1962, to those shareholders so entitled whose names appear in the Company's books on the 12th March, 1962, or to their mandatees. No application for Dividend Warrants will be necessary.

MADURA MILLS COMPANY LIMITED

Registered Office:
NEW JAIL ROAD, MADURAI

NOTICE IS HEREBY GIVEN THAT THE Annual General Meeting of the Company will be held in Pandyan Building, West Veli Street, Madurai, on Wednesday, the 28th March, 1962, at 3.45 p.m. The Share Transfer Books will be closed from 1st March to 28th March, 1962, both days inclusive. It is recommended that:

1. All persons holding shares on blank transfers should immediately arrange to have the shares registered in their own names, as the Company will pay any dividend declared only to the person(s) in whose name the share stands on the date of declaration of dividend.
2. Shareholders desiring dividends to be paid to Banks or other Mandatees should register the mandates with the Company before 1st March 1962.
3. Intimation of any change of address should be given to the Company immediately.

A. & F. HARVEY LIMITED,
Managing Agents.

MADURAI, 1*st February*, 1962.

NATIONAL PIPES AND TUBES COMPANY, LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Eighteenth Annual General Meeting of the Shareholders of National Pipes and Tubes Co. Ltd., will be held at the Registered Office of the Company, NICCO HOUSE, Hare Street, Calcutta, on Monday the 12th March, 1962 at 3-30 p.m., to transact the following business:—

(1) To receive and adopt the Directors' Report and the Audited Balance Sheet and Profit and Loss Account for the year ended 30th September, 1961.

(2) To declare Dividends on the Preference and Ordinary Shares.

(3) To appoint a Director in place of Shri M. L. Shah, who retires by rotation and is eligible for re-appointment subject to compliance with the provisions of Section 281 of the Companies Act, 1956 and to consider and if thought fit, to pass the following Resolution of which a Special Notice as required by Section 281 of the Companies Act has been received by the Company:

"RESOLVED that pursuant to the provisions of Section 281 of the Companies Act, 1956, Shri M. L. Shah, who has attained the age of 67 years and who retires by rotation be and is hereby reappointed a Director of the Company and it is hereby specifically declared that the age limit for the Directors prescribed under Section 280 of the said Act shall not apply to him."

(4) To appoint a Director in place of Shri S. C. Roy, who retires by rotation and is eligible for re-appointment subject to compliance with the provisions of Section 261 of the Companies Act, 1956 and to consider and if thought fit to pass the following Resolution as a Special Resolution of which a Special Notice as required by Section 261 of the Companies Act, 1956, has been received by the Company.

"RESOLVED that pursuant to the provisions of Section 261 of the Companies Act, 1956, Shri S. C. Roy, a Director of the Company who is also a Director of Messrs. Associated Industrial Development Co. (Private) Ltd., the Managing Agents of the Company and thereby an associate of the Managing Agents and who retires by rotation be and is hereby re-appointed a Director of the Company.

(5) To appoint Auditors and fix their remuneration.

The Share Transfer Books of the Company will remain closed from 27th February, 1962 to 12th March, 1962, both days inclusive.

By Order of the Board,
FOR NATIONAL PIPES & TUBES COMPANY LIMITED,
FOR ASSOCIATED INDUSTRIAL DEV. CO (PRIVATE) LIMITED,
K. M. NAIK,
Director,
Managing Agents.

NICCO HOUSE,
HARE STREET,
CALCUTTA-1,
The 29th January, 1962.

N.B.—A member entitled to attend and vote at the Meeting is entitled to appoint a proxy to attend and vote instead of himself and that a proxy need not be a Member.

The Dividend, if declared, will be paid to those shareholders whose names appear in the Register of the Company on 27th February, 1962 or their mandatees and the dividend warrants will be posted from 26th March, 1962 onwards.

An Explanatory Statement pursuant to Section 173 of the Companies Act, 1956 in respect of Item Nos. 3 and 4 has been appended to the Notice of the Meeting which is being forwarded to the Shareholders.

TO ALL SHAREHOLDERS:

And in particular to:

R. R. Bhandary, Esq., Mr. Cali Shawakshaw Dinshaw and Mrs. Louise Cali Shawakshaw Dinshaw, Mrs. Chandi Devi, Lt.-Genl. Shanker Shum Shere J. B. R. and Rani Jagadamba Kurmari Debi.

LONDON LETTER

(Concluded from page 282)

reckoned on being 6 per cent up on this year as compared with last. Imports, on the other hand, will probably not rise anything like as much because of a lag in building up stocks (which will, of course, be helped by a maintenance of the Banks' tight credit policy). If these two trends are realised, there will be a surplus on the current balance of payments.

At home, the boom in fixed investment can be expected to ease off, again because of the continuance of tight credit. There will be some rise in domestic consumption but not to the full extent of the total rise in incomes, so that the whole structure of the economy will be what is traditionally known as "sound." If it is true that there will be more money about waiting to be spent and the goods are there to spend it on, the economy will qualify for being "buoyant." The next phase would be a much steeper rise in consumer spending as wage increases are pushed into circulation but that will be a problem for 1963. On the forecast to date, 1962 is going to be a healthy year, with the prospect of economic conditions steadily improving and it is too soon to worry about what inevitably happens a year later!—*All Rights Reserved.*

NIGHT AIR MAIL SERVICE

IN the course of a recent conversation with the Press, the General Manager of Indian Airlines Corporation outlined some of the Corporation's plans for modernisation and expansion of services. He indicated, amongst other matters, his intention to alter, with effect from October of this year, the present pattern of the Night Air Mail Service, with a view to increasing both capacity and the speed of travel. The proposal is, it appears, to operate direct services between the four major cities now served by the Night Air Mail. In that event, Nagpur, presumably, would be omitted from any future plan. At first glance, this seems to be good news. One may even exclaim it to be excellent! No more tedious delays or transhipment at Nagpur at dead of night and a much faster service too! A little reflection, however, leads to certain doubts: will it, we wonder, be economic and will it, for that matter, be so advantageous as we first imagined? It may be useful to examine I.A.C.'s proposal more closely.

The Night Air Mail—N.A.M. for short—it will be generally agreed, has served a most useful purpose for a considerable number of years. It was devised to provide a cheap and comprehensive air mail service between the Capital and the three other major cities of India. The original licence for its operation was granted by the then Air Transport Licensing Board to Indian Overseas Airways. This Company soon ran into financial difficulties and the licence passed to Himalayan Airways. On the recommendation of the Rajadyaksha Committee—which, it will be remembered, made a thorough examination of India's air transport system—the licence changed hands again. The new licensee—Deccan Airways—retained control, until the passing of the Air Corporations Act in 1953.

The main feature of the N.A.M is that, in one composite but simple operation, and with the maximum possible economy, it connects the four major cities of India. By using the natural focal point of Nagpur as a redistribution centre for passengers, mails, and freight, these can be transported from any one of those cities to any other with a minimum use of aircraft and flying time.

In any 'omnibus' solution of this kind, there are bound to be some disadvantages. In the case of N.A.M., these are: firstly, the non-arrival, or even the late arrival, of any one of the four aircraft at Nagpur can dislocate the smooth running of the service; secondly, all passengers are obliged to disembark at Nagpur and await the redistribution of the freight and mails; finally, passengers from Delhi to Bombay or Calcutta—and, of course, *vice versa*—have to fly two sides of a triangle instead of a direct line. The same thing applies to passengers between Madras and Calcutta. These disadvantages, one suggests, are not very material. Provided the service is run efficiently, dislocation at Nagpur should be a very occasional event. Passengers, who have to fly a longer distance to reach their destinations, receive compensation by way of a reduced fare. The wait at Nagpur is inevitable, but passengers are made as comfortable as circumstances permit. In any event, passengers, presumably, use the N.A.M. by choice. There are direct services available at a higher fare.

The Corporation complains that the N.A.M. is uneconomic. The revenue does not cover the cost of operation. The service, therefore, constitutes a continuous drain on the surplus revenue derived from the trunk routes. That certainly is a point, but the cause, one suggests, is not the nature of the N.A.M.—which is an ingenious and economical method of serving the four cities—so much as the equipment and the way it is used. The service requires five aircraft—four in use, one in reserve. If these are exclusively retained for the N.A.M.—as are I.A.C.'s five Skymasters—then the utilisation achieved is low. Moreover, the Skymasters are becoming increasingly more costly to maintain. The assumption is that discontinuation of the N.A.M. would enable I.A.C. to dispose of these aircraft.

The advantages of the N.A.M., however, deserve the fullest consideration. Its operation involves a nightly route mileage of 4,400 miles, contrasted with 10,000 miles of operation required to link the four cities by direct services. Admittedly, the importance of this factor varies and is governed by a number of other considerations—the equipment available, for instance, the total volume of traffic between the four cities and the number of frequencies which, consequently, have to be operated. Demand on the trunk routes—particularly the triangle of routes linking Delhi, Bombay, and Calcutta—has exceeded the capacity I.A.C. can provide. The Corporation computes that traffic on the triangle amounts to 100 passengers each way daily in the case of Delhi-Bombay, and about 60 passengers each way on each of the other two routes. At a rough estimate, this calls for three daily frequencies between Delhi and Bombay and two frequencies on each of the other routes. This the Corporation has, heretofore, been unable continuously to provide. With the acquisition of four more Viscounts, however, that difficulty, one assumes, has—temporarily, at least—been surmounted. But what of the N.A.M. traffic? Will not additional frequencies be required and, if so, will the load factor remain economic?

A study of the traffic records of the N.A.M. reveals a curious and interesting fact. In the first six months of 1957—five years ago, that is to say—the service carried 27,886 passengers, 954,504 kilos of mail, and 702,505 kilos of freight. The latest period for which figures are available is the first half of 1961. For those six months, the relevant figures are: 26,479 passengers, 952,878 kilos of mail, and 747,937 kilos of freight. In other words, during a four-year period, in the course of which I.A.C.'s passenger traffic, as a *whole*, has risen by some 70 per cent from 242,624 passengers in the first half of 1957 to 416,009 passengers in the first half of 1961, N.A.M. traffic in all categories has remained virtually unchanged.

This is very remarkable. Is it that the N.A.M. habitually operates so near capacity that there is no room for expansion? Or is it that such expansion of traffic as would normally have affected the N.A.M. has been syphoned off on the direct day services of the trunk routes? This is an interesting question, but only I.A.C. can supply the answer. But here we are concerned with the actual volume of traffic, because, in any *new route pattern*, the traffic now borne by the N.A.M. has to be accommodated.

From the figures mentioned above, we find that the average nightly traffic carried on the N.A.M. amounts to 160 passengers, 5,304 kilos of mail, and 4,155 kilos of freight. The average load of each aircraft works out at 40 passengers, 1,326 kilos of mail, and 1,038 kilos of freight. In practice, of course, the loads do not average out so conveniently, but let that pass. The point one wants to make is that, generally speaking, each aircraft carries a good economic load. Split three ways for three direct services, the loads, however, look like being extremely poor. The Corporation may, of course, merely substitute a *night frequency* for one of the present day frequencies. That provides an easy way out for the Corporation, but it is hard to see how the public would benefit.

In any event, these direct night services will operate, one assumes, at times most convenient to the post office. The present hour of 11 p.m., or thereabouts, is indicated. Assuming such a departure time from Delhi, arrivals at Bombay and Calcutta would be about 1.40 a.m. and 2.15 a.m. respectively. Such times of arrival are the antithesis of convenience. An alternative would be to adjust departures for arrivals at about 6 a.m., but that would mean departures from Delhi for Bombay and Calcutta at, or about, 9.15 a.m.—*entailing*, for the passenger, a rendezvous at the Corporation's coach terminus at about 1.30 a.m. One finds it difficult to be very enthusiastic about that, too.

It can be argued that the N.A.M. entails considerable inconvenience such as disembarkation and wait at Nagpur. There is, however, some compensation in the lesser fare. Will that benefit be passed on to the user of direct night mail services? It remains to be seen. Indeed, final conclusions must await the Corporation's plan in detail. Perhaps it is just innate conservatism; perhaps it is because the N.A.M. has served us so well for such a long time; at this stage, however, one cannot but view the decision to *discontinue it with considerable* suspicion.

EMPLOYMENT GOALS OF PLANNING

PLANNING today in the less developed, non-communist economies is generally growth-oriented rather than employment-oriented. In practically all the plans and programmes that have been announced by a number of countries in Asia, Africa and Latin America, employment creation is looked on only as a by-product of general economic development. Employment creation, in other words, is regarded principally as a consequence of the general process of output expansion to be brought about by the investment programmes provided under a country's plan. Most of these investment programmes are guided by considerations, such as the strengthening of the infrastructure, the development of basic capital goods industries, import-saving and export industries, and so on. If the emphasis in most plans is on such growth-oriented investment, it is because unemployment and underemployment are regarded *primarily* as symptoms of economic underdevelopment and the employment problem is thought of as too stubborn to be solved except over a long period.

That employment problems will not be solved without more rapid economic develop-

ment is, of course, recognised in a report* released by the International Labour Office, a few days ago. But—and it is a very important 'but'—it does *not* follow, the report adds, that measures to promote economic development will of themselves suffice to provide enough jobs for the impoverished masses within an *acceptable* period of time. It is obvious that the 'time' factor is crucial here, for many underdeveloped countries are engaged in a race against time, so that Communism may not overtake them. Since a "revolution of rising expectations" has been caused in these countries by the general proclamation that the purpose of economic development is to raise levels of living, the following emphatic observations of the I.L.O. team of experts (of whom Dr. K. N. Raj of the Delhi School of Economics is one) would need to be seriously pondered by planners in the less developed countries:

"The rate of population growth is such that, unless hundreds of millions of new jobs are provided in the next decades, hundreds of millions of people will be deprived of the opportunities for productive work. There are alternative paths of development, and along some of these more new jobs will be created more quickly than along others. If paths of development are chosen that provide relatively few new jobs in the early stages, those who need and seek work or more work will scarcely share in the benefits of progress.... The main purpose of insisting that employment objectives should be given weight in the choice of alternative paths of economic development is that this is the surest, if not the only, way of making certain that the improvements in levels of living that come about as economic development proceeds will be widely shared. Unemployment and underemployment are major causes of poverty, and the objective of providing more and more productive employment is a major element in the broader objective of promoting higher levels of living."

If the I.L.O. experts have thus emphasised the need for a more positive employment-orientation to planning, it is because the plans of several underdeveloped countries aim only at absorbing all or most of the new entrants to the labour force arising from growth of population over the period covered, *leaving the existing number of unemployed and underemployed unchanged or increasing.* For instance, in India, the first Plan had estimated the *increase* in labour force during 1951-56 at 5.5 million and it actually created employment only for that number. The second Plan had estimated the *increase* in labour force during 1956-61 at 10 million, but it is claimed to have created employment for only 8 million. The third Plan has estimated the labour force to increase during 1961-66 by 14 million, but, again, there will be a shortfall in actual employment-creation, unless, of course, more labour-intensive projects are energetically executed in the countryside where the new entrants to the labour force will swell the ranks of the already unemployed and underemployed. In Ceylon, the ten-year (1959-68) Plan has estimated the *increase* in labour force during the Plan period at 1.3 million and is expected to create employment only for about that number. Another example is provided by Egypt, where the Plan currently under implementation has estimated the *increase* in labour force during the 1960-65 period at 0.8 million and is expected to create employment only for that number.

These examples serve to underline the need for raising the employment targets of Plans in the less-developed countries, so as to absorb not only the *additions* to the labour force during the Plan period but also some part of the already unemployed and underemployed segment of the labour force. Here the I.L.O. experts themselves have recognised that there are certainly possibilities of conflict between the objectives of "more employment" and "more rapid economic growth." But, according to them, the conflicts are not always or everywhere operative and, where they exist, they can often be eased by appropriate policies. It is their considered opinion that, as a rule, the employment of more labour will increase total output and that, given appropriate measures to raise the level and improve the pattern of investment, more employment can also lead to a higher rate of economic growth. And a higher rate of growth, if so achieved, will in turn facilitate the absorption of more labour at higher levels of productivity. Thus, they contend that not only is an expansion of employment compatible with economic growth but the two can reinforce each other. The I.L.O. experts believe that there are opportunities for exploiting more energetically the possibilities of a mutually reinforcing increase of both employment and the rate of economic growth.

But such possibilities as exist in agriculture and traditional industry will call for *more* investment, even though additional employment opportunities can be created with a minimum complement of scarce resources. How much more investment will be required for the purpose? The I.L.O. experts almost take one's breath away when they say that "countries now in process of development are likely to need higher investment rates—probably of the order of 20 per cent or more of national income—and higher rates of increase of national product than did countries which developed in the eighteenth and nineteenth centuries." That 20 per cent is an impossibly high rate of investment could be easily seen from the experience of India where, even after the completion of two Plans, the aggregate investment (a substantial part of which is to be financed through external assistance) will represent a rate of no more than 14 per cent of national income during the third Plan period. It is an impossibly high rate for several underdeveloped countries, including India, because the attempt to achieve it would necessitate adoption of some very drastic and controversial steps of the following kinds, suggested by the I.L.O. experts themselves:

(1) Measures to restrain consumers' demand will be needed, if a substantial proportion of increasing output is to be reserved for investment.... Bold and effective fiscal and administrative measures and an appropriate wage policy will be needed to bring about such a redistribution of consumption. They will encounter political and administrative difficulties but will be eased by the fact that those who previously supported the unemployed will now have fewer dependents, so that it will be possible for them to consume a smaller proportion of their incomes without reducing their own consumption. Much of the redistribution, indeed, will take place within households.

(2) The instruments of development policy should be designed to reduce non-essential spending. They may include tariffs and import control, high corporate and personal income taxes, high indirect taxes, and possibly a general expenditure tax. Tax concessions can be designed to encourage appropriate investments.

(3) Wage and price policies will be needed to ensure that wages in the modern sector rise no faster than is consistent with a satisfactory rate of increase of employment. Excessive wage increases would encourage capital-intensity and an increase of consumption.... Wage increases can be moderated only if prices are kept reasonably stable and if high incomes from profits, rents, interest and salaries are restrained. Wage incomes can, on the other hand, contribute to capital formation to the extent that they are saved through contributory social insurance schemes, deferred pay schemes or encouragement of voluntary savings by tax concessions. Public savings may be increased directly through taxation on personal incomes or indirectly through a reduction of subsidies to public services or utilities. Governments should seek the support of employers' organisations and of trade unions for wage and price policies designed to achieve higher levels of employment.

One wonders whether all these measures will be politically feasible. The authors themselves have anticipated "political and administrative difficulties" in this connection. But some of these measures can be rendered less drastic and thus more acceptable to the groups concerned (as has been done in India), if the rate of investment is not pitched at the suggested high level of 20 per cent or more of national income. By adopting some of these measures, in a mild and cautious manner, by changing, to some extent, the pattern of investment so as to include more employment-oriented and production-oriented projects, especially in the related fields of agriculture, irrigation, afforestation and soil conservation by using more fully the existing capacity of industrial plants and by mobilising more small savings in rural areas, it may be possible for planners in the less developed countries to step up their planned rates of investment (which are generally less than 15 per cent) by an additional 2 per cent or so. Anything more than this cannot be easily achieved under the current plans (some of which extend to 1969) of such of those underdeveloped countries as are democratically governed. Democratic planners, if they are practical, would have to balance somehow the conflicting considerations involved in saving, investment, growth and employment if Draconian measures are to be avoided. It is in vain that one looks for light in the I.L.O. report on how this balancing feat is to be performed in a democratic polity.

**Employment Objectives in Economic Development*—Report of a Meeting of Experts. Published by the International Labour Office, Geneva (Switzerland).

PROTECTION FOR CONSUMERS

THE formation of another consumers' association, called the National Federation of Consumers, at a convention held at New Delhi this week, is a clear indication of the growing awareness among consumers that their case will go by default if they do not organise themselves and raise their voice against the tyranny of rising prices, adulteration of foodstuffs and several other malpractices in the distribution of essential goods. Although in many foreign countries, notably the U.K., consumers have, through voluntary organisation, become effective social groups, influencing policy-making and the price and quality of goods, in India they have hitherto remained an amorphous mass of infinitely patient, normally meek and generally silent, long-suffering people on whom have been inflicted the wounds of trade union battles, Government failures and management intransigence. But rising prices, inadequate supply of essential goods and many other hardships seem to be slowly transforming these apparently placid philosophers into malcontents.

The sufferings and grievances of consumers in this country found their first clear-cut expression at a seminar organised by the Consumers' Association of India in New Delhi in October last year. Experts who participated in the seminar underlined the need for vigorous enforcement of anti-adulteration laws, and strict adherence to quality standards by manufacturers. It was also urged that representatives of consumers should be associated with the Government's policy decisions affecting cost of living and that they should be represented on Wage Boards, Bonus Commissions, and Export and Import Advisory Councils. The argument for representation is unexceptionable in principle, because it is the consumers who will ultimately bear the brunt of the decisions of these bodies. But, as consumers have so far been unorganised, the Government was looked upon as the guardian of their interests. The moves towards organisation of consumers to fight for their interests show that they have realised the folly of leaving the vital matter of protection of their interests entirely to the Government.

In a young democracy like India, it is all the more necessary that consumers should organise themselves so that pressures and pulls exerted by other groups would not work to their detriment. India is a closed market for most consumer goods and will be so for a long time to come. Due to foreign exchange scarcity and import restrictions, no competition from imported goods is possible. Nor are the prospects of competition among domestic manufacturers bright, because productive capacity is subject to regulated growth for a variety of reasons, of which shortage of capital is only one. Meanwhile, the demand for many consumer goods will continue to grow, in view of rising population and money incomes. With such assured prospects for a sellers' market in consumer goods, consumers will find themselves at the mercy of suppliers, not all of whom are, unfortunately, entirely honest. There is thus a strong case for organising consumers' associations into effective bodies in every town, city, State capital and the Union capital. An organisation here and another there will not suffice. There should be consumer councils all over the country, affiliated to a chief organisation in each State which, in turn, can have an all-India Federation at Delhi or in one of the principal cities of India. The success of these organisations will depend on the calibre and character of leaders. They must be independent and impartial in their judgment. Besides, politics should not be imported into such bodies. If the right type of persons get together to safeguard the interests of consumers, they could render really useful service to the nation as a whole, because, in the ultimate analysis, their activities would be directed towards improving the quality of consumer and durable goods produced in the country, or, in other words, national efficiency.

MARKET GOSSIP

Inter-bank Agreement

IT is common practice in this country, especially with Governments, to appoint a committee to deal with any irksome problem the solution for which is either inconvenient or not readily available. The chairmen and chief executives of members of the inter-bank agreement on rates of interest on deposits resorted to this well-known method of "putting off the evil day" when they met in Bombay on Friday the 16th inst. to consider the notice given by the five medium banks (namely, Union Bank, Canara Bank, Dena Bank, Indian Bank and Indian Overseas Bank). As readers are aware, these banks wanted the ceiling rates of interest payable by them to be higher by ½ per cent, instead of the present uniform rates for all banks other than small banks. For this purpose, small banks are defined as those the deposits of which are less than Rs. 25 crores according to their latest balance-sheet. Alternatively, they wanted freedom from the agreement.

The meeting of bankers could not come to any agreed solution. The big banks, however, persuaded the medium banks to give them more time, and the latter consented to wait till the end of April 1962. A special committee consisting of nine members—three each representing the big, medium and small banks—was appointed to consider a revision of the agreement and report well before the end of April. The big banks, however, conceded that, "in view of the changed circumstances since the formation of the agreement, some revision is called for." Pending further study and examination by the Committee, the *status quo* will continue. In other words, the justification for the demand of medium banks has been recognised in principle; the issues that remain to be decided are: the extent of differential to be allowed in favour of the medium banks; the manner in which it should be done; the definition of medium banks; and its application to Exchange banks.

It is not understandable as to why a decision could not be taken on these issues at last week's meeting itself. It is now nearly a year since the medium banks had first raised the issue. Obviously, it is only after seeing that their request had failed to get a satisfactory response from the other members of the agreement that they must have given the six months' notice necessary to break away from it. If six months were not sufficient for an understanding to be reached, would two more months be adequate? It looks as though brinkmanship tactics were adopted by those banks which did not want to concede the medium banks' demand, only to find that they did not work.

It is now quite evident that all banks realise that the inter-bank agreement is worth preserving. This is particularly true of the big banks. If the latter did not want the agreement to continue, they could have simply refused to entertain the medium banks' request at last week's meeting. The attitude of big banks is reflected in the annual statement of the Chairman of the Bank of India Ltd., circulated to shareholders this week. Says Mr. Cowasjee Jehangir, Chairman:

"A large measure of unity in the ranks of commercial banks is essential. It is a matter of regret that some banks desire to break away from the inter-bank agreement on deposit interest rates. This agreement was brought about after much labour and deliberation. It will be unfortunate if it is discontinued. Instead of bringing the agreement to an end, there is a good case for an extended agreement between the Indian and foreign banks in the private sector and the State Bank of India (in the public sector) not only on deposit interest rates but also on rates of interest for advances."

The task of reaching an understanding on deposit rates and sustaining it has itself been a trying one. It will be too much to bring the rates of interest chargeable on advances, loans and bills purchased and discounted also within a voluntary agreement. The considerations to be borne in mind in this case are many and varied. To give one instance. There is no consideration of quality so far as deposits are concerned, but it is a very important one in the case of bank credit. In the interest of healthy and orderly growth of banking, however, all that one can lay down so far as advances are concerned is the minimum rate of interest that a bank should charge. But such a floor has already been prescribed by the Reserve Bank of India. Besides, if banks themselves get together and prescribe agreed rates of interest to be paid on deposits and to be levied on advances, bills, etc., as well as adopt uniform service charges, they will lay themselves open to the charge of indulging in restrictive practices through collusion. Such a situation may do them no harm so long as there is a Government which appreciates the necessity for it. In the prevailing state of affairs in this country, however, none can afford to take this condition for granted. A certain amount of clean and vigorous competition is necessary to vindicate the superiority of private enterprise over the public sector and State monopoly and such competition should cover both the cost and price of money. Besides, the question of interest rates is linked with the larger issue of monetary policy and, as such, it would be better to leave it to be determined by the authors of that policy. If, however, there is a consensus of opinion among bankers that they should have a convention among them on interest rates, then their arrangement should be a sufficiently flexible one to withstand the stress and strain of fundamental changes in the state of the capital market.

Life Insurance in 1961

Preliminary figures relating to new business done by the Life Insurance Corporation of India in 1961, just announced, indicate that the Corporation has had another highly successful year. Completed new business last year crossed the Rs. 600-crore mark and stood at Rs. 608 crores, as against Rs. 497.54 crores in 1960 and Rs. 429.17 crores in 1959. Thus, new business in 1961 registered an increase of 22.3 per cent as compared with 1960 when the increase was only 15.9 per cent over the 1959 figure. This remarkable increase in business was achieved, in spite of the fact that 1961 was a difficult year for the Corporation, inasmuch as floods and other natural calamities, which occurred in many parts of the country, were not conducive to selling insurance.

Although the 1961 business was 22.3 per cent higher than in the previous year, it still fell short of the Corporation's five-year plan target of Rs. 655 crores for the year by about Rs. 46 crores. This shortfall is greater than that in the previous year when it was Rs. 27.50 crores; only in one year, namely, 1959, which was the first year of the plan, was the Corporation able to exceed the target. The new business done in that year was Rs. 429.17 crores, as against the target of Rs. 415 crores. It is thus evident that the gap between target and performance has widened for the second year in succession. The Corporation, however, would have been able to reach the target for 1961 had it succeeded in completing a larger percentage of the introduced business. Such business was as high as Rs. 703 crores, that is, some Rs. 95 crores more than the completed business.

Although a detailed analysis of the 1961 business has not yet been prepared, it is seen that, out of the 823,470 policies issued till 30th November 1961, 578,897 policies, or 70 per cent of total policies, were first insurances, that is, policies issued to persons who took up life insurance for the first time in their life. This indicates that the benefit of life insurance is spreading to a wider section of the people. The maximum percentage of first insurances was secured by Madurai Division and Cuttack Division (88 per cent of total policies issued by the Divisions) followed closely by Coimbatore (84 per cent), Trivandrum (80 per cent) and Lucknow (80 per cent) Divisions. Policies issued under the non-medical schemes introduced throughout the country during the year aggregated 284,000 upto the end of November 1961, or 34.6 per cent of the total policies issued during the period; this experience suggests that non-medical schemes are extremely popular. Zone-wise, the Southern Zone topped the list, the number of policies issued under non-medical schemes being 42.7 per cent of total policies issued. The Central Zone ranked second, with 39.8 per cent of the total policies issued being under non-medical schemes.

Along with the increase in new business, there has also been a rise in the premium income, which rose from Rs. 97 crores in 1960 to about Rs. 110 crores last year. The renewal expense ratio had registered a welcome decline from 15.87 in 1957 to 15.46 in 1958 and still further to 12.92 in 1959, but had stayed unchanged at that level in 1960. The authorities of the Corporation are now confident that this ratio has fallen under 12 per cent in 1961. The lapse ratio for 1961 has not been worked out yet, and it could not, therefore, be said whether the upward trend, which was noted in 1959 and had gathered momentum in the following year, persisted last year too. But the probability is of an increase in the lapse ratio, considering the presence of continued inflationary pressures and natural calamities which must surely have affected the economic position of policyholders.

While the 1961 new business figure is thus encouraging, it is still a far cry from the five-year plan target of Rs. 1,000 crores which the Corporation is expected to reach next year. The Chairman of the Corporation, Mr. P. A. Gopalkrishnan, who will shortly be relinquishing this office, is, however, optimistic that the target will be achieved, though he is cautious enough to qualify his optimism by adding the words "with some difficulty." This optimism is based on certain encouraging trends in the business of the Corporation, more especially the progress made in respect of rural insurance, non-medical schemes and on-the-spot policies. The Corporation's business in rural areas is showing a steady increase. It is encouraging to find that the rural business accounted for 36.3 per cent of the policies issued and 29.3 per cent of the sum assured during the period 1st January 1961 to 30th September 1961. The Corporation has succeeded in persuading the Post and Telegraph Department to permit post offices to collect premium on behalf of the Corporation. The facility of paying premiums at post offices is expected to give an additional stimulus to rural business. The *Janata* scheme, on the other hand, has not proved a success, except in certain areas, and the Corporation has, therefore, rightly decided to go slow with the extension of the scheme to other areas.

Seminar on U.S. Food for India

At a seminar in the Institute of Economic Growth at New Delhi in which the U.S. Director of Food-for-Peace, Mr. McGovern, participated, some of the ideas regarding the use of food as part of wages for using unemployed manpower in India were discussed. Mr. McGovern then made it clear that the intention was not to make food a substitute for wages but only to make it a part of them; but the problem is not solved thereby, because the question arises next whether the other goods to be purchased with the money part of the wages will be available in sufficient quantities so as to prevent an inflationary situation. In the context of the non-availability of cotton under P.L. 480, the situation becomes a little more complex, since essential wage-goods may be lacking.

Some of the participants felt unduly disturbed by the difficulties of paying labour with foodgrains obtained under P.L. 480. For example, it was pointed out that wheat could be used only in North India and that meant restriction of such schemes to this part of the country. This conclusion need not follow, especially after the experience of both Bombay and Madras under total rationing (in force prior to 1952), when people took several kinds of grains as part of their rations and slowly got used to them. Another objection about the feasibility of distribution of grains was also not warranted after the experience in running fair price shops. Anyhow, these ideas may influence thinking on this programme and perhaps limit it to special areas and types of projects. Mr. McGovern indicated that the real scope for expansion lay in the school lunch programmes and in the supply of feedgrains for livestock and poultry farming which can help to diversify occupations in agriculture and provide more employment.

There was consensus of opinion at the seminar that imports of food surpluses have not created disincentives for Indian agriculture and that prices have not been depressed to uneconomic levels so far. American officials are not hopeful that the surpluses will end in the near future: the chances of President Kennedy's proposals being accepted by Congress are considered remote and past experience has shown that there are loopholes for evasion by farmers in any programme enacted by Congress.

Whither World Coffee?

The attention of all coffee growers, exporters and importers the world over is now focussed on the forthcoming meeting of the International Study Group on Coffee scheduled to be held at Washington in a few days. The one question that is uppermost in the minds of every one is whether this meeting would succeed in evolving a new long-term agreement for world coffee trade, in place of the *ad hoc* agreement which has been in force since 1st October 1959. The answer will depend on how far and to what extent the conflicting interests will be reconciled not merely between the exporting and importing countries but also as between the producing nations themselves. Happily, we are told that there is a consensus of opinion among all coffee interests that the new agreement, if it is to be effective in bringing about an orderly development of world coffee trade, should be more comprehensive in approach than the present agreement which is essentially based on an adjustment of supply-demand position through establishment of export quotas for each country. The principal foundations on which such an agreement could be built are: (*a*) equilibrium between supply and demand as well as fair prices; (*b*) participation of the largest number of exporting and importing countries; (*c*) reduction in the standing stocks to a reasonable level and adjustment of production to the exact potentialities of utilisation in each country; (*d*) fixation of revisable export quotas; (*e*) limiting of coffee imports into member-countries from non-member countries; and (*f*) removal of barriers to consumption.

There are two chief difficulties which will have to be encountered before a general, global agreement is reached on coffee. They pertain to export quotas and standing stocks. The African coffee producers, who have entered the world market lately, are regularly developing their production and, therefore, any basis of mean output during the past few years does not suit them; they are urging another method of reckoning that makes allowance for future increase. On the other hand, the Latin American countries desire that such an increasing competitive production be arrested by maintaining African production at present levels. The agreement concerning the existing stocks also involves certain sacrifices to be made by the producing countries. The total of these stocks is put at as high as four million tons. May be, world coffee consumption will increase faster than output in the next three years, the crop in 1964-65 being placed higher by only 300,000 tons at 5.0 million tons as compared with 1959-60, whereas the estimated consumption is put higher by 700,000 tons at 3.9 million tons. Even so, the stocks will continue to be heavy, exerting an increasingly heavy pressure on prices every succeeding year. It is this factor which invests the need for stabilising prices of coffee and securing new sources of demand with urgency, rather than solutions through restrictive regional mechanisms.

Independent of the long-term world agreement for stabilising the coffee market currently under study, Mexico and five Central American countries have presented to the U.S. Government a scheme for a special regional agreement to stabilise earnings derived from coffee exports. The scheme envisages the setting up of a $20-million Seasonal Fund, of which half will be contributed by the U.S., the other half being shared jointly by Mexico, Costa Rica, El Salvador, Nicaragua, Honduras and Guatemala. It also envisages the establishment of minimum prices to govern quota shipments: that is, whenever coffee does not fetch a previously agreed upon minimum price in the world market, the countries named will be committed to export only less-than-quota quantities and the unsold portions of the quotas will be absorbed by the Seasonal Fund which will be able to place its stocks on the market in the following quarter (at the minimum price or higher). Under these conditions, the member-countries will voluntarily reduce their own quotas, in order to make room in the market for the coffee accumulated by the Fund during the previous three months. The other eight countries

EQUITIES MOVE UP

UNDERTONE STEADY

(From Our Own Correspondents)

BOMBAY, *22nd February*

THE share market commenced the week on a subdued note induced by settlement considerations, but picked up strength after the new account opened on Monday. There was selective buying in textiles induced by the proximity of dividend announcements for 1961 and hopes of bonus issues. Steel shares elicited fresh support in anticipation of higher retention prices. The lower *budla* charges at the last settlement, indicating a somewhat oversold position of the market, also helped sentiment. The firmness gathered momentum on Tuesday, following fresh support and covering by bears. Both cash and forward scrips recorded sizable gains. A part of the gains was, however, erased in yesterday's trading, thanks to profit-taking at higher levels and nervous selling by some parties prompted by the Prime Minister's election speeches, emphasising the socialist content and goals of the Congress Party's Programme. His critical observations about private enterprise and disparaging remarks about the place of stock exchanges in the Indian economy were particularly regarded as disturbing symptoms of the future that awaits the objects of his attack. Nevertheless, the undertone of the market remained steady and the closing prices of most scrips were well above the last week-end quotations. Although the market was officially open today, traders refrained from doing business as a mark of respect to the memory of Dr. I. C. Patel, honorary doctor of the Stock Exchange Badge-holders Association, who passed away on Thursday morning.

Two shares, *namely*, Edward Textiles and Apollo Mills, attracted margins in the course of the week's trading but for opposite reasons. The first attracted margin at the rate of Rs. 33.50 per share on Tuesday, because of the rise in price of more than 10 per cent over the previous clearing rate, while, in the case of Apollo Mills, the decline in the price by more than 10 per cent over the previous clearing rate, resulted in a margin of 15 nP per share being imposed on bears payable by Saturday next.

Steel shares presented a distinctly steady trend. Tata Steels began the week at Rs. 140.75, as against the previous close of Rs. 140.25, gradually improved to touch Rs. 140.85 yesterday before receding to Rs. 141.25 at close, showing a net gain of Re. 1 over the week. Indian Irons opened higher at Rs. 25.15, as against the previous close of Rs. 25.05 and firmed up, on good support, to Rs. 25.60 yesterday before winding up at Rs. 25.40. The net gain over the week is 35 nP. Mukand Irons, too, followed the same pattern. After opening at Rs. 25.75, same as the previous close, the scrip spurted to Rs. 28 on Monday and remained steady at that level till the close, registering a net gain of 25 nP over the week.

Textile shares met with selective support. Bombay Dyeings and Edward Textiles were a firm feature. The strength of the former was due to speculative support induced by rumours of a higher dividend for 1961 and a bonus issue. Opening at Rs. 69.70, as against Rs. 69.60 last week-end, the scrip advanced to Rs. 72.20 on Tuesday. Profit-taking led to a decline in the quotation to Rs. 70.50 at the close yesterday. The net gain over the week is 90 nP. Edward Textiles too attracted influential buying and jumped up by as much as Rs. 69.50 to Rs. 452.50. Mafatlal Fine continued the strident advance witnessed last week and firmed up by Rs. 70 over the week to Rs. 1,120. Centurys met with good support and improved from the opening level of Rs. 610 to Rs. 621 yesterday. The finish was, however, a shade lower at Rs. 616, the net loss over the week being Rs. 9.50. Finlays firmed up by Rs. 24 to Rs. 390. Swans put on Rs. 12.50 to Rs. 450. New Greats were marked up by Rs. 20 to Rs. 286 and Phoenix by Rs. 16 to Rs. 274. Gokaks gained Rs. 5 to Rs. 228. Bradburys put on Rs. 10 to Rs. 195. Podars picked up Rs. 5 to Rs. 158. Shreenivas strengthened by Rs. 11 to Rs. 312. Svadeshis were quoted Rs. 5 higher at Rs. 301. Khataus also found buyers Rs. 5 higher at Rs. 480. Morarjees too appreciated by a like amount to Rs. 415. Simplex gained Re. 1.50 to Rs. 174. Kohinoors fluctuated narrowly and closed unchanged at Rs. 317. Standard Mills, however, met with selling and eased by Rs. 6 to Rs. 1,135. Apollo Mills receded by 34 nP to Rs. 2.40.

Sugar shares attracted some support. Belapurs were quoted Rs. 235 *ex-div.*, as against Rs. 247.50 *cum-div.* last week-end, a net rise of Rs. 5 over the week if account is taken of the dividend of Rs. 17.50 net. Phaltans put on a rupee to Rs. 114.50. Walchandnagars hardened by Re. 1.50 to Rs. 153.50. Maharashtra Sugars were neglected at Rs. 165.50.

Among cement shares, A.C.Cs moved in a narrow groove and closed at Rs. 152.75, as against Rs. 152.25 last week-end. Digvijays met with support and improved by Rs. 3 to Rs. 204. Orissa Cements edged forward by 24 nP to Rs. 19.52.

Shipping shares were subdued. Scindias were neglected, with the quotation remaining nominally unchanged at Rs. 12.60. Great Easterns softened by 4 nP to Rs. 12.64. Among automobile shares, Premier Automobiles were quoted 50 nP higher at Rs. 140.75. Hindustan Motors put on 24 nP to Rs. 20.72.

Rayon shares depicted a divergent trend. National Rayons lacked buyers and eased from Rs. 547 last week-end to Rs. 545 yesterday, a net loss of Rs. 2 over the week. Indian Rayons eased by Re. 1 to Rs. 98. Baroda Rayons, which had gone down in the past week from Rs. 161 to Rs. 154, declined further on consistent selling to Rs. 149.50, but looked up towards the close to Rs. 153.50 due to some fresh buying. Gwalior Rayons were better by 30 nP at Rs. 55. South India Viscoses finished unchanged at Rs. 192, after being irregular in the course of the week.

Chemical shares met with good support. Indian Dyestuffs advanced by Rs. 13.75 to Rs. 561.25, Poly-Chems hardened by Rs. 5 to Rs. 235. Colour Chems shot up by Rs. 17.50 to Rs. 502.50. Synthetics strengthened by Rs. 5 to Rs. 221. Alembic Chemicals, after last week's spurt, were unchanged at Rs. 275. The directors of the Company have decided to issue one bonus shares for every 10 shares held and four equity rigat shares of Rs. 100 each at a premium of Rs. 30 for every equity and preference share held.

Engineering shares ruled firm. T.E.L.Cos. opened at Rs. 356.50, as against the previous close of Rs. 355, and firmed up to Rs. 363 yesterday before finishing lower at Rs. 361. The net gain over the week was Rs. 6. Alcock Ashdowns advanced by Rs. 5 to Rs. 368. Larsen and Toubros strengthened by 25 nP to Rs. 43.25. Jost's Engineerings hardened by Rs. 3.50 to Rs. 100. New Standard Engineerings rallied by a like amount to Rs. 223.50. Mahindra and Mahindras improved by 64 nP to Rs. 21.88.

Miscellaneous industrials presented a mixed nattern. Bombay Burmahs met with selling and receded from Rs. 651.50 last week-end to Rs. 647.50 on Monday but finished higher at Rs. 650.50 today, showing a net loss over the week of one rupee. West Coast Papers eased by Rs. 2.50 to Rs. 175.50. Premier Tyres lost a like amount to Rs. 152.50. Shivrajpur Syndicates softened by 50 nP to Rs. 42.50. Wimcos, on the other hand, attracted buyers and hardened by Rs. 3 to Rs. 313. Likewise, Anil Hardboards strengthened by Rs. 3.75 to Rs. 240. Hindustan Levers were fully steady at about Rs. 68. Voltas wound up the week Rs. 2 higher at Rs. 304.

Calcutta Stock Exchange

CALCUTTA, *21st February*

Thanks to a number of bonus and rights issues and to indications of better working of companies resulting from expansion and diversification, activity on the Stock Exchange enlivened during the week under review, though the country-wide elections and the emphasis on socialism in election speeches imparted caution leading to intermittent profit-taking and reducing overall gains. Shortage of funds was acutely felt, and such a phase was expected to continue, as the number of new issues would absorb a good portion of floating funds also. The possibility of increased taxation restrained long-term commitments, and it was apprehended that bonus issues would be a target in the forthcoming budget. That explained for quite a few bonus issues at the present time. Speculation in the newly-listed forward counters led to gains, but Indian Irons tended bearish, in view of the delay in announcing the new retention prices. Cotton mills were in the forefront, in view of better working. Gardens producing quality teas were thought to be working well and that accounted for the selective interest in this section. Miscellaneous industrials advanced and, though institutional support was meagre, shortage of scrips lent support to the steadying influence. Jutes consolidated recent gains, as the view that mills are doing well is widely shared. Coals did not participate in this week's steadiness, thanks to the difficulties facing the industry.

Among cottons, J.Ks, benefiting from replacement buying, hardened from Rs. 20.37 to Rs. 21.37. Elgins, after being fractionally higher at Rs. 26.06, eased to close at Rs. 25.50, that is, 31 nP lower than the opening. Bowreahs eased from Rs. 40 to Rs. 39.62 and Dunbars from Rs. 35.81 to Rs. 35.62.

Coals were neglected. Burrakurs were unchanged at Rs. 17.50, while South Karanpuras hardened from Rs. 7.64 to Rs. 7.69. Pench Valleys recovered from Rs. 15.62 to Rs. 15.94, but Raneegunges at Rs. 15 were fractionally lower.

Jutes mustered support at advancing prices. Anglo-Indias at Rs. 221 recorded a further gain of Rs. 6, while Barnagores after slipping by one point were firm at Rs. 139. Northbrooks were better at Rs. 32.75. Kanknarrahs, after adding two points to Rs. 94, closed at Rs. 93. Ballys forged ahead from Rs. 237 to Rs. 264. Keen interest pushed up New Centrals by Re. 1.12 to Rs. 19.12. A reaction reduced Birlas from Rs. 35 Rs. 34.69. Lansdownes at Rs. 136 recorded a ten-point rise. Aucklands at Rs. 169 scoring Rs. 4.

Among engineerings, sellers of Guest, Keen, Williams turned to their advantage the rumour of a bonus issue which was reflected in the quotation impressively rising to as high as Rs. 45.94 from Rs. 42.56 earlier. Indian Irons opened at Rs. 25.16 and rose to Rs. 25.56. Texmacos, under speculative impetus, put on a handsome gain at Rs. 21.30. Burns were better at Rs. 560. Considered interest picked Jessops from Rs. 23.22 to Rs. 23.69, but profit-taking soon reduced the gain to Rs. 23.94.

Paper mills received better attention. Titaghurs were fully steady at Rs. 43.31, following the proposal to issue to existing shareholders one bonus share for every two held and two right shares for every three shares at a premium of Rs. 5 per share. Orients, after rising from Rs. 41.30 to Rs. 42.50, closed firm at Rs. 42.15.

Among teas, Huldibaris, following the news of official sanction for a bonus issue, were firm at Rs. 32. New Dooars were unchanged at Rs. 286. Bagamaris were pushed up from Rs. 20.87 to Rs. 21.12 and Hasimaras from Rs. 32.12 to Rs. 32.94. Jutlibaris, however, were lowered from Rs. 34.06 to Rs. 32.

Among miscellaneous shares, keen interest pushed up Orissa Cements which were taken at Rs. 19.62, as against Rs. 18.56 earlier, while Kesoram Industries shed from Rs. 35.56 to Rs. 34.87, on profit-taking. Following dividend of Rs. 2.75 a share, Martin Burns were as high as Rs. 34.75, as against Rs. 32.75 earlier, while profit-taking in East Anglia Plastics reduced the recent gain and brought the rate down to Rs. 30.87. Dunlop Rubbers were steady at Rs. 43.44, as the proposed rights issue was thought to be on the heralding. Interested buying lifted National Insulated Cables from Rs. 38 to Rs. 44.50. The company has sought official permission for capitalising Rs. 45 lakhs from the general reserve of Rs. 90 lakhs and issuing bonus shares to existing shareholders in the ratio of one new share for every two shares.

* * * *

Madras Stock Exchange

MADRAS, *21st February*

Barring textiles which tended to move up on investment support, equities on the Stock Exchange ruled dull during the week under review. Operators were not inclined to extend their commitments either way, in view of the General Elections. There were no encouraging developments of import to the market this week. The Prime Minister's caustic observations regarding expansion of public sector and the role of stock exchanges adversely affected the sentiment of the market. Tea shares lacked support, notwithstanding reports of higher prices at auction centres. In sympathy, rubbers and coffees were quite. Sugars encountered selling, in view of the persistently low level of sugar prices. Activities in the miscellaneous section was considerably restricted, only shares of well-known companies eliciting some enquiries.

Textiles, as stated at the outset tended to move up on hopes that the financial results of many mills for the year 1961 would show an improvement. Vasants spurted by Rs. 13 to Rs. 310. Vijaylakshmis picked up Rs. 3 to Rs. 110. Lakshmis gathered a like amount to Rs. 117. Buckinghams were done at Rs. 262, as against Rs. 259, and Cannanores at Rs. 172, as against Rs. 168. Rayalaseemas hardened by Rs. 2 to Rs. 165. Coimbatore Spinnings rose by a like amount to Rs. 83. Loyals gained 60 nP to Rs. 49, Pankajas 50 nP to Rs. 93.50 and Cauvery Spinnings 25 nP to Rs. 16.75.

Among sugars, Jaypurs declined by 45 nP to Rs. 14.50. Deccans and Indias shed 10 nP each to Rs. 9.90 and Rs. 10.40, respectively. Andhras were dull at Rs. 22.90, as also Kirlampudis at Rs. 71, K.C.Ps at Rs. 22.95 *ex-div.*, Travancores at Rs. 8 and Kotharis at Rs. 7.90.

In the planting section, Highlands dropped 35 nP to Rs. 13.40. Parksides fell by a rupee to Rs. 24. United Nilgiris receded by 88 nP to Rs. 21.62. Coonoors were done at Rs. 25, as against Rs. 26 last week-end. Kallas lost 5 nP to Rs. 5.30. Waterfalls shed a like amount to Rs. 2.45. Valkundams were neglected at Rs. 13.12, Rajagiris at Rs. 18.94, Nonsuchs at Rs. 23.50, Malankaras at Rs. 16.90, Kalpettas at Rs. 12.10 and Devasholas at Rs. 30.30. Balanoors, however, met with special support and rose by Re. 1.25 to Rs. 13.75. Kumergodes were also well fancied and improved by 20 nP to Rs. 4.50. Midlands put on 10 nP to Rs. 11 and Twyfords 5 nP to Rs. 10.80.

In the miscellaneous section, Hindustan Levers attracted good attention of operators and strengthened by Rs. 8.75 to Rs. 68. Western India Plywoods spurted by Rs. 5 to Rs. 215. Orissa Chemicals rose by 85 nP to Rs. 19.10. Travancores gathered 25 nP to Rs. 18.50. Andhra Cements picked up 10 nP to Rs. 9.50. Mysore Papers came in for selling and declined by 75 nP to Rs. 14.25. Loyals eased by 30 nP to Rs. 30.87. Spencers dropped 15 nP to Rs. 23.25. Rallis were dull at Re. 1.52, as were Standard Motors at Rs. 16.60, Textools at Rs. 189, Tube Investments at Rs. 282, Madras Cements at Rs. 91, F.A.C.Ts at Rs. 8.35 and Binnys at Rs. 310.

(Concluded from previous page)

in the Coffee Federation of America (that is, all the Latin American coffee-producing nations with the exception of Brazil and Colombia), it is said, will be at liberty to join the scheme at a later date. It may be noted here that the Federation members export approximately eight million bags of coffee annually, of which Mexico and the other five Central American countries account for 70 per cent.

The U.S. Government officials, however, do not appear to be optimistic regarding the operation of the regional coffee plan, for it is felt that the effectiveness of the Seasonal Fund will be limited by the fact that its support of the market will be only for short periods. In their opinion, a more lasting stability in the world coffee market cannot be achieved except through a long-term agreement. At any rate, the U.S. officials maintain that it is necessary to fulfil certain other requisites and that the Federation countries should agree to (1) try to obviate production surpluses by abstaining from planting new coffee trees, (2) make every effort to persuade exporters to observe the export quotas assigned to them, and (3) levy production taxes as a means of discouraging expansion of coffee output.

So far as India is concerned, the benefits that will accrue from its joining the International Coffee Agreement are not obvious. The country, however, must keep a close watch over the developments in the world and make sure that no new discriminatory arrangements are concluded in the name of stabilising the price of this beverage. After all, it must be remembered that India has to depend on commodities like coffee for earning the badly needed foreign exchange. While India cannot be a party to any move which tends to encroach upon its right to regulate its coffee production which, by world standards, is still small, it will doubtless be ready to co-operate in efforts designed to bring about higher world consumption of coffee.

NEWS IN BRIEF

THE "lame duck" session, the last and concluding session of the present Lok Sabha, will commence from 12th March next.

The State Bank of India opened its second branch in Goa on the 14th inst. at Vasco da Gama, the first one having been opened at Panjim in January last.

Owing to the constructional defects of the Bhakra-Nangal project a loss of Rs. 188.12 lakhs has been incurred since its inception, according to the latest work audit report on the project.

The Union Government has reconstituted the Development Council for Art Silk Industry, with Mr. A. R. Ramanathan, Chairman, Travancore Rayons Ltd., Madras, as the Chairman. The tenure of the Council is for a period of two years.

The State Government of Punjab has decided to set up a modern co-operative tea factory at a cost of Rs. 5 lakhs, near Baijnath, Kanga district, during the next financial year. Tenders for the purchase of plant and erection of the factory have already been invited.

Tools manufactured by the State-owned Hindustan Machine Tools are expected to be exported to the U.S., according to Mr. K. C. Reddy, Union Minister for Commerce and Industry. A sales agency is being established in the U.S. for this purpose.

A 7-mile, 14.33-million-ton graphite belt has been located by the Geological Survey of India at Uritehsil, Kashmir. The graphite is likely to provide raw material for the manufacture of paint, varnishes and pencils. The reserves have been calculated upto a depth of 100 feet with an average fixed carbon content of 10.06 per cent.

The total area under rubber in India at the end of 1960 is placed at 321,002 acres. Of this, Kerala accounts for 95 per cent, that is, 303,021 acres, Madras 13,610 acres, Mysore 3,949 acres and the territory of Andamans 422 acres. The production of natural rubber has increased from 17,422 tonnes in 1951 to 25,192 tonnes in 1960.

The Eagle Vacuum Bottle Manufacturing Company will be setting up a glass plant, in the near future, at a cost of Rs. 5 lakhs in Thana, in collaboration with the Eagle Company of Japan. The factory will manufacture glass shells for refills for vacuum flasks as well as pressed, blown and decorated glassware. The plant is expected to go into production towards the end of this year.

A survey of paint industry, for ascertaining the unit production cost of each class of manufacture is to be undertaken by the Government of India. Such a survey, it is claimed, will be useful to those whose unit production cost is higher to regulate the cost of production and to eliminate wastage. The survey is expected to be undertaken either by Technical Co-operation Mission (T.C.M.) experts or by the personnel of the National Productivity Council.

The Government of India has decided to offer some export incentives from April next. Accordingly, in a circular to trade bodies, it has advised the exporters to enrol themselves under the incentives scheme. Those exporters who are not entitled under the scheme before 31st March will not be entitled to the incentives. The circular does not, however, specify the nature of incentives to be offered.

The Maharashtra State Warehousing Corporation is expected to open 10 warehouses during the next financial year. The Corporation at present has 40 warehouses. All the warehouses have been opened in hired accommodation to begin with, but the Corporation has also undertaken construction of new buildings to replace the hired accommodation. New warehouses have already been completed at Dhulia, Dondaiche, Amalner and Karad. The new warehouse at Karad also provides for storage of *gur*. Construction is now under way at Vijapur, Nandurbar, Barsi and Nanded.

With the increase in the total employment offered by foreign firms between 1954 and 1961, the number of Indian officers, as also their percentage, has been increasing every year. Their number rose from 3,455 in 1954 to 10,229 in 1961, while the percentage of officers increased from 33.0 to 70.1 in the same period. In contrast to this increase, the number of non-Indians has been on the decline since 1954 and stood at 4,364 in 1961 as against 7,008 in 1954, their percentage in the total employment being reduced from 67.0 to 29.90.

Twenty-four tank wagons of Ankleshwar crude, the first shipment of indigenous crude to Stanvac refinery, have arrived at the refinery site. With the unloading of the cargo from Ankleshwar, Stanvac refinery commissioned into service its newly installed facilities to discharge the crude from the tank wagons, to pump it into the storage tanks, and to feed it into the processing unit. When the full quota of Ankleshwar crude starts coming, the Stanvac refinery will be processing approximately 5,000 tons of Persian Gulf crude and 600 tons of Ankleshwar crude every day. The total saving of foreign exchange on account of processing Ankleshwar crude at the Stanvac refinery will be Rs. 1.35 crore per year, as the crude imports from the Persian Gulf will be reduced to that extent. The present agreement for processing Ankleshwar crude will be in effect for 2½ years from 16th February 1962.

An industrial licence for manufacturing 19,800 tons per annum of all types of silico-manganese alloy steels has been granted to Messrs. Gangadhar Baijnath of Kanpur who control the Bagla Group of industries. The factory will be located at Kanpur where a suitable land is under acquisition. The U.P. Government has agreed to meet the requirements of electric energy estimated to be 10,000 K.V.A. Negotiations for financial and technical collaboration with a leading alloy steel manufacturer on the Continent are nearing the final stages. The collaborators will supply the plant and machinery, erect the plant, supply technical know-how for the next five years including training of Indian technicians in their works. The project is estimated to cost Rs. 2½ crores and will be the largest alloy steel plant in northern India in the private sector. A public limited company will be floated to undertake the project and shares will be offered to the public in the near future.

From Abroad

The Government of Jordan has lifted all restrictions on imports of cars, radios and gramophone pick-ups, recorders, refrigerators, cheese, canned foods and certain other goods.

The uranium and radium mines at Urgeirica in Northern Portugal, which have been exploited by an all-British company since 1950, will be handed over to the Portuguese Nuclear Energy Board next month.

An official decree issued by the Government of Poland provides for a tighter wage policy, including cuts in overtime and factory bonuses for some 7.5 million workers. Further, with effect from April next, the wage increases will be linked directly to higher output.

The European Investment Bank has announced its second public issue, the first having been issued in the Netherlands market in July last. The issue amounts to 15,000 million Italian lire, in the form of 15-year 5 per cent bonds for public subscription at par, redeemable at par in 1977. Coupons and bonds due will be payable in Italian lire, or at the request of the member-banks of the syndicate for account bearers, in currencies of other member-countries at the official middle rate of exchange.

The Government of South Korea has approved for the first time of private foreign investment in the development of gold, silver and copper fields. The International Consolidated Mining Company of New York will invest one million dollars through a Korean Mining Company this year primarily to mine gold. The Government has stipulated a condition that the refining must be done within South Korea and that only Koreans must hold the mining rights.

PERSONAL

MR. M. P. Mathur, India's Ambassador to Czechoslovakia, has presented his credentials to President Novotny.

Lord Bicester, Mr. Geoffrey C. R. Eley and Sir Alfred Roberts have been reappointed Directors of the Bank of England for four years with effect from 1st March next.

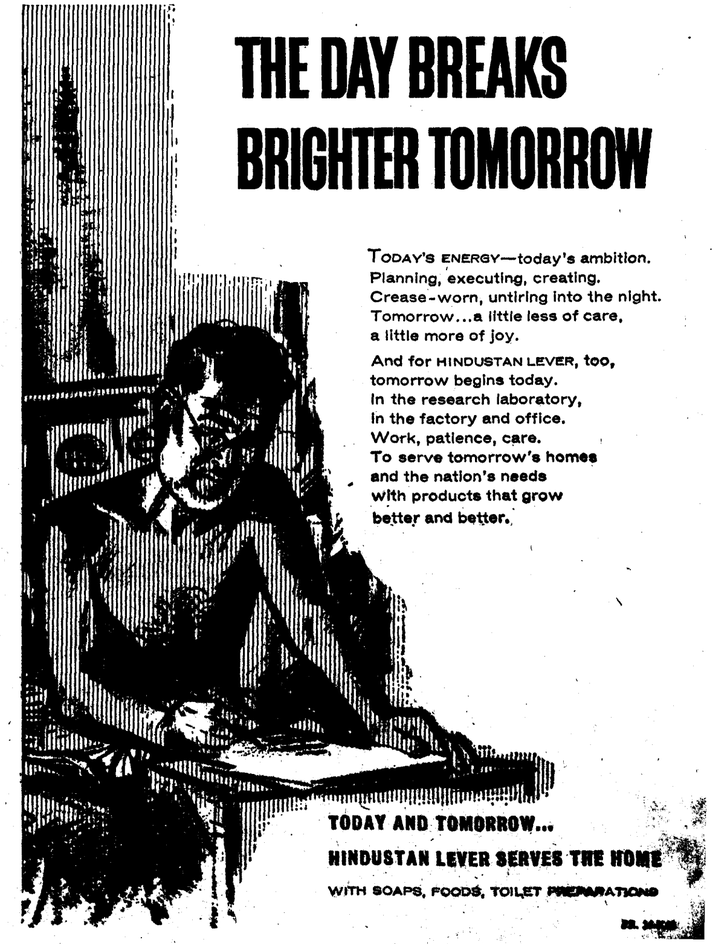
Mr. William H. Weathersby, Director of the U.S. Information Service in India, arrived in Bombay on the 18th inst. from New Delhi for a three-day visit.

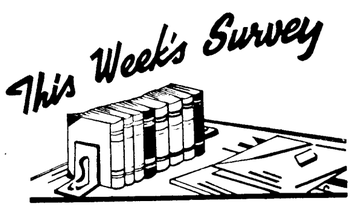
Mr. P. J. Engineer and Mr. G. D. Modi have been elected President and Vice-President, respectively, of the Association of Merchants and Manufacturers of Textile Stores and Machinery, India, for the year 1962.

Messrs. H. R. Nevatia, Vithaldas Rathi and B. P. Maheshwari, have been elected President, Senior Vice-President and Junior Vice-President, respectively, of the Nag-Vidarbha Chamber of Commerce, Nagpur, for the year 1962.

Mr. H. Mackay Tallack and Mr. A. R. Foster have been elected President and Vice-President, respectively, of the Bengal Chamber of Commerce and Industry for the year 1962-63. Messrs. F. A. Collett, J. W. Easson, J. V. Jardine Patterson, H. K. S. Lindsay, A. I. Murison, A. D. Ogilvie, D. C. B. Pilkington, S. M. Smith and I. G. Thomson have been elected as members to the Committee of the Chamber.

Kuwait will soon have a petro-chemicals industry. A new company, known as the Kuwait Petrochemical Company, has been established with a capital of £16 million, of which 40 per cent has been subscribed by the Kuwait Government, 40 per cent by de Nora Associates, and the balance of 20 per cent by the Kuwait National Petroleum Company, and the public. It is proposed to install at Shaiber, near the oil port of Ahmadi, a plant which will use such basic raw materials as natural gas and salt. The main products to be manufactured are urea, polyvinylchloride, caustic soda and chlorine derivatives. In future, it has plans to produce methanol, ammonium nitrate, acetic acid, carbon black, formaldehyde and chloroparaffins. As Kuwait will absorb only a small quantity of these products, the bulk of the production will be exported, the main market being in the Far East and Africa.





EASTERN INDIA'S PRESSING NEEDS

THERE is a growing doubt whether Eastern India will be able to maintain the rate of industrial growth which it has been able to record in the last decade. In raising this doubt in his presidential speech at the annual general meeting of the Bengal Chamber of Commerce held at Calcutta on the 16th inst., Mr. N. Stenhouse had before him a picture of bottlenecks pertaining to power, coal, transport and raw materials. The picture presented by him was by no means overdrawn, for these bottlenecks have persisted for more than a year now and threaten to continue into the immediate future. In the first place, according to Mr. Stenhouse, the existing supplies of electric power are uncertain in West Bengal and Bihar, in general, and in the Calcutta industrial area, in particular. Even now, mills and factories in the Calcutta area have to work staggered holidays—a form of rationing. More stringent rationing of power might again become inevitable in the current year as well as in the next, for demand from both existing and new customers for power would be continuously in excess of supplies and it would be some years before the proposed increases in the D.V.C.'s generating capacity and in that of other power stations in the area flowed along the power lines to industry.

There is, next, the acute problem of transport in respect of coal movement in the area. Here it is not only a question of physical difficulties faced by local consumers who have to take coal by bad and overcrowded roads upto 150 miles. But it is also a question of increased cost by way of the additional cess levied on all coal leaving the collieries for the purpose of subsidising the transport of coal by sea to Southern and Western India and by way of the higher road haulage charges which are often 2½ to 3 times the rail freight rates. Mr. Stenhouse is wholly justified in the case he has advanced for a subsidy for road-borne coal. But it is doubtful whether his plea for freeing such coal from the payment of the freight subsidy levy has equal justification. By far the fairest compromise would be to subsidise road transport of coal too, till such time as the railways are in a position to move more coal.

Mr. Stenhouse's reference to the difficult problem of obtaining wagon space in any reasonable period of time for the movement of other commodities into and from the Calcutta industrial area is quite pertinent. Here, too, the official tendency is to sacrifice the vital interests of industries in this area "at the altar of administrative emergency." How shortsighted such an approach is will be evident from the following passage from Mr. Stenhouse's speech:

"In a situation such as we find ourselves, there is a strong tendency for the interests of the 'haves' to be sacrificed for the sake of the 'have-nots.' Egalitarianism may have its place in politics and social economy but, in my view, it is fatal to try to ignore differential regional, natural and physical advantages. That is probably accepted by all as good long-term economics, but the danger of the present situation is that stop-gap short-term remedies are being imposed which will, in the long-term, seriously harm the interests of Eastern India, particularly of Greater Calcutta. For, in the long-term, to try to maintain high-cost producers in areas where industry is not naturally favoured merely means, in national terms, less efficient utilisation of our natural resources than could be otherwise achieved."

The locational advantages of industries in Eastern India would need to be fully used for another reason too. This is the need for maintaining, and even expanding, the *relatively* low-cost exports from Eastern India through the Calcutta port which has traditionally been the largest Indian exporting centre. But here, again, there is a serious bottleneck. This pertains to the deteriorating conditions in the river Hooghly which is Calcutta port's outlet to the sea. While generous financial assistance has been promised for the investigation of the river's capricious points and for the planning of the subsidiary port at Haldia, implementation of all the related projects, including the **Farakka** barrage, does not seem to be quite fast and energetic. There is still insufficient recognition of the fact that Calcutta and its outlets to the sea are a national heritage and that the works required to maintain and improve them should be regarded as such. A sense of urgency is called for, in this connection, if Calcutta is not to be regarded by shipping lines as one of the most expensive ports in this part of the world and if more exports of jute goods, tea and engineering goods are to be effected and more coal is to be transported by sea to Southern and Western India. There can, therefore, be no two opinions on the strong plea made by Mr. Stenhouse for greatly increasing the efficiency and serviceability of the Calcutta port as a matter of high priority.

JAYANTI SHIPPING COMPANY

Registered in February 1961 as a private limited company, the Jayanti Shipping Company has made its debut in the private sector of Indian shipping in a daring and enterprising manner. Its purchase of a 20,000-ton Norwegian tanker and its initial order with a Japanese shipbuilding company for the construction of two ships on deferred payment terms have come in for a lot of critical attention and scrutiny in recent months in shipping circles. The negotiations of this Company with the statutory Shipping Development Fund Committee for a big loan have also been reported in the Press off and on and followed with not a little anxiety by the spokesmen of some older shipping concerns in the private sector. But there is no longer any need for speculation over the so-called "mysterious" doings of the controversial newcomer in the shipping field, for the Government has just published all the relevant provisions of a loan agreement, signed on the 18th instant, between the Shipping Development Fund Committee and the Company.

Under this agreement, the Shipping Development Fund Committee has agreed to advance a loan of Rs. 20.25 crores to the Jayanti Shipping Company for the acquisition, before the end of 1964, of about 13 new cargo ships aggregating 200,000 g.r.t. The loan is equivalent to 90 per cent of the cost of acquisition of the 13 ships on deferred payment terms. The terms and conditions laid down in the loan agreement are as follows:

(1) The Company should raise its paid-up equity capital to Rs. 1.5 crore before it can become eligible for any portion of the loan. Thereafter, the Company will have to build up its equity capital progressively upto Rs. 5 crores as further instalments of the loan fall due. A debt-equity ratio of 4 : 1 is to be always maintained by the Company.

(2) The Company should convert itself into a public limited company within a period of one year from the date of the signing of the loan agreement or immediately before the first instalment of the loan is due for payment, whichever is earlier.

(3) The entire loan amount will be secured by first mortgage of all the ships to be built and will be repayable in 18 years commencing from the date of receipt of the first instalment of the loan. The State Bank of India will issue a guarantee to the shipyards concerned in respect of the payment of 90 per cent of the price of the ships in eight annual instalments.

(4) The effective rate of interest for the entire loan of Rs. 20.25 crores will be at the rate of 3 per cent per annum.

(5) A nominee of the Committee will function on the Board of Directors of the Company for the entire duration of the loan. The Company is to comply with Section 21 of the Indian Merchant Shipping Act 1958 in regard to the quantum of foreign participation in equity capital and the composition of the Board of Directors. In addition, the Chairman or the Managing Director is to be a resident Indian national.

(6) All the ships should be manned by Indian crew from the beginning.

The above terms and conditions governing the loan are *prima facie* strict, if not very stringent, in every respect. The debt-equity ratio of 4 : 1 may seem to be unduly generous to the Company. But this is neither unusual nor unreasonable for a shipping company of a country which has still a lot of leeway to make up to attain its rightful place in world shipping. Further, it must be remembered here that the lending agency's position is fully safeguarded by the provision that it will have the first charge on all the 13 ships to be acquired by the Company. In view of the provision for the State Bank's guarantee to the shipyards concerned, there is no question of the latter having the first charge on the ships. Incidentally, a noteworthy feature of the order for eight bulk carriers placed by the Company on the Mitsubishi Shipyard in Japan is that no payment in respect of a ship is to be made to the Shipyard until the ship is delivered; the first payment is 10 per cent of the price of the ship and, when this payment is made, the ship will be in a position to earn or save foreign exchange to the country.

The concessional rate of interest is no different from what the Government has fixed in respect of all loans granted by the Shipping Development Fund Committee for acquisition of ships by any company. The condition that the Company should convert itself into a public limited company within a specified period is most salutary. If, in the context of the massive State support given to the Company, it attracts more equity capital, it will not be surprising. The debt-equity ratio may then be actually more favourable from the point of view of the lending agency. The foreign participation visualised by the Company will be subject to the regulatory provisions of the Indian Merchant Shipping Act. It may, therefore, be validly presumed that it will not be repugnant to the national character of the Company; if anything, it may do good by bringing in some fresh enterprise and technical knowledge in the field of tramping in which the Company, with its proposed fleet of five tramp ships, will be partly operating. The provision regarding employment of Indian crew is also good, for as many as 700 seamen of various ranks will be absorbed by the Company. Since the Government has laid down the terms in a pretty strict manner and the statutory Shipping Development Fund Committee is within its rights in granting the loan without consulting any other body or agency, it may be a wise thing for the private sector of shipping to welcome the new company at least on the ground that, by adding eight bulk carriers and five tramp ships, it will be making a significant contribution to the growth of Indian mercantile marine, besides imparting a certain amount of balance to the fleet. It is, indeed, gratifying to find that, instead of entrusting more responsibilities to its own Shipping Corporation, which it could have done had it so desired, the Government has given one more opportunity to the private sector. This is a welcome addition to the very few recent instances of pragmatism in the implementation of the Government's economic policies.

PASSPORTS TO WORLD TRADE

Three Banks have merged. Separately, they have large assets, a fine tradition and a wealth of experience. United, they offer a comprehensive service in all matters affecting business between India and any part of the world. Their advice and help are your surest "passports" to profitable trade with those areas.

WORLD RICE SITUATION

Out of every hundred tons of rice produced in the free world, the share of India alone comes to as much as 32 tons. The actual output of rice (milled) in India during 1960-61 is estimated at nearly 34 million tons, as against the aggregate free world production of 107 million tons. Indeed, India is the second largest producer of rice in the whole world, next only to Mainland China. But it consumes all the rice it produces, leaving nothing for export. In this respect, it is unlike other countries in South-East Asia, especially Burma, Thailand and South Viet Nam, the rice economy of which is predominantly export-oriented. Indeed, India has been an importer of rice in recent years, as its production has been insufficient to cope with the needs of its rapidly expanding population. Accordingly, India is not isolated from the trends in world markets and is naturally awaiting the outcome of the sixth annual meeting of the F.A.O. Consultative Sub-committee on Rice now in session at Rangoon. The deliberations of the meeting will certainly provide a clear picture regarding the current world situation, the outlook for trade in the rest of the 1960s and the methods of reducing instability in world rice trade.

Among some of the documents prepared for the Rangoon meeting by the F.A.O. Secretariat is a special study which makes certain interesting statistical projections in regard to the pattern of world rice economy in the next four years. These projections point to the possibility of a comfortable supply position. The free world production of rice by 1965 is expected to be higher by 25 per cent over the average for 1956-59, whereas actual demand is likely to increase by 21 per cent. The total output of milled rice in 1965 is estimated at 106 million tons (157 million tons in terms of paddy), as against the average annual harvest of 85 million tons (126 million tons of paddy) during the years 1957-58 and 1958-59, and consumption at 104 million tons, as against 85 million tons.

The anticipated rise in rice production, we are told, will accrue largely from an improvement (of as much as 16 per cent) in the yield per hectare and partly also from an increase (of 7 per cent) in acreage. This means a rate of rise in paddy production of 3.5 per cent per year, almost double the average rate of increase in the five years preceding 1957. Such a rate of increase, according to F.A.O., "will be well ahead of the expected world population growth of about 2 per cent annually." Within the global increase, production in the Far East is expected to rise by 25 per cent or four million tons of paddy per year, the total output by 1965 being put at 130 million tons of paddy. The percentage increase in output elsewhere is placed at 23 for Near East, 20 for Africa and 30 for Latin America.

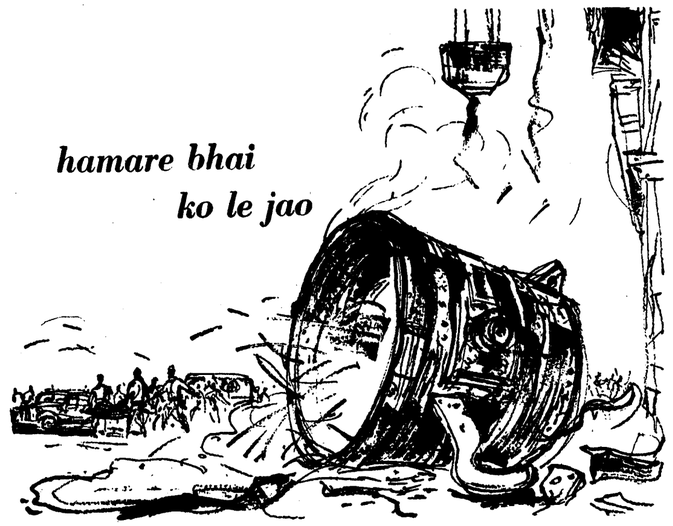
Examining the prospects from the consumption angle, the F.A.O. study refers to the several factors that affect demand, namely, population, incomes, prices, competition from other food crops, marketing and distribution arrangements, and use of rice for animal feed and such industrial purposes as making starch and beer. The population increase is assumed to be largely in accordance with the estimates made by the U.N. and its regional commissions as modified by the results of recent censuses. For instance, the actual rate of increase in recent years or as planned by individual countries has been taken into account. The retail prices in real terms and the price of rice relative to competing foods like wheat are assumed to be the same as in the base period 1957-59. The marketing policies followed by Governments and the preference of people for rice are also assumed to remain unchanged.

It is, however, somewhat doubtful whether these assumptions are justified, what with the recent changes in prices and marketing policies in some of the countries. One such change pertains to the extension of the European Common Market dispositions to agricultural products. Drawing attention to this extension, the delegates of South Asian rice producing countries to the Rangoon meeting have expressed fears that it may harm their sales of rice to the West European centres (mainly Holland and West Germany) which together buy about 5 per cent of the world total rice sales. It is apprehended that Italy may become the exclusive supplier of rice to the countries within the framework of the Common Market. Indeed, the delegates have urged that recommendations be made in the F.A.O. report to be drawn up at the meeting to avoid such a danger.

Be that as it may, the analysis of the demand potential for rice in the different regions, as made by the F.A.O., shows that the actual extent of the rise in requirements in 1965, as compared with 1957-59, will be of the order of 25 per cent in Latin America, 21 per cent in the Far East, 20 per cent in Africa and the Near East, and 10 per cent in West Europe and North America. The net increase in rice consumption in 1965 over 1957-59 is estimated at 18 million tons in terms of milled rice (computed on the basis of an average increase of 2.8 per cent per annum), the rise in population accounting for 13 million tons and rising incomes for 5 million tons. An interesting conclusion arrived at in the F.A.O. study is that rising incomes do not appear to make much difference to rice consumption in exporting countries, since the *per capita* consumption in most of these countries is already fairly high. It is not surprising that the share of these countries in the total net rise of 18 million tons in the consumption of rice is put at no more than 4 million tons, whereas the importing countries are expected to consume 14 million tons more in 1965 than in 1957-59. If these estimates turn out to be correct, the countries with a surplus of rice will be able to fare better in their plans for economic development.

COTTON PRODUCTION DILEMMA

The dominant theme of the brief but stimulating speech delivered by Mr. Madanmohan R. Ruia, President of the East India Cotton Association, at the fortieth annual meeting of the Association held in the City on Monday, was the recurring crisis of cotton shortage and the measures to deal with it. He observed that, considering the sharp fall in production during the season from 5.4 million bales last year to as low as 4.3 million bales and the upward trend of consumption, estimated to aggregate 5.5 to 5.7 million bales



It happened some years ago in the steel melting shops at the Jamshedpur works. A large ladle, carrying 75 tons of molten iron, suddenly crashed to the ground with a deafening noise from an overhead crane. The spattering sparks and red-hot metal seriously injured a number of brick-layers working at what seemed to be a safe distance. The air was rent with the frenzied shouts of the men and the hissing of steam.

The first ambulance could remove only five of the injured to the hospital. General Manager Keenan could take only three more in his car. He chose the three who had a better chance of survival than the rest. One of these men, a Hindu worker, however, refused to go. "Do not take me away", he said. Disregarding his own agony, he feebly nodded towards a half-burnt Muslim colleague, and said: "*Hamare bhai ko le jao.*" As Keenan recalls, "The Hindu who was in pain and danger of death remembered, not that the Mohammedan was of a different faith, but that he was his brother."

This feeling of comradeship, born of the common bond of labour, is the spirit that characterises Jamshedpur, where industry is not merely a source of livelihood but a way of life.

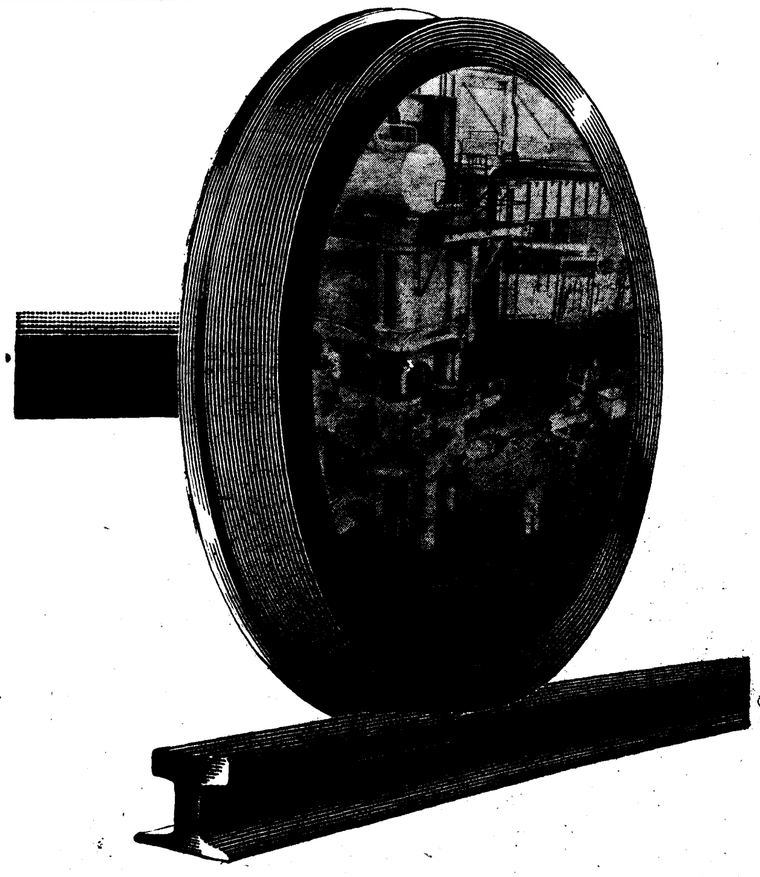
during the season, heavy inroads would be made into the carryover stocks to a level which would be precariously small at the end of the season. More imports of foreign cotton than has been bargained for are obviously the best solution in the present circumstances. But Mr. Ruia recognised the difficulties in the way of imports, including scarcity of foreign exchange. This state of affairs inevitably led him to the conclusion that the country was in the midst of a crisis and the position, to quote Mr. Ruia, was "alarming." He, however, appealed to the trade and cotton textile industry to co-operate with the authorities who were doing their best to ensure an equitable distribution of the available supplies in a manner that would not lead to an increase in the price of cloth.

The long-term solution to the problem of cotton shortage, as also to all the ills of the cotton trade, also figured in Mr. Ruia's speech. He said the solution lay in stepping up the domestic production of cotton. None can disagree with both Mr. Ruia's diagnosis and prescription. But how to bring about the increase in production is the real problem. This could be done, according to Mr. Ruia, (1) by giving farmers a price incentive and (2) by helping them to increase the yield per acre. While we agree with what he said on the yield per acre, it is the way in which he seeks to apply the solution that is open to objection. He continues to maintain that it is the lack of price incentives that has been responsible for cotton production not keeping pace with demand. We do not think that failure of cotton production to come up to expectation is due to any defects in the ceiling prices of cotton; it is, on the other hand due to adverse weather and the failure of the Government, Central or State, to place the wherewithal of production such as better seed, irrigation, more fertilisers, etc., in adequate quantities, at the disposal of farmers. Unless, therefore, energies are bent more vigorously in this direction, price incentives, however attractive, will not produce the desired result. That price is not the decisive factor in cotton production is evident from the fact, which Mr. Ruia himself recognises, that, in spite of wide fluctuations in prices, the acreage sown to cotton has remained practically unchanged for many years. This indicates that every year the farmer has been sowing more or less the same area to cotton, irrespective of price. This, however, does not necessarily mean that prices in a particular season do not influence the acreage devoted to the crop in the following year. But far more than price, it is the other factors that influence production and price adjustments should not, therefore, be given priority over other measures as a means of increasing production. A straight increase in the maximum price of cotton will only bring more area under this crop to the detriment of other crops. Surely, India has far more acreage under cotton than it can afford. To aggravate this evil would be foolish.

The more urgent need is to increase the yield per acre which, as Mr. Ruia rightly pointed out, is one of the lowest in the world, being only 93 lbs. per acre (on an average for the country as a whole), as against 231 lbs. in Pakistan, 267 lbs. in Sudan, 446 lbs. in the U.S., 542 lbs. in Egypt and 604 lbs. in the U.S.S.R. Mr. Ruia put forward three suggestions to increase production: (1) Government should put in some extra effort to help farmers to increase production; (2) cotton should be included in the "package plan" for agriculture, so that supplies of fertilisers, pesticides, etc., could be adequately provided; and (3) priority should be given to production of cotton in new areas brought under irrigation. While wholeheartedly supporting these suggestions of Mr. Ruia, we would like to throw one of our own. Neither Mr. Ruia's Association, which is the premier organisation of cotton traders in the country, nor the Cotton Buyers' Association, of which also Mr. Ruia is the President, or even the Indian Cotton Mills' Federation representing the millowners, whose fortunes are intimately bound up with that of cotton, has, to our knowledge, taken the initiative to demonstrate to the farmers and to the Government that yield per acre of cotton could be improved if better seeds, more fertilisers, and better cultural practices were adopted. The Indian Jute Mills' Association proposes to do this in respect of jute. Why not cotton interests too do likewise? Surely, example is better than precept.



Wheels for the Railways

The Wheel and Axle Plant at the Durgapur Steelworks is now ready to go into operation. Initially, the plant will manufacture a total of 45,000 wheel sets per year, including broad and metre gauge, for the Indian Railways. The ultimate rated capacity of the plant is 75,000 wheel sets and 8,000 spare axles per year.

With the erection of the Wheel and Axle Plant, the Durgapur Steel Works Project is now complete and stands as a lasting tribute to Indo-British collaboration.

BRITISH COMPANIES WORKING FOR INDIA

ECONOMIC OUTLOOK FOR U.K. OPTIMISTIC

EQUILIBRIUM IN BALANCE OF PAYMENTS

(From Our Own Correspondent)

LONDON, *17th February*

LONDON LETTER

THE principal City feature these days is the strength of the pound sterling which even the poor January trade returns could not upset. A part of the strength stems from the stubbornness of the Bank of England in maintaining high interest rates and the well-known grip which the Bank and the Chancellor of the Exchequer between them have managed to impose on the banking system to keep credit tight. Even the protagonists of devaluation are obliged to conduct their propaganda in the background in the face of this strong dose of old-fashion probity.

In other circumstances, the rigidity of this financial policy would be leading the country into recession but such is the innate buoyancy of the economy that, in spite of it, the production trends are favourable. Admittedly, if one simply looks at the current industrial production figures, there is no consolation. Equally, it seems dismal to record that, in the last three months—November-January—(but eliminating seasonal variations), exports from the U.K. were 3 per cent less than in the previous three months and 2 per cent less than the 1961 average. Particularly dismal when, on the same basis, imports were only one per cent less than in the previous three months as well as than in 1961 as a whole. Yet the sentiment is towards a coming improvement.

Balance of Payments

After all, 1961 has probably finished with the balance of payments in equilibrium. The monthly average of imports (c.i.f.) was £366½ million, which, converted to (f.o.b.), is about £326½ million. Exports and re-exports were £320 million. On visible trade account, there was thus a deficit of between £5 and £10 million which could—although this is not certain—have been made up by a favourable balance on the invisibles. January 1962, however, seems to have started off badly, with imports on an f.o.b. basis (and eliminating seasonal variations) of around £338 million and exports around £312 million. But one month is too short a period on which to form a judgment.

Yet there is no doubt that industry is optimistic. The Federation of British Industries has just completed one of its quarterly inquiries. As regards the past, the experience of individual firms simply supports the overall statistics, that is, falling production, firms working below capacity, less difficulty in obtaining labour, a decline in planned investment and a running down of stocks and a rise in costs. As regards the immediate future, under the factory roofs, a new scale of values has been evolved, the scale of pessimism! Before long, we shall no doubt be having index figures taking the degree of pessimism in January as zero! For this is how the City Editor of the *The Times* analyses the position. "Although industry is on balance less optimistic than four months ago, the increase in *pessimism* appears to be rather less." If this can be regarded as a bull point, it is hardly a strong bull.

Improvement Slow

The significance of the F.B.I. inquiry lies fortunately in the assessment of a number of firms who expect, as a result of inquiries, (*a*) that total orders and output will increase, and (*b*) that current and prospective exports *are* increasing.

The improvement is not coming too soon. In the last two years, Britain's strength of balance of payments has been determined not by her exports but by her imports. In 1960, exports which began at a peak of about £300 million per month, first declined and then rose, towards the end of the year, to beat slightly the figures at the commencement. And yet 1960 showed a heavy deterioration in the balance of payments, because imports rose strongly throughout the year until the late autumn. In 1961, the trend of exports has bumped along the same level more or less throughout the year, with a slight declining tendency. And yet the balance of payments has strengthened, because imports have fallen drastically, though the trend is now beginning to rise once more. But one cannot run an economy on declining imports; the movement of exports is critical and the economic success of 1962 will depend upon whether industry's present forecasts of improvements are realised.

* * * *

Indian Steelmen Complete Their Training

Sixteen Indian steelmen left Britain to return home this week, following the completion of their nine-month's training with British firms. They are members of the thirteenth group of engineers and senior technicians from the Durgapur Steelworks in India who had come to Britain for training under the Technical Co-operation Scheme of the Colombo Plan. The Department of Technical Co-operation in the U.K. has so far supervised a programme of training in Britain for 400 Indian supervisors and senior technicians for Durgapur which has been in operation for just over four years. The sixteen who have just completed their training bring the number who have done so to 344.

The travel costs and maintenance grants for these trainees is met by the British Government under the Technical Co-operation Scheme of the Colombo Plan. The object of the scheme is to give the Indian trainees—most of whom are graduates in mechanical, electrical or chemical engineering—specialised training to fit them for particular posts in the organisation operating the plant at Durgapur.

The training facilities are provided free by the British steel industry and by the manufacturers of the plant installed in the new works. The British Iron and Steel Federation and the Indian Steelworks Construction Company Limited (ISCON—a consortium of thirteen British companies which was formed in 1956 to construct the steel-works) advise on the actual training programmes which provide experience in iron and steel manufacturing processes and plant maintenance.—*All Rights Reserved.*

DIRECTORS OF THE BANK AS ON 31st DECEMBER 1961

1. SHRI P. C. BHATTACHARYYA, Chairman, State Bank of India, "Dunedin," 5, Harkness Road, Bombay-6. — Director Ex-officio under clause (a) of Sub-Section (1) of Section 25 of the State Bank of India (Subsidiary Banks) Act, 1959.
2. THE DEPUTY CHIEF OFFICER, Reserve Bank of India, Department of Banking Operations, 16-A, Jayachamarajendra Road, Bangalore-2. — Director appointed by the Reserve Bank of India under clause (b) of Sub-Section (1) of Section 25 of the State Bank of India (Subsidiary Banks) Act, 1959.
3. SHRI B. MUKERJI, Managing Director, State Bank of India, Bombay.
4. SHRI S. M. RAMAKRISHNA RAO, "Lakshmi Nivas," Krishnarajendra Road, Fort, Bangalore-2.
5. SHRI V. H. CHANNABASAVIAH, Cottonpet, Kolar. — Directors appointed under clause (c) of Sub-Section (1) of Section 25 of the State Bank of India (Subsidiary Banks) Act, 1959.
6. SHRI A. H. ELIAS, Chief Officer, State Bank of India Subsidiary Banks Section, State Bank of India, Central Office, P. B. No. 12, Bombay-1.
7. THE AGENT, State Bank of India, Bangalore. — Directors appointed under clause (c) of Sub-Section (1) of Section 25 of the State Bank of India (Subsidiary Banks) Act, 1959.
8. SHRI S. RAMANATHAN, 23, Krishnarajendra Road, Basavangudi, Bangalore-4.
9. SHRI D. M. SHANKARAPPA, Merchant, Tiptur. — Directors elected under clause (d) of Sub-Section (1) of Section 25 of the State Bank of India (Subsidiary Banks) Act, 1959.

Report of the Board of Directors to the State Bank of India and the Reserve Bank of India in terms of Section 43 (1) of the State Bank of India (Subsidiary Banks) Act, 1959

PERIOD COVERED BY THE REPORT: 1st JANUARY 1961 TO 31st DECEMBER 1961

CHANGES IN THE BOARD OF DIRECTORS

Under clause (c) of Sub-Section (1) of Section 25 of the State Bank of India (Subsidiary Banks) Act, 1959, the State Bank of India nominated Shri A. H. Elias and Shri B. Mukerji, I.C.S., as Directors in place of Shri T. S. Ragavachary and the Secretary and Treasurer, State Bank of India, Madras (Ex-Officio), on the 22nd February, 1961, and 6th June, 1961, respectively. The tenure of office of Sarvashri S. Ramanathan and M. V. Veerappa as Directors expired on the 28th February, 1961. In pursuance of Section 25 (1) (d) of the Act (*ibid*), Sarvashri S. Ramanathan and D. M. Shankarappa were declared elected as Directors of the Bank with effect from the 1st March, 1961. The names of the Directors on the Board of the Bank on the 31st December, 1961, are listed above.

ACCOUNTS

The Balance Sheet and Profit and Loss Account for the year ended 31st December 1961 as approved by the Board of Directors are annexed.

The working of the Bank resulted in a net Profit of Rs. 20,67,023.69 and with the addition of Rs. 80,442.47 brought forward from the previous year the total amount available for appropriation is Rs. 21,47,466.16 which the Board of Directors have appropriated as under :—

Transfer to Reserve Fund	Rs.	6,60,000 00
Bonus to Staff	Rs.	4,25,000 00
Dividend at 10 per cent (subject to tax)	Rs.	10,00,000 00
Carried forward	Rs.	62,466 16
	Rs.	21,47,466 16

The Accounts of the Bank have been audited by Messrs. Fraser & Ross, Chartered Accountants, who were reappointed as Auditors by the State Bank of India in exercise of the powers conferred by Sub-section (1) of Section 41 of the State Bank of India (Subsidiary Banks) Act, 1959, with the approval of the Reserve Bank of India.

CAPITAL AND RESERVES

The Authorised Capital of the Bank at Rs. 2.00 crores and the Issued and Paid-up Capital at Rs. 1.00 crore remained unchanged. With the transfer of Rs. 6,60,000 from the Profits of the year under review, the Reserve Fund of the Bank now stands at Rs. 60,00,000.

DEPOSITS AND OTHER ACCOUNTS

The deposits and other accounts of the Bank stood at Rs. 22.99 crores at the end of the year as against Rs. 19.94 crores as on 31st December 1960 and are higher by Rs. 3.05 crores.

CASH BALANCES AND MONEY AT CALL AND SHORT NOTICE

The Bank's Cash Balances (including Balances with the Reserve Bank of India and the State Bank of India and its Subsidiaries) at the end of 1961 stood at Rs. 1.41 crores as against Rs. 1.16 crores at the end of 1960. The Balance with other Banks aggregated Rs. 0.09 crores as against Rs. 0.22 crores at the end of 1960. The ratio of Cash and Bank Balances to Demand Liabilities was 20.89 per cent.

INVESTMENTS

The Bank's Investments recorded an increase of Rs. 56.40 lacs during the year covered by the Report and as at the end of the year, the Investments at or below market value stood at Rs. 9.10 crores which was 39.58 per cent of the Deposits.

ADVANCES

Advances outstanding in the Bank's Books as on 31st December 1961 amounted to Rs. 13.15 crores as against Rs. 12.43 crores as at the end of the year 1960. The ratio of Advances to Deposits being 57.20 per cent on the 31st December 1961 as against 62.34 per cent at the end of the year 1960.

PROFIT AND LOSS

The income of the Bank for the year amounted to Rs. 1,25,76,782.90 (including Tax deducted at source Rs. 7,84,735.95) as against Rs. 1,06,10,007.51 for the 10 months period ended 31st December 1960. After making the usual and necessary provisions and providing for taxation the net profit of the Bank amounted to Rs. 20,67,023.69 for the year as against Rs. 28,05,442.47 for the 10 months ended 31st December 1960 before providing Rs. 12.5 lacs for taxation.

While making appropriations out of the net profits the Board of Directors of the Bank considered that a bonus of an amount equal to two months salary, which generally is the maximum bonus that Public Sector institutions functioning under the Central Government allow to their staff, should be ordinarily payable. However, they decided to sanction, as a special case, the payment of an additional *ad hoc* bonus of one month's salary as was done last year.

GOVERNMENT AND AGENCY BUSINESS

In pursuance of the agreement entered into with the State Bank of India in terms of Section 36 of the State Bank of India (Subsidiary Banks) Act, 1959, the Bank has been conducting Government business. During the period under review the Bank has extended its Agency business at 14 additional centres thus bringing the number of branches conducting Government business to 32.

BOARD AND EXECUTIVE COMMITTEE MEETINGS

During the year six Meetings of the Board and Twenty-four Meetings of the Executive Committee were held.

OFFICES OF THE BANK

The Bank had in all 51 offices as on 31st December 1960 including the Head Office. To these 8 offices (including 2 Pay Offices) were added during the current year at the following Centres :

1. Linganamakki (Pay Office)
2. Turuvekere (Pay Office)
3. *Holenarasipur
4. Byadgi
5. *Kollegal
6. *Madhugiri
7. Chamarajanagar
8. Puttur

* These have also commenced conducting Government Business.

DEVELOPMENTAL ACTIVITIES

(a) Expansion Programme

In addition to the 6 Branches and 2 Pay Offices opened during the year under Report, licences for opening 10 more branches have been secured from the Reserve Bank of India. Investigations of the business potentialities of 14 centres have been conducted and are under active consideration.

The subsidy expected to be received from the State Bank of India to reimburse losses incurred by the Bank on account of its Expansion Programme in terms of Section 48 of the State Bank of India (Subsidiary Banks) Act, 1959, for the year under Report will be Rs. 1,22,878.52. This has been taken into account in the Profit and Loss Account for the year.

(b) Small Scale Industries

The Bank's advances to Small Scale Industries recorded a small increase during the current year. Assistance was afforded to 97 units accounting for a total limit of Rs. 82,76,850.00 as against 104 units with an aggregate limit of Rs. 82,37,850.00 as at the end of 1960.

(c) Warehouses

Advances against Warehouse receipts showed a considerable improvement. There are 17 Warehouses in the State of Mysore established by the Mysore State Warehousing Corporation and the Central Warehousing Corporation at centres where the Bank has branches. The total outstandings against Warehouse Receipts were Rs. 21,83,727.00 as on 31st December 1961 as against Rs. 10,57,263.00 on the same date of the previous year.

(d) Co-operative Institutions

The total amount of advances to Co-operative Institutions during the year was Rs. 43.56 lacs as against Rs. 17.94 lacs which was the figure as at 31st December 1960.

STAFF

The strength of the staff was 1,201 as on 31st December 1960. With the opening of new branches and with the increased business of the Bank the number has increased to 1,380 as on 31st December 1961.

The relationship of the staff with the management was cordial and co-operative and the Board of Directors wishes to place on record its appreciation of the services rendered by all categories of the staff during the year.

By Order of the Board,
A. KRISHNA MURTHI,
General Manager.

REPORT OF THE AUDITORS

We, the undersigned Auditors of the State Bank of Mysore, appointed under Section 41 (1) of the State Bank of India (Subsidiary Banks) Act, 1959, do hereby report to the State Bank of India upon the Balance Sheet and Accounts of the Bank as at 31st December 1961.

We have examined the above Balance Sheet and the Profit and Loss Account and the Accounts relating thereto of the Central Office, and Head Office and the Returns submitted by the Branch Managers, which returns have been incorporated in the above Balance Sheet and Accounts, and report (i) that, in our opinion, the Balance Sheet is a full and fair Balance Sheet containing all the necessary particulars and properly drawn up so as to exhibit a true and correct view of the affairs of the Bank, according to the best of our information and the explanations given to us and as shown by the Books of the Bank ; (ii) that where we have called for any explanation or information such explanation and information have been given to us and have been satisfactory ; (iii) that the transactions of the Bank which have come to our notice have been within the competence of the Bank ; (iv) that the Returns received from the Branches of the Bank have been found adequate for the purpose of our audit ; (v) that the Profit and Loss Account shows a true balance of Profit for the period covered by such account ; (vi) that, in our opinion, the Balance Sheet and Profit and Loss Account are drawn up in conformity with Law and (vii) that, in our opinion, Books of Account have been kept by the Bank as required by Law.

SIGNIFICANCE OF GENEVA TEXTILE TRADE PACT

BOGEY OF LOW-COST IMPORTS LAID

From Our Special Correspondent

NEW DELHI, *20th February*

DELHI LETTER

WHEN both sets of countries which are parties to the international agreement on trade in cotton textiles appear satisfied with the results and consider them the best that could be obtained in the present circumstances, there are still some who are querulous and doubtful whether the exporting countries have had a square deal. Mr. K. C. Reddy's statement in Bangalore expressing satisfaction with the outcome represents the mood of the Government; as a framework within which detailed agreements could be negotiated on a bilateral basis, the agreement appears to be a very constructive step forward. That it has been reached under G.A.T.T's auspices is not the least of its merits; it enables the emergence of a set of fair trading principles to which any aggrieved party can always refer and secure redress. While the textile interests affected in the particular importing countries continue to talk of low-wage exporters, the agreement has scrupulously eschewed such ideas; "disruption" is a less objectionable term, as it may occur even when wage and raw material costs are comparable when an importing country has an inefficient or outmoded textile industry.

No More High-pressure Lobbying

The preamble not only declares that the approach will be constructive and not restrictive but also emphasises that the main objective will be to increase the earnings and promote the development of the less developed countries possessing the necessary resources such as the raw materials and technical skills. The development of the trade in cotton textiles in an orderly and reasonable manner should be welcome even to the most enthusiastic exporting countries. What amounts to "disruption" will not in future be decided by high-pressure lobbying but by definite and determinable criteria; nor will discriminatory measures be applied, as between two countries whose exports are restricted, on political and other grounds.

Since the net effect of the agreement will be a slight expansion of the European markets for textiles when North American markets wish to restrict entry, an element of certainty has been introduced in the matter of textile exports for the next five-year period, thereby removing one of the vexed issues connected with the proposed British entry into the European Common Market from the area of controversy. It represents, in a sense, the triumph of the commodity approach, though it does not follow that this method will be adopted in other cases. In fact, there is a specific clause to the effect that the measures proposed are intended to deal only with the special problems of cotton textiles and that they are not to be considered as lending themselves to application in other fields. This may be interpreted to mean that the developing countries may not invoke this as a precedent to claim regulated entry for other manufactures in order to earn foreign exchange; on the other hand, it can also be cited to support the view that other manufactures which they wish to export are not in the category of articles which cause or are likely to cause "market disruption" to justify application of similar protectionist measures.

India Losing Ground

To what extent the emphasis placed on the needs of the less-developed countries and of those who possess the necessary raw materials will favour India and Pakistan as distinct from Japan, is not clear. Among the Asian countries, Japan has recently expanded her textile exports to the other industrial countries from $48 million in 1953 to $239 million in 1960, whereas India's exports to them have increased only from $119 million to $219 million in the same period. Japan has offered keener competition in the markets of non-industrial countries also, especially African markets, where India's sales dropped in 1960 for that reason.

Article 8 of the Agreement states that, besides the annual review of the working of the provisions, a major review will be undertaken at the end of the third year. This means that, normally, at the end of three years, the situation of disruption will be considered to have ended, as there would have been enough time for adjustments in the domestic textile industries of the importing countries to the new conditions in world trade; moreover, sufficient material will then be available regarding the alleged disruption. The bogey about low-cost imports has thus been laid and expansion of the manufactures of the developing countries, in the context of the report of Committee III of G.A.T.T., has become an accepted basis for future policy.

• • • •

A Virtue of Necessity

For several years now, the Government of India has been circulating the results of its policy of Indianisation of staff in foreign firms. How much credit it is entitled to claim for the growing proportion of Indians employed in high executive posts can be debated; while it is true that there are fewer non-Indians today (4,364) than in 1954 (when there were 7,008), the declining trend is due more to the enormous expansion of employment opportunities for skilled technical and managerial personnel in Western countries than to the pressure on foreign firms for Indianisation. These foreign companies have often been forced to recruit second-rate talent whenever they needed top executives or technicians from their own or other European countries, so that many have made a virtue of necessity and chosen to train Indians for higher posts. Perhaps, they have increasingly discovered that Indians are not inferior and that, given the opportunity, they can prove both reliable and competent. At junior levels, below a salary of Rs. 2,000 per month, the number of persons willing to come to India from their own countries where an equivalent job can be easily found (along with the amenities and consumer goods of affluent societies), is likely to be very small; even Indians abroad are able to profit by these employment opportunities and are increasingly reluctant to return home. In the matter of taxation, foreign personnel will not get any advantage; and, in relation to some other countries, there is a positive disadvantage in coming to India. But, even where tax concessions are given as in the case of foreign technicians, there has been no real rush of applications. Short-term technicians exempted from payment of income-tax on their remuneration increased from 194 at the beginning of 1960 to 215 one year later and they are mostly found in chemical and engineering firms; it cannot be said that the smallness of this number was due to the restrictive policy of the Government in permitting their employment.

While there may be no harm in keeping a watch on the trends in employment of non-Indians and deriving whatever satisfaction is justified, from the figures, it is doubtful whether it is any longer a serious issue of public policy. Because of the dearth of suitable replacements, retirements of European officers is resulting in the succession of Indians to responsible posts. In the salary range Rs. 2,000-Rs. 3,000 per month, Indians are holding 1,633 (58.2 per cent) out of 2,808 posts and the Government has expressed the hope that the percentage will rise to 70 by the end of this year. In the next higher range, the results are not very striking yet; Indians hold only 24.9 per cent of the posts, obviously because responsibility tends to be concentrated at the top and held by foreign executives. A curious feature is that the percentage of Indians is lower than the average (of 70 per cent) in the older industries like jute mills and presses, banking companies, and planting companies. In the last group, the percentage of Indian executives drawing more than Rs. 1,000 per month has increased from 30 per cent in 1959 to only 37.5 per cent in 1961. This feature is, perhaps, explained by the circumstance that foreign personnel have taken to these lines as a career, and cannot profit by opportunities nearer home. With the increasing consciousness shown by both Indian and foreign firms of the importance of management training, future trends are likely to be even more favourable than hitherto; when the Government began paying attention to this problem in 1954, it could not obviously have expected that, in the normal course, the position would change, owing to conditions abroad and the relative unattractiveness of employment in this country due to taxation, cost of living and import cuts. The Government's policy of persuasion has thus secured a favourable atmosphere and yielded good results; it shows that any other radical policy which some might have advocated would have been shortsighted and ill-advised.

PRESS NOTE

ISSUED BY THE

GOVERNMENT OF INDIA, MINISTRY OF COMMERCE AND INDUSTRY
DEPARTMENT OF COMPANY LAW ADMINISTRATION
NEW DELHI

It has come to the notice of the Government of India that a Society called the "All India Society of Corporate Accountants and Auditors" has been registered in Calcutta under the Societies Registration Act reportedly for training up students in the profession of accountancy. The Government would like to make it clear that the Institute of Chartered Accountants of India constituted under the Chartered Accountants' Act, 1949 is the only statutory body the Members of which, namely Chartered Accountants, are, along with the Restricted State Auditors, entitled to be appointed as auditors of companies under Section 226 of the Companies Act, 1956. The Society referred to above is not recognised either by the Government of India or by the Institute of Chartered Accountants and its members are not eligible to be appointed as auditors of companies under the Companies Act or to undertake any other audit work required by law to be done only by chartered accountants. As this Society has no statutory backing and its members no recognised status in the eye of law, public are hereby informed that engaging any member of this Society for performing any work which is statutorily required to be performed by a Chartered Accountant would result in non-compliance with the relevant provisions of law with the penal consequences thereof.

REPORT OF THE AUDITORS TO THE STATE BANK OF INDIA

We have examined the annexed Balance Sheet of the State Bank of Saurashtra as at 31st December, 1961, and also the Profit and Loss Account of the Bank for the year ended on that date, in which are incorporated returns of the Bhavnagar Branch audited by us and returns of the other Branches certified by the respective Branch Agents, and report that:

(1) in our opinion, the Balance Sheet is a full and fair one containing all the necessary particulars and is properly drawn up so as to exhibit a true and correct view of the affairs of the Bank, according to the best of our information and the explanations given to us and as shown by the Books of the Bank;

(2) where we have called for any explanation or information such explanation and information have been given to us and have been satisfactory;

(3) the transactions of the Bank which have come to our notice have been within the competence of the Bank;

(4) the returns received from the Branches of the Bank have been found adequate for the purpose of our audit; and

(5) the Profit and Loss Account shows a true balance of profit for the year covered by such account.

N. M. RAIJI & CO.,
Chartered Accountants.

Dated, 6th February, 1962.

LONG-TERM PLAN FOR WORLD COTTON TEXTILE TRADE

EXPORTS TO BE REGULATED

ALTHOUGH the text of the agreement reached at the G.A.T.T. International Cotton Textile Conference, held at Geneva from 29th January to 9th February, does not give any definite answer to the poser as to what would be the pattern of world cotton textile trade in the coming years, it nevertheless makes it quite clear that, instead of moving freely on a multilateral basis as hitherto, the trade would proceed on a regulated basis with some sort of quota restrictions. The agreement has been signed by the leaders of the official delegations of India and eighteen other G.A.T.T.-countries (Pakistan, Japan, Britain (also for Hong Kong), U.S., Canada, Germany, France, Italy, Belgium, Luxemburg, Netherlands, Austria, Denmark, Norway, Portugal, Spain, Sweden and Australia). And it is open for acceptance by any other G.A.T.T. member-countries, as well as by nations that are not parties to the G.A.T.T. or have not acceded provisionally to this body. The agreement, which is subject to ratification by the Governments concerned, will come into force on 1st October next, when the current one-year short-term arrangement worked out in Geneva in July 1961 is due to expire, and run for five years thereafter, that is, upto 30th September 1967.

Obligations

The broad purpose of the long-term agreement is described by the *communique* issued at the end of the Conference thus: "To ensure the orderly development of trade in cotton textile products so as progressively to increase export possibilities, particularly for less-developed countries, while, at the same time, avoiding disruption of markets in importing countries." This objective is sought to be achieved through the imposition of certain well-defined obligations on the part of both importing and exporting nations. The obligations are as follows:

Importing countries: All those participating countries that are still maintaining restrictions inconsistent with the G.A.T.T. provisions on cotton textile imports from other participating countries must relax those restrictions progressively each year with a view to eliminating them as soon as possible. No participating country shall introduce new import restrictions, or intensify existing import restrictions, on cotton textiles, in so far as this would be inconsistent with its obligations under the G.A.T.T. The countries at present applying import restrictions to cotton textiles imported from other countries undertake to expand access to their markets for such cotton textiles so as to reach by the end of the period of validity of the present arrangement, for the products remaining subject to restrictions at that date, taken as a whole, a level corresponding to the quotas opened in 1982, for such products, as increased by the percentage mentioned. Where bilateral arrangements exist, annual increases shall be determined within the framework of bilateral negotiations. It would, however, be desirable that each annual increase should correspond as closely as possible to one-fifth of the overall increase. The countries concerned shall administer their remaining restrictions on imports of cotton textiles from countries in an equitable manner and with due regard to the special needs and situation of the less developed countries. If, during the licensing period preceding the entry into force of this arrangement, a specific basic quota is nil or negligible, the quota for the succeeding licensing period will be established at a reasonable level by the importing country concerned in consultation with the exporting country or countries concerned. Such consultation would normally take place within the framework of the bilateral negotiations. The countries shall, as far as possible, eliminate import restrictions on the importation, under a system of temporary importation for re-export after processing, of cotton textiles originating in other countries.

Exporting countries: An exporting country should, in case of complaint by an importing country, take steps to remove or avoid market disruption in the latter as a result of excessive imports. The exporting country must restrain shipments of such products as are causing market disruption at a specific level mentioned by the importing country. It is, however, made clear that this level "shall not be lower than the one indicated in Annexure B." The procedure for seeking such a restraint lays down that the minimum level at which the exports may be pegged should be the average exports during the twelve months ending three months during the request for restraint is made. If the restraint is needed for more than twelve months, there will ordinarily be an increase of 5 per cent in the permitted exports during the next twelve-month period and a further increase of 5 per cent in the third year. Normally, at the end of three years, the situation of disruption will be considered to have ended, as there will have been time for the adjustment of the domestic industry to the new conditions in world cotton textile trade.

In order to avoid administrative difficulties in enforcing a given level of restraint on cotton textiles subject to measures taken, the countries have agreed that there should be a reasonable degree of flexibility in the administration of these measures. It is agreed that, where restraint is exercised for more than one product, the agreed level for any one product may be exceeded by 5 per cent, provided the total exports subject to restraint do not exceed the aggregate level for all products so restrained on the basis of a common unit of measurement to be determined by the countries concerned. If the countries have recourse to the measures envisaged in this article, they shall, in introducing such measures, seek to avoid damage to the production and marketing of the exporting country and shall co-operate with a view to agreeing on suitable procedures, particularly as regards goods which have been, or which are about to be, shipped.

Non-compliance of Request

The agreement also contains a special provision governing cases where an exporting country fails to comply with the request by the importing nation and there is no agreement either on the request or on any alternative solution within a period of 60 days after the request is received by the exporting country or countries. The provision is that the importing country which makes the request may decline to accept imports for retention at a level higher than that specified in Annexure B in respect of the period starting on the day when the request was received by the exporting country.

The agreement particularly lays down that the measures for restraining imports should be resorted to only sparingly and, that too, limited to the precise products or precise groups or categories of products causing or threatening to cause market disruption in the importing country. The products include yarns, piece-goods, made-up articles, garments and other textile manufactured goods in which cotton represents more than 50 per cent (by weight) of the fibre content, with the exception of handloom products of the cottage industry.

Other Measures

Further, the agreement provides for measures dealing with circumvention of arrangements by transhipment or re-routing, substitution of directly competitive textiles, and action taken by non-participants. The measures are:

Transhipment: The importing and exporting countries agree to collaborate with a view to preventing circumvention of this arrangement by transhipment or re-routing and to take appropriate administrative action to avoid such circumvention. In cases where a country has reason to believe that imports shipped to it from another country and purporting to have originated in that country did not originate there, it may request that country to consult with it with a view to assisting in the determination of the real origin of the goods.

Substitution of directly competitive textiles: It is not the intention of the countries to broaden the scope of this arrangement beyond cotton textiles, but, when there exists a situation or threat of market disruption in an importing country, to prevent the circumvention of this arrangement by the deliberate substitution for cotton of directly competitive fibres. Accordingly, if the importing country concerned has reason to believe that imports of products in which this substitution has taken place have increased abnormally, that is, that this substitution has taken place solely in order to circumvent the provision of this arrangement, that country may request the exporting country concerned to investigate the matter and to consult with it with a view to reaching agreement upon measures designed to prevent such circumvention. Such request shall be accompanied by a detailed, factual statement of the reasons and justification for the request. Failing agreement in the consultation within 60 days of such request, the importing country may decline to accept imports of the products concerned as provided for in Article 3 and, at the same time, any of the countries concerned may refer the matter to the Cotton Textile Committee which shall make such recommendations to the parties concerned as may be appropriate.

Non-participants: The countries agree that, if it proves necessary to resort to the measures envisaged in Article 3 above, the importing country or countries concerned shall take steps to ensure that the country's exports against which such measures are taken shall not be restrained more severally than the exports of any country not participating in this arrangement which are causing, or threatening to cause, market disruption. The importing country or countries concerned will give sympathetic consideration to any representations from exporting countries to the effect that the principle is not being adhered to or that the operation of this arrangement is frustrated by trade with countries not party to this arrangement. If such trade is frustrating the operation of this arrangement, the countries shall consider taking such action as may be consistent with their law to prevent such frustration.

Textiles Committee

The G.A.T.T. Cotton Textiles Committee is entrusted with the responsibility of ensuring the satisfactory working of the agreement. The Committee is required to meet from time to time to discharge its functions. It will undertake studies on trade in cotton textiles as the countries may decide. It will collect the statistical and other information necessary for the discharge of its functions and will be empowered to request the countries to furnish such information. Any case of divergence of view between the countries as to the interpretation or application of this arrangement may be referred to the Committee for discussion. The comments of this Committee will be taken into account if the matter is subsequently brought before the G.A.T.T. Contracting Parties under the procedures of Article XXIII. The Committee shall review the operation of this arrangement once a year and report to the Contracting Parties. The review during the third year shall be a major review of this arrangement in the light of its operation in the preceding years. The Committee shall meet not later than one year before the expiry of this arrangement, in order to consider whether the arrangement should be extended, modified or discontinued.

From the aforesaid details, it is apparent that the agreement represents a compromise formula incorporating the viewpoints of Japan, the U.S. and the European Common Market. "It provides," to quote a report, "an assurance to the exporting countries that they can enjoy an orderly growth in their markets. The formula is at the same time completely satisfactory to the United States, in that it provides for the restriction of imports which threaten or cause disruption of domestic markets. The Common Market and other countries which have already been imposing importing restrictions have committed themselves to a minimum liberalisation of these restrictions during the five-year period of the agreement."

Reactions of Countries

The reactions of some of the countries to the Geneva formula are summed up below:

Japan: Although Japan is not satisfied entirely with the agreement, it wants to co-operate with international efforts to stabilise the world cotton textile market. Japan can expect an expansion of orderly exports of its cotton products as a result of the Geneva Conference. Japan had made its attitude clear at the Conference that, if the U.S. were to impose the proposed equalisation fee on imports of cotton products from Japan, the country would refuse to sign the agreement. Seeing that the agreement was signed on the basis of an understanding on this point between the U.S. and Japan, Mr. K. Matsumura, Director of the Textile Bureau of the Ministry of International Trade and Industry and leader of the Japanese delegation to the Conference, says that he expects the equalisation fee issue to be settled in favour of the Japanese position. The agreement, according to him, satisfies the minimum requirements and, by bilateral arrangements with the European Common Market and other quarters, Japan will be able to enjoy exports exceeding quantities provided for in the agreement.

Hong Kong: The outcome is not unsatisfactory as far as Hong Kong is concerned.

U.S.A.: President Kennedy considers that the agreement will help the U.S. cotton textile industry to sharpen its competitive position with the confidence that foreign imports will not disrupt its activities. White House officials are reported as saying that the Inter-Agency Cotton Textile Committee or a similar body will determine whether or not textile imports from Japan, Hong Kong and other nations are disrupting the American market.

Common Market: There is general agreement that safeguard measures for domestic industries should only be invoked by importing countries when market disruption exists. But the extent to which an exporting country can be asked to cut back its exports is strictly limited under the agreement.

Britain: The agreement is generally welcomed. The Cotton Board hopes that the Government will quickly ratify the agreement and apply it so as to ensure a greater stability in the indigenous industry. The effectiveness of the agreement will depend on the extent to which the other Western markets ease the British cotton industry of the unequal burden it is now called upon to shoulder.

Australia: While deciding the question of Australia's participation, the Government will keep fully in mind the position of the domestic industry.

Canada: The Canadian Government, according to the Finance Minister, accepts the principle of orderly growth in imports of low-cost textiles. But it cannot accept automatic increases each year in its imports of such textiles, whatever the state of the domestic economy or of the industry.

So far as *India* is concerned, both official circles and textile interests feel that, con-

TEXTILE OUTPUT AT AN ALL-TIME LOW

CURRENT SITUATION REVIVES MEMORIES OF 1952

From Our Special Correspondent

MANCHESTER, 13th February

HISTORY has a habit of repeating itself, and little credit can be taken for predicting that the build-up of available supplies over the past year was threatening a repetition of the events of 1952 when the Lancashire textile industry was involved in its big post-war recession which caused extensive unemployment, short-term, and the closing of mills. Current circumstances, although altered by the intervening Government reorganisation programme, offer a glimpse of the same ugly situation, prefaced by the sharp reduction of output last September and December.

MANCHESTER LETTER

The danger point was, in fact, sensed early in 1961 when the output returns for the previous year could be assessed. These showed an available balance for the home trade, after imports had been added and exports deducted, of more than 2,300 million yards. The trade cycle has since maintained its movement, and had it not been for the notable curtailment of imports in the final two months of last year, the surplus would have reached a new peak. The following table shows the comparative supply situation covering both cotton and man-made fibre cloth:

(In million yards)

Year	Output (a)	Imports (b)	Total (a) and (b)	Exports	Balance for home trade
1947 ..	4,122	75	4,197	2,001	2,196
1949 ..	2,592	400	2,992	1,078	1,914
1950 ..	2,840	342	3,182	1,017	2,165
1951 ..	2,960	478	3,438	1,105	2,331
1952 ..	2,192	210	2,402	871	1,531
1953 ..	2,632	143	2,775	895	1,880
1954 ..	2,773	335	3,110	812	2,298
1955 ..	2,470	365	2,844	688	2,156

Output during 1960 from the local mills showed a relatively small decline, considering the extensive reconstruction which had taken place and the scrapping of so much machinery. For most of the subsequent year the spindles and looms were well engaged on old contracts, but the final results show a fall of nearly 70 million yards to a new low point. Yarn production in ratio was increasingly affected by direct competition from imported goods, either as yarn or as cloth. Spinners turned out 686,730,000 lbs. of yarn, a drop of nearly 65 million lbs.

At the end of 1961 some 15,000 fewer workers were on the books of spinning and weaving employers, and the total had been reduced for the first time in living memory to below 170,000. Again the spinning section was appreciably hit, its manpower declining by nearly 8 000, while in weaving the fall was little more than 4,000. Very little change occurred in the labour situation in waste spinning, but in doubling, the figure was 2,700 lower than the total of 16,080 recorded at the end of 1960.

Heavy supplies of cloth are still available on a statistical basis, although stocks have not accumulated during the year to the extent that might have been expected in the circumstances. Restrictions on credit, however, have made merchants increasingly reluctant to absorb deliveries without reasonable opportunity of disposing of them quickly. Traders all along the line of production and processing have been chary of carrying supplies due to the high cost of finance, and no immediate sign of relief on this score is apparent.

It is safe to forecast that any business which develops within the next few months will be largely on a hand-to-mouth basis, which in turn is not altogether remunerative for producers. Salesmen, in any case, are being constantly subjected to keen pressure on margins, despite the concessions made since mid-1961.

Ten Million More

A new peak for earnings from exports of textile machinery last year had already been established before the final month, and shipments during December merely added to the record figures so far achieved. During the whole year plant valued at £62,139,935 was exported, an increase of £10,000,000 on the previous year's record.

The quantity of machinery sent abroad at 76,902 tons was nearly 10,000 tons higher than in 1960, and was the largest total since 1956. In relation to past efforts, however, it should be pointed out that from 1948 to 1952 more than 100,000 tons of textile machinery was exported annually, and 40 years ago the figure exceeded 150,000 tons.

The Soviet Union retained its place as the leading consumer of British textile plant last year, absorbing 174,635 cwt. against 162,257 cwt., while India took 137,437 cwt. against 130,126 cwt. Other main markets were (in cwts. with 1960 comparisons): Pakistan 94,877 (60,589); Australia 83,907 (42,513); Italy 59,625 (50,099); Western Germany 57,450 (50,752); France 52,074 (31,570) and Israel 45,471 (31,314).

Several other countries also took more than 30,000 cwt. of British textile plant, including the Irish Republic, Belgium, Japan, the Philippine Republic, the United States and South Africa. A feature of this trade was the revival in business with the South American Republics, notably Brazil and the Argentine, whose takings increased from below 12,000 cwt. to 32,000 cwt. and 20,000 cwt. respectively. On the other hand, there was a sharp fall in shipments to Poland from 47,000 cwt. to less than 17,000 cwt.

Although trade in December was negligible, the volume of exports of textile plant for extruding man-made fibres during 1961 was double the quantity sent abroad in the previous year, the total being 89,990 cwt. Another branch where considerable progress was made was in machines for spinning and twisting cotton and stable fibre, whose shipments during the year increased from 85,504 cwt. to 124,276 cwt.

Exports of winding machines also improved from 10,816 cwt. to 18,866 cwt. while shipments of looms for weaving were substantially higher than in the previous year. Those with automatic weft replenishing accounted for 99,630 cwt. against 63,955 cwt. and other looms represented 42,090 cwt. against 26,698 cwt.

Imports of textile machinery last year increased by nearly one-third in volume as compared with 1960, and cost a good deal more. Arrivals amounted to 315,933 cwt. against 229,913 cwt., the respective values being £17,768,551 against £11,862,512 in 1960.

This was mainly due to a threefold rise in the quantity of looms for weaving bought from abroad, which amounted to 76,569 cwt. against 24,104 cwt. The cost of these machines exceeded £2,000 000 against little more than £750,000 in the previous year. Parts and accessories for these looms nearly doubled in volume and their value was correspondingly increased.

Raw Cotton Supplies

Dwindling activity in the mills invariably shows itself in the smaller quantities of raw cotton imported and the current lack of momentum within the industry is no exception. Arrivals of the raw material in the first half of the present season were distinctly lower than twelve months ago and unless there is a sudden change in the atmosphere, the full season's imports are unlikely to reach the one million bale mark, for the first time for many years and certainly this century.

As in the case of other trade activities, the major changes have been in the growths most favoured in the past. Whereas supplies of American cotton reaching British ports remained stable during the first half of the past two seasons, the quantity absorbed so far this season has been over 50,000 bales lower, but even this is still some 30,000 bales in excess of the very small quantity procured in the first half of the 1953-59 season. The following table shows the current situation, together with recent comparisons:—

(In bales)

	1st half 1961-62	1st half 1960-61	1st half 1959-60	Total 1960-61
American	164,334	220,737	220,214	450,551
Mexican	30,818	26,671	63,516	43,983

Pakistan	4,143	2,001	5,204	5,597
Indian	4,850	335	1,382	2,719
Russian	3,078	22,475	18,016	36,438
Others	24,627	78,866	78,168	76,555
Total ..	469 404	577,427	720,021	1,156,413

* Included in "Others."

With the exception of South American cottons and certain Middle Eastern varieties, the trend of imports remains downwards, especially those obtained from African sources. Another notable reduction is in the quantity of Russian staple imported, a tendency which was becoming evident in the second half of last season.—*All Rights Reserved.*

Millions of hands like this are reaching eagerly every day for a glass of cool water. ACCOOLER water cooler has the proud privilege of supplying them plenty of cool water—as a matter of fact, as much as they need.

ACCOOLER WATER COOLER

★ Storage and instantaneous type ★ Hygienic and convenient
★ 6 to 40 gallons cooling capacity per hour ★ 10 to 300 gallons storage ★ One year guarantee

REPORT OF THE AUDITORS

We have audited the foregoing Balance sheet of the Habib Bank Limited, Indian Union Branch as at 31st December, 1961 and also the above profit and loss account of the Bank for the year ended upon that date.

In accordance with the provisions of Section 29 of the Banking Companies Act 1949, read with the proviso to sub-sections (1) and (3) of Section 211 and sub-sections (5) of Section 211 and 227 of the Companies Act 1956, the Balance sheet and Profit and Loss Account are not required to be and are not drawn up in accordance with the sixth schedule to the Companies Act 1956, they are, therefore, drawn up in conformity with Forms A and B of the Third Schedule to the Banking Companies Act 1949.

We report that :

(a) we have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them to be satisfactory ;

(b) the transactions of the Bank which have come to our notice, have been within the powers of the Bank ;

(c) in our opinion, proper books of account as required by law have been kept by the Bank so far as appears from our examination of these books ;

(d) the Bank's Balance Sheet and Profit and Loss Account dealt with by this report are in agreement with the books of account and the returns ;

(e) in our opinion, and to the best of our information and according to the explanations given to us, the said accounts give the information required by the Companies Act 1956, in the manner so required for Banking Companies and on such basis the said Balance-sheet gives a true and fair view of the statement of the affairs of the Bank as at 31st December, 1961 and the Profit and Loss Account gives a true and fair view of the profit for the year ended upon that date.

EFFECTS OF EURO-DOLLAR MARKET

NO NET DRAIN ON UNITED STATES

AMONG accompaniments of the general freeing of currencies in recent years has been the development of an extensive deposit-and-loan business done in U.S. dollars outside the United States. This is at once an aspect of the dollar's position as a medium of exchange with high international acceptability, which sustains a considerable world-wide demand for it, and of the chronic deficit in the U.S. balance of payments, which feeds the supply.

The core of overseas dealings in dollars is the fact that foreign banks are accepting deposits and making loans in U.S. currency. Doing so is not a new practice for them. Indeed, European banks were holding and lending external currencies, notably sterling, even before World War I, and they resumed the practice between the two world wars. The emergence of the dollar as the focus of such activity, and the proportions the activity now has assumed, however, are new.

Because European banks are particularly active in the field, the term Euro-dollars is commonly applied to the funds involved. The term is misleading in two ways. First, it sounds like a label for a wholly different kind of dollar. Actually, the dollars so used differ from ordinary ones only in the channels through which they move. Second, the term overlooks the large deposit-and-loan volume carried on in U.S. dollars by foreign banks other than European—e.g., Canadian. Their transactions also are part of the total external traffic in the dollar.

A Euro-dollar transaction is based ultimately on dollars held on deposit in a United States bank. The owner-presumably in response to the offer of a higher interest rate than he is receiving—transfers the deposit to a foreign bank. The return offered has to be sufficiently above that available in the U.S. to compensate for such risks as the chance that the country where the dollar deposit is collectible may impose exchange restrictions or otherwise impede eventual recovery of the funds.

The simple act of transfer to a foreign depositary is what makes just plain dollars into Euro-dollars. In the normal mechanics of international funds flow, the basic dollars are shifted to the account which the foreign bank accepting them maintains with a U.S. correspondent. The foreign bank's books then show the liability of the deposit it has accepted, offset by the "due from banks" asset of the dollars standing to its credit with the U.S. bank.

Since the purpose of the transaction is to make a profit, the foreign bank proceeds to lend or invest the dollars—at a rate higher than the one it as depositary is paying on them. It is the widespread demand for dollars—principally for use in connection with trade—that makes foreign banks confident of being able to find profitable uses for their dollars and thus encourages them to bid aggressively for dollar deposits.

Sources

The supply comes from dollar owners almost everywhere—Europe, the Middle and Far East, South America, even the United States. On the demand side, too, the market is truly international. Among the large takers are Canadian banks, which usually place the funds at the disposal of their New York agencies to be loaned to securities brokers and dealers in Wall Street. Foreign branches of United States banks compete for and accept Euro-dollar deposits, thus enabling their head offices to regain control over the investment of the funds. The Soviet Union and other countries behind the Iron Curtain, formerly net suppliers of Euro-dollars, are now net takers. On the other hand, Germany and Italy, formerly net takers, have become net suppliers. Since 1960, the Japanese commercial banks have become large net borrowers of Euro-dollar deposits. The most important centre of Euro-dollar transactions is London, but markets exist also in Paris, Zurich, Frankfurt, and Milan.

The Euro-dollar market is a fast-moving one. It has some of the characteristics of the domestic Federal funds market—in which banks borrow and lend balances that are on deposit with the Federal Reserve banks, using this medium to correct "underinvested" or "overinvested" positions on a day-to-day basis. Euro-dollar deposits and loans often are made, like those of Federal funds, on a very short-term basis, but they can run for longer periods.

It is not uncommon for one foreign bank to re-deposit in another the dollars it is holding. The chain of transactions may cross several international boundaries and may even include one or more "swaps" of the dollars for a foreign currency, with the exchange transaction putting the dollars in the hands of yet another owner, who presumably deposits, lends, or spends them.

Through all this, the original dollars remain on deposit in the U.S. banking system. Each transaction in the chain may very well occasion their transfer from one U.S. bank to another, but at no point are they withdrawn from the U.S. banking system—unless an owner should present them to the U.S. Treasury in purchase of gold, something only a foreign Government or central bank can do directly, or unless they are used to retire a loan made by a United States bank.

Big Young Market

There are no solid statistics on the Euro-dollar markets. Taking that term to encompass all foreign borrowing and lending of dollars, estimates as to the total amount involved range from one billion to more than two billion dollars. At two billion, the figure would equal about one-fifth of all foreign-owned dollar deposits held in U.S. banks, including those due official holders.

This impressive volume has developed within a remarkably short time—most of it within less than three years. About the end of 1958, Western European governments made their currencies convertible for non-residents and removed some other exchange restrictions, thus permitting the development of relatively free and active foreign-exchange markets. The new fluidity among currencies encouraged banks abroad to undertake dealings in dollars, which were in consistent demand and which they could readily obtain by bidding sufficiently above the interest rates offered in the U.S. Those rates were limited not only by the ceilings of the Federal Reserve Board's Regulation "Q" but also by the prevailing structure of interest rates in this country, usually lower than those abroad. The selective raising, effective from 1st January 1962, of "Q" limits gives U.S. banks greater flexibility to bid against foreign institutions for dollar deposits; the extent to which they will do so will depend largely, of course, on the prospective rates at which those deposits can be employed.

The spread between cost of money (interest paid on deposits) and price of money (interest received on loans or investments) is characteristically narrow in the Euro-dollar market. The participants regard their operations in the market as a side-line which adds little, if anything, to the cost of doing their basic business. Further, they see in them an accommodation to their clients and a source of prestige as a factor in international banking. Thus, they are willing to accept a very slender margin of profit on Euro-dollar transactions. This double standard of profitability seems also to characterise foreign banks' attitudes toward doing business in the other Euro-currencies, which presently include sterling and the leading Continental currencies although none in nearly so large volume as the dollar.

The Euro-dollar has become the most important of the Euro-currencies for two main reasons. First, the dollar has emerged as the leading international currency; during most, if not all of, the post-war period, it has been generally regarded as the most stable, and it is almost the only currency used by European central banks as a reserve currency. Second, the supply of dollars in foreign hands has grown steadily and rapidly for a decade, as a result of the chronic deficit in the U.S. balance of international payments.

Thus, far there has been only minor activity by U.S. banks in developing the obverse of the Euro-dollar market—the accepting of deposits and making of loans in Canadian dollars or in the various externally convertible European currencies. As their domestic customers increase their positions in and needs for foreign currencies, it is only natural to expect that American banks, particularly those with overseas branches, will be active in what may some day be called Amero-currencies.

Assessing the Meaning

As a phenomenon of international finance, the rapid growth of foreign traffic in dollars has not yet made its implications entirely clear. Paradoxically, it has enhanced the dollar's position as the leading international currency, while at the same time reducing, to some extent, the relative importance of the United States—more specifically New York—as a world financial centre. In effect, a substantial share of dollar financing business is eluding the U.S. banks.

Dealings in Euro-dollars do not directly affect the U.S. balance of payments, except where an American-owned deposit is transferred from a domestic to a foreign depositary or where American-owned dollars that normally would be repatriated are left instead on deposit abroad. The large volume of Euro-transactions may, in fact, have helped support the dollar's value in foreign-exchange markets by increasing the demand for dollars and their acceptability. It may have helped to limit the outflow of gold from the United States by deterring the cashing-in of externally owned dollar balances. It probably has increased the effectiveness of international liquidity by contributing an added measure of velocity to the available pool of reserves. Some authorities, however, fear that it has made financial markets more susceptible to credit disturbances.

But probably the Euro-dollar's clearest effect, and most important in the long run, has been to contribute to the closer integration in individual countries of the domestic money market and the foreign-exchange markets. Thus, it has further complicated the problems of central banking authorities in adopting and enforcing monetary controls. The easier the flow of funds between countries, the more heed the authorities in each country must pay to the financial winds that blow across national boundaries. This difficulty has been well illustrated in the United States during the past year and a half, as the monetary authorities have worked at the delicate task of keeping money easy enough to stimulate business recovery at home without making it so cheap as to occasion large-scale flows of funds abroad, where interest rates have been higher.

In foreign countries, the existence of the Euro-dollar market has at times suggested a means of evading local monetary restraint. If the authorities in a given country are restricting the money supply, banks may obtain dollar deposits and sell or "swap" the dollars for local currency. Under the country's commitment to the International Monetary Fund to maintain established exchange rates, the central bank may have to furnish local currency for the offered dollars. The result is an unwanted increase in the money supply, and means must be found for offsetting it.

Thus the evolving trend toward a world money market tends to wear away the insulation that has shielded individual monetary systems. The effect is to place even greater emphasis on the need for sound policies of money and credit—both to promote stability in individual countries and to provide a reliable financial basis for the carrying on of international trade.—*The Morgan Guaranty Survey.*

BIRDS are stepping up it

To sustain its expanding output, India's steel industry needs increased quantities of essential raw materials like iron and manganese ore, coal, limestone and refractories. By meeting a large part of this demand, Bird & Company (Private) Limited have been making significant contributions to the progress of the steel industry.
Birds have now launched on a programme of expansion, which when completed will step up considerably the annual output of these raw materials.

	PRESENT PRODUCTION	EXPECTED INCREASED PRODUCTION
Iron and manganese ore	2,000,000 tons	3,000,000 tons
Coal	2,250,000 tons	3,000,000 tons
Limestone	2,000,000 tons	2,500,000 tons
Refractories	100,000 tons	120,000 tons

This expansion will assure the steel industry of increased supplies of these vital raw materials.

NEW PUBLICATIONS

Effects of Land Reforms in Saurashtra. By R. R. Mishra. Published by Vora & Co., Publishers Private Ltd., 3, Round Building, Bombay-2. Pages: 240. Price: Rs. 12.

SAURASHTRA was the first State in India (before the merger with Gujarat) to complete the implementation of land reforms. Before the formation of the State there were as many as 222 princely States, several of them being small principalities; the problem was to replace the old feudalistic order by a democratic system based on the ownership of land by the tiller of the soil. Therefore, the problem had to be faced in a twofold manner; elimination of the class of parasitic middlemen and aiming at increasing the efficiency of agriculture without further fragmentation of holdings by declaring illegal the leasing of land, by scaling down the debts of the agriculturists and by other like measures. The scheme of compensation adopted differed from that of other States in so far as the basis of compensation was not rent (or net income) but assessment, and the payment was made in cash annuities; secondly, the deferred instalments carried no interest. Though this procedure resulted in more cost for the entire reform it enabled the State to achieve the objective in the quickest possible time. Amongst the principal pieces of legislation undertaken are the Saurashtra Land Reform Act of 1951, the Saurashtra Barkhali Abolition Act of 1951, the Saurashtra Estates Acquisition Act of 1952 and a few minor legislations, such as the Saurashtra Prohibition of Leases of Agricultural Lands Act of 1953, Prevention of Fragmentation and Regulation of Holdings Act, the Agricultural Debtors Relief Act and the Land Improvement Schemes Act, all of 1954. The survey of the effects of land reforms was conducted in 1955-56 and the year 1947-48 used as the base year. The survey was undertaken on behalf of the Research Programme Committee of the Planning Commission. Mr. R. R. Mishra has done a useful job in the analysis of the data and in presenting the same in a proper perspective.

With a gap of only four years between the land reforms and the period of the survey, no long-range effects could have been discernible. A reading of the survey impresses one of the undeveloped nature of the agrarian economy under the princes, the non-availability of reliable land records which in many cases were non-existent, the absence of regular land survey, the anxiety of the State to implement the reform in the face of political circumstances and law and order situation and the new role assigned to an economic agency, namely, the Land Mortgage Bank. The reforms affected 28,39,449 acres of *Girasdari* and 8,07,225 acres of *Barkhalidars* and the estates of 1,55,766 persons. The total amount of compensation paid by 1956-57 was Rs. 3.65 crores as against an estimated cost over a period of 21 years of Rs. 10.14 crores. The scheme of compensation payable consisted of two parts: (1) the amount paid by the tenant to obtain occupancy rights and (2) payment by Government for a period of years of an amount equal to the assessment on the holding. The former was to be paid out of the loan obtained by the tenant from the land mortgage bank, where he had no other source, and the latter annually out of land revenue collections by the Government.

The effects of the land reforms may be briefly summarised as—

(1) It brought into existence the Land Mortgage Bank which in the following years was able to finance land improvement. Financing of land reforms was a novel role given to a co-operative land mortgage bank and meant relaxation of several orthodox principles but had the benefit of bringing the cultivator into contact with an institutional agency and this was able to build up relationships to facilitate development and, secondly, established the bank's role as "an emblem of the national policy of planned development of the country along socialist lines." While the bank fulfilled its role "admirably well" the response as revealed by the overdues in instalments was somewhat unsatisfactory.

(2) The survey reveals the existence of a certain degree of lack of appreciation of the programme of planned development on the part of revenue officials.

(3) Though too early at the time of the survey to hazard a firm conclusion, during the post-reform period the land utilisation pattern, as well as the crop pattern, has shown desirable changes. The increase in production is noticeable in the case of cotton and groundnut and there has also been an increase in the area under irrigation.

(4) The Government has undertaken a number of development activities and the co-operatives were almost nominal in the pre-integration period. There has, therefore, been a greater prominence in the case of *takkavi* loans rather than in utilising co-operative finance. Even now the co-operatives, which have made considerable headway, are suffering from heavy overdues.

(5) During the period of review, though there were many shifts from one side group of holdings to another, they were traceable to normal courses like partition of land between coparcenaries; sales and purchases were limited. There were also indications that land values showed an upward trend over the period. On the whole, the survey concludes that the reforms did not entail any great hardships for the *Girasdars* and *Barkhalidars* in view of the fact that a majority of them were small holders. In the selected villages for survey, as against 4,828 holdings in 1947-48 there were 4,859 holdings in 1954-55, indicating a net increase of only 31.

A survey of this nature which deals with socio-economic conditions cannot be more pointed in view of the short period during which the reform was in progress. The statistical analysis had to be restrictive mainly on account of the inadequacies of the base data. All the same the publication is a useful first record.

Studies in the Economics of Welfare Maximisation. By Dr. P. R. Brahmananda, Reader in Monetary Economics, Department of Economics, University of Bombay. Published by T. V. Chidambaram, Registrar, University of Bombay. Pages: 520.

The book under review, *Studies in the Economics of Welfare Maximisation*, by Dr. P. R. Brahmananda, who needs no introduction to students of economics in this country, seeks to provide a competent and incisive analysis of the theory of welfare economics in its historical perspective. In the author's own words, "part of this work is an interpretation of the ideas of others; a part is a criticism of the interpretation of these ideas by others." Although the work is predominantly a critical examination of others' contributions, Dr. Brahmananda himself has been able to improve upon the existing theoretical framework of welfare economics, which, incidentally, is still in the process of being evolved.

The book is divided into four parts. The first part presents a self-contained account of the writings of classical economists on economic policy and economic development. The second part surveys and develops the Marshall-Pigou-Hicks approach towards welfare theory and examines the obstacles that keep an economy or its particular sectors in involuntary infra-optional situations. The analysis is carried forward a step further in the next part, which is devoted to certain problems of applications, with particular reference to immobilities, involuntary unemployment, conspicuous consumption and production, etc. The author is to be complimented for having examined some of the major issues against the background of underdeveloped economies.

Although the development of welfare economics as a distinct academic discipline is of relatively recent origin, the classical economists were no less concerned about the effects of economic policy in respect of both allocation and distribution for the welfare of the community. The author, of course, is aware of the limitations of the classical approach. For he readily admits that the classical economists failed to formulate a dependable framework of analysis by which a theory of inter-relation between allocation and welfare could be built. Marshall, however, provided the rudiments of a theoretical frame acceptable to the rational mind by pointing out the possibility of quantitative measurement of "relative worthwhileness of different economic activities." He showed that the economist could discover various possibilities of productive improvements, provided adequate organisational adjustments were made.

Dr. Brahmananda is of the opinion that it is possible for the economist to point out how various policies affect different income groups and to show how various results could be obtained through the adoption of what he calls "equivalence scales." This will necessitate the social evaluation of marginal utilities of income, which, in turn, calls for classification of different income groups composing a community. It must be pointed out here that a separate section dealing with post-war welfare studies would have enhanced the utility of the book. Notwithstanding this omission, it may be readily conceded that Dr. Brahmananda's book is a valuable addition to the none-too-abundant literature on welfare economics—a subject which still offers challenging opportunities for research workers and advanced students of economics.

The Elements of Income-tax Law. By C. N. Beattie, LL.B. Fourth Edition. Published by Stevens & Sons Limited of 11, New Fetter Lane in the City of London. Obtainable from N. M. Tripathi Private Ltd., Bombay. Pages: 221. Price: Rs. 24.

Beattie is a well-known author on taxation subjects, his distinction being clarity of thought, simple language and preciseness. He is a practising Barrister and appears in taxation matters for the Commissioners of Inland Revenue in the United Kingdom. His book on Death Duties in the U.K. is very popular in India.

This book is the fourth edition. The commentary is based on the law as it stood on 1st January 1960. It is mainly intended for students of law, who desire to practise in Income-tax law. The book does not give details of other enactments like the law of trusts and of partnership and international law, as the author assumes that those who desire to practise in Income-tax law know all these laws and the general law in the U.K. He has given explanations and illustrations wherever required. Subjects which are of everyday importance to lawyers like trusts, tax on income from property, husband and wife, etc., have been dealt with elaborately. In this edition he has rewritten the original text and brought it up to date. Certain chapters have been completely rewritten and rearranged. The author has also taken pains to give some sort of help to persons who draft bills everyday. Guidance of this nature is always welcome, as it saves time in looking up case law and the statute law.

How far are the English Income-tax law, case law and books on income-tax law useful to us in India? This query has been answered by the Supreme Court of India in the case of *Vazir Sultan vs. C.I.T.*, reported in 36 Income-tax reports. The Supreme Court says: "The Indian Income-tax Act is not *in pari materia* with the British Income-tax Statutes, it is less elaborate in many ways, subject to fewer refinements and in arrangement and in language it differs greatly from the provisions with which the courts in England have had to deal. Little help can therefore be gained by attempting to construe the Indian Income-tax Act in the light of the decisions bearing upon the meaning of the income-tax legislation in England. But on analogous provisions, fundamental concepts and general principles unaffected by the specialities of the English Income-tax Statutes, English authorities may be useful guides."

Whatever may be their usefulness according to the Supreme Court, one cannot forget the last sentence in the above passage which alone is sufficient to make a lawyer or an accountant, practising in Income-tax law or even a student studying Income-tax law, to study the English law and the commentary on the subject. For this purpose, Beattie's book is quite handy and up-to-date. One should not forget that Beattie is not Simon whose *Commentary on Income-tax Law in England* is well known and looked upon as an authority on the subject, but Simon is also not Beattie.

Britain—An Official Handbook, 1962. Prepared by the Central Office of Information, London. Published by Her Majesty's Stationery Office, London. Pages: 588. Price: 13s. 6d.

A standard official reference book on Britain, the Handbook under review is the thirteenth in the series which is the mainstay of the reference facilities provided by the British Information Services in foreign countries. It covers events up to September 1961 and, like its predecessors, gives a factual account of British administration and the economy, and is illustrated with photographs, maps and charts, which add greatly to the charm and utility of the publication. A 30-page bibliography is intended to guide the reader to further reading on subjects covered in the book. The exhaustive index makes reference easy. Some useful information for visitors to Britain are given in an appendix. The publication is, in every way, a model reference book.

A PASSENGER FROM NEW ORLEANS WRITES:

". . . I am familiar with your First Class service and needless to say "IT IS SUPERB", but after having expected so little, I wish to comment how impressed I am with the service you render your Economy Class passengers . . .

TURBO-CARS STILL A LONG WAY OFF

CHRYSLER CORPORATION'S CURRENT TESTS

NOTWITHSTANDING recent hints from the Chrysler Corporation in the United States that it may possibly decide next year to equip 50-100 of its cars with its newly developed 140 h.p. automotive gas turbine, there is still no apparent prospect for turbine power to become economically attractive for road vehicles in the near future, according to *Petroleum Press Service*, London. Should Chrysler in fact put some turbo-cars on the market fairly soon, it would solely be with a view to getting some clearer idea of the likely response of the public to a sweeping innovation in motoring. However, that decision still depends on the outcome of current tests with two turbine-powered versions of modified Chrysler Dodge and Plymouth 1962 models at present touring the United States for the evaluation of the performance and cost features of the new turbine unit. It is claimed that the latest prototype substantially surpasses its predecessors in both technical and economic efficiency. Those advances are attributed partly to the incorporation of a more effective heat regenerator, but in particular to a novel system of movable nozzle blades whose pitch is automatically varied with changing gas velocities and turbine speeds, thus improving engine acceleration and braking power as well as fuel economy.

Credited with a specific fuel consumption of only 0.51 lb. per horse-power-hour, the Chrysler turbine closely matches the thermal efficiency of a reciprocating gasoline engine, with the added advantage of accepting a wide range of less expensive fuels—from unleaded gasoline and kerosine to jet and diesel fuels. Even so, however, the Company's technical experts make no secret of the obstacles yet to be overcome on the production side, before turbine cars can be expected to appear on America's roads in significant numbers. They have always contended that if the gas turbine were ever to present a serious challenge to the automotive piston engine, it would have to be made competitive in both performance and price. And they hold that equality in first cost could only be achieved by mass production, for which the passenger car market alone offered the requisite conditions. While General Motors and Ford in the U.S., Rover and Austin in Britain, Fiat in Italy, and others likewise directed their research on automotive gas turbines initially to developing prototypes for cars rather than for larger commercial vehicles, some of these firms have in recent years concerned themselves increasingly with the prospects of smaller gas turbines in the latter field and in certain industrial applications.

The widely varying approaches made in the past decade to paving the way for gas turbine power in road transport were comprehensively discussed last month by Dr. J. H. Weaving, Chief Gas Turbine Engineer of the Austin Motor Company, at a meeting of the Institution of Mechanical Engineers in London. His survey of small gas turbines for both automotive and general industrial uses covered altogether over two dozen types of power units from 17 different firms, including twelve of America's and Europe's leading motor and aircraft manufacturers. The author's own company, which in 1949 started the design of a 120-h.p. gas turbine for exploring its potentialities in the automotive field, installed this engine experimentally five years later in a modified passenger car, but did not pursue the further development of that particular model, largely on account of its prohibitively high fuel consumption. Instead, Austin proceeded to design a 250-h.p. industrial turbine for possible use in stand-by power sets, pumping units, etc., and, in later stages of development, for use in heavy lorries, rail cars and off-road vehicles.

Especially interesting for its automotive potentialities, however, is, Austin's 30 h.p. gas turbine, a prototype of which was recently completed under a Government contract aimed at stimulating investigations into the prospects of very small gas turbines for cars. This is indeed the smallest two-shaft turbine ever built, but its fuel consumption of 0.85 lb./h.p.-hr. exceeds the design target by about eight per cent, despite the incorporation of a recuperative heat exchanger. Furthermore, it has been found that even at quantity production of, say, 1,000 units a week, units costs of manufacture would be about twice as high as those of a piston engine of comparable power. Dr. Weaving therefore discounted this model in its present form as an economic proposition for the small automobile.

Thermal Efficiency

Obviously, better thermal efficiency is easier to attain in higher-powered turbines, whose greater overall size allows more space for larger and more effective heat exchangers. As already mentioned, the specific fuel consumption of Chrysler's 140 h.p. turbine is just over half a pound per h.p.-hour, while that of Ford's latest prototype turbine of 300 h.p. is of about the same order at both quarter-load and full load, and lower still at half-load. General Motors' 225 h.p. model with two revolving heat regenerators average 0.59 lb./h.p.-hr., and so does the latest 140 h.p. unit of the Rover Company in the U.K., which made history twelve years ago by producing the world's first experimental gas turbine car; this latest Rover turbine also embodies two heat exchangers but of a different type.

While such devices for re-utilising part of the exhaust heat in the combustion cycle have evidently brought appreciable improvements in fuel economy, they have, on the other hand, inevitably superimposed more complex features upon the basic simplicity of the gas turbine as well as added to its weight and bulk. Some other firms working on automotive gas turbines—e.g., Boeing in the U.S., Fiat in Italy and Daimler-Benz in Germany—have therefore dispensed with heat exchangers and sought to achieve acceptable thermal efficiency solely by stepping up the pressure ratios and gas temperatures in the turbine cycle. But this has raised certain new problems in other directions, in design and operation as well as on the metallurgical side. As in most fields of engineering, the best solution to a particular application usually lies in a compromise between several factors, with efficiency, reliability and cost being of prime importance in the case of the automotive gas turbine, though tending to be mutually exclusive.

Summing up his review, Dr. Weaving observed that after some ten years' development the gas turbine has as yet failed to make the general conquest on land that it has done in the air, though it has proved admirably suited for certain industrial uses in selected fields. For powering road vehicles, however, the drawback of the gas turbine's inherently heavy fuel consumption, high shaft speeds, noisiness and higher production costs, still largely outweigh its equality outstanding advantages over the piston engine. The most compelling of these are, of course, the turbine's excellent torque characteristics, freedom from vibration, lightness, absence of reciprocating parts and, not least, the wide range of fuels it can use. But, evidently, there is wider scope for exploiting these virtues in large commercial vehicles than in cars.

INDIGENOUS PLANT FOR COAL WASHERIES

The third Plan, it may be recalled, has proposed the establishment of additional capacity for the washing of coal to the extent of about 12.7 million tons per year. A part of this washing capacity is to be set up by the Hindustan Steel and another part by the National Coal Development Corporation. The Hindustan Steel's programme comprises the setting up of a second unit at the existing Dugda washery with a capacity of 2.4 million tons and by expansion of the Bhojudih washery which is expected to be commissioned shortly. Of the washeries planned by the N.C.D.C., one at Kathara, with an input capacity of 3 million tons, and another at Karanpura, with a capacity of 2.8 million tons, are being financed from Russian and Polish credits, respectively.

The project reports for two other washeries, namely, one at Chalkari (0.5 million tons) which will be an extension of the present Kargali washery of the N.C.D.C., and the other at Swang (1 million tons), are expected to be ready by March and June 1962, respectively. According to a Government Press note, the placing of orders for supply of plant and equipment for these two washeries is likely to take place between July and December this year. The above two washeries, the expansion project of the Dugda washery, the N.C.D.C.'s proposed washeries at Ramgarh (1.5 million tons) and Sudamdih (2.2 million tons) and some more washeries likely to be set up by the N.C.D.C. and the private sector steel plants—all these will offer plenty of work to indigenous manufacturers of plant and equipment. The Government of India, it is gratifying to note, has decided to give preference to indigenous manufacturers of such plant and equipment over foreign suppliers, provided price and delivery terms are reasonable. But at present there is only one indigenous manufacturer of coal washery plant and equipment. The Government has clearly stated that, with the setting up of additional capacities in India for such plant and equipment, future tenders will be restricted to indigenous manufacturers. This is an encouraging development in the sector of machine-building industries.

GLAXO LABORATORIES (INDIA) PRIVATE LTD.

invite applications for the post of Assistants in their Organisation and Methods Department. Applicants should have at least a first or second class degree in Business Management or Accountancy of an Indian or Foreign University, and must, in addition, have some practical experience in Organisation and Methods work. Total initial emoluments will be about Rs. 600 per month with good future prospects. Higher emoluments may be considered for an exceptionally suitable candidate.

Applications giving full details about qualifications and experience should reach the Personnel Officer, Glaxo Laboratories (India) Private Limited, Dr. Annie Besant Road, Worli, Bombay 18, on or before the 28th February 1962.

SISTA'S

NEW PRODUCTS AND PROCESSES

Plastic Film Cutter

A DUTCH firm is manufacturing a portable apparatus for sealing and cutting polyethylene bags and similar packaging materials. An unusual feature of the machine is that it seals and cuts in one operation. It works on the heat-impulse system; the plastic films to be sealed are first clamped tightly together and then, by depressing an arm with a sealing bar attached, sealed by momentary heating. The seal is subsequently allowed to cool until adequate strength has been regained. The entire operation takes only a few seconds. Sealing time (½ to 2½ seconds) is automatically determined by a built-in time switch. The thickness of the plastic packaging materials may vary from 0.02 to 0.25 mm. The cutter fitted to the apparatus enables the polyethylene to be cut off during sealing, which means that two operations can take place simultaneously. The machine is 36 cm. long, 11 cm. high and weighs 5.18 kgs. It can be used for sealing lengths of up to 21 cm. It uses alternating current of 220/240 Volts and its power consumption is 110 Watts.

New Stainless Steel

A new ferritic stainless steel containing 17 per cent chromium and one per cent molybdenum has been developed by a subsidiary of the United Steel Companies Ltd., Britain. Known as Silver Fox 17 MO, the addition of one per cent molybdenum to a straight 17 per cent chromium stainless steel has been found to give a marked increase in corrosion resistance without in any way adversely affecting physical properties. Of all the many qualities of stainless steel produced the 17 per cent chromium quality represents the largest tonnage. It has been recognised for some time, however, that there was a need to enlarge the scope for using this relatively cheap stainless steel by improving its properties without adding appreciable quantities of expensive alloys. This objective has now been achieved with Silver Fox 17 MO. Comparative laboratory tests have been carried out with Silver Fox 17 MO, Silver Fox 17 (straight chromium) and Silver Fox 302 (18/8 type). A wide range of tests, including those with a variety of acids and acidic foodstuffs revealed a general superiority of Silver Fox 17 MO over the straight chromium steel, and results were in some cases as good as Silver Fox 302.

Burton Hardness Tester

An instrument for measuring the 'hardness' of large diameter steel rolls, as used in steel rolling mills, flour mills, and paper mills, has been designed by a British firm J.O. Deakin and Co. Ltd. It enables measurements to be made on the machines, where previously it was almost impossible to obtain accurate measurement of the hardness value of the whole surface. The instrument—a Burton hardness tester—is fitted with magnetic contacts which secures it to the piece of metal to be measured. There is no danger of side-slip, or damage to the diamond indentor. The instrument is located in a non-ferrous block between two magnetic bases, with a machined Vee running horizontally to allow maximum contact on cylindrical surfaces. Magnetic contact is made by the push button method of permanent magnets, and the instrument is operated by gripping the twin handles on each side. This causes the top set to depress, bringing a diamond indentor in the instrument in contact with the material, and through the dial mechanism, giving a direct reading of the hardness value.

New Plant Cuts Production Costs

Amongst the latest pieces of modern production machinery to be installed in the Lancashire factories of Leyland Motors Ltd. is a gas-fired, batch type, sealed quench heat treatment plant for gas carburising, which features fully automatic control of the heat treatment cycle and carburising atmosphere. It is now being used by Leyland primarily for case hardening their heavy duty rear axle spiral bevel pinions under the most precisely controlled metallurgical conditions. Its design allows components to be automatically quenched straight after carburising, fully protected by a non-oxidising atmosphere, thus cutting out the need for reheating for hardening, and producing work free from scale. This leads to substantial economies in heat treatment and cleaning costs and also reduces the opportunity for distortion to occur. Believed to be the first of its type to be used on such heavy duty components by a manufacturer in the heavy vehicle industry, the plant was installed by British Furnaces Ltd., Chesterfield.

Baking Varnishes

A range of water-soluble resins which give excellent baking varnishes when mixed with phenolic or amino hardening agents is now available in Britain. Non-inflammable and non-toxic, the new formulation also permits spray rooms to be cleaned down by flushing with water. Excess spray can be collected and used afresh while badly sprayed articles can be washed and treated again. During stoving, nitrogen compounds in the resins volatilise or become insoluble and the finished film shows extreme hardness, elasticity and adhesion, particularly to aluminium surfaces. Thick priming coats are easy to obtain and the material flows well, so that no sanding is required to finish off. Standard spraying and stoving equipment can easily be adapted to the new formulations.

Fire-resistant Conveyor Belt

An improved fire resistant conveyor belting, particularly suitable for mining, is now available for export from a North of England firm. It is especially suitable for face work where conveyor belting must have exceptional characteristics such as a high resistance to splitting, impact and tearing. The manufacturers say that its operating efficiency should compensate for any increase in initial cost compared with other grades of P.V.C. belting. Known as "Facemaster 1445," the new P.V.C. belting has been developed by the firm who make conveyor and transmission belting and rubber hose for many purposes including lined and unlined fire hoses. By using nylon blended and woven with cotton, the firm have produced a fabric, three plies of which, it is claimed, have a tensile strength exceeding five plies of cotton to British Standard 490. Resistance to tearing and splitting has been achieved by a weft strength more than double that of cotton. To improve resistance to impact—a frequent cause of belt damage—and provide ample transverse stability, a resilient impact sheet has been provided between each carcase ply.

Timber Treatment

A British firm, Pratchitt Brothers Ltd., which has supplied timber impregnating plant to a number of countries, including India, has recently improved its equipment. Its latest vacuum pressure plants are compact and have a simplified layout. The new layout has the preservative storage tank on steel channel supports above the treating cylinder, instead of at ground level. The space between the two cylinders now houses the electrically driven pumps to create the vacuum and the hydraulic pressure in the treating cylinder. The capacity of the various pumping units has been increased. Less time is now needed to treat timber. When used for fire-proofing, a bigger storage tank is made into two separate compartments, different liquids being isolated for the preserving and fire-proofing processes.

Open-type Package Sub-station

After pioneering the package form of switchgear in Britain, South Wales Switchgear, Limited, Blackwood (Mon), has introduced a new design of open-type package sub-station. A 33-kV substation, the first of its kind, has been erected at Windsor Colliery in the South-Western Division of the National Coal Board. The completion of the installation was speeded by prefabrication, a high proportion of the assembly work being carried out at the manufacturers' works and transported to the site in units. The substation, allows for a built-in control room between the oil circuit breakers, which can be seen horizontally withdrawn on their wheels and rails. The new design, filling a need between the open orthodox open-type sub-stations requiring a large site area and ultra-compact metal clad package sub-stations, was planned to meet the needs of the colliery, where economy of space is of primary importance.

Atomic Power Plant Produces More Fuel

The United States Atomic Energy Commission has nearly completed the building of a new type of atomic reactor which will produce more nuclear fuel—plutonium—than it consumes, while at the same time generating commercial quantities of electricity. The power plant is located at the Commission's research station at Idaho Falls, Idaho, in the north-western part of the United States. Preliminary testing of the reactor has already begun, and it is expected that the reactor and power plant will go into full operation about the middle of this year. The plant's electric power output will be 20,000 kilowatts, which is enough to supply the electricity needs of a town with a population of 35,000. Its reactor is called a "breeder" reactor, because it "breeds", or creates, new fuel at the same time that it is burning up its original fuel.

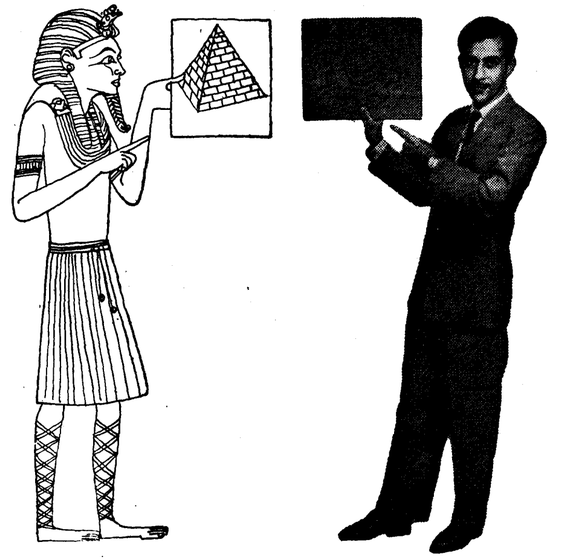
Better Staple Fibre Yarn

A new process which, it is claimed, will give man-made fibres all the advantages of wool and some extra ones as well has been developed by Newhill and Earnshaw of Bingley, Yorkshire, Britain. The new process is called Airvel and it is the first time, the producers claim, that a staple spun yarn has been produced possessing the attributes of bulk and elasticity in the degree that they are present in this new yarn. Although Airvel is believed to be applicable to several fields of the textile industry, its application is at present confined to the field of knitted wear. The process allows the production of knitted wear with warmth and light weight as well as excellent shape retention during wear and wash.

Non-slip Plastic Flooring

Flooring material with a non-slip surface and claimed to offer a solution to the stiletto heel problem is being manufactured by Plastics and Resins of The Airport, Pendeford, Wolverhampton, Staffordshire, Britain. Called "Terraplex," it is described as a plastic composition which is applied cold to almost any type of floor, including concrete, wood, steel, either by brush or spray gun. One gallon is said to cover about 4 square yards. Because it hardens quickly, says the manufacturer, the plastic material can be applied in the evening and be ready for use next morning.

TELL US YOUR JOB—



AND WE'LL GIVE YOU THE TOOLS

The size, shape or complexity of a project doesn't overawe us. We have the tools to help build it with a minimum of time, labour and cost. For nearly 70 years, BATLIBOI have supplied Industry and Trade in India with goods ranging from complete power plants to hacksaw blades. We represent internationally known manufacturers from the United Kingdom, U.S.A. Czechoslovakia, France, Germany, Japan and many other countries. BATLIBOI also represent some of India's leading manufacturers of Machine Tools, Diesel Engines and various other types of machinery. Industry and Trade are vitally connected with the economic growth of any country, and BATLIBOI are vitally connected with Industry and Trade in India.

TRENDS IN BRITISH INSURANCE

BOOM IN LIFE BUSINESS—OTHER CLASSES UNDER STRESS

A COMPREHENSIVE survey of the developments in the main branches of insurance in Britain during 1961 is presented in the thirty-fourth Annual Reinsurance Number of *The Review*, the international insurance journal published from London. For life insurance, according to *The Review*, 1961 was another successful year, whereas for other classes—namely, fire, accident and marine, it was a year of continued expansion in premium income accompanied by poor underwriting results. The year witnessed further evidence of the realisation by the insurance industry of the need for greater capacity—financial and administrative. Much of the driving force behind the recent spate of mergers has been engendered by the need for greater capacity in the face of the ever-growing size of risks. One of the biggest mergers was that between Royal Insurance and London and Lancashire Insurance which resulted in a £400 million insurance group, the largest in Britain and which handles one-third of all British insurance in the U.S. By the purchase of two old-established Canadian companies, namely, the Western Assurance and the British America, the Royal also increased very materially the stake of British insurance in Canada. Other proposed mergers were, however, not as successful as that of Royal and London and Lancashire. Negotiations between Eagle Star Insurance and London and Manchester Assurance and those between Mercantile and General Reinsurance and the Reinsurance Corporation proved abortive. In spite of the recent mergers, it is felt in British insurance circles that the amalgamation process would have to go much further for monopoly danger to arise.

Life Insurance

Life insurance scaled fresh peaks in 1961. Ordinary new life insurance business rose by 15 per cent over 1960 to £2,673 million last year. Premiums from this new business, including annuities, rose by £19 million to £160 million. In the industrial branch, new sums assured rose from £398 million in 1960 to £416 million in 1961. Total annual premium income of the life offices, excluding industrial assurance, exceeded £525 million last year, of which £160 million related to deferred annuities. Industrial assurance premium accounted for £190 million.

Alongside the boom in new business, there were also substantial increases in bonuses on with-profit policies. About 22 ordinary life offices declared new rates of reversionary bonus during 1961 consequent upon their periodic acturial evaluation made during the year. Without exception, all the 22 offices stepped up the bonus. In fact, five of them announced special bonuses of a non-recurring nature, in addition to the normal reversionary bonus. This is doubtless a reflection, in the majority of cases, of the large gains made in the equity holdings of the companies.

As a result of their ability to earn high interest on new investments, many life offices reduced the rates of premium for immediate annuities in 1961 and there were also adjustments in a downward direction in premium on with-profits policies.

A striking development in the field of life insurance underwriting in Britain was the notable increase in the number of offices quoting premium rates for policies which included a right to take out further assurance, within limits, without medical examination, if such application is made, say, 10 to 15 years from the date of the first policy. The ability to offer this type of policy depends partly on the favourable mortality experience of recent years—particularly in the middle years of life—and partly on the prospects of better health based on the progress in the medical world.

High Fire Wastage

As regards the other classes of business, a development of considerable concern to the companies is the continued deterioration in fire insurance underwriting. The cost of fire damage in the U.K. jumped up from £24 million in 1958 to £44 million in 1959, the highest total ever recorded, followed by a total of £43.7 million in 1960. For the first 10 months of 1961, the estimated fire wastage is £37 million, which indicates that, for the third year in succession, fire wastage would have exceeded £40 million. This phenomenon was, however, not confined to Britain. In both U.S. and Canada, the rate of loss by fire in 1961 exceeded that of 1960.

The granting of cover against flood damage has never been a particularly favoured risk among insurers even in the U.K. Nevertheless, the disastrous floods in the winter of last year cost the insurance companies and Lloyd's over £6 million in claims, while it was left to the Government to compensate thousands of uninsured sufferers. In the light of the heavy losses suffered by the community, the British insurance market has announced a scheme to make flood insurance cover more widely available. This has given rise to a considerable demand for the extension of policies which insure the building of houses and flats to include flood risk and, perhaps, in recognition of the advisability of associating storm and tempest cover with flood insurance, a not inconsiderable switch from "fire only" policies on buildings and contents to policies in comprehensive form.

Accident Business

Underwriters for world-wide accident risks have been spared few, if any, of the usual mixed bag of problems. In many parts of the world, motor insurance business, which constitutes more than half of the total accident business, is still unprofitable. In 1959, British companies succeeded in cutting the world-wide loss on motor insurance business from its 1958 figure of £10 million to £1½ million. In Britain itself, by exercising their right of freedom to select, refuse, and rate up individual motor business in accordance with the underwriters' judgment of the risks involved—a freedom denied to them in the U.S. but being freely exercised in India—the companies were able, in that year, to produce a meagre profit margin. This, however, virtually disappeared in 1960 under the impact of higher claims cost, and therefore, after four years of relative stability in standard motor premium rates for the U.K. business, most companies found it necessary to make certain adjustments. The Accident Offices Association, whose members transact a substantial portion of motor insurance in the U.K., announced, with effect from 1st June 1961, increases ranging from 17½ per cent to 25 per cent on the standard rates of insurance premium for vehicles used in the motor trade and on hire. For the better protection of policyholders, the limit of indemnity for damage to third-party property was increased from £10,000 to £50,000 in any one accident and made applicable to all types of commercial vehicles, including motor traders' vehicles and hire cars.

There also followed, with effect from September last, certain changes in the standard premium rates for insurance of private cars. The object of the changes was to ensure that the total of premiums required to cover total claims is more fairly and accurately apportioned among policyholders in accordance with the degree of risks to which they are exposed. The overall effect of these changes was expected to increase total private car premiums of the offices concerned by rather less than 5 per cent. As a result of the changes, a substantial number of policyholders will be charged increased premiums ranging from 10 per cent to 30 per cent, according to the district in which the car is garaged, a few will pay less and the majority will not be affected at all.

Marine insurance, which is a world-wide business in the true sense of the word, also produced a serious crop of losses last year. Most insurers found a sad deterioration in marine insurance figures. This was especially so in the case of hull insurance. The 1959 underwriting year was singularly free from major casualties, but 1960 proved to be a good deal worse than average, thanks to heavy casualties which kept up a disturbingly hot pace last year. Of course, there were factors that operated in favour of marine underwriters last year. They were (1) upward trend of premium income, (2) withdrawal of old tonnage and (3) the replacement of obsolescent vessels by modern ships. The utilisation of a greater proportion of modern vessels was not, however, an unmixed blessing, because shipowners the world over found it difficult to secure in adequate numbers experienced sea-going personnel, particularly competent, certificated engineers, to operate the highly complex machinery installed in the most modern vessels. This situation augmented claims cost.

The problem of market capacity was one of the most vital affecting the marine insurance market in 1961. This was relevant mainly to the high insured values of certain ships, not all British, brought into commission. Actually, the market managed to absorb these entirely, but real concern was expressed as to what would happen if it was asked to cover much bigger risks than normal.

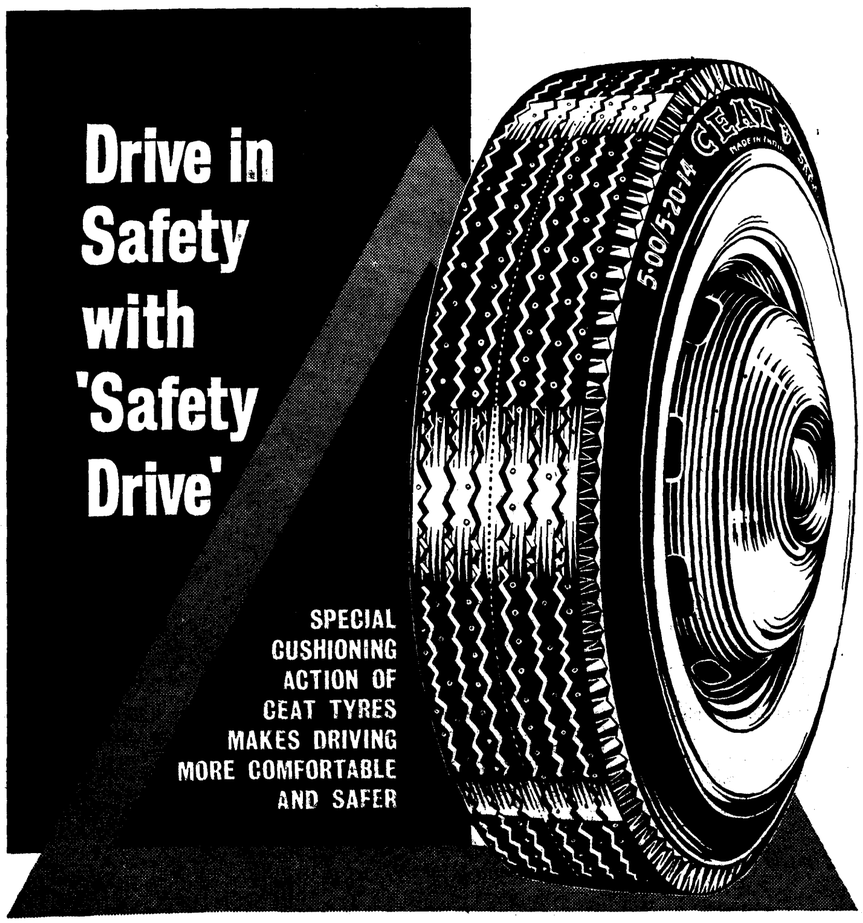
Aviation Insurance

The past year would appear to have been a record one for aviation insurance. The London market, which is one of the world centres for aviation insurance, shared in the expansion of world aviation insurance stimulated by the increase in the number of jets in service. World hull damage during the first three years of big jet operation is expected to have aggregated $100 million at the end of 1961 when about 600 jets were in service. Their number is expected to rise to 700 by the end of 1962. Studies suggest that hull losses are more closely related to flight time (or landings) than calendar time and, such is the intensity of jet operations, that 1962 may add another $100 million to the loss record, not all of which is necessarily insured. It is, therefore, too early to form any idea of the underwriting reserves which may be available to meet claims of this magnitude, particularly when it is realised that catastrophe exposure is rising with the increased density of air traffic and accumulations of jets parked at the major airports.

With international passenger fares at their present level, this increased jet activity has thrown up more airline seats than can be filled and hence the major operators continue looking for methods of reducing operating costs. The tempting economy of "self-insurance" by a single insured operator represents a concentration of risks without spread—which, normal prudence suggests, is a highly dangerous state of affairs. More fruitful economies can be effected by the careful planning of excess levels or co-insured participation by the insured. But this requires a high degree of co-operation between operators and underwriters, of which there is no sign at present, at any rate within the traditional market structure with its rigid rating formulæ.

Atomic Risks

No account of the trends in British insurance could be complete without a reference to the progress of nuclear insurance, which, though a comparatively young and highly specialised class of insurance, is assuming increasing importance on account of the rapid advance in the application of nuclear energy to industrial uses. The past year has been an important one for atomic risks insurance. The British Insurance (Atomic Energy) Committee, which manages the Pool of Companies and Lloyd's Underwriters, set up in 1956 to provide capacity for the insurance of nuclear risks, has now come to occupy considerable standing both as an insurer of and as an expert adviser on the world of nuclear risks. The Committee has, within the span of five years, won a leading position for the London market in this new and highly specialised class of business. The British Pool continued to provide substantial assistance to foreign Pools and, in the course of 1961, added Denmark, Germany, Japan, the Lebanon, and Peru to the countries where it has direct business or a share of the local insurance on nuclear installations. The importance of the Pool is bound to increase both as a direct underwriter and a reinsurer of nuclear risks as more and bigger installations are commissioned and special legislation on the liability of the operators spreads.



"SIPES"—*the little ring knobs* found in the tread give extra safety—hold the road better. These "safety rings" combined with CEAT's exclusive deep tread pattern give complete driving confidence.

THE AMERICAN ECONOMY: PROSPECTS FOR GROWTH THROUGH 1975

PART IV: GROWTH POTENTIAL OF MATERIALS AND CONSUMER GOODS

By Dr. Dexter M. Keezer

ECONOMIC ADVISOR, McGRAW-HILL PUBLISHING CO., INC., NEW YORK

IT takes materials, as well as equipment, to turn out goods; so U.S. needs for basic materials will grow, too. But we will probably turn more and more to the newer, lighter materials in the years ahead.

We can expect an average growth of 50 per cent to 60 per cent over the next 15 years in the consumption of such old standbys as copper, lead and zinc. There will be more growth in steel and, especially, alloy steel. As machines run faster, we will need more and better alloys to stand greater stress and heat. That means a more than proportionate rise in consumption of the valuable alloying elements like columbium, molybdenum and the rare earths.

Light Metals

But the really spectacular growth will be in light metals. Output of titanium—a wonderful metal for lightness and heat resistance—is expected to increase several-fold. Magnesium production may increase 300 per cent during the next 15 years. And the use of aluminum may triple by 1975.

Fifteen years from now, the building industry alone may take as much aluminum as went into all uses in 1960. It is being used increasingly for doors, window frames—even whole walls. And aluminum makers expect to see a tremendous increase in the use of the white metal by the automobile and pleasure boat industries.

Among the non-metallic minerals, needs for phosphate and potash will more than double by 1975, because of the growing need for fertilisers. This will also promote a fairly rapid growth in consumption of sulphur. Fluorspar—used in making glass and aluminum—is another mineral with expanding markets.

The *Electrical World* magazine estimates that, by 1975, we shall be using about 2½ times as much power per worker in industry and about 2½ times as much electricity in the average home. The total result: more than four times as much electric power will be consumed in 1975.

Fuel

Where will we get our fuel? Mostly from the same sources we use now—coal, oil and natural gas. But, by 1975, as much as 25 per cent of the new power installations (7.5 per cent of capacity in place) may be utilising atomic fuel. Up to 1975, the main effect of the rise in power generation on fuel demand will be to increase coal requirements of the power industry. These may go up by 100 per cent by 1975, even with improved burning techniques.

Imported fuel oil will still be used for power generation and some home heating. But most of our domestic supply will probably be converted into chemicals, gasoline and lubricants. Our total demand for petroleum products will rise about 65 per cent by 1975.

Increasing shares of the home heating and industrial fuel markets will go to natural gas. Chemical companies have already made great progress in extracting chemicals directly from coal by hydrogenation. It is quite likely that, by 1975, coal will be gassified underground and then piped directly to plants for use in steam boilers for breaking up into chemical compounds.

Total production of chemicals is expected to rise 140 per cent by 1975.

The future for plastic materials is exceedingly bright. Output should approach 25,000 million pounds (11,250 million kilograms) in 1975, as compared with nearly 6,500 million pounds (2,925 million kilograms) in 1960. Among the big uses that lie ahead are these: in homes—walls, ceilings and furniture; in industrial plants—dies and heavy bearings; in consumer goods—automobile body parts and housing for large appliances.

Synthetic fibres, like plastics, are rapidly displacing natural materials. Output may triple by 1975. The new fibres are not likely to eliminate wool and cotton in wearing apparel uses; but they will continue to take over more of the market in the form of blends for winter as well as summer wear.

Chemicals

The farm market for chemicals may double by 1975.

Most industrial chemicals will track along with the general growth in industrial production, but the sharpest growth within this group will be in synthetic organic chemicals. And, among these, the petrochemicals—those made from oil—stand out. By 1975, about three-fourths of all synthetic organics will be made from oil and gas. By 1975, output of petrochemicals may be up 240 per cent.

There are bright prospects for a number of other basic materials—particularly those used in construction. Plywood, cement, glass and gypsum are among the items that will double or nearly double in use by 1975. The growth trend is also very strong for materials used in the packaging field. Output of paper and products is likely to increase about 90 per cent by 1975.

The outlook for consumer goods industries is very bright. As our national product increases, a larger and larger proportion can go for raising the standard of living—for consumer durable goods, housing and home improvements and travel and recreation.

The average family in the years ahead will have a lot more money to spend than in 1960. It is estimated that, by 1975, family income (after taxes) may rise by 40 per cent from the 1960 level. That would amount to $8,800 in real income, measured in constant prices.

And most of the gains will occur as people from the lower income brackets move up to middle income brackets and then work up to fairly high incomes where they can greatly increase their spending. Chart IV depicts the revolution in redistribution of incomes which has taken place and which will continue to take place, although at a somewhat different pace.

More people with higher incomes means sensational growth in total consumer spending. Consumer expenditures (in 1960 prices) may increase from just under $350,000 million in 1960 to $439,000 million in 1965, $538,000 million in 1970 and $656,000 million in 1975.

Housing and Transportation

The greatest improvement in the American standard of living between now and 1975 is likely to be in housing standards. Mass production methods—whether factory prefabrication or large-scale fabrication at the site—will bring costs down. And higher incomes will lead to a demand for higher quality. Thus homes built in the future will be bigger, better designed and better furnished than those of the past decade.

Prefabrication will make it possible to turn out standard, low-cost housing, much as we now produce cars. With prefabricated sections, it will be possible to remodel, alter or add to existing homes as the family grows or its style of living changes.

New housing starts in the 1970's are likely to average two million per year. By 1975, about 40 per cent of new homes will be prefabricated.

The automobile market—largest of all for consumer durables—is still expanding, despite all talk of saturation. Domestic passenger car production in 1975 is likely to reach 9 million units, as compared with 6.7 million units (not all of which were sold) in 1960. By 1975, there may also be a substantial market for personal planes—the next major step forward in consumer transportation.

All in all, these projections add up to a portrait of a growing and successful economy.

UNITED BANK OF INDIA LIMITED

Registered Office:

United Bank Buildings
4, Clive Ghat Street, Calcutta

NOTICE

NOTICE IS HEREBY GIVEN THAT THE next Annual General Meeting of the shareholders of UNITED BANK OF INDIA LIMITED will be held at the Registered Office of the Bank at the United Bank Buildings, 4, Clive Ghat Street, Calcutta, on Monday, the 26th March, 1962, at 11 a.m., to transact the following business:—

1. To receive the Directors' Report and Audited Accounts for the year ended 31st December, 1961.
2. To declare a Dividend.
3. To elect a Director in place of Dr. N. N. Law who retires but offers himself for re-election and to consider and, if thought fit, to pass the following resolution as an Ordinary Resolution:

   "Resolved that Dr. N. N. Law who has completed 74 years of age be and is hereby elected and appointed a Director of the Company and it is specifically declared that the age limit of Directors prescribed under Section 280 of the Companies Act 1956 shall not apply to him."

   Special notice of intention to propose the foregoing resolution has been received by the Company.
4. To elect a Director in place of Sir Chunilal B. Mehta, Kt., who retires but offers himself for re-election and to consider and, if thought fit, to pass the following resolution as an Ordinary Resolution:

   "Resolved that Sir Chunilal B. Mehta, Kt., who has completed 74 years of age be and is hereby elected and appointed a Director of the Company and it is specifically declared that the age limit of Directors prescribed under Section 280 of the Companies Act 1956 shall not apply to him."

   Special notice of intention to propose the foregoing resolution has been received by the Company.
5. To elect a Director in place of Sri T. S. Santhanam who retires but offers himself for re-election.
6. To elect a Director in place of Sri B. N. Chaturvedi who retires but offers himself for re-election.
7. To appoint Auditors and fix their remuneration.

AS ORDINARY RESOLUTIONS

The following resolutions will be moved as Ordinary Resolutions:—

8. "By virtue of the discretion vested in the General Meeting by Section 228(3) of the Companies Act, 1956 as amended in 1960, it is hereby resolved that the accounts of the branch offices of the Bank may be audited otherwise than by the Company's auditor and it is further resolved that the Directors be and are hereby authorised to appoint from time to time persons qualified for appointment as auditors under Section 226 for audit of the accounts of such of the branches of the Company in India as they may deem fit or where branch offices are situated in countries outside India by persons qualified to act as auditors of the accounts of such branch offices in accordance with the laws of those countries in consultation with the Company's Auditor and pay them such remuneration as the Directors may decide."
9. "Resolved that pursuant to the provisions of Section 293(1)(d) of the Companies Act 1956, as amended in 1960, the Board of Directors be and are hereby authorised to borrow from time to time such sum or sums of money as they may in their absolute discretion think fit up to Rs. 10 Crores notwithstanding that the amount borrowed may by this or together with any other sum or sums already borrowed and outstanding be in excess of the Company's paid-up capital and free reserves, i.e., reserves not set apart for any specific purpose."

AS SPECIAL RESOLUTIONS

The following resolutions will be moved as Special Resolutions:—

10. "Resolved that the Company consents to Sir Chunilal B. Mehta, Kt., holding appointment as Member, Local Advisory Committee of the Bank at Bombay notwithstanding his appointment as a Director of the Company."
11. "Resolved that the Company consents to Sri T. S. Santhanam holding appointment as Member, Local Advisory Committee of the Bank at Madras notwithstanding his appointment as a Director of the Company."
12. "Resolved that pursuant to provisions of Section 314 of the Companies Act as amended in 1960, consent of the Company be and is hereby accorded to the appointment of—

    (a) Each of the following officers who is a relative of the Director of the Company mentioned against his name holding and continuing to hold his employment in the grade and in the scale of pay mentioned against his name together with the usual allowances, benefits, amenities and facilities applicable to other employees occupying similar posts and the Board is hereby permitted to promote Sri Pabitra Kumar Sen to the next higher grade and scale of pay, viz. Rs. 850-50-1150-100/2-1550 and adjust his basic pay at Rs. 850 in the said scale:

	Name of the employee	*Grade and Scale of Pay*	*Related to*
1.	Sri Dhires Chandra Dutta Gupta	170-15-260-E.B.-15-305-E.B.-15-320-20-440	Sri B. K. Datta
2.	Sri Bhupendra Nath Sen Gupta	235-15-310-20-330-E.B.-20-450-25-500	Sri N. C. Datta
3.	Sri Kshiti Bhusan Dutt	295-15-310-20-450-E.B.-25-600	Dr. S. B. Dutt
4.	Sri Biswa Ranjan Das Gupta	475-25-500-30-710-40-750-50-1000 E.B.-50/2-1150	Sri K. C. Das
5.	Sri Pabitra Kumar Sen	Do.	Sri B. K. Datta

    (b) Sri Satyendra Krishna Dutta Roy, who is a relative of Sri N. C. Datta and Sri B. K. Datta, Directors, holding and continuing to hold his employment as Inspector of Tea Advances, on part-time basis, on the following terms:

    (i) Consolidated salary of Rs. 350 per mensem without allowances.

    (ii) An inspection charge of Rs. 30 per tea garden inspected.

    (iii) Actual travelling expenses as follows:

    (a) First class Railway fare in India and second class in Pakistan,

    (b) Second class Steamer fare,

    (c) Actual Air passage with prior sanction of Head Office.

    (d) Third class Rail and Steamer fare for the attendant sub-staff,

    (e) Reasonable expenses incurred while on tour for conveyance to and from station, porterage, food etc.

    (iv) Reimbursement of the expenses for a clerk and sub-staff not exceeding Rs. 50 and Rs. 20 per month respectively and actual running expenses and maintenance of a car placed at his disposal.

By Order of the Board,

A. K. ROY,
Secretary.

Dated, Calcutta, the 16th February, 1962.

Note: (i) A MEMBER ENTITLED TO ATTEND AND VOTE IS ENTITLED TO APPOINT A PROXY TO ATTEND AND VOTE INSTEAD OF HIMSELF AND THE PROXY NEED NOT BE A MEMBER.

(ii) The Transfer Books of the Company will remain closed from Monday, the 12th March 1962 to Monday, the 26th March 1962 (both days inclusive).

(iii) The dividend, when sanctioned, will be payable on and after the 16th April, 1962 to those shareholders whose names stand on the Register on the 26th March, 1962 and who are entitled to participate in the distribution of dividend in terms of Article 149 of the Company's Articles of Association.

(iv) Dividend Warrants will be posted to shareholders at their registered addresses or in accordance with their mandates. Such mandate, if not already given, and intimation of any change of address should be given to the Bank early in time.

The Explanatory Statement required under Section 173 of the Companies Act, 1956 has been forwarded to the members of the Company.

STATE BANK OF INDIA

NOTICE

THE SEVENTH ANNUAL GENERAL MEETing of the Shareholders of the State Bank of India will be held at the Bank's Local Head Office at Apollo Street, Bombay, on Tuesday the 27th February 1962, at 4 p.m. (Standard Time), for the transaction of the following business:—

To receive the Central Board's Report, The Balance Sheet and Profit and Loss Account of the Bank made up to the 31st December 1961 and the Auditors' Report on the Balance Sheet and Accounts.

P. C. BHATTACHARYYA,
Chairman.

STATE BANK OF INDIA,
CALCUTTA, *the 19th January* 1962,
29th Paus. 1883 *(Saka).*

THE TASK OF MANPOWER ECONOMIST

PROBLEMS OF FULFILMENT EXAMINED

By Dr. K. M. Saran

IN this age of advanced technology, when mankind is trying to score a victory over nature by unfolding its innermost secrets, the unique importance that used to be attached to the acquisition of capital is fast being forgotten and it is now, perhaps more than ever, realised that skilled and trained manpower constitutes the key resource for economic development. All the resources in the world would be nought if highly skilled and/or trained manpower is not available for effectively exploiting and utilising them. That is why high-talent manpower is coming to be prized most by those underdeveloped nations which are trying to reach that stage of economic development where economic growth becomes a self-sustaining process. It is also now, more than ever, being realised that trained manpower is not a commodity that can be purchased across the sales-counter in any quantity and also that it takes a long time to develop it. Manpower requirements have, therefore, to be assessed much in advance, so that personnel could be selected, trained, developed and made available for being utilised effectively wherever and whenever required. The manpower economist has, therefore, to concern himself with "determining policies, objectives and programmes for the development of the occupational skills required to build and administer the economic and social institutions and to produce the goods and services essential to achieving economic goals."

Indispensable Function

An important and perhaps an indispensable function of the manpower economist is the assessment of the manpower requirements sufficiently well in advance, so that the ways and means of supplying the required number of requisite calibre could be explored. It is a tedious task and needs considerable skill. Manpower requirements are usually determined by the economic targets to be achieved and the pattern of development envisaged. The pattern of development envisaged has thus an important bearing on the task of the manpower economist. If the economy is to be agriculture-oriented, the pattern of manpower requirement would be different from what it would be if large-scale industrialisation is the aim. Economic targets are similarly and equally important since the number and categories of personnel would largely depend on them.

The techniques which are commonly adopted for estimating future requirements and availability of different categories of personnel may be briefly reviewed here. Manpower economists usually take the help of investment-employment and output-employment ratios for making long-term projections of investment or output targets and requirement of professional, skilled and other highly trained manpower while taking into account the various factors which affect demand for workers in each occupation such as numbers needed for replacing workers who die, retire, or give up jobs, changes in technology, changes in investment-employment ratios as a result of changes in the price-level, increase in the productivity of workers, changes in the pattern of the economy etc., the behaviour of such factors in future and their combined effect on future requirements. The use of such improved and modernised techniques as linear programming is also made in making the estimates of requirement and availability of personnel. But, while it is not impossible to arrive at global figures of requirement, it is certainly difficult to arrive at exact requirements of different categories of personnel many years in advance. The supply position is equally difficult to project. Manpower economists have to make use of such data as the intake capacity of existing institutions for training different categories of personnel, intake capacity of the new institutions that may be set up in course of time, the extent of utilisation of intake capacity, the wastages and stagnation in educational institutions, the outturn rates, etc. It may even be necessary to work out the trends in the growth of institutions for extrapolating the outturn of trained manpower in future under certain assumptions.

In order to arrive at more correct estimates of the outturn of technically or professionally trained persons from various institutions or institutions that may be set up during the period for which estimates are to be built up, the usual technique is to deflate the total intake capacity by wastage, stagnation and non-utilisation rates which might be based on a number of case studies that may be taken up in different types of educational, technical or professional and kindred institutions on census or sample basis—the presumption being that the rates thus obtained would hold good in respect of the existing and new institutions in future. In case any marked improvement in the methods of teaching, calibre of the trainees, or in the utilisation of capacities and outturn of trainees from the institutions can be foreseen, necessary adjustments can be made in these rates, or, if the estimates have already been worked out, the figures can be inflated to the extent of the improvement visualised.

For a better understanding of these techniques, it would be necessary to define these terms and the underlying distinction among them, namely, (1) wastage rates; (2) stagnation rates and (3) non-utilisation rates. Wastage rates are the rates at which the trainees abandon their studies without completing the courses to which they were admitted. Such wastages occur largely due to the students leaving the course at any stage for some reason or other. Non-utilisation rates, on the other hand, are a measure of the extent to which the seating capacities at the initial stage or at different stages of different courses in different institutions could not be utilised for reasons of non-admission. Stagnation rates, which are different from wastages and non-utilisation rates, are a measure of the extra time taken beyond the prescribed duration of the courses owing to failures or discontinuance for sometime for any other reason. They have to be worked out under certain assumptions. For example, one of the assumptions may be that the trainees do not go on taking indefinite number of chances at the examinations nor are they allowed to do so and that the number of chances is restricted to two or three; another assumption may be that any previously failed candidate has the same probability of getting through as any fresh candidate. The probability that a trainee would get through all stages of the course without failing at any stage is usually worked out by getting the multiples of all the probabilities for each stage of the course. The probability of getting through on taking more than one chance at one stage can be similarly calculated. The studies that might be conducted for ascertaining these rates would throw adequate light on the causes of wastages, non-utilisation and reasons for failure, etc. and the steps that could be taken to avoid such waste of the training facilities would automatically get suggested.

Growth and Quality

Sometimes the trends in the growth of population have also to be taken into consideration and the accuracy of the estimates of outturn have often to be examined in the light of such factors as usually affect the outturn of personnel from professional or technical institutions, for example, improvements in teaching standards, general standard of the trainees, teacher-trainee ratios, availability of better and sufficient equipment, availability of finances, likely changes in the trade-preferences, likely outturn of 'practical hands' from industrial, commercial and scientific units, etc. It would be appreciated that it is an extremely tedious task and most of the many things mentioned above are not so easy to estimate with any degree of certainty. The estimates are almost rendered as mere conjectures. Had it been possible to make absolutely correct and reliable estimates of both requirement and availability of trained manpower many years in advance in a dynamic economy, the manpower economists would come to be regarded as no ordinary mortals and the problems of striking an equilibrium between supply and demand in the short run would never crop up. Such estimates can, perhaps, be made with a slight degree of accuracy only in a planned totalitarian economy, but, certainly, not in a dynamic democracy and free and mixed economies. It has, perhaps, yet to be seen if an electronic brain can do it.

When the long-range requirements and the availability of trained manpower in the normal course have been worked out, the problem of bringing about an equilibrium between the two engages the attention of the manpower economist. If the requirement of manpower is more than the estimated supply, the manpower economist will have worked out and put forward suggestions for opening new institutions, expanding the capacity of the existing ones, introduction of apprenticeship schemes or on-the-job practical training courses or new courses, engaging personnel from foreign countries, diversion of trainees in particular directions having regard to their aptitudes, etc. He might also have to suggest periodical evaluation of the progress being made in different institutions, establishments or organisations by official or non-official bodies of experts like the Regional or State Manpower Committees that might be set up for the purpose or by experts on training. Such experts or Expert Committees could suggest ways and means of adopting new techniques of training, etc., which could be developed by associations of managers or workers engaged in particular trades or with the help of qualified consultants available in the country or abroad.

If the outturn is estimated to be more than the estimated requirements, the question of bringing about a reduction in training facilities, halting further expansion, exploring new avenues of employment in the event of some persons likely to be rendered surplus, diverting some of the new entrants to other trades where shortages may be visualised, making the passing out standards more rigid, etc., will have to be considered and the necessary recommendations made for avoiding any possible maladjustments in future. The suggestions can range from national regulation of education to even population controls, depending upon the gravity of the problem.

Unforeseen Contingencies

But, despite all the care that might be taken to ensure a perfect equilibrium, things are sometimes likely to go off the track as a result of some simple or violent deviations from the prevously outlined programmes which in their own turn might be caused by some unforeseen and compelling circumstances, mismanagement, change in basic policies or planned pattern of development due to abundance of scarcity of funds, new innovations which may bring about revolutionary changes in various spheres, acts of God or developments which could not be imagined a few years or even a few days back by any mortal. Such circumstances could create problems peculiar to them only and cause surpluses of certain categories of personnel and/or a spurt in the demand for other categories. Some of the remedies usually resorted to in such cases are diversion of personnel from particular trades to other trades by giving short-term courses or sandwich courses, appointment to higher jobs of practical hands or persons holding lesser qualifications but having experience, taking away administrative duties from technical personnel, getting the services of trained persons from abroad, etc. The nature of steps to be taken will depend on the exigencies of the situation.

It might also be necessary to make suggestions for better distribution and utilisation of manpower and the facilities for the development of manpower, so that none of the sectors of a nation's economy get unbalanced. Such suggestions would perhaps be of the nature of setting up of area or central pools or central exchanges or national registers of trained and experienced personnel on which demands can be made from time to time by the units requiring the services of such personnel. This would not only provide a sound system of locating the trained persons but would also help in better distribution and utilisation of the available talent in the country. The task of the manpower economist will be rendered considerably difficult and tiresome in the absence of accurate, authentic and reliable data. Statistics form the base on which he constructs the superstructure of future manpower requirement and availability. For any planning to be sound and feasible this base should not be shaky. In a predominantly underdeveloped country where the bias for statistics is usually conspicuous by its absence, it takes a pretty long time to build up a sound statistical system, develop the statistical sense and outlook and construct the numerous statistical series, rates and ratios so essential for proper manpower planning.

IN THE SPACE OF 10 YEARS...

the resources of National and Grindlays Bank Limited, which now incorporate the Eastern Branches of Lloyds Bank Limited, have increased from £130 million to £230 million. Similarly the number of offices now operating in countries overseas total 140—*100 more than existed ten years ago.*

TERMS OF TRADE OF PRIMARY PRODUCING COUNTRIES

VIEWS OF A BRITISH ECONOMIST

ON general considerations, it is clearly desirable that developing countries should be able to pay for as much of their development as possible; and they are right in laying more stress on trade than on aid. This sound approach to the question of commodity prices in relation to the terms of trade has been enunciated in a study by Sir Robert Hall, who was Economic Adviser to the British Government from 1953 until May 1961, in the January 1962 issue of *Lloyds Bank Review*. It is his considered view that the prices which developing countries get for their products are an important element in their situation and prospects and that advanced countries have more to fear from their own rising export prices than from rising import prices. Sir Robert Hall has also referred, in this context, to a growing feeling in the West that, if the incomes of underdeveloped countries fall because of low commodity prices, the need for aid to these countries will be all the greater.

If the immense and urgent problems of development in the less-developed countries are to be tackled in the light of this recognition, the relationship represented by the "terms of trade," that is, by the rate at which imports are exchanged for exports, gains an added significance. The actual position in the matter of "terms of trade" continues, however, to be unfavourable to the underdeveloped countries. This is so, because, in many cases, the countries which are most in need of additional development are the ones which produce mainly primary products. As much of the trade between advanced and underdeveloped countries has taken the form of the exchange of manufactured goods for primary products, particular interest attaches to the terms of trade between the two groups of countries. This interest is all the greater, because the prices of primary products generally fluctuate much more than prices of manufactures and the terms of trade between the advanced and underdeveloped countries are fluctuating much more than the terms of trade among industrialised countries themselves.

U.K.'s Experience

How unfavourable this trend has been in recent years to primary poducers is illustrated in the case of the terms of trade for the United Kingdom. As between 80 and 90 per cent of that country's imports is in the form of primary or semi-processed products and about the same proportion of its exports is in the form of manufactured goods, it is an outstanding example of the favourable position which industrialised countries generally have *vis-a-vis* the underdeveloped countries. The following index figures of U.K. terms of trade, taken from Sir Robert's study, are eloquent:

(1954=100)

Year	Import prices	Export prices	Terms of trade*
1957	107	111	104
1958	99	110	111
1959	98	109	111
1960	99	111	112
1961 (October) ..	96	112	117

* Export prices divided by import prices.

It will be seen from the above figures that the U.K. terms of trade are now appreciably more favourable to that country than in 1957. This favourable position is the result of the continuing circumstance that, though industrial production has been rising almost everywhere, primary product prices have remained weak. This is what Sir Robert Hall has to say on this situation by way of interpretation and comment:

"It is very convenient for us to get our essential imports so cheaply, and this is one of the reasons for the improved standards of living about which we talk so much. But should we really take too much satisfaction from this? The first thing to remember is that, while our imports are cheap, those who buy our goods are having to pay more for them. Unless their output has gone up by more than the price per unit has fallen, they will be absolutely worse off. In the past few years, although world trade in primary products has in fact expanded enough to offset the fall in price, the increase has come mostly from countries which, though themselves industrial, also produce primary products. Underdeveloped countries as a group have been actually worse off. Thus, the advantages that we have obtained from the improvement in our terms of trade have been, at least to some extent, at the expense of countries which are poorer than we are.

"Even if we could leave this out of account, an improvement in the terms of trade is not an unmixed blessing, since it could lead to a reduction in our exports (because our customers overseas have lower incomes). Given time, and the maintenance of the new prices, adjustments can be made, so that we consume at home the things we previously had to export, or at any rate other things made with the resources which have become available. This is the process by which we benefit from favourable terms of trade. But the disturbance to the pattern of trade costs us something, and may be very awkward if import prices rise again and the adjustment has to be reversed.

"More serious than this, a loss of earnings by developing countries reduces their ability to develop themselves further. Thus, it adds to the amounts which advanced countries have to find by way of grants or loans, if the same rate of advance is to be maintained. In practice, what usually happens is that development is slowed down and more help is needed. Politically, and in terms of human need, there are, therefore, real disadvantages connected with improvements in our own terms of trade, though most of us are naturally enough unaware of this.

"We have, indeed, a real interest in the stability of commodity prices and we certainly should not want to see them as low as possible."

India's Experience

That is a very fair and considerate comment by a British economist. As a developing country, India has particular reason to be gratified by this sympathetic approach, for its own terms of trade, though not wholly unfavourable, have been widely fluctuating since 1951. In the case of India, the terms of trade index figures are given below:

(1958=100)

Year	Overall import unit value index	Overall export unit value index	Terms of trade*
1951	109	152	140
1955	95	96	103
1956	99	101	103
1957	78	105	135
1958	100	100	100
1959	93	100	107
1960	98	109	111
1961 (Jan.-May) ..	101	115	113

*Ratio of overall export unit value index to overall import unit value index.

As nearly two-thirds of India's exports continue to be primary products, raw materials and semi-processed goods, the export prices realised by it continue to be a matter of great importance. But here, unfortunately, the wide fluctuations, as revealed by the export unit value index, are accompanied by similar fluctuations in the country's terms of trade. It is clear that export prices are not as stable as one would like them to be, though they have been looking up in the last two years to a greater extent than import prices.

What is the outlook for commodity prices in the near future? The predictions made by Sir Robert Hall are of some interest. His approach here is cautious for the simple reason that the supplies of primary products are inclined to be much less sensitive to pice changes than those of manufactured goods and, as a consequence, their prices are much more variable. What is intriguing in the situation, according to Sir Robert Hall, is that commodity prices are still falling, in spite of the spectacular industrial expansion in Europe and of the recovery of output in the U.K. and the U.S.A. in recent years. But it is not so very intriguing when the supply position of primary commodities is considered. For instance, though the U.S. gives away large quantities of food to poorer countries, its stocks continue to pile up. The post-war disorganisation and the change in political regimes in primary producing countries have not tended to limit their output. There is at present something of a glut of copper, lead and zinc. Visible oil reserves are now larger than they have ever been. There are, according to Sir Robert Hall, very few commodities in which the supply position looks comfortable from the producers' point of view.

Outlook

The main reasons which have worsened the outlook for the primary producers are three. The first reason is the development of substitutes for raw materials, such as artificial fibres for practically the whole range of natural fibres and various forms of plastics for natural rubber. The second reason is that big changes in the productivity of some primary products have taken place. For instance, the introduction of high-yielding varieties of rubber trees has increased the yield per acre of rubber plantations by as much as four to five times. (If, however, the rubber growers have been relatively prosperous in spite of the enormous increase in synthetic rubber production, it is because the demand for rubber has risen very rapidly.) The same forces have been at work in varying degrees in the case of most agricultural products, for new strains have been developed, giving higher yields. The outlook for the future here is that, even with existing resources and state of knowledge, very big increases in supply could be obtained, if the countries with low yields could be brought up even part of the way to those with higher ones. Thirdly, in the field of minerals and oil, the mining of non-ferrous metallic ores, iron ore and bauxite in ever-increasing quantities for producing more non-ferrous metals, steel and aluminium and the exploitation of embarrassingly large supplies of mineral oil point to an abundant supply position. For these three reasons, the supply position of many primary products and raw materials is likely to be so very easy that their prices may not look up in the next few years. The broad outlook for prices, therefore, may not be quite optimistic from the point of view of producers as far as the immediate future is concerned. It is in this situation that more international commodity agreements, which are foreseen by Sir Robert Hall as quite likely before long, may be relied upon to influence the prices of the primary products concerned.

SOME ANOMALIES OF SECTION 23A OF AMENDED INCOME-TAX ACT

By S. C. Renganathan

IN this article, I propose to discuss the provisions of Sections 104 to 109 in the new Income-tax Act, 1961, which relate to the existing provisions of Section 23A of the Act. The main changes made in the amended Act are as follows:

1. The percentage mentioned in clause (ii) of sub-section 2 of Section 23A has been increased from 5 to 10.

2. Where a re-assessment is made in the case of a company under the provisions of existing Section 34(1)(b), an opportunity, if found necessary, will be given to the assessee for making up the deficiency in distribution.

3. A time limit has been laid down for passing an order under the existing Section 23A. It has also been clearly stated that no order shall be made after the expiry of four years from the end of the assessment year relevant to the previous year or after the expiry of one year from the end of the financial year in which the assessment or re-assessment of the profits and gains of the previous year is made, whichever is later.

4. In computing the distributable income for purposes of determining the statutory percentage of dividend, the following deductions are allowed:

(i) any amount paid as donation to a charitable institution;

(ii) losses under the head "capital gains";

(iii) income arising outside India in a country the laws of which prohibit or restrict the remittance to India. If the restriction is subsequently removed, any deduction allowed under this provision shall be included in the distributable income of the previous year in which the restriction is withdrawn.

5. In addition to the above deductions contemplated in the new Section 109 which deals with the definition of "distributable income," the following items of expenditure besides the dividend paid are also allowed to be set off against the distributable income when calculating the additional super-tax under Section 104:

Any *bona fide* expenditure actually incurred for the purpose of business but not deducted in computing the business income for purpose of income-tax assessment such as (i) bonus paid to employees, (ii) legal charges, (iii) revenue expenditure which has not resulted in the creation of asset or in the enhancement in the value of the existing asset and (iv) any expenditure which results directly or indirectly in the provision of any remuneration or benefit or amenity to a Director or to a person who has a substantial interest in the company.

6. Another important change made is that, for the purpose of comparing the cost of the fixed assets of the Company with the accumulated profits and reserves, for determining the statutory percentage of dividend to be declared by a Company, only the book value of the fixed assets is to be taken into consideration. Previously, the original cost of the fixed assets was taken for this comparison. It is said that the amendment made is of a clarificatory nature.

It is true that the concessions announced in the new Act are a welcome measure and this will go a long way to help the Section 23A companies. But, on actual working, it is likely to create certain anomalies. If a company prefers to declare the statutory percentage of dividend and comply with the provisions of Section 23A, it has to declare dividend on certain *bona fide* expenditure not deducted in computing the business income (expenditure contemplated under Section 109). Whereas if a company wishes to pay 23A super-tax instead of declaring the statutory percentage of dividend, it need not pay 23A super-tax on such of those items of expenditure dealt with under Section 109. The illustration at the bottom of the first column will reveal the disparity.

It will be seen from a perusal of the above example that companies which opt for payment of 23A super-tax are allowed to set off the disallowed items of expenditure included in their total income from out of the distributable surplus while companies which declare the statutory percentage of dividend are not entitled for such deductions. As Sections 104 to 109 mainly deal with 23A companies, there cannot be a differentiation between the same class of companies irrespective of the fact whether the company distributes the statutory percentage of dividend or not. If a company were asked to declare dividend from out of the disallowed items of expenditure also included in its total income for income-tax assessment, it would only cause hardship to those companies which comply with the provisions of Section 23A by distributing the statutory percentage of dividend. In order to remove this hardship, it is necessary that the "distributable income" for the purpose of Section 109 should be computed in the same manner as is laid down under Section 104 in the case of a company which pays 23A tax instead of distributing the profit by way of dividend.

The last two decades have witnessed a continuous rise in the prices of various assets to be added out of necessity by companies. In such an inflatory period, depreciation allowance based on an antiquarian convention cannot measure the actual loss in the value of assets through constant use. Despite the frequent representations made by the business community, the Government is not willing to allow depreciation on the replacement cost. Companies are already hard-pressed for finance for replacing their old machinery on account of the withdrawal of special depreciation from the year 1959 and also due to a tightening of the provisions in regard to allowance of development rebate. Although the position is mitigated to a small extent by the liberalisation of depreciation rules, the recent amendment made to Section 23A of the Act clarifying that the book value is to be taken for purposes of comparison with reserves and surplus for determining whether a company is to declare 65 per cent or 90 per cent of the undistributed profits of a year as dividend is a bolt from the blue. This would only force companies now declaring 65 per cent of their distributable profits to declare 90 per cent of their distributable profits after meeting tax liability. Failure to distribute the statutory percentage of dividend will entail the company to pay penal super-tax at 37 per cent for the entire undistributed balance of profits in a year.

The above provisions and restrictions limit the amount of profits which could be better utilised for the successful conduct of the company in their business. To be out of the scope of the provisions of Section 23A, a company must of necessity have to convert itself into a public company in the real sense of the term and as is recognised in the Income-tax Act.

In our country, where private capital is an enigma, it is very difficult, if not impossible, for small and medium companies to raise share capital through public subscription. It is needless to add that this new measure places a serious restraint on the growth of small and medium-sized joint-stock companies and thereby runs counter to one of the avowed objectives of the Government's industrial policy.

An Illustration

Working for distributable income in respect of a company declaring statutory percentage of dividend:

	Rs.
Total income (assumed)	10,00,000
Tax liability at 45% (less rebate at 20% on exempted donations—taken as Rs. 75,000)	4,35,000
	5,65,000
Less: Exempted donations	75,000
	4,90,000
Capital loss	..
Remittance of foreign profits	..
Distributable income	4,90,000
The statutory percentage of dividend will have to be declared on the distributable income of	4,90,000

If the above company pays 23A tax, instead of distributing the profit by way of dividend:

	Rs.
Distributable income as above	4,90,000
Expenditure incurred by the assessee but disallowed in assessment (included in the assumed total income figure of Rs. 10 lakhs)	
Bonus to employees .. .. Rs.	10,000
Legal charges .. .. .. ,,	5,000
Directors' remuneration .. .. ,,	4,000
	19,000
Amount on which 23A tax is leviable ..	4,71,000
Dividend declared	Nil

THE BANK OF INDIA LIMITED

Registered Office:

70/80, Mahatma Gandhi Road, Bombay-1

NOTICE

THE FIFTY-SIXTH ANNUAL GENERAL Meeting of the Shareholders of The Bank of India Ltd. will be held at the Registered Office of the Company at 70/80, Mahatma Gandhi Road, Bombay-1, on Thursday the 15th day of March, 1962, at 4 o'clock in the afternoon, to transact the following business:—

(1) To receive the Report of the Directors and the audited Balance-Sheet and Profit and Loss Account for the year ended 31st December, 1961.

(2) To declare a Dividend.

(3) To elect a Director in the place of Mr. Ambalal Sarabhai, who retires by rotation, is eligible and offers himself for re-election and for that purpose to consider and if thought fit to pass the following resolution as an ordinary resolution of which special notice as required by Section 281 of the Companies Act, 1956, has been received by the Company:—

RESOLVED that Mr. Ambalal Sarabhai, who has attained the age of 72 years and who retires by rotation, be and he is hereby re-elected a Director of the Company AND it is hereby specifically declared that the age limit for Directors prescribed under Section 280 of the Companies Act, 1956, shall not apply to him.

(4) To elect a Director in the place of Mr. N. K. Petigara, who retires by rotation, is eligible and offers himself for re-election.

(5) To elect a Director in the place of Mr. Jugmohan Prasad Goenka, who retires by rotation, is eligible and offers himself for re-election.

(6) To elect a Director in the place of Mr. Jaisinh Vithaldas, who retires by rotation, is eligible and offers himself for re-election.

(7) To appoint Auditors and to fix their remuneration.

SPECIAL BUSINESS

(8) To consider and if thought fit to pass, with or without amendment, the following resolutions as special or ordinary resolutions as specified below:

I. **Audit of Branches**

Ordinary Resolutions

RESOLVED that:

(a) The accounts for the year 1962 of the branches of the Company at Bombay, Delhi, New Delhi, Hyderabad (Deccan), Indore, Jamshedpur, Poona, Nagpur and Sholapur (including any branches at the said places or any of them which may be opened hereafter) shall be audited by the Company's Auditors, Messrs. A. F. Ferguson & Co. and Messrs. S. B. Billimoria & Co., Chartered Accountants, in such manner as may be arranged between themselves.

(b) The accounts for the year 1962 of the branches of the Company in India at places other than those specifically provided for (including any branches at such places or any of them or at any other place in India which may be opened hereafter) shall be audited either by the Company's Auditors, Messrs. A. F. Ferguson & Co. or Messrs. S. B. Billimoria & Co., or by persons qualified for appointment as auditors of the Company under Section 226 of the Companies Act, 1956, as may be decided upon by the Board of Directors and that the Board of Directors be and they are hereby authorised from time to time to appoint one or more qualified auditors for audit of the accounts of the said branches or any one or more of them as they deem fit, in consultation with the Company's Auditors, and to fix the respective terms and conditions of appointment and the remuneration of such auditors.

(c) For the audit of the branches referred to in the foregoing resolutions Messrs. A. F. Ferguson & Co. and Messrs. S. B. Billimoria & Co., shall be respectively paid such remuneration (over and above the remuneration they may receive as the Company's Auditors) as the Board of Directors may fix.

(d) The accounts for the year 1962 of the branches of the Company outside India (including any branches which may be opened hereafter) shall be audited by persons qualified to act as auditors of the accounts of each such branch in accordance with the respective laws of the country in which such branch is situate and that the Board of Directors be and they are hereby authorised from time to time to appoint one or more qualified persons for audit of the accounts of the said branches outside India or any one or more of them as they deem fit, in consultation with the Company's Auditors, and to fix the respective terms and conditions of appointment and the the remuneration of such auditors.

(e) The Board of Directors be and they are hereby authorised to exercise all such powers and to do all such acts, deeds and things as may be deemed necessary by them for the purpose of giving effect to these resolutions.

II. **Inspection of Branches by Auditors**

Ordinary Resolution

RESOLVED that the Company's Auditors shall be entitled at such times as may be agreed upon between themselves to visit for any one of them, at least once in every calendar year, every branch in India for test inspection and that a report on such test inspection shall be submitted to the General Manager of the Company and that for such work the Auditors shall be paid all out-of-pocket expenses that they may incur for travelling, board and lodging and otherwise and that such payment shall be in addition to the remuneration fixed for the said Auditors.

III. **Alteration of Memorandum of Association**

Special Resolutions

RESOLVED that Clause 3 of the Memorandum of Association of the Company be and it is hereby altered as under:—

(a) By deleting the existing sub-clause (j) and substituting in its place the following new sub-clause (j)

"To acquire and undertake the whole or any part of the business, property and liabilities of any person or company carrying on or proposing to carry on any business which the Company is authorised to carry on or possessed of property suitable for the purposes of the Company or which can be carried on in conjunction therewith or which is capable of being conducted so as directly or indirectly to benefit the Company."

(b) By adding after the existing sub-clause (l) thereof the following new sub-clause (ll), namely.—

"To amalgamate with any other company."

IV. **Directors' Remuneration**

Special Resolutions

(a) RESOLVED that the remuneration of the Directors shall with effect from the 15th day of March, 1962, be as under:

(i) The Chairman of the Board of Directors shall be entitled to the sum of Rs. 250 and each of the other Directors shall be entitled to the sum of Rs. 200 for every meeting of the Board which he attends;

(ii) Each of the Directors (including the Chairman) shall be entitled to the sum of Rs. 125 for every meeting of any Committee or Sub-Committee of Directors which he attends.

(b) RESOLVED that Article 87(b) of the Company's Articles of Association be and it is hereby altered by substituting therein for the words and figures "Rs. 200", "Rs. 150" and "Rs. 75" the words and figures "Rs. 250", "Rs. 200" and "Rs. 125" respectively.

V. **Increase of Capital and Offer of New Ordinary Shares**

Ordinary Resolutions

(1) RESOLVED that the capital of the Company be increased to Rs. 10,00,00,000 (Rupees ten crores) by the creation of 4,50,000 New Ordinary Shares of Rs. 100 each.

(2) RESOLVED that out of the 4,50,000 New Ordinary Shares so created 2,00,000 New Ordinary Shares shall be offered in the first instance at a premium of Rs. 20 per share to the members of the Company on its Register of Members on 12th April, 1962, in the proportion of one such New Ordinary Share for every three existing shares, whether Ordinary Shares of Rs. 100 each (on which Rs. 50 are paid-up) and/or "A" Ordinary Shares of Rs. 50 each (issued as fully paid Bonus Shares) held by such members on the specified date AND so that half, namely, Rs. 50, of the full nominal amount of each such New Ordinary Share taken up plus the premium, namely, Rs. 20, in respect of each such New Ordinary Share shall be paid to the Company in cash with acceptance of the offer and before allotment.

(3) RESOLVED that the 2,00,000 New Ordinary Shares of Rs. 100 each shall be subject to the Memorandum and Articles of Association of the Company and shall, subject thereto, rank for dividend on profits and in all other respects *pari passu* with the existing 5,00,000 Ordinary Shares of Rs. 100 each (of which Rs. 50 are paid-up) and the existing 1,00,000 "A" Ordinary Shares of Rs. 50 each (which are fully paid-up) save that the 2,00,000 New Ordinary Shares shall not be entitled to participate in any interim dividend for any period prior to the 1st July, 1962.

(4) RESOLVED that such offer be made by notice as hereinafter mentioned and that any member receiving such offer shall be entitled either to take up by paying therefor all or any of the New Ordinary Shares so offered to him or to renounce (upon signing a renunciation in such form as shall be prescribed by the Board of Directors) his right to all or any of such New Ordinary Shares in favour of a nominee or nominees: Provided that such nominee or nominees shall be a member or members of the Company or be approved of by the Board of Directors and that such nominee or nominees shall sign an acceptance of the shares so renounced in such form as shall be prescribed by the Board of Directors and that any such renunciation by a member and acceptance by such nominee or nominees shall be effective only if made upon forms to be supplied by the Company and lodged duly completed with the Company within the time specified together with the sum of Rs. 70 per share in cash (being the proportionate payment of Rs. 50 per share plus the premium of Rs. 20 per share).

(5) RESOLVED that the said offer be made to such members by a notice specifying the number of New Ordinary Shares to which each such member is entitled for every such three shares, whether Ordinary Shares and/or "A" Ordinary Shares, of such member's holding on the specified date and having forms annexed to such notice for acceptance by such member, where such member accepts (whether wholly or in part), and for renunciation, where such member renounces (whether wholly or in part), in favour of such nominee or nominees and for acceptance by such nominee or nominees of any shares so renounced with any other necessary provisions in such offer and/or forms and that such notice shall limit the time within which the offer, if not accepted by payment of the said sum of Rs. 70 for proportionate payment plus premium as aforesaid in respect of each such New Ordinary Share, shall be deemed to be declined.

(6) RESOLVED that the notice making the offer to members shall, additionally, invite offers from members on the Register of Members on the specified date, namely, the 12th April, 1962, for additional shares and that forms for application for such additional shares be annexed to the notice making the offer so that any shares not taken up as rights may be allotted to members applying for additional shares on an equitable basis with reference to the shares already held by such members: Provided that members who renounce their rights wholly or partly shall not be entitled to apply for additional shares AND Provided further that the allotment of additional shares shall be at the entire discretion of the Board of Directors.

(7) RESOLVED that no fractional certificates be issued to members but that the fractions of shares remaining after the offer of one share for each three existing shares, whether Ordinary Shares and/or "A" Ordinary Shares, shall be consolidated and allotted as the Board of Directors deem fit to any person or persons, including any one or more of themselves or any one or more of the employees of the Company, for the purpose of being sold and the proceeds, less the proportionate payment of Rs. 50 plus premium of Rs. 20 per share and also less the expenses of sale and any other expenses, be divided *pro rata* amongst the members who would otherwise have been entitled to a fraction or fractions of such New Ordinary Shares.

(8) RESOLVED that when any New Ordinary Shares applied for are not allotted the amount paid on application therefor shall be refunded in due course without interest.

(9) RESOLVED that the Board of Directors be empowered not to allot or in the alternative to dispose of such of the New Ordinary Shares as are not taken up in response to the offer in such manner as they think most beneficial to the Company.

(10) RESOLVED that the Board of Directors shall have the right in their absolute discretion to reject any application for New Ordinary Shares and to refuse allotment to any person or persons (not being a member) not approved of by them without assigning any reason.

(11) RESOLVED that the Certificates in respect of the New Ordinary Shares shall be completed and ready for delivery within nine months after the last allotment thereof.

(12) RESOLVED that for the purpose of giving effect to the foregoing resolutions the Board of Directors are authorised to give such directions as may be necessary and to settle any questions or difficulties that may arise in regard to the issue and the distribution of the New Ordinary Shares as they think fit.

By Order of the Board of Directors,

T. D. KANSARA,
General Manager.
The Bank of India Ltd.

MCLEOD & CO. LTD.,
C. HOCKLEY,
Secretary,
Managing Agents.

CALCUTTA, *14th February*, 1962.

ASHOK LEYLAND'S PROGRESS ENCOURAGING

DIVIDEND MAINTAINED ON HIGHER CAPITAL

THE statement of accounts of Ashok Leyland Ltd. (Chairman: Dr. A. Ramaswami Mudaliar, Madras) for the nine months ended 30th September 1961—the Company has now changed its accounting year to end on 30th September to be in conformity with its technical collaborators, Messrs. Leyland Motors Ltd., England—makes happy reading. With the continued popularity of the Leyland "Comet" chassis among the State transport undertakings, Government departments and, particularly, the private sector, the gross sales have maintained an upward trend and amount to Rs. 811.93 lakhs, with the inclusion of the excise duty recovered, for the nine-month period, as compared with Rs. 832.67 lakhs for the previous period covering the twelve months of 1960. Other income has also shown an improvement to Rs. 9.01 lakhs from Rs. 6.70 lakhs chiefly because of the increase in the over-riding commission. The closing stocks of vehicles have shown a very perceptible decline from Rs. 55.28 lakhs as at the beginning of the period to Rs. 4.76 lakhs as at the close, indicating a vastly improved demand for the Company's vehicles. Finished stocks of components, however, have risen in value by Rs. 36.91 lakhs, but, even then, the total value of closing stocks reflects a small, yet welcome, fall of Rs. 11.64 lakhs to Rs. 96.95 lakhs.

Although the cost of raw materials, stores and components consumed still forms a very substantial portion of the total sales proceeds, its ratio to the gross turnover has witnessed a marked decline from 82.1 per cent in respect of the previous year to 72.3 per cent for the period under review. This improvement has been instrumental in enabling the Company to earn a gross profit of Rs. 63.21 lakhs for the nine-month period, as against Rs. 71.18 lakhs for the preceding full year. The gross profit would have been higher still had it not been for the abnormal increases in the cost of services, which amounted to Rs. 44.00 lakhs as against Rs. 45.12 lakhs (for 12 months) and other expenses, which were higher at Rs. 34.87 lakhs as against Rs. 30.54 lakhs. As a result, the ratio of gross profit to total sales has declined slightly to 8.4 per cent in comparison with 8.6 per cent for the previous year.

Provision for depreciation has been pruned from Rs. 25.32 lakhs to Rs. 23.60 lakhs but that for taxation is higher by Rs. 3.60 lakhs at Rs. 14.60 lakhs. These leave a net profit of Rs. 30.01 lakhs or 3.7 per cent of the sales as against Rs. 34.86 lakhs or 4.2 per cent previously. *Transfer to the development rebate reserve* is also lower by Rs. 1.83 lakh at Rs. 8.89 lakhs. Ordinary dividends, the rate of which has again been maintained at 8 per cent per annum, subject to deduction of tax, claim Rs. 20.33 lakhs, leaving a carry forward of Rs. 0.91 lakh, as against Rs. 0.12 lakh brought in. The rate of dividend has remained unchanged for the second year in succession, but such has become payable, it is to be noted, on an increased share capital of Rs. 344.97 lakhs as against Rs. 302.88 lakhs a year ago.

The progress made by the Company during the nine-month period to 30th September 1961, as well as during the three full years immediately preceding it, is clearly brought out in the comparative table that follows:

(In lakhs of rupees)

	For nine months ended 30th Sep.	For the year ended 31st December		
	1961	1960	1959	1958
Sales (gross)	811.93*	832.67*	582.82	501.49
Other income	9.01	6.70	4.59	4.68
Closing stocks of vehicles and finished components	96.95	108.59	48.02	85.20
Excise duty	75.38	69.42	..	..

Following the issue of a further 8.03 lakh ordinary shares of Rs. 5 each on which Rs. 2.50 have so far been called up, the share capital now amounts to Rs. 344.97 lakhs, with a supplement of Rs. 46.16 lakhs in the reserves, giving the total capital funds at Rs. 391.13 lakhs. Against these, the net block, inclusive of the cost of buildings under construction and plant and machinery in transit or awaiting installation, itself amounts to Rs. 312.25 lakhs. A further Rs. 20.49 lakhs has been taken away by investment, of which as much as Rs. 19.70 lakhs are in Ennore Foundries Ltd., a company belonging to the same group. Borrowings from banks, secured by a floating charge against all the movable assets of the Company, have increased by Rs. 32.69 lakhs and stand at Rs. 168.32 lakhs in addition to current liabilities and provisions aggregating Rs. 272.26 lakhs. These are more than fully covered by current assets, loans and advances amounting to Rs. 493.97 lakhs.

The period under review witnessed very good progress in the establishment of incentive bonus and material progress systems which are expected to lead to greater efficiency and increased output per man-hour in the future. The expansion programme, initiated sometime ago, is well under way with the completion of new buildings and of planning for the progressive installation of plant and machinery designed to increase output to 5,000 chassis per annum and, in addition, spare parts and heavy duty industrial type engines. At the same time, the progressive deletion of imported components continues in accordance with the phased programme of manufacture.

Ennore Foundries Ltd., in which the Company holds substantial interest, commenced production during the period and are at present producing 40 tons per week of quality castings. It is expected that, by early 1962, the full requirements of iron castings for the Company's make of vehicles will be met by this associated company.

The Rs. 5 fully paid shares of the Company are presently quoted on the Madras Stock Exchange at Rs. 8.89, exclusive of the net dividend component. At this price, the net yield works out to about 3.2 per cent per annum.

(*Concluded from next column*)

still as high as 59.9 per cent, which is undoubtedly much more than is necessary from the point of view of even a conservative banker.

The issued, subscribed and paid-up share capital has remained unchanged at Rs. 1 crore and continues to vest in the State Bank of India. With the accretion of Rs. 6.00 lakhs from the profits for the year under review, the reserve fund now stands at Rs. 57.50 lakhs or 57.5 per cent of the paid-up capital. The ratio of owned funds to deposits is as high as 11.57 per cent, that is, nearly twice as much as the ratio mentioned in the Reserve Bank's convention with commercial banks. It will not, therefore, be necessary for this Bank to raise its paid-up capital for a considerable time to come, though it will have to set apart a sizable portion of the profit for strengthening the published reserve fund at least until that fund becomes equal to the paid-up capital.

As at the close of 1960, the Bank had 24 branches and 38 pay offices. During 1961, two more branches were opened, while one pay office was upgraded into a branch. Thus, at the close of 1961 the Bank operated 27 branches and 37 pay offices. It has in hand a programme to open three more branches and one pay office and of upgrading eight pay offices into branches. The Bank's activities, it will be agreed, are steadily expanding.

I.C.I.C.I.

The net profit (after providing for depreciation and taxation) of the Industrial Credit and Investment Corporation of India Limited for the year ended 31st December 1961 amounts to Rs. 46.52 lakhs, as against Rs. 37.65 lakhs for 1960. A sum of Rs. 11.50 lakhs has been placed to special reserve in terms of Article 163 of the Articles of Association and Rs. 1.00 lakh to general reserve. Out of the balance, together with the amounts brought forward from the previous year, the Directors have decided to recommend a dividend of 6.50 per cent subject to tax (5.75 per cent subject to tax last year) on ordinary shares.

ANDHRA BANK

The profit of the Andhra Bank Ltd. for the year ended 31st December 1961 amounts to Rs. 13,54,368 (Rs. 11,57,071 for 1960). After paying one month's bonus to staff and bringing in Rs. 4,823 (Rs. 10,301) from last year's profit, the net profit available for appropriation comes to Rs. 12,05,467 subject to audit (Rs. 11,68,023).

STATE BANK OF SAURASHTRA

RESERVES STRENGTHENED

THE working of the State Bank of Saurashtra (General Manager: Mr. R. L. Sopariwala, Bhavnagar) during the year ended 31st December 1961—the first full year of its working as a subsidiary of the State Bank of India—resulted in a total income of Rs. 78.39 lakhs, of which Rs. 65.84 lakhs came by way of interest and discount, Rs. 9.03 lakhs as commission and exchange *and only the balance*, namely, Rs. 3.52 lakhs, as other income. These figures are not directly comparable with those for the previous year, because, first, the preceding accounting period relates only to eight months and, secondly, the income in respect of the year under review is reported at net, that is, after deducting the income-tax, besides the other usual essential provisions. Unfortunately, the Directors have not found it necessary to disclose the Bank's overall tax liability or the provision made therefor, thereby making it impossible to arrive at an accurate estimate of the Bank's gross earnings.

From the income earned, Rs. 43.10 lakhs have been paid as interest, and Rs. 26.20 lakhs as expenses. A sum of Rs. 1.93 lakh has been provided for depreciation on the Bank's assets. The net profit earned amounts to Rs. 7.16 lakhs, and compares with Rs. 5.01 lakhs for the eight months ended December 1960. Proportionately, the net profit is a shade lower than that for the previous year. Together with Rs. 1.39 lakh, the sum available for distribution is Rs. 8.55 lakhs. Of this, Rs. 6.00 lakhs have been transferred to the reserve fund and Rs. 2 lakhs have been earmarked for payment of bonus to staff. This leaves Rs. 0.55 lakh to be carried forward, as against the Rs. 1.39 lakh brought in. No dividend has been proposed, as priority has been given to the need for strengthening reserves.

The operating results of the Bank in respect of the past four years, as well as the balance-sheet position, are set forth in the comparative table below:

(In lakhs of rupees)

	For the year ended 31st December

* For a period of eight months only.
† After taxation for 1961, but before taxation for the previous years.
‡ Necessary provision has been made from the income for the year.

During the course of the year, there has been a marked contraction in the two main sources from which a bank generally derives the major portion of its income, namely, advances and investments. The former has gone down by Rs. 65.24 lakhs to Rs. 727.92 lakhs, and the latter from Rs. 803.72 lakhs to Rs. 673.98 lakhs. The total fall in these two items is thus of the order of Rs. 193.88 lakhs and as such it would not be unreasonable to conclude that the Bank must have had to suffer a small setback during 1961. This shrinkage in advances and investments is reflected in the resources side by a perceptible decline in borrowings from Rs. 263.96 lakhs to Rs. 82.53 lakhs. There has, however, been a slight improvement of Rs. 18.18 lakhs to Rs. 13.57 crores in deposits. As a result of the rise in deposits and the fall in advances, investments and cash, all the three principal ratios to deposits show fall as compared with the position a year before. Thus, the credit ratio has declined from 39.2 per cent to 53.6 per cent, the investment ratio from 60 per cent to 49.8 per cent and the cash ratio from 11.4 per cent to 10.1 per cent. Nevertheless, the ratio of liquid assets to deposits is

(*Continued in previous column*)

STATE BANK OF MYSORE

DIVIDEND RAISED

DURING the second year of its working as a subsidiary of the State Bank of India, which ended on 31st December 1961, the State Bank of Mysore (General Manager: Mr. A. Krishna Murthi, Bangalore) made satisfactory progress. While the results for the year referred to are not exactly comparable with those obtained in the previous year, as the period covered then was of 10 and not 12 months, the performance, nonetheless, shows a distinct improvement over recent years. The gross income of the Bank registered an improvement of Rs. 19.67 lakhs over the preceding period and reached a record figure of Rs. 125.77 lakhs. This has prompted the Directors to step up the taxable dividend from 9 per cent to 10 per cent per share of Rs. 100. The total distribution of Rs. 10 lakhs comes close to Rs. 11.50 lakhs paid for 1959, when the dividend was as high as 23 per cent, subject to deduction of tax, though on half the present capital of Rs. 1 crore. The increase in the capital was brought about in the year ended 31st December 1960.

The profit for the year under report, after meeting all expenses and providing for depreciation, has, however, declined from Rs. 28.05 lakhs to Rs. 20.67 lakhs, due to an increase in interest paid on deposits and borrowings, as well as higher expenses, both of which have wiped off the advantages scored in income by way of interest and discount, and commission, exchange and brokerage. Interest paid has been as much as Rs. 60.85 lakhs, as against Rs. 46.41 lakhs previously. The expenses have gone up sharply from Rs. 29.68 lakhs to Rs. 41.46 lakhs, with the wage bill alone increasing from Rs. 24.16 lakhs to Rs. 31.46 lakhs. Depreciation has absorbed Rs. 2.65 lakhs, as against Rs. 1.96 lakh previously. Reserves get about Rs. 3 lakhs more at Rs. 6.60 lakhs. No provision has been made for taxation, presumably because in the previous year a large sum of Rs. 12.50 lakhs was set aside.

The salient features of the Bank's working in the past four years are brought out in the table below:

(In lakhs of rupees)

	For the year ended 31st Dec. 1961	For 10 months 1-3-60 to 31-12-60	For the year ended 31st December 1959	1958

* After deducting Rs. 6.14 lakhs being income-tax on interest earned on investments.
† Subject to deduction of tax.

The balance-sheet of the Bank as at 31st December 1961 confirms its sound financial position. The capital, which was increased in 1960 from Rs. 50 lakhs to Rs. 100 lakhs by transfer from reserves, which had stood at Rs. 100 lakhs on 31st December 1959, is now supplemented by reserves of Rs. 60 lakhs. There is a welcome decline in borrowings from banks from Rs. 44.75 lakhs to a mere Rs. 6.50 lakhs. Cash, balances with other banks and money at call and short notice make an impressive total of Rs. 274.37 lakhs, as against Rs. 138.71 lakhs in the previous year. The deposits have gone up impressively from Rs. 19.94 crores to Rs. 22.99 crores. But advances have increased only modestly from Rs. 12.43 crores to Rs. 13.15 crores. A part of the increase in deposits has been utilised to step up the investment portfolio sizably from Rs. 8.63 crores to Rs. 9.10 crores.

As a result of the sharp increase in deposits, the ratio of advances to deposits has fallen from 62.3 per cent to 57.2 per cent and of investments to deposits from 43.2 per cent to 39.5 per cent. The ratio of cash to deposits, however, has increased from 6.9 per cent to 11.9 per cent. The table above shows at a glance the trends in the Bank's deposits and the disposition of its funds over the past four years.

The Bank's advances to small-scale industries recorded a small increase during the year. Assistance was given to 97 units, accounting for a total limit of Rs. 82.77 lakhs, as against 104 units, with an aggregate limit of Rs. 82.38 lakhs as at the end of 1960. The total outstandings against warehouse receipts were Rs. 21.84 lakhs, as against Rs. 10.57 lakhs previously. Advances to co-operative institutions aggregated Rs. 43.56 lakhs, as against Rs. 17.94 lakhs at the end of the preceding year.

The subsidy expected to be received from the State Bank of India to reimburse losses incurred by the Bank on account of its expansion programme in terms of Section 48 of the State Bank of India (Subsidiary Banks) Act, 1959, for the year under report will be Rs. 1.23 lakh, which have been accounted for in the accounts. As for the Government and agency business, the Bank extended its business to 14 additional centres, bringing the number of branches conducting Government business to 32, out of the total of 59 offices. In addition to the six branches and two pay offices opened during the year under review, licences for opening 10 more branches have been secured from the Reserve Bank of India. Investigations of the business potentialities of 14 centres have been conducted and are under active consideration.

TEXTILES

(*Concluded from page 322*)

sequent on the Geneva pact, the prospects for exports have improved greatly. Here is what Mr. K. C. Reddy, Union Minister for Commerce and Industry, says: "Cotton textile exports have now been assured that there would be no reduction in exports. On the other hand, efforts are being made to increase them. The agreement is an excellent example of what mutual discussion can do for maintaining harmony among various countries in matters of trade." A Government of India spokesman is reported to have remarked:

"The cumulative effect of the agreement will be to widen the markets for Indian cotton textiles in foreign countries, particularly France and West Germany. It is for the Indian textile industry to take full advantage of the opportunities created by the Geneva accord and step up exports to the maximum extent possible. In the case of France and West Germany, which at present restrict textile imports, the actual extent of increased access, as agreed to at the Geneva talks, will be determined by means of bilateral negotiations between these countries and India. It is to be hoped that the increase of access to these markets will correspondingly reduce the pressure on the markets like the U.S. which do not at present apply restrictions and will, to that extent, reduce the need for such markets invoking restrictions on exports to their markets by the exporting countries."

Expressing opinions more or less similar, export circles point out that the Geneva agreement on textile quota liberalisation over the next five years should prove beneficial to India. In their opinion, inasmuch as India's exploitation of most of the European markets has been at a negligible pace, the agreement will be in the larger interest of this country's textiles exports, for the European countries will not be in a position to take shelter under the second criterion in the escape clause.

How far and to what extent the aforesaid assessment of the impact of the Geneva agreement on cotton textile exports from India is correct, time alone could show. There is, however, no denying the fact that some sort of protectionism is being introduced in markets where imports have been free, though, in some other markets where restrictions have been in force, there will be some relaxation subject to successful bilateral negotiations. In other words, this means that there will be keener competition among the textile exporting countries to secure as much as possible of the available markets in the importing countries.

The Commerce and Industry Committee of the Japanese Cabinet has opposed the proposed imposition by the U.S. of a surcharge (amounting to 8.50 cents per lb.) on imported cotton textiles. According to the Committee, the surcharge, otherwise called the equalisation fee in the U.S., will not only adversely affect Japan's cotton textile exports but also constitute a threat to Japanese workers employed in the textile industry. The Committee is expected to submit a resolution to the session of the lower house of the Japanese Diet.

HABIB BANK LTD.

NOTABLE PROGRESS MADE

THE Habib Bank Ltd. (Chairman: Mr. Ahmed Habib, Karachi), the leading commercial bank in Pakistan, continues to expand its activities through the establishment of more branches, the total of which as on 31st December 1961 was 130, as against 111 a year before and 96 two years before. Reflecting such an expansion of business, the credit facilities accorded by the Bank to its clients during 1961 rose by 5.65 crores to Rs. 36.68 crores as compared with the previous year. The whole of this rise was accounted for by loans, overdrafts, cash credits, etc., which together amounted to Rs. 32.00 crores, as against Rs. 25.57 crores, while bills discounted and purchased were lower by Rs. 78 lakhs at Rs. 4.68 crores. The gross earnings of the Bank have gone up from Rs. 315.83 lakhs in 1960 to Rs. 341.04 lakhs in 1961. The increase of Rs. 25.21 lakhs is, of course, less than that (Rs. 35.48 lakhs) noted in the previous year. Moreover, practically *the entire improvement* in income has been offset by a marked rise in expenses, from Rs. 134.95 lakhs to Rs. 159.61 lakhs, so that the profit (before providing for taxation) has risen by just Rs. 79,000, as against Rs. 2.50 lakhs in 1960. Even so, the profit for 1961 is at the impressively high level of Rs. 175.02 lakhs.

Excluding the Rs. 75 lakhs provided for taxation, the net profit of the Bank comes to over Rs. 100 lakhs. The Directors have not made any allocation to the reserve fund; in the previous year, a sum of Rs. 100 lakhs had been transferred to the share capital account. Instead, they have raised the dividend from 17½ to 20 per cent, the sum required for this purpose being Rs. 60 lakhs, as against Rs. 52.50 lakhs in 1960. This leaves a large sum of Rs. 50.91 lakhs, including Rs. 10.89 lakhs brought in from the previous year, which has been carried forward.

The following comparative table indicates the progress made by the Bank in the past four years:

(In lakhs of Pak. rupees)

	For the year ended 31st December			
	1961	1960	1959	1958
Gross income	341.04	315.83	280.35	259.61
Expenses	159.61	134.95	106.87	92.88
Depreciation	6.41	6.65	2.25	2.58
Profit	175.02	174.23	171.73	164.15
Appropriations—				
To taxation	75.00	100.00	60.00	130.00
,, capital account	..	100.00	..	..

	(20%)	(17½%)	(15%)	(14.6%)
Carry forward	50.91	10.89	89.16	7.43

	As on 31st December			
	1961	1960	1959	1958
Capital	3,00.00	3,00.00	2,00.00	2,00.00
Reserve fund	2,00.00	2,00.00	2,00.00	2,00.00
Deposits	80,32.31	77,23.66	74,04.66	70,48.16
Advances and bills discounted and purchased	36,68.06	31,03.55	29,52.80	17,45.16
Investments	38,23.22	42,57.71	46,97.84	37,27.45
Cash	16,56.31	13,54.37	11,13.15	20,31.24
Balance sheet total	129,88.82	128,64.14	121,63.62	94,68.94
Ratio to deposits of—	%	%	%	%
Advances	45.7	40.2	39.8	24.7
Investments	47.6	55.1	66.1	52.8
Cash	20.6	17.5	15.0	28.8

N.B.—The figures of interest paid is not shown separately. It is, perhaps, deducted from gross income before showing it in the profit and loss account.

The above table shows that, while advances and bills are higher by Rs. 564.51 lakhs, fresh accrual to deposits have been only Rs. 308.65 lakhs. Consequently, the ratio of advances to deposits has gone up from 40.2 per cent to 45.7 per cent. There has been a fall of Rs. 4.34 crores to Rs. 38.23 crores in investments, whereas the cash in hand and with bankers show a rise of Rs. 3.01 crores to Rs. 16.56 crores. The bulk of the investments, amounting to Rs. 36.46 crores, is accounted for by Government securities, the corresponding figure for 1960 being Rs. 40.83 crores. Investments in shares of joint-stock companies aggregate Rs. 33.82 lakhs (Rs. 31.17 lakhs a year ago) and those in bullion are of the order of Rs. 143.22 lakhs (same). Bills lodged for collection have risen by Rs. 30 lakhs to Rs. 5.02 crores, while customers' liability for acceptances and guarantees has receded by Rs. 3.51 crores to Rs. 31.98 crores. The Bank's balance-sheet total as at the end of December 1961 stands at the all-time peak level of more than Rs. 129.88 crores, as against Rs. 128.64 crores a year before and Rs. 94.69 crores on 31st December 1958.

LENDERS SCARCE

(From Our Own Correspondent)

BOMBAY, 21st *February*

Stringent conditions prevailed in the short-term money market during the week under review. Lenders were scarce in the inter-bank section, with the rate for call money ruling steady at 4½ per cent throughout the week.

A meeting of chairmen and chief executives of banks, which are members of the all-India inter-bank agreement on maximum rates of interest on deposits, was held at Bombay on Friday the 16th inst. to consider the medium-banks' notice of withdrawal from the agreement, unless their request for a ½ per cent increase in the rates payable by them was conceded. The meeting reiterated the value of inter-bank agreement as a stabilising factor in the cost of operations of banks and expressed the need for continuing it, with suitable amendments to meet the changes that had taken place in banking and monetary trends since its revision with effect from 15th March 1961. It appointed a special committee of nine bankers, representative of all the types of banks, to examine the lines on which the agreement should be revised. The five medium banks, which had given notice of termination, agreed to stay their hand till the end of April. Thus, the controversy over the inter-bank agreement still remains unresolved.

For the fourth week in succession, the average rate of 91 days' Treasury Bills sold by tenders has gone up. This week, the tenders received were Rs. 2.02 crores, as against an invitation of Rs. 2 crores, showing a rise of just Rs. 2 lakhs over the amount offered last week. Nevertheless, the average rate of accepted tenders was higher at Rs. 2.580 per cent, as compared with 2.545 per cent a week ago; four weeks ago, the rate was 2.520 per cent per annum. Sales of Intermediate Treasury Bills fetched Rs. 5 lakhs, only one-third of the amount collected in the previous week. Sales of both the types of 91 days' Bills are being continued.

The Reserve Bank's statement for the week ended 16th February 1962 discloses only minor variations, of less than Rs. 1 crore, in the Issue Department. There has been a small increase of Rs. 41 lakhs in balances held abroad shown in the Banking Department. With this increase, the foreign assets held by the Reserve Bank are at Rs. 136.86 crores. The deposits of the Central Government have gone up by Rs. 9.39 crores, but those of other Governments have come down by Rs. 6 crores. Balances held by the banks are a shade higher at Rs. 76.17 crores. Their borrowings from the Reserve Bank against usance bills have, however, declined by Rs. 3.58 crores There may have been a fall in their loans against investments also, because the item "other loans and advances" show a contraction of Rs. 6.38 crores.

A sharp rise of Rs. 14.35 crores in bank credit, met by a reduction of Rs. 8.41 crores in investment, of Rs. 6 32 crores in money at call and short notice and of Rs. 1.15 crore in total cash is the main feature of the scheduled banks' statement for the week ended 9th February 1962. There has been a decline of Rs. 9.50 crores in deposits, mainly due to a substantial fall of Rs. 12.12 crores in demand deposits. This decline has been nearly neutralised by an increase of Rs. 9 crores in borrowings from the Reserve Bank.

The State Bank of India has accounted for the bulk of the variations in the scheduled banks' position *as noted above*. Thus, its advances have gone up by Rs. 7 crores, investments have declined by Rs. 7 crores and deposits have suffered a fall of Rs. 4.93 crores.

The Gilt-edged market continued to be dull with a quiet undertone. Turnover was greatly restricted.

In the foreign exchange market, too, there have been no noteworthy features. The pound sterling ruled quite steady throughout the week, with the New York on London spot rate remaining almost unchanged at 281.510-281.540 cents per £ for spot and 279.710-279.740 cents for three months forward. Over the week, the spot rate shows a very fractional fall of 0.020 cent, while the forward rate is up by 0.030 cent. In keeping with such negligible changes in the value of sterling, the rupee-dollar rate has also remained steady. The banks' selling rate for ready T.T. on New York is Rs. 475.50 for 100 dollars, their buying rate being Rs. 472.

KIPS STEADY

(From Our Own Correspondent)

MADRAS, 19*th February*

The kip market remained steady. Arrivals of tanned stocks met with steady clearance. Shipment business was of moderate volume in cow hides. Tanners who were holding stocks of higher selections after selling lower ends all these days, for which demand had been excellent, let go their inventory to U.K. buyers at slightly reduced prices. Inquiries for lower selections in cow hides were less brisk for inland trade and good for export. There was good demand for buff hides and for lighter averages in cow calf and for 2-pounders in buffalo calf top marks.

In the tanned goat skins section, there was good call from the U.S. and Continental importers. As exporters increased their prices in view of the strength in raw centres, export sales were small and selective. Demand for prime and semi-prime sheep skins was negligible and that for middle class was patchy.

The following are the ruling prices per lb. for all-round parcels in the local market:

	Rs.
Tanned cow hides 8/8½ lbs. average ...	2.35 to 2.45
„ buff hides 12/14 lbs. „ ...	1.90 to 2.00
„ cow calf 11/2 lbs. „ ...	3.70 to 3.80
„ buff calf 1½/2 lbs. „ ...	3.20 to 3.35

BULLION FIRM

(From Our Own Correspondent)

BOMBAY, 21*st February*

The bullion market ruled firm during the week under review. Upcountry advices were encouraging and there was also buying, especially in gold, by option dealers. Reduced arrivals, too, imparted strength. The daily average rate of arrivals was 7,400 tolas of gold and 12 bars of silver, as against 9,500 tolas and 29 bars, respectively, in the previous week. Offtake of gold was 6,400 tolas (7,000 tolas last week) and that of silver was 14 bars (13 bars). It was reported that about 350 tolas of contraband gold were confiscated at Calcutta on Saturday the 17th inst.

The adjustment rates fixed today were Rs. 121.25 per 10 grams of gold and Rs. 212.75 per kilogram of silver. The corresponding rates for Wednesday last week were Rs. 119.65 and Rs. 212.35, respectively.

The *Fagun* (22nd March) settlement in gold began the week at Rs. 120 80, as against the previous close of Rs. 120.65, and advanced to touch a high of Rs. 122.40 today. The closing was a shade lower at Rs. 122.30.

Ready gold continued to be quoted at a discount under the forward throughout the week. The actual discount increased from 75 nP last week-end to 80 nP today when the spot rate stood at Rs. 121.50, as against Rs. 119.90 on Wednesday last, ths highest touched being Rs. 121.80 on Monday the 19th inst.

In silver, the *Fagun* (23rd March) settlement was subjected to scattered selling early in the week and declined from Rs. 213.25 to Rs. 212.45 on Friday. After recovering to Rs. 213.15 on Monday, the settlement eased to Rs. 212.40 yesterday, but rallied again to Rs. 214.10 today before finishing at Rs. 213.90.

Ready silver improved from Rs. 212.35 to Rs. 212 85 on Monday and, after easing to Rs. 212 25 the same day, recovered to Rs. 212.95 today. The closing was Rs. 212.75 at which rate the discount under the forward was Re. 1.15, as against 90 nP on Wednesday last week.

The dollar price of gold in the London bullion market dropped from $35.14¼ to $35 09⅛, following fairly large offerings (on Continental account), with little buying interest in evidence. The sterling price also eased from 249s. 8d. to 249s. 3d. Silver, too, drifted downward, spot and forward shedding ¼d. each to 85¼d. and 85⅛d., respectively. The decline was in sympathy with the weakness of silver at New York where the quotation fell by one cent to 102 cents.

The following table shows the trend of prices during the week under review:

	21-2-62 (closing)	High	Low	14-2-62 (closing)
	Rs.	Rs.	Rs.	Rs.
GOLD				
Ready (.99 fine)	121.50	121.80	119.50	119.90
Forward: *Fagun**	122.30	122.40	120.30	120.65
Sovereign	96.75	96.75	96.50	96.50
SILVER				
Ready (.996 fine)	212.75	212.95	211.65	212.35
Forward: *Fagun*†	213.90	214.10	212.40	213.25
London—				
Silver Ready	85¼*d.*	85¼*d.*	85¼*d.*	85¼*d.*
Silver Forward	85¼*d.*	86*d.*	85¼*d.*	86*d.*
Gold	249*s.*3*d.*	249*s.*7½*d.*	249*s.*3*d.*	249*s.* 8*d.*
New York—				
Silver	102.00 cents	102.50 cents	102.00 cents	103.00 cents

* 22nd March settlement. † 23rd March settlement.

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.7 tolas). London and New York quotations are per ounce.

METALS RECEDE

(From Our Own Correspondent)

CALCUTTA, 20*th February*

In response to overseas advices, lead and zinc eased during the week under review. Tin ruled steady, while, following releases of virgin copper against permits, copper scrap shed a portion of the recent gains. It should, however, be noted that there was no lessening of shortage. Utensil scrap eased from Rs. 505.75 per 100 kgs. to Rs. 495.75 and berry scrap from Rs. 549.25 to Rs. 544. On the London Metal Exchange, the quotation closed at £234½ per ton, after opening at £234 and rising to £234½. The higher trend followed reports of labour troubles in some North Rhodesian mines. Lead here eased from Rs. 124 per 100 kgs. to Rs. 123, as demand was slow while the stock position was good. The recovery in London in spot lead from £57¼ a ton to £58 was attributed to increased consumer interest. Electrolytic zinc was quiet here at Rs. 234.25 per 100 kgs., while, in London, the price was around £68⅜ per ton, as against £68¼ earlier. The gain followed Continental interest. Tin in London softened to £948½ a ton, after being higher at £950¼. The rate in Calcutta was lower at Rs. 1,580.75 per 100 kgs., as against Rs. 1,586.50 earlier.

The proposal of the Lead and Zinc Development Associations, London, to set up an Information Bureau in respect of lead and zinc at Calcutta in order to make available to consumers of these metals in India details of latest technical developments leading to improved uses has been news of considerable importance. Mr. R. Lewis Stubbs, Director of the Associations, stated at Calcutta recently that the proposed Bureau would start *functioning before* the end of this year.

COTTON FUTURES RALLY

(From Our Own Correspondent)

BOMBAY, 21*st February*

After a period of listless trading, characterised by limited turnover and narrow price *movements*, the cotton futures market staged a smart rally during the week under review. The Jarilla March contract, which was hovering round Rs. 690 (per three quintals) during the past many weeks, spurted, on frantic covering, to hit the ceiling of Rs. 693 on the 14th inst. The bullish fervour of the market was fanned by the reported statement of Mr. George McGovern, Director of the U.S. Food-for-Peace Programme at New Delhi on the 16th inst. that there was little chance of India getting U.S. cotton under P.L. 480 during the current season. Bullish advices from up-country markets further helped sentiment. The Jarilla March contract consequently advanced and pierced the ceiling and was quoted, unofficially, at Rs. 701, that is, Rs. 8 above the ceiling on Monday. But the quotation for the contract declined yesterday in unofficial trading (the market was officially closed yesterday on account of the election of the new committee of the E.I.C.A.), thanks to report that legal opinion was that the ceiling rate was inclusive of the penalty. The contract ruled steady today with the quotation ruling at the ceiling of Rs. 693.

Meanwhile, the East India Cotton Association, at an extraordinary general body meeting on *Monday*, is reported to have approved the amendments to its bye-laws. The amended bye-laws will be applicable only to the August contract. The E.I.C.A. have approached the F.M.C. to give permission to commence trading in the August contract.

In the spot market, comparatively quiet conditions prevailed. The usual interest was reported in such varieties as Co2, L. 147, Khandesh, 197/3, Vijay, Digvijay and Kalyan. Prices were well maintained.

Export demand for Bengal *Deshi* was moderate. Shippers are eagerly awaiting a fresh quota for Bengal *Deshi*. Exporters point out that considering the latest crop estimate, the quota so far announced and the requirements of local mills, there is still a considerable export surplus in Bengal *Deshi*. The crop is estimated at nearly 500.000 bales. So far 200.000 bales have been allowed for export. The requirements of domestic mills are not expected to exceed 150.000. An additional quota of 100.000 bales of Bengal *Deshi* could, shippers argue, be safely released. Export circles are optimistic that a decision favourable to them would be taken by the Government after the Export Promotion Advisory Council meeting *on 5th March.*

In the foreign section, Sudan cotton continued to attract the attention of mills. Only routine interest was noted in other varieties. The following are the latest available quotations—in rupees per candy of 784 lbs.—from the spot market at Sewri:

Bengal *Deshi* 683; Co2 1,200; Digvijay 1,100; Broach 1,090; Jinga 1,300; Sudan G3S 1,575; XG3S 1,600; P5L 1,261; XG2L 1,390.

Karachi cotton futures market continued to rule distinctly firm during the week. Fresh mill buying and renewed *export* demand imparted strength to the market. The N.T.R.G. March contract firmed up from Rs. 83.35 last week-end to Rs. 89.50. The May contract rose from Rs. 80.40 to Rs. 80.95.

In contrast to the steadiness witnessed last week, cotton futures values in Liverpool receded during the week. Commission house selling and liquidation by weak holders were only partially absorbed in short-covering and some trade buying. Both the American and American type contracts consequently eased. Sudan cotton contracts at Liverpool were quietly steady. The following are the latest available *quotations*—in pence per lb. from Liverpool:

American cotton one inch staple contract: March 24.35; May 24.75; July 24.85; October 24.35.

American cotton mixed growth contract: March 24.75; May 25.15; July 25.25; October 24.75.

Sudan: March, May 31.75; July 30.50.

The downward trend witnessed in the New York cotton futures market last week gathered further momentum during the week under review. Large-scale selling prompted by the possibility of large tenders being issued against the maturing March contract resulted in a break in prices. The announcement of lower support price for 1962 for middling one inch cotton induced further weakness. Spot prices, however, ruled steady, thanks to good domestic mill and export demand.

The following are the latest available quotations from New York, as compared with those a week and a fortnight ago.

(In cents per lb.)

	20-2-62	13-2-62	6-2-62
New York spot	35.55	35.55	35.55
March	33.27	33.51	34.05
May	33.96	34.24	34.65
July	34.34	34.60	34.88

SPURT IN ART SILK YARN

(From Our Own Correspondent)

BOMBAY, 21*st February*

Art silk yarns registered a handsome rise in values, while staple fibre yarns tended to look down and cotton yarns were dull. The firmness of art silk yarns was engendered principally by the rise in import licence premium on yarn from 170-180 per cent to 200-210 per cent. There was also good demand from consuming centres where the weaving mills are reported to be producing larger quantities of fabrics, in view of the prospective enlarged offtake during the forthcoming festivals and marriage season. The improvement in exports of art silk fabrics from 2.99 million metres in December 1961 to 4.10 million metres in January 1962, too, imparted strength. Staple fibre yarns lacked support. Business put through was limited and values moved narrowly. Cotton yarns were dull. Operators were buying only to meet current requirements.

The Government of India has modified the policy for licensing of art silk yarn under the export promotion scheme for the period October-March 1962. Accordingly, no manufacturer will be entitled to import art silk yarn under the scheme in excess of Rs. 10 per loom per shift. The total number of loomshifts which will be taken into consideration for determination of maximum export entitlement under the scheme for the current licensing period will be the number of loomshifts worked by a manufacturer-exporter in the art silk powerloom sector during April-September 1961. If, however, any manufacturer-exporter has no loomshift performance during the April-September 1961 period, the maximum export entitlement for the current period will be determined on the basis of one shift working, assuming 150 working days during the current period. On 9th October 1961, it will be recalled, it had been announced that maximum licence under the scheme per loom would be Rs. 3,750 for the six-monthly period.

Amilan yarn (20 x 1) February contract spurted from Rs. 3,230 to Rs. 3,320 and April delivery from Rs. 3,327 to Rs. 3,405, thanks to continued bull support. 120 Japan advanced by Rs. 55 to Rs. 1.929. 150 Japan was fully maintained at Rs. 1,984. 120 Italy rose by Rs. 26 to Rs. 1,900. 150 Italy rallied from Rs. 1,763 to Rs. 1,819. Among indigenous yarns, National Rayons 120 Bt. cones 1st grade hardened by 22 nP to Rs. 13.68. 150 Bt. cones 1st grade picked up 5 nP to Rs. 12.08.

Staple fibre yarn (40 x 1) February settlement declined by Rs. 4 to Rs. 744. Spot Kohinoors dropped 20 nP to Rs. 8.73. Centurys lost 9 nP to Rs. 8.47.

Among cotton yarns, 10 counts Podars gathered 12 nP to Rs. 17.62. Moderns were dull at Rs. 18.25. Twenty counts Gokaks were done at Rs. 22.75, same as last week. Forty counts T.T. corings were well supported and rose by 63 nP to Rs. 33.50. Eighty counts Maduras climbed up from Rs. 72.50 to Rs. 75.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	21-1-1962	14-2-1962
	Rs.	Rs.
Art silk yarn—		
20/1 Amilan (100 kg.)—		
February	3,320.00	3,230.00
April	3,405.00	3,327.00
120 Japan (per 100 kg.)	1,929.00	1,874.00
150 Japan (per 100 kg.)	1,984.00	1,984.00
120 Italy (per 100 kg.)	1,900.00	1,874.00
150 Italy	1,819.00	1,763.00
Nat. Ray. 150 Bt. 1	12.08	12.08
Staple fibre yarn (40 x 1)—		
February	730.00	734.00
April	744.00	746.00
Kohinoor (per kg.)	8.73	8.93
Cotton yarn (per bundle of 10 lbs.)		
10s Modern	18.25	18.25
20s Modern	22.75	22.75
40s T. T. Corin	32.50	32.87
60s T. Mangal	52.00	52.00
80s Mahindra	75.00	75.50

GROUNDNUTS IMPROVE

(From Our Own Correspondent)

BOMBAY, 21*st February*

Mixed trends prevailed in the oilseeds market during the week under review. Groundnuts and cottonseeds maintained a firm front. But castorseeds suffered an initial setback, which was, of course, partly offset by some renewed bullish fervour towards the close. Their closing prices, however, were still lower than those a week ago. Linseeds ruled easy. The firmness of groundnuts was engendered mainly by the sustained support extended by a leading operator. There was also good demand from *vanaspati* producers and crushers. Another bullish factor was the offtake of groundnut extractions by some of East European countries. Arrivals, particularly from the Nizam region, were on a relatively small scale. Cottonseeds moved up in sympathy with the firmness of raw cotton. Castorseeds, which were neglected early in the week, gained considerable ground subsequently on expectations of good export enquiries for castor oil. The buoyant conditions noted in the linseed section last week, was halted early this week, following weakness of mustardseed in North Indian markets. But linseeds staged a modest rally towards the close on technical considerations.

Pursuant to notices of motion by certain private operators in a suit against the Bombay Oilseeds and Oil Exchange Ltd., the City Civil Court has granted injunction restraining the defendants from taking any action under bye-laws 262, 305 and 306 against the plaintiffs who had paid penalty in respect of groundnut January 1962 contract. The Court is expected to give a final judgment tomorrow on the question of the penalty imposed by the Exchange.

Groundnut May 1962 contract advanced from Rs. 243 to Rs. 245.50. Khandesh quality rose from Rs. 48.50 to Rs. 48.75, before closing at Rs. 48.50. Oil ex-mill gathered 30 nP to Rs. 20 10 and railway receipts 20 nP to Rs. 19.80. Oil May 1962 contract improved by 15 nP to Rs. 20.80.

Cottonseed July 1962 contract wound up the week higher at Rs. 110.25, as against Rs. 109.50 last week-end. Whites strengthened by 50 nP to Rs. 20.75. Both Non-whites and Berars put on 25 nP to Rs. 21.

Castorseed March 1962 contract fell initially from Rs. 176 to Rs. 173.75, but rallied later to close at Rs. 175.75. June 1962 contract, which had fallen from Rs. 174.25 to Rs. 172.75, improved to Rs. 173.75 today. Ready Madras finished at Rs. 35.37, as against Rs. 35.50. Oil B.S.S. eased by 15 nP to Rs. 15.25. But oil commercial hardened by 5 nP to Rs. 15.

Linseed March 1962 contract fell from Rs. 40.37 to Rs. 39.56. Thereafter, the contract moved up and finished at Rs. 37.75 today. The net loss over the week was 62 nP. Bold ready lost *Re. 1.50* to Rs. 42.50 Linseed oil shed 50 nP to Rs. 18.50.

The following table shows the closing prices of oilseeds and oils on Wednesday, the 21st February as compared with those of the two previous weeks:

	21-2-1962	14-2-1962	7-2-1962
Groundnut	Rs.	Rs.	Rs.
May 1962	245.50	243.00	237.00
Nizam bold	48.12	48.50	47.25
Khandesh quality	48.50	48.50	47.62
Oil ex-mill ready*	20.10	19.80	19.75
Railway receipts*	19.80	19.60	19.45
Oil May 1962	20.60	20.45	—
Castorseed			
March 1962	175.75	176.00	172.75
Ready Madras	35.37	35.50	35.25
Ready Kanpur	34.25	34.25	34.00
Oil B.S.S.†	15.25	15.40	15.40
Oil commercial†	15.00	14.95	14.90
Linseed			
March 1962	39.75	40.37	39.25
Bold ready	42.50	44.00	43.50
Oil ready†	18.50	19.00	18.90
Cottonseed			
April 1962	110.25	109.50	109.25
Niger seed	36.00	36.00	36.00
Kardi seed	24.00	25.00	25.00

* Rates include excise duty but exclude sales tax.
† Rates exclude both excise duty and sales tax.
N.B.—All quotations for futures contracts are per 250 kilograms, except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

BLACK PEPPER QUIET

(Messrs. Parekh and Co.)

BOMBAY, 21*st February*

Malabar black pepper ruled quiet during the week, as New York refused to follow the rise and the squaring up of February contracts was lower than expected. Ungarbled, after touching the highest at Rs. 305, came down to Rs. 295, and garbled slipped from Rs. 313 to Rs. 305. Calicut was nominally quoted at Rs. 295. Rumours regarding Russian buying proved unfounded.

New York, after buying few parcels at $0.35, withdrew and was now reported giving buying indication at $0.34. Singapore was down by Str.$2½ for black. Renewed arrivals of Muntok affected the sentiment. Spot at New York was nominally quoted at $0.36, the grinders' idea being about one cent down.

The bullishly inclined traders are giving out reduced estimate of Malabar black at 24,000 tons. The reasons put out for such lower estimate are heavy rains and floods during the last monsoon. But the trade in general refuses to swallow the story, as the production of ginger is not affected and in view of the attitude of the growers who exhibit more anxiety whenever the buyers withdraw. Knowledgeable sources place the crop at 28,000 tons.

The tendency of the market is likely to remain downward unless big parcels are lifted out of the market either by the East European countries or by America. Daily arrivals at the primary centres are not fully absorbed and floating stocks, as a consequence, are increasing.

Ready pepper in Bombay is nominally quoted at Rs. 167 per 50 kilos.

QUALITY TEAS BETTER

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, 13*th February*

A total of 376,000 kgs. was on offer in sale No. 7 held today. Quality showed general improvement. Medium kinds were brighter, but there was not such a good selection of Nilgiris as last week. There was good general demand except for the plainer types. Best highgrowns met with selective demand, with buyers following quality closely. Highgrown B.O Ps sold well, whilst their fannings were well supported and often dearer. Good medium B.O.Ps were firm to dearer. Fannings in this category, however, were about steady and appreciated in price with improved quality. Medium and low medium B.O.Ps were irregular and sometimes easier, but medium B.O.P.Fs were about firm and dearer at times. Low medium B.O.P.Fs tended to be easier. Black leaf brokens were steady, while their fannings were also firm on last rates. Whole leaf grades were well supported at enhanced rates, but, at times, they were irregular.

The quotation per kg. were:

	1962	1961
	Rs.	Rs.
Low medium	3.85-4 05	4.75-4.95
Medium	4.10-4 75	4.95-5 25
Good medium	4.85-5 60	5 25 5.80
Nilgiri B.O.P.	5.70	11.70

The average price realised in sale No. 7 was Rs. 5.44 per kilo, as compared with Rs. 5.13 a week ago and Rs. 5.22 in the corresponding sale last year.

About 236.000 kgs. were offered in dust sale No. 7 held on Thursday, the 15th inst. There was a strong general demand. Grainy exportable kinds were again a feature of the sale and often appreciated in price. Plain and low medium descriptions shared in the upward trend of the market. There was more support than in recent weeks for milled and residual teas. Wynaad types, though meeting with better inquiry, often sold at a discount. C.T.C. types were a little easier, as also legg-cut types. Highgrown descriptions were well supported.

The average price realised in dust sale No. 7 was Rs. 4 18 per kilo, as against Rs. 4 02 a week ago and Rs. 5.02 in the corresponding sale last year.

Colombo: Just over 5 million lbs. were offered and they met with very strong general demand. Best highgrowns were steady, but the lesser kinds were substantially dearer. Mediums advanced 10-20 cents, while lowgrowns were firm. Commonest sorts were slightly easier.

London: *North Indian and other growths*: 27,007 packages were offered in Tuesday's sale, of which 10,125 packages were from South India. Demand was strong and prices were fully firm to dearer for all teas except the plainest B.O Ps. Coloury mediums were the strongest feature, particularly B.O.P. fannings. There was strong demand for South Indians, buyers emphasising more on the useful liquoring and improved quality teas which were appreciably dearer. Plainer descriptions and lowgrowns were easier and occasionally neglected.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd., wire as follows:

"*Sale No. 8*: 270,000 kgs. offered. Strong demand. Best liquoring highgrowns irregular and often below valuation. Mediums and good medium very strong and considerably dearer, particularly broken plain and low medium fully firm to dearer. Unorthodox irregular and sometimes dearer."

INFERIOR TEAS DECLINE

(From Our Own Correspondent)

CALCUTTA, 20*th February*

The fall in demand for inferior grades of teas that was in evidence in yesterday's export and last week's internal sales was not surprising, inasmuch as the quantity of such teas yet remaining to be marketed is so large that its absorption can only be at declining prices. On the other hand, quality teas did well yesterday, and the fall in U.K. stocks from 146 million lbs. to 143.68 million lbs. during the week ended 9th February indicated the approach of the end of the season, symptomatic of which was the marked fall in shipments during the week. In the sale held at London last week, the keen bidding for quality teas, particularly North India's bright liquoring teas, emphasised the need of stockists there for replenishment. Prices in London gained 8d. a lb. The same emphasis was in evidence at last week's auctions in Colombo where, it was reported, liquoring coloury medium brokens gained about 10 to 20 cents a lb. and plainer teas 5 to 8 cents.

There are indications that the promotional campaign of producing countries in the United States and other dollar areas has been followed with commendable success. India's capacity for competition is weakened by high costs of production, the different taxes, among other things, contributing to the same. While in an effort to raise exports, the industry has, time and again, demanded tax concessions, incentives have not been granted. Although excise duty reduction is being looked forward to in the forthcoming budget, the trade would welcome any concrete measures adopted for according incentives. For instance, it would be worth while to consider whether a garden and/or a blending firm can be given a cash subsidy if it succeeds in exporting a higher quantity than, say, the average for the past three years. The granting of rebate of excise duty on exports to areas to which shipments have been falling may also be considered. Such subsidy and rebate can be granted from the excise duty collections. The trade points out that, if some such export incentive measures are adopted, the Government does not stand to lose, as its total collections from the industry are not likely to fall. Moreover, the country would benefit from increased foreign exchange earnings.

Unless some practical measures are adopted, the possibility of achieving the 900 million lbs. production target and selling the extra tea at remunerative prices is, apprehended to be remote. Recently, the Chairman of the Indian Tea Association, Mr. I. F. Morriss, invited attention to the memorandum submitted to the Tea Board by the Consultative Committee of the Tea Producing Associations which had suggested, in the interests of larger exports, the abolition of the export duty and simplification of the internal taxes by combining the Central excise duty and the different taxes levied by the State Governments, such as tea cess, Assam carriage tax and West Bengal entry tax. He had also called for more propaganda abroad as well as revival of the campaigns inside the country. For he declared that the industry could not develop a steadily expanding export market without a broad and secure domestic market. It will be remembered that having regard to greater exports, the Tea Board has discontinued all internal propaganda.

That there is a restricted demand abroad for India's inferior teas will be readily admitted by all. Most of such teas can be consumed only within the country or exported to neighbouring countries. With the increasing standard of living and Government's emphasis on prohibition, tea stands to gain in India's new industrial areas. Some sort of propaganda in these areas, the trade feels, would lead to useful results.

In the internal sales held here last week, dusts on offer aggregated 29,106 packages which met with restricted demand. Legg-cut teas were a strong feature in an irregular trend, with the bright teas

realising higher prices and other teas in this category being firm. Orthodox teas declined by 20 nP. C.T.C. teas were generally easier, while the bright liquoring teas hardened. Powdery and secondary fibrous dusts were steady. The quotations per 1 kg. inclusive of excise duty were: good Assam C.T.C. dust Rs. 6.40 to Rs. 7.00; medium Assam C.T.C. dust Rs. 5.50 to Rs. 6.00; legg-cut dust Rs. 4.60 to Rs. 5.30; medium Assam dust Rs. 4.30 to Rs. 5.10; and plain orthodox Rs. 3.90 to Rs. 4.60.

Leaf on offer amounting to 335 chests were irregular.

Offerings during yesterday's export sales amounted to 75,647 chests. While quality teas was in good demand, others were quiet. Fannings were a totally weak feature. Keen competition pushed up prices for the best autumnal C.T.Cs which were the strongest feature. Fannings in this category were taken up at about last week's rates. Medium and secondary sorts possessing autumnal liquors recorded a small gain in prices, with brokens showing the highest advance. Plain brokens and fannings eased by 20 nP. Well-made orthodox teas possessing bright liquors were in good demand, but other sorts eased. An irregular trend was recorded by legg-cut teas as well as whole leaf grades. The cheaper varieties of the latter were steady. Tippy teas met with good support. Darjeelings were also better according to quality. The quotations per 1 kg. inclusive of excise duty were: best Assam C.T.C. fannings Rs. 5.80 to Rs. 6.40; best Assam C.T.C. B.P. Rs. 6.00 to Rs. 6.50; medium Assam C.T.C. fannings Rs. 5.10 to Rs. 5.40; medium Assam C.T.C. B.P. Rs. 5.20 to Rs. 5.50; clean plain pekoe Rs. 4.20 to Rs. 4.40; plain fannings Rs. 3.70 to Rs. 4.10; plain B.P. Rs. 3.50 to Rs. 3.80.

JUTES RISE MARKEDLY

(From Our Own Correspondent)

CALCUTTA, *20th February*

Following greater support, jute goods recorded impressive gains during the week under review and the distinctly firmer trend in fibre was due partly to arrivals falling much shorter of mills' purchases and partly to the imminent entry into the market by the Buffer Stock Agency. The news that burlap consumption in the United States during January was as high as 88.2 million yards, as against 72 million yards in the previous month and 73 million yards in January 1961, cushioned sentiment in hessian and, though business passing in this construction was small, prices staged a recovery to keep pace with the gains in heavy goods noted in the last two to three weeks. The remarkable improvement in burlap consumption in a country which is India's principal customer for hessian was hailed with considerable satisfaction, as this denoted a comeback to hessian from bulk handling methods and substitutes. Burlap stocks in the U.S. at the end of January increased by 4 million yards to 241.4 million yards, but such an increase becomes insignificant considered against the background of the increase in consumption by 16.2 million yards. If the present trend in consumption was maintained in the U.S., the stocks at the end of January represented a little less than twelve weeks' consumption. At the end of January 1961, stocks were as high as 257 million yards, which represented fifteen weeks' consumption, the average monthly consumption in 1961 being 65 million yards. Such an analysis led to expectations of greater interest by buyers on behalf of the U.S.

The fact that, although output in mills in January at 96,700 tons declined by 900 tons as compared with the previous month, stocks with mills at the end of January had increased by 4,600 tons was not taken much notice of. For demand in the month was of the order of 92,100 tons, considering stocks at the end of December were 55,600 tons and those at the end of January 60,200 tons. The low level of stocks *vis-a-vis* demand was a factor which was made use of by sellers during the week. Export bookings during the week were only normal, but the trade was anticipating increased business from overseas countries. Those of such buyers overseas, who were hitherto keeping away from the market in the hope that prices of goods would decline further, should now be satisfied in that the prices, after reaching the bottom, have now started moving up. The firmness in fibre prices and the difficult supply position of the superior varieties, in no small measure point to the same conclusion. That the mills are stocked with adequate fibre, which can see them through even up to the end of June, is a happy augury, since such a position may ensure that any rise in prices of goods would be kept within a reasonable level. The low level of goods in stock with mills against the background of good demand from overseas has led to the expectation that mills would be allowed by the I.J.M.A. to keep in operation as many of the unsealed looms as possible even beyond the end of March. While note was taken of the end of the labour troubles in Dundee mills, the report of the decision by the Thailand Government to purchase one million gunny bags from Calcutta caused satisfaction and led to a rise in the prices of heavy goods.

The trade was not prepared to give credence to the rumour earlier in the week that the official estimate of the crop was now 7.2 million bales. Since this was lower than previous estimates, it imparted firmness to fibre prices, at any rate. The imminent commencement of operations by the State Bank of India on behalf of the Buffer Stock Agency also pushed up prices in areas where they had fallen below the minimum prices. Fibre arrivals during the week on an all-India basis were estimated at 500,000 maunds, whereas the purchase quota for the week ended 17th February exceeded arrivals by 200,000 maunds. The issuance of higher purchase quota compared to arrivals is in accordance with the I.J.M.A. policy to purchase as much fibre from the market as mills can, in order that the minimum prices can be maintained. Purchases by mills must have exceeded the quota. Tossa continued to be quoted at a premium, and was only available against purchase of mesta. The fibre in stock with mills is so satisfactory that it has been stated that the mills can use them to their advantage in at least two seasons in order to prevent any rise in prices. Meanwhile, the Indian Central Jute Committee *Bulletin* has warned that consequences of another jute shortage would indeed be grave for both the industry and the country. The reference is to the fall in prices below minimum levels during recent weeks. It should be realised that prices are at what levels they are due to the progressive purchasing policy of mills. There should also be the realisation that what is now available for sale to mills is low quality jute which cannot fetch the same prices as at the beginning of the season. The general feeling in the trade is that the cultivators had completed their marketing of 75 per cent of their produce before the present phase of the recession. In the season as a whole, cultivators would make more profits than last year and, considering this, it should be hoped that there would be no shrinkage to acreage for sowing for which land preparations have already commenced.

Mills accorded steady support to fibre. Ready jute could be had at minimum prices only, while forward fibre commanded a premium of 50 nP per maund. Lower arrivals in the agencies as well as in Calcutta only confirmed the earlier impression that there was not much that was to come from the producing areas. Towards the end of the week, March-April fibre quoted as follows: Assam bottoms Rs. 30.50 per maund, as against Rs. 30 earlier, northern bottoms Rs. 30, as against Rs. 29.50, and daissee bottoms Rs. 32.50 (unchanged). A steadier trend was also reported in cuttings in the Pakistan markets. Overseas buyers, however, continued to keep away from the market in anticipation that the Pakistan Government would have no alternative other than reducing the E.P.C. rates. Shortage of finance with dealers led to a further fall in arrivals.

On Tuesday last, ready B. twills were firm at Rs. 125.00. There were a good number of inquiries for both hessian and heavy goods, and short-covering in ready and near hessian was a feature. Ready hessian 40" 10 oz. hardened from Rs. 52.25 to Rs. 52.80. On the following day, the price gained to Rs. 53.15, since the demand for near delivery goods continued unabated. B. twills were firmer at Rs. 125.25, as sales with overseas buyers indicated increased interest. The announcement of lower production for January highlighted attention on the low level of stocks which presented about two weeks' demand. Activity in the futures market became keen, and prices there spurted by Re. 1 on Thursday. The increasing interest shown by overseas buyers was taken as the indication of their realisation that prices had begun to rise after touching rockbottom levels. Ready heavy goods were involved in scattered business, but that greater business was in store was indicated in that overseas inquiries were increasing. Ready B. twills advanced to Rs. 125.75 and hessian 40" 10 oz. to Rs. 53.40. Activity on Friday was on an increased scale, and the impressive gains recorded followed speculative manipulations in February delivery futures. Ready B. twills advanced to Rs. 126.50 and hessian 40" 10 oz. to Rs. 54.80. Over the week-end, these constructions rose to Rs. 127 and Rs. 56, respectively, and the news of increased U.S. consumption of burlap fanned enthusiasm. By and large, overseas interests for sacking goods has reached parity with hessian, and it is thought that, if demand at present level continues, a re-transfer of hessian looms to sacking would follow. A good amount of covering business was done during yesterday, and there were a fair number of inquiries from overseas. Hessian 40" 10 oz. was firm at Rs. 55.75 and B. twills at Rs. 126.25.

FOODGRAINS DEPRESSED

(From Our Own Correspondent)

HAPUR, *19th February*

Foodgrains ruled quietly depressed during the week under review, thanks to better *rabi* crop prospects. While coarse grains of new produce would begin reaching the market after about a month, wheat harvesting would begin early in April. Wheat here eased fractionally to Rs. 17 a maund for average quality and upto Rs. 19 for better farm produce. Wheat arrivals in the market were poor and the consumer demand was met mostly through imported wheat that was being sold through fair-price shops in ration at Rs. 15.25 a maund. Wheat crop was now in very good progress and sunny weather was the need of the hour.

Rice ruled quiet, as Mainpuri quality was reaching the market and demand was slack. Week-end prices were: *Mainpurisela* Rs. 19.50; *gadda kutcha* Rs. 19.12; *ramajwayansela* Rs. 22, *raimuniasela* Rs. 23, *basmatisela* Rs. 26 to Rs. 28, superior Rs. 30 to Rs. 34 a maund.

Gram drifted slightly lower to Rs. 16 to Rs. 16.12 a maund. Demand, however, was good and local stocks, consequently, declined to 3,000 maunds. Barley and *bejhar* were listless at Rs. 13 and Rs. 13.25 a maund, respectively. Crop prospects of all these coarse grains were bright and harvesting would begin in about a month's time. Maize drifted lower to Rs. 12 to Rs. 13 a maund according to quality, as the stockists were anxious sellers, in view of the fear that seasonal demand would soon come to an end. Arrivals of maize still continued and stock here was estimated at around 20,000 maunds. *Bajra* sought lower levels at Rs. 14.25 a maund, as demand was lacking. Prices in other sections were quiet at *methi* Rs. 27; *juwar* Rs. 13.25; *guwar* Rs. 14; and oats Rs. 11.50 a maund.

Among pulses, peas and *arhar* ruled steady, as demand for both for conversion into *dal* was good. Consequently, stocks declined with peas stock put at 5,000 maunds and *arhar* at 15,000 maunds. While *arhar* crop prospects were dim following heavy losses due to frost last month, peas late variety was progressing well. Demand for new *urd* and *moong* which were reaching in small quantities from Rajasthan side, was good and prices stayed steady. Week-end prices (in rupees per maund) were:—peas *dara* 13.25; farm 14.25; peas *dal* 14.75; gram *dal* 18.50; *arhar* 15.50; *arhar dal* 18.75; *urd* 22 to 24; *urd dal* 25 to 28; *moong* 18 to 21; *massor* 16 to 17.50; *massor dal* 19; *moong dal* 21 to 24; *moth* Rs. 16; *moth dal* Rs. 19.

SUGAR RELEASE SMALLER

(From Our Own Correspondent)

HAPUR, *19th February*

Sugar ruled quiet during the week under review. In order to help the mills to dispose of their remaining stocks of the last releases, the Government no doubt delayed this time the release of monthly quota by a few days and reduced the quantity offered from 200,000 tons to 185,000 tons. But this did not help the factories having stocks of inferior small crystal sugar, prices of which still registered sagging trend. Production in west U.P. was still being carried with vigour, as cane prices here were: wholesale Rs. 106.50 per bag; retail 97 nP to Rs. 1 per *seer*, mill delivery per maund E29 Simbhauli Rs. 37.50; D29 Bijnore Rs. 35; Dhampur Rs. 36; Amroha Rs. 36.19.

Despite delay in the release of monthly quota and reduction in quantity offered for free sale, inferior quality did not improve in the Muzaffarnagar market during the week. While inferior stocks were mounting, superior white bold crystal was much in demand from Gujarat, Delhi and Saurashtra, and good business was done for these Rs. 39.72; Iqbalpur Rs. 40.22; Mansurpur Rs. 40.41; Shamli Rs. 39.30; C29 Daurala Rs. 39.31; Dhampur Rs. 37; D29 Seohara Rs. 36.31; Modinagar Rs. 37.30.

Khandsari was steady during the week, due to good buying support from Rajasthan and east U.P., Gujarat, Madhya Pradesh and Punjab also showed buying interest. Prices sought higher levels, inferior being quoted at Rs. 25 to Rs. 30 and superior at Rs. 31 to Rs. 33 a maund.

Gur was quietly depressed during the week, as demand was reported only at lower price levels. Loading was restricted to the consuming areas of Gujarat. Small quantity, however, was sent to West Bengal. The rest of the arrivals at an average of 2,500 maunds was lifted by stockists with the result that local *gur* stock mounted to 10,000 maunds, the stocks at the corresponding period past year were heavy around 42,000 maunds. Total arrivals of *gur* here during the current season totalled 3.75 lakh maunds, as against 4.10 lakh maunds on the corresponding date of last year, and week-end prices here were: *pansera* best Rs. 14.12; *dara* Rs. 13.75; *balti* Rs. 14; *shakker* Rs. 17 a maund.

Gur futures were bullish during the week on vigorous bull support. *Fagun* and *baisakh* on Saturday closing was quoted at Rs. 14.23 and Rs. 15.07, as against the Monday's opening of Rs. 13.88 and Rs. 14.60 and highest touched in mid-session at Rs. 14.34 and Rs. 15.16, respectively, on Saturday. Futures were closed today, due to general election polling date and yesterday due to Sunday. Sowings of new cane crop have begun.

LINSEED DULL

(Messrs. A. Bradley and Co.)

CALCUTTA, *19th February*

Dull conditions prevailed in the linseed market during the week under review. Very small business was reported. Arrivals were small and millers showed more interest for forward deliveries at lower prices, in view of the new crop coming in a month's time.

Trading in the oil market was slow. Only bazar parties showed some interest for ready delivery on account of high prices ruling for other vegetable oils.

The oilcake market was steady during the week, as stocks were getting low and the demand was good.

Ready/February was quoted at Rs. 31.50 per maund.

Notice

THE ALKALI AND CHEMICAL CORPORATION OF INDIA LIMITED

ANNOUNCEMENT

THE ANNUAL GENERAL MEETING OF THE Members of the Company will be held on Thursday the 22nd March 1962 at 2.30 p.m. at the Registered Office, 34, Chowringhee, Calcutta-16.

Notice of the Meeting together with the Annual Report and Accounts has already been posted to the Shareholders direct.

The Ordinary Share Registers of the Company will remain closed from the 6th March 1962 to 22nd March 1962, both days inclusive.

By Order of the Board,

IMPERIAL CHEMICAL INDUSTRIES (INDIA) PRIVATE LIMITED,

Secretaries.

23rd February, 1962.

UNDER SECRETARY ... 26 FEB 1962 ... PUBLIC DEPAR

Note.—Outstandings relate to end of period and do not include Indian Union's share of pre-partition liabilities: repayments, however, include those from the pre-partition holdings of Indian investors. A—Discontinued from July 1, 1953. B—Discontinued from June 1, 1957. C—Discontinued from 1st January 1959. D—Discontinued from August 15, 1947. E—Progressive net repayments at the end of period from August 15, 1947. F—No sales from June 1, 1957. G—1st series issued from July 1954 to 1957 and 2nd series issued from January 1958. H—Outstandings in respect of items in column 9 marked 'E' are not included, amount to 17.60 crores of rupees. N.B.—Five-year prize bonds were issued from 1st April 1960 and the total outstandings at the end of Oct., 1961 amount to 17.60 crores of rupees.

DEVELOPMENT BANKING

THE latest annual statement of Mr. G. L. Mehta, circulated to shareholders of the Industrial Credit and Investment Corporation of India, in his capacity as their Chairman, is notable for the thoughts it contains on two subjects of considerable current importance. One is the relationship of a development bank with its clients in economies such as India where rapid industrialisation is stimulated. The other is the pattern of capital that an industry must have, if it is to face the changes in economic climate with equanimity. Both are topics on which precious little has been said in this country. Mr. Mehta, therefore, has done well to devote a good part of his statement to them. His observations on the first subject are by way of an explanation to the criticisms that the Corporation takes too long to come to a decision on the applications for assistance, that its inquiries about the merits of an industrial project is nothing short of an inquisition and that it continues to have an eye on the borrower even after the loan is sanctioned, despite the searching inquiry made prior to giving the loan. Much of this criticism will cease, if there is a proper understanding of the relationship that should exist between a development bank and the entrepreneurs taking its assistance.

The object of the Corporation asking for a variety of information from the promoters of a project who seek financial assistance from it is not to sit in judgment over them or merely to find loopholes, but to help them improve the profitability of their projects in the long run by examining them from all angles. A development bank can thus render valuable assistance for raising the quality of industrialisation. The argument that the promoter of a project knows all about his scheme and that, otherwise, he would not stake his capital and labour is true, though only up to a point, for two heads are invariably better than one. In an underdeveloped country, which is anxious to stimulate the growth of economic development to keep pace with its leaping population and which provides ample scope for private enterprise, not all those who wish to establish industries will be having adequate industrial tradition and experience. A trader, or a landlord or a technician may decide to become an industrial entrepreneur. Such businessmen can by no means be all-knowing experts. There are many like them in India today; they will find the detailed scrutiny, to which their projects are subjected by the I.C.I.C.I., to their advantage, as it will expose the drawbacks that had escaped their attention. It may be a time-consuming process, to some extent, but it will prove rewarding in the long run.

The various angles from which the I.C.I.C.I. looks at a project coming up for its assistance are explained at length by Mr. Mehta. And in the process he gives one a glimpse of the mistakes that are being made by the entrepreneurs in this country when they draw up their plans for either a new unit or expanding an existing one. In the first place, Mr. Mehta is of the view that there is no proper assessment of the size of the prospective markets. The tendency to assume that the present scarcity conditions would continue in almost all products is widespread and the possibility of the emergence of a buyers' market through increase in productive capacity is being ignored. This fault leads to the second one, namely, lack of cost-consciousness among the promoters. "Our entrepreneurs," to quote Mr. Mehta, "have become so used to conditions of artificial scarcity brought about by import and licensing restrictions that the need to produce at economic costs is not adequately recognised." Thirdly, there is a tendency to underestimate the capital cost of a project as well as the requirements of working capital. "Promoters are prone to ignore," says Mr. Mehta from experience, "a large amount of financial expenditure which is not for 'hardware.'" Elucidating this point, he adds: "Expenditure on buildings, machinery and equipment is more easily visible than pre-operative items. In fact, we have calculated that such financial expenditure often forms about 30 per cent of the expenditure on what I have called the 'hardware' of development." It is thus seen that the private sector which has been criticising the public sector for underestimating the cost of capital projects is itself guilty of this financial weakness. And, finally, many promoters tend to keep the equity base of their companies small and prefer to rely on medium-term credits and bank borrowings to a larger extent than is prudent.

It is in order to make sure that the projects which it finances are free from these defects as far as possible that the Corporation asks for detailed information on the cost of a project according to certain standard categories. In assessing the market for a product, the Corporation looks ahead, taking into account the plans of other manufacturers who are likely to compete with the entrepreneur seeking its assistance, as well as the other factors that govern the growth of demand and supply. With a view to improving its capacity to judge proposals from this aspect, the Corporation has taken steps to build up a

This rate of progress, in relation to the total second Plan outlay of Rs. 102.7 crores in the State, cannot be considered quite impressive. For instance, under the related heads "agriculture and community development" and "irrigation" the five-year (1956-61) outlay was of the order of Rs. 48.6 crores. It had been envisaged that, by the end of the Plan, the production of foodgrains would be increased to 4.21 million tons, oilseeds to 240,000 tons, sugarcane (*gur*) to 110,000 tons and cotton to 270,000 bales. These targets indicated that, by the year 1960-61, the foodgrains production would be raised by 21 per cent, oilseeds by 60 per cent, sugarcane (*gur*) by 150 per cent and cotton by 82 per cent. The actual achievements in 1960-61, as compared with 1955-56, were as follows:

Crops	1955-56 output (as originally estimated)	1960-61 output	Percentage increase in actual output in 1960-61 as compared with 1955-56	Target increase percentage
Foodgrains (lakh tons) ..	35.0	44.6	27	21
Oilseeds (lakh tons) ..	1.2	1.7	42	60
Sugarcane (*gur*) (lakh tons)	0.5	1.0	100	150
Cotton (lakh tons) ..	1.5	1.5	..	82

(One lakh = 100,000)

It may be inferred from the above figures that the target was exceeded in the case of foodgrains. Actually, however, the revised estimate for foodgrains production in 1955-56 is 4.18 million tons. If this figure is taken as the basis for calculating the percentage increase in production in 1960-61, it will be found that the actual increase is only 7 per cent. In the case of oilseeds, the revised estimate of their output in 1955-56 is 2.5 lakh tons; on this basis the 1960-61 output represents a decrease of 32 per cent. The revised estimate of cotton output in 1955-56 is 180,000 bales; on this basis the 1960-61 output represents a decrease of about 17 per cent. Only in the case of sugarcane has a big increase in output to the extent of 100 per cent taken place. It would appear from the figures, so interpreted, that the production potential for neither foodgrains nor commercial crops has increased substantially.

Considering the fact that the outlay on agriculture, community development and irrigation has accounted for 47 per cent of the entire second Plan outlay in the State, this is a pretty disappointing performance. The increase in irrigated area (net) from 3.1 million acres in 1955 to 3.6 million acres should, of course, have contributed to such increase in agricultural production as had taken place. But, at the same time, the decrease in the area irrigated more than once from 0.7 million acres in 1955 to 0.5 million acres in 1959 seems to have been responsible for slowing down the increase in production. If the availability of irrigation facilities has not led to an increase in double cropping, it is something surprising and hard to explain. It is the extension of cultivation to some 3 million acres of marginal land under the stimulus of higher agricultural prices, rather than the irrigation factor, that seems to have accounted for the larger part of the increase (whatever the percentage) in foodgrains production. In this connection, a reference may be made to the report's claim that, during the second Plan period, 42,000 wells were constructed and 30,000 wells deepened. If so much construction activity had really taken place, how is it that the area irrigated by wells came down from 2.0 million acres in 1955 to 1.9 million acres in 1959? But for the increase in the acreage irrigated by canals and tanks, the state of affairs in agriculture would have been worse.

To consider the next major head, namely, "power." Here the State's second Plan outlay has been to the tune of Rs. 15.1 crores. Thanks to this outlay, the aggregate installed capacity increased from 109,000 kw. in 1955-56 to 125,100 kw. in 1960-61 and the total power generation from 70 million kw.h. in 1955 to 105 million kw.h. in 1960. All this was reflected in an increase in the amount of electricity sold to ultimate consumers from 50 million kw.h. in 1955 to 85 million kw.h. in 1960. But in spite of this increase, industrial consumption of power in 1960 accounted only for about a third of the entire power consumption, that is, same as in 1955. This is a telling indicator of the industrial backwardness of the State, as compared with all-India where industrial consumption of power accounts for about two-thirds.

The State's industrial backwardness is clear enough even otherwise, for it has very few large-scale industries. From the point of view of growth in production, some of them do not seem to have prospered during the second Plan period, while some others have fared well. The following figures of industrial production are given in this context:

Industry	Unit	Production in 1956	Production in 1960
Mill cloth	Lakh yds.	612	527
Mill yarn	Lakh lbs.	338	308
Cement	Lakh tons	5.3	9.5
Glass	Tons	810	672
Salt	Lakh tons	2.9	2.8
Sugar	'000 tons	17.7	12.1 (1959)
Electric meters	'000 Nos	32.4	134.5

(One lakh = 100,000)

It will be seen from the above figures that, as of 1960, production in the State has actually declined in cotton textiles, glass, salt and sugar industries. That no substantial industrial expansion has taken place in the private sector except in the cement and electrical industries could also be inferred. This can only be described as unfortunate. But there is no gainsaying that the State has potentialities for large-scale industrial and mineral development. The progress report has the following to say on these potentialities:

"Rajasthan is rich in raw materials needed for industrial development, abounds in mineral resources and is well known for the superiority of its entrepreneurial ability. A large number of industrialists of the country hails from this State. About one-third of the raw wool of the country is produced in Rajasthan. It is the only producer of lead-zinc in the country. Also 92 per cent of the total production of gypsum in India is produced in Rajasthan. Among the other major minerals produced in the State mention may be made of fullers' earth, glass-sand, lignite, mica, manganese, iron ore, marble and soap stone. About 25 per cent of the mica production of the country is from Rajasthan which is also rich in beryl supplies—a strategic mineral used in atomic fission."

Even mineral production in the State during the second Plan period was more or less static from year to year. An outlay of Rs. 3.4 crores over the period for "industries and mining" has benefited only small-scale and cottage industries. Roads have accounted for an outlay of just Rs. 10 crores during the period. An increase of 2,750 miles in the State's 1955-56 road mileage of about 14,000 is relatively little. The metalled road mileage has increased by a mere 125 miles during the period. Unless roads are developed on a larger scale and more power is produced, it is difficult to see how entrepreneurs can take advantage of the raw material and mineral resources of the State.

F.B.I. ON EXPORT PROMOTION

THERE is one important lesson that India can draw from the interesting report on export promotion prepared by the working party of the Federation of British Industries, London. It is that the sorely needed tonic for exports must come not from direct incentives but from the indirect influence of appropriate domestic economic policies. Direct incentives such as export subsidies do help greatly in times of emergencies, but they do not constitute an effective solution to the problem of putting a country's export trade on a permanently secure and sound footing. The solution lies in the creation of a climate in which the industry and trade as a whole can flourish. This is a far more important condition than the grant of marginal inducements specifically directed at exports. After all, it is on the level of output, the quality of products and their prices that ultimately depends the competitive capacity of export goods in world markets. Although the Federation does not say so in as many words, it nevertheless makes the point clear that the Government should encourage exporters by creating what it calls "a sound home economy," and, in dealing specifically with exports, act within the framework of normal market processes. Proceeding, the Federation candidly remarks:

"The biggest single factor bearing on the export situation is the Government's general economic policy. Agitation for special incentives to export would lose much of its force, if trade could be carried on in a climate not subject to sudden changes. Each time the country runs into balance of payments difficulties, action is taken on the now familiar lines of protecting the £ sterling by measures designed to restrict internal investment and consumption. These measures inevitably react to the detriment of exports by curtailing the necessary base of domestic trade and increasing the cost of exports.... The time is overdue to find some alternative approach to our chronic economic problems which will strike at the basic causes giving rise to them. The primary solution to the country's problem lies in the achievement of sound and stable policies for the economy as a whole."

The aforesaid remarks, though they are addressed to the Government of a highly developed country, are of equal relevance to this country too. It is true that the official spokesmen often emphasise the urgency of stepping up export promotion efforts, but concrete shape to the various ideas implicit in such statements is yet to be given. So long as the authorities add to the strain caused by rapid economic development by importing ideological considerations into their calculations, there can be no significant nor sustained growth in India's exports in the foreseeable future.

In the sphere of taxation, in particular, there is need for a suitable revision if the export promotion drive is to be really launched on a vigorous scale. In this respect, the principle behind the suggestion made by the Federation of British Industries to the U.K. Government is pertinent for India also. A broadly based system of indirect taxation, the Federation says, affords a more widespread inducement to export than the high purchase tax imposed on a narrow range of goods. This, in turn, permits lower direct taxation and a subsequent reduction in costs. What the F.B.I. means here is that the practice of restraining domestic consumption either through heavy taxation or other forms of restriction in order to find surpluses for export does not pay the country in the long run. Unfortunately, this device is being adopted in India, too, on a wide range of goods. As businessmen in this country have been repeatedly pointing out, a broad-based domestic market is the surest foundation for building up an expanding export trade.

The F.B.I.'s report contains quite a number of other suggestions, many of which are, of course, not suitable to Indian conditions. One of them pertains to tax remission on export profits. It is stated that the disadvantages of this type of incentive heavily outweigh advantages and that none of the signatories to the main G.A.T.T. declaration or the Rome Treaty employ this method for stimulating exports. It is, however, adopted by Japan, Australia and Eire. In the case of a country like India where many industries are new and work on a high cost base, the need for some relief in taxation on export profits cannot be totally denied.

The Federation has found that there is no evidence of lack of credit availability nor of any loss of export orders for this reason. But it has urged extension of facilities for re-financing export bills with the Bank of England whenever shortage of bankers' credit for medium-term exports emerges. It also wants the Government to consider the modification of the E.C.G.D. concept of acceptance of goods by the buyer, in order to enable the E.C.G.D. bankers' policy to become available before shipment. Three other notable suggestions of the F.B.I. are: (1) In order to reduce the cost of credit to exporters, the Bank rate must be lowered and the Government should lessen its reliance on changes in the Bank rate as a means of controlling the economy; (2) the British taxes on earnings of branches and on dividends from subsidiaries abroad should not be wider in scope than those levied by other countries; (3) the Government should improve, in certain directions, the existing Governmental promotional services for export.

It will be seen from the foregoing account that, while the Federation has called upon the Government to adopt appropriate economic policies for making export promotion effective, it has not hesitated to oppose the introduction of Government-financed export incentives, even though the grant of such incentives has been strongly advocated by a section of industry and trade. In this respect, the Federation seems to be in direct conflict with the National Association of British Manufacturers which has been urging the Government for some months past to devise some positive incentives, as, for instance, tax relief to industry in respect of any profits made on export sales. May be, there is, as *The Financial Times*, London, says, nothing very startling in the F.B.I.'s report on export incentives. And may be, the report does not, as *The Economist* avers, contribute much to the wider question of what should be done to give a push to British exports now, nor, indeed, does it dispose of the question of export subsidies for general international use. Nevertheless, the report has impressively highlighted one home truth that the success of exports cannot be separated from the success of the economy as a whole. The report is also very useful for purposes of reference, as it gives a lot of information about fiscal practices and credit arrangements in a number of countries.

MARKET GOSSIP

Post-election Musings

LISTLESS conditions have come to prevail in the share market. The bulls and bears alike are hesitant. Neither side is able to make out clearly the shape of things to come after the new Cabinet is formed. Almost all the leading members of the Union Cabinet have been elected *plus* Mr. T. T. Krishnamachari. Will the third Government of the Republic be more socialist than the second? This is the question on the lips of every one who is interested in the share markets, whether he is a speculator or an investor. All of them are hoping to get a clue from the Cabinet formation. Meanwhile, the success of Mr. Morarji Desai, Union Finance Minister, in the elections for the Lok Sabha has had no perceptible impact on the market. This is rather intriguing and in striking contrast to the setback generated by T.T.K.'s dramatic return to active politics. Apparently, many must be in doubt whether the Prime Minister will let Mr. Desai be the Finance Minister for another term.

Many competent political observers feel that Mr. Nehru may try to push the country towards his socialist goals rather vigorously in the coming five years, as he cannot be sure of getting another chance, that he will interpret the success of Mr. Krishna Menon in North Bombay as a crushing defeat to his opponents who challenged his socialism and foreign policy, and that Mr. U. N. Dhebar's presence in the Lok Sabha will be a source of additional strength to him. It may be noted here that Mr. Dhebar is a great idealist and a believer in such measures as ceiling on incomes, with a view to reducing economic disparity. But the *pundits* in share markets do not seem to be attaching much importance to these interpretations. They are still optimistic enough to nurse the hope that there would be no fundamental changes in the trade, industrial and fiscal policies of the Government, at least this summer.

The Congress Party has lost some strength in the Elections, but it commands a comfortable majority in the Centre and most of the States. Excepting for the defeat of Dr. K. N. Katju, Chief Minister of Madhya Pradesh, the top leaders of the Congress Party who have been holding Ministerial posts in the Centre as well as the States have fared quite well. In contrast, many leaders of opposition parties have lost their seats. The third Lok Sabha will, therefore, be a relatively tame house. The country will very much miss Mr. Asoka Mehta and Acharya Kripalani who were alert and balanced critics of the Government's foreign policies at least and did a lot to focus the people's attention on the danger of communist China in the North and North East. It is now left to such critics as Mr. Mahavir Tyagi within the Congress Party itself to be the watchdogs of the Administration.

Go And Get More Deposits

The necessity for banks to do all they could for gathering more deposits was stressed by Mr. P. C. Bhattacharyya in his address to the shareholders of the State Bank of India as their Chairman on the eve of his joining the Reserve Bank as its Governor. This is a timely reiteration because the ratio of advances to deposits is already high—for most banks it is in the neighbourhood of 70 per cent—and the rate of growth in bank credit is outstripping that of deposits. Almost the entire increase in deposits has been devoted to meet the requirements of the private sector, leaving very little for investment in Government loans. Mr. Bhattacharyya did not exaggerate a bit when he said, in effect, that failure of bank deposits to expand at a faster pace than they did in 1961, which was a year of appreciable growth, would jeopardise the third Plan. He, however, did not say much on the ways and means to be adopted by banks for getting more deposits from the public. The reasons are understandable; as the Governor-elect of the Reserve Bank, he could not have dilated his views on a problem over which there are sharp differences of opinion among banks themselves. The Government, too, may have its own views. Nevertheless, he did make some broad observations. According to him, there is no single solution to the problem. The banks should continue the drive for promoting banking habit in new areas and make a concerted and co-operative effort to increase their deposits. Better customer service and wider coverage of depositors could also be of much help. On the crux of the issue, namely, interest rates on deposits, it is better to quote exactly what he said:

"The question as to the extent to which an increase in interest rates leads to an increase in deposits is very much before the banks at this moment. In my speech last year, I had referred to the fact that, as an experimental measure, the rate of interest on savings bank deposits had been raised by us to see whether this would assist in attracting more deposits from rural and semi-urban areas. I am glad to report that this experiment has shown some good results. The accretion to savings bank deposits during 1961 was of the order of Rs. 3 crores, compared to Rs. 5 crores in 1960, and to an average of about Rs. 2 crores in the earlier years. There is, however, a limit to which deposit rates can be raised, as they have to be in line with the overall structure of interest rates in the country and also take account of the financial position of each individual bank. It is also obvious that a continuous increase in interest rates cannot go on resulting in an increasing growth in deposits. The truth, as usual, lies somewhere in between and ... it is necessary to experiment with interest rates. ..."

By implication, Mr. Bhattacharyya means that the stage of experiment with interest rates is not yet over. It will be quite relevant to remember, in this connection, that interest rates on short-term deposits today are lower than those four years ago, though since then the demand for funds has gone up tremendously. They are also lower than in most of the developed countries where the volume of savings is not lagging behind their requirements as is the case in this country. All bankers are now looking at interest rates only from the point of view of collecting deposits. It would help them to look at the issue in a better perspective, if they attached some importance to interest rate as an instrument for ensuring the efficient use of resources, including capital. The Government, too, must consider this point carefully. It cannot expect to raise funds at a disproportionately lower rate of interest than that paid by others. If banks are to take up a sizable amount of Government loans, the return on them must be sufficiently attractive.

U.K. Repays I.M.F. Credit Further

To those who have been closely watching the fortunes of the pound sterling, the latest repayment by Britain of I.M.F. credit to the tune of £75 million (or $210 million) should cause no surprise. For the pound sterling has of late been ruling extremely steady in the foreign exchange markets of the world. Since the commencement of 1962, it has been standing well above the parity rate of $2.80 per £. In fact, the rate would have even gone above the upper limit of the parity ($2.82) had not the Bank of England been regularly supplying the market with sterling.

The main reason for the firmness of the British pound is the weakening confidence in the U.S. dollar. In fact, reports early in February said that the U.S. balance of payments deficit in the last quarter of last year would have exceeded $1,000 million. This, coupled with the continued outflow of gold from the U.S., sparked off a sharp movement out of dollar into sterling. Although this movement has subsided since then, misgivings about the dollar still persist and, consequently, sterling continues to be preferred to dollar. Other factors, too, have been responsible for the strength of sterling. One is of a seasonal nature. Another is the high level of interest rates in Britain as compared with both the U.S. and Continental countries. In view of the continued flow of funds into Britain, the Bank of England had been steadily acquiring dollars through the market, estimated at £2 million a day, throughout last month. The surplus funds thus acquired have apparently prompted the British authorities to repay a part of the loan taken from the I.M.F. in the past. This action is in keeping with their policy not to embarrass other countries, especially the U.S. But some British commentators point out that this is a very costly policy. For the cost of I.M.F. credit is cheaper than the cost of hot money finding investment in Britain. The best thing to do, according to them, would be to cut the Bank rate which would automatically dry up the flow of hot money. The prevailing Bank rate of 6 per cent is generally considered as too high and not warranted by the economic situation. But the British Government is reluctant to adopt this solution, as it fears that it might be interpreted as a "green signal" for workers to demand more wages and that a substantial part of the gains accumulated through a policy of restraint would be lost and that the efforts now being made for curtailing expenditure and increasing exports would be neutralised. In any case, with the Budget only six weeks ahead, the Chancellor is not expected to make any change in the Bank rate now.

An Abortive Bid?

Judging from the initial response from Courtaulds' shareholders to their Board's four-point counter-plan to defeat I.C.I.'s takeover bid (for details *vide* page 367 of this issue), it looks as though the bid is heading for failure. The new Board of Courtaulds, while advising shareholders to reject the I.C.I.'s share exchange offer, had thoughtfully enclosed a postcard, in each and every letter sent to its 180,000 shareholders, requesting them to return the card duly signed as an indication of their consent to the continued independent existence of the Company. Already about 20 per cent of the holders of equity capital have given their full support to the Board of Courtaulds and there is still time for others to indicate their preference. The initial closing date for the I.C.I.'s share exchange offer is 8th March and the date of the extraordinary meeting of the shareholders of Courtaulds called to approve of the proposed cash distribution to shareholders and the £40 million loan stock issue is 15th March. And there is no reason to suppose that Courtaulds had fired its final shot. In fact, as if to make amends for the ultra-conservative policy of the previous Board, the new Board of Directors, headed by Sir Alan Wilson, has promised important policy changes and has disclosed that fundamental changes were taking place in the Board. Whereas last year, according to Sir Alan, the average age of the four senior members of the Board was 66, the average would come down to 51 later this year: "We are the new men in charge," he said in London last week, and "I can assure you that we shall take a very different policy."

It is, therefore, evident that the I.C.I. could not hope to obtain the 90 per cent acceptance of its offer for it to proceed with the merger. Meanwhile, the Courtaulds Board has announced that it will go ahead with its loan stock and cash distribution plan irrespective of the level of acceptance received by the I.C.I. Knowledgeable quarters in London think that, if the I.C.I. wins a majority holding and Courtaulds Board insists on going ahead with its plan of capitalisation and cash distribution, a Court action would be inevitable. For I.C.I. would not be able to vote on the shares it might have acquired by that time, because it would not be the registered holder and there would not be sufficient time to obtain proxies from the acceptors. The only way it could prevent Courtaulds from proceeding further with its plan would be, it is said, through legal action. The whole issue thus shows signs of getting more and more complicated. Whatever be the future course of the battle, management circles in Britain have not viewed with favour this unseemly wrangle between two giants of British industry.

Barium Chemicals Ltd.

By the end of this year, a new factory at Kothagudam near Dornakal in Andhra Pradesh will begin manufacturing all types of barium compounds and inorganic chemicals, if everything goes well according to the plans drawn up by the promoters. The factory will be put up by the Barium Chemicals Ltd., a new company floated at New Delhi with an authorised capital of Rs. 1 crore, of which the Company is issuing Rs. 50 lakhs in equities. The promoters, directors and their friends have already taken up shares worth Rs. 10 lakhs, and the balance of Rs. 40 lakhs (in equity shares of Rs. 100 each at par) will be offered to the public; the list is due to open for subscription on Friday the 9th inst.

The Company's project has many attractive features. In the first place, the various barium salts, carbonate, sulphide, nitrate, etc., produced by the factory will have an assured market. It is stated that the barium salts are essential for more than 70 industries such as caustic soda, rayon, paints, textiles, x-ray screens, photographic paper, fine crackers, explosives and pyrotechnics. The margin of profit is expected to be quite handsome, considering that (*a*) the production costs will be one-third of those in the U.K., (*b*) the current selling prices in India include a premium of 150 to 400 per cent over the landed costs of imported products, and (*c*) the average costs of prime products (barium sulphide and barium carbonate) and by-product (sulphur) will be about 20-25 per cent below the landed costs. What is more, the foreign technical collaborators, the well-known U.K. firm of Messrs. L. A. Mitchell Ltd. (Manchester) have guaranteed the quality of barium chemicals to B.S.S. requirements, as well as the cost structure and performance of the plant and machinery. Further, the location of the factory commands excellent facilities from the point of view of raw material (barytes and coal) supplies, power, water and railway connection.

The proposed plant will have a capacity to produce annually 2,250 tons of blanc fixe (pigment quality), 450 tons of barium chloride (technical quality), 25 tons of barium chloride (B.P. quality), 25 tons of barium sulphate (B.P. quality), 1,100 tons of barium nitrate, 600 tons of barium carbonate and 100 tons of barium hydroxide. In addition, it is expected that 1,600 tons of barium sulphide (black ash) and 600 tons of sulphur will be recovered annually as by-products.

British Steel Prices Increased

The controversy that has been going on in the United Kingdom over the pricing formula governing steel has just been resolved, following the Iron and Steel Board's decision to increase the prices of British steel by an average of 2½ per cent or 25 shillings a ton with effect from 26th February 1962. It is estimated that, if the increase is applied to the whole trade, the extra cost could come to £21.22 million a year, of which British steel users will pay £16.17 million. The average increase of 25s. a ton conceals wide variations as between different types of steel. For instance, sheet steel, the British prices of which are still below Continental prices, has been granted a price increase of 5½ per cent or 60s. a ton. Billets, re-rolled products and hot rolled strip, on the other hand, have been accorded a price increase of one per cent or 7s. 6d. a ton. The present average increase of 2½ per cent, it is said, broadly means that the overall level of British steel prices will become very similar to those in the Common Market.

The most significant feature of the latest price increase is that it is based on the expectation of a fall in the average rate of working in the British steel industry from 90 per cent (which has hitherto been taken as the yardstick for purposes of price fixation) to 84 per cent of capacity over the period 1962-64. But it does not allow for any change in the expected profit margins of the industry. These margins are likely to be higher, if all the obsolescent capacity (2½ million tons) in the industry is withdrawn from production, for then the industry will in fact be operating at about 88 per cent of capacity. But they will be lower if the obsolescent capacity is not withdrawn, for then the industry will be working only at 81 per cent of capacity. Since the Board's assumption is that the obsolescent capacity will be withdrawn from production by 1965, the industry is expected to complete its process of modernisation. It is clear that the Board is aiming at more efficient production by forcing out obsolete plant. When this takes place, the British steel industry will be in a better position to face intensified and extended competition in the event of the U.K.'s entry into the Common Market.

For us in India, the steel price increase in Britain is of more than academic interest. Depending on the types of steel products imported or used in imported equipment, the incidence of the price increase will be felt by this country to varying extent. Both development and maintenance imports of steel from Britain will thus cost more to some extent.

EQUITIES SUBDUED

VALUES, HOWEVER, RECOVER TOWARDS CLOSE

(From Our Own Correspondents)

BOMBAY, 1st *March*

EQUITIES on the Stock Exchange were distinctly subdued during the major part of the week under review. Operators were not inclined to extend their commitments, as they preferred to await the composition of the new Union Cabinet. The load of Mr. Krishna Menon over his chief rival in the North Bombay Parliamentary constituency election had a bearish impact on the market in that Mr. Menon's victory was regarded as a triumph for the left wing in the Cabinet and it was apprehended that aggressive socialist policies would be pursued with renewed vigour. Such apprehensions led to bull liquidation and bear pressure resulting in an all-round decline in prices, with the exception of a few select counters which tended to move up on investment support. Even encouraging corporate news in the form of quite a few bonus and right issues and expectations of more was not of much avail. Some recovery was no doubt in evidence today, thanks to selective buying and a part of the earlier losses was made up. Nevertheless, the closing rates for most scrips were well below those at the end of last week; only a few scrips, especially in the cash list, showed net gains over the week.

Two shares, namely, Apollo Mills and B.B. Petroleum, attracted interim margins during the week but for opposite reasons. Thus, the former attracted a margin at the rate of 9 nP per share on account of a fall (on Monday) of more than 5 per cent in its price from its interim *havala* rate, while the latter attracted margin at the rate of 7 nP per share on Friday, following the rise of more than ten per cent in its price over the previous clearing rate.

Steel shares encountered selling. Tata Steels moved down from Rs. 141.25 to Rs. 139.75 and, after recovering to Rs. 140.50, finished at that rate The net loss over the week was 75 nP. Indian Irons began at Rs. 25.30, as against the previous close of Rs. 25.40, and eased to Rs. 24.92 yesterday. They, however, rose to Rs. 25.10 today. The net loss was 30 nP. Mukand Irons declined from Rs. 28 to Rs. 27.50 before finishing at Rs. 27.60, showing a net loss of 40 nP.

Barring a few select scrips which registered gains, textile shares, too, drifted downward. Standards fell by Rs. 10 to Rs. 1,225. Swans declined by Rs. 15 to Rs. 435. Finlays dropped Rs. 10 to Rs. 380. Gokaks eased by Rs. 7.50 to Rs. 220.50. Khataus Rs. 5 to Rs. 475 and Phœnix by Rs. 9 to Rs. 265. Minervas receded by Rs. 6 to Rs. 80. B.R. Cottons lost a like amount to Rs. 84. Central Indias were done Rs. 4 lower at Rs. 145.50. Tata Mills softened by Rs. 2.70 to Rs. 79. Dawns shed Rs. 2.50 to Rs. 161.50. Mafatlal Fines in the cash list were marked down by Rs. 45 to Rs. 1,075. Bombay Dyeings, however, attracted some support and rose from Rs. 70.50 to Rs. 71 before finishing at Rs. 70.70 today. Centurys began the week at Rs. 617, as against the previous close of Rs. 616, and firmed up to Rs. 630 on Saturday. In subsequent sessions, they came in for selling and fell to Rs. 620.50 today. Simplex were done at Rs. 175, as against Rs. 174 last week-end.

Sugar shares were depressed. Belapurs opened at Rs. 235 and, after rising to Rs. 236, receded to Rs. 232 today, showing a net loss of Rs. 3 over the week. Walchandnagars eased by Rs. 1.50 to Rs. 152. Phaltans shed 50 nP to Rs. 114. Maharashtra Sugars, however, rose from Rs. 165 to Rs. 165.50.

Cement shares ruled fully steady. A.C.Cs opened at Rs. 152.50, 25 nP lower than the previous close, and, after fluctuating between Rs. 152 and Rs. 153, finished at Rs. 153. Orissa Cements gathered 40 nP to Rs. 19.92. Digvijays were unchanged at Rs. 204.

Shipping shares lacked buyers. Scindias lost 12 nP to Rs. 12.48. Great Easterns shed 8 nP to Rs. 12.56. In the automobile section, Premier Automobiles suffered a fall of Rs. 4.75, today's closing rate being Rs. 136. Hindustan Motors, on the other hand, picked up 28 nP to Rs. 21.

Rayon shares drifted lower. National Rayons retreated from Rs. 545 to Rs. 538.50 today, though the closing rate was markedly higher at Rs. 543.50. Baroda Rayons were subjected to selling and eased by Rs. 2.50 to Rs. 151. Gwalior Rayons and Indian Rayons shed Re. 1 each to Rs. 54 and Rs. 97, respectively. South India Viscoses dropped Rs. 4 to Rs. 188.

Chemical shares were no exception to the general trend. Amar Dyes slumped by Rs. 15 to Rs. 355. Indian Dyestuffs declined by Rs. 10 to Rs. 251.25. Foly Chems eased by Rs. 7.50 to Rs. 227.50. Colour Chems reacted by Rs. 12.50 to Rs. 490. Dharamsis softened by Rs. 2.50 to Rs. 173.75.

Engineering shares presented a mixed pattern. T.E.L.Cos. opened at Rs. 359.50 and, after improving to Rs. 362, reacted to Rs. 356.50. The closing was, however, Rs. 3 higher. Alcock Ashdowns slumped by Rs. 19 to Rs. 349. The Directors of the Company have decided to issue 9,536 right shares of Rs. 100 each at par in the ratio of two shares for every nine held. Greaves Cottons eased by Rs. 3 to Rs. 204.50, Larsen and Toubros by 75 nP to Rs. 42.50 and Texmacos by 44 nP to Rs. 20.56. Premier Constructions were dull at Rs. 192.50 as also New Standard Engineerings at Rs. 223.50. Cooper Engineerings, however, were well favoured and taken up by Rs. 4.50 to Rs. 187.50. T. Manekjals also attracted some support and improved by Rs. 11 to Rs. 890. Kamanis too were better by 48 nP at Rs. 17.

Among miscellaneous industrials, Bombay Burmahs opened lower at Rs. 649, as against the previous close of Rs. 650.50, and, after rising to Rs. 659.50 in early dealings, reacted to Rs. 638 today. At this level, some covering business took place and the scrip improved to finish at Rs. 645, a net loss of Rs. 5.50 over the week. Voltas were marked down by Rs. 7 to Rs. 297. West Coast Papers eased by Rs. 5.50 to Rs. 170. Wimcos shed a rupee to Rs. 312. Premier Tyres lost Rs. 2.50 to Rs. 150 and Anil Hardboards Rs. 10 to Rs. 230. Hind Cycles softened by a rupee to Rs. 113. Hindustan Levers were neglected at Rs. 68. Ceat Tyres (Old), however, improved by Rs. 5 to Rs. 207.50, the new shares advancing by Rs. 10 to Rs. 198.25.

* * * *

Calcutta Stock Exchange

CALCUTTA, *28th February*

Good corporate news, assisted by expectations of more bonus issues before the Central Budget and hopes of Government sanction for diversification and/or expansion in some industries, led to steady trading conditions on the Stock Exchange during the week under review. Sellers of scrips in the more popular counters were difficult to be found, though it was thought that much of the recent change of hands had been motivated by speculative fervour rather than on investment account. This was evident in the profit-taking that took place in several new scrips, which had risen impressively in recent weeks. Investors preferred to proceed cautiously, since election results so far announced have shown that several constituencies which had previously returned leftist candidates have now voted the Congress by a comfortable majority. Although this cannot be interpreted as denoting public sanction for a further dose of socialism, investors have not failed to take note of the election speeches of prominent Congressmen, including Mr. Nehru, which made no mistake about the Party's views. There was also the opinion, at the same time, in market circles that the Congress would not adopt any hasty measures which might disturb the existing well-balanced economy. The special interest shown to cotton textiles was the result of hopes regarding increased exports following the Geneva recommendation that no country would add to existing restrictions on imports of cotton textiles. Jutes made further headway on revival of foreign demand for heavy goods. The dissatisfaction in the amended range of coal prices, which, it was apprehended, would not compensate collieries for the increased royalty was reflected in coals idling around previous levels. While sugars were dull, paper mills were about steady.

Among cottons, Jayshrees were a strong feature following interested buying and rose from Rs 17.12 to Rs. 18.06. J.Ks. were firmer at Rs. 21.75, with Bharat Commerce changing hands at Rs. 31, as against Rs. 29.19 previously. Both Bowreahs and Dunbars were fractionally lower at Rs. 39 and Rs. 35.37, respectively.

Coals lacked support. South Karanpuras fell from Rs. 7.69 to Rs. 7.25, while Burrakurs hardened from Rs. 17.81 to Rs. 18.12 on replacement buying. New Beerbhooms at Rs. 21.62 recorded a small gain, but Dhemo Mains were pushed down from Rs. 6.94 to Rs. 6. Equitables were quiet at Rs. 27.25, Raneegunges being unchanged at Rs. 15. Earlier in the week, East Indians met with interested support to raise the rate from Rs. 34.25 to Rs. 35.12.

Jutes met with good support. At Rs. 147 Baranagores bagged Rs. 8. Fort Glosters gained two points to Rs. 423. Cheviots rose by Rs. 2.44 to Rs. 20.81, with Deltas at Rs. 170 scoring three points. Budge Budges were pushed up five points to Rs. 137. Ballys were better at Rs. 282. Northbrooks were quoted higher at Rs. 34.50, as were Ganges at Rs. 13.87, while New Centrals at Rs. 18.19 conceded nearly a point to recover to Rs. 18.56. Lawrences were lowered by two points to Rs. 165. Megnas put on 37 nP at Rs. 12.81, while Dalhousies receded by Rs. 2 to Rs. 131. Indias were unaltered at Rs. 16.62. Nuddeas receding by 50 nP at Rs. 66.50.

Engineerings evoked increased support. Under the impetus of bonus rumours, Guest, Keen, Williams recorded a further gain to Rs. 46.12. Indian Standard Wagons recovered from Rs. 143 to Rs. 146 and scored to Rs. 169 on bonus anticipations. Jessop & Cos. were steady at Rs. 23.37, while Braithwaites eased from Rs. 50 to Rs. 48.75. Kumardhubis enjoyed good support at the improved rate of Rs. 8.44. Indian Irons opened at Rs. 25.54 and receded to Rs. 24.84 on renewed selling to close at Rs. 24.92. Texmacos were lower on balance at Rs. 20.70.

Among paper mills, Titaghurs were firm at Rs. 43. India Pulps hardened from Rs. 17.62 to Rs. 19.31 while Bengals receded from Rs. 107 to Rs. 106. Orients were maintained at Rs. 41.80, but Shree Gopals moved down from Rs. 26.19 to Rs. 25.44.

Miscellaneous industrials accounted for several features. Bonus rumours attracted attention to Indian Coppers, which steadily rose from Rs. 5 to Rs. 5.12. Rallis rallied support to recover from Rs. 145 to Rs. 154.00. National Cables were difficult to be located, in view of the imminent bonus issue and the quotation was fully steady at Rs. 44.37. Orissa Cements were unchanged at Rs. 19.50. Dunlop Rubbers were subjected to profit-taking and fell from Rs. 43.30 to Rs. 42.75. For the same reason, Kesoram Industries were lower at Rs. 34.12, but Indian Cables at Rs. 37.94 recorded a small gain to ease to Rs. 37.37. Indian Aluminiums at Rs. 39 lost Re. 1.12. Hindustan Motors were quiet at Rs. 20.56. B.I. Corporations came down from Rs. 12.44 to Rs. 11.31 on profit-taking, while Metal Corporations were better at Rs. 12.81.

* * * *

Madras Stock Exchange

MADRAS, *28th February*

The Stock Exchange ruled easy during the week under review, with the exception of textiles which met with persistent buying support and tended to move up further. The easiness was due to paucity of buyers, in view of tight money conditions. Several operators were also stated to have utilised quite a bit of the funds available to buy scrips in other markets on prospects of bonus and right issues, as well as hopes of higher profits. Plantation shares encountered selling and drifted downward. Sugars lacked support. Miscellaneous industrials ruled dull.

In the textile section, Lakshmis spurted by Rs. 3 to Rs. 170. Bangalore Woollens rose by a like amount to Rs. 245. Dhanalaxmis improved by Re. 1.50 to Rs. 262.50. The dividend for the year 1961 has been maintained at the previous year's level of 17½ per cent (subject to tax). Cannanoors picked up a rupee to Rs. 172. South India Viscose and Coimbatore Spinnings gathered 50 nP each, the former to Rs. 190 and the latter to Rs. 83.50. Buckinghams were firm at Rs. 362.50, as against Rs. 262. Maduras gathered 10 nP to Rs. 40.60 and Travancore Rayons 5 nP to Rs. 43.30.

Sugars were dull, Mysores being unchanged at Rs. 53.40, United Breweries at Rs. 82.25 and Cauverys at Rs. 106. Travancores declined by 40 nP to Rs. 7.60. East India Distilleries lost 25 nP to Rs. 36.25. Indias shed 10 nP to Rs. 10.30.

Among tea shares, Peermades and United Nilgiris eased by 50 nP each to Rs. 21.50 and Rs. 21.25 respectively. Highlands receded by 20 nP to Rs. 13.20. Kil Kotagiris lost 10 nP to Rs. 5.15. Chembras declined from Rs. 3.68 to Rs. 3.65. Blue Mountains were neglected at Rs. 2.81. In the coffees group, Coffee Lands climbed down by 75 nP to Rs. 14.75. Consolidated Coffees were lower by 13 nP to Rs. 17.62. Cowcoodys lost 10 nP to Rs. 3.95. Among rubbers, Vaikundams were neglected at Rs. 32.75. The Directors of the Company have declared a final dividend of 15 per cent making the total of 30 per cent (taxable) for the year ended 31st December 1961, same as that distributed in the previous year. Travancores were quiet at Rs. 13.12.

A drop of Rs. 7 to Rs. 208 in the quotation for Western India Plywoods was the feature of trading in the miscellaneous section. Mettur Chemicals fell by Re. 1.43 to Rs. 13.32 ex-right. Indian Standard Rollings lost 13 nP to Rs. 11.87. Tube Investments were subdued at Rs. 282. Textools, however, put on 50 nP to Rs. 189.50. Standard Motors gained a like amount to Rs. 18.70. Dalmia Cements gathered 20 nP to Rs. 13.30. Aluminium Industries were better by 25 nP at Rs. 24.25.

INVESTORS' CHART

The Investors' Chart published by Mr. Mukund Guruji (273, Mapla Mahal, Girgaum Road, Bombay-1. Price: Rs. 6, exclusive of postage) shows the highest and lowest quotations (weekly) for 16 active scrips traded on the Bombay Stock Exchange, as well as rates for the 2 per cent Government conversion loan 1986, during the period from 1st January 1957 to 10th February 1962. The scrips included are Tata Steel, Indian Iron, Bombay Dyeing, Kohinoor, Century, A.C.C., Central Bank, Scindia, Tata Chemicals, Hindustan Motors, National Rayon, Voltas, Tata Locomotive, Bombay Burmah, Premier Construction and Belapur. The chart is well displayed by the use of different, appealing colours, with peak and bottom prices clearly recorded.

STATE BANK OF PATIALA

After providing for taxation and necessary provisions, the net profit of the State Bank of Patiala for the year 1961 amounts to Rs. 3.31 lakhs, the total income being placed at Rs. 53.71 lakhs. Together with the Rs. 50,820 brought forward from the previous year, the amount available for appropriation comes to Rs. 5.82 lakhs. A sum of Rs. 1.10 lakh has been allocated to the reserve fund and bonus to staff takes Rs. 2.04 lakhs. The proposed dividend at 6 per cent (subject to tax) absorbs Rs. 2.10 lakhs, leaving Rs. 57,720 to be carried forward.

NEWS IN BRIEF

THE military and defence taxes on certain categories of people in Goa imposed by the Portuguese regime in Goa have been abolished.

The Shipping Corporation of India has acquired a 13,460-ton Swedish-built cargo ship, bringing the total number of ships owned to 20 with an aggregate 148,600 tons.

The Bonus Commission will meet in Bombay on the 6th and 7th inst. to finalise the questionnaire to be issued for eliciting the views of industry and labour.

The Government of India has entered into an agreement with the Pakistan Industrial Development Corporation for the import of 150,000 tons of high quality gypsum required by the Sindri fertiliser plant.

The *Bharat Krishak Samaj*, a national organisation of farmers, will set up four commodity councils to study the problems of production, grading and marketing faced by cash crop growers. The Council will make recommendations on improving production of cotton, sugar, jute and fruit crops with a view to earning foreign exchange.

An official Indian delegation led by Mr. B. M. Adarkar, Joint Secretary, Ministry of Commerce and Industry, is scheduled to leave for Rangoon on the 13th inst. for discussion on trade matters with the Government of Burma. The trade agreement between India and Burma has already expired.

The cotton textile mills' production during the month of January 1962 is provisionally placed at 73 million kgs. of cotton yarn and 399 million metres of cotton cloth. At the end of the month, the composite mills held an estimated stock of 156,000 metric bales of cloth as unsold and 191,000 metric bales as sold but not lifted.

Oil India Ltd. is claimed to be capable of producing slightly over two million metric tonnes of oil per annum from the wells already drilled and tested. It expects to complete a minimum of 40 more wells by the middle of 1963 in order to meet its commitments of supplying crude to the public sector refineries at Nunmati and Barauni. So far, it has completed drilling in 122 wells in Naharkatiya and Hoogrijan and 17 in Morgan.

A socio-economic survey of Bhilai has just been completed by a committee consisting of the representatives of the Reserve Bank, Gokhale Institute of Economics, Poona, Directorate of Statistics and Economics, Madhya Pradesh, Central Ministries of Commerce and Industry, Finance and Steel, Planning Commission and experts like Dr. V. K. R. V. Rao and Mr. M. N. Shah. The report is expected to be finalised within two months.

The sixteenth annual general meeting of the Indian Confectionery Manufacturers Association, Calcutta, will be held on Friday the 23rd inst. at New Delhi. Mr. A. L. Goenka, President of the Association, will preside over the meeting. Besides a review of the important developments in the confectionery industry during the outgoing year, the meeting will also take up for consideration certain important resolutions having a vital bearing on the future development of the confectionery industry.

A contract for the supply and installation of a complete iron-ore sintering plant at Rourkela has been signed by the representatives of the Hindustan Steel and the Koppers Export of West Germany. The plant will be a German-American venture with a rated capacity of 4,000 tons of sound blast furnace quality sinter per day. The total cost, including the civil works, is estimated at Rs. 4.16 crores, of which the foreign exchange component is put at Rs. 2.58 crores. The plant is scheduled to go into operation early in 1964.

The Union Government is making a detailed study of the production capacity of workshops, both in the private and public sectors, which are supplying major items of equipment required for irrigation and power projects in the country. These items, *inter alia*, include gates, hoists, penstocks, tubing, gantry cranes and transmission line towers, some of which are at present imported. The study group will also draw up a phased programme, in the context of the needs of irrigation and power projects in the third Plan, with necessary financial implications, particularly in terms of foreign exchange, for manufacture of items, presently imported, to the extent to which indigenous capacity can replace them. It will also give recommendations on the balancing machinery to be installed in selected public works departments and irrigation and power workshops in the States, so that these might be equipped for the manufacture of items of machinery for which they are best fitted. Further, it will study what type of additional design and testing facilities should be provided for transmission towers and ancillary equipment. The report of the study group is expected to be ready in April 1962.

* * * *

From Abroad

Under a barter deal concluded at Cairo, Egypt will export £2 million worth of cotton yarn and textiles to the U.S. in exchange for 60,000 R.C.A. television sets.

Malaya has banned all imports of sugar with effect from 22nd February. Only imports against specific Government licences will be allowed. This move is a sequel to official investigation which revealed that price cutting by certain exporting countries had led to "undesirable instability" in the local sugar market.

The Governments of Japan and Soviet Russia have signed a trade agreement under which Japan will supply two liquid gas carriers, ten floating cranes, other machinery, steel products, textiles, chemicals and other goods in exchange for 2.4 million tons of crude and heavy oil, manganese, pig iron, chemicals and machinery from Russia. The total value of trade is estimated at $225 million.

Japan has agreed to grant a credit of $13 million to Pakistan for importing textile machinery. The credit is in addition to the $25 million provided through the World Bank consortium. The Pakistan Government has already sanctioned the establishment of seven textile mills in East Pakistan and three in West Pakistan. These units will be financed out of the new Japanese credit.

Sweden's total production of finished steel increased by 239,000 tons to 2,424,000 tons in 1961. Output of crude steel is placed at 3.56 million tons. While exports of finished steel rose by 109,000 tons to 640,000 tons, imports were down by 134,000 tons to 1,001,000 tons. Total supply of finished steel on the Swedish market remained practically unchanged at 2,785,000 tons. Exports of iron ore showed an increase of 469,000 tons, reaching a total of 20.3 million tons.

France has agreed to buy 1.1 million tons of petroleum products (half crude and half refined) from Soviet Russia in the current calendar year under the new protocol governing trade between the two countries. The French import quotas under this protocol also include non-ferrous metals, furs, caviar and flower seeds, while Russia will buy, among others, machinery, man-made fibres and cars from France. The value of Franco-Soviet trade during 1961 amounted to NF 450 million in each direction.

Australia has completed the sale on credit of another 600,000 tons of wheat to China which thus becomes the largest buyer of Australian wheat for the second successive year. It is Australia's third wheat transaction with China. The sale has been made at satisfactory prices on terms of 10 per cent deposit, a further 40 per cent in six months and full payment within twelve months. The sale will involve shipment of about 24 million bushels between March and May. The previous sales were reported to be worth a total of £A54 million.

An agreement to set up a £10-million oil refinery at Umrali in Rhodesia has been signed by the Federal Government of Rhodesia with six oil companies, namely, Shell, British Petroleum, Vacuum, Caltex, Total, American Independent Oil and Kuwait National Petroleum. The participating companies are committed to spend a total of about £250,000 on the construction of the refinery. A team of officials and representatives of these companies is now in Mozambique to negotiate for a pipeline concession which will enable crude oil to be carried at 785*d.* per ton.

PERSONAL

MR. B. C. Biyani has been re-elected President of the Calcutta Tea Merchants' Association for the current year.

Mr. K. Sankaran, former Chief Justice of Kerala High Court, has been appointed Chairman of the Railway Rates Tribunal at Madras.

Mr. Madanmohan R. Ruia and Mr. Ramdas Kilachand have been elected President and Vice-President, respectively, of the East India Cotton Association, for the current year.

Mr. B. K. Kaul, I.C.S., until recently Joint-Secretary in the Department of Economic Affairs, Union Ministry of Finance, has assumed charge as Chairman of the Life Insurance Corporation of India *vice* Mr. P. A. Gopalkrishnan, I.C.S.

Mr. N. K. Karanja, who has been the General Manager of the Central Bank of India Ltd. since 1955, has been appointed Managing Director of the Bank, in recognition of his long and meritorious services to the institution for over forty years.

Mr. B. Venkatappiah, Deputy Governor, Reserve Bank of India, has taken over charge as Chairman of the State Bank of India from Mr. P. C. Bhattacharyya, who has succeeded Mr. H. V. R. Iengar as Governor of the Reserve Bank of India, with effect from 1st March 1962.

Mr. Jaikrishna Harivallabhdas, a leading industrialist of Ahmedabad, has been elected Chairman of the Gujarat State Fertilisers Company Ltd. Mr. Fredrick J. Hiredia, Deputy Secretary for Industries, has been elected the Managing Director of the Company.

Mr. Michael R. Bonavia, a British expert in transport economics, has arrived in New Delhi to assist the Planning Commission's Committee on Transport Policy and Co-ordination in its work. His services have been made available by the British Government under the Colombo Plan.

Mr. Hermann J. Abs (Director, Deutsche Bank A.G., Frankfurt), The Viscount Harcourt (Managing Director, Morgan Grenfell and Company, London), Mr. Andre Meyer (Senior Partner, Lazard Freres and Company, New York), Baron Guy de Rothschild (a partner in de Rothschild Freres of Paris) and Mr. George D. Woods (Chairman of the Board of Directors of the First Boston Corporation of New York), five prominent international investment bankers, have agreed to serve as Advisers to the International Finance Corporation. These bankers will meet periodically with Mr. Eugene R. Black and officers of the Corporation to review the investments and investment policies. They will also be available for individual consultation on investment opportunities or problems. They will serve without compensation.

The following is a Statement of Ownership and other particulars about "Commerce," Bombay, as required under Rule 8 of the Registration of Newspapers (Central) Rules 1956.

FORM IV

1.	Place of Publication	"Brady House," Veer Nariman Road, Fort, Bombay
2.	Periodicity of Publication	Weekly
3.	Printer's Name	Mr. John Middleton
	Nationality	British
	Address	Brady's Flats, Block No. 6, Flat No. 6, Sohrab Bharucha Road, Fort, Bombay 1
4.	Publisher's Name	Mr. Jamshed Dinshah Kapadia, For the Proprietors "Commerce" (1935) Ltd.
	Nationality	Indian
	Address	57, New Marine Lines, Bombay
5.	Editor's Name	Mr. Subramanya Venkata Rayan
	Nationality	Indian
	Address	4, Narasingha Bhuvan, Brahmanwada Road, Matunga, Bombay 19

6. Names and addresses of shareholders holding more than one per cent. of the total capital:

Messrs. W. H. Brady & Co., Ltd., 12/14, Veer Nariman Road, Bombay.

AN UNWARRANTED STRIKE

"UNWARRANTED" is the only correct term to describe the strike by the Bombay Dock and harbour flotilla crew, which has paralysed activity in the Bombay harbour for over three days now. The strike has been called by the Bombay Port Trust General Workers' Union to back the demand for weightage for night work in the form of additional payment known as "night coefficient allowance." The point at dispute is not whether night coefficient should be paid for workers on continuous work (this has been accepted in principle by the Port Trust Authority) but whether the flotilla crew is entitled to it. The B.P.T. General Workers' Union does not apparently want the flotilla crew to be considered as intermittent workers but as continuous workers. The Port Trust Authority, however, has refused to grant the demand of the Union for immediate payment of "night coefficient allowance," pending the report of the Inter-Ports Committee which is studying the question. Since flotilla crew in all ports are equally affected, the Bombay Port Trust Authority was right in postponing a decision pending the recommendation of the Committee which is expected by 21st March.

Whether the work of flotilla crew is a continuous job or an intermittent one is a technical question, best left to the Committee to decide. The B.P.T. General Workers' Union was, therefore, ill-advised to incite the workers to strike on the apprehension that the Committee's verdict might go against them. It is significant that the Union has refused to be persuaded by either Mr. Abid Ali, Union Deputy Minister for Labour, or Mr. O. Venkatachalam, Deputy Chief Labour Commissioner to the Government of India, not to take the drastic step until all other avenues of settlement have been explored. It is a sad commentary on the leadership of the Union that it has, with scant respect for the machinery for the settlement of disputes that exists both at the Centre and in the States and ignoring the restraint enjoined on all parties by the Code of Discipline, has plunged the workers headlong into a full-fledged strike, which has resulted in fifteen ships being detained in mid-stream and at least 10 ships being "shut in" at the berths.

What is more disquieting is the threat of the B.P.T. General Workers' Union to spread the strike to other categories of port workers, including those engaged in essential services, thus creating a grave situation. This is sheer intimidation. That the Union has taken an utterly irresponsible attitude is evident from the fact, testified to by Mr. Abid Ali himself, that it did not even inform the Ministry of Labour of its demand nor avail itself of the services of that Wing of the Ministry which has been specially created to help the parties to reach amicable settlement of disputes. The Union has also rejected the suggestion of Mr. Abid Ali to call off the strike, so that talks about the points at dispute could be held in a better atmosphere. Instead, it has insisted that an assurance be given that the flotilla crews' demand would be considered immediately by the Bombay Port Trust. In an issue which concerns workers in ports all over India and, especially, when it is being considered by an appropriate committee, unilateral action by one Authority is undesirable. The action of the Union in precipitating a strike with a view to coercing the Bombay Port Trust Authority into a decision in its favour, without the slightest regard to its serious repercussions on the country's economy, is highly reprehensible.

RESOURCES FOR PRIVATE SECTOR

There is some doubt in industrial circles whether the private sector would be able to mobilise adequate resources for financing its projects under the third Plan. This doubt has found expression in the presidential speech of Mr. Vallabhdas V. Mariwala at the fifty-fourth annual general meeting of the Indian Merchants' Chamber held at Bombay on the 24th February. It may be thought that any such doubt is not quite warranted, for the climate for industrial investment, as evidenced by the index number of prices of various industrial securities, has continued to be favourable. While Mr. Mariwala himself has referred to this favourable factor, he could not ignore, at the same time, the increasing need and demand for funds in the private sector for development. The reappearance of tight-money conditions can be remedied in two ways. One of these would be to make it possible for the commercial banking system and the institutional agencies set up by the Government to provide more industrial finance. And the other would be to rely more on the buoyancy in yields of existing sources of revenue than on new taxation measures. Mr. Mariwala, in this connection, has made out a good case in the following passage of his speech:

"There is a buoyancy apparent in the Government revenues and the yields from excise and customs duties and corporation taxes are much more than what have been anticipated. The Central revenues are known to have increased by Rs. 85.37 crores during the first eight months of the financial year 1961-62 over that in the corresponding period of 1960-61. The additional taxation measures introduced by the Central Government during the current financial year are expected to yield Rs. 83 crores, as compared with the budget estimate of Rs. 57 crores, showing an improvement of Rs. 26 crores. A recent study by the Finance Ministry has shown that actual receipts on account of additional taxation measures in Central excise alone is likely to be Rs. 52 crores, as against the budget estimate of Rs. 28 crores. Thus the aggregate receipts from additional measures of taxation are now placed at Rs. 83 crores. It has always been noticed that there has been a considerable underestimation of revenues from current measures of taxation and, in spite of the additional realisations over the expectations further burdens are being placed."

Mr. Mariwala's related plea is for reviewing the policy pertaining to direct taxation in such a way as to abolish those taxes which are not sufficiently productive but which have an adverse effect on the incentive to save and invest. The Union Finance Minister, Mr. Morarji Desai, has so far been reluctant to do away with the tax on bonus issues (though he saw the necessity to reduce the rate of this tax from 30 to 12½ per cent), the expenditure tax, the personal wealth tax or the gift tax. Experience to date is not quite conclusive on the productivity of some of these taxes or on their effectiveness as devices to plug loopholes in income taxation. Whether Mr. Morarji Desai, if he continues to be at the helm of the Finance Ministry after April next, will order an inquiry into the working of the integrated structure of taxation is a question that can only be posed but cannot be confidently answered now. As there is a stronger case against the proposal—as yet vague—for a ceiling on urban incomes than against the combined incidence, albeit high, of direct taxes, it will not be surprising if business opinion veers round to accepting the latter as the lesser of the two evils.

THE INDUSTRIAL SITUATION

Mr. S. P. Jain's presidential address at the third quarterly general meeting of the Indian Chamber of Commerce held at Calcutta on the 22nd ultimo is notable for its pointed analysis of the current industrial situation. The most disquieting fact of the situation is that the tempo of industrial production in 1961 has slowed down considerably, as compared with 1960. The rate of industrial growth during the first eight months of 1961, for instance, was only 8.3 per cent as against 12 per cent in the corresponding period of 1960. This slower growth trend is disquieting, because, if it is allowed to persist in the early years of the third Plan, it may cause serious shortfalls in the achievement of industrial production targets. If the growth trend is to be quickened, the factors responsible for slowing it down would need to be removed.

Some at least of these retarding factors are already well known. There is, for instance, the factor of transport inadequacy which, according to Mr. Jain, is hampering industrial production and bringing about a crisis in distribution in many regions of the country. In particular, the bottleneck in coal transport has hampered production not only in the coal industry but in other industries depending on coal. Since the second Plan's coal production target of 60 million tons will not be achieved even in the first year of the third Plan, Mr. Jain has uttered the warning that the target of 97 million tons, too, may not be achieved, unless something drastic is done to expand coal production and improve coal transportation. The authorities should heed this warning issued by one more representative organisation of industry.

Another inhibiting factor is the shortage of power. Mr. Jain has urged, in this connection, that some of the power projects should be more expeditiously executed in the earlier years of the third Plan. This will call for an immediate review of the Government's policy in the matter. Unless such a review leads to some positive measures for expanding power generating capacity in the private sector and for encouraging the private electrical industry to undertake the manufacture of some power generating machinery, the shortage in this crucial field is bound to continue. The industrial targets of the third Plan cannot then be fully achieved.

A third factor which threatens to slow down industrial production further and which has again come into the picture is the tight money conditions. As the third Plan envisages a 65 per cent increase in industrial investment, as compared with the second, the demand for funds is bound to increase at every stage of investment and expansion in production. But Mr. Jain has not indicated how the supply of rupee finance for industry can be augmented. However, his plea for revising the price policy pursued by the Tariff Commission and the Government of India is calculated, albeit indirectly, to enhance the industry's ability to accumulate more internal resources as well as to procure more funds from banks and credit institutions. Mr. Jain's observations on this subject are quoted *in extenso* below:

"The policy of the Tariff Commission now affects the growth of major consumer goods industries whose prices are regulated or controlled on the basis of the Tariff Commission formula. The purpose of the Tariff Commission now is to help the development of important consumer and producer goods industries in the country consistent with the interests of the consumer. It is a moot question whether the 'cost plus profit' basis of price fixation pursued by the Tariff Commission helps the achievement of this purpose and objective. In theory as well as in practical implementation, this formula does not help to serve the purpose of development. The policy pursued has not only affected the rate of growth of the industries but also technological progress in the industries. If technological development of our important industries is to be achieved, there needs to be a reorientation in the policy of price fixation. The policy also tends to increase the pressure on the transport facility available at present by the encouragement to concentration of industries in centres where cost of production is cheapest without taking into consideration the transport costs involved which the consumers ultimately pay. The price fixation on the basis of 'cost *plus* profit' either for individual factories or group of factories or industry seems basically unsound, as it gives no incentive for technological improvement but only penalises efficiency. The standard rate of return on capital employed that the formula provides is grossly inadequate and leaves the industry high and dry. The units are not left with enough to pay an adequate return to the investors and to meet the needs of rehabilitation, modernisation and expansion. This is the reason why some of the important industries whose prices are fixed by the Tariff Commission formula have not been able to develop in spite of large industrial licences granted in those fields to attain the targets set for them in the Plan. It is clear also that this policy is bound to affect the growth of industries in the coming years due to the absence of adequate internal resources which were largely the single factor responsible for the rapid development of the industries in the past. This impact of the Tariff Commission's price policy is further intensified by the Government's arbitrary decisions, reducing the prices either for the industry as a whole or for certain units in the industry. With the consequent

thus affected, the industry's ability to procure funds from banks and credit institutions for capital development is also impaired."

The needs of long-term industrial development, according to Mr. Jain, require certain fixed principles of price policy. If such principles are laid down, the different industries will know more clearly where they stand in regard to the scope for expansion. At the same time, the tendency of licensing authorities to encourage the establishment of units of uneconomic size in the name of diffusion of economic power would need to be curbed for the simple reason that such units would inevitably aggravate the high-cost character of our economy.

U.K. AND COMMON MARKET

The two-day Ministerial meeting of Britain and the Common Market, held at Brussels on 22nd and 23rd February, was quite a notable one, for it was at this meeting that the agricultural problems stemming from Britain's application to join the Market received their first broad examination. Each side, we are told, fully and frankly stated its views on all the important and difficult issues at stake. No final decision did, of course, emerge, but the way was prepared for detailed discussions at official level. The discussions will proceed on the basis of a five-point programme agreed upon at the meeting. The programme, which covers all the points brought to the attention of the Common Market Ministers by Mr. Edward Heath and Mr. Christopher Soames, Britain's Lord Privy Seal and Agriculture Minister, respectively, comprise the following:

(1) A study of problems raised by extending the membership of the European Community as it affects the principles on which the Common Market and its farm regulations are based.

(2) An examination of types of guarantees which should be given to, or envisaged for, farmers —special emphasis being placed on farm income levels and on the need to harmonise U.K. agricultural support arrangements with those of the Common Market.

(3) A reappraisal of the length of the transition period over which national policies can be adjusted to the Common Market policy, in order to discover whether special provisions are either necessary or possible for the U.K.

(4) An analysis of the problems, both long and short-term, of Commonwealth producers of temperate foodstuffs.

(5) A survey of the financial arrangements built into the farm policy of the Six; these incorporate a principle of Community responsibility for its farm support programme.

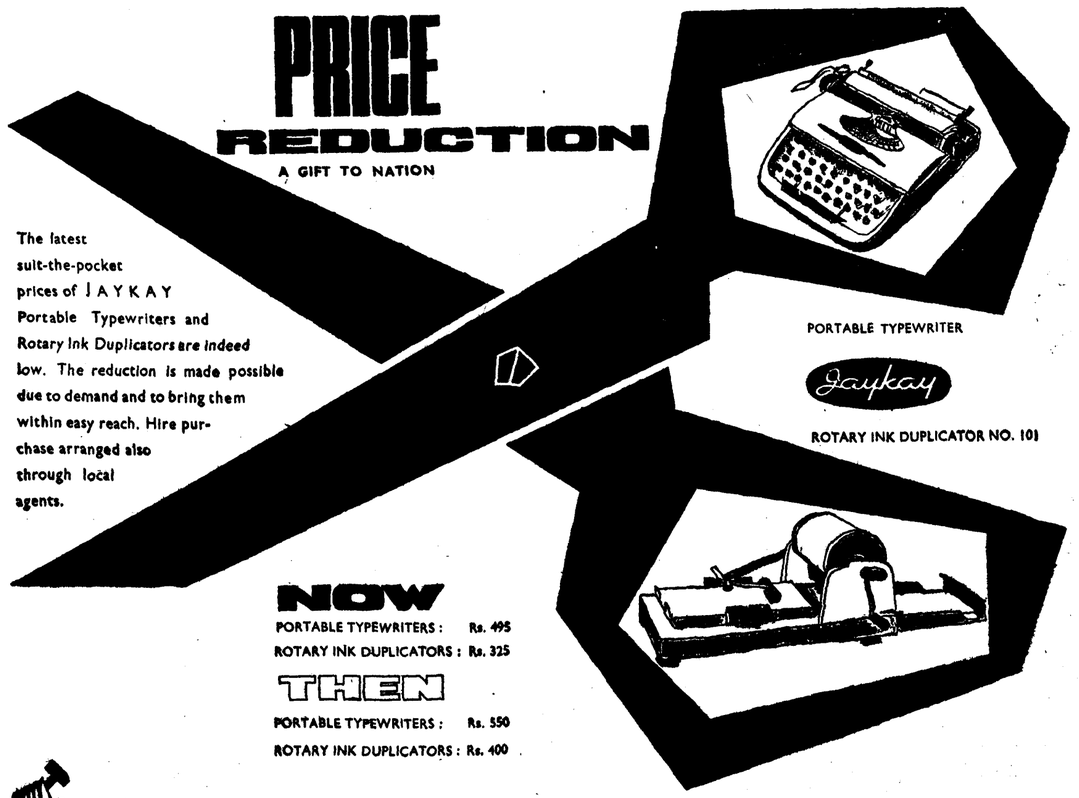
The aforesaid items are expected to be considered by the officials from Britain and the Common Market countries. On the basis of the viewpoints expressed by them, the next meeting of Ministers, convened for the 22nd of this month, will decide whether or not to set up separate working groups for further detailed study.

So far as Britain is concerned, the official approach to the whole problem of agriculture as was elucidated at the Brussels meeting by both Mr. Heath and Mr. Soames is quite clear. Briefly summed up, the position is this: Britain accepts the basic principles of the Common Market's agricultural policy, namely, common price levels and variable import levies, but it wants modifications (*a*) to take into account the expanding boundaries of the Market, (*b*) to allow the U.K. to fulfil its Commonwealth obligations and (*c*) to permit the smooth adjustment of Britain's farm economy. In particular, Britain has asked for a 12-year transitional period for its farmers (as against 7½ years for those of the Six), annual reviews to take account of farm income levels, trend of output of individual products and the transitional relationships of member-countries with the outside world. Neither Mr. Heath nor Mr. Soames spoke at length on Commonwealth problems, though Mr. Heath is stated to have reiterated a point he made at Paris in October last that Commonwealth producers should be given "considerable outlets," at least over an adequate transitional period, to those they have hitherto enjoyed in the U.K.

The approach of the Common Market to Britain's problems may be summed up thus: The main lines of the common agricultural policy must be adhered to, implying that any hint of deficiency payments will have to be forgotten by Britain. Again, there is no necessity at this stage for extending the farm transition period for Britain. Further, there is the need for limited transitional arrangements for the Commonwealth, and world-wide arrangements are the best. Annual reviews may be accepted, but they need not be the same as that currently operated by Britain.

From the point of view of Commonwealth countries and territories, four categories have been made according to the problems they present. They are: (1) The developed countries—Australia, Canada and New Zealand; (2) the countries the exports of which will be affected if the common external tariff of the E.E.C. is applied to them—India, Pakistan, Ceylon and Hong Kong; (3) countries whose exports are likely to compete with the exports of the existing designated associated overseas territories of the Six—mainly the African and Caribbean countries; (4) a miscellaneous category containing all the remaining countries and territories. It is the countries in the second category (their manufactured goods enter Britain duty-free) that need help if their domestic economies are not to suffer a serious dislocation. Besides manufactured goods, their other exports also present tariff problems. Britain has done well to reiterate that nothing should be done to damage the export trade of these countries which must maintain, nay, increase, the level of their exports in order to improve the living standards of their teeming millions. After all, it has to be remembered that the costs of industrial growth in underdeveloped countries can be met in the long run only by the money earned through exports. It is to be hoped that the developed countries of the Common Market will appreciate this point and help the less developed nations by following a commercial policy that will not hinder the growth of their export trade.

The Government of India has announced grant of export draw back of customs and central excise duties to bicycle accessories, pistons, gudgeon pins, cylinder liners, piston rings and centrifugal castings other than iron castings, hydraulic brake fluid not otherwise specified and machine tools.



PROBLEMS OF VANASPATI INDUSTRY

SHORTAGE OF OIL AND HIGH, UNSTABLE PRICES CRIPPLE GROWTH

FOR its age and size the *vanaspati* industry has had more than its due share of problems. High prices of edible oils, which account for more than three-quarters of the cost of production of *vanaspati*, unstable market for oil, excess capacity, and demand from some quarters for banning the industry or colouring *vanaspati* to prevent its being used to adulterate ghee—all these combined to make the industry one of low profitability. If, in spite of these vicissitudes, the industry has managed not only to survive but also to acquire the size and stature of the largest food processing industry in Asia, it only goes to show that the industry meets a genuine demand and its product is popular with the consumers, in spite of much adverse propaganda from a section of politicians and social workers.

A closer look at the progress of the industry will bear out this conclusion. The following table indicates the actual performance of the industry during the first and second Plans, as compared with the Plan tagets:

(In tonnes)

	Vanaspati	Hardened groundnut oil	Total	Target
1950-51	154,800	10,200	165,000	
1955-56	280,000	13,800	293,800	300,000
1960-61	338,500	19,100	357,600	400,000

It is evident from the above table that the rate of growth of production witnessed in the first Plan could not be maintained during the second Plan when production increased by only 63,600 tonnes (2,204.5 lbs. each) or 22 per cent, as against 128,800 tonnes in the first Plan. Considering that national income increased by about the same rate during the first and second Plans and industrial production in general increased by about 40 per cent during the second Plan period, the 22 per cent rise in *vanaspati* production is disappointing. With a large portion of its productive capacity of 500,000 tonnes still unutilised, the industry continued to be plagued with acute price competition and very low returns on capital.

Slow Progress

The primary reason for the slow progress of production was the insufficient supply of edible oils and their consequent high prices. As edible oils constitute nearly 75 per cent of the total cost of *vanaspati*, the rise in oil prices inevitably pushed *vanaspati* prices to a point which brought forth consumer resistance.

While the progress of the industry during the second Plan has thus not been satisfactory, its prospects for the third Plan period are also not bright. The third Plan envisages an increase in the production of *vanaspati* and industrial hardened oil to 500,000 tonnes. Considering that national income is expected to rise by 30 per cent during the Plan period, the proposed production target for *vanaspati* is not unreasonable. The industry has already the necessary capacity to produce this quantity. The only limiting factor will, therefore, be supply of edible oil. If oilseeds production continues to lag behind the rapidly increasing needs of the country and oil prices continue their upward trend, the achievement of the target will prove extremely difficult.

Output of oilseeds during 1960-61, the last year of the second Plan, aggregated only 6.53 million tonnes, as against the target of 7.60 million tonnes, a shortfall of over one million tonnes. The result of this shortfall, in the face of rising demand, has been a sharp increase in oil prices as will be noted from the following table:

(In rupees per metric tonne)

Crop year	Groundnut oil price		
	Low	High	Average
1956-57	1,420	1,645	1,527
1957-58	1,370	1,700	1,500
1958-59	1,420	1,770	1,587
1959-60	1,520	1,960	1,773
1960-61	1,946	2,349	2,135

The third Plan target for oilseeds output is 9.8 million tonnes to be reached by 1965-66, an increase of about 50 per cent over the production in 1960-61. Considering the probable fat requirements and the need to earn foreign exchange, the target is not unrealistic. But, if account is taken of the fact that actual production during the first and second Plans increased by only 600,000 tonnes and 900,000 tonnes respectively, and that too, chiefly through increases in acreage under the stimulus of higher prices, the achievement of the third Plan target presents a formidable task.

The integrated oilseeds scheme is the primary instrument for hitting the Plan target for oilseeds. Although the Planning Commission did consider the target for oilseeds as of critical importance from the standpoint of the country's needs, it did not provide for adequate finance for oilseeds development. A modest sum of Rs. 2.3 crores is all that is earmarked to achieve an increase in oilseeds production of 3.3 million tonnes worth Rs. 200 crores. As oilseeds are grown largely in rain-fed conditions on relatively poor soil, they may not come under the package plan for intensive cultivation in selected districts. With uncertain weather, farmers are generally reluctant to adopt improved cultivation methods entailing enhanced outlays on fertilisers, pesticides, etc. Some States have yet to establish the organisation for oilseeds development, while the working of the existing staff is severely limited by administrative delays and insufficient finances. Considering all these points, the prospect of an adequate supply of edible oils during the third Plan period for the industry is bleak. It is no wonder, therefore, that the *vanaspati* industry is examining the need for importing soyabean oil. It has already imported 3,021 tonnes of soyabean oil from U.S.A. for experimental purposes. Trials are said to have proved that soyabean oil could be used in significant proportion in the manufacture of *vanaspati* without any adverse effect on its quality.

Utilisation of Cottonseed Oil

The shortage of groundnut oil naturally encourages the demand for substitutes such as cottonseed oil for *vanaspati* manufacture. Apart from the relative cheapness of cottonseed oil (even this advantage is rapidly tending to disappear) and the incentive given by the Government (with effect from 1st July 1960) in the form of a rebate in excise duty on *vanaspati* containing cottonseed oil in excess of 5 per cent, have led to larger utilisation of this oil. The industry has fulfilled the undertaking to the Government that it will use 7½ per cent of cottonseed oil in 1961. In fact, the actual utilisation during 1961 is expected to have been about 7.8 per cent. The industry has promised to utilise cottonseed oil to the extent of 10 per cent during 1962, provided sufficient oil of good quality is available.

The agitation for coloration of *vanaspati* has not so far produced any concrete result. The Committee of Scientists appointed by the Union Ministry of Food and Agriculture to review the colours suggested in the past and recommend a suitable one after further investigation is still continuing its work. Meanwhile, the results of the experiments carried out at the Nutrition Research Laboratory at Hyderabad in regard to the relationship between dietary fat and incidence of coronary heart disease was announced in the Lok Sabha. The conclusions drawn on the basis of the aforesaid research are as follows:

Results of Scientific Investigation

(1) The intake of hydrogenated vegetable fats at moderate or low levels (10 to 15 per cent of total calories in the diet) is associated with no significant increase in serum cholesterol levels.

(2) If consumed in high amounts, i.e. supplying nearly 40 per cent of the total calories in the diet, hydrogenated vegetable fats tend to increase serum cholesterol concentrations significantly.

(3) If, however, 20 to 30 per cent of the total hydrogenated fat intake is replaced by unhydrogenated vegetable oils which are rich in poly-unsaturated fatty acids, the increase in serum cholesterol brought about is considerably less.

(4) Studies have shown that distribution of hydrogenated vegetable fat equally in all the meals of the day results in considerably less increase in serum cholesterol than consuming the same amount all at one sitting.

(5) There is at present no definite evidence to show that consumption of high amount of hydrogenated vegetable fats alone can produce coronary heart disease. All that can be said is that such a high intake may produce an increase in serum cholesterol.

Commenting on the above results, the *Vanaspati* Manufacturers Association says in its annual report for 1961:

"Consumption of *vanaspati* in moderation does not raise serum cholesterol which is implicated in the development of arterial diseases. Only when *vanaspati* is consumed continuously at the rate of about 4 ounces a day that serum cholesterol level rises significantly. Furthermore, if *vanaspati* is consumed at high levels in conjunction with edible oils rich in poly-unsaturated fats the blood cholesterol level does not rise significantly. In India, where the average fat consumption is less than half an ounce and the normal fat intake includes not only *vanaspati* but also oils, there is little danger of a serious rise in serum cholesterol levels. What is true of *vanaspati* applies equally to ghee and coconut oil. It is to be hoped that these scientific conclusions will remove the doubts created by the earlier unwarranted statements on the subject made by persons in authority."

Nevertheless, the announcement of the results of research in Parliament, without clearly explaining their implications, must have had some adverse effect on the consumption of *vanaspati* in 1961 which did not show any substantial improvement over that in the previous year, having been only 331,500 tonnes, as compared with 329,729 tonnes in 1960. The regional pattern of consumption of *vanaspati* is indicated below:

(In tonnes)

Region	1958	1959	1960	1961*
Andhra, Madras, Mysore, Kerala	20,462	22,174	23,082	23,500
Bombay, M.P., Rajasthan ..	82,877	96,009	98,170	94,500
U.P., Punjab, Delhi ..	110,454	123,055	128,108	130,200
W. Bengal, Bihar, Assam, Orissa	67,676	68,197	71,458	71,800
Supplies to Defence Services ..	9,195	9,577	8,981	11,500
Exports	2,983	2,793	6,438	4,200
Total ..	299,647	321,805	336,187	335,700

* Estimated.

While the past has thus been riddled with problems for the industry, what of the future? This depends as much on the present state of the industry as on the supply of raw materials and the demand for *vanaspati*. As to the state of the industry, an expert assessment of its health was made by no less a person than Mr. P. L. Tandon, Chairman of the *Vanaspati* Manufacturers' Association, in his speech at the sixteenth annual meeting held at Bombay last week. "The health of an industry," Mr. Tandon said, "is measured by two things: the goodwill it enjoys among its consumers and the efficiency with which it is run. *Vanaspati* enjoys considerable goodwill, as is evidenced by the fact that, even during periods of strong and bitter criticism, consumers of *vanaspati* have remained loyal and continued to consume *vanaspati* as before. They have left it to the scientists to judge the product and they have been assured by scientists that *vanaspati* is a wholesome product."

As regards the second test, namely, efficiency, it is, in Mr. Tandon's opinion, best measured by the return on employed capital. Judged by this yardstick, the industry's record is poor. It is doubtful, says Mr. Tandon, if the *vanaspati* industry had made a profit of more than one to two per cent during the last decade. According to a study of the Reserve Bank of India, gross profit, as a percentage of employed capital, was the lowest in the vegetable oil industry (including *vanaspati*) during 1951-55, being only 2.5 per cent, as against the average of 9.2 per cent for all industries. If out of this low figure of 2.5 per cent are deducted tax and interest, it will be seen that the return after tax is, indeed, very small. The reasons for such poor financial performance have been stated in the earlier part of this article.

Effect of Speculation

In his speech, Mr. Tandon clearly brought out the deleterious effects of excessive speculation in groundnut seeds and oils on the manufacture of *vanaspati*. The following is the relevant extract:

"The oil market in India is singularly unstable. A rise of 20 to 30 per cent and a fall of the same magnitude in the crop season is not uncommon. With the *vanaspati* manufacturer ready to cut prices in pursuit of extra production, this lack of stability in oil prices is conveyed with full force to *vanaspati*. It turns the *vanaspati* dealer into a speculator making a living not through his earnings on turnover but correct guessing of price variations. Forward sales by some manufacturers encourage this tendency. No wonder, 'forward markets' have sprung up in some places for dealings in *vanaspati*. It must be the only packed, branded product to be so treated. The situation benefits no one. The manufacturer fares badly. He is forced to vary his production schedules frequently, not according to the needs of the consumer but according to the influence of speculation in the groundnut oil market and dictates of those *vanaspati* dealers who speculate. There is no reason to believe that *vanaspati* consumption drops to half as much in September-October as in December-January, which is what has often happened to *vanaspati* production."

Vanaspati—A Product, not a Commodity

The major need of the industry, therefore, is, as Mr. Tandon averred, "cheaper oil and

BUOYANCY IN CENTRAL REVENUES

LARGE SAVINGS IN BUDGETED OUTLAYS EXPECTED IN 1961-62

From Our Special Correspondent

NEW DELHI, *27th February*

DELHI LETTER

IN a week which appropriately belongs to the Central Budget, either for purposes of speculation or analysis, under normal circumstances, a scrutiny of budgetary policies is not quite irrelevant; there is also an immediate provocation for it in the Finance Accounts for 1959-60 and the Audit Report 1961 which for the first time comes out not very long after the close of the year to which it relates. The compilation of these reports had fallen into arrears in the past as there was no settlement of the various cash balances and debt heads with the Pakistan Government; when it was found that no progress could be made towards a settlement, the balances were worked out on a provisional basis and the arrears accounts were presented by the previous Auditor-General in two batches in 1960, the first covering the years from 1948-49 to 1954-55 and the second from 1955-56 to 1958-59. These may now be of no more than academic interest but a striking feature of the Central Budgets of independent India is the influence of the conservatism of the Treasury which restrained the tendency, if there had been any, under democratic pressures to pursue unorthodox or unsound policies. While the restraint had been helped considerably by the presence at the helm of traditionalists like the late Dr. John Matthai and, later, Mr. C. D. Deshmukh, the Finance Ministry has been able to adjust itself to changing situations arising out of Planning, steady growth in excise revenue, large-scale sharing of revenues with the States and grant of substantial assistance to them, and, last but not least, to the conditions of expanding deficit financing.

Accounts Since 1948-49

Looking back over the period, this characteristic feature is seen in the regular surpluses which have been realised on revenue account since 1948-49; there was only one lapse from this rule in the year 1958-59 when there was an actual deficit of only Rs. 3.8 crores. If this is excluded, the cumulative total of the actual surpluses realised on revenue account in these twelve years would amount to Rs. 560 crores; there were two exceptional years, the first due to the Korean war boom in 1951-52 when the surplus amounted to Rs. 126.4 crores and 1956-57, the first year of the second Plan when the revenue was buoyant enough to produce a surplus of Rs. 93.26 crores. In all the other years the surpluses have been substantial (except in 1953-54 when it was only Rs. 8.64 crores) and were achieved by the double process of under-estimating revenue yields and over-estimating expenditure. Opinions will differ as to what extent this was deliberate or part of the normal precaution of Treasury officials or the result of unexpected circumstances like the windfall revenue from export duties during the Korean war. Audit reports and those of Public Accounts Committees have pointed out that this feature is an example of loose budgeting but when plans have to be made and several of them have to be deferred or dropped for various reasons appropriations are saved and surrendered. Only sticklers for form will quarrel with the methods even when the result is to redress an initially unsound budgetary position of deficit or small surplus; in the context of larger deficits in the capital budgets, this policy has been helpful.

The final accounts for 1959-60 shows the same trend in an accentuated form. The Budget indicated a prospective revenue deficit of Rs. 81.67 crores and taxation proposals covered only Rs. 12.59 crores, but instead of the deficit of Rs. 59.08 crores, the year closed with an actual surplus of Rs. 44.24 crores; this improvement of Rs. 103.32 crores was the result of larger revenue of Rs. 92.80 crores and lesser expenditure to the extent of Rs. 10.52 crores. A major imponderable factor in this year was the contribution of mineral oils towards customs and excise revenue under the constant proddings of Mr. K. D. Malaviya on the oil companies; besides under the new scheme of company taxation, corporation tax yielded more than anticipated. The major saving in expenditure was in respect of the Defence services and was slightly over Rs. 10 crores.

It is probable that the same trend will be revealed when the accounts of the year 1960-61 are presented along with the caretaker budget in the final session of the Second Lok Sabha before it is dissolved at the end of March 1962. The revised estimates showed a reduction of the budgeted deficit (from Rs. 60.7 crores to Rs. 33.65 crores) mainly because of a reduction in expenditure of about Rs. 23 crores; but there was scope for further cuts in actual spending, if not for a large improvement in revenue over the revised estimates. These savings are likely to occur in civil administration, both under administrative services and under social and development services, but perhaps not under Defence in view of the continuing preparations in the frontier areas.

The Budget for the current year (1961-62) showed a small surplus after the taxation proposals for nearly Rs. 60 crores. In the first eight months of the year, the yield of revenues was Rs. 85 crores more than that during the corresponding period of the last financial year. This is almost equal to the additional revenue expected in the whole year over the previous year's total, so that in the remaining four months, further additional revenue of about Rs. 50 crores may be expected.

So far as the outlay on the third Plan is concerned, it is very unlikely that there was a considerable stepping up in the first year; apart from the many uncertainties due to foreign aid and delays in project preparation, the general election has diverted the attention of the Governments both at the Centre and in the States and large savings may be normally expected. (These of course will be larger in the capital budget outside revenue account.) On the other hand, there is some doubt about the size of the Defence budget because of the Goa operation and preparations on the northern borders, but it seems improbable that this expenditure would have absorbed all the savings in the revenue budget or offset the additional revenue. A very handsome surplus on revenue account should therefore emerge.

While the yield from customs is not much in excess of the expectations (of Rs. 193 crores over the whole year), Union Excise duties may be higher by about Rs. 40 crores, Corporation Tax by about Rs. 10 crores and Income-tax by a slightly smaller amount. However, a second factor which may upset calculations of the likely surplus in the Central Budget for the current year is the effect of the recommendations of the Third Finance Commission which may reduce the net availability of excise revenue to the Centre if more has to be distributed among the States; if more liberal grants are also added to this (under Article 275 of the Constitution) to meet the special needs of particular areas, the expenditure budget will swell accordingly. But the tradition of budgeting for a surplus is, and will remain, strong; there will be time enough to speculate on how that will take shape in the May Budget after the new Government takes charge at the Centre.

A two-member technical delegation has left for Moscow towards the end of last month to finalise designs, contracts and orders for the Pathratu thermal power station in Bihar. The delegation consists of Mr. S. S. Kumar, Chairman, Central Water and Power Commission and Mr. P. R. Sundaram, Chief Engineer, Bihar State Electricity Board. A director of the Central Water and Power Commission, who has already left for Moscow for finalising designs of equipment to be procured from the U.S.S.R. for the Neyveli thermal power station expansion scheme, will also join this delegation. The Soviet authorities have agreed to supply plant and equipment for the Patratu power station which, under the third Plan, will have five additional units of 50 M.W. each. There is, however, a possibility of installing three units of 100 M.W. each, and the delegation will discuss the proposal with the Soviet authorities. The delegation is also likely to visit Belgrade in Yugoslavia for a week in order to obtain a first hand knowledge of working efficiency of the 30 M.W. sets manufactured in Yugoslavia.

AMERICAN LETTER

INTEREST RATES ON DEPOSITS RAISED

ECONOMY STEADILY EXPANDING

From Our Special Correspondent

NEW YORK, *24th February*

LIFE in the United States came to a virtual standstill on 20th February 1962, when Lieutenant-Colonel John Glenn was shot into space and orbited the earth three times. Radio and television covered the event during the entire day to the exclusion of anything else. Vast crowds congregated around monitor screens in public places and voice communications were broadcast throughout the flight. After the recovery, it was a circus atmosphere which reflected itself in the various market places.

Otherwise, the United States economy is proceeding at a slowly expanding pace. There has been some slowdown in the acceleration as a result of steel labour-management negotiations which have already begun in order to avert a steel strike at the mid-year. Steel consumers who have been heavy buyers in recent months and weeks are now ordering smaller volumes than before. The reasoning for this is that, if there is no steel strike, inventories amply protect current manufacturing operations.

The Savings Rate Boost

Beginning 1st January, commercial banks have been authorised to pay 3½ per cent per annum interest on savings account and 4 per cent on funds on deposit for more than one year. This move by the Federal Reserve Board was designed to accomplish two major objectives.

One was to make it more attractive for foreign banks to leave time deposits here and thus help improve the current balance of payments which is unfavourable to the U.S. The other was to stem the flow of funds into the stock market. Investors who are assured of 3½ or 4 per cent presumably think twice before gambling in stocks where the return is not always at that level and where prices are subject to often severe fluctuations.

Thus, in the last few weeks, changes in the deposit structure of banks have taken place. Both corporations and individuals are thinking twice before placing funds in demand deposit accounts which draw no interest and instead increase their savings and time deposits.

Conversely, the banks have been changing their portfolio policies, since they are under pressure for income to be able to pay 3½ or 4 per cent to their depositors. There has been selling of lower-paying short-term securities in favour of higher-paying long terms. This trend has also increased the demand for tax-exempt State and Municipal securities which, in turn, has helped support the building of civic projects such as schools, water and sewer systems.

By the same token, mortgage departments of banks have become more active because of the greater return of that type of investment. It is certainly increasing the flow of funds into building and construction from the commercial banks. Depending on supply and demand conditions, it may reduce the flow of such funds from mutual savings banks and mutual savings and loan associations and building society.

Three Types of Banks

The U.S. banking structure is three-pronged. There are commercial banks which are stockholder-owned corporations. In the same category, there are private banks which are partnerships. The commercial banks may accept deposits and make loans and buy Government securities. They may not hold stocks, except those acquired in settlement of a loan or foreclosure. Most of these commercial banks are members of the Federal Reserve system. Some do not choose to be, even though it deprives them of official rediscount facilities. Others do not meet the standards of Reserve system in one way or another and cannot be members. As a whole, these banks are the mainstay of the U.S. banking system.

The second category are mutual savings banks which operate in 14 of the 50 States. They are not stockholder-owned and, in theory, each depositor owns a piece of the capital and surplus in case of liquidation. This banking system goes back to revolutionary days. Since there are very strict requirements for the establishment of mutual savings banks and no public underwriting is involved, hardly any new such banks have been established in recent years.

There are now plans afoot in Washington to have legislation enacted to make it possible to establish Federally chartered shareholder-owned savings banks. This group is essentially a mortgage bank, synonymous to the *banques fonciers* in Belgium and France. It may invest in all types of mortgages and in rapidly growing areas of the country, mortgage investments are as high as 90 per cent of assets, the balance in cash and Government securities. Traditionally, they have been paying higher interest rates than commercial banks, but they can hardly afford to pay more now.

The third group is composed of the savings and loan associations and building societies. They are advertising for "deposits" and in some of the Western States they pay as much as 4.6 per cent. Technically, funds left with these institutions represent share accounts, or a piece in the business rather than deposits which would have to be treated as a liability.

The New York savings banks, like the *commercial banks throughout the country*, pay a premium to the Federal Deposit Insurance Corporation which ensures individual deposits up to $10,000 each. The savings and loan companies have their own Federally sponsored insurance scheme, also up to $10,000 each. This group, too, is strictly interested in the building and mortgage field. Since the establishment of Federal insurance corporations, there have been very few losses. Defunct savings and loan associations have been merged with others, except in the rare cases of management misconduct.

U.S. Corporate Profits

The outlook is for better corporate earnings this year. Last year's record was somewhat disheartening. Final 1961 figures will probably show a total of $22,700 million. While it is better than in the preceding year, it compares with $23,700 million in 1959, $23,500 million in 1956 and with $23,000 million in 1955. The reasons for this situation include excess plant capacity in relation to markets and rising productivity abroad which have cut markets under highly competitive conditions. It has stymied outlays for expansion, but it has increased dividends.

The International Development Association, an affiliate of the International Bank for Reconstruction and Development, which operates as a sub-division of the United Nations, finally concluded long expected arrangements for an $18.5 million development credit to the Government of India.

Proceeds, according to statements made here, will be used for the expansion of electric power supply in the Damodar Valley. The funds are earmarked to help finance the installation of 140,000 kilowatts of new generating capacity and the expansion of transmission facilities in the system operated in that industrial area. The recipient of the credit is Damodar Valley Corporation. Since its inception, 14 years ago, Damodar has received loans from the World Bank totalling $49.2 million. The current credit is for a term of 50 years, free of interest. Repayment of principal is to begin on 1st August, 1972. There is a service charge of ¾ of one per cent on the amount withdrawn or outstanding.

(Concluded from next column)

are taking advantage of the boom in prices to sell on the market in the ordinary way and, secondly, because many market bulls will have formed the view that, since I.C.I. will not increase their offer any more and the take-over bid may fail, the bullish element has disappeared and the shares are ceasing to be interesting to them.

But the story is not quite at an end, for I.C.I. is bound to receive a number of acceptances; if it gets substantially less than half, it will be left with a major shareholding in a competitive industry in which, however, it will be unable to exercise any control. In the event, this would be a private investment worry of I.C.I., as, presumably, industrially the two giants would go very much their own ways.

LONDON LETTER

TANGLE IN MAN-MADE FIBRES

I. C. I. BID MAY FAIL

(From Our Own Correspondent)

LONDON, *23rd February*

NO struggle in the history of take-over bids has equalled that of the present one between Courtaulds and I.C.I. The issues involved and the manner in which the battle is being fought have made this bid one of far more than usual interest and, because of the world-wide distribution of these firms, of international interest.

At home, not only are three-quarters of a million investors interested but the issue has become political. Although the President of the Board of Trade refused to intervene, except to see the Directors of both firms and then to adopt a policy of masterly inactivity, on both sides of the House there has been uneasiness. There are many Government supporters who would not like to see the degree of monopoly in the man-made fibre industry which an amalgamation of these two giants would produce. On the Labour side, while there is the normal objection to the growth of capitalised monopoly, there have not been wanting those who pointed out that, in the event of a merger giving one hundred per cent monopoly in this industry, the case for eventual nationalisation would become unanswerable. Some of this fear has spread to the Government side too.

It seems that the initial discussions between the two companies envisaged only what has been euphemistically called "the strengthening of the man-made fibre industry generally." Since I.C.I. is largely a supplier of the chemical raw materials for making man-made fibres and Courtaulds is principally a user, there could have been a great deal of effective monopoly simply by even closer collaboration between the two than has been normal.

But I.C.I.—and some say that this has been with an eye on future negotiations in the Common Market—decided to go further and acquire complete control. They made an offer on the basis of three shares in I.C.I. for every four of Courtaulds. They later raised that offer to four of their shares for every five of Courtaulds and they have now made an alternative offer of 6½ per cent loan stock. I.C.I. have now declared that they will make no further offer.

Meanwhile, Courtaulds has sprung into life with fierce counter-attacks. They have said that I.C.I. future earnings prospects are declining while Courtaulds is likely to increase its profits substantially over the next three years. They have spent vast sums on advertising the case for retaining their independence and they have emphasised that on I.C.I.'s proposed take-over basis their capital and earnings have been under-valued by about 25 per cent. Finally, they have been drawn into making promises regarding dividends this year and next, so that investors can do their sums with certainty. On the basis of I.C.I.'s offer, a Courtaulds shareholder would get 10 per cent gross on his nominal capital, but, if he sticks with Courtaulds, he would get 16½ per cent. For the next financial year, I.C.I.'s offer would give 11 per cent (or just over 16 per cent on the stock loan basis), but, by staying with Courtaulds, there would be 20½ per cent. These are large differences and indicate the extent to which Courtaulds are fighting for their lives. They have been obliged to offer a 2½ per cent tax-free bonus for each of the next three years out of past profits and also to promise a free issue of loan stock through the capitalisation of reserves.

There seems little doubt that, on this basis, that is to say, on pure financial terms, they have made out the better case. The Courtaulds stockholders, for their part, will, if the bid fails, nevertheless have much for which to thank I.C.I. At one time last year before the battle began, Courtaulds £1 share were quoted at 26s. from which point they rushed up to 52s. They are certainly worth that on the basis of I.C.I.'s present offers but, oddly enough, the prices have been declining below 50s. that is, below the actual money-worth that could be realised by taking up the I.C.I. offer. This could be because, firstly, many stockholders

(Continued in previous column)

I.C.I.C.I.'S PERFORMANCE GRATIFYING

WORLD BANK GIVES ANOTHER LOAN

THE progress made by the Industrial Credit and Investment Corporation of India Ltd. (Chairman: Mr. G. L. Mehta, Bombay) in the year ended 31st December 1961 is impressive. Its income and profit are higher. It has stepped up the dividend to a level at which the net return in the hands of shareholders is better than the tax-free dividend of 4 per cent per annum paid for 1957 and 1958. The net worth of the Corporation's share has improved further. All these features naturally reflect an expansion in the Corporation's activities, depicted in the comparative table at the bottom of this page (columns 1 and 2).

The perceptible improvement in the profitability of the Corporation's operations in recent years is brought out in the following table:

(In lakhs of rupees)

	1958	1959	1960	1961
Gross income	58.33	62.46	87.84	115.56
Profits before tax	51.65	50.06	62.61	74.27
Profits after tax	25.29	28.23	37.07	49.52
Dividend per share (in Rs.)	4*	5	5.75	6.50
Net worth per Rs. 100 share	105	108	115	125
Market value as on 31st December per Rs. 100 share	78	88	71	82

* Denotes tax-free.

The Corporation has been pursuing a judicious policy of conserving a sizable part of its profits, with the result that its reserve funds have grown to a respectable level of Rs. 124.38 lakhs, which is equal to almost one-fourth of the paid-up capital of Rs. 5 crores.

There was a 50 per cent increase in the number of loan operations during 1961, as compared with that during the preceding year. The amount of loans sanctioned rose from Rs. 3.94 crores to Rs. 10.45 crores. The rise in the amount disbursed, from a mere Rs. 1.77 crore to as much as Rs. 4.46 crores, was even more marked. This suggests two things: (1) the Corporation was in a position to expedite the disposal of applications for assistance; and (2) its borrowers' projects had advanced further to be able to draw upon the credits sanctioned to them on a larger scale than in the previous year. Another feature shown by the table is that the bulk of the loans sanctioned and disbursed is in foreign exchange. This is only as it should be, considering the acute scarcity of foreign exchange.

On the underwriting side, the number of operations were fewer than in 1960, the entire reduction having been under preference shares and debentures, which only reflects the reluctance of the promoters of industries to go in for these forms of capital, in view of their unpopularity with investors. The Corporation also directly subscribes to capital of companies. Here, it agreed to take more shares than in 1960, namely, Rs. 35 lakhs against Rs. 20 lakhs. There is, however, no gainsaying the fact that the underwriting and direct subscription sides of the Corporation's activities are still of only modest proportions, though, of late, they have gradually been growing. It will be observed that out of the total business (in terms of amount sanctioned) done so far, namely, Rs. 42.71 crores, nearly 70 per cent or Rs. 29.63 crores represents loans and guarantees. Essentially, therefore, the Corporation continues to be a long-term lender to industries.

Prominent among the industries which have received financial assistance from the Corporation are paper and pulp, iron and steel fabrication, chemicals and chemical products, automobiles and cycles, machinery manufacture, and glass, pottery, etc. Fuller details are given in the table below:

Nature of industry	Net amount sanctioned (in lakhs of rupees)	Percentage of amount sanctioned to total sanctions
Automobiles and cycles	481	11.3
Cement	133	3.1
Chemicals and chemical products	539	12.6
Electrical equipment	330	7.7
Electricity, gas and steam	156	3.7
Glass, pottery, etc.	290	6.8
Iron and steel	525	12.3
Leather products	3	0.2
Metal products, ferrous and non-ferrous	190	4.4
Machinery manufacture (other than electrical)	377	8.8
Paper and pulp	572	13.4
Rubber products	74	1.7
Shipping	100	2.3
Sugar	212	5.0
Textile	119	2.8
Wood, cork and hardboard	93	2.2
Miscellaneous	72	1.7
Total	4,271	100.0

Besides its paid-up capital of Rs. 5 crores, 70 per cent of which is held by institutional investors in India, and the balance by banks and financial institutions (in the private sector) in Britain, the U.S. and W. Germany, and the reserves built up so far, the resources of the Corporation are made up of Rs. 17.50 crores by way of loans and advances by the Government of India, $40 million (about 19.04 crores) loan from the World Bank and $5 million (Rs. 2.38 crores) from the U.S. Government through its Agency for International Development (A.I.D.), formerly known as the Development Loan Fund (D.L.F.). The Corporation has already utilised in full the World Bank loan of $40 million by sanctioning foreign exchange loans to its customers. Of the A.I.D. loan, it has disbursed only a small portion, namely $190,000 (Rs. 9.23 lakhs). With a view to augmenting its foreign exchange resources, the I.C.I.C.I. had sought another loan of $20 million from the World Bank, its godfather. This application has just been granted (on Thursday 1st March 1962), so that the Corporation now has nearly $25 million. The readiness with which the World Bank has sanctioned another loan (the fourth so far, the first one was in March 1955 for $10 million, the second in 1959 for a like amount, and the third in October 1960 for $20 million) is a striking testimony to the vital role which the Corporation has been playing as a catalytic agent in the economic development of the country.

The terms of the latest World Bank loan to the Corporation are similar to those governing the one taken in 1960. Thus, interest will be applied to each part of the loan at the Bank's current rate when that part is committed for one of I.C.I.C.I's projects. At that time, the Bank and I.C.I.C.I. will agree on an amortisation schedule for repayment of that part of the loan.

As regards the rupee credit of Rs. 17.50 crores provided by the Government of India, the Corporation has drawn only Rs. 9.50 crores, leaving a balance of Rs. 8 crores. Since the total commitments in rupees to its borrowers (as at the end of 1961) are only of the order of Rs. 10.21 crores and having regard to the fact that its owned funds are about Rs. 6.25 crores, there are still sizable rupee resources at its disposal. Surely, the Corporation can afford to be a little more active and liberal in encouraging the growth of sound enterprises in the private sector which need rupee capital.

STATE BANK OF INDIA

PROGRESS WELL SUSTAINED

THE past year, that is, A.D. 1961, was one of sustained progress for the State Bank of India, though the pace of growth was considerably less than that in 1960, taking the year-end figures into consideration. Excluding the changes in P.L. 480 funds, the deposits of the Bank went up by Rs. 37.7 crores, as compared with Rs. 45.1 crores in 1960. (Incidentally, repayment of P.L. 480 deposits in 1961 to the Reserve Bank seems to have been of the order of Rs. 72 crores, as against a similar amount in 1960.) Advances (bank credit) show a net rise of Rs. 23.07 crores over the year, as against no less than Rs. 63.66 crores in the preceding year. The pace of growth has been smaller as compared with that registered by other scheduled banks also. Thus, in 1961, the deposits and advances of the latter had gone up by Rs. 119.75 crores and Rs. 81.16 crores, respectively. The fact that the other banks were able to make speedier progress than the State Bank in 1961 supports the conclusion that, despite all the special advantages enjoyed by this public sector undertaking, it has not inhibited the growth of commercial banks in the private sector, thereby belying the widespread fears entertained at the time the Imperial Bank of India was nationalised and made into the State Bank of India.

There is also a specific reason for the relatively smaller increase in the deposits of the Bank as compared with its own record in 1960 as well as with the progress of other scheduled banks in 1961. The failure of the Palai Central Bank had upset the confidence of depositors in some of the other commercial banks and many had preferred the State Bank to others in 1960. This fortuitous factor had ceased to operate in 1961 and the other commercial banks were naturally able to regain their momentum.

The transfer of a further large amount of P.L. 480 funds in 1961, as well as the relatively slower pace of growth of deposits and advances alike, has not adversely affected the rate of improvement in the Bank's profit; if anything, it has been greater, as will be seen from the following comparative table showing the Bank's growth since 1958:

(In lakhs of rupees)

	For the year ended 31st December			
	1961	1960	1959	1958
Gross income	19,74.64	19,58.35	18,58.82	15,77.97
Of which: Interest and discount earned	14,12.24	14,86.91	14,52.94	12,21.11

Cash	12.9	11.19	11.8	13.1

* Subject to deduction of tax.
† Including money at call and short notice.

Striking features disclosed by the profit and loss account section of the table are: a fall of nearly Rs. 74.67 lakhs in the interest and discount earned; an increase of Rs. 110.93 lakhs in commission and exchange earned; a big increase of Rs. 116.32 lakhs in interest paid; and an impressive rise of Rs. 53.41 lakhs in profit, as against only Rs. 30.49 lakhs in 1960 and a fall of about Rs. 3 lakhs in 1959. Almost the whole of the increase in profit has been tucked away into the reserves.

If the profit has increased at a greater pace than the year-end figures in regard to advances, such is mainly due to (a) the overall level of advances being much higher throughout the year than in 1960, (b) a rise in the rate of interest on advances, and (c) an apparently larger share in the financing of India's foreign trade than hitherto. The report of the Central Board of Directors clearly says that the volume of foreign exchange business handled by the Bank recorded a further increase, with the number of rupee accounts maintained by the foreign correspondent banks rising to 144. The Bank also continued to provide facilities for financing the foreign trade resulting from several barter deals and other special arrangements entered into by the Government of India and the S.T.C.

The number of branches opened by the State Bank was only 37, as against 76 in 1960, the exact number being 954, as compared with 907 at the end of 1960 and 831 a year before that. The chief reason for opening fewer branches in the year under review than in the previous year was the completion of the branch expansion programme laid down under the State Bank of India Act well ahead of the targeted date, and the recommendation of the Karve Sub-committee to slow down further branch expansion, pending consolidation of the branches already opened and the building up of necessary staff. It will be recalled that, under the Karve Committee scheme (adopted with effect from 1st July 1961), the State Bank, as distinct from its subsidiaries, has to open only 145 additional branches by 30th June 1965, as compared with 400 branches in the five years ended 30th June 1960. The target for its subsidiaries is about 155. Under this Karve Plan, the Bank had opened 25 branches by the close of 1961.

Under the State Bank of India Act, the Bank is enjoined to help certain developmental functions, such as assistance to small industries and co-operative institutions. Tracing the achievements of the Bank in these spheres, the Central Board's annual report for 1961 provides the following information:

Finance to Small-scale Industries: The number of small industrial units assisted by the Bank, the credit limits sanctioned and the outstandings rose from 2,451, Rs. 7.8 crores and Rs. 3.7 crores in 1960 to 2,811, Rs. 10.1 crores and Rs. 5.1 crores in 1961. Similarly, the number of units assisted by the Bank's subsidiaries, the credit limits sanctioned and the outstandings also rose over the year from 384, Rs. 2.7 crores and Rs. 1.1 crore to 463, Rs. 3.4 crores and Rs. 1.5 crore in 1961. The bulk (82.8 per cent) of the limits sanctioned by the State Bank at "intensive centres" was less than Rs. 50,000 each, indicating that the Bank is really assisting small-scale units.

Rural Credit: The various facilities granted by the Bank to co-operatives, such as remittance facilities, purchase/discounting of bills/cheques, holdings of debentures of land mortgage banks and loans and advances, recorded an increase during the year. Between 30th September 1960 and 30th September 1961, the total number of advances granted by the Bank to co-operatives, the limits sanctioned and the outstandings increased from 527, Rs. 22.8 crores and Rs. 5.5 crores to 550, Rs. 24.6 crores and Rs. 6.6 crores, respectively. There was also a marked increase in the advances granted against warehouse receipts. The credit limits sanctioned against such receipts rose over the year from Rs. 2.2 crores to Rs. 4.5 crores in the case of the State Bank and from Rs. 0.8 crore in December 1960. to Rs. 2.7 crores in December 1961 in the case of its subsidiaries.

Remittance facilities granted by the Bank to co-operative financial institutions under the Reserve Bank of India Remittance Facilities Scheme increased from Rs. 94.0 crores during the co-operative year ended June 1960 to Rs. 123.6 crores during the year ended June 1961 and those under the Bank's own scheme from Rs. 65.9 crores to Rs. 102.7 crores.

The credit limits sanctioned by the Bank to co-operative sugar factories alone as interim accommodation increased from Rs. 76.0 lakhs in September 1960 to Rs. 139.5 lakhs in September 1961. A clean limit of Rs. 30.0 lakhs granted during the year for working capital pending accumulation of sugar stocks was current at the end of September 1961. Pledge limits sanctioned to co-operative sugar factories on stocks rose from Rs. 273.0 lakhs to Rs. 340.0 lakhs.

While the total credit limits sanctioned by the Bank to co-operatives have been increasing gradually, the relative outstandings continued to be comparatively small, except in the case of co-operative sugar factories. This matter, we are told, has been receiving the attention of the Bank.

Medium-term Finance: Further progress was made during the year under report in the matter of providing medium-term finance and furnishing guarantees for deferred payment for plant and machinery by industries. The Bank's assistance, as at the end of 1961, covered aluminium, cement, chemical, fertiliser, hydro-electric power generation, light engineering, paper, shipping, ship-building, steel fabrication, rolling wire nails and wire rope, synthetic rubber and transport industries. The Bank did not obtain any fresh refinance facilities from the Refinance Corporation for Industry during the year. Advantage of these facilities will, however, be taken in respect of some of the loans that have already been approved, after they are disbursed on completion of the necessary formalities.

STERLING AND INTERNATIONAL TRADE—I

HISTORICAL PERSPECTIVE—POST-WAR TRENDS

By W. F. Crick, C.B.E.

MEN of my generation, or the one before it, are subject to momentary attacks of nostalgia. In the City of London, one of the recurrent experiences of this kind carries the victim back to the days when the pound sterling was the unchallenged and unchallengeable currency of world trade and finance. In the period of nearly half a century which ended with the firing of an assassin's shot in Sarajevo in 1914, the world was supposed to have been on the gold standard; the truth is more nearly stated by saying that the world was in fact on a sterling exchange standard. All other currencies were subordinate, whether formally related to sterling or not. London was the focal point of the world's monetary arrangements, and what happened in the London money market had its echoes in every monetary centre throughout the world, while the impact of shocks elsewhere was taken and absorbed in London.

Historical Dominance

It is a useful introduction to a study of the present position of the pound sterling to inquire what were the factors that had created and sustained its historical dominance. They were many and varied, and I can do no more than recall them summarily, in a series that should not be taken as implying any order of precedence in time or weight. First, then, there was the influence of political power and Empire. The contacts thus established and the constitutional relations thus maintained fostered profitable intercourse, carried the British currency round the world, introduced trade and financing arrangements and opportunities that centred upon the United Kingdom, and protected British interests right out into the remote corners of the earth.

The political factor could not have been so powerful, however, had it not been accompanied by leadership in industry—a leadership which had been undisputed until the phenomenal development of German industry, in particular, during the decades preceding the First World War. The ominous economic, as well as military, implications of this development had not gone entirely unnoticed in Britain. Political power and industrial supremacy went hand in hand, again, in that, even before the days of a protective tariff subject to "Imperial preference," and perhaps still more after that innovation in 1932, the fact that a territory was coloured pink on the map of the world made it a natural area for the sale of Britain's manufactures and gave it, in practice, a privileged position as a supplier of primary products for use or re-sale in Britain.

Basis of Financial Leadership

Turning to another point, for a long time previously the expansion of Britain's trade, outward and inward, had been fostered by the location within England—thanks in part to simple geography—of principal world markets for an almost infinite variety of primary commodities. Look at a copy of that remarkable and venerable daily news-sheet, the Public Ledger, for any business day in the early years of the century, and see the astonishing range of commodities of every kind and grade—some of them known by name only to experts—for which regular market quotations were given. Much of this vast and varied trade was concerned with providing raw materials for British industry and food and drink for Britain's people; but a substantial part of it was entrepot trade, and some of the market dealings covered supplies which moved from source to place of consumption without touching the soil of these islands. Closely integrated with this trade nexus were the ownership and management of about half the world's mercantile shipping, offering among other things, regular mail and passenger services in all directions; unrivalled cable and other communications; comprehensive insurance facilities and complete ancillary services. All this not only provided for the world a concentrated equipment of expertise, efficiency and reliability, but for Britain a revenue-earning asset adding 'invisible' to 'visible' export receipts.

So much for political, industrial and commercial factors; but so far I have said nothing of the financial and monetary factors contributing to Britain's leadership in the world's business affairs. Here, perhaps, the most important single fact was that this country generated a large supply of savings, which permitted a continuous and heavy flow of capital for investment overseas. Both Empire and foreign Governments, public bodies and enterprises had free access to the London market, where bonds and other securities found ready subscribers. The funds so raised could be used to finance capital projects in the borrowing countries, which in turn often entailed exports from the United Kingdom. Industrial leadership was thus allied with financial enterprise and resources. Then, again, Britain—perhaps one should say Scotland in particular—was a source of banking enterprise in widely scattered parts of the world, providing not only finance but also the men to run the banks.

It was natural that, with abundant capital and a sound and highly developed banking system—with, moreover, a currency that had a longer record of stability than any other—London should have become pre-eminent as a centre of finance, in a variety of forms, for both short-term and long-term purposes. The bill on London was one expression of this dominance, sustained as it was by an elaborate structure of acceptance houses, bill brokers and discount market. Moreover, as Bagehot wrote, as long ago as 1873: "At whatever place many people have to make payments, at that place those people must keep money. A large deposit of foreign money in London is now necessary for the business of the world."[1] In turn, this necessity led to the establishment of branches in London of many overseas banks. The City became more and more cosmopolitan in its financial activities. By 1914, it appears,[2] there were more than 120 banks in London whose principal trading areas were outside the United Kingdom, and about one-half of them were foreign banks in the sense of having their head offices outside Britain, the Dominions and Colonies—that, is to say, in Germany, France, the United States or other foreign countries.

Britain was fortunate, too, in that, as gold established its decisive primacy over silver as the sole metal for international monetary reserves, she was able to fortify her position as required from supplies of gold newly mined in British countries overseas and sent to London as the natural market and the centre of control over the mining companies themselves. To sum up, during the nineteenth century Britain developed a smoothly working and intricate monetary system, along with an elaborate structure of arrangements for financing both current trade and capital investment; and, so far as the pound sterling could be said to be managed, the world had complete faith in the integrity and skill of its management.

Sterling Area

Although, as I have said, London's interests and relationships were world-wide, the associations were particularly close with territories of British settlement or colonisation. Hence the development of what came to be known eventually as the sterling area. Its roots go far back into history; it took shape as a largely (but by no means wholly) voluntary association of countries closely linked in politics, trade and finance, which habitually kept their monetary reserves mostly in London and their local currencies at established parities with sterling. Later on when, in 1931, the pound sterling broke away from gold, the solidarity of the sterling bloc was demonstrated by its continuance in more readily definable and recognisable form; within this association, the members enjoyed great advantages—not least, stable exchange rates among themselves while rates with outside countries were subject to wide fluctuation. In the 'thirties, the sterling bloc included more than

[1] *Lombard Street*, 14th Edition, pp. 34-35.

[2] From Scrutiny of the *Bankers' Almanac*.

"The history is recounted in some detail in two lectures delivered by the present writer and published by the Institute of Bankers in 1948: *Origin and Development of the Sterling Area* and *The Sterling Area during and after the War*.

one-fifth of the world's population and was responsible for about one-quarter of the world's exports. The seal was set upon the sterling area, when, at the outbreak of war in 1939, it was transformed into a formal, administrative entity for purposes of exchange control; but enough has been said, I think, to show that, if exchange control were completely dismantled today, little more than the formality of the association would disappear—the sterling area itself would remain.

So much for the main factors—political, industrial, commercial and financial—which contributed to the supremacy of the pound sterling. Even by 1914, however, that supremacy was becoming a little less firmly grounded, as other countries advanced, in economic development, at a relatively rapid rate. Industry was making great strides, particularly in Germany, France and the United States. After that date, two world wars made inroads into Britain's overseas investments, and the course of affairs between the wars—especially the prolonged world depression of the 'thirties—shattered the old structure of international debts and undermined the old freedom of movement of capital in search of enterprise. Politically, great changes were taking place in the alignment of power. After the Second World War, moreover, it seemed that the United States dollar had become generally accepted as the basic currency, as good as gold for all practical purposes and in some ways much better. When new international organs were set up for reconstruction and economic stabilisation—I.M.F., I.B.R.D., E.P.U. and so on—and new arrangements were entered into for promoting development, the funds involved were expressed in dollars or a notional equivalent of dollars. In the early years, the United States was the only available source of funds for aid in rebuilding the world's economic structure, and, under U.N.R.R.A. and Marshall Aid, dollars were spread generously around the world. It almost looked as though the pound sterling had "had it," and was fated to be henceforth a subordinate currency, leaning on the dollar for support and finding its utility only within the confines of the sterling area—now chiefly an administrative organ of exchange control. Appearances, however, proved to be deceptive.

Post-war Rehabilitation

Undoubtedly the pound sterling had lost ground, in relation to the dollar in particular, through the necessity of imposing and maintaining exchange control. I have often wondered whether it lost ground before the war in the period when it had no fixtd parity with gold or the dollar. Any disadvantage it may have suffered on this account was diminished by the fact that, for part of the period, the dollar also had no effective parity with gold; no doubt, moreover, the utility of sterling was aided by the invention and skilful operation of the Exchange Equalisation Account and the development of forward exchange facilities. At all events, after the Second World War, the British Government seems to have had little hesitation, in the light of experience and under pressure of the new internationalism, about accepting membership of a post-war organ of international collaboration, the International Monetary Fund, which entailed the establishment and maintenance of fixed parities. It was a shock to the prestige of the pound when devaluation became necessary in 1949, and, however much weight may be attached to arguments in favour of a "floating exchange rate" for sterling, it can hardly be doubted that the foreigner's willingness to hold sterling in the ordinary course is strengthened by a presumption of stability in its exchange value within narrow limits of a formal parity.

Along with the maintenance of a fixed parity, it has been a consistent policy of the United Kingdom Government ever since the war to move towards the largest possible measure of freedom from exchange control. In assessing the importance of this process, we are liable to forget that, even during the period of *maximum exchange control*, the pound had retained a large measure of effective convertibility over a wide sector of international trade, namely, within the sterling area. Nevertheless, it was subject to strict exchange control in relations with the larger part of the world, and, in this respect, was in a position far different from that which had obtained with the free pound sterling of pre-war times. The control was exercised through the obligation placed on residents to hand over to the authorities all non-sterling currencies coming into their hands and the requirement to make formal application, with evidence of purpose, for any foreign currency they might wish to acquire. National reserves—and indeed most of the monetary reserves of the entire sterling area—were thus pooled, and needs were met according to an officially determined and administered order of priorities. To a large extent, currency relations with non-sterling countries were on a bilateral basis, until, in 1947—just before the short-lived return to convertibility—the "transferable account" system was established to permit dealings in sterling among residents of a number of countries whose currencies were not particularly 'hard.' Dealings between the pound and the United States dollar (and other "American Account" currencies) remained rigorously controlled. At this stage, moreover, the power to administer and enforce exchange control was put upon a permanent statutory basis (*vide* The Exchange Control Act, 1947), in place of the war-time "emergency legislation."

Big Step Taken in 1951

A big step towards re-establishing London's position as an international financial centre was taken at the end of 1951, when the exchange market was re-established with facilities for 'authorised' banks to deal, within prescribed limits, in foreign currencies. In 1953, the facilities were broadened to permit arbitrage transactions. In the following year, the gold market was reopened under limitations as to residence of the overseas buyer and mode of payment. In 1954, again, the transferable account system was broadened to include nearly all the non-dollar non-sterling currencies, and, before long, transferable sterling became subject to official market intervention so as to keep quotations in financial centres abroad generally quite close to those for the corresponding foreign currencies in the London market. Finally, the transferable account group and the American account group were merged, in December 1958, making substantially all currently-earned sterling in the hands of residents outside the sterling area virtually convertible at will. Since then, various further relaxations have been made, and, by 1959, the Chancellor of the Exchequer was able to observe that, while "in formal terms the pound is convertible only for non-residents, . . . in view of the ending of currency restrictions on travel and on most of our imports from dollar and non-dollar countries, it is in effect convertible also for residents, except for capital movements."

The exception is significant. Investment from the United Kingdom in non-sterling-area countries is still closely regulated, and the raising of capital in this country by non-residents is still subject to official permission. Moreover, one special type of sterling remains and is subject to restrictive regulation; namely, "security sterling," which comes into the hands of non-residents by the sale of foreign-owned investments and other capital assets in this country and can be used only for the acquisition of similar assets. This distinction between freedom of current sterling and regulation of capital transactions is clearly acceptable under the statutes of the International Monetary Fund: hence, the formal step, taken by Britain along with several other countries in February this year, of switching from its 'transitional' status under Article XIV to the slightly more exacting status of membership under Article VIII. This step reinforces the international position of sterling, since, thereby, it becomes acceptable, as a *de jure* convertible currency, in repayment of drawings from the Fund in any currency.

In our present context we must not overlook the process of liberating trade along with current exchange transactions. In 1946, Government departments were directly responsible for buying by far the greater part of the country's imports, and it took some time to turn this business back into the hands of private traders. Even as late as 1950, the proportion of imports for which Government departments were responsible was not far short of one-half. The reopening of commodity markets was spread over a long period, and subjected to precautionary regulation in the interests of continuing exchange control. The wool and rubber markets were reopened in 1946, but others had to wait much longer. Meanwhile, progress was made with freeing imports from quantitative control exercised by licence; the last to go were restrictions on imports from dollar countries. Now all that remains is a few quantitative controls maintained for purposes not connected with exchange requirements. Similar progress, step by step, was made in order to permit the resumption of full facilities for world-wide banking, insurance and other ancillary services.

Exports Double

On the revenue side of the balance of payments, public and private activity have been allied in a steady effort to promote a remarkable growth of exports, to a 'volume' twice as large as before the war. "Export campaigns," improved insurance cover from the official Export Credits Guarantee Department, the resumption of facilities for London credits to finance a great variety of business and the extension of these facilities into the category of "medium-term credits"—all these have helped to restore Britain's position in international trade and finance. Furthermore, while capital movements have remained largely under control, deliberate and in parts selective encouragement has been given to pioneering investment overseas, so that now Britain can once again lay claim to being a net creditor country on the balance-sheet test as well as on revenue account.[4]

We ought, I think, to notice before leaving this chapter of history that the world-wide use of sterling had been encouraged by the very fact of the 'hang-over' from the war of a large volume of externally-owned sterling balances, though these again were highly concentrated in the possession of countries then within the sterling area. For the first ten years after the war, th dollar was a "hard currency" on trading account, and it was generally supposed that dollars would thus be difficult to get for an indefinite further period except for such bounty as the United States Government might bestow through defence expenditures abroad and generous "economic aid," and except also for American private investment in non-American countries. As things have turned out, in recent years, the supply of dollars made available from these sources has outstripped the surplus on the ordinary current account of the United States balance of payments. Dollars have been, in the post-war jargon, in excess supply just as sterling was in the early post-war years and still is at times when the Un.ted Kingdom's balance of payments shows a deficit. The dollar, too, has had the attraction of unlimited convertibility—even, in effect, into gold itself —throughout the period.

Present Position and Outlook

The outcome of all these cross-currents and conflicting factors is anything but clear. I know of no measure by which one can assess the relative status of different currencies, at different points of time, as media of international trade and finance. It is said, however, with some authority but no indication of the basis of calculation,[5] that nearly one-half of the world's international trade is financed in sterling, and the disproportionate size of this share is indicated by the fact that the export trade of all sterling-area countries taken together—whether that trade be with other sterling-area countries or elsewhere—comprises less than one-quarter of the total of world exports, while just under one-quarter of the world's population is to be found within the area. What I think we can say with some assurance is that sterling finances a bigger share of world trade than in the early post-war years but probably a smaller share than in the period preceding the First World War, when its supremacy was unquestionable. As a "reserve currency," the dollar has lost ground latterly, and, in terms of the volume of externally-owned short-term funds, there is probably little to choose between the dollar and the pound. Almost certainly, however, the dollar is foremost today as a medium of investment, if only thanks to the impressive economic development programmes of the United States Government and the operations of the World Bank.

(To be continued)

[4] In each of the post-war years (according to the official balance-of-payments estimates) receipts by way of "interest, profit and dividends" have exceeded outgoings under the same heading; but, only lately, has it been estimated that the amount of British-owned assets abroad well exceeds that of external liabilities. In October 1960, the Economic Secretary to the Treasury stated that, "if a full inventory coul'd now be made of all United Kingdom external financial assets and liabilities, I have no doubt that we should be seen to be a creditor nation, despite the large post-war loans we received from the United States and Canada, and the large overseas holdings of sterling."

[5] One official publication (dated 1957) stated: "About half the world's international trade and payments is transacted in sterling." Another (dated 1961) remarked that "sterling . . . is the currency in which about two-fifths of the world's trade is conducted." Perhaps, significance is to be read into the difference between "trade" and "trade and payments."

GENEVA TEXTILE PACT WELCOMED WITH SOME RESERVATIONS

PRODUCTION AND EMPLOYMENT DOWNWARD

From Our Special Correspondent

MANCHESTER, *20th February*

THE disclosure of the terms of the agreement reached at the Geneva talks on international trade in cotton goods was welcomed with some reservations in Lancashire. Under the new arrangements, the United Kingdom cannot be called upon to increase its imports of cotton textiles from low-cost producers—but cannot reduce these imports. A country which has its market disrupted by imports of cheap cotton goods can, under the new arrangements, ask the supplying country to keep exports to a level not lower than that of its sales in the first 12 months of the preceding 15 months period.

MANCHESTER LETTER

Mr. Roger Lee, Chairman of the Lancashire Cotton Corporation, expressed the view of many Lancashire traders at the Company's annual meeting when he said that the pact could provide a more favourable climate for Lancashire's textile industry, was based solely on the proviso that the British Government would be prepared to recognise the disruption which has already occurred in the industry, and would operate the safeguards provided by the agreement "with vigour and speed." He made it abundantly clear how essential it is that Lancashire should have the full support of the Government in maintaining a powerful front towards other countries which are bound to be affected by the proposals.

Relaxation Ahead?

Five years can be a relatively short time in an industry so prone to swift reversals of fortune as is the textile business in Britain and abroad. In view of the developments which have already occurred in the past decade and the enormous increase in arrivals from foreign sources, no emphasis of this particular point is necessary. Very much depends on the interpretation of what "disruption" means to an individual market, but the new agreement should at least provide some relaxation of the burden which has lain far too heavily on our local industry for a number of years.

In the absence of bilateral action to avoid threatened disruption of the domestic market, a 60-day period is permitted for negotiations, after which it will be possible to freeze imports at the level of the first twelve-month period of the preceding 15 months. Subsequently, the freeze can be extended for a further year and any increase in imports at a later date must be limited to five per cent per annum.

Few, if any, local traders would disagree with the Cotton Board's verdict that imports into the United Kingdom are already far too high. The basic period on which the agreement is planned happened to coincide with a phase of arrivals which permitted larger inroads than have ever been allowed before or since into this country. Other nations, notably the United States, have managed to avoid such a situation and their sufferings have been correspondingly smaller.

A Rescue Operation

Amid the various disheartening influences which are at present at work in the Lancashire cotton industry there remain many traders who are prepared to make a fight of it. Most of the official information which comes to hand presents a gloomy aspect; the figures of production and employment follow a downward trail; although imports have lately been reduced, the export situation can hardly be described as encouraging; lack of enterprise among customers is attributed to fears about oversupply and the questionable rate of future consumption.

It is scarcely surprising that the psychological effect of all this "talking-down" has resulted in numerous owners of mills refusing to chance their arm by indulging in the long-term re-equipment plans which were so much to the fore up to a year ago. Many traders are inclined to blame an absence of leadership, contending that, now that the politicians have quite obviously deserted the industry, the only hope is to make communal plans to eject the invader and, if necessary, put the trade on what amounts to a war-time footing.

Historically, antecedents hardly justify much faith in the various sections of the trade joining together for such a purpose. The individuality displayed by single companies, let alone a group of firms within the same branch, may have earned the region's reputation for rugged isolation in the past, but the time has come for the sinking of differences in an attempt at a rescue operation. In the past 15 years, collaboration has become far more widespread than it ever was before the war, but there is still considerable scope for improvement in this direction.

Profitable Business?

Many and varied are the schemes which traders are now contemplating as possibilities in their efforts to secure relief from an almost untenable position. One which is gaining adherents works on the basic premise that, so long as merchants find it remunerative to obtain goods from abroad, they will continue to import substantial quantities, provided no actual quota restrictions are imposed. This has always been a fundamental factor in the long-standing controversy about imports. Outsiders can certainly point out that importers would only continue to carry out their functions as long as the business was profitable.

To offset this situation, it is being suggested that the re-introduction of the old utility cloth schedules, under specifications drawn up by the British Standards Institute, would provide a solid platform on which publicity on behalf of the industry could be effectively handled. The intention would be to encourage consumers of textiles in Britain to avoid the purchase of foreign cloth by stressing the value and quality offered by the home producer. Details of such a plan would naturally be complicated, bringing some form of control into force and thereby creating opposition in some quarters. Every yard of British goods would need to be suitably stamped on the selvedge; price margins, for the benefit of customers, would be subject to restrictions.

Promotional activities by the Cotton Board in the past have proved their worth in certain markets, but a wider campaign on such a basis would probably require additional cash and levies or the use of accumulated reserves. All these ideas are obviously open to argument, but it is widely felt that, within the industry, the drift cannot be allowed to continue.

Positive Action Needed

Some action, even if it offends in certain quarters, should be taken to make a positive move forward. This does not imply that the negotiators at Geneva did not do their best, but their task against the combined opposition from the low-cost countries who wish to export more and the developed areas which are tightly guarding their own domestic markets gave them an uphill struggle.

A big boost for British standards in textiles is one way of trying to stem the tide. There are other aspects which deserve consideration but the trade itself would welcome an active pressure group operating on its behalf. Even such ventures must have their speculative element, although the aim may be high. A recent survey undertaken by Courtaulds showed how fickle the taste of at least one important section of the consuming public can be. An attempt was made to assess the clothing habits of the female teenager—defined as unmarried women between the ages of 12 and 24. They number 3,300,000, or 13 per cent of the total female population. Their average expenditure on clothing is £1 a week, involving an annual expenditure of £146 million or 20 per cent of the total spent on women's wear. The report says that teenagers' first consideration when choosing garments is style and colour. The material is secondary; even then it may not be the fibre which is important, but the general appearance of the cloth and whether it is suitable for the occasion.

Re-equipment Plans

A substantial re-equipment programme involving expenditure of more than £3,750,000 is being drawn up by the Lancashire Cotton Corporation, the big Lancashire cotton combine. Mr. Roger Lee, the Chairman, told the annual meeting of the Company in Manchester that a close watch would be kept on the situation before finally concluding firm orders. The Corporation had already launched a modernisation scheme involving £1,250,000 by the end of October last and the new programme consisted of a £2,500,000 project.

"If we are satisfied that there are good prospects of earning an adequate return from this expenditure, we shall proceed with the schemes," Mr. Roger Lee announced. Orders must be placed by July 1963 and the work completed by July 1964 to qualify for the 25 per cent subsidy offered by the Government. An increase in sales orders in the first quarter of the new financial year suggested that the pipelines which had been choked by excessive imports were now clearing, he continued, but it might take some considerable time for the full effect to be felt.—*All Rights Reserved.*

USE OF RADIOISOTOPES IN TEXTILE INDUSTRY

Wider use of radioisotopes in the textile industry was forecast at a conference held in Manchester on 24th February 1962. The conference was sponsored by the isotope group of the Textile Institute in conjunction with the United Kingdom Atomic Energy Authority. Believed to be the first conference of its kind devoted to uses of isotopes in the textile industry, it was attended by the representatives of all sections of the trade.

Mr. H. E. Knobil, presenting a paper on some current uses of radioactive isotopes in the textile industry, said that they had a great potential application in such fields as quality control of warp knitted fabrics, the application of resin finishes (to make materials crease-resistant and give them quick-drying properties), and the measurement of threat thicknesses. Dr. J. C. Putman, of the Atomic Energy Authority's research laboratory at Wantage, in a paper on new techniques and possible future uses of isotopes in the textile industry, stated that he foresaw greater use of radioactive control devices in the processing of natural cotton and in the spinning and weaving sections.

THIS IS AN ANNOUNCEMENT AND NOT A PROSPECTUS

Consent of the Central Government has been obtained to this issue by an order of which a complete copy is open to public inspection at the Registered Office of the Company. It must be distinctly understood that in giving this consent the Central Government do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinion expressed with regard to them.

A Licence has been obtained from the Central Government for the establishment of this new Industrial Undertaking of which a copy is open to public inspection at the Registered Office of the Company. It must be distinctly understood that in granting this Licence, the Government of India do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinions expressed in regard to them.

A copy of this Prospectus, having attached to it the documents required by Section 60 of the Companies' Act 1956, has been delivered for registration to the Registrar of Companies, Delhi.

Application will be made to the Stock Exchange at Bombay for permission to deal in and for an official quotation of the Equity Shares of the Company.

The subscription list will open at the commencement of Banking hours on the 12th March, 1962 and will close at the discretion of the Directors but not earlier than the close of the Banking hours on the 14th March, 1962.

Application in the Company's Printed Form should be made for a minimum of 5 shares or multiples thereof on the basis of the Prospectus copies of which along with the application forms are available from the Brokers and the Bankers to this Issue.
