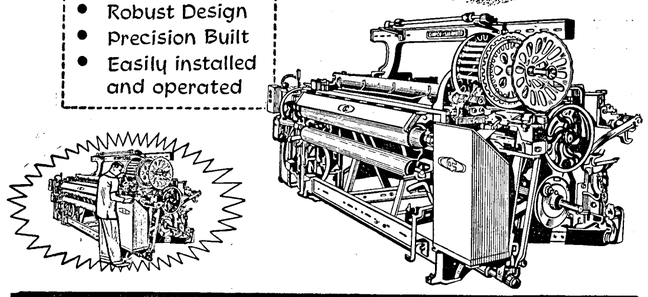
One of the two latest loans is for $15.6 million (Rs. 7.5 crores) to the Hindustan Motors Ltd. (Calcutta) which currently manufactures about 25 per cent of the trucks and 50 per cent of the cars and jeeps produced in India. It will enable the company to step up its capacity for manufacturing Bedford trucks from 9,000 to 10,500 per year and increase the indigenously-manufactured content of Hindustan's Bedford vehicles from 74 per cent to 90 per cent. The other loan of $13.7 million (Rs. 6.5 crores) is being made to Tata Engineering and Locomotive Co., Ltd. (Jamshedpur) which manufactures only Mercedes-Benz trucks and no cars. This company has already doubled its production from 6,000 vehicles in 1955 to about 12,000 in 1961. The U.S. A.I.D. loan will enable T.E.L.Co. to expand its plant capacity from 12,000 vehicles a year to 18,000 a year and increase the indigenously-manufactured content of the vehicles from 74 per cent to 86 per cent by 1964 and 90 per cent by 1965. It is expected that the truck expansion projects of both the companies will be completed by 1963-64.

The two loans which are being provided through the Agency for International Development, carry, as in the case of other loans from this organisation, no interest but only a service charge of ¾ per cent and are repayable by the Government of India over a period of 40 years, with no payments being due during the first 10-year grace period. The two recipient companies will, however, be required to repay the loans to the Government of India over a 10-year period with an interest charge of 5¾ per cent—a rate which compares favourably with the terms currently available in the Indian capital market. It is noteworthy that the present loans are analogous to those given by the World Bank's associate, the International Development Association, in that they will keep to a minimum the burden on India's balance of payments.

IN AUTOMATION LIES
the future of India's textile industry
CIMMCO-SAKAMOTO
AUTOMATIC LOOMS

- Robust Design
- Precision Built
- Easily installed and operated



Made in India by Cimmco in close collaboration with Messrs. Enshu of Japan - Manufacturers of world famous Sakamoto looms - Cimmco - Sakamoto Automatic Looms are a vital necessity, for India's textile mills.

CIMMCO-Sakamoto looms are backed by a powerful loom-building tradition combining Cimmco's 18 years of experience with Enshu's 34 years. Sakamoto type looms are used in more than 40 countries of the world, and over 60% of the automatic looms installed in India are of the Sakamoto type.

With a low initial investment Cimmco Sakamoto automatic looms produce a greater volume and variety of quality textiles at lower running costs than any other looms in the same range.

THE SPENDING OF A "HAVE"

HOW THE GAD-ABOUT BRITISHER LIVES

(From Our Own Correspondent)

LONDON, *7th December*

LONDON LETTER

THE British social-economic statistics of consumer spending attract relatively little attention in this country because they lack colour for the individual consumer. The individual industry is also quite well informed from its internal data as to what is happening to it and the cinema industry, for instance, hardly needs to look up these statistics to discover how far its box office receipts have dropped.

But with so much more attention being given to the standard of living in the underdeveloped areas, the British statistics form a useful basis of comparison; after all, Britain is one of the "have" countries. How does the average citizen of such a country spend his money? How much of his spending is essential and how much is luxury? Of course, there is no such thing as an average citizen. Last year, there were 27 million individual incomes being earned (a fraction over half the total population was earning) but they were earned over a very wide range: nearly 20 per cent, that is rather more than five million incomes, were under £5 per week; a fraction over 25 per cent of all incomes were between £5 and £10 per week; about 23 per cent earned between £10 and £15 per week; less than 20 per cent earned between £15 and £20 per week; and only something like one-eighth of the total number of incomes was over £20 per week. So when we look at the total of personal spending we are looking at "average" for the nation as a whole which varies widely from group to group. In the lowest income groups the proportion spent on necessities is obviously very much higher and that proportion goes down as the income range rises; but for the purpose of comparison of one nation with another, the average serves.

Change in Pattern

There has been a great change in pattern over the past ten years and the following table shows the amount of money spent on necessities against the total available income. The first part of the table takes current prices and the second part translates them all into prices at the level of 1958.

Consumer Expenditure

(In million £s)

	Current prices		1958 prices	
	1951	1961	1951	1961
Food	2,947	4,989	4,061	4,879
Alcoholic drinks and tobacco ..	1,974	2,283	1,741	2,181
Housing, fuel and light ..	1,227	2,393	1,808	2,167
Clothing	1,116	1,687	1,171	1,644
Household goods	827	1,327	912	1,307
Total of necessities	7,691	12,664	9,693	12,178
All other expenditure	2,488	4,672	3,178	4,477
Grand Total	10,179	17,336	12,871	16,655

In terms of money, incomes and spending have risen 70 per cent in the past decade; in terms of real value they have risen less than one-third; the difference is the measure of inflation. It will appear strange to many that last year in real terms this country spent a little more on alcoholic drink and tobacco than it did on housing, fuel and light. One may question whether alcoholic drink and tobacco should be put into the category of necessities but for the consumers of these items there is little question: they would rather go without other things than go without these. Even so, for the non-smokers and non-drinkers of this world, that one-eighth of Britain's spending should be on these items must seem unreal.

Rising Standard

Evidence of a rising standard of living is provided in the lower ratio of food to total spending in 1961 than in 1951. Such expenditure rose over the decade by one-fifth (against about, say, 30 per cent for all items) indicating that anticipations were being achieved and surplus money diverted to less essentials. The smallest rise in housing, etc., is largely due to the control of rents—it does not indicate that demand is being satisfied. On the other hand, increases of nearly 45 per cent in the expenditure on clothes and household articles shows how spending has switched into these as incomes rose and as de-rationing and a freed economy enabled production to catch up with demands frustrated during the War and immediate post-war years.

All other items rose about 40 per cent for similar reasons and since over one-quarter of Britain's spending was in this "residue" it is interesting to see of what it consists. Here are the main items:

(In million £s)

	Current prices		1958 prices	
	1951	1961	1951	1961
Cars	74	521	88	553
Books	150	268	236	238
Travel	527	1,128	706	1,031
Entertainment	214	266	233	266
Miscellaneous goods and services	1,514	2,489	1,865	2,389
Total ..	2,488	4,672	3,178	4,477

When one has gasped at a nation which can afford to spend one-quarter of its income on non-essentials (more, of course, if one took into account the semi-luxury items in the household goods and drink and tobacco classes) one can hardly be surprised that half of these items are so widely spread as to defy summary classification—they range from the cost of domestic service to chemists' goods and sports equipment.

The separately classified items are all curious: the British spend *no more* on books now than ten years ago—the only important items not to rise. But what about entertainment—if the British do not read why aren't they going to the theatre and cinema? The answer is television, and expenditure on television sets is under household goods for the modern household regards kitchen stoves and television sets as all one in importance; so the British take their pleasures at home, eyes glued to the television set, while the cinema languishes—spending on this being only *one-third* in real terms of what it was ten years ago and half what it was five years ago.

What the British are really spending their surplus money on is motor cars (the jump is due to the ending of petrol rationing) and travel—and it is quite clear that they are on the move more than ever before.

SUPERSONIC TRANSPORT

IMPLICATIONS OF ANGLO-FRENCH AGREEMENT

By Our Aviation Correspondent

THE signing of an Anglo-French agreement to collaborate in the development of a supersonic transport marks the end of a long-drawn-out controversy. That is not to say that opponents of the SST—and they are not few—have been silenced. There will, no doubt, be plenty of criticism as the project proceeds. It does mean, however, the end of uncertainty. We now have some indication of the size, shape, and capability of the airliner to be developed, with approximate dates—1966 and 1970—for first flight and entry into airline service.

Specific details have not yet been released, but, so far as present information goes, both Britain and France will each build a prototype. Whilst these will be geometrically identical, that built in France will be a medium-haul version with a maximum range of 2,750 miles. The British version will be long-haul and designed specifically for the transatlantic routes. The cost of the joint-project is estimated to be £175 million and the greater part of this sum will be found by the two Governments.

Opponents of the SST range from national Governments to powerful aeronautical organisations and individuals. By and large, however, opposition is confined to three main lines of argument. These are, first, the unknown, and probably harmful effects of cosmic radiation at the altitudes at which supersonic liners will fly; secondly, the equally uncertain reaction of the public to the effects of the 'sonic-boom' and the noise nuisance generally; thirdly, the prodigious cost of development—funds, the critics complain, which could far more usefully be devoted to such aeronautical projects as the vertical take-off and landing (VTOL) transport.

There can be no doubt that, to date, no one has conclusively or authoritatively assessed just what the effects of cosmic radiation and the sonic-boom are going to be. These issues remain to be resolved. Nor can it be denied that, from many points of view, the vast sums, now to be expended in the development of the SST, could, as usefully, if not more usefully, be spent on aeronautical projects of potentially greater commercial and public utility value. All these aspects, however, have been threshed out at great length over the past two years. The object of this article is not to add to these marathon discussions but rather to examine the economic possibilities of the Anglo-French venture.

The economics of an airliner are, of course, based on certain known factors—first cost, for example, its productive capacity, its seat or ton-mile costs of operation, and its useful competitive life. It would be idle, at this early stage, to attempt to work out such figures in respect of the 'Concord'—that, incidentally, is the name chosen for the Anglo-French project. The available data is quite insufficient. The best that can be done is to apply the probable configuration and performance to the known facts of present subsonic jet operation.

Take first cost, for example. Assuming the long-range version to seat 90 passengers—which seems to be the proposed configuration—and assuming a speed of Mach 2.2, it has been computed that, to carry the entire present trans-atlantic traffic, only some twenty units would be required. That seems to pose an initial problem of some magnitude. If the airlines are to avoid a situation of enormous surplus capacity, the number of units required for total world operations must be extremely limited. In other words, the numbers which can be sold are likely to be small. That, in turn, argues a very high first cost. Possibly, one difficulty cancels out another, so high is the first cost likely to be that few individual airlines will be able to afford a fleet of Concords. All this, of course, is mere speculation but it does seem to make nonesense of the manufacturer's suggested break-even figure of 130 units.

The principal reason is that all the present subsonic jets are of such comparatively large capacity that only thus can their seat-mile or ton-mile costs of operation be reduced to an economic level. That being the case, the long-range Concord, with capacity seating of only 90, will start, one can only surmise, at a considerable economic disadvantage. Even assuming that supersonic and subsonic jet costs will be very similar, the seat-mile costs of the Concord are bound to be higher. This argues, one suggests, either a substantial fare differential or the attainment of exceptionally high load factors. Neither alternative is necessarily unreasonable. Supersonic travel will, presumably, be such a novelty—and to some, at least, such a convenience—that, even at increased fares, high load factors are likely to be achieved.

The hinge upon which all else will turn is, perhaps, the question of time. What kind of a market lead can the Concord achieve over a possible American competitor—or, assuming some thaw in the cold war, even a Russian competitor? Whilst Britain and France are confident that their research, in this particular field, is considerably ahead of the United States, the latter's enormous productive capacity cannot be ignored. So far as we know, at present, the Americans plan to launch development of a Mach 3 transport—a vehicle, that is to say, some six hundred miles per hour faster than the Concord. It is an ambitious programme. Even assuming, however, that this will not be in service till 1972, will the Concord's two-year lead prove a decisive selling factor? It remains to be seen.

Finally, the productive capacity of the Concord, in terms of annual seat-miles—and, consequently of course, its seat-mile costs of operation—must depend, very largely, on the kind of block speeds achieved. If the aircraft meets its specification of Mach 2.2 (1,450 m.p.h.) on routes such as London-New York, it should average a block speed of 900 knots. On medium-haul routes, the block speed will, of course, be very much less. But, on all routes, the block speed will depend on the kind of aids—meteorological, directional, and landing—provided, and the standards of traffic control maintained.

The inadequacy, even for subsonic jets, of aids and facilities on many international routes today is a source of continual complaint; there is, too, growing congestion at many major airports. Can all this be rectified, and the system brought up to supersonic standards, in the comparatively short space of seven years? It is a task of considerable magnitude and, judging by past records, one is by no means optimistic of the results.

SALE OF 'CORPS DIPLOMATIQUE' CARS

The procedure for the disposal of cars imported without payment of Customs duty by diplomats and diplomatic missions organisations in India has been revised. A diplomat leaving India either on transfer or at the end of his assignment may re-export his car or sell it to another diplomat or diplomatic mission in this country. Alternatively, he may offer to sell it to the State Trading Corporation. If the offer is accepted, the car would be purchased at the full c.i.f. price without deduction of any depreciation charges. If the S.T.C. is not interested in the offer, the diplomat will be informed accordingly and he will then be free to sell the car in the open market. Such a sale, however, will be subject to the fulfilment of customs regulations regarding payment of duty, procedure for sale, disposal, etc. This revised procedure will also apply to cars and similar vehicles of diplomatic missions or organisations which are proposed to be offered for sale in India.

NEW
FORTLOK CONSTRUCTION
GIVES DUNLOP
CONVEYOR BELTS
AN EDGE
OVER OTHERS

Conveyor belts are most vulnerable at the edges. The new Dunlop **FORTLOK** construction more than doubles the life of the belt edge by providing double edge cushioning capacity.

A common cause of belts wearing out prematurely is edge wear due to rubbing against the side of the structure, against the chute, against jammed abrasive loads, or by the excessive use of guide idlers. When the edge has been worn or torn away, further wearing of the edge and consequent belt deterioration is usually comparatively rapid.

Dunlop **FORTLOK** overcomes this problem. Note its construction as shown under the magnifying glass in this illustration of a conveyor belt section.

- The thickness of the edge protection rubber has been doubled as compared with the conventional conveyor belt edge.
- Note, too, that the edge rubber has been keyed into the carcass of the belt which produces an anchorage infinitely greater than in conventional belt edges. This permits the use of thicker edge protection of assured stability—especially important where guide idlers or trippers are used.
- The thicker, stronger edge protects the belt carcass from attack by moisture, grip, acids, alkalis or oils.

FORTLOK is a registered Trade Mark.

MONETARY SITUATION IN PAKISTAN

AN APPRAISAL OF PROBLEMS AND SOLUTIONS

THE credit and monetary situation in Pakistan seems to be inherently healthy and bids fair to be so in the next few years, provided energetic steps are taken to remove some of the handicaps. This at any rate is the broad conclusion that emerges from the special report which the Economic Adviser to the State Bank of Pakistan, Dr. S. A. Meenai, recently submitted to the Governor of the Bank. The report is based on a comprehensive appraisal of the credit and monetary situation in the overall framework of the Government's declared policy objectives and the revised second Five-year Plan. In the report, Dr. Meenai has made a critical evaluation of the role of credit mechanism in Pakistan's economic development, with particular reference to the part played by the State Bank, pinpointed the problems confronting the monetary authorities and offered several constructive solutions therefor.

It would appear from the data presented in the report that the marked expansion in economic activity noted in Pakistan during the last few years might not have taken place but for the vital contribution made by the banking sector. Increasingly larger and larger credit facilities are being made available by the banks. Thus, between June 1959 and June 1962, bank credit spurted by 120 per cent, from Rs. 130.20 crores to Rs. 286.15 crores. As against the rise of Rs. 156 crores in credit, the aggregate deposits of banks have gone up by only Rs. 105 crores, from Rs. 262.30 crores in 1958-59 to Rs. 369.72 crores in 1961-62, so that the credit-deposit ratio has increased from a low of 49.6 per cent to as high as 77.4 per cent. There was, therefore, considerable strain on the liquidity position of the banking system. Naturally, the scheduled banks had to make a more intensive use of their resources through increased lending

and borrowing among themselves. This is evident from the inter-bank borrowings which touched an all-time high of Rs. 30.14 crores in the 1960-61 busy season—they were, of course, lower at Rs. 28.41 crores in 1961-62—as against Rs. 16.33 crores and Rs. 7.34 crores, respectively, in the busy seasons of 1959-60 and 1958-59, respectively. The State Bank of Pakistan has played a key role in enabling the scheduled banks to meet the growing demand for funds for the private sector, besides making available sizable counter-finance for lending to the Government. The peak level of banks' borrowings from the State Bank stood at Rs. 77.63 crores in 1961-62, as against Rs. 47.88 crores in 1960-61 and Rs. 21.23 crores in 1959-60.

Flexible Credit Policy

The State Bank, it is claimed, has endeavoured to pursue a flexible credit policy with a view to directing the flow of credit to most productive uses and to support the economic policies of the Government. "Its credit and monetary policy," to quote the report, "has, in general, been quite liberal and can by no stretch of imagination be termed as restrictive. In exercising its credit control powers, the State Bank has generally resorted to qualitative measures in preference to quantitative measures." Dr. Meenai has dismissed as incorrect the allegation that the selective credit control measures adopted by the State Bank from time to time are designed to check and restrain the overall expansion of bank credit. Their underlying intention, according to him, has only been to distribute the scarce resources in the most economical manner among essential users and to prevent their dissipation in less important pursuits. The State Bank, we are told, has played an equally important role in (*a*) assisting the co-operatives and helping the expansion of agricultural credit; and (*b*) providing liberal assistance to the State-sponsored corporations such as Agricultural Development Bank, Industrial Development Bank and House Building Finance Corporation.

The Economic Adviser to the State Bank of Pakistan has sought to view the problem of credit expansion in the perspective of the overall rate of monetary expansion. His main conclusions are as follows:

"The principal aim of Government policy all these years has been to work off the excess demand from the economy by increasing the domestic availabilities by way of larger production and higher imports and at the same time to keep the rate of monetary expansion down. That this policy has had a highly salutary and stabilising effect on the economy making possible the relaxation of controls and remarkable movement towards a freer economy in the framework of overall price stability cannot be denied. Similarly, it is fairly clear that our external situation would have been considerably worse if the rate of monetary expansion had not slowed down so distinctly. True, there have been some complaints that the economy is developing a slack and is approaching a deflationary situation. However, judging from all available indicators, there seems to be little justification for such exaggerated apprehensions. While there have been adjustments in relative prices, the overall price situation indicates remarkable stability. . . . Meanwhile, investment activity in the economy continues at notably high levels."

Monetary Expansion Will Pick Up

The analysis of Dr. Meenai reveals that, though money supply in the conventional sense has not risen so sharply—the actual rise between 1958-59 and 1961-62 was only Rs. 54.50 crores (at constant prices)—the total monetary resources, that is, money supply plus quasi-money or time deposits, at the disposal of the economy have maintained a rapid rate of expansion, as is evident from the accompanying table. A close examination of the forces at work shows that the rate of monetary expansion in Pakistan's economy will pick up perceptibly for the following reasons:

1. The foreign sector is in no position to provide the offset against expansion which it had during the past year.

2. While it is difficult to be certain about the future tempo of releases and accumulations, the role of the counterpart funds seems to have been reversed. They had in the past served as an offset to the Government sector proper. Judging from the present trend, they have assumed an expansionary role.

3. The expansion in the private sector shows no signs of slackening and may well exceed the levels attained last year.

4. The State Bank is being called upon to provide assistance on an increasing scale both in the form of counter-finance and primary reserves to the commercial banks, co-operatives and the Government-sponsored credit agencies.

5. The Indus Basin Account has so far exerted a contractionary influence on money supply. This cannot be regarded as a lasting factor.

A Warning

In the light of the above possibilities, Dr. Meenai contends that there is no case for any deliberate effort to expand money supply. Emphasising that the objective before the country today is to maintain a high rate of economic growth within the framework of economic stability, he says: "It is our firm belief that, by creating a healthy climate for long-term investment, both foreign and domestic, a higher rate of development can be achieved and sustained." The State Bank's whole approach has been to press for strengthening the external situation which is having an impact on the internal situation. Knowing as it does that this is a long-drawn-out process, it has thought it fit to resist an inordinate increase in money supply so long as the country's foreign exchange situation does not permit it. Dr. Meenai has warned against any action that may aggravate the external imbalance and set at naught the progress which the country has made in recent years and which it is anxious to accelerate by giving a push to monetary expansion.

If there is no case for a deliberate effort to accelerate the rate of monetary expansion through large-scale deficit financing, there is, it is pointed out, even less justification for enlarging the flow of bank credit further, inasmuch as excessive credit creation for the private sector carries with it the same dangers that are involved in deficit financing. To quote Dr. Meenai again:

"The excessive credit creation resulting in inflationary pressures almost inevitably gives rise to balance of payments difficulties. The use of bank credit in the realisation of a higher rate of investment pushes up the internal price level and tends to effect export earnings both through a loss in the competitiveness of exports and reduction in exportable surplus. This, in turn, necessitates the imposition of severe restrictions on imports leading to a vicious circle."

Deposit Mobilisation

The need for keeping the overall credit supply within reasonable bounds is regarded as urgent, especially because of the steep rise in credit-deposit ratio which has gone up, as already noted, from 49.6 per cent in June 1959 to 77.4 per cent in June 1962. The latter figure is higher than in Ceylon (49.4 per cent) and India (72.0 per cent). It is in this context that Dr. Meenai has underlined the urgency of safeguarding the soundness of the banking system. The solution to the problem lies, according to him, in the merger of weak banks with the financially stronger units, as well as in the liquidation of banks which are so unsound and weak as to be beyond repair. Pointed attention has been drawn to the fact that, while the overall operations of banks have increased manifold over the past years and branch expansion programmes have been carried out vigorously, adequate attention has not been paid by the banks to the need for augmenting their capital and reserves commensurate with the expansion of their operations. Indeed, the ratios of capital and reserves to deposits and to earning assets have declined significantly. Four specific suggestions have been made in this connection. First, the banks should be actively encouraged and, if necessary, be forced to divert a part of their profits to building up reserves. Two, only banks sponsored by parties of high financial standing must be allowed to be started. Three, the proportion of cash, gold and unencumbered securities in the total assets that the banks are required to maintain must be stepped up from 20 to 30 per cent, which incidentally is the traditional ratio in vogue in Britain. Four, in order to inspire confidence of depositors in the banking system, the Deposit Insurance Scheme which has already been agreed upon in principle should be implemented

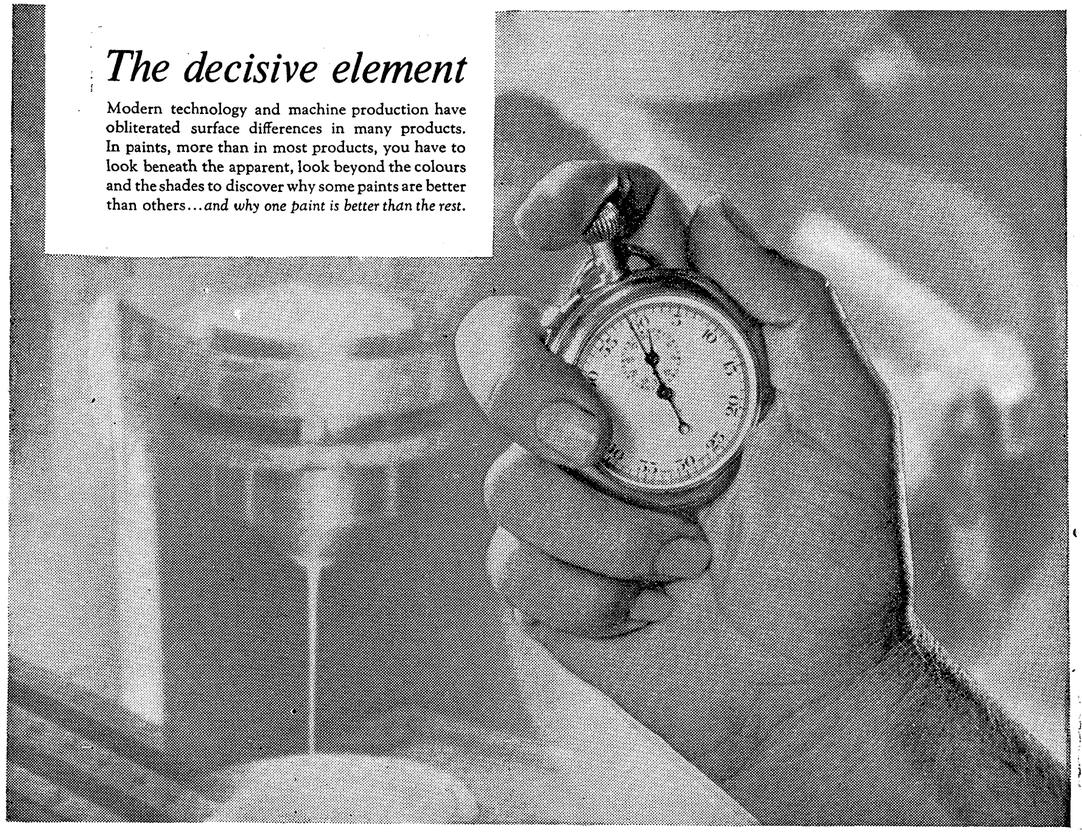
The decisive element

Modern technology and machine production have obliterated surface differences in many products. In paints, more than in most products, you have to look beneath the apparent, look beyond the colours and the shades to discover why some paints are better than others... *and why one paint is better than the rest.*



Quality-control

Quality-control is a manufacturer's contract with himself. Quality-control is the voice of rectitude forever repeating "do not compromise". Quality-control is the essence of leadership. Shalimar Paint has progressively raised quality-control standards as finer raw materials have been discovered, improved processes evolved and new products developed. Quality-control—a decisive element in manufacturing—has made Shalimar paints the leading choice for use in India's homes and industries over the last sixty years. In every Shalimar paint you are offered the sum of four decisive elements—resources, research, know-how, quality-control.

SHALIMAR PAINT
pathfinders in paintmaking

JWTSPW 701

expeditiously. On the question of deposit mobilisation, Dr. Meenai commends for acceptance the following course of action:

The procedural framework in which banks work must be simplified especially in respect of small accounts.

It is necessary not only to minimise the risk element but also to make depositors aware of all the advantages that they can obtain by dealing through banks.

People must be educated in the methods of operating bank accounts.

The banks must gradually move towards a higher deposit-rates structure; the real purpose must be to achieve a material increase in average deposit rates—they range from slightly above 1 per cent, whereas the average advance rate is well above 5 per cent—rather than setting the banks against one another.

Everything possible must be done to enlarge the institutional framework of the banking system by enabling it to spread its offices far and wide.

There seems to be a powerful case for providing a measure of fiscal incentive—as, for instance, tax exemption on interest income—for deposit-mobilisation and promotion of banking habit.

Banking Facilities

A brief reference to Dr. Meenai's picture of the growth of banking facilities in Pakistan over the past few years may be made here. Between 1st July 1948 and 30th June 1962, while the number of scheduled banks has declined from 38 to 33, the number of banking offices has increased from 195 to 713 (217 in East Pakistan and 496 in West Pakistan). The country has now one bank office per 131,500 of population, as against one office per 150,000 persons at the end of the first Five-year Plan. The second Plan (1960-65) target of 250 additional bank offices had been more than fulfilled by June 1962.

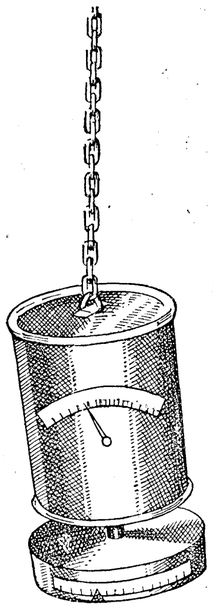
Dr. Meenai is of the view that the question of the State Bank providing financial resources to the State-sponsored credit corporations will assume larger proportions in the years to come. He feels that this problem can be tackled, as in the case of India, through the establishment of a Refinance Corporation. And he makes it clear that, to the extent the State Bank has to assist the State-sponsored corporations, it may have to cut down its assistance to the commercial banking system.

How the Government of Pakistan's operations and policies have impinged upon the credit situation and what policy adjustments are warranted to rectify the position have also been discussed by Dr. Meenai. The total advances made by scheduled banks to the Government have gone up quite perceptibly from Rs. 11.82 crores in 1957-58 to Rs. 44.61 crores, raising the percentage share of Government in the total bank credit from 9.6 to 11.4. Dr. Meenai has not hesitated to urge for greater restraint on the part of the Government in exercising its claim on bank resources.

Interest Rate Policy

The interest rate policy has also been examined at some length by Dr. Meenai. In his considered view, a rise in Bank rate from the present level of 4 per cent, to which level it was raised from 3 per cent in January 1959, can hardly exert any decisive influence in restraining consumption, in view of the substantial non-monetised sector net covered by the banking system, the nascent stage of the Gilt-edged market, the disruptive effects of a steep decline in the market value of fixed-interest bearing securities on the country's financial structure and the growth requirements of the economy. As an alternative, Dr. Meenai has advocated the institution of a quota system under which the banks will have to pay a penal rate of interest on a graduated scale, if their borrowings from the State Bank exceed certain limits. This system, he says, combines the twin advantages of curbing credit demand and providing an incentive for mobilising deposits by pushing up deposit rates. As a corollary of this system, he suggests the need for necessary adjustments in the Gilt-edged market so as to raise the yield and mark down prices, thus taking away the incentive for unloading securities on the State Bank. He wants the Government to be persuaded to agree to a higher yield pattern on its future borrowing programmes. In particular, he emphasises that the Government should convert a good part of the *ad hoc* Treasury Bills into a funded debt carrying a more realistic rate of interest.

It will be noted from this account of Dr. Meenai's recommendations that he wants the State Bank of Pakistan and the Government of Pakistan to adopt measures similar to those which have been in force in this country for nearly two years. This is an indirect tribute to India's monetary policy.



DOODLE BUG

In the early days of oil, prospectors were introduced to an amazing invention which, it was claimed, would detect underground oilfields. The device appeared to be merely a tin suspended from a chain. Held above the ground it would whiz round and point out the place where oil was sure to be found.

Of course the whole thing was a hoax. Oil explorers have learnt better since then. Today, scientific instruments are in use which really *do* help the search, but the final answer always depends on the driller's test well.

The principal and most successful tools of the modern oil-seeker are the techniques of exploration geophysics. These cannot point directly to oil, but in favourable circumstances they can indicate places underground where oil *may* be found.

UNEVENNESS IN COTTON TEXTILE TRADE

MILLOWNERS EXTREMELY CAUTIOUS

From Our Special Correspondent

MANCHESTER, 4th *December*

MANCHESTER LETTER

"PUBLIC confidence in the well-being of an industry is something which has to be worked for." With these words, Sir Cuthbert Clegg, as Chairman of Combined English Mills (Spinners) Ltd., put in a nutshell what many people within the Lancashire trade are thinking. That his additional comments on current conditions reached a wide public through the medium of "banner" headlines was not entirely his fault. It is cotton's misfortune that both its ills and its prosperous periods are often magnified beyond justification. Good tidings from an industry are exceedingly welcome, but they can be built up beyond their immediate importance. Equally so, the depressing phases, as Lancashire knows only too well, can be made to sound far more disastrous than they really are.

At the same time, Sir Cuthbert mentioned twin factors which the local industry must accept if it is to gain ground in the years ahead. Both are fundamental, but there is in some quarters a slight tendency to take an ostrich-like attitude of ignoring the obvious. The first objective, he said, was to recognise the challenge of the new Europe in the conception of Britain as a member of the Common Market. More than average efficiency, including high machine utilisation and good management, would be needed to take full advantage of the new conditions. The second acceptance was of the fact that considerable imports of cheap cloth from the Far East Commonwealth countries were here to stay. "Since the ceilings to the level of imports have already been fixed by the Government to the end of 1965, we must carve out a market which takes those imports into consideration," he declared.

The current situation, in which more activity has emerged, has led to some contradictory statements being made. Sir Cuthbert reported a general improvement in the volume of business. Increased demand, he added, has made it possible to refuse unprofitable business. Others within the industry, while not challenging the fact that further negotiations are in progress on a wide front, do not subscribe to the view that margins have risen to a point where they can be described as even reasonably remunerative. Stocks of manufactured goods in the pipelines, according to Sir Cuthbert, are decreasing while many weaving and hosiery trade consumers of yarn are fully employed, and are delivering all their production.

Emblazoned on the front page of a newspaper circulating widely in City circles, this encouraging comment has been reflected in a sharp advance in textile share prices. Without wishing to pour cold water on this laudable attempt to restore confidence to the industry, it can scarcely be denied that some of the financial figures likely to be received in the next few weeks will have just that effect. The stock markets will then quickly forget that returns published in December cover the major part of a year when business has been negligible and margins disappointingly low. The outlook, however, is now far more stimulating and should bring a bigger offtake in due course.

Making the Worst of it

As if to illustrate just how contrary the trade can be in doing itself damage, the Textile Action Group emerged from a few weeks of self-imposed seclusion with a statement refuting Sir Cuthbert's comments, apparently with the object of making the worst of the situation. This organisation, whose "off beat" activities have accentuated any cleavage of opinion there may be within the industry, claims to have investigated the position of its members and others, and found "no evidence whatsoever of any improvement in trade sufficient to justify public confidence in the industry as shown by the advance in share prices."

To complete the picture of widespread confusion, Mr. J. H. S. Wishart, Chairman of the Household Textiles Association, chose the same day to deplore the image of the industry presented to the public by the newspapers. From reports appearing in many publications, he said, the public could scarcely be blamed for regarding the cotton trade as "a group of spinners who had failed to move very far away from the machinery of Richard Arkwright, lacking the energy or ability to utilise the new machinery which a generous Government is providing out of the taxpayers' pockets."

Giving Favourable Facts

Such misconceptions, as he said, are all too frequent, but we must join issue with him on certain of his further remarks. "One might expect some newspapers to be interested in presenting news of the firms concerned with expansion and increased employment as against contraction and redundancy," Mr. Wishart said. "I am sure the trade would gladly provide the opportunities for more factual reporting of its activities."

In actual experience, this has not always been the case. We should welcome the opportunity to present the success stories referred to by Lord Rochdale at Harrogate a few weeks ago. Such a project is at present in the blueprint stage, but its effectiveness in brightening the image of the industry will depend very largely on the co-operation received from those individual firms which are prepared to make their good deeds more widely known.

A Sombre Record

Keeping a record of the fortunes and misfortunes of a single industry can be a sobering experience; when that industry comes within the general heading of textiles, with its recognised unevenness in trading, the task can become at times extremely disheartening. Most of the dismal forecasts made by company chairmen earlier in the year are now being reflected in the figures coming to hand. Whereas profits were still being earned in those reports announced in 1961, the threat of a move "into the red" has now in a number of instances become an established fact.

Among the major companies which have lately made announcements both Joshua Hoyle and Sons and Combined English Mills (Spinners) have incurred deficits, the net results being losses of £73,000 and £145,000, as against comparable profits of £236,000 and £465,000, respectively. Such a sharp reversal of fortunes is indicative of the very troubled times through which the trade as a whole has been passing, and seems to emphasise the fact that both horizontal and vertical organisations have found the going equally tough.

Still on the right side of the ledger was the net profit earned by Tootal, but again the figures showed a steep drop, from £340,000 to £195,000. An exception to the general rule, however, was provided by Nahums, whose former net loss of £95,000 became during the past year a small net profit of £7,000. In contrast, the profit of £35,000 previously announced by Thorne & Co., the merchanting group, has been transformed into a trading loss of £250.

Cautious Approach

Most boards of directors are being extremely cautious in their approach to the future, which is scarcely surprising after the disturbing experience of the recent past. Interim dividends have been almost uniformly lower than 12 months ago and among those companies which have reduced their payment in this way are Hayeshaw, Clegg and Orr, Crosses and Heatons and Swan Lane Spinning. Several textile firms have issued statements which contain direct warnings to shareholders and public alike about future trends. For example, John Bright and Bros., although maintaining their interim payment, pointed out that reduced margins had already had a marked adverse effect on profits. Wardle and Davenport, the Leek manufacturing group, went further and, in passing the interim dividend, forecast that losses over the full year would be incurred, despite the closure of their hosiery section which had proved unremunerative. On the other hand, a rather better outlook is forecast by Boardman, Marden, whose transfer from straightforward textile manufacturing to making-up and the drapery trade has involved some

IHTY-4

COTTON SUPPLY SITUATION

SHARP FALL IN FUTURES CONTRACT

THE cotton futures market has depicted a persistently declining trend of late. The fall in futures values, which started since the beginning of November, has now developed into a veritable slump. The Jarilla March 1963 contract, the only hedge contract of the season, has recorded a fall of as much as Rs. 77 per three quintals since the beginning of November when the downward trend started. Thus, it is currently quoted at as low as Rs. 668 per three quintals, as compared with Rs. 747 as on 1st November last.

In a bid to arrest the fall in prices and to eliminate wide fluctuations, the Forward Markets Commission has decided to limit, with immediate effect, the weekly fall in the price of the Jarilla March contract traded at the East India Cotton Association, Bombay, to Rs. 10, when the price rules below Rs. 675 per three quintals. Accordingly, for the current week, which commenced on Monday the 10th inst., forward trading will not be permitted below Rs. 622.25, that is, Rs. 10 below the closing rate on that date. For the next week, the limit will be fixed with reference to the closing price on the last trading day of the week. Similar limits have also been prescribed for contracts at other recognised associations at Ahmedabad, Akola and Ujjain.

The setback in cotton futures is attributed to many factors. The most important of them is lack of mill support. Mills are said to be worried about heavy accumulation of cloth stocks with them which are currently estimated at 646 million yards, as compared with 571 million yards at this time last year. In the normal course, stocks of this magnitude, which are equivalent to only six weeks' domestic consumption, should not cause much strain on the finances of mill companies. But in the context of the banks' reluctance to make available adequate credit facilities at reasonable rates, mills are said to be feeling the pinch very much. Another factor which has contributed to the bearish trend in the futures market is the expectation of a good crop of 5.4 million bales during the season which is 700,000 bales more than last season's crop of 4.7 million bales. Although the recent unseasonal rain in certain areas had given rise to fears that the crop would be affected, the crop picture has not changed materially. In fact, some are inclined to think that the rains were beneficial for picking and that the crop would be better because of it. Even if the crop turned out to be a little less than the latest unofficial estimates, prices are not expected to rise steeply, thanks to the Government's determination to hold the price line at any cost and stringent controls on the price and distribution of cotton.

Only a Temporary Phase

Another factor is the commonly held view that, in view of the present emergency, the Government would be more successful in persuading the U.S. to supply more P.L. 480 cotton than was believed at one time. This view has been strengthened by reports that India has indicated the extent of its requirements of foreign cotton and asked for more P.L. 480 cotton from the U.S. The news that several barter proposals involving exchange of materials which this country can spare for raw cotton are under study by the State Trading Corporation has also encouraged the hope that sufficient foreign cotton would be available to fill the gap between the prospective supply and demand. It remains to be seen whether all these speculations, including that on the size of the crop, will prove correct in course of time, but the fact remains that a bearish fervour is now widely prevalent, with its depressing effect on futures prices. But knowledgeable observers, who are level-headed and take a long-range view of things, are inclined to think that the present debacle in cotton futures is only a temporary phase and that prices are bound to recover. Their reasoning is on the following lines:

The current season started with a record low carryover stock of 1.6 million bales. If the crop turns out to be 5.4 million bales as is now rumoured, the total supply, excluding imports would be 7 million bales. As against this, the estimated requirement of cotton during the season is 8.4 million bales, comprising 5.9 million bales for consumption by mills and non-mill units, 300,000 bales for exports and 2.2 million bales for stock at the end of the season. The gap to be filled through imports is, therefore, 1.4 million bales. As against this, the import quotas released so far in the season, less the recent cut in the global quota, aggregate no more than 555,000 bales. A quantity of 250,000 bales from last season's quota is expected to arrive this season. This still leaves a gap of about 600,000 bales which has got to be filled by imports whether it be from the U.S. or other countries. The entire calculation is based on the fact that the crop would be 5.4 million bales. If it falls short, imports would have to be stepped up to the extent of the shortfall.

Unwarranted Speculation

As everyone knows, it is still too early for one to be sure of the size of the current crop. One severe cold wave in January or February will be sufficient to deflate the crop substantially. Accordingly, those who are spreading a bearish view of cotton and depressing the contract are simply indulging in unwarranted speculation. Surely, they are not performing any useful function. On the contrary, they are creating a false impression which may generate a feeling of complacency among officials, undermine the Government's efforts to get more P.L. 480 cotton and revive the demand by politicians that the Government should intervene to arrest the downward trend in prices. All that is now happening in the spot market is only a healthy readjustment of prices from the unduly high levels to which they had climbed earlier under conditions of scarcity. Several varieties of cotton are still available only at ceilings or a few rupees under. It must be borne in mind, in this connection, that the ceilings for the current season were enhanced by as much as Rs. 125 per candy or Rs. 35 per quintal. So the growers are actually getting more than what they received last year. There is, therefore, no need for anyone to feel concerned about the interests of growers.

MANCHESTER LETTER

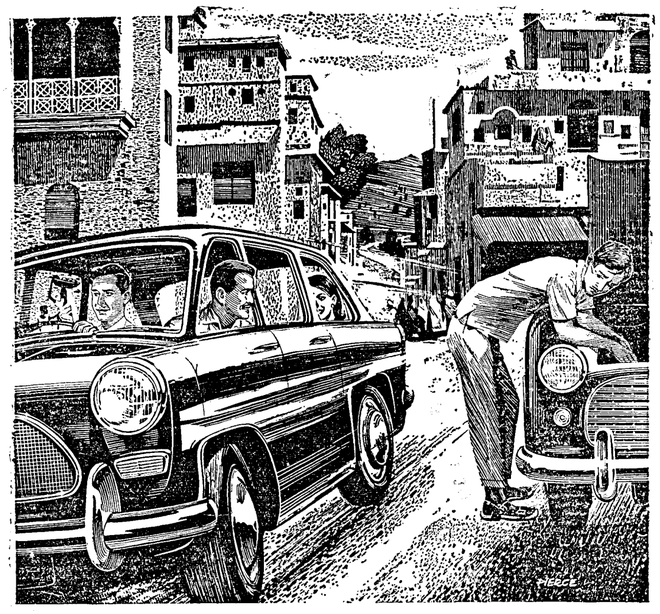
(*Concluded from previous page*)

difficult phases, as well as extremely prosperous periods during the past few years. The latest report suggests satisfactory overall figures for the half-year, but no record in sight.

In the meantime, one of the trade's most forthright spokesmen, Major J. A. Barber-Lomax, Chairman of Barber Textile Corporation, has commented on the import situation in terms which most of his colleagues and competitors would echo: "It is not unreasonable to expect the Government to look after our well-established cotton textile industry, so that some 80 per cent of home trade requirements be supplied by the trade of which we are members. If this were the policy, trading conditions would quickly improve and ensure a fair return on the capital employed in our group activities."

Lest it should be thought that textile firms have been alone in their experience of disintegrating margins, it should be emphasised that large sectors of British industry are equally struggling against an adverse tide. From engineering works, paper manufacturing units, even light industrial undertakings and producers of some of the modern plastic inventions, have come statements which describe a constant battle to keep machinery engaged and avoid accepting business at scarcely remunerative levels.

Steps lately taken by the Government to ease the restraints on business may eventually have far-reaching effects. Certainly more initiative seems to be at hand, and the mood is more optimistic. For consumer industries, especially textiles, it may be a straw in the wind that a Manchester-based departmental store, with branches in other cities, has lately announced that its sales increased by 24 per cent in the past half-year. If this trend is reflected in other directions, even at a lower level, its impact on merchants must be considerable.



Exide Batteries still keep going when the rest have stopped

Everywhere you go motorists agree Silver Exide are the strongest, most reliable batteries under the sun. They are made from the finest materials and are quality tested at every stage of production. .that's why you're sure of a long and trouble free life. Exide Batteries are known and trusted all over the world. Silver Exide Batteries are obtainable from dealers everywhere. So don't delay—fit the finest battery money can buy and you'll still keep going when the rest have stopped.

WAR RISKS INSURANCE LEGISLATION

LOK SABHA GIVES ITS APPROVAL

THE Lok Sabha gave its quick approval on the 7th inst. to the Emergency Risks (Goods) Insurance Bill and Emergency Risks (Factories) Insurance Bill, subject to two amendments. These Bills seek to empower the Government to insure, on a compulsory basis, goods and factories, as defined in the Bills, against the risks of loss or damage arising from enemy action. Of the two amendments adopted by the House, one lays down a ceiling on premium rates applicable to goods and factories and the other reduces the minimum insurable limit for goods from Rs. 50,000 proposed in the Bill to Rs. 30,000. Provision is, however, made for optional insurance of goods below the minimum limit. This is to afford protection to small traders who might like to cover their goods against possible loss or damage. The amendment seeking to lower the minimum insurable limit was suggested by a private member, Mr. D. C. Sharma, but, during the debate on the Bill, Mr. Morarji Desai, the Union Finance Minister, who piloted both the Bills, accepted the suggestion and moved the amendment himself.

It is noteworthy that originally the Bills did not specify a ceiling rate for goods, factories or inland vessels, although the explanatory memorandum had indicated the maximum rates the Government had in mind. These were two per cent per annum of the insurable value in respect of factories and three-fourths of one per cent per quarter or 3 per cent per annum in respect of goods. But the Bills, as amended, fixed 3 per cent as the ceiling rate for both factories and goods, thereby making a departure from the ceiling proposed in the memoranda in respect of factories. The Finance Minister, however, indicated to the House that the premium rates for factories would not exceed 2 per cent in actual practice and 3 per cent for inland vessels. He also assured the House that the ceiling rate would not necessarily be the rate applicable to goods and factories at the start of the scheme or during the major part of the duration of the scheme. They were the permissible maximum upto which the Government could go. In other words, the actual rates to be charged would vary from time to time and depend upon the Government's assessment of the risks involved. Mr. Desai gave the assurance that, in determining what should be the prevailing rate from time to time, for goods during the present emergency, the Government would keep in view all the relevant considerations and circumstances and would take fully into account the views expressed by members from time to time in Parliament. He admitted that the Government was not yet in a position to arrive at an accurate judgment of the variety or degree of risks involved. Although the Government had, for its own working purposes, a very broad picture of the insurance value of the goods and factories covered under the scheme, this estimate, he said, was very much in the nature of a guess and did not even give the estimated figures. It was not possible, he averred, to forecast with any degree of accuracy, the premium revenue which might be obtained on the basis of a given schedule of rates.

No Exemption for Public Sector

Clarifying the position regarding the applicability of the scheme, Mr. Desai said that the scheme would not apply to Government departments or departmentally-run undertakings but would apply, without distinction, to factories and plants in the public sector run on commercial lines in the same way as it did to those in the private sector. The Government, he pointed out, unlike private property owners, was in a position to bear the risks of loss or damage from war. It did not need at present, any more than it did in the last war, any insurance for itself. According to him it was a moot point whether, from the point of view of the adequacy of the insurance fund, the extension of the scheme to cover Government property would be worthwhile or desirable, if it were to lead, owing to a combination of circumstances, to a net surplus in the fund which the Government will be claiming back at a later stage or to a net deficit in the fund which may have to be wiped out by the Government itself. Moreover, the administrative difficulties of extending the scheme so as to cover Government stocks were immense. The decision to include autonomous public corporations and undertakings was deliberately taken because the Government thought it was undesirable to discriminate between public and private undertakings run on commercial lines.

As regards the goods to be covered under the scheme, the Finance Minister said that goods excluded from the scheme were broadly the same as those in the last world war, but, if any special problem existed in relation to goods of any class or description, the Government would have the power to include or exclude them. The present scheme differed from the last war scheme only in one significant respect, apart from the obvious difference in premium rate; the difference lay in the inclusion under the scheme of oil installations and tea gardens. As in the case of factories in the public sector, goods owned by Government corporations and companies will come under the scheme, while those owned by Government departments will be excluded.

Modest Aim

Explaining the objects of the scheme, Mr. Morarji Desai said that the scheme was intended to ensure that industrial and commercial activity were not hampered, because of the fear of what may happen as a result of political or military action, and that normal production, sale and movement of commodities continued uninterrupted. He made it clear that property in various forms such as land and growing crops (excluding tea), residential houses, or household goods owned and held for purposes other than sale would be excluded from the scheme. He gave no rational explanation for leaving out these assets. All that he had to say was that it was neither necessary nor possible to cover, in a scheme of insurance of this kind, the entire physical wealth of the country. In reply to suggestions from members of Parliament that agricultural crops and buildings in cities also should have the benefit of insurance, Mr. Desai merely repeated his argument that the Government did not think it proper, or practicable for administrative and other reasons, to provide cover for them now.

He, however, said that the Government would again consider the matter and if the necessity arose, bring these properties also within the ambit of the war risks insurance. Accordingly, the argument about administrative feasibility is only a lame excuse.

It is true that insurance of agricultural crops against risks of damage by war is difficult because of the peculiar nature and uncertainties inherent in agricultural operations in this country and the total absence of any experience of crop insurance to go by. But this is not an adequate explanation. Surely, a way out will have to be found to give protection to livestock, standing crops, orchards and other plantation crops too. It is not clear as to why the poor farmers should be exposed to the risks of war without any certainty of getting adequate compensation. It is true that the Centre will not be able to handle this job adequately, but that is no excuse, for the State Governments may be asked to administer the scheme.

The problem of insuring immovable property such as residential buildings, houses, etc., should not present any insuperable difficulties. It is easy to assess their value and fix premiums. Moreover, in urban areas, they are usually insured against fire risks. It may be recalled here that, in the U.K., the War Damage Acts 1941-45 provided cover for all immovable property and chattels as well. It is not suggested that protection for all the assets now left out should be provided forthwith. With a lull in fighting and with the Chinese gradually withdrawing their forces from N.E.F.A., there has been a lessening of the emergency. But as the revival of hostilities cannot be ruled out, the Government should be ready with the necessary scheme which can be given effect as soon as the necessity arises. The absence of this approach in the Government's plan is a disquieting feature and, therefore, highly deplorable.

Oriental Sole Agent

The Finance Minister set at rest the doubts regarding the agency for administering the scheme caused by the absence of any reference to it in the Bills by disclosing that the Government intended to appoint the Oriental Fire and General Insurance Company, a subsidiary of the Life Insurance Corporation of India, as the Government's sole agent. In spite of the Minister's assurance that the Oriental would make adequate arrangement for the smooth and efficient functioning of the scheme, opinion in the House was divided on the question whether one company, and that too State-owned, should be given the monopoly of administering the scheme, especially because private insurers had offered to act as agents even without charging any commission. But the House seems to have finally accepted the Government's assertion that the Oriental could do the job without the assistance of private insurers. One fails to understand this stubborn insistence on the part of the Government that only the public sector insurer should administer the scheme even when private insurers have offered their services free of cost. It is obvious that it will be physically impossible for any one company, however big, to deal with the enormous task involved. It may be noted here that the Oriental has only about 100 offices in the country and these are supposed to insure goods and factories scattered over the entire length and breadth of India. There is no mystery behind this attitude of the Government. It is plain enough to suggest that the Government does not wish to encourage general insurance in the private sector and that it is tolerating private insurers now merely because it does not suit its convenience to take over their activities.

Before concluding this article, one may record here the categorical assurance of Mr. Morarji Desai that it is not the intention of the Government to introduce a taxation measure in the guise of an insurance Bill and that, "in fixing the actual rate of premium, the Government will not have a fiscal motive." This is a welcome assurance and rejects as unacceptable the opinion of some that the war risks insurance scheme will serve the additional purpose of raising finance for war effort.

MISLEADING THE LAYMAN

In a communication addressed to us, Mr. T. S. Krishnamurthi of Madras observes as follows:

"Mr. O. S. Gupta's article on the 'Investment Element in Life Insurance,' published on page 916 of *Commerce* dated 24th November 1962, must have shocked all your readers. The learned Professor thinks that Life Insurance has no element of investment and that to say, as we have been saying, that an increasing portion of his total premium always belongs to him, which he can get as surrender value on surrendering his policy, is misleading. I hope the learned Professor will not expect to get any surrender value on the policies of life insurance he might have taken.

"It is true there is another in the nature of insurance, whether it is life insurance or any other class of insurance, that by itself contains an element of investment in it. Undoubtedly, insurance as such is not an investment. It is purely protection and the premiums that the insured pays is the price that he pays for eliminating the uncertainty of loss. Hence, if a person effects a life insurance policy under what is called a term insurance contract, the insurer agrees to pay a certain sum only in the event of his death during the period, just as a fire insurer agrees to pay a certain amount by way of indemnity in the event of damage or destruction to, the insured property. If the life assured, in the above case, survives the period or the property does not suffer any damage during this period, nothing is payable to the insured.

"But, there is nothing to prevent to combine an element of saving with life insurance and all plans of life assurance, which are called permanent contracts, mix an element of insurance with a large element of investment. An endowment assurance policy is definitely a combination of decreasing term assurance with an accumulating investment. Mr. Gupta calls this definition misleading and says that it is based on a wrong foundation that the fund of policies in any generation, which an insurance company, carried at any time, is divisible *pro rata* into each individual policy. If an insurance company issues only endowment assurance policies, this statement is definitely true and the life insurance fund is apportionable among all the policyholders who have paid the premium. This is the reason why surrender values are paid and the Insurance Act stipulates that a similar policy of life insurance must have a guaranteed surrender value, which should be stated in the policy itself.

"Under these circumstances, it is quite true that, behind every policy that is issued, the insurer holds a certain amount of reserve. Actuaries can calculate what this reserve for each policy is individually. Prof. Gupta has also confused between the investment element of the policyholder and the investment element of the insurer. This explains his statement that, even in property insurance, there is an investment element, because the insurer holds some money with him. When we say that life insurance contains an investment element, what is referred to is not that the insurer has got money for investment, but that every policyholder who contributes premium does accumulate a saving which is guaranteed to him by a statutory Act and the policy contract. It will be good for the life insurance companies if people can be satisfied with Mr. Gupta's explanation and do not expect surrender value to be paid on their policies, with a shrug of their shoulders that life insurance is very costly. If we were to say to a holder of an endowment assurance policy that either he should live or die in order to get any money from us, then probably Mr. Gupta's statement would be right. But, we do not say so, and I am sure that Mr. Gupta does not expect us to say so, in regard to his policies."

IMPORTANT!

NEW HIGHER RATINGS FOR TIMKEN BEARINGS: GREATER CAPACITY—LONGER LIFE

Bearing ratings are only as good as the engineering that develops them and the tests that prove them. With the most extensive bearing engineering and testing programmes in the world, the Timken Company has developed a new and more accurate bearing rating formula.

The radial ratings are increased 7% to 11%. In terms of bearing life expectancy, this is really important because a 10% increase in capacity lengthens bearing life by 37%. Since life changes drastically with even small changes in capacity, catalogue bearing ratings must be accurate to prevent selecting bearings that are too small or too big. Establishing the most accurate ratings requires the utmost integrity.

HOW DID IT HAPPEN?

Increase the quality—and the bearing capacity and life increase, too Call the increased life a performance dividend. As with all dividends, an investment is normally required. The investment in this case is the Timken Company's expenditure for nickel-rich steel and for better machinery, methods, engineering and research.

One investment alone involved the life testing of over 35,000 bearings in the last 15 years. These tests continue. Today's bearings show better life than those of only a few years ago. The quality, sometimes called workmanship and material, is improved. We experience longer bearing life on tests and refine the bearing rating formula to establish new ratings.

The performance dividends are impressive. For example, in the last twenty years, bearing number 2788–2720 has had a quality increase in basic radial rating from 820 kilograms to 1325 kilograms. This 62% increase in rating results in a bearing that has a life expectancy five times as long.

HOW DO YOU BENEFIT?

Applying the new ratings to your Timken bearing applications will in most cases show an increased life expectancy. This means that the bearings are actually lasting longer than we expected, providing a direct increase in performance for you and your customers.

You may now be able to select lighter, more economical bearings. If so, your design can be made more compact with resulting savings. And you will save from our giving you more hours of bearing life for your money than ever before.

The Timken Roller Bearing Company, Canton, Ohio, U.S.A., Cable: "TIMROSCO". Timken bearings manufactured in Australia, Brazil, Canada, England, France and U.S.A.

NATIONAL 42562 CL 2 27•

PROSPECTS FOR E.N.I., THE ITALIAN STATE-OWNED OIL COMPANY

A NEW PHASE HAS BEGUN

AS was to be expected, the Italian Government quickly appointed a successor to the late Signor Enrico Mattei, President of the state-owned E.N.I., who died tragically at the end of October when his aircraft crashed near Milan. The natural succession has been followed. The organisation's Vice-President, Professor Marcello Boldrini, who has long held that office, becomes President, and the General Manager, Dr. Eugenio Cefis, becomes the Vice-President. The present appointment of President is, however, for a period of about six months, this being the unexpired time of Signor Mattei's current three-year term of office. Professor Boldrini is 72 years of age, and, besides serving A.G.I.P. and then E.N.I., he has continued his life-long distinguished academic career.

In the nature of things, his tenure of office is unlikely to be a long one. A general election is due in Italy in the spring and, as some of E.N.I.'s activities have aroused considerable political controversy, the appointment for the next full three-year term of E.N.I.'s presidency will certainly be influenced to a great extent by the election results. The choice of candidates able and willing to direct such an organisation can never be very wide. Also, but irrespective of who may be the holder of the office of President, the Italian Government of the day can, if it is so minded, exert a considerable influence upon E.N.I.'s affairs through its power to sanction investment which it has not always been able to do in recent years.

Something of a Rebel

All large organisations have their own built-in continuity and momentum which ensure that their business can be conducted irrespective of who may be the holders of the few highest posts. Nevertheless, a change of helmsman in this instance is of especial interest: first, because of the highly personal rule of Signor Mattei, and, to many, the disturbing policies which he evolved and pursued; secondly, because changes in policy hitherto deemed, for political reasons, virtually impossible to make may now become feasible. All this does not only concern oil matters. E.N.I.'s activities have also affected several other sectors of Italian industry and had a bearing on issues transcending the production and buying and selling of oil. Indeed, it may be said that the world-wide notability that Signor Mattei had achieved did not rest, in the main, upon his achievements as an oilman. The heads of far larger oil concerns, State-owned or private, whose solid achievements in the oil world far outweigh his, remain relatively unknown figures in their country and abroad. But Signor Mattei was by nature something of a rebel and he presented the figure of the bold noble pioneer that got things done. In Italy, he was seen as one of the modern industrial leaders, but better known than the others, who injected new life and verve into the industrial scene helping to bring unprecedented prosperity to northern Italy and some to less favoured regions of the country too. The very fact that he gave rise to public criticism and controversy helped him; and, where political issues and passions are aroused, cold economic facts or the challenge of principles evoke comparatively little interest. Abroad, he was often regarded as the David face to face with the Goliaths of the oil industry, and evidently enjoyed the role. One of his notable achievements, fleeting though it may be, was that, despite a natural personal modesty, he became a tremendous public relations success from which E.N.I.'s activities greatly benefited. The press, radio and television of all countries, always eager for the colourful, the dramatic, the challenging, made him "news." This magic, and the aura of his personality have gone. The critics of E.N.I. are strengthened, and rational examination of some of E.N.I's activities will now be possible and will no doubt be undertaken.

In such an inquest three major issues will present themselves. The basic one which this, or the next, Italian Government has to consider is whether an entity of the Italian State is to persist in seeking to disrupt the international oil trade by challenging, as Signor Mattei did, the ordinary commercial principles upon which the international oil industry rests. He preached the virtual elimination of the international oil companies as we know them today and their substitution by direct trading between the Governments of oil-exporting and oil-importing countries, who would then use the oil companies' organisations to work on their behalf. Allowance must be made for the fact that there was an element of rancour in Signor Mattei's attitude to the major oil companies, and that he was not particularly given to philosophical reflection. He probably never thought through the implications of this particular notion, which, apart from its impracticability, is quite incompatible with the notions that underlie a free society. Italy is entitled to share in international oil trading, and her special interest in the Mediterranean area is recognised. However, while commercial competition from State-owned concerns is normal and acceptable, attacks of the kind made by an appointee of a Government whose country is itself highly dependent upon the achievements and progress of the international oil industry is quite another matter.

E.N.I. has formed an impressive list of local companies in developing countries, but few are as yet of much significance as far as volume of trade is concerned. More widely known are the so-called 75/25 exploration and production partnerships in favour of local Governments concluded with some countries. The only partnership of this kind which has come to full fruition so far is that with the State-owned National Iranian Oil Company in S.I.R.I.P., now a producer of oil. But N.I.O.C. has been unwilling to make available its half share of the capital outlay, with the result that it is not now receiving any income from current production which it would otherwise be doing under the customary 50/50 arrangements where the oil company provides all the risk capital. Also, of course, the Italian authorities must ponder whether the home economy should not have had first claim upon some of the State-owned capital resources E.N.I. has ventured abroad, and whether it must make this claim in the future.

Russian Oil

The second important matter that calls for decision is E.N.I.'s big purchases of Russian oil upon which, together with its virtual monopoly of the natural gas in the Po Valley, E.N.I.'s commercial viability largely rests. There is a commitment under the Italo-Russian trade treaty until 1965, which will, of course, be carried out. N.A.T.O., as well as Italy's partners in the Common Market, frown on this high dependence on Russian oil, and the hitherto suppressed voices in Italy will no doubt now lodge their protests too.

The third major issue to be considered by the Italian authorities is how far a State entity, originally destined to deal with matters of energy, and enjoying various privileges, should diversify so as to encroach on other established Italian industries; for example, its ventures into civil and mechanical engineering, synthetic rubber, fertilisers, petro-chemicals, motels, etc. All these satisfied Signor Mattei's ambitions but it is widely believed that many of these extensions of activity are basically uneconomic, a fact which is masked by the support they receive from E.N.I.'s activities in the field of energy. The finances of E.N.I. may now also receive closer analysis, not least in view of its heavy borrowings and the mounting interest charges.

In any event, henceforth E.N.I. will not be quite the same as before. The work of the always essential pioneer has ended, and a new phase has begun in which fundamental issues of national policy must be squarely faced.—*By special arrangement with Petroleum Press Service.*

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

INDIAN ALUMINIUM COMPANY, LTD

(Incorporated under the Indian Companies Act 1913)

Registered Office: 31 Chowringhee Road, Calcutta-16

EXISTING FACILITIES

The Company owns and operates a fully integrated aluminium industry of substantial size and flexibility. The details of its existing operating facilities are as follows:

Product	Plant Site	Annual Capacity (metric tonnes)	
Alumina	Muri, Bihar*		55,000
Ingot	Hirakud, Orissa	20,300	
Ingot	Alupuram, Alwaye, Kerala	5,120	25,420
Sheet & Circle	Belur, West Bengal	16,800	
Extrusion	Alupuram, Alwaye, Kerala	3,760	
Powder	Kalwa, Maharashtra	600	21,160

**with related bauxite mining facilities at Lohardaga, Bihar*

DEVELOPMENT PLANS

The Company plans to carry out an expansion programme, consisting of (i) the expansion of the ingot capacity at Alupuram, Kerala to 10,850 tonnes per annum by setting up a second smelter adjacent to the existing one, and (ii) the setting up of an aluminium foil rolling and finishing mill with an annual capacity of 2,500 tonnes in Maharashtra.

FUTURE GROWTH OF OIL INDUSTRY

SOME LESSONS FROM RUSSIAN EXPERIENCE

IT is well known that India has a very low consumption of petroleum products. In *per capita* terms, its consumption is a little more than four gallons, as compared with six gallons in Pakistan, 13 gallons in Thailand and 663 gallons in the United States. The aggregate consumption of petroleum products in the country last year was about 8.5 million tons. To meet this demand, India is now importing about 6 million tons of crude oil for refining and about 2.5 million tons of finished products. The amount of foreign exchange spent on imports of both crude and refined products in 1961 was of the order of Rs. 79 crores. In the current year, the demand is expected to be about 9-10 million tons. Indigenous production of crude oil, mostly from the Digboi oilfield and, to some extent, from the Nahorkatiya and Ankleshwar oilfields, is now in the neighbourhood of one million tons per annum. According to latest estimates, the annual demand by 1965-66 is expected to be 18-19 million tons in terms of crude oil or around 17-18 million tons in terms of refined products.

If the country is to become completely self-sufficient in its crude oil requirements, more rapid efforts will be necessary to locate more oilfields and establish production of crude. As things stand, the Digboi, Nahorkatiya and Moran oilfields in Assam and the Ankleshwar oilfield in Gujarat are the only productive fields. If everything goes well, these may be expected to produce, at the most optimistic estimate, some 6-7 million tons of crude oil. The deficit in crude requirements by 1965-66 will, therefore, be 12 million tons and this will necessitate doubling the present quantum of annual imports of crude. Whether the newly-discovered Rudrasagar oilfield in Assam will help reduce the deficit is not known, for firm indications regarding the size of its reservoir are not yet available.

On the refining side, the present effective capacity is about 8.0 million tons per annum—5.80 million tons in the Burmah-Shell and Stanvac Refineries, 1.0 million tons in the Caltex Refinery, 0.45 million tons in the Digboi Refinery of the Assam Oil Company and 0.75 million tons in the Government-owned Nunmati Refinery. Two more refineries—one at Barauni in Bihar for processing two million tons of Nahorkatiya crude and the other near Baroda for processing two million tons of Ankleshwar crude—are to be completed during the third Plan period.

The following table shows at a glance the salient features of the existing and proposed refineries:

Company	Location	Cost (Rs. crores)	Year of establishment	Annual capacity (Million tons)
Assam Oil Co. ..	Digboi	N.A.	1901	0.45
Burmah-Shell ..	Bombay	26	1955	3.50
Esso	Bombay	17	1954	2.40
Caltex	Vishakapatnam	15	1957	1.05
Indian Refineries	Gauhati	17.7	1962	0.75
*Indian Refineries	Barauni	40	1963-64	2.00
†O.N.G.C. ..	Koyali	30	1964-65	2.00

* Under construction. † Under planning.

The aggregate refining capacity in both the public and private sectors will thus be a little more than 12 million tons by 1965-66. The deficit, by that year, in product requirements will be 5-6 million tons, assuming that everything will go well with the public-sector refineries under construction. This, again, will necessitate more than doubling the present quantum of annual imports of petroleum products.

It should be clear from the foregoing facts and figures that the real problem facing the oil industry in India is the increasing gap between the crude oil production and the demand for it. Frantic efforts, in the words of the Indian Productivity Team which has just reported on the oil industry in the U.S.S.R., Czechoslovakia and Rumania, have, therefore, to be made to provide more supply of crude oil by finding new oil deposits. Thereafter the crude will have to be extracted, transported, refined and marketed. At each stage, the industry faces a challenge.

How can this challenge be met? In the light of its study of the state of oil industry in the three Communist countries, the Team has reached some conclusions applicable to India and made certain related recommendations. At the outset, the Team has given the finding that, if the present *rate of growth* of oil output in the U.S.S.R. is about 18 million tons per annum, it is due to intensive prospecting operations in that country. Similar efforts on the part of the Indian oil industry, the Team says, are essential to achieve the desired self-sufficiency in oil. The relevant observation of the Team is as follows:

"While the Team lauds the magnificent work done by the Oil and Natural Gas Commission and other organisations, it is clear that the current pace of development needs to be considerably augmented *by all possible means*." (Italics ours.)

When the Team refers in general to the "Indian oil industry" and speaks of augmenting development "by all possible means," it seems to have in mind an increasing role for the private sector, in addition to that of the present dominant role of the public sector in oil exploration and development. If that is so, it passes one's comprehension why the Team should have fought shy of saying it explicity. Obviously, even with the revised higher allocation of about Rs. 200 crores for oil exploration in the third Plan period, the Oil and Natural Gas Commission of the Government of India cannot be confidently expected to deliver the goods on the scale required. For, according to the Team itself which has quoted the estimate of a leading Indian geologist, an investment of Rs. 300 will be necessary for locating and annually producing an extra ton of oil. On this basis, as much as Rs. 360 crores by way of capital investment will be required to locate fresh oilfields and produce additional oil to meet the estimated deficit of 12 million tons by 1965-66. Surely this is a task which will be beyond the capacity of the Oil and Natural Gas Commission with its substantial, but still limited, budget. It is difficult to see how self-sufficiency in crude oil can be achieved without massive participation by private oil companies in oil exploration and development. After all, it may be noted in this connection, only a fringe of the country's 400,000 square miles of sedimentary basins has been probed for oil so far.

As far as the required additional refining capacity is concerned, the Team has emphasised the need for establishing it on the ground that imports of products, which are costlier than crude oil imports in terms of foreign exchange, should be minimised. But, here again, the Team has not explicitly stated whether the additional refining capacity should be established in the public sector or in the private sector. But, in the light of experience in the U.S.S.R. where maximisation of output from existing refineries by simple changes in processes is given top priority, the Team has expressed the opinion that ways and means be explored for fully utilising the existing spare capacity in the refineries. The Team has also recommended, in the light of conditions in Czechoslovakia and Rumania, that a beginning be made in India, too, to manufacture at least drilling, refining, distribution and marketing equipment.

In view of the emergence of a relative surplus in motor gasoline in India, the Team has drawn attention to the current Russian practice of curbing the use of high-speed diesel oil by encouraging the production of petrol-driven engines/vehicles upto 5 tons on the medium range of transport. It has also expressed the view that all refineries planned for the future should be based on minimum gasoline production. The problem of surplus gasoline, according to the Team, could be partly mitigated in the following four ways:

1. Production of naphtha base aviation jet fuel for military use.

2. Use of surplus naphtha for the production of petrochemicals to meet the increasing demands for organic chemicals and consumer goods in the country.

3. Gasification of naphtha for supply of town gas to major cities. This practice, to which Russia, for instance, is giving increasing importance, will result in restricting the use of kerosene as a heating medium.

4. Reduction in the flashpoint specifications of industrial diesel oil will also result in lower gasoline production.

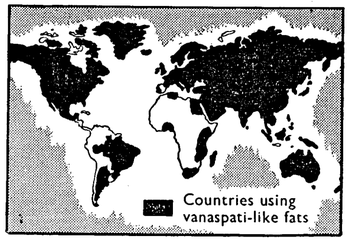
The demand for kerosene will continue to grow even after an effort is made to restrict its use by making available liquefied petroleum gas as an alternate fuel. So the Team has recommended that advanced technological processes be adopted to obtain maximum possible recovery of kerosene distillate fractions from crude oil. In regard to furnace oil, the Team has suggested that its production should be increased by process alterations in the new refineries being set up. To reduce the burden on coal, the Team continues, it may be advisable to make increasing use of furnace oil for railway traction as in the countries visited, particularly the U.S.S.R. Furnace oil, in its view, could also be profitably utilised for thermal power generation. While dealing with lubricants, the Team has noted that only a limited number of grades, about 180, are being marketed even in a highly industrialised country like the U.S.S.R., whereas in India there are at present 1,000 brands of lubricants. There is, according to the Team, great scope for reducing the variety of such lubricants. This would help in improving efficiency and reducing costs.

Some other observations made by the Team in the light of Russian experience may be usefully mentioned in conclusion. In the U.S.S.R., for instance, the trend is to locate a refinery near the market which it is intended to serve. In India, the Team says, it would be more economical to pump the crude oil by pipeline for refining it near the consuming area than to refine the crude at source and then transport the finished products. Secondly, the current trend in Russia is to plan refineries with capacities upto 6 million tons. In India, according to the Team, a refinery unit should have a minimum capacity of two million tons with provision for future expansion to 4-5 million tons. The amount of attention given in Russia to economical refinery operation is another noteworthy aspect which deserves to be emulated in India. On the side of products distribution, the increasing role played by pipelines and water-transport in the U.S.S.R. is equally noteworthy. To relieve the ever-increasing burden on Indian railways, the Team has strongly recommended a change in the present distribution system by increased use of pipeline and water transport. Pipeline transport, it has been found from experience in the countries visited by the Team, contributes most to a low storage cover at production, refining and marketing centres. The present storage cover in India goes up, in some cases, to an unduly high 90 days' capacity. It would also be worthwhile to economise on steel, as in the U.S.S.R., by using reinforced concrete underground tanks. As for automation, the Team has given the finding that, in an age of keen competition, the Indian oil industry cannot afford to neglect an effective weapon for achieving higher productivity. The fact that none of the countries visited has such petroleum regulations as are in force in India also deserves to be highlighted here. In the considered opinion of the Team, the stringent code of practice in India has been responsible for more elaborate construction, involving greater costs and resulting in delays in the execution of plans.

More MILK! More VANASPATI!

NUTRITIONISTS recommend a minimum daily consumption of 280 gms. of milk per person for a well-balanced diet. Because milk is a complete food in itself—rich in proteins, minerals, vitamins and fats. For vegetarians, milk is the only source of essential animal proteins. Unfortunately, the total availability of milk for direct consumption, as well as for conversion into milk products is only 140 gms. per head per day. And even by the end of the Third Five Year Plan, it will be just 145 gms.

With improved transport facilities and the establishment of more organised dairies, a greater quantity of milk will be available for drinking.



This will benefit not only the consumer, but also the dairy farmer because the sale of milk as such yields a better price to the dairy farmer than the sale of milk products.

More consumption of milk as such means less ghee. In India, as in the advanced countries of the world, Vanaspati will gradually meet the growing demand for a semi-solid fat like ghee. Even in the butter-rich countries of Denmark and Holland, where the dairy industries are well-organised, the major semi-solid fat consumed is vegetable fat very similar to Vanaspati. Vitaminised Vanaspati is nutritionally on par with the purest milk fat obtainable. Furthermore, Vanaspati is very economical because it is made from readily-available vegetable oils.

★ ★ ★

Vanaspati and Vanaspati-like Fats are used throughout the world!

★ ★ ★

SJSTA'S BJ-2A

NEW PRODUCTS AND PROCESSES

New Mobile Motor Generator

A NUMBER of 10 mva. mobile motor-generator sets have in the past few years been delivered by Asea to SJ, the Swedish State Railways, reports the Asea Journal. Previous deliveries by Asea of such sets include units with a rating of 2.9 mva. and 5.8 mva. The large type of sets will meet SJ's increased power requirements as a result of the higher power of locomotives, particularly on the iron ore line in Arctic Sweden and on the local shuttle traffic lines in the Stockholm area. The 10 mva. motor-generator set differs considerably in many of its design features from the two previous types because of the close tolerances in weight and space. While the synchronous motor is virtually of the same design as in previous sets, the synchronous generator is new. The bar-winding previously used has been replaced by a coil-winding with projecting coil ends. Owing to the limited width, oriented sheet steel has been used in the stator thus making the losses lower. The set consists of two vans—a 138-ton converter van and a 59-ton transformer and control van. The two vans are short-coupled and their total length is 20 m. In addition to the 5,200/17,000 V transformer, which is directly connected to the generator, the control van also contains the other equipment needed for starting and supervising the motor-generator, including air-blast circuit-breakers. The motor-generator can be started and phased entirely automatically and the control equipment is also designed for remote control, which is being used on an ever increasing scale in the Swedish State Railways feeder stations. As the three types of motor-generator sets can be run in parallel, great flexibility is obtained and the sub-stations can be run more economically since the total efficiency is improved.

Stitched Containers

Stitching provides a reduction of 93 per cent in the cost of fabricating aluminium containers, according to Steadman Industries, Toronto, Canada. Small panels, either all-aluminium, or plywood bonded to aluminium or steel sheet, are used, and split reinforcing posts are stitched to the panels. Claimed to be as effective as conventional methods such as riveting, bolting or spot welding, the sheet-and-post construction for containers is economical as well. Stitching has been tried before for attaching the reinforcing or stiffening posts to sheets. However, such operations were difficult and quality control was hard to maintain. Steadman's use of split posts is said to have eliminated many of the difficulties. The method can be used to produce truck bodies as well as containers. Steadman intends to concentrate on the container applications but is reported to be licensing the process to other manufacturers.

Pressing Magnesite Bricks

Czechoslovak technicians have successfully solved a new method of making liners for moulds for pressing magnesite bricks. The liners are made of sintered carbide and lengthen the service life of the moulds up to several years. The old liners resisted the abrasion of the magnesite mass only 30,000 times and when pressing chrome magnesite bricks only 15,000 times. After producing this number of bricks it was necessary to regrind the pressing mould and insert it again into press. During tests of the new liners more than 300,000 bricks were pressed in a period of two and a half months and the mould remained in good working order. The new method of producing liners for pressing moulds is protected by a Czechoslovak patent.

Aluminium-coated Steel

The use of aluminium-coated steel sheet in car mufflers has cut failure to one quarter that of plain steel units, according to a United States road survey. The survey involved the first cars (1959 models) to use the aluminium-coated steel mufflers, and was conducted by one of the producers of the sheet, Armco Steel Corp. The coated sheet is used in varying degrees in the exhaust systems of more than 90 per cent of all 1962 U.S.A.-made automobiles. The need for resistance to high heat and corrosion makes the aluminium-coated sheet an ideal material for mufflers. Until it was put into use, early muffler failure was a major problem for U.S. motorists. The sheet is made by applying aluminium to both sides of cold reduced steel sheets with a continuous hot dip process. The product combines the protective surface characteristics of aluminium with the physical and mechanical properties of steel.

Fuel from Dust

A West German firm claims to have developed a continuous and economical way of converting coal and iron ore dust into strong briquettes suitable for charging to an iron-making blast furnace. The dust is first bonded into briquettes with tarry oil. The briquettes are then oxidised as they pass along a conveyor belt at a temperature of 150 degrees Centigrade or more. At the end of their travel they are not strong enough for the blast furnace but they are strong enough to be fed one on top of another into a tall shaft furnace, where their oxidation treatment continues at a much higher temperature (500 degrees Centigrade). Afterwards they are cooled in an inert gas and then removed from the bottom. Use of the shaft furnace avoids the need for more expensive conveyor belts, it is stated.

Faster Freezing

Commercial freezers capable of doubling the daily output of quick-frozen foods previously obtainable from machines of the same capacity are being marketed by a British firm, G. Williams Engineering Ltd., Norfolk. This is achieved by freezing times which are reduced by at least half and for some products the time taken is only one-fifth of that previously required. The freezers are of the double-contact plate type in which the products to be frozen are placed between multi-layered "sandwiches" of hollow metal plates through which the refrigerant is passed. Hydraulic pressure maintains the plates in close contact with the products during freezing and opens them up for loading and unloading. The plates are said to have a heat transfer co-efficient more than double that of the conventional type. Conventional construction is for the hollow plate to be lined with refrigerant-carrying tubes; this means that heat transfer is limited by two thicknesses of metal and by the non-conductive areas between the tubes. In the new freezers the plates are built up from hollow extruded aluminium planks through which the refrigerant is passed, and the temperature applied to the products is thus very close to that of the refrigerant.

New Sheet Steel

A new type of sheet steel of major importance to the vitreous-enamelling world has been produced by a British company. Its special qualities enable a finished vitreous surface to be applied in one coat—direct on to the steel—instead of two coatings, thus cutting manufacturing costs and enhancing the quality of the products. Tests have shown that articles made from the new steel, known as "Diron" such as cookers, resist damage much more than those from the traditional material. It costs only slightly more than ordinary enamelling steel but can yield a substantial reduction in costs, not merely from the elimination of a process but also by a cut in rejects resulting from damage in production and transport.

Silica from Sand

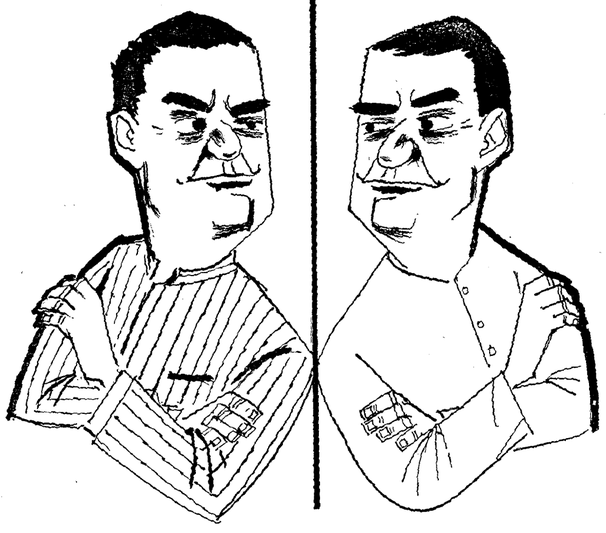
The *Financial Times*, London, reports that a French concern has invented a continuous and economic process for turning coarse sand into pure, ultrafine silica suitable for use in the rubber industry, for use as a chemical catalyst, as a filler in paints and varnishes and as a constituent of high-temperature refractories. The sand is first ground to a suitable size and then treated with a solution of an acid which contains fluorine and silicon and has also some uncombined silica already dissolved in it. Silicon fluoride is obtained as a vapour and this is again reacted with a solution similar to that used in the beginning until ultrafine silica is obtained.

Microbe-proof Fibre

Letilan, a synthetic fibre with a bactericidal action, has been developed at the Leningrad Textile Institute. It is said that letilan will find its most important application in surgery where it can be used without sterilisation for sutures, as cotton-wool and dressing material. Stockings made of the new material protect feet from diseases caused by fungi. Numerous analyses have shown that the new fibre is not contaminated by air-borne or water-borne microbes and kills bacteria at a distance. The bactericidal action of letilan is due to emanation of infinitesimal amounts of the compounds which enter into its chemical composition and are deadly to microbes.

Novel Alarm System for Crankcase Bearing Wear

A comparatively inexpensive alarm system for preventing crankcase explosions in ship's diesels caused by abnormal wear on or breakdown of bearings has been developed by the Gotaverken shipyard, Gothenburg. Patents for the new system have been applied for in several countries. Alarms for breakdowns in lubricating oil pumps have been available for a long time, but such breakdowns constitute only one cause of bearing wear. The new system has therefore been designed with a view to giving accurate information on the wear itself, the Company says. Thus, if the total wear on the bearings in a crankcase amounts to 0.3 mm., the alarm is released. The same applies if the wear on the crankshaft bearing or the cross-head reaches the same figure.



DON'T EQUATE !

Most of us resent being compared to our neighbours. So it is with Metric Weights.

To obtain the maximum benefit out of the metric system, use metric weights as they are, for their intrinsic value.

DO NOT USE A NUMBER OF METRIC PIECES TO MAKE UP A SEER OR A VISS.

You will waste your time and often lose in the transaction.

FOR QUICK SERVICE AND FAIR DEALING

USE METRIC UNITS IN ROUND FIGURES

ECONOMIC PLANNING IN FRANCE

MOST SUCCESSFUL AMONG DEVELOPED COUNTRIES

By Dr. H. GIELB

THE French experiment in economic planning goes back sixteen years now. It has its origin in a decision taken by the Provisional Government of France, under General de Gaulle, aiming at the drawing up of a modernisation and equipment plan and setting up of an authoritative body, the General Commissariat for Planning and Productivity (Commissariat General du Plan), to be responsible for projecting, activating and co-ordinating the preparation of the Plan and to report on its execution.

From the beginning, however, the French Government did not envisage the Plan as a Government instrument imposed on the economy of France. This type of Government planning would have been resented by the freedom-loving people of France, and it would not have received the required full-hearted co-operation.

In his instruction in 1946 to Monsieur Jean Monnet, who conceived the French type of economic planning and was appointed the first Commissaire General du Plan—General de Gaulle pointed to the way by which the great national effort of co-ordinated economic activities acquired the indispensable psychological stimulant. "Since the execution of the Plan," said General de Gaulle, "will require the co-operation of everyone, it is essential that all vital elements of the nation participate in its preparation."

It should be noted that post-war economic conditions in France provided an ideal background for an enterprise designed to rehabilitate the country economically and politically. Post-war France had not only to rebuild and repair the damage of the occupation period; it had to catch up with the industrial progress achieved by the great powers in the years preceding the war and during the war.

In these circumstances, it was perfectly clear to the French Government that the choice was between *modernisation* or *decadence*. Modernisation was adopted as the motto for the First Plan (1947-50, extended later to 1953).

The Monnet Plan which was to provide a programme for France's economic recovery, due to limited resources, was restricted to the modernisation and equipment of the basic industries (coal, power, steel, cement, agricultural machinery, transport) and to a number of other industries, with the distinction that, for the basic sectors, the objectives were considered imperative while for the other sectors they were only indicative.

In the long-term projections, however, the basic industries were to provide the springboard for the next plan. The idea of long-term forecasting, projecting and planning was at the basis of the whole conception and machinery of economic planning in France.

The Decree of 3rd January 1946 created the Commissariat General du Plan. The duties of the Commissariat are to make economic projection, prepare drafts for the Plan, submit them to the Government for approval, pilot the drafts through an elaborate series of debates and analysis by numerous specialised and overall commissions, re-submit to the Government the final draft for approval and, after the Plan has passed the analysis and debates of the Superior Council and the Economic and Social Council, supervise its execution and report to the Government on the achieved results and encountered obstacles as well as propose means of overcoming the difficulties.

The Planning Organisation

The organisation responsible for economic planning in France is composed of three main elements:

1. The permanent administration and research body, in the first place responsible for economic forecasting and conception of the Plan—the Commissariat General du Plan;

2. Working groups proposed by the Commissaire General and appointed by the Prime Minister before the elaboration of each Plan. These groups, known as "Modernisation Commissions," hold their meetings in the offices of the Commissariat General; and

3. Supervising bodies, the Superior Council and the Inter-ministerial Committee.

The Commissaire General is the permanent delegate of the Prime Minister with regard to Government Departments in all matters concerning the preparation of the Plan. He is assisted by a Deputy Commissaire General and a General Secretary and about 40 specialists: industrial and agricultural engineers, inspectors of the Treasury and of the Ministry of Finance and Economics, experts in administration, lawyers, economists and University professors.

The Commissariat General is sub-divided into sections of general competence; economic, financial and regional; specialised sections: labour, power, transport, industry and others; Productivity Division and General Services.

Government Departments often look to the projects and plans of the Commissariat General for the appreciation of their own short-term projects.

A number of official bodies collaborate directly with the Commissariat General. These are—the National Institute of Economics and Statistics, the Technical Divisions of Government Departments and the Division of Economic and Financial Studies of the Ministry of Finance and Economics.

Two other organisations are closely linked with the Commissariat General. The National Institute of Demographic Studies and the Centre of Research and Documentation on Consumption.

The Commissariat General du Plan was first attached to the Prime Minister's Department, but, since 1954, it is attached to the Minister for Finance and Economics, who, in relation to the Commissariat, acts as the Prime Minister's delegate.

The Modernisation Commissions are the second element in the French economic planning organisation (the name "modernisation") has been preserved from the first Plan in which "modernisation" played an important part. These commissions are appointed by the Prime Minister on the proposal of the Commissaire General for the purpose and before the elaboration of each plan. The commissions vary in numbers for each Plan; seventeen were apponted for the third Plan and 28 for the fourth Plan (1962-65). The number of members of each commission is usually between 30 and 50. The members of the commissions work in an honorary capacity.

The members of the Modernisation Commissions of the fourth Plan were divided into commissions on agriculture, the trades, public building and work, fuel, chemistry, commerce, fats, power, cultural problems, sanitary and social development, education, urban development, housing, primary industries and food, secondary industries, non-ferrous metals, deep-sea fishing, post and telecommunications, radio and TV, iron and steel, tourism and transport.

Taking into consideration all commissions and working groups that participated in the preparation of the fourth Plan there was a total of 3,137 persons. These were:

281 trade union representatives;

107 farmers' representatives;

715 representatives of nationalised industries, commerce, banks and the trades;

562 representatives of employer organisations;

781 Government Department officials;

691 representing the professions, experts, University professors, etc.

It is important to note that there is no set proportion of representation for each group.

The supervising bodies of the Plan—the Inter-ministerial Committee and the Superior Council of the Plan of Economic and Social Development—is chaired by the Prime Minister. It is composed of:

The Governor of the Bank de France;

President and two Vice-Presidents of the Investment Department of the Economic and Social Council;

Eight members from the Auditor-General's Department;

Seven presidents of the Regional Committees for Expansion;

The President of the Chamber of Commerce and Industry of Paris;

Indoxco Bronze Rods and Fluxes

for strongest welds Not a single batch of Indoxco Bronze Rods and Fluxes is put into the market unless it meets the stringent requirements of our quality control tests. Intended for specialised applications, you can get the best results from these Bronze Rods and Fluxes when they are matched to your job specifications.

General Confederation of Cadres;

La Confederation General du Travail Force Ouvriers (Trade Unions);

La Confederation Francaise de Travailleurs Chretiens (Trade Unions of Christian Workers);

La Confederation Generale du Travail (C.G.T.);

and personalities appointed by the Prime Minister and Minister for Finance and Economics. (This group must not exceed one-third of the total membership of the Council.)

Ministers also take part in the work of the Council when problems relating to their departments are under consideration.

The Inter-ministerial Committee and the Superior Council took part in the preparation of the first Plan. They did not function during the preparation of the second Plan and the third Plan. A Decree of 11th July 1961, re-established these two bodies for the preparation and supervision of the fourth Plan, now under implementation. According to this Decree, the functions of the Council are to report to the Government on the project of the Plan prepared by the Commissariat General du Plan. For this purpose, the Council is being kept informed during the preparation of the project. The duty of the Council is also to examine the yearly reports on the implementation of the Plan and the achieved results and accordingly make submissions to the Government on measures for the achievement of the social objectives of the Plan.

The Government may request the Council to undertake special research and recommend measures for the implementation of the Plan.

The Procedure of Economic Planning

The preparation of the Plan is divided into three distinct phases:

1. Preparation of preliminary drafts by the Commissariat General du Plan, and their submission to the Government.

2. Analysis and debates on draft Plan approved by the Government, by the Modernisation Commissions and Working Groups.

3. Synthesis and adjustments of draft Plan (within limits of draft approved by the Government), according to reports of Modernisation Commissions, Working Groups and Regional Commissions, and submission of final draft to Government.

As already stated, French Economic Planning is long-term planning on which the professional staff of the Commissariat General du Plan is working continuously. Each Plan is conceived as part of a long project which follows the previous Plan and makes provision for the one that will follow.

Before the drafting of each new Plan, the Commissariat General du Plan, assisted by the Department of Economic and Financial Studies of the Ministry of Finance and Economics, undertakes a general survey of all aspects of the national economy and of the development trends as far ahead as the duration of the Plan *plus* 10 years. This limit is considered the "economic horizon," after which provisions become too uncertain to be of any value. The purpose of these surveys is to establish the general lines of the projection and to detect the difficulties likely to arise in course of its realisation.

Draft projects are drawn up in several variants, envisaging different rates of production, growth and economic development. These drafts are prepared in co-operation with the Investments and Planning Section of the Economic and Social Council and are submitted to the Government. The rates adopted by the Government become the official draft Plan and are submitted to the Modernisation Commissions and other working groups, for discussion, analysis and the preparation of their sectoral reports which, however, must be kept within the limits of the rates adopted by the Government.

The provisional drafts prepared in 1960 for the fourth Plan (1962-65) envisaged alternative overall increases in production of 3 per cent, 4½ per cent and 6 per cent. Each of these alternatives was accompanied by detailed provisions for the maintenance of a balance of the basic elements of the economy: full employment, equilibrium between investment and savings, sound monetary position, balance of payments, etc.

This is established after a thorough analysis of demands of internal and external markets based on the last year of the Plan plus ten years ahead for: capital formation of enterprises, housing, public administration, import and export, raw materials, unfinished products, etc.

These calculations are based on demographique evaluations and consumption per head of population allowed for on the basis of corresponding increases in the standard of living. The surveys also extend to family budgets and family requirements. Further, they estimate the "consumption" of raw materials and unfinished goods in each of the sectors into which the Plan is divided. The fourth Plan was first sub-divided into 17 but, finally, into 28 sectors. This internal inter-sectoral movement of raw materials and unfinished products is necessary for the estimates of final production needs for internal consumption and for export.

After the preliminary estimates with all alternative rates of development have been completed, the drafts are submitted to the Government. The drafts are then examined by the Investments and Planning Section of the Economic and Social Council and the Government decides upon the rate of development for the Plan. The final draft of the fourth Plan (1962-65), for instance, was adopted in June 1960, with a yearly rate of development of 5.5 per cent.

The adopted draft is then submitted to the Modernisation Commissions which examine their respective sections. They can alter details within their section but these must remain inside the general hypothesis adopted by the Government. The Commissions prepare reports covering their deliberations and final decisions arrived at. These reports are further confronted at meetings of the Presidents and Secretaries of of the Commissions. In the event of important differences and conflicts between commission reports, inter-commission working groups are formed to work out solutions acceptable to the conflicting commissions. The draft is also analysed by the overall commissions (finance, manpower, research, productivity, regional planning). As a result of this process, the work of the commissions and other groups established for the preparation of the fourth Plan took approximately one year, until the reconciled reports were returned to the Commissariat General du Plan.

These reports are finally analysed and collated by the experts of the Commissariat and a reconciled draft plan is returned to the Government. The draft is examined by the Superior Council and submitted to the full assembly of the Economic and Social Council after which the Government finally approves the draft and the Plan is published with full details.

Since 1955, the Plan for economic development is supplemented by "Regional Plans" dealing with economic development of the particular regions and the adaptation of regional development to the programme and scope of the national Plan. For the purpose of balanced regional planning, France has been divided into

Help Mobilize National Savings

SERVE AS

VOLUNTEER AGENT

Whatever your walk of life you can be of real help to the country in the present emergency by becoming a SAVINGS VOLUNTEER.

Savings are urgently needed for the country's defence. Collection of Savings is, therefore, a concrete expression of your determination to fight the aggressor.

People everywhere are now more willing than ever before to save and invest their Savings in various Government Savings Schemes. You can help and guide them to do it regularly.

HOW TO ENROL

If you are over 18 years of age, Government will authorize you to bring the people's Savings into National Savings Schemes. Apply immediately to your Tehsildar/Collector for an authorized agency. Formalities completed, you will sign an agreement. You will be given receipt books to enable you to collect amounts from your neighbours, friends, colleagues and others for their investments in

National Defence Certificates

Defence Deposit Certificates

Annuity Certificates

YOU EARN COMMISSION ON CERTIFICATES SOLD

1¼% on sales of National Defence Certificates

1% on sales of Defence Deposit Certificates and Annuity Certificates

You have the option to donate your commission wholly or in part to the National Defence Fund. If you wish to work without any commission, please advise the Collector accordingly.

Your agency will be thrice blest: you bring new Savings to meet our Defence and Plan needs; commission earnings swell the National Defence Fund; you help promote thrift and help keep the prices down.

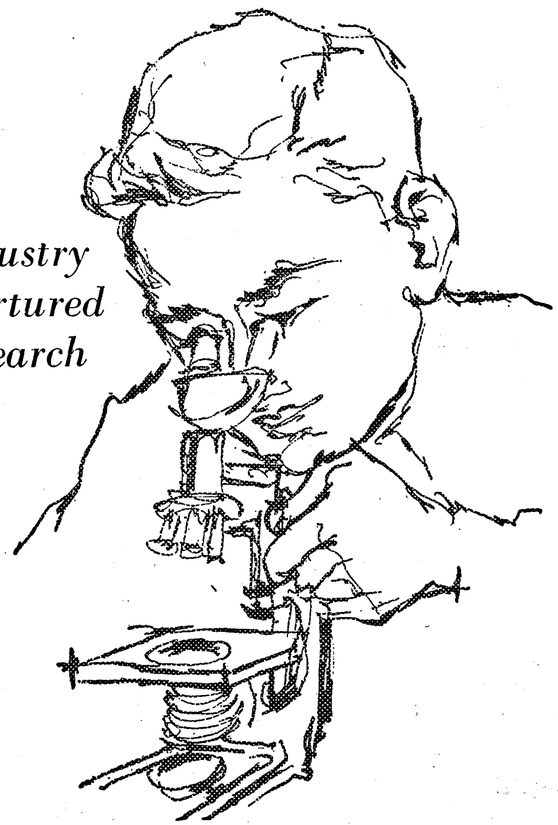
An Industry Nurtured by Research



'More than any other industry,' someone has said rightly, 'the Dyestuffs Industry has' been nurtured by Research'. Dyestuffs is a complicated industry, comprising hundreds of intermediates and complex processes. An important feature of this industry is that it is DYNAMIC and PROGRESSIVE...it keeps on changing with the tastes and preferences of people. Its prosperity, therefore, depends primarily on the extent to which research in Organic Chemistry—with particular accent on the Chemistry of Dyes—advances in the country. ■ A sound foundation for Research has been laid at AMAR DYE to enable it to keep its standards abreast of the latest trends in the world of dyes. AMAR DYE's ambitious research plans are based on a bid to secure rapidly for the country a firm place among the important dyestuff manufacturers of the world.

21 sub-divisions. A permanent body, the "Inter-departmental Conference" (the department, in this instance, is an administrative unit) was established in 1959. The duty of this body is to study and co-ordinate the programme of public investment in the region and prepare an economic development plan for the region. Besides this body, there is also in existence a Regional Committee of Expansion comprising representatives of all categories of professional and social activities. This is a purely consultative body of the region. However, according to a Decree of January 1961, the Regional Committee of Expansion must be consulted in connection with the preparation of the regional plans on economic and social development.

The aim of the regional plan is to "guide private enterprise, local co-operatives and professional organisations, and, within the scope of the national Plan, advise how action taken by the Government within the national Plan will influence the development of the region." A Committee of Regional Plans under the chairmanship of the Commissaire General is supervising the regional planning and is co-ordinating these plans according to the programme of the national Plan.

Addressing a symposium on French Economic Planning, organised by the National Institute of Economic and Social Research in London, in April 1961, Mr. Pierre Masse, the present Commissaire General du Plan, summed up the "Logic of the Plan" in the following way:

"The modern economy requires the employment of large investments whose profitability may be profoundly affected by changes in the environment. These changes not only occur rapidly, they are difficult to predict. Without going so far as to say, like Keynes, that the information available to the investor 'is usually very slight and often negligible,' we must admit that the individual business concern has no valid bases for calculation. For there are no 'generalised markets' on which, several years in advance and as a function of future circumstances, orders would be handled and prices formed for food, clothing, raw materials, finished products, capital goods, etc. This gap can be filled in only one way: by the study of the market. Accordingly, every firm carries out studies of this type before drawing up its investment and production programmes. The iron and steel manufacturer ensures his supplies of ore and coke, estimates his markets in the power, mechanical engineering and building sectors, and keeps informed about his competitors' programmes. He makes his decisions only after a thorough exploration of his industrial environment. But, by confining himself to that environment, he may neglect fields of activity which seem to him remote from his own, yet which are capable of affecting his situation. Developments in farm income or petroleum research, for example, have repercussions which spread by degrees throughout the economy and, after affecting the production of tractors or tubes, ultimately influence steel sales.

"The guiding principle of indicative planning is to integrate all these effects of interdependence by doing, on a *nation-wide scale*, what the iron and steel manufacturer does with regard to his supplies and his markets. . . ."

"In this generalised and consequently approximative form, it lays down a general line of programming that promises each branch of activity that it will acquire its factors of production and sell its produce on balanced markets. However, the promise is fulfilled only if everyone joins in the game. The promise encourages participation in the game, but it does not make it compulsory, so that the Plan reduces uncertainty without eliminating it completely. It does not relieve enterprises of the need to make estimates of probabilities and to adopt a definite line of thought on the risks involved, but it allows them to do so with a better knowledge of the facts."

Implementation

Having adopted the Plan, the Government assumes the obligation of setting the example. Accordingly, it pursues budgetary, credit, fiscal and price policies within the framework defined by the Plan. The psychological factors stressed by General de Gaulle are given wide credit for the success of French economic planning. Monsieur Pierre Masse attached great importance to these factors. He said:

"The harmony achieved during the elaboration of the Plan tends to carry over spontaneously into the execution phase. If the dynamic forces of the country are associated with the planning, they will associate themselves more readily with the action that follows. The foreknowledge of this sequence is indeed one of the major factors behind the French methods of planning."

Having moulded an adequate psychological background and a perceptive mood for "everybody's" Plan, the Government has at the same time, prepared a perceptive mood for the measures it will take for the implementation of the Plan. Although the Plan is considered more "indicative" than "imperative," the Government initiates powerful economic measures to gear the activities of all sectors of the national economy within the framework of the Plan. This is how Monsieur Pierre Masse sees the intervention of the Government in the implementation of the Plan:

There are, first of all, the Government-controlled investments, the equipment programmes of the Government departments, in which private enterprise is dependent in large measure on State aid. Each of these sectors in turn affects other sectors up the line: the French National Railways and Electricite de France, for example, affect the electrical engineering industry. Consequently, it is no exaggeration to say that, directly or indirectly, the State promotes and controls approximately one half of all investment.

Last but not least, the Government has a number of incentives it can offer to foster the execution of programmes consonant with the objectives of the Plan. These incentives, which are granted after consideration of each case, consist in tax reductions with respect to capital gains and transfer duties and of a liberal interpretation of the regulations applicable to parent corporations and their subsidiaries. These consist of priority access to credit, whether in the form of public bond issues, loans from specialised institutions or recourse to the Economic and Social Development Fund; in exceptional cases, interest rates may be reduced. Subsidies may be granted for research projects, to be repaid if the project is successful. Special agreements may facilitate the start of new manufactures. Lastly, equipment subsidies, depending upon the amount of the investment and, in certain cases, on the number of jobs created, may be granted in depressed areas, in accordance with the spirit of the Treaty of Rome. In all these spheres, *the views of the General-Commissariat play a leading role.*

In order to preserve the implementation of the Plan against possible yearly fluctuations of a budgetary nature, the 1956 Act which approved the third Plan provided for appropriations for several years.

Targets and Achievements of the First Three Plans

Although the implementation of the first three French economic plans encountered some temporary difficulties, these difficulties have rapidly been overcome and the targets have been achieved in full.

The first Plan which gave priority to the basic sectors of the economy was later enlarged in its scope and extended until 1953. The obtained results were: 71 per cent increase in industrial production, 21 per cent increase in agricultural production and a 30 per cent increase in the standard of living. At the end of 1952, all targets set by the Plan were achieved or exceeded.

The second and third Plans, however, were strictly limited to four-year periods. The second Plan (1954-57) was designed to cover all production activities; agriculture, the processing industries, housing, etc. This plan provided for an overall harmonised growth.

Furthermore, the watchword of the second Plan was no longer merely to produce more. It was, essentially, to produce better, that is to say, under competitive conditions of quality and price. There was in this, a foreknowledge of the trend toward the liberalisation of trade that was to come later, and the desire to prepare the French economy for the lifting of trade barriers.

The second Plan placed the emphasis on measures more or less long-term, of achieving the desired reduction in cost prices; the development of scientific and technical research, the specialisation of business firms, the training of labour and the organisation of markets.

On the whole, the targets fixed in the second Plan were exceeded. In 1957, the national production index reached 130 (instead of 125) and the industrial production index, not including construction, reached 146 (instead of 130). Electricity production and the automobile and chemical industries were particularly outstanding.

The super-expansion of economic activity resulted, however, in throwing the economy out of balance and in inflation. It was in these conditions that the third Plan (1958-61) was put into effect. The objective of this Plan was restoration of monetary stability and improvement of the balance of payments and, in a balanced economy, increase national production by 20 per cent in four years.

In order to arrest the boom conditions the increase in national production for 1958 and 1959 was reduced to 2.5 per cent a year. The measures taken by the Government (devaluation of the franc and other monetary and fiscal measures) proved so successful that, in the beginning of 1960, the French Government adopted an "Interim Plan" which increased the target of national production to 11 per cent for the second half of the third Plan (1960-61).

The fourth Plan (1962-65) which commenced in 1962 was also limited to a four-year term. It set an ambitious target of overall internal production growth of 24 per cent in four years.

This Plan, called "Plan of Economic and Social Development," however, has also a wide scope of long-term social development.

The fourth Plan envisages a number of first and second preferences in social development. The first choice, adopted in conformity with the opinion of the Economic and Social Council, is in favour of collective investment services in preference to the proliferation of individual consumer goods. These collective investments relate to essential or hitherto insufficiently developed categories such, for instance, as scientific and technical research, culture, public health, education, housing and urban facilities. In particular, the fourth Plan will endeavour to better co-ordinate urban growth, in relation to the development of the tertiary sector.

The second choice is in favour of social action for the benefit of the most needy sections of the population—the families, old people, students, wage earners and farm workers at the bottom of the wage ladder.

Conclusions

The French approach to economic planning is based on a realistic appraisal of the role of Government in the economic and social development of the country. It is, at present, universally admitted that, in a modern economy, the Government must assume responsibility for a sound economic and financial balance with all the implications that stem from it (full employment, population growth, development of national resources, research, etc.). Yet, because of old prejudices or fear of Government "planning," or because of parochial interests, the Governments in some countries are not given enough power to influence the basic economic activities of the private sector of the economy (investments, savings, research, etc.).

These obstacles have been overcome in France in a most satisfactory manner resulting in wholehearted co-operation of all vital forces of the country in the realisation of mutually elaborated plans for economic and social development.

The results achieved in France are remarkable. The annual rise in output per head of occupied population between 1947-48 and 1956-57, compared with other countries, was as follows:

France	5.5	U.S.A.	2.2
West Germany ...	4.6	N.Z.	1.8
Netherlands ...	3.4	U.K.	1.5
Sweden	2.8	Australia ...	1.1

(These figures are taken from the Fourth Annual Report, July 1961, of the Council on Prices, Productivity and Incomes, of Great Britain, London, Her Majesty's Stationery Office.)

It is because of these achievements that the Governments of a number of countries have turned their eyes to the French experience and have initiated some sort of economic planning, more or less imitating the French experiments. This can be noted in Belgium, Holland, and most recently in New Zealand and the United Kingdom.

The Economic and Monetary Council of New Zealand set up by the National Government in 1961, in its Second Annual Report released at the beginning of June 1962, stated:

"If New Zealand does not have a long-term economic policy for growth, it will lack the means of even choosing wisely between the short-term expedients to which its difficulties may drive it."

The British Council on Prices and Productivity quoted earlier, which is reputed to be the most influential Government advisory body, referred several times to the French example of economic planning. In February 1962, the British Government established the National Economic Development Council to examine, among other things, "the economic performance of the nation with particular concern for plans for the future in both the private and the public sectors of industry." On 9th May 1962, the Council adopted a five-year plan for growth of national production at the rate of 4.5 per cent per year. By thus emulating France, the U.K. has paid a tribute to the success of French planning.

Under the spur of the Sino-Indian war emergency, the machine tools industry is being increasingly defence-oriented. In particular, the new units in this industry will be generally geared to defence production. As indicated by Mr. C. Subramaniam, Union Minister for Steel and Heavy Industry, last week, the Union Government has decided to grant facilities for the full utilisation of existing capacities in the heavy machine tools and heavy electrical equipment industries as well as for their further development. But this will be subject to foreign exchange availability. The Government might also "sympathetically consider" the establishment of ventures jointly by the public and private sectors for the manufacture of heavy machine tools with a view to meeting both the defence and developmental requirements of the country.

INTERNATIONAL INDUSTRIAL CONCERNS

HOW SHOULD THEY BE OWNED?

By Frederic G. Donner

CHAIRMAN, GENERAL MOTORS CORPORATION

IT is my conviction that the international industrial corporation performs an important service that should be encouraged. Advantages accrue to all countries in which it operates no matter where the parent organisation may reside. The international industrial corporation in the sense in which I am using the phrase engages in manufacturing operations on an international scale—that is, has plants in many countries—and also carries on a world-wide export business both from its home plant and from these subsidiary plants. Under the definition I am using, it is not a trading corporation nor is it engaged in the public utility or extractive industries.

From the standpoint of the countries in which subsidiary operations are set up, the result is an investment of capital that in many instances would not be available locally. Technical and managerial skills that, in many cases, could not be otherwise obtained and centres for teaching these skills are also supplied.

Foreign investments bring together human and material resources in the recipient countries. They create good jobs for people who might otherwise be less productively employed and produce goods which might otherwise not be available. Our own experience at General Motors demonstrates that the development of a managerial group staffed by that country's citizens is often a by-product of great value. These international industrial corporations also create new demand for materials, components, supplies and services, and produce tax revenues for local and national governments. And they increase the capacity to export from the countries in which the investments are made.

From the standpoint of the investing country, once a manufacturing operation is established abroad, a part of the investment is often spent for capital goods and services in the home country. Additional exports from the investing country are also generated in the form of materials, parts and services required to support the new activity. And, most important, the increased level of economic activity in the recipient country supports and requires a higher level of imports.

There is thus, and of necessity, a close relationship between the business and the citizens of these countries. This relationship takes many forms—producer to customer, employer to employee, purchaser to supplier and so on. Can we not now visualise the extension of these relationships in many cases to include the relationship of corporation to stockholder? Hasn't the time come when thought should be given to making the ownership of these international corporations also truly international? In other words, should it not be possible for investors in the countries in which international corporations operate plants to participate directly in the ownership of these international corporations? This is, to me, an idea that holds great opportunity to investors throughout the world as industrial corporations widen their horizons and operate on an international scale. While such an evolution appears to be a logical next step, it is not necessarily the only practical approach for every international industrial corporation.

Local Participation

Direct local participation in the ownership and earnings of the local subsidiary in some cases may have advantages over participation in the ownership of the parent international corporation. This approach is consistent with local pride in national development and, in the case of some types of world-wide businesses, is the most efficient kind of operation.

In the case of other world-wide corporations, however, direct local ownership participation in the individual foreign subsidiary, and the resulting fragmentation of ownership interest, is not consistent, either from a manufacturing or a marketing point of view, with efficient service to the customer. As matters stand now, the world-wide corporation is often committing its funds, sometimes on a fairly large scale, to the expansion of subsidiaries which contribute directly to local development and which are responsive to the local concern and desire, often stimulated by government action, for such development.

How can it be made more clear to a local investor in the world-wide corporation that his investment is contributing directly to this expansion and benefiting his country? As one possibility, should the corporation's stock be made available locally when the expansion of facilities is planned, the proceeds from the sale to be retained by the subsidiary to meet the capital needs of the expansion?

To offer another suggestion, perhaps international corporations could place stock in the hands of local employees through savings or supplemental compensation or other benefit plans. What I am suggesting is a possible long-range approach predicated on greater knowledge of common stocks by the public everywhere and on a greater desire to own them, coupled with improved facilities for their purchase and sale and enlightened tax and foreign exchange policies by individual governments.

Flow of Funds

By making possible a broader base of ownership participation in international corporations, the flow of investment funds generally would be stimulated and directed to those countries where they can be of greater use, thereby contributing most effectively to the economic growth we so earnestly seek. It is a natural complement to the rapidly widening acceptance of free world trade. In proposing that we give thought along these lines to increasing world-wide participation in the ownership of international industrial corporations, I am not suggesting that it is the only way to achieve economic progress nor do I have any illusions that the task is an easy one. A great many details, some of them very complex, would have to be worked out almost on a country-by-country basis.

I do believe that the approach I have visualised—true international ownership of the world-wide corporation—merits the most serious consideration. It is logically a part of the other great efforts now being made to reduce the restrictions on trade and on investment. And, as in the case of both of these, it is an effort which must call forth our highest technical and professional skills. It is, above all, an effort which will depend for its success on a deeper understanding of the role of the international industrial corporation in the world of tomorrow.

In mentioning several practical aspects of international ownership, it has not been my intention to stress the means, for I am not attempting to present a finished plan. Rather I have wanted to call attention to a development which in some ways is creating a new kind of capitalism. It is the emergence of the modern industrial corporation as an institution that is transcending national boundaries.

These great concerns of the free world both here and abroad, are no longer adequately described as Dutch, German, French, Italian, British or U.S. corporations. We may be approaching a stage where we will not think of them primarily in terms of a single country nor will we think of their benefits as flowing especially to any one country. In interests and ambitions, in investments, in employees, in customers, they are an international resource. Their benefits should be regarded as flowing to workers and customers—and to owners as well—without regard to any individual nationality.

When and to the degree that this concept of ownership is realised, the vision of true freedom of trade and investment which inspired the great philosophers of economic freedom in the past will be closer to realisation. The free world markets of the future, I am convinced, hold out tremendous promise. Economic growth in the industrialised nations throughout the world will be vigorous during the decade ahead. I think we can also safely look forward to an even more rapid rate of growth in many of the other parts of the free world now just on the threshold of industrialisation. These are markets which the world-wide corporation is uniquely fitted to serve. The opportunities that lie ahead are limited only by the degree of our determination to master old problems with bold, new efforts. To the extent that we achieve success, the beneficiaries will be the economies and—more importantly—the people of the free world.

Kumardhubi the largest single refractory manufacturing unit in the East offers

EARLY DELIVERIES OF SILLIMANITE REFRACTORIES

PIONEERS in the manufacture of Firebricks and Silica bricks, Kumardhubi's venture in the field of Sillimanite has met with unrivalled success. Recent large-scale expansions, harnessed to the most up-to-date equipment and rigid quality control, ensure prompt, early deliveries of Sillimanite Refractories... Refractories indispensible to the Glass, Enamel and Ceramic industries.

KUMARDHUBI SILLIMANITE bricks are ideal for glass furnaces, oil and gas-fired furnaces, roofs of electric furnaces, soaking pits and wherever ability to support heavy loads under extreme temperature variations is essential.

KUMARDHUBI'S MODERNISATION PROGRAMME to meet increasing demands during the Third Five Year Plan assures the nation of a consistent supply of Kumardhubi Sillimanite Refractories—in regular shapes and sizes, or to specification.

STRUCTURAL ENGINEERING CUTS DIVIDEND

EXPANSION PROGRAMME UNDER WAY

AFTER having staged a fairly good recovery in 1960-61, the Structural Engineering Works Ltd. (Managing Agents: Messrs. Bhagat and Sons (Private) Ltd., Bombay) has just managed to maintain the level of profit during the year ended 30th June 1962. The proceeds from sales and work done have shrunk slightly from Rs. 145.16 lakhs to Rs. 139.95 lakhs. But thanks to a relief of nearly Rs. 8 lakhs in the cost of materials, stores and spares consumed at Rs. 65.61 lakhs and of about Rs. 6 lakhs in other expenses at Rs. 14.98 lakhs, the gross profit, at Rs. 19.31 lakhs, has remained more or less unchanged over the year. At Rs. 6.67 lakhs, the net profit shows, however, a setback of almost Rs. 1 lakh, because of an increase of Rs. 1.30 lakh in the provision for taxation at Rs. 5.40 lakhs following the five-point raise to 50 per cent. in the rate of income-tax for companies under the 1962-63 budget. The profit retained in business amounts to only Rs. 1.20 lakh, as against Rs. 4.65 lakhs a year before. Notwithstanding this substantially lower plough-back to reserves, the profit available for distribution is insufficient to cover fully the previous year's dividend of 13 per cent per annum, subject to tax, and that too on the increased ordinary share capital of Rs. 45 lakhs following the issue of 15,000 rights shares of Rs. 100 each at the premium of Rs. 30 per share to the shareholders as on 2nd May 1961 in the proportion of one new share for two shares held. The dividend has, therefore, been slashed to 8 per cent. The net return, amounting to 5.6 per cent, is the lowest, at least for the past nine years.

As anticipated in our review of the 1960-61 results of the Company, the ordinary share capital has been increased further by the issue of 45,000 new ordinary shares of Rs. 100 each at a premium of Rs. 5 per share to the shareholders as on 2nd July 1962 in the proportion of one rights share for every share held by them. As it was made after the close of the year, this issue of additional capital is not reflected in the balance-sheet. However, we are told, the sum of Rs. 55 payable per share on application, including Rs. 5 towards the premium account, has been paid on 44,996 shares which have been allotted. The first call of Rs. 25 per share has been made. The second and last call of a like amount will be made in due course. This almost 100 per cent increase in the issued and paid-up capital should enable the Company gradually to reduce its great dependence on borrowed funds. At the same time, however, it remains to be seen whether there will be any further cut in the dividend for the current year ending 30th June 1963. If the profit-margin in the current year were to show no material change over 13.8 per cent in 1961-62, which had continued to be about five points lower as compared with 18.3 per cent in 1959-60, the dividend for 1962-63 would possibly be still lower.

The following comparative table mirrors the progress made by the Company in the past four years:

(In lakhs of rupees)

	For the year ended 30th June			
	1962	1961	1960	1959
Sales and work done	139.95	145.16	94.46	102.37
Closing stocks	70.88	67.15	58.80	41.41

Low	120.00‡	167.50‡	225.00	208.00‡

* Subject to deduction of tax.
† cum. right. ‡ ex. right.

The results for the year under report have to be read in the light of the very keen competition in the structural steel fabricating industry and the need, therefore, to continue accepting work at competitive rates. On the other hand, the cost of labour went up owing to revision of wage scale, introduction of a scheme of gratuity and certain other amenities for the workmen and staff. Consequently, the profits of the Company were adversely affected both by the downward trend in prices and the upward trend in the cost of labour.

The outlook for the Company is basically good. Orders on hand are said to be sufficient to keep all its establishments engaged during the current year. Besides, there is an expansion programme which is progressing well. Thus, the machinery, plant and drawings required for the manufacture of prestressed concrete pipes have been received, and a foreign technician has been engaged to set up the factory. The project will cost Rs. 30 lakhs. The factory will go into production during the current year. Plant and machinery worth Rs. 10 lakhs for the manufacture of Cochran boilers and penstocks have been received and some more of the value of Rs. 4 lakhs already shipped. Further machinery and equipment of Rs. 5 lakhs have been ordered from the U.K. and the balance of plant and machinery are to be obtained from the U.S. It is expected that all the plant and machinery will have arrived by June next, when a new factory building will also have been set up. The capital outlay on this project is estimated at Rs. 108.45 lakhs. Another project on hand is for the fabrication of transmission towers. A workshop is being set up at Mulund, suburban Bombay. The plant will start operating in March 1963. This Rs. 20-lakh project will enable the Company to execute large-scale orders for fabricating and galvanising transmission towers for which there is a great demand in the country. The Company has been commissioned to produce reinforced concrete pipes for the duct line project of the Bombay Municipal Corporation. It has set up a factory 39 miles north of Bombay. Production has commenced and the laying out operations will be in full swing in the near future.

While the above is a rosy picture, the Directors have cautioned about any unforeseen difficulties that may arise due to the serious emergency created by the Chinese aggression.

The paid-up capital of the Company, as at 30th June 1962, amounts to Rs. 70 lakhs, of which Rs. 45 lakhs are in ordinary shares and the balance of Rs. 25 lakhs in two types of preference shares. Reserves and surplus aggregate Rs. 50.86 lakhs. Borrowings stand at Rs. 133.75 lakhs, as against Rs. 115.52 lakhs a year before, and are nearly double the share capital. In addition, there are current liabilities and provisions aggregating Rs. 71.81 lakhs. The total indebtedness to outsiders thus works out to Rs. 205.56 lakhs, but is fully met by current assets, book debts and investments amounting to Rs. 234.68 lakhs. The gross block, which expanded during the year from Rs. 109.39 lakhs to Rs. 122.93 lakhs, has been written down to Rs. 68.20 lakhs. Projects-in-progress are shown separately at Rs. 23.54 lakhs, as against Rs. 6.60 lakhs a year before.

The Rs. 100 fully paid ordinary shares of the Company are currently quoted at Rs. 128.75 *ex-right*, but *cum-div.* On the *ex-div.* basis, they offer a net yield of 4.5 per cent per annum.

PAPER MILL PLANT AND MACHINERY LTD.

The Paper Mill Plant and Machinery Manufacturers Ltd. has been making good progress in regard to manufacture and delivery of plant and machinery and production of components for the existing paper mills during the current year ending 31st March 1963. The value of orders on hand is estimated at Rs. 1.24 crore. Out of this, orders worth Rs. 14.60 lakhs have already been fulfilled. Plants of the value of Rs. 10 lakhs are said to be under delivery and further orders for a like amount will be fulfilled before 31st March 1963. The Company has entered into an agreement with the promoters of a mill at Mandi Dip, Bhopal, for the supply of plant and machinery worth Rs. 24.5 lakhs for a 10 to 20 tons paper mill to be operated on a co-operative basis by the Tibetan refugees. Finance for the project is expected to come partly from His Holiness the Dalai Lama and partly from the refugees themselves.

BURNPUR
—A PORTRAIT
IN STEEL

A busy steeltown. Alive to the problems of the day, prepared for the challenge of tomorrow. Thousands live and work here day and night. All of them think in terms of steel—and more steel, for India.

Yet less than ten years ago, the rated annual capacity at Burnpur was about half a million tons of crude steel and a similar quantity of pig iron. A two-step expansion programme has since raised annual production at the integrated steelworks to 1 million tons of crude steel and 1.3 million tons of pig iron. The smallest additional capital cost can expand production further, by another million tons of steel if need be.

Meanwhile, IISCO steel—in all the shapes that steel can take—serves India's developing economy.

WORK * SAVE * DONATE—FOR DEFENCE

T. 820 A EVEREST

SCINDIA'S PROFIT SOMEWHAT BETTER

FREIGHT CARRIED DECLINES, BUT COSTS CUT

THE operating results of the Scindia Steam Navigation Company Ltd. (Chairman: Mr. Dharamsey M. Khatau, Bombay) for the year ended 30th June 1962, reveal two basically contradictory trends which, should they continue, could be expected to bring about the much needed improvement in the Company's profit position in the coming years. With the continuance of depression in the shipping industry and unsatisfactory operations in coastal services because of persisting fall in the draft of the river Hooghly, unsatisfactory turnround of vessels at ports and occasional strikes at Calcutta by salt boatmen and pilots, the Company could carry only a lower volume of cargo aggregating 2,504,287 tons in 1961-62 as against 2,595,362 tons during the preceding year. There has, therefore, been a further drop in earnings, the exact fall being Rs. 142.03 lakhs taking the total down to Rs. 16.49 crores. This fall is on top of the decrease of Rs. 86.28 lakhs suffered during the preceding year. Thus, within a spell of two years, the Company's earnings have dwindled by as much as Rs. 2.28 crores and are in fact the lowest on record since 1958-59. The steady fall in the tonnage carried and in the freight earned, particularly during the preceding two years, is clearly shown below:

	Cargo carried (Tons)	Freight earned (Lakhs of Rs.)
1958-59	2,453,738	16,58.65
1959-60	2,676,690	18,35.79
1960-61	2,595,362	17,50.11
1961-62	2,504,287	16,00.51

This downward trend in earnings has, however, been offset during the year under review by a welcome decrease in the cost of operation, thanks to the success of efforts at rationalisation and economy. Thus, the cost per ton has been brought down from Rs. 62.98 to Rs. 58.11 and is only fractionally higher than that during 1958-59 which, it will be recalled, was a year of high profits. As a result, there has been a sharp improvement of Rs. 44.12 lakhs or well over 20 per cent in the gross profit to Rs. 246.09 lakhs. This increase has naturally brought about a rise in the Directors' remuneration by Rs. 1.03 lakh to Rs. 1.95 lakh. The provision for depreciation has only been slightly pruned from Rs. 196.45 lakhs to Rs. 195.38 lakhs. Because of the absorption against current profits of the arrears of the development rebate to which the Company was entitled in prior years, no provision for taxation has been made for the third successive year. Thus, with a higher gross profit and the essential provisions nearly maintained, the net profit has vastly improved from Rs. 4.60 lakhs to Rs. 48.76 lakhs. But it is still small and insufficient to pay a decent dividend. It may be noted here that the net profit for the year under review is only a fraction of that for 1959-60 and 1958-59. Accordingly, there is no reason for investors to feel jubilant over the outcome of the Company's performance in the past year and for the Government to conclude that everything is fine in the garden of Indian shipping. In fact, the profit was not sufficient even for providing the development rebate in full and the reserves built up in the past had to be depleted again even to pay a token dividend of 3 per cent per annum, subject to deduction of tax.

It will be recalled that the statutory development rebate allowance in respect of ships purchased during the year 1960-61 came to Rs. 128.00 lakhs and the statutory reserves to be provided (at 75 per cent) amounted to Rs. 96.00 lakhs. As the assessable income for that year was less than the rebate claimed, the full amount of the reserve could not be provided. Taking into account the assessable income for the year under review, an amount of Rs. 64.50 lakhs has been transferred to the development rebate reserve. The three per cent dividend, subject to tax, requires a sum of Rs. 33.79 lakhs. Since the available profit falls much short of these two requirements, a sum of Rs. 55.18 lakhs has been withdrawn from reserves and past provisions. The comparative table in the previous column provides a synoptical view of the Company's performance in the past four years.

The financial position of the Company, however, continues to be satisfactory. The paid-up capital has remained unchanged at Rs. 11.28 crores, all in ordinary shares of Rs. 20 each, fully paid, and is backed by reserves and surplus aggregating no less than Rs. 11.61 crores. Against these owned funds of Rs. 22.89 crores, secured loans are of the order of Rs. 12.69 crores of which Rs. 8.44 crores represent a long-term loan from the Government for the purchase of ships. Then there are current liabilities amounting to Rs. 4.15 crores, but are fully taken care of by current assets, loans and advances aggregating Rs. 9.16 crores. The net block is worth Rs. 25.25 crores and has been arrived at by writing down the gross block of Rs. 37.97 crores by Rs. 12.72 crores representing the amount of depreciation provided so far. Investments, mostly in Government securities and shares and debentures of companies other than subsidiaries, are valued in the Company's books at Rs. 5.71 crores.

During the year under review orders for three 17-knot motor vessels of Mitsubishi type were placed with the Hindustan Shipyard Ltd. The first vessel, the keel of which was laid in October 1961, is expected to be launched during the current year. The keel of the second vessel was laid in May 1962 and that of the third will be laid some time in 1963.

The continued difficulty faced by the shipping industry in general, the drop in profits of the Company in recent years and the very low rate of dividend have all tended to depress the price of the Company's Rs. 20 paid ordinary shares. The present nervousness in the market has made matters worse and the shares are now available at Rs. 11.04 *cum*-dividend against a break-up value of over Rs. 40 per share. At the current market price the scrip fetches a net yield of about 4 per cent per annum. When the fortunes of shipping industry turn for the better, this premier shipping scrip is bound to stage a spectacular rise. It is only a question of time.

ALUMINIUM LTD. EARNS MORE

Aluminium Ltd. of Montreal, Canada, earned a consolidated net income of $30.6 million, or $1.00 per share, in the nine months ended 30th September 1962, as against $20.8 million, or 68 cents per share, in the corresponding period of 1961. The third-quarter net income this year was $9.7 million (32 cents per share), as against $5.7 million (19 cents per share) in 1961, when the third-quarter earnings were adversely affected by the shutdown of the Kitimat smelter for repairs to the power tunnel. Consolidated sales and operating revenues in the first three quarters were $417.1 million, that is 10 per cent more than $379.2 million in the nine-month period of 1961.

In his message to shareholders, Mr. Nathanael V. Davis, President of Aluminium Ltd., states that "the improvement in the Company's sales volume has occurred principally in the Canadian and United States markets while sales tonnages have held approximately level in other major markets as a whole. Shipments of semi-fabricated products from the Company's growing network of fabricating outlets are continuing to show satisfactory expansion in total." He adds: "Despite these encouraging indications of growth in aluminium consumption, the general price structure for aluminium has weakened further in the past few months because of the continuing surpluses of metal in the western trading world and resulting pressure of competition. The Company's operating rate at its Canadian smelters has been maintained at about 75 per cent of rate capacity for the past 12 months."

(*Concluded from next column*)

ed during the year by Rs. 2.60 lakhs to Rs. 161.78 lakhs, has been written down to Rs. 76.29 lakhs. Besides, there is shown a capital expenditure of Rs. 6.21 lakhs on electrical installations and buildings under construction.

Currently, the Rs. 10 ordinary shares are quoted at Rs. 24.50 *cum-div.*, interim of 12 per cent. On the *ex-div.* basis, the net yield at the current price works out to 5.3 per cent per annum.

SPENCER & CO. FAILS TO MAINTAIN PROFIT

LOWER OUTPUT MAIN CAUSE

NOTWITHSTANDING a further improvement of Rs. 53.65 lakhs (Rs. 74.79 lakhs in 1960-61) in net sales (that is, excluding the excise duty paid) and receipts from hotels, bakeries, laundry and catering to Rs. 505.36 lakhs during the year ended 30th June 1962, Spencer and Company Ltd. (Chairman: Mr. Z. R. Irani, Madras) has reported a small setback in its gross profit from Rs. 29.53 lakhs to Rs. 28.46 lakhs. The improvement in turnover is evidently a continuation of the benefits arising from the diversification of activity undertaken by the Company some years ago from the original lines of business of merchandise, storekeeping and commission agency for a number of foreign suppliers to such complex fields as general trading, hoteling and catering, house furnishing, refrigeration and air-conditioning, tea plantation and the manufacture of drugs, pharmaceuticals, cigars and aerated waters.

Such diversification into varied and mutually independent lines must have presented its own problems. That probably explains why the Company has been able to earn only a modest profit-margin of roughly 6.5 per cent per annum in the three years ended 30th June 1961. During the year under review, the ratio of profit to net sales has actually slipped down to 5.6 per cent. The Directors attribute this setback mainly to the fall in production (the extent of which, however, is not indicated) of carbon dioxide owing to the difficulty in obtaining supplies of coke. The trend of profit was also affected by the decline in tea crop in the Company's estate, as well as the average price realised from Rs. 4.40 per kg. in 1960-61 to Rs. 4.28 per kg. The average daily occupancy at some of the Company's hotels also declined, but this did not affect the profits. The current year's profit, we are told, may also be affected by competition expected to be offered by a larger number of new manufacturers of carbon dioxide.

In relation to gross profit, the net profit for the year under report shows a bigger setback of Rs. 1.35 lakh at Rs. 13.54 lakhs because of slightly higher allocations to depreciation and taxation. Nonetheless, the dividend on the Rs. 10 fully paid ordinary shares has been maintained at 18 per cent per annum, subject to tax, including the interim dividend of 6 per cent. But reserves and provisions have got only Rs. 1.01 lakh, as against Rs. 2.25 lakhs a year before. The carry forward, however, is larger at Rs. 10.74 lakhs, as against Rs. 9.57 lakhs brought in.

The following comparative table gives a clear idea of the progress made by the Company in the past four years:

(In lakhs of rupees)

	For the year ended 30th June

* Subject to deduction of tax.

Financially, the Company is pretty sound. Its authorised capital, aggregating Rs. 100 lakhs, of which Rs. 40 lakhs are in ordinary shares and the rest in two types of preference shares, has been fully issued and paid-up. The capital is supplemented by reserves and surplus standing at Rs. 113.89 lakhs. The equity is thus nearly three times covered. Borrowings increased during the year by about Rs. 10 lakhs to Rs. 48.05 lakhs. Current liabilities and provisions total Rs. 74.63 lakhs. The Company is thus indebted to outsiders to the tune of Rs. 122.68 lakhs. Against this, it has current assets, loans and advances aggregating Rs. 215.27 lakhs and investments of Rs. 38.81 lakhs, Rs. 16.05 lakhs of which are quoted and command a market value of Rs. 22.67 lakhs. The gross block, which expand-

(*Continued in previous column*)

BALLARPUR PAPER

PRODUCTION UP—NET PROFIT DOWN

WITH a higher output and larger sale of paper—12,786 tonnes and 12,649 tonnes in 1961-62 as compared with 12,387 tonnes and 12,411 tonnes, respectively, in 1960-61 and a satisfactory working of the stationery wing, the Ballarpur Paper and Straw Board Mills Ltd. (Managing Agents: Messrs. Karamchand Thapar and Brothers Private Ltd., Calcutta) have been able to report slightly better results for the year ended 30th June 1962 as compared with those for the preceding year. Sales of paper and stationery have increased from Rs. 240.10 lakhs to Rs. 248.78 lakhs and so also the gross profit from Rs. 73.70 lakhs to Rs. 76.11 lakhs, despite a heavier incidence of excise duty. The higher profit, coupled with the increase in the rate of corporate taxation, has necessitated a bigger provision for taxation, Rs. 31.50 lakhs as against Rs. 25.00 lakhs. Thus, taxation has swallowed up all the increase in gross profit and something more. The provision for depreciation is also slightly higher at Rs. 7.42 lakhs as against Rs. 7.38 lakhs a year ago. Consequently, the net profit has actually dwindled by Rs. 4.25 lakhs or 11 per cent. to Rs. 32.16 lakhs.

In the course of 1960-61, the Company had issued further equity shares on which only a proportionate amount of dividend had become payable in respect of that year. With the new shares now becoming eligible for a full year's dividend along with the old shares, a much larger outlay has been found necessary to finance the ordinary dividend. Accordingly a sum of Rs. 20.68 lakhs as against Rs. 9.70 lakhs has been appropriated out of the net profit for this purpose, even though the rate of dividend is unchanged at 14.50 per cent per annum, subject to tax. Even this has been possible only by sharply reducing the transfers to reserves from Rs. 26.10 lakhs to Rs. 11.20 lakhs. The details of transfers to reserves are: Rs. 1.20 lakh (Rs. 1.10 lakh) to development rebate reserve, Rs. 5.00 lakhs (Rs. 15.00 lakhs) to general reserve, Rs. 5.00 lakhs (Rs. 10.00 lakhs) to dividend equalisation reserve. Even so, the carry forward is only Rs. 93,000, as against Rs. 2.28 lakhs brought in.

The following table shows at a glance the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 30th June			
	1962	1961	1960	1959
Sale of paper and stationery ..	248.78	240.10	235.43	218.73

* Subject to deduction of tax.
† Includes Rs. 3.87 lakhs at 5 per cent., tax-free, upto 30th June 1958 and the balance fully subject to tax.
‡ For the Rs. 25 paid shares.

There has been a further improvement in the Company's financial position during the year under review. The paid-up share capital has increased from Rs. 159.86 lakhs to Rs. 161.19 lakhs and reserves and surplus by Rs. 9.85 lakhs to Rs. 81.37 lakhs. The share suspense account has, however, thinned down from Rs. 3.51 lakhs to Rs. 12,738. Secured and unsecured loans total Rs. 95.13 lakhs in addition to current liabilities of the order of Rs. 124.66 lakhs. But both of these are fully covered by current assets, loans and advances aggregating Rs. 318.24 lakhs. The investment amount has increased a little to Rs. 34.24 lakhs but miscellaneous expenditure yet to be recouped has declined to Rs. 3.93 lakhs from Rs. 4.08 lakhs a year ago. During the year new assets worth Rs. 11.60 lakhs were acquired and this has raised gross block account to Rs. 290.64 lakhs. Against this, however, the amount of depreciation provided to date is as high as Rs. 222.90 lakhs, so that the net block works out to Rs. 64.81 lakhs. Then, there are patents and trade marks, livestock, capital-work-in-progress and advances against machinery aggregating Rs. 41.24 lakhs, so that the total net block is worth Rs. 106.05 lakhs.

As regards the operations of the Company during the year under review and the progress so far achieved in executing the expansion and modernisation plan, it is best to reproduce here what the Directors themselves have to state in their report to shareholders:

"A distressing feature during the year under review was the steady and continuous rise in prices of chemicals and other stores. These increases have resulted in a rise in the cost of production. The chemical cost per tonne alone has gone up by about 20 per cent. Apart from price increases, certain chemicals were also in short supply. Representations through the Paper Associations have been made to the Government for making available essential chemicals to the industry in adequate quantities and at reasonable prices.

"Of late, there has been a noticeable tendency on the part of State Governments to put up the royalty rates for bamboo forests. The mills have been called upon to pay for the additional bamboo forests required by them for the expanded capacity a basic royalty rate which is substantially higher than the royalty being paid at present. This increased rate of royalty is further subject to revision after every five years.

"In June, the Government increased the selling price of white printing paper by 5 nP per kg. and of other qualities by 6 nP per kg. While the industry has welcomed this price increase, the Directors regret to point out that it is not sufficient to cover the increased costs of production which have already taken place.

"The plant and machinery ordered on German suppliers are being shipped according to schedule and, in fact, a number of consignments have already reached the mills site. French suppliers are expected to commence shipment immediately. Similarly, plant and machinery from indigenous sources have started arriving at site according to schedule. Civil engineering work has made good progress and the foundations for a number of machines are ready and it is proposed to take up erection of the machinery from March or April next year . . . on the basis of the present progress, it is hoped that one of the machines, that is, the Voith M. G. Machine, would be ready for being commissioned by October next year. The Voith pulp mill and the second Voith machine would be ready by the end of next year. The Empacel pulp mill and the Allimand machine would be commissioned shortly thereafter."

The Rs. 10 fully paid ordinary shares of the Company are currently quoted at Rs. 17.50 *cum-div.* On an *ex-div.* basis, the net return on fresh investment works out to 6.20 per cent per annum.

JAYANT PAPER MILLS LTD.

The Jayant Paper Mills Ltd. started regular production soon after its plant was commissioned on 8th October 1962. The quality of the kraft liner paper produced by the Company is said to be of a high standard and has been well received by the trade and industrial consumers. The assembly and erection of the plant and machinery were completed by the Japanese engineers, who were under contract with the Company, during the year ended 30th June 1962. The plant is being run by Indian engineers and the foreign technicians have returned home. During the year, the Company doubled its production capacity to 20 tons a day. It has been granted a licence for the import of a ground wood-pulp plant from Japan and has accordingly placed an order. The plant is expected to produce five tons of ground wood-pulp per day and will help the Company to raise production in its pulp section. Arrangements have been completed for the supply of the indigenous raw materials which will be supplemented by the import of unbleached sulphite wood-pulp, spares and consumable stores under licences in accordance with the requirements of the Company. The Company was sanctioned during the year a long-term loan of Rs. 10 lakhs by the Gujarat State Financial Corporation and it withdrew out of it a sum of Rs. 5.50 lakhs till the end of the year. Subsequently, a further withdrawal of Rs. 3.50 lakhs was made, bringing the amount withdrawn to Rs. 9 lakhs. Mr. Hargovinddas R. Mehta and Mr. Bhagawandas P. Shah were appointed Managing Directors of the Company during the year.

LECTURES ON COMPANY LAW

The Research Sub-committee of the Chartered Institute of Secretaries India Association of Calcutta had organised in August and September last a seminar on Company Law at the committee room of the Bengal Chamber of Commerce and Industry. Some eminent authorities on companies, company affairs and Company Law participated in the seminar. It goes without saying that the lectures they delivered were highly informative, thought-provoking and useful, especially to the members of company secretaries' profession. Those lectures have now been compiled and brought out by the Association in the form of a booklet, entitled *Lectures on Company Law*, which is priced at Rs. 2.

SYNOPSES OF COMPANY REPORTS

Phosphate Co., Ltd.

(*Secretaries and Treasurers*: Messrs. Bangur Brothers Ltd., Calcutta.)

Annual General Meeting—28th December 1962.

Working Results:

	For the year ended 30th June (In thousand rupees)	
	1962	1961
Sales of superphosphate	56,48	52,47
,, ,, ammonium sulphate and fertiliser mixtures	24,42	24,44
,, ,, sulphate of alumina	4,98	2,55
,, ,, other materials	34	1,05
Closing stock	11,99	6,41
Gross profit	16,14	12,90
Transfer to Secretary's and Treasurers' commission	1,15	76
,, ,, depreciation	1,51	1,48
,, ,, development rebate	3,23	21
,, ,, provision for taxation	5,70	4,90
Net profit	4,55	5,55
Balance brought forward from previous year ..	2,10	2,05
Appropriations:		
Total available balance	6,65	7,60
Transfer to general reserve	1,00	1,75
Proposed dividend (taxable) ordinary ..	3,94*	3,75†
Dividend per cent.	(17½%)	(25%)
Dividend per share	[Rs. 17.50]	[Rs. 25.00]
Carry forward	1,71	2,10

* The dividend for 1962 is on the increased paid-up capital of Rs. 22,50 lakhs.
† For 1961 the dividend was on a paid-up capital of Rs. 15.00 lakhs.

Extracts from the Directors' report:—During the year under review, the price of superphosphate was increased by Rs. 11.10 nP per tonne by the Ministry of Agriculture with effect from middle of June to compensate the rise in cost of production of superphosphate due to the inclusion of import of sulphur under the D.L.F. and the imposition of excise duty on sulphuric acid. This was inadequate but most welcome.

Expansion: Trial runs of new Sulphuric Acid Plant were made during the year and normal production has started from early August this year. This has made the Company self-sufficient in sulphuric acid for its requirements. With a view to diversify the activities of the Company, the Directors have decided to set up a Ferro-Alum Plant for which there is a good market, and if everything goes well the plant will start production early next year.

With the installation of continuous superphosphate plant which has started production from October, 1962, the Company's productive capacity has increased considerably.

Sales: The Company's superphosphate was in demand throughout the year and, in view of Government's 'Grow More Food' campaign and the target fixed for agricultural products in the Third Five Year Plan, the demand will continue to be better next year.

Accounts in brief as at 30th June 1962 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	22,50,000	Gross block	54,13,726
Reserves and surplus..	17,12,389	—Depreciation ..	23,26,166

* Adjustments represent Rs. 2.55 lakhs transferred from development rebate reserve.
† This includes Rs. 33,725 being additional preference dividend for three half years ended 30th June 1959.

Extracts from the Directors' report: The Company had been able to show distinct improvement in the working in the past few years despite adverse factors like increase in wage bill, higher cotton prices etc. The 'B' Mills is working with 3 shifts from August 1961.

During the year under report the Company had availed a further sum of Rs. 2.60 lakhs out of the loan of Rs. 8.73 lakhs sanctioned by The National Industrial Development Corporation Ltd. for the first stage of rehabilitation scheme. A sum of Rs. 2,30,000 has been repaid to the Industrial Finance Corporation of India during the year and with this the total repayment against their loan amounts to Rs. 4,60,000.

The first stage of rehabilitation scheme is expected to be completed shortly. 76 *Automatic looms* under the expansion scheme, one *Doubler Winder* and one *Ruti High Speed Warping Machine* have been commissioned. Four *Howa Simplex Fly Frames* will be installed soon. In addition to 28 *Ring Frames* already ordered a further order for 21 *Ring Frames* comprising of 8,484 *spindles* has been placed under the rehabilitation scheme.

Accounts in brief as at 30th June 1962 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	48,51,250	Gross block ..	1,21,93,139
Reserves†	9,75,419	—Depreciation ..	50,35,700
Other liabilities ..	62,28,306	Net block	71,57,439
		Current assets ..	47,03,808

* Loss after providing for Managing Agents' remuneration, Secretaries' and Treasurers' remuneration; doubtful debts and depreciation.
† This represents excess provision for liability written back.
‡ Preference dividend for two years 1961 and 1962 calculated at 7.8 per cent.

Extracts from the Directors' report:—Further modernisation of the preparing and spinning sections has been carried out during the year including the installation of 16 *Sliver Spinning Frames* on the fine side, and also 5 *Sliver Spinning Frames* and 2 *Drawing Frames* on the coarse side. The introduction of the new machinery has improved the efficiency and a further programme for modernisation is now in progress.

In common with other Mills in the Jute Industry the Company's Mills have passed through an extremely difficult time. The short crop of 1959/60 followed by a poor harvest of 1960/61 crop due to drought, forced Mills to close down one week in June 1961, and one week in July, 1961, due to shortage of raw material. This resulted in unsatisfactory trading conditions and business was therefore carried out at a substantial loss to the Company during the first half of the year. However, in the latter half with improved supplies of raw jute from the 1961/62 crop and stringent economy and control in working inspite of unsatisfactory labour relations the Company was able to earn sufficient profits to offset the previous loss and carryover an overall profit figure of approximately Rs. 11 lakhs for the year's trading. The prospects for the current year are very favourable.

Accounts in brief as at 31st May 1962 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	45,00,000	Gross block ..	1,57,75,372

Carry forward	15	13

* Represents Rs. 1.15 lakh transferred from dividend equalisation reserve.

Extracts from the Directors' report: In the year under report, the Company's factory had to face keen internal competition which, no doubt, has been felt also by other well established units. As a result of this, profits have come down. The Company's export has also been to some extent responsible to this lower profits. Though the total turnover, is not very much lower than the previous year, the number of units, produced and sold has been on the increase. However, the general trend during the current year has been encouraging. The Factory has been geared up to produce all types of *lead acid batteries* required for the various applications and have successfully built a substantial business during the current year, of special batteries for industrial and other uses.

Accounts in brief as at 30th June 1962 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital* ..	37,50,000	Gross block ..	83,35,936

,, ,, ,, C. preference ..	1,27	..
	(9.3%)	..
,, ,, ,, cumulative redeemable preference ..	12	..
	(9.3%)	..
,, ,, ,, equity ..	3,90	Nil
	(8%)	(Nil)
Carry forward	30	10

* This includes Rs. 13,865 being excess development rebate reserve written back.
† Profit available for distribution after deducting the loss brought forward from 1960 of Rs. 7.51 lakhs.
‡ Represents arrears of preference dividend upto 31st August 1961.
§ Represents arrears of preference dividend upto 31st August 1960.

Extracts from the Directors' report: Although the Company has balance of profit available for distribution, there would be no assessable income for income-tax purposes. Hence, no provision has been made in this regard.

The working of the Company's factory during the year was quite satisfactory, and production of clinker and cement reached the rated level.

	1961-62	1960-61
Clinker produced ...	66,009 M.T.	65,297 M.T.
Cement produced ...	65,604 M.T.	71,385 M.T.
Cement despatched ...	65,656 M.T.	72,026 M.T.

Though the Company did not suffer much from coal shortage this year, the quality of coal allotted was not satisfactory; and, this had retarded production to some extent, whilst increasing the rate of coal consumption. This fact was represented to the authorities, and improvement is expected in this regard, in the near future. Demand for cement continued to be very encouraging throughout the year (almost four times the Company's production potential).

Expansion: Satisfactory progress has been maintained on the expansion project. The civil construction work on the *Kiln Foundations, Slurry Basin, Crane Gantry* etc., are at an advanced stage. Consignments of machinery have now started arriving at the factory site. The second plant is expected to go into production, other things being equal, as per schedule.

The Government of India have taken a decision that the second phase of the recommendations of Central Wage Board for Cement Industry should be implemented by the cement producers with retrospective effect from 1st January 1961. The Wage Bills are expected to go up substantially on this account. Adequate provision for the payment of arrears, on this account, have been made in the accounts for the year, although this decision was announced on 15th September 1962. The total commitment on this account upto the end of August 1962 would be Rs. 2,03,625 out of which the Government is expected to compensate via. The State Trading Corporation of India Ltd., a sum of Rs. 1,02,987.

Accounts in brief as at 31st August 1962 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	83,40,350	Gross block ..	1,10,23,668
Reserves and surplus. .	13,53,049	—Depreciation ..	34,88,476
Other liabilities ..	62,33,449	Net block	75,40,192
		Block in progress ..	4,05,630
		Current assets ..	63,96,876
		Investments	3,000
		Cash	14,60,084
		Miscellaneous expenditure ..	1,21,066
	Rs. 1,59,26,848		Rs. 1,59,26,848

* Paid-up capital consists of :—(*a*) 13,640—9.3 per cent. (*less* income-tax) cumulative preference shares of Rs. 100 each; (*b*) 975—9.3 per cent. (*less* income-tax) cumulative redeemable preference shares of Rs. 100 each fully called up; (*c*) 10,335—9.3 per cent. (*less* income-tax) cumulative redeemable preference shares of Rs. 100 each—Rs. 75 per share called up and (*d*) 49,713 equity shares of Rs. 100 each fully called up and 25,000 equity shares of Rs. 100 each—Rs. 75 per share called up. Calls unpaid on preference shares amount to Rs. 17,700. Calls unpaid on equity shares amount to Rs. 7,49,550.

GENERAL TYRES LIMITED

CHAIRMAN, DR. A. RAMASWAMI MUDALIAR THROWS LIGHT ON EXPANSION SCHEME

ADDRESSING the shareholders of General Tyres Ltd., at their Second Annual General Meeting which was held at Calcutta on Tuesday the 11th inst., Dr. A. Ramaswami Mudaliar, Chairman of the Company, stated that the application of the Company for expanding its manufacturing capacity by 120,000 units each of tyres and tubes had been approved in principle by the Government. The Chairman added that steps were being taken to finalise the expansion scheme which, when implemented, would raise the Company's capacity to 300,000 units each of tyres and tubes per annum. He disclosed that the proposed licence for the additional capacity will also cover production of 600 tons of tyre retreading material per annum.

The following is the full text of the Chairman's speech:

"GENTLEMEN,

"I have great pleasure in welcoming you to the second annual general meeting of your Company. The Directors' report and the audited accounts for the year ended 30th June 1962 have been in your hands for some time now, and with your permission I shall take them as read.

"The operation of the Company during the year under review resulted in a loss of Rs. 92,822 on account of the expenses incurred during the period of construction; your Directors have recommended that this amount be carried forward.

Industry's Progress

"The automobile tyre and tube industry in India recorded satisfactory progress during the period under review. Taking 1956 as the base year, the index of production of rubber manufactures, including tyres and tubes, in July 1962 was 173.9, as against 151.9, being the general index of industrial production. Actual production of automobile tyres and tubes, during the twelve months from July 1961 to June 1962 was substantially higher than that during the corresponding period in 1960-61. This would be evident from the following figures:

(Lakh Nos.)

Description	*Production*	
	1960-61	1961-62
Automobile tyres	15.93	17.94
Automobile tubes	15.21	16.95

"During the year under review, the Government of India made an upward revision of the target for automobile tyres and tubes to the exent of about 40 per cent over the capacity target of 38.43 lakh numbers and production target of 37 lakh numbers as originally provided in the third Five-year Plan. The latest available position relating to the proposed target as above is detailed below:

(Lakh Nos.)

Particulars	*Quantity covered*
Capacity in operation	18.18
Additional capacity licensed and under implementation	20.23
Further expansion under consideration	13.04
Total ...	51.45

"The Government of India has been considering requests from various units for sanctioning expansion schemes to cover the revised and increased target capacity as indicated above. I am glad to inform you that the application of your Company for expansion of its manufacturing capacity by 120,000 numbers each of tyres and tubes has been approved in principle by the Government of India and steps are being taken to finalise the said scheme of expansion. With the implementation of this expansion scheme the total manufacturing capacity of your Company will be raised to 300,000 tyres and tubes each per annum. Besides, the proposed license for expansion will also cover 600 tons of tyre retreading material per annum.

New Priorities for Plan

"Recently, the Government of India is reported to have decided that for the purpose of rephasing the third Plan, projects already approved but not yet at an advanced stage of execution will have to be cleared by the Government again so that such projects as do not fit in with the new order of priorities may be deferred in spite of previous approval. It is, however, understood that the highest priority will be accorded to projects having a bearing on defence efforts such as basic and heavy industries, power and transport. In the present national emergency, transport has been appropriately given a high place in order of priority which is essential for effective defence efforts. The automobile tyre industry has a great strategic significance being ancillary to transport and as such the scheme of development and expansion relating to this industry is being accorded a similar degree of high priority. I am sure I shall be voicing the feeling of the tyre industry as a whole, when I say that this industry on its part will always offer its unqualified support to the Government in its defence efforts by stepping up production of tyres and tubes and thus maintain the vital means of transport all over the country.

"The construction work at the factory site and also installation of plant and machinery have made considerable progress over the past one year and, at present, work is going on round the clock. Another team of technicians deputed by the collaborators, Messrs. Technoexport Foreign Trade Corporation are expected to arrive in India in course of a month or so to put the plant and machinery on trial run and the factory is expected to commence production early next year. Suitable arrangements for supply of raw materials required for production during the initial stage have been made.

"The supply position relating to imported raw materials may sharply deteriorate due to further cuts in foreign exchange allocations with a view to meeting essential needs under the prevailing circumstances. It is, however, expected that in view of the strategic importance of the tyre industry raw material requirements of the industry will be accorded the priority it deserves.

Imported Materials

"Meanwhile, it is gratifying to note that the tyre industry in India is expected to be fairly relieved of its almost total dependence on imported raw materials, as and when the new units set up for the manufacture of synthetic and reclaimed rubber, tyre cord, bead wire, tube valves, carbon black and rubber chemicals go into production in course of the next one year or two according to present plans. Till, however, the country is substantially self-supporting in this respect, adequate imports should be allowed to enable the industry to keep reasonable stocks for maintaining production according to programme.

"Before concluding, I take this opportunity of expressing our sincere appreciation of the co-operation and assistance received from the technical collaborators, Messrs. Technoexport Foreign Trade Corporation, Czechoslovakia, and the loyal and devoted work of the officers and staff of the Company."

Note:—*This does not purport to be a record of the proceedings of the annual general meeting.*

Notice

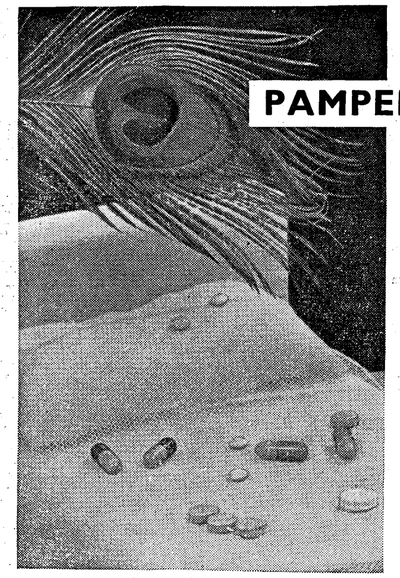
THE CALCUTTA TRAMWAYS COMPANY LIMITED

(*Incorporated in England*)

NOTICE IS HEREBY GIVEN THAT THE Preference Share Transfer Books will be closed from the 17th to the 31st December, 1962 (both days inclusive), for the preparation of Dividend Warrants in respect of the Final Dividend of 2½ per cent less Income-tax payable on the 1st January, 1963, on account of the profits for the year ending 31st December, 1962.

By Order of the Board,
R. W. TURNBULL,
Agent.

P4, MISSION ROW EXTENSION,
CALCUTTA-1,
Dated 7th December, 1962.



PAMPERED PILLS (OR POWER PLANTS OR PATIENTS)

Quite an odd assortment: but do you have a problem in common with them?

Do you have a manufacturing process or installed machinery which require pampering—RIGID temperature, humidity and dust-free conditions?

TRANE

central air-conditioning equipment is the answer where exact environmental conditions have to be strictly maintained. TRANE equipment is famous all over the world for specialised applications ranging from instrument control-rooms in power-plants or photographic laboratories to pharmaceutical and electronics manufacture.

Unusual TRANE installations include explosion-proof air-conditioning in surgical theatres or explosives factories where no air can be re-circulated and potato cold storage where tubers cannot be allowed to germinate.

Innumerable machines, instruments and factories in India and abroad *depend* on TRANE equipment.

You can too.

MONEY SCARCE

(From Our Own Correspondent)

BOMBAY, 12*th December*

Although there has been no undue pressure of demand for money especially in the past two days, inter-bank call rate ccntinues to rule high, at 5¼ per cent. This is due to shortage of floating funds. One of the big banks has been a consistent borrower of day-to-day money at this rate. Quite a bit of the Bombay Municipal loan of Rs. 5.15 crores has still not been redistributed from the State Bank of India to other city banks and the State Bank is not a lender in the inter-bank market; it lends to other banks only at 6 per cent per annum. Conditions in the short-term money market at Calcutta also continued to be extremely tight. Fresh money there is being offered 6 per cent.

Barring unforeseen developments, nineteen days from now—on 1st January next—the Inter-Bank Agreement on minimum rates of interest on advances will come into force and be valid for at least 18 months. Under the Agreement, it will be recalled, the minimum interest on advances is fixed at 6 per cent per annum, calculated on daily balances and applied at least once every three months. The advances made to certain institutions, such as public sector corporations and co-operatives, as well as advances granted against Gilt-edged securities or under Government guarantee and against deposits are exempt from this minimum rate. So far, 33 Indian and foreign banks have agreed to participate in the Agreement.

The amount offered and accepted against tenders for Government of India's 91-day Treasury Bills sold on Tuesday this week were both equal to the amount invited which was unchanged at Rs. 2 crores. The average rate of accepted tenders, however, rose further to Rs. 2.355 per cent per annum, from Rs. 2.350 a week ago and Rs. 2.345 per cent two weeks ago. Intermediate Treasury Bills, which were on tap from the 5th to 8th inst., fetched a sizable sum, Rs. 125.25 lakhs. Last week it will be recalled, no Intermediate Bills could be sold.

There was a notable rise of Rs. 3.25 crores to Rs. 96.78 crores in India's foreign assets during the week ended 7th December 1962. The whole of this rise was accounted for by balances held abroad which aggregated Rs. 8.70 crores, while foreign securities were unaltered again at Rs. 88.08 crores. Loans and advances to scheduled banks jumped up by over Rs. 24.68 crores to stand at Rs. 29.89 crores, indicating the prevailing stringency in the money market. Of this total, the amount advanced against usance bills alone stood at Rs. 17.38 crores, an increase of Rs. 15.95 crores in just one week. Notes in circulation forged ahead from Rs. 2,071.31 crores to Rs. 2,122.59 crores, representing a rise of more than Rs. 51.28 crores.

The total volume of credit made available by scheduled banks to their clients registered an improvement of Rs. 9.59 crores to Rs. 1,372.61 crores during the week ended 30th November 1962. Inter-bank borrowings, too, rose by Rs. 2.62 crores, while deposits fell by Rs. 10.75 crores. The total outstanding amount stood at Rs. 2,174.59 crores. The aggregate cash was lower by Rs. 10.20 crores at Rs. 116.23 crores, so also investments by Rs. 4.57 crores at Rs. 700.26 crores.

Activity in the Gilt-edged market was restricted, with values moving narrowly. 4½ per cent 1985 dropped 5 nP to Rs. 100.15, 3½ per cent 1967 National Plan Bonds shed 15 nP to Rs. 98.40, 4 per cent 1979 was on offer at Rs. 98.25, as against Rs. 98.55. State loans were dull.

METALS MOVE UP

(From Our Own Correspondent)

CALCUTTA, 11*th December*

Although advices from the London Metal Exchange showed an easier trend, prices in the local market moved upwards in view of the basic short-areas Demand was, however, limited as, with the uncertain border situation, not many were prepared to enter into fresh commitments. Utensil copper scrap rose from Rs. 482 per 100 kgs. to Rs. 509. On the London Metal Exchange, spot copper was firm at £234 a ton, and the resumption of work in an African mine following settlement of the mine-workers' strike failed to have any impact on the price trend.

On the New York Commodity Exchange, copper suffered a setback. It was, however, anticipated that demand in the U.S.A. would increase shortly, as usually towards the close of the year inventories tend to be high. According to an announcement by a leading American custom smelter, a reduction in the bid price for copper scrap has been made and with this reduction the price of No. 2 wire scrap is lower by 2 cents a lb., which is the same as 30½ cents a lb. for copper refined from scrap. Despite excess of production over world demand, it is significant that the London price for the spot metal is being maintained unchanged at £234 a ton. There are indications that the U.S. is increasing its consumption of copper; in October, it was 139,686 tons, as against 120,406 tons in the previous month.

Tin, in London, opened at £867 a ton and in active dealings improved to £868¼ following good demand on account of East European countries. But such demand was short-lived, and the rate eased to £865. In Calcutta, the price spurted from Rs. 2,550 per 100 kgs. to Rs. 2,660. Shortage was acute, despite the low level of demand. As in copper, in tin also the U.S. consumption is increasing. For the eight months ended August 1962, the U.S. consumption totalled 37,500 tons, as against 32,610 tons in the corresponding previous period, thereby raising the respective monthly average to 4,687 tons from 4,076 tons.

Zinc here was neglected. But, the price was better at Rs. 260 per 100 kgs., as against opening level of Rs. 257. In London, zinc declined from £683 a ton to £67-7/8 and lead from £56 to £55⅝. In Calcutta, virgin lead opened at Rs. 141 per 100 kgs. and edged forward to Rs. 142.

SILVER STEALS SHOW

(From Our Own Correspondent)

BOMBAY, 12*th December*

In the absence of new official measures to back Union Finance Minister Mr. Morarji Desai's and Deputy Finance Minister Mrs. Tarkeshwari Sinha's statements in the Lok Sabha on the 5th inst. that the Government was considering ways and means to bring down the market price of gold and also to mobilise idle gold, bullion prices presented a distinctly firm tone during the week under review. The start was, however, shaky and prices moved down a little further on some realising following the smart recovery in the previous week. This sagging tendency continued well up to Saturday the 8th inst. But, from Monday, the market recovered and improved to close with fair gains over the week due to absence of selling, renewed spot demand for gold and revival of fairly strong upcountry support for silver futures.

Operators seemed to have picked up courage from the Finance Minister's statement in the Lok Sabha on the 5th inst. that the Government could not disclose at that stage the policy that was being formed to bring down gold price to the international level, as the suggestion in the statement was that the policy was still in its embryonic stage. Besides, Mr. Desai also went on record, in reply to a questioner in the Lok Sabha who had drawn attention to recent strident recovery in gold, to the effect that the Government was satisfied with the measures already taken for bringing down the price of gold and the progress achieved so far. Sentiment was also influenced by Mrs. Sinha's disclosure in the Lok Sabha on the 5th inst. that, up to the end of the last month, a total of 49,675 tolas of gold valued at Rs. 30 lakhs had been received under the gold bond scheme. This disclosure went to confirm marketmen's suspicion that the Gold Bonds might not attain the desired success in inducing hoarders to part with their holdings.

At a meeting of the Congress Party's Standing Committee on Finance held at New Delhi on Tuesday the 11th inst., Mr. Morarji Desai again warned that, if people did not invest in gold bonds, they might have to repent later, but added in the same breath that, if there was no adequate response from the people, there would be no further issue of the bonds after the initial three-month period was over. Market circles did not pay heed to Mr. Desai's reiteration at that meeting of his earlier statements that additional steps to bring down the price of gold to the neighbourhood of international price were still under consideration. Instead, they took solace in the adjournment of the Lok Sabha session to 21st January 1963, as they believed—rather wished—that the proposed new measures would be deferred at least till that date. The tendency, therefore, was clearly bullish.

While all—gold, sovereign and silver—showed a fair improvement over the week, it was silver which stole the week's show for three reasons. First, it is the only precious metal in which futures trading is possible. Secondly, ready demand for gold was rather halting. And thirdly, traders argued that, if purchases of gold were to be restricted as anticipated by many, buyers would turn to silver and that in turn would inevitably contribute to a further rise in its price, especially as floating stocks in Bombay (at roughly 1,400 bars) and in the whole country (at about 3,300 bars) are very limited.

Silver *Fagun* commenced the week at Rs. 198.80, against the previous close of Rs. 198.60, rallied on Thursday the 7th inst. to Rs. 200.75 only to slip back to Rs. 197.40 the next day. But thereafter, it gradually recovered and advanced to close at the week's highest level of Rs. 202.40. The maturing *Margashir* settlement opened 30 nP higher at Rs. 196, edged forward to Rs. 198.05 on the 7th inst., reacted to Rs. 194.40 the next day, but improved to go off the board today at Rs. 200.15. The delivery order rate for *Margashir* was fixed at Rs. 195.75 and the clearing rate for *Fagun* at Rs. 199. Ready silver moved between Rs. 196.30, Rs. 197.75, Rs. 194.40 and Rs. 200.15, and closed at the highest level. The average arrivals at 30 bars were heavy in relation to the offtake which amounted to only eight bars.

At the week's closing rates, which are the highest for the week, both ready and forward silver were higher than the previous week's best levels, namely, Rs. 198.75 for spot, Rs. 199.25 for *Margashir* and Rs. 201.95 for *Fagun*. But spot gold failed to repeat the previous week's highest level of Rs. 107, as, after opening 25 nP higher at Rs. 103 and easing to Rs. 98.25 on Saturday the 8th inst., it could rise only up to Rs. 105, touched on Tuesday the 11th inst. At today's closing price of Rs. 104.25, it was, however, Re. 1.50 higher over the week. Daily average arrivals exceeded the offtake of 4,000 tolas by 1,000 tolas. Sovereign moved between the previous week's close of Rs. 77 and Rs. 78.50 and closed higher.

Trading during the week in London and New York was restricted. Ready gold, in London, closed 1d. lower over the week at 250s. 2¾d. But the dollar price of gold today was fractionally higher at $35.07⅛ as against $35.07⅛ a week ago. Silver, in New York, eased during the week from 120.50 cents to 119.50 cents.

The following table shows the trend of prices during the week under review:

	12-12-62 (closing)	High	Low	5-12-62 (closing)
GOLD	Rs.	Rs.	Rs.	Rs.
Ready (.99 fine)	104.25	105.50	98.25	102.75
Sovereign	78.50	78.50	77.00	77.00
SILVER				
Ready (.996 fine) ..	200.15	200.15	194.40	195.60
*Margashir** ..	200.15	200.15	194.40	195.70
Fagun	202.40	202.40	197.40	198.60
London—				
Gold	250s.2¾d.	250s.3¼d.	250s.2¾d.	250s.3¾d.
Silver Ready ..	102¼d.	103¼d.	102¼d.	103¼d.
Silver Forward ..	103¼d.	104¼d.	103¾d.	104¼d.
New York—				
Silver	119.50 cents	120.50 cents	119.50 cents	119.75 cents

* 11th December settlement.

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.7 tolas). London and New York quotations are per ounce.

FALL IN COTTON FUTURES ARRESTED

(From Our Own Correspondent)

BOMBAY, 12*th December*

The easy trend witnessed in the cotton futures market in the past few weeks gathered momentum during the week under review. Reports of heavy accumulation of cloth stocks with the mills and the consequent absence of spinner interest and expectation of a bumper crop of not less than 5.4 million bales prompted large-scale selling. Speculative elements took advantage of the situation to hammer down prices. The weakness of the spot market, where mills were reluctant to make purchases, and lower advices from upcountry centres accelerated the downward trend. The Jarilla March 1963 contract slumped from Rs. 685 per three quintals last week to Rs. 670.75 on Monday the 10th inst. In private dealings, the contract declined further to Rs. 666, the lowest level touched so far. This sharp decline provoked the Forward Markets Commission to intervene and fix the limit of the weekly fall in prices of the contract in a bid to arrest the fall. Accordingly, the weekly fall in the price of the contract has been limited to Rs. 10 per three quintals when the price of the contract ruled below Rs. 675. For the week ending 15th December the limit shall be calculated with reference to the closing price on Monday, the 10th inst. For the subsequent weeks, the limit shall be calculated with reference to the closing price on the last trading day of the previous week. Similar limits have also been prescribed at other recognised associations trading in cotton.

Acting in concert with the F.M.C., the Textile Commissioner issued the second instalment of Indian cotton quota to mills. Curbs on the movement of cotton from Nasik, Dhulia and Jalgaon, imposed early last month when prices were ruling above the ceilings, were also removed so as to enable farmers to sell cotton to any buyer at any destination. These measures had some effect on the market which cried halt to the falling trend. In fact prices tended to recover yesterday. The statement of Mr. Ram Suthag Singh, Union Minister for Agriculture, in the Lok Sabha that the Government had agreed to consider a suggestion for raising the floor price of cotton imparted further strength to the market. The Jarilla March contract recovered to Rs. 675.50 at close today.

In spite of the release of the second instalment of quota, mill demand for ready cotton did not show any market improvement. Mills were reluctant to make purchases partly due to financial difficulties and partly because they preferred to wait in anticipation of a further fall in prices. Limited activity was, however, reported in such varieties as 197/3, L.147 and Co2. Some mills showed interest in new crop Vijay, Digvijay Surti, Kalyan and Wagad. As per the Textile Commissioner's announcement, all eligible mills in the country will be granted, as second instalment, a quota of 25 per cent of their consumption of Indian cotton and foreign 'B' cotton during the cotton season 1960-61. Mills in the northern zone, consisting of the Punjab, Rajasthan, Delhi, U.P., Madhya Pradesh, Orissa, Assam, Bihar and West Bengal will be granted an additional ten per cent for purchases from the local growths in Rajasthan, Punjab and U.P. Additional quotas will be given in case mills have increased their consumption of cottons in the year 1961-62. The decline in spot price of cotton below the ceilings and the prospect of a good crop have led some to question the need for continuing the supervisory scheme introduced this season. It is pointed out that the continuance of the scheme in the changed circumstances would do more harm than good.

Demand for exportable cotton was moderate. Foreign cotton was practically neglected. Spinners showed very little interest in ready lots. The following are the latest available quotations—in rupees per candy of 784 lbs.—from the spot market at Sewri:

Bengal *Deshi* 662; Co2 1,070; Kalyan 925; Digvijay (new) 1,115; Busoga (UNUG) 1,185; Sudan G4S 1,435.

In contrast to the firmness witnessed in the past three weeks, the Karachi cotton futures market ruled easy during the week under review. Values declined on long liquidation and hedge selling. A part of the selling was attributed to the decision of the British Board of Trade to limit imports into U.K. of cotton yarn originating in, or consigned from, Pakistan to 1.2 million lbs. for the two years 1962 and 1963. The Board of Trade also notified that, with effect from 5th December, licences would be required for imports of yarn from Pakistan into U.K. N.T.R.G. January receded from Rs. 72.40 to Rs. 69.95. The March contract shed Rs. 1.70 over the week to Rs. 71.20.

Listless conditions continued to prevail in the Liverpool cotton futures market. Futures ruled quietly steady with practically no net change in prices. In the ready section, spinners showed interest in Peruvian cotton and limited quantities of U.S. cotton offered forward. The following are the latest available quotations—in pence per lb.—from Liverpool:

American cotton one inch staple contract: December 23.90; March 23.70; May 23.65.

American cotton mixed growth contract: December 24.25.

Sudan: January, March and May 29.75.

Cotton futures in New York ruled steady during the week. In spite of the higher December crop forecast and the expectation of lower price support, futures prices were well maintained, thanks to commission house buying and encouraging advices from the spot market. The December contract was quoted 4 points higher at 33.97 cents, as against 33.93 cents last week. The May position was unchanged at 34.38 cents. New York spot was steady at 34.80 cents and New Orleans at 32.65 cents, same as last week.

The preliminary final forecast published this week, estimates the 1962-63 U.S. cotton crop at

14.72 million bales of 500 lbs. each. This represents a decline of 190,000 bales from last month's figure. The yield per acre is higher at 455 lbs., as against 444 lbs. last month and last season's yield of 438 lbs.

SPOT ART SILK YARNS IMPROVE

(From Our Own Correspondent)

BOMBAY, 12*th December*

Notwithstanding reports of a serious crisis in the weaving section of the rayon industry leading to curtailment of production and even threatened closure of some units in Surat, spot art silk yarn and 40 x 2 staple fibre yarn staged a recovery, albeit small, during the week under review on revival of buying interest at lower levels. Thus, N.R.C. 150D looked up from Rs. 10.34 to Rs. 11 and 120D from Rs. 11.68 to Rs. 11.97, as did S.I. Viscose 150D from Rs. 10.45 to Rs. 11 and Century 100D from Rs. 14.78 to Rs. 15.05. Century 75D, however, slipped down from Rs. 18.70 to Rs. 18.15.

Among 40 x 2 staple fibre yarns, Centurys edged forward from Rs. 6.95 to Rs. 7.08 and Kohinoor gained 6 nP at Rs. 7.63, while Citys closed unchanged at Rs. 7.48. But the futures section continued weak, the December contract closing at the minimum price of Rs. 650 and the February settlement five points higher than the minimum price of Rs. 670.

Trading in cotton yarns was dull. 60s Finlay eased from Rs. 70.25 to Rs. 69.75.

The Government announced during the week that import of only viscose staple fibre (man-made) would be permitted from the U.S. under the Aid Loan N. 217. According to the notification, cotton mills which have indicated their requirements of viscose staple fibre need not apply again for import of this item under the said Loan, unless they require additional quantities and give justification for the same. Applicant consumers, having already been allotted staple fibre under the 'Staple Fibre Control Order, 1958,' are also required to give an undertaking that the quantity of the fibre they intend to import will be over and above the indigenous allotment made in their favour and that they will lift in full the indigenous material to be allotted to them from time to time.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	12-12-1962	5-12-1962
	Rs.	Rs.
Art silk yarn (per kg.)—		
National Rayon 120D	11.97	11.68
Century 75D	18.15	18.70
S. I. Viscose 150D	11.00	10.45
Staple fibre yarn (40 x 2)—		
December („)	650.00	650.00
February	675.00	670.00
Kohinoor (per kg.)	7.63	7.57
Century	7.08	6.95
Cotton yarn (per bundle of 10 lbs.)		
10s Podar	18.44	18.44
22s Century	24.25	24.25
30s Bradbury	27.00	27.00
40s Hind	34.00	34.00
60s Finlay	69.75	70.25
80s Kasturi	77.00	77.00

Note.—Quotations for 120 and 150 Japan and Italy are not available, since there has been no trading in view of paucity of stocks.

NILGIRI TEAS STRONG

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, 6*th December*

A total of 544,000 kgs. was offered in sale No. 48 held on Tuesday the 4th inst. Quality was about maintained, but a few Nilgiris showed an improvement. There was good demand. A few brighter Nilgiri kinds were well supported and fully firm, others in this category, however, were irregularly lower with quality, particularly fannings grades. The brighter good medium descriptions were about steady, but other types were slightly easier. Medium and low mediums were irregular but declined by some 10 to 20 nP. Plain kinds again met keen competition and were well supported. Black leaf varieties sold well but must be quoted slightly easier. Whole leaf grades, though irregular, shaded somewhat in price. Unorthodox teas generally followed the lower trend of the market.

The quotations (per kg.) were:

	1962	1961
	Rs.	Rs.
Low mediums	4.50-5.00	2.90-3.15
Mediums	5.00-5.30	3.20-3.70
Good mediums	5.35-6.05	4.00-4.50
Nilgiri B.O.P.	5.45-7.70	5.00-7.80

The average price realised in sale No. 48 was Rs. 5.16 per kilo as against Rs. 5.13 a week ago and Rs. 3.82 in the corresponding sale last year.

In dust sale No. 48 today, 373,000 kgs. were offered. There was less general demand than in recent weeks and prices eased, especially as the sale progressed. Mediums descriptions declined irregularly by up to 40 to 50 nP and sometimes more particularly towards the close. Highgrown dusts followed the general trend of the market and sold at much easier rates. Black, grainy sorts were better supported, but these also registered declines. Teas of unorthodox manufacture were easier, while C.T.C. types and legg-cut descriptions met with more enquiry than the rest.

The average price realised in dust sale No. 48 was Rs. 4.19 per kilo as compared with Rs. 4.55 a week ago and Rs. 3.49 in the corresponding sale last year.

Colombo: In Monday's auction, there was slightly less general demand and, whereas the market opened with best dimbulas lower, demand improved for these descriptions and at the close they were firm. Other dimbulas eased by 10 to 20 cents but their fannings were strong. Prices for uvas were unchanged and whereas good mediums were generally slightly easier, others shed 5 to 15 cents, but their fannings were strong. Lowgrowns eased 10 to 20 cents.

London: North Indian and other growths: In Monday's auction, there was good demand with best Assams about steady, but the remainder were mostly 1*d.* to 2*d.* dearer. The quotation for clean lowgrown B.O.P. is 3*d.* to 10*d.*

Ceylon and South Indians: Offerings met a strong market in Tuesday's auction and prices were generally firm to dearer.

As we go to press Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire as follows:

"Sale No. 49: 891,000 kgs. offered. Fair demand at much lower prices. Plain and low mediums 80 nP to Re. 1 lower. Brighter mediums and good mediums 50 nP easier. Highgrown brokens generally 50 to 60 nP lower. Similar fannings, more unorthodox substantially easier."

GROUNDNUTS FORGE AHEAD

(From Our Own Correspondent)

BOMBAY, 12*th December*

The Forward Markets Commission has given its permission for commencement of trading in new hedge contracts in groundnut, groundnut oil and cottonseed (April 1963 delivery) as well as linseed and castorseed (June 1963 delivery) on Friday the 14th inst. It is significant that, contrary to earlier fears of operators, the Commission has not reduced the ceiling rates for any contract. All the terms and conditions of trading also remained the same as those governing the existing contracts.

The fixation of ceiling rates at existing levels induced bull operators to extend their commitments. Besides, the very low levels touched in the groundnut section last week attracted buying. Tight supply position, following a marked decline in arrivals from upcountry centres on account of the recent sharp setback in values in the local market also imparted strength. Consequently, groundnuts and oil staged a smart rally. Castorseeds, too, ruled distinctly firm, on rumours of enquiries for castor oil from communist countries. In sympathy with groundnut and castorseed, linseed and cottonseed futures contracts registered handsome gains, while the spot section ruled listless in the absence of support.

Groundnut January 1963 contract forged ahead from Rs. 204.75 to Rs. 212.12, before closing today at Rs. 211.62. Khandesh quality strengthened by 2 to Rs. 42.50. Nizam bold rose by Re. 1.50 to Rs. 41.50. Oil January 1963 contract picked up 80 nP to Rs. 29.50. Oil railway receipts hardened by 20 nP to Rs. 17 and oil ex-mill by 10 nP Rs. 17.20.

Castorseed March 1963 contract put on Rs. 3.75 to Rs. 161.25. Madras small improved by 50 nP to Rs. 32.25. Kanpur gathered 63 nP to Rs. 31. Oil commercial was higher by 35 nP at Rs. 12.85 and B.S.S. by 30 nP at Rs. 13.60.

Linseed March 1963 contract spurted from Rs. 36.37 to Rs. 37.12. But bold ready, fell by Rs. 2 to Rs. 37. Linseed oil declined from Rs. 15.50 to Rs. 15.20, before recovering subsequently to Rs. 15.40.

Cottonseeds January 1963 contract rose by Rs. 2 to Rs. 94. But non-white and berar, however, ruled easy.

The following table shows the closing prices of oilseeds and oils on Wednesday 12th December, as compared with those of the two previous weeks:

	12-12-1962	5-12-1962	28-11-1962
Groundnut	Rs.	Rs.	Rs.
Groundnut January 1963 ..	211.62	204.75	213.37
Nizam bold	41.50	40.00	41.75
Khandesh quality	42.50	40.50	42.75
Oil ex-mill ready*	17.20	17.10	17.90
Railway receipts*	17.00	16.80	17.45
Castorseed			
Castorseed March 1963	161.25	157.50	161.37
Ready Madras	32.25	31.75	33.00
Ready Kanpur	31.00	30.37	30.62
Oil B.S.S.†	13.60	13.30	13.45
Oil commercial†	12.85	12.50	12.60
Linseed			
March 1963	37.12	36.37	37.25
Bold ready	37.00	39.00	40.50
Oil ready†	15.40	15.00	15.90
Cottonseed January 1963 ..	94.00	92.00	96.00
Niger seed	33.50	33.00	35.00
Kardi seed	25.00	25.00	26.50

* Rates include excise duty but exclude sales tax.
† Rates exclude both excise duty and sales tax.
N.B.—All quotations for futures contracts are per 250 kilograms, except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

EXPORTABLE TEA EASY

(From Our Own Correspondent)

CALCUTTA, 11*th December*

With the end of the strike by the Pakistani crew of the Assam-West Bengal river services, movement of tea tended to return fast to normalcy. Shipments during the week under review were satisfactory, and those to the United Kingdom were expected to rise in the following weeks. Shipping companies made available extra tonnage, and forward bookings gained momentum. The prospect of heavy arrivals from Assam was re-

"FREE AS A BIRD... that's how I feel!

THE BANK OF INDIA LTD.
T. D. KANSARA, General Manager

B/C/133

flected during yesterday's export auctions when bidding was slower than usual.

The rise in the U.K. tea stocks and the prospect of increased shipments from Calcutta were duly reflected in last week's Mincing Lane auctions, where North Indian tea on offer totalled 42,175 packages. In the two sales there, good quality teas, including best Assams, were easy and lost part of the recent gains. But poor quality teas, including Dooars, met with strong demand. Pakistani offerings totalled 330 packages. The trade here took note of the Dacca report suspending the export auctions scheduled to have taken place in Chittagong on 5th December. Although no reason for this suspension was given, it is presumed that it was due to the acute shortage of tea in Pakistan itself. Significantly, no date has been fixed for the auctions. As in North India, output in Pakistan is much lower than the earlier optimistic expectations which led the Pakistani Government to double the export quota.

The trade has noted with much enthusiasm that the revival of the Assam-West Bengal river services would not deflect the Government of India from measures proposed to improve and augment the road transport from Dubri in Assam to Siliguri in West Bengal. The swift economic development in this part of the country has made it necessary that the full utilisation of the river services through the Pakistani waters be supplemented by other transport facilities so that movement of goods in transit can be accelerated.

The magnificent work done by all concerned to use alternative means of transport during the strike period was fully appreciated by Mr. K. Ghosh, Chairman of the Calcutta Tea Traders Association, when he addressed the Association's annual meeting here last week. The strike has rightly given the tea trade an opportunity to think in terms of quicker transport. Road and air transport facilities were considerably augmented and, as a result, tea auctions last month in Calcutta were well maintained, although at the peak of the strike period the weekly offerings fell to 50,000 chests as against the normal average of 70,000 chests.

Transport by road and air, though much quicker, is costlier than river transport, and to the extent of the extra cost the export price, which is determined by world market trends, cannot be raised. Against such a background, it is to be hoped that the plea of the industry for revising taxation on tea finds favour with the authorities.

In this context, Mr. Ghosh asked the Government to consolidate all the various levies on tea into a single comprehensive tax to be levied at one point. He said that taxation at several points caused the trade much trouble. He believed that it should not be difficult to work out the average yearly collections by the States and the Centre and transform the various levies into one central tax, with the Centre paying a part of the tax to the States in lieu of their foregoing their direct taxes.

Dusts on offer in the internal sales, held on the 5th inst., totalled 29,062 packages. Although demand was good, it could be sustained only at lower prices. While a few bright teas realised satisfactory prices, good C.T.Cs eased. A few selected lines in medium C.T.Cs sold well, but the remainder sold at prices lower by 30 nP. Plain orthodox teas gave way by 20 to 30 nP. The plainer medium Assam teas dropped by 20 nP, but the brighter lines eased slightly in an irregular trend. Legg-cut teas also dropped, despite good support. Quotations (in rupees) per one kg., inclusive of excise duty, were: Good Assam C.T.C. dust 6.30 to 6.60, medium Assam C.T.C. dust 5.80 to 6, legg-cut dust 5.40 to 5.60, medium Assam dust 4.80 to 5.40 and plain orthodox dust 4.65 to 5.00.

Demand at yesterday's export sales, where offerings totalled 54,208 packages, was lower. The whole leaf grades and more tippy teas eased in line with the general trend. Orthodox teas declined by 30 to 50 nP. The decline in the price of the better liquoring Assam teas was sizable and led to withdrawals. C.T.C. grades were pushed down by 30 to 50 nP. The best sorts eased by 70 nP. Legg-cut teas dropped by 30 to 50 nP. In line with the general trend, Darjeelings also eased. The quotations (in rupees) per one kg., inclusive of excise duty, were: Best Assam C.T.C. fannings 6.40 to 6.80, best Assam C.T.C. B.P. 6.20 to 6.50, medium Assam C.T.C. fannings 5.50 to 6, medium Assam C.T.C. B.P. 5.40 to 5.90, clean plain pekoe 4.30 to 4.50, plain fannings 4 to 4.50 and plain B.P. 3.80 to 4.20.

RAW JUTE IMPROVES

(From Our Own Correspondent)

CALCUTTA, 11*th December*

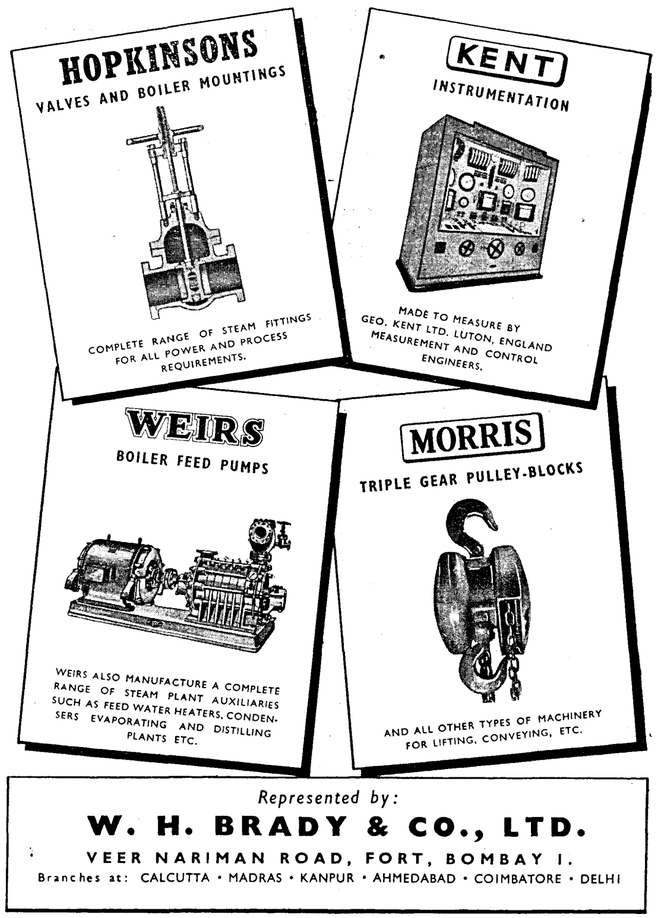
The increased support accorded by mills enabled fibre prices to rise from their lowest levels during the week under review. In goods, hessian closed lower on balance, while sacking added an overall gain. U.S. buying of hessian during the week was paltry and traders thought that, in view of the substantial offtake in recent weeks, U.S. buyers could afford to hold out of the market for the time being. When the market was viewing the outlook this way, the release of figures relating to goods in stock as at the end of November came in handy to weaken sentiment. While a decline in heavy goods stocks had been anticipated due to the tendency among mills to increase the proportion of output of hessian by transferring looms from sacking, the actual decline of 3,700 tonnes was above earlier expectations and this explained for the firmness of heavy goods following the announcement. The stocks of hessian increased by 3,100 tonnes and those of miscellaneous constructions by 1,100 tonnes, leading to an overall increase of 500 tonnes. The increase in hessian stock came as a surprise. If, despite the limited availability of fibre fit for hessian manufacture, the output of this construction exceeds demand, it follows that the process of transfer of looms from sacking to hessian must stop. This, coupled with fewer inquiries from abroad, led to the fall in hessian prices.

The investment interest which jute shares attract, notwithstanding an extremely subdued stock exchange, is an index of the encouraging development that the jute mills have generally improved their profitability. While about a year ago, the mills could procure fibre at not less than double the existing prices, the fall in prices of goods has been only small in comparison. Of course, the fact that mills were incurring heavy losses should be kept in mind. As such, if profitability of mills has now increased in comparison, mills have to make up past losses. At the same time, the demand for sacking has not been as satisfactory as that for hessian. Also, in an endeavour to give support to the fibre market, fibre stocks with mills are heavier than at any time in the past, thereby increasing financial commitments. For the time being, the mills are not likely to place any restriction on output and, as such, the extended rate of production would continue. The huge stocks of fibre with mills also makes this expedient. Internal demand for jute goods has increased and Defence needs have also meant more orders on mills, with the result that the order books of mills are full for months to come. Moreover, there has been a steady flow of overseas demand for hessian.

It is no surprise, therefore, that the trade fully shares with the Government the expectation that this year's exports of jute goods would realise a record level of foreign exchange earnings of Rs. 150 crores. Dr. B. P. Kedia, who presided over the annual meeting of the Gunny Trades Association here last week, was hopeful that, given determination, the industry could raise exports further in 1963. In the nine months to September last, the monthly average of exports was 79,011 tonnes and the average earnings Rs. 13.23 crores. In the last two months, exports have been higher. Even maintenance of the earlier average would give a total for the year at Rs. 158 crores, which, however, would be surpassed. Dr. Kedia was one with the Government on the need to ensure an economic floor price for growers. On this subject, the mills would welcome a re-examination of the issue of production cost for cultivators. For they feel that, with the fall in quality and increase in output, cultivators' costs have fallen, and maintenance of last year's minimum prices only encourages the cultivators to be indifferent to quality. If any price support measure becomes allied with "the reservoir plan" and this is followed with a similar bumper crop, it can only follow that the buffer stocks would be difficult of consumption and in course of storage would only become obsolete. Naturally, therefore, much depends upon an improvement in the quality of the next crop.

It was good news during the week that the strike by the Pakistani crew operating the Assam-West Bengal steamer services has been called off and the river transport was being revived in its original frequency. As a result of the strike, movement of Assam jute to Calcutta was affected and prices of Assam jute declined much below the minimum levels. In order to relieve the distress caused to cultivators in Assam and North Bengal, purchases for buffer stock as well as for mills' own stocks would be mainly from these two areas. The latest quota of 250,000 bales for buffer stock has been directed to be completed by 19th December. Since the godowns of mills are full, there is hardly any spare storage space either in Calcutta or at other mills' stations. In the current month, mills would be required to buy 650,000 bales, of which at least 200,000 bales should be Assam jute. Mills are surprised that they are asked to shoulder this burden at a time when they have no storage capacity. There is the acute need to build warehouses in the growing areas, so that cultivators can store not only jute but other products also. Against this background, the decision of the West Bengal State Warehousing Corporation to build warehouses in all West Bengal districts except Purulia is welcome. It is to be hoped that Assam and Bihar follow the example of West Bengal and increase warehousing facilities to cultivators.

On Tuesday last, there was some covering business in jute goods. However, genuine business passing was limited. As a result, ready B. twills eased from Rs. 119 to Rs. 118.50, and ready hessian 40" 10 oz. from Rs. 56 to Rs. 55.75. For a good part of the following day, there was very little activity, but soon some interest developed in the futures market to push up ready B. twills to Rs. 118.80. In the absence of any interest, however, hessian 40" 10 oz. eased to Rs. 55.65. The absence of U.S. interest was taken as an indication that recent purchases by U.S. buyers had far exceeded their minimum needs. It was being apprehended that mills' output of hessian was exceeding demand and that it was necessary to stop the process of transfer of looms from hessian to sacking. This was indicated by the continued absence of interest in hessian, as a result of which hessian 40" 10 oz. receded to Rs. 55.60 on Thursday. On the other hand, covering business raised ready B twills to Rs. 119. The announcement of figures relating to goods in stock with mills as at the end of November was made on Friday. These only confirm the earlier fears relating to hessian. Ready hessian 40" 10 oz. dropped to Rs. 54.85, while, as a result of the fall in the stocks of sacking goods, B. twills was firm at Rs. 119.00. Over the week-end, conditions eased slightly and B. twills were quoted lower at Rs. 118.80 and hessian 40" 10 oz. at Rs. 54.30. A factor for this recession was the announcement by mills that they had decided to extend the present maximum level of production until the end of January. It was stated that, despite the small increase in stock, offtake from mills had been maintained in November. The reopening yesterday after the week-end holiday was marked by steady conditions on the development of demand for hessian both in the ready market and the futures market. Ready hessian 40" 10 oz. hardened to Rs. 55 and in sympathy ready B. twills to Rs. 120.25.



KIPS RECEDE

(From Our Own Correspondent)

MADRAS, 10*th December*

Trading in kips here continued restricted this week owing to very limited inquiries from overseas despite shippers' reducing their prices by 2d. to 3d. However, demand for the inferior fifths was fair, and prices remained unchanged. In the cow-calf section, there was regular demand for semi-premiums, but premiums were nearly neglected. Prices continued unchanged due to restricted arrivals. Buffalo hides maintained previous week's prices, but light buffalos were a shade easier. Buff-calf skins were distinctly easier, and though prices declined by 4d., buyers were not many.

Goat skins again maintained the firm trend, though buyers continued to resist higher prices. In sheep skins premiums, semi-premiums and F.A.Q. were selling fairly regularly at unchanged prices. There was continued demand from the U.K. and the Continent, and to some extent from Japan.

FOODGRAINS BEARISH

(From Our Own Correspondent)

HAPUR, 10*th December*

An easy trend continued in foodgrain prices here this week. Stockists were reported anxious sellers and demand was slack. Heavy stocks with the Government and continued imports coupled with good crop prospects acted as bearish factors.

While the farm wheat was quiet, the dara wheat declined by 67 nP to 99 nP a quintal during the week under review due to slack demand in the face of heavy stocks. Today, the dara quality was quoted between Rs. 38.86 and Rs. 39.20 a quintal and the farm quality at Rs. 42.87 to Rs. 44.21 a quintal. Arrivals were small and local stocks were estimated around 78,000 maunds. Rains in the week-end have brightened crop prospects. Rice prices also registered an easy trend due to better arrivals from East U.P. in the face of poor demand. Week-end prices were: Rice *basmati* superior Rs. 80.38 to Rs. 91.09, *sela basmati* Rs. 72.34 to Rs. 77.70, *mainpuri* Rs. 50.24, *ramajwayan* Rs. 57.60, *raimunia* Rs. 60.28 and *gadda* Rs. 46.22. a quintal.

Grams ruled easy due to lack of support and lower advices from Punjab. Prices ran down 32 to 67 nP a quintal. The Punjab variety was quoted at Rs. 39.85 and the local produce at Rs. 39.52. Maize eased by 67 nP to Re. 1.34 per quintal due to heavy arrivals which averaged 500 maunds a day. Local stocks mounted to 30,000 maunds. Barley and *bejhar* prices also drifted lower on slack demand to be quoted at Rs. 24.12 and Rs. 24.78 a quintal, respectively. Local barley stocks were around 16,000 and of *bejhar* at 3,000 maunds. *Juwar* was quiet and *guwar* prices sought lower levels, as arrivals were better. *Bajra* drifted lower. Other grains were listless. Week-end prices were: *Juwar* Rs. 32.15 to Rs. 33.49, *guwar* Rs. 33.49, *methi* Rs. 58.94, *bajra* Rs. 34.83 to Rs. 36.17 and oats Rs. 29.47. a quintal.

In pulses, peas declined sharply up to Rs. 2 per quintal according to quality on selling pressure from stockists. Demand was slack and the week's offtake of peas and peas dal was seven wagon-loads mostly to the South. Crop prospects have very much improved due to the rains during the week. Local stock of peas is now put around 51,000 maunds. *Arhar* eased fractionally to be quoted at Rs. 48.23 a quintal. New *urd* and *moong* arrivals increased and prices drifted to lower levels. Week-end prices were: Peas dal Rs. 32.15, *arhar dal* Rs. 66.98, *urd* Rs. 48.23 to Rs. 56.26, *urd dal* Rs. 66.98, *moong* Rs. 42.87 to Rs. 45.55, *moong dal* Rs. 56.26, *mascor* Rs. 49.57 to Rs.53.58, *masoor dal* Rs. 58.94, *moth dal* Rs. 48.23 and *gram dal* Rs. 45.55, a quintal.

SUGAR DECLINES FURTHER

(From Our Own Correspondent)

HAPUR, 10*th December*

Sugar prices here declined further this week on selling pressure from factories following the easy supply position. While Punjab and Delhi evinced some interest, demand from the South was lacking. All the factories in West U.P. were reported to be facing shortage of cane supplies and the crushing season was expected to end by March or even earlier in the case of some factories. Production in the country is likely to run down to 25 lakh tons. Efforts were, however, being made to prompt growers to divert cane to factories.

Spot delivery prices of sugar eased by 50 nP per quintal to Rs. 104.25 and the mill delivery prices fell by 19 nP to 67 nP per quintal. Week-end mill delivery prices were: (D29) Amroha Rs. 100.78, Dhampur Rs. 100.98, Seohara Rs. 100.78, Meerut Rs. 102.75 (E29) Simbhauli Rs. 102 and Bijnore Rs. 100.47.

The Muzaffarnagar market was also easy due to limited demand. Mills were eager sellers, but the wagon supply position remained far from satisfactory. Some mills were unable to find buyers even at lower than the former controlled prices. Prices eased by 16 nP to 60 nP for different grades of the various factories.

Increased arrivals in the face of lack of demand resulted in a sharp fall in *khandsari* prices during the week. Prices eased by Re. 1.34 to Rs. 6.69 per quintal according to quality. *Khandsari* wet inferior was quoted at Rs. 77.70 to Rs. 85.74 and the non-crystal variety fetched Rs. 87.08 to Rs. 95.11 per quintal. Crystal *khandsari* was done between Rs. 88.41 and Rs. 95.11 per quintal.

Gur prices drifted lower due to lack of demand even at lower rates. Daily arrivals here averaged 4,000 maunds and were lifted by Gujarat and Saurashtra, thanks to the easy loading facilities. Week-end prices of *gur* here were: Pansera Rs. 40.20 to Rs. 43.20, *balti* Rs. 40.19 to Rs. 42.87 and *shakker* Rs. 45.55 to Rs. 48.23 per quintal.

Gur prices drifted lower also in the Muzaffarnagar market, as demand was reported only at lower levels. The *chaku* quality eased by 75 nP to Rs. 16.50 to Rs. 17.50 and *khurpar* by 50 nP and *rusket* by Re. 1 per maund. *Gur* laddoo was in demand from East U.P. and M.P. at Rs. 17 to Rs. 17.50 per maund.

After an early slight fall, *gur fagun* registered sharp gains on sustained bull support to be quoted today at the highest level of the week. It opened at Rs. 20.50 last Monday, eased to Rs. 20.38, and then advanced to Rs. 21.18. Shortage of cane accounted for this bullish trend in prices.

ATOMIC POWER PLANS

There is an element of mystery still around the decision of the Government to award the contract for the Tarapore nuclear power plant to the American General Electric. As reported earlier in these columns, the American firm had made the lowest offer. The Western debate over the economics of nuclear power and whether countries like India would be wise to go after the atoms for power has never had any effect on the thinking of Prime Minister Nehru or Dr. Homi Bhabha. Even after the intensification of the Chinese offensive on the border, Mr. Nehru went out of the way to emphasise the importance he attached to nuclear power development plans. The decision to award the Tarapore contract to the Americans is not the end of the affair, because there is still the safeguard hurdle to be cleared, the Americans being wedded to the inspection programme to see that atoms for peace do not become atoms for war except within the exclusive nuclear club. Some American observers in the Indian capital took it for granted that after the Chinese attacks and the decision to accept American arms and arms inspection, Mr. Nehru would readily agree to open the doors of the Tarapore project for international inspection.

Some members of Parliament tend to view the Indian nuclear power development policy this way. The present Government so far has pledged itself to an atoms-for-peace policy and even a few days ago presented a programme for a ban in the nuclear weapons field. But Mr. Nehru does not want to tie down the hands of any later administration to the inspection system for Indian nuclear power development plans. If China goes in for nuclear weaponry, the psychology behind India's atomic policy may suffer changes.

The discussions on the second project nuclear power plant at Rana Pratapsagar in Rajasthan is still in a preliminary stage, but the Canadians are expected to underwrite the project. Meanwhile, the Government has announced the choice of the site for the third nuclear power plant, to be established in the south. The most favoured site in the Indian technical experts' report is Kalpakkam, near Mahabalipuram, south of Madras. Three other possible sites recommended are in Madras, Mysore and Andhra Pradesh. The Government has agreed with the choice of the site near Mahabalipuram, since the other choices are related to pre-conditions like development of some hydro-electric projects and use of an atomic station to offset seasonal power cuts due to water shortage.

Note:— Weight shown against the sub-groups under each of the groups are those assigned to the respective sub-group to arrive at that group index. R—Revised. * Estimated.

STOCK & SHARE QUOTATIONS

Abbreviations:—D.—Deferred shares. P.O.—Preferred Ordinary shares. Y.—Accounts published yearly. H.—Accounts published half-yearly. P.—Company has Preference shares. T.—Company has Debentures. N.—Nominal quotations. x.d.—Ex. Dividend. c.d.—Cum. Dividend. i—Interim Dividend.

Shares:—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns 'Paid-up Ordinary Capital' and 'Paid-up per share.

Accounts:—Figures in the Accounts Closed column represent the months of the year in which the respective companies close their accounts 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other its - on which depreciation is allowed less sales, if any and stands for the gross figures except where otherwise indicated.

Dividends:—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

S.—The reserves of Straw Products Ltd. include a non-distributable amount of Rs. 63,40,054 brought about by revaluation of land, buildings, plant and machinery in the year ended 31st December 1955. §§ Investment at cost.
H.—Clive Row Investment—Dividend for 1959 includes additional dividends of 9 nP for the year ended 31st March 1955 and 37 nP for the year ended 31st March 1956. * Includes bonus.
M.—Managed by the Board of Directors. *N.B.*—Dividends paid since 31st March 1959 are shown as taxable. (k) Investments.
A.—Associated Battery Makers (Eastern) Ltd. The effective dividend for the year 1960 would work out to 16.36 per cent approximate, as the final dividend of 10 per cent was paid on the increased capital of Rs. 118 lakhs, whereas the interim dividend of 15 per cent was on a paid-up capital of Rs. 50 lakhs only. X.B. Ex-Bonus.

MARKET GOSSIP

(*Concluded from page* 1021)

mittee would report on the effect which the proposals of both sides would have on individual products. It would make a purely technical enquiry, without prejudice to the respective views of the Six and the U.K. on agriculture.

The final outcome of the Committee's report cannot be predicted with any degree of certainty, especially because of a marked change in the mood of the various participants in the negotiations. Among Common Market countries, while France refuses to budge an inch on the question of British agriculture, the other five countries have made no secret of their impatience with French tactics and the consequent lack of real progress in the negotiations. In the meantime, the U.K. Government's approach itself has undergone some change. Its spokesmen have made it pretty clear that Britain is not in favour of entry at any cost. This approach probably reflects its awareness of the need for pursuing a more cautious policy *vis-a-vis* the E.C.M., in view of the defeats suffered by the Conservative Party in the latest by-elections. It may be noted here that, in one of the traditional conservative constituencies, the Conservative candidate, who had expressed all-out support to Britain's entry into the Common Market, failed to win.

Problems of British agriculture, no doubt, constitute the major stumbling block in the U.K.-E.E.C. negotiations. But that should not be taken to mean that all other problems have been solved. Far from it. The U.K.'s relationship with the other members of the European Free Trade Area, for instance, is a problem that still hangs fire. Britain, in this connection, appears to have conceded in principle the demand of the Six that it should start applying common external tariff against the products of Sweden, Switzerland and Austria, soon after it joins the Six. These neutral countries have also applied for membership of the Common Market, but negotiations with them are not likely to be over before the U.K.'s entry into the C.M.

Meanwhile, the Six seem to be attracting strange bed-fellows. According to a report, Japan is making a bid to seek association with the Common Market. It is not known whether the Japanese Prime Minister, Mr. H. Ikeda, discussed this question with the Common Market countries during his recent visit to Western Europe. If the Japanese move finds favour with Common Market countries (which does not seem to be a smooth affair), this will constitute an immense threat to India's exports of manufactured goods, such as textiles and engineerings, to the Common Market countries and the U.K.

World Meet On Trade

A resolution seeking to organise a world conference on trade has been passed almost unanimously by the U.N. General Assembly. The proposed conference will address itself to the task of reducing trade barriers in industrialised countries with the object of increasing export opportunities of underdeveloped countries. The near-unanimity —only Cameroons voted against—obtained for the resolution augurs well for the outcome of the Conference. It may be recalled here that, when the resolution sponsored by a group of developing countries came up last month at the General Assembly's Economic Committee, some of the industrialised countries such as the U.S., the U.K. and France withheld their support to the move. Their major objection was that the deadline of September 1963 in the original resolution did not provide for sufficient time necessary for preparations for the meeting of this sort. A compromise has now been reached. Thus, under the revised resolution, the Conference will be held as soon as possible, after the thirty-sixth session of the U.N. Economic and Social Council in July 1963, "but in no event later than early 1964."

Apart from the deadline, a major amendment has been incorporated in the resolution in respect of the terms of reference for the Preparatory Committee, which will work out the background for the discussions. The original resolution had asked the Committee to consider "measures for the removal of tariff, non-tariff and other trade barriers" adopted by the industrially advanced countries. This demand has been toned down to ensure that the Committee considered "measures leading to the gradual removal" of these barriers. Although the compromise resolution falls short of the anticipations of underdeveloped countries, the modifications have nevertheless helped create an atmosphere conducive to the full co-operation of developed countries without which the conference would be of no avail.

Small And Hand Tools Industry

The manufacture of small and hand tools is an important engineering industry. Some examples of small tools are drills, reamers, end cutting tools, taps, dies, lathe and planer tools, milling cutters, gear cutters and saws, while hammer, chisel, files, scraper, hack-saw, pliers, punch, screwdrivers, wrenches and scribers are examples of hand tools. These tools largely determine the production efficiency of metal processing machinery. They are also essential for giving effective maintenance service to modern machinery. Though no industrial unit can do without such tools, the demand for them mostly comes from engineering factories and servicing workshops. Thus, they have quite an important role to play in the development of engineering practices. Recognising their importance, the Research Department of the Engineering Association of India (India Exchange, Calcutta-1) recently carried out a survey of the industry and has just published the report thereon.

It is seen from the report that, as of 1961, the small and hand tools industry had 140 small-scale units and 27 large-scale units, accounting for an estimated production of about Rs. 1 crore and Rs. 4.1 crores, respectively. Statistics of capital investment, covering all the small-scale and large-scale units, are, however, not available. But the survey report shows that the aggregate capital (both fixed and working) invested in 48 small-scale and 17 large-scale units is Rs. 2.73 crores.

The main conclusions and recommendations of the survey report are:

(i) The size of some of the existing units is rather small.

(ii) Generally speaking, there is plenty of scope for new entrants and for expansion of existing units.

(iii) The Indian Standards Institution should lay down standard specifications for the entire range of items under the category of small and hand tools.

(iv) For such a basic industry, raw materials should be made available on priority basis in right quantities and desired specifications. Presently, indigenous as well as imported steel is not available in certain cases to proper specifications.

(v) Some of the existing manufacturers of small and hand tools are fairly well equipped to build up special purpose machines for their own use as well as for the use of other units manufacturing similar items. Such units should be persuaded to manufacture special purpose machines. This will result in more and cheaper production and the products will also be of a uniform quality. This will also result in saving precious foreign exchange.

The scope for expansion in this industry is clear from the fact that imports of small and hand tools in 1961 were valued at Rs. 4.82 crores, as compared with Rs. 3.18 crores in the previous year.

Cuba Replaces China In Soviet Trade

The volume of Soviet Russia's trade with Cuba is expected to exceed that of Sino-Soviet trade, for the first time, in 1962, according to the latest available information. Thus Cuba is fast replacing China as one of Russia's leading customers. A rapid increase in Russia's trade with the former has coincided with a sharp setback in its trade with the latter. Since 1959, when China was Russia's leading trade partner, Sino-Soviet trade has continued to shrink. Russia's imports from, and exports to, China aggregated just 827 million roubles in 1961, which represents a sharp fall of 45 per cent as compared with 1,500 million roubles in 1960. The number of commodities in Sino-Soviet trade has also declined of late. Russia has stopped buying from China lead, pig iron, cement, chemicals and tea this year, though it is in need of all these commodities (except perhaps lead). Similarly, Russia has stopped exports of tractors, generators, oil equipments, machine tools and excavators to China. The precipitous decline in Sino-Soviet trade is almost equalled by the rapid expansion of Soviet-Cuban trade, which is expected to touch a record of 750 million roubles in 1962. In 1961, the total trade was only 540 million roubles and, in 1959, it was as low as less than 7 million roubles.

HINDUSTAN LEVER'S EXPANSION

Further details of the expansion plans of Hindustan Lever Ltd. were given by Mr. P. L. Tandon, Chairman of the Company, to the shareholders at their extraordinary general meeting held at Bombay on Friday the 7th inst. Mr. Tandon observed that the variety of projects, the progress of which had been reported in the Directors' reports for the last two years, had moved to a stage of early implementation. For instance, the milk scheme at Etah was going ahead and the factory was under construction. The test-marketing of dehydrated peas and other vegetables, Mr. Tandon said, had produced encouraging results and plans for large-scale production had been finalised. After meeting the test-market requirements of dehydrated peas, the balance capacity of the existing plant would be utilised to produce dehydrated vegetables for the Armed Forces. The Chairman saw great scope for the development of non-soapy detergents in the country and averred that the Company's well-known brand *Surf* had gained increasing acceptance in the market to an extent sufficient to warrant expansion of its production to meet future requirements. He pointed out that non-soapy detergents release valuable edible oils otherwise used in the manufacture of the conventional soap. The Company might also go in for the manufacture of nickel catalyst, in order to save foreign exchange.

According to Mr. Tandon, the Company's experiments with scientifically compounded animal feeding-stuffs have shown promise and their manufacture would provide cattle and poultry farmers with scientifically balanced rations for the first time on any scale in the country. The Company would thus be making a valuable contribution to the country's economy. To meet increasing demand on the technical skills arising from the expansion plans, the Company's research facilities are to be extended and housed in separate premises in suburban Bombay.

The expansion plans would need large funds, especially the essential foreign exchange. In this context, Mr. Tandon disclosed that the I.C.I.C.I. had released the Rs. 25-lakh loan in foreign exchange, which it had promised the Company in 1961.

Defending the recently proposed rights issue at the premium of Rs. 25 per share on the ground that, despite the general and serious fall in the share market, the Company's existing shares had been steadily placed at over Rs. 42 during the past few weeks, Mr. Tandon observed that the issue price of Rs. 35 gave the shareholders the reasonable present return (the suggestion being that it would be maintained on the higher capital too) and good future prospects. Through the subscription of the parent company, Unilever Ltd. of the U.K., to the rights issue, the Company would obtain Rs. 100 lakhs in foreign exchange.

WEEK'S STOCK EXCHANGE TREND

...And all you do is turn the key!

Turn-key jobs are a speciality of Larsen & Toubro. From the design and construction of buildings to the supply, erection and commissioning of plant and equipment, L&T can do the job for you. Larsen & Toubro represents some of the world's foremost manufacturers of plant and equipment in every branch of engineering. L&T's own manufacturing programme at its Powai Works embraces a wide variety of equipment. The Company's qualified engineers and first-rate service stations ensure effective after-sales service. With its ten Divisions and several subsidiary Companies, Larsen & Toubro is in an excellent position to undertake turn-key jobs, including all design work, civil engineering, and the supply and erection of equipment.

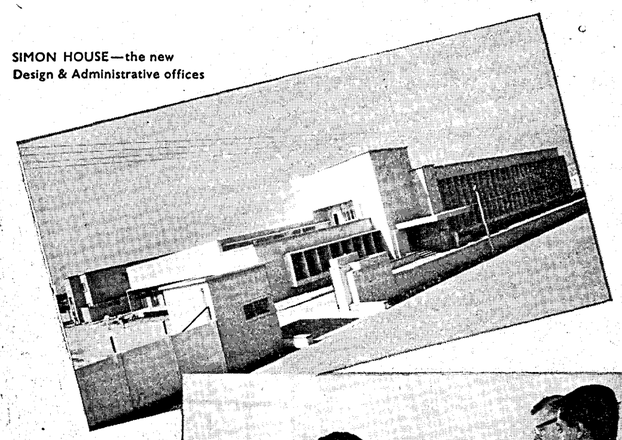
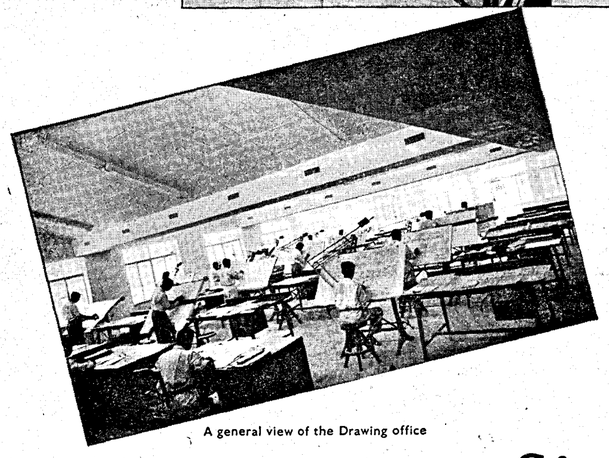
FIFTY YEARS IN INDIA

The opening in 1962 of SIMON HOUSE, the new Design and Administrative offices of Simon-Carves Limited, crowns more than half a century's service to the Indian Chemical and Metallurgical Industry.

SIMON HOUSE—the new Design & Administrative offices



A design being discussed.



A general view of the Drawing office

Staffed with designing engineers who have on-site experience of construction problems, the modern Drawing and Designing office is a step forward in the completion of the full cycle of Consulting, Designing and Construction activities of Simon-Carves Limited in India.

Simon-Carves are responsible for the design, procurement and erection of numerous plants in India: Coal Washery, Power Plant, Coke Oven and ancillary plants at Durgapur; most of the Coke Ovens in the private sector of the Indian Steel Industry; Sulphuric acid plants that account for approximately half the entire acid production in the country; India's first Polythene plant; and a completely integrated compound fertiliser plant.

As a result of their experience extending over half a century in India, Simon-Carves Limited have acquired vast 'know-how' of local conditions and it is now available for the execution of new projects.

Simon-Carves Ltd

Incorporated in England.
The liability of the members is limited.

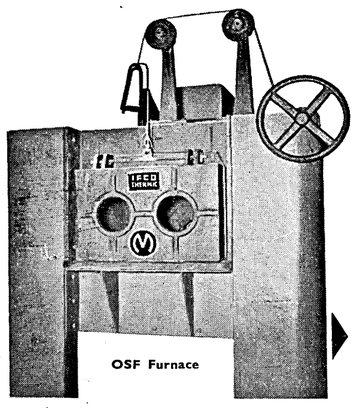
IFCO-THERMIC FURNACES
FOR HEAT TREATMENT

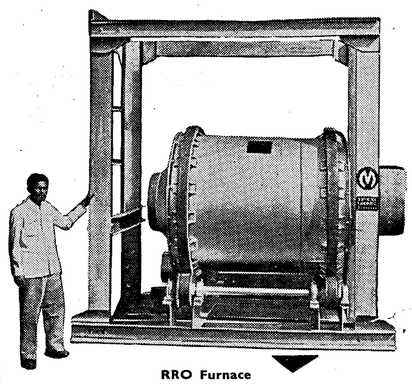


OSF Furnace

Recuperative Oil Fired FORGE or STAMP FURNACE

This Furnace is used for heating billets for forging or stamping; and other high temperature treatments.

Maximum operating temperature 1350 deg. C. Normal operating temperature 1300 deg. C.



RRO Furnace

Recuperative Oil Fired ROTARY REVERBERATORY NON-FERROUS MELTING FURNACE

Sizes with Capacity ranging from 1300 lbs. to 7280 lbs. in terms of BRASS. This Furnace is of the latest design of Crucible-less type and no crucible costs are involved. Oil consumption is also lower.

Suitable for a maximum operating temperature of 1200 deg. C.

Ideally suited for:

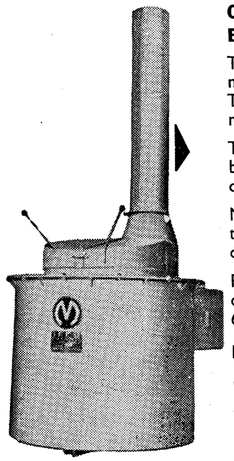
- **MELTING NON-FERROUS METALS AND ALLOYS**

SEMI-MUFFLE FURNACES
Types F5, F10 and F15

These standard types of Furnaces are suitable for General Heat Treatment work such as:—

- **PACK CARBURISING**
- **HARDENING**
- **NORMALISING**
- **ANNEALING**

of Carbon and low alloy steels and other Heat Treatment of Non-Ferrous metals and alloys. Temperature range between 600 to 1100 deg. C.



OCP 8A Furnace

OIL FIRED SALT BATH FURNACE

This Furnace is a General Purpose Heat Treatment Equipment.

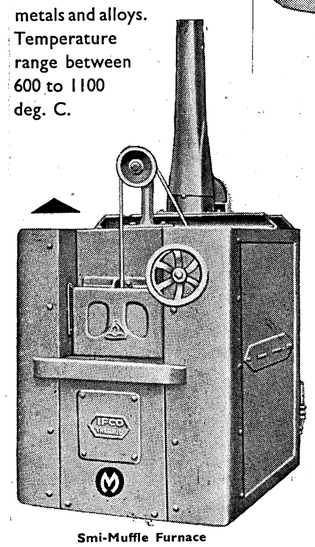
Temperature range between 600 to 950 deg. C.

Normal operating temperature 920 deg. C.

Pot size: 18" dia. × 24" deep. (457.2 mms. × 609.6 mms.)

Ideally suited for:

- **CYANIDING**
- **LIQUID CARBURISING**
- **HARDENING IN NEUTRAL SALTS**



Smi-Muffle Furnace

- **TOOL ROOM HARDENING FURNACE**

IDEALLY SUITED For

HARDENING OF

- **HIGH SPEED STEEL &**
- **ALLOY STEELS**

Double Chamber Type for Preheating and Hardening. Provided with Recuperative system for preheated air supply to the Burner.

Maximum Temperature Range:
1400 Deg. C. in Hardening Chamber and
900 Deg. C. in Preheating Chamber.

Early delivery—No Import licence required.
We also make other Models.
For details, please write to us.

Year Of "Ashtagraha"

IF there are any in this country who have reasons to feel that A.D. 1962 has not disappointed them, they must be the astrologers whose predictions of the malefic effects of *Ashtagraha* (conjunction of eight planets) on 4–5th February 1962 had received country-wide publicity and caused consternation. Of course, nothing untoward happened on the day of *Ashtagraha*, but the astrologers, when taunted for failure of their prophecies, promptly reaffirmed that the bad effects of the conjunction of eight heavenly bodies might last for a period of nearly 18 months. They can, therefore, justifiably claim that their prognostications were not wide of the mark. The world was on the brink of a thermo-nuclear war in the last week of October when the Cuban crisis raised its head. But the Soviet Premier Khrushchev was clever enough even to outwit the devilish Satan by quickly withdrawing the nuclear weapons which he had surreptitiously planted in the Caribbean island, Cuba. His Chinese comrade, Mr. Mao Tse-tung, however, behaved differently and allowed himself to come under the evil spell of Satan, thereby making the predictions of Indian soothsayers come true. How he did this is now part of history and need not be elaborated here, for our purpose is not to relate the war in the Himalayas but to take it as the peg on which to hang this annual survey of economic conditions in India.

The Chinese invasion of India was easily the most outstanding event of the year for India, if not for the whole world. But, as it occurred two months and eleven days before the close of this year and as the Chinese unilaterally ceased fire exactly thirty-three days after they had started marching into India, its impact on the economy in the year now fast fading out was more psychological than physical. Neither production nor employment was adversely affected; on the contrary, it produced a more favourable climate for increased and, what is more important, conscientious effort. The balance of payments position also remained unaffected, as the initial supplies of arms by the U.K. and the U.S. were on the basis of gifts *cum*-lend-lease. The worst sufferer was the capital market where confidence slumped to the lowest ebb seen in recent years. Even here a slight recovery is noticeable as we write, following the impression that the Chinese would not risk a shooting war again with India and that prospects of amity between India and Pakistan are better. Foodgrains and commodity markets, as well as cloth and yarn which even before the Chinese perfidy were experiencing consumer resistance and poor export demand, became soft. This was the combined result of official curbs on speculation, costlier (plus inadequate) bank credit, official threats of more stringent action against price-boosting, spontaneous decision of manufacturers and merchants to play fair and not to take advantage of the emergency, fear psychosis among merchants in the Northern and Eastern regions close to the scene of conflict which discouraged them from stocking goods, and above all some improvement in the production of food, cotton and oilseeds. The U.S. decision to expedite and enhance the supply of foodgrains and cotton under P.L. 480 also had a sobering effect on commodity markets. Due to diversion of transport capacity to war effort, supplies of a few essentials were badly affected in one or two places, albeit only for a short while. On the whole, therefore, consumers were not hit by the border war; if anything, they got some relief in the closing weeks of the year.

The physical impact of Chinese aggression on the Indian economy will, however, be felt in 1963 and the years to follow. Even if the Chinese vacate the aggression in full, which seems to be extremely doubtful, India will have to spend large sums on strengthening its armed forces, for, whatever might have been the earlier belief, it is now clear that the security of the nation can be ensured only through military strength and not by preaching non-violence. The changes this will involve in our economic policies and the sacrifices that people must make to find the resources for Defence are the subject matter of a few special articles in this Annual Number of *Commerce*. It is obvious that days of much greater hardship than was implied in the implementation of third Plan projects lie ahead for all sections of the people of this country. There is, therefore, no room for complacency among either the Government or the people. It would be fatal for the security of the nation, if the prevailing softness of commodity markets were to lull the authorities and leaders of business community into the facile belief that the challenge can be met by a Niagara of words. The initial fear of inflation, scarcity of goods and rising prices was surely not unwarranted. It will surely materialise, if vigilance on the price front is relaxed and if steps to increase the production of food and wage goods are not vigorously implemented. Investors, too, must be cautious and refrain from entertaining expectations of any spectacular capital appreciation in buying equities even at the current levels, if they are not to be disappointed again.

There is little reason to think that 1962 would have ended on a cheerful note but for Chinese aggression. The developments on the economic front preceding the border war were far from encouraging. There were many stresses and strains, with shortages of power, transport, raw materials and foreign exchange becoming more acute than in 1961. Further, the mobilisation of resources for the third Plan in the public sector caused considerable hardship to the people. In the budget for 1962-63, the Centre imposed additional taxes to the tune of Rs. 68.20 crores, on top of Rs. 85 crores of fresh taxation levied in 1961-62. In addition to these tax loads in two consecutive years, the railway fares and freights were also enhanced. It has been calculated that these measures would yield about Rs. 850 crores during the whole third Plan period, or a little over three-fourths of the target of additional taxation to be raised by the Centre, namely, Rs. 1,100 crores, for the third Plan. The States, too, called upon the people to pay more taxes. Their levies are expected to bring an additional revenue of Rs. 47 crores in 1962-63 and Rs. 71 crores in a full year, on top of Rs. 14 crores of fresh taxation in 1961-62. In other words, the States have covered in the first two years of the Plan three-fifths of their target of additional taxation of Rs. 610 crores. These taxes have meant lower net income for corporations and individuals and higher cost of living for all classes of people.

Besides these direct and indirect taxes, the people had also to absorb heavier doses of deficit financing, which, as everyone knows, is another form of taxation, indeed, the worst form, as it hits the poor and fixed income groups more than it does the other sections. It is hard to give a precise idea of the extent of deficit financing in the first two years of the third Plan, but a rough picture is possible. In the first year of the Plan, deficit financing was of the order of Rs. 121 crores, as against the annual average of Rs. 110 crores in the Plan estimates. In the current year (1962-63) it will be much more; taking into account the supplementary grants for defence amounting to Rs. 95 crores and the overall deficit of State Governments, one finds that it will be anything between Rs. 200 and 220 crores. That this estimate does not err on the high side is evident from the fact that, between 29th December 1961 and 15th December 1962, notes in circulation increased by Rs. 183 crores, as against only Rs. 79 crores in the same period of 1961. In this period demand deposits with scheduled banks also grew at a greater pace, by Rs. 69 crores. as compared with Rs. 41 crores in 1961, so that money supply would appear to have shot up by Rs. 252 crores during the first 50 weeks of 1962, as against Rs. 120 crores in the comparable period of 1961. The actual increase would appear to be much more, in view of the fact that a substantial portion of time deposits with scheduled banks consists of extremely short-period funds fit enough to be regarded as demand deposits. The growth in time deposits is, therefore, of much significance in this context; such growth in the 50 weeks of 1962 was Rs. 141 crores, as compared with Rs. 79 crores in the comparable period of 1961. There is thus enough evidence for the conclusion that monetary inflation in 1962 was of far greater magnitude than in 1961 and that, since (*a*) in the first two years of the Plan over 61 per cent of the third Plan limit on deficit financing (Rs. 550 crores) will have been exhausted, (*b*) defence expenditure is expected to increase by Rs. 400 crores per annum over the present level, (*c*) the scope for cutting the third Plan without impeding the defence effort is not that large to offset the rise in defence expenditure, and (*d*) there are severe limits to raising the tax burden without aggravating the inflationary pressures already present in a large measure, Mr. Morarji Desai, the Union Finance Minister, will be hard put to fulfil his promise the other day that he would not resort to deficit financing for raising the military strength of this country.

The price situation was a source of considerable concern during 1962, in distressing contrast to the experience in 1961 when it proved to be a redeeming feature of economic trends by recording little or no increase. After being steady in the first quarter of 1962, prices and cost of living went up sharply in the second and third quarters. The index number of wholesale prices registered a rise of 7 points between April and September, when a high of 131 (1952-53=100) was touched. The cost of living index also went up by 5 points to 132 (1949=100) and by another 2 points to 134 in October. By the middle of November, the commodity price index had gone up a little further, with an all-time peak of 130.8 being hit in the week ended 17th November. Since then, for reasons already outlined above, the price index has fallen by as much as three per cent to 127.5 (as of 1st December 1962), but it is higher by 3.5 per cent as compared with that a year before (123.2) and by 4 per cent as compared with the level (122.6) at which it stood at the close of 1961. Much of the rise in the price index between March and November was a reflection of the increases in the prices of food articles due to the failure of food production to keep pace with the inflation in population (at the rate of 8 million a year) and the addition to the purchasing power in the hands of the people. In spite of the recession in prices since mid-November and the prospect of a slightly larger food crop than in 1961-62, food articles are still costlier by about 6 per cent over the year.

In fine, as India is preparing to ring out the old year and ring in the New Year, the general price level is up by 4 per cent, with food alone being dearer by over 6 per cent. This state of affairs on the price front, when viewed against the prospect of sizable deficit financing and heavy taxation discussed in the preceding two paragraphs, is disturbing to a degree. It is more so, considering that world commodity prices show hardly any increase over the year—the *Financial Times*' latest (17th December 1962) commodity index (base: 1st July 1962=100), for instance, is actually a shade lower at 78.45, as compared with 78.53 a year ago—and that India has to boost its exports, willy-nilly if it is to survive with a fair degree of economic stability, dignity and self-respect. In the eleven months ended November 1962, it may be noted here, India's exports were no better than Rs. 615 crores (provisional), as compared with Rs. 600 crores in the same period of 1961 and the Plan target of Rs. 720 crores. Despite the further pruning of imports from Rs. 953 crores to Rs. 922 crores, the balance of trade showed a deficit of no less than Rs. 307 crores, though it was Rs. 44 crores smaller than in the corresponding period of 1961. There is no room for any further appreciable cut in imports, except at the risk of aggravating the already serious problem of underutilisation of industrial capacity.

Indeed, the last mentioned factor was one of the principal causes for the continued slow growth of industrial production in 1962 also. There was a rise of only 6.6 per cent in industrial production in 1961, as compared with 11.6 per cent in 1960 and 8.9 per cent in 1959. On the basis of figures available upto July 1962 and even taking into account the successful efforts made to raise steel production in the past three months, it would appear that the growth this year will work out to not more than 7 per cent, despite substantial additions to capacity in a number of industries and the absence of any serious labour trouble; in fact, industrial relations during 1962 were remarkably peaceful. The poor industrial growth rate suggests that a return on the capital invested will be delayed, thereby upsetting the calculation of resources available for reinvestment and further development. One can, however, have the negative satisfaction that the downward trend noted in 1961 was checked in the year under review. This may well turn out to be a prelude to the resumption of upward trend in industrial growth, if the enthusiasm for more and better production generated by the national emergency is sustained in the coming year. After all, there is no denying the fact that, given strong will-power on the part of managements and workers, a lot more can be achieved with the same resources than is possible in its absence. The performance on the industrial front can doubtless be bettered still, if the Government scrupulously eschews doctrinaire policies and reduces red-tape to the minimum, providing ample room for entrepreneurs in the private sector and managers in the public-sector undertakings to use their ingenuity and skill for blasting the bottlenecks to production. But the recognition of this point by the authorities is exasperatingly slow and halting.

PERSPECTIVES & PROJECTIONS

By Mercator

1962: All is Flux

"Prosperity is not without many fears and distastes; and adversity is not without comforts and hopes. Prosperity doth best discover vice, but adversity doth best discover virtue."—FRANCIS BACON.

THE time has come when a verdict on the closing year, according to a hallowed custom, has to be delivered. The general feeling is that 1962 has been a bad year because evil forces have been let loose in the world; violence and untruth, symbolised in Chinese aggression on India, have gained the upper hand. But our traditional history and philosophy have always stressed that good comes out of evil and eventually triumphs over it. As if to prove that these ancient truths have not been played out even in this age of science and rationalism, we have been directly confronted by the evidence of greater national and international solidarity in the struggle against evil. With the revision of many earlier assumptions and alignments, it has become easier to tear off many masks and separate the desirable from that which is not. President Kennedy has appropriately called this a "climactic" period, as relations in many parts of the world are fast changing; Mr. Khrushchev, for example, has been openly calling the Albanians "hooligans" and we all know whom he really means. As the Greek philosopher, Heraclitus, said, all is flux, nothing stays still.

1962 will go down in Indian history as the year in which the country, more particularly its leaders, woke up from a long spell of unreality. The rudeness of the shock is a guarantee against a possible quick relapse into old frames of mind, that half-awake state in which lines dividing friend and foe easily got blurred. Even more, this year has brought to the fore some of the sterling qualities of that usually indefinable entity, the common man. He has shown his spirit of self-sacrifice, patriotism and readiness to respond to the call of duty and risk danger. These have offered a refreshing contrast to the signs of apparent decadence and corruption in public life, waste of time and money in grandiose schemes, of the evil of self-righteousness in high places and "insolence of office," and of the greed possessing men who cling to hoards of metal or money acquired through dubious means and withheld from deserving causes. This cannot but have far-reaching results on our projected social revolution.

A more dispassionate view is now possible of the first casualty of the national emergency—the official moves for national integration. The disintegration which they were intended to remedy or counteract was not, it now appears, the instinctive impulse of a people to quarrel among themselves for lack of a common purpose or enemy, but the natural result of a brand of politics which came into vogue with adult suffrage and was based on opportunism, sycophancy and inability of political leadership, whether of the majority or the minorities, to subordinate personal attitudes to a larger national interest. Hence the spectacle of many opposition parties all saying much the same thing to the party in power without ever having combined in the past to make their voices effective or their influence felt. One may well speculate on what could have happened if the Swatantra, P.S.P and the various other permanently dissident elements inside or outside the Congress had coalesced at some stage to constitute a responsible opposition, without ever falling into the temptation of playing to the gallery or allowing personal frustrations to influence principles and public conduct. Such a coalition could have acted as a corrective to supercilious policy-making, empire-building and concentration of authority in a manner which has (*a*) paralysed initiative at non-official levels, and (*b*) given free scope for patronage. Such an integration of the political opposition is vital to our democracy. The merger of the Socialists in U.P. is, indeed, a good sign. But it may be yet too much to hope that the beginnings made during these critical days will endure and be expanded upon to provide a stable basis for the future. This continuing default of the Opposition makes nonsense of judgments on the ruling party's imperfections arising largely out of its internal weaknesses and the absence of proper tests of accountability.

* * *

Aligned But Uncommitted

Non-aligned nations have generally been identified as the uncommitted but how words can suddenly lose their older meanings is illustrated by recent developments. The cold war, for example, is not so intense now between the West and the East as it is between the Yugoslavs and Albanians. While the Communist bloc is aligned together, it is not committed to support China in its adventures just as Russia was not committed to retain its missiles or bombers in Cuba even though aligned. Pakistan is similarly aligned with the West but not committed to support the principles behind its alignment, or even to refrain from making independent friendly approaches to China against whom its alignment was intended. Non-aligned India has not been prevented from seeking military aid, when her national interests demanded it, from one side more than the other; and, lastly, the newly independent nations which found anti-colonialism a common bond are not so deeply committed to it as to make common cause for preserving their hard-won freedom against newer forms of colonialism. All this is not mere semantic confusion but real and hideous contradictions of post-war international diplomacy, which stand exposed to a staring and bemused public.

If India reiterates that she is still non-aligned, it only means that she is not party to any combination that is ideologically or otherwise opposed to Russia or Communism as such. Very soon, the West may also be reaching the same position, of not being aligned against the Soviet Union, if the current favourable trends for a *detente* continue. The prospective closer links between India and the West need, therefore, cause no great anxiety. It is, however, tempting to speculate how Pakistan will reconcile her position *vis-a-vis* the West, after all that has happened in that country. Western observers, who have been friendly to Pakistan, cannot fail to ask the question whether India's longstanding suspicions of Pakistan's *bona fides* were not well-founded after all, if Western advice, after a long period of sympathetic attitudes and massive aid, could be completely disregarded in a critical situation. Much of the goodwill for Pakistan might have been thrown away by now, while the real complexity of the Kashmir problem will be revealed during the impending negotiations. There is bound to be a better Western understanding of India's reluctance to feel optimistic over Pakistan's attitude.

To expect India to fight for barren and uninhabited Ladakh after giving away the Valley to Pakistan under any of the possible formulæ that may be suggested by the West is obviously unrealistic. But what other solution can satisfy Pakistan now to persuade its Government to give its co-operation to India's defence against Chinese aggression? India's spirited defence against Chinese aggression has naturally brought together all those who wish to safeguard the democratic way of life; Pakistan's lack of interest in preserving democracy may well explain the posture of neutrality and the continued refusal to recognise any commitment other than one founded on a Kashmir solution.

* * *

Shot in the Arm?

Preparations for war always act as a spur to economic growth and the Indian economy may prove no exception. For some time now, evidence of stagnation has been accumulating and it is, indeed, strange that recessionary symptoms should manifest themselves in a country in the process of implementing a bold development programme. Foreign exchange shortage and insufficient "untied" aid are the main reasons for slackness but the compulsion to find solutions and improvise methods was hitherto lacking and the defence effort may now be expected to bring in a new sense of urgency.

A stock market recession is understandable in times like these but in a year in which Plan outlay was expected to be the highest yet and the defence services have claimed substantially more, why should rayon and cloth stocks accumulate, sugar prices sag, cotton and *jowar* need price support? Have we very much exaggerated the inflationary potential in the economy? There is some basis for this suspicion as the Union Finance Minister is estimating Plan outlay in the Budget was building on hopes rather than actual capacity to implement schemes; the budget deficit envisaged may now be due to increased defence rather than larger Plan expenditure. However, current recessionary trends are not an unmixed evil, since they provide a comfortable cushion for the inflationary pressures likely to be generated when defence outlay goes up steeply to over Rs. 700 crores in the coming year. Military requirements on this scale will soon be absorbing much of the excess stocks and industrial capacity; the real danger may be that the present declining trends may induce complacency and unpreparedness for situations of shortage that may not be very distant. What has happened to kerosene and cement is a portent and, while the co-operation of the business community is very much to be appreciated, it is rather too much to expect that the natural tendencies of millions of wholesalers and retailers during periods of shortage can be effectively curbed. The Congress Party has been building into its structure a very strong resistance to controls and rationing, which is understandable, in view of some experiences after the last war, but, to say, as Mr. S. K. Patil is reported to have declared at Calcutta, that they will not be enforced under any circumstances is being a bit too categorical when defence has to go hand in hand with development and when future trends are uncertain.

* * *

Prohibition—New Angle

One of the welcome features of the present emergency is the reassessment of some very ancient attitudes and prejudices. There are now more people willing to grant that a salt tax and withdrawal of prohibition should have priority if substantial fresh taxation has to be levied. I believe, however, that in the three States in which there is total prohibition—Madras, Maharashtra and Gujarat—there will be no turning back; since its foundation, Andhra Pradesh has been wavering and may continue to be so. Elsewhere, it seems, prohibition has definitely met with a wall of resistance. The Chief Minister of Madras has an argument when he says that expectations of revenue from this source may be exaggerated, since any increased revenue may not be a net addition but only a diversion of tax yields on consumption expenditure on other items. Will there be a corresponding reduction in the tax yields on tobacco, entertainment and betting, and from excise duties on other consumer goods levied by the Centre? This is one of the imponderables in the situation but I think the answer depends on how we view the drink problem.

Obviously the bulk of the revenue from liquor excise will have to come not from the relatively well off middle classes who may maintain their family expenditure while spending on drink (even then their contribution to saving may be reduced) but from the less affluent working men in industry and agriculture who will be unable to do so. To the extent there is in fact a diversion, there is no net gain. But some hold the view that there is already extensive evasion and illicit consumption and that, if this is merely legalised, revenues should increase. How extensive is a debatable point; not all who would compromise with their dignity or social prestige over mere drunkenness will perhaps care to be involved in prohibition offences and prosecution. Also I think, democracy, relative prosperity in rural areas and new ideas about living standards have changed habits which it may be neither possible nor desirable to change; and at least in the three States in which there is total prohibition, womenfolk are much more assertive than before and may not meekly suffer a diminution of the spending on the family—which has meant a little more clothing, variety in food, cinemas and, possibly, travel. I am not surprised that a Mysore legislator has attempted to mobilise Harijan opinion against a reversal of the prohibition policy in that State, but one cannot, of course, overlook that there may be others opposed to revocation, like those who now profit by the organised bootlegging business.

PROSPECTS FOR INVESTORS

Winds of Change Blowing Across India

By GEORGE CARVELHO

THIS annual exercise in the assessment of investment prospects for readers of *Commerce* presents greater complexities and entails graver responsibilities this year than at any time in the past. Like so much else in this country, the investment outlook has been radically transformed by the still undeclared war with China. A whole way of life and thought and the institutional structure that embodies it have to be reshaped to fit the harsh reality of aggression by a powerful and ruthless neighbour. Nothing will ever be quite the same as it was before the Chinese came swarming over the Thag La Ridge.

The first nine months of 1962 now appear strangely remote, as if they belonged to a different epoch, as indeed they did in a historical, though not in a chronological, sense. Yet there is a continuity in history, the present has its roots in the past. Some account of this psychologically distant period is, therefore, a necessary preliminary to an understanding of the present and an estimate of what the future is likely to hold.

At the start of the year, the share markets were still riding the boom that began in 1958 after the shock of the Krishnamachari Budget of May 1957 had worn off. The Reserve Bank's index number of variable dividend industrial securities (base 1952-53=160) rose from 119.7 at the beginning of 1958 to 187 at the start of 1962. The rise continued till May, when the index touched its highest level for the year, 195.6. Neither the planetary conjunction or *Ashtagraha* at the beginning of February, nor socialist tub-thumping during the general elections inspired more than momentary uneasiness. Even the Budget proposals of April, including a 5 per cent increase in the rate of company taxation to 50 per cent were greeted by a spurt in share prices because, as usual, the worst that the Finance Minister had to disclose was discounted in advance.

Heavy Weather

But the boom was well-nigh spent and from May onwards the markets turned downwards. The Wall Street crash towards the end of May produced a sympathetic reaction in Indian markets and to this was added mounting anxiety over shortages of coal, power, transport and foreign exchange. It was evident that the third Plan was running into heavy weather and the rate of growth of industrial production was visibly slowing down. Exports were sluggish and the prospect of Britain joining the European Common Market with no adequate safeguards for Indian trade further depressed sentiment. Mr. Manubhai Shah, as Minister for International Trade, was clearly not going to find it easy to boost exports to the target set by the third Plan. The move towards dearer money, neglected in the terms of the borrowing programme of the Central and State Governments, was interpreted as a pointer towards a lower level of share prices in the future. The drastic revision of the Tariff Commission recommendations regarding increase in steel retention prices was a severe blow to market sentiment at a time when nervousness over Chinese incursions across the border was mounting.

The market was thus in a highly vulnerable position when the massive attack by Chinese in N.E.F.A. and Ladakh was launched on 20th October. At the end of September, the index stood at 180.4, almost seven points lower than at the beginning of the year. It was already evident that the bull phase which stretched over four years was over and that equity holders would end the year with a capital loss. No one, of course, realised at that time what the last three months of the year held in store for the country and for investors.

Ups and Downs

Ups and downs in share prices are nothing new to investors in India or for that matter in any part of the world. The curve of equity prices since 1938 resembles the course of a switchback railway or, to take a more topical simile, the terrain in the N.E.F.A. area, with its precipitous climbs and steep declines. A statistical comparison is difficult, because the structure of the equity index has been twice revised during this period, once in 1949-50, and again in 1952-53. A *Financial Express* study, published on 7th November, attempts to present a continuous picture by relating the index number to the 1938 base. This is subject to the limitation that it takes no account of the changes in number of scrips and in the weightages, but it does give an idea of the range of fluctuations.

The figures are impressive. In the boom from 1938 to 1946, the advance in share prices was 153.5 per cent, the index rising from 100 in 1938 to 253.5 in 1946. Then came a seven-year period of decline which wiped out almost the whole of these gains and brought the index down to 103.7 by 1953. It is a sobering thought that, from 1938 to 1953, the net gain in equity values was only 3.7 per cent. Once again, the tide turned and in the three years from January 1953 to December 1955, the index recorded a gain of 43 per cent. But, in the following two years, that is up to the end of 1957, once again prices slumped heavily and the index dropped to 109.4. From the beginning of 1958, the bullish trend reasserted itself and lifted the index to 176.3 in May 1962. The decline that started thereafter developed into a landslide with the Chinese aggression and on 7th November, the index was down to 156.

The moral to be drawn from this survey of this roller-coaster behaviour of share prices in the last thirty-four years is not that, because that is how prices have moved in the past, nothing better can be expected in the future and that equity investment is inherently speculative in nature and there is nothing that anyone can do about it. There are quite a few excellent reasons why such a complacent attitude on the part of the authorities should be discarded, if it ever were held.

Investment Pattern

In the first place, the kind of economic system that India has chosen as its basis of development (which incidentally is one of the fundamental differences between us and the Chinese) is one in which private saving and investment have an important and even a vital role to play. The spread of the investment habit to the middle classes in recent years has been welcomed by the Government and, on more than one occasion, official spokesmen have expressed the Government's desire to see the shareholding habit spread yet more widely. So long as the ranks of investors consisted of *zamindars* and ruling princes, the gyrations of share prices, whatever their economic implications for capital formation, did not create a social problem of any great magnitude. Such persons could afford to look after themselves. But when equity capital represents, as it increasingly does now, the savings of middle-class people, a stock exchange collapse creates a situation comparable to widespread bank failures.

Furthermore, the Government itself, through the Life Insurance Corporation, is the biggest investor in stock exchange securities. Foreign private capital, which is increasingly sought after to make up the deficiencies of domestic resources, pays a great deal of attention to the state of the stock market in assessing the attractiveness of investment. In such conditions, wildly fluctuating share prices are a matter of national concern and cannot be dismissed as a matter concerning shareholders and no one else.

It is not, of course, suggested that shareholders expect the Government to make sure that share prices always move up and never down. Investors in equities provide risk capital and must be prepared to face the normal and even, to some extent, abnormal risks that are inseparable from business enterprise. But it might reasonably be expected that, to these risks which shareholders will willingly take should not be added other avoidable ones resulting from the vagaries and the changing ideological texture of economic policy. At least some of the wide swings in share prices since independence could have been avoided had this consideration received greater attention.. In normal times, in a developing economy such as this, the overall trend of share prices should be upward and expectations of moderate capital appreciable and legitimate.

Chinese Aggression

Having said so much, it is time to add that the situation created by Chinese aggression is neither peaceful nor normal and investors' expectations have been revised accordingly. The demoralisation of share markets, the panic that caused a landslide in share prices and the confusion and contradictions that characterised the attempts to cope with the situation reflect no credit neither on the speculators, the stock exchange authorities nor the Stock Exchange Directorate of the Government. No censure is too strong for those operators who tried to turn the national emergency to either private advantage by means of heavy bear selling. The various stock exchange authorities, in their desperate attempts to meet the crisis, seemed to have overlooked the simple fact that only action on an all-India scale could be effective in such circumstances. It is meaningless to fix minimum prices in Calcutta when no similar action is taken in Bombay or Madras and it is difficult to understand why the already existing Committee of Stock Exchange Presidents could not get together in time and work out concerted measures. Finally, one would have thought that one of the principal functions of the official Stock Exchange Directorate was precisely to ensure co-ordinated action in such situations.

Things were eventually sorted out, minimum prices were fixed on all stock exchanges and forward trading in shares has been banned throughout the country. The position now is that stock exchange activity is virtually at a standstill, brokers have almost nothing to do and are wondering what other occupation they are qualified to enter and investors are left with shares on their hands in which dealings are impossible at the official minimum prices.

Since shareholders have, willy-nilly, to hold on to their shares, there is not much that a financial commentator can offer in the way of advice. With stock exchanges moribund, investors do not even have a clear idea of the extent to which their capital has depreciated. The minimum prices are clearly quite unreal and it is anybody's guess what the prices would be if they were removed. Liquidity of investments has been lost since the holdings are practically unsaleable, with rare exceptions.

All things considered, perhaps it is just as well that this is so, for any free market quotation under present conditions would give a false and distorted idea of the real value of the investments. The best, in fact the only, thing to do in the circumstances is to wait for the emergency to pass and the return of peace, when the interrupted plans for national economic advance can once again be taken up. Till then, one can only counsel patience and the willingness to make whatever sacrifice may be needed for the defence of the nation and for victory over the aggressor.

Dividend Outlook

How long this period of waiting and sacrifice will be it is impossible to guess. The Prime Minister has repeatedly warned the country that the struggle will be long and hard. Both China's motives in attacking India and her future plan of action are an inscrutable mystery, on which there is almost endless scope for conjecture. Any estimates of the future must, therefore, be based on assumptions which may well be falsified by subsequent events.

Even on the reasonably favourable assumption that the struggle with China remains confined largely to the present area of occupation, that is, assuming that there is no further advances into Indian territory or destruction through aerial bombardment, the outlook for 1963 from the investment point of view, cannot be considered anything but bleak. Capital appreciation may be ruled out and even dividends may have to be slashed or passed over for the duration. Contributions to the National Defence Fund by companies, according to the formula prescribed by the Federation of Indian Chambers of Commerce and Industry, will be of the order of 5 per cent of assessable income. Mr. Morarji Desai, in the Calcutta meeting of the Associated Chambers of Commerce and Industry, left no doubt that a heavy increase in tax burden would have to be accepted. All this will reduce the distributable profits and shareholders must accept the consequences as their share of the burden which the whole country has to carry.

It is a grim prospect, but it has its relieving features. The Chinese attack and the initial reverses suffered by the armed forces of India have forged a new consciousness of national unity that has tran-

Canada has from January to June 1962 purchased 396000 pairs of footwear from Bata India

scended all the divisive factors that were so prominent earlier. The economic counterpart of this is likely to be a greater degree of realism and the subordination of ideological considerations to the overriding necessity of building up the defensive strength of the country. The role of industrial strength in the nation's defence potential is recognised and bureaucratic red-tape may not be permitted to smother economic progress. The private sector may have greater opportunities and a greater measure of freedom than in the past. Every industrial unit whose product is related to the war effort (and it is hard to find any that does not come within this category, directly or indirectly) will be required to step up production to the limit of its capacity. Where new productive capacity has to be created, the stress will be on expansion of existing units rather than on the setting up of new units. In every project, the accent will be on quick returns. Long-term projects, involving heavy capital investment and long periods of gestation, will now be out of favour. In the opinion of many competent observers, one of the major weaknesses of economic planning in India was a preoccupation with attainment of the take-off into self-sustaining economic growth in the shortest possible time. Under the stress of the emergency, the take-off may have to be delayed but the fruits of development will make their appearance sooner. Even if the fruits in question are directed to war and will not be immediately available for civilian consumption, it must be counted a distinct gain that the tempo of industrialisation is being speeded up.

Long-term Implications

There will be more employment, income and all-round economic activity. Labour troubles which took so heavy a toll of lost man-days and wasted production will cease and labour and management will find, in the stress of war, a community of interest and consciousness of partnership that eluded them in times of peace. The massive foreign aid, in the shape of military equipment from Western countries cannot but cause a leaning towards the West in foreign policy, though the stance of non-alignment may be retained. It is inevitable that this strengthening of ties with the West should have its influence on domestic economic policy as well as on the flow of foreign private investments into India. Long-established habits of thought and patterns of behaviour are not easily cast aside, even in the face of a national crisis and Mr. K. D. Malaviya seems determined to stick to his guns in regard to allowing private sector oil refineries to expand their capacity. But the last-ditchers must know that they are struggling against the tide of history. The winds of change are blowing across India and the face of the country will be transformed.

Investors who are inspired by these prospects need to remind themselves that, so far as the outlook for 1963 is concerned, there is little to wax enthusiastic about. How the fighting will go in the next few months, no one knows except perhaps Mr. Mao tse-Tung and he won't tell. Even if, by some miracle, the present crisis ends, there can be no letting up in the task of building an impregnable defence power for the country. Contributions to the National Defence Fund, heavier taxation, particularly of business profits, realignment of the third Five-year Plan, diversion of resources from development to defence and rigid measures to keep prices within bounds and to check hoarding, profiteering and other anti-social practices will all add up to less profits and greater regimentation. Investors had better get used to the idea that, for 1963, capital appreciation may be ruled out and dividend prospects are anything but bright. On a longer view, the outlook is distinctly better.

Marking Time

More specifically, prices of even first-class blue chips at present levels are so low that yields are attractive, even allowing for the possibility of reduced dividends. Industries directly concerned with the national defence, such as steel, engineering, copper and chemicals should be the greatest beneficiaries. The jute industry is doing well at present, though the long-term outlook is obscure on account of the growing menace of Pakistan competition. Cotton textiles and sugar seem to be in difficulties on account of large stocks with mills and sluggish offtake. Tea gardens in Assam are in the danger zone and their difficulties are heightened by the transport problem created by the strike of Pakistan steamer crews. But those in other areas are in a more comfortable position and should do reasonably well. The new issues market has dried up and will not see any return of activity as long as the emergency continues.

For those stout-hearted investors who refuse to be daunted by the present impasse and the uncertain future, there are thus some attractive opportunities to pick up good shares cheap. But even they would be well advised to defer business until the prevailing minimum prices are abolished and the market is left to find its own level. Others may prefer to wait until after the Budget for 1962-63, when the worst that Mr. Morarji Desai has to offer the taxpayers will be known. The majority will probably decide to mark time and let the crisis take its course.

As long ago as June this year, in the weeks following the Wall Street collapse on Blue Monday, this writer propounded the view that the time had come for investors to shift their attention from prospects of capital appreciation to considerations of yield and that high-yield, fixed-interest-bearing securities such as good preference shares were a good buy. Subsequent events have vindicated the soundness of this advice. That same counsel would appear suitable for present conditions. The indications are that interest rates are on the rise and, in the uncertainties that lie ahead, regular interest holds greater charm than a precarious dividend income with no prospect of capital appreciation.

HERE
AND
ABROAD

BOMBAY DYEING FOR COTTON FABRICS!

For over 20 years, BOMBAY DYEING have been exporting their wide and fast-colourful range of cotton fabrics to U.K., Europe, U.S.A., Canada, West Indies, East and West Africa, Sudan, Middle East, Australia, New Zealand, Burma and the Far East. That's how BOMBAY DYEING came to be one of India's first and largest single exporters of cotton fabrics!

The BOMBAY DYEING range of cotton fabrics includes Bedsheets, Sheetings, Mattress Materials, Casement, Upholstery, Damask Table Linen, Shirtings, Drills, Coatings, Poplins, Cotton Blankets, Towels and Towelling Materials. These are now available in the Indian market. And, for their price, they are all excellent value for your money!

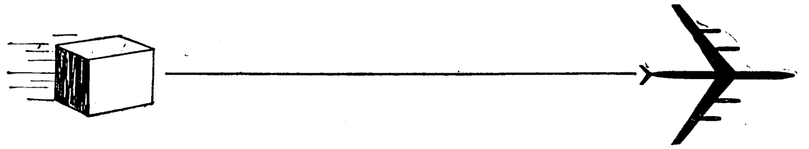
EXPORT?



AIR-INDIA!

Export your goods the modern way—on Air-India's Boeings!
Here's how we can help you earn valuable foreign exchange:

SPEED We jet-speed your cargo at 600 m.p.h., reaching foreign markets in a matter of hours. This means less tied-up capital for you! Also you can safely export perishable goods—be sure they'll arrive fresh and unspoilt!

FREQUENCY We have a frequent network of flights direct to the business centres of the world.

CAREFUL HANDLING Whatever your product it is handled with care by specially trained staff, eliminating loss through damage and pilferage.

REDUCED COSTS Because of our special handling facilities, expensive crating becomes unnecessary. Only light packing is needed. And the time factor reduces insurance rates and eliminates warehousing charges.

DISCOUNTS The larger your consignment, the lower our freight charges. And we also offer special reduced rates on certain commodities!

Let us assist you in promoting your exports.

WORLD BANK'S ROLE IN INDIA'S DEVELOPMENT

By EUGENE R. BLACK

PRESIDENT, INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT

THE active association of India and the World Bank is nearly of thirteen years' standing. It began two years after India attained independence and a year after the Bank turned from reconstruction to development lending. Thirteen years is not a long period in the history of a country like India, with a great civilisation dating back to over 5,000 years. But I have no doubt in my mind that posterity will judge this period as a crucial one in India's march toward the goal of self-sustained growth—a goal that has to be reached by stages over a fairly long period. In the past, Indian civilisation has bequeathed enduring gifts to mankind. In the future, the destiny of humanity will be influenced profoundly by the extent of India's success in absorbing the changes that economic development inevitably entails, without sacrificing respect for individual liberty.

The great industrial revolution now going on in India is a process and not an event. As it may continue for many years, creating and obliterating one form of economic and social life after another—even as the Industrial Revolution in the West did—no one can ever say that this or that is the normal state of modern India. Nor can one accurately predict what will tomorrow's India be like or what will emerge from the labour and tumult of the present generation. One can only answer these questions in general terms as Mr. Nehru once did when he said, "Tomorrow's India will be what we make it by today's labours." It is to these present efforts that I propose to confine my remarks.

Good Progress

One can look back with a sense of pride in a good deal of what has so far been done in India through planned development based on local public and private initiative and resources, into which international co-operation has been productively integrated. Indicators of economic and social development show substantial advances over the past ten years. Tangible evidence of India's economic progress is to be found in the improved health and longer expectation of life of the people, in the increasing number of children going to school and the resulting spread of literacy, in the greater range of consumer goods to be found in shops, in the rapid increases in the number of buses, trucks and bicycles on the road. Agricultural production has increased, and the industrial landscape is fast changing.

National income is estimated to have increased from Rs. 88.5 billion in 1950-51 to Rs. 126.9 billion in 1960-61, a rise of more than 40 per cent. And, while population growth has reduced the net gain in *per capita* income to only about 2 per cent per year, the rise of one-fifth in average income in the span of a decade or so is by no means an insignificant achievement. But, if one dominant fact were to be singled out as the achievement of the past decade, it could well be the awareness, growing throughout the country and among the countries outside, of the urgent need for more rapid development and for efforts to be directed toward that end.

During the past two years, difficulties have emerged. Shortages of coal, power, steel and transport—sectors in which the Bank had shown a keen interest—marked the latter half of the second Plan. Bearing in mind that the task which India is attempting in the field of economic development is incomparably more difficult than any which has faced the more developed economies of the West, one should resist the temptation of exaggerating these difficulties. Nevertheless, it would be a great disservice to India to gloss over them.

Export Performance

A lag in export performance could be a serious setback to the Plan. Notwithstanding the growing export-consciousness on the part of the Indian Government and Indian industry, India's exports so far have shown an uneven and slow rate of growth, while imports have been expanding rapidly. There has not been any significant expansion in the world markets for India's principal traditional exports—tea, jute goods and cotton textiles. A number of other traditional exports have either been swallowed up by rising home consumption, or are faced with special market difficulties. There is another difficulty, over which India has no control, namely, the trade barriers erected by some of the industrially advanced countries against what are called "low-cost manufactures." At the recent annual meeting of the Governors of the World Bank in Washington, I expressed my anxiety lest future trade restrictions frustrate hopes for rising exports from the developing countries, and especially of products of their growing manufacturing industries. India and some other developing countries have viewed with concern the new regional economic groups of countries in Europe and elsewhere. If these groupings adopt liberal trade policies, instead of attempting to surround themselves with high protective barriers, the underdeveloped countries will have nothing to fear.

But, in the meantime, India should not relax its efforts to promote exports and to increase its foreign exchange receipts. Fundamentally, export performance will depend on these factors: on increases in real output; on a reasonable restraint of domestic consumption, especially of commodities with an export potential, in order to create surpluses for export; on the maintenance of monetary stability; and on improvements in productivity and of quality standards. These are factors within the control of India, and mastering them will be an important element in the effort to achieve a higher standard of living.

* * *

Plans and the Bank

Raising the standards of living in member-countries is the central purpose of the Bank. Given India's size and the urgency of its problems, it is not to be wondered at all that the Bank has become one of India's close collaborators, or that the Bank has lent more money—some $817 million—in India than in any other of its member-States. Yet this outcome was by no means inevitable: the Bank, in many respects, models its lending policies on the strict practices of private investment institutions, and a simple humanitarian belief in the importance of raising living standards would not have been, by itself, sufficient reason for the Bank to provide assistance on the scale it has done in India. The launching of the Five-year Plans, initiated in 1951, drew the Bank closer to India. The country's determination to expand its economy, and its choice in favour of the political and constitutional arrangements generally associated with the Western democracies, created a favourable impression in the capital-exporting countries from which the Bank itself draws most of its finance. A relatively high level of technical skills in India also enabled her to attract and use capital effectively.

For her part, India recognised that most of the investment effort should be financed internally. At an early stage of the Bank's operations in India, however, we recognised that the role of external assistance in India's development plans would be vital. Without such complementary resources, even domestic resources could not be put to effective use. External assistance has been very substantial: in the third Plan, it constitutes (including P.L. 480 assistance and debt refinancing) Rs. 32 billion in a total programme of Rs. 116 billion; and the character of this assistance and the sectors into which it flows make it crucial for the success of the entire developmental effort. The Bank itself has lent $817 million for public and private projects in India. When the amounts made available by the Bank's two affiliates—the International Finance Corporation and the International Development Association—are taken into account, the sum rises to more than $1,000 million.

Sinews of Development

The Bank's role in India and elsewhere is to help build the basic sinews of economic development, thus creating a base from which the expansion of agricultural and industrial activities can be carried forward. Bank loans totalling $447 million—over half of the Bank's total lending to India—have gone toward the development of transportation. The $379 million lent by the Bank for the Indian railways is by far the largest amount that it has lent anywhere for a single undertaking, and this sum has helped to implement a major rehabilitation and expansion programme vital to India's economic development. Bank loans for development of power total $81.60 million. The Bank has also extended direct financial assistance to private industry. Bank loans totalling $107.5 million made between 1956 and 1957, helped the Tata Iron and Steel Company to double its finished steel capacity under the "Two Million Ton" programme. Three loans totalling $68.7 million were made to the Indian Iron and Steel Company. The story of the Bank's assistance to Indian private industry is incomplete without reference to the Industrial Credit and Investment Corporation of India, which the Bank helped to found. The Corporation has so far received $60 million in Bank loans. Total financial assistance sanctioned by the Corporation in various forms up to the end of 1961 was about Rs. 427 million, of which loans amounting to Rs. 194.3 million were in foreign currency.

Besides assisting specific projects, the Bank has shown a keen interest in the progress of the Five-year Plans as a whole. In 1958, when

NEW

FORTLOK CONSTRUCTION GIVES DUNLOP CONVEYOR BELTS AN EDGE OVER OTHERS

Conveyor belts are most vulnerable at the edges. The new Dunlop **FORTLOK** construction more than doubles the life of the belt edge by providing double edge cushioning capacity.

A common cause of belts wearing out prematurely is edge wear due to rubbing against the side of the structure, against the chute, against jammed abrasive loads, or by the excessive use of guide idlers. When the edge has been worn or torn away, further wearing of the edge and consequent belt deterioration is usually comparatively rapid.

Dunlop **FORTLOK** overcomes this problem. Note its construction as shown under the magnifying glass in this illustration of a conveyor belt section.

- The thickness of the edge protection rubber has been doubled as compared with the conventional conveyor belt edge.
- Note, too, that the edge rubber has been keyed into the carcass of the belt which produces an anchorage infinitely greater than in conventional belt edges. This permits the use of thicker edge protection of assured stability—especially important where guide idlers or trippers are used.
- The thicker, stronger edge protects the belt carcass from attack by moisture, grip, acids, alkalis or oils.

FORTLOK is a registered Trade Mark.

DRAC-91

the success of the second Plan was threatened by an acute shortage of foreign exchange, the Bank brought together for consultations a group of industrialised countries (Canada, Germany, Japan, the U.K. and the U.S.). This resulted in the five nations entering into bilateral arrangements with the Indian Government for aid which, together with additional World Bank lending, covered the foreign exchange needed in the third year of the Plan. Subsequent meetings of the Consortium led to similar arrangements for aid in the final two years of the second Plan. Before the third Plan came into operation, the Bank circulated its analysis of the Plan to members of the Consortium. A meeting of the Consortium—now enlarged to include Austria, Belgium, France, Italy and the Netherlands—held in July this year indicated additional commitments for the second year of the third Plan. These additional commitments brought the total amount of aid to India indicated by the Consortium for the two years to $2,365 million. Of this, the commitments of the Bank and the International Development Association amounted to $450 million.

* * *

I.F.C. and I.D.A.

Needs have arisen over the years for new types of development finance which the Bank's constitution had not equipped it to provide, and these needs led to the creation of the Bank's two new affiliated organisations. The International Finance Corporation (I.F.C.), established in 1956, invests in private industrial enterprises in the less developed member-countries. It is able to provide share capital, which the Bank does not do; and it does not seek Governmental guarantee of its investments, which the Bank is required to do when it lends to a private borrower. An I.F.C. mission has recently returned from a long stay in India after discussions and investigations that may lead to several investments in the coming year. In the meantime, I.F.C. already has two investments in India, totalling $1,575,000. One investment, in Assam Sillimanite Ltd., was made to enable the Company, which has long mined and processed minerals for export, to begin manufacturing refractory materials at Ranchi. The other I.F.C. investment is a loan to K.S.B. Pumps Ltd., a new enterprise which has erected a plant near Poona.

India is the leading customer of the Bank's other affiliate, the International Development Association (I.D.A.), which was established in 1960. Although only in active operation for about 18 months, I.D.A. already has made credits totalling $362 million, of which India has received $212 million. I.D.A. credits to India have included sums for highway construction, telecommunications and electric power. They also include six credits totalling $56.5 million for the development of agriculture. Under the third Plan, India is trying to achieve a very substantial rate of increase in agricultural output, with the object of achieving self-sufficiency in foodgrains and a substantial increase in output of commercial crops. Since not much new land can be opened up, emphasis is being put on irrigation and other means of intensifying production and increasing crop yields. All the agricultural projects for which I.D.A. credits have been extended fit into this pattern.

I.D.A. itself is an attempt to solve a pressing international financial problem which is a result of the quickening pace of development. Many countries are finding that their capacity to make effective use of aid is growing faster than their capacity to repay. During the early nineteen-fifties, when external debt was still comparatively small and well-prepared projects were few, most less developed countries could still prudently accept loans at conventional rates of interest and repayable over the conventional period of time. But today, in many cases, a dangerously high proportion of export earnings (the prospects for which are themselves clouded) are mortgaged to future debt service. Our own figures show that, between 1955 and 1961, a group of 34 countries, accounting for some 70 per cent of the population of the underdeveloped world, more than doubled its total external public debt. Yet, over the same period, the export earnings of the same group increased by little more than 15 per cent.

If the momentum of development is to be maintained, it can only be by grants or by loans largely at very long term and at very low interest. This is why the International Development Association was brought into existence. Up to now, all I.D.A. credits have been for 50 years and free of interest, carrying only a small annual service charge. Thus, the Association meets the special needs of those member-countries which cannot borrow on conventional terms all the funds they can usefully employ for development. But, although the terms of I.D.A. credits are "soft," I.D.A. is by no means a soft lender. Like the Bank, it supports only sound projects of high developmental priority.

* * *

Technical Assistance

As the financial activities of the Bank and its affiliates have grown, there has been a marked increase of the Bank's work in the field of technical assistance as well. Under an expanded programme of project and sector studies launched last year, the Bank has organised and helped to finance a variety of pre-investment studies. One of these will result in the drawing up of plans for a new bridge across the Hooghly river, an essential part of the planning for the redevelopment of Calcutta. Another departure of the year was the creation by the Bank of a Development Advisory Service, consisting of experts available to serve as economic and financial advisers to the Governments of the less developed member-countries. In the Bank's technical assistance work, India has as often been on the contributing as the receiving end. The Bank's Economic Development Institute, a staff college for senior economic officials of member-Governments, has always included an Indian national on its small faculty: and no less than three members of the new Development Advisory Service are Indian.

* * *

Prime Minister Endorsed

Economic progress has been a great theme of Indian life since independence, and I believe it should continue to be so. No doubt, these are difficult days facing India. While it is too early to assess precisely the impact on India's economy of the menacing developments on the border with China, defence expenditures already have risen, and fresh strains have been imposed on financial resources. But one aspect of the present situation is simply to emphasise the need for pursuing the path of progress more vigorously than ever, and to underline the urgency of continued efforts to build a strong and productive economy. As Prime Minister Nehru has said, "the major projects of the Plan must be pursued and implemented, because it is that way that we shall strengthen our country not only in the present crisis but in the years to come."

ECONOMIC MOBILISATION AND THE THIRD PLAN

Production For Exports Must Have Equal Priority

By TARLOK SINGH
MEMBER, PLANNING COMMISSION

THE basic assumptions of planned development of India have been profoundly affected by China's aggression. The first impact may be on the plans for the next year or two, but the implications are likely to be more far-reaching. No Five-year Plan stands alone: progressively, the various Plans have become much more interdependent and, indeed, constitute a *continuum*. Each important act of omission or commission exerts a powerful influence across the economy today, tomorrow and beyond. This makes it all the more necessary that the issues be more widely understood.

The opening paragraph of the chapter on Objectives in the Report on the Third Plan contained these words:

"The basic objective of India's development must necessarily be to provide the masses of the Indian people the opportunity to lead a good life.... In the larger context of the world, the realisation of this objective for India, as for other countries, is intimately tied up with, and dependent on the maintenance of world peace ....Peace, therefore, becomes of paramount importance and an essential prerequisite for national progress."

Peace was the major premise against which our Plans and their social and economic philosophy were set. We knew that war was something which even rich countries could ill afford and that the vast resources they were pouring into defence and armaments, while serving perhaps as a mutual deterrent, could not but delay the economic and social progress of the world and, more specially, of millions in the less developed countries. However long and tortuous the course, humanity has no alternative to this approach. Yet, with the turn events have taken, there is no gainsaying that, as a nation, we are ourselves faced with a radically new situation.

The Threefold Challenge

The broad types and scale of the problems which have arisen are easier to visualise than the magnitudes that may be involved. Past experience of the economic implications of mobilisation pertains mostly to countries which already achieved development and had built up a considerable industrial and economic potential. These countries could draw not only on their internal resources but also on the resources of far-off lands. At the moment of final crisis, whole groups of nations rather than countries in isolation confronted one another. As with others in the past, new sets of circumstances will keep coming into our picture, so that, even apart from obvious and inevitable uncertainties, static assumptions should be avoided. At the very least, however, from now on India's economy and resources must be so managed and developed that national security is never again seriously threatened. To meet the threefold challenge of mass poverty, social justice and national security is an obligation from which there is no escape, and it is just as well that we are compelled to face it now rather than at a later date.

The initial stages of economic mobilisation are the more difficult both because they entail so many new and critical judgments and because the dimensions change so suddenly. But, given the ability to adjust the sights and to adopt the correct economic policies, as higher levels of production and employment develop, the burdens should become more sustainable.

Economic mobilisation poses a series of problems in the context of the third Plan and calls for a careful review of the assumptions and policies in the Plan. The essential problem is not that there are major divergences to be reconciled but that there are specific goals, larger in scope and sharper and more decisive in content, which have the first claim on all available resources and have to be attained with the greatest speed. In turn, they raise many new problems of balance and equity throughout the economy.

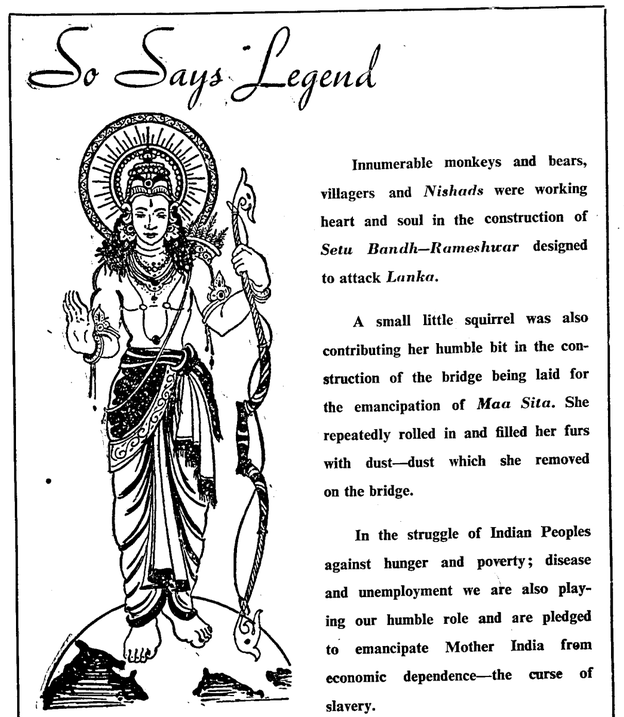
Balance of Payments

India's economy has reached the stage at which foreign exchange resources are crucial not only for the expansion of basic capacities but also for securing the fullest production from existing capacities. Neither aspect can be neglected. On the whole, while there are still important gaps and delays may occur, there is fair reason to assume that foreign exchange for most of the projects included in the third Plan will become available. In the immediate future, imports of industrial raw materials, components and spares and balancing equipment will have the highest priority. To an extent, it may be necessary to secure these against foreign aid available for projects. The existing procedures of lending countries do not always facilitate such interchange. In the existing circumstances, on balance, the substitution of maintenance for development imports will be to the overall advantage of the economy. It is to be hoped that, in recognition of the problem such shifts in resources entail, it might be possible to secure additional assistance from abroad on account of maintenance imports. Equally with maintenance imports, import substitution becomes now a matter of the highest urgency and has to be pursued systematically industry by industry.

A sharp increase in the burden on the balance of payments, which is one of the first results of the effort to mobilise the country's resources, will also call for more intensified measures to increase exports. The programme of exports drawn up for the third Five-year Plan envisaged an increase of about a third in the annual level of exports. The experience of the first two years shows that the achievement of this higher level of exports is a much more difficult task than has been generally appreciated. The usual economic forces and stimuli do not operate sufficiently in favour of exports even though for several years liberal incentives have been given for exports. There is now no serious alternative to devising measures, as far as possible in co-operation with each industry, for securing the surpluses required upto the limit of foreign demands. In other words, if the export objectives are to be increased, we cannot stop far short of schemes virtually of compulsion. These have to be worked out in consultation with each industry and implemented with the help of the appropriate organisations. It would be essential also to review the existing pattern of production within each industry, so that the goods required by foreign markets are produced to quality and specifically earmarked for exports. At the same time, it should be possible to work out suitable means for securing the reasonable interests of individual undertakings. Although a considerable volume of engineering capacity will be taken up for the defence effort, production for exports should have equal priority, and the aim should be to go on expanding industrial and engineering exports, as these are a major factor in realising the plan for doubling exports by the end of the fourth Plan. Special efforts should be made to intensify measures for exports of agricultural products and of minerals. The demands of economic mobilisation make it all the more necessary to go beyond the export targets which had been set earlier for the third Plan.

Harnessing Internal Resources

Next in urgency to the balance of payments, an even more important aspect of economic mobilisation and one within our grasp concerns the raising of internal resources to finance the increased defence and production effort. The truth is that, although the need for increasing the rate of domestic savings has always been recognised, as a country we have not imposed on ourselves the economic discipline necessary for harnessing all the resources we could and thereby achieving a rapid increase in the rate of growth. At the end of the first Plan, the rate of domestic savings was 7 per cent of the national income, as compared with the initial target of 7.5 per cent. At the end of the second Plan, the rate of domestic savings was 8.5 per cent, as against 10 per cent envisaged in the Plan. Thus, in two Five-year Plans, we did not reach the accepted goals in a most vital sector, although the targets set during each period were more cautious than those justified by the needs and conditions of the country. In the Report on the Third Plan it is proposed that the rate of domestic savings should rise from about 8.5 per cent of the national income to about 11.5 or 12 per cent. The rates of domestic savings envisaged for the fourth and the fifth Plans are, respectively, 15 to 16 and 18 to 19 per cent of the national income. It is clear that, as a minimum, by the end of the third Plan, India must raise its rate of domestic savings to about 15 per cent of the national income and that, as early as possible thereafter, the rate of domestic savings must be stepped up to about 20 per cent. This will be the main test of our willingness to labour for



whatever we value and proof that our scheme of planned development and our institutions are capable of meeting the new circumstances.

In order to attain markedly higher rates of domestic savings, it will be necessary to examine more critically the working of different sectors in the economy and the existing distribution of burdens and opportunities within the community. Some of the directions in which action has to be pursued will be readily appreciated. First, all enterprises, whether in the public or the private sector, must be both expected and helped to realise the maximum surpluses of which they are capable. This will involve, on the one hand, deliberate efforts to remove impediments or bottlenecks which stand in the way of greater production and, on the other pricing policies for all industries in harmony with the objective of mobilising the maximum resources. Secondly, until the necessary potential and the higher rates of domestic savings have been achieved, dividends, profits and wages will have to be strictly regulated. Thirdly, since at present substantial resources leak out, as it were, through trade and speculation, these activities will have to be brought under greater control and regulation. In the fourth place, while safeguarding the prices of essential commodities, in respect of many other goods, both for restraining consumption and for securing the necessary revenues, high levels of excise duties will be inevitable. Fifthly, the uses to which the available surpluses are put, whether these are accumulated by Government or by private parties, will have to be strictly determined in accordance with national priorities. The savings of the community have to be treated as a pool rather than as separate streams. Thus, it will be essential not only to control and regulate investment from the point of view of the economy as a whole, but also to ensure that these satisfy the criterion of economic efficiency. Finally, the existing disparities in income, which could never be justified in social terms, cannot be allowed to continue even on considerations of economic growth and mobilisation. Following the Taxation Enquiry Commission, the Planning Commission envisaged in the Report on the Third Plan that, over the next two or three Plans, the objective of securing a range of incomes after tax of about thirty times the average family income should be achieved. Even this range represented a considerable disparity, but it was thought that, as lower incomes rose, the range could be further reduced. In the present circumstances, it becomes imperative that steps to reach this objective should be hastened and should, indeed, be regarded as an essential ingredient of national defence.

Changes in Priorities

The various measures for increasing internal resources and earning foreign exchange mentioned above are related intimately to the production goals which may be set. It is apparent that the production and development targets of the third Plan have to be revised in several directions. The emergency alters both the time scale and the tests of essentiality. In many directions, the targets set for the third Plan have to be achieved earlier. This would require larger resources as well as readiness to adopt agencies and methods of production which will produce results more speedily. Secondly, increases in targets in some directions will involve downward changes in certain other directions either because these have a lower priority or cannot be given the scarce material resources or foreign exchange which would otherwise have gone to them. Broadly speaking, in the field of agricultural production, there has to be intensification all along the line. In industry, the demands in each field have to be assessed with greater precision and direct allocations resorted to for a wide range of critical products and materials. The industrial system as a whole has to be operated in a planned and integrated manner. Since the objectives will be more sharply defined both quantitatively and in terms of time schedules, the inputs in all branches of industry can be more precisely planned. This would involve radical changes in the present methods of industrial planning and licensing. Another area in which the emergency involves intensification and enlargement in almost every direction is that of manpower training and of putting the available manpower to the most efficient use.

A Major Concern

These are some of the directions in which the emergency should lead to the fulfilment of the third Plan in a larger measure and more speedily than was earlier contemplated. Essential supplies for the civil population are a critical area in a time of economic mobilisation. Shortages of essential goods and services hamper production and upset the social balance. Where shortages become inevitable, the equitable distribution of the available supplies becomes a major concern of policy and administration and demands the utmost vigilance.

There are two areas in which the temptation to take a short view of the requirements of economic mobilisation should be resisted. Both in the first and second Five-year Plans insufficient attention was given to education and health and, generally, to the development of human resources. In the third Plan, an attempt was made to provide for a wider base of effort in social services with some sense of the future perspectives. The tempo of development in social services still falls considerably short of the minimum requirements. The cost of any setback at this stage would be far greater than may appear at first sight. Secondly, despite the development over the past decade, the basic capacities in the Indian economy in terms of power, transport, machine-making industries, fuel and facilities for scientific research are still relatively limited. It is of the utmost importance that, whatever the urgent pressures, every effort should be made to safeguard the fundamental requirements of growth in the future. Already, the gap between the more advanced and the less advanced countries has been increasing and not all our plans of development can be considered adequate.

The new needs demand both additional effort and determination to fulfil the essential commitments already accepted for the third Plan. The emergency will take the country forward towards a self-sustaining economy sooner than had been hoped for if its significance is more fully recognised. As a country, we have to prepare ourselves for heavier burdens and, at the same time, adhere to the basic principles and strategy of our Plans.

Look again

Ask a schoolboy and he'll give you the literal meaning of research: look again. It is a simple statement but it holds a lot of truth. For one of the basic functions of research is to look again, to explore the unexplored and find the answers that have eluded man. □ If you visit any of the CIBA Research Centres throughout the world, you'll see dedicated men and women testing and retesting; evaluating, rejecting, starting afresh. And you'll see the significance of this search as ideas become reality. □ Research has been a tradition with the CIBA group for many years, resulting in new and better pharmaceuticals, dyes, plastics, agrochemicals. And CIBA's new centre for fundamental biological and chemical research at Goregaon, Bombay, will place special emphasis on India's particular needs. Indian scientists in 80 modern laboratories and an animal farm make up the nucleus of the centre.

The Present Crisis and Import of Private Foreign Capital

Commercial Diplomacy Needs Judicious Handling

By H. V. R. IENGAR

CHAIRMAN, E.I.D.—PARRY GROUP

DURING the month of October this year, I was in the United Kingdom, Canada, and the United States, to hold discussions on certain major industrial projects in India, on behalf of the companies with which I am now associated as Chairman. It was during this visit that the Chinese invasion of our northern frontiers took place, followed almost immediately after by the Cuban crisis. It was interesting to watch the effect of the Cuban crisis on the business community in the United States and Canada. Whatever their private views and apprehensions might have been, they went about their work as if nothing had happened. Their feeling was that, if things came to a head, everybody would get blown up and there would be no one to worry anyway; meanwhile, they thought that the most appropriate course was for them to carry on in the normal way. Although the Cuban crisis overshadowed our own crisis with China, the latter was never relegated to the background in the responsible press. It is true that few people were fully aware of the nature of the problem that we now face with the Chinese. In fact, they had only the vaguest ideas about the frontier problem as such. But they realised that the situation must be potentially one of great gravity, and the thing that brought this home to them was the statement that the Prime Minister made immediately after the large-scale Chinese attacks. The Prime Minister, according to popular feeling in the West, has been rather soft in his dealings with Communist regimes; certainly he is known to have attempted most strenuously to enter into an honourable and peaceful arrangement with the Chinese. If he, of all people, felt that they have committed flagrant aggression, and compared their behaviour, for lack of scruple and the complete negation of decencies of international behaviour, with the behaviour of Nazi Germany, people felt that his view must be accepted as correct. In fact, one phrase in the Prime Minister's statement has done more to bring home to our friends abroad the seriousness of the Chinese menace than tons of propaganda that could be put out by our publicity departments: it was the phrase that we have been living in a world of illusion of our own making, out of touch with reality.

Favourable Reaction

I was concerned, of course, with the question of certain industrial projects. Not one of the groups with whom I have had discussions showed any hesitation in going ahead with their projects in India. One of them told me they telephoned to the State Department immediately after the Chinese attack, to inquire what were the views of the American Government on the crisis in India. They said the State Department informed them that the American Government would give all the assistance the Indian Government would require for the purpose of repelling the Chinese attacks and, further, that they would consider it necessary to support the third Five-year Plan because failure of the Plan was probably one of the things that the Chinese were after. This indication of American official attitude was good enough: the company concerned decided to go right ahead with their project which is going to involve very considerable outlay. In fact, they and their collaborators sent out teams in the first week of November for the purpose of finalising certain details with the Government of India. This was also the attitude of the Canadian group. They indicated that, in addition to the funds they have already put into India, they would be prepared to put in further amounts for new expansion projects that we may want to undertake. On my way back home, I had discussions with a well-known British group. They informed me that they had decided, last year, not to make any further investments in India because one of their schemes in the country had been a financial failure, but now they had decided to revise their decision, and told me that they would sympathetically examine any concrete proposal that I had to make involving their financial and technical collaboration.

It would be a mistake, of course, to generalise on the strength of experience in a limited number of cases, but the firms with which I dealt are so important and, geographically, so separated from one another that I think they could be assumed to be a fair sample. If we could demonstrate that we are determined not to give in to the Chinese, and if the great surge of enthusiasm that has swept the country could be maintained, I have little doubt that private investment from abroad in India will merely not diminish, but actually show a substantial rise. The attitude of the private sector in the U.K., the U.S.A., and Canada is thus closely parallel to that of the Governments in these countries, allowing for the inevitable differences in approach between organisations which are concerned with profitability of investment and Governments which are preoccupied with major strategic considerations.

Trend of Investments

It is, I believe, generally known that there has been a steady increase in foreign business investment in India since 1947. Initially, after independence, there was a certain degree of disinvestment, due to nervousness about the possible attitude of a Government formed by people who had fought against the British. But this trend was reversed very rapidly because of the very correct policy pursued by Government, in word and in deed, to honour their commitments in regard to repatriation of capital and the remittance of dividends. At the end of June 1948, the outstanding foreign investment in the private sector amounted to Rs. 256 crores; the entire amount being from private sources. At the end of December 1960, the outstanding investment amounted to Rs. 691 crores, of which the investment from official sources such as the World Bank, was Rs. 124 crores, and from private sources Rs. 567 crores. In terms of percentage this is a substantial increase. It is worth noting that these figures relate to investment and not to market price which, in many cases, is substantially higher. Some of the increase in investment was the result of fresh capital inflow into India, but the greater part was consequential on the retention of profits and their ploughing back into business. From India's point of view, the ploughing back of remittable profits has, of course, the same significance as the bringing in of fresh capital from abroad. Of the total outstanding investment at the end of 1960, the break up in the field of investment was as follows:

	(Rs. crores)
Manufacturing	289
Petroleum	152
Plantations	100
Others	148

The leading investor in India was the U.K., whose investments amounted to Rs. 446 crores and the next in importance was the U.S.A., with Rs. 113 crores.

Flow Into India Only Fractional

It would be a mistake, however, to derive any satisfaction merely from the fact of a substantial percentage increase in foreign business investment in India. The quantum of investment, apart from investment by official sources such as the World Bank, should be related to the total flow of such investment by the major capital exporting countries. Seen from this context, India has been able to attract, hitherto, very little foreign private capital. In fact, in relation to the total flow of capital from the major exporting countries, the percentage which India has been able to draw to herself is only fractional. The point that requires examination is, whether there are any policies or procedures in force in India which have had an inhibiting factor.

Certainly monetary soundness has not been an inhibiting factor. On any comparison with world standards in the last eleven years after the first Plan was inaugurated, we have been able to maintain the stability of our currency at a pretty satisfactory level and, in fact, our performance has, on the whole, been better than that of most countries. During the same period, countries where monetary management has been quite unsatisfactory and inflation has become rampant have, nevertheless, succeeded in attracting far larger magnitudes of foreign capital. It is not the purpose of this article to go into the reasons for this phenomenon, although that, in itself, is a fascinating subject for study. Apart from monetary stability, Indian performance in the matter of profits has by no means been unsatisfactory. The average dividend on paid-up capital in India in medium and large-scale industries in the year 1960 was 11.6 per cent. This compares very favourably with domestic yields in the capital-exporting countries. The figure of 11.6 per cent is an overall average. There are, of course, great disparities as between industry and industry. In the oil refining industry, I believe the repatriation of capital has been pretty quick, and in the metal industry, with which I am associated, the profit, although not spectacular and although there has been a long period of gestation, has been better than in many other countries. By and large, it is neither the adequacy of profitability nor apprehension about the stability of our currency that has stood in the way of our being able to attract private foreign capital.

Major Inhibiting Factors

I believe the major inhibiting factors are twofold. First of all, there is, in some quarters, apprehension about the attitude of the Government of India to the private sector, generally, and to the foreign element of the sector in particular. Some of this apprehension is due to misunderstanding of Government's intention, possibly arising out of semantic difficulties such as the use of the word "socialism." Such misunderstanding can be corrected by explanation. And I have generally found that, when I have explained the particular situation in India which has led to the enunciation of the doctrines embodied in our statement of industrial policy, the response has been sympathetic. But it must be confessed that nervousness and misunderstanding are not solely due to ignorance. They arise because, on occasions, official pronouncements and administrative decisions do not always follow the settled pattern.

Highly Sensitive

The foreign entrepreneur is, not unnaturally, highly sensitive to statements made at Ministerial level which indicate that the speaker at least is not in full sympathy with Government's policy in this regard. While the importance attached to this factor is frequently exaggerated, it is nevertheless fundamental that the top level servants of Government should be completely consistent in their conduct, and in their public utterances, in supporting the declared policy of Government. In none of the longer established democracies do we find that any one Minister expresses views or follows administrative policies that conflict with the general policies of the Government of which he is a member. The principle of Cabinet responsibility, and more than this, that all members of a Government whether in the Cabinet or not, should unreservedly support any agreed policy, is a fundamental for the successful operation of a democracy and an outward sign and manifestation to foreign countries of the stability of the democracy. I make this point because I am convinced that, if there could be more consistency in the enunciation and implementation of policy, the climate for foreign investment would be substantially improved.

Jungle of Red-tape

The second and a very serious inhibiting factor is the jungle of red-tape in which we have got enmeshed. This has steadily become worse and worse. I believe most foreigners who have had dealings with the Indian Government have acquired very great respect for the senior Ministers and senior officers, but they find that these are badly overworked and are not always well served by their juniors. There is a feeling abroad that decisions take an unconscionably long time to take; that even when they are taken, they are subject to further processing by ministries and organisations outside the operating ministries; and that, as a general rule, co-ordination is inadequate. Occasionally also, there are complaints of arrogance and rudeness. No one asks for obsequiousness. And the fact that we are receivers of foreign aid and net importers of private capital from abroad need not stand in the way of our sticking firmly to principles which we have enunciated. But it does seem that, on occasions, we tend to forget that commercial diplomacy no less than political diplomacy requires to be

(Continued on page 38)

Office space seems to grow when cumbersome partitions are replaced with glass. Rooms look lighter, brighter and so much more elegant. It's not surprising glass is finding its way into more and more homes, stores, schools and restaurants—wherever light and space are important considerations.

Glass is so practical too. It keeps out noise and dust and lets in natural light. And keeping glass clean is the easiest thing in the world.

Available in a wide variety of sizes and thicknesses, and quality tested at every stage of manufacture, there's an HPG sheet glass to suit every purpose.

For the finest, most durable glass you can depend on HPG

Trends in Foreign Investment

By R. S. BHATT

EXECUTIVE DIRECTOR, INDIAN INVESTMENT CENTRE

THE international movement of private capital had touched a very low level during the Great Depression and practically ceased during the Second World War. In the post-war period, most of the countries were in the grip of inflation and whatever savings could be mobilised were needed for internal investment. The main capital-exporting countries of Western Europe were occupied with their own reconstruction problems. Further, apart from certain deterrent factors, the rates of return on investments within these countries were so high that it was unnecessary for capital to seek profitable investment abroad. But the keynotes of the post-war economic environment were reconstruction and development. All the war-ravaged countries wanted to reconstruct and practically all underdeveloped countries of the world were keen to develop. Barring the United States, there was hardly any other country which had surplus funds for foreign investment. At this point came the Marshall Plan. It infused new life into the European economy and laid the foundations for the vigour and prosperity which are now in evidence. The result was that, on the one hand, it increased the ability of the U.S.A. to divert the flow of aid to the less-developed countries and, on the other, it restored Europe's ability to export capital.

A factor of major importance was the emergence of institutional finance which paved the way for a freer flow of private capital. The World Bank, in particular, has made a unique contribution to the process of rehabilitating the international economy and has assisted the emergent countries in their plans for development. Many new agencies and institutions have also since been set up to provide financial assistance to the developing countries. The role of these institutions right until the middle fifties was one of filling the void created by the disappearance of private capital from the international scene.

Climate Improves

In recent years, the international climate for private investment has improved and private capital has begun to flow across national frontiers. The revival first started with a gross long-term capital outflow of $76 million in 1949 from Switzerland, one of the non-belligerent neutral countries in the war. This was followed by Belgium-Luxembourg with an export of $100 million in 1950. The United Kingdom re-entered the field in a big way in 1952 when she exported capital worth $421 million. The international movement of private capital was in full swing by 1954 with the entry of other major capital-exporting countries.

This marked the turning point, for, ever since, a rising trend in the flow of private capital has been in evidence. Net flow of international private long-term capital averaged $3.69 billion per annum for the period 1956-59 as against the annual average of $1.94 billion for the period 1951-55. The bulk of the increase is attributable to the U.S., whose annual average outflow went up from $1.280 million in 1951-55 to $2,924 million in 1956-59. The annual outflows from the U.K. and Switzerland amounted to $595 million and $243 million during 1956-59 indicating an increase of 25 per cent and 52 per cent, respectively, over the previous period. The annual average outflow from Belgium-Luxembourg and West Germany amounted to $113 million and $74 million during 1956-59, indicating an increase of 61 per cent and 147 per cent respectively.

According to a United Nations Study—*International Flow of Long-term Capital and Official Donations. 1951-59*—the aggregate net outflow of long-term private capital from the main capital-exporting countries amounted to $14.76 billion in the four years 1956-59, or an average annual net outflow of $3.69 billion, which was about twice as much as that for the period 1951-55.

It is evident from the foregoing analysis that it was only after the programme of reconstruction in European industrial countries was completed that they were able to export investment capital to the rest of the world. The outstanding features of this period were Britain's re-entry in the field of international investment and the emergence of the Federal Republic of Germany as a substantial exporter of capital.

U.S.—The Largest Investor

Of all the capital-exporting countries, the U.S.A. has so far made the largest contribution. The U.S. direct private foreign investments aggregated $29.8 billion at the end of 1959 as against $11.8 billion recorded in the first post-war survey for 1950. With a further increase of $3 billion, the total value of foreign investments stood at nearly $32.8 billion at the end of 1960 and these are estimated to have gone up to $34.7 billion by the end of 1961. Of major interest are the geographical distribution and the industry-wise pattern of U.S. investments.

Canada's share of the U.S. direct foreign investments rose substantially from $3.6 billion in 1950 to $11.8 billion in 1961. The investments in Latin America rose from $4.4 billion in 1950 to $9 billion in 1959 before falling to $8.2 billion in 1961. In relative terms, Latin America's share was somewhat reduced over the period (1950-61) from 38 per cent to 24 per cent. As compared with 1950. Europe had larger shares of the total investments in 1961. Europe's share went up from 14 per cent to 22 per cent while that of Africa and the Far East remained level at 6 per cent. To give the aggregates, U.S. direct investments in Europe went up from $1.7 billion in 1950 to $7.7 billion in 1961, in the Middle East and Africa from nearly $1 billion in 1950 to $2.3 billion in 1961. in Far East from $0.3 billion in 1950 to $1.2 billion in 1961, in South America from $3 billion in 1950 to $6.4 billion in 1961 and Oceania from $0.3 billion in 1950 to $1.1 billion in 1961.

Reports covering over 10,000 direct investment enterprises furnished to U.S. Department of Commerce by about 2,800 U.S. companies indicated that over 3,000 of the affiliates of U.S. companies were in Latin America. Canada and Europe each had about 2,700 affiliates.

Oil Dominates

Industry-wise, a little more than one-third ($12.2 billion) of the total U.S. direct investments $34.7 billion) in 1961 were in the petroleum industry which also recorded the largest increase (of $7 billion) between 1950 and 1959. Manufacturing investments rose by $5.9 billion to $9.7 billion between 1950 and 1959 and further by $2.2 billion to $11.9 billion in the subsequent two years, that is to say at a lower rate than petroleum investments. This was partly because the dollar value of these investments was particularly affected by the depreciation of certain foreign currencies after 1950. Investments in the mining and smelting industries rose over the period (1950-61) by $1.3 billion to $3.1 billion. Most other industries also scored substantial gains.

The largest 45 U.S. investing companies with foreign holdings of over $100 million accounted for 57 per cent of the total book value of U.S. direct foreign investments in 1957. Included among the largest 45, are 15 petroleum companies, 15 manufacturing companies and 6 mining companies.

Of the total U.S. direct investment $25 billion in 1957, nearly $19 billion or three-quarters was in enterprises in which the U.S. equity ownership was 95 per cent or more and one-fifth was in the ownership range of 50-95 per cent. Only one-twentieth of the total U.S. investment was in enterprises with minority U.S. ownership.

II

PRIVATE CAPITAL FOR DEVELOPING COUNTRIES

Against this background of the international movement of private capital, we may now analyse the trends in flow of capital from the main capital-exporting countries to the developing countries.

In a study, *The Flow of Financial Resources to Countries in Course of Economic Development,* made by the Organisation for European Economic Co-operation, the net flow of private capital from O.E.E.C. member and associated countries to underdeveloped countries was estimated at $3 billion per annum during 1956-60 as against an annual average of $1.6 billion during 1950-55. Though the capital outflow to the underdeveloped countries was twice as large as in 1950-55, it still formed only one-half of the total outflow to all the countries of the world taken together.

Of the average annual capital outflow of $3 billion, about $1.3 billion came from the U.S.A. alone and nearly $1.7 billion from countries of Western Europe. The U.S. outflow of private capital to the developing countries was approximately one-third of the total net outflow of private capital from the U.S.A. which averaged $3.8 billion per annum during the period 1956-59. It is, however, noteworthy that the U.S. outflow of private capital to the primary producing countries has steadily moved up from an annual average of $0.7 billion in 1946-52 to $0.8 billion in 1953-55 and further to $1.6 billion in 1956-59. Further, U.S. private foreign investment has throughout the period increased in approximately the same proportion to the primary-producing countries as to the rest of the world.

Of the total American aid of $16.7 billion to the developing countries during the five-year period 1956-60. private investments accounted for one-third while two-thirds came from Government sources. A large part of the new U.S. private investment accrued to Latin America; it amounted to $3.6 billion out of the total new investment of $4.7 billion during the period 1956-59. A good deal of the U.S. private investment flowed into the oil industry, particularly in Venezuela which obtained about a third of the total investment in Latin America during the period 1956-59.

The U.K. outflow of private capital to the underdeveloped countries aggregated $2.3 billion during the five-year period 1956-60. During 1956-60, it was slightly more than twice as much as the U.K. Government's aid to the underdeveloped countries. Almost the entire U.K. outflow went to the Sterling Area. Earnings on British investments in the other countries of the Sterling Area amounted to £167 million in 1960 which represented 67 per cent of the total earnings on British investments abroad.

Continental Countries

The outflow of private long-term capital from France totalled $1.9 billion during the five years ended 1960, which was only one-third of the total aid extended by France during the period. This includes investment in colonial territories, as France's contribution was almost entirely to her own overseas countries. This outflow was made up of reinvested earnings ($0.6 billion), suppliers' credits ($0.2 billion) and new investments ($1.1 billion).

West Germany exported during the period under review private capital valued at $0.6 billion to underdeveloped countries, which equalled separately Government grants (mainly reparation payments to Israel) and Government loans. German private investment in underdeveloped countries which was concentrated in Latin America (especially Brazil) was no less than in Western Europe. Nearly 40 per cent (DM877 million) of total German investments of DM2,227 million between February 1952 and the beginning of 1959 have gone to Africa, Asia and Latin America.

The outflow of funds from the Netherlands, Belgium and Portugal has, in recent years, consisted mainly of private investment, the bulk of which has gone to their own overseas territories. South and South-East Asia have received, under the Colombo Plan, the major portion of Canadian Government aid while the bulk of Canada's private investments have flowed into countries in the Western Hemisphere.

In analysing the trends in the movement of private capital, we should bear in mind an important distinction regarding the nature of investment between "portfolio investment" and "direct investment." Broadly, portfolio investment consists in the acquisition of assets by the purchase of securities on the stock exchange, whereas direct investment takes the form of equity participation in an industrial enterprise, so as to acquire control on the policies and management of the enterprise. The borderline between the two is sometimes thin but the underlying aims of investment are different. Portfolio investment is mainly motivated by consideration of appreciation of capital value and the rate of return of invested capital. Direct investment entails a more abiding interest in the success of the industrial venture and its expansion with the long-term aim of raising the value of its equity and the rate of return on capital. The flow of capital between the industrialised countries takes both these forms and, in the aggregate volume of investment, there is at times a fairly large proportion of "portfolio investment." Dr. Livio Magnani, in his article on "Foreign Investment in Italy,"* states that, among foreign investors in Italy, the first place was occupied by Switzerland and Lichtenstein which together had acquired 1,277 million dollars worth of assets at the end of 1960 which was equal to 54.9 per cent of the total. Switzerland, in addition to direct investments, made portfolio investments. He has commented further that "it is quite likely, in view of the progress made by German investments in Italy, that the invest-

HINDALCO ALUMINIUM

TO MEET THE GROWING DEMAND OF MANUFACTURING INDUSTRIES

The 20,000 tons (per annum) aluminium plant of Hindustan Aluminium Corpn. Ltd. is in operation from May 1962.
Supplies of Hindalco's very high quality COMMERCIAL GRADE ALUMINIUM INGOTS, ELECTRIC CONDUCTOR GRADE ALUMINIUM INGOTS and ALUMINIUM WIRE-RODS (rolled from "Hindalco" ingots) are now available to meet the nation's industrial requirements.

ments of the Common Market countries will increase in the near future, but such increase will take place mainly in the purchase of securities." The movement of capital from the capital-exporting countries to the developing countries usually takes the form of direct investment. This is, perhaps, due to the fact that, in most of these latter countries, there is a paucity of good industrial securities which command an international market; nor is the institutional organisation in these countries sufficiently developed for international trading. In several cases, there are also exchange difficulties which do not permit portfolio investment.

Policies Important

Another important factor which has a direct bearing on the form of foreign investment in the developing economies is the policies in that regard adopted by both the capital-importing and the capital-exporting countries. Between the industrialised countries, there is now considerable freedom of movement of private capital. The flow of private capital to the developing countries, however, depends not only on the policies and regulations of the Governments and the attitudes of private investors in capital-exporting countries but is governed, to a large extent, by the policies and rules and regulations governing foreign investment and the climate for investment in capital-receiving countries. The volume and pattern of foreign investment in a particular developing country is, therefore, the result of the interplay of these two sets of forces. Most of the developing countries are now free, independent sovereign States. Most of them desire to encourage investment of foreign private capital, since there is now a fairly wide appreciation of the strategic role of foreign capital in the process of economic growth, as supplementing the domestic supplies of savings, the country's foreign exchange earnings and the availability of technical and managerial skills as well as entrepreneurial talent which are necessary for mobilising the human as well as material resources. However, for a variety of reasons, among which historical experience and the need to conserve scarce resources for the most efficient uses are, perhaps, the most important, the Governments of these countries often wish to channel foreign capital selectively in fields where they are considered to contribute most to the tempo and pattern of development.

From the foregoing analysis of investments from capital-exporting countries, it would appear that both the geographical distribution and the industrial pattern of private foreign investment are gradually undergoing a change. There is no doubt that there has been a marked shift in U.S. foreign aid from the advanced European countries to the developing countries, though the contribution of U.S. private investment to economic development in areas other than the traditional ones like latin America has so far been comparatively small. But from the middle fifties, private investment increased in countries of Asia and Africa. The flow of private capital from the countries of Western Europe has been directed mainly towards countries with whom they have had either long political association or have long been their traditional markets. But, here again, it is being gradually attracted towards developing countries of Asia and Africa. The major attraction for the bulk of private investment in these countries is still the petroleum industry but the pattern is getting diversified with a gradual shift towards manufacturing industry.

During the last decade, the Governments of economically advanced countries have taken a positive and growing interest in giving aid in the form of loans and grants to the developing countries. A large part of such aid as well as technical assistance has been utilised in creating a basic framework of economic and social overheads. Without this framework, the investment of private capital is often not only unprofitable but sometimes even impossible. It is, therefore, evident that, among the developing countries, those which have created the necessary infra-structure have been able to attract foreign private capital and techniques in a much larger measure. Of particular significance are the recent developments in certain countries for promoting investments through the establishment of special institutions. These institutions supplement the valuable work being done already by institutions such as the Export-Import Bank of the U.S. Government, the International Finance Corporation and the Commonwealth Development Finance Company in Britain. A special mention should also be made of the Development Banks which have been established in various developing countries through the assistance of the World Bank to extend financial assistance for the development of industries in the private sector.

Developed Countries Encourage Outflow

It is also encouraging to find that Governments of some of the capital-exporting countries have taken steps to promote investments of private capital in developing countries. For instance, the Government of Federal Republic of Germany has taken measures through the Kredit-Anstalt (Reconstruction Loan Corporation) to encourage private investment, especially in the medium and small industries in the developing countries. The West German Government has also set up (on 14th September 1962) the Corporation for Economic Co-operation ("Deutsche Gesellschaft Fuer Wirtschaftliche Zusammenarbeit mbH") to assist small and medium-sized German industrialists for investing in the developing countries. The U.S. Government provides a guarantee to U.S. private investors on payment of a small premium against risks of inconvertibility, expropriation, war, etc., and many U.S. firms have taken advantage of this facility. Another welcome development has been the change in the attitude of private investors in capital-exporting countries towards investment opportunities in developing countries and many industrial enterprises on a joint venture basis have been set up in the developing countries.

III

FOREIGN BUSINESS INVESTMENTS IN INDIA

We may now analyse the trends of investment of foreign private capital in India.

The increase in foreign investment at present takes place in three broad ways: (i) some capital comes in the form of cash; (ii) some investment assumes the form of import of plant and equipment; and (iii) some of the foreign-controlled companies plough back a part of their profits. At the same time, some of these companies may repatriate their capital in any particular year. After allowing for such outflow of capital, the balance is the net inflow of capital in the country.

The inflow of non-banking business investments in India during the period June 1948-December 1960 is set out in Table 1.

According to the assessment of foreign investments in India in 1960 and 1961 (preliminary trends) made by the Reserve Bank of India, the net inflow from private and official sources together at Rs. 78.4 crores in 1960 was substantially larger than that of Rs. 37.9 crores in 1959, while the preliminary estimates place the total net inflow during 1961 around Rs. 70 crores. Further, it will be noticed from Table 1 that, despite a much larger outflow during the period 1956-60, the average net inflow from private sources was somewhat higher at Rs. 21.9 crores as against the annual average of Rs. 20.1 crores in 1948-55.

The net inflow of foreign capital (from official and private sources abroad) in the private sector according to main industry groups is shown in the Table 2 below. It will be seen from the table that more than two-thirds of the total net inflow during the period 1956-60 accrued to the manufacturing group alone, a little more than one-fifth to the petroleum industry.

Table 3 below gives the outflow of capital by field of investments.

It will be seen that the repatriation of foreign capital was mostly accounted for by petroleum industry. A little less than three-fifths of the total outflow during 1956-60 was due to the repatriation by the U.K.-owned petroleum distribution and refining companies of Rs. 22 crores in 1958, Rs. 13 crores in 1959 and Rs. 6.3 crores in 1960. A little more than one-fifth of the outflow was attributable to the manufacturing industry during the same period.

It is interesting to note that there was a net addition of Rs. 157.6 crores* in the manufacturing segment during the period 1956-60, as against Rs. 61 crores between 1948 and 1955. Since the profits of foreign-controlled companies ploughed back into the manufacturing industry amounted to Rs. 27.9 crores during the period 1956-60, fresh net capital receipts would come to Rs. 129.7 crores or an annual average of about Rs. 26 crores.

Over two-fifths of the total foreign business investments in India are now in the manufacturing industry. There has been a remarkable growth in the value of these investments from Rs. 70.7 crores in June 1948 to Rs. 131.8 crores by 1955 and further to Rs. 289.4 crores by the beginning of 1961. It may be noted that nearly three-fourths (Rs. 112.3 crores) of the total increase in manufacturing investments (Rs. 157.6 crores) during 1956-60 was attributable to the engineering industries which accords well with the priorities of industrial development. Further, it is of interest to observe that the bulk of the fresh foreign business investments in 1960 took place in petroleum and manufacturing industries, the respective shares being Rs. 31.5 crores and Rs. 38.8 crores. In the manufacturing sector, the largest increases took place in metals and metal products, chemicals and allied products and transport equipment. This growth is explained partly by the new investment opportunities offered by the industrial development programmes included in the Five-year Plans, partly by the special incentives offered for investment in industrial enterprises and partly by the high rates of profits realised on foreign capital invested in manufacturing enterprises.

The increases in foreign business investments in the two sub-periods 1948-55 and 1956-60 amounted to Rs. 200.3 crores and Rs. 234.4 crores respectively. The share accruing to the plantations went down from 17.5 per cent in 1948-55 to 5.2 per cent in 1956-60, to petroleum from 40.7 per cent to 20.7 per cent and to services from 12.2 per cent to 5.1 per cent. The manufacturing sector, on the other hand, made a substantial gain, i.e. from 30.5 per cent in 1948-55 to 67.2 per cent in 1956-60.

Of the total business investments of Rs.690.5 crores at the end of 1960, as much as Rs. 501.7 crores were invested in branches of foreign companies and rupee companies controlled by foreign firms. The portfolio investments, indicative of foreign minority participation, amounted to Rs. 64.7 crores. The capital provided by foreign official sources to private Indian enterprises aggregated Rs. 124.1 crores. An analysis of the figures of net inflow of foreign business investments during 1960 reveals more or less the same pattern of investment. Of the amount of Rs. 78.4 crores, Rs. 52

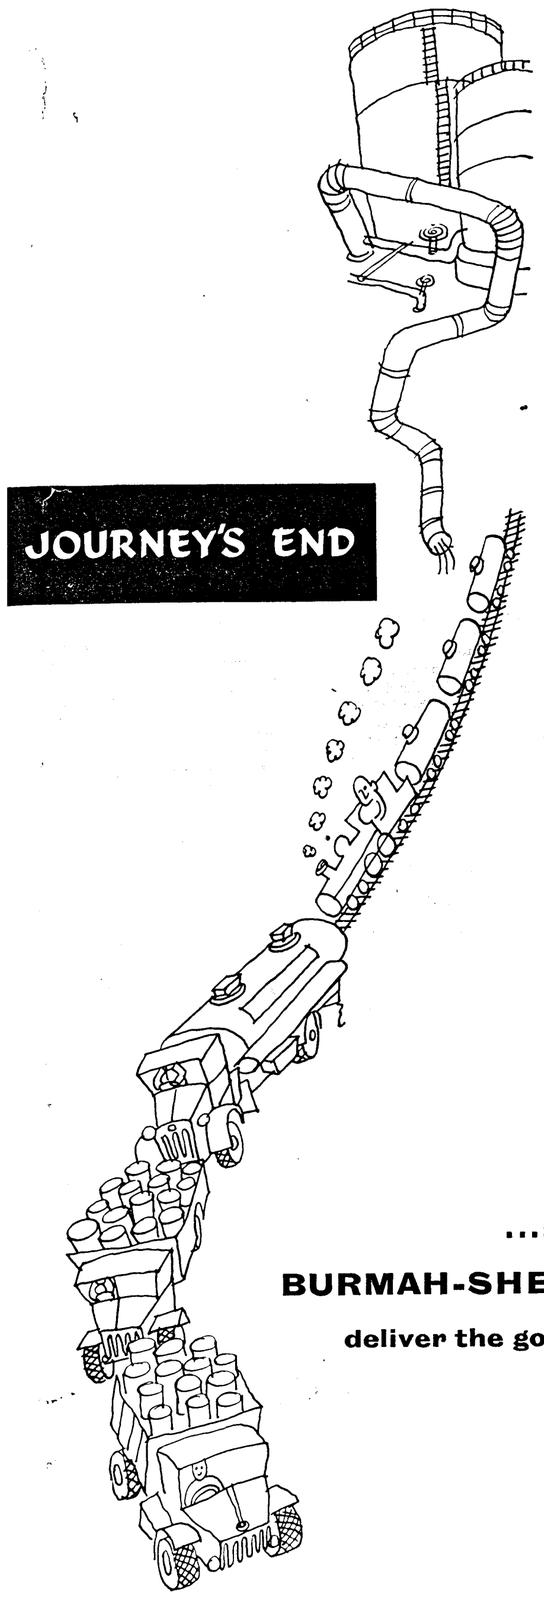
*The net inflow in 1956 at Rs. 12 crores was exceptionally low. If this were excluded, the net inflow in 1957-60 would aggregate Rs 141.6 crores or nearly Rs. 35.4 crores per annum.



"The provision of sufficient quantities of the required products in the right place and at the right time often produces serious problems and to solve these necessitates a careful but flexible organization, an elaborate system of transportation, storage and distribution. There are more than 3,000 Burmah-Shell petrol dealerships and over 1,600 kerosine agencies, besides nearly half a lakh kerosine sub-dealers in India's 5½ lakh villages"

...and

BURMAH-SHELL

deliver the goods

crores were invested in branches of foreign companies and rupee companies controlled by foreign firms, while investment in other rupee companies was only of the order of Rs. 1.3 crore. Foreign official sources provided a substantial amount of Rs. 25.1 crores. It should be remembered, however, that the actual investments in 1960 have accrued in respect of projects which were approved in earlier years. In the subsequent period, perhaps, this pattern may somewhat alter, because it seems that a fairly large number of foreign investors have taken minority participation in the capital of joint enterprises in India.

U.K. The Principal Investor

The bulk of the foreign investments in India continue to be owned by investors from the United Kingdom; these amounted to Rs. 446.4 crores at the beginning of 1961 and were distributed over manufacturing (Rs. 129.2 crores), petroleum (Rs. 105.1 crores), services (Rs. 100.5 crores), plantations (Rs. 98.6 crores) and mining Rs. 13.0 crores). Although U.K. investments represented 65 per cent in 1960 as against 80 per cent in 1948, they are still the largest single group in the total foreign business investments in India.

Next in order of importance comes the U.S.A. with business investments valued at Rs. 112.7 crores which have steadily grown from Rs. 11.2 crores in June 1948, mainly concentrated in manufacturing industries (Rs. 61.2 crores) and the petroleum industry (Rs. 47.2 crores). The net inflow of private capital during the period 1956-60 was the highest in the case of the U.K. and amounted to Rs. 62.8 crores as against Rs. 33 crores from the U.S.A. and Rs. 13.8 crores from the other investing countries.

At the beginning of 1961 the value of outstanding business investments from Switzerland and West Germany amounted to Rs. 8.9 crores and Rs. 6.8 crores, respectively. The bulk (Rs. 7 crores) of Swiss investments was also in manufacturing industries, investments in services amounting to Rs. 1.8 crore only. West German investments were intirely in the manufacturing industries. Investments from the rest of the countries (including those by the I.B.R.D.) amounting to Rs. 115.7 crores* were also mainly in the manufacturing industries (Rs. 85.0 crores). Services claimed Rs. 29.6 crores.

In making an assessment of foreign private investments, the importance of gross inflow of capital as well as retained earnings may be appreciated. In India, every investment of a foreign company is screened by the appropriate authorities and is allowed entry on terms approved by Government. All these investments are for productive purposes. It will be seen from Table 1 that, of the gross inflow of Rs. 62.4 crores in 1960, as much as Rs. 41.8 crores came as non-cash inflow, namely, in the form of plant and equipment. The retained earnings, when reinvested, also contribute to the creation of productive assets. In the context of the priorities of the Plan, most of these resources are being directed to mining and manufacturing activities which contribute to an increase in the gross national product of the economy. Thus, the role of the foreign private capital in the form of cash, plant and equipment or retained earnings in our economy has been appreciably growing and is likely to play a vital part in the years to come.

† Of which Rs. 5.2 crores were from Canada, Rs. 3.4 crores from Japan, Rs. 4.2 crores from Pakistan, Rs. 1.3 crore from Malaya and Rs. 78.1 crores from I.B.R.D.

IMPORT OF FOREIGN PRIVATE CAPITAL

(*Concluded from page 32*)

handled with tact and finesse, without an abandonment of the basic objectives of the country.

There are some relatively minor points on which we sometimes needlessly adopt a gesture of some rigidity. Take, for instance, the question of the majority holding of equity. There is a tendency to stipulate that as far as possible 51 per cent of the equity should be given to Indian participants, evidently on the ground that this will ensure control in Indian hands. Two points tend to be forgotten in this context. From the foreign investors' point of view, a holding of 49 per cent or less does not necessarily mean that he ceases to have the effective controlling interest in the company. In fact, provided it is held solidly in one block, a much smaller percentage is adequate to ensure controlling interest. More particularly, if a company is well run and has a good dividend record, shareholders who are widely dispersed take little interest in its affairs and, often, it is not easy even to get a quorum for shareholders' meetings. To insist, therefore, that the foreign participant should hold not more than 49 per cent does not really mean that we are effectively dealing with the problem of control. I imagine that the real argument against large-scale foreign investment is that, potentially, it is liable to create balance of payments problems, because of the pressure of remittance of profits and, even more so, of repatriation of capital. This is a problem that has assumed importance in other countries such as Australia. It could, in a number of cases, be argued effectively that, if the foreign holding is limited to the foreign exchange component of a project and that happens to be the minority of the equity, there need in reality be no loss of effective power in management and, at the same time, the prospective burden on the balance of payments would be reduced to the minimum. Such an argument may not always succeed; however, it is a sound argument and always worth making, and may eventually be accepted.

It is a truism to say that we are passing through a crisis. The use of an expression such as "climactic" is now commonplace. Certainly it cannot be gainsaid that we are in the midst of a reappraisal of our entire strategic situation, both military and diplomatic, and such a reappraisal will necessarily involve an examination of our economic principles. No major shift in the latter may be called for. But it is to be hoped that we will seize this opportunity to see that such difficulties of our making as impede the inflow of private foreign capital are eliminated.

MADRAS, 30*th November*

The turbulent river has been harnessed.
It now feeds dry, parched land
to yield a rich harvest.
This boy, when he becomes a man,
will raise more grain per acre
than his father. He will enjoy a fuller life.

But dams are built by men and machines...
and Mahindras make the machines, thus
participating in the nation's march to prosperity.

Place Of Foreign Aid In India's Economic Development

Delays In Utilisation Explained—Repayment Implications Analysed

By RADHESHYAM R. MORARKA, M.P.

INTERNATIONAL co-operation in the field of economic development is essentially a post-war innovation. Foreign aid is its main form. The Lend-Lease Programme and the Marshall Plan have rehabilitated war-torn Europe. The massive American aid has rebuilt the devastated industries of Japan. And it is this foreign aid which is now developing the underdeveloped countries of Asia and Africa. Foreign aid has not only rebuilt Germany and Japan and made them prosperous but these two vanquished nations of the last World War have almost attained the industrial leadership in their respective continents.

The need for this international co-operation has never been greater and its importance never higher. Immediately after the war, even the East European countries were offered assistance under the Marshall Plan but Molotov, speaking on behalf of Stalin, rejected this American offer. The Communist press derisively commented that the Marshall Plan countries were bartering their economic freedom for a dried egg omelet. The consequences are apparent.

For the developing countries, foreign aid is no more a facility but is a necessity. For the developed countries it is no longer discretionary but almost compulsory. They are obliged to give aid to provide foreign exchange to enable the developing countries to import goods and services from the developed countries. Foreign aid has thus become the most potent instrument of export promotion in recent days. Eighty per cent of the American Aid comes back to America in the form of payments for American exports. Efforts are made to increase this percentage. In other countries, where *only* "tied" aid is given, this percentage is 100.

Case for Aid

The importance of foreign aid for the economic development of underdeveloped countries is best explained by Ambassador Galbraith in his recent speech (on 4th June 1962) at San Francisco. Said he:

"There is, we have anciently been advised, a certain physical difficulty in extracting blood from stone. This, however, is comparatively easy as compared with getting savings out of a poor society. When people do not have enough to eat, they are loath to forgo any part of their meal, in order to eat better in the future.... The Western pattern of development, with its prospect of assistance from outside the country, eases one of the most painful problems of development. This is why economic aid has become such an important feature of Western foreign policy. It is the process by which savings are transferred from countries where saving is comparatively unpainful to those where it is painful."

It is true that, due to our development strategy, our Plans are leaning heavily on foreign aid. The exact figures of requirement for the third Plan are:

	Rs. crores
Plan projects	1,900
Components, balancing equipment, etc.	200
Maturing obligations	500
	2,600
Add :—	
Maintenance imports, i.e., raw materials, components, replacement machinery, etc.	3,700/3,800
Total ..	6,300/6,400
This we propose to finance by :—	
Foreign aid	2,600
Exports	3,700/3,800
	6,300/6,400

From the above, it would be clear that foreign aid is the bulwark of our Plan. In fact, our planners have provided that the entire need of foreign exchange for the Plan projects shall be met by foreign aid and nothing through export earnings.

Aid India Club

Fortunately, the fourth meeting of the Aid India Club held last year (May 1961) accepted a target of about 2,286 million dollars, that is, Rs. 1,164 crores for the first two years of the Plan. The actual commitments, however, were of the order of Rs. 1,064 crores. It then appeared that it would be possible to meet the foreign exchange needs of the entire Plan. We felt that half the battle was already won.

Later on, the attitude of the Aid India Club was less encouraging and doubts were raised about the anticipated aid even for the first two years of the third Plan, that is, whether it would be forthcoming. Some people were apt to think that the change was due to some political and ideological differences between us and the Western countries, believing that our action in Goa and the proposed M.I.G. deal were responsible for the change. But the actual facts were quite different. It was because of their own difficulties—of the assisting nations including America—that we found the Aid India Club less enthusiastic.

France was heavily committed to her African colonies and was concentrating her attention on building the European Common Market and making the African countries as associates. West Germany's contribution, which was highest at 225 million dollars in the first year, did not hold out high hopes for further (that is, more than 139 million) assistance. The revaluation of the German mark created domestic problems. It confronted the German economy with rising costs and falling reserves. From a fat surplus she moved to a small deficit in international payments. The U.K. had been telling since long about her own financial position and the commitments to the rest of the Commonwealth and thus expressed inability to help more. The surpluses of Belgium and Switzerland were also declining. Japan had clamped on import controls and Canada was obliged to raise its tariffs on many items from 5 per cent to 15 per cent mainly to bolster its sagging dollar.

The position of the U.S.A. was hardly better. Her gold reserves were falling every week and that did not leave the U.S. senators very enthusiastic for any liberal aid.

Even in the U.S.S.R., Premier Khrushchev admitted that Russia had not the resources required to match the U.S.A. in its military might and at the same time to improve the living standard of the people. He said: "We can only do things for which we have the material means."

This was the background against which our Finance Minister went to Europe in June 1962 in an effort to bridge the gap of 220 million dollars in the total requirements of 500 million dollars as a matching contribution from the European countries. The prospects were bleak and it really required some explaining and some persuasion to achieve the results of reducing the gap from 220 million to 80 million dollars.

So the position in regard to the Rs. 2,600 crores required for the Plan projects is as follows:

	Rs. crores
Actual aid received through and promised by Aid India Club for the first two years of the Plan	1,126
Aid from U.S.S.R., Poland, Switzerland, etc.	373
Carry forward from the 2nd Plan ..	375
Total ..	1,874

This leaves a balance of Rs. 727 crores to be arranged for, in the remaining three years of the Plan. To this, we must add some amount for spill-over to the fourth Plan, say, Rs. 400 crores. If we could manage to get another Rs. 1,125 crores, our purpose would be served.

Our main headache so far as foreign exchange is concerned is about the maintenance imports for which we require about Rs. 3,700 crores. This we hoped to get from our exports which, unfortunately, are not showing any sign of improvement yet. Due to various steps taken by the Government, it is now expected that the foreign exchange requirements in the second year of our Plan would be adequately covered.

Slow Utilisation of Foreign Loans

Our net position on 1st July 1962 was that we had the following unutilised balance as indicated in Tables I, II and III on page 45:

(I) Total amount of aid ..	Rs. 1,038.91 crores
(II) Total amount of grants ..	Rs. 30.70
(III) P.L. 480 assistance ..	Rs. 508.59 ,,

From Table I it would be noticed that during the first Plan, the total amounts for which loan agreements had been signed were of the order of Rs. 233.77 crores. Out of this, only Rs. 126.42 crores were utilised in the first Plan and Rs. 105.73 crores during the second Plan. A little more than a crore of rupees were utilised in the first year of the third Plan and a little more than half a crore of rupees still remain to be utilised.

During the second Plan, the total amounts for which loan agreements were signed, were Rs. 1,295.81 crores and out of these Rs. 631.96 crores were utilised during the second Plan, Rs. 172.27 crores were utilised during the first year of the third Plan and a sum of Rs. 491.58 crores still remains to be utilised as on 1st July 1962.

During the third Plan, the total amounts for which loan agreements have been signed so far come to Rs. 661.81 crores and the amount utilised upto 30th June 1962 was Rs. 115.03 crores, leaving a balance of Rs. 546.78 crores.

Communist Countries

The point to be noticed is that there has been a long time-lag between the authorisation and the actual utilisation of the loan. This is particularly so in the case of U.S.S.R. and the other East European countries. Out of Rs. 319.07 crores loans given by U.S.S.R. during the second Plan period, only Rs. 10.24 crores were utilised during that Plan and Rs. 32.76 crores were utilised during the first-year of the third Plan, making a total of Rs. 43 crores. This leaves a balance of Rs. 276.07 crores out of the total amount of Rs. 319.07 crores sanctioned by the U.S.S.R.

Similarly, in the case of Yugoslavia, out of Rs. 19.05 crores and in the case of Czechoslovakia out of Rs. 23.10 crores, not a single pie was utilised either during the second Plan or till June 1962 (that is, 15 months of the third Plan). In the case of Poland, the position is more or less the same. Out of Rs. 14.30 crores promised, Rs. 14.15 crores still remain to be utilised, with only Rs 15 lakhs having been actually utilised.

It is true that, when the loans are sanctioned for specific projects and are tied to certain countries for utilising them, some time is naturally lost, but, even then, the time taken by Communist countries appears to be unreasonably long.

It is only after the sanctioning of these loans that tenders are invited and orders placed, some time in stages according to our phased programmes. It is only after this finalisation of our orders that the manufacture of these heavy equipments start in the exporting countries. And since the final payments are made only at the time of shipment, it naturally takes two to three years and sometimes even longer. In some cases, payments have to be made by us first and then reimbursed by the foreign Government or agencies. Besides, some of the loan agreements lay down detailed procedures to be followed by us to comply with the legislative requirement of the lending countries.

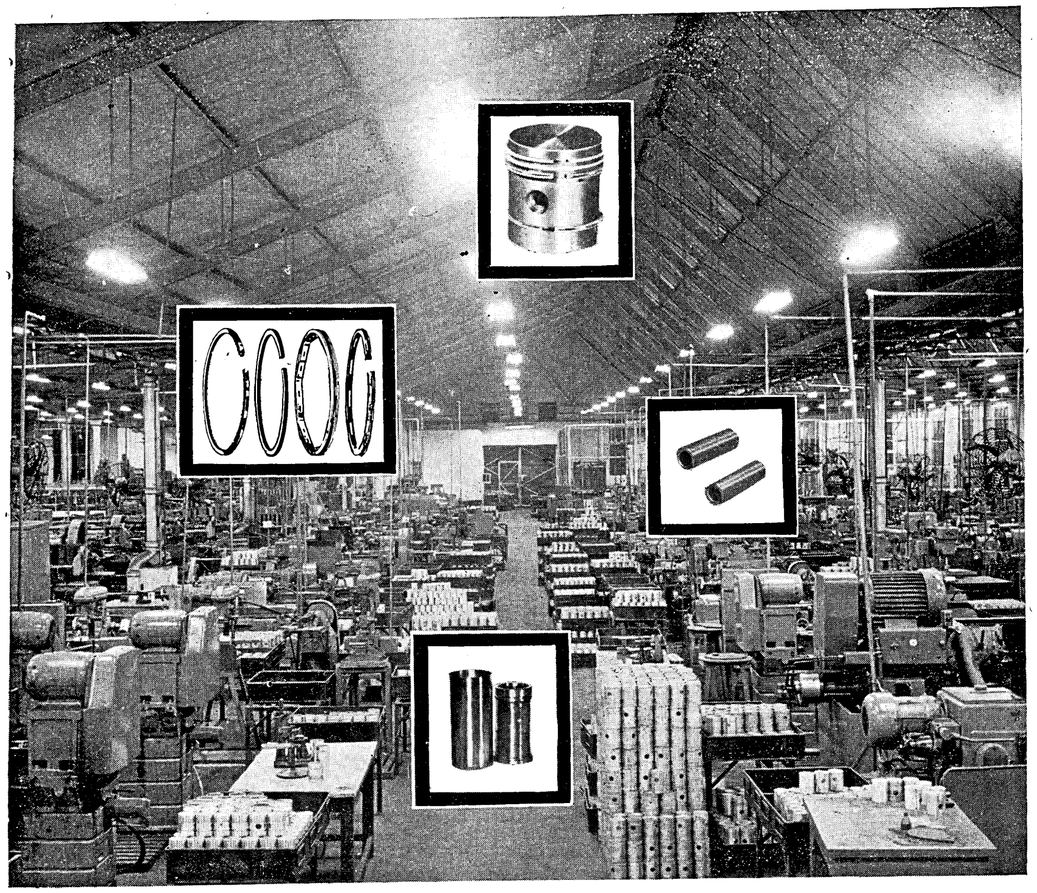
It is also not uncommon on the part of some foreign suppliers to raise the prices of the equipment when they come to know that a particular credit is tied to a particular project. A situation like this would necessitate long negotiations to bring down the prices. Finally, delay in the utilisation of the foreign loan is also caused by inadequate physical progress of the project which is again governed by several factors such as acquisition of land, availability of power, water, transport, etc.

Sometimes when the sanction of a loan by a foreign country requires legislative approval, it also takes unduly long time—sometimes loans are sanctioned in principle but they are made subject to the approval of the project reports, appointment of consultants, etc., all of which are time-consuming processes.

The above points indicate that a time-lag between authorisation and utilisation of foreign loans is inevitable. Efforts have been made and are being made to shorten this period to some extent, but it is impossible to eliminate it. It is, therefore, vital that the requirements of foreign exchange for any Plan must necessarily be negotiated about five years in advance; otherwise, the projects included in that Plan cannot be implemented or matured with the loans sanctioned during the same Plan period. If a loan is sanctioned in the third year of a Plan, then, naturally, the project concerned cannot come up within that Plan period and so also its utilisation.

Tied Loans

There are very few countries in the world which are interested in giving free and untied loans. They are more interested in increasing their exports and are, therefore, willing to give the aid on the condition that we buy the equipment and spend the amount of loan in that very country. Some loans are tied to specific projects, some are tied to specific countries and some are tied to both. In the result, we



All under one roof

India Pistons has attained self-sufficiency from the raw material to the finished product, manufacturing under one roof all the components that go into the piston and liner assembly. The range includes the Chromium plated, Duaflex and Expander rings; single cast and centrifugally cast piston rings; wet and dry centrifugally cast cylinder liners; die cast and forged pistons to any specification, drawing or design.

India Pistons Quality Products cover the most exhaustive range in India with a wide application.

INDIA PISTONS LIMITED, SEMBIAM, MADRAS-11.

are obliged to purchase our equipment not from the most competitive market in the world, not the best quality of the equipment but from a particular market whatever is available and at the price asked for it.

It is estimated that the U.S.A. which gives loans and aid more freely than any other country in the world, expects 80 per cent of all financial aids sent abroad, returned to the United States in the form of payments for the U.S. exports. The U.S.A. has given since 1945 total aid to all the countries in the world aggregating 62 billion dollars. This would give some boost to American exports. Would it not?

From the point of view of the lending countries, there is ample justification for giving us tied loans, that is, loans for specific projects. Before sanctioning a loan, the agencies satisfy themselves about the economic merits, including the financial soundness of the project for which the loan is to be sanctioned. It is not uncommon that, in developing countries, projects are often selected not so much on economic merits as on political consideration. Sometimes they are located at a place most unsuitable from the point of view of economic viability. Since the foreign countries do not want to make any poor investment which might necessitate further sinking of funds in rescue operations, they are fully justified in selecting the projects which they want to finance. To that extent, it is to our advantage also. But then, there is a danger too. As already stated, not unoften, there is a tendency on the part of foreign suppliers to put up the prices when they know that credits are tied to particular projects. In such cases the negotiations become prolonged and the time taken is excessive.

The Bhadra Hydro-electric Project in Mysore State is a comparatively small project but even there I was surprised to find that the equipment for that project has come from eight or nine different countries. Hydraulic turbines from France, generators from Japan, transformers and switchgears from Italy, circuit breakers from Sweden, lightning arresters from the U.S.A., switchboards from England, carrier equipment from Switzerland and control panels from Denmark. I am not suggesting that it is always advantageous or desirable to buy equipment for one project from so many different countries. It may create its own problems for spares, etc., but the fact remains that our freedom to buy from the most competitive market is curbed.

Significant Remark

In this connection, I must express our sense of appreciation for the speech our Finance Minister made at the meeting of the U.N. Economic and Social Council on 9th July 1962 in which he said:

"Most of the countries which are today making available credits to help developing countries insist, in order to safeguard their own balance of payments, that these credits should be tied to purchases in the lending countries. An extension of the same principle would suggest the conclusion that, when these loans are repaid, the repayments should be tied to purchases from the borrowing countries."

Most of our difficulty would be solved if this proposition of the Finance Minister is accepted, which, in all fairness, deserves acceptance. It is practical, equitous and just.

Attitude of Foreign Countries Towards India

A word about the attitude of foreign countries towards India—or of developed countries towards the underdeveloped. There was some speculation that, due to the M.I.G. deal, our aid would be substantially cut by the U.S.A. due to the difference in political outlook. In this connection, I may quote an extract from the speech of Dean Rusk, U.S. Secretary of State, on 10th July 1962. He said that it would be calamitous if the President's freedom of action for rendering economic aid to India were prohibited by law. He added:

"There have been irritations between us and India in the last several months; two great countries in opposite parts of the world with different positions, different problems, are bound to have points in which they are in disagreement and sometimes they disagree very sharply. The basic fact is that there is a country of 450 million people which is the largest constitutional democracy in the world that the world has ever seen, more people going to the polls in free, orderly elections than we have ever seen anywhere with basic commitments with which we are familiar.... They have maintained the democracy in the face of some grave difficulties ... a dozen or more major languages inside the country, no common language throughout the country, and yet they have made a constitutional system work along democratic lines.... Now we will disagree on certain subjects. There is no reason why we should not. India is not a satellite of ours and we are not a satellite of India. We have great and vital interests all over the world. So we will have our own differences, but we also have great common commitments that are important. It would be a great mistake, I think, if we did not take an active even though just a small, part in the Indian development programme."

Mr. Duncan Sandys, the Commonwealth Secretary, answering a question in Parliament about aid to India, conceded that the success of India's Five-year Plan was vital to the future of the Commonwealth and the survival of democracy in Asia and possibly in the Far East.

President Kennedy, in his Press Conference at Washington on 5th July 1962, made the following observations about the economic aid to foreign countries. He said:

"Our foreign aid programmes have made great demands on our people, and still do, but they are vital to our security and are carefully designed to respond to the national interests of the United States as well as the maintenance of the peace and security of the free world."

The *New York Times*, commenting on President Kennedy's statement on foreign aid, said:

"Foreign aid demands statesmanship ... it calls for understanding and sophistication, so that the value of helping some communist countries like Yugoslavia and Poland can be grasped. It calls for tolerance, so that we can condemn a few of India's policies without forgetting that she is much the most important democratic nation in Asia and is essentially on our side."

The World Bank in its report drew the conclusion that the outlook for the Indian economy appears to be favourable if it receives foreign aid in the requisite amounts at the appropriate time and in the required form.

From the outcome of the Aid India Club's last meeting held at Washington, it is proved that, though there is a lack of mutual admiration, there is no lack of mutual interest.

World Bank Loans

The World Bank has also shown great consideration to us. The Bank was established in 1946 and it has given till today 321 loans totalling 6.673 million dollars to several of its members. India has received 30 loans, totalling 846 million dollars. This makes it the recipient of the largest number of loans and largest amount. Next to India comes Japan which has received 24 loans totalling 488 million dollars.

Even from I.D.A., the World Bank's new affiliate, which has just completed two years of its existence, India has received the largest consideration, both in the number of loans and the amount. She has received 7 loans totalling 122 million dollars out of a total of 235 million dollars sanctioned by I.D.A. so far. More than 50 per cent of the amount has gone to India. Pakistan which comes next has three loans totalling only 21 million dollars.

International Monetary Fund

Another safeguard, though of a limited nature, is the existence of the International Monetary Fund. This is a 17-year old institution, with 76 member nations and resources amounting to 21 billion dollars. It has given help to various member countries whenever these countries needed any assistance. We have borrowed recently 100 million dollars from this institution. On three previous occasions also, namely, 1948-49, 1957 and 1961, we had credit facilities from this institution.

There is nothing wrong in borrowing from this institution. Our quota in this Fund amounts to 600 million dollars and we are entitled to draw 25 per cent of the quota as a matter of right and another 25 per cent in an emergency without a question being asked. That is, against our right of 300 million dollars, we have arranged a loan of only 100 million dollars.

Other countries have borrowed much more than we have. For example, Chile borrowed 125 per cent of its contribution. Even the U.K. had to take credit from this Fund to improve her balance of payments position. The Fund boasts proudly that, when the Canadian dollar crisis grew acute, it provided one billion dollars for the Canadian Government within four to five days and its Managing Director Per Jacobsson said that, should the U.S. dollar begin to quake, the Fund stands ready to shore it up with a loan of more than 4 billion dollars.

But with our external resources standing at the nadir, with our exports not only running well below target but even declining and our capacity to borrow from the I.M.F. already resorted to, it is unwise to say that India does not regard the situation as serious.

Problem of Exports

There is one danger in our getting this foreign aid on this scale. The danger is that this borrowing from abroad may be substituted for the earnings from abroad. Our earnings from abroad depend on the volume of our exports and it must be admitted that, during the last decade, the behaviour of our exports has been very uninspiring, inelastic and sagging. Japan, during her development, had to slash her price to push her exports to earn foreign exchange. We have not felt that compulsion as we get the needed foreign exchange through foreign aid.

There are three main problems for our exports:

(a) The demand for India's major traditional exports is static.

(b) The foreign countries, particularly of Western Europe, have imposed restrictions on importing our goods.

(c) Both the Government and our business community are lacking in any aggressive drive for developing export markets.

I would like to illustrate my point with figures concerning the most important item of our exports, namely, tea.

During the last decade (from 1951 to 1960), our tea exports to U.S.A. have fallen from 13,670 thousand kgs. in 1951 to 8,585 thousand kgs. in 1960. Over the same period, the exports of Ceylonese tea, on the other hand, increased from 12,766 thousand kgs. to 18,534 thousand kgs. The total exports of tea by all the

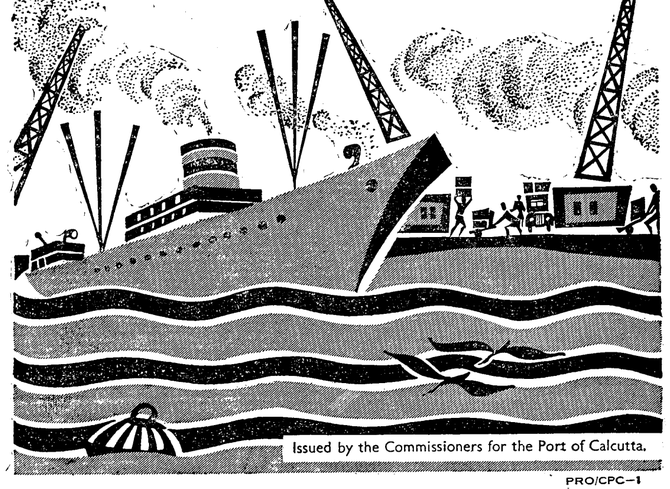
... in tune with the progress of trade and industry

Serving a hinterland of 5,00,000 square miles with 180 million people, The Calcutta Port has to live up to the increasing demands of our national plans and progress. With the aid of over 42,000 workers and the best possible equipment, the Port helps the country to earn 50% of the foreign exchange from export. The task and target of the vital cause that this Port serves are as complex as they are extensive. By 1971, the traffic capacity has to be geared up to about 14 million tons from nearly 10 million tons in 1960. To be an active participant in the gigantic national programme of progress is the proud privilege of

CALCUTTA PORT COMMISSIONERS

Food & oil, huge machineries & tiny equipment, raw materials and finished goods—are all part of the total cargo and none is less important. Men who work and the machines that help have also to be looked after with all care and attention.



Issued by the Commissioners for the Port of Calcutta.

WE SELL AND ALSO SERVE!

Faithfully yours....

COFFEE...TEA...CLOTH...we produce and contribute over Rs. 4 crore-worth of these products for export.

While continuing to strengthen our export economy and earn valuable foreign exchange, we are also now turning to serve our growing needs in sugar, chemicals and fertilisers, cables and conductors. A factory for the manufacture of 50,000 tons of superphosphate annually was commissioned recently. Construction of a plant with a sugar-cane crushing capacity of 1000-1250 tons daily is presently under way. We have also secured a licence for a cable factory with a capacity of 3000 tons of A.C.S.R. and 18 million core yards of covered conductors.

We are happy to have such a continuing opportunity to serve so faithfully.

countries to U.S.A. have increased from about 35,000 thousand kgs. in 1951 to 41,500 thousand kgs. in 1960.

Similarly, our exports to Canada have also fallen from 8,854 thousand kgs to 6,892 thousand kgs., whereas the Ceylonese tea exports increased from 7,229 thousand kgs. to 7,978 thousand kgs. over the same period. The tea exports from the United Kingdom of imported tea increased from 166 thousand kgs. to 2,654 thousand kgs. during the same period.

This is just to illustrate how our exports have been falling.

The confidence of the world in the stability of the Indian rupee would ultimately depend on our balance of payment position; that position can be improved only by augmenting our exports. Our exports are stagnant for almost a decade now. In spite of some efforts they are not picking up. Actually, there is a tendency for them to sag.

Cost Structure Rigid

The biggest difficulty in our exports is that our cost structure is both high and rigid. It is becoming higher and more rigid every day. The quality of our products hardly justifies these phenomena in our production economy. There is no inclination on the part of our exporters to slash the prices to make our products competitive in the international market. Japan was obliged to do so to earn foreign exchange. Nor is our Government in any mood to subsidise the exports to any appreciable level. Other Governments, including well developed countries like West Germany and Japan, are doing so.

There are other factors which contribute to this high and rigid cost structure. Under-utilisation of installed capacity is one of them—indeed the main. The lack of raw materials, components, spares and certain stores (all imported ones) are mainly responsible for this under-utilisation of the installed capacity. In America, the steel plants are running at less than 50 per cent capacity, because there is no demand. In India, where there is abundance of demand, the industries are running—some of them at any rate—to 10 per cent of their capacity for want of raw materials and components. In other words, instead of one unit working at full capacity, ten units are working at 10 per cent capacity each. The result is that full depreciation is loaded on 10 per cent production. The same applies to overheads, interest charges, rents, rates, taxes, etc.

The second major handicap in developing our exports is the lack of latest means of production. Science and technology make rapid progress these days and, unless our plants and equipments are modern and up-to-date, our competitive position, from the point of view of both quality and cost, is bound to suffer in the world market. In America again, a steel plant which is only eight years old is considered fit to be scrapped on grounds of being outmoded. Whereas, in India, even the preparation of the project report, planning, installation and the initial working all take almost a decade. By the time our plants become ready, in other countries they would have become obsolete and ready for replacement. It is only because of technological development that American coal can be sold cheaper in Hamburg than German coal.

It is strange that every country in the world is trying to boost its exports and cut down its imports. This is more so in the case of industrially developed countries of Western Europe and America. For that purpose, the European countries have formed themselves into various economic groups and they are trying to boost their exports and cut their imports irrespective of its consequences for the rest of the world. It is, therefore, surprising that the highly developed countries should be afraid and hence obliged to take such steps to insulate their economy against the imports from comparatively undeveloped countries. It is also paradoxical that, on the one hand, the developed countries give all the aid that is necessary for the development of these underdeveloped countries, and, on the other, they do not allow the exports of these countries to develop.

Even America is now thinking in terms of inter-Continental co-operation. On the day of American Independence (4th July 1962) President Kennedy said:

"But I will say here and now on this day of independence that the United States will be ready for a declaration of interdependence that we will be prepared to discuss with a United Europe the ways and means of forming a Concrete Atlantic partnership."

The real problem for us, therefore, is going to be the repayment of the foreign loans. The only way seems possible is through export of our goods. To the extent to which these countries create hurdles for the exports of developing countries, they are nullifying the effect of the massive foreign aid. The optimum limit of development would soon be reached if there is no outlet for the products manufactured in these developing countries.

Now a word about the future. The importance of international co-operation for the economic development has been well recognised by the U.N.O. which is thinking in terms of devising ways and means to increase the flow of foreign aid. It has to channelise this flow through various agencies and forms —private and public, bilateral and multilateral within and without the United Nations system, hard and soft investment and pre-investment, etc.

U.N. Efforts

The main wings of the United Nations which now participate in the flow of capital are the International Bank with its associates—the International Development Association, the International Finance Corporation and the International Monetary Fund. The resources of the Bank and the Fund are being augmented and the activities of these institutions are expected to increase more and more.

Special mention may be made about the role played by the I.D.A. (International Development Association). Since many developing countries have reached their borrowing capacity on conventional terms, I.D.A. has come out to lend on long-term basis with very low or no interest. Its credits are for 50 to 60 years with no interest and very easy instalments of repayment. As I said earlier, India has been one of the biggest beneficiaries of this Association.

The United Nations, as distinct from its financial agencies, concentrates on technical co-operation and pre-investment work. The finance involved in pre-investment work is also large. These funds are derived from the Special Fund of the U.N.O. and the expanded programme of technical assistance, both of which together have annual resources of about 100 million dollars.

Apart from the expansion of the I.D.A. and the enlargement of the Special Fund, the General Assembly of the United Nations has passed a resolution to establish a capital development fund which has the support of great many members of the U.N.O. Its constitution is being drafted and some important points are still under consideration, such as whether it would make grants or loans, or both.

Besides this, there is what is known as *ad hoc* financing on multilateral basis which is technically called "grey aid." It is under this aid that the Consortium was formed for helping India. This method was also employed for the Colombo Plan. The sum total of the scheme is that, once the projects are approved, an effort is made to find a Government or Governments willing to provide that finance.

Foreign Private Investments

According to the U.N.O. report, foreign private investment has to play still more important role in the economic development of underdeveloped countries. There are, however, difficulties in the way of effectively mobilising foreign private capital. For example, in underdeveloped countries, there is a lack of the necessary supporting infrastructure (power supplies, transport, etc., and lack of skilled labour and lack of developed markets). These underdeveloped countries also fear interference by foreign business interests. The foreign investors, however, fear the consequences of political instability, balance of payment difficulties, the absence of institutional structure and economic policies in which the role of business is clearly established.

To get over these difficulties, many measures have been discussed and reported by the U.N.O. I shall end this article by referring to two of them.

(a) *Provision of information on investment opportunities and conditions*: Many underdeveloped countries have established Investment Information Centres both at home and abroad to disseminate information to intending and interested investors in the developed countries about the conditions, regulations and opportunities in the developing country. Some of the Development Banks also play an active role in attracting foreign investment.

(b) *The protection of private foreign investment against non-business risks*—such as nationalisation, confiscation, expropriation, non-convertibility of profits and of the principle of investment, violence, unrest, war, etc. Against these risks, assurances have been given to overcome the apprehensions through policy statements, guarantees, investment laws and international treaties. But the value of these assurances will ultimately depend on the stability of the Government. Therefore a few capital supplying countries—the Federal Republic of Germany, Japan and the United States, for instance, offer guarantees and insurance to their investors.

Table I: Statement Showing Authorisation and Utilisation of Foreign Aid

(Rupees in crores)

INDO-AMERICAN RELATIONS

Some Reflections On Developments In Recent Years

By Dr. M. S. VENKATARAMANI

Head, Department of American History and Institutions, Indian School of International Studies, New Delhi

WHEN on 27th October 1962 Prime Minister Jawaharlal Nehru of India wrote a letter to President John F. Kennedy of the United States of America requesting U.S. military equipment, a dramatic chapter opened in the relations between the two countries. The response of the United States to the Indian request was favourable and speedy. Within a few hours, giant transport aircraft began ferrying American weapons urgently needed by the valiant Indian jawans who were on the point of being "outmanned and outweaponed" by the aggressive legions of Mao Tse-tung. The people of India will ever remember with gratitude the hand of friendship which the American Government and people extended to them in their hour of crisis.

There could have been no doubt in the minds of students of Indo-American relations, except in those clogged by irrational bias or dogmatic cobwebs, that, in the event of *aggression* against us by China or any other country, including Pakistan, the United States would promptly have lined up on our side. The most solemn assurances to that effect were given by a President of the United States eight years ago. Consider carefully, if you please, the following statement by President Dwight D. Eisenhower in a personal letter to Mr. Nehru on 25th February 1954:

"We also believe it in the interest of the free world that India have a strong military defence capability and have admired the effective way your Government have administered your military establishment. If your Government should conclude that circumstances require military aid of a type contemplated by our mutual security legislation, please be assured that your request would receive my most sympathetic consideration."

Eisenhower explained the reasons for America's decision to provide military assistance to Pakistan and assured Mr. Nehru that, in case Pakistan used U.S. arms to commit aggression against India, "I will undertake immediately, in accordance with my constitutional authority, appropriate action both within and without the U.N. to thwart such aggression."

Ill-advised Move

The present writer is convinced that the military alliance that the United States entered into with Pakistan was one of the most ill-advised diplomatic moves by the former in the post-war years. At this point, however, we are not concerned with that aspect, but with the response of India to the assurances of the President of the United States. Mr. Nehru dismissed the idea that China might pose any threat to Pakistan and the subcontinent. "Now it is not clear to me how China is going to come over the Karakoram Pass into Pakistan, or how it is going to get there," the Prime Minister said, commenting on Eisenhower's letter, in a speech in the Lok Sabha. Mr. Nehru unceremoniously rejected Eisenhower's offer to consider sympathetically any request for military assistance from India. "In making this suggestion," said Mr. Nehru, "the President has done less than justice to us or to himself. If we object to military aid being given to Pakistan, we would be hypocrites and unprincipled opportunists to accept such aid ourselves."

The Prime Minister's stand was widely applauded by a country and a people deeply moved by the passions of the hour and suspicious of the motivations of Pakistan in accepting modern arms from America. We brushed aside in somewhat cavalier fashion eight years ago the voluntary offer of a President of the United States. Having asserted in 1954 that it would be hypocritical and opportunistic to accept military aid from the United States, Mr. Nehru remained a prisoner of his own rhetorical assertion till 27th October 1962, when the sweep toward the Assam plains of Mao's marauders led him to pen a note to President Kennedy asking for urgent military assistance. The present writer was far from happy as he visualised his Prime Minister making the request under such circumstances. At any other time during the last eight years prior to the date on which the Chinese launched their invasion we could have made the decision to modernise our armies and could have negotiated with the United States, with our head held high. We failed to do so because, in the poignant words of our Prime Minister, we were living in an artificial world of our own creation. It was the age of innocence of our young Republic.

Basis of Collaboration in the Present Crisis

What are the factors that influence two nations to collaborate in a time of crisis? Identity of race, religion and ideology may serve to promote collaboration, but history shows that they do not necessarily and always ensure collaboration. Differences in these factors have not prevented nations from the closest collaboration for the attainment of specific objectives. The "Grand Alliance" of World War II between the United States, Great Britain and the Soviet Union is an example of how ideological antagonisms have not stood in the way of intimate collaboration. In recent years, emphasis has been placed in our part of the world on "Afro-Asian solidarity" as a factor promoting intimate collaboration between nations of the two continents. This factor is still rather vague and nebulous and has not yet become meaningful except in the sphere of rhetoric. Protection of economic interests is a factor that does figure significantly in influencing a nation to collaborate with another in a crisis. But only Marxian talmudists (not the realistic policy-makers of Communist Governments) will ascribe to this factor a determining role.

While the factors mentioned above do play a part in influencing the actions of a nation, the overriding factor in a situation where a nation seeks and another offers collaboration is the evaluation by each of the considerations of its own national security. India, for instance, faced with a serious problem of rearmament to ensure national survival against the onslaught of China, seeks collaboration from all quarters but knows that its request will be viewed with sympathy only by nations which regard China as an actual or potential enemy. The United States is the most important and powerful of such countries. However, it will be willing to offer collaboration to India only if it feels that such action will promote *its own security*. Whatever may be the feeling of sympathy, assistance will not be offered by a country if it feels that its own security might thereby suffer unacceptable damage. For instance, during the Hungarian crisis, the United States, despite its proclaimed sympathy for the regime of Imre Nagy, did not give active assistance to the latter, because it reached the painful conclusion that such a course was likely to endanger its national security by possibly provoking a global war.

Thus, it can be stated that a country would give assistance to another if it promotes its own security, hurts its present, identifiable enemy, and also improves relations with the recipient. The factors are given in the descending order of importance. A country will ask for and accept such aid, if, after weighing all aspects, it concludes that that such acceptance is indispensable to ensure national survival. On the basis of this line of argument, the following general statement can be offered:

> Two nations may embark on close and intimate collaboration when, in the opinion of each of them, the advantage accruing to it are far greater than the disadvantage arising therefrom.

Need for Realistic Appraisal

This is the basic reality behind the recent developments in American-Indian relations. India has sought American assistance and the United States has responded favourably because the security interests of the two countries *happen to coincide at this time*. That this situation might develop was, as we shall discuss subsequently, foreseen by American policy-makers but not to the same extent by their Indian counterparts. It is time for politically-conscious Indians to emancipate themselves from inadequately thought-out and emotional responses to developments and to anchor their actions on a realistic appraisal of the problems that confront our country at the present time and that will arise in the future. It will not, therefore, be the path of wisdom if we blandly assume that the present developments in Indo-American relations were pre-ordained and that they are likely automatically to continue to remain on the same basis for an indefinite period. Nor will any useful purpose be served, if, as some commentators have attempted to do, we try to build a myth of "200 years of friendship" having existed between the United States and India. Orations and editorials on Thoreau's contributions to Gandhi's thinking, Emerson's references to the *Upanishads*, Vivekananda's visit to America, and Franklin Roosevelt's interest in India to bolster up such a myth cannot really lead to fruitful results. There is an imperative need for us to have a clear picture of the nature of our past relations with the United States, so that we can find out how we can improve them for mutual benefit in the years ahead. It is not by pushing things under the rug or by wishful thinking that we can build close co-operation between our nation and any other country. It is by an awareness of the ups and downs in the past history of our relations that we can meet the challenges of the future in better fashion.

Till the outbreak of World War II, there was no significant interest taken by American leaders in India. Britain was securely entrenched in our country and the American leaders evinced no particular desire to advise the British to quit India. But, after 1939, Britain sorely needed America's assistance and American leaders had an opportunity to exert some influence on British policy. Contrary to the widely-held impression in the United States and India, President Franklin D. Roosevelt's efforts in this direction were half-hearted and apologetic. The United States Government was so awed by Winston Churchill's bellicose opposition that it made no efforts to help India when, in 1943, three million people starved to death in the greatest famine in recent history. The United States again bowed to British pressure and did not exert itself to enable India to qualify for assistance from the newly established United Nations Relief and Rehabilitation Administration. In 1943, the American people contributed considerably less than a quarter of a million dollars to aid the victims of famine in India but gave $16.2 million to Russian War Relief.

American leaders put India's case on the shelf, because they were convinced at that time that the security of their country called for the closest harmony with Great Britain. Even as late as 1946, the last year of our freedom struggle, American leaders made no special effort to win Indian goodwill. There was a food crisis in India during that year and American assistance fell far short of what was urgently requested by the Government of India.

That was a period when the Soviet Union had begun to loom large as a potential enemy in American calculations. But the United States was in sole possession of atomic bombs and this factor enabled it to force the Soviet Union to stage a retreat in disputes relating to Iran and Turkey. Under those circumstances, the United States did not experience any special fears concerning a possible extension of Russian influence in India. In any event, American policy in Asia was built around the concept of collaboration with China, then under the leadership of their war-time ally, Chiang Kai-shek.

India's Importance

By 1950, however, the United States had come to attach far greater importance to India than it had done in earlier years. American atomic monopoly had been broken by the Soviet Union in 1949. To meet the contingencies that might arise, the United States had already embarked on a gigantic plan to promote European recovery (Marshall Plan) and had entered into a military alliance (N.A.T.O.) to "contain" what it characterised as "Soviet expansionism." The United States, under what came to be known as the Truman Doctrine, proclaimed that it would be its policy "to support free peoples who are resisting attempted subjugation by armed minorities or by outside pressures." While the firm posture of the United States enabled it to win its basic objectives in Europe, its Far Eastern policy was in shambles by the end of 1949. Mainland China had come under the control of the Communists who proclaimed solidarity with Moscow and uncompromising opposition to "American imperialism." The outbreak of the Korean War and Chinese intervention in it were other factors that decisively influenced the American attitude.

Even though the United States was not entirely happy over the manner in which India, under Prime Minister Nehru's leadership, practised its policy of non-alignment, it clearly realised the importance of ensuring that India did not "go the China way." Such a development and its possible aftermath were regarded as extremely detrimental to the security of the United States and the "Free World." The success of the Indian experiment of parliamentary democracy, constitutional Government, and planned economic development was regarded as an important objective of United States' policy. It is interesting to note that the Point Four General Agreement for Technical Co-operation was signed by representatives of India and the United States on 28th December 1950. In 1951, when India faced a critical food shortage and asked for assistance, President Harry S. Truman promptly urged Congress to offer wheat on terms even more favourable than had been asked for by Mr. Nehru. The Emergency Food Act of 1951, under which the United States furnished two million tons of wheat to India, was the beginning of an "Indo-American Programme" which has since grown to massive dimensions. The nature of the American response to India's request in 1951 was so dramatically and significantly different from what it was in 1943 or even in 1946 not because the character of the American and Indian people or leaders had changed in the interim but because of the changed evaluation by American leaders of India's importance to their own national security. The present writer does not for a moment intend to underestimate the goodwill and humanitarian spirit displayed by the American people. But this does not affect the basic validity of the argument presented here. The new evaluation of the nature of America's relations with India were by no means altered when a Republican administration under Dwight Eisenhower assumed office in 1953.

A Note of Disharmony

A disturbing element in the progressive strengthening of bonds between India and the United States was the fact that the identity of the principal opponent of each was different. American diplomacy had, as its driving motive, the objective of stemming the advance of the Sino-Soviet bloc. From the moment of its existence as an independent nation in August 1947, India had been involved in conflicts with Pakistan, including a shooting war over Kashmir. Indian leaders who regarded Pakistan as the only possible potential enemy, did not share the anxiety of the United States concerning "Communist expansionism." The action of the United States in signing the A.N.Z.U.S. treaty and the bilateral treaties with Japan and the Philippines were not viewed with favour by India. India regarded them as acts of provocation against the People's Republic of China—a nation with a record of "two thousand years of unbroken friendship with India" and whose leaders were supposedly committed to "socialist construction" at home and peaceful relations with their neighbours. Chinese occupation of Tibet and the insolent response of Peking to our mild remonstrances were forgotten or treated as matters of relatively minor consequence as India's leader offered his admiring people a parchment embodying the Panch-Sheel treaty with China. In the United Nations and its various organs, India was vigorous in its opposition to what it regarded as the unjustifiable attempts of the United States to prevent the Peking regime from taking its "rightful place."

As the Eisenhower Administration expanded the American military alliance programme and sponsored the establishment of the South-East Asia Treaty Organisation and the Baghdad Pact (1954), there was mounting criticism in India. The signing of a bilateral military agreement between the United States and Pakistan in May 1954 touched off a wave of indignation in India. Since this agreement was, as the American Ambassador to India at that time described subsequently, "the single most difficult problem" in the relations of the United States with India, it is necessary for us to examine why the Americans embarked on that step.

Impact of Technological Developments

The key reason for the American move is to be found in the fact that, in September 1953, the Soviet Union had exploded a hydrogen bomb. Shortly thereafter, American policy-makers obtained incontrovertible evidence to the effect that the U.S.S.R. had built a fleet of long-distance jet bombers capable of "delivering" the thermo-nuclear bomb on targets in the United States itself. For the first time in history, the United States faced the stark prospect that its own homeland could be devastated by enemy attacks. While girding itself up for a determined effort in the race for intercontinental ballistic missiles, the United States simultaneously sought to safeguard its interests in the years that lay immediately ahead. The American response was to counteract the geographical advantage of the Soviet Union and China by establishing a ring of bases all around those countries. American military planners believed that the Soviet Union could not knock off all these bases simultaneously by a surprise attack. They also argued that from these bases vital Sino-Soviet centres of population and industry could be more effectively menaced than from more distant bases in Europe and Australia. To obtain these bases which were regarded as imperative by its military experts, the United States set afoot measures that led to the S.E.A.T.O. and the Baghdad Pacts and the signing of the military agreement with Pakistan.

The United States would have liked nothing better than Indian support to their policy. But they were determined not to be deterred from their course even if India was vehemently opposed. Considerations of national security were deemed far more important than earning Indian approbation. If India was not prepared to co-operate and if Pakistan was ready to "play ball," the United States was willing to enter into an agreement with Pakistan. It was for the American leaders a period of great tension. Unlike European statesmen who were familiar with war, defeat, revolution, and enemy occupation, American leaders had never contemplated in their worst nightmares the prospect that Chicago and Detroit and Omaha and Los Angeles might face destruction at the hands of a relentless enemy. It was because of their state of unaccustomed tension and anxiety that many American citizens, whose memories of losses of dear ones in Korea were still fresh, found it difficult to understand how any other nation could remain "uncommitted" in the struggle between what they regarded as the forces of good and the forces of evil. It is in this background that we have to view Mr. John Foster Dulles' characterisation of neutralism as "immoral" and Mr. Richard Nixon's equally uncomplimentary references to non-alignment. Perhaps in the light of our own recent evaluation of friendly nations which have sat on the fence or proffered gratuitous advice to us, we may get a somewhat better understanding of the adverse reaction that our attitude evoked in the United States in 1954 and the years that followed.

The vehemence of the Indian reaction to S.E.A.T.O. and the Baghdad Pacts was principally due to the association of Pakistan with them. True, Indian leaders expressed their opposition to such things as the "extension of the cold war," the "intrusion of the military mind," the "intensification of the arms race" and the like. But the extent of the emotion and indignation aroused in India over American policies was basically due to fear and suspicion of Pakistan. The fear and the suspicion were not groundless but most Indians were not prepared to accept the solemn assurances of the President of the United States that the military agreement with Pakistan was not directed against India and that the United States would not countenance any aggression by Pakistan against its neighbour.

It is interesting to note that the situation at present is the entire reverse of the above. A President of the United States is giving assurances to Pakistan that American military equipment given to India would not be used against Pakistan. It is now the turn of the Indians to wonder why Pakistan should be so obdurate despite solemn assurances by the leaders of their country and of the United States.

Unfortunate Aftermath

In view of their overall evaluation of the importance of India and in view of the complexities of the relations between India and Pakistan, American policy-makers might have refrained from a course of action that intensified discord and instability in an area which they regarded as vital. Critical though India would have been of American alliances with Iran and Thailand, for instance, they would never have evoked such criticism of the United States as alliances that included Pakistan and, worse still, a direct U.S. agreement with Pakistan. India has found it quite possible to have exceedingly close relations with Britain and Canada which are tied militarily far more intimately than Pakistan with the United States. India's solicitude for Tito's Yugoslavia was not perceptibly lessened by its membership of the Balkans Pact and acceptance of substantial military assistance from the United States. It is thus clear that the factor that led to severe criticism of American policies in general was the association of Pakistan—India's identifiable potential opponent—with the military pacts sponsored by the United States.

Once the United States had got into the agreement with Pakistan, it had to persist in it despite misgivings, at first small but steadily growing, that the venture was ill-advised. And as the alliance continued and as Indian criticism persisted, it was inevitable that every debate in the American Congress and the Indian Parliament became an occasion for exchange of charges by hot-tempered elements on both sides. Unfortunately, during most of these years, there was on each side a person whom critics on the other side found possible to cast in the role of a villain—John Foster Dulles in America and V. K. Krishna Menon in India. Both these men, dedicated emissaries as they were of their respective leaders, had a tendency to say the wrong thing from time to time. Mr. Menon was more verbose and more rasping than the late Secretary of State and paid far more visits to the United States than Dulles did to India. Mr. Menon's able presentation of India's case on several important issues was, however, marred by an attitude and a manner which appeared to many Americans as sanctimonious arrogance and sneering bluster. Indians visiting America found it no easy matter to convince Americans that the latter's appraisal of Menon was not quite correct and that, basically, the man was a gentle theosophist who bore them no ill-will. It was unfortunate that the image of India that millions of television viewers and newspaper readers in America obtained was quite different from what they had expected of the land of gentle Gandhi. In the areas where Nehru excelled—courtesy, graciousness and the scrupulous avoidance of rudeness and pointless sarcasm—his chosen mouthpiece was sadly deficient. However, many Americans who are quick to draw attention to Krishna Menon's critical remarks seem to be oblivious of what is said about India by some of their own politicians. The present writer, who regularly wades through many hundreds of pages of the *Congressional Record* and of Congressional hearings, knows that there were American Congressmen and publicists whose diatribes against India, while spiced with more sarcasm and innuendo than Mr. Menon was ever able to muster, were also wholly bereft of any evidence of comprehension, balance or perspective. Fortunately for Indo-American relations, not many in our country have the doleful task of perusing such screeds.

U.S.'s Reappraisal

During these days of acrimony, the United States did not modify its evaluation of India's importance or its objective of assistance to India. American leaders remained quite conscious of the fact that the policy of military pacts and, especially, the agreement with Pakistan, had been evolved to meet a specific set of circumstances, and that it would have to be modified when the circumstances changed. It was Secretary Dulles himself who, in 1958, testified before the Senate Committee on Foreign Relations that it would be a calamity for the United States if India were overwhelmed by Communism. "India has a culture, and influence, a prestige in the area which, if it were an asset in the hands of Communism, would greatly endanger all the rest of the free countries of Asia." American assistance to the efforts of the Government of India would mean that "we are helping everybody not just India," Dulles asserted. American assistance and commitments during the period 1951-61 were of the magnitude of $4,408.8 million. This generous and continuing assistance was one of the major factors that prevented the suspicion generated by military aid to Pakistan from hardening into antagonism towards the United States. As the years passed, professional "anti-imperialists" in India found it increasingly difficult to win adherents to their view that the United States was plotting to subvert India by massive economic aid or to promote aggression against India by arming Pakistan.

In the United States also, the "thaw" in the relations with Russia since about 1958 contributed to a more balanced evaluation of India's role than was previously possible. There was growing awareness of the fallacy of labelling Nehru as "neutral in favour of the Communists." Developments in the field of weapons technology, especially long-range ballistic missiles and Polaris nuclear submarines, provided considerable impetus to a reappraisal of American policies, especially relating to overseas bases. Though it was believed that many bases would continue to be needed for several more years, there was no longer the same urgency concerning their availability as in 1954. The continued provision of military hardware to Pakistan came under increasingly severe criticism in the Press as well as in Congress. In a report in 1959, the Foreign Relations Committee of the United States Senate asserted that a majority of its members believed that "military activities in underdeveloped countries were being over-

emphasised at the expense of economic progress." "The security of the free world and of the countries concerned is not well-served when resources, which are at best inadequate, are consumed in unproductive expenditures to a disproportionate degree," the report added. The stand of the influential and powerful Foreign Relations Committee approximated what Prime Minister Nehru himself had long advocated.

The Foreign Relations Committee evidenced its interest in India's economic development by supporting an amendment to the Mutual Security Bill of 1958 introduced in the Senate by John F. Kennedy (Democrat, Massachussetts) and John Sherman Cooper (Republican, Kentucky). The text of the amendment was as follows:

"The Congress recognizes the importance of the economic development of the Republic of India to its people, to democratic values and institutions, and to peace and stability in the world. Consequently, it is the sense of Congress that it is in the interest of the United States to join with other nations in providing support of the type, magnitude, and duration, adequate to assist India to complete successfully its current program of economic development."

That the same Kennedy who initiated this extraordinary expression of solidarity with India is now the President of the United States of America is not without significance for U.S.-Indian relations during the next few years.

Thus, by 1958, the Indian policy of non-alignment was not a subject for critical comment from the executive branch of the United States Government or by any influential politicians with the exception of a very small number of diehards. When Averell Harriman testified before a Senate Committee in 1958 that India's non-alignment did not mean that it was "neutral on those things which are basic to our own Constitution and the principles on which our nation was founded," not a single Senator chose to question or challenge him.

Threat on India's Northern Borders

Continued incursions by Chinese intruders in our Northern border areas touched off a process of reappraisal of foreign policy in India itself. For quite a long time, the tempo of reappraisal was rather slow but it steadily increased after the suppression of the Tibetan uprising by the Chinese and the open acknowledgment by the Government of India of continued and persistent aggression. The evolution of the Indian attitude on this issue was watched with the greatest interest by the United States. For years, American spokesmen at the United Nations had tangled with their Indian counterparts on the question of the admission of the Peking regime. Indeed the vociferous Indian championship of the cause of the Peking regime from every conceivable platform was one of the constant irritants that confounded our numerous well-wishers in the United States and enabled our critics to depict us as double-faced opportunists. As the story of our conflict with China unfolded, American policy-makers realised that a drastic reorientation of Indian policies towards China was in the making and they indicated their support to the Indian point of view with tact and circumspection. Thus, during the last year of the Eisenhower administration, Secretary of State Christian Herter, obviously with India in his mind, told a group of Senators about "certain areas of the world where certainly the attitude toward the free world has changed very materially in the last 18 months." Said Herter:

"I think we have to recognise that the actions of Communist China have given us a great assist. On the other hand, I think that the mere fact that what we had predicted previously would likely be the attitude of that country has gained us greater confidence among those nations, and I think that they are looking with much less suspicion on what they felt might be colonial or imperialistic or selfishly interested actions on our part, and feel today that the assistance that we are giving, whether it be technical or financial, is a very beneficial thing for their countries."

In the months that followed responsible American officials pointed out, from time to time, that China was making massive efforts to build roads, communications and military installations in Tibet and that these developments were more "for the purpose of using the national power of Communist China than as an outlet for . . . expanding population or for any other humanitarian purpose." Over a year ago, Mr. J. Graham Parsons, Assistant Secretary of State for Far Eastern Affairs, made a very interesting analysis of China's motives which his Indian counterparts could have studied with benefit. He pointed out that the Tibetan rebellion and the Chinese determination to seal off the frontier effectively, created a confrontation, between India and China which did not exist before. Mr. Parsons continued:

"However, it is a fact that, throughout China's history, there has been an effort to assert that China's frontiers go, indeed, well beyond those which have been the accepted frontiers of India. So there has been, from the Chinese viewpoint, an unresolved issue over the location of the frontier. However, we also think that this matter goes beyond the mere existence of this historical difference. We think that the pressures which the Chinese Communists have exerted on India are, in part, at least the reflection and outcome of this militant and aggressive regime which seeks to expand its power wherever it can . . . it may well be that among the motives of the Chinese Communists was the motive of seeking to place the Indians in a difficult and humiliating position and to demonstrate to other people in Asia that it is Communist China which is the dominant power and the power to be reckoned with, and that India does not have a similar status."

Nehru's Quiet Diplomacy

During this period, our Prime Minister appears to have carried on quiet diplomacy to explain to American leaders some delicate aspects involved in the Indian response to the Chinese threat and, at the same time, to convey India's determination to meet the challenge. Former Senator H. Alexander Smith, who visited India in 1959 as a Consultant to the Secretary of State, told his Senatorial friends that, after talking with Mr. Nehru, he was convinced that the Government of India was fully alive to the nature of the Chinese threat. "I think there is evidence she [India] has had her mind slanted our way—I do not think that is final, but it looks hopeful," he said. Early this year Senator Gale McGee stated that Mr. Nehru had impressed on him and a group of his colleagues that "we [Americans] had to remember one thing, and that is that India lives right next to China and Russia and, therefore, there will be some kinds of policy decisions that will be of a little different intensity and a little different consideration than, say, we would project ourself in the United States, and there would be a gap or difference there occasionally in interpretation." Such efforts by the Prime Minister almost invariably produced beneficial efforts in enabling important Americans to obtain some insight regarding the Indian point of view.

It is, however, not clear whether, at any time during the last two or three years, there were any high-level discussions on what exactly India might need from the United States in case the Chinese did embark on large-scale aggression. All that the newspaper-reading public in India and the United States knew was that Prime Minister Nehru was not interested in the slightest in asking for any military assistance from the United States. The occasion was provided by Mr. Nehru's reaction to a comment made by Under Secretary Chester Bowles at a meeting in New Delhi under the auspices of the Indian Council of World Affairs in August 1961. Bowles had stated, in reply to a question, that "India could count on United States' help if she was ever attacked by any country." Mr. Nehru acted speedily to clarify the situation "in the interests of the United States as well as India." There was no commitment on the part of any country to come to the assistance of India in the event of aggression, the Prime Minister asserted. "There has been no mention of this [aid to India], no talk and no commitments so far as we are concerned," he added. "We are not," Nehru emphasised, "under anybody's protection or anybody's client in this respect. That should be made perfectly clear." Those were wonderful sentiments that gratified our pride, even if they did not promote our security. Such sentiments would have been appropriate had we, at that time, been in a position to meet and beat back a major invasion across our borders by China. As we now know only too well, such was far from the case.

During the last two years, we should have made efforts to obtain from the United States modern weapons and aircraft and plants for the manufacture of weapons in sufficient quantity to meet the challenge from the North. We could have sought them on the basis of negotiations of the type that we initiated with the Soviet Union for the purchase of MIG aircraft. Had we taken advantage of the favourable opportunities that opened before us with skill and determination, and with single-minded devotion to the security interests of the country instead of to prejudices that crippled our flexibility, there would have been no need for our Prime Minister to have had to write a letter to President Kennedy when the world was witnessing the spectacle of our magnificent troops reeling back under the "human sea" attacks of the Chinese aggressors. Such a course, based on prudence and self-interest, would not have involved our entering into any pact or alliance with the United States and would not have meant the casting away of non-alignment which has been and should continue to be the sheet-anchor of our foreign policy. Non-alignment, as our Prime Minister himself has repeatedly stated, means in essence that India will decide each issue on its own merits, instead of being influenced by membership in any bloc. It will be a tragic parody of non-alignment if the concept were to be twisted to mean that, on the merits of an issue involving the very survival of India as a nation, we should have been fearful and hesitant in making meaningful judgments and in following them up by resolute actions.

Soviet MIGs

If certain aspects of our Government's policies appear to have been unrealistic, the approach of some of its most vociferous critics is even farther removed from realism. These critics appeared to be burdened with the anxiety that the only way of obtaining support from the United States in the event of serious difficulty with China would be to jettison non-alignment and enter into the "closest possible relationship" with the United States. They trembled to think of America's reaction to India's acceptance of substantial economic aid from the Soviet Union. Their nightmares over our attempts to purchase Soviet MIG aircraft were as unrealistic as the rantings of other extremists who hailed them as a bold act of defiance against the "Pentagon" and "U.S. monopoly capital."

What exactly has been the attitude of responsible elements in the United States Government, especially in the executive branch? There was no deep disquiet in these quarters, but understanding and a great deal of interest. India with a stable Government and institutions was "quite capable of absorbing resources from the Soviet Union without being subject to subversion or to endangering itself," emphasised George W. Ball, Under Secretary of State for Economic Affairs in 1961. Henry R. Labouisse, Chairman of a Task Force on Economic Assistance set up by President Kennedy, declared that acceptance of substantial Soviet aid by India was "all to the good" and that he had no worry that through such aid the Soviet Union would obtain a place of primacy in India.

Contrary to widespread Press opinion in India as well as in the United States, the Kennedy Administration was by no means vigorously opposed to the idea of Indian purchases of MIG aircraft. This statement is not a mere impression of the present writer but is made on the basis of testimony given a few months ago before the Senate Committee on Appropriations by Phillips Talbot, Assistant Secretary of State for Near Eastern and South Asian Affairs. Talbot told the Committee that the Indian move should be viewed in the background of its growing awareness of the threat from China. Said the Assistant Secretary:

"Indeed, as one examines the evidence that is now coming forward, it begins to appear that the Communist China regime is quite unhappy about what the Soviets have been saying to the Indians lately. . . . This may be the first occasion on which the Soviets have been dealing in this way with a country which is in dispute with another member of the Sino-Soviet bloc. So in a sense if the Soviet fighters, advanced fighters, were to be sold to India, the ensuing complications in Sino-Soviet relations would be something of great interest to watch."

Comment is superfluous on the meaning and implications of the Assistant Secretary's statement.

Indo-Pakistan Disputes

What then of American relations with Pakistan? How should India view them in the light of recent happenings? The Nehru-Ayub joint *communique* announcing talks to be held shortly to resolve outstanding issues between India and Pakistan has closely followed the visit to the two capitals of Averell Harriman, leader of the special United States Mission to India. The move is the most recent in the efforts that the United States has been quietly engaged in for a considerable time and especially during the last three years. As the need for bases in Pakistan became progressively less urgent owing to developments in weapons technology already referred to, the United States was increasingly anxious to bring about some arrangement that would enable it to maintain Pakistani goodwill, remove Indian misgivings and, at the same time, promote the defence of the sub-continent against aggression. The United States would have warmly welcomed India's acceptance three years ago of President Ayub's proposal for an understanding concerning joint defence of the sub-continent, but Nehru was not willing to consider the proposal at that time. It is interesting to note that Averell Harriman made a visit in his personal capacity to India and Pakistan in 1959 and, on his return, told a Senate Committee that the United States should continue to work quietly and without undue publicity

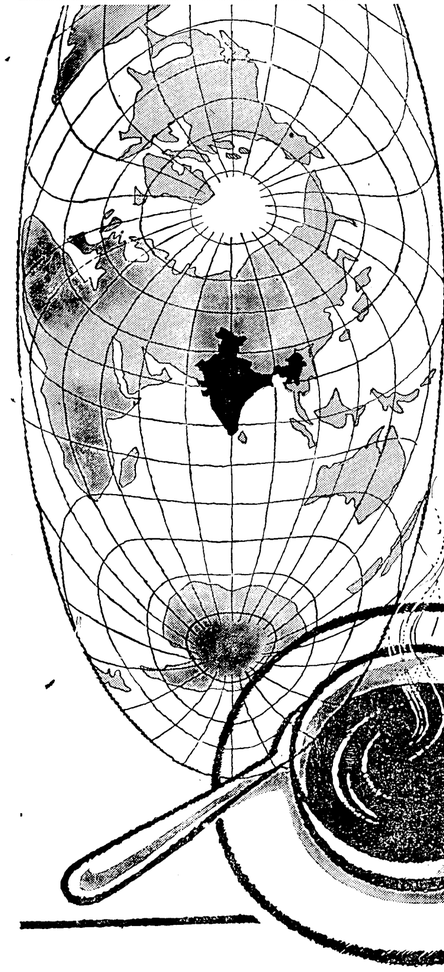
The world over people of taste prefer

INDIAN COFFEE

for its distinctive aroma

From the world's finest Coffee Plantations in India, where ideal conditions for growing superior Coffee exist, INDIAN COFFEE goes to cheer up millions of Coffee lovers in France, Italy or Germany, in U. K., U. S. A., or U. S. S. R. - in fact all over the world!



The expansion of Indian Coffee industry has been rapid in the last decade as can be seen from these figures:-

PRODUCTION HAS NEARLY TREBLED in the last eight years: from 23,943 tonnes in 1952-'53 to 67,925 tonnes in 1960-'61. The target of production by the end of the Third Five-Year Plan is 80,000 tonnes.

CONSUMPTION IN INDIA HAS INCREASED from 26,000 tonnes in 1955-'56 to over 35,523 tonnes in 1960-'61.

EXPORT HAS GONE UP FIFTEEN TIMES since 1952: from only 2,200 tonnes in 1951-'52 to 32,271 tonnes in 1960-'61.

DEVELOPMENT PLANNING IN LATIN AMERICA

By ALVIN MAYNE

ADVISER ON PLANNING TO THE U.S. CO-ORDINATOR FOR THE ALLIANCE FOR PROGRESS

SIXTEEN months ago (August 1961) twenty sovereign nations of the Western Hemisphere joined together in an alliance "to accelerate the economic and social development of the participating countries of Latin America, so that they may achieve maximum levels of well-being, with equal opportunities for all, in democratic societies adapt to their own needs and desires." (*Charter of Punta del Este*, Title I.) The goals which were set were numerous. The more significant ones were: (1) the achievement of substantial and sustained growth of *per capita* income at a rate which is designed to assure self-sustaining development of not less than 2.5 per cent *per capita* for any country; (2) the achievement of a more equitable distribution of national income, raising more rapidly the income and standard of living of the needier sectors of the population and at the same time devoting a higher proportion to investment; (3) greater diversification of the structure of the economy so as to free the economies from dependency upon a few critical exports; (4) acceleration of the process of rational industrialisation and the raising of the productivity of the agricultural sector; (5) encouragement of programmes of comprehensive agrarian reform: (6) elimination of adult illiteracy and by 1970 to assure, as a minimum, access to six years of primary education for each school-age child; (7) increase in life expectancy at birth by a minimum of five years; (8) increase in the construction of low-cost houses for low-income families; (9) maintenance of stable price levels, avoiding inflation or deflation; and (10) development of co-operative programmes of economic and social sive fluctuations in foreign exchange earnings derived from exports of primary products.

Emphasis on Self-help

The American republics recognised that the achievement of the foregoing goals would require the development of comprehensive and well-conceived national programmes of economic and social development, aimed at the achievement of self-sustaining growth, carried out in accordance with democratic principles. Further, it would be necessary to develop systems for the preparation, execution and periodic revision of national programmes for economic and social progress. While recognising the need for external financial assistance on a large scale, emphasis was to be placed on self-help efforts which would: (*a*) improve human resources; (*b*) use natural resources more efficiently; (*c*) strengthen the agricultural base by extending the benefits of the land to those who work it; (*d*) mobilise and utilise financial resources in a more rational and equitable way through the reform of tax structures, including fair and adequate taxation of large incomes and real estate and the improvement of fiscal administration; (*e*) promote conditions which encourage foreign investments and help increase the capital resources of participating countries; and (*f*) improvement of systems of distribution and sales to make markets more competitive and prevent monopolistic practices.

In effect, a little over one year ago, one of the most ambitious programmes for development planning and implementation was launched in the Western Hemisphere for the purposes of accelerating social and economic development. Nineteen sovereign nations (the twentieth being the U.S.) agreed to prepare long-range development plans to achieve not only an annual rate of growth of 2.5 per cent *per capita* but to undertake wide-reaching reforms in land tenure, fiscal administration, education, health, housing, income distribution, institutional arrangements between labour and management, etc. The plans were to take into account the individual problems of each economy and society and to reflect the desires of all levels of society through the development of procedures for consultations and collaboration among public authorities, employers, and labour organisations.

Indian Model

While the Government of the Republic of India was not represented in the meetings of the experts which laid the groundwork for the ministerial meetings in August 1961 which created the Alliance for progress, anyone familar with the Indian system for planning, preparation and implementation of the Indian Five-year Plans would recognise that the countries of Latin America were seeking to establish a methodology which has been evolving in India since the late 1930s when the Congress Party initiated national economic planning in India. While the model of the Indian development planning system is not explicity referred to in the official documents, there is constant reference to the Indian example in various conferences and discussions concerning the individual country plans and the problems encountered in obtaining external financing. Thus, it is possible to state that an important service has been rendered to the Alliance by the pioneering work carried out by the Indian Planning Commission and the Government of the Republic of India, in creating a system whereby planning for rapid economic and social development may take place in accordance with democratic principles.

Because the countries in the Western Hemisphere had little or no experience in developing national economic plans, a panel of nine high-level, full-time experts, with appropriate experience, technical ability and competence in the various aspects of economic and social development, was appointed. As each country completes the preparation of its development plan, it may submit such a programme or plan to an *ad hoc* committee composed of not more than three experts from the panel and an equal number of experts who are not members of the panel. The *ad hoc* committee is to study the development programme, exchange opinions with the interested Governments as to possible modifications and, with the consent of the Government, report its conclusions to the Inter-American Development Bank and to other Governments and institutions that may be prepared to extend external financial and technical assistance in connection with the execution of the programme.

In addition the various hemisphere organisations such as the Organisation of American States, the Economic Commission of Latin America, and the Inter-American Development Bank are to provide technical assistance for the formulation of development programmes as may be requested by the participating nations.

During the month of October, just a little over one year after the Alliance was initiated, the participating Governments met in Mexico City to assess the progress, to refine the concepts of the Alliance and to commit themselves to further action where it was deemed necessary. The meeting was a remarkable one for Latin American countries, in that the representatives, both on the expert and the ministerial levels, were self-critical, not only of the operation of the Alliance as a whole, but also of the progress being made in their own countries. Briefly, it was concluded that:

1. Self-help in Latin America received strong impetus during the first year of the Alliance. Programmes of agrarian reform and agricultural development had been initiated in several countries. Substantial improvements in public administration, collection and codification of tax systems were carried out. Expenditures devoted to education and improvement of human resources have increased substantially in a large number of countries. Shortage of housing for low-income families is being attacked on a broad front through improvement of credit facilities for housing, technical assistance and specific housing projects.

2. There was forward movement toward economic integration. Nine countries had ratified the establishment of a Latin American Free Trade Association and a start had been made in eliminating tariffs on intra-area trade. Integration of the economies of the small countries of Central America has gained momentum. Activities of the Central American Economic Integration Bank were initiated, uniform tax incentives for industry were adopted by all countries and advances were made in tariff equalisation.

3. The flow of external public funds increased during the first year of the Alliance with $1.7 billion authorised by the International lending institution; and the U.S. to Latin American countries. Disbursements of funds reached $1.2 billion.

4. Almost all of the Latin American countries have established central planning agencies within the governmental structure. The development plans of Bolivia, Chile, Colombia, Mexico and Peru have been submitted for consideration by the Panel of experts and international lending agencies. Three other countries are expected to submit plans before the end of 1962. (Organisation of American States, Inter-American Economic and Social Council, First Annual Meeting.)

Shortcomings

In addition to these points of progress, problems and shortcomings were also spelled out. Briefly, these are as follows:

1. The rate of economic growth is still below the long-term objectives. Growth has not been widespread among the countries or among the various sectors of the economies. While manufacturing growth advanced by more than 8 per cent for the Latin American countries as a whole, the growth was concentrated in relatively few countries. The agricultural sector tended to lag behind other sectors, indicating the need for an intensified attack on the problems of the rural communities of Latin America.

2. Tax reform (both with respect to administration and structure), agricultural reform and improved public administration all need strengthening.

3. The development plans being now prepared tend to draw attention to aspirations. However, a framework of realisable goals is also required together with the measures designed to achieve them. Planning must reflect the interests and potentialities of all productive sectors—industry, agriculture, labour and others—and must identify not only the investment projects but also the important structural reforms which are essential to development. More attention and resources must be concentrated on developing the feasibility, engineering requirements, costs and benefits and social impacts of various programmes and projects.

4. The flow of foreign private capital to Latin America has diminished and there is strong evidence of substantial capital flight from Latin America. In view of the limitations as to the availability of public funds, it is clear that the Alliance cannot achieve its objectives without full participation of the private sector and adequate measures must be taken to assure maximum contribution to growth by the private sector.

5. Price declines for the major export commodities of Latin America continue to limit the ability of Latin America to pay for necessary imports of capital goods and to service external debt.

6. In looking to the future, the Council of Ministers, among other recommendations, indicated that more emphasis must be placed upon adequate economic planning in the various Latin American countries and recommended an intensified effort should be made by the various elements of the Inter-American system to assist the countries of Latin America in the field of planning. Effective planning should be considered on the part of financing agencies and institutions as a major element of self-help, with particular attention to financing pre-investment studies.

The Role of National Development Planning

The above summaries point to some progress but insufficient to meet the objectives of the Alliance. Particular stress was laid on the need for the creation of adequate national economic and social planning in each of the countries. In fact the Panel of Nine in their report to the Council of Ministers stated that, "Furthermore, it can be said that the preparation and execution of a development programme is a necessary condition for obtaining technical and financial aid within the terms of the Alliance for Progress."†

The question has been frequently raised as to whether it is really necessary to have a definite programme or plan which has been adopted or whether it might not be enough if a country had sufficient fiscal, monetary, foreign trade, etc. policies, balanced and reasonable, oriented toward the economic and social development of a country? The Nine concluded that, "not only would this be an incomplete answer to the requirements of the Alliance, since it would not permit the rendering of a true judgment of the possibilities of reaching specific goals proposed, but economic theory and most recent practical experience have shown that the monetary, fiscal and commercial policies, in themselves alone, do not supply a

ESSO STANDARD EASTERN, INC. (Incorporated in U.S.A. with Limited Liability)

sufficient basis for determining the quantity, the distribution and the timing of public investments, or the incentives and restrictions needed to orient the private sector's contribution to the development effort."†

On the other hand, the Panel of Nine is realistic for it is emphasised that "in view of the technical resources existing in the Latin American countries, of the statistical and economic information available, of the uncertainty of foreign markets, and of the lack of a sufficient number of specific projects, there is no practical value in formulating programmes of eight to ten years or more, save for the purpose of establishing guidelines for development and aims for the immediate future. . . . Fortunately, there are few projects, in certain sectors, that require decisions many years in advance. Nevertheless, certain decisions made today may influence others regarding investments to be made in subsequent years. In particular massive, permanent works and installations, representing basic social capital, which cannot be undertaken piecemeal, require long-term rather than short-term decisions. Taking into account the foregoing considerations, it would seem advisable to concentrate planning efforts on medium-term programmes, particularly if their development be viewed as a continuous process."†

The Panel found that most of the countries are in a position to prepare frames of reference defining the strategy and aims of development rather than investment plans drawn up with the proper detail. On the other hand, they felt that it would be undesirable to repudiate these first attempts and not provide the financial assistance needed to develop the country until the deficiencies in the plans were overcome. The Panel was of the opinion that the deficiencies will disappear if the planning and development process is made a continuous process.

Defects in Development Plans

Probably, the most widespread defect of the programmes or plans so far submitted is that they lack the identification of a small number of key activities upon which practical effort might be concentrated during the first years of the development period. Generally, the statements of strategy are too general to be translated into positive activities. Instead they give rise to a proliferation of activities which cannot be put into effect due to the limited financial and human resources available.

The lack of specifics becomes even more noticeable when an attempt is made to find the uses for the external financial assistance which is called for by the plan. In the plans thus far reviewed, there are very few projects which have been studied as to their technical viability and economic validity. Much financial credit has been given during the last few years, however, only an insignificant amount of it has been used, and only a small fraction has even been committed.

While this defect is serious in the public sector, it is even more serious in the private sector. The plans generally fail to recognise what it takes to increase the rate of savings which will permit the private sector to fulfil its role. The Nine feel that one of the weaknesses of the present planning is the failure to bring the private sector into the process of drawing up of plans. This is, of course, a difficult task, except in an advisory capacity, for, unlike Government decision-making, which is concentrated, it is difficult to identify the decision-making individuals in the private sector except as groups. The most that can be hoped for is that the private sector will make use of the information which becomes available in the planning process and programme its operations accordingly.

The problems facing the Alliance in utilising the national plans which have been submitted so far may be best illustrated by a review of the use of the *General Plan for Economic and Social Development*, prepared by the National Council of Political Economics and Planning and the Administrative Department of Planning and Technical Service of the Republic of Colombia. The Colombian Plan is the most advanced one so far reviewed by the Panel of Nine and the international finance agencies. The preparation of the Plan took roughly four years. It was initiated shortly after the military dictatorship was overthrown. It should be pointed out that Colombia is a relatively well developed country. For example, its *per capita* income exceeds $250 per annum; it has three fairly well-developed industrial centres—Bogota, Cali and Medellin—it has a progressive and fairly well-developed banking system. It has an aggressive business community and a fairly well-educated elite.

In order to prepare the Plan, it enlisted the assistance of the Economic Commission of Latin America. Eventually, the Plan was to consist of some nine volumes analysing each sector of the economy and government. The first volume which was transmitted to the Panel of Nine and the international financing agencies consisted of some 460 pages. This was the General Plan. The sectorial plans were to follow. To date only one sectorial plan has been published, namely, for the industrial sector. This Plan also has 400 pages.

Savings and Investment

The Plan was carefully reviewed by a large and competent mission from the International Bank for Reconstruction and Development. As the Bank's report was nearing completion, the Panel of Nine set up an *ad hoc* committee for the review of the Plan. This Committee had available the Bank's study. In general, the Bank and the *ad hoc* Committee agreed that the Plan was fairly sound, though certain actions and reforms had to be undertaken if the growth and investment goals were to be achieved. The growth called for was 5.6 per cent per annum in the Gross Domestic Product in constant prices for the decade of the 1960's with an annual rate of investment which would have to increase from 18.6 per cent of the Gross Domestic Product in 1959 to 26.9 per cent by 1965. This increase in investment is expected to come primarily from domestic savings. Domestic savings are expected to increase from 20.5 per cent of G.D.P. to 23.3 per cent in 1965 and to 25.1 per cent in 1970. The public savings figure which must increase from $1.1 billion pesos (a peso is equivalent to 11 cents U.S. on the free market) in 1959 to 1.6 billion pesos in 1964 or a 50 per cent increase in five years. Private savings will have to do even better. The Plan calls for an increase in private savings from 3.4 billion pesos in 1959 to 5.1 billion in 1964 and over 7 billion in 1970. External financial assistance which was negative 400 million pesos in 1959 would have to increase to an annual rate of 800 billion pesos in 1964.

While the increase in public savings does not appear to be especially great, it is necessary to look into the ability to increase the revenue to the Government and the growth of current expenditures by the Government. Both the International Bank and the *ad hoc* Committee concluded that the Plan overestimated the present tax yields and underestimated the requirements for current expenditures, so that the public savings estimate in the Plan could be considered to be greatly overestimated unless even greater tax increases than contemplated in the Plan were introduced. Even after the Mission of the Bank and the *ad hoc* Committee completed their reports in April and June of this year, the situation became even more desperate with the current expenditures rising still more rapidly and the revenues continuing to decline.

An analysis of the private savings projections raises doubts as to whether the personal savings projections can be achieved. For example, after allowing for population growth, the projections imply that two-thirds of the increment in family income would be saved. Here the Indian experience is valuable. The First Indian Five-year Plan projected a marginal savings ratio of 50 per cent. Experience showed that this was excessive and in the second Plan only 20 per cent was projected.

External Financing

Turning to the problem of external financing, both groups of reviewers examined the balance of payment requirements and concluded that the projections in the Plan understated the probable situation. For example, the *ad hoc* Committee of the Nine recommended that the projections of exports be reduced by 11 per cent and imports be increased by 6 per cent. The result was that it was forced to conclude that the balance of payments deficit will probably be quite a bit greater than that indicated in the Plan, with the result that the external financing requirements would be considerably higher. The *ad hoc* Committee arrived at a figure of an average deficit in the balance of payments of 213 million dollars, excluding external debt amortisation. If amortisation is included, the figure goes up to $270 million per year.

What is even more serious is that, even if this deficit were to be covered by external financing, there is no assurance that rapid economic and social development would take place. Thus, it was not possible for either the Bank or the *ad hoc* Committee to relate the balance of payments deficit directly to specific projects which would insure an increase in the productive capacity of the country. For example, in order to cover the gap between the balance of payments deficit and the probable capital expenditures by the public sector and the identifiable capital expenditures by the private sector, it was necessary to create a private credit fund which would be fed into the banking system to support general business expansion. It will, of course, be very difficult for the banking system to direct these credits into productive enterprises and not into consumption or price increases.

A still further problem exists, in that a careful examination of the status of the capital projects in the public sector reveals that very few of them are in a position where construction could take place in the near future. In effect, the meeting of the balance of payments deficits will merely mean that the counterpart funds obtained from the sale of the foreign exchange received through foreign borrowing will have to remain frozen, unless it is used for consumption or current budgetary support. Unless the actual investment is made, then the productive base will not be expanded and the development will not move forward in accordance with the Plan.

If the Plan and the actual pre-investment work were consistent and controls were introduced to make sure that the Plan would be implemented in detail, the financial agencies could merely provide programme loans which would meet both the balance of payments requirements and the financing requirements of individual sectors and projects of the Plan without trying to make loans for individual projects. In the case of Latin America, as illustrated by the Colombian experience, the organisational and institutional structures are not in operation to insure the necessary execution. The result is that the international financing agencies feel obligated to review specific projects and make judgments on the individual pieces rather than on the entire plan.

Indian Planning Ahead

This again emphasises how much further along the Indian planning system is than the Latin American planning operation. Another feature which is being borrowed from the Indian experience is the concept of an international consortium to finance the planning. After the review of the Plan by its Mission, the World Bank announced that it considered that the Colombian Plan was sound and that it was planning to give considerable financial support to the Plan and it invited other institutions and countries to join in providing financial assistance.

Another problem facing the Latin American countries is illustrated by the Colombian experience. India so far has enjoyed government by the same party since independence. This is not true in most Latin American countries. Even if the same party is in power, it is not possible for the President to be re-elected for a second term until there is an intervening term. The result of this constant shifting is that the Plans, even though they may have been accepted by the international financing institutions, are discarded. Valuable time may be lost while a new plan is prepared. More important is the fact that new personnel is frequently brought in, not only at the policy-making levels, but at the working level as well. Even in the case where the change in political control is not necessarily sharp as in the case of Colombia which was ruled by a coalition and the only basic change was in the Presidency, a radical change seems to have occurred with respect to the role which planning is expected to play. Most of the staff of the Planning agency has left. The new ministers in the various Governmental departments do not understand the role of planning and the co-ordinating function it can perform. They view it primarily as a curtailment of their authority.

Probably the greatest weakness in the planning systems of the Latin American countries is the lack of institutions to develop the sectorial plans and then to implement them. This is true of the public, semi-public and private sectors. The planning agency is rarely given the tools necessary to make their plans stick. Thus, in India and other countries where the planning system has been in operation for some time, the Plan is linked with the budget with regard to the public sector. Appropriations for any project to any agency of the Government or Local Government can only be made if it is in the Plan. In the private sector, the actions are similarly co-ordinated by the Plan and the Central Planning Body.

India and the Alliance for Progress

India should be interested in the growth of the Latin American economies, since these two hundred million persons, with a fairly high level of income, present future potential markets for the Indian economy. At this time it is, of course, difficult to identify the particular products which India might export to the Latin American countries as they expand their income

AGRICULTURAL PRODUCTIVITY LAGS BEHIND

Why Is It So?—Who Is Responsible?

By H. M. PATEL, I.C.S. (Retd.)

THAT it is of vital importance for us to maximise our agricultural productivity is accepted almost as a self-evident truth by all. What the steps necessary for achieving increased agricultural productivity are, are also fairly generally known, and quite large sums of money have been provided during each of the three Plans to ensure that no programme for increasing agricultural productivity suffers for want of funds. And yet we do not seem to have been able to achieve results of a correspondingly satisfactory nature. At the end of the second Plan, and even today during the second year of the third Plan, our yields per acre of different crops are among the lowest in the world, and, indeed, do not show any significant improvement over what they were, say, ten years ago. Indeed, in a recent careful study of *Trends in Yields Per Acre*, Prof. Dantwala came to the conclusion that "taking all crops together, yields per acre appear to have increased only slightly and insignificantly during 1931-59, a period covering nearly three decades." A later study by Prof. V. K. R. V. Rao came to the same conclusion regarding 1960-61. Why is that the case? And why, even when throughout this period, we were under pressure to maximise our agricultural productivity and success in such efforts as we put forward would have made enormous difference to our efforts in other directions, did we fail? What are the obstacles? What are the factors which stand in the way of our improving our agricultural productivity which is so vitally necessary?

An Administrative Failure

If a short answer were sufficient, I would say that our failure is very largely an administrative failure. It is due, in the main, to our failure to organise and make the best possible use of our available resources, and of the results of valuable research carried out at Pusa and other agricultural research institutes. There has been, in fact, a surprising lack of purposive action in this field.

How else, for instance, can we explain the very large percentage of foodgrains which are lost each year while in storage? The loss has been placed at as high a level as 40 per cent, or even if we prefer to accept the lowest estimate, the loss would be of the order of 20 per cent and more. Would it not be reasonable to expect effective and substantial action to prevent such recurring loss, or at any rate to reduce it to a minimum? And yet, so little is done, even though the solution for this particular problem is well known, namely, establishment of scientifically constructed silos, warehouses, and godowns, and the machinery with which to give effect to that solution exists in the Central and State Warehousing Boards!

Storepests Thrive

A critic and a persistent advocate of well-constructed silos was exasperated into saying almost bitterly the other day that "in the long run, it is cheaper and more profitable to save and use the harvested crops than to grow more food to feed the already thriving storepests." For some inexplicable reason, after over six years of its existence, the Central Warehousing Board has constructed warehouses with a capacity for no more than 165,000 tons, and not all of them are designed to keep out pests: only two silos have been erected, and so far as is known, no more are planned. And yet, if an adequate number of warehouses and godowns could be made available, even the problem of marketing and of provision of credit to small cultivators would have been materially assisted. This one simple and economic solution to our food shortage problem is virtually ignored: no one even hears of this as an effective method of adding to the availability of foodgrains.

No Reason to Quarrel

We prefer to concentrate upon ways of increasing agricultural production, and there is no reason to quarrel with this preference. What is our actual achievement, however, in this direction? What are the concrete steps we have taken? We have established large administrative organisations at the Centre and in the States, each with its complement of technical and scientific experts. But, on the whole, it is no exaggeration to say that there has not been much effective transmission to this day of known knowledge to the ordinary average farmer. And this, in spite of our having lighted upon an effective method, the method of community development. We decided, or rather unfortunately drifted into the view, that rural development should be our objective, in which increased agricultural productivity found a place as only one of several items to be achieved. Health and education and agricultural production are, of course, interrelated, but agricultural productivity ought perhaps to have been given at least equal, if not greater attention, for increased agricultural productivity would have not only helped rural welfare programmes materially, but would have also assisted industrial development. But for several years now, programmes for improvement of agricultural practices appeared actually to have been pushed into the background. It was left to a Ford Foundation Team of experts to draw our attention pointedly to the lapse and to recommend that the emphasis in community development ought to be on increasing agricultural productivity. To the extent we succeed in increasing the yields per acre, we would not only be able to reduce our reliance on import of foodgrains, but also succeed in increasing our exports of agricultural raw materials, or of goods produced therefrom. Either way, we would be making a significant contribution to our foreign exchange problem.

If this view is correct, it follows that we should, even at this stage, give agricultural productivity the highest priority, in fact, and not just in name. If we are to do this in earnest, we must first of all recognise that agriculture is a commercial enterprise and view its problems as we would view the problems of a commercial enterprise. Agriculture must adopt for its success appropriate technological improvements that have occurred, and it must be provided with appropriate economic incentives.

To take the latter first, fair and stable prices for agricultural produce would be the most effective economic incentive. Despite loud verbal protestations, Government still continues to fight shy of assuring our farmers economic, fair and stable prices. A support price for every principal crop would remove one of the two crucial uncertainties from the farmers' horizon; they would be protected against low, often artificially depressed prices both at harvest time and whenever crops are particularly good. Even when support prices are announced, no effective machinery is simultaneously set up to give them a reality. And yet there can be very little doubt that, given this incentive, freedom from the uncertainty regarding the minimum prices they can rely upon, the farmers would have no hesitation in working for maximum agricultural productivity, and thereby also for making production progressively more economic.

All this is obvious and never seriously controverted. How, then, is one to explain the failure to take any effective action in this direction? Why is there such a strongly apathetic attitude in this respect? It is not as if any other interest would suffer if support prices were fixed and machinery set up to give effect to them. Consumers' interest could be safeguarded, where necessary, by fixing ceiling prices. Why then the continued and almost studied indifference to a step which is in the interest not merely of the farmers but of the country's economy? When export promotion became a major problem, incentives were readily forthcoming as well as other schemes involving financial benefits. It is not, therefore, as if Government has any bias against economic incentives! One conclusion at least seems irresistible: there is no real understanding of or sympathy with the problems of agriculturists amongst those who formulate Government's policies.

Irrespective of incentives, agricultural productivity can, of course, only be increased by the adoption of scientific methods, and resultant technological changes. It has long been recognised that Indian agriculture is neither primitive nor backward: in parts of India, farmers have shown themselves as good as the best anywhere, and as willing to adopt the latest practices and technological changes. The problem, however, is to persuade the farmers generally throughout the country to adopt the changes. If we have not succeeded, we have only ourselves to blame. This will be clear from the brief review of the various essential changes and practices in question.

Improved Seeds

The first of these is the use of improved seeds. After so many years of effort, only 15 per cent of the cultivated acreage are estimated to be using seeds of improved varieties. Dependable supplies of seeds of improved varieties and seeds tested for freedom from disease of any kind are not yet readily available. There are not enough seed farms yet, and there is not enough control over the multiplication farms. Only recently there were reported instances of seeds distributed as "improved seeds" being diseased! One can scarcely overemphasise the obvious fact that the right quality of certified seeds are an essential prerequisite to im-

proving productivity. And yet, it has to be admitted that the programme of multiplication seed-farms, of distribution of improved seeds, and of their inspection has made extraordinarily slow progress. Why should this have been the case, when the problem is one essentially only of organisation?

Soil Fertility

Our soils, after years of continuous cultivation, are in the main of low fertility. It is the considered view of experts that almost all our soils need nitrogen, three-quarters of our soil is deficient in phosphorus, and one-third of available area is deficient in potash. Adequate and right use of chemical fertilisers would rectify these soil deficiencies and pay rich dividends. In the United States, 25 per cent of the increase in yields is attributed to the use of fertilisers. In India, too, the benefits would be immediate, and possibly even greater. The farmer in India, fortunately, is not averse to using chemical fertilisers. Once he is convinced that the increase in yield will more than cover the extra investment involved, he will offer no resistance to change. During the third Plan period, it is proposed to make available one million tons of fertilisers in terms of nitrogen, 400,000 tons of phosphatic fertilisers, and 200,000 tons of potash. How much of these targets will actually be achieved, remains to be seen. If they are achieved, the resultant increase in yield will be striking. But not only is progress, in so far as new production is concerned, not encouraging, but what is produced is also not efficiently distributed, with the result that, on the one hand, production in one of the new fertiliser factories was reported very recently to have been stopped or about to be stopped, and, on the other, the farmers do not receive their supplies in good time. The machinery for, and the method of distribution, is still administratively unsatisfactory. Co-operatives used for distribution of seeds, etc., are, in parts, not as honest and fair as might be expected. Here, once again, we see a major administrative failure.

Effective steps for protecting growing crops from pests and diseases are as essential as when the crops are harvested and in storage. Plant diseases and insects, which affect yields, can be controlled effectively, if farmers are provided with such equipment as dusters and sprayers; and specialists are available near at hand to advise on the right pesticides to use. Once again, one is up against a problem of organisation. Pests of almost any kind can today be controlled effectively, and benefit in terms of increased yields must necessarily follow.

Better Implements

Improved implements of a relatively simple and inexpensive nature have been devised, but they are not yet as readily available as is necessary. Their use would materially assist the farmer in obtaining better results from cultivation and it is essential, therefore, to popularise them. The Indian farmer, like farmers anywhere in the world, is a conservative, but he is by no means unwilling to take to the use of anything that is demonstrably to his advantage. We have unfortunately not yet succeeded in discovering the right way of convincing him of the value of improved implements.

The next most important direction in which effective action is possible and would be most rewarding in terms of increased productivity is soil and water conservation. While water applied in right quantity and at right times will increase yields appreciably, inefficient use of water, too much or too little water, at wrong times, would actually reduce yields. Unsatisfactory surface drainage like excessive use of irrigation water tends to waterlogging. "In the Punjab alone waterlogging exists on some 3 million acres of land, with a serious rising water table on at least an additional 3 million acres." The Ford Foundation Team said in 1956: "There are places in India where millions of acres could be reclaimed and made productive by surface drainage at less cost and in less time than by developing new irrigation projects." In view of this situation, which is not disputed, one may legitimately inquire what steps have been taken for providing proper drainage wherever this problem exists. What is being planned to educate the farmer into controlled as against wasteful use of irrigation water? The answers to these and similar questions are unfortunately not likely to be satisfactory. Committees have been appointed and various measures have been recommended. But of action to implement, there is not very much.

Contour bunding and terracing could lead to increased yield in millions of acres of non-irrigated arable land; labour and material *plus* the necessary technical skill are all that is necessary. Organisation, coupled with competent technical guidance, will achieve remarkable results. A good deal of work has been done in this direction and, although the bunding has not always been as accurate and as extensive as necessary, the results have been remarkable. And yet, the progress, as a whole, is and continues to be slow.

Livestock

Livestock control, controlled grazing and soil erosion are all closely linked, and are responsible for much loss of land and productivity. Our cattle population is enormous and far exceeds our capacity to feed it satisfactorily. Half the number of cattle we now have is all we can afford. The smaller number would give us more milk, as also as much dung as now, for there would be more adequate fodder and feed for them. Until an appreciable reduction is achieved, every effort needs to be made to ensure only controlled grazing, so that no further damage is caused to the land. In every way, the country would benefit. And we would be more truly kind to animals and living creatures; we would have better fed healthy animals instead of mangy-looking bone and skin stunted creatures we see around us today.

These are all matters which are well known to the Ministry of Agriculture in Delhi and to the Departments of Agriculture in State Governments. Very useful pamphlets on all these subjects have been prepared and circulated. But the farmer in most areas still goes very largely his own way; he has accepted some things but he is not yet fully convinced about many others. This is where technical guidance comes in, but, unfortunately, because the technical experts do not usually inspire confidence, they fail to carry conviction. Few of these experts have ever worked with their hands and are often themselves unable to show how a particular practice they recommend should be carried out. Moreover, there is no sustained attempt at persuasion and conversion.

P.L. 480

Finally—and this in many ways is the most to be deplored—there would seem to prevail in regard to agriculture and its problems a great deal of indifference and not a little confused thinking. Lest this be considered too harsh a judgment, let me invite attention to the attitude of Government in regard to P.L. 480 imports of foodgrains, and in regard to dairy development. An American critic poses the problem in so far as the consequences of the P.L. 480 imports are concerned, thus:

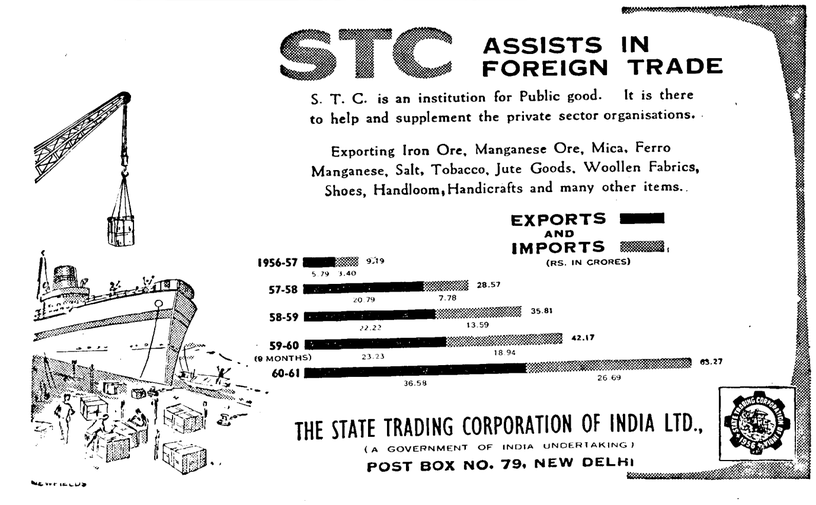
"Let me assume that a country absorbs a substantial volume of P.L. 480 farm products, that they are grants so that no payments are made for it and that the country purchases and imports the same quantities of comparable farm products as specified in P.L. 480 Agreement under which she receives U.S. farm products. Assume further that there are no close substitutes either in consumption or production within the country. Under these assumptions, take the recently announced P.L. 480 Agreement with India which apparently would provide a stream of U.S. farm products equal to 6 per cent of her domestic production of food. Imports of food from other countries continue at the same rate as before; also, imports formerly purchased from the United States are maintained as before. A price elasticity of the demand for farm foods of no less than unity, implies a reduction of farm food prices of 6 per cent which will be increased by the income effects of the rise in real needs associated with the receipts of P.L. 480 grants. Clearly, if this were the consequence, non-farm consumers would be better off. Cultivators in India, however, would be confronted by some decline of the relative prices of the farm products for purchase and sale. The incentive to maintain or expand agricultural production would have taken the wrong turn."

Since the main justification for welcoming P.L. 480 foodgrains has throughout been publicly stated to be reduction in price fluctuations and price stability generally, the full benefits of these imports can only be derived if they are in fact utilised so that prices get stabilised. Today, however, while P.L. 480 foodgrains are welcome, no real thought is given to the problem of achieving price stabilisation. Call it indifference, or call it inability to understand the farmer's problems and to grapple with them, nothing really effective in this direction has so far even been attempted.

Another illustration of this same nature is to be found in the large dairy established in Delhi under the direct supervision of the Ministry of Food and Agriculture, the very Ministry whose primary function it is to increase the production of milk. The primary justification for the establishment of such a dairy can only be the improvement of the condition of the farmer, who owns or maintains a baffalo, or a cow or two, on the small piece of land he cultivates. No doubt there exist other objectives, but these are subsidiary. And how does this dairy project proceed to serve the farmers of the villages surrounding Delhi? By fixing the price of its pasteurised milk at an arbitrarily determined low figure! It then proceeds to buy its milk not direct from the villages but from contractors, so that the farmers do not even receive the full price, which the dairy pays. The urban consumer undoubtedly gets better milk at a low or even lower price. But the farmer is certainly not better off because of the dairy. Indeed, were the dairy being run on correct lines, it should by now have led to a striking increase in the production of milk, as has been happening in the area served by the Kaira Union of Milk Co-operatives. Is it not strange that a dairy run directly by the Ministry, whose business it should be to further the interests of the agriculturists, should be so confused in its thinking as to place urban interests before rural?

It is evident that our "economic" policy today is influenced by the one dominating conviction that, without rapid industrialisation, we cannot forge ahead. To make that possible, rise in price of the basic necessities of life and of agricultural raw materials must be checked. "Fair prices" for foodgrains and for agricultural produce generally tend invariably to mean low prices, unrelated to cost of production, unrelated to prices, which may be considered objectively to be the minimum necessary to induce the farmer to put forth his best effort. How then can agricultural production show the improvement we expect or desire in it?

Two reasons, in short, may be said primarily to be responsible for the failure of agriculturist to show the requisite increase in productivity: unwillingness of the Government to provide the minimum financial incentive of fair support prices for the principal agricultural crops, and administrative indifference towards satisfactory implementation of projects designed technologically to increase the ability of the agriculturists to produce more.



When an accident occurs, a lot depends on the representative who rushes to the spot. An intelligent representative knows that the owner is anxious to get his vehicle repaired and put into service quickly. He goes all out to help him.

The MMGI representatives are trained to understand your problems. They can assess the damage and come to a settlement. This arrangement avoids unnecessary disputes and delays, makes prompt settlement of claims possible. That's why more motor vehicles are insured with MMGI than any other insurance company in South India.

MMGI underwrite Fire, Marine and Miscellaneous insurance. And in these new fields, too, you can expect the same promptness in service that has made our motor insurance so popular in South India.

STABILISATION OF FOODGRAINS PRICES

Devices, Like Antibiotics, Must Be Chosen Carefully

By S. K. PATIL

MINISTER FOR FOOD AND AGRICULTURE, GOVERNMENT OF INDIA

NEVER before in the history of India was the need for maintaining the agricultural prices at reasonable levels so great and pressing as it is now when the country is fighting the Chinese aggression on its northern frontiers. Stability was, of course, the aim even before the Chinese Dragon started extending its poisoned fangs towards our territory. Stable prices are necessary not only to reduce fluctuations in farm incomes but also to minimise aberrations in consumer prices. Assurance of reasonable return to the producer is as necessary for maintaining his incentive as assurance of stable cost of food is for maintaining prices of industrial goods. Stable prices keep inflationary pressures at bay and thus smoothen the process of economic planning and development.

Several methods of price stabilisation are known to economic literature. In practice, however, doctrinaire approach does not help always. Pragmatism has to take its place. What might suit the economic, political and social environments of a particular country need not necessarily suit another. And, what might suit a country in the given circumstances might fail when circumstances change. The method has, therefore, to be adapted to the needs and circumstances as they shape themselves. The keynote of all methods of price stabilisation is to create a psychology of confidence, for shaken confidence is the beginning of a price spiral. The need for a psychological approach is further emphasised by the preponderance of human factor and its delicate sensitiveness to speculation, rumours, subjective influences and other elements influencing the working of the human mind. All devices of price stabilisation, therefore, attempt at nipping in the bud what might ultimately swell into a crisis of confidence. But these devices, like antibiotics, have to be chosen carefully. One has to be selective and not wedded to any dogma if he is to strike at the right remedy for each ailment. After all, the remedy chosen is a means to an end and not an end in itself.

Kingpin of a Sound Policy

Public confidence being the kingpin of a sound price policy, the question arises: how to bring it about and sustain it? The level of internal production is, no doubt, the most important element and this level has got to be kept up where population is rising and export needs are pressing. But prices themselves have to be remunerative to maintain the incentive of the growers which is basic to augmentation of production. The farmer has to be assured of at least a reasonable minimum price for his produce. And this is what has been done in the case of at least the major agricultural commodities in the country, namely, cotton, jute, sugarcane, wheat and rice. This is apart from other State assistance to agriculture in the form of seed, irrigation, fertilisers, implements, credit, etc.

Internal production alone is not enough; for what is produced must find its way to the market where price formation actually takes place. The pace and pattern of farm disposal influence the market prices more than any other single factor. If the produce is kept from the market because of certain genuine bottlenecks or ignorance or design, prices are bound to be affected; and, if this happens, the situation worsens still more in the deficit areas which look to the surplus pockets for meeting their shortage. On the other hand, there are areas of large concentration of population which would suck any amount of supply from surplus regions. Any shortage, real or artificial, in these areas of heavy demand is bound to affect prices there. Thus, the price administrator has constantly to keep an eye on what might be called the epicentres of price rise, with a view to localising the adverse effects of shortages on market prices and keeping them from spreading far into other regions. This requires, particularly in the case of essential supplies like foodgrains, storage at strategic points and judicious and effective distribution therefrom. Once Government granaries are or appear to be full and their machinery of distribution alert and awake, the private trade, too, will keep the supplies moving which, in turn, would keep the prices stable. Stepping up of internal production has, therefore, to be coupled with devices which would keep the flow of marketable surplus even. To the extent the internal production is short of total requirements, there is no alternative but to supplement the domestic supplies with imports from abroad and use such imports for what has come to be known as buffer stock operation.

Localised Rises Only

One might recall that, soon after India entered into a long-term agreement with U.S.A. for import of foodgrains in May 1960, the hoarded stocks of wheat in the country came out in the open even before the American grain started flowing in. Since then, wheat prices in the country have been stable and, what is significant, internal wheat production has been steadily going up. While buffer stock of foodgrains is being steadily built up and modern storage accommodation is being progressively increased, movement of wheat from one corner of the country to the other has been made free. In the case of rice, too, the area of free movement has been considerably enlarged. Reliance has thus been put on the market mechanism to stabilise prices. At the same time, however, strategic location of stocks and governmental purchases and sales have succeeded in keeping prices within reasonable limits. Even the seasonal price rise, particularly in the case of rice which is an annual affair between July and September, was, in 1962, confined to the few States in the eastern region, where production in 1961-62 had suffered due to diversion of paddy area to jute and also to adverse weather conditions. For wheat, the rise was marked in Maharashtra, Gujarat and Madhya Pradesh where the millets crop suffered heavily and also in the Punjab where the pressure on supplies increased owing to larger demand from the former set of States. Therefore, with buffer stock operations, a stage has clearly been reached where general price rise of the past has yielded place to localised rise, which, too, is attributable to certain specific factors.

Aggression and After

The above system of price stabilisation was put to test when China attacked India in October 1962. Immediately after the aggression, Government acquired emergency powers. That was necessary for various reasons. It was, however, suggested in many quarters that those powers be used immediately and straightaway for launching a system of controls which alone, according to this view, would maintain internal prices. It was feared, and genuinely, that there would be situations of transport bottlenecks and temptations of speculative profits which would lead to rise in prices. It was apprehended that the system of regulation of market prices which had borne fruit all this time prior to the Chinese aggression might not continue to deliver the goods. But, whether in peace-time or otherwise, public confidence is the keynote of stable prices. Whether, therefore, the emergency powers are used or not, the objective should be to ensure that people's confidence is not shaken. When the whole nation is at war as one man, the interest of the trader in agricultural commodities is none too different from the interest of, say, the consumer or any other class of people in the country. There is only one interest, and that is the common interest of all. If that were brought home pointedly to all concerned, public psychology could be maintained. One could rely on the sense of patriotism and civic responsibility of the business community to stand shoulder to shoulder with their other compatriots and to so regulate their individual and collective conduct as to ensure that the supplies moved freely into the market, that there was no hoarding or withholding of stocks, that their margins were reduced and that prices were maintained at a reasonable level.

The Real Test

Gifts of money from the business community are undoubtedly welcome but, more than these, what would bear the seal of patriotism are the services that they can render to the community in the hour of need. To the extent that trade could achieve the common objective of maintaining prices stable by its own regulations and restraints, these should serve as the best reward that patriotic duty can bring them. At meetings held with the trade, their duty by the country in this hour of trial was brought home to them. They displayed their readiness and willingness to cut their margins and maintain prices at reasonable levels. It is gratifying that the trade has since been so conducting itself that resort to statutory measures has so far proved unnecessary. The whole country would applaud them as those who rose in full stature to the demands of the crisis that faces the entire nation, if they continue to exercise self-regulation and self-discipline. It will be noted that, between 10th November and the first week of December 1962, the all-India index of wholesale prices of rice has declined from 117 to 113, wheat from 92 to 89, *jowar* from 137 to 132 and all cereals taken together from 110 to 106. With the increasing arrivals of the new crop and the continued co-operation of dealers in agricultural commodities, one should hope that the prices would continue to be maintained at reasonable levels. Even so, it would be useful to have Commodity Boards to exercise regulatory and supervisory functions to ensure a continuing equation of supply with demand and standardisation of market margins at different levels.

INDO-AMERICAN RELATIONS

(*Concluded from page 48*)

to promote an "accommodation" between the two countries. "I think," said Harriman, "it is of vital importance to both of them that they do work together, and perhaps they can work together without a pact."

Steps in this direction were taken during the later part of Mr. Eisenhower's second term. Knowing well the intensity of the feeling in India and Pakistan over Kashmir, the United States decided to skip that problem and to start its efforts with a bid to help in the settlement of the dispute over the waters of the Indus River. William H. Draper, appointed by Eisenhower to study the American military assistance programme, held many discussions on the subject with Eugene Black, President of the World Bank, who had initiated (undoubtedly with the blessings of the U.S. Government) negotiations with the Governments of India and Pakistan. Draper told the Senate Foreign Relations Committee in 1958 that the solution of the Indus Waters dispute offered "an opportunity, an opening" for what the United States was looking for, namely, "some composition of the problem as between India and Pakistan." "That is more important to the future of the free world and the United States than whatever money is involved here, many times over," he emphasised. Eisenhower's Defence Secretary, Neil McElroy, agreed with this interpretation and asserted that the settlement of the dispute would in time enable the two countries to focus their attention on "their problems in the North." The Kennedy Administration has continued the policy of its predecessor and has evinced keen interest in supporting further stages in the Indus programme and has publicly announced that the establishment of close relations between India and Pakistan was "a major policy objective of the United States."

There has been widespread appreciation in India of America's good offices in the settlement of the Indus Waters dispute. The Kashmir dispute is, however, a great deal more complicated, with far-reaching ramifications. On the basis of the record, it appears that the United States would favour a settlement of the dispute on terms satisfactory to both sides. It is to be earnestly hoped that the United States would not swerve from that sound position. Any other course on the part of the United States would drain away the tremendous goodwill that its speedy assistance to India has evoked.

* * *

In the present article the writer has set forth some observations on the broad course of the relations between the United States and India in recent years. India erred in slighting U.S. warnings concerning the implications of the establishment of Mao Tse-tung's Communist regime in China. India neglected to take advantage of America's standing offer of military assistance even after its leaders were in no doubt concerning the expansionist designs of Peking. The United States played its cards wrongly in complicating the situation in the sub-continent by associating Pakistan in its military alliance programme. Despite these problems, however, sufficient good sense prevailed among the leaders of the two countries to maintain relations of cordiality and friendliness. Such differences as existed were freely and openly discussed in the two democracies—a process which may have the disadvantage of exacerbating feelings occasionally but which also keeps alive and fosters a propensity to know and understand the other party's point of view. The basis of goodwill and mutuality of interests was so strong that, in its hour of need, India instinctively turned to the United States as the principal source of assistance. Few Indians harboured any doubts as to what the response of the United States would be.

Close collaboration with the United States does not mean and does not involve any abandonment of the objectives that India has set before itself and sincerely pursued under the leadership of Mr. Nehru—the establishment of a secure peace, the elimination of the danger of thermonuclear war, the abolition of all kinds of colonial domination, and a better future for the underprivileged everywhere. In these and other tasks, India and the United States will continue, as before, to judge each issue independently on its merits. The question of our joining any bloc or military alliance does not arise at all, despite the frantic exhortations of some nervous Indians. Certainly, no suggestion has come from the United States that India should enlist itself as a member of any military alliance.

It is also absolutely necessary that we should not fall into any habit of depending on America or any other country to pull our chestnuts out of the fire or prop us up on our feet for an endless period. That will be the surest way to forfeit our self-respect and even the essence of our independence. Equally to be avoided is the habit of constantly suspecting the *bona fides* of friendly nations and giving dubious bystanders the benefit of every doubt. Above all, we must remember that this crisis too will pass and India—and the world—will go on, with new problems and challenges arising from time to time.

NEW DELHI 3*rd December*.

COLLECTIVE FARMS IN EAST EUROPE

Far-reaching proposals for the decollectivisation of farms in Czechoslovakia, East Germany and Hungary are reported to have been made to the Communist Party Central Committees in these countries. The proposals have originated at the recent secret Comecon meeting in Warsaw. The proposals vary slightly from country to country, but the basis is the same for all the three countries. According the new proposals, in farming areas which for more than three years have not been able to make deliveries of farm products in the quantities required by the State Plans, the collectives should be abolished. Farms of up to 20 hectares (about 50 acres) should be returned to their former owners or put into other private hands. Farm co-operatives should be formed for the purpose of owning machinery, which would be handed over to them by the machine-tractor stations.

The prospective private farmers would own their land, but deliveries would have to be made into the State wholesale centres and surpluses over the demanded figures could be sold by the farmers themselves. Apart from the last item, the system now apparently proposed corresponds closely to that already prevailing in Poland. The proposals, if adopted, would constitute a fundamental policy change for all the countries concerned.

The need for some drastic reforms has been felt in all these countries. As was pointed out at the Comecon secret meeting, collective farmers under the current system generally lack interest in their work and find few incentives to work well. In Hungary, collectivisation was completed only in 1960 and droughts in 1961 and 1962 would in any case have ensured a poor harvest, but it is generally agreed that too many, if not most, of the peasants there do not like the collective system and consequently do not work well under it.

CO-OPERATIVE FARMING

Tests For Evaluating Its Success

By J. C. RYAN, I.A.S. (Retd.)

NOT long ago, co-operative farming was a subject of much controversy; but now we hear little of the opposition to it. The third Five-year Plan has programmed for it; the Ministry of Community Development and Co-operation has undertaken the implementation of the programme in 320 Pilot Projects with 3,200 farming societies; the co-operative officers in the States are busy organising these societies; and shrewd agriculturists are taking advantage of the financial and other inducements provided by the Government and are joining them. By the end of the Plan period, the targets will have been reached, as co-operators know too well how they are reached; and successive evaluation reports will pour in recounting the success of these societies and advocating their multiplication. The taxpayer may be in for more taxes to support the Fourth Plan of Co-operative Farming Societies even as he has had to foot the bill for maintaining prohibition, notwithstanding the loss of revenue it has caused to State Governments, the increased expenditure it has involved them in on the enforcement staff and prisoners, and the loss of much needed foreign exchange it has brought about by hindering tourists in spite of Governmental efforts to mitigate the inconvenience. It is the purpose of this article to indicate what ought to be assessed in co-operative farming societies, if they are to be pursued as a national policy.

Four Types of Farming Societies

For a proper appreciation of the matter, one should have a correct view of what is meant by co-operative farming societies. The All-India Co-operative Planning Committee of 1945 which was presided over by Mr. R. G. Saraya, classified them under four categories: (1) Co-operative Better Farming societies in which the individual member owns the land in freehold or leasehold but cultivates it according to the advice and with the facilities provided by the society; (2) Co-operative Tenant Farming societies in which the society owns the land in freehold or leasehold and individual members take portions of it on lease and cultivate them as its tenants in the manner advised and assisted by the society; (3) Co-operative Joint-farming societies in which the individual members own their lands but lease their use to the society for being cultivated on its account with their labour; and (4) Co-operative Collective Farming societies where the society owns the land and cultivates it with the labour of its members. On 30th June 1960, farming societies of these four varieties were as follows:

(1)	Co-operative Better Farming Societies	908
(2)	Co-operative Tenant Farming Societies	2,012
(3)	Co-operative Joint Farming Societies	1,758
(4)	Co-operative Collective Farming Societies	803
	Total ..	5,631

The Ministry of Community Development and co-operation has decided that the first two classes of societies are not farming societies and that the last two alone are farming societies eligible for the various aids offered by the Government. Following this decision, in some States, the first two kinds of societies are not registered at all. Madras, however, has found the Tenant Farming Societies very suitable and in the district of Thanjavur alone (the granary of South India) there are 69 societies of this type. That State is actively encouraging temples to lease out their lands to these societies for being sub-leased to tenants, eliminating the middlemen who till now intervened between the temple and the tiller. A recent study in 21 tenant farming societies has revealed that the average yield per acre has gone up in these societies by 14 per cent.

Achievements of a Tenant Farming Society

In one co-operative tenant farming society in the Thanjavur district, where the society had taken on lease about 95 acres from a Devasthanam and divided them among 31 members for individual cultivation, the average yield per acre was 30 *kalams* of paddy, as against the previous yield of 24 *kalams* when the Devasthanam itself was cultivating the land. During 1960-61, the society collected 1,215 *kalams* of paddy from the members as its share of the produce and paid the Devasthanam 1,110 *kalams*. The society had borrowed medium-term loans from Government for the purchase of bullocks and agricultural implements and short-term loans from the Central Co-operative Bank for cultivation expenses on Government guarantee, and passed them on to its members. When they fell due for repayment, the society collected the amounts due from the members and paid them to Government and the central bank; there were no overdues. The society made a net profit of Rs. 708 after meeting its own running costs, which were not much, as the biggest item was only the salary of a part-time clerk who was paid Rs. 30 a month. Government had given the society the free services of an agricultural *maistry*.

Achievements of a Joint Farming Society

As against this, another society, which was called a co-operative collective farming society, in the same district has got into shoals. Six A class members holding lands had contributed Rs. 1,250 of share capital, 25 B class members, all agricultural labourers, had put in Rs. 375 and 26 C class members, casual labourers, had paid Rs. 26. This society took 127 acres of land on lease from its president for fifteen years. The Government lent a Senior Inspector of Co-operative Societies and a field-man to work as its secretary and technical guide, respectively. They also gave a subsidy of Rs. 4,500 and a loan of Rs. 4,500 for the purchase of bullocks, country carts and agricultural implements. The society purchased eleven pairs of bullocks and three country carts. It also bought from the president his pump set for Rs. 3,000, although it was not in working order. None of the A class or B class members took part in agricultural operations. Some of the C class members did the job; but, soon, the secretary could not find enough workers among even the C class members; and the president obliged the society by sparing the services of some of his own farm labourers for work. The society incurred a loss of about Rs. 11,000 in the first year and about Rs. 2,250 in the second year. The total assets of the society amounted to about Rs. 13,000 as against a liability of about Rs. 26,500. The central bank, which had lent about Rs. 14,500, may have to recover the amount by enforcing the Government guarantee on which the loan had been advanced. It is doubtful if the society can be set right and put on a sound business footing. This confirms the view of the Committee on Co-operation in Madras (1955-56) that joint farming on co-operative basis is not likely to be popular and capable of implementation on an extensive scale.

Financial Aids from Government

But Madras and all other States are establishing joint and collective farming societies as prescribed by the Plan; and the public will have no opportunity of comparing the achievements of joint farming societies with those of tenant farming societies as the Government of India have directed that separate statistics should not be published in the annual Statistical Statements of the Co-operative Movement in India for all the four types of co-operative farming societies but should be published only for collective and joint farming societies. Quite a lot of the taxpayers' money is being spent on these two kinds of societies. Government contribute towards the share capital of each society a sum not exceeding Rs. 2,000 per society. Long and medium-term loans are provided by Government up to Rs. 4,000 per society for land improvement, purchase of bullocks, etc. In addition, a long-term loan of Rs. 3,750 and a subsidy of Rs. 1,250 are offered to each society for the construction of a godown-*cum*-cattle shed. For cottage and village industries, they will be assisted by Government from the schemes of the Khadi and Village Industries Commission and those of the Ministry of Commerce and Industry "on a preferential basis." Further, a subsidy of Rs. 1,200 spread over a period of three years is given towards managerial expenses.

Bank Credit

It will be observed that all this financial aid from Government does not include short-term loans for the annual cultivation expenses. These are expected to be provided as short-term loans by the Central Co-operative Banks in the districts. It was indicated to Government that these banks would not be willing to lend to collective or joint farming societies, because one could never tell whether these societies would be able to repay their loans out of the income derived from joint cultivation. But the difficulty was brushed aside on the ground that *a priori* joint farming should yield larger incomes than individual farming and central banks were required to lend to them freely. Instances of heavy overdues where central banks had lent to these societies and examples of where they could not recover their dues were given, and it was suggested that, if Government were so sure that the repaying capacity of the society would be better than that of the individual farmer, they need have no hesitation in standing guarantee for the loans taken by the society. In the end, in the pattern of financial assistance from Government, it was included that Government would contribute to a special bad debt reserve of co-operative central banks "two per cent on the additional loans given by them to co-operative farming societies over the loans given in the previous year." The Madras Government, however, have very wisely agreed to continue their policy of guaranteeing the loans given by central banks to co-operative farming societies. They recognise that these banks are not the "creatures" of Government but autonomous institutions which are accountable to their shareholders and depositors and whose credit with the public and the Reserve Bank would suffer if they carry a heavy load of bad debts.

Pseudo-Co-operative Farming Societies

On account of the financial aids available to co-operative farming societies even before the present scale of Government aid was announced, several such societies had sprung up in the country to avail themselves of Government help. There were also other questionable motives which gave rise to the formation of some societies. The Working Group on Co-operative Farming (1959) stated that "attempt to evade land ceiling and secure advantage of facilities offered by Government in the grant of lands and financial assistance also led to the establishment of a few societies." They observed, too, that, in some cases, they were "merely a family affair," and in some they consisted of absentee landlords who sought "to eject their tenants or to prevent them from obtaining better rights." In any evaluation of the attainments of co-operative farming societies all such societies should be excluded. Also, societies which, under the title of Joint Farming societies or Collective Farming societies, are actually doing individual farming should be left out. It will not do to say, as the Working Group did: "*Gramdan* societies were carrying on individual cultivation and were at the initial stages." Hopes of joint-farming at later stages should not be accepted as a justification for including societies under the approved forms of farming societies for assessing their performance. Only those societies should be studied which conform to the true concept of a co-operative collective or joint farming society.

Collective Farming Societies

Collective farming societies, in particular, have to be scrutinised with care. When the Andhra area was still a part of the Madras State and I happened to be the Registrar of Co-operative Societies at Madras, I had a collective farming society registered at Nuzvid with 12 members who voluntarily offered to pool their lands in the society. Anxious to try out this new enterprise, I obtained from the Government substantial grants and long-term loans for the society to erect oil engines and pump sets to irrigate the 500 acres that were to form a compact farm. But the society could not start work. In spite of the fact that all the members belonged to the same community, disputes arose over the valuation of each one's land according to which each had to be given share certificates in return for their surrendering their title to the lands to the society. Many endeavours to bring about a compromise failed, and, ultimately, some of the disgruntled members applied for the voluntary liquidation of the society. It is very doubtful if there are today any collective farming societies where the members have surrendered their title to the lands in perpetuity. Societies of the collective type can be formed only where Government or some philanthropic persons or institutions donate their lands to a society for good. In such cases, the question of issuing share certificates in the name of each member will not arise; for, it may then have to be done by dividing the society's land into individual bits and valuing each bit. Moreover, when it has been announced that the pooling of lands in a farming society should be

voluntary, that it should be done for at least five years, and that every member should have the liberty to withdraw from the society, agriculturists are not likely to make an absolute transfer of their lands to the society. Hence, in classifying societies as collective farming or joint farming societies, only those should be grouped under collective farming societies as have the full title to the lands they possess. The fact that, in some joint farming societies, they have adopted the method of issuing share certificates for the value of the lands, livestock and agricultural implements which are pooled will not entitle them to be called collective farming societies. What is pooled in this case is only the use of the land and not the title to it. When the use of the land alone is pooled, the society holds it only on leasehold. When the lease is for only five years and when the member is free to withdraw from the society thereafter, his share capital is withdrawable. Creditors will have to beware of the value of the share capital of the society for sanctioning loans, as it will be a slippery margin of security for the loans.

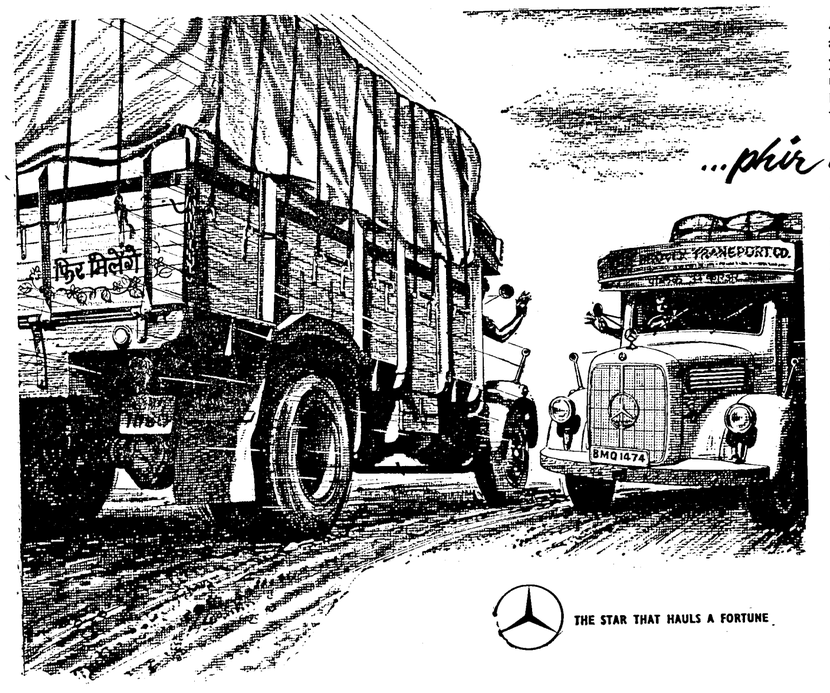
Business Test

When by the process of elimination suggested above, all pseudo-co-operative farming societies have been excluded and a correct classification has been made of joint and collective farming societies, the genuine collective and joint farming societies should be assessed on their performance, not allowing sentiment to overcome realities. In one joint farming society, which is a show-piece in the country, visitors are shown the farm which is cultivated by its members jointly; they are taken round the luxuriant crops on the fields, the irrigation wells, pump sets and channels, the cattle-yard, the tractors, etc.; they are told that the members work in groups under group leaders, that they are paid better wages than those prevailing in the neighbourhood, that they are supplied vegetables from the farm free of cost, that their children are given school books and writing materials without any charge, that the society has worked profitably, and that it has built up reserves and distributed bonuses to members on the number of work days put in by each. And yet what is the overall position of the society? The Government gave it 223 acres of lands about twelve years ago on lease at an annual rental. The rent was in arrears to the extent of Rs. 17,000 on the date when its affairs were examined critically. Six years ago, the society purchased 150 acres of lands for Rs. 1.30 lakh; but Rs. 39,000 were in arrears to the vendor of the property. The society had borrowed from Government long and medium-term loans for the purchase of this land as well as for other purposes such as godowns, land improvement, poultry project, and motor trucks, as much as Rs. 1,42,000; but it was overdue to Government in respect of these loans to the extent of Rs. 49,750 under principal and Rs. 11,000 under interest. When the repayment of the loans was in arrears, how was the society shown to be working at a profit of Rs. 24,658 at the end of 1958-59? Did the profits come from the subsidies given by Government for land improvement, the manager's pay, seeds and fertilisers and godowns? Was the income of the society less than its expenses? And did it leave no surplus to clear the instalments due on the loans every year? This kind of business test is the chief test that has to be applied in evaluating the achievements of a joint or collective farming society.

The Working Group on Co-operative Farming took the view that, "while financial position can be a good indicator of the success of a society, for a proper appreciation, it is important to know the extent to which the objectives of the society have been fulfilled." These objectives, according to them, are increased production of agricultural commodities and the economic and social well-being of the members of the society. In the society described, the yield of paddy and sugarcane per acre on the farm had declined progressively from 1954-55 to 1958-59; and the members were indebted to the society to the extent of Rs. 68,000, which they had borrowed for unproductive purposes, and the bulk of which cannot be recovered from their wages. But even if production had increased every year, and even if the members had benefited economically and socially during the period, what will happen to the members if, in due course, the society is liquidated for being a business failure? It is time that it is recognised that a co-operative society is a business institution and that, when farming is shifted from the individual's account to an institution's account, the business aspect is the most important aspect.

Pertinent Point

The point is that institutional farming entails the payment of wages, whereas individual farming seldom employs paid labour. The small land-holder toiling on his farm does not take into account his labour charges; and his wife and children work on the farm without wages. In a co-operative joint-farming society, not only has the member to be paid his wage but the members of his family also have to be paid wages if they work on the farm. In one joint-farming society in the Trichirapoly district, which I had sponsored, the members complained that the wages paid were below the rates prevailing in the neighbourhood. It was explained that what they were paid was only an advance and that, when the produce was harvested, they would get an additional payment. This did not satisfy them, and the society had to give in and fix their wages at the local rates. Later, they complained that these wages, too, were inadequate and went on a strike. The society was obliged to enhance the wages further to retain their labour, and, in the end, the society's wage bill had eaten up all its income from the harvest and its own share capital, besides leaving the Government loans heavily in arrears. For a proper evaluation of joint-farming societies, therefore, the cost of agricultural operations, of which wages form an important part, should be carefully reckoned and compared with the income from the farm. Depreciation on machinery, livestock, buildings, etc. will also have to be taken into account. Enthusiasts for joint-farming may say that institutional farming *should* result in increased production, and that the increase *should* more than cover the cost of production and depreciation charges. But realists will ask whether it *does* really cover them? Moreover, as a co-operative institution, the society has to pay dividend on share capital and bonus on wages earned. Will the increased production be so large as to enable the society to meet these payments too?



Any time of the day or night, along India's highways and byways, you'll come across signs and messages gaily painted on the backs of T-M-B truck tail-boards. This one cheerfully says:

...phir milenge

"we'll meet again..."

Ahead of this driver lies an arduous journey over rough roads, steep gradients and marshy ground, but his reliable T-M-B overcomes these hazards without a protest! Soon he will be back again with his speedy, economical STAR to haul yet another load of fortune.

Economic Implications Of The Present Emergency

Heavy Additional Taxation Inevitable

By Dr. P. S. LOKANATHAN

THERE is, undoubtedly, some difficulty in analysing and assessing the economic impact of the present emergency, because one does not precisely know the scope, limits and dimension of the Chinese aggression. Will this be only a border war or will it turn out to be more serious than that? How long and persistent in an active way would this aggression continue to be or last? There is a general belief that the emergency will continue in its present form for the next two or three years, perhaps longer. But one can never tell.

While, therefore, there is an essential element of uncertainty in respect of the nature and duration of the emergency, what is not in doubt is its impact on the scale of our thinking in regard to both defence and development. The Prime Minister said the other day that the present emergency was a blessing in disguise. It has already altered the scale of our thinking. The problems of defence and development have assumed a new dimension, the effects of which will be apparent in the next few years. Not only should defence effort be mounted up fast and in a substantial way, but the scale of our development planning should also undergo a radical, almost a revolutionary change. Economic development and defence are not unrelated to each other; industrialisation and the building up of a strong economic base are basic to defence. Viewed in this light, it is clear that our Prime Minister was right. The emergency is a blessing in disguise. If it can revolutionise our ideas, in relation to the scale of our planning, and, if we take full advantage of the opportunity thrown by the challenge posed to us, the country will have gained a great deal.

Savings Must Be Stepped Up

Time was when even the modest investment target of the third Plan was regarded as ambitious and excessive and it was argued that the targets should be limited to the resources immediately available or near at sight. It is now evident that these targets are modest, if not inadequate, and that we must build up our economy rapidly and substantially. To have allowed ourselves to be severely limited by the poor rate of savings of 10 per cent of our national income is seen in the present context as both short-sighted and weak. India can no longer afford to be a mere 10 per cent saver. Within a few years, she should strive to become a 15 to 20 per cent saver. There can be no hope otherwise of the country being both able to defend itself and to raise the standard of living of the people.

The emergency does provide the opportunity. The requirements of the war (or defence) brook no delays or shortfalls. It is agreed on all hands that our defence forces should be doubled in the next 12 months or so. The additional outlays involved in the doubling *plus* the needs of equipment, supplies and other requirements would involve an overall expenditure of at least Rs. 500 crores, even after allowing for the import, under lend-lease or any other arrangement, of the more sophisticated armaments and equipments from friendly countries.

Some expansions of the capacity in ordnance factories to meet the defence requirements and further expansion in related sectors of the economy, e.g., transport, power, etc. are also necessary. Similarly, in the industrial sector, after allowing for fuller utilisation of existing capacity, additional expansion in the key industries like chemicals, petro-chemicals, engineering, plastics and some further development of electronics may be needed; all of which would imply an extra investment of Rs. 200 crores or so. The pruning of relatively unnecessary or low priority plans and expenditure may result in a saving of about Rs. 100 crores. But care should be taken to ensure against hasty or ill-conceived cutting down of all so-called unnecessary expenditures in the field of social overheads, some of which, even from the short-term point of view, are essential. Already the haste with which some of the States have reduced their Plan expenditures has created problems of unemployment and slowed down development. However, some reduction of expenditure is fully justified and called for. Making allowance for this, an extra Rs. 600 crores (in addition to the Plan outlay) would seem to be called for.

Whatever be the contribution to saving by voluntary means—through the different forms of contributions like defence bonds, defence certificates and market loans—it would be wholly inadequate for the heavy demands made by the present emergency. No amount of voluntary effort can meet the situation; additional taxation to the tune of an extra Rs. 300 to 400 crores will be needed for the emergency alone. Taxation in the present context has a double purpose. Its first purpose is to provide the Government with the sinews of war; but equally its purpose is to ensure that the burdens and sacrifices are, to the extent possible, distributed according to ability. Only taxation properly devised can protect the poor against uneven sacrifices. Voluntary savings cannot distribute the burdens equitably between the different sectors of the community. Another important objective at the present juncture is to ensure against inflation and high prices which would hit the poor more than the rich. It is clear that all available resources should be diverted for defence purposes, defence-oriented industries and for mainly essential consumption.

Taxable Capacity

The supply of consumer goods cannot, of course, increase as rapidly as that of defence goods, capital goods and others required during the emergency. But incomes will increase because many more will be newly employed; many will have fuller employment and those already employed will increase their earnings because of overtime and other similar opportunities to increase their incomes. The stream of money supply will flow more intensely but the flow of consumer goods will be thin; the flow of some of the goods may even dry up. In such circumstances, if inflation is to be avoided and if the price line is to be maintained, there is no escape from the responsibility of mopping up all surplus purchasing power in the hands of the community to such an extent that there may be a matching to the extent possible between the money flow and that of consumer goods. Hence taxation is trebly needed.

Is it possible to raise such an enormous amount of financial resources? The view that the limits of taxable capacity have been reached already in our country just because the average *per capita* income is low is untenable. Taxable capacity is not something fixed; in an emergency like this, it may be assessed as equal to Gross National Product (G.N.P.) *minus* essential consumption for maintaining the strength and morale of the people. But even in other cases it is conditioned by a number of circumstances, for example, the purpose for which the taxes are raised and the nature of the expenditures incurred and also institutional factors. The question, therefore, is not whether we can raise sufficient financial resources but how and in what ways. In war-time, no country can afford not to meet its imperative financial needs. How much and how easily sufficient resources can be raised by additional taxation will also depend upon the increases in national income that may be added in 1963 and in the following years. If national income which during the first two years of the third Plan has been increasing only at a rate of about 3½ per cent rises 7 or 8 per cent, the extra income can be mopped up more easily by raising marginal taxation to 50 or even 60 per cent. All excess incomes and earnings and purchasing power accruing to people during the emergency and later should be mopped up through additional taxation. In the last resort, recourse will have to be made to deficit financing. But the extent to which we manage our financial affairs at the present juncture without recourse to considerable deficit financing and meet both our defence and developmental expenditures will be a measure of the success of our policy.

New Taxation Outlined

No one can pretend that he has the answer to the methods of mobilising enough financial resources. I wish to indicate below the kinds of taxes that may be imposed but, ultimately, it is the responsibility of the Finance Minister who has both the knowledge and the power to take suitable taxation measures:

	Approximate yield Rs. (crores)
1. Excise	150
2. Income-tax	20
3. Corporation tax	35
4. Salt tax	35
5. Tax on bank advances and advertisements	10
Total taxation ..	250
Non-tax resources :	
1. Borrowings	75
2. Savings through diversion and cut in non-planned expenditures	100
3. Relief to the Centre ..	75*
4. Deficit financing	50
Grand total	550

* On the assumption that the States will be able to raise revenue to the tune of Rs. 50 crores by scrapping prohibition and Rs. 25 crores through economy in expenditure. Thus the total tax effort will be to the tune of Rs. 300 crores.

If for political or other reasons it is not found possible to scrap prohibition or levy salt tax, either higher rate of taxes may become necessary or higher degree of deficit financing may be permitted. But the country may be ready to undergo sacrifices and hence it should not be beyond the ability of the Finance Minister to mobilise the financial resources to the full extent necessary. It may be emphasised that this addition in revenues will be over and above what the Government would, in normal course, require to meet Plan obligations.

II

Impact on Industrial Structure

What would be the impact of the present emergency on the industrial structure of the economy? There is bound to be some switch-over from civilian production to defence industry and to basic industries related to defence. But the extent to which such switch-over is possible seems to be limited. What is more likely is that the defence industry and basic industries will be geared to fuller utilisation of capacities and maximum production and that expansion of capacity will be built up quickly and significantly. In order to ensure full production, industry should be provided with essential supplies of raw materials, spares and components in adequate quantities, some of which may have to be imported. Labour has patriotically come forward to co-operate fully in the task by agreeing to work in double and triple shifts. The establishment of an Emergency Production Committee by the Government to facilitate production and help in removing obstacles and bottlenecks is a welcome step.

But the most important task is to secure expansion of facilities in essential industries. These would include chemicals, including petro-chemicals, plastics, engineering and electronics. Detailed studies will be required to assess the needed inputs and ancillary requirements for the additional output to be planned. As already pointed out, some capacity may be switched over from production of consumer goods, for example, the entire capacity for producing automobiles may be set aside for army trucks and jeeps. Curtailment of resources for making cars, refrigerators, air-conditioners, radios, etc., will have to be enforced. Similarly, in respect of certain essential articles like cotton textiles, the production of fine, superfine and innumerable varieties of cloth should give way to standard and utility production. To save materials and labour for the essential construction needs of defence, private residential construction and unnecessary construction should be banned. The whole question of control and distribution of raw materials and allocation for essential and urgent uses assumes enormous importance at this juncture and a full-fledged control organisation should be set up. There is need to strengthen the present Ministry of Defence and Supply Co-ordination by making it responsible also for control of production.

III

Agriculture Plays Key Role

Both from the point of view of meeting the additional defence requirements and easing the balance of payment problems, agriculture holds a key place. The food requirements of the new recruits may not be a net increment in demand, but there will be increase in food demands and the scale of food consumption will also alter. Additional food supply required must be forthcoming from agriculture, in addition to meeting the rising demand

of the growing population. The balance of payments position also requires that we should be able to save on imports of raw cotton and other agricultural commodities. It is also essential to increase exports of oilseeds and other export crops. Hence, for all these purposes, reorganisation of agriculture is a most urgent task and there should be a crash programme through the Community Development Organisation to bring about a rapid increase of production through double cropping, through fuller use of water, fuller use of fertilisers and so on. Towards this end, all functions, not directly related to raising production, must be assigned a lower priority. This, for example, will apply to health, housing and welfare of backward classes. New priorities will have to be established and village production plans must be established anew. The additional financial provision for minor irrigation, dry farming and seeds and fertilisers is a step in the right direction. But greater and close co-ordination of different agencies functioning in the rural areas must be effected.

IV

Exports and Balance of Payments

Balance of payments position will be a very difficult one and foreign exchange will continue to be a serious bottleneck. Additional foreign exchange to the tune of about Rs. 100 crores may be required not only for maintenance imports but for essential imports for expansion of certain industries. It is here that there is great need for ingenuity to secure for India credits from friendly countries in addition to what they have promised us for the third Plan, besides the lend-lease arrangements for defence purposes. In this connection, the extent to which we succeed in mobilising the gold hoards and securing a large subscription to gold bonds is a crucial factor.

The need to increase exports has become even more urgent than before. Unfortunately, there is great deal of loose thinking on this matter. Already many people feel that, because of the needs of defence, there would immediately be a diminution of exports. While there may be restriction on exports of particular items, our policy should be to aim at an acceleration of exports. In this connection, it may be mentioned that, at the recent Board of Trade meeting, it was decided to plan for what may be called an Export Sector in the economy by which in respect of every industry export products may be identified and facilities for large production and export may be provided. Our aim should be to increase exports, wherever possible, by intense efforts towards accelerating agricultural and industrial production.

V

Inflation and Price Levels

That there is going to be a great pressure on prices cannot be doubted. The incomes will increase as a result of enormous expenditures and at the same time the essential supplies for civilian consumption will diminish. It is possible to achieve a great deal of restriction on consumption without causing undue hardship because our economy has been, to some extent, diversified now; the supply of civilian consumer goods is not so limited or poor as in the last war. Nevertheless, there will be scarcities of some commodities and scarcities in some areas—cloth, vegetable oil, kerosene oil, pulses and a few other commodities, but there is no need for any large-scale rationing of the kind which was attempted during the last war. Apart from scarcities which give rise to high prices, the lack of proper distributive arrangements and transport facilities and lack of trading organisations are the main factors that contribute to an increase in prices. The Government's efforts to establish co-operative stores to control wholesale trade and to bring about better distribution system is on the right lines.

There are certain special problems which may have to be dealt with on a war-time basis. The bottlenecks arising out of transport and power shortages had emerged even before the emergency, but this would become more acute now. Short-term measures to meet transport must be undertaken. The improvements of roads, the building and strengthening of bridges, removal of unnecessary restrictions on the movement of goods from one State to another may all be needed. So far as power is concerned, there should be some austerity and some rationing in its consumption. But power shortage cannot be remedied in quick time.

VI

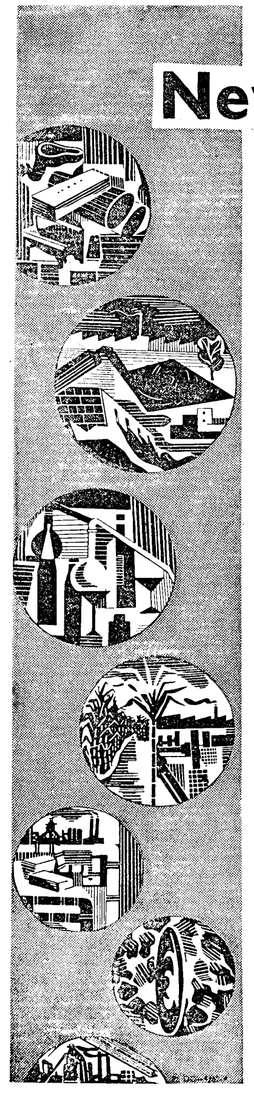
Manpower Problem

The whole question of manpower problem has not been tackled in a proper way. While there will be less of unemployment and underemployment, there will still be pockets of unemployment and, at the same time, there will be scarcity of trained personnel for a number of jobs. The most urgent task here is the immediate preparation of estimates of the additional requirements of trained personnel for various kinds of related services for defence requirements and for other essential administrative requirements. There is need also for a good recruiting programme, accompanied by a quick training programme.

Above all, the Government machinery should be geared to the present emergency situation. We have little experience in dealing with the emergency of the nature that exists today. This should be immediately remedied, if necessary, even with foreign advice.

There should be co-ordination in the Cabinet also. In the U.K., several Co-ordinating Committees were established in the last war. There was a Cabinet Priority Committee, Material Sub-committee, Manpower Sub-committee, Works Construction Sub-committee, Industries Sub-committee and Special *Ad hoc* Subjects Sub-committee. These Committees did a marvellous job and the consumption of raw materials like cotton, wool, non-ferrous metals and leather was all greatly restricted. Here in India, too, we shall have to have an administrative machinery to ensure that wastes are reduced to a minimum.

In conclusion, it may be stated that the emergency should be regarded as an opportunity and a challenge. There is no room for pessimism. The response of the public has not only been enthusiastic but pretty sustained and the public will be prepared to do things and accept sacrifices which in normal peace-time they would have never agreed to. We should take advantage of this situation to mobilise adequate resources not merely for meeting defence requirements but also for ensuring rapid economic development, especially the industrialisation of the economy. Our objective should be to take advantage of the present situation to intensify both defence efforts and development efforts. The view that there would be an inevitable slackening in the momentum of economic development can only be accepted in the immediate run. Over the next few years both should be possible; only, the scale of national effort should be greatly raised and sustained.



New Horizons

In pre-Independence era, India had plans and programmes for social and economic betterment of the people. But there was a fundamental weakness – the weakness of their belonging more to the Government than to the people.

Independence came, and with it a new awakening, and people's plans, for the people, by the people. The results were tangible – more and more of better and cheaper things ; a better way of life for more and yet more people of our land.

We of DALMIA ENTERPRISES have been constantly endeavouring to produce more and more of such goods that contribute towards improved living standards of our people. We are doing this not only since Independence but almost for a quarter of a century. The task is not so easy. Yet we are going ahead, undauntedly, in the hope of seeing a brighter tomorrow .... a new dawn .... along the new horizons.

CONCENTRATION OF ECONOMIC POWER

Unwarranted Fear Rendering India A High Cost Industrial Producer

By An Esteemed Correspondent

THE belief that the time has arrived for the adoption of stringent measures to prevent concentration of economic power in India would appear to be based more on presumption than on fact. The presumption has apparently arisen from acquaintance with conditions which have developed in the United States of America during the last few decades. The fear is that similar conditions might eventually develop in India, unless the growth of corporate power is continuously kept under control. It is necessary to examine whether the fear is justified and, for the purpose of such an examination, to get acquainted with the actual conditions prevalent in the United States. One has to wade through several U.S. reports to gather some knowledge of the vast power of economic influence wielded by big business in that country over every aspect of life and human behaviour, but there is a book by Gunther Stein published in the year 1953 in New York with the title *The World the Dollar Built*, from a perusal of which one could obtain sufficient material to warrant being aghast at the economic consequences of such concentration in a country where private enterprise has unlimited and unrestrained scope. The statistics furnished in the book are over a decade old; nevertheless, by and large, the general picture given there could be taken to be substantially the same as exists today.

Position in U.S.

In the following paragraph is given a summary of Gunther Stein's analysis, almost in his own words. We may assume that the facts are authentic, as most of the material appears to have been taken from published reports and surveys:

Round about 1950, the U.S., with six-and-a-half per cent of the world's population, owned close to half the world's developed wealth, harvested one-third of the grain and half the cotton grown on earth, melted 55 per cent of the world's steel and other basic metals, pumped 70 per cent of its oil, used 50 per cent of its rubber, generated 45 per cent of all mechanical energy, produced 60 per cent of the world's manufactured goods, and enjoyed 45 per cent of the entire annual income of humanity. The wealthiest 48 corporate giants in that country owned assets of over $120 billion which was more than one-sixth of U.S. national wealth, placed at $648 billion. As employers of labour, the 11 leading industrial corporations eclipsed the Federal Government. Technically, none of the companies *alone* monopolised its field of business. But, in many industries, a few companies did. They followed policies and practices which avoided any real competition among themselves and yet maintained their dominant positions. The huge domains of many industrial and banking concerns were merely the provinces of junior dependencies of even greater financial empires whose controls extended not only into every sphere of business but also into the nation's increasingly commercialised agriculture; not only into press, radio and film, but even into the hallowed halls of colleges and universities which they subsidised and influenced. Eight main "vertical" business empires controlled more than half of the 48 billionaire corporations. The leaders of this enormous corporate power were in a position to determine how much the nation was to produce, consume, invest and try to export; how many jobs there were to be, what incomes the people were to earn, what prices to pay, what life to lead, what role America was to play abroad, what reactions she was to arouse among her foes and friends, and how the nation's foreign policy had to respond to the realities which Big Business created at home and in the outside world. All this was possible, because private enterprise managed almost every field of national activity including public utilities, railways, telephones, telegraphs, communications, airways and waterways.

It is my thesis that such developments as have taken place in the U.S. *cannot* take place in India, where we have a mixed economy, some part private and a large part public, over which a very large measure of Government control exists, and the economy is essentially planned and executed with due regard to set priorities. Even if mistakes are committed here and there, any concentration of economic power in the hands of private individuals would take several decades to develop with sinister significance. The position today is that there is far more concentration of economic power in the hands of Government than in any other sector.

Industrial Policy Resolutions

The two Industrial Policy Resolutions of the Government of India clearly define the extent and scope of permissible private enterprise. These are being zealously interpreted and adhered to both by the Planning Commission and by the several Economic Ministries. Questions of doubt are decided only at Cabinet level. Government has retained in its hands enormous powers of control under the Essential Commodities Act and the Tariff Commission Act to investigate into prices and impose price control where necessary. The Indian Companies Act and the Company Law Administration tie up all company managements into knots, and regulate their day-to-day activities in such a manner as to allow no person or group to acquire any form of unhealthy control over units engaged in the production, sale or distribution of goods.

The rules governing the licensing of industrial undertakings are so vast and so onerous that the colossal effort that has to be put in before an industrial undertaking comes into existence leave entrepreneurs almost physically and intellectually emaciated before a productive enterprise eventually comes into being, not to mention the fact that, after it is established, managements have to be constantly at the portals of Government for diverse favours and also practise callisthenic kowtowing on pain of being black-listed.

There may be a few groups in the country which control a larger number of business enterprises than others. But this is inevitable in any society where neither organisational ability nor monetary affluence is evenly distributed. A pragmatic approach to the problem of industrial development can be achieved not by oppressing the fortuitously elevated but by controlling them from using their elevated status to defeat social justice. To equate the mere existence of a few affluent groups with "concentration of economic power" leads only to vague and presumptive fear of what might happen under uncontrolled conditions in the distant future.

The fear of concentration of economic power has recently manifested itself in two directions. The first is disapproval of any diversification of existing industrial units into unrelated lines. The second is disapproval of licences being granted to the comparatively more affluent groups for ventures involving heavy investments, for which large financial resources, and organisational and entrepreneurial ability of high order is called for. The economic consequences of these two disapprovals which are based on ideological considerations can be highly deleterious to national economic development.

Diversification

As regards diversification in manufacturing units into unrelated lines, two reasons have been mentioned in support of the disapproval. The first is that, under inflationary conditions, when the stock market is buoyant, speculation would be encouraged, if established concerns are permitted to take on new industrial ventures. And, in order to remove this possibility, Government would only permit *new* companies to be started, so that the investing public would have fresh opportunities for investment and ownership of enterprise would tend to be more broad-based. The second reason is that, if a company is permitted to continue its operations in different fields, there is the apprehension that it would result in concentration of wealth and economic power in a few hands.

In an academic thesis, both these objections may be considered valid upto a point. But, in formulating the policy for industrial licensing, an essentially pragmatic approach is called for when applications for diversification are received. Increase of output in the original line of manufacture may not be advisable beyond a particular stage, especially if conditions had changed since the date of original establishment, and locational disadvantages had set in. Difficulties may have arisen regarding raw materials, both in supply and in quality, or there may have taken place shifts in the patterns affecting production, distribution and selling. Undertaking a new line of manufacture may be the only way of reducing costs and protecting labour. Starting a new company will benefit neither the equity capital nor the labour employed in the old company, and will not prevent concentration of economic power so long as the management remains the same for both ventures.

Case of Sugar Industry

In India, where high cost of production affects the fortunes of most industries, academic or ideological objections against diversification should not be applied by rule of thumb. The case of the sugar industry, especially in north India, affords a good example of a field in which diversification can be an excellent way out of the difficult situations faced by several units which are forced to employ substandard raw material and maintain production only for three or four months in a year. The balance-sheets of quite a few units which had been allowed, in the past, to diversify their manufacturing activities provide much better reading than those of the rest. At a time like the present when sugar units are being called upon to undertake exports and make sacrifices, the logical way of strengthening them and augmenting their resources would be to permit them to embark on other more remunerative lines of manufacture within existing units. The case of the East India Distilleries and Sugar Factories Ltd. provides an example of how strong a primary sugar producing unit can become when it is permitted to undertake other lines of manufacture, which, in the case of E.I.D.S.F., cover such totally unrelated lines as fertilisers, pottery, sanitaryware, chemicals, etc. The orderly transfer of resources or even the raising of fresh resources for manufacturing new products may constitute the only way of protecting shareholders and labour interests in many units which are facing dead-ends or other difficulties. Diversification in such cases is, in fact, a process of rationalisation. Disapproval of such rationalisation on the plea that concentration of economic power has to be avoided can be treated only as alienation of pragmatic commonsense from economics, the more indefensible as it is based on irrelevant ideological considerations.

Waste of Resources

We now come to consider the economic effects of the slogan of concentration of economic power. The current trend appears to be for issuing licences to a number of new and small entrepreneurs in diverse regions of the country without considering the several factors which are essential for achieving quick implementation and for securing low-cost production. Political pressure exercised by the various State Governments has resulted in a measure of capitulation to their demands in disregard of the economics of production. Fear of the bogey of concentration of economic power has also resulted in discarding the merits of established and proved entrepreneurial ability, financial as well as organisational, to the extent that certain new ventures which have been licensed are likely to result as drags on the economy.

The case of automobile tyres illustrates haphazard licensing in good measure. The present established capacity in the industry is 18.18 lakhs; schemes under implementation cover 20.23 lakhs, and schemes under consideration aggregate 13.03 lakhs. The total of established capacity, capacity under implementation and capacity under consideration thus amounts to 51.44 lakhs. If and when all these schemes are eventually implemented, there will be eleven units, of which three will have capacities of 10.25 lakhs, 10 lakhs and 5.10 lakhs; one each will have capacities of 4.50 lakhs and 3.60 lakhs; and six will have capacities of 3 lakhs each. The first three units (which are international in character) will be able to achieve production at comparatively lower cost than the rest, partly through their long-standing experience and partly through economies of large-scale production. All the rest will have to trail behind them. Apart from being unable to offer the giants any kind of healthy competition, they may have to be continuously supported by disparate price policy or other measures. In addition, what has not been taken note of is the question of royalty fees which will have to be paid by every unit to its foreign collaborator. This multiplication of foreign collaboration must result in considerable drain of foreign exchange to the country and payment for invisible imports of technical knowledge. Rubber tyre manufacture started in India nearly 30 years ago and no effort has been made so far, nor any appears to be in the offing, for research to be carried out in India, outside the tyre companies, in any of the important processes involved in the manufacture of tyres and tubes. If the number of licences that have been granted had been kept to a minimum, and a pilot project for the manufacture of tyres and tubes had been undertaken, the country's economy would have greatly benefited.

Cost Will Be Higher

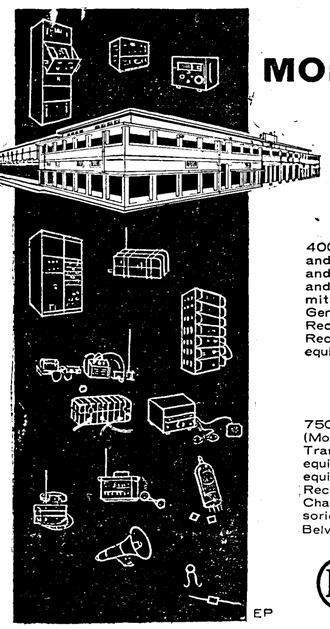
In the field of aluminium manufacture, out of four projects sanctioned, only two have made progress, and the prospects of the other two being established appear to be remote. The Minister for Commerce and Industry has recently stated that a plant at Madhya Pradesh in the public sector is under consideration and that the Mysore Government has applied for a separate licence in the State, outside the one in the private sector which had been sanctioned but has not registered any progress. Here, again, the same kind of mistake as was made in the case of rubber tyres and tubes is likely to be repeated if the new units which are under consideration are not licensed for high capacities. The manufacture of aluminium also involves heavy payments in technical fees and the few units which are under production are never likely to achieve manufacture at low cost on account of the high cost of electric power. If the aluminium produced in India is to achieve its versatile uses and replace costly metals like copper, it is of paramount importance that production is established at as low a cost as possible.

The Planning Commission is reported to have negatived the suggestion by a syndicate of Madras industrialists to establish a thermal power plant in the private sector, although the scheme was supported by the State Government. The reasons why this suggestion was not approved have not been made clear. But, reading between the lines of pronouncements in authoritative quarters here and there, it would seem that they can be (*a*) because the generation of electricity has been scheduled as a prerogative of the State, and (*b*) that, if the private sector is allowed to encroach into this sphere of public enterprise, it might lead to the transference of economic power to private parties. Under the prevalent acute shortage of power which acts as a severe drag on the development of industries, the objection to the establishment of a power plant by the private sector must be considered puerile.

Examples of Italy and France

It would, perhaps, be useful, if the Planning Commission was provided with information regarding developments which have taken place in advanced countries in Europe like Italy and France which, at any rate, are not guilty of having permitted unrestrained concentration of economic power in a few groups to the detriment of national interest. The building of Autostrades in Italy has been through the combination of private enterprise and State participation. Companies who built the Autostrades were usually given a 30-year lease during which they could collect a toll from users, and at the end of which the roads reverted to State control, while the toll collected by the builders was reduced to a nominal levy. There are about 700 km. of highways in Italy at present in use, half of which have reverted in this way. In France also, joint State-*cum*-private projects have built a huge suspension bridge and 18 major highways, covering a distance of 3,250 miles, and the expenditure was recouped by a graduated system of toll over a period of years at the end of which ownership reverted to the State.

The fear of using national talent and national endeavour at a time when every means should be availed of for accelerated development can become very juvenile, if pragmatic and economic considerations give place at every stage to ideology and irrelevance. The compulsions of the country's economic needs make it imperative that the task of educating public opinion towards harnessing all the means, resources and talent available in the country in furthering industrial progress without sacrificing the principles of economic and social justice is as much the concern of Government as of politicians and industrialists.



MORE NATIONAL EQUIPMENT

means saving Foreign Exchange

The steady but rapid progress made by BEL has contributed to our sound National economy. The equipment manufactured in this factory are equal to the world's best and competitive in price. Buy more national equipment and save foreign exchange.

H. F. EQUIPMENT

400 Watts H. F. Transmitter, 1 kw and 5 kw SSB Transmitters, 2 kw and 20 kw ISB Transmitters, 1 kw and 10 kw Medium Wave Transmitters, H. F. Transreceivers, General Purpose Communication Receiver, Independent Side Band Receiver and accessories of HF equipments.

V. H. F. EQUIPMENT

750 mw (Manpack) 20 watts (Mobile) and 50 watts (Static) Transreceivers, VHF Multichannel equipment, VHF-AM Tone Signalling equipment for Railways. VHF (FM) Receiver, Single, Twin and Ten Channel Transreceivers and accessories of VHF equipments and Belwin Transmitter.

A. F. EQUIPMENT

Engineer Consoles, Preamplifier, 10 watt and 40 watt Monitoring Amplifiers, 2 watts General Purpose Amplifier, Console and Portable Tape Recorders and Tape Decks.

MISCELLANEOUS EQUIPMENT

Belhaler (Transistorised Megaphone), Hearing-Aid, Faraday Cage, Audio meter, AF Generator, Vacuum Tube Voltmeter, Crystal Harmonic Generator, Output Meter and Regulated Power Supply Units.

COMPONENTS

Radio Receiving Valves, Crystals, Ceramic and Mica Capacitors, Chokes, Coils and Transformers... and soon Transistors.

EP

RESOURCES FOR DEFENCE

Voluntary Contributions Alone Will Not Do

By "Reflector"

THERE is a lull in the border fighting due to the unilateral Chinese withdrawal. Probably, the Chinese may not be anxious to resume the hostilities in view of the success achieved in damaging our military reputation and the change in international situation following the "Cuban Affair." But it is difficult to be categorical because of the many political imponderables. The Government of India has, therefore, been going ahead with its efforts to mobilise the nation to place it on a war footing. It is equally keen not to sacrifice the basic industrial complex and agricultural development of the third Plan, because these are considered essential to build up the war potential and to hold the price line. The endeavours put forward to attract private savings to the public Exchequer have invited a great exhibition of patriotic fervour but negligible monetary response. The subscriptions to the National Defence Fund collected so far (Rs. 19.02 crores as of 15th December, 1962) will hardly be adequate to meet the military expenditure even for a few days. Similarly, the subscription received so far for gold bonds is a few thousand tolas as against the estimated gold hoards of 20-crore tolas. It is obvious that the results achieved do not seem to be commensurate with the war needs. The Finance Minister has declared categorically that he would be financing the additional expenditure on defence through taxation and borrowing and not by deficit financing. The necessary measures would be proposed in the 1963-64 budget. Parliament has, therefore, adjourned without making any overall assessment and without taking any decision on appropriate economic policies. The object of this article is to outline broadly the dimensions of the expenditure involved in the Government's decision, the type of pressures such expenditures would generate and the policies necessary to keep a grip on the economy.

Less for Civilian Use

A point to be remembered about the war expenditure is that it does not result in the creation of any matching productive assets. This is because the bulk of the supply of goods and services produced are employed in destruction. Naturally, this will mean less goods and services for civilian use but the money created to pay for such goods and services will go on progressively mounting up. Thus, "too much money" will be chasing "too few" goods and services. The fiscal and monetary policies should, therefore, aim at sterilising the money incomes created by war expenditures.

Even before the proclamation of the emergency, it was evident that the third Plan was limping badly. National income during the first year (1961-62) of the Plan went up by 2.2 per cent, as against the projected rate of 6 per cent and an increase of 2.4 per cent in the population. Agricultural output remained stationary and the rate of industrial production slowed down owing to bottlenecks in power, transport, etc.—the legacy of the pruning done in the second Plan. The foreign exchange reserves touched a new irreducible minimum (Rs. 94 crores) due to delayed assistance from abroad. The pressure on prices was visible once again. This is the background against which the national emergency has been declared and the nation exhorted to divert its energies to war effort.

The expenditure on defence during the emergency, on a very conservative basis, is expected around Rs. 700 crores a year or twice the normal budgetary expenditures on defence. Probably an expenditure of this order will be necessary to feed, clothe, transport and maintain the *jawans* on a war basis even if somebody is prepared to supply the equipment without immediate or no payment.

As things stand at present, the combined public sector expenditures, inclusive of the normal defence spending, are around Rs. 3,500 crores, a quarter of the total national income, and the extra defence expenditure, owing to the emergency, besides the normal step up in the third Plan outlays, may be another Rs. 300-400 crores. The nation will, therefore, have to spend about Rs. 4,000 crores a year, in addition to the increase in third Plan expenditures which may be conservatively placed at another Rs. 1,000 crores next year. An increase of, say, Rs. 1,400 crores in expenditure in a year which probably will be progressively stepped up over a period of years to implement the Plan 'core' but which will not be accompanied by a matching increase in consumer goods and services will invite a hyper-inflation of the type witnessed in post-war Germany before the accession of Hitler to power. What is urgently necessary is, therefore, a blueprint of wartime monetary and fiscal policies to be pursued by the Government. But the Government of India is yet to announce such a policy.

Short-term and Long-term

In considering the impact of the emergency expenditures on the economy, it is necessary to distinguish between the short-term and the long-term impact. In the short-term, until the presentation of the 1963-64 budget next March, the additional expenditure may be of the order of Rs. 200 crores on defence. In view of the ample buffer stocks of foodgrains, the decline in gold and commodity prices due to the initial shock of Chinese invasion and official measures and the exhibition of patriotic sentiment, the Government seems to believe in voluntary effort to check the inflationary pressures. The Government has in view the starting of a chain of consumer cooperatives to distribute the essential commodities to hold the price line. The Finance Minister has declared himself against the imposition of controls. As the Government has not introduced a supplementary budget and as the public response to National Defence Bonds, etc., is negligible, it is obvious that the expenditure up to next March has to be met by deficit financing. The fall in commodity prices, the accumulation of cloth stocks, the continuing under-utilisation of capacity in various industries—all symptoms of slow down of the economy and of transition from peace to war will prove a temporary phenomenon. It is likely that an expenditure of this order (Rs. 200 crores) in the next few months may push up the present price level (129.1 with base 1952-53=100), which has already gone up in the past year by six points or five per cent if the past experience in this regard is any guide.

In the long run, it may be difficult to hold the price line through voluntary controls and patriotic feelings. This is so, because while it is easy to whip up public enthusiasm for war effort initially, it would be extremely difficult to sustain the enthusiasm over a period. There is already evidence of this view, as witness the recent kerosene shortage at the capital city (Delhi) and the increase in the "black" prices of cement. The expansion in money supply must, therefore, be matched by an increase in the volume of available goods and services or something must be done to sterilize the monetary hoards. As the first alternative is ruled out in view of the acute bottlenecks in industrial production which are expected to be further aggravated when the economy is geared for war purposes, special measures are necessary to inactivise the growth in money supply.

Some Suggestions: E.P.T.

A step which is usually resorted to in war-time is an excess profits tax. The main justification for such a tax is that war-time profits are due to inflation and not due to normal business efforts. The various business establishments have voluntarily agreed to donate 5 per cent of their net profits to the National Defence Fund but the national emergency requires more drastic measures. Excess profits made by business and industry over the normal profits, that is to say, profits made in the last three years preceding the national emergency, may compulsorily be required to be invested in long-term Government Bonds issued for the specific purpose. Likewise, net income in excess of Rs. 1 lakh a year by individuals may be asked to be invested in such Government Bonds. This will place a temporary ceiling on incomes in the urban sector during the emergency.

Gold Bonds

The steep decline in gold, share and commodity prices after the declaration of the emergency has achieved a deflation of the order of Rs. 1,000 crores in private savings. If the Finance Minister succeeds in bringing down the gold prices to Rs. 70 per tola as promised—this, however, seems unlikely—he will have succeeded in introducing a substantial deflation in hoarded savings in the non-urban sector. As things stand at present, gold prices, after touching a low of Rs. 82 per 10 grammes recently, have shot up once again to Rs. 116 per 10 grammes. The prospects of mobilising the idle wealth held in the form of gold, therefore, seem remote, unless more drastic measures are taken.

An important measure that could be taken to make the Gold Bonds attractive is to ban officially the possession of gold beyond a small minimum, say, 25 tolas, by each individual family for personal purposes, namely, on religious and social grounds. Possessing gold beyond the minimum should be made a penal offence. All gold in excess should be asked to be made over to the taluk treasuries or village post offices against valid official receipts. The Government may license dealers in gold on the pattern followed for licensing foodgrain dealers and disposal of gold outside should be severely punished. In advanced countries like the United States, private possession of gold is banned and there is no reason why this should not be done under conditions of emergency and when people are in a mood to sacrifice. This should be followed by a big propaganda drive, explaining the need for such prohibition to educate the public, especially in the countryside. It is, however, possible that all gold might not come out. But it is likely that the response will be more encouraging than what it is at present. Unless drastic measures are taken and the price of gold is brought down, the scheme of Gold Bonds will turn out to be a flop as the Prize Bonds' Scheme has been.

Land

Further, the various measures to restrict land-holdings should be vigorously pursued, so that they may go a long way towards preventing speculation in land and diverting the rural savings into real estate. The imposition of agricultural income-tax, enhancement of land revenue and special surcharge on cash crops like cotton, groundnut, tobacco, etc., for the duration of the emergency, may help in taking away a sizable part of the war-generated incomes to the national exchequer.

Economy

Simultaneously, a rigorous pruning of non-essential expenditure at the Central and States' level seems called for. The expenditure on civil administration in the States has gone up from Rs. 167 crores in 1960-61 to Rs. 194 crores in 1962-63 and the total non-developmental expenditure from Rs. 418 crores to Rs. 525 crores. A reduction of 25 per cent in such expenditure will result in a saving of Rs. 25 crores only at the States level. Similar screening at the Union Government's level will yield more fruitful results.

Prohibition and Salt Tax

An important direction in which the States can increase their revenues is by scrapping prohibition during the emergency. It is expected that the abolition of prohibition in all the States will give a substantial additional revenue, besides saving in security expenditure on police. While States like Uttar Pradesh, Mysore, Andhra Pradesh and Kerala, which are having partial prohibition, have almost made up their minds to scrap prohibition in the national interest, Gujarat and Madras, which have complete prohibition, have been adamant and want to retain it. In Maharashtra, which is also wholly dry, there seems to be a move to reconsider prohibition policy. In the interest of uniformity and in order to raise revenue, the Centre should direct all the States to scrap prohibition at least for the duration of the emergency. The imposition of salt tax may also be explored. If the several measures cited above are explored, there is no reason why the nation cannot take the additional defence and Plan expenditures without losing its grip on the economy.

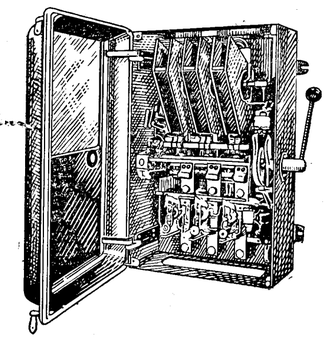
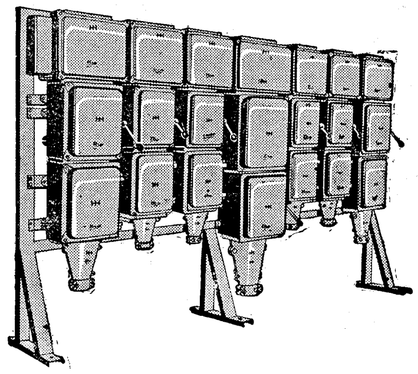
CALL ON 'ELCON' FIRST FOR LOW TENSION DISTRIBUTION GEAR

ELCON



IRON-CLAD
AIR BREAK CIRCUIT BREAKER
WITH COVER OPENED

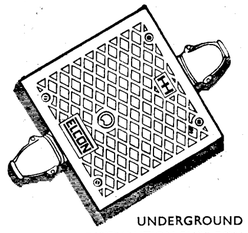
* Compact
* Trip-free lever type
* Thermal and electromagnetic overload relays
* Arc-chutes with magnetic blow out
* Easy accessibility
* Standard flanges for direct assembly to our boards



IRON-CLAD UNIT TYPE
L.T. SWITCH FUSES
&
DISTRIBUTION BOARDS

* Totally enclosed
* Simple in erection
* Switch and fuses in separate enclosures
* Two-tier arrangement
* Easily extensible at site
* Wide interchangeability
* Internal parts easily accessible

ELCON GEAR ARE APPROVED BY THE FIRE INSURANCE ASSOCIATION OF INDIA B.R.C.
TESTED BY THE ALIPORE TEST HOUSE
Our present programme includes:
LIGHTING DISTRIBUTION FUSE BOXES
LOOM SWITCHES AND COMBINATION SWITCH FUSES



UNDERGROUND
DISTRIBUTION FUSE BOX

* Heavy duty
* Watertight
* Floor flushing
* Easy to install
* Introducing latest, efficient and economical system of distribution
* Suitable for cotton, jute, silk, textile and similar industries

MANUFACTURED TO DESIGN OF AND IN THE TECHNICAL COLLABORATION WITH MESSRS. HAZEMEYER N.V. OF HOLLAND

ELECTRIC CONTROL GEAR MANUFACTURING COMPANY

THE CRISIS OF THE COMMONWEALTH

Discomfiture And Decline For Britain Ahead

By Dr. THOMAS BALOGH

FELLOW OF BALLIOL COLLEGE, OXFORD

THE bewilderment and shock in India is natural at Mr. Macmillan's determination to sue for admission to the Common Market, to cut the remaining ties (beyond "gracious" Royal visits) with the Commonwealth, the *ci-devant* Empire. Here after all is the head of a political party which even a year ago affirmed its loyalty to, and faith in, the Commonwealth system and accused the Opposition of not being "patriotic." Here are the people whose fathers grew rich on the pickings of capitalistic dominance scuttling out at the first suggestion that they should shoulder some economic burdens, as benefits the richer part of a political system now based on equality and co-operation.

Tories' Fond Hope

Far from being willing to analyse afresh the beneficent role which such a system could play for all its members, they suddenly embrace the "Liberal" faith—to shake off the obligations that accumulated in the two hundred years in which English needs and English policies shaped the pattern of the population and the economy in these areas. Malta without the dockyard, the West Indies and Mauritius without the need for sugar would never have become what they are, bursting with populations in many cases transplanted from China, India and Africa. The self-satisfied self-praise on the supersession of Empire by a peaceful march towards independence really hides a determination to cut expense. Joining the Common Market will enable the Tories to do this, while they are confident that their innate superiority and political skill will permit them to dominate the new European Community. In this way, they will, in a new fashion, once more be able to make their voice heard in the world and protect their interests. They seem as unaware of the brutal strength of their prospective new partners as they are of the great advantages in economic strength they still derive from the informal but effective preference for the English language, for English goods and English services due to the existence of Commonwealth ties. Giving this up they are bound to suffer a further eclipse in power and influence in the new European Community.

These apprehensions are brushed off in a cavalier way, both here and in America. The growing resistance of the Labour Party to British entry on the basis of a strict acceptance of all provisions of the Rome Treaties, the doubts cast on the bipartisan approval of the Conservative policy has been dubbed a betrayal of the budding "unity of Europe," which has brought comfort to Mr. Khrushchev and weakened the coherence of the West.

Americans Impatient

No doubt Americans are impatient for a "final" solution of the German problem, for the establishment of a powerful bloc capable of meeting the Russian challenge with less dependence on the U.S. This dependence has created a severe balance of payments problem for the U.S. which endangers American prosperity and growth, and thus undermines the capacity of the leaders of the West to meet the Russian socio-economic challenge in vital non-committed areas. They are easily driven towards violent short cuts, and are reluctant to see the grave problems which are created by their impulsive insistence on what they conceive to be a perfect solution.

The desperate longing of the anti-Communist Left in Europe for a British entry is equally comprehensible. They feel isolated in a Conservative-dominated Little Europe. Their only hope seems in bringing in not merely Britain but the Scandinavian countries which believe in progressive social policies and planning. They, too, are impatient with British doubts and objections. It seems left out of account that the Rome Treaties were formulated mainly by the new and brilliant French technocrats, necessarily without any regard to the special problems raised by the relation of Britain to the Commonwealth. And they embody—at least superficially—a *laissez faire* philosophy of life such as has been enforced in the U.S. by the Supreme Court until Roosevelt broke its inflexible majority against State intervention and initiative, and which the very people who are the most insistent protagonists of a Union of Europe would be the first to repudiate. Nor is there great likelihood that the progressive planners will make headway even if Britain did enter. The cards especially of judicial interpretation are stacked against progressive policies.

All Choices Distasteful!

In this essay, I shall review the question mainly from a British angle. In the history of this country, the choice, which is now more and more openly admitted, between entry into the Common Market and maintaining even a semblance of a cohesive Commonwealth, is as grave as any which have confronted it before. It seems the catastrophic end of disastrous policies. If, in the affairs of a man or a nation, a time comes when all possible choices appear distasteful or fraught with grave danger, it is useful, indeed essential, to reflect on how one got into the dilemma. Past choices and past mistakes may well illuminate the problem more clearly than arguments about the present, for they will show the often unstated premises which brought the situation to its present predicament. If these mistakes are not remedied, I feel confident that the choice, however it may fall, will lead to further discomfiture and decline for Britain, with disastrous consequences to the cause of the non-Communist orbit itself. Those crude "cold-war" precepts, which seems to have dictated the policy of the State Department in its attitude to Britain's joining the Six, the formation of a cohesive Great Power able and willing to resist Communism in Europe are, in my opinion, based on naive emotions (finding unwarranted similitude with the formation of the U.S.) and are likely to lead to disillusionment and regret.

I

After the war, Britain found itself in a position of unchallengeable pre-eminence in Western Europe. She alone had stood up to the Nazi threat in 1940. While her contribution to the actual liberation of the Continent had been less than that of her giant partners—the U.S. and the U.S.S.R.—she had earned and was granted equal status. No doubt her capital equipment was run down; she had suffered severe damage and her population was exhausted. But, in her war-time controls, she possessed instruments which could achieve conscious allocation of her resources to maximise progress and ensure social equity. And the war-time created a strong Sterling Area in which Britain enjoyed undoubted favourable treatment such as the Ottawa Empire preferences had never been able to supply. Bulk-purchase agreements for foodstuffs and raw materials also initiated during the hostilities provided stable markets for the overseas areas, while the metropolis benefited from relatively low prices. Moreover, there was an economic union between complementary economic areas, capable of being developed into a Third Power and of giving an exemplar of planned socio-economic progress without totalitarian compulsion.

Splendid Opportunity Missed

It was not to be. Insistent American pressure starting with the Lend-Lease negotiations and the Bretton Woods Conference, and reinforced by the normal predilections of the British bureaucracy, led to policies of liberalisation and currency convertibility which, as early as 1947, ushered in the first of the eight exchange crises in British post-war history. Bankruptcy and unemployment seemed inevitable not merely in Britain but in the whole of non-Communist Europe, in the face of an acute dollar shortage.

At that point, the Americans recoiled from their own dogmas and inaugurated the Marshall Plan. They voluntarily permitted a sharp discrimination against American exports and the establishment of a double preferential system which united the Sterling Area and Western Europe. With the establishment by Mr. Gaitskell, against the resolute opposition of the Treasury and the Bank of England, of the European Payments Union, this new economic unit became a working system which was to lay the foundation of Europe's recovery.

Here was a splendid opportunity. Britain could have utilised the Organisation for European Economic Co-operation, created to administer American aid, for a close co-ordination of investment plans and of trading between Western Europe, Britain and the Commonwealth, thus laying the foundation for a reconstruction on a regional scale and on a sensible inter-governmental basis. But British officialdom, clinging to its "liberal" tenets, prevented this even under the Attlee Government, and thus sealed the fate of British pre-eminence in Europe.[1] They resisted all attempts at an intra-European planning of investment which would have enabled specialisation and thus made Europe more competitive in world markets while becoming more complementary internally. The French, incensed by British standoffishness then began their drive towards a supra-national union in Europe and as a first move established the European Coal and Steel Community.

[1] It is illustrative of impudent ignorance of these luminaries that Lord Plowden, who was Sir S. Cripps' unfortunate choice as his chief planner, and was largely responsible for this failure, now claims that no planning could achieve such co-ordination, while our entry into the Common Market would automatically do so.

With this Britain's chance of European leadership lapsed.

In the second place, Britain could have resolutely opposed any plan for partial West European economic unification either by using the most-favoured-nation clause (for a customs union in agriculture was not to be established) or by political hostility. This would have been fatal to the Common Market, because, in each of the potential member-countries, there was powerful economic and political opposition to union, partly, perhaps mainly, because of its partial and rather negative character. The planners ("*dirigistes*") in Western Europe, especially in France and Italy, were frightened of a scheme which embodied *laissez faire* as the basis of the new community. Moreover, the rest of Western Europe was frightened of German predominance not merely for economic but also for political reasons. The outlook for peace, with a truncated Germany aiming at reunification, within a large Western European combination, would not, under such circumstances, be bright. British hostility would certainly have prevented ratification in France and possibly in Italy.

The British Government themselves could have taken the initiative. They could have promoted the creation of a loose but far-reaching economic unit, dedicated to maintain full employment and having built into it the necessary institutions to safeguard growth. A positive leadership might conceivably still have worked as late as 1955 but on only a less informal inter-governmental basis than would have been possible in 1948-49.

Badly Misinformed

The British Ministers did none of these things. They seem, if their statements and policies are an indication, to have been imperfectly informed on developments abroad, especially about French attitudes, which proved to be decisive.[2] Nor were they better advised on the economic implications of the proposals. They waited, doing nothing, until the Treaties establishing the Common Market were agreed upon at the Messena Conference, and even until they were subsequently ratified. After some further delay, the Board of Trade published ill-considered arguments against joining the Common Market, disclosing publicly that the professional competence, on the basis of which policy decisions were made, left much to be desired.[3]

Finally, the so-called "large" "Free Trade Area" scheme was brought forth to include the whole of the O.E.E.C. area. This aimed, in the first instance, to establish in Europe free trade in *industrial products* without, however, a Common Tariff or harmonisation of socio-economic policy. The latter deficiency made it as unacceptable to the French; the former to the poorer non-industrial areas of Europe which would have been ruined by it. The plan thus contained in an exaggerated form the objectionable negative features of the Common Market scheme without any of the mitigating policy provisions and institutions by which the harshness of the uncontrolled market forces to the weak nations might be curbed. This tactic was hardly consistent with British interests, because no conscious and determined effort had been made to increase the rate of investment in Britain and to speed technical progress by all possible means. Indeed, the intermittent deflationary policy necessitated by the efforts to maintain the balance of payments within a framework of liberalised trade and progress towards full convertibility had exactly the opposite effects. Without a drastic change towards dynamic expansion, it ought to have been clear to the Government that Britain would not be able to meet successfully the shock of German competition in a regime of "free trade" after all protective devices had been abolished under the proposed E.F.T.A. arrangements. Thus, the British proposals were framed with a complete ignorance of the requirement of British industrial prosperity and were inimical to British progress. Throughout this period, moreover, and disregarding the increasing probabilities and, after 1956, the certainty, of the coming into being of a new powerful preferential system in Europe as a result of the establishment of the Common Market, *they continued in the insensate policy of unilaterally weakening, indeed almost completely destroying the Sterling Area*, which gave preferential access to our exports over a wide area. Yet here was a powerful counterweight, the dismantling of which could and ought to have been used as a bargaining weapon with Europe and the U.S.A. A dogmatic frenzy appears to have overcome, at an unfortunate moment, a historically pragmatic Conservative Party and Government. Under the powerful stimulus of a clever bureaucracy totally ignorant of modern economic[4] analysis an arrogant ultra-liberal attitude dominated British policy at this fatal juncture.

E.F.T.A. A Bluff

Worse was to come. The "large" Free Trade Area proposals were rejected with contumely by the Common Market powers under French leadership. No alternative having been prepared, the British Government first hastly tried to patch up a counter-force in the "little" Free Trade Area of seven nations—from Portugal to Norway and Austria. This effort was doomed from the outset, because, apart from Britain, it contained only small peripheral powers with little in common, and little strength, fatally depending on the Six for markets and communications. Like the pledges given to Poland in 1939, this move was bluff which only impressed the bluffer. It was a host of promises on the part of the British, almost impossible to fulfil but dishonourable to repudiate. The futility of this tactic has hardly any historical parallel.

The British Government could have retraced their policy towards the Commonwealth and tried to build up again the Sterling Area. They were, however, under growing American political pressure against this course. The Americans wanted a compact allied Europe. They did not take into account that the exclusion of the "neutral" countries would fatally weaken them and thus promote Russian interests in Europe. The blow to the exporters of the Pacific "old dominions" of Britain joining the Six would, moreover, force them to come to some agreement with China, Japan, and India to find new outlets for their foodstuff production and thus weaken the U.S. defence posture in the Pacific.

In the end, Britain found herself without any bargaining counters in hand and unprepared for increased competition. The Conservative Government then decided to throw in their hand and to sue abjectly for admission into the Common Market on the terms of the Continent, which formerly had so eagerly sought British co-operation on almost any terms which Britain could have named. The timing of this surrender could not have been less aptly chosen: The Six had experienced unparalleled growth in the period before while maintaining a vast export surplus. Britain was all but stagnant yet (or, rather, because of it) beset with balance of payments difficulties. Not many months afterwards the Germans and Italians experienced rude shocks to their confidence; wages were beginning to mount and progress slowed down. Negotiations undertaken at a time when an economic setback began to loosen the coherence of the Six might have meant a triumph for Britain in reconciling the interests of the Commonwealth with European integration on the basis of deliberate planning.

II

The Common Market of the Six countries, Western Germany, France, Italy, Belgium, Holland, Luxembourg is a many-splendoured thing. It has come about after the failure of the British to make use of the Marshall Plan to establish a wide Third World Unit equivalent to the U.S. and the U.S.S.R. in power and economic potential and comprising both Western Europe and its associated areas *and* the Commonwealth. For some, it is mainly a powerful economic unit. The width of the Market—almost 200 million even without Britain—according to them provides automatically the basis for rapid growth. The obverse feature of this claim is, of course, that it also represents a "rich man's club," from the privileges of which the (poor) outsiders (and the U.S.) are, if not entirely excluded, at least limited by the protection of a common tariff and, as in the case of agriculture, certain rather more powerful quota-regulations, much as the 50 American States are protected from foreign competition by the Federal tariff and commercial policy. Some—like most of the French Civil Service—would like to extend the sort of persuasive, untotalitarian planning they practise at home to comprise the whole area. Others—especially the German entrepreneurs and their political spokesman, Dr. Erhard, who aspires to be the next Chancellor of West Germany—will not hear of planning and hope that the superior competitive power of Germany will give them free play for prosperity and expansion on a strictly nineteenth-century basis.

Up till now the Six have been wonderfully successful in the material sphere. Their economic growth was well above 6 per cent per annum between 1953 and 1961, as against 1¾ per cent in Britain and some 2 per cent in the U.S. Despite the increasing discrimination against outside goods, Common Market imports increased very fast, far faster than either those of Britain or the U.S. But the relative cheapness of its products and the aggressive selling tactics, including favourable credit conditions, resulted in an even faster increase in Common Market exports. Germany now has the second largest gold reserve in the West; and France and Italy have recently increased theirs by billions of dollars. Wages in real terms have been increasing faster than anywhere else but in Japan and full employment is being attained in an increasing area.

Rate of Growth in Six

All this has given tremendous prestige to the Six and to the idea of *laissez faire*, despite the fact that the French and the Italians have increasingly relied on a kind of persuasive planning in which Government and the great enterprises as well as trade unions establish production targets and see to their accomplishment by co-operative effort. The economic success was, in fact, mainly due to the cut in the value of currency by the so-called reform in Germany and the devaluation in Italy and France which reduced real wages and thus gave decisive competitive advantages to these countries. The rate of growth was high in Germany, France, and Italy before the Common Market became effective but has remained low in the other three little countries despite its coming into effect. It will be interesting to see what will happen if and when growth slows down and the "free market" economy experiences a setback. Dr. Erhard does not seem to realise how far his success has been due to the competitive advantage of German export. It is to be feared that, if a recession occurs, he might react in an "orthodox" way (as his predecessor Dr. Bruning did in 1930), cut expenditures, and thus spread havoc. If the British want to join, this surely is not the time for trying to do so. They should have waited until after a setback tested the new Community.

For most people, including Mr. Kennedy's advisers, the Common Market represents a new *political* departure, the rise of a powerful anti-Russian unit, which would enable a better distribution of the burden of defence. They realise the distinct economic disadvantage for the U.S. of the discrimination against it, especially in temperate zone agriculture, but also in manufacture, implied in the Common Market. They are, however, prepared to pay the price (the magnitude of which they seem unaware of) for the political advantages. They are enchanted by the fact that the German-French differences and hostilities which plunged the world and Europe into incessant warfare since the beginning of the sixteenth century, and caused two World Wars in the present one, would cease. They forget that the rise of the two super-States, of the U.S. and the U.S.S.R., has in any case reduced intra-European affairs to the status of provincial difficulties. The rise of a powerful Third Unit might well cause more rather than less trouble, especially as the most powerful member of that unit is a Western Germany intent on reunification, when reunification without neutralisation would inevitably provoke a war with Russia. The growing dissensions with Adenauer and de Gaulle show that the political promoters of the Common Market in the U.S. have gravely miscalculated the effects of a super-European unit on U.S. influence in the North Atlantic system of alliances. It is this miscalculation which now drives them to favour the entry of Great Britain. Whether Mr. Macmillan or Mr. Gaitskell leads Britain, they think it would act inside the Common Market as a spokesman of the Anglo-Saxons moderating Continental excesses. This is quite comprehensible.

Six Suspicious

Equally comprehensible is the fact that the Continental leaders, who want to retain their independence and influence so unexpectedly won after the disasters of two wars which all but liquidated Europe, eye with suspicion this newly found British fervour in favour of Britain joining the Six even when this means abandoning the Commonwealth, those proud remains of erstwhile British supremacy and Empire. This explains why the French, in particular, are determined to force Britain to renounce her special relations with overseas countries. The American hostility to the entry of the neutral countries and the Scandinavians, however, is as incomprehensible as its lack of appreciation of the consequence in the Pacific area of the exclusion of Pacific exports (both Indian and Japanese manufactures and Australian, Canadian, and New Zealand agricultural products) from Europe. It must drive those countries to an accommodation with China. The U.S. does not seem to realise that the new post-Eisenhower policy of *detente* would be menaced, if the British were confronted with a Franco-German compact which could veto policies in a unit of "Seven," while, in a unit of Eleven or Fifteen, the smaller countries, hostile to adventure, would be more likely to back the American line. Like the British, the Americans seem to have acted in ignorance of possible developments inimical to their interests.

III

In the meantime, the French civil servants, aware of the prodigious and potentially devastating German competitive power, succeeded far beyond my early expectations in providing positive institutional safeguards. Moreover, the surprising resilience of high-cost producers outside Germany during the 1957-58 recession showed that German competitive power would remain on a political leash through some sort of cartel arrangement and would not be permitted to destroy the weaker units within the new union. There was to be no displacement of "high-cost producers" as the most effective way of "increasing income in a customs union consisting of competitive rather then complementary units" on which "liberal" economists based their commendation of the Common Market. Thus, the Italian steel industry remained intact, despite a 25 per cent under-employment in 1958 of German steel-making capacity. The foolish irrelevance of those economists who tried to "measure" the advantages of the customs union on the basis of comparative static considerations (through the "specialisation of the participants") has been once more exposed. The importance of growth to economic welfare has once more been demonstrated.

Britain Mesmerised

If the fears that the strongest economic power would swamp its partners within the Common Market proved wrong until now, the

[2] Sir Gladwyn Jebb (now Lord Gladwyn) who has, surprisingly, become the figure-head of the pro-Common Market movement, was at this period Ambassador in Paris and shares heavily in the responsibility for this prolonged blundering.

[3] A surprising exception to the rule of silence on the part of serving Civil Servants (apart from their defence of Government policy on television) is represented by Sir Edgar Cohen's recent defence of the so-called Free Trade Area proposals (*Board of Trade Journal No.* 7 1958, pp 975-78). Sir Edgar showed complete unawareness of the flagrant contradictions of his case and unawareness of the resistance he was facing (e.g. he attempted an illegitimate contrast between the effect of protection of industry and agriculture—p. 977, completely neglecting the impact effect on British industry, or on that of the less developed countries of British Commonwealth, of German competition). He was even less clear of the implications of failure or of the need to have an alternative policy. In this, he is a worthy successor of those British experts who torpedoed the Ouchy Convention of 1931 on the plea of non-discrimination while preparing for the Ottawa Preferential System. Sir Frank Lee's (the then Permanent Secretary of the Board of Trade) recent utterances on the work of the Board of Trade (Stamp Memorial Lecture 1958) only strengthen the impression of grave weakness on vital points of the policy-making machine. At this stage, the Board of Trade successfully persuaded Ministers that entry into the Common Market would destroy our competitive power through an increase in our cost due to the tariff protection of foodstuffs and certain raw materials.

[4] I have analysed the fatal role of the British bureaucracy in an essay published in a collection entitled "*The Establishment*." London, 1960.

impact abroad did not prove unfavourable either. No doubt all the large members of the Common Market absorbed an inordinate amount of gold through continuous export surpluses, but these reserves came from the U.S., while, at the same time, imports from overseas, especially from the underdeveloped world (and Britain), into the Common Market, continued to expand. It was demonstrated once more that tariffs do not stifle trade when national income is vigorously expanding. The slogan coined to differentiate between "outward looking" expansionary and "inward looking" restrictionist, customs unions, according to whether their tariffs are low or high, has been shown up as a dangerous oversimplification. Instead of demanding safeguards on general economic and income policy, the British have been mesmerised by tariff levels on which French resistance was as easy as it was successful. Thus the British negotiators did not win even where they might have obtained binding assurances from the Six.

Moreover, the French and Italian success all demonstrate that Britain would, in the framework of the Rome Treaties, be permitted to accelerate her economic development by deliberate planning, or that the overseas countries will not be hurt. The French and Italian examples are, however, not applicable to Britain, unless sterling is sharply devalued and Trade Union strength is broken. The French revival of the early 'fifties was based on inflation buttressed *by direct controls on foreign trade and payments*. In the French Community, they possessed a vast preferential market overseas. Through increasing productive investment, this preparatory phase was to provide an increase in productivity which decisively benefited France after 1958. This would not be feasible in Britain *after* it joined the Common Market. The French revival after 1958, and the Italian spurt (just as the German miracle after 1948) have been due to a more or less severe depression of real wages relative to the world economy. There has been a consistent and very large excess of exports, and planning could restrict itself to discouraging unwanted ventures. In Britain, on the contrary, planning would have to consist of positively encouraging investment which is necessary. This would not be feasible. Without a *successful* devaluation (i.e., an appreciable cut in real wages), because Britain would not be capable of consciously increasing and directing investment into innovation in the new framework of the Rome Treaties, according to which it must eschew the use of direct controls. The choice of the timing of our entry could, therefore, not have been more unfortunate and if our entry coincided with a slowdown or a setback on the Continent, the impact on Britain which has yet to accelerate her growth, might be calamitous.

The total immorality, however, of devaluation as a means of a successful entry is patent: it would involve an open if partial default on the sterling reserves of the Commonwealth countries which Britain will in any case severely hurt through the abolition of the existing preferences. It is totally incomprehensible that most of these countries have not begun to liquidate their sterling holdings in London. Nor is it by any means certain that a devaluation will be effective in restoring British industrial resilience.

IV

In final analysis, the effects at home and overseas of the economic unification of Europe (and also of Britain's entry) will depend on whether it imparted dynamism only to the strong and inhibited the growth of the weaker members of the non-Soviet orbit, or would be used for a balanced development of the constituent countries and resulted in a fairly strong impulse to expansion all round i.e., including countries outside. This will depend partly on the institutional arrangement (but in my opinion only to a minor extent on the exact nature of the common tariff), and to a much greater extent on the policies pursued. Neither can be foreseen in any definite manner, though, as the picture unfolds, increasing doubts seem forced on the even basically sympathetic observers.

Dominance of Finance

There is little doubt that the enlargement of an economically unified area must weaken the capacity to plan deliberately for accelerated economic development, unless it is followed by the creation of new organs capable of doing for the new unified area what the Governments of the constituent units would do. In a "free" market customs union, the most dynamic and least progressive units would acquire decisive power and dictate through their strong creditor position. The banking interests, moreover, can co-ordinate their policy through the Basle Bank, the B.I.S., whilst there is no supernational planning body. It is to be feared that, in this respect, the dominance of the Franco-German financial circles will be detrimental, unless it can be offset by determined efforts on the part of the rest of the Community to plan. There is no guarantee that this latter will happen, especially since the Rome Treaties make judicial obstruction to planning easy while the enforcement of agreed plans between the member-countries can easily be sabotaged. The existing institutions created under the Rome Treaties are far too weak to do the job. The European Investment Bank represents a small fraction of the difference in investment capacity of the different members and could not be used for an effective equalisation of opportunity without such enlargement as would make it a completely new institution. The European Social Fund suffers from identical disability.

Only if Britain's entry was followed by that of the Scandinavians and the Austrians, thus giving the planners in the Common Market a sufficient majority, could this be hoped for. Unfortunately, there is no reason to think that British influence under a Conservative (and, if the power of the Civil Service is not reduced, even under a Labour) Government will be exercised in favour of European planning. The desire of the French, Dutch, and Italian planners for British entry is quite understandable. But it does not mean that some form of planning for full employment and growth will be the accepted system for the enlarged Common Market. Professor Erhard's rejection of all suggestions for deliberate planning was absolute. There is no reason to expect a change in attitude on the part of Germany. And the planners will not have any opportunity without such a change.

Indeed, it is to be feared that the ultimate consideration which determined the Conservative Government to sue for admission was the fear that the isolation into which Britain had drifted as a result of past policy mistakes could not be retrieved by a solution based on the Commonwealth, because this would demand too great an effort and sacrifice, as well as too conscious a commitment to planning and the reintroduction of direct controls. This would be needed, because investment innovation would have to be speeded up for obtaining a minimum of export surplus, in order to be able to sustain a recrudescent Sterling Area. Britain outside the Common Market would suffer a further weakening of the dynamism of her industry. Yet her relative competitive power is already gravely affected by her seeming incapacity to devote a high enough proportion of her resources to investment to match that of her main competitors. Unless this is remedied, Britain could be left helpless in the face of subsequent worsening of the terms of trade due to increased competition, whether coming from Japan and the Common Market, or, ultimately, from Russia. Conversely, the shock caused by the decision to join would succeed in effecting the necessary transition to dynamic expansion. In addition, the desire to weaken trade union bargaining power through increased competition from abroad must have been a powerful motive on the part of some of the champions of the Common Market. An emulation of the German and French miracles, a cut in real wages administered through devaluation (in the German case currency reform) and profits and investment might then be hoped for.

V

It is unfortunate that these dynamic considerations counselling caution received so little attention in recent debates. The conventional pleas in favour of joining the Common Market were based more or less on the nineteenth-century static "Free Trade" argument (in less propitious circumstances for Britain) that Britain would *ipso facto* benefit by becoming part of a large free trading area. But, unlike the countries of Latin America or West Africa, Britain is neither too small nor too poor to be able to provide industry with broad enough markets in efficiency. A merger to obtain the advantages of mass production is—apart from a very narrow range of industries, e.g., aircraft—not needed. The failure of British industry to shed its oligopolistic integumen will not necessarily be altered. Nor is it plausible to assume that there will be vast opportunities to specialise in ways which would increase productivity. Standardised tastes do not exist, and there is no reason to assume that trade promoted through aggressive selling methods necessarily increases satisfaction.

Conversely, the effects of being exposed to the competition of less socially conscious countries on industrial survival might be disadvantageous, if not worse. The idea that the good and bad effects of a union are shared alike by all and that, because the "whole area benefits" (if this expression has any meaning at all), *every part* will share in the benefits is certainly not convincing. The world is littered with regions which have become penurious as a result of joining with powerful partners; Nineteenth Century India, Ireland, and the South of Italy or Twentieth Century New England in the U.S. are only some flagrant examples. It would, of course, certainly be unreasonable to claim that Britain is likely to suffer the fate of India or Ireland, for her industry is strong. But it is unwarranted to claim, on present evidence, that she will necessarily gain. It should be noted, moreover, that Britain will exchange a very favourable preferential arrangement with a complementary area, the Sterling Commonwealth, for one which is strictly competitive. The consequential loss in trade will not necessarily be offset by gains.

A Fallacious Argument

The argument that increased competition increases efficiency has been shown to be fallacious by the lesson of the 1920's: all the world had then free entry into the British market. British industry decayed and only the "inward looking" protectionism of Ottawa succeeded in reviving it in the 1930's—still quite insufficiently to secure full employment. The experience of the 'fifties is equally conclusive: competition has increased in world markets. Our imports have been steadily liberalised. But British business as a whole has become weaker, as exemplified by the continuous deterioration of her share of the world market in manufactures and the rapid increase of our manufactured imports. Whatever effect this increased competition may have had on specific industries, its overall impact was to worsen the balance of payments. This in turn enforced crude general monetary restrictions, because more subtle discriminating policy weapons were no longer at our disposal as a result of the policy of liberalisation. Monetary restrictions, however, prevented investment in effective productive capacity from rising sufficiently. The stops and starts of Government policy, moreover, were especially discouraging to investment innovation—the replacement of old capacity which depends very much on an expectation of steadiness in demand.

There is thus no reason to believe that our entry into the Common Market would result in a radically different organisation of our industry which could not be brought about without it. It might, of course, result in bankruptcies and thus lead to an increase in efficiency of the *whole* Common Market—including Britain. It is fallacious to argue, however, that the place of bankrupt capacity and the employment it gave will be necessarily filled by British firms rather than Continental ones. If it were to be filled by Continental ones, however, underemployment and stagnation will be aggravated in England and not the reverse. The fact that population and manpower are expanding faster on the Continent is not necessarily an adverse factor for Britain. We shall be part and parcel of the whole and our industrialists *could* draw on Continental manpower.

A Snag

If, on the other hand, it is from changed Government policies, e.g., planning, that the acceleration of growth is to be expected, this is surely not dependent upon accepting the Rome Treaties. *Indeed, planning and sacrifice might be as much, and more, stimulated by the shock of the decision of staying out of the Common Market.* One would have thought the continuous crises of the 1950's ought to have led the Government to take all steps to increase productivity irrespective of joining the Common Market. The snag is that our entry into the Common Market is likely to worsen our balance of payment. The degree of protection in Britain is, on the whole, higher than on the Continent, especially Germany. Our imports are likely to go up more than our exports. Thus, a repetition is only too likely of the old distressing sequence of gold losses, namely, restriction of investment leading to decreased competitiveness leading to further gold losses. The vicious circle from which we have suffered certainly since 1947 (and probably since 1923) would be not merely perpetuated but accentuated.

Only if we could count on enlightened expansionist policies in the new community, would these prospects be relieved. Provided demand in the European space expanded faster than supply, pressure on the British industries would be lifted. But, as we have seen, this is not at all likely. Indeed, the Germans have taken active steps to

SIEMENS

discourage demand through cuts in Government expenditure and increasingly shrill warnings about the dangers of inflation. They have attempted to put pressure on wages by importing a large number of Greeks, Italians and Spaniards to replace the immigration from East Germany which has been stopped by the Russians through the erection of the Berlin Wall. If they continue in this policy, general deflation, cut-throat trade competition, rather than a harmonious amalgamation of Britain into the European space, can be expected.

VI

It must be admitted, however, that the conventional arguments that have been put forward against joining have equally been of dubious validity. They, too, are based mostly on irrelevant static considerations, e.g., that our entry would endanger our competitive power through making food "dear".[5] Even if we accept the argument that the cost of British agricultural protection is borne by the "rich," i.e., through subsidies financed by general taxes, the vital consideration is whether British dynamism will be stimulated or not; for the probable maximum "loss" in real wages suffered from "dear" food would be more than made good in four years if British growth increased to the German rate. In arguing against our joining the Common Market, the unpalatable fact is completely ignored that German real wages were 30 per cent below British in 1950, and are now definitely higher, and are still increasing at about two to three times our rate. The revenue saved by the abolition of agricultural subsidies might, moreover, be used to buttress social services or to reduce taxation falling on the lower incomes.

Nor is the argument more convincing that Britain will not be hurt sharply by staying out, because it has not been much hurt until now, and might not expect to benefit considerably from entry into the Common Market. The policy of Treasury, the Board of Trade, and the Bank of England has so undermined the cohesion of the Sterling Area that Britain cannot rely on having a secure base; and, unless a completely new policy changes the attitude of British entrepreneurs and re-establishes intimate relations with overseas areas, there is every reason to fear that the Common Market competition will continue to increase even in the parts of the Sterling Area in which British commercial preponderance is still marked, and the decline of our share in world exports will continue.

A Curious Contention

On the other hand, it is curious to observe that those who were responsible for deliberately weakening the economic cohesion of the Commonwealth should use the ensuing weakness as an argument in favour of joining the Common Market, even at the cost of finally and fatally injuring Commonwealth solidarity, on the grounds that the Commonwealth could not provide sufficiently dynamic alternative markets. This weakness has been their handiwork, and it hardly fits the assassin to complain that his victim was so weakened by the loss of blood that he is hardly fit for combat as an ally.

Finally, the effects on outside countries (whether it is "outward looking" or "protectionist") cannot be gauged by *static* considerations such as the level of tariffs applied, or whether the numbers have "actually similar but potentially different structure." In the end, demand for foreign products will depend on whether the national income of the new unit in Europe will be permitted to increase as fast as, or slightly faster than, its productive capacity, thus giving the rest of the world a continuous stimulus.

Africa

This is certainly true of the tropical Commonwealth.[6] They seem the only countries which could definitely hope to benefit from our entry into the Common Market. Yet the African colonies have refused to accept associated territories status, which Mr. Heath has succeeded in negotiating for them. In their case the European discriminatory system is in their favour and against the tropical products of Asia and South America. While this is not overly important in markets—such as cocoa—where price fluctuations are a multiple of any conceivable tariff barrier, it is some help and especially some help in establishing processing industries, e.g., groundnut and cocoa processing, in the case of which the Common Market protection is much higher. In addition they would receive some immediate foreign aid through the European Development Fund. In the case of the ex-British colonies, this would hold the British Government to its pledges to give aid from which it may otherwise wish to escape. The only disadvantageous aspect of the Common Market for these countries is that, up till now, the association has been negotiated country by country. Hardly any of these territories, however, is large enough to provide a market for a national industry. Unless, therefore, they can create a common market or perhaps two common markets, one in West and one in East Africa, their industrialisation is bound to be stifled by the Common Market rule which prohibits the imposition of discriminatory tariffs. But, as time goes on and the African leaders wake up to this problem, concessions can surely be secured, as the French are loath to sever their connections with Africa completely.

Asia and Temperate Zone

The prospects for the industrial products of the developing poor countries, such as India, are less clear. But a progressive expansionist policy would probably also aid them as the expanding market for Asian cotton textiles in the U.S. tends to show. The only exception is the production of foodstuffs of moderate climates: wheat, meat, and dairy products. In these cases, it would be essential to secure tariff quotas at favourable rates to protect our Commonwealth partners. Even in that instance, it is not tariff protection that is the threat but the complicated system of levies and subsidies likely to accentuate the increase in food-production in Europe. But the French refuse to concede this breach in European protectionism and they are in a strong position by being able to insist on the letter of the Rome Treaty. Their solution of the problem of the "Old Dominions" is through general international commodity agreements, such as were elaborated by M. Baumgartner, which combine high prices and production control. As it was the British who have been most opposed to such agreements because they supersede the price mechanism and would burden the British balance of payments, the total immorality of the attitude of the Macmillan Cabinet is patent. It has barred even this remaining escape route from ruin for a large part of the Commonwealth. Moreover, the prospects for such agreements performing the task effectively, however, are dim even if British resistance ceased. The Commonwealth certainly cannot rely on them as an alternative to free entry into the British market.

VII

We might sum up. The case opposing entry can only rest on an analysis of the destructive impact of the Union on Britain as a less dynamic partner, and on the outside world as a focus of deflation and loosening such bonds of the Commonwealth as still exist. It would have to be shown that (*a*) British industry is more likely to be swamped rather than stimulated, that the development on the Continent will remain far faster, that the institution devised to harmonise developments in Europe will prove as ineffectual as they now seem to be, and that the arrangements (to which allusion has been made) will prove more inimical to Britain than they have proven to, say, Italy; and that (*b*) it will prove impossible to maintain full employment, owing (i) to the rapid change in technique in the more dynamic area which impairs continuous and extremely costly readjustment, and (ii) the rules of the Union which do not permit the long-term use of direct controls, e.g., on capital exports from Britain, or on industrial location without which a shift to higher dynamism while maintaining social justice might not prove possible. In fact, both the Social Fund and the Investment Bank account for a fraction only of the difference between capital investment in the more and less dynamic regions. Their names could, of course, be increased, but such increase will be opposed by conservative financiers. The threat to the prosperity of overseas countries of the combined effects of conservative income policy and the specific incidence of commercial exclusiveness, especially in the field of temperate zone agriculture, represents a formidable further political argument.

Too Much To Expect

On the other hand, it is extraordinarily odd to ask the Europeans to forgo all economic advantages they have secured by their union at some cost and risk by drastic cuts in the "Common Tariff" or the liberty to impose import restrictions. Those who wish to liberalise international trade further, in order to ease the painful impact of the Common Market overseas, do not seem aware that they demand a weakening not merely of the exclusiveness of the European unit (and a conscious sacrifice of economic advantage), but also of its power to plan and to secure the maintenance of demand, without holding out any alternative means of planning for the wider "freeish" trade area, i.e., presumably the whole of the non-Soviet orbit. It is by no means certain that this tactic, if successful, will prove favourable to the weaker or primary producing areas. But the fact that the Americans are pressing for a general tariff cut is one more important reason for doubting the justification for a precipitate rush into the Common Market.[7]

There is thus no doubt that Britain's entry into the Common Market is far more risky than its protagonists like to pretend. The only "industry" which is certain to benefit is London, and in London the great international issue houses. They are far better organised than any of the Continent, and they are found to attract business and take an increasing role in handling the savings of the whole Western European complex. It is not surprising that much the strongest support for Britain's entry comes from these circles. But they have also been in favour of the return to the pre-1914 parity and to the "liberalisation" since the war which so weakened the country and is responsible for its relative stagnation.

Yet within the strict limits of a liberal framework, an economic gamble on the favourable consequences of any entry into the Common Market might seem comprehensible. After all, if the British economy were to be swamped rather than stimulated, if the limitation on our freedom of choice of economic policy, if the inhibition on planning for full employment once more seem important, and membership of the Common Market will no longer look so desirable, the country could always withdraw from the Common Market, whether such withdrawal is foreseen in the Treaty or not. The rest of Europe is unlikely to enforce the union by force of arms—as did the Northern States of America a hundred years ago—or by overwhelming economic warfare. No doubt the general, international position of Britain will have in the meantime deteriorated as a result of the consequences on her relations with third areas of her joining the Common Market. The Pacific Dominions will have to come to terms with countries such as Japan to find new outlets and might not reverse their policy. Still, in the face of continued stagnation, the threat to the existence of the Commonwealth and other disadvantages now appear to have lost in weight to the Tory leaders. The support given to our entry into the Common Market by the Government really shows the hollowness of the concept of N.E.D.C. ("Neddy") which purported to open a new chapter for Britain by deliberately planning for speedier expansion.

The Alternative

The alternative then of joining would be a policy of expansionist (but not necessarily socialist) planning aimed at regaining industrial dynamism by one's own efforts. This would demand higher investment, high external lending capacity, and deliberate rationalisation of industry. The former would have to be borne through justly shared sacrifice to which the trade unions need to give full consent and co-operation. It would require tightening of the controls. In one word, it would require the conscious shouldering of additional burdens. This presumably is the reason why even the Labour Party has not put before the country the real alternative to the liberal gamble up till recently. If there was a serious chance of accomplishing such a transformation, the implications for Britain of the Common Market would change fundamentally: the possible economic advantages of joining would be far outweighed by the grave international political risks it entails, not merely for the Commonwealth but also in the relations of the West to Russia.

The event which in all probability will decide Britain's fate is whether the Conservative Government will be able so to accelerate negotiations that it is able to effect our entry into the Common Market by January 1964. In that case, it could hold elections in May or June 1964—four months before the last possible date of a five-year Parliament and five months after the entry. The country would have been accustomed to the *fait accompli* of entry but the harsh facts of readjustments would not yet have been borne upon an unsuspecting electorate. The Government could bask

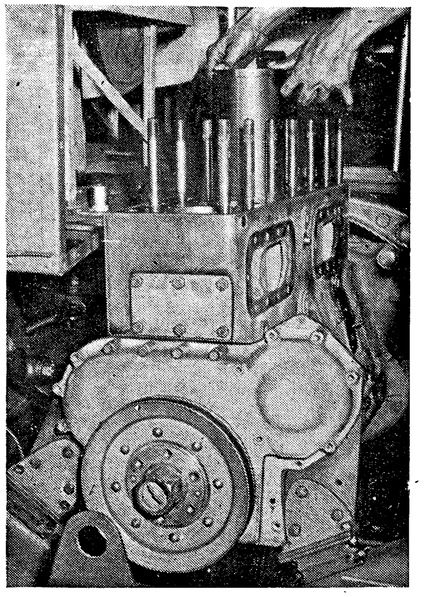
(*Continued on page 85*)

[5] This was the main argument used by the Board of Trade against our entry into the Common Market in 1957-59.

[6] I have dealt with this problem elsewhere. *Common Market Studies*, No. 1. Blackwell, Oxford 1962.

[7] It is interesting to recall that the Board of Trade, some years ago, published a scathing denunciation of proposals to join the Common Market because the consequential increase in our costs would price Britain out of the world markets. That thesis was patently wrong. Now the opposite is being pressed with equal vigour by the upholders of conventional wisdom.

The Ashok Leyland engine needs no re-boring- *all you do is replace the slip fit cylinder liners*



The shoulder-located cylinder liners of the Ashok Leyland engine are cast and pre-finished to a high degree of accuracy. They can be easily removed and replaced, together with the piston and connecting rod assemblies, with the engine *in situ*—another ideal feature of Ashok Leyland engines.

Heavy-duty chassis

The Ashok Leyland Comet is a heavy-duty chassis built for rugged performance. Every part is specifically designed for heavy duty. No other chassis offers 100 B.H.P. 255 lbs./ft. Torque Engine, Nitrided Crankshaft, Slip Fit Liners, 13" Diameter Clutch, 5-speed Constant Mesh Gearbox, 9"-deep Frame, 8-ton Rear Axle, 24-volt Electrical System and Individual Wheel Cylinder Brakes.

Fleet owners prefer Ashok Leyland Comets

Remarkably low fuel consumption and economy in maintenance and overhead costs make the Leyland Comet the choice chassis in India, just as it is in sixty other countries around the world.

EXPANDING THE GOLD STANDARD

Promising Developments Ahead For Underdeveloped Nations

By GEORGE O. HOSKINS, O.B.E.

GOLD and the International Monetary Fund between them today form the security for the settling of all countries' balances of payment. One might, indeed, say gold alone, since the resources of the I.M.F. are the currencies of member-countries convertible in turn into gold. But, although it has been a widely heard complaint for many years that the world's currencies are not sufficiently broadly based on gold reserves so that they cannot be made to totter, this proposition is not universally upheld. We may dismiss any argument that the gold standard on the present basis of valuation of gold and without the I.M.F. would be adequate, but there is a strong body of opinion including the governance of the I.M.F. itself which is satisfied with the gold standard *plus* the I.M.F. as it stands at the close of 1962. And there are also voices to maintain that world currencies would be a deal healthier if they reverted to a classical gold standard *plus* a revaluation of gold in order to broaden the base for exchanges.

We are concerned here primarily with the working of the present international monetary system from the point of view of the United Kingdom and the sterling area and we should first analyse what is the international credit base of the United Kingdom.

Gold and Convertible Currency Reserves

The United Kingdom holds gold and currencies convertible into gold to a value of about £1,000 million. If we look at the end-year figures over the past four years, the breadth of fluctuation is evident: a total of £977 million at the end of 1959 to £1,185 million at the end of 1961 and, at the end of October this year, it was £1,008 million. In view of everything that the gold reserves have to do, the fluctuations are narrow but this is because the United Kingdom is also using the resources of the I.M.F. and drawing on them when sterling is under pressure and repaying when sterling is in demand. During 1961, the gold reserves did indeed dip as low as £865 million before being replenished by loans from the European banks, and then rose to £1,226 million at the end of June this year before being diminished by repayments to the I.M.F. It is clear that the gold stocks are only part of the United Kingdom's resources.

Exchange Equalisation Account

This is the account which in fact holds this country's gold and convertible currency reserves. In addition to the basic reserves, this account has, since the early days of the last war, held a substantial stock of formerly privately-owned dollar securities. This stock is subject to fluctuations between a figure of around $750 million and $1,250 million. One might, therefore, set it down at an average of $1,000 million, or say, £360 million. In case of need these securities could be sold in America and yield dollars convertible into gold.

Quota in the I.M.F.

The United Kingdom is one of the principal subscribers to the I.M.F. (holding 13 per cent of its capital), its subscription having been made one-fifth in gold and four-fifths in sterling. In 1959, its quota of $1,300 million (£464 million) was increased by 50 per cent to $1,950 million (£696 million). The subscription of this quota gave the I.M.F. call on sterling to the full amount of the subscription, but it also gave the United Kingdom the right to call on the Fund for other currencies. It is as if by opening a bank account one had at the same time acquired overdraft facilities. These overdraft facilities are to a limit of twice the quota. Thus, in case of need, the United Kingdom could draw funds from the I.M.F. to meet overseas obligations to the extent of approximately £1,400 million.

Effective Reserves

The effective reserves of the United Kingdom are, therefore, the sum of the items set out in the three previous paragraphs, namely, the gold and convertible currencies £1,000 million, the dollar securities £360 million, and the I.M.F. drawing facilities £1,400 million, a grand total of around £2,750 million. This is a great deal more than the published figure of reserves and, perhaps, in time the fetish of publishing the gold reserves may be dropped in favour of publishing a composite total of at least the gold reserves and the I.M.F. resources. At present, every time that a gold reserve figure is published, one has to examine whether payments have been made to the I.M.F. in settlement of some past debt, reducing the gold reserve, but increasing the ability to draw on the Fund.

Drawing Rights of the I.M.F.

In order to show how these I.M.F. drawings have been used as an effective basis for international payments, it may be recalled that, in December 1956, the United Kingdom drew £201 million ($561 million) and this operation meant that the United Kingdom put sterling at the disposal of the I.M.F. and received in exchange other currencies. The sterling resources of the Fund were thereby increased and its holdings of gold, dollars, etc., were reduced. Then, where other countries wanted to buy sterling, the Fund unloaded sterling and acquired back other currencies, so reducing the U.K.'s debt to the Fund. Between March 1959 and October 1960, the United Kingdom purchased back the outstanding balance of this original drawing, thereby reducing the country's gold reserves and equally reducing its liability to the I.M.F. and increasing, *per contra*, its right to draw once again from the I.M.F. In spite of all this juggling, real resources remained the same.

The next dramatic use by the United Kingdom of its I.M.F. resources was in August-September 1961 (following the famous July crisis), when the United Kingdom had to meet an enormous outflow of hot money. Instead of meeting this outflow by heavily running down its holdings of gold and convertible currency, the United Kingdom sought the help of a Consortium of European bankers for a short-term advance. It then made its longer-term drawing arrangements with the I.M.F. and repaid the European bankers. These longer-term arrangements were to draw from the I.M.F. $1,500 million (£536 million)—a sum equal to about three-quarters of its I.M.F. quota—and to arrange a stand-by credit, that is, not to draw but to have the right to draw on demand, a further $500 million (£178 million). Thus, the United Kingdom, instead of seriously diminishing its gold reserves, acquired a credit line of $2,000 million, that is, slightly in excess of its I.M.F. quota, and proceeded to meet its obligations out of that.

Great Deal of Resilience

It will be observed from the foregoing recital, that, had the United Kingdom so needed, it *could* have acquired a credit line of almost double that which it did in fact acquire. Thus, even the tremendous disturbance of mid-1961 did not put too vast a strain on this country's gold and convertible currency resources in spite of all appearances.

One should interject here that there are three stages in drawing from the I.M.F.: the final stage is the actual drawing of gold or convertible currency to meet debts, the stage prior to this is organising a stand-by credit which means that one has the right to draw further sums to the amount of this credit, and behind this again are the general arrangements to draw up to twice one's quota. But, while these general arrangements exist, they have to be translated into practice with the approval of the Board of the I.M.F.; just because one has a quota with the I.M.F., it does not mean that one can *automatically* draw twice that sum. The Board has to approve that, in the light of the country's circumstances, a stand-by credit be created or currency actually advanced.

In the event, the United Kingdom did not have to use its stand-by credit. On the other hand, as soon as the crisis of confidence had been countered by mobilising the resources of the I.M.F., the hot money outflow ceased and was soon replaced by a return of funds. Before the end of 1962, the United Kingdom had repaid the whole of its 1961 drawing and, therefore, owed the Fund nothing. The amount repaid was added to the amount of the stand-by credit which was, therefore, pushed up to £714 million. This meant that, without any complications, the United Kingdom could, in case of need again, draw upon this £714 million which had thus become as effective a part of the country's international resources as its gold reserves.

At the end of October 1962, therefore, the United Kingdom had gold and currency reserves of £1,008 million, a stand-by credit with the I.M.F. of £714 million and behind that again the right to apply to the I.M.F. for a further £679 million to bring the total potential drawing up to double the quota. So, leaving aside the dollar securities held by the Exchange Equalisation Account, the country still had international resources, actual and potential, of £2,400 million.

The U.K.'s Liabilities

These liabilities consist of debts outstanding at any one moment (known as the sterling balances) and the annual surplus or deficit on the balance of payments and long-term capital movements. In the middle of 1962, the sterling balances were as follows:

(In million £s)	
Balances owned in the sterling area ..	2,689
Balances owned by non-sterling countries ..	840
Total ..	3,529
Add—	
Sterling held by the I.M.F. and other non-territorial organisations	785
Grand total ..	4,314

In assessing the potential drain on the resources of the United Kingdom, one can leave out of account the sterling balance held by the I.M.F. up to the amount of the quota. It is true that the I.M.F. could, in response to demand, sell sterling and acquire other currencies but this sterling might then appear under the heading of the sterling balances held by non-sterling countries. These countries might in turn want to dispose later on of their balances and so sell sterling and acquire for example, gold, but, under the I.M.F. arrangements, if the I.M.F. balance drops below its quota, it will wish to buy sterling up to the total of the quota and the sterling would simply flow out of the accounts of the non-sterling countries back into the account of the I.M.F.

Can one, then, take the total of the sterling balances held outside the non-territorial organisations and regard them as a potential liability to be weighed against this country's overall external resources? If we make this comparison, we find that these sterling balances greatly exceed the United Kingdom's total external resources. But we must remember that, within the sterling area, these balances are in turn the external resources of the countries to which they belong and the liabilities which these balances represent could only become a drain on the United Kingdom's external resources, if, over a period of years, the countries owning the sterling balances found themselves obliged to dispose of them for other currencies in order to obtain imports other than from the United Kingdom. But a move on this scale involving the liquidation of the holdings of sterling balances would be fraught with some very special significance and in any case it would take a long time. Indeed, of the total of sterling balances, official institutions held £2,492 million, while commercial and private holdings were £1,037 million (to give a total of £3,529 million). It is thus only the non-official holdings of £1,037 million that can be regarded *in toto* as a current liability to be weighed against the country's external resources.

Potential Drain

What about the potential drain on the United Kingdom's external resources represented by deficits on the current balance of payments and long-term capital investments overseas? The total of these deficits over the past three years has been as follows (but excluding the U.K.'s subscriptions to the I.M.F. since these, being part of the quota, are countered by the U.K.'s right to draw on the I.M.F.):

(In million £s)	
Deficit 1959	146
Deficit 1960	484
Deficit 1961	42
	672

Unfortunately, the United Kingdom statistics, detailed as they are, are not yet sufficiently precise to identify how the whole of this deficit has been accounted for. We know, for instance, that the sterling balances rose by £277 million; we also know that miscellaneous holdings of foreign currencies and such-like items (assets of the U.K.) dropped by £95 million, while the U.K.'s official holdings of other currencies also dropped by about £20 million, giving a total of £392 million. On the other hand, in this period of heavy deficit, the United Kingdom actually received gold to the tune of £89 million, so that, in reality, we have only accounted for £303 mil-

lion of the deficit. And it is possible that the truth of the matter is that the deficit is somewhere between this figure and the total given above.

The purpose of the foregoing comparison is to weigh the United Kingdom's liabilities and the sort of deficits that (largely as a result of lending abroad) the United Kingdom can build up against her monetary balances. Nothing has been said in this about the flows of hot money; it is known that, in last year's summer crisis, the outflow was of the order of £600 million but even a sum like this does not look impossibly large against the reserves in gold and I.M.F. credits which the United Kingdom has, which is something like five times the total amount of the hot money outflow. Provided, therefore, that the United Kingdom's balance of payments is kept reasonably in equilibrium the resources of the United Kingdom in gold and I.M.F. credits appear adequate. It is unfortunate that only movements in gold receive publicity since the effect of this is to make the authorities seek to stifle the gold movements and operate instead their I.M.F. credit. Leaving aside this presentational defect in the present system, the true resources of the United Kingdom are workable and, applying the same argument more generally, one can understand why the I.M.F. itself regards the present international credit basis as adequate.

Aid to Underdeveloped Countries

By and large, the great trading nations of the world do maintain their balance of payments in reasonable equilibrium. Hot money flows are a disturbing factor, but, with the proper use of the I.M.F. credits, they can be coped with. The real reason for seeking a broadening of the credit base is the obvious need to do far more to assist underdeveloped countries than has hitherto been practicable.

If the United Kingdom, for instance, extends substantial credit to the underdeveloped countries, then it could put its balance of payments into deficit. This is the fear which inhibits many countries from being more open-handed and it is a very reasonable fear.

To combat this, there was put forward in 1959 and again today in a modified form, the Stamp Plan (named after the banker Maxwell Stamp), the essence of which is to build up a credit basis inside the I.M.F. Today, the balance-sheet of the I.M.F is very simple: on the one hand, it has the capital of the authorised subscriptions of members of a little more than $15,000 million and, on the other side are the gold holdings of a little less than $3,000 million and the holdings of currencies and securities of the member-countries to rather less than $12,000 million and other miscellaneous assets. In all this there is no credit item and, if the I.M.F. were a central bank, in addition to the capital one would show, for example, an issue of notes and on the asset side there would be debts and securities. The Stamp Plan would, in fact, provide for such an issue of notes. These notes would, it is suggested, be issued to a total value of $2,000 million, i.e., to about 13 per cent of the capital of the I.M.F. They would be put out in the form of grants-in-aid to the underdeveloped countries and the latter would be able to cash them with other member-countries in exchange for their currencies which they would use to finance capital imports.

Because the underdeveloped countries would, through the International Development Association, receive as much as they could profitably use (they would, incidentally, have to repay their borrowings over a period of fifty years) and because these credits would be cashable anywhere, it is considered that the recipient countries would be able to spread their capital requirements through the whole range of industrial countries. This would thus avoid throwing the balance of payments of any particular country into deficit and at the same time the individual lending countries would have a safeguard, in that they would not be required to accept a larger sum of these credits than their quota in the I.M.F.

It is important to note that the essence of this scheme of broadening the international credit base is not simply to finance existing international monetary movements but essentially to make it possible for a central international fund to finance the crying capital needs of underdeveloped countries. To those who cry "inflation," the answer is that, on the world-scale, inflation would not arise: the international credit is neither more nor less inflationary than national credit—this country does not suffer inflation because its business is conducted on the basis of bank credit instead of on the basis of gold. Nor would the comity of nations suffer inflation if they conducted their international monetary exchanges on a basis of credit as well as on a basis of gold. The credit would serve to stimulate production and, in the United Kingdom and the United States of America, to take two examples alone, there is great productive capacity at present unused which such a system could put into activity.

The European Economic Community also has its proposals to achieve the same sort of effect. The Monetary Committee of the E.E.C. is, indeed, due to consider a scheme known as the Triffin Plan, whereby the member-countries would count in their reserves 25 per cent of "credits"; these "credits" would, therefore, be the equivalent of gold or convertible currencies and they would take the form of deposits in the Bank for International Settlements or of deposits with the I.M.F. In short, a deposit at either of these two institutions (made in the country's own currency) would be reckoned as gold. This is a more local form of the Stamp Plan, but the intent is the same: to increase the capacity of the countries party to such a plan and to put funds at the disposal of capital-hungry countries.

Mr. Maudling's Proposals

Mr. Maudling's proposals, which were not received enthusiastically by the I.M.F. at their September meeting, envisaged something not very far removed from the Triffin† Plan. Mr. Maudling proposed that countries should, in fact, count holdings of currencies which they deposited with the I.M.F. as the equivalent of gold. In short, he would have the I.M.F. receiving deposits and these deposits would, in the I.M.F.'s balance-sheet, be matched on the asset side by additional holdings of currencies. Then a country could draw on its deposits with the I.M.F. in the form of convertible currencies.

This is one step removed from the original Keynes Plan when the I.M.F. was formed of having that institution issue its own notes, "Bancor." Thus, a country having a deposit with the I.M.F. would be able to draw that deposit in the form of "Bancor" which would be an internationally acceptable currency. The practical effect of a country having "Bancor" can also be likened to the Stamp Plan proposal that the I.M.F. should issue its own credits to the underdeveloped countries.

At the moment, of course, the I.M.F. can only deal in national currencies and if, under the Maudling Plan, deposits made with the I.M.F. were monetised—that is, acceptable as gold—transactions on these deposits would still require to be in particular national currencies: just as when the United Kingdom made its heavy drawings on the I.M.F. last year, it had to receive the currencies of several countries. The Keynes Plan would substitute this mixed bag of currencies by "Bancor"; the Stamp Plan simply uses the words "I.M.F. Credit."

All these add up essentially to schemes for providing internationally acceptable money created by the central organisation and lendable under the control of that organisation.

Against all these schemes, there are still those who would like to see all forms of international credit swept away and replaced by a new gold standard involving a substantial upward revaluation of gold, so that, for example, the whole of the I.M.F.'s capital of $15,000 million could appear as gold instead of only one-fifth of it. These upholders of the gold standard argue that they are not being restrictionist, because they, too, want to see the credit basis expanded but they want to see it kept in terms of gold. If there was enough gold, they say, then the I.M.F. or the individual countries or groups of countries could make advances to the underdeveloped countries in gold.

A Significant Difference

It will be seen that the difference between the two schools of thought is not the difference between an expansionist and a restrictionist school; it is the difference between a school which believes in the conscious adaptation of the means of international payments to the requirements of the international trading and lending system and, on the other hand, the faith in the greater security of an automatically working regulator. The gold standard adherents are, in effect, saying that, provided you have enough gold and if countries then conduct their affairs on the basis of the gold which they have, or is available to them from the I.M.F., then the movements in their gold stocks would, as under the traditional gold standard, indicate at once that their balance of payments was either too active or too passive. They would have to put their houses in order one way or the other, but there would be no getting out of whatever position they found themselves in through credit juggling. But, surely, the adherents to this argument are deceiving themselves: no one can lay down now what is the right amount of gold without incurring, in years to come, what is right now is no longer right, reconsideration and endless argument. There can be little doubt that plans such as the Stamp Plan and Triffin Plan will ultimately lead to the production of a plan by the I.M.F., and the monetisation of credit on an international scale is likely to become a reality within this decade.

Meanwhile, the I.M.F. at the beginning of this year achieved additional command over currencies by taking borrowing powers up to a third of its present capital. The United States agreed to advance $2 000 million, the United Kingdom $1,000 million (both figures about 50 per cent of those countries' quotas) and so on. When these powers are used then debtors and creditors will appear in the I.M.F. balance-sheet and more currency will be available to strengthen the world's international credit base. The resources are beginning to be provided; but not yet the techniques for making advances from these resources to the underdeveloped countries. That is where imagination is needed—to make international money put the unused productive resources of the "haves" to the service of the "have-nots."

Are Capitalism And Communism Converging?

Mr. Nehru's Thesis Lacks Substance

By NEIL McINNES

SPEAKING at U.N.E.S.C.O. in Paris in September, Mr. Nehru, Prime Minister of India argued that the power conflict between the two blocs was bound to diminish, because capitalism and communism were in reality converging toward a type of organisation where similarities were more evident than differences. In other words, capitalism is becoming less capitalist, notably in that it is adopting planning methods that substitute central co-ordination for the free market; while communism is becoming less communist, in that it is decentralising economic decisions and allowing (indeed encouraging) State-owned corporations to behave more like independent enterprises. Ultimately—or so it is hoped by many who share the Prime Minister's view—the two systems that yesterday were as black and white will evolve to a common pattern which is pre-figured by the economic ideals (though not yet the economic practice) of countries like India and France: democratic planning that combines efficient central control with great liberty at the periphery.

Meanwhile (so this theory runs), the two systems would be brought nearer together by certain superficial but striking resemblances. Firstly, both would approach an era of abundance: the point at which most needs for food, shelter and manufactures will be virtually saturated is in sight for both blocs and, presumably, nations that have attained material satisfaction will find less to disagree about than nations that are divided over the best way to attain that goal. Secondly, in both systems a new class of managers, planners and experts will come to power, and they will get along together better than the "ideologists" of capitalism and communism. Mr. Nehru did not go into detail about these changes, but he must have had in mind the speculations of those who have ventured the prophecy that the apparently insoluble conflicts between the two camps will be removed by their evolution toward a third type of economic system. That he chose U.N.E.S.C.O. as the audience for these reflections suggests that he was assuming that increasing economic similarities will lead at last to cultural unity, within which war, or even cold war, would be unthinkable.

Argument Analysed

The argument obviously may be divided into (*a*) the interpretation of certain facts about current changes in economic practice in capitalist and communist countries; and (*b*) some rather bold and wishful deductions concerning the implications for foreign politics of these facts. The latter set of propositions may be dismissed fairly briefly. They are worth nothing, unless we have got right the facts about supposed economic similarities between present trends in capitalism and communism. And even if such similarities exist and are increasing, there is nothing in history to prove that nations with the same economic system must live in peace and aimty. President de Gaulle is the best known advocate of the contrary view, namely, that nations are basic historical facts which continue their secular rivalries regardless of passing ideologies and varying economic systems. Capitalist nations have made war on each other often enough, and the dream that communist nations would never fall out has not survived the Sino-Russian quarrel.

However, these large speculations on peace and war are not our point, for we are obliged to ask first what is the force of the claim that capitalism is becoming more planned and communism more liberal. No one, one hopes, would base such ambitious generalisations on isolated events, e.g. President Kennedy's veto of an increase in the price of steel, or some minor liberalisation regarding private sale of Russian peasants' produce. Occasional, forceful Government intervention in the price mechanism is as old as capitalism itself; markets have never been "free" outside the models of classic liberal economists, and odd Government actions that indispose certain private interests do not prove that capitalism is being dismantled. On the other side, compromises with private (and particularly peasant) profit-seeking are as old as communism, and whole chunks of Lenin's "new economic policy" could be restored without anyone being entitled to fear (or hope) that communism was being dismantled.

Long-range Significance

No; one would have to be able to cite coherent, long-term trends in the Russian and Western economies that seemed to point to the same ultimate method. There are only two such developments of long-range significance. On the Russian side, there is the substitution for the arbitrary and irrational allocation of resources typical of Stalinism, of superior (mathematically superior) methods of linear programming that owe much to American mathematicians. On the Western side, there is the immense prestige gained by French planning methods, which are being imitated already by half a dozen other European States, studied by the Kennedy Administration, and proposed for the enlarged Common Market which will soon be the world's second or third economic unit. If there is anything in the story of a convergence of communism and capitalism, it must refer to these two processes. Russia, it could be argued by folks who take this apparent convergence of methods seriously, is being Americanised while America is in danger of being Europeanised. The eventual state of both systems would be something that does not yet exist in West Europe but is imagined by French planners. The French *planning experiment* is central to the theory of convergence. In reality, it is easy to show that the similarity between the planning trends in Russia and France is more apparent than real, and in no way supports the notion of evolution toward a common style of economy.

Russian Plan

The Russian case is fairly simple. Planning is being improved, made more rational and efficient, in that country, and especially by adopting mathematical procedures invented in the U.S.A.—but which the Americans have no intention of ever applying to the whole of their economy. The "electronic market," conceived by American theorists as a substitute for irrational decision, has great possibilities in both types of economy, when the myriad pieces of information needed to compose it become available, which will not be before several decades. But its application could, certainly will, be quite different in the two cases: on the one side of the Atlantic, it could be used by major corporations and some Government departments (e.g. Defence), while, on the other side it could be used by the central planning authorities. There is nothing there to indicate a convergence of the two systems. Moreover, in so far as it is applied in Soviet Russia, it will be in order to facilitate progress toward objectives that remain characteristically communist and quite unacceptable to Western people: the abolition of money, the institution of as much equality as is consistent with continued innovation, communal use of goods and services for which demand is inelastic and rationing of the rest. The new planning techniques are aimed at making Russia more communist, not less. In the process, some theological absurdities such as the Marxist labour theory of value will have to be sacrificed (because they are incompatible with rational planning), but whatever happens the consumer will never be allowed to enjoy the power over the economy he has in the West.

French Plan

The planning techniques being developed in France have no such aims: indeed, on many points, their objectives are just the opposite. One cannot say, for the sake of a balanced antithesis, that they seek to make capitalism more capitalist, because ideas about what is essentially capitalist differ. But it is clear that they remain, and are meant to remain, compatible with the right of the consumer to decide his own outlays, of the worker to take the employment he chooses, and of entrepreneurs to make profits. The function of the national plan in that liberal arrangement is to act as an *uncertainty-reducer* for the most influential economic agents. It lets them behave in their traditional ways but enlightens them about the consequences of their decisions. There is only one way in which national planning of that sort could lead to convergence with communism— lead to it insensibly and by stealth without the nation deciding to adopt compulsory, central allocation of resources.

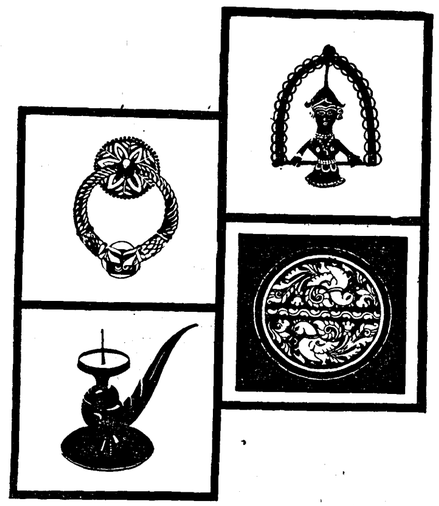
It is this. If the plan succeeded so well that it not merely reduced uncertainty but abolished it, then most people (without being converted to communism) would demand confiscation of profits. Without embracing any moralistic theory *about profits and dividends being* the just reward for risk-taking, it is obvious that, if an entrepreneur and his shareholders were able to make a sure killing simply by acting on a central, public decision, then people would think this unjust. If an electronic calculator in the central planning bureau made some people richer without them having to take a risk or accept any uncertainty, confiscation of their profits would be demanded just as it is today when an urban housing project enriches land speculators or a defence programme assures the fortune of one supplier. Occasional interventions of that sort occur now: entrepreneurs are made to contract on a cost-plus basis, or armaments profits are limited. Now, occasional confiscations of profits are, exceptionally, compatible with capitalism, but, if they become at all common, capitalism is being struck at its very roots. High taxes, social welfare and a dozen other things that capitalists fulminate against might hamper (and in some cases might not, in the longer run) the working of the capitalist system, but once the idea gets about that there are "normal" or "just" profits, that the capitalist has to accept a limited return because public decision has taken all the risk out of his enterprise, then capitalism is dying and is really converging with communism. The question is whether democratic planning techniques are really tending toward that hypothetical extreme or limiting case.

The Basic Aim

If not, if democratic planning merely avoids disastrous waste (such as can occur now that investment programmes are slow to mature and entail huge sums of capital), then it remains consistent with firms making unlimited profits-before-tax, and hence with capitalism as a system. It could remove unnecessary risks, such as might arise from firms making large investments in ignorance of what other firms and the biggest firm of all, the Government, were doing; but it would leave intact the risks inevitably associated with the freedom of consumers to buy what they chose, the right of workers to refuse certain jobs and to bargain about the wages they accept, and with the fact that the country remained part of the world trading system with all its uncertainties. None of those risks and uncertainties exist for the factory manager in the Soviet system, which is the reason he is not entitled to make profits.

"Indicative" and "Imperative" Planning

This approach—that planning remains consistent with capitalism and implies no convergence with communism as long as it leaves enterprises to face risks that justify profits, and notably the risk of serving free consumers—is better than the debate about "indicative" and "imperative" planning. In the most liberal economy, enterprises are subject to all sorts of imperatives; for a Government to tell certian enterprises what to do does not mark the end of capitalism, because Governments have been doing this for ages. Besides, when a democratic Government wants to ensure the production of just so much of something, at a certain price and in certain places, it does not organise a plan; it *nationalises* the industry concerned, and this has happened to numerous industries and services in the West without the rest of the free market being destroyed. Planning as practised in France has led to no fresh nationalisations and in fact has reduced the pressure for socialisation measures from the Left. (Incidentally, this point cannot be too strongly emphasised: planning arose in France as a defence—some would say a diversion—against the campaign for authoritarian plans put up by the post-war socialist-communist majority.) The "imperatives" that are envisaged from time to time in France relate to minor sectors that let down big enterprises because their effort is diverted to satisfying an easy consumer market; for the rest, the only enterprises that folk want to see constrained to fulfil targets are Government departments or nationalised corporations, so this is a demand for administrative efficiency and forebodes no drift to authoritarian planning. The Government has in reserve numerous incentives to encourage firms to do what other firms expect of them, without hav-



In this age of all powerful machinery and of mass production, lovers of beauty and art still yearn for hand-made individual creative crafts in which design is the first and primary concern.

Realising the needs of changing times and of the modern man, the All India Handicrafts Board opened four Regional Design Centres at Delhi, Bangalore, Calcutta and Bombay. Articles produced at these Centres keep to the spirit and beauty of the traditional designs, which are less elaborate but more simple, less expensive but more useful. Research is made here in new directions for the improved methods of treating materials and in new processes. These Centres, not only help the manufacturers in the marketing of modern designs but also assist the craftsman to understand the needs and tastes of the modern public and yet remain true to his tradition.

Thus, a happy beginning has been made and in the near future when more and more trained craft designers become available, the country can look forward to an era of greatness in our crafts which will reveal to the world the glory that was, *and is*, India.

ing to issue edicts. In sum, there exists no insidious drift to imperative as against indicative planning. The idea that indications might give way to imperative orders covers not convergence but revolution, a political conversion to the communist point of view.

Uncertainty-reducer

The only possibility of insidious drift to a convergence with communism lies, to repeat, in the perfection of the plan as an uncertainty-reducer, to the point where profits would appear unwarranted. What prospects of this reside in planning as now practised in France and imitated elsewhere in West Europe? Very little, to judge from French experience to date. To prove this, we will have to emphasise the great uncertainties in which French industry has had to pursue its development throughout the four plans so far written. In doing so, we may seem to be arguing that planning has been useless, for it has left all this indecision, incertitude and obscurity. Not at all: for it could still be true that it had reduced certain crucial uncertainties, relating to inconsistency between various investment programmes. To that extent, it would have been valuable, and well worth imitation elsewhere. The test would be in the efficiency of total investments in relation to increases in national product. That is, French industry under the plans may have been left to face all sorts of uncertainties known in other democracies (and would thus be entitled to earn what profits it could), but, if it avoided the uneconomic consequences of sterile competition, duplication of effort and unco-ordinated programmes, this would show up in the circumstance that the same pace of expansion was being secured with smaller total investment (or a faster pace of expansion with the same volume of total investment). We would then have the situation of planning making converts because it reduced the wasteful defects of the competitive system, while remaining perfectly capitalist, i.e. based on multiple initiative, risk-taking, and free choice for consumers and workers. Capitalism in that situation might well be evolving, and in ways unpalatable to dogmatic liberals, but it would surely not be converging toward communism.

Three Facts

Three facts should be enough to show the extent of the uncertainty accepted by French industry under the plans. First, material conflicts between various sections of the population associated with planning have been as frequent and as acute in France since the war as anywhere else, and more frequent than in most European countries. Strikes by organised labour, a veritable peasants' revolt by the resurgent farming community, and intense lobbying by industrial interests have all been glaring features of this planned capitalism. Secondly, the country has returned to the system of convertibility, has liberated capital movements to a large extent, has abolished price controls and subsidies, and has restored the operation of monetary policy (variations in interest rates and in the volume of bank liquidities) as a governor of the economy. Thirdly, whereas the theme of the first plan was recovery from war damage, of the second general economic expansion, and of the third the control of inflation, the fourth plan has as its basic aim the integration of French life into world markets. Everything in the current plan is directed at co-ordinating the French economy with the Common Market and with world trade in general.

Now, any presentation of French planning as a movement, however gradual, toward a liberalised communism is just a play on words (on the word "plan"), unless it recognises these three fundamental facts, these three immense uncertainties: direct action by discontented sections of the people, liberal money markets, and full participation in world trade. All of these have become more marked, not less, while the French plans have been in course of implementation. Where is there the communism, even an imaginatively liberalised communism such as some may hope to see emerge in a freer, richer Russia, that would be compatible with any of these things? An economy may be held to be moving toward a system not so dissimilar from a humane, rational and decentralised communism when it begins by making impossible strikes, lobbying and peasant revolts, when it abolishes the monetary weapon as a way of allocating resources, and when it cuts the country off from the extensive risks and incertitudes of world trade. But not until then; any more than a communist country could be held to be evolving toward a type of planned capitalism, until it restored the sovereignty of the consumer, free movement of labour and the possibility for enterprises to make theoretically unlimited gross profits.

Definitely Not True

It might be replied (some socialist critics of French planning argue this) that all these things are just "contradictions" that will be purged as the country sees the real requirements of the planning course it has entered. That is no doubt true of the acuter forms of peasant discontent, which the French planners aspire to relieve by better planning in future, and of strikes too, which might be reduced by the national wages policy now being mooted rather vaguely; it is certainly true of the effects of the monetary weapon, which the planners hope to annul, in certain cases, in the interests of fulfilment of the plan, by offering other incentives to selected enterprises (special loans, tax concessions, etc.). But it is definitely not true as regards the integration of the French economy into world trade, for this is precisely the basic aim of the fourth Plan. That is, the competition and the unpredictable risks of greater participation in world trade are not seen as temporary uncertainties that later planning might remove, but as the real task that the French have to face, using planning where it helps to make the task easier, and adjusting the plan where the impact of world trade conditions makes that necessary.

Significance of France's Fourth Plan

The crucial figure in the Fourth Plan is the positive balance of $310 million set as a target for the country's current external payments in 1965; all the other figures, as to possible pace of expansion, rate of saving and investment, etc., have been calculated *from* that figure. But that figure itself is not, strictly speaking, calculated from anything. Professor Perroux has written: "It is not properly an objective that has been worked out in view of attaining an optimum; and no more is it a rigorous statistical projection. . . . Under the disguise of a number, we have here a *qualitative option*. The authorities wish to orient the French economy toward the exterior, to *extravert* it with the aim of disposing of sufficient international liquidities to reimburse our external debt, face up to accidents, and invest abroad in the developed countries, in the overseas franc zone and in other undeveloped countries. . . . The option is for a moderate industrialisation oriented toward the exterior and, specifically, toward the other industrialised nations."

This basic option may be criticised on a variety of grounds, and one may dispute its consistency with sundry other provisions of the Fourth Plan; one may have, too, different ideas about its chances of being realised. None of that matters to us at present. Our point is to bring out the real nature of French planning as exemplified in the current plan. It consists in asking entrepreneurs to face up to the most uncertain field of all, the uncontrolled and unpredictable domain of international trade, while offering them the uncertainty-reducer of a national plan that will try to ensure that they do not step on each other's toes needlessly. In fact, those entrepreneurs have to contend with a host of other uncertainties: the freedom of consumers, the importation of new styles and tastes (the so-called Americanisation of Europe), free labour and an aggressive peasantry, convertibility of the currency, and so on; but the full participation of France in world trade is the biggest and least familiar of them, for it was not among the aims of earlier plans.

Forward Programming: German Conception

So, even if the plan were a complete and entire success, the planner, with his electronic computer, will not be able to say to French capitalists in 1965, "I guaranteed your profits by taking the risk out of your enterprise"—which is what the Gosplan authorities can say to any Soviet factory manager, or rather will be able to say when Russian planning becomes more rational and, in particular, drops the absurd notion of overfulfilment of targets by certain enterprises. What the French planner could claim, at most and on the assumption that his rather empirical, trial-and-error forward programme is realised in the facts, is that he helped ensure that private capitalists did not complicate their task by taking conflicting risks, by working one against the other. To the extent he does so, his contribution will have been exceedingly valuable; compared with other Western economies where capitalists made long-term plans in ignorance of each other, of the Government and of statistical information, French investments will have produced a proportionately greater return. Yet no one would be able to allege that most capitalists had had their work cut out for them and thus did not deserve to take any profit they could reap. As long as that is so, the main—or at least one of the main—principle of capitalism is intact, and it is idle to talk of a convergence toward communism. All the more because, as we have seen, communism meanwhile has been becoming more communist, approaching nearer the goal of efficient central allocation of resources and ultimately the abolition of money.

The French are at present seeking to persuade the West Germans to co-operate in avoiding wasteful, conflicting and excessive investments in the Common Market, just as they have done themselves inside their own economy. Because of the Germans' unpleasant memories of Nazi "planning," they have to baptise the sort of co-operation they mean "forward programming" rather than "national planning." The name is not just a euphemism, but a more accurate description of what the French have been doing, in that it avoids confusion with planning as practised by totalitarian States. For the French plans are not rigorously calculated models; the "targets" they contain are something more than mere *wishes* but far short of *obligations*. Such plans are better described as collective experiments in trial-and-error, i.e., they do not claim to abolish all risks but just to ensure that most people are taking consistent risks, risks that are consistent with each other, because they are based on the same information and similar aspirations. They constitute, that is, attempts to *organise empiricism*. In one important sense, they still deserve the name of plan, because, at the most general level, a plan is a way of provoking, in the name of some higher interest, a use of resources different from the use that would have resulted if agents had been left to act spontaneously.

A Superficial Thought

One can see how different this procedure is from communist planning, even as this is being revised and made more rational. It might be too much to say that planning *a la francaise* makes capitalism more capitalist, but at least it leaves intact the main features of the capitalist economy. The British conservatives would scarcely be showing the interest in it that they are if matters were otherwise. Only if we are ready to be misled by words like *plan*, whose content is unspecified, could we conclude that capitalism and communism are converging to a common, third type of economy.

If Mr. Nehru's notion of convergence is essentially optimist (tension will diminish because the two systems are approaching each other), the contrary view is not necessarily pessimist. That communism becomes more communist while capitalism remains capitalist does not prove that tension must persist, with constant danger of war. It is almost certainly false that the basic cause of tension between the power blocs is their different economic ideologies. Different economic systems could well live in peace, or in more or less friendly rivalry, if they had something else to worry about. Such subjects for mutual concern are not wanting. There is, for example, China. There is the danger of nuclear war. There is the challenge of underdevelopment, and of space exploration. One cannot predict that these things will bring West and East together. But one can conceive them being tackled simultaneously by regimes of which one remained capitalist and the other communist.

THE CRISIS OF THE COMMONWEALTH

(*Concluded from page 76*)

in the glory of new opportunities rosily pictured which their policy had opened. In any case, the financiers of New York, Basle and Frankfurt would be only too willing to oblige to get their protagonists in Britain over a difficulty. Labour would thus be forced to fight the election under a double disadvantage. Its dire predictions about the consequences of entry on the Government's terms would also be in the position of advocating a change—that is, withdrawal from the Market—fraught with unknown dangers.

Mr. Macmillan's calculations, however, are themselves based on factors outside the control of his Government. He can meet his deadlines leading to the signature of the treaty only if the French co-operate in speeding up the negotiations. The politics of the Common Market have already engulfed Britain. If German intransigence over Berlin and if French ambitions for nuclear status independent from the U.S. are taken into account, it must be an intrepid if not purblind Cold War Warrior who has no doubts.

EXPORT TRADE OF DEVELOPING ECONOMIES

Who Is Responsible For The Slow Growth?

By PROF. M. L. DANTWALA
UNIVERSITY OF BOMBAY

[The problem of foreign trade expansion of the underdeveloped countries has many facets. This article deals only with some of them. Firstly, it gives the latest available statistical picture of trends in their export trade. Secondly, it briefly examines the controversy regarding the demand and supply deficiency for their exports. Lastly, it just summarises the findings of the G.A.T.T. Committee III on Trade of Less Developed Countries contained in a recently published report. The problem of national policies for export promotion is not discussed.]

THE paucity of foreign exchange resources constitutes one of the most crucial constraints on the economic growth of the developing economies. In these countries, the import content of investment finance for development is very large, far exceeding their normal export earnings. While the inflow of private and public capital aid, which has grown significantly in recent years, has helped to avert impending foreign exchange crises from time to time, it is well recognised that this could not be a continuing solution to the problem and that, *in the ultimate analysis*, exports will have not only to finance the current imports, but also the repayment of previous aid-loans.

At a time when so much depends upon the expansion of exports from the developing countries, the recent experience in this regard, since the collapse of the Korean war boom, is not encouraging. As the tables below indicate, all the three indicators of export performance—the quantum index, the value index and the unit value index—do not exhibit much resilience. Not only are the rates of growth distinctly slower as compared to those in the developed areas, but they are also not adequate for the purpose of the growing import requirements. This is reflected in the substantial trade deficits experienced in these countries in recent years.

*World Exports**

Underdeveloped areas ..	102	100	95

(Source: *U.N. Monthly Bulletin of Statistics, July and August*, 1962.)

* Excluding the trade of countries with centrally planned economies.

†U.S.A., Canada, Western Europe, Japan, Australia, New Zealand, South Africa.

During the decade ended 1960, the value of the exports from the developed areas increased by 126 per cent, as against an increase of a mere 41 per cent in the value of exports of the Underdeveloped Areas. The growth in the quantum of exports also shows the same disparate trend. The quantum index (with 1953 as the base) shows an increase of 67 per cent by the end of the decade for the developed areas as against an increase of only 34 per cent for the underdeveloped areas. The unit value of exports shows a rising trend for the developed areas and a declining one for the underdeveloped.

The export performance of some regions of the underdeveloped areas is less unsatisfactory since 1958. Both Africa and Asia have been able to maintain a rate of growth comparable with that of the developed areas. But exports from Latin America are lagging behind. In regard to the unit value of exports, whereas Asia has been able to more or less maintain the level, there have been serious declines in the unit value of exports from Africa and Latin America.

II

The analysis of the facts relating to sluggishness in the growth of exports of developing countries may be attempted in terms of the following questions:

(1) Is the sluggishness due to demand or supply deficiencies?

(2) What is the effect of industrialisation in the primary producing countries on the growth of exports?

(3) To what extent is the export performance of different countries associated with the degree of inflation in these countries?

These questions open up a vast field of theoretical and empirical analysis. As pointed out at the outset, they are discussed below merely by reference to some current literature on the subject.

As is well known, Nurkse, in his Wicksell lectures, attributed the lag in the growth of trade in primary commodities mainly to the relative sluggishness in external demand emanating from the industrial countries. He conceded that "domestic policies causing limitations on the supply side in producing countries have also been effective in certain cases." It is, however, possible that such policies reflect the past experience regarding the unfavourable demand conditions for primary export products.

On the other hand, it has been argued that the failure of primary producing countries to expand their exports is mainly due to the process of industrialisation, inasmuch as industrial growth in these countries involves the consumption of greater quantities of their own agricultural produce, thus restricting supplies for the export market. Prof. Cairncross has, in addition, pointed out that "prices of exports from the non-industrial countries have risen since pre-war by half as much again as the prices obtained by industrial countries for their exports of primary produce. This sharper rise in prices reflected the acute pressure on supplies of primary produce in a fully employed economy—a pressure that continues because of the low elasticities of supply of this produce." Whatever may be the truth in this statement when it was made, it cannot be said that supply inelasticities are currently a serious obstacle to the growth of exports.

As for the marked difference in the performance of the so-called semi-industrialised and other non-industrial countries, the Haberler Committee had observed that "there appeared to be a long-term tendency for the export proceeds of the semi-industrialised countries taken as a whole to rise more slowly than is the case for non-industrial countries. The Committee, however, clarified the observation by stating that "this tendency is not necessarily due to industrialisation policies as such, but to certain forms of such policies which carry with them an anti-export bias." Other writers who have examined this question take a somewhat different view. For example, A. Maizels, in his article in *Kyklos* suggests that (1) the process of industrialisation *per se* did not have a retarding effect on the development of exports from the semi-industrialised countries taken as a whole; and (2) the slower rate of growth in their exports compared with those of the non-industrialised countries was due essentially to the differences in the commodity pattern of exports of the two groups of countries.* On the other hand, he observes that the pace of industrialisation has itself been heavily dependent upon progress of exports in these countries.

Maizels brings out the doubtful character of generalisation regarding the differential performance of semi-industrialised and other non-industrialised countries by dividing the exports of the non-industrial countries in two parts: the commodities directly competitive with those of semi-industrialised countries and other primary products. The result of this analysis reveals that, whereas the export volume of non-industrial countries in 1955 for the first ('competitive') group was 105 (1937/38=100) as compared with the index of 101 for the semi-industrialised countries, the index of export volume in the second ('non-competitive') group had risen to 224. From this, he concludes that the demand deficiency argument is nearer the truth than the supply deficiency argument.

Mr. K. Bieda, in an article in *Kyklos*, has countered Mr. Maizels' argument and tried to prove that, basically, it was *supply deficiency* which was responsible for the 'lag' in the export trade of the primary producing countries.† Mr. Bieda argues that "if the causes of the phenomenon (of the lag) were deficiency of world demand for raw materials in the period discussed, the exports of the rapidly industrialised countries should be affected more or less in the same degree as the exports of other primary producing countries. But.... this is not the case." Mr. Bieda takes the analysis further by comparing the quantum index of exports of the United States and Australia, and shows that "while Australia's volume of primary exports, having dropped in the war from the 1939 level, remained well below that level until 1952 and did not regain the pre-war level until 1953 or 1955, the United States' primary product export showed no such trend." From this, he concludes that "the market demand was there, but such countries as Australia did not respond to the opportunities and, therefore, an industrialised country like the United States had to fill the gap." In fact, Mr. Bieda goes further and makes certain very categorical statements. He asserts that a great deal of the potential gap must have been filled by:

(*a*) An increase in the domestic production of these materials in the importer countries, who, unable to obtain them in the world markets, and worse, unable to pass enough manufactures over the protection walls of the industrialising countries, decided themselves to 'agriculturalise' also behind a tariff, or import-restriction wall.

(*b*) For the rest, as the above difficulties *tended* to manifest themselves, the importer countries would be *forced to economise at a cost* in the use of these materials by switching into using domestic substitute materials in the production process, and switching into altogether different consumer goods or into services, in the consumption process. (Author's emphasis.)

When the matter is put in this manner, it would appear that the fault lay entirely with the industrialising countries and what the importer countries did was primarily in self-defence.

Mr. Maizels, in his reply to Mr. Bieda, has taken care of some of his arguments and once again emphasised the fact that "the commodity pattern of trade was the overwhelming reason for the differences in the overall export performance of the two groups of countries." Apart from this, and accepting that, for the period concerned, there was a real problem of supply deficiency in the developing countries, it would be wholly inaccurate to attribute it to independent and autonomous decisions arising out of the policy of what Mr. Bieda calls, "forced industrialisation" by the developing countries. For one thing, it completely ignores the experience of the pre-war period during which demand deficiency was an undisputed fact and resulted in a precipitous fall in the prices of primary commodities and economic disaster for the primary producing countries. It would have been an extraordinary act of faith on the part of these countries to have kept up their production potential in trim hopefully waiting for a time when an emergency like the World War II or the Korean Boom stockpiling would cause a sudden upsurge in world demand for their products. At best, it is the usual hen-egg debate whether it was the demand deficiency which forced the primary producing countries to cut down production or supply deficiency which forced the developed industrial countries to 'agriculturalise' and 'economise' at a cost.

That there have been instances of deliberate policies in developing countries, resulting in restrictions on supplies for exports, cannot be denied. For example, Brazil did

Pioneers in Plantations

One of the largest groups of planting companies in South India today lies within the Peirce Leslie & Company Limited fold. Resources, experience and skill have combined in PL & Co. to command wide confidence. The diversification of interests from fertilisers to estate stationery has firmly emphasised that PL & Co. are now part of the planter's life. Tea, rubber and coffee interests are blended in the PL & Co. group.

The Rupee companies that Peirce Leslie & Co. Ltd. look after as Managing Agents are:

The Periа Karamalai Tea & Produce Company Limited; The Ouchterlony Valley Estates (1938) Limited; The Kil Kotagiri Tea and Coffee Estates Company Limited; Chembra Peak Estates Limited; The Cochin Malabar Estates Limited; Kumergode Estates Limited; The Kalasa Tea & Produce Company Limited.

Peirce Leslie & Co. Ltd., are also Secretaries and Treasurers of The Savamalai Estates Limited; The Thirumbadi Rubber Company Limited; Cowcoody Estates Limited and Lingapur Estates Limited.

try to cut down its production of coffee in the hope of maintaining a certain level of world price for coffee. Similarly, restrictions have been placed in India on the export of oilseeds with a view to making them available for domestic production of oils. All such instances, however, singly or cumulatively cannot wholly explain the lag in the export of primary commodities. On the side of the demand for primary commodities also, there are a number of instances which show that the decisions to *agriculturalise and economise at a cost* were the direct consequence of national policies in the interest of the domestic producers rather than of real or apprehended supply deficiencies.

Regarding the effect of inflation on the exports of primary producing countries, Miss Gertrude Lovasy, in an article in the *Staff Papers* of the International Monetary Fund, has examined this question both with the help of a brief theoretical analysis and considerable empirical data. Her major finding is that "inflation tends to hamper the expansion of exports and to retard their diversification." This happens primarily because of the increased domestic demand and the resulting rise in prices relative to those in competing or importing countries. As inflation progresses, the economy also becomes structurally oriented towards meeting domestic demand. The following findings emerge from her study:

(1) *While the behaviour of* exports of countries with mild inflation differed very little from that of countries where prices were stable, exports of countries with strong inflation, however, showed a relatively small increase in the earlier period, and complete stagnation after 1953.

(2) An examination of the export performance by reference to changes in domestic price *in terms of dollars* indicates that, in countries with mild inflation, *exports responded more promptly* to changes in prices.

(3) Analysis in terms of 'major' and 'minor' exports indicates that stable countries expanded both their major and minor exports considerably while those of inflationary countries failed to grow. Major exports of *the stable group* were some 30 per cent higher in 1959 than in 1953; for the inflationary group, the volume was practically the same in the two years. The difference in the trends is even more pronounced for minor exports—*a decline of roughly 6 per* cent for the inflationary group and a rise of 50 per cent for the stable group. In other words, stable countries made considerable progress than inflationary countries in developing exports.

(4) The sluggish behaviour of the exports of the average *inflationary country cannot* be explained by their encountering a less favourable demand for their main products. World trade in most of these products increased considerably but the inflationary countries were not able to keep pace with *world trade* in respective commodities.

III

The problem of expansion of trade of less developed countries was recently examined by a subcommittee of the G.A.T.T. This *Committee* was primarily concerned with the question of what the developed countries could do to promote exports from the developing countries. The main findings of the Committee regarding obstacles to expansion of trade are summarised below:

(1) *Quantitative import restrictions*: One of the serious barriers confronting exports of less developed countries was identified by the Committee as being quantitative import restrictions. Exports from less developed countries of such important products as vegetable seeds and oils, coffee, raw cotton, tobacco, tropical timber, manufactures of jute, of cotton and of coir and sewing machines are often adversely affected by quantitative import restrictions which are sometimes applied in a discriminatory manner.

(2) *Tariffs*: High tariffs and tariffs which differentiate disproportionately in favour of imports of raw materials, as compared with duties for processed goods, were also identified as constituting serious barriers to exports from less developed countries.

(3) *Revenue duties and internal fiscal charges*: High revenue duties and high fiscal charges were also emphasised as major barriers to such important traditional imports from less developed countries as coffee, tea, cocoa and tobacco and for some of the newer exports of manufactured consumer goods.

(4) *State monopolies*: The Committee also found that the activities of restrictive State monopolies, whether in countries with centrally planned or market economies, had an adverse effect on imports from less developed countries of items such as coffee, cocoa, tea and tobacco, particularly where retail prices fixed for these products were very high in relation to import costs.

(5) *Other obstacles*: A possible loss of trade opportunities for less developed countries arises from the operation of price support schemes, surplus disposal operations and mixing regulations in some countries. Excessive price fluctuations in the field of commodity trade were also noted as an obstacle to expansion of trade.

In the light of the above findings, the Committee made specific recommendations for acceptance by the Contracting Parties to the G.A.T.T. These include:

(1) Speedy removal of quantitative import restrictions; (2) removal of element of discrimination in the application of import restrictions; (3) re-examination, especially by industrialised countries, of their tariffs with a view to bringing about a general reduction in tariffs; (4) substantial reduction in the internal revenue and fiscal charges on products of interest to less developed countries; and (5) reduction in difference between import and sale prices where State import monopolies or purchasing agencies operate.

In general, the industrial countries were exhorted to take into account, when formulating and implementing their commercial or economic policies, the long-term development plans of the less developed countries and their need to step up progressively the rate of growth.

While the exports of the developing countries would receive considerable stimulus if all these recommendations are accepted and sincerely implemented, it should be emphasised that it is equally important for the developing countries to adopt policies, which though not painless, are necessary for the promotion of exports.

A new role for the Sirens

TWELVE YEARS AGO, Murugappa & Sons of Madras joined efforts with Tube Investments of England to build a cycle industry in South India. The partnership has since been widening the scope of its activities year by year, and today embraces steel strip rolling, tube making, and cycle and cycle accessories manufacture. Possibilities of starting new ventures are being explored.

Industrially, India is well set on the road to progress and many a siren is singing the song of the happy co-operation between the two countries—co-operation which is helping to accelerate the pace of her development.

THE PRICE OF GOLD

Problem Both Desperate and Intricate

By Prof. B. R. SHENOY

DIRECTOR, SCHOOL OF SOCIAL SCIENCES, GUJARAT UNIVERSITY

UNDER the free gold standard, the market price of gold corresponds to the official price. The deviations of the latter from the former would be insignificant, being within a narrow margin determined by the distance between the "gold points." With the abandonment of the gold standard on 21st September 1931, the market price of gold rose from its statutory moorings of Rs. 21-3-10 per tola—Rs. 18.21 per 10 grammes—adopted by the Indian Currency Act, 1927; the highest price touched in the immediate pre-war year, 1938-39, was Rs. 32.28 per 10 grammes. With the progress of inflation from 1940-41, the price of gold skyrocketed, together with the general index of prices, the price of gold touching a high of Rs. 103.74 per 10 grammes in February 1949, a rise of 321 per cent in about ten years. With the abeyance of inflation, from 1949-50 to about 1954-55, the price of gold, in company with the general index of prices, remained comparatively steady for a time thereafter and then declined to a low of Rs. 71.16 in June 1954. The re-emergence of inflation in 1955-56 drove both gold prices and the general index of prices upward again. In April 1959 they reached the 1949 high and have since established new records. They touched an all-time peak of Rs. 129.90 on 31st August 1962, a rise of 25 per cent over the 1949 high.

Since then, gold prices have sagged, parting company with the general index of prices, which continue to move up; they reached a low of Rs. 86.00 on 24th November, a fall of 34 per cent in 12 weeks. There has been a noteworthy recovery since, prices rising to Rs. 96.50 on 1st December and to Rs. 101.50 on 3rd December, despite the warning in Bombay on 2nd December of the Finance Minister that the Government would "initiate shortly" further steps to bring down gold prices. (*By 15th December 1962, the price of gold had recovered to Rs. 107.75 per 10 grammes.*—ED.)

Rising prices of gold caused a divergence between the internal prices and the external price, the latter being the same as the official price Since September 1931, the gap between the two prices rose to Rs. 14.17 per 10 grammes in 1938-39. With the devaluation, by 51.07 per cent from the pre-September 1931 parity, of the rupee and the pound sterling on the 14th September 1939, the price gap was eliminated, the official price, now fixed at Rs. 37.22 per 10 grammes—Rs. 43-6-9 per tola—having moved up to the market price.

But, with the commencement of inflation in 1941-42, the gap re-emerged; during the year, the annual average price of gold, Rs. 38.15 per 10 grammes, was Re. 0.93 higher than the external price expressed in rupees (Rs. 37.22). This gap grew with the progress of inflation, reaching a high of Rs. 66.52 in February 1949. The devaluation of the rupee for a second time by 30.5 per cent on 21st September 1949, i.e., the lifting up of the official (external) price to Rs 53.58, reduced the price gap to Rs. 45.66 on 23rd September 1949; on 16th September 1949, the gap was Rs. 61.37. The gap declined thereafter with the downtrend in the price of gold; it reached a low of Rs. 17.58 in June 1954. But, with the resumption of the rise in internal prices in 1955-56, the price gap widened again, reaching an all-time peak of Rs. 76.32 on 31st August 1962, when the internal price was 235 per cent of the external (official) price. Since long, the Indian price of gold has been the highest in the world.

The current phenomenon of sagging gold prices is out of alignment with the basic economic logic of the situation. Our experience of the past two decades has demonstrated, as may be seen from the accompanying graph, that the price of gold, like commodity prices in general, reflect the prevailing state of inflation. Except for the past three months, the movements of the general index of prices and of the spot gold prices have more or less faithfully responded to changes in the volume of money with the public. As the volume of money supply with the public is an index of the flow of the money incomes of the public, the variations in the money incomes directly influence the demand and, therefore, the prices of commodities in general and of gold. (*Vide* the table on this page.)

The prevailing fiscal and monetary situation does not warrant a fall in gold prices. The root cause of inflation—the queer attempt to "invest" non-existent resources through created moneys—has continued apace. Investment outlays in the public sector moved up in 1961-62 by 7.2 per cent and, in the current year, by a further 26 per cent to Rs. 1,446 crores. The volume of money with the public rose as a result by 6 per cent in 1961-62, or nearly three times as fast as the estimated increase in the national product. Further inflation has been taking place in the current year. On 23rd November 1962, the note circulation was over 8.7 per cent above that of a year back.

There has now emerged on the scene another powerful inflationary factor, the border war with China. The supplementary vote of Parliament on 20th November 1962 for Rs. 95 crores on account of defence is but a beginning of the inevitable jump in defence expenditure. The financial needs of the war may well be several crores a day. The overall budget deficits today are due mainly to the Plan outlay. This is demonstrated by the fact that, though the rest of the expenditures and outlays have been moving up, the jumps in them have been more than covered by the jumps in revenue collections. The (public sector) Plan outlay of the past six years has averaged Rs. 2.6 crores per day and the budget deficits of the period have averaged Rs. 230 crores per year. This had driven up, during the period, the volume of money supply with the public by Rs. 603 crores to Rs. 2,027 crores in March 1962 and the general index of prices by 24 per cent. Unless finance for the war is found from savings and foreign aid—the former being stepped up through drastic cuts in the consumption expenditures of the State—there is a danger of the budget gaps and inflation galloping ahead.

The sagging gold prices would seem to be, principally, the result of a succession of bad jolts which the bullion market has received from our unfolding gold policy. The Finance Minister, speaking to the Informal Committee of Parliament on Finance, on 21st August 1962, observed that the Government was considering measures to mobilise private gold holdings—which, he stated, were currently estimated at 110 million ounces or Rs. 4,100 crores—for Plan finance and that it may "come forward with some definite proposals in a year or so." Maybe, because a year was still to go before the threatened measures may come true or because he indicated that the Government was against "any drastic or hasty step,"* this did not make any immediate impact on the uptrend in the price of gold. But the market probes probably indicated that the Government was seriously pursuing the matter; with the spread of awareness of this, prices began slipping downward with the turn of the month.

Press reports on 14th September 1962 of a study by the Reserve Bank of India of the volume and pattern of trading in gold during the past ten years in the major bullion markets in the country gave gold prices another push downward. The Finance Minister's appeal, following the declaration of a state of emergency on 26th October 1962, for subscriptions in gold and gold ornaments to the National Defence Fund caused gold prices to fall by Rs. 2 in a day to Rs. 116.50. As earlier, this fall, too, was followed by a recovery. But the announcement, on 3rd November 1962, of the issue of Gold Bonds caused near-panic conditions. There were hardly any buyers for two days and gold prices came tumbling down from Rs. 121.50 on 3rd November 1962 to Rs. 102.75 on 6th November. This attracted both investment and speculative support and also advance purchases for marriages, the marriage season being within sight, and prices recovered to Rs. 108.75 on 8th November.

The Reserve Bank ban on bank credit against gold, reports of which appeared on 10th November, depressed prices once more. Prices recovered again to Rs. 106.50 on 13th November. Though the Centre's ban on forward trading on that date passed almost unnoticed, the extension of the ban to specific delivery contracts on 15th November produced a sharp drop in prices and the earlier recovery was wiped out. In the absence of this extension, speculators were, perhaps, hoping to "make do" with the war-time innovation of the specific delivery contracts, which, though less efficient than unqualified speculation to meet their needs, was in certain essential respects, a first cousin of speculation. The drop in prices expressed the market's feelings of distress on being denied even this solace.

Though recovery reappeared, prices went tumbling down again when the market received the biggest ever jolt of this series. Speaking on 20th November to the Consultative Committee of Parliament on Finance, the Finance Minister announced that the Government would introduce "within a month" some drastic measures—believed to be regulation of spot trading—to bring down gold prices—he cited Rs. 60 per 10 grammes as his target—produced panic of a degree not seen before and prices fell on 21st November to Rs. 97.25 from the overnight closing price of Rs. 106.00; subsequently, they touched, as noted above, a low of Rs. 86.00, the lowest price since 1956-57, the low for the latter year being Rs. 84.83.

While the determined use of the sledge hammer by Government would seem to be the principal factor responsible for the price shake-up, in the earlier part of this phase of the price decline, it might also have been due to the heavy arrivals of gold as may be seen from the table below. In July and August 1962, the weekly average arrivals were 43,000 tolas and 47,000 tolas respectively; in September, they jumped up to 59,000 tolas, in October to 82,450 tolas and in November they were 62,800 tolas. The sudden jump in the arrivals in September and October is believed to reflect largely a stepping up of gold smuggling induced by fears of devaluation, which the depletion of the reserves and the uncertainty of the amount of the general-purpose foreign aid might force upon us. As, by raising the rupee cost of smuggled gold, this would reduce the profit-margin of the smugglers, the conjecture is that smuggling activity had, perhaps, redoubled.

In November, with the steep drop in gold prices, smuggling seems to have suffered materially, especially in the latter part of the month. When prices remained around Rs. 90, gold was flowing from India to Pakistan, where prices remained higher, though they too were affected by the collapse of the Indian prices. The large figure of arrivals in November would seem to be largely panic unloadings caused by the uncertain price trend and fear of some drastic action by Government to mobilise gold. When prices fell to around Rs. 90, they included, too, gold released on the market by private financiers who had advanced moneys on the security of gold, the margin of security—usually around 10 to 20 per cent—having been more than wiped out by the price fall and the debtors concerned not being able to restore the margin requirements through the hypothecation of additional gold.

Crux of the Problem

The crux of our gold problem is the gap between the internal and the external prices of gold. There is nothing to be gained by allowing this gap to continue. It is causing the economy considerable damage. First, it involves exploitation of the Indian buyers of gold and of the Indian economy by the smugglers, believed to be mainly Arabs operating from Kuwait and elsewhere in the Middle East and the Chinese from Hong Kong and Macao, though people of other nationalities, too, joined in. The Indian buyers have been paying for the gold double, or, as until about a month back, more than double, its landed cost, the latter being reckoned to be the external price *plus* the expenses of transport. The difference between the landed cost and market price is shared by the smugglers and their Indian accomplices; a part is appropriated by the corrupt among the vigilance people and a part, as premium for the hard currencies —with which to buy gold for smuggling—by the suppliers of foreign exchange in the free markets for foreign currencies. A small fraction accrues to the Government through the confiscated gold in the detected cases of smuggling, as this is necessarily debited in the smugglers' accounts to their gross profit margins.

Secondly, the magnitude of the gap has rendered futile all attempts to prevent gold smuggling. These attempts have included, in addition to stricter vigilance, the use of electronic detectors at the customs counters for incoming passengers; the issue in May-June 1959 of distinctive Indian currency notes for circulation in the Persian Gulf territories, to prevent the use of Indian money to purchase gold abroad for smuggling into India; the amendment in April 1955 of the Sea Customs Act, 1878, to shift the burden of proof that gold, seized on suspicion, was not smuggled gold, from the police to the party from whom it was seized; and drastic penalties for smuggling, including confiscation of the gold and imprisonment. The Select Committee on the Sea Customs Amendment Bill, 1962, has recommended even more severe penalties and would expressly declare dealings in smuggled goods a penal offence.

Smuggling Continues

As these measures made no difference to the price gap, which is what sustains smuggling, smuggling continued unabated. Confiscation was no deterrent, as, even if one in every three consignments were seized, the smugglers could still continue in business and prosper. In actual fact, the incidence of the seizures would seem to have been much lighter. The Finance Minister, as we have noted above, placed the amounts of gold smuggled at Rs. 30 to Rs. 40 crores annually. The quantities seized during the three years 1956, 1957 and 1958, for which period alone quantity figures are immediately available, averaged about Rs. 1.75 crore per year. Even accepting the Finance Minister's order of magnitude of smuggling—which falls far short of certain other conjectures—seized gold works out to a confiscation ratio of one in every about 17 consignments. The electronic detectors are of limited value as gold is known to come by country craft, by land transport or is air-dropped; round the clock vigilance over two thousand miles of sea, land and air frontiers, day after day, year in and year out is beyond the physical capacity of any Customs force, even if we assume that the incidence of corruption among them was *nil*.

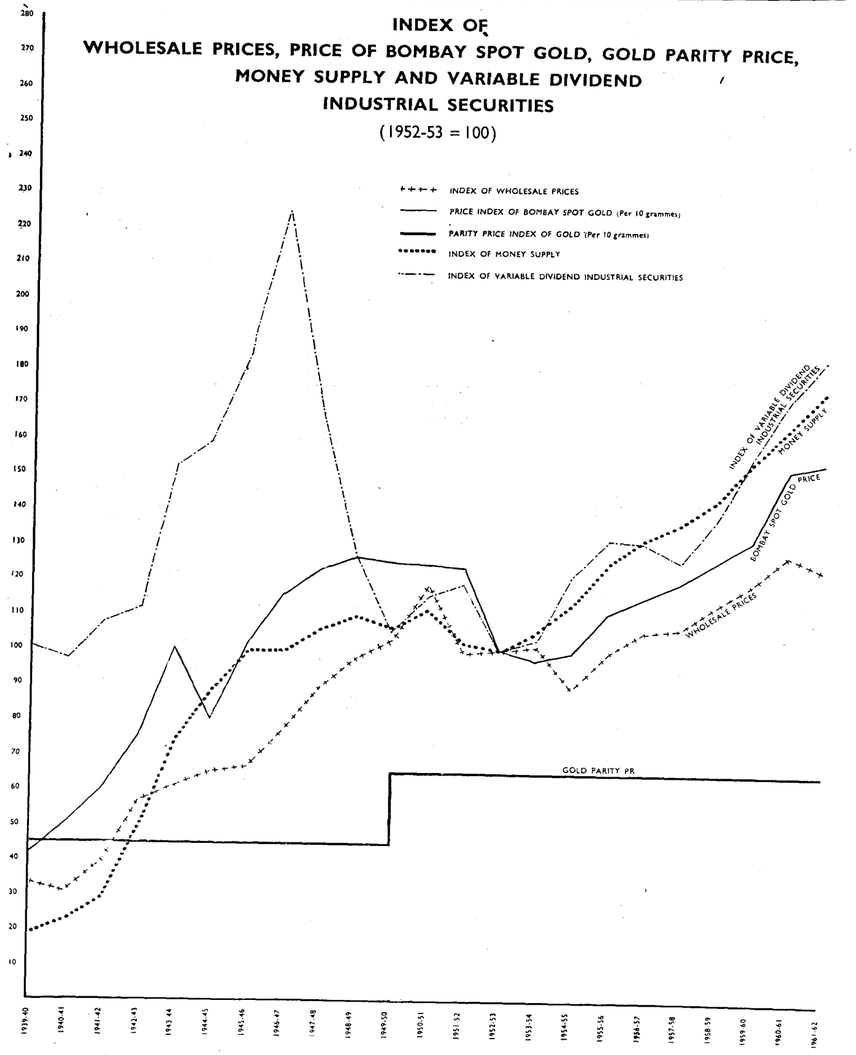
Thirdly, the elimination of the price gap is essential for a better response to Gold Bonds. Though these bonds enable the conversion of black funds into white, bring over 2 per cent higher yield than similar Government debt and are exempt from wealth tax and capital gains tax, subscription to them involves a heavy penalty on capital account, which, before prices started collapsing, amounted to 50 per cent or more. The attraction of the bonds would get enhanced materially if the subscribers could be saved from this loss, through closing the gap.

Remedy

Thus, our gold problem is both desperate and intricate. Using the sledge hammer on the bullion market is not the remedy to the central feature of this problem, namely, the gap between the official and the market prices. For a satisfactory and lasting remedy, the malady must be tackled at its roots. First, further inflation must cease. This will stop the rot from growing, as the price gap was created by, and feeds on, inflation. Secondly, the official price of gold must be stepped up to a more realistic level. In doing so, we would be merely acknowledging a change which has already materialised. There is no escape from this measure, as the price gap cannot be closed by beating down the market prices by shock treatment of the bullion market. Similar attempts in the past to beat down the prices of foodgrains, sugar and equities have failed. It cannot be different with gold. Even as it is not possible to contain inflation in Maharashtra while it is active in Gujarat, there is no device of keeping inflation from the bullion market when inflation pervades the rest of the economy.

There is also another important aspect to this problem. The utterly unrealistic official price of Rs. 53.58 —the price at which the Reserve Bank sells foreign currencies—has necessitated the erection of stringent exchange control barriers. We cannot possibly maintain an island of restrictions, below sea level, in an ocean of freedom in gold transactions. Since early 1961—factually

(*Continued on page 206*)



* In view of later events, it is interesting to note that the measures he cited as having been proposed to him to "check smuggling" included the banning of forward trading in gold, control on spot transactions through licensing gold dealers, records of purchases, sales and stocks and issuing gold bonds. He thought that a country-wide system of spot dealings may not be practicable and "might involve harassment of the people" and that the issue of gold bonds may not be immediately feasible.

Note:—I wish to acknowledge the research assistance I have received from Mr. T. A. Bhaskar in the preparation of this article.—B. R. SHENOY.

INSURANCE OF EXPORT RISKS IN INDIA

By Dr. S. P. CHABLANI

[*Formerly Professor of Economics at the Sind College, Karachi. Joined the Government of India in 1947; served in several capacities: as Private Secretary to the Union Minister for Rehabilitation; as India's trade representative in Germany for five years; as Joint Chief Controller of Imports and Exports; also as member-Secretary of the Mudaliar Committee on Import and Export Policy. Currently, he is Managing Director of the Export Risks Insurance Corporation and member-Secretary of the Study Group on "Export Finance." Author of several books:* Economic History of Sind (*Orient Longmans*); Rehabilitation of Refugees in the Federal Republic of Germany (*Institute of International Economics, Kiel*); Economic conditions in Germany and Indo-German Trade; Motilal Nehru Commemoration Volume (*S. Chand*).—Ed.]

CREDIT plays an important part in our daily life. We buy our milk and our bread on credit; we pay for gas, light and water at the end of the month. How intolerable life would be if at the crack of dawn we had to answer to the call of the milkman, the baker and a host of similar functionaries, each pressing for payment in cash.

The role of credit upon the economic scene is even more important. Credit is of the essence of economic development. What a poor place the world would have been without credit! Industry would have scarcely gone beyond the primary stage and trade would have been elementary.

In recent times, credit has assumed a new significance. The post-war era has witnessed political and economic readjustments of far-reaching consequences; and man has set before himself new targets of achievement which, a generation ago, would have been impossible to conceive. Among other things, the character and composition of world trade has undergone a fundamental change. Prof. Cairncross's analysis would show a remarkable increase in the share of capital goods in the world market—from 12.5 per cent to 37.7 per cent in the total exports—over the first half of this century. Evidence for later years reveals an even more pronounced accent on the exports of engineering products.

Nations, like individuals, find it difficult to finance their capital development out of their current income. And the only way to reconstruction is through recourse to credits secured from overseas suppliers, from international lending agencies or foreign Governments. On the other hand, international competition has become severe; the balance of power has shifted from the seller into the hands of the buyer. Naturally, the seller is compelled to offer more and more attractive credit terms to woo and win his customers abroad.

Credit and Risk

Each credit involves a risk, be it given to the "householder" by the baker's errand boy, or by the retailer to his mofussil client, or by the giant shipbuilder in Hamburg to the coastal line in remote Argentine. In the home market, the length of credit may be a week or a month, but, in the world of commerce, it may vary from sixty days to several years, depending upon the nature of the goods supplied, the creditworthiness of the overseas buyer and the economic and political situation in his country.

In the case of the baker's credit to the 'householder,' the risk is secured by the seller's knowledge of his client, his past experience of previous settlements and the latter's reputation *vis-a-vis* his neighbours. But in the wider arena of international trade, such safeguards do not always exist.

The overseas buyer may default; he may go bankrupt. There may be a war or insurrection in the buyer's country; he may be a victim of quake or typhoon, which may wreck his fortunes. There may be a sudden import or exchange restriction; there may be a moratorium. In all such events, the exporter's money would be blocked abroad, and he would find himself in difficulty. There will be no neighbours to complain to, as in the case of the 'householder.' The buyer is 'extra-territorial,' subject to an entirely different set of trade practices and customs; he will be beyond the call of the laws and regulations in the exporter's country.

As territorial division of labour increases, as the economic system becomes more complex, as the lines of credit extended to the overseas buyers become longer, the risks tend to assume large dimensions. Exporters cannot—indeed, need not—always carry such risks on their own shoulders. In many countries, Governments have, therefore, come to the aid of exporters, and have offered to cover the export risks on payment of a premium.

History

The first glimmering of the need to secure credit risks goes back to the days before the Christian era:

"Be not one of them
That are sureties for debts"

so says Solomon (Proverbs xxii:26).

The history of export risks insurance in its modern complexity is a chequered one. Its advent can be traced to the turn of the nineteenth century, when there was a financial crisis in Australia, resulting from a series of bad harvests and, of course, some credit aberrations. Thus sprang a demand for the insurance of export risks. A few insurance companies in London responded to the call. However, in the absence of the requisite 'know-how,' they tended to underwrite even the most suspect risks and so came to grief. But the grim lessons then learnt by them have become the cardinal principles in the theory and practice of export risks insurance.

Gradually the credit insurance movement gathered momentum. The business of export risks insurance spread beyond the shores of Britain to France and Germany, Switzerland and Sweden and Benelux. It received a setback during the two wars; but, with the reconstruction of the world and the phenomenal growth of international trade in recent years, a vigorous drive for insurance of export risks got under way. Today, twenty-two countries, including India, have their own Export Risks Insurance institutions; and they have formed themselves into a loose confederation—*'L'Union Assureurs des credits Internationaux*, popularly known as the "Berne Union."

State and Export Risks

In most countries of the world, export promotion has become a prime responsibility; and insurance of credit risks has assumed high national importance. This is not only because the element of risk in international commerce is greater than in domestic trade, but also for the reason that it is difficult to have a real insight into the affairs and *standing of a buyer who* lives in another clime, often thousands of miles away. Equally important is the hazard, flowing from political and monetary factors. The history of export risks insurance is replete with examples of 'non-payment' by overseas buyers who are perfectly solvent, but who have been compelled by *force majeure*, by war, by a *coup d'etat* or an embargo on exchange remittances, to withhold payment to their overseas suppliers with whom they are on the best of terms.

Indeed, so great is the risk involved that credit insurance has gone beyond the pale of private insurers; and, in every case, the risks have had to be covered under the umbrella of Government. Insurance covers may be provided either directly by a department of Government like the E.C.G.D. (Export Credit Guarantee Department) in the U.K., or it may be furnished by a private insurance company on Government account, like the *Hermes Kreditversischerungs*, which offers by far the best example of its class.

There is also a variant of the same principle adopted by the *Nederlandsche Credietverzekering*. It insures the export risks; but these, in their turn, are reinsured by the State. In between these polarities are Corporations like E.R.I.C., the Export Risks Insurance Corporation of India, which are owned entirely by Government, but have on their directorate strong non-official elements drawn from industry and trade. Similar autonomous corporations exist in Canada and Australia.

Functions

It is remarkable how readily manufacturers and merchants insure against hazards of burglary and theft, against fire and quake; and how reluctant they are to cover their export risks, which might endanger the safety of their capital and cause serious injury and embarrassment to them. Resistance to export risks insurance generally comes from the exporter's belief that he knows his overseas client better than anyone else. This may sometimes be true: but, often, there is no escape from the fangs of an economic crisis, the eruptions of a volcano, the heat of political ferment.

The most important function of export risks insurance is the financial protection that it affords to the exporter against all these hazards over which he has no control. It lubricates the credit system, which is one of the main springs of economic activity.

Credit insurance also serves to improve the exporter's financial standing *vis-a-vis* his banker. It is not a gilt-edged security, but is certainly a useful collateral, acceptable to most banks, on the basis of which the exporter can secure a line of credit by assigning his policy to the lending institution. Thus the exporter may enlarge his business, without unduly deploying or straining his financial resources.

As equally important function of the risks insurer is to furnish—in its endeavour to improve the quality of its own risks—valuable information to the exporter about the status, the probity and resources of his overseas buyer. When a credit insurer declines to accept a cover or 'approve' of a credit limit, it should be deemed to be the alarm signal, the 'red' light, which the exporter can ignore only at his own peril.

A credit insurer also assists its policyholders in the collection of their dues and debts and the remnants of salvage. It places at their disposal its expert knowledge of legal and procedural matters; it irons out technical difficulties.

International trade is a tricky business. When a default occurs, the exporter may not be able to help himself; whereas the credit insurer is able to relieve him of a large part of the burden of legal proceedings, should these become necessary. Having behind them the backing of a Government, the credit insurers are able to draw upon the services of the country's diplomatic representatives, upon their counterpart organisations and the chambers of commerce in the various parts of the world. Thus are they able to deal with the most intricate issues in an area where the exporter, on his own, would be wringing his hands in despair.

Position in India

The question of insurance of export risks was first mooted in India in 1949. The proposal was considered by the "Export Promotion Committee"; but it did not find favour. The issue was then inconclusively discussed by the "Export Advisory Committee" in 1953 and again in 1955. Eventually, the matter was entrusted for detailed examination to the "Export Credit Guarantee Committee," which recommended that an autonomous corporation, owned by Government, for the purpose may be set up. Thus was born E.R.I.C., the Export Risks Insurance Corporation in India in 1957.

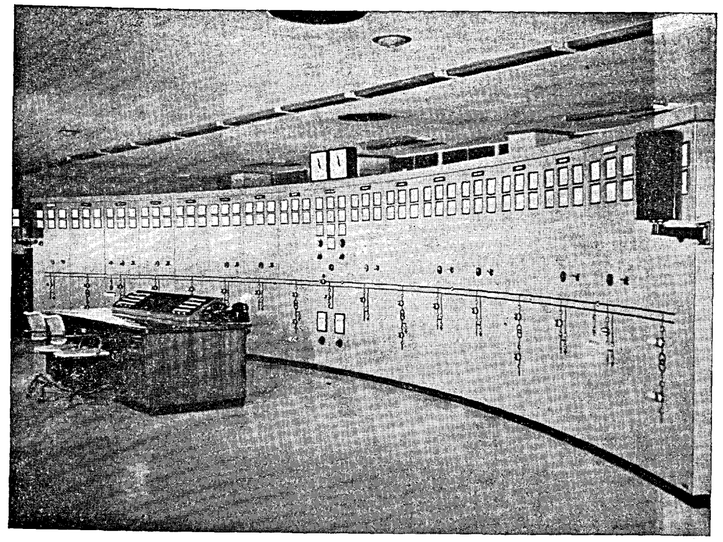
E.R.I.C. follows the general principles of credit insurance outlined in the foregoing paragraphs and issues insurance covers much in the same way as do its counterpart organisations elsewhere.

World experience of insurance of export risks over the years has shown that, normally, the covers must represent a genuine average of the commercial credits risks. This would be possible only if the exporters' "whole turnover" is insured. If this were not the case, there would be a tendency to insure only the dubious transactions; and the insurer would be left on his hands with nothing but the 'sick' patients of trade. Therefore, insurance of the "whole turnover" has become an important principle, designed to secure the benefit of the "law of averages." Of course, insurance of specific risks is not excluded; but, in that event, the insurer has to exercise the greatest circumspection.

Another essential principle followed by all insurers of export risks is that the policyholder must invariably bear a part of the risk, so that he may deal with his overseas clients with discrimination, avoid overtrading and pursue his debtors with vigour when a default occurs.

It is for these reasons that E.R.I.C., like the other credit insurers, favours the "whole turnover policy" and never covers the risk in its entirety. E.R.I.C.'s liability is limited to 85 per cent of the loss in the case of "political risks" and to 80 per cent in the case of "commercial risks." This generally corresponds with the practice followed by its counterpart organisation in Europe and elsewhere. The *E.C.G.D.* covers political risks upto 95 per cent and commercial risks upto 85 per cent. The *C.O.F.A.C.E.* of France, on the other hand, bears 80 to 90 per cent of the loss in the case of "political risks" and only 65 to 80 per cent of the commercial risks.

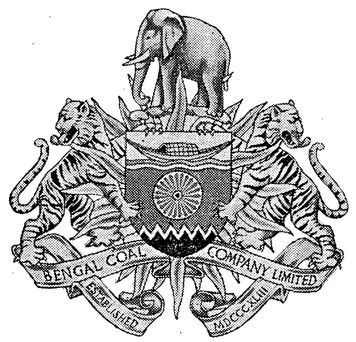
During the short span of its existence, E.R.I.C. has designed a wide range of policies to suit the varying requirements of exporters and to



Control Board at Tata's Receiving Station at Dharavi, Bombay.

ASEA ELECTRIC INDIA, PRIVATE LIMITED

BOMBAY CALCUTTA MADRAS



India's vital Coal Industry had its beginnings here in Bengal with the opening of the first mine at Ranigunj in 1814, and in this era of transition and promise, coal is in demand more than ever before to meet the requirements of Industry, Trade and Commerce.

The Bengal Coal Company, Ltd., were the first of existing Coal Companies to be formed and on its formation in **1843,** took over, among others, this famous Ranigunj Colliery.

Telephone: 22-4668 Telegrams: "COLLIERIES"

provide for differing patterns of trade. These are:

(i) *Shipments (Comprehensive Risks/Political Risks) Policy.*

(ii) *Contracts (Comprehensive Risks/Political Risks) Policy.*

The first set of policies covers the risks of the insured from the date of shipment, whereas the second category of policies protects his interests from the date of the contract. In either case, the exporter may seek a cover for "commercial" as well as "political" risks. But he has also the option to secure himself only against "political risks" if he so chooses.

(iii) *Packing Credit Policy.*

This is a new policy recently issued. It is designed to help the exporter to secure a line of credit from banks for the purpose of buying, processing and packing goods destined for the export market. Often, exporters have firm orders in hand for the finance of which they need credit which is in excess of the bank's normal rating of their capacity. In such an event, E.R.I.C. is ready to step into the breach and, for a nominal premium, share the risk equally with the lending banks.

(iv) *Manufacturers' Credit Insurance Policy.*

(v) *Exporters' Credit Insurance Policy.*

We have seen above that, quite frequently, exporters have to supply their goods to overseas buyers on credit terms. In order to replenish their resources, the exporters have to have recourse to their own suppliers for similar credits. Conversely, exporters may have to finance the supplier to produce the goods due to be exported. In either event, a credit risks would be involved which E.R.I.C. is able to underwrite.

(vi) *Market Development Policy.*

E.R.I.C. has also recently introduced a policy to assist exporters to survey new markets. If the expenses of the survey are not recouped by the exporter, in accordance with the findings of the survey within a given period, E.R.I.C. would share the loss with the exporter on a 50 : 50 basis.

The growth of export risks insurance is slow everywhere partly due to the natural disinclination of the exporter, but largely because a bulk of the international trade is done against letters of credit. In the U.K., where the institution of credit insurance is more than forty years old, the coverage of risks is of the order of only about 20 per cent of the total exports. It is a little over one per cent in Canada and 1.5 per cent in Australia. So far as E.R.I.C. is concerned, it has brought two per cent of the export risks under its sweep. Its performance thus compares well with that of its counterpart organisations of the same age; and its progress has been steady, as will be seen from the table below:

Progress of export risks insurance in India

Year	Maximum liability (Crores of Rs.)	Risks insured (Crores of Rs.)	Premium income Rs.
1957-58, Oct.-Sept.	7.52	1.30	43,109
1958-59, Oct.-Dec.	9.87	7.35	2,65,427
1960, Jan.-Dec.	8.14	6.96	2,36,448
1961, Jan.-Dec.	13.02	12.01	3,48,338
1962, Jan.-Dec.	16.50*	18.00*	5,25,000*

* Estimated value.

In the West, export risks insurance has become an important element, specially in medium-term finance of international trade. As India's trade grows towards the targets of the third Five-year Plan and the plans to come, as the pattern of our foreign trade changes and India becomes a supplier of capital and quasi-capital goods, export risks insurance will be called upon to play a role of ever growing national importance.

E.R.I.C. is to be conceived as a spearhead of export promotion. If trade is to be developed, Indian merchants and men will have to venture into new markets, delve into new commodities, and deal with new clients. They can do so with confidence, for E.R.I.C. stands behind them in this great national task which presents a challenge and an opportunity.

INDUSTRIAL PRODUCTION IN ASIA

The rates of increase in the manufacturing and mining industries in Asia (excluding mainland China) from 1958 to the first half of 1962 were the highest among all regions of the world, excluding eastern Europe, according to data compiled by the United Nations Statistical Office appearing in the November issue of the *Monthly Bulletin of Statistics*. The index of overall industrial and mineral production for Asia has more than doubled in the last six years. This data includes Afghanistan, Brunei, Burma, Ceylon, Singapore and the Federation of Malaya, Hong Kong, India, Indonesia, Iran, Japan, Republic of Korea, Pakistan, Philippines, Sarawak, China (Taiwan), Thailand, the Republic of Viet-Nam. Taking as a base 1958=100, the index was only 86 for 1957, but climbed to 183 for the period April-June of this year. This figure comprises the indices of 136 for mining and 190 for manufacturing. Heavy manufacturing, particularly basic metals and metal products, is by far the fastest growing segment of industrial activities in Asia. While the index for food, beverages and tobacco was only 114 in the second quarter of this year, always with reference to 1958=100, the index for metal products is 306. Heavy manufacturing rose ten times in the last 14 years, from 24 in 1948 to 240 in April-June 1962. Nevertheless, the relative weight of heavy manufacturing in Asia in comparison with total world production is only 4.8 per cent. Other activities showing relatively high rates of increase are paper and paper products, chemicals and petroleum and coal products and non-metallic mineral products. Their indices are, respectively, 175, 162 and 166.

The United Nations publication gives separate data for selected countries, among them China (Taiwan), India, Japan, Republic of Korea, Pakistan and the Philippines. Coal and iron mining in India reflected moderate increase during the first five months of this year with regard to the index of 128 for a year ago. The most marked expansion corresponded to electricity with an index of 168 last May. The industrial production of Taiwan rose at a steady pace to reach 185 last January. The indices were 113 for 1955, 128 for 1960 and 143 for last year. Nevertheless, general industrial production seems to have slackened its pace during the first months of this year, to be 150 in June. While mining, manufacturing, and electricity and gas had continued a steady expansion, construction diminished to be only three-fourths of 1958, with an index of 72 for the whole of 1961 and 74 for June 1962.

Japan shows the greatest rate of increase in industrial production, which has more than doubled in the last four years and tripled since 1955. The index that in 1955 was 69 for general industrial activities rose to 189 for 1961 as a whole, was 210 for last December and reached 226 in March of this year. However, the work dropped to 209 for June. An even greater expansion corresponds to mining in the Republic of Korea. Its index was 54 in 1955 and it grew vigorously to 139 in 1959, 183 in 1960 and 207 last year. The last figure shown for August this year is 248, almost five times the production in this field seven years ago. Provisional data for Pakistan put general industrial production at 142 for the last term of 1961, with practically the same figures, 144 and 142, for mining and manufacturing, excluding food products, clothing, furniture, most non-metallic mineral goods and metal products for which data are not yet available.

ORIGIN AND GROWTH OF GENERAL INSURANCE

Nationalisation Would Be A Retrograde Step

By K. P. MODI, B.Com., B.L, A.F.I.I.

THE principle of mutual protection has long since been known to mankind. It is very difficult to trace the actual beginning of insurance, but it is believed that there existed among the Aryan tribes of India almost three thousand years ago a form of community insurance.

Economic activities are always subject to uncertainty and risk. A fortuitous event may prove to be of advantage or disadvantage. A single loss may ruin an individual completely, as he may not be in a position to provide for such losses by himself. The aim of general insurance is, therefore, mainly the mitigation of pecuniary loss suffered by a few, by its distribution over the many. It is in the realisation of this principle that we find the beginning of general insurance.

It was in the fourteenth century that a form of regular marine insurance started taking shape. The records of some of the outstanding families in some parts of Italy have provided the earliest examples of Bill of Exchange and the evidence that insurance of marine was practised by them. Their activities expanded to Britain and to some other European countries. There is in existence a *Chronicle of Flanders*, beginning from the year 621 to the end of 1725, gathered from the ancient writings and, in this work, there is a passage of which the translation runs: "At the request of the inhabitants of Burges in 1310 he (the Count of Flanders) permitted the establishment in the town, of a Chamber of Insurance, by which the merchants were enabled to insure their merchandise exposed to the risk of the sea, or other hazards, for the consideration of a small premium as is practised at the present day." This statement, however, has not been corroborated by other contemporary writers. Marine insurance developed with the growth of trade in the various countries and later on London became the most important centre for the same.

Fire Insurance

The birth of fire insurance dates back towards the end of the seventeenth century. The need for insurance against fire risk was increasingly felt after the Great Fire in London in 1666 and fire insurance started taking proper shape thereafter. The real fillip came with the impact of the Industrial Revolution in the eighteenth century. Far-reaching changes in the manufacturing processes and expansion in material wealth necessitated protection of property such as factories, machinery, warehouses, etc., and fire insurance was in great demand. Since then fire insurance business has steadily grown and forms an important section of general insurance.

With the development of marine and fire insurances, other types of insurance, such as personal accident, fidelity guarantee, employers' liability, credit insurance, loss of profits, housebreaking and burglary, motor vehicles, aviation and engineering insurance, etc., became highly developed in the European countries and the U.S. and then in other parts of the world. Today, the scope of general insurance is not only very wide, but it is expanding day by day to meet the individual and collective requirements of the people of the world.

It will not be out of place to mention briefly the history of Lloyd's which is the biggest Insurance and Reinsurance House of the world. As against the normal practice of a company or a corporation assuming liability, all the underwriting business at Lloyd's is transacted by the individual members of the Society, each of whom carries on his business for his own account and risk. The general practice is that a number of members carry on their business through an agent in association but not in partnership. Each member is legally liable in respect of his commitments to the full extent of his means, that is, his liability is unlimited, and he has to deposit with the Committee of Lloyd's such security for his underwriting liabilities as the Committee may think fit to require. This amount of deposit varies according to the volume of insurance busines which is to be transacted by the member. There are certain other requirements, including Central Guarantee Fund, which protect the interests of policyholders.

Lloyd's has a very interesting beginning. Before the institution of joint-stock companies, marine insurance was carried on by individuals. Those requiring insurances had to obtain the subscriptions of each individual who was prepared to accept the risk and for this purpose he had to go either personally or through his broker from office to office. In the seventeenth century, when coffee houses were started, persons requiring insurances came to the coffee house where they would find a number of businessmen and get their confirmation for Insurance at one place, instead of visiting their offices separately. One such house was kept by Edward Lloyd towards the end of the seventeenth century and this house became the main meeting place of persons interested in shipping and marine insurance and it was from this beginning in the coffee house that the Corporation of Lloyd's under the Act of 1871 came into existence.

In addition to the insurance business, one of the important functions of Lloyd's is to collect and collate shipping intelligence, reports of accidents to civil aircraft and other important information of interest to Lloyd's Underwriters, as well as to the shipping, insurance and commercial community generally. There is a world-wide organisation for this purpose through the medium of Lloyd's agents, signal stations, wireless stations, semaphores, etc.

Development in India

General Insurance in regular form was first conducted in India on mutual basis when the East India Company was engaged in its trading operations. Later on, the business was conducted under the agency house system as agents of British insurance companies. It is said that the Alliance British and Foreign Life Insurance Company was the first to start regular insurance business in India through their agents in 1825. The first Indian insurance company registered in India was the Triton Insurance Company in 1850 under foreign patronage. A few companies were registered before the First World War but the real birth of Indian insurance came in the year 1920, when a number of leading Indian insurance companies were floated.

The history of growth of Indian general insurance is linked up with the political evolution in this country. In earlier stages, the Indian insurance companies had to struggle very hard to establish themselves in the market and even to make the foreign banks agreeable to accept their insurance policies. With the growth of nationalist movement and the growing confidence of the public in the Indian insurance companies, they started getting more and more support. Powerful groups of foreign insurers like the French, Dutch and Italian insurance companies, apart from the British companies, were keen competitors of Indian insurers. Fortunately, the Indian companies could withstand all these difficult days and, today, they write the major portion of general insurance business in this country. The share of Indian insurers in 1960 for which compiled figures are available was 71.2 per cent of the total Indian business in India. It may also be of interest to note that, in 1920, there were only eight Indian general insurance companies, whereas, in 1960, the number had increased to 88. The number of foreign companies operating at present is 78.

Plan and After

The development of general insurance as could be seen from the experience of foreign countries is closely linked with the economy of the country. India has successfully completed her first decade of planning and the third Plan has already been functioning for the past two years. The first two Plans had considerably stimulated production process as a whole and the pattern of industry has also become more variegated. The gross premium written direct in India during 1960 is estimated at Rs 38.12 crores, as against the actuals of Rs. 23.88 crores in 1951. It would be seen from the figures given below that only during the last three years there has been an annual increase of nearabout Rs. 5 crores, whereas during the previous years the expansion was rather slow:

Gross Premium Written Direct in India

(Rs. crores)

	Fire	Marine	Miscellaneous	Total		Fire	Marine	Miscellaneous	Total
1951..	12.02	5.94	5.91	23.88	1956..	12.06	6.61	7.40	26.07
1952..	10.33	5.52	6.09	21.94	1957..	11.90	7.03	8.90	27.84
1953..	9.83	4.88	6.11	20.81	1958..	12.66	6.77	10.28	29.80
1954..	10.07	5.21	6.07	21.35	1959..	13.73	7.60	11.97	33.81
1955..	10.44	5.98	6.67	23.09	1960..	14.35	8.55	15.21	33.12

Percentage Increase in Insurance and Industrial Production

	1951	1952	1953	1954	1955	1956	1957	1958	1959	1960
Index No. of insurance.	100	104.4	104.7	112.2	135.3	139.9	140.4	146.8	157.9	169.7
Index No. of industrial production	100	103.6	105.6	112.9	122.4	132.6	137.3	139.7	151.9	170.3

While the increase in quantum of premium in recent years shows an improved trend, the tendency of general insurance business to lag behind the comparative increase in percentage of the industrial production is an unsatisfactory feature.

The index number of general insurance recorded a rise of 11.8 points in 1960 as against 11.1 in 1959 and 6.4 in 1958; as against this, the index number of industrial production went up by 18.4 points in 1960, as compared to 12.2 in 1959 and 2.4 in 1958.

In recent years, the Indian insurers have extended their activities in other field of general insurance, apart from conventional fire, marine and motor and miscellaneous accident insurances, particularly to engineering contractors, all risks and credit insurances. There is still a vast scope of development of other types of insurances, such as cattle and agricultural insurances.

The Indian companies have not only expanded their business in this country but have gone to foreign countries and have been successfully operating in some of those countries earning valuable foreign exchange.

Insurance and Foreign Exchange

It is not very often realised that general insurance can earn a sizable amount of foreign exchange for the country. The securing of adequate foreign exchange resources for the implementation of the country's Five-year Plans is a major economic problem today. The import bill for the third Plan has been estimated at Rs. 5,750 crores and this is bound to increase in the coming years with new industries growing up and existing industries expanding. A number of measures are being taken by Government for boosting exports. The formation of the Export Insurance Corporation is an important step in this connection. Invisibles like banks, shipping and insurance can earn and save a considerable amount of foreign exchange for the country. In the United Kingdom, insurance is one of the important industries earning foreign exchange for the country.

The development of Indian insurance is still very unsatisfactory, looking to the size and the resources of the country. The annual premium income in the United Kingdom exceeds Rs. 2,000 crores, while, in India, it is only Rs. 40 crores, taking all the companies together. With a vigorous drive and assistance from the Government, the Indian insurers can raise this premium income to at least Rs. 100 crores in the next several years. A large part of the medium-size industries and trading stocks go uninsured. Residential houses are seldom insured. The advantage of insuring their properties should be brought home to each and every individual in this country.

The Post-War Sub-Committee of the Insurance Advisory Committee in their report in 1947 stated that concerted measures should be taken to make the public acquainted with the benefits of insurance and make them more insurance-minded. They laid stress on joint publicity on the lines of the Indian Coffee Board.

Insurance Legislation

Prior to 1912, the insurance companies in India were subjected to

In the Service of the Nation for 97 Years

ALLAHABAD BANK LIMITED

THE OLDEST JOINT STOCK BANK IN INDIA

Established 1865

Registered Office: 14, India Exchange Place, CALCUTTA-1

the Indian Companies' Act of 1882. In 1912, the first Act relating to life insurance was brought into force which was based on the Insurance Act of 1909 in the U.K. It was in 1938 that a full-fledged Insurance Act was passed which applies to all the sections of insurance including fire, motor and marine. This Act has been subjected to amendments from time to time. Major amendments were passed in 1950 and far-reaching changes were made therein, particularly relating to control on the expenses and the investment by the insurance companies. Apart from the Insurance Act, the general insurers have subjected themselves to the voluntary Code of Conduct to place general insurance on a sound and healthy footing. These measures have helped the general insurance companies to strengthen their financial position and regulate their expenses. The process is still continuing and changes are made in the provisions of the Code of Conduct according to the experience gained.

Nationalisation

Life insurance was nationalised by the Government in the year 1956 and those companies which had both life and general departments had to face some difficult times in adjusting their organisational set-up. History will show the justification or otherwise of the nationalisation of life insurance business. There is a strong opinion that, had the life insurance business not been nationalised, there would have been much more development and progress of the life insurance business in this country. The inherent defects of Governmental set-ups, particularly where highly efficient and prompt services are required to the public, cannot be denied.

There is talk of nationalisation of general insurance from time to time from certain sections and particularly those who do not understand the intricacies and technicalities of this business. Any hasty action on the part of the Government because of political pressure would be a retrograde step in the economic development of this country. It is, perhaps, not realised that the general insurance business of one country is linked with almost all the other leading countries of the world through exchange of reinsurance business and general insurers are thus ambassadors for the goodwill of the country.

Social Security

The social security problems have been solved by many countries through their national insurance schemes. Our own country has since several years brought into effect the State Insurance Corporation which is applicable to the workers employed in leading industries and the scope is gradually expanding to include more and more factories and areas. In addition to the compensation payable to the workers for any injuries received by them due to accidents while employed in their factories under the Workmen's Compensation Act, the workers and their families are getting medical benefits in case of illness.

The insurance companies are not permitted to cover war risk damages on inland properties. They normally cover goods in transit by sea.

In case of war or war-like emergency, the insurance against war risk damages is covered by the Government. During the last war the Government of India had promulgated an ordinance for war risk insurance of factories and of goods in trade and also vessels plying on inland waters.

Due to the present Chinese aggression and at the instance of the Central Government, Parliament has passed recently two Acts, namely, (1) The Emergency Risks (Factories) Insurance Act, 1962, and (2) The Emergency Risks (Goods) Insurance Act, 1962. All factories and goods over the value of Rs. 30,000 are compulsorily insurable at certain rates to be notified by the Government. In times of emergency, war risk insurance goes a long way towards creating confidence among the people and enables them to carry on the manufacturing of goods and the trade without fear of loss by enemy action.

Insurance Education

The nature of general insurance business requires fully trained personnel with sufficient grounding in principles and practice of insurance so that they can shoulder the burden of scientifically running the insurance business. Present-day insurance business is definitely increasing in complexity and, therefore, it is necessary that the right type of training is imparted to those who come forward to take insurance as a career. The work that is being done in this regard by the Federation of Insurance Institutes (J. C. Setalvad Memorial) is, indeed, commendable and it is hoped that a college will soon be started for the purpose. There should be a well-equipped central library to facilitate research work in insurance. This library should collect the literature on insurance in different countries and should make the same available for reference and study.

The insurance companies have a vital role to play in the expanding economy of the country. They should work in close co-operation and should avoid unhealthy competition among themselves. In these days, no industry can fully develop without the Government's assistance. It is felt that our Government has not as yet realised the importance of the insurance industry and the need to extend their unreserved assistance in the wider interest of the country. There should be closer co-operation between the industry and the Government. It is hoped that, with the support of the Government and the public, this important industry will play its rightful role in times to come in the all-round progress of the country.

THE GRAND PARADE

Fundamentals Of Social Security

Means To Mitigate Inequality In Income Distribution

By Dr. J. N. MONGIA, M.A., LL.B., Ph.D.

THE expression social security has gained universal currency and has come to stand for the main objective of the post-war reorganisation of society. But its meaning and its connotation are still vague.

Individuals and people find themselves drawn, at different times, either towards adventure or towards a secure sufficiency. In the present epoch, most of mankind appears to be opting for "safety first." The ever-widening and augmenting demand for social security bears witness to this tendency. The average man today is older than at any other time in history, and caution comes with years. Perhaps, opportunities for profitable adventure have become so rare that they no longer fire the imagination, and adventure must hereafter be sought outside the economic sphere. However that may be, every worker, nowadays, wants to be certain not only of his next meal but also of his subsistence for the rest of his life and the subsistence of his dependants as well. This aspiration, though often unvoiced, has always existed, but only recently has it been seen by the masses to be within their reach. "The mechanics of social security consists in counteracting the blind injustice of nature and economic activities by rational, planned justice with a touch of benevolence to temper it."[1]

Origins of Social Security

It may be of some interest to trace the origin of the social security and, for the purposes of the present paper, it will suffice to locate the same at the beginning of the early nineteenth century in Western Europe. In this region, industrialisation had begun and the "proletariat" had made its appearance. Here was a large new class of factory hands, completely dependent on the regular payment of wages for their subsistence and, therefore, reduced to privation by a spell of sickness or unemployment. It is true that there existed some poor relief in some areas but it must be made clear that poor relief, far from being designed to afford a modicum of social security, was conceived of as a police measure which, by preventing the despair of starvation, would diminish the potential danger of desperate action and the ensuing disturbance to society. Thus, in the period upto about 1880, three methods had been devised and applied in order to protect the urban labouring class from destitution; small savings, employers' liability, and various forms of private insurance.

The first of these methods, that is, the savings, was the Government-sponsored savings banks, but it has had only limited success, obviously because the level of wages 50 or 100 years ago and the large families of those days simply left no margin for saving among unskilled workers.

The second method is that of placing liability for the maintenance of the worker in sickness, as in health, on the employer in virtue of the *quasi*-paternal authority of the master over servant and the correlative responsibility of the former. This method is, as a rule, better than nothing. Employers' liability is, however, mostly associated with compensation for injury caused by the employment and it is very clear that a general system of social security cannot be provided by the employers' liability method.

The third and the last of the nineteenth century methods of fending off destitution is private insurance in its various forms, two of which can be easily distinguished, namely, insurance through mutual aid societies and insurance through insurance companies. The former seems to have sprung up spontaneously among urban workers at different times and in places as ancient as Rome or the seventeenth century Madrid. Their main objects were to help the member in times of sickness with simple medical care and to pay for his funeral in return for a regular periodical contribution. However, realising that the mutual aid societies run by the workers themselves could not safely undertake old age or life insurance, a number of European Governments, in the second half of the nineteenth century, created insurance offices under the guarantee of the State, which offered facilities for those branches of insurance to persons of small means.

The different methods were tried upto about 1880 in order to insure that the working class family could continue to subsist, during times when wages were interrupted or ceased altogether, without recourse to poor relief. Saving and insurance, whether mutual or commercial in character, broke down always for the same reasons. Poverty and improvidence form an inseparable pair. The error of the nineteenth century was its optimism respecting the effective power of the lower ranks of workers to cover their risks themselves. Towards the end of the nineteenth century, therefore, several countries of the European continent, being convinced that the unskilled labour would not provide its own social security, decided, though reluctantly, to spend public money or give subsidies to voluntary thrift. These ventures have yielded useful results in some countries. In Denmark and Switzerland, subsidised mutual aid still exists in the sickness branch, where benefits, mainly in kind, are extended to the large majority of the population; again in Denmark and Sweden, the trade unions, heavily subsidised, still administer unemployment insurance. This variant of the insurance method is attractive, in that it involves a genuine partnership between the individual and the State, each having a part of the responsibility for the proper working of the scheme. However, to this we shall return later.

What *is Social Security?*

Thus, it will seem that an attempt to find security for people is among the oldest of political obligations and greatest of the tasks of the State. It is, however, time we undertook to assign a meaning to that expression to conjure with "Social Security." "It is no blessing to be had for the asking. It is no gift of the Government through a single legislative Act. It is no abstraction too nebulous for definition. Security begins with bread and butter. But, mere subsistence is no security. Security is more than a condition of material well-being. An opportunity to earn a living, to be a member of the community, to have a part in the Government, is basic. In positive terms, the security of a people is the sum of arrangements set by business, by the Government and by society through which the things we cherish, are safeguarded against the hazards, we, as individuals, cannot control."[2]

"Social security is the result achieved by a comprehensive and successful series of measures for protecting the public (or a large sector of it) from the economic distress that, in the absence of such measures, would be caused by the stoppage of earnings in sickness, unemployment or old age and after death; for making available to that same public medical care as needed; and for subsidising families bringing up young children."[3]

What is meant by social security? It is, according to Haber and Cohen, in *Readings and Social Security:*

"Social security is security which society provides, through appropriate organisation, against certain wants to which its members are exposed, either the population at large or important classes. They are essentially wants against which the individual cannot be expected to provide by his own ability and foresight alone, or even in private associations with others. It is characteristic of these wants that they arise out of emergencies, occasions or limited periods of straitened means of extraordinary expenses, and that failure to deal with them has serious consequences both for the individual and for society. In other words, they are wants against which social insurance and social assistance were invented to provide."

Modes of Social Security

The modes of providing social security may be called "Social Security Schemes" and may be classified under the headings of "Social Insurance" and "Social Assistance.' Standards, carrying international authority, have been established for social insurance and, incidentally, for social assistance, by the International Labour Conference during the twenty years between the two world wars. All collective methods involve either assistance or insurance or a combination of the two.

Social assistance denoted in the past the relief to the poor out of the public funds and usually it was looked down upon. Many workers preferred to starve than to avail themselves of this help which deprived them of all the social status and reduced them to the position of social parasites.

A special resolution on the aims and functions of social insurance, adopted at Havana, expresses succinctly and adequately the essence of social insurance as internationally understood on the eve of World War II. The following contingencies, or risks, or industrial hazards, are covered by social insurance schemes supported or subsidised by the State-employment: Injury, industrial disease, invalidity or disablement, ill-health or sickness, maternity or child-birth, old age, burial, widowhood, orphanhood and unemployment.

These are the occasions where the worker is unable to work or to obtain work, or where, after his death, he leaves a dependent family. They involve in all cases, loss of earnings, raising thereby the problem of income security. Social insurance primarily deals with the problem of providing income security.

Social insurance, which took its form, as almost mutual insurance, assumed the modern systematised form when nearly seventy-five years ago, Germany introduced a compulsory sickness insurance scheme. The element of compulsion has since then been accepted, mainly because compulsory insurance has a wider scope and is financially more sound than voluntary insurance. It is now universally agreed that the modern State has the right to make insurance compulsory and ought to do so in the public interest.

The Social Security (Minimum Standards) Convention (of I.L.O.) recognises social insurance and social assistance as alternatives. This Convention is intended to be within the reach of underdeveloped countries, and this intention is nowhere more evident than in the clauses defining the minimum scope of each branch of social insurance. These countries experience great difficulty in applying social insurance outside the urban centres; the villages and small towns have only scanty medical facilities, and undertakings with more than a few employees are rare. So the Convention is satisfied that, if the prescribed standard of benefits is reached for half the employed population, it is good enough. Social assistance, embracing as it potentially does, the entire population, and financed as it necessarily is by taxation, is generally beyond the economic capacity of underdeveloped countries.

As against other methods of collective provision, such as social assistance or schemes of non-contributory pensions, financed entirely out of public funds, compulsory social insurance offers substantial advantages:

"(a) It associates the workers concerned, from whom a contribution is required, both materially and morally, in the protection of their health and their working capacity; (b) it implies the establishment of autonomous insurance institutions, dedicated solely to the organisation of prevention and the service of medical and cash benefits; (c) it grants benefits in virtue of definite rights, and thus preserves the self-respect of the beneficiary, who is secured against arbitrary decisions on the part of the body responsible for awarding benefits; and (d) it guarantees the payment of benefits by the assignment of specific resources, and by distributing the cost over long periods in accordance with the rules of actuarial science."

The Difference

Social security is thus the objective and social insurance is one of the means by which the objectives may be reached. Social security plans, however, differ fundamentally from the social insurance schemes for the following reasons:

First, social insurance schemes may be partial, but social security plans must apply to the whole population. No full employment policy, no health service, no income distribution scheme can afford to be restricted to certain groups of workers. For the same reasons, social security must cover all the risks which deprive a person of earning an income.

Secondly, various components of social security cannot be kept apart. An economic policy of full employment, for example, cannot be dissociated from a policy of income distribution because the income to be distributed itself depends, to a large extent, on the level of employment, and because the failure of a full employment policy will require the provision of alternative incomes for the un-

employed. The connection between health policies, on the one hand, and income redistribution, on the other, is equally evident.

"The evolution from social insurance to social security consists in extending its protection to an even larger scale of the population, in widening the range of the risks that it covers, and as regards the quality and quantity of its benefits, caring more for social adequacy than for actuarial equality."[4]

Scope of Social Security Benefits

A social security scheme, therefore, covers both social insurance and social assistance. Under primitive poor relief schemes, the fundamental attitude towards applicants was: Are you in vital need, and are you incapable of satisfying it? If so, here is your subsistence; and here, if you are sick, is your medical care. The functions of social security schemes can still be described in the most general terms as the provision of subsistence and medical care. But, for each main cause of need, the social security system provides a benefit which is specially designed to cover the contingency, very often through an agency set up for that specific purpose.

The specialisation of social security organisation by branches, each covering one contingency or a group of closely related contingencies, is to be explained by the historical process with which we are becoming familiar. We have already seen in the earlier pages that mutual benefit societies were able to provide their members with medical care and short-term cash benefits; insurance companies could take over employers' liability for workmen's compensation, and trade unions could furnish benefits during unemployment (if not prolonged), but only large public institutions could make themselves responsible for pensions. Co-ordination of all the different kinds of agencies in countries where they have been operating for a generation or more, has progressed with difficulty, and the final step of unification is a recent and a rare achievement. In fact, the desirability of unification is sometimes open to question.

The Social Security (Minimum Standards) Convention distinguishes nine benefits, enumerating them in an order which has little significance. The branches into which they are commonly grouped for organisational purposes are the following:

Family allowances;
Medical sickness and maternity benefits;
Invalidity, old age and survivors' pensions;
Employment-injury benefits;
Unemployment benefit.

It is at once clear that all the contingencies in question are alike, in that they render the workers' earned income insufficient to meet certain proper claims on it. Also, all of them, except unemployment benefit, are of a biological nature; disease or injury; childbirth; old age; which is somehow correlated with senile decay and death.

A social security system cannot (or should not) pay more than one benefit at a time in respect of cessation of earnings. If, for example, an unemployed person becomes incapable of work, he incurs no additional loss warranting payment of an additional benefit. On the other hand, where a contingency has already led to a reduction of earnings, a fresh contingency may produce a further reduction: for example, a partially incapacitated person may become unfit for even the minor employment which he was able to perform and, in such a case, the payment of additional benefit is called for.

It should be noticed that cessation or reduction of earnings can, of course, occur only to gainfully occupied persons. Medical and funeral expenses, on the other hand, are charges that may be incurred for any person, and any adult may find himself legally responsible for maintaining a dependant.

The technique of social insurance was first developed for the protection of employees, and social insurance for independent workers has been an after-thought and something of a makeshift. Employment injury insurance and unemployment insurance were, of course designed for employees only. But several countries have enabled, and even obliged, small employers and independant workers to take out insurance against injury in the course of their work; in Denmark such insurance is subsidised by the State.

As against social insurances, social assistance is intended for the population at large, with the further difference that the effect of cessation or reduction of earnings on the total income of the claimant has often to be ascertained in each case individually before benefit is awarded.

Except for the funerals (where no expenses arise in the case of a pauper's burial) and employment injuries and maternity (where the employer may be made liable for compensatory payments), the same contingencies can be and are covered equally well by social insurance or social assistance. There are six contingencies for which social assistance has sometimes been preferred even when important schemes of social insurance are already operating in the country concerned, namely, need for medical care; invalidity; old age and the death of a breadwinner; family responsibilities, and prolonged unemployment. Social assistance in each of these contingencies except the last is tending to drop the means test and so to develop into a universal social security service.

Qualifying Conditions

The qualifying conditions for the right to benefit are, first, that the contingency has occurred and, with it, a cessation or reduction of earnings, or a need to incur certain expenses; and, second, that the claimant possesses the particular status prescribed by the scheme of social insurance or social assistance concerned.

Now, regarding the second condition, some schemes merely require a claimant to be engaged in employment within the scope of the scheme when the contingency occurs. In a large number of cases, however, it is not enough to be an "insured person," since, more often than not, a scheme does not confer "protection" on a person merely because he is "insured." It is further required that he shall have been engaged in an "insurable employment" for a minimum period varying in length with the type of benefit, and that corresponding minimum number of contributions shall have been paid on his account. It will be readily understood that the duration of the qualifying period is likely to depend on the probability of persons arranging to enter employment, simply because they have a reason to fear, or already know, that a contingency giving rise to benefit is about to happen to them —in other words, when they are "bad risks." The more valuable the benefit in view, the greater this probability is. But, in a country where social insurance is almost universal, more of the bad risks are already insured and the problem loses much of its significance.

The occurrence of the contingency and the fulfilment of the qualifying conditions having been ascertained, the form and the amount of the appropriate benefit are then determined. In the case of medical care, the medical officers of the scheme must perforce be given discretion as regards the nature and duration of the care to be rendered, within the limits that the scheme specifies.

It may also be mentioned that the rates of cash benefits payable under social insurance scheme are usually proportional to the rate of the claimant's former earnings as averaged over a shorter or longer period, though they may sometimes be fixed on a subsistence basis.

In a social assistance scheme, the cash benefits are intended always to correspond to the cost of subsistence, and, in some cases, private income in excess of a prescribed level is deducted from the benefit.

Another noteworthy point is that a social security scheme which does not adopt its benefits to changes in the value of money is evidently not fulfilling its original purpose. Since the Second World War, and with the dissemination of the ideas of J. M. Keynes, most Governments have not favoured any reduction in the nominal value of wages. The aim, however imperfectly attained, has been that wages should rise in proportion to productivity. In practice, nominal wages show a tendency to outstrip productivity, and inflation results in a greater or smaller degree. Governments have carried out general revaluations of benefits only to find, a year or so later, that the new scales have already become inadequate. Hence a growing number of social security schemes now incorporate permanent provisions for the adjustment of benefits to the general level of wages or prices.

Owing to an absence of co-ordination between the various social security schemes comprised in a national system, discrepancies often appear in the rates of benefit payable in contingencies which, though different, appear to create the same needs. Intelligible explanations can sometimes be found, but frequently the differences seem to be accidental. For example, if the cessation of earnings is expected to be temporary, it may be argued either that the person can draw upon his savings, so that a relatively low benefit will suffice, or, on the contrary, that he cannot reduce suddenly his usual expenditure, so that a relatively high benefit is indicated. Either line of argument is, perhaps, tenable, but doubts are inevitably awakened when examples of both are found in the legislation of the same country.

The work of the International Labour Conference has helped Governments to fix the level of their minimum benefits, especially through the influence of the Social Security (Minimum Standards) Convention. That definite figures could be embodied in that Convention is evidence of a growing consensus of opinion in the different countries about what represents a tolerable benefit in a given contingency.

International Problems of Social Security

The rapid progress of the concept of social security throughout the world has raised international problems in addition to the problems peculiar to each country. If social security is defined as a general aim of all social policy as the securing of decent and stable living conditions—its international implications are merely one aspect of the essential interdependence of nations, and the problems it raises are bound up with the realisation of effective co-operation between all countries in economic and social matters. But, if social security is considered in the concrete rather than in its "philosophical" sense, with the meaning that we give it when we speak of security laws, institutions or services, the problems involved are of a more technical and precise character. The object of the present paper is to make only a passing reference to the problems of the latter type, that is to say, those arising in the international field out of the co-existence in the different countries of laws, institutions and services to cover exceptional expenses incurred by individuals and families, and to provide a substitute income if they lose their normal earnings. Hence, under the present heading, we may just give a bird's-eye view of the general line followed in solving (1) the problem of conflicts of laws and of determining the limits of the national laws applying in social security matters; (2) the problem of maintaining the rights of migrants to social security benefits; and (3) administrative problems under the international convention on social security.

Different Approaches

(1) Social security laws and institutions are national laws and institutions and it is often difficult to know, when a case comes up for being dealt with by the social security machinery, which nation's legislation, if any, is applicable. Different approaches are thus adopted even where the laws of different countries are based on similar principles. This is because, quite apart from technical considerations, there is the opposition between territorial and personal laws. To quote an instance. Apart from migrants, this question is chiefly of practical interest where a worker is employed and insured in one country while his family is living in another and treatment is given to his wife or dependent child. If the right to treatment for the whole family is a personal right related to the worker's contribution, the scheme to which he belongs must pay for treatment given to the wife and child in their country of residence. If, however, the worker is employed in a country where treatment is organised on a territorial basis, he will only be covered if their country of residence also has a similar territorial organisation and this organisation provides them with treatment.

Thus, it is very clear that the difference in the concepts underlying the legislation of the different countries inevitably results in gaps and overlapping. Certain contingencies may be left uncovered by any system, whereas others are simultaneously covered by the legislation of two or more countries. This leads to situations that are socially intolerable. It is one of the purposes of the international agreements on social security to settle such problems. Experience has shown, however, that, with laws so numerous and varied, the adjustments must be made bilaterally, since it is, indeed, extremely difficult to lay down simple principles that can be applied in relations between a large number of countries. But the problem of how to deal with a situation, where the law is territorial in one country and is based on the personal character of entitlement in the other country, remains unsolved. In actual fact, the only general agreement so far concluded between countries with legislation based on different principles provides for the application of the territorial system. It also remains a fact that, in practice, every country discriminates, to a greater or lesser extent and for varying reasons, between aliens and nationals in regard to social security legislation. In doing so, a distinction is usually made between contributory and non-contributory benefits, where the latter are usually restricted to nationals only.

(2) The second problem of determining a migrant's position under the social security laws of the emigration country and immigration country is a familiar one that has already been solved to a large extent. It is obvious that this problem is closely related to the problem of determining the limits of each national legislation—the solutions of the second problem must make it possible to decide when a migrant leaves the field of operation of one law and enters that of the other. The migrant, however, may already be entitled to certain forms of benefit in the country which he is leaving. Is he to lose such acquired rights and, if not, on what conditions and to what extent will they continue? Moreover, even if he has not acquired rights, he may have partly completed the period of residence, employment or contribution required for entitlement to benefit. Thus, to the question as to whether a person will keep, on leaving the country, acquired rights to social security benefit, the answer depends primarily on the law of the emigration country and also depends, to some extent, on the law of the immigration country. If the two laws by themselves lead to a negative result, the situation may be and often is remedied by international agreements. Thus, attempts have been made by international conventions and agreements to resolve these difficulties and remove the obstacles to the maintenance of acquired rights.

In the first place, the conventions of agreements are intended to overcome the obstacles in legislation founded on the personal nature of benefit rights which prevent the emigrant from retaining his rights. In practice, it means the abolition of any residential requirements which such laws impose for receipt of benefits. In the second place, the conventions or agreements are intended to overcome the obstacles in legislation founded on the territorial nature of benefit rights which prevent the immigrant from enjoying these rights. These obstacles, it may be repeated, are mainly the result of conditions regarding the place of occurring of contingency or the nationality of the beneficiary.

(3) The application of international social security agreements involves the creation of a whole system of new relations between the social security services and institutions of the signatory countries. These services and institutions, designed in relation to the national legislation and hitherto functioning in a closed space, are brought into close collaboration, and relations between them give rise to a complex of new administrative and technical problems.

And, since it is not possible to regulate these relations through ordinary diplomatic channels, an understanding must be reached directly between the actual administrators and technicians. Hence the importance of the administrative agreements that have been made to supplement the main social security agreements. In addition to specifying and setting in motion the delicate machinery required, these must provide a basis for relations of mutual confidence between the services and institutions of the countries covered.

It is also obvious that all the problems involved in applying social security agreements are bound with the need to ensure ease and facility in the discharge of obligations arising out of the agreements and to provide benefits to entitled persons with a minimum of formalities and a maximum of social efficiency. The problems are many but not all are of equal importance. In actual fact, the problems that have arisen and have been dealt with, relate almost exclusively to benefits.

Thus, it would seem that, parallel with the elaboration of national systems of social security, the last decade has been the beginning of organised international relations in social security matters. The different aspects of the problems involved in this process have been gradually disentangled. If final solutions have not been found for all of them, at least methods have been evolved and tried out, so that the general lines of a body of accepted practice are gradually taking shape. At least, a practical result has been that the relations between the men in charge of social security services or agencies throughout the world are becoming closer and it would seem that without show, and often unknown to the public, the solving of international social security problems represents a practical contribution towards the construction of a community of nations.

Concluding Remarks

It would be clear from the foregoing analysis that social security measures have a twofold significance for every underdeveloped country. They constitute an important step towards the goal of a Welfare State by improving living and working conditions and affording the people protection against the uncertainties of the future. These measures are also important for every industrialisation plan, for, not only do they enable workers to become more efficient but they also reduce wastage arising from industrial disputes. Lack of social security measures impede production and prevent the formation of a stable and efficient labour force. Social security is, therefore, not a burden, as some might think, but a wise investment which yields good dividends in the long run. It would, however, be suicidal to overlook the effects of social security on the worker's will to produce. Some people ask the question: "Is security not mankind's chiefest enemy?" "Does not security weaken initiative and breed slackness?" "Does it not sap the pioneering spirit on which progress so largely depends?" These are serious questions and need serious consideration but much more experience is needed of the effects of comprehensive system of social security before any definite answer could be given to them. The ultimate effect of social security schemes amounts to payments being made by the productive to the unproductive, i.e., by those who are fit and employed to the aged, the sick and the unemployed. The problem is one of the effects of the system on initiative, independence, and efficiency. Properly devised and administered, social security, though it will be abused by some, is likely to facilitate increased production by reducing the harm done to the main body of workpeople by the fears, anxieties, and privations of insecurity. "It must never be forgotten, however, that the resources to provide social security benefits are largely due to the energy, ability, and initiative of the relatively small group of really enterprising people from all classes, and there should be more joy ... over one who blazes a new trail and is willing to take its risks than over ninety and nine who stagnate in the sheep fold of social security.[5] At the same time, one may also bear in mind that, when, "properly devised, controlled and financed, it (that is, unified social insurance) need have no depressing effect on incentive."[6]

are you wearing Colour-Chem

Look around. It's just possible that COLOUR-CHEM is in your clothes, or on the painted walls of your room, or in the fascinating tapestry of your drawing room, and may be in these very printed words you are now reading.

Colour is so much around us that quite often we are not even aware of it. But the pleasant contribution it makes in colouring our existence into a thrill, is a fact—as true as the fact that COLOUR-CHEM is an enterprise very much drenched in colours! Making colours is the sole business of COLOUR-CHEM.

Colour making is a basic industry, in that it lends a dynamic strength to our mammoth Textile Industry by making available an abundant supply of colours of countless kinds and varieties. It's a vital industry, too, being an integral part of the Chemical and Pharmaceutical Industry.

COLOUR-CHEM's speciality is "Pigment" colours, a particular kind that is supremely popular for printing textiles all over the world—besides being a prime material for such industries as Paints, Printing Inks, Rubber and Plastics.

This is a highly technical job, the making of "Pigment" colours. But the technicalities posed no problem, because when COLOUR-CHEM thought of making pigments in the country, they brought the experience of Germany's oldest leaders in the manufacture of dyes and pigments—who not only lent a helping hand, but actually participated in the project. That's how German technical 'know-how' and Indian skill combine and work continuously, giving perfection to the pigments before they are released for the markets. And they are working across the seas, too, for in the laboratories of German collaborators, unceasing research goes on and the benefit of all new discoveries and improvements in the processes is at once shared.

The introduction of indigenous makes of "Pigment" colours by COLOUR-CHEM in 1959 made history in the realm of textile printing in India, because the pace of popularity it set in motion for itself, shows no sign of relaxing. Pigment prints are the preference of the people—more and more, and, more and more. Nothing abnormal, nothing like a passing-phase, for printing with pigments is popular all over the world, and easily snatches a lion's share of the total print order. In countries like Japan it is fantastic.

COLOUR-CHEM cannot yet meet the total demand. A few essential raw materials and foreign exchange are the handicaps beyond control. But one thing is certain, that despite all the limitations COLOUR-CHEM produces a wide range of "Pigment" colours to meet the increasing demands of the consuming industries and that too, at a reasonable price. Of course indirectly COLOUR-CHEM is also very much in Exports—through exports of pigment printed fabrics.

So, when you see the fascinating world of man-made colours around you—spectacular prints on your fabrics, colourful inks in your favourite magazines, red plastic balls for children—remember that COLOUR-CHEM, India's largest makers of famous pigments, is so much a part of your day to day life.

PROGRESS OF TRADE UNIONS

Some Suggestions For Strengthening Them

By Dr. J. L. RASTOGI

ALTHOUGH under the Indian Trade Unions Act, trade unions include even employers' organisations, they are essentially organisations of workers—manual and non-manual—and are formed for protecting the rights and promoting the interests and welfare of their members, in particular, and of the working class in general. The growth of trade unions has been associated with the rise of factory industries and large-scale production. As in any other country, in India also workers were completely unorganised in the early years of *industrialisation, not being conscious* of their rights and strength. Their employment and terms and conditions were entirely at the mercy of employers. They had no outlet, except to abandon their jobs, to express their dissatisfaction either with the work or the management. Hopeless plight and severe exploitation of labour led to the formation of some associations for protecting the ignorant working people until the First World War. However, these early organisations were not trade unions in the real sense. These were philanthropists and humanitarian associations for promotion of workers' welfare and representing their case to various commissions, etc. Most of these were short-lived due to inadequate finances or had to be dissolved on the death of their leaders or after achieving their immediate objectives. Moreover, these failed to *generate among employees a consciousness* of their rights and strength and a spirit of co-operation and responsibility.

The Real Beginning

Although circumstances were favourable in the country for the development of the trade union movement after the First World War, the real beginning could not be made until the Indian Trade *Unions Act was passed in 1926.* Most of the unions formed in post-war I years were more of a political nature. Their main purpose had been to intensify the freedom struggle by infusing in workers the benefits of freedom of association and concerted action and by creating work stoppages and internal disorders. Any effort on the part of employees, even for genuine objectives, was thus looked down upon, and employers did everything in their power to undermine the authority and following of trade unions.

No doubt, the Indian Trade Unions Act went a long way towards promoting and protecting the trade unions. But it could not achieve the desired results due to inherent weaknesses in the movement and opposition of employers. Trade unions were, however, attached a new importance during World War II when they were associated with the Plenary Conference on Labour and the Standing Labour Committee. Immediately after World War II, the number of trade unions and their membership witnessed a continuously rising trend due to greater consciousness on the part of workers of their rights and strength, on the one hand, and additional recognition accorded to these by the Industrial Disputes Act, 1947 for the formation of works committees and conciliation boards, on the other. The total number of registered unions increased from 2,666 in 1947-48 to 3,987 in 1950-51, 4,909 in 1952-53, 6,649 in 1954-55, 8,553 in 1956-57, 10,045 in 1957-58 and more than 10,228 in 1958-59. Of these, a substantial number did not submit returns to the Registrars. Thus, in 1958-59, the number of unions that submitted returns was only 6,040, as against 5,520 in the previous year and 4,399 in 1956-57. The membership of the unions submitting returns also grew from 16.63 lakhs in 1947-48 to 18.75 lakhs in 1950-51, 20.90 lakhs in 1952-53, 21.70 lakhs in 1954-55, 23.77 lakhs in 1956-57, 30.15 lakhs in 1957-58 and 36.45 lakhs in 1958-59.

Stunted Growth

In spite of the rapid strides made by trade unionism in the country in the post-independence years, its growth has not been entirely satisfactory, as will be seen from the following defects in it:

1. Trade unions in India cover only a portion of the working population. A large number of workers is still outside their fold.

2. While in certain spheres unions are highly developed as in the organised industrial sector, they are moderately organised in others, as among white-collar workers, and are yet to be promoted among certain sections of the working class like contract labour, domestic servants, agricultural workers, etc.

3. Even in the organised sector, trade unions sometimes lack responsibility. A large number of unions either do not file any return or fail to do it in time.

4. No doubt, recently the gospel of unionism has spread even to less important industrial towns, but the bigger industrial metropolises still remain the important venues of its activities.

5. Multiplicity of unions is also not uncommon. There are rival unions *even in one concern.*

6. Due to absence of initiative and consciousness among workers and slow development of internal leadership, the union scene is still dominated by outsiders, particularly politicians.

Thus, trade unions in the country have still not reached a mature stage of development. Funds at their disposal are meagre and services provided by them are utterly inadequate. More weight is generally attached to political rather than socio-economic considerations. They are mainly concerned with protection of workers' rights than with generation of a spirit of responsibility and co-operation in them. Welfare and educative activities on the part of unions are conspicuous by their absence. Moreover, in the absence of direct contacts between leadership and the rank and file, the latter are usually indifferent to the affairs of their unions. Meetings are inadequately attended and membership dwindles in periods of industrial peace.

Relations "Inter se"

There are four strong central trade union federations in India, viz., I.N.T.U.C., A.I.T.U.C., H.M.S. and U.T.U.C. and a large number of unions are affiliated to either of these according to aims, ideology and political allegiance of their leaders. However, a good number of unions are still not affiliated to any of these. Non-affiliated trade unions give rise to a new problem. These are not bound by any agreement concluded by the central *federations even by unanimous* consent. Therefore, these have to be tackled separately and independently. Moreover, trade unions affiliated to different federations and independent unions usually lack goodwill in relations *inter se.* Sometimes, they do not even hesitate to undermine the authority and following of other unions.

Although the need has been felt for long to end union rivalries and *to place their relations inter se on* a sound footing, it was only in 1958 that the four central trade union federations agreed to abide by a common Inter-Union Code of Conduct for maintaining harmonious inter-union relations. The basic principles of the Code are:

(a) every employee to have freedom and right to join the union of his choice and no coercion to be exercised;

(b) no dual *membership to* be allowed;

(c) casteeism, communalism and provincialism to be discouraged;

(d) unreserved respect for democratic functioning of unions;

(e) regular and democratic elections of executive bodies and office-bearers of trade unions;

(f) ignorance and backwardness of workers not to be exploited;

(g) no excessive or extravagant demand on workers; and

(h) no violence, coercion, intimidation or personal vilification in inter-union dealings.

Code Fails

Although well-intentioned, the Code of Conduct has failed to secure the desired results partly due to its inherent weaknesses and partly due to non-co-operation of trade unions and their leaders. Further, while the Inter-Union Code of Conduct has been adopted by the central trade union federations, most of the unions at the lower level, affiliated or unaffiliated, are yet to adopt its provisions. The Code has also failed to promote co-operation and consolidation amongst rival unions. It does not prevent exploitation of trade unions for personal and political ends of leaders. Moreover, no sanction has been prescribed for non-observance of the provisions of the Code even by those who have adopted it. The net result is that the provisions of the Code have been frequently flouted.

Even between trade union federations and their affiliates, there is no set pattern of relationship. Affiliated unions are free to manage their internal affairs as they like. They are not always bound by the advices, verdicts and promises of the federations. Very often the federations have failed to persuade the affiliates to abide by the agreements concluded by them. Cases are not uncommon in which, in spite of the adoption of the Code of Discipline by the federation, strikes have been staged by affiliates without either exploring the grounds of settlement or giving advance notice to the authorities concerned.

Trade unions occupy a dignified place in Western society. They are much more than organisations for protecting the rights and privileges of members. They are, indeed, an integral part of the community life, provide facilities for all-round development of members, and protect them against uncertain odds. Sometimes, trade unions are responsible for achieving industrial objectives and national aspirations.

Western Experience

One of the important features of trade unionism in Western countries has been a tendency towards unification of the movement. At present, there is only one powerful central trade union federation in each advanced industrial country, as witness the Trade Union Congress in Britain, German Confederation of Trade Unions in West Germany and A.F.L.-C.I.O. in U.S.A. to name some countries. Most of the unions in these countries are affiliated to their respective central body. The federation has its own political philosophy which is designed to achieve its own immediate objectives. Affiliated unions are not in any way subservient to the central federation and they are free with regard to their internal affairs and in dealing with managements. However, generally, they are under a moral obligation to accept certain organisational principles as in West Germany and to abide by the advice of the federation as in England.

The functions of the central trade union federations in different countries have been to promote and safeguard the interests of workers, in general, and aid and advise the affiliates on matters of common interests or requiring uniformity.

Trade unions in the West have tried to improve the lot of workers either by encouraging collective bargaining or labour participation or by inducing labour legislation. While legislation has been deployed to set minimum standards of wages, working and service conditions and social security, collective bargaining has helped settlement of conflicting interests on such issues as hours of work, overtime, lay-offs and dismissals, vacations, transfer, promotions, health and safety, etc., around the table. Labour participation in management, on the other hand, prepares the ground for peaceful and co-operative relations by promoting the common interests in industry.

In the United States, "as a result of skilful and determined collective bargaining, wages have been increased to a very high level and hours of work reduced until they are probably the lowest in the world. Wage increases have been supplemented by fringe benefits such as medical care, pensions, insurance payment and holidays with pay. Benefits have also accrued to union members from social legislation relating to minimum wages and maximum hours, social security and unemployment compensation. By all these means the unions have succeeded in helping to bring about a continuous rise in the living standards of the workers which no country in the world has exceeded."[1] In recent years, attention has also

been paid to other matters by some unions. "For example, they have stepped up actions at the local and State levels in support of a variety of liberal causes such as public education, conservation of resources and so on."[1]

In Great Britain, "besides the 'bread and butter' services that unions supply to their members—in negotiating with management better wages and working conditions, in the processing of grievances and so on—there are certain other services provided by unions of a financial, legal and educational *nature*."[2] Some of the unions maintain convalescent home service for members. Trade unions are also productivity conscious and contribute substantially in achieving the industrial goals.

In West Germany, while "the D.G.B.'s main functions lie in matters which affect all workers alike regardless of the industry in which they are employed, such as economic policy, social security, general labour legislation, research and education,"[3] affiliated unions are mainly concerned with collective bargaining and settlement of industrial disputes. Trade unions also play an important role in co-determination and appointment of labour directors in different enterprises.

Trade unions have been entrusted with even more important tasks in communist countries. In the U.S.S.R., "in addition to defending the workers' rights and their share in the benefits obtained by the community, the workers' organisations have been expected to assume the responsibility of co-operating directly in the promotion of economic progress of the country."[4] Thus "the functions of trade unions range from legislative initiative and participation in national economic planning to negotiation of collective agreements and administration of cultural and recreational facilities."[4] In Yugoslavia also, besides protection of workers' interests, trade unions are responsible for promotion of industrial objectives and the continuous development of the economic system itself.

Social Responsibilities

In the changed context of India's political and social climate, trade unions have to play a constructive role. Their immediate tasks are to protect the dignity of labour and strive to get it a rightful place in society. However, in safeguarding the interests of workers, social obligations and national aspirations should not be lost sight of. India's development plans call for an active support of all sections of society for their success. Trade unions should, therefore, view their immediate objectives in broader perspective and act in a responsible manner. Their activities should neither, in any way, undermine the productivity drive nor hinder the growth of national economy. In fact, higher wages, better working conditions, greater employment opportunities and an improvement in standard of living directly depend on the prosperity of the industry.

Production today is a co-operative venture and capital, management and labour are all needed for effective and efficient performance. "Capital and management, without labour would be sterile, and labour without capital and management would be disorganised, ill-equipped and ineffective .... (thus) 'two sides' attitude should be broken down and more attention given to matters of common interest to workers and management alike."[5] Trade unions can contribute substantially in this direction by diverting members' energies to useful and co-operative channels and by curbing indiscipline and undesirable traits in them.

Recently, greater responsibilities have been placed on trade unions under labour participation schemes and under the Code of Discipline in industry. These would be further enhanced by the Code of Efficiency and Welfare. The success of any of these, however, calls for a change in the attitude of trade unions and management. The outdated ideas of conflict, strife and non-co-operation should yield place to the spirit of co-operation and goodwill. Management should be regarded not as agencies for exploitation of workers but as trustees of their welfare. Similarly, trade unions should be considered as co-operative agencies which would contribute materially towards the success of the enterprise.

While protecting the rights of labour, trade unions should also take upon themselves the responsibility for the conduct of their members at and out of workplaces. These should act as a clearing house of the management's grievances against members and *vice versa*. In settlement of industrial disputes, resort should be had to conciliation and voluntary arbitration, and strikes should be used only as a last weapon for achieving their objectives.

Reorganisation and Consolidation

In the interest of industrial peace and higher productivity, therefore, the trade union movement in the country should be reorganised and consolidated. Instead of a number of central trade union federations, there should be only one National Trade Union Federation at the apex and all primary unions should be affiliated to it notwithstanding ideology, belief and political affiliation of the leadership. This national federation should have its industrial units at regional level for dealing with problems relating to particular industries and for aiding and advising primary unions in different regions. Such a unified federation would go a long way towards promoting and protecting the interests of labour in general and ensuring greater uniformity in dealing with the management.

At the plant level, the principle of one union in each establishment should be followed and all workers should be allowed to become its members irrespective of their caste, religion, sex or political belief. Besides, all the primary unions should be affiliated to the National Federation. Such a move would put an end to union multiplicity and rivalry and make the movement strong.

The possibilities of such a consolidation should be explored. A convention of all the political parties having a say in the trade union movement and different trade union federations should be convened at an early date under the auspices of the Indian Labour Conference. The matter should be dispassionately considered and the various political parties should voluntarily withdraw from the trade union movement in favour of a National Trade Union Federation.

However, until such a unification is feasible, efforts should be made to end trade union rivalries. A new Code of Conduct for inter-union relations should be drawn up. The provisions of the existing Code should be made more comprehensive. It should include a provision that trade unions would not be used for attaining personal ends or political ideology of the leaders and would not flout the authority and the following of other unions. Some sanctions should also be provided for against the unions and their office-bearers for non-observance of the Code. Besides, all trade unions must be affiliated to one central federation or the other. However, mere adoption of the Code by different trade unions would not do. Its provisions are their sacred trust which must be strictly adhered to in the interest of a strong trade union movement and healthy industrial relations in the country.

Leadership of trade unions should vest in actual workers—past and present. Their practical experience and knowledge of the work and work-environment would enable them to take a responsible and co-operative view of the affairs of the concern. However, outside leaders with suitable restrictions may have to be continued for some time, particularly until the development of adequate leadership from the rank and file and until worker-leaders are immune from victimisation for their union activities. Moreover, a few more outsiders may have to be associated with the trade union movement as full-time experts to deal with the technical matters.

Membership Drive

A large-scale membership drive should immediately be taken up. Efforts should be made to cover the fields which are still unorganised or less organised so that the gospel of unionism may be spread to the entire working population. The aims and advantages of union membership should be widely publicised. The rank and file should be educated in the principles of working and techniques of unionism. A close contact should be established between leadership and primary members and more and more members should be encouraged to take an active part in the affairs of the unions. In order to make union programmes interesting, they should be followed by dramas, film-shows, exhibitions and light refreshment. Such an education and participation of members in union activities would make them conscious of their rights, strength and obligations. Besides, these would train them in the working of democratic institutions and make them better citizens.

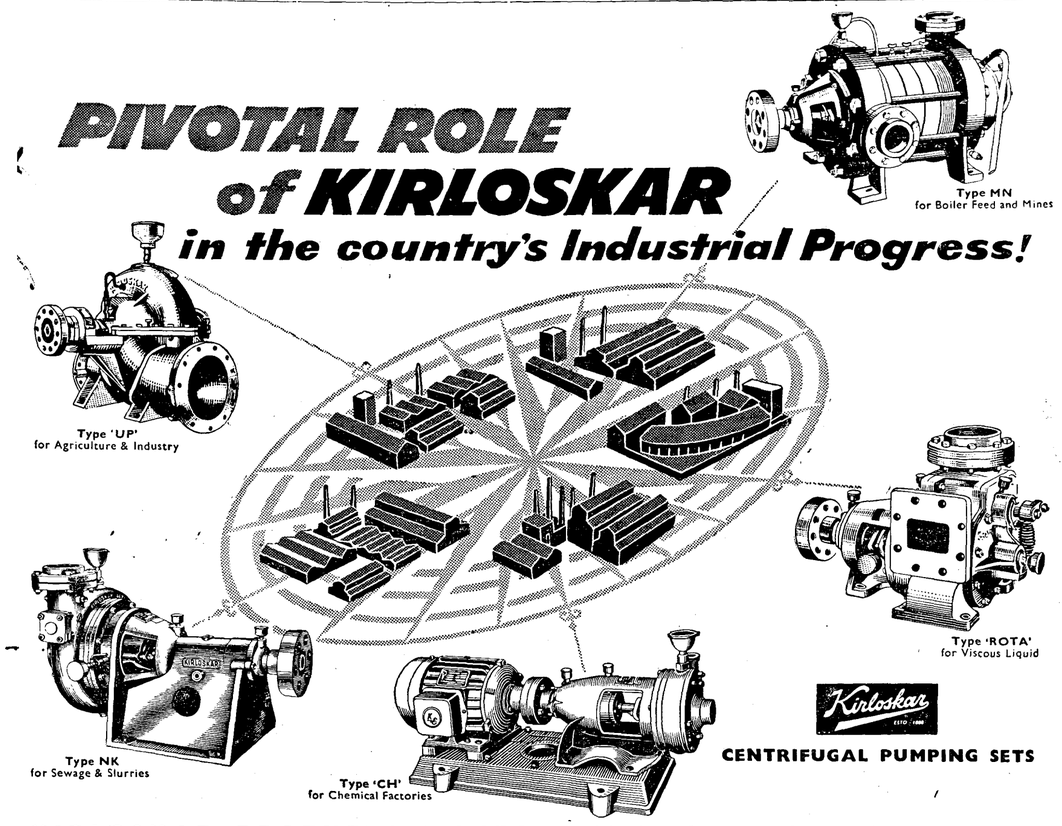
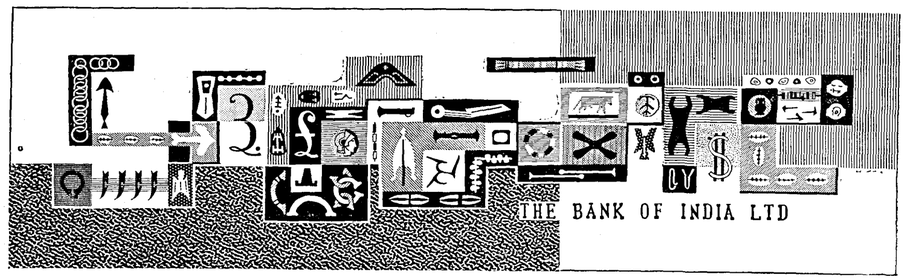
NEW APPROACH IN WEST GERMANY

West Germany's employers keep the door open for the trade unions to come to reasonable and peaceful labour relations in the Federal Republic of Germany. This offer to reach an agreement on fair co-operation on the West German labour scene has once more been made by Dr. Hans-Constantin Paulssen, President of the Confederation of German Employers' Associations, at this year's annual meeting of the Confederation in Bad Godesberg on 6th December 1962. Placing the employer-union relations on a new basis is one of the main aims hoped to be attained in 1963, Dr. Paulssen said. It is particularly necessary to remove the "mutual barriers of mistrust." A "peace agreement" according to the Swiss model is desirable. If such an agreement is out of reach for the time being, both parties—employers as well as unions—should agree to a voluntary arbitration authority with power for the whole of the industry could not be reached, why couldn't it be established, Dr. Paulssen asked, for individual sections of the industry such as the textile and metal industries for example, which were facing new wage demands.

Dr. Paulssen's statement has been well received by the German public. Once again, the German employers have invited the unions to come to reasonable settlements on the basis of partnership. They hope that the unions will take the hand extended to them.





This is the impressive 84 feet x 18 feet mosaic mural on the outside of the Bank's new building in Kampala, East Africa. The mural depicts many of the tokens used as coinage in various parts of the world through the centuries.

Power Development In Third Plan

A State-wise Review of the Programme

By M. R. SACHDEV, I.C.S.

POWER, which accounted for 7 per cent of the total investment in the second Five-year Plan of the country, claimed 10 per cent of the total outlay during the third Plan period. The outlay actually provided was Rs. 1,089 crores in the public sector including Rs. 50 crores in the private sector. The power development programme was intended *not* only to meet the expected load demands during the various years of the Plan, but also to cater for a sizable backlog of unsatisfied demands due to the shortfall in the achievements of the second Plan target because of foreign exchange difficulties. The provision in the Plan has recently been increased to the extent of Rs. 34 crores, of which Rs. 23 crores relate to additional capacity under the ordinary power schemes and Rs. 11 crores for the nuclear power plant in Rajasthan. If all goes well, the installed capacity in the country should reach the 13 million kw. target by the end of the Plan period. The major projects being executed by the various States are mentioned below:

ANDHRA PRADESH

Upper Sileru Hydro-electric Scheme

The Upper Sileru hydro-electric scheme will utilise the tail-race waters of the Machkund power house and the run-off from the intermediate catchment at a total drop of a little over 400 ft. The scheme involves the construction of a diversion weir across the Sileru river at Guntewada and a short length of power channel to convey the water to a reservoir formed by an earthern bund and a power station with an initial capacity of 2 x 60 MW. This stage is expected to be completed in 1965-66.

The second stage development of this scheme is also envisaged later by installing *additional generating* capacity estimated at 180 MW by utilising the regulated discharge of water available from a common storage reservoir to be located at Balimela in Orissa. No benefits from this scheme would be available during the third Plan period.

Kothagudam Thermal Power Station

This new thermal power station being set up at Kothagudam, partly for power supply to the proposed fertiliser factory and partly for feeding the Andhra Pradesh grid, will have an installed capacity of 2 x 50/60 MW turbo sets and four boilers each of 360,000 lbs./hr. capacity supplying steam at 1,290 p.s.i.g. and 1005° F. and designed for burning inferior quality of fuel. The station is expected to be commissioned in 1965-66.

Ramagundam Thermal Power Station

In order to meet the increasing power demand in the Telengana region of Andhra Pradesh, a new thermal power station was commissioned in 1957 at Ramagundam in the heart of the coal mining area, with 3 x 12.5 MW turbo sets and six boilers of 50,000 lbs./hr. capacity. In addition to installation of one more boiler of 50,000 lbs./hr. capacity, this power station will be extended by 62.5 MW during the third Five-year Plan, and is expected to be commissioned early in 1965.

ASSAM

Nahorkatiya Gas Turbine Power Station

It is proposed to utilise, for power generation, the natural gas that would become available during the production of crude oil from the Nahorkatiya Oilfields at Namrup in North-eastern Assam. This scheme provides for the installation of three gas-turbine driven generating units of capacity 23 MW each. This plant is expected to be commissioned in 1964-65.

Umiam (Barapani) Hydro-electric Scheme—Stage I

The Umiam hydro-electric project comprises a dam across the narrow gorge of Umiam River about 2½ miles downstream of Barapani Bridge on the Gauhati-Shillong road and the installation of four generating units of 9,000 kw. each. The first unit is expected to be commissioned towards the end of 1964 and the remaining units by mid-1965.

BIHAR

Chandrapura Thermal Power Station

This thermal power station in the South Bihar area is being set up by the D.V.C. for meeting the additional power needs in the area. The power station will have an initial capacity of 2 x 140 MW. The turbo sets will be hydrogen cooled, designed to operate at steam conditions of 1005° F. and 1900 p.s.i.g. The boilers that are semi-outdoor type are rated at 960,000 lbs./hr. designed for burning low-grade coal with ash content upto 43 per cent and will utilise middlings and rejects from the nearby Dugda washery. These units are expected to be commissioned by 1964-65. Two additional similar units have also been sanctioned for installation by the D.V.C., one at Chandrapura power station and the other at the Durgapur thermal power station in West Bengal where two units of 82 MW each were installed during the second Plan.

Barauni Thermal Power Station

This power station, with an initial installation of 2 x 15 MW, is being constructed at Barauni opposite Mokhamehghat. Each boiler will be rated at 160,000 lbs./hr. operating at 900° F. temperature and 850 p.s.i.g. and is designed for burning either pulverised coal and/or crude oil, to be available from the Barauni oil refinery. The station is expected to go into operation by March 1963.

The power station will be extended by 1 x 15 MW and 2 x 50 MW generating units during the third Five-year Plan. The 15 MW unit is likely to go into operation in 1963-64, and the 50 MW units in 1965-66.

Pathratu Thermal Power Station

For power supply to the Heavy Engineering Project at Hatia near Ranchi, a thermal power station with an initial capacity of 2 x 50 MW is being established at Pathratu. This is a second Plan scheme expected to be commissioned in 1964-65. The boilers are of semi-outdoor type, rated at 493,000 lbs./hr. and designed to burn fuel of ash content as high as 45 per cent. The turbo sets will operate at 1350 p.s.i.g. and 995° F. The fuel for the power station will be available from the south Karanpura coalfields initially, and later in the form of middlings from the proposed coal washery near Bhurkunda. The capacity of this power station will be augmented by 300 MW in the third Five-year Plan. These units are expected to be commissioned partly in 1965-66 and partly in 1966-67.

GUJARAT

Cambay Thermal Power Station

Works have commenced on this thermal power scheme which will be a key source of power serving the major part of the State. The power station located at a site six miles from Kathana railway station will have four generating units of 62 MW each. There will be two boilers for each turbo set, each having a capacity of 300,000 lbs./hr. operating at 1000° F. and 1250 p.s.i.g. and designed to burn pulverised coal and adapted for burning oil and/or gas expected to be available from the newly found oilfields. The station is expected to be commissioned in 1963-64.

KERALA

Pamba-Kakki Hydro-electric Scheme

The Pamba-Kakki hydro-electric project continuing from the second Plan, harnesses the waters of the Pambayar and Kakkiar rivers utilising the difference of level of more than 2,000 ft. existing between the beds of the two rivers for power generation. The scheme envisages the construction of a 165 ft. high dam across the Pamba river, a 346 ft. high dam across Kakki river with a saddle dam 101 ft. high, and interconnecting tunnel 10,000 ft. long between Pamba and Kakki reservoirs, a head-race tunnel 19,900 ft. long of 2,300 cusecs capacity taking off from the Kakki reservoir. The waters would then be lead through six pipe lines each of 60" diameter and 6,050 ft. length to a power station on the left bank of the Muzhiar with an installed capacity of 6 x 50 MW operating under a gross average head of 2,448 ft. Two of these generating sets are expected to be commissioned in 1964-65 and the remaining in 1965-66.

MADHYA PRADESH

Korba Thermal Power Station Stage—II

The existing Korba thermal power station under Stage I comprises three turbo sets of 30 MW each operating at 850 p.s.i.g. and 900° F, and five boilers of capacity 180,000 lbs./hr. each, designed to burn low grade fuel of ash content as high as 42 per cent from the nearby coalfields of Korba. This is being extended by 10 MW during the current year. During the third Plan a second power station will be set up near the existing power station with 4 x 50/60 MW turbo sets and four boilers of 500,000 lbs./hrs. capacity supplying steam at 1,340/1,470 p.s.i.g. and 930/1050° F. Two of these sets are expected to be commissioned in 1964-65, and the remaining two in the following year.

Satpura Thermal Power Station

This thermal power station will help to bring about co-ordinated development of the western region of Madhya Pradesh through a network of grid lines for efficient and economical generation and utilisation of power. The scheme provides for the installation of 5 x 62 MW turbo sets in the Pench Valley coalfields together with five boilers of capacity 600,000 lbs./hrs. supplying steam at 1,300 p.s.i.g. and 960° F. The exact site of the power station will be selected keeping in view the availability of adequate cooling water from the nearby Tawa river, communication facilities, etc. The power station will be jointly owned by Rajasthan and Madhya Pradesh and will be interconnected with the Chambal-Chandni grid by 220 KV transmission lines. Two sets are expected to be commissioned in 1964-65 and three in 1965-66.

MADRAS

Kundah Hydro-electric Scheme Stage—III

The Kundah hydro-electric project under Stages I and II, now completed comprises storage reservoirs across the Avalanche and Emerald rivers in the Ooty hills with a combined storage capacity of 5,500 m.c. ft., a tunnel 14,829 ft. long from the Avalanche leading to two penstocks at the power house No. 1 with 2 x 20 MW generating sets operating at a head of 1,117 ft. The tail race waters of power house No. 1 as well as the flow from 44 sq. miles of free catchment are led into a low pressure tunnel 11,862 ft. long ending in a surge shaft, a pipeline of 8 ft. dia. trifurcating into three penstocks, and another of 6 ft. 6" dia. pipeline, bifurcating into two penstocks, feeding power house No. 2 with 4 x 35 MW generating units (with provision for a fifth unit) operating at head of 2,418 ft. The third stage of this project taken up in the third Plan provides for the construction of forebay reservoir of capacity 35 m.c.ft. for collecting the tail-race waters of power house No. 2 and the free flow of Pegumbuhalla catchment; a low pressure tunnel 31,400 ft. long, leading to three penstocks each with 78 inches diameter and 2,570 ft. length, to power house No. 3 with 3 x 40 MW generating sets; a reservoir of capacity 1,568 m.c.ft. across the river Bhavani at Pillur with two penstocks 12'-16" diameter embedded in the dam and power house No. 4 below the dam with two sets of 25 MW each. An addition of a third 20 MW set at power house No. 1, and a fifth set of 35 MW at power house No. 2 and an auxiliary power house at the exit of the tunnel from the Upper Bhavani to Avalanche reservoir comprising one penstock 56 inches dia. and one 15 MW generating set are also provided. Stage III is expected to be completed partly in 1963-64 and partly in 1964-65.

Neyveli Thermal Power Station

A large new thermal station with an initial capacity of 5 x 50 MW is now under construction at Neyveli in South Arcot district as a part of the Neyveli Lignite Project for mining and processing lignite deposits, manufacture of fertilisers, and power generation. The power station will be extended by 150 MW in the third Plan and will be inter-connected with the existing Madras grid, thereby resulting in the optimum utilisation of hydro resources of the State. One unit of 50 MW has already been commissioned. The second unit is expected to be commissioned in January 1963. The remaining units will be commissioned progressively thereafter and completed by 1965-66.

Parambikulam Multi-purpose Scheme

The multi-purpose Parambikulam irrigation *cum* hydel project included in the third Five-year Plan envisages utilisation of the waters of seven rivers, viz, Nirar, Sholiyar, Parambikulam, Tunakadavu, Peruvaripallam, Tekkadiar and Aliar, in the Anamalai hills of the Coimbatore district for generation of power before being utilised for irrigation. The power houses envisaged in the scheme are as under:—

Sholiyar power house No. I	.. 2 × 35 MW
Sarkarpathy power house	.. 1 × 30 MW
Sholiyar power house No. II	.. 1 × 20 MW
Aliar power house No. I	.. 2 × 20 MW
Aliar power house No. II	.. 1 × 20 MW

The Sarkarpathy power house is expected to be commissioned in January 1965 and the Sholiyar power house No. I in 1965-66. The rest of the power stations will be completed early in the fourth Plan.

MAHARASHTRA

Koyna Hydro-electric Project

The Koyna hydro-electric project Stage I, which was initiated in the first Plan will be completed during the third Plan. It provides for a dam across the east flowing Koyna river creating a reservoir of ultimate capacity 97.500 m.c.ft.

An intake tunnel 4.000 ft. long takes off from the reservoir leading to a head race concrete-lined tunnel 12,000 ft. long with 21 ft. dia. terminating in a surge shaft whence two steel-lined 10 ft. dia. pressure shafts 21,000 ft. long driven through rock lead the water into four penstocks each with 72" dia., and then to the underground power station with 4 x 60 MW units to operate at an average head of 1,610 ft. Another tunnel 26 ft. wide and 7,500 ft. long leads the tail race waters into the Vasishti river. Two of the generating sets under stage I have already been commissioned and another will come into operation very shortly. The fourth machine is expected to be commissioned early next year.

Stage II of the Koyna Project included in the third Plan provides for additional power generation by installing 4 x 75 MW generating units in the underground power station and one 40 MW machine in a power house at the foot of the dam. One 75 MW unit is likely to be commissioned in 1964-65 and two more in 1965-66. The power from the Koyna system will feed into the existing Tata-Chola Trombay Hydro-thermal grid via 220 KV double circuit transmission lines besides supplying power to Karad over 220 KV single circuit line and therefrom to Satara, Sholapur, etc. over 110 KV lines.

Bhusawal and Paras Thermal Power Stations

The installation of a new thermal power station with installed capacity of 62.5 MW at Bhusawal and extension of the existing thermal power station at Paras by an additional thermal unit of capacity 62.5 MW are being taken up in the third Plan under the Khandesh-Marathwada Electrification Scheme. There will be two boilers for each of these units, each having a steam raising capacity of 300,000 lbs./hr. at 1,300 p.s.i.g. and 960° F. Both these schemes are expected to be completed in 1965-66.

Trombay Thermal Power Station Extension

The existing Trombay thermal power station in the private sector completed during the second Five-year Plan is located near the oil refinery at Trombay operating in conjunction with the Tata Hydro-electric System and having an installed capacity of 3 x 62 MW turbo sets and three boilers of capacity 600,000 lbs./hr. operating at 1,250 p.s.i.g. and 950° F. The power station is being extended by an additional generating unit of capacity 125 MW and will be completed by the end of the third Five-year Plan period.

MYSORE

Sharavathi Hydro-electric Project

The ultimate solution for power supply in the State is the development, in stages, of the Sharavathi Valley Hydro-electric Scheme, the first stage construction works on which have already started. This stage provides for the construction of a dam 177 ft. high and 7,500 ft. long across the river Sharavathi near Linganamakki village with a reservoir capacity of 156,000 m.c.ft. from which a power channel 14,200 ft. long takes off, designed for a discharge of 6,200 cusecs terminating in a balancing reservoir created by a dam 198 ft. high and 1,200 ft. long across the Talakalale stream for meeting the daily and weekly load variations. The water for power generation is drawn from this reservoir through two pressure tunnels 22 ft. dia. and 3,400 ft. long, leading to two surge tanks from each of which five penstocks 8 ft. dia. will take off, each feeding one generating unit. The bulk of the civil engineering work required for the ultimate stage of 10 x 89.1 MW will be carried out in the first stage itself, which involves the installation of 2 x 89.1 MW units. These units are expected to be commissioned in 1964-65. The second stage included in the third Plan covers necessary civil engineering works such as raising the height of the dam, installation of ten crest gates 55 ft. x 24 ft. and extension of the generating station by installing 6 x 89.1 MW units. Two of these are likely to be commissioned in 1964-65, two more in the following year and the rest in the fourth Plan.

ORISSA

Talcher Thermal Power Station

This new thermal power station will have an installed capacity of 4 x 62.5 MW. The fuel for this power station will be supplied from the abundant reserves of low grade coal available in the Talcher area. One unit is expected to be commissioned in 1964-65 and the remaining three in 1965-66. The power station will be interconnected with the Hirakud hydro system.

PUNJAB

The Bhakra-Nangal multi-purpose project was the only major scheme in this State taken up in the second Plan. It is a joint venture of the Punjab and Rajasthan States. It comprises a straight gravity concrete dam on the Sutlej river 740 ft. high (the highest of its type in the world) with a reservoir capacity of 7.4 m.acre ft. and a power house with 5 x 53/90 MW generating sets at the foot of the dam on the left bank, the Nangal Barrage about eight miles down stream of the Bhakra Dam, about 95 ft. high with a reservoir capacity of 24,000 acre ft. This dam diverts the regulated flow from the river into the Nangal hydel canal besides serving as a balancing reservoir for the power houses on the canal. The canal is 40 miles long and of 12,500 cusecs capacity leading to the two power houses at Kotla and Ganguwal, each with a capacity of 77 MW. During the third Plan, another power station will be constructed on the right bank below the Bhakra dam with an installed capacity of 4 x 70/120 MW generating sets to operate under an average head of 400 ft. The size of the unit for the generating sets of the Bhakra right bank power station, has been decided taking into account the availability of the extra waters from the proposed Sutlej-Beas Link Scheme, and also future possibility of operating Bhakra power station at a lower load factor through integrated operation with the thermal station under construction at Delhi.

RAJASTHAN

Ranapratapsagar Dam/Kotah Dam Project

This scheme constitutes the second stage of the Chambal project and provides for the construction of the Ranapratap Sagar dam about 20 miles downstream of the Gandhi Sagar dam located in Madhya Pradesh with a power station below the dam with generating capacity 4 x 32 MW. A further extension of this project envisages the construction of a dam at Kotah and a third power station with an installed capacity of 100 MW. The power from these projects will be shared equally between the participating States of Rajasthan and Madhya Pradesh.

As already stated, Rajasthan has two-third share in the Satpura thermal power station to be constructed in Madhya Pradesh.

UTTAR PRADESH

Yamuna Hydel Scheme—Stage I

Stage I of the scheme includes the construction of a barrage 1,777 ft. long about two miles downstream of the confluence of Yamuna river with Tons, a power channel nine mines long 4.700 cusecs capacity leading to two power houses; one at Dhakrani with an installed capacity of 2 x 11.5 MW operating at a head of 65 ft. and the other at Dhalipur with a capacity of 2 x 17 MW operating at a head of 100 ft. These are likely to be completed in 1965-66.

Under stage II of the project which will be taken up towards *the end of* the third Plan, it is proposed to construct a 68 ft. high concrete dam across the river Tons for diverting its water into a 22 ft. dia. concrete-lined tunnel about four miles long terminating in steel pipes 18 ft. dia. each, leading the water to the first power station with an installed capacity of 4 x 57 MW operating at a head of 405/425 ft. The tail race waters will again be picked up by another 114 ft. high dam to be constructed down the river creating a fall of 85 ft. for power generation at a second power house with 3 x 12 MW sets. The output of the two stations will feed into the Ganga Canal hydro thermal grid through 220 KV double-circuit lines.

Singrauli Thermal Power Station

This power station with an installed capacity of 300 MW is being set up at Obra in the vicinity of the low grade coal deposits in the Singrauli coalfields located in the Singrauli district of Madhya Pradesh near the south-eastern tip of U.P. The first unit of 50 MW is likely to be commissioned by the end of 1964-65. Two units of 50 MW each are expected to be commissioned in 1965-66. The power station will be interconnected with the Rihand hydro system.

Obra Hydro-electric Scheme

This scheme will enable production of hydro-electric power for augmenting the power needs of the eastern districts of U.P. and will utilise the continuous tail race discharge from the Rihand power station through a dam 20 miles downstream and a power house at the dam with an installed capacity of 100 MW in four units. Three of these units are likely to be commissioned in 1965-66.

WEST BENGAL

Bandel Thermal Power Station

This power station is being set up about 35 miles north of Calcutta with an installed capacity of 4 x 75 MW turbo sets together with four boilers of capacity 550,000 lbs./hr. each operating a 1,000° F. and 1,450 p.s.i.g. designed to burn pulverised fuel. The station is expected to be commissioned in 1964-65.

Durgapur Coke Oven Thermal Plant Extensions

A thermal station of installed capacity 2 x 30 MW was commissioned in 1960 by the West Bengal Government during the second Five-year Plan as a part of their coke oven plant at Durgapur in the industrial sector. This power station meets not only the power requirements of the coke oven plant but also of other industries being set up in the region. During the third Plan this station will be extended by three units of 75 MW each. Two of these units are expected to be commissioned in 1963-64 and the remaining in 1965-66.

DELHI

A new thermal power station of installed capacity 3 x 62.5 MW will be set up at Delhi during the third Plan. This will be jointly owned by the Delhi Electric Supply Undertaking and the Punjab State Electricity Board. Three boilers of steam raising capacity 600,000 lb./hr. will supply steam at 1,300 p.s.i.g. and 960° F. to the turbo sets. These generators are expected to be commissioned by 1965-66.

As stated earlier, the projects undertaken during the third Plan are estimated to raise the generating capacity in the country to over 13 million kw. It is true that even this capacity may not be adequate to meet all the demands freely and power shortage conditions may persist in some of the areas. This fact has been fully taken note of and some schemes sanctioned, from time to time, over and above those included in the third Plan with a *view to meeting the regional* demands.

An important aspect of the power programme which has emerged from our experience of the last two Plans is the need for introducing long-term approach in planning for power development. Although planning on five-year basis will still be required for co-relating the power development programmes with development in other sectors of economy, the power programme should proceed on a continuous basis on a 15-year perspective planning. With the passage of each Five-year Plan, the perspective Plan should also move forward. This requirement has been fully appreciated and steps are being taken to plan for power development for the period upto 1976 and to formulate proposals for the fourth Plan.

STATES' FINANCES

(*Concluded from page* 110)

adopted by the State Governments. But, now that the country is faced with a terrible danger from a cruel and ruthless enemy and that the State Governments would not be able to raise much additional revenue from other sources, there is no choice but to give up the policy of prohibition. It has been estimated that the annual loss of revenue due to prohibition in Mysore is Rs. 10 crores, in Maharashtra nearly Rs. 20 *crores and in* some other States equally high. It is likely that, to begin with, the withdrawal of prohibition, apart from economising public expenditure, would increase the State Governments' tax revenues at least by Rs. 100 crores per annum. This would be a welcome source of additional tax revenue to the State Governments without putting heavier burdens on the public and without doing any harm to anybody.

It goes to the credit of the State Governments that, in spite of enormous difficulties in raising additional revenues, they have tried hard to implement the third Plan. In 1961-62, the first year of the Plan, the total Plan outlay of the fifteen State Governments at Rs. 610¾ crores amounted to nearly 16 per cent of the States' target of the third Plan at Rs. 3,847 crores. This rate of outlay could not be considered adequate if the Plan targets were to be realised. But, in 1962-63, the State Governments' Plan outlay increased to 18¾ per cent of the Plan target and, at this rate, it is quite reasonable to assume that the targets of the States' third Plan could be achieved. In the case of West Bengal, Gujarat, Jammu and Kashmir and Mysore, the Plan outlay (*vide* Table III), between 20 and 25 per cent of the total, has actually been much higher than the average.

It is possible that, in the remaining months of the current financial year, the Plan outlay might have to be reduced at least in some of the States and in the future the outlay on the third Plan might have to be curtailed everywhere because of the Chinese aggression. The targets of the third Plan might themselves have to be reduced because of the national emergency. But, whatever the revised targets, the conclusion is irresistible that, in order to discharge their responsibilities satisfactorily, the State Governments will have to mobilise their tax resources *more carefully than* has so far been done.

THE SECURITIES AND EXCHANGE COMMISSION

Watch-dog of American Investors' Interests

By D. R. PENDSE, M.A. (Cantab.)

IT is often said that investors can at best be prevented from being fooled by others but not from making fools of themselves. In the United States, the Securities and Exchange Commission (the S.E.C.) obviously believes in this dictum. During the last twenty-eight years, this giant agency of the U.S. Government has built up an excellent record of enabling the investors to make informed investment analysis conducive to prudent and discriminating investment decisions. At the same time, it repeatedly emphasises that the ultimate judgment and decision are always of the investor and the S.E.C. cannot prevent purchases of shares which such analysis may show to be of little or no value. Although the Commission was established under the Securities Exchange Act, 1934 (the S.E. Act), dealing with stock exchanges and allied matters, several further responsibilities came to be entrusted to it gradually, so that today the S.E.C. is charged with the administration and enforcement of a whole lot of U.S. laws about the different aspects of finances of public companies. The Commission is authoritatively described as "an outstanding example of the independent Commission at its best" and its expert advice to American law courts has brought unqualified praise from the judges. An analysis of the S.E.C's working is, therefore, not only valuable in itself, but is of special significance to countries which profess to promote the interests of the investors.

The Establishment

The S.E. Act owed its origin to the aftermath of the great stock exchange crash in 1929-32, when market values of listed shares declined from 89 billion dollars to 15 billion dollars, and at least 100 listed shares were known to have been subjected to heavy manipulations. There were no restrictions on credits given by broker-dealers to their clients on the security of their shares, resulting in the customers being sold out at short notice in the declining market and in the brokers-dealers themselves being declared insolvent. Persons in the management, having access to vital information about the progress of the company, commonly built up suitable positions and booked handsome profits on subsequent market fluctuations. Several operating companies in the public utility industry like electricity, gas, etc., were subsidiaries of holding companies and were overburdened with their debt and fixed charges, making reductions in rates quite a difficult proposition. Officials of investment companies entered into transactions in shares held by the company and pursued their personal good at the cost of that of their shareholders. Many company managements had 'traditional' relations with certain investment bankers who obtained a virtual monopoly over the financing of such companies and charged heavy underwriting commissions. Several investigations into the causes of this debacle underlined one principal contributory factor: investors were unable to obtain financial and other information upon which to evaluate the merits of particular shares. They had actually fallen a prey to false and misleading information, tips and rumours which flooded the market place. It was in the midst of such a state of affairs that the S.E.C. was brought to life.

Today the S.E.C. administers six American laws in the field of business finance:

(i) The Securities Act, 1933: This Act, also known as the "truth in securities" law, aims at adequate and correct disclosure of all material facts relating to public issues of capital by companies and seeks to prevent fradulent practices therein.

(ii) The Securities Exchange Act, 1934: This deals with stock exchanges, listing of shares, registration of dealers and brokers and allied matters. As regards the regulation of credit generally and particularly the advances against shares, the Act entrusts the responsibility to the Federal Reserve Board, the S.E.C. being concerned with the enforcement of the limits prescribed by the Board. Administration of this Act is even now perhaps the central, the largest and the ever-growing activity of the Commission.

(iii) The Public Utility Holding Company Act, 1940: This attempts to regulate the activities of the public utility holding company systems with the aim of freeing such companies from the control of absentee and uneconomic holding companies so that they could be more efficiently regulated by the concerned States.

(iv) The Trust Indenture Act, 1939: This applies to bonds, debentures and other similar 'debt' securities and was passed as a result of frequent cases in which the trustees absolved themselves of fulfilling even the minimum obligations in discharge of their trusts. The Act requires that the trustees be a public company, fulfil certain minima as regards capital and reserves and be free of conflicting interests. It makes certain other provisions—including prohibition of preferential collection of claims, etc.

(v) The Investment Company Act, 1940: This deals with those companies whose shares are held by the investing public and whose business it is to invest and trade in shares of other companies. Such companies have to register themselves with the S.E.C. after complying with its prerequisites. Thereafter, their activities continue to be under its regulation, e.g., they cannot generally alter the nature of their business, nor can underwriters, broker-dealers, investment advisers, etc., form anything like a majority on their Board.

(vi) Investment Advisers' Act, 1940: This regulates the activities of those persons who, for monetary consideration, advise others on the investment of their moneys. They have to be registered with the S.E.C. which is permitted only if and as long as they observe certain standards of business integrity to the satisfaction of the Commission, e.g., they must disclose the nature of their own interest in transactions executed for their clients and their remuneration must not generally be linked to the capital gains accrued to their clients. Recently, an amendment to the Act was passed after repeated requests of the S.E.C., which is now authorised to direct the registered advisers to maintain certain books and documents and to order their inspection.

In the administration of these statutes, the Commission has shown not only thoroughness but also a keen desire to translate into practice the aims and objectives of the laws. As an illustration, the Commission's present activities under the S.E. Act may be briefly reviewed. There are now fourteen recognised stock exchanges (known in the U.S. as 'National' Securities Exchanges) in addition to one recognised ('registered') association of brokers and dealers engaged in the over-the-counter markets (i.e. outside these stock exchanges). The stock exchanges together have 2,748 listed shares and 1,183 listed bonds of which the New York Stock Exchange, the largest one, alone accounts for 56 per cent of shares and 95 per cent of bonds. The Spokane Cincinnati and Pittsburgh stock exchanges are among the smallest with respectively 23, 41 and 41 listed shares and practically no listed bonds. In furtherance of its objective of securing maximum (or, rather, 'optimum') disclosure, the S.E.C. insists on regular submission of returns by listed companies both to the Commission and the concerned stock exchange. The data are not only open for inspection by the public but also widely used for circulation by investment advisers, brokers, dealers, etc., e.g., the law requires directors, officers and beneficial owners of at least 10 per cent of a listed company's shares to report their transactions every month. The information is published in a monthly publication which, last year, was subscribed to by more than 16,000 persons and contained more than 39,000 such reports. An effective check to the abuses of such 'insider' trading is provided by the fact that profits arising from transactions within a six-month period are liable to be recovered by the company or by any shareholder on its behalf. Similarly, the brokers and dealers, particularly in the over-the-counter markets, have to be registered with the S.E.C., which carries out periodic inspection of their books. During the last year, the Commission unearthed over 2,000 cases of violations of S.E.C. rules regarding credit and advances provisions, financial difficulties, charging unreasonable prices for clients' transactions, taking secret profits, etc. Investigations into any such violations are made privately and are fact-finding. Complaints by the public (or aggrieved parties), surprise checks of books of accounts and inquiries into sudden fluctuations in the market prices of particular shares are some of the sources which give the Commission the first clues of possible violations. In recent years, some of the problems on which the Commission undertook investigations include: (i) transactions in shares prior to or without listing, (ii) manipulation of market prices, (iii) misappropriation of customers' funds, etc. The Commission has just completed a special statistical study of put and call options.

In the administration of the other laws also, the Commission's efforts to restore investors' confidence and establish high standards of financial and company practices have been strikingly successful. Issues of capital increased from 1,300 million dollars in 1938 to 14,100 million dollars in 1961. As regards public utility companies, controlling interests had earlier resented the law of 1940 and had gone to Court, challenging its constitutionality, but the firmness and tact on the part of the Commission soon brought a stream of voluntary plans for divestment. The rigours of the Investment Company Act have presumably checked an excessive growth of this 'industry,' but the existing companies have consolidated their positions. Thus, during the period 1941-61, while the number of registered investment companies increased from 436 to 663, the value of their assets (at market prices) increased from 2,500 million dollars to 29,000 million dollars. (The Commission has now undertaken a study of the implications of this increase in the size of the investment companies.) The Commission's control on the activities of the investment advisers has yet to give full results because the necessary amendments thereto were carried out only very recently.

Sanctions and Remedies

What are the sanctions with which the S.E.C. ensures effective regulation without impairing the confidence of the business community? The laws which it administers no doubt confer vast powers upon the Commission to force compliance with the provisions; and, by its record of work the Commission has shown all concerned that it will not shirk from making use of these powers whenever necessary. It is a quasi-judicial body, empowered to issue summons and call for evidence. When warranted by its preliminary investigations, it initiates injunction proceedings and when it has a *prima facie* evidence of violations of anti-fraud provisions, it also brings criminal prosecutions through the U.S. Government Department of Justice. Indeed, pending litigations under the various Acts, where the S.E.C. is a party or the sponsor, are always so numerous and of such varied nature that there is little doubt that the Commission has accepted these as an integral part of its existence. In the criminal cases developed by the Commission so far, it obtained 1,507 convictions as against 329 acquittals; and, out of 1,076 civil injunction cases instituted by it, 958 were granted.

Equally important are the administrative remedies like suspension or expulsion of members of stock exchanges or brokers' associations, actions against stock exchanges, etc. But, perhaps, the most important and effective of the S.E.C.'s sanctions lies in the growing awareness of the need for self-regulation. The awareness that everyone concerned with the management of other peoples' money—stock exchanges, company promoters, investment trusts, brokers and dealers alike—has a responsibility to safeguard the interests of the investors. This awareness has emerged not only from the desire to avoid complications with the all-powerful S.E.C.—which it certainly has, but also from self-interest. For the confidence of the investing public is so essential for the smooth flow of capital to industry. This self-regulation plays a particularly effective role in the fast-moving world of the stock exchanges where action at the hands of an agency like the S.E.C. might at times be not prompt enough.

A word about the internal organisation of the S.E.C. The Commission, which was established in

ECONOMIC TRENDS IN UNITED STATES

Twentieth Century Fund Fosters "One World" Thesis

By Our New York Correspondent

THE year 1962 has come to an end without a recession in sight which was feared so widely just a few weeks and months ago. Some observers refer to the present business situation as "a mixed pattern." Others suggest that the fairly stable price levels which have prevailed are a sign of stability, even though some industries may not be doing as well as others.

Recent developments have shown that the underlying strength of the United States economy has been greater than many analysts held possible. Perhaps, it is interesting to know what the Federal Reserve Bank of New York has to say on the overall situation.

"It is important to recognise," the Bank observes, "that even the more optimistic current business forecasts do not envision a rate of advance in activity during the coming year that will be sufficient to bring about a marked reduction in the unemployment rate. A need for tax reduction, therefore, remains, not because the economy would otherwise slide into a recession, but because such action seems to be required to help strengthen the incentives for long-term economic growth."

While changes in the statistics have been relatively small since July, there has been improvement in several unexpected sectors. Automobile sales have been at a high rate. Steel production jumped up from 50 per cent of capacity to 65 per cent, construction outlays increased and new orders by durable goods manufacturers advanced.

Corporate Profits

There are other factors which are not so favourable. For example, while 1962 corporate profits were higher in most industries than in the preceding year, they were less than anticipated. This, obviously, is an impediment to business investment and investment plans. Also, while many economists and legislators support the tax-cutting plans, including President Kennedy himself, others are violently opposed.

Tax cuts, it is argued, would place American business and industry on competitive terms with Western Europe and would, therefore, be most welcome. The opponents point to the continually increasing spending by the Government "which has to be paid for." Federal Budget outlays are now approaching the $94,000 million mark.

If budgetary estimates for the current fiscal year come true, it would be the seventh out of ten years in which there would be a Federal budgetary deficit. Two major areas which are mainly responsible for increased Government spending are the costly space programme and all sorts of benefit and support schemes.

Capital Expenditures

For the first quarter of the New Year, capital expenditures for plant and equipment are scheduled at the rate of $37,700 million, according to the latest Government estimates. The well-known McGraw-Hill survey of 1963 annual spending plans places the figure at $38,150 million.

It should be noted, however, that spending plans tend to outpace actual expenditures during periods of expansion. Frequently, too, actual spending outpaces previous plans when things look good. Conversely, there are lags in times of retraction, or when there is fear of a contraction.

Prevailing conditions are the motivating factors. Plans are not firm commitments and surveys, *per se*, are fragmentary anyway. Plans have been and will be changed to suit existing conditions. It is the psychological climate which dictates final decisions.

So far as the outlook for 1963, as a whole, is concerned, it is better than expected and this is no exaggeration. There is an expanding population, the same as in India, but perhaps not to the same extent. Demands for schooling, housing and transportation are greater than before. Public utilities are expected to deliver more water, electricity, gas and provide better sewage facilities than before.

International Trade

The U.S., which had a virtual monopoly in the world markets for industrial goods for several years after the war, is now up against stiff competition. American manufacturers, in order to maintain their international competitive position, have bought substantial positions in successful concerns overseas and American banks and insurance companies have followed the same path.

All indications are that there will be no change of pattern in 1963. It follows that the countries in the non-Communist bloc are to become more and more uniform in their business methods and practices, adopt the same patterns as the nations of the Common Market and of the British Commonwealth, despite the legal and technical difficulties which seem to stand in the way at this writing.

The Twentieth Century Fund, here, issued an interesting study which says, in effect, that the world is approaching a stage where national autonomy in economic matters is no longer possible for any country, no matter how large or small.

Shaping the World Economy

The study is entitled *Shaping the World Economy—Suggestions for an International Economic Policy*. The paper maintains that just as the United States and other nations at least recognise the validity of the principle of one world or none in political relationships, that thought must be extended into the economic sphere even if, at present, it does not seem too feasible.

The author, Professor Jan Tinbergen, a European economist, points to the tensions created by the disparity between the developed and less-developed countries. He suggests that the problem of the developing countries is aggravated by economic instability, especially in primary markets and by the shortsightedness of national policymakers in matters of foreign trade.

Despite the prevailing newspaper strike, the Twentieth Century Fund study has received wide attention through other news media. The reason, perhaps, is that August Heckscher, a Director of the Fund and a former editorial writer for the *New York Herald Tribune*, has been appointed by President Kennedy as his adviser on fine arts.

The Fund has been criticised often for being too "liberal" but the fact remains that its views are being aired and are taken seriously. The "one-world" thesis of the study is reminiscent of the theories of the late Wendell Willkie who was defeated in the Presidential elections by the late Franklin Delano Roosevelt.

The Twentieth Century Fund, which is extremely well financed, suggests that doctrinaire paths must be avoided at all costs. To quote: "They are not compatible with an open-minded approach to world problems and they imply a loss of effectiveness."

The study criticises the Western powers in two respects—with regard to economic systems and with regard to national autonomy. It advocates mixed systems in saying "neither of the economic systems defended today by doctrinaire extremists is particularly effective in creating well-being and development. A pure free-enterprise economy is not optimum: neither is a completely regimented economy. Mixed systems are better; the nature of the mixture depends on circumstances and must be subject to careful engineering."

Incidentally, Professor Tinbergen as a Director of the Netherlands Central Planning Bureau, is credited with having made major contributions to the post-war economic recovery in Holland, as Professor Erhardt is in West Germany.

In addition to the already existing organisations, the Twentieth Century Fund study calls for the creation of another "international authority of considerable strength" to make centralised expenditures for development purposes. The study also calls attention to the need for more agencies to deal with the problem of stabilising the revenues of countries producing primary commodities, such as India. It also calls for an international insurance scheme against non-economic risks.

No Monopoly of Wes

The paper does not envisage a Western world monopoly on such a proposition, but it advocates that it should embrace the Soviet bloc as well and that it should be instigated and operated through the United Nations. This, it is felt, would attract more of the heretofore uncommitted countries into taking a stand for carrying out crucial tasks in the international field and to a change of attitude by the leading Western powers.

All these suggestions have become a matter of discussion and long-range planning, but no immediate developments can be expected. The immediate points of concern are still Cuba, the Sino-India conflict, the rift between China and Russia and, from the sublime to the ridiculous, tax reductions.

World Stock Markets

So far as world finance is concerned, the showing on the international stock markets is regarded as quite interesting. London, Wall Street and Tokyo where liquidity was high showed a remarkable price recovery from the 1962 lows. Centres where money was tighter such as on the Continental exchanges, the recouping was less pronounced. West German securities recouped less than one-fifth, the same as in the Netherlands, and Italy and France one-seventh.

London has shown the best recovery. It has recouped more than two-thirds or four-fifths of previous losses depending on which index you use. Tokyo and London have recovered about one-half of their price losses. In both Wall Street and London, the leading stocks, or blue chips, have been the recovery leaders. It puzzles American bankers that France, with its new currency and increasing gold reserves, and Italy should have been such bad performers by comparison.

The balance of international payments problem is still very much in the minds of the U.S. Treasury, the Federal Reserve and bankers. To be sure, the gold outflow is lower than last year, but it is nevertheless persisting. As I said in my previous despatches, everyone wants to do something about it—like about the weather—but I have yet to find anybody who has any concrete suggestions as to what to do.

Large expenditures for U.S. overseas bases and the people and dependents manning them simply cannot be talked away. It represents dollars leaking out of the country without any economic benefit whatsoever. It is the price which is being paid for U.S. national security, real or imaginary, in the atomic age.

In the first nine months of 1962, the U.S. lost $826.5 million of gold which was less than in 1961. In the third quarter of 1962 alone, no less than $213.8 million were earmarked to France to bolster its new currency, but gold prices at London remained fairly steady at between $35.07 and $35.09 an ounce. Black market prices were different, of course, but not too far out of line.

The international silver markets have been very much in the news.

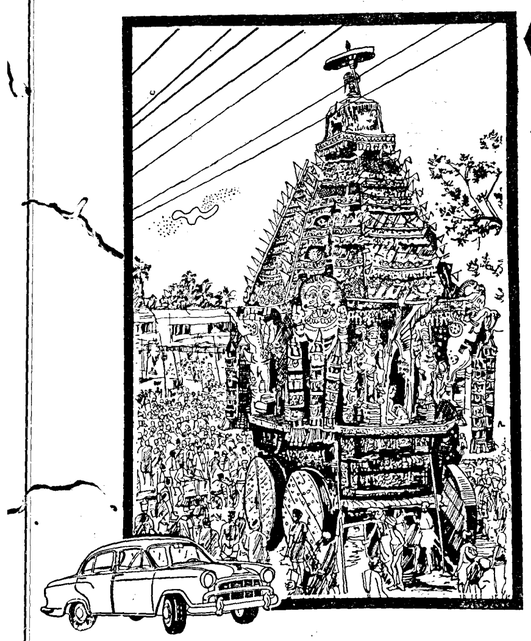
A car without springs...

a car fit only for divine amble - a car for gods!



This is a temple car—a car made of seasoned wood and pieces of iron—a car in which Gods travel once a year—a car dragged by devotees—just a mile in 24 hours—a car steered by triangular wooden pieces at the wheel on the ground! A car fit to be a museum piece but still road-worthy and sacred—a car that has no engine, no clutch, no battery, no gasoline and no springs!

That is the car of today—the car that has to take you places—the car that has to hold pace with time—the car that has to travel hundreds of miles a day on roads and ruts—the car of Man—this car has got to have springs—CANARA SPRINGS, of course, for comfort, safety and reliability. That's why fastidious car owners choose CANARA for carefree carriage.

ECONOMIC TRENDS IN BRITAIN

Search for New Methods of Controlling the Economy

By Our London Correspondent

1962 will be remembered primarily for its Chancellors of the Exchequer and their diverse handling of the economic situation. There is no doubt at all that this year the seeds of revolt against a "Stop" and "Go" system of running the economy have been firmly sown. This is a milestone on the British society's long road to organise its economic affairs intelligently and, perhaps, Mr. Selwyn Lloyd, who held sway for the first nine months of the year, will go down in economic history as the last of the Chancellors who—in the post-war Keynesian world—tried to run the economy by the automatic application of the regulators.

We have to remind ourselves that the idea that Chancellors should run the economy at all is novel. Up to a generation ago, there were automatic regulators built into the gold standard system and the financial authorities simply had to give effect to them. Then came the modern phase of managing the economy, though the dominant factor has remained the balance of payments, and criticism, as it became more informed, has steadily mounted against the *techniques* used. The new Chancellor, Mr. Maudling, has not yet shown that he will be the first to inaugurate longer-term machinery that will avoid the hideous jerks to which the economy has been subjected in the past two years. But he is certainly going to be the first to have to try.

It will be recalled that, during the period that Mr. Selwyn Lloyd held the reins, he was the architect of the 'crisis' measures of July 1961 which were intended to stop a potential inflation and, in particular, to reverse the serious imbalance in the United Kingdom's overseas balance of payments. This imbalance was, of course, simply a continuation of that which had persisted all through 1960 and he could be criticised for having waited so long before he did anything. But then he was conscious of the horrid dilemma that if he moved sooner he would be accused of "Stop"/"Go": however this consciousness did not save him. Yet his measures did succeed so far as the balance of payments was concerned: in the first half of 1961, the total adverse balance was £60 million and in the second half-year this had been cut to £17 million. The first half of 1962 actually showed a *favourable* balance of £96 million. Even if this should be whittled down by the year-end, the favourable balance will still be substantial. And the credit will be Mr. Lloyd's (in spite of his methods) and not his successor's.

Overseas Trade

1962 has then been a year of both expansion and improvement in overseas trade. In exports, the figures for January to October averaged £317 million per month (allowing for seasonal factors) which compares with a monthly average of £307 million in 1961. In both years, the monthly average of re-exports has remained steady at around £13 million, so that the monthly increase in total exports is £10 million, equivalent to £120 million per annum.

Imports on a c.i.f. basis have, however, increased nearly as fast. In 1961, the monthly average was £366½ million and for January-October this year £375 million, a rise of £8½ million per month or approximately £100 million per year. But, while the trend of exports has been steadily upwards since 1961, the import pattern is quite different. The first half of 1961 showed a high level of imports dropping through the year to a floor along which the figures bumped through the summer and autumn of last year and the spring of this year. The import recovery of 1962 dates from about the month of April—the implication is that the gap between imports and exports looks like being widened in the months ahead as imports rise more rapidly in relation to exports, so that the adverse visible balance is likely to grow.

One can forecast the outcome of 1962 as a whole by converting the import figures from c.i.f. to a basis comparable with the export figures. We arrive then at a monthly average of exports and re-exports to date of some £329 million against a monthly average of imports of around £335 million, giving an adverse visible monthly balance of £6 million or, say, £70 million for the year as a whole. As against this, we can set the substantial invisible balance in this country's favour of £112 million for the first six months. This compares with £55 million only for the first half of 1961: so that, the invisible income of the country has been doubled. If the second half-year shows the same doubling that would give an invisible income of about £22 million, making £134 million for the year as a whole which might, therefore, end up with a *favourable* balance of about £60 million as compared with an *adverse* balance of £77 millions for 1961 and an *adverse* balance of £300 millions for 1960. The doubtful figure here is the invisible income for the second half-year, but, unless heavy overseas Government spending has turned this into a deficit, the overall result should be encouraging. One must, however, still concede that the favourable balance is not enough to enable this country to finance as much overseas investment as would be desirable; yet there is no question of the fact that there has been an improvement as compared with 1961.

Overseas Sterling Area

A similar balance of payments study for the overseas sterling area cannot be brought quite as up-to-date, but the first half of this year can be compared with the first half of last year. Total imports of the area were £2,079 million, as against £2,139 million in 1961, while total exports rose from the 1961 figure of £1,878 million to £1,932 million. The adverse visible balance which, in the first half of 1961 was £261 million, was, in the first half of this year, only £147 million. Making allowance for invisible payments and receipts and for the production of gold (excluding local consumption), the adverse balance in the first half of 1961 was £303 million and this was nearly halved in the first half of 1962 to £165 million. This deficit of the overseas sterling area has been met mainly by the import of capital.

Thus, between the first half of 1961 and the first half of this year, the deficit on current account has been almost eliminated. The improvement has been primarily due to the improvement in the United Kingdom's position: the crisis measures of 1961 have succeeded in rehabilitating the balance of payments in time-honoured fashion, but at what cost will be observed later.

One of the most notable measures of the 1961 crisis was the raising of Bank Rate to 7 per cent. By the autumn, it was possible to take the first step down and on 1st November 1961 the Bank Rate was cut further to 6 per cent. There it stayed until the spring of this year, when, in March, two successive cuts of ½ per cent each time reduced it to 5 per cent. By the end of April a further ½ per cent cut put it at 4½ per cent at which level it has since remained.

The system of credit control also required the joint-stock banks to make special deposits with the Bank of England, the maximum being 3 per cent of their total deposits which at one time reduced their credit basis by something like £210 million. 2 per cent of these special deposits have since been refunded to the banks thus broadening their credit base by some £142 million. But the early restriction was so effective that, whereas the credit restriction meant that the banks were forced to squeeze borrowers, credit expansion now means that the banks are trying unsuccessfully to find sufficient new borrowers. For instance, total bank advances in July 1961 were £3,549 million. By the beginning of this year, they had dropped to £3,224 million but by September they had risen no more than to £3,428 million; they are still well over £100 million below the July 1961 level. The Banks have had, instead, to put their funds into investments, which have risen. As compared with the July 1961 figure of £1,049 million, total investments of the same banks are £1,234 millions, a rise roughly equivalent to that which has taken place in the total deposits of joint-stock banks over the past year to a total now reaching £7,130 million.

The dismantling of the structure of credit restriction was also Mr. Selwyn Lloyd's work, but he, ultimately, went when it was felt that he was not the man to replace restrictive by expansionist machinery sufficiently fast. Nevertheless, his successor, Mr. Maudling, has not yet made any further reduction in interest rates, although he has taken other reflationary steps and abolished (on 29th November) the last one per cent of special deposits. This last mentioned action will restore to banks resources amounting to £80 million during the first half of December 1962.

Taxation and Consumption

The other great regulator on which the former Chancellor relied was "purchase tax." His crisis measures added 5 per cent all round to indirect consumer taxation (both customs and excise duties), in order to restrict consumption and much of the increase was incorporated into the new rates of tax, in the April Budget. Thus, even in April, the Government was convinced that nothing should be done to assist spending, apparently on the assumption that, somehow, consumer expenditure would rise of its own accord. But events soon proved that this assumption was wrong and the Government had to retrace its steps. Various steps have been taken to boost consumer demand, all of them small except for the slashing cut (to nearly a half) in the tax on motor cars. Actually, the volume of consumer expenditure in the third quarter of 1962 was nearly 2 per cent higher than in the fourth quarter of 1961—partly through increased car sales and sales of household durable goods on which hire purchase restrictions were reduced in June. The pumping of £42 million of "post-war credits" to elderly people into circulation will gradually appear as increased consumer spending, but even the new Chancellor has not thought it expedient to make drastic reductions in indirect taxation in order to stimulate demand.

Incomes

The former Chancellor will also go down in history as the creator of the "wage pause." This policy was both ill-famed and short-lived. Case after case came up of under-privileged industries and occupations: arbitrators inevitably decided in favour of the under-privileged and the wage pause became so shot through with exceptions that it had disintegrated before the Government announced its demise.

The Chancellor had also attempted to set up an index of what pay rises were reasonable. This index was put at 2½ per cent. Again, under-privileged industries claimed more than this, and got it. Just recently, the railway workers, who had shown their rationalising chief, Dr. Beeching, that, when they did not like his methods, they would go on strike (although the strike was on the principle of consultation before action, rather than of the substance of any complaint), refused to accept a pay offer of 5 per cent. Without any further argument, Dr. Beeching raised his offer to 6 per cent which was accepted with alacrity. Now even those who think the railwaymen had a good case wonder whether a tide of wage demands can be held back. For 6 per cent is not only over twice as high as that the former Chancellor thought was right but is also half as high again as the proposed theoretical expansion of British industry for the years ahead and three times as high as it has actually been in recent years. The fear is that the country may have embarked this year on a road leading to inflation through a traditional outrunning of wages before an appropriate expansion of business activity.

There is now a new planning body (it is odd how a Conservative Government had proliferated more planning bodies than the post-war Labour Government ever set up) to busy itself with problems of incomes. This is N.I.C.—the National Incomes Commission. Its three wise men have a tough task: in the first place, their suitability is questioned; in the second place, they are thought to overlap with Neddy (National Economic Development Council): and, in the third place, their terms of reference are thought to be wrong, since they are called upon to worry over what has already happened—presumably to prevent a clash with Neddy, which is supposed to worry about what ought to happen. The Trade Unions detest N.I.C. anyway, on the grounds that "incomes" is likely to be interpreted as "wages" and that, in practice, N.I.C. will not worry enough about non-wage incomes!

In spite of all the alarums over wages, the employed wage-earner earned 3.8 per cent more in hourly rates in the third quarter of 1962 than in the closing quarter of 1961. Even allowing for overtime changes it seems that earnings *per head* are up about 4 per cent over the year—much more than the comparable rise in production. Since there has been no rise in employment total wage incomes have increased about the same. A number of claims for increased wages are still outstanding, but they do not outrun the pattern above.

Broadly speaking, the wage pause policy has had no effect on wages and the country is as far away from a wage or an incomes policy as ever.

Yet, it can, perhaps, be counted for gain that there is a greater awareness of the need for this than ever before, provided "incomes" cover all incomes and not only wages. In this sense, it has now become a part of official policy of the Labour Party.

Stock Markets

Investments by the banks and the cutting of Bank Rate have caused Gilt-edged to appreciate in value this year. At the beginning of the year, the war loan index stood at 52 per cent, but, by the end of September, it had risen to 63 per cent, a phenomenal increase of 20 per cent in value in nine months. Since that time, there has been some easing in the market, though the trend is likely to be up so long as interest rates look like coming down further.

On the other hand, the market in industrial stocks has not been particularly exciting, although it has had its vicissitudes. The *Financial Times* index began the year at 130, very much the same level as a year before, and, although the market rose gently, in April-May it was still no more than 134; then came a slump, so that, at mid-year, the index was as low as 112. This was followed by a recovery through August to a high point of 125 and, since then, there has been another slump to 117. Uncertainties in Wall Street and uncertainties over the Common Market are all blamed for the lack of life in the Stock Market but the basic reason is the relative stagnation which lies over British industry. The *pundits* assert that the markets are due for a rise since things are bound to get better!

Production

In September of this year, industrial production stood at nearly 4 per cent over the corresponding depressed figure of a year ago. For, with the "July crisis," the previous steady rise in industrial production collapsed. Even allowing for the improvement early this autumn, the first nine months of 1962 registered 115 against 114 for the same period a year ago—only 1 per cent better! Unemployment has risen steadily through the year to the highest level for over three years, that is, to a total of some 550,000 in November. It is expected that the rise will continue to a new high level of, perhaps, 600,000 by the end of the year. Unemployment is now about the same as the highest figures in the spring of 1959. Equally, employers have had less difficulty in filling vacancies. These vacancies, at 0.8 per cent of all jobs filled, are the same as their lowest point in 1958.

Domestically, the rise in unemployment has been marked by a more disquieting factor and that is the relatively more severe growth in unemployment in the basic industrial areas of this country, the North and North-West. In the Midlands and the South-East, the percentage of unemployment has, in fact, gone down as compared with the worst times of 1958. The social implications for the United Kingdom are serious and there is much discussion as to whether the Government should take steps seriously to encourage a reversal of the present southwards trend. This trend, if unchecked, will mean the loss of much social capital in the decaying parts of the country, matched by a pressure on resources in the active parts—pressure to build houses, roads, schools and public buildings, transport, etc., all of which deflects efforts from investment capital and exports.

The stagnation in the production figures over a period, the unemployment figures and the mounting protests from the chairmen of Regional Industrial Boards, all put increasing pressure on the Government to adopt expansionist measures. The new Chancellor of the Exchequer, as soon as he came into office, announced refunds of taxations held back in war-time and an increase in public expenditure with the aim of pumping more money into circulation. His autumn measures announced at the opening of the new Parliament in November carried on the same theme by giving inducements through tax cuts to industrialists to renew their plant and equipment and to increase investment. There was in addition the cut in the car tax already referred to.

The principal criticism of these measures is that, while they are good so far as they go, they do not seem to form part of any plan, and yet planning is something which the present Government has made respectable for the former adherents of *laissez faire*. The National Economic Development Council (N.E.D.C.), to which the Trade Unions reluctantly agreed to adhere at the end of 1961, is now at work and has already prepared a blueprint for British industry on the assumption that output can be increased at the rate of 4 per cent per annum. This is something like twice the rate over recent years.

The Case for Planning

The rise in industrial production in September could, if the trend is maintained, raise national output by 3 per cent between the middle of this year and the middle of next. This percentage would be upset if production turns out to have stuck at the September level. But 3 per cent is not as much as the economists of the N.E.D.C. have shown as within the capacity of the United Kingdom. The next stage is for the Development Council itself to make recommendations, after which the Chancellor will be expected to give such impetus to them as lies within the capacity of the Government.

As the year closes, we find a Government desiring to stimulate the economy and yet fearful that the wrong results may follow; for example, spending stimulation could bring about a large increase in imports and a slackening in export efforts. That would simply recreate the familiar "Stop" conditions as soon as the ravages to the balance of payments became apparent. Besides, there are certain national priorities such as the need to stimulate investment: the Government have already helped by more generous tax and obsolescence allowances on new equipment—but they still shrink from the more radical means of giving tax concessions to firms in accordance with the ratio between their export and their overall trade. Such a measure would be fraught with anomalies and British politicians and law-makers are scared of anomalies (the same sort of difficulty is found over the capital gains tax) whatever powerful an impetus it might give.

Then, there is the constant need to develop social services—roads, hospitals, schools, technical colleges, etc. and, of course, the need for more houses. Demand here could (using the right techniques) fall on the steel, heavy engineering, plastics and constructional industries. For instance, ways are now being found of building using large pre-fabricated sections that are at last cheaper than traditional methods. But enough has been said to show that, if the United Kingdom production is to be expanded, it is not enough to expand purchasing power and hope that all will then be for the best. That was the economics of "Stop"/"Go" and, if there is to be a new "Go" which will not lead to the familiar balance of payments problems, a great deal of serious planning will be involved.

Planning used to be the perquisite of the Socialists, but political thinking (driven by the twin spurs of information on the economy and need to act) is so changing that, within less than a decade, it will not be possible to distinguish the political parties of this country by their attitude to planning. N.E.D.C. is, after all, a Conservative concept and the Conservatives will be driven by the logic of finding answers to their own questions to find ways of putting these answers into effect. In this sense, 1962 may prove to be an economic turning point, not only for the Government of the day, but in the national philosophy.

Common Market

No survey of 1962 can be complete without comment on the negotiations in which this country has been involved throughout the year for entering the Common Market. But, while it is not proposed to deal here with the great issues at stake, since these are adequately covered in special surveys, it is worth bringing up-to-date the British reaction to these long-drawn-out negotiations. These reactions have gone through various phases: first, there was the indeterminate one which endured through the summer when it was generally supposed that the Government was trying to negotiate satisfactory terms for entry and the Press, in particular, supported a policy of hard bargaining but with intent to join. The Government was conceived as committed to join but only if they could get the Six to provide adequate safeguards for British agriculture and Commonwealth interests in particular. The Labour Opposition was seen as sitting on the fence somewhat against, but not wholly against, the Government's policy.

Then came the Autumn Party Conferences which showed the Labour Party uncompromisingly opposed to entry, *unless* the Government could get far better terms than appeared likely. The Conservative Party Conference fully endorsed the Government's negotiations but went further: in an emotional spirit of revivalism, the Conference saw Britain charging gloriously into the Common Market to its own advancement and that of its Six partners.

No one appreciated at that time how much too far forward this enthusiasm had gone, but it has become painfully evident in the third stage of reappraisal through which this country is now going. For the impression was undoubtedly conveyed to the negotiators, on the other side, that the Government intended to enter the Common Market under *any terms*. Thus, when the negotiations in Brussels were resumed, the British negotiators found a completely uncompromising spirit. This was something with which they had not reckoned, for the Government had all along been confident that their reasonable demands would be met by the Six. The country is thus passing through a phase in which it is no longer unquestionably assumed that Britain will enter the Common Market. The arguments that Britain must stand up for her rights and duties are carrying weight and, too, it is not consistent with national dignity that Britain should enter the Common Market without any regard to the conditions. In one of the recent by-elections, a Conservative Anti-Marketeer opposed the Conservative pro-Government candidate and attracted enough votes to give the seat to the Labour Party. The Government are no longer sure of support for the Market in the country. Everything, therefore, depends upon the spirit with which the Six continue the negotiations and the recent election successes of the French President and his party make it less likely that there will be compromise. While talk thus continues of Britain entering the Common Market by the spring of 1964, such talk is increasingly dominated by the word "if."

LONDON, 30th November

THE SECURITIES AND EXCHANGE COMMISSION

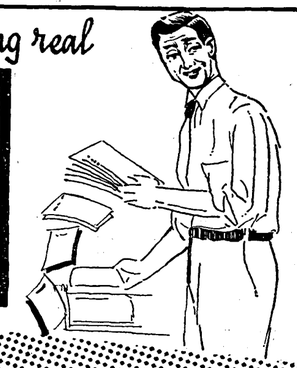
(Concluded from page 114)

1934 under Section 4 of the S.E. Act, consists of five members (including one Chairman), not more than three of whom should belong to the same political party. They are all appointed by the President for five-year terms which are staggered in such a way that one member retires every year. The annual salary of the Chairman is 20,500 dollars and that of each member 20,000 dollars. The members are prohibited from participating in any stock market operations or engaging in any other business. The Commission reports annually to the U.S. Congress. The staff of the S.E.C., which exceeds one thousand, consists of lawyers, engineers, accountants, etc., working at the headquarters at Washington as well as at its nine regional and several branch offices. The S.E.C.'s office has several departments, but that of the Chief Accountant deserves special mention. The Commission appreciates that the value of all financial information depends to no small extent on the soundness of the accounting principles followed. To achieve this, the Chief Accountant's office brings out regularly "Accounting Series Releases," containing necessary opinions, rules and decisions of the Commission; requires that the accountant certifying the financial statements be independent of the client, and even denies the privilege of practising before the Commission to an accountant found lacking in integrity.

Considering this record of the Commission's achievements, it is interesting to find that, but for one solitary exception, the U.S. Congress has never, in the last eleven years, accepted fully the estimates for budget and staff submitted by the Commission; every time they are slashed by varying degrees. On the other hand, the Commission recently submitted certain reorganisation proposals with a view to relieving itself of dealing with many matters of lesser importance and to conserve its time for the consideration of major matters of policy and planning. But this proposal too was disapproved by the Senate. The Commission finds that its present budget grant is just enough for immediate problems and has to ask for *ad-hoc* grants every time it considers it necessary to undertake any special studies.

Critics of the Commission sometimes seem to argue that the Commission is far too much preoccupied with the doctrine of 'disclosure' and that, therefore, it does not take any active lead even when a glaringly worthless security is being publicly offered for sale. This argument is plainly unfair to the Commission, for the S.E.C. does not make laws, much less does it decide their objectives. It only administers the laws—efficiently and faithfully.

A paper dream which is becoming real



With the rapid advance of industrialisation in this country, and the important role the Paper Industry will be required to play in its economy, the imperative necessity for starting a Paper Mill was long felt by the organisers of The Thakur Paper Mills Ltd.

The Thakur Paper Mills was started at Samastipur, Bihar, and it will go into production very soon. The Mills have been fitted with uptodate plant and machinery, and has the advantage of modern methods and processes of manufacture, while experienced technicians have been engaged to supervise the performance and production. The main object of the Mill is to manufacture all kinds of paper, pulp, paperboards, etc.

USHA
HELPS NATIONAL PROGRESS

Usha is playing a vital role in actively assisting the country to earn valuable foreign exchange. The largest exporters in the light engineering field, Usha sewing machines and fans are warmly welcomed in about 50 countries around the world. Besides giving technical know-how to other countries, Usha have taken a major step forward in export promotion by setting up sewing machine assembly plants in Saigon and Colombo.

We look to the future with confidence and in a spirit of dedication to serve the country well.

Disquieting Trends In British Cotton Industry

Profit-margins Of Mills Squeezed To The Utmost

By Our Manchester Correspondent

COTTON industries throughout the world have been facing critical times and none more so than the mills of Lancashire where such important structural changes have taken place within the past three years. On the trading side, it must be admitted that the year 1962 witnessed a continuation and intensification of the highly disappointing trade conditions which had persisted almost since the beginning of 1961. Only in the final quarter of the period did the sun begin to gleam through the mist—both in fact and metaphorically.

Many traders with intimate knowledge of the industry contend that the situation during this latest phase of inactivity has been as dismal as they have ever experienced and certainly the number of mill closures coming so swiftly after the large-scale reorganisation less than three years ago fully reflects this opinion. Not only was business virtually at a standstill until the autumn, but, when operations were under consideration, the prices available offered no justification for acceptance. Margins have been squeezed to the utmost and the full impact of this period in the doldrums has not yet been illustrated by financial results still to come.

Imports—Hong Kong's Approach

So swiftly do events follow each other in these days that only the record books show how much has happened. An example can be provided by the important developments which have occurred on the question of imports—still perhaps the most vital factor affecting the local industry.

Early in the year, Hong Kong made an approach to the British Government suggesting that the existing ceilings on its shipments of various types of cotton goods to the United Kingdom, as already fixed for 1962, should be maintained at the same level until the end of 1965. Much to Lancashire's chagrin, the Government took up this offer with alacrity and, with the minimum of consultation, made an approach to India and Pakistan urging the other participants in the inter-industry agreements to accept the same terms. The response from India was favourable, but Pakistan, which probably stood to gain least from this arrangement, was reluctant to agree to the proposal. A significant letter has since passed between the President of the Board of Trade and the Chairman of the Cotton Board, indicating that the Government would not hesitate to enforce this plan if Pakistan continued to object.

In one instance at least, the Government has been true to its word in creating a precedent by imposing a definite quota on imports of cotton yarn arriving in this country from Pakistan. The privileged position of Commonwealth suppliers has, therefore, been broken after many years in which they have been provided with virtually unlimited facilities for shipping cotton goods to Britain. The voluntary arrangements, which have been the subject of so much negotiation in latter years, have given these markets very favourable terms, despite the complaints which their own producers have raised. It is doubtful whether this change of policy will have any wider repercussions for a number of reasons. The quantity of yarn involved, a total of 1,200,000 lbs. covering the two-year period 1962-63, is relatively small when viewed in perspective of either production at home or the total level of imports.

In the meantime, there were signs that the British Government was very slowly moving in the direction which Lancashire has been advocating for a number of years. The introduction of open individual licences on imports cleared the way for action to be taken in the event of a sudden surge of arrivals from any particular area; a sharp curtailment of the quota on imports from Formosa was carried out, reducing the maximum arrivals from this source from about 12½ million yards to 2½ million yards in 1963; and the President of the Board of Trade even admitted that "Britain is already taking her full share of these products" in referring to imports of cotton goods.

Geneva Pact

All these developments stemmed from the action being taken in a much wider field to regulate the flow of supplies of cotton yarn and cloth throughout the world. The international arrangement, first mooted by President Kennedy and established on a short-term basis, was eventually translated into a five-year agreement which took effect from the beginning of October. Not only the original signatories endorsed the pact, but others indicated their readiness to accept the terms, which aimed at an orderly expansion of trade by the underdeveloped areas without causing undue disruption in the countries where the manufacture of cotton textiles has been a traditional accomplishment during the past century or so.

Although the agreement is now officially in force, some details are still lacking. For example, the extent to which European countries are prepared to open their doors to supplies from the Far East remains somewhat in doubt and, as has been forcibly pointed out in Lancashire, even an increase of 100 per cent in the takings of a market currently absorbing only one per cent of its supplies from the underdeveloped areas makes little difference to the global picture or outlook. At the same time, the importance of the basic acceptance of this idea of international agreement on the subject should not be minimised.

Agitation to secure relief in one form or another continued on an official and unofficial basis by Lancashire organisations during the year. The Prime Minister granted the representatives of the trade a direct interview, while, at the other end of the scale, two protest marches organised by the Textile Action Group surprised Londoners, many of whom had little inkling of the numerous underlying factors which had caused so much resentment in the North against the authorities in Whitehall and its surroundings.

In the course of a debate on the industry in the House of Commons, the President of the Board of Trade emphasised that no further extension of the appropriate dates for receiving a subsidy under the re-equipment scheme could be envisaged. This left mill managements with only a week or two in which to submit their final applications; the response was sudden and illuminating. From the figure of about £70 million quoted by the President in Parliament, schemes involving modernisation to the tune of £116 million flooded into the Cotton Board offices, some even arriving by hand on the last day.

Many of the plans submitted may never see the light of day, but it was recognised that, unless projects were put forward and approved, no subsidy would be available, so that nothing was to be lost by making a claim—whatever the final decision as to its implementation. To be eligible to obtain the 25 per cent grant from the Government, all these schemes must be completed and machinery installed by July 1964, while actual orders for plant must be placed by July next.

Europe, the Key

Impinging on all these events and never far from the thoughts of traders throughout the period has been the prolonged series of negotiations arising from the United Kingdom's application to join the European Economic Community. Entry into the Common Market has been the subject of keen controversy, but, apart from individual viewpoints, the main body of traders feels that Britain should join the Six. No one denies that the move presents incalculable problems, and certainly risks, but the general opinion was summed up by the Cotton Board in an unusually forthright booklet which described Britain's entry as "probably Lancashire's last chance."

Whether or not this is the case, the shadow of Europe, either as friend or foe, has been over the shoulder of every trader for much longer than the period now being reviewed. Fact-finding missions sponsored by the Cotton Board have visited several Continental countries and individual firms have already gone deeply into the outlook for textile products, if and when the tariff barriers are shortly to be torn down.

Mill production in Lancashire has been adversely affected by the slow trading and a complete dearth of new business for most of the year. Short-time working was widely introduced and various methods were used to cut down machine activity. In consequence, the continual drain on manpower persisted and the figures issued by the Cotton Board showed that the number of those available for employment by spinners and weavers dwindled at the rate of nearly 2,000 a month. By the year-end, it seems probable that operatives on the books will have declined to below 150,000. For comparative purposes, it should be recalled that the peak post-war total exceeded 320,000 in 1951.

Not until mid-November did the Industrial Court award the long anticipated wage advance to the operatives, but the figure of 3 per cent was a grievous disappointment to the unions. The possibility persisted that a further approach might be made to the employers so that the firmer undertone in the market, originally caused by the belief that higher overhead charges were imminent, was fully justified.

The accompanying tables indicate the latest position of exports, imports, employment and production as compared with recent years.

Raw Cotton Prices and Supplies

In the days when the laws of supply and demand were largely responsible for creating price changes in raw cotton, there was plenty of scope for discussion among operators; crop reports were keenly scrutinised; the trend of imports and consumption was duly analysed and regular assessments of the outlook were an

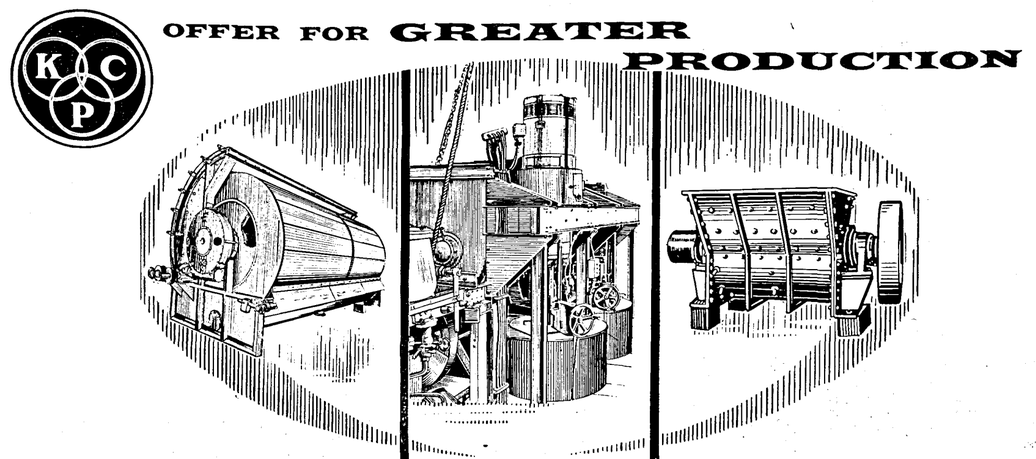
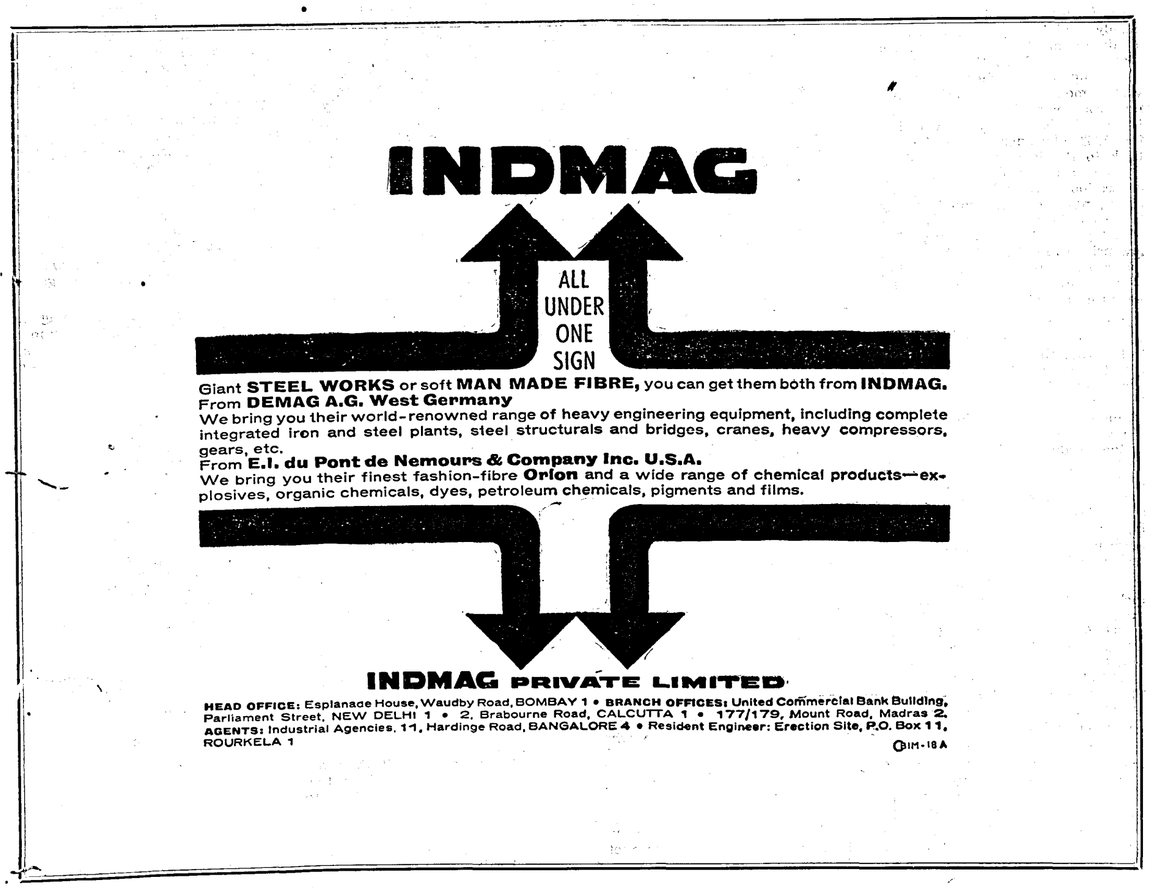
* Excluding doubled yarn.





essential part of every trader's business. Since Governments virtually took over control of the distribution and production of their respective crops all this has been changed. As a result, it needs a cataclysm of nature to have any pronounced bearing on the trend of values. Only some sudden and unexpected move by the American Administration is likely to cause even the swing of a few points in the official values quoted in Liverpool or other former centres of world cotton trading.

An example of the vacuum in which business in the raw material is now carried on was evident when the Cuban crisis erupted, bringing the world to the edge of war. An essential commodity like cotton would, in past circumstances, have advanced sharply in price and although fluctuations were not absent in New York, the Liverpool market displayed a complete lack of interest, with only a trickle of transactions and virtually no effect on prices.

Single Price Again?

Administrative elements remain the one factor which could shake the market out of its apathy and, in this direction, there have again been suggestions that a cotton programme may be devised next year in the United States aimed at removing the disparity in prices between sales for domestic and export purposes. This follows the rejection by the Tariff Commission of a claim submitted by the American textile industry urging that an import fee should be imposed on textiles arriving in the United States equal to the current raw cotton export subsidy of 8½ cents per lb. President Kennedy has charged the Department of Agriculture with the task of producing a programme to re-establish a one-price system.

Although nearly all observers are keenly anxious to ensure that such a development eventually takes place, the alternative methods of arranging the scheme create a vast amount of confusion and numerous variations on the same theme. It is already known that the 1963 plantings are to be cut back to the legal minimum of 16 million acres and, unless some concessions are allowed on this figure, next season's crop is likely to be considerably smaller than in recent years. The probability of a low price support level is being put forward as a reason for stimulating a speed-up in legislation on the one-price aspect.

Stocks of raw cotton throughout the world are now officially stated to be lower than at any time in the last ten years. The added significance of this comment, quoted by the International Cotton Advisory Committee, is that it coincides with almost continuous expansion in cotton production during the same period. Rising output has, in fact, been matched and sometimes overtaken by increases in consumption. Some observers believe that a turning point is at hand because of the fresh upward movement in acreage and output.

At the beginning of January, one-inch middling American cotton on the spot in Liverpool was quoted at 24.20d. After rising to 24.60d. in the following month, prices reverted to 24.20d. in June and the low point of 23.95d. was posted in September. The rate subsequently reverted to 24.20d. which was the figure in operation in November.

Practically identical changes took place in the rates quoted for 15/16" middling American cotton, the January opening being 23.60d. and the peak of 24.00d. occurring in February. Later 23.35d. was posted in September and 23.60d. in November.

Very little additional liveliness was evident in the Sudan market and the Sakel C6 variety, after opening at 30.90d., fell to 29.25d. in March and thereafter remained unchanged for long periods. In July, 28.85d. was posted and the November figure was 28.75d.

Equally uneventful trading occurred in the Lambert 6 variety, the price being 32.65d. in January, followed by a reduction to 30.25d. in March and to 29.40d. in July. The November figure was 29.65d.

Dim Reflection

No repetition is needed of the fact that the world's spot markets provide a misty mirror indeed of events affecting the raw material. In Liverpool, the stagnation which has persisted for so long clogs the mechanism of trading to such an extent that any change in values is an event worth comment and prices often remain unaltered for weeks on end. Sluggish demand throughout the market for either cloth or yarn has inevitably had its effect on the call for supplies of actual cotton. The diminished rate of forwardings to the mills have discouraged merchants from carrying stocks of any size, although modest forward requirements have been under consideration on a regular basis. Competition from outside growths has continued to react unfavourably on the offtake in United States staple. Constant inquiries have been received for growths emanating from the Middle East and South America.

Experimentation with such qualities has convinced most spinners that their attributes can justify widespread use in producing yarns which were, at one time, the entire prerogative of purely American cotton. Judging from both production and consumption statistics, this trend may well continue, irrespective of whether the United States Government is prepared to provide subsidies to equalise export and domestic charges.

Small Stocks

In the 1961-62 cotton season, arrivals in Great Britain barely exceeded one million bales, being 140,000 bales down on the previous twelve months and 430,000 bales lower than 1959-60. The major reduction took place in supplies of cotton from the United States and the Sudan, although Nigeria also shipped much smaller quantities to this country. Visible supplies held at the end of the season had recovered from the very low point reached about twelve months ago when less than 120,000 bales of cotton was held in Liverpool, Manchester or afloat, but only a few weeks ago the stock figure had again slumped to as low as 116,000 bales.

Narrowing interest in futures and the operation of the Liverpool market has continued. Suggestions have lately been made that a fresh basis might be established on yarn rather than the raw material, but, for the time being, with so many restrictionist influences at work, the outlook for any extension of the traditional methods of price insurance through futures seems decidedly obscure.

Cotton Spinning

For most of the past year, trading in cotton yarns continued at a very meagre rate and the deterioration in the position of spinners was marked. As a result, many firms had recourse to short-time working and various measures were taken to curtail output so as to avoid stockpiling at a time when such a policy could in no way be advocated. The weakness of their position made it difficult for spinners to maintain price levels and the further erosion of margins caused much anxiety and a continual drain on assets. Yarn quotations were raised on a very modest basis in October for the first time for more than 18 months, this, in itself, indicating the more confident mood of spinners after so long a period of virtual inaction. In the meantime, however, some of the prices taken in order to secure contracts had been depressingly low.

Shipments of cotton yarns for the first nine months of the current year were virtually unchanged as compared with 1961, the total being 11,223,938 lbs. valued at £4,030,508, as against 11,587,642 lbs., which earned £4,596,795 last year. While the halt in the decline is a minor cause for satisfaction, these figures should be read in conjunction with the post-war peak for the full year of 1949, when 82 million lbs. of yarn were sent abroad, and the earning capacity of £31 million in foreign currency reached in 1951.

As in other directions, the quantity of yarn imported has fallen this year due to the poor state of demand generally in the local market. Arrivals upto the end of September aggregated 24,251,776 lbs., costing £4,875,102, as against 33,820,087 lbs. in the same period of 1961, the value being £6,989,799. Within these import totals, however, it is noticeable that purchases of single cotton yarn from overseas have been virtually halved this year, but that the quantity of doubled yarn and cotton thread has shown very little reduction.

Cotton Weaving

For almost the whole of 1962, the weaving industry has been struggling, just like the other sections, to keep its head above water. In some cases, individuals have, indeed, become submerged, but in general it has been possible to keep at least part of the looms working on business which has been only just remunerative. By holding grimly on, manufacturers have finally reached slightly calmer waters, but they still have a long way to go if they are to regain their former momentum.

The same distressing story of lack of workable demand, low bids and the threat of mounting stocks was still being told until only a few weeks ago, when merchants began to take a slightly less jaundiced view of the situation. Stimulated by the growing opinion that prices would be affected in the event of a wage increase and the realisation that supplies had moved steadily, if slowly, through the normal distributing channels, buyers decided that further forward purchasing was necessary.

A notable feature of the current year has been the sharp reduction in the acquisition of foreign cloth by merchants. After the peak performance of imports in 1961, the rate of arrivals of grey cloth in particular has been severely cut. To the end of September, the quantity imported was 323,169,000 square yards, valued at £19,608,677, whereas, in the same period last year, supplies from overseas had already amounted to 470,426,000 square yards at a cost of £30,129,146. In contrast to this marked change, the arrivals of foreign finished fabric showed only a relatively small curtailment, being 103,975,000 square yards, as against 117,782,000 square yards, the respective values being £18,030,537, as against £19,718,989.

In the meantime, there has been another substantial decline in the quantity of cotton cloth shipped abroad from this country. During the first nine months of the current year, exports reached only 177,218,000 square yards, as against 220,657,000 square yards in the same period of 1961. Earnings from this source fell from £31,422,884 to £24,920,591.

Labour Matters

For considerably more than a year, desultory negotiations have been proceeding between the employers and trade unions in the cotton industry both on a direct wage claim and the call for compensation for those workers who are thrown out of employment when mills close down. In each case, the applications have been formally rejected by the employers, whose attitude was strengthened by the poor trading encountered during this period and whose reluctance to come to terms was substantiated by a series of unmistakably depressing financial returns.

The 10 per cent pay claim was eventually submitted for arbitration to the Industrial Court, whose award of a three per cent advance announced in November was not received very well by the unions who had confidently expected more. Previously the employers had offered a flat rate increase of 5s. 9d. per week, but this was turned down. The award was back-dated to the beginning of October.

On compensation, the employers are sympathetic, but are still not prepared to introduce an industry-wide scheme to replace the arrangement ruling during the course of the reorganisation programme when a definite scale was laid down as to rates which should be paid, according to length of service, for those who were declared redundant. Individual firms which contemplate closing down have been urged to do the best they can for operatives affected in this way.

Average Earnings

The latest returns issued by the Ministry of Labour relating to average earnings show that, in April 1962, men in spinning and doubling were receiving £12 7s. 3d. and women £7 10s. 3d. This compared with £12 11s. 2d. and £7 12s. 6d., respectively, twelve months previously. In weaving, the position was that the average earnings of men had decreased from £13 5s. 7d. to £13 3s. 1d. in the six months ending April this year. In the case of women operatives in weaving, the average fell from £8 1s. 4d. to £8 0s. 2d. during the half-year.

The number of hours being worked by men in spinning and doubling in April this year was 45.7, as against 46.2 in October last and 47.5 in April 1961. For women, the average was 38.8 hours, as against 39.1 in October last year. In the weaving section, men were operating looms for 43.4 hours, as against 43.9 in October last, while women were working 39.5 hours, as against 39.9.

Earnings in textile finishing in April averaged £14 5s. 11d. for men and £7 4s. 6d. for women, as against exactly £14 and £7 5s. 3d., respectively, in October last year. The average hours worked by men in this branch were reduced from 48.8 in October 1961 to 48.5 in April.

Over textiles as a whole, the average wage for adult male labour was £14 2s. 2d. in April, as against £13 19s. 5d. in October 1961. Women received an average of £7 13s. 10d., as against £7 12s. 6d. In all industries dealt with in the survey, covering about 7 million workers, average earnings in April were £15 12s. 10d. for men and £7 17s. 2d. for women.

The Outlook

While some improvement in the general outlook can be forecast now that more active buying has been resumed on distributive account, there remains the underlying fear that the gap between the existing level of imports and the established ceilings still presents overseas suppliers with a very adequate slice of the home market in which to compete with Lancashire-made goods. For this reason alone, local producers have been outspoken in their disappointment

TEXTILES IN WESTERN EUROPE

Some Suggestions For Countries Wanting To Export To That Area

By ARTHUR TATTERSALL

"The creation of the E.E.C. is, in fact, the most important development in the history of twentieth century Europe."

WITH these words, a booklet prepared by Britain's Cotton Board sets the background for any modern consideration of the textile industries of Western Europe; their past, present and future, and particularly their position as potential importers of foreign cotton goods and as a market for the rest of the world.

This survey of the implications of Britain's proposed entry into the European Economic Community on the Lancashire cotton trade is slanted in the direction of British mills and their numerous problems but the advice given and the facts contained in the document are equally applicable to other textile industries, including those of the Indian sub-Continent and the major producers of cotton goods in the Far East.

There must inevitably be a considerable amount of speculation as to the eventual outcome of the complex negotiations proceeding at Brussels in connection with Britain's application to enter the Community as an equal partner. The future from that aspect is obscure and so, therefore, is the effect of so vital a step on the ability of India and the East to compete not only for the British home market but for the very much wider horizons opened up by the prospect of a federation of European States with common trading aspirations and common protective barriers.

Origin and Purpose

It is, perhaps, only fair to establish at the outset the origin and purpose of the European Economic Community which was established under the Treaty of Rome in March 1957. The six founder members—Western Germany, France, Italy, the Netherlands, Belgium and Luxemburg—brought their goal of an economic union into perspective by starting the Community from the beginning of 1958. Subsequently, Greece has become an associate member of the group.

Leaving aside the political aspect of the formation of the Community, its economic importance can scarcely be underestimated. The intention of gradually establishing a single unrestricted internal market of 170 million people by merging their varying policies into a common objective for the whole community was to eliminate within 15 years intra-market import duties and other restraints on trade, coupled with the establishment of a common tariff and commercial policy towards the outside world.

The original scheme to cut out duties and quotas between member-States and to establish a common external tariff was scheduled for completion within 12 years, divided into three stages of four years each. The progress so far made has been swifter than at first anticipated and customs duties on trade between the E.E.C. countries have already been reduced by 50 per cent. Almost all quota restrictions on industrial products within the Community have been abolished and the first move has already been made towards the establishment of a common external tariff.

Undoubtedly, one of the main reasons for the swift progress made in achieving these objectives and, in fact, getting ahead of schedule, has been the high degree of prosperity which the six major countries concerned have enjoyed during the past few years. The initial impetus supporting the objectives of the plan came from the struggle to survive after the devastations caused by the war. In this connection, the European Recovery Programme played a very considerable part in restoring benefits to the various industries involved.

Dynamic Market

The rapid development of industrial and commercial activity since the Treaty of Rome was signed has caused the participating countries to recognise that their original timing was too slow and that both economic and political structures in Europe are well behind the scientific and technical progress which has been made in the area. The E.E.C. countries are, therefore, no longer prepared to wait as long as 15 years for the realisation of the Common Market scheme, particularly when the accomplishments of the United States and the Soviet Union, their chief rivals as a world force, are constantly within their focus.

It can scarcely be denied that the prospect of participating in this dynamic market and securing the same rate of economic growth and expansion of trade is the main attraction for Britain of membership of the E.E.C.

So far, only the basic issues involved and the general industrial outlook has been mentioned in assessing the effect of the United Kingdom's application to join the Common Market and the importance of this fresh move to strengthen the Community. The specific angle of cotton textiles within the overall framework of the Community deserves detailed consideration and has a vital bearing on the ability of countries outside this sphere of activity to secure a trading foothold within the market.

The transitional period for removal of tariffs on E.E.C. trade extends until the beginning of 1970. Within that period the separate national tariffs with the rest of the world are to be replaced by a single common tariff. This is the arithmetical average of the customs duties enforced at the beginning of 1957, covering Western Germany, France, Italy and Benelux. Any member-State, however, can bring its own external tariff into line with the common external tariff more rapidly than is required by the Treaty.

Stiff Opposition

It is difficult to separate the negotiations which have been constantly in progress on the question of Britain's entry into the Common Market with those which have dealt with the wider application of an orderly extension of trade in cotton textiles on a world-wide basis lately completed at Geneva. Suggestions have been made that the common external tariff should be applied to imports of cotton textiles into the United Kingdom from India and Pakistan by stages, so that the full tariff would be effected towards the end of the current decade.

The cotton textile industries of the Common Market countries, however, are diametrically opposed to any opening being procured by Commonwealth producing areas which might give unrestricted entry into their own home markets. With the example of the United Kingdom staring them in the face, the mill-owners in Europe, backed by their own Governments, are prepared to take unilateral action to avoid such developments taking place in their own cotton industries. As has frequently been pointed out in Britain, even the admittance of an extra 100 per cent of imports, when this is applied to merely one or two per cent of the domestic production, has an infinitesimal effect on the total quantity of goods involved.

So far as the British home market is concerned, it is presumed that quota restrictions by quantity will be retained against Japan, China and Formosa, but imports from Spain, although safeguarded by the voluntary arrangements made with that country, have apparently been able to surmount the existing tariff barrier of 17½ per cent for cotton cloth and 7½ per cent for yarn.

An extension of the existing inter-industry arrangement or by recourse to the Geneva agreement would deal with this particular situation, but imports from the E.E.C. countries could not be curbed in the same way as, on entry, Britain would need to abide by the decision to remove quota restrictions on manufactured goods. Imports from European countries, in fact, might well fill any gap made by a reduction in arrivals from Commonwealth sources.

A vital factor in considering the effect of British entry into the European Economic Community and the subsequent adoption by the United Kingdom of the common external tariff would be the effect of this development on preferential tariffs enjoyed by many Commonwealth countries on cotton manufactures. Inevitably, these would be reduced and in some cases might even be abandoned. It should be emphasised that, in 1961, rather more than 50 per cent by value of all British cotton goods exported went to Commonwealth markets in which preference is given. Although smaller shipments are continuing, any sudden and sharp deterioration in this trade could have serious repercussions.

State of Industry

One of the major factors involved in dealing with the textile industry in Europe is the mergers which have lately taken place, resulting in a comparatively small number of firms with a comparatively large number of mills. This is somewhat in contradiction to the situation in Britain where a substantial number of small units—often family businesses—remain, particularly in the weaving branch.

Another important variation between the structure of the Continental European industry is its predominantly vertical set-up, whereas, in Britain, the horizontal system is still mainly in vogue, especially in the spinning section. In Italy, for instance eight firms each control more than 100,000 spindles and in weaving the 16 largest companies, all vertically organised, control over 1,000 looms each. Many are still family businesses, although often in the form of public companies. According to information obtained, there is not a great deal of contact or co-operation between different producers and each mill tries to produce a wide variety of products.

The situation in West Germany is that many firms are mainly family run and are generally vertical in structure. About two-thirds of the output comes from vertical spinner-weavers. An important point is that direct selling has replaced the converting system which flourished before 1933.

Although the average size of French mills is smaller than in Lancashire, amalgamations have lately taken place generally for reasons of greater financial strength. This has resulted in specialisation by the mills in each group and the closure of the older and less economic units. A number of large vertically organised firms are in existence, many of which operate finishing plant as well as spinning, doubling and weaving.

In the Dutch cotton industry one firm alone is responsible for about a quarter of the industry's output and the average number of spindles and looms per firm is larger than in any other E.E.C. country. The independent merchant converter is almost unknown.

A larger number of firms is in existence in Belgium but, although there are about 200 weaving mills, 25 of these are responsible for 85 per cent of total production. Integration with the spinning section is widespread and many units also conduct finishing operations.

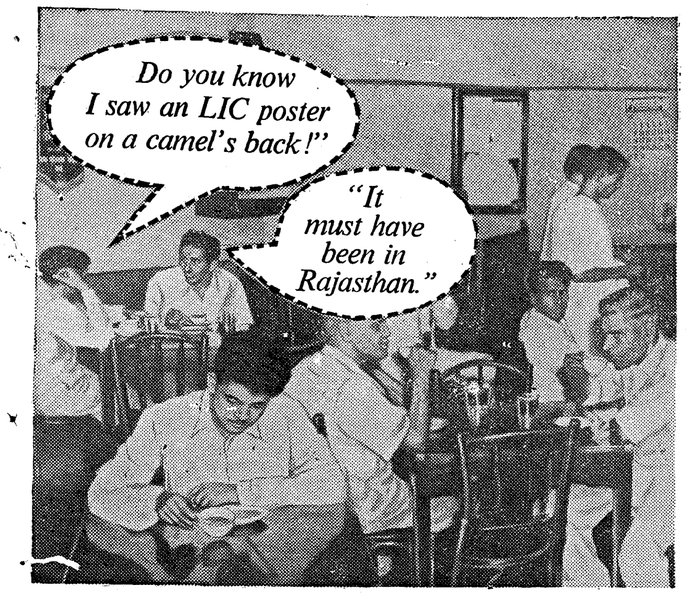
Intensive Utilisation

Machine utilisation in the E.E.C. countries is much greater than in Britain and three-shift working is commonly operated. The number of hours worked per active spindle during 1960 ranged from a peak of 5,001 in Belgium to 3,782 in West Germany, while the comparative British figure was 2,680. The hours worked per active loom on the same basis varied from 3,770 in the Netherlands to 3,297 in Western Germany, but the position in the United Kingdom was 3,020 hours worked.

Since the war, fairly extensive re-equipment has taken place in all the European Common Market countries. A substantial proportion of this modernisation has been by way of replacement after heavy war damage, particularly in West Germany where many completely new mills have been constructed. Re-equipment projects by firms in the European industries have always been undertaken on the assumption of multi-shift working accompanied by scrapping of obsolete machinery.

Figures of average wage costs and social charges in manufacturing industry in Europe show West Germany at the top of the scale, with rates of 6s. 3d. an hour, while France and Belgium average 5s. 3d. an hour and Italy and the Netherlands 4s. 6d. an hour. Britain's comparative position shows total costs of 5s. 9d. an hour, of which the hourly wage rate is higher than European countries but social welfare charges are smaller. The financial cost of social charges in Europe is largely borne directly by the employer rather than by the Government. Bonuses for third-shift work are paid at rates varying from about 15 per cent to about 30 per cent.

Total production of yarn and cloth in the European cotton and



PEOPLE ARE TALKING ABOUT LIC

One of LIC's objectives is to extend the protection of Life Insurance to every insurable person who can afford it. Since most of our people live in villages, LIC have intensified rural publicity. Travelling by jeep and bullock-cart and even by boat and camel, LIC workers spread the message of Life Insurance to every nook and corner. They take films and cine-projectors with them to explain the benefits of Life Insurance more effectively. Such intensive publicity pays handsome dividends; often villagers come forward to take Insurance policies immediately after such a propaganda session.

Life Insurance Corporation of India

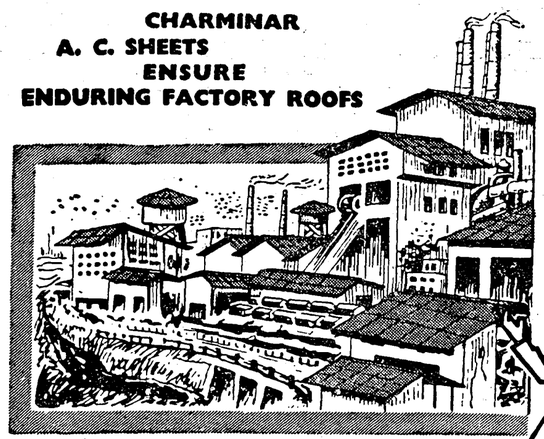
CHARMINAR A. C. SHEETS ENSURE ENDURING FACTORY ROOFS



Rust, rot and fire-resistant Charminar A. C. Sheets make enduring factory roofs. These sheets need no maintenance under any weather conditions and give trouble-free service year after year. Use Charminar A. C. Sheets, the ideal roofing material for your factory.

Charminar corrugated and *semicorrugated sheets are* available in all important cities and towns.

HYDERABAD ASBESTOS CEMENT PRODUCTS LTD. SANATNAGAR-HYDERABAD 18

allied textile industries has shown a steadily rising trend since the last war and output between 1958 and 1960 was greater than that in the preceding three-year period. Average annual yarn output in those years was about 2,400 million lbs., of which some 2,000 million lbs. was cotton yarn. Average annual cloth output over the same period was around 9.3 million quintals, of which about 7 million quintals was cotton cloth. (*Note*: One quintal= 100 kilograms or 220.462 lbs.).

Western Germany is the largest E.E.C. producer, with France second. Italian production, particularly in man-made fibres, is growing noticeably but some stagnation is apparent in Belgium's output and the Dutch industry encountered some years of relative stability before increasing production in 1960.

Intra-market Trade

Intra-market trade in cotton yarns within the Community between 1957 and 1960 expanded by about 45 per cent. Belgium sent substantial quantities of yarn of the Netherlands and Italy was another major exporter. Imports of yarn between countries of the Community account for about 70 per cent of total yarn imports, the major source of arrivals being West Germany, but France and Italy took only negligible quantities.

The post-war history of exports of cotton cloth showed an expansion until 1951 and then a decline until 1956. Two years of stability followed, after which a marked expansion occurred until signs of slackening appeared in the latter part of 1961. Much of the increased trade has been intra-European and intra-E.E.C. trade was 75 per cent greater by volume in 1960 than in 1957. The two countries to have benefited most from this rising trend of trade were France and the Netherlands.

British imports of yarn and cloth from E.E.C. countries have grown during the period. The present position shows a substantial net import of about 10 million lbs. of yarn and 75 million square yards of cotton cloth. Across the Channel, West Germany is by far the largest importer of cotton yarn and cloth, supplied chiefly by France and the Netherlands.

As indicated in earlier passages of this article, the Cotton Board offer a great deal of advice to British textile interests in relation to their future attitude towards the Common Market countries. Although the details may differ a little, similar advice is worth repeating to other countries whose millowners might consider that Europe presents a developing market for their products.

Suggestions

New marketing techniques are advocated and their adoption should be carried out without delay. This, in fact, means an entirely new approach and the new European market will, it is stressed, be highly competitive as it is already sufficiently supplied from its own existing connections.

Among the most obvious differences involved in creating opportunities to dispose of cotton goods in the E.E.C. countries are the multiplicity of languages, the use of the decimal system in currency, weights and measures, various exchange rates and, of major importance to textile producers, the basic differences of race, nationality and cultural heritage and the wide variations in the modes of living which exist among the people who form part of the present and future European Common Market.

Any individuals or countries contemplating an attack on trading prospects in Europe must conduct research on a more than adequate scale. Not only must all available factors about the market be secured but an investigation into existing channels of distribution and preferences and dislikes of consumers in the area must be taken into account.

British cotton millowners and distributors have already been warned that they will have to maintain a higher standard of colour, design and styling if they wish to secure a foothold in Europe. Promotional activities are of vital importance and general and specialised trade fairs, which form an integral part of European textile marketing, should be used to stimulate interest in the products of exporting areas.

It has been suggested that many of the early orders secured in Europe will be of a hand-to-mouth variety and small in size. Many of the disadvantages of the short-run order position, however, can be overcome by co-operative marketing, involving the establishment of joint selling agencies comprising producers or merchants or both. The agency could also provide other important functions, such as specific market investigations, general market surveys, joint advertising and sales promotion and other such projects.

Importance of Designs

Warnings issued to British textile firms about their design and styling apply equally to those producers in other countries who are contemplating trying to sell in Europe. The matter is not one of foreign designs being bad and Continental designs good, but rather of differences between the two. Britain's Cotton Board says that a completely new approach would be necessary in dealing with trade with the E.E.C. in view of the major variations in Continental design. An invasion of European taste in design and styling has lately taken place in the United Kingdom, especially in such fields as furniture, cars and cutlery. Many observers believe that design rather than price will be the prime factor in selling textiles in the European Economic Community. Openings exist for trade with Europe in combed cotton yarns in the 30s count range, in quality shirtings and in some coloured wovens. Various finishing processes, especially those incorporating resin finishes, should be successful.

Size of Imports

Some indication of the volume of cotton cloth imports into the various European markets can be obtained from figures for 1961, which show that Belgium absorbed 78,000 quintals, of which 61,000 quintals came from other E.E.C. countries; France took 57,000 quintals, including 20,000 from other members of the Community; Italy imported 30,000 quintals, of which nearly 11,000 quintals was from other E.E.C. countries; the Netherlands absorbed 264,000 quintals, including 134,000 from within the Community and West Germany imported 239,000 quintals, of which 129,000 quintals was intra-E.E.C. trade.

In considering the prospects for other countries to secure some part of the respective home markets in the E.E.C., it should be noted that sales of British cotton goods in this connection have been practically negligible during the last few years. Exports to Belgium in 1961 were non-existent, while France took only about 2,500 quintals. Italian imports from the United Kingdom consisted of only 1,600 quintals and the Netherlands absorbed 1,400 quintals. Even Western Germany, whose total imports last year amounted to 239,000 quintals, received a mere 2,000 quintals from Britain.

The major suppliers for these markets outside their own Community were Japan and China in the case of the Netherlands; other European countries, including Switzerland, Portugal and Spain, as well as Japan, in the case of Germany; Spain and the United States in the case of France and Switzerland in the case of Italy. From the figures given, however, the tight economic interlocking of the countries of the Community is a major factor and must be expected to become even more pronounced in the future.

Cloth production figures quoted by the International Cotton Federation for 1961 show that the biggest increases over the year were recorded in European countries outside the Community, namely Spain, Switzerland and Portugal. On the other hand, taking a comparison of output in 1961 as compared with 1958, it is seen that Belgium headed the list with a rise of 23 per cent. Italy's production increased by nearly 16 per cent and the Netherlands by 14½ per cent. Germany's output was 8 per cent higher but France alone among the E.E.C. countries suffered a reduction of nearly 4 per cent.

May Be, Long-term

Not for the first time, the whole situation affecting the interchange of cotton textile goods between manufacturing areas and importing countries is in the melting pot. Centuries ago India was leader of the world, with hand-woven goods of wonderful texture. The invention of the powerloom and the industrial revolution in Britain gave new impetus to the countries of the Western hemisphere which has lasted for well over 100 years. That the basic considerations of manufacturing are altering is a simple enough explanation and the initial rise of Japan a generation or more ago set the pace for other developing areas, particularly in the East.

The Geneva agreement marks a phase of international collaboration, in which the defending countries, whose traditional business of making cotton textiles is severely threatened by the industrialising areas, have their backs to the wall, but the protective measures it upholds must presumably be of only interim duration. Eventually, it should be possible for some of the countries in the Far East to secure an increased share of markets in the West but this would seem to be a long-term project.

In the meantime, many of the countries concerned in raising their production and export capabilities must consider the outlook very carefully. Although on the face of current circumstances they can expect to gain considerable ground by making substantial inroads into the home markets of individual areas where manufacturing has been built up as a substantial home industry, they must realise that protectionism will be maintained for as long as possible. Without a marked change in the situation, their prospects of securing a stranglehold on those countries which are fighting a rearguard action to retain a textile industry of some importance will be hampered by the opposition they will meet at every turn.

India has applied for membership of the 18-nation International Federation of Cotton and Allied Textile Industries, which has headquarters at Manchester. The request has been made by the Indian Cotton Mills Federation, the central organisation representing mills throughout the country. Mr. Mario Ludwig, Director of the International Federation, said that, at present, membership equalled 66 per cent of the world's cotton spindles and looms. India's admission would increase this figure to 85 per cent.

BRITISH COTTON INDUSTRY

(*Concluded from page 124*)

that the Government was unable to get better terms from the Commonwealth countries involved in the negotiations, setting a top limit to the annual arrivals from Hong Kong, India and Pakistan up to the end of 1965.

Coupled with any consideration of imports from the trio of Commonwealth countries must be linked the way in which such goods will be permitted to enter the home markets of other Western nations if and when the United Kingdom is admitted into the European concept of economic and political unity. The niggling fear of "a war on two fronts" has been as much a reason for lack of confidence among millowners and merchants for the past two or three years as any other disturbing element in Lancashire.

Continental cotton men have made no secret of their strong opposition to even a minute opening of the door to such imports and, perhaps more important still, they have had the full support of their respective Governments in this attitude. In this connection, it is worth repeating the words of Mr. Michael Grey, who reported at the Cotton Board conference only a few weeks ago on the negotiations at Geneva for the regulation of trading in cotton goods between the developing areas and the traditional manufacturing centres. He said:

"It was significant throughout the negotiations that the Governments of the other countries of the Western community had no doubts whatever in their minds about the wisdom and the necessity for the protection of their own domestic textile industries on a permanent basis as necessary and desirable elements in their national economies. They have all witnessed with alarm the fate in recent years of the United Kingdom textile industry and regard this as a most solemn warning of the irreparable damage and disruption which can be caused to a textile industry in a Western country, if vast and virtually unrestricted cheap imports from the low-cost economies of the less-developed countries are allowed to flow into its own home market."

Signs of Recovery

The year now under review has ended with the market showing signs of recovery and this more favourable trend can be expected to continue. Diminished stocks and the recognition that prices have reached a low point from which some upward movement must be expected, combine to create circumstances which should lead to freer buying. Producers will, therefore, derive some benefit from the position, although they may well have to struggle hard to secure really remunerative business.

Perhaps the most promising aspect of the outlook is concerned with the probable extent of home trade demand for textiles. Although the latest Government measures to stimulate the growth of the economy may take some time to percolate down to retail level, their effectiveness will eventually be gauged by the way in which they encourage wider purchasing power.

Tax concessions provided for the car trade may have the immediate reaction of diverting some surplus cash to products other than textiles, but, in the long run, a more volatile economy should breed confidence and bring lasting benefit. Incentives lately announced by the Government to speed up the payment of some post-war credits, increases in capital investment allowances and a fresh rise in capital expenditure by the Government promised for next year all suggest a more buoyant state of affairs, which may well transform the Lancashire industry into at least the semblance of an expansionist phase.

LALLUBHAI AMICHAND

marched forward

...back to its prerequisites

Half a century ago Lallubhai Amichand started with the manufacture of kitchen-ware ... gleaming aluminium and stainless steel pots, pans, ladles, containers that have been the pride and joy of two generations of Indian housewives.

Progressively Lallubhai Amichand stepped into the next logical industrial process—smelting and rolling non-ferrous metals. Metal Rolling Works Private Limited formed for this purpose was amongst the pioneers in India.

The next phase of development is currently well advanced at the plans stage. Lallubhai Amichand will be promoting a new company to manufacture for the first time in India stainless steel ... today's most modern, versatile, useful metal on whose incomparable physical properties jet planes have soared higher into the heavens and streaked faster across the skies.

When this great project is completed shortly, the House of Lallubhai Amichand will have covered almost the whole ground in its industry—kitchen-ware of aluminium and stainless steel ... only in this case the finished product came before its raw materials were processed by Lallubhai Amichand. That's why it is true to say, "Lallubhai Amichand marched forward ... back to its prerequisites."

BRITAIN AND THE COMMON MARKET

Likely Impact On The Trade Of India And Other Commonwealth Countries

By Dr. MARTIN GOTZ

AFTER the conclusion of the meeting of the Commonwealth Prime Ministers in September 1962, Mr. Macmillan emphasised in a broadcast that Britain's application to join the Common Market did not imply that Britain was faced with a choice between the Commonwealth and Europe. "The Commonwealth and Europe are two different kinds of organisation," he said, and "membership of one can help and not hinder the membership of the other." The significance of the Commonwealth, Mr. Macmillan declared, lay in its extreme diversity and covered all parts of the world "with a history link," but it was not a compact economic grouping. On the other hand, E.E.C. was a customs union, a great economic group.

If Britain was to buy sufficient quantities of the manufactured goods produced by the newly-developed Commonwealth countries in Asia and Africa, she must be strong enough economically to make the necessary changes and adaptations in her own industrial life. Britain would have to concentrate on producing complicated and specialised goods—power stations, conventional and nuclear, computers and so on—which required very large capital investment and needed a large home market in order to be sold at a competitive price. Such a large home market would be provided by the E.E.C. if Britain joined.

Problems Realised

Although the Commonwealth is not primarily a trading area, Commonwealth trade "is one of the strongest elements in maintaining the Commonwealth association." These words of Mr. Heath, the British chief negotiator in Brussels, in the statement with which he opened the discussions on Britain's application in October 1961, make it abundantly clear that the British Government fully realises the problems which Britain's entry into the Common Market would present to the other Commonwealth countries. As he pointed out, "the economies of most Commonwealth countries have been built up on the basis of supplying the British market, which has traditionally imported their produce duty-free and often on preferential terms. In the last few decades, the majority of them have sought to enlarge both the variety of their production and the range of their markets. But the British market is still of great importance to the economies of most Commonwealth countries."

Continuous Consultation

The problems of the Commonwealth are playing a great part in the Brussels negotiations. The British delegation is keeping in close touch with the Commonwealth representatives in Brussels and Mr. Heath is also regularly informing the High Commissioners in London about the progress of the negotiations. Continuous consultation is maintained with the Commonwealth Governments in the normal way, and a thorough discussion took place in the course of the Commonwealth Prime Ministers' meeting.

No complete picture about the possible outcome of the negotiations was then available (nor is it now) and, naturally, the Prime Ministers stressed the problems of their individual countries and their anxieties. Of course, as in all international negotiations, some compromises will be necessary if the Brussels negotiations are to come to a successful conclusion—though Britain could not enter the Common Market if the price were irreparable damage to the Commonwealth link.

Present Position

A short survey of the trade of the overseas Commonwealth with Britain and the E.E.C. countries will show the present position. In 1960, total exports of the overseas Commonwealth amounted to £5,835,000,000. Of these, £1,349,000,000 or 23 per cent went to the United Kingdom and £721,000,000 or 12 per cent to the E.E.C. countries.

Although the share of the U.K. in Commonwealth exports is falling (it was 29 per cent in 1954), a market which still takes almost a quarter of all their exports is clearly of vital importance to the Commonwealth countries. The E.E.C. countries took barely half as much as the U.K. from the overseas Commonwealth countries: but one-eighth of the total export income is still a sizable slice, and this explains why the Commonwealth countries anxiously watched the development of E.E.C. policy even before Britain decided to make her application for entry.

The total figure does not mean that all overseas countries within the Commonwealth are equally dependent on the British market. In fact, there are wide differences. Malaya, Singapore, Ghana and Uganda, indeed, have a larger outlet in the Common Market than in Britain (Malaya to Britain 13 per cent, to E.E.C. 18 per cent; Singapore to U.K. 8 per cent, to E.E.C. 9 per cent; Ghana to Britain 31 per cent, to E.E.C. 35 per cent; Uganda to Britain 16 per cent, to E.E.C. 21 per cent). On the other extreme lies Sierra Leone (73 per cent to Britain and 12 per cent to E.E.C.), New Zealand (53 per cent to Britain and 17 per cent to E.E.C.) and Nigeria (48 per cent to Britain and 30 per cent to E.E.C.). India occupies an intermediate position (27 per cent to Britain and 8 per cent to E.E.C.).

Four Broad Groups

These countries apart, the variations from the average for the total Commonwealth are not very large if one divides the Commonwealth countries into four broad groups. The first group, comprising the three Commonwealth countries with temperate climate (Canada, Australia, New Zealand), sends 22 per cent of its exports to Britain and 11 per cent to E.E.C.; the second group, consisting of the three independent Asian countries now on the way to development (India, Pakistan, Ceylon) ships 26 per cent to Britain and 10 per cent to E.E.C. The third group (all other independent Commonwealth countries, mainly with tropical climates) supplies 25 per cent of its exports to the U.K. and 19 per cent to E.E.C. And the fourth group (the dependent overseas territories, now on the way to independence, also mainly with tropical climates) sends 21 per cent to Britain and 7 per cent to E.E.C.

Different arrangements are necessary for the different groups of countries to mitigate damage to their trade if Britain joins the Common Market. Canada, Australia and New Zealand are exporters of foodstuffs, Canada and Australia also of metals and, in particular Canada, of manufactures. Wool, a large export of Australia and New Zealand, presents no special problem, since the Common Market tariff is zero. For foodstuffs, the Six have recognised that New Zealand's problem is a special one, since Britain takes about 90 per cent of its butter and 60 per cent of its meat exports and they have undertaken to examine what solutions would be possible.

The future of Australia's and Canada's exports of unprocessed foodstuffs will depend to a large extent on the price policy of the Community on which, of course, Britain will be able to exert an influence. It has already been agreed that the price policy will be "reasonable." The present Six members of the E.E.C. are also willing to initiate world-wide commodity agreements to safeguard the interests of overseas producers.

Manufactured Foodstuffs

A special interest of Australia and Canada is manufactured foodstuffs, in particular canned salmon from Canada and canned fruit from Australia; the latter presents a social problem, since it was largely established for the employment of ex-servicemen after the First World War. Negotiations on these commodities are still in progress.

Among Canada's exports of manufactured products, aluminium and newsprint are of special importance. Britain has asked for a *nil* duty for these products in the common tariff: so far the Six have not conceded this, talking instead of a duty-free quota, non-discriminatory for all suppliers from non-E.E.C.-member countries.

For the independent Commonwealth countries in Africa and the Caribbean and for most dependent territories, the Six have agreed to offer association with the Common Market and to give them the same preferential treatment as that given to the former French, Belgium and Dutch dependent territories which are already associated. This would offer great economic advantages in some cases, but some Commonwealth countries have rejected this proposal. They may change their minds, but, meanwhile, other safeguards have to be found and the Six have already declared their willingness to reduce the tariff on tropical hardwoods to zero.

The Brussels negotiations have brought home to the E.E.C. countries the need of India, Pakistan and Ceylon to increase their export income and to enlarge and diversify

their economies. As soon as Britain enters, if she does, the enlarged Community will seek to negotiate comprehensive trade agreements with the three countries and these could include tariff policy, quota policy, export policy and measures to facilitate the promotion of private investment and the provision of technical assistance.

Tea and Cotton

Agreement has been reached to reduce the common tariff on tea, India's (and Ceylon's largest single export), from 18 per cent to *nil*. Thus, Indian tea will continue to have free access to the market in Britain. The elimination of the tea duty is a major concession to India, since it also gives easier access to the European market. The Indians object that internal taxes on tea are to continue; but the German tax on tea is lower than that on coffee and there is, therefore, an opportunity for increased sales of Indian tea.

Cotton textiles presented special difficulties in the negotiations. On the one hand, India's urgent need to maintain and expand her exports was fully understood. On the other hand, the difficult position of the European cotton industries had also to be taken into account. It was agreed that the common tariff would not be applied to these goods at the normal time-table by Britain, but at a slower pace (so-called decalage). The first step of 20 per cent of the rate of the common tariff would be taken on the accession of Britain to the Community; a second step of 20 per cent 18 months later; a third step of 30 per cent after a further year; and the final step of 30 per cent when the common tariff applies throughout the Community. As in the main the rate in the common tariff is 18 per cent, the rates applied by Britain in the first three stages would be about 3.5 per cent, 7 per cent and 12.5 per cent *ad valorem*. But Britain won a substantial concession for the Commonwealth exporters of cotton textiles.

The enlarged Community would take steps without delay to restore the situation if, as a result of the progressive application of the common tariff by Britain, exports were to decline. (This applies until the conclusion of the comprehensive trade agreements or the end of 1966.) Such a decline would be measured in relation to a base level for such exports to the Community which would be established before the accession of Britain. It would be at least the average tonnage of imports into the enlarged Community during the years 1959 and 1960. Provisions for certain additions in accordance with the Geneva Arrangement for cotton textiles was also agreed in principle for the markets of the present E.E.C. members. Britain would restrict her imports from India and Pakistan to about the present level. It deserves special emphasis that the undertaking to maintain the level of exports is unique in international arrangements, since it refers to the actual level of exports and not to quotas. On her part, Britain has undertaken to control exports of cloth based on Indian or Pakistani cloth to other members of the Community if difficulties arise in their markets during the period before the British duty on such cloth reaches the full rate of the common tariff.

Five Stages

For some minor industrial goods, notably certain sports goods, the common tariff will be reduced to zero. For other industrial goods from India (and the two other countries), there will be a "very soft decalage." The common tariff will be applied in five stages. No agreement has yet been reached on the abolition of the duty on East India kips, some heavy jute goods and some other products. For jute goods, the common tariff will be applied by Britain by progressive stages and Britain will also establish a quota for jute goods (other than heavy jute goods) for imports from member-countries and finally abolish quantitative restrictions on such imports. Jute goods from India will thus be subject to the tariff, but, on the other hand, the additional protection afforded to the British jute industry through the jute control will be abolished.

Concessions Obtained

As this short survey shows, the British negotiators have already won substantial concessions for India's exports, though not all wishes of India have been fulfilled. But the negotiations are not yet finished and some other products, including most tropical products, including coffee, have still to be considered. (A suspension of duties on cashew-nuts has alreay been agreed upon.) It is important for India to realise that the agreements relate not only to Britain but the prospective enlarged Common Market. India has exported in recent years less than one-third to the Six of what it imported from them. Its exports to Britain also declined last year, and it needs to rely on self-help and energetic export promotion.

The concessions already made on cotton textiles are proof that Europe sees India's problems. It is clear that the contraction of the European textile industries—before World War I, the British cotton industry exported more than it sold in the home market whereas now one-third of home consumption is imported—has a strong psychological effect. Th will be overcome in time when the British and Continental economies are fully geared to the new industries in a large European market. For this reason alone, India has a vital interest in a prospering European Community, enlarged by Britain's accession. In addition, as already pointed out, the mere fact of the present negotiations has already awakened a wider understanding of India's problems and economic requirements among the Six.

At the moment, the outcome of the Brussels negotiations is still uncertain. But if Britain is able to gain added prosperity by joining, she will be able to help the developing Commonwealth countries even more by trade and aid. Close links with the Six will undoubtedly help the co-ordination of aid programmes. But, in addition, it will also facilitate the flow of private investment to India.

The experience of London in international business is unrivalled in Europe, indeed in the world. If the City can attract funds from European investors for investment in industrial and other projects in the Commonwealth, a new source of funds will be available for India. It is true that India will have to make her own efforts to adapt herself to the new situation if Britain joins the Common Market, whatever concessions yet may be gained. But there is little doubt that a strong Britain in a strong European Community will benefit India's economic welfare.

THE BIG HURRY IN THE WORLD OF ASTRONOMY

Suddenly, a star exploded. ■ Turning within its spiderwork of iron and steel, the 200 ft. wide saucer-shaped 'eye' of the radio telescope at Jodrell Bank looked deep into black space and recorded: the star had exploded FIVE MILLION YEARS AGO! ■ Peering so deep into space as to question time itself such radio telescopes are revealing to us the breathtaking, even frightening, dimensions of space and time, gathering astronomical data that are making space travel a fast nearing reality. ■ Into the fashioning of the 2000 ton Jodrell giant went the most advanced technique and knowledge of welding and gas cutting. ■ It is this precise knowledge of industrial gas and its diverse applications that Indian Oxygen affords Indian industry.

INDIAN OXYGEN LIMITED

Importance Of Petrochemical Industry To India

Valuable Source Of Raw Material For Several Industries

By N. D. NAGRECHA AND R. M. BARDHAN
ESSO STANDARD REFINING COMPANY OF INDIA LTD., BOMBAY

AT the time of attaining independence in 1947, India was primarily dependent on agrarian economy. After independence, the country took to planned economy for rapid industrialisation and attainment of the fundamental objectives of national prosperity and social justice.

The first Five-year Plan (1951-56) emphasised agriculture, irrigation, power and transport. The second Plan (1956-61) consisted of a harmonious blending of agriculture and basic/heavy industries. The third Plan that became operative last year recognises that growth industries such as steel, fuel, power and chemicals should largely determine the pace at which the economy of the country can become self-reliant and self-generating. It, therefore, gives special emphasis to the expansion and further promotion of these industries.

In the past, the rate of growth of chemical industry was slow due to three principal reasons:

(a) Restricted markets which could not justify economic units.

(b) Necessity to import technical know-how; reluctance of foreign firms to provide technical and financial collaboration.

(c) Non-availability of many raw materials.

Experience has shown that, in many cases, the high demand potential remains latent until a plant comes into operation. Industrial growth in India has reached a level at which ample market potential exists for all kinds of chemical and engineering goods, although not necessarily so by Western standards. Foreign firms are, therefore, becoming interested in investing in chemical projects in India.

Raw Materials

The Indian organic chemical industry, has, so far, remained dependant on substantial imports for many of the intermediate chemicals required for the manufacture of various end-product derivatives such as polystyrene, plasticisers, detergents, dyestuffs, agricultural chemicals and solvents. In a few cases, the end-products such as synthetic rubbers are imported directly. However, unfavourable foreign exchange position has prevented free imports of all chemicals. The major raw materials available indigenously to date for organic industry are ethyl alcohol, benzene and toluene from coal carbonisation unit, and calcium carbide.

It has been estimated that the availability of molasses by 1966 being about 1.1 million tons per year, alcohol production possible by then would be about 63 million gallons per year. The installed capacity for production has already reached 54 million gallons per year, and additional 28 million gallons capacity is under implementation. Since alcohol is available abundantly at present, Government licensed three major projects for its utilisation. These are: polyethylene units of I.C.I. (Calcutta) and Union Carbide (Bombay), and butadiene and styrene units (for SBR rubber) of Firestone-Kilachand (Bareilly). Although these plants involved obsolete technology, Government felt from the standpoint of alcohol utilisation they were quite attractive.

If petrochemical ethylene could be made available in the country, production of ethylene chemicals via alcohol route would be uneconomical. Alcohol ethylene probably costs about 50-60 nP/lb. (including profit-margin), whereas petrochemical ethylene would cost around 35-45 nP/lb., depending upon naphtha cracker capacity. In view of this, the Government has now decided in principle not to license any more projects which would utilise alcohol for manufacturing ethylene chemicals.

In the past, demand for benzene for the organic chemicals industry was small, but, during the next few years, the demand is expected to increase very rapidly which cannot be met by the benzene recovered from coal carbonisation unit. This is so, because coal carbonisation is linked mainly to steel production, and the rate of growth in aromatics-consuming industries would be faster as compared with steel industry. The deficit in benzene supply would have to be bridged by the production of benzene from petroleum sources.

The cost of calcium carbide production in this country is high and the quality is relatively poor. This is due to high cost of electricity and non-availability of proper quality limestone and coke required for carbide manufacture. The sale value of acetylene from carbide in the country is estimated to be as high as 85-90 nP/lb. There is a growing realisation that it is impractical for the organic chemical industry to use high cost acetylene from calcium carbide, especially when availability of cheaper acetylene/ethylene from naphtha crackers is in the offing.

It has been recognised by all concerned that the above materials would not be able to meet the ever-increasing demand of "Building Blocks" (i.e. basic raw materials—ethylene, propylene, butadiene, etc.). Hence, to meet the need of "building blocks," the country must turn to petroleum sources. Petroleum naphtha cracking units would be able to provide a wide range of basic raw materials at low cost for the projected organic chemical industry like plastics, synthetic rubber, detergents, etc. Chart I shows the host of chemicals that can be derived from petroleum.

The Indian automobile industry is still in its infancy and, therefore, the demand for gasoline in the country is small. Consequently, the existing four refineries plus three projected refineries would produce larger quantities of naphtha than may be used for the manufacture of gasoline. With all the seven refineries operating at full capacity, there will be a surplus of naphtha variously estimated at 500,000 to 900,000 tons in 1966 after meeting local gasoline demand. This naphtha surplus would be utilised for fertiliser manufacture, and for production of "building blocks" by steam cracking.

Basic Organic Chemicals Requirements

Petroleum-based raw materials would be contributing a greater percentage of the share of basic raw material requirements of the organic chemical industry. Table A below shows the estimated requirements of basic organic chemicals in the country during the third and fourth Plan periods. Due to the recent national emergency, these requirements will go down to some extent, but it is difficult at this stage to predict its effect on the growth of chemical industry.

Table A : Estimated Requirements of Basic Organic Chemicals

(All in tonnes/year)

	1965-66	1970-71
Alcohol	198,000	265,000
Methanol	25,000	60,000
Acetylene	24,000	59,000
Ethylene	47,000	165,000
Propylene	18,000	70,000
Butane/butylene ..	60,000	155,000
Benzene	80,000	170,000
Toluene	4,000	6,000
Oxylene	9,000	30,000
Naphthalene ..	12,500	15,000

In order to emphasise the importance of petrochemical industry in India, we discuss below several of the industries and bring out the contribution of petrochemicals for their development.

Plastics

During the last few years, the Indian plastics industry has emerged from the state of infancy and is now developing at an accelerated rate. The industry today occupies an important position in India's economy, with a capital outlay of about Rs. 220 million (Rs. 22 crores), and the investment is expected to increase at least at an annual average of Rs. 50 million (Rs. 5 crores) for the next five years. Despite the accelerated growth of the industry, the *per capita* consumption of plastics remains today at only 0.18 lb. This hardly compares with that of 0.66, 2.00 and 9.02 lbs. in Turkey, Spain and Italy, respectively.

In 1966, when the demand potential for plastics reaches 133,000 tons, their manufacture will require considerable quantities of chemicals. The major portion of these will have to be based on petroleum sources. Some portion will also be based on coal-tar products, alcohol, and products from other industries. Table B and Table C, respectively, give the estimated plastics requirements and raw materials required for their manufacture.

Table B: Estimated Plastics Requirements

(All in tonnes/year)

	1965-66	1970-71
Major Thermoplasts		
Polyethylene ..	36,000	115,000
Polypropylene ..	4,000	20,000
P.V.C. ..	30,000	75,000
Polystyrene ..	20,000	50,000
	90,000	260,000
Other Thermoplasts		
Cellulosics	7,000	10,000
Others (P.V.A., polyurethane, etc.) ..	13,000	70,000
	20,000	80,000
Thermosets		
Phenol-formaldehyde..	8,000	18,000
Urea-formaldehyde ..	11,000	26,000
Others (melamines, etc.)	4,000	16,000
	23,000	60,000
Grand total ..	133,000	400,000

Table C: Estimated Building Block Requirements for Plastics Industry

(All in thousand tonnes/year)

	Total		From petroleum source	
	1965-66	1970-71	1965-66	1970-71
Ethylene	45.0	138.0	24.0	117.0
Propylene	4.5	22.0	4.5	22.0
Benzene	18.5	46.0	11.0	30.0
Phenol	2.5	6.0	2.5	6.0
Phthalic anhydride	9.0	21.0	4.0	10.0
Formaldehyde ..	3.0	7.0	3.0	7.0
Urea	3.0	7.0	3.0	7.0

Judging from the slow rate of construction of new plants and particularly because of the national emergency, it is more or less certain that plastic production targets shown in Table B will not be attained to the fullest extent. Nevertheless, petrochemical raw materials alone will permit its development.

Rubber

Until 1930, practically all the raw rubber produced in India was exported. But, with the implementation of India's five-year development plans, the consumption of rubber has completely outstripped domestic production. As a result, year by year larger quantities of raw rubber are being imported.

From the point of view of savings in foreign exchange, the gap between demand and supply must be filled by maximising the proportion of synthetic rubber to the fullest extent. Until 1955, the consumption of synthetic rubber by the Indian rubber industry was very insignificant. Since then, however, it has shown a continuous increase as shown in Table D.

Table D: Synthetic Rubber Consumption

(All in tonnes/year)

	Total rubber consumption	Synthetic rubber consumption	Synthetic rubber as % of total
1952 ..	23,167	18	0.08
1955 ..	30,151	106	0.35
1958 ..	42,059	3,252	7.73
1960 ..	57,800	6,900	11.94
1961 ..	64,000	9,600	15.00
1965-66* ..	138,000	73,000	52.80
1970-71* ..	300,000	180,000	60.00

* Estimated.

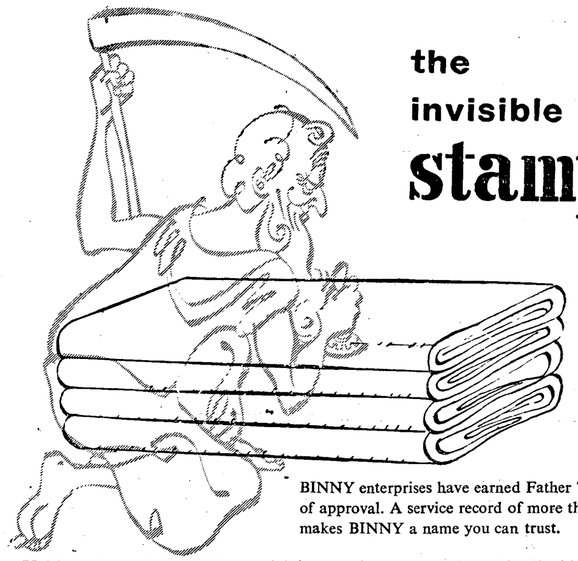
The production of synthetic rubbers are not only necessary to fill up the gap between demand and supply of natural rubber but they have special properties, are often cheaper, and have a steadier price. Their demand will therefore continue to rise.

Synthetics and Chemicals Ltd. (Bareilly) have been licensed to manufacture 30,000 tons/year of SBR synthetic rubber. This plant will utilise alcohol and benzene as the basic raw materials. The rest of the rubber deficit will have to be met by synthetic rubbers based only on petrochemicals. The suitable types of synthetic rubbers for the country are SBR, Butyl, Polybutadiene and Polyisoprene. Table E below shows the raw material requirements for all these varieties of synthetic rubbers.

If all the 73,000 tons rubber deficit in 1966 is met by indigenous synthetic rubber production, the foreign exchange savings (at the approximate rate of Rs. 3,000 per ton) would amount to Rs. 219 million (Rs. 21.9 crores). Even after allowing for foreign exchange component of plant investment and repatriation of dividends and loan payments, India would save significant quantities of foreign exchange.

Synthetic Fibres

Even at the low *per capita* cloth consumption rate, India has to import cotton, wool and other yarns. To bridge the gap India must



the invisible stamp

BINNY enterprises have earned Father Time's stamp of approval. A service record of more than 160 years makes BINNY a name you can trust.

BINNY & CO. (MADRAS) LTD. control their two well-known subsidiary companies, The Buckingham & Carnatic Co. Ltd., Madras and The Bangalore Woollen, Cotton & Silk Mills Co. Ltd., Bangalore. The proved high quality of their fabrics has made them famous in India and over 50 other countries around the world.

BINNYS also offer a variety of handloom textiles in delightful designs and colours. The 'BINTEX' mark is a guarantee of quality handloom fabrics.

BINNY'S Engineering Works Limited specialise in the manufacture of complete factories and spares for the Sugar Industry. They also fabricate and erect structural steelwork of all types, produce ferrous and non-ferrous castings and light forgings for the Cycle and Motor Industries. An ocean-going-ship repair section functions in the Madras Harbour. B.E.W. with BINNY'S other engineering connections provide the sinews for Industry in South India.

BINNY & CO. (MADRAS) LTD. also provide shipping, stevedoring and insurance facilities. They are booking agents for many international shipping companies and airlines, including Indian Airlines Corporation.

REAR WINDOW...

If you take a rear window view of the House of Thapar, you will discover that our manifold business activities have grown in response to the requirements of our Country's developing economy. The pattern of demand is getting diversified, and we, in our humble capacity to meet the expanding demand in the country, have increased our activities. This is the secret of our growth, our expanding network of offices and factories. Today, we produce a variety of goods which the country needs—paper, sugar, textiles, radios, electricals, chemicals and industrial equipments, to name only a few, of our activities. In addition, we have a division devoted to imports and exports.

KARAM CHAND THAPAR & BROS. PRIVATE LTD.,
"THAPAR HOUSE", 25, BRABOURNE ROAD, CALCUTTA-1.

SKAI-KCT-8

duce regenerated (rayon) and other synthetic fibres. Consumption of man-made fibres increased from 57 to 140 million lbs. within ten years (1951-60). The third Plan has set the 1966 target for man-made fibre production at 215 million lbs., inclusive of 10 million lbs. of non-cellulosics.

The production of non-cellulosics like nylon, terylene, acrylics and polypropylene is increasing rapidly in U.S., U.K., Japan and other Western countries. India will also have to increase the production of synthetic fibres. It will have to be based on raw materials available from petrochemical industry.

Upto now, the Government of India has approved the following synthetic (non-cellulosic) fibre manufacturing capacities:

(a) *Nylon*: Five companies have been given licences for manufacture of total 14 million lbs. of nylon.

(b) *Terylene*: I.C.I. have been given a licence to produce 4.5 million lbs./year of terylene.

(c) *Acrylic*: Birla Bros. have been licensed for a 7.5 million lbs./year of acrylic fibre plant.

Two units have been approved to produce caprolactum used for nylon manufacture, with a combined annual capacity of 21 million lbs. This will need about 9,500 tons of phenol. Since coal carbonisation will yield only 2,000 tons of phenol, the balance will have to be synthesised from benzene available from petrochemical industry. This will need 8,500 tons of benzene and 4,700 tons of propylene if phenol is produced by cumene route.

I.C.I. expects to meet the raw material requirements for terylene plant by imports in the initial stages. This plant will require ethylene glycol (1,000 tons) and p-xylene (1,700 tons) as basic raw materials. National Organic Chemicals have been granted licence to produce 1,000 tons/year of ethylene glycol which will be produced from ethylene obtained from a naphtha steam cracker. There is no firm project yet for the production of p-xylene. However, production of p-xylene via petrochemical route is creating interest in the country.

The acrylic fibre plant of 7.5 million tons/year capacity licensed to Birla Bros. would use gas from the Assam Oilfields and produce via the acetylene route. However, the recently developed process is based on propylene available from a naphtha steam cracker.

Detergents

The synthetic detergent industry in the country is still in its infancy and presents very attractive possibilities for future growth. The present detergent production of 2,650 tons/year is much smaller than the third Plan target of 20,000 tons/year. Development of the synthetic detergent industry is essential to avoid imports of vegetable oils for the manufacture of soap. The latter cause an annual foreign exchange drain to the tune of Rs. 16 crores.

The most important raw material, Dodecyl Benzene (DDB), is at present entirely imported. Many schemes are afoot in the country for manufacture of Dodecyl Benzene. The production of basic raw materials for DDB manufacture, viz., propylene tretramer, is expected to be started soon after propylene from steam crackers, or refinery gases is made available to the potential manufacturers.

Dyestuff

Although the Indian dyestuff industry is of recent origin (1953), a firm footing has already been established. Annual production has increased sevenfold between 1953 and 1961, from 1.6 to 11.5 million lbs. However, about one-third of the market demand is still met by imports. The third Plan has set the target to make the country self-sufficient in most of the important dyes by 1966 with an annual production of 25 million lbs.

The major drawback of this industry has been the dependence on imported intermediate chemicals. The ultimate savings in foreign exchange by the dyestuff industry is at present to the extent of not more than 25 to 30 per cent. Plans are ahead to make the country self-sufficient in this respect also by 1966 in most of its requirements. The dyestuff industry requirements by 1966 of the basic aromatic raw materials, that is, benzene, toluene and naphthalene are expected to be 7,000, 2,800 and 6,000 tons per annum, respectively.

Table E: Estimated Building Block Requirements for Synthetic Rubber

(All in 1,000 tonnes/year)

	SBR		Polybutadiene		Polyisoprene		Butyl	
	1965-66	1970-71	1965-66	1970-71	1965-66	1970-71	1965-66	1970-71
Plant capacity	30	30	30	30	..	30	10	30
Ethylene ..	2.3	2.3	..	..	..	..	..	..
Propylene ..	..	..	..	..	..	69	..	..
Butadieno ..	22.4	22.4	31.2	83.2	..	..	..	..
Isobutylene ..	..	..	..	..	..	..	11.1	33.3
Isoprene ..	..	..	..	..	..	..	0.4	1.1
Benzene ..	6.2	6.2	..	..	..	..	..	..

NOTE:—*All raw material requirements, excepting those for SBR, have to be met by petrochemical source.*

The dyestuff industry is localised in Western India. There are no coal reserves in the western part of India, and the nearest coal carbonisation plant is at Bhilai, about 600 miles from Bombay. A petrochemical aromatic producing plant around Bombay/Gujarat, therefore, would be a good source for the supply of the abovementioned aromatics to the dyestuff industry.

Fertilisers

In order to meet the large increase in the demand for nitrogenous fertilisers and to achieve the targets of agricultural production, steps have been taken in the third Plan to increase the production of fertilisers. The demand for nitrogenous fertilisers by the end of the third Plan period is anticipated to be one million tons (of equivalent nitrogen). Against this demand, 1.3 million tons production capacity has already been licensed by the Government.

Hydrogen required for fertiliser production can be obtained from coal, electrolysis of water, lignite, coke oven gases or refinery naphtha/gases. Large quantities of coal are found in Bengal and Bihar and to some extent in Andhra Pradesh. Coal transportation from these places to any other part of India is a serious bottleneck today. Lignite is available only in Madras and Rajasthan States. Transport problems exist for this raw material also. Due to power shortage and high cost of electricity, new fertiliser plants cannot be based on electrolytic hydrogen.

As mentioned earlier, India will have surplus naphtha after meeting the local gasoline demands. It is claimed that the cost of producing fertiliser from naphtha is generally lower than from any other abovementioned sources. Table F below shows the naphtha requirements of different projected fertiliser plants in the country.

Under the present circumstances, it is unlikely that the targets set for nitrogenous fertilisers manufacture during the third Plan will be achieved fully. Several private sector fertiliser projects have been approved for construction during the third Plan, but the promoters are finding many difficulties in organising their projects with respect to foreign exchange, know-how and raw material resources. The projects licensed in the public sector during the third Plan would also have to face most of these difficulties and will take some time before they come into operation. It has been mentioned that actual nitrogenous fertiliser production capacity by the end of third Plan will be of the order of 700 to 800 thousand tons (nitrogen equivalent) as against the licensed capacity of 1.3 million tons.

Conclusion

The chemical industry has established an impressive record during the last twelve years of planned development. This record will improve substantially as the country progresses towards self-sufficiency. In the coming years, the organic chemical industry will steadily continue to assume greater importance. Due to limitation of other resources (e.g. molasses, coal tar) this industry will have to rely heavily on the petrochemical industry to provide the basic feedstocks.

Table F: Naphtha Requirements for Fertiliser Plants

	Tonnes/yr.
Fertiliser Corporation of India (Trombay)	45,000*
Fertiliser Corporation of India (Gorakhpur)	80,000
FACT (Alwaye)	62,000
Gujarat State Fertilisers (Ankleswar)	40,000*
East India Distilleries (Madras).	8,000
East India Distilleries (Vishakhapatnam)	80,000
Shaw Wallace (Mangalore) ..	100,000
Kothari and Sons (Tuticorin) ..	33,000

* 50 per cent. of the requirements to be met by refinery/natural gas.

Construction of new refineries and expansion of existing ones in the country will make surplus petroleum naphtha available for conversion into "building blocks." With the availability of this surplus raw material (naphtha), it should be possible to build large-size naphtha cracking units. Petrochemical industry, being capital-intensive and amenable to considerable increase in production capacity at marginal increase in cost, should provide "building blocks" at cheaper prices, and this, in turn, would contribute to lower cost of end-products.

NEEDS OF ENGINEERING INDUSTRY

Underutilisation of Capacity a Major Problem

By K. L. CHOWDHURY

PRESIDENT, ENGINEERING ASSOCIATION OF INDIA

THE engineering industry has made phenomenal progress during the past decade. During the first two Plans, the industry, which previously used to supply railway equipment and manufacture simple products, has diversified itself a good deal, and now produces industrial machinery and consumer products involving considerable skill and advanced production technology. Perhaps, the best indication of the enormous progress lies in the fact that some of our manufacturers are now in a position to provide new industrial projects with the technical know-how and collaboration which had formerly to be imported from abroad.

The industrial base, as a consequence, has widened. The following table will give an idea of the overall progress so far achieved:

TABLE No. I

Progress of Engineering Industry

Year	*Output (Rs. in crores)	Index of industrial production Base—1951		
		General and electrical engineering	Manufacture of machinery except electrical machinery	Electrical machinery apparatus and appliances
1956..	152	218	215	210
1957..	185	241	296	247
1958..	202	254	364	274
1959..	233	288	423	296
1960..	284	354	550	385
1961..	324	419	617	431

*If output of heavy engineering industry is also added, it will amount to Rs. 500 crores approximately for the year 1961.

Third Plan

In the third Five-year Plan, on the development of engineering and metallurgical industries, an investment of Rs. 1,274 crores is envisaged. Of this, Rs. 1,100 crores are going to be invested in iron and steel, heavy casting and forging, heavy electrical equipment and heavy machine building projects; Rs. 117 crores will be invested in transportation industries and Rs. 57 crores for the development of light electrical and mechanical engineering industries. The basic objective of the third Five-year Plan is to lay the foundation of further rapid industrialisation, because, without building machines, we cannot build a strong self-generating industrial economy. For this purpose, special emphasis has been laid on the development of the basic capital and producer goods industries. A few years ago, we hardly built some machines and machine tools. During 1960, Rs. 160 crores worth of machinery and equipment were produced and, by the end of 1965, we will be producing, if everything goes well, Rs. 500 crores worth of industrial machinery alone.

Industrial licences issued by the Government, under the Industries (Development and Regulation) Act, throw considerable light on the fast and accelerated growth of engineering industries. When the above Act came into force, 1,013 firms got themselves registered with the Development Wing, and, subsequently, upto December 1961, 2,894 licences were issued, out of which 1,025 were for new units, 711 for the manufacture of new articles and 689 were for substantial expansion of the existing units. The fact remains that, had the foreign exchange bottleneck not been there and had the industrial licensing machinery been a little bit more streamlined, the issuance of licences would have been still more.

While all this constitutes a record of achievement, it does not mean that all is well with the engineering industry. The second year of the third Plan is going to pass and the industry has got still a few formidable challenges to meet. This brings us to the problems of the engineering industry.

Rising Costs—A Serious Problem

The problem of increasing cost of production in the engineering industry is one which must be solved without any further loss of time. Successive increases in costs have been brought about as a result of increasing cost of pig iron and steel, shortage in the supply of fuel and power and rising wage spiral without adequate increase in productivity. Costs have been rising since 1956, as would be observed from the following figures:

TABLE No. II

Increase in Cost of Production

Year	Input (Rs. in crores)	Output (Rs. in crores)	Input as percentage of output
1956	86	134	61.6
1957	104	162	64.3
1958	112	174	63.7
1959	128	199	64.5
1960	159	239	66.0
1961	181	267	67.5

From these figures, it would be observed that there is a steady rise in the input factor without a corresponding increase in its ratio to output. As cost of production increases, the profitability of the industry declines and, even though the industry expands and develops, its competitive position gets adversely affected. The object of export promotion cannot be realised in the face of rising production cost. It is, therefore, essential that prices must be held in check and productivity of labour increased, in order to make the engineering industries compete in world markets.

Idle Capacity

There are several engineering industries where capacity is not fully utilised. Aluminimum wire rods, copper pipes, and tubes, copper sheets and circles, lead (virgin metal), lead pipes and tubes, expanded metal, motor cycles, trailers, etc., are some of the industries where capacity utilisation is very low. This has a number of serious consequences, but its contribution in enhancing the cost of production is quite appreciable.

In view of the above circumstance, it is imperative that the Government should stop further industrial licensing in such industries where there is large unutilised capacity. Even in such cases, where it is considered to be necessary to issue a licence for regional considerations, the existing units should at first be asked whether they are interested in shifting their plant to that region.

Shortage of Steel

The steel situation in the country is very disquieting. Production is falling behind schedule, the gap between supply and demand is widening and the prospects of attaining the third Plan targets appear bleak. According to the Planning Commission, production of finished steel in 1960-61 was to be 3.5 million tons, increasing to 4 million tons in 1962-63, 4.3 million tons in 1963-64, 5.5 million tons in 1964-65 and 6.8 million tons in 1965-66. However, in 1961-62, the production has averaged around 2.8 million tons only, the production of flat products being only ten per cent. Thus, it is clear that even the second Plan target has not yet been achieved. The shortfall of about 700,000 tons cannot easily be made up.

The demand for engineering industry alone has been estimated to be about 1.7 million tons in 1961-62 and 1.5 million tons in 1962-63. As against this, the supply of steel to the steel processing industries has been only 153,000 tons in 1960-61. For April-July in 1961-62, about 91,500 tons have been made available, as against the demand of about 300,000 tons for restricted categories. At present, only about 30 per cent of the requirements of the industry are being met.

Steel is likely to be in short supply for quite sometime. Therefore, both long-term and short-term measures are necessary to enable the industry to carry on the production. As far as long-term measures are concerned, the overall supply of steel needs to be augmented. Besides establishing the fourth steel plant at Bokaro, the existing steel plants can be further expanded depending upon the circumstances. As far as short-term measures are concerned, a procedure may be laid down by which the industry knows beforehand as to how much steel will be available to it for consumption during the next six months and of what specifications. It must be emphasised that the industry needs steel of very precise quality, specifications and sizes. This keeps its machining and fabrication costs low.

Shortage of Pig-Iron

Pig Iron, which was available in plenty in 1960 and a part of 1961, is now in short supply. The total demand for pig iron is about 1.2 million tons. But the availability is only about 600,000 tons. Of this, about 370,000 tons are going for the fabrication of sleepers, with the result that commercial foundries are not likely to get more than 25 to 30 per cent of their demand. Coupled with the shortfall in the overall supply position of pig iron, supply of graded pig iron is all the more acute. Government had expected that about 350,000 tons of pig iron from the fourth steel plant at Bokaro would be available in the third Plan period, but this source of supply is not in sight. The only course open appears to be to create conditions for the establishment of low-shaft blast furnaces in the private sector on an urgent basis. If this is not done, the commercial foundries would greatly suffer and even the Government projects cannot be put into operation.

Shortage of Coal and Coke

The coal and coke crisis, brought about by the inability of railways to move the entire offerings, is another inhibiting factor so far as engineering industry is concerned. In order to relieve pressure on rail transport in the north-eastern region, road permits are being issued. But there are serious lacunæ, as, for instance, the bottlenecks in inter-State road transport. Unless all these difficulties, in general, and the difficulties of lorry operators, in particular, are removed, the shortage is bound to be there.

Moreover, freight rates have been so developed that long-distance railway transport is partly subsidised by the shorter hauls in the north-east and industrial consumers in Bengal, Bihar region have to accept their coal and coke by road, with the resultant increased costs and inconveniences. It has also been reported that, as the long-distance carriage of low-quality coal with a high ash content is a waste of transport space, consumers situated nearer the coalfields are under constant pressure to accept lower grade coals, with a consequent reduction in their efficiency and operational costs.

Shortage of Power

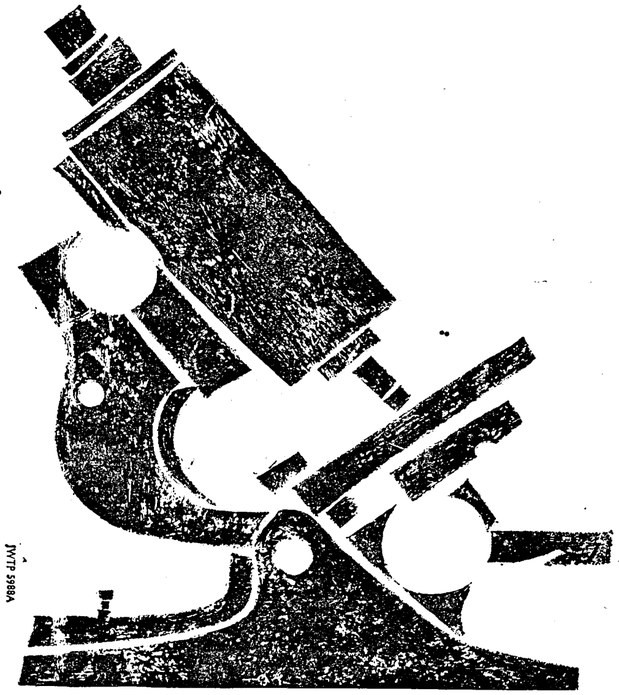
Breakdowns of power plants, causing load shedding in different States, have become nowadays a regular phenomenon throughout the country. In fact, within the first two years of the third Plan, we have started feeling the pinch of these breakdowns here and there, causing the industries to incur huge losses. These losses are not only in terms of profits of entrepreneurs, but also in terms of national wealth, since it tells upon the efforts for cost reduction, export promotion and the like—so vitally necessary for the growth of our economy—besides effecting the life of plant and equipment installed. Breakdowns, in all the above cases, nevertheless, indicate that margin of safety in the demand-supply equation has not been provided for in the major consuming areas. In order to avoid recurrence of any such deficiency in future, the power plan should be formulated on a realistic basis.

The Union Ministry for Irrigation and Power is reported to have set up, in consultation with the Planning Commission, a Planning Group for chalking out a long-term power development programme. The group, it is learnt, will prepare a programme for the fourth Plan with the ultimate target date going even beyond it. In other words, it will take into consideration the load demand beyond the fourth Plan period in estimating the load target for the fourth Plan. With bitter experience of power shortages, the reported venture of the Planning Group has to be welcomed.

But the implementation of the programme that will be chalked out by the Planning Group will require no less than three to four years and power shortage is, therefore, likely to persist for a few years more. Consequently, certain short-term remedies require to be adopted to meet this deficit at temporary measures.

In the first instance, the private entrepreneurs should be encouraged to go in for power generation whenever they are prepared to do so. Secondly, better returns should be provided for investment in electrical undertakings. Janab Hafiz Mohammed Ibrahim, Union Minister for Irrigation and Power, assured sometime back, in last December in Bombay, that slight increase might be permitted, but nothing further was heard from New Delhi. Thirdly, power may be diverted from wherever a temporary surplus may exist. Fourthly, power holidays may be introduced in different States and power that will thus be available from the holiday area may be utilised in some other deficit area. Fifthly, it should be ensured that supply of better grade coal to thermal units can be improved with supplies of better quality of coal.

In fact, power needs more dynamic and imaginative handling than has hitherto been done, in order to get rid of the crisis that is showing up every now and then in the industrial sector of our national economy, causing anarchy in our production process.



PHILIPS RESEARCH SPELLS TECHNICAL EXCELLENCE

A great deal of thought and research goes into the design of every Philips product used every minute of every day to satisfy countless human needs.

Yet research work, conducted in the Philips laboratories, is only *one* of the responsible factors. To complete the picture, add to it the invisible *plus* of international experience and know-how. You will not wonder Philips products are of the highest technical standard, the last word in reliability.

Pharmaceuticals' Growth Spectacular

Research Must Receive Greater Attention

By GAYLORD J. HOFTIEZER

FIFTEEN years is not a long time in the history of an industry—yet 15 years ago, the Indian pharmaceutical industry was almost completely dependent on foreign imports of raw materials, and the final products were largely manufactured abroad and imported in a fully finished form.

At that time, pharmaceutical production in India was valued at approximately Rs. 12 crores. Today, annual pharmaceutical production has jumped over the Rs. 90 crores figure. It is a story of success and phenomenal growth in the short history of India's industrial revolution. In just the past five years, the production of penicillin and sulpha-drugs has more than tripled. New drugs have been introduced recently for the treatment of tuberculosis and, among plant products, the production of some of the alkaloids such as reserpine, morphine, emetine, ephedrine, and atropine have been started. Pioneering efforts in synthetic drugs, as well as in antiprotic and antidysentery drugs, have also begun. The Government has made an impressive step forward in building their modern research centre at Lucknow, and private industry, too, has now entered the field of basic research with the new CIBA Centre for fundamental biological and chemical research at Goregaon, Bombay.

It sounds like an impressive story, and it is. Pharmaceuticals are one of India's major industries, with a capital investment of over Rs. 70 crores. There are more than 3,000 licensed manufacturers, both large and small, employing more than a lakh of persons.

Foreign Investment

There are two ways of dividing the pharmaceutical industry in India. There are the foreign firms (working independently or in collaboration with Indian firms), and the Indian manufacturers. Another way of categorising, although this is a rather dangerous thing to do when there is a great deal of overlapping, is between the private and Government-sponsored companies. Aid in the form of loans and technical assistance in the form of personnel or machinery have come from a broad variety of sources. The Indian Government itself has financed some projects within the pharmaceutical industry; the Soviet and American Governments, in addition to the United Nations, have also contributed in loans and technology.

These are rather general statements and one must examine the industry more carefully to find a truer picture. For example, Soviet assistance has been in the form of loans and technology only in the public sector. Although there has been some financing of several Indo-American companies from Public Law 480 funds under the Cooley Amendment, they have been small in comparison to the capital investment made by the private American firms. The same is true of the U.K. and Swiss companies. Although one is not aware of any noticeable political or psychological competition between the public and private sectors, it is interesting to see the two types of organisations, and the overlapping, of both private and Government-sponsored pharmaceutical development in India.

The same situation is somewhat true in other industries, but the very broad international character, and the wide range of capital investment sources, make the pharmaceutical industry unique as a study or pilot project in international industrial co-operation in the largest democratic nation in the world. Let us take a few case studies or examples to illustrate this bird's-eye view of the pharmaceutical industry.

Per Capita Expenditure

First of all, the market. In India, the average person spends about Rs. 2.50 annually for drugs as compared with $7.00 (Rs. 33) in the U.S., £1.5 (Rs. 20) in the U.K., and DM 30 (Rs. 34) in West Germany. Although *per capita* consumption of pharmaceuticals is still low in India as compared with other countries, it must be remembered that prices are somewhat lower here. It should also be pointed out that it is estimated that over 50 per cent of the consumption of drugs is by a metropolitan and above-average-income group. Many of the rural areas of India are still hard to reach conveniently in effectively dispersing medicines. Also the scarcity of doctors, clinics, and qualified chemists in the rural areas, in addition to the lower purchasing power of the villager or farmer, have left a sizable potential market untapped of the greater portion of India's 440 million people. In order to reach this market, the pharmaceutical industry must be able to obtain raw materials and intermediates at world market prices and should be able to resort to automation. The Western world is ahead of India in the latest and best drugs or medicines, and new discoveries or the introduction of better products offers a challenge to those pharmaceutical firms in India.

Hindustan Antibiotics, one of the examples of a growing Indian firm, financed by Government Funds, has made impressive gains in the manufacture of penicillin, producing over 40 million mega units annually. U.N.I.C.E.F. financed the purchase of some of the machinery for Hindustan Antibiotics and W.H.O. trained technicians. A streptomycin plant was finished in March of 1962, with an annual capacity of 40 to 45 tons, and yet this is still not nearly enough to meet the demand, for Hindustan Antibiotics is now doubling its size, making it one of the largest in the world. The new antibiotic plant of Alembic Chemicals also produces 20 million mega units of penicillin per annum.

In the Government's third Five-year Plan, the following production goals have been set for 1965-66:

		Units
Penicillin	m.m.u. ..	120
Streptomycin	tons	150
Tetracycline	,, ...	50
Chloramphenicol ..	,, ...	50
Sulpha drugs	,, ...	1,000

Four projects in the public sector for the manufacture of synthetic drugs, antibiotics, phytochemicals, and surgical instruments have been undertaken with Soviet assistance. For this purpose, a company called India Drugs and Pharmaceuticals has been formed, with an authorised capital of Rs. 40 crores. The Soviet Union has extended credit of 80 million roubles (Rs. 9.5 crores) to meet foreign exchange expenditure. The proposed units that are expected to go into production by 1964 include the antibiotic plant at Rishikesh, Uttar Pradesh; the synthetic drug plant at Sanatnagar, Andhra Pradesh, to produce sulpha drugs and vitamins; the phytochemical plant at Nerimangalam in Kerala, to produce 76 tons of active substances from plant products; and the surgical instrument factory near Madras.

As a contrast to the Soviet interests in the public sector, the many American companies representing private enterprise reveal an interesting example. The complexities of American investment are much greater and show a broader, and certainly more versatile scheme of investment and technical assistance than the Soviets.

Variety in Private Sector

Some examples of private sector investment reveal an interesting picture.

Merck, Sharp and Dohme of India, affiliates of the American Merck Sharp and Dohme International, furnished some technical assistance for the Indian streptomycin plant at Pimpri, and joint ventures of Merck are evidenced by the Merck-Sarabhai vitamin C plant at Baroda, and the financial collaboration with Tata Chemicals in other fields such as steroids, vitamins, and diuretics.

Other Indo-American projects are Lederle's antibiotic fermentation plant at Bulsar in conjunction with Atul; Pfizer's new manufacturing plant for an anti-tuberculosis drug; Johnson and Johnson's plant at Mulund in collaboration with K. M. Premchand; Squibb and Sarabhai forming Synbiotics Limited; Wyeth, American Home Products, and Geoffrey Manners are undertaking a sizable joint venture and plans are under way for the construction of a factory; and Parke Davis, too, are expanding in collaboration with Indian capital.

CIBA of India Limited, Roche Products Limited, Sandoz (India) Limited, and Suhrid Geigy Limited are four of the largest Swiss affiliates. Both Roche and Sandoz opened new factories in 1961. CIBA, the largest and oldest of the Swiss group, has a modern manufacturing plant that was built in the fifties in Bhandup. It is interesting to note that a sizable portion of CIBA stock is owned by Indian nationals and that the Geigy venture is also Indo-Swiss. BIBA has also recently formed a new company called CIBATUL for the manufacture of some intermediates with Atul Products Limited.

Hoechst Pharmaceuticals Limited is one of the largest Indo-German companies with a factory at Mulund.

One example of British private investment is Glaxo Laboratories Ltd., which had its origin in India as an infant food manufacturer and was one of the earliest companies to expand and build a pharmaceutical factory in 1947, just at the time of India's independence, and they twice again expanded in the fifties. They now market over one hundred ethical products in India. Other well-known British pharmaceutical firms here are May and Baker, British Drug Houses, and Boots Pure Drug Company.

Because the growth of the industry has been spectacular in speed and size, there are problems to overcome. For example, the drug industry is sometimes hampered by the slower pace of the chemical industry for the manufacture of organic intermediates. In order to try to overcome this problem, the Government will establish the Central Intermediate Plant near Bombay (where most of the drug companies are located) which will produce 5,000 tons of 30 or 40 intermediates annually.

Another problem is that exports have not risen considerably in the past five years remaining at about Rs. 1 crore annually. The high cost of raw materials, containers, cartons, and higher prices of intermediates are the major obstacles. While Indian (or those foreign affiliate) companies may economise on packaging—that is the quality and design of the particular carton, bottle, or tube—in order to reach the greater lower economic groups in India, but still maintain the actual product quality, they must also be adaptable to a higher standard of "appearance" or package design for competition outside India. If the label is poorly printed, or if a cardboard box and glass bottle must compete with sleek plastic containers, the consumer is going to be suspicious of the quality of the product. Better packaging design must come eventually, but, in the meantime, India is losing out on precious foreign exchange.

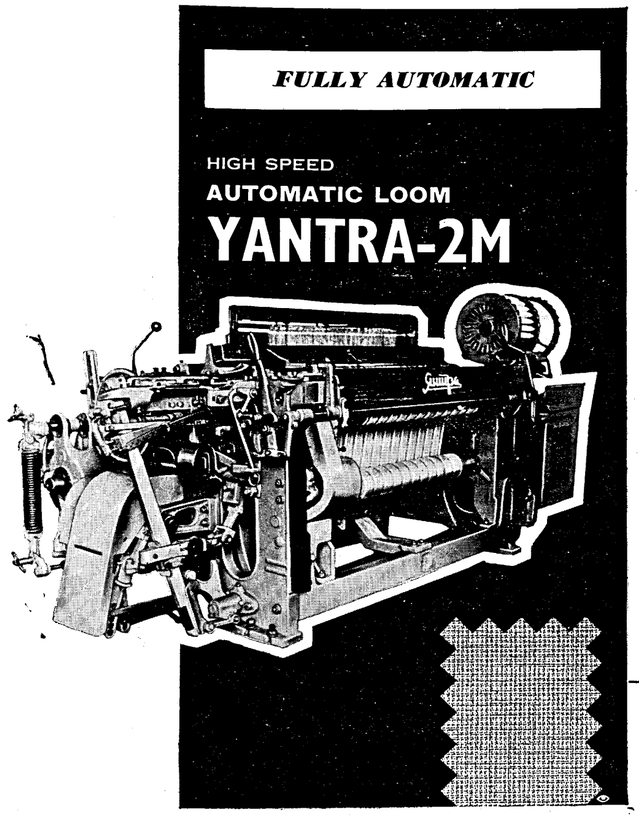
Because of the foreign exchange shortage, Government has issued an increasing number of import restrictions on many of the essential raw materials and chemicals that go into making drugs, thus forcing many of the manufacturers to adapt their needs to locally available raw materials, or to build their own chemical manufacturing plants. Nevertheless, in an industrially developing country such as India, every precaution has to be taken and encouragement given to local production and manufacturing in order to reach the goal of self-sufficiency.

Drug testing facilities have not always kept pace with the fast growth of the industry. There are eight thousand types of drugs manufactured in the country which should all be tested but could not be, due to inadequate facilities and untrained personnel. This is not a problem particular to India, however. A recent investigation in the United States revealed somewhat the same problem there. The larger companies in the industry in both the U.S. and India have, however, kept up the standard of their own testing.

Research Needs

Medicines peculiar to the needs of a tropical area, such as South Asia, were, and in some cases still are, scarce. Many firms do not have the resources to start research on a scale necessary to develop and discover new medicines for India. The Government, in its present Five-year Plan, has made a plea to private industry to begin basic research. It would also open the possibility of earning foreign exchange from new drugs discovered and manufactured here for export. Yet, the tremendous capital investment in setting up a modern basic research organisation, plus the many uncertainties of discovering that one drug which might pay-off, have so far discouraged most private companies.

The Central Drug Research Institute at Lucknow and the CIBA Research Centre at Goregaon, when it opens, will be the only two fundamental research organisations working full time in biological and chemical research in India. Now that the industrial revolution in India is in full swing, and striving to meet the colossal demands of 440 million people, the next step is basic research that will be the source of new discoveries to better fit the special pharmaceutical and medical needs of the Indian people, and research that will bring forth new products for export



- Streamlined & Sturdy-A crownless Model.
- Let off motion without Beam-Feeler.
- Positive shedding, Eccentrics' device works upto 8 shafts without counter shaft.
- Positive takeup motion-Doffing of the cloth possible without interruption in working of the loom.
- Highly efficient Brake ensures instantaneous stoppage-A MUST for High Speed looms.
- Performance par Excellence.
- Easy to operate.
- Moderately priced.
- Plus many more outstanding features.

PAINT INDUSTRY—ITS GROWTH AND FUTURE

Imports Of Better Types Of Raw Materials Needed

By F. H. KAPADIA

TECHNICAL MANAGER, BRITISH PAINTS (INDIA) LTD.

THE origin of paint industry is often ascribed to a minor accident that took place in Holland nearly three centuries ago. Before this period, all colours were mixed with water and various natural gums, but, on this one occasion, a servant bringing a painter his lunch while he was working in water colour, spilled salad oil on his master's palette. He thereby not only revolutionised the painting on canvas but laid the foundation of a great industry.

Paint making remained a secret of the artist painter for over two hundred years. The paints made in this period were devoted to the pursuit of beauty. Today, in many galleries around the world are left the superb creations of the artists of those days—the human form in glorious studies where the play of light and shadow has been so vividly captured that the figure seems alive—scenes of nature where the colours have been so perfectly recreated that they bring the sunshine and the snows into a dark room—a basket of fruit so real that one is compelled to try and touch them. These masterpieces are often marked by colours produced from exotic sources as a result of a technique that was long and laborious. The pictures themselves show how well these paints have stood the test of time and clearly prove that paint, carefully prepared and carefully applied, endures for long periods.

Protector of the Steel Age

The Industrial Revolution ushered in the steel age, and the tremendous developments in technology leading to the manufacture of steel in large quantities brought with it its own problems. With iron and steel came rust. The usage of iron and steel has increased greatly in the twentieth century and the damage by corrosion has kept pace, though, fortunately, at a lower rate. That steel rusts and reverts to the original condition of the oxide from which it was won, is a major handicap. This natural phenomenon is inherent in the nature of the metal itself and can be avoided only by totally changing it—as has been done in stainless alloy steels which are rust-free. But by far the greater amount of steel utilised is used as such and, while treatments such as metal plating and galvanising protected some of it, the most economical protection to tens of millions of tons of steel which are in use today is achieved through the use of a thin film of paint.

The Indian paint industry had its beginning at the turn of the current century in the city of Calcutta. A large company, with considerable shipping interests, started out to meet its own requirements. Almost sixty years have passed since then and today the country manufactures some 80,000 tons of paint and the development of the economy as planned will double this figure before 1970.

In the beginning the Indian paint industry was extremely small, consisting essentially of about a dozen units. The greater quantity of paints utilised in the country were imported and a substantial part of Indian manufacture was devoted to finishes in linseed oil. The Second World War provided a great stimulus, as the country was forced to utilise all its resources to meet the war effort and all units which were established during this period grew rapidly and acquired large shares of the local market. The great shortages of paint raw material continued for the period immediately after the war and, in the year 1948, India exported paints valued at sixty-two lakhs of rupees. In the next year, however, as production outside was stepped up and increasing normalcy prevailed, these exports fell sharply to thirty-three lakhs of rupees in 1949 and to only seventeen lakhs of rupees in 1950. In 1951, however, there was again considerable demand abroad and exports rose to the figure of sixty-eight lakhs of rupees, a figure which the industry is hard put to achieve today, in view of the extremely stiff competition from European, American, Japanese and Hong Kong manufacturers.

The past decade has been a period of real expansion. The number of units has grown, so that today there are some 53 units in the large-scale sector and between 200 and 300 small factories. The large-scale sector manufactures 80 per cent of the total production which is centred mainly in Bombay and Calcutta, Bombay producing slightly less. The growth of the engineering industry throughout the country has helped the establishment of several units in areas away from these two main centres and there are factories in Delhi, Kanpur, Hyderabad, Madras and small factories in almost every other manufacturing centre.

The third Plan envisages a very rapid expansion in the industry. This very rapid expansion will be due to the addition of 2½ million tons of steel, requiring 15,000 tons of paints per million tons steel, and 10 million tons of cement, requiring 3,000 tons of paint per million tons cement in the third Plan. The paint industry has had the support through sufficient imports to meet the expanding demands in the past and has grown from Rs. 8 crores in 1951 to over Rs. 20 crores in 1961. The present dearth of foreign exchange and the drastic reduction in imports of essential raw materials required by the paint industry so that it can continue to play its part, place both the industry and, it is submitted, the entire growing economy at an unnecessary and easily avoidable handicap. The imports required by the paint industry should be a first priority in any priority that is formulated.

A Thin Film of Paint

The need to give the imports required by the paint industry a first priority, in any priority that is formulated, can be very briefly justified. The expansion of the economy is going to utilise very large further amounts of steel and involves an extra investment in the new construction of major projects of about Rs. 1,000 crores. The value of paint required for protection against corrosion of this vast investment is about 2 per cent only of the total outlay—or Rs. 20 crores.

The value of the imported components required for the manufacture of protective paints will be between 10 and 12½ per cent or, approximately, Rs. 2½ crores, spread over the period during which the paints will be utilised on the various construction projects. To deny this essential import will increase the growing bill for corrosion losses in the country, the toll of which is already in the region of Rs. 50 crores on a conservative estimate

An Asset for Export Drive

Industrially, we are flourishing and our vastly improved engineering output is seeking new markets outside the country. Here they compete with similar items, electric fans, machine tools, sewing machine, bicycles, electric motors, diesel engines, pumps, etc., all protected by paints that modern paint technology has devised to meet the most drastic climates and working conditions. The superior finishing of competitors' products is a major sales handicap and the Indian paint industry should not have their imports restricted but expanded rather, so that the final finish of all our engineering products, worth perhaps less than 1 per cent of its sale value, is the same Silicone or Polyurethane or Epoxy or Acrylic that gives the superiority to the competitors.

That a thin film of paint, probably only five-thousandth of an inch thick, can make this difference is certainly true. Manufacturers of various equipment today are calling for more and more specialised paints to finish their products. Refrigerators and sewing machines cannot be painted with linseed oil paints or ships bottoms be protected with linseed oil. Linseed oil and our growing indigenous chemicals industry will play an important part in providing raw material for paints. But, until new industries develop which can offer the epoxies, the silicones, the polyurethanes, the acrylics and the vinyls and the newer water thinned phenolics, etc., which the paint industry needs to meet the demands of our growing industrial output and for the protection against corrosion of our entire industrial base, these materials should be imported in the quantities required and there should not only be any curb on the foreign exchange for the importa-

STATISTICAL PICTURE OF PAINT INDUSTRY

Programme of Development in the Third Plan

In assessing the requirements of paints and varnishes in 1960-61 at the time of the formulation of the second Five-year Plan, the production in the small-scale sector was not taken into account. The Small-scale Industries Organisation of the Ministry of Commerce and Industry carried out a survey of the paint, varnish and lacquer industry in 1957. According to this, the production in the small-scale sector was estimated at about 15,000 tons in 1957. Assuming that this rose to about 18,000 tons in 1960 in line with the trend in the organised sector, the consumption of paints and varnishes including nitrocellulose lacquers in 1960 may be estimated at about 70,000 tons.

The Paint Panel of the Development Council for Oils, Soaps and Paints has estimated the requirements of surface coating materials in 1966 at 160,000 tons. The paint consuming industries have large expansion programmes in the third Plan. In almost all cases the targets fixed for 1965-66 are more than double the achievements in the second Plan. The construction activities are also envisaged to increase considerably during the third Plan period. In view of these developments, a doubling of the consumption of surface coating materials during the Five-year period 1961-66 is not considered to be excessive. Thus, the requirements of surface coating materials in 1965-66 have been roughly estimated at 140,000 tons.

In order to obtain a production of the order of 140,000 tons in 1965-66, a capacity target of 160,000 tons is considered adequate.

It is roughly estimated that a capital investment of Rs. 2.0 crores will be required during the third Plan period for achieving the capacity target of 160,000 tons. Its foreign exchange component is estimated at Rs. 20 lakhs.

The additional employment expected from the development of the paints and varnishes industry in the third Plan is estimated at 5,000.

The following table summarises the development programme for the paints and varnishes industry in the third Five-year Plan:

	1960-61	1965-66
Capacity ('000 tons) ..	88*	160
Production ('000 tons).	52.5*	140

*Figures relate to the organised sector only.

Table 1: Capacity of Paint Industry

The State-wise distribution of the paint industry's capacity as reassessed by the Development Wing of the Ministry of Commerce and Industry is as follows:

	Number of factories	Annual capacity (Tons)
Maharashtra	23	34,000
West Bengal	19	39,500
Uttar Pradesh	5	8,100
Madras	3	2,000
Delhi	2	1,000
Andhra Pradesh	1	300
Total ..	53	84,900

Table 2: Capacity of Pigments

The position in regard to capacity of major pigments in 1956 and April 1961 is indicated below:

	1956 (Tons)	1961 (Tons)
Zinc oxide	12,360	18,000
White lead	3,720	3,720
Red lead	5,100	9,780
Titanium dioxide ..	1,800	3,600
Aluminium paste and powder	500	500

Table 3: Production of Paints

	Paints, varnishes and enamels ('000 tons)	Nitrocellulose lacquers (Lakh'gallons)
1955	39	3.0
1956	42	2.4
1957	42	2.7
1958	48	2.7
1959	54	3.0
1960	51	3.5

Table 4: Production of Paint Pigments

	Zinc oxide	White lead	Red lead	Titanium dioxide	Aluminium paste and powder
1955 ..	6,370	730	3,950	1,810	260
1956 ..	5,110	637	3,620	1,700	328
1957 ..	5,450	1,020	4,120	1,670	452
1958 ..	8,825	1,100	4,940	1,715	333
1959 ..	7,045	1,010	4,200	1,840	421
1960 ..	8,550	866	3,420	2,680	425

Table 5: Imports and Exports

The following table shows the position of total imports and exports of pigments, paints, varnishes and related materials for the four years ended 1960:

(Rs. lakhs)	Imports	Exports
1957	175.1	11.9
1958	106.4	11.3
1959	111.3	25.1
1960	164.7	27.5

Note: *All the aforesaid data and the programme of development in the third Plan are taken from the Planning Commission's publication entitled* "Programmes of Industrial Development."—ED.

INDUSTRIAL FINANCE CORPORATION OF INDIA

(INCORPORATED UNDER THE INDUSTRIAL FINANCE CORPORATION ACT, 1948 (XV OF 1948))

HEAD OFFICE : **Reserve Bank Building, Parliament Street, NEW DELHI**

BRANCH OFFICES: **Liberty Building, 8, Marine Lines, BOMBAY · P-11, Mission Row Extension, CALCUTTA · 38, Whites Road, Royapettah, MADRAS**

AUTHORISED CAPITAL - - - - - - - - - - Rs. 10,00,00,000
ISSUED AND PAID-UP CAPITAL - - - - - - - Rs. 7,00,00,000
TOTAL LOANS OUTSTANDING (as on 30th June 1962) - Rs. 49,61,58,295

AUTHORISED BUSINESS

(a) (i) Granting of medium and long-term loans and advances in Rupees to or subscribing to the debentures of public limited companies or registered co-operative societies engaged in or proposing to engage in the manufacture, preservation or processing of goods, or the generation or distribution of electricity or any other form of power, or mining, or shipping or hotel industry with an option to convert at its discretion the loans and/or debentures into stock or shares.

(ii) Granting of loans in foreign currency under arrangement with the Development Loan Fund of the U.S.A. to industrial concerns.

(b) Guaranteeing of loans raised by industrial concerns (i) which are floated in the public market and are repayable within a period not exceeding twenty five-years and (ii) from scheduled banks or state co-operative banks.

(c) Guaranteeing loans raised from or credit arrangements made with any bank or financial institution in any country outside India by industrial concerns in foreign currency.

(d) Underwriting the issue of stock, shares, bonds or debentures by industrial concerns

(e) Subscribing to the stock or shares of industrial concerns.

(f) Guaranteeing of deferred payments in respect of import of capital goods from abroad or their purchase in India by industrial concerns.

PURPOSES FOR WHICH LOANS ARE SANCTIONED

Purchase of new or second-hand machinery, renovation or modernisation or replacement of worn-out or obsolete machinery, purchase of land for factory site and construction of factory buildings.

IMPORTANT TERMS AND CONDITIONS OF LOANS

(i) **SECURITY** - First charge of all the fixed assets such as land, buildings, plant and machinery and fixtures. Raw materials, stock-in-process and finishied goods will not be mortgaged and will, therefore, be available for raising working capital from elsewhere.

(ii) **MARGIN** - Generally 50 per cent of the value of total assets including those to be acquired with the loan. This margin may be reduced to 40 per cent in case of industrial concerns importing plant and machinery under the U.S. Export-Import Bank Loans or other foreign currency loans (tied credits) taken by Government from foreign governments or financial institutions abroad where the cost of imported plant and machinery is 60 per cent or above of the total capital cost of the project. The margin may be further reduced to 35 per cent in special cases.

(iii) **INTEREST** - The current rate of interest for rupee loans is 7½ per cent per annum subject to a rebate of ½ per cent for punctual repayment of instalments of principal and payment of interest. D.L.F. loans carry interest at 8½ per cent p.a. less a rebate of ½ per cent p.a. for prompt payment (net 7½ per cent) plus an extra ¼ per cent p.a. to provide for incidental expenditure.

(iv) **REPAYMENT** - Rupee loans are repayable within a period not exceeding 25 years to suit borrower's convenience. D.L.F. Loans are repayable within a period not less than 5 years and not more than 15 years from the date of the disbursement of the final instalment of the loan. Repayments shall not, however, commence earlier than one year from the date of the final disbursement of the loan.

tion of these items, but whatever top priority there is should be given to it. If this is done, we will find that we have certainly protected the very much greater foreign exchange allotment for the expansion of the economy.

The Indian Paint Association was formed on 1st July 1960, incorporating the two separate bodies, the Indian Paint Manufacturers Association and the Paint Federation to which belonged the various units in the large-scale sector. The formation of a single association for the industry has been a widely-hailed move, as the industry now has a powerful voice in its representations to Government and can speak with greater authority in the formation of policy. The I.P.A. has regional committees in the Eastern, Western, Northern and Southern regions and a governing body composed on an all-India basis with meetings monthly to review the many pressing problems with which the industry is now beset. These problems relate mainly to the availability of essential raw material supplies for existing manufacturing equipment and new manufacturing equipment being developed abroad.

There has been a minor revolution in the manufacturing methods and, particularly where an accent is being placed on the importance of exports, it is essential that the most economic means of production should be available if our products are to be competitive. In the case of raw materials, it has already been mentioned that many items need to be imported and, although many of the 400 or so raw materials which are required are available in the country and many that were hitherto being imported are progressively manufactured, there is also the difficulty of the price of indigenous manufacture, as, in some cases, the prices are almost double that of the imported equivalent. The reason advanced by the manufacturers of such raw materials is that their cost of production is very high, either due to their having to manufacture in a small plant of uneconomic size, or to having large plants with large fixed overheads which are working at about a quarter of their total production capacity. In any case, these high costs naturally tell on the final cost of the finished product and makes the Indian products less competitive when exported abroad.

The Government is appreciative of the difficulties Indian paint manufacturers face in establishing themselves in new markets where foreign brands are widely accepted. Schemes involving export incentives such as drawback of duty, issue of import licences against exports, replenishment of steel used in containers exported, etc., are all of assistance. These schemes, however, fail to consider the essential item of both high cost of raw material and high cost of manufacture. To this has also to be added the high rates for shipping Indian products abroad—all adding up to a situation where the Indian product cannot be offered at an adequate price which would materially assist in its establishment in the export trade.

Changing Consumer Demand

Only ten years ago, it was the widely established practice throughout the country to use zinc paste let down with linseed oil as a general purpose paint for almost all applications. Tinters were added to this mixture to give required shades and there was a very substantial sale of refined linseed oil as such. Today, the pattern has changed entirely and numerous homes throughout the country have in the least one room done with plastic emulsion paints and the other rooms finished with flat oil paints and distempers in a large range of pastel shades which are soft and very pleasing to the eye. This use of colour has also extended itself into large-scale industrial plants. Large industrial plants in the steel industry, textiles, heavy engineering, etc., have found that, when the time comes for a repainting of their factories, it does not cost more to do it in a suitable blend of several colours.

Colour in Our Lives

Colour can be actual or apparent and, if the greatest advantage is to be obtained, it will have to be applied with careful thought to the prevailing light. For example, to obtain an impression of cream in a room facing west, the window wall should be painted white, the opposite wall pale yellow with a suggestion of pink on the ceiling. This, it may be argued, is going to extreme lengths, but it serves to illustrate how important it is to defer final decisions on colour selection, until expert advice, which can only be given after on-the-spot inspection, confirms that the finished effect will be as desired.

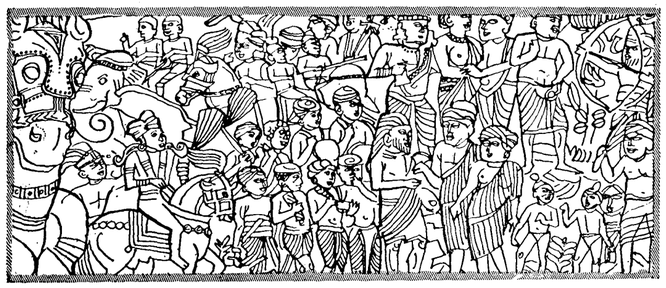
The proper application of colour in workshops, factories, offices, etc. can make a great contribution towards industrial welfare and efficiency. The aim of this is not the embellishment of plant or equipment, or good housekeeping, but to get the most out of both natural and artificial light to make seeing easier. This reduces or even eliminates eye fatigue, which is the main factor adversely affecting health, morale and productive efficiency.

Special Paints

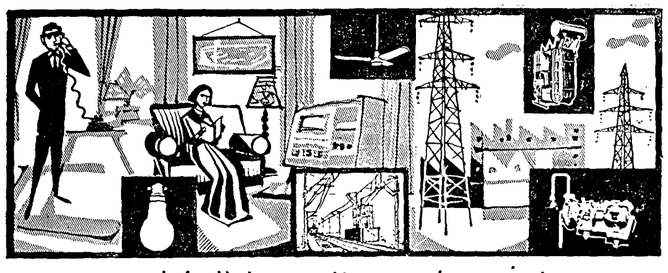
The demand for special paints continues to increase and the last five years have seen the manufacture in India of items which were previously not considered necessary. Particular products such as coatings for underground pipelines, for penstocks, for water-supply mains, for sewage disposal plants are available, instead of the conventional bituminous finishes considered suitable before. The use of specialised finishes has also led to the development of special skills in their application and to the realisation that good paint must be properly utilised. Several manufacturers offer technical service which involves supervision of paint application by trained staff and advisory services on proper selection of product for particular requirements. Large paint users also employ these services in the setting up of their finishing plants and for speedy investigation of complaints during manufacture.

The products of the paint industry today are a fusion of beauty and utility and the steel tray of black plate is rarely seen any more—instead we have an item decorated in patterns or designs in a few or several colours. The many cars on the roads and the trucks that are rapidly increasing in number, are not "in any colour as long as it is black," of the days of Henry Ford, but, in cream and blue, and grey and crimson and white and, yes, in black also. Special finishes for wood bring out and protect the beauty of the grain. Plaster on walls glows in many soft and soothing or bright and cheerful colours.

The history of paints and their impact on daily life cannot be written yet because we are just beginning to realise that paints have more than just an impact. The Indian paint industry has progressed rapidly and given the necessary assistance, has the ability to meet the growing needs in the country and its people. The recognition of this fact will go a long way towards enabling the industry to be of service to the country and to everyone in it.



As times change



people's living patterns change, too

IF A CITIZEN from ancient India were to revisit our country, he would see many things that were familiar to him — Sadhus and bullock-carts, potters and wooden ploughs. He would also see many things he could never have dreamt about — products and services made possible by the Power of Electricity.

In India today, electric power has an important role in improving the living standards of the people. Cromptons, whose business is putting power and lighting to work, are happy and proud that they are helping the nation in this great task.

from skilled workmanship and great accuracy...a wide range of

Quality Wire Ropes

Usha Martin Black manufactures what hitherto had to be imported and saves the country vital foreign exchange.

The manufacture of efficient, durable wire rope demands skilled workmanship and a high degree of accuracy. The Usha Martin Black plant is equipped with some of the world's most modern wire drawing, rope making, rope testing machinery. Usha Martin Black wire ropes may be used in different climates, under varying conditions below the earth, on the surface, afloat or in mid-air! The right wire rope for a given job eliminates wastage.

The principal construction ranges are 6x7, 6x19 and 6x37 Group wire ropes—made according to British Standard Specifications and Indian Standard Specifications.

HIGH LEVEL OF PRODUCTION IN JUTE INDUSTRY

Progress in Modernisation Substantial—Manufacture Diversified

By M. C. MUKHERJI

THE year 1962 will go down in the annals of the Indian jute mills industry as one of the most remarkable on account of the marvellous revolution wrought in its fortunes in record time following a year in which its very existence was threatened.

There has been no instance in recent memories when the mills could work with none of their machinery idle. Surplus capacity has ever been a drag the industry has learnt to live with.

Since the middle of January 1962, however, the instrument of output regulation, the Indian Jute Mills Association's Working Time Agreement, has been in complete disuse. Mills have gone full steam with the shuttles of all their looms flying, a development which could not be even vaguely guessed till about July last year. By then, the mills had gone through two weeks of block closure, over and above sealing 19 per cent of the installed loomage and reducing the work-week to 42½ hours from the normal 48.

In having to run all the looms, the industry has come up against a new set of problems—the shortage of spinning capacity, scarcity of skilled workers and limited supply of coal and electricity.

All-India Problem

The last is an all-India problem. However, the jute industry, because of its strategic importance to the national economy, has been singled out by the Union and the West Bengal Government for special treatment in this respect and the mills have, with but brief unavoidable breaks, received nearly the full quota of their motive power from the Calcutta Electric Supply Corporation. The coal supply also has, of late, largely improved.

For an industry conditioned for decades to living with an annoying surplus of labour, the exigency of having to augment its work-force is a novel turn in the situation, pleasing to the country's planners as well as to the large army of the unemployed. Since November last year, some 30,000 more workers have found employment in the mills. To supply yarns to the looms brought off the seal, the entire spinning capacity has been at work for 23½ hours daily for six days in the week and for part of the time also on the weekly closed day.

The outcome of this maximum possible utilisation of the productive apparatus is a record output bettered only in 1942 when the jute industry had been geared to India's war efforts. Between January and September this year, the jute mills reporting to the I.J.M.A. produced 890,300 tonnes of goods. The monthly average of almost 99,000 tonnes was 6,000 tonnes more than the comparable figure for 1956, the industry's previous best year since the cessation of World War II. The nine-month aggregate could have been slightly higher still to approximate the 1942 level if the supply of power to the mills had not been interrupted in June and July last.

Operation at full capacity has brought a sharp rise in the equivalent raw jute consumption by the mills, which, for the nine months ended September 1962, totalled 5.04 million bales, averaging about 560,000 bales a month. The higher consumption has enabled mills to go all out to support the raw jute market. Mills' end-month fibre stocks together with the undelivered balances have seldom gone below 2.5 million bales.

More than anything else, intensive mill working has led to spectacular improvement in the financial position of the jute industry. The staggering loss of Rs. 60 million suffered in the six months ended September last year has been completely wiped out between November 1961 and September 1962 and when the balance-sheets for the current trading year are announced it is expected that most mill-groups will show bumper profits.

Return to profitable trading has been hastened by a combination of three very favourable factors—reasonably low prices for raw jute due to abundant supply of the fibre, relatively high prices for the finished goods caused by a strong world demand, and a considerable reduction in the mills' manufacturing costs resulting from increased productivity in the wake of a high degree of mechanisation of the production processes.

Singly the most important factor in transforming the outlook for the jute industry was the 1961-62 jute and mesta crop, an all-time record, estimated at about 8 million bales, which, together with the supply carried over from the 1960-61 season as well as the quantity imported from Pakistan and Thailand, took the total availability of raw material for the past season to 9.26 million bales against only 7.26 million bales in the season before. At one stroke, the main impediment to normal mill working (represented by the crippling shortage of raw jute in 1960-61) was removed.

The assurance of another bumper crop of nearly 7 million bales from the 1962 sowings, together with over 2 million bales of jute and mesta carried over from the 1961 crop, guarantees the continuance of the present maximum level of activity in the industry till about the middle of 1963.

The very size of the supply rules out the possibility of any runaway movement in raw jute prices affecting the offtake and price level of jute goods.

World-wide Demand

Along with the vast improvement in the availability of raw jute, also contributing to the quick revival of the jute industry's fortunes was the release since November last year of a large demand for jute goods from all corners of the globe, pressing for immediate satisfaction.

Competitive bidding for all available goods resulting from this pent-up demand of the consuming centres overseas, which had been compelled by the high prices of the previous two years to reduce purchases to the minimum and cut down stocks to dangerously low levels, soon gave rise to a situation where even the industry's maximum output, particularly in hessian, was found manifestly short of offtake. It was no wonder, therefore, that prices in the finished goods market kept consistently to a much higher level than the ruling raw jute prices could justify.

The outgo of jute goods from the I.J.M.A. mills on account of both export and Indian domestic consumption in the nine months ended September this year aggregated 845,500 tonnes, less only 44,800 tonnes than the period's total production. The average of roughly 94,000 tonnes a month despatched from the mills is the highest for the last 19 years.

Modernisation

The industry has been able to effect considerable cost-savings following from its modernisation programme, only the first phase of which has gone through at a total cost of Rs. 320 million. The installation of high-speed semi-automatic machines has led to greatly increased productivity, particularly in the preparing and spinning sections where the renovation is practically complete.

Modern spindles already installed are sufficient to supply about 86 per cent and 87 per cent, respectively, of the fine and coarse yarns requirement of the industry's hessian and sacking looms.

The most revolutionary change to take place is the introduction of sliver spinning, a process which entirely replaces old-type rove spinning. By providing for a special device to control fibre during drafting on the spinning frame, sliver spinning enables a large use of the low quality jute, which predominates Indian production, in the spinning of yarns of great regularity and strength. The process employs a high-speed semi-automatic machine, having drafts of up to 20 and a spinning speed of over 4,000 r.p.m. Sliver spinning increases productivity, saves labour and leads to a substantial reduction of the mill cost on 'batch.' Given a price differential of Rs. 6 per maund between long jute (Assam bottom) and Pakistani cuttings, sliver spinning, as opposed to rove spinning, gives a monthly saving of Rs. 100 per loom—Rs. 65 on batching and Rs. 35 on labour costs. The lower the price of cuttings relative to that of long jute, the bigger the saving on batch.

Along with sliver spinning every mill has had to install a third drawing frame, another innovation which reduces the weight of sliver, making it suitable for spinning direct from the can.

A large number of mills have introduced the combined spreader and hackling machine, replacing the spiral fluted horizontal softener. The combined breaker-finisher card has substituted the old type separate single breaker and single finisher card. The first and the second drawing frames have been fitted with can turning and tramping motions as well as with electrical sliver stops. The saving on labour resulting from all these steps to modernise the preparing sections is considerable.

Work has commenced on modernising the post-spinning processes, too. Renovating the winding departments, where the machines and methods used have long become obsolete, has naturally been accorded priority. The new high-speed warp and weft winders, with their continuous feed arrangement (commencing at the sliver spinning frame and, in the case of warp yarn, carried right through to the pre-beaming stage), enable over 50 per cent higher output with less labour and at lower cost. Again, the high machine efficiency obtainable results in the production of precision yarns. Maintenance in the cop winding department, usually extremely high, has been reduced as the new machine incorporates ball-bearing and friction reducing rollers, which minimise the wear on moving parts and lead to lower consumption of power.

A modest beginning has been made with the installation of pre-beamers and new dressers. Feeding the present three-cylinder dressing machine requires six workers, whereas the new dresser needs only one, with three more tending the pre-beamer. Equipped with electrical stop motions, the pre-beamer prevents any thread-end slipping away to the weaver's beam unnoticed and eventually causing a loom stoppage. The new dresser's steam dry chamber also avoids any direct contact of the yarn with the hot metal parts, so as to leave the warp free from deflection by getting flattened up. Warp beams thus prepared are faultless, making it possible for the weaver to concentrate on weft shotting and thereby run two or more looms at a time with ease.

If the survey of the industry's performance in 1962 were to end on a note even vaguely suggesting that all is well with Jute India, it would be entirely erroneous and misleading.

Total production has, no doubt, been the highest since 1942 as have been total despatches of jute goods, but neither hessian nor sacking is responsible for the improvement in either case.

Making the major difference to the overall position is the contribution made by the production and export of jute goods other than hessian and sacking cloth and bags.

This quite significant change in the structure of demand and consequently in that of production may tend to mask the erosion, rather rapid in the case of sacking, that is going on in India's export markets for standard goods. The high world demand for hessian notwithstanding, the output of this fabric for the nine months ended September 1962 gave a lower average than that for any single year from 1936 to 1939. It does not mean that world demand for hessian has since contracted. If anything, there has been a small expansion; only, India's share of the market has decreased.

The loss to India is far more conspicuous in sacking. The output of heavy goods this year is substantially lower than the average of 1936-46, 1949, 1952 and 1955-58. Similarly, sacking despatches for export purposes have dropped to the lowest figure of any normal year with the exception of 1961. The loss on export account of sacking has been partly neutralised by a sharp rise in India's domestic consumption of this category of goods, which at 162,900 tonnes for January-September 1962 constituted the industry's biggest home sale so far.

Along with the high domestic demand for the heavy quality sacking goods (resulting from a large increase in India's industrial and agricultural production under the impetus of planned development), another factor to have maintained the equilibrium of the industry is the strong and ever-increasing foreign demand for non-standard jute products. The popularity of speciality goods overseas has led to a phenomenal rise in the production of the category of jute manufactures known in the trade and industry as "others." During the first nine months of 1962, the output of other manufactures amounted to 121,600 tonnes, an amount much bigger than the 12-month total of any previous year.

The change in the structure of overseas demand relative to sacking and non-standard goods has also changed the order of priorities in the industry's rationalisation and re-equipment programme and imparted a new urgency to the long-felt need for diversification.

Carpet Backing Cloth

The largest single component among the non-standard speciality products is the broadloom hessian for carpet backing. The biggest market for wide hessian is the U.S., where the annual demand is currently running in the neighbourhood of 200 million square yards. Both in volume and the relatively high profit margin yielded by the manufacture of wide hessian cloth, export sales of this one speciality product have tended largely to neutralise the loss to the industry caused by the shrinkage of the traditional sacking markets.

As on 1st September 1962, the industry had 1,100 broadlooms working with a monthly output of about 5,400 tonnes of wide hessian. This is barely sufficient to cope with the U.S. demand, as the tufted carpet, which uses the material as backing cloth, is passing through a phase of a unique popularity enjoyed by no other segment of the carpet trade.

About 29 mill companies have, therefore, obtained licences under the Industries' Regulation Act to set up 1,450 more broadlooms to bring the total to 2,550 in due course. How soon these can be installed will, however, depend on the availability of foreign exchange and on the capacity of the internal units manufacturing broadlooms to maintain their production schedule, currently running at 360 a year.

The installation of additional spinning capacity, in which the industry is a little over 5 per cent short, is being tied to the need for feeding the broadlooms with high quality yarn. Hessian looms are similarly having some priority in respect of the additional spinning frames required, but sacking is again posing the old problem of surplus.

India's export trade in sacking goods is faced virtually with the problem of survival. Sacking despatches for export this year have been running at an average of 25,000 tonnes a month, as against 35,000 to 40,000 tonnes between 1947 and 1957.

The debacle has been caused by the fast expanding Pakistan jute industry. It has already made serious inroads in the principal sacking markets—Australia, West Indies, Cuba, Peru, Burma and Africa. Over 75 per cent of the Australian market and 50 per cent of the Cuban market have been captured by it.

The Pakistan industry is cent per cent modern, working 2½ shifts daily. Productivity is high and increasing. It has other cost advantages to gain sufficient competitive edge over India such as lower wages, cheaper and more abundant raw material of far superior quality, and freedom from welfare and social service benefits. The decisive weapon in Pakistan's armoury, however, is the export bonus system, which alone gives sellers of heavy goods a cost advantage of Rs. 12 per 100 bags. Taking all factors into account, the cost difference in favour of Pakistan is placed around Rs. 400 per ton.

One of the main objectives of the Third Plan is to secure a marked advance towards self-sustaining growth. An important aspect of this problem is to increase the STEEL OUTPUT which will help to make the economy self-sustaining. And hence, under the Third Plan the Bhilai, Durgapur and Rourkella Steel Plants are proposed to be expanded, contributing jointly 5.5 million tons of steel ingots. The plan also provides for a fourth Steel Plant in the Public Sector to be started at Bokaro.

As in the previous plan, so in the next one, paper would prove to be an essential pre-requisite to the implementations of all schemes for expansion and starting of new steel plants.

STAR PAPER is ready to prove its worth in carrying out the responsibility of the country's economic development. It has recently added M.G. Kraft and Posters to its line of production.

GROWTH OF CERAMIC INDUSTRY

A Sprint Over The Past, Present And Future

By V. N. SARMA

ADMINISTRATIVE OFFICER, BOMBAY POTTERIES AND TILES LIMITED

THE name "ceramics" is derived from the Greek word 'Keramos' meaning "burnt stuff" but the Greek word itself stems from a Sanskrit root meaning "burnt clay" or "burnt mineral." To understand ceramics, one must have some fundamental knowledge of clay minerals and their behaviour when subjected to varying degrees of temperature. A mineral is usually a mixture of compounds formed by the processes of nature alone as distinct from artificial minerals which are formed in the laboratory or in the smelting furnaces. Mineral substances which are formed through the agency of organic life are *not* included among minerals, as the pearl of the oyster, for instance. Minerals are solid substances, the only exception being mercury and water. In most cases, minerals have definite atomic structure.

The chief raw material in the manufacture of 'pottery' is clay and clay is an aggregate of minerals, mostly complex aluminium silicates. Ceramics can be defined as a study of high temperature inorganic chemistry, chiefly related to silicate minerals. Products made from such silicate minerals alone are not always satisfactory and hence an addition of other constituents, such as non-silicate minerals, metallic oxides, and organic substances is necessary to produce a ceramic body of definite design, strength, special physical and electrical characteristics, and elegance in the finished products.

Research scientists in the ceramic field the world over have been and are still continuing their tireless quest with the aid of most up-to-date plant and equipments to establish formulæ and characteristic temperature curves relating to physical metamorphosis due to mineralogical reactions at various phases of firing and cooling the articles after vitrification. The science of ceramics is both fascinating and exacting as is evident from the innumerable applications of ceramics in use today in our daily life. It is extremely difficult to pin-point a particular period in which a scientific approach and application was made to the manufacture of a vast variety of ceramic products. From the time primitive man started life on this planet, he has fashioned out of clay, stone, wood, and metal, tools for his use and the discovery of "earthen fragments" by archæologists at various times in various parts of the world has proved that these places were his "home and habitat" and these fragments of tools have lent to the archæologists a basis for assessing the contemporary cultural advancement of the human race.

Origin

It will not be out of place to mint here a historical cameo of the origin of pottery, if only to give the reader a panoramic picture of the bewildering growth of the ceramic art and industry through the successive centuries. Five thousand years before Christ, the Egyptians made bricks of coarse earth dug out of the plastic deposits of the overflow of the river Nile and fired them when they found that this earth had the property of hardening under the influence of heat. According to Mariette Bey, vases of terra-cotta were found in the tombs of the deceased of the Memphite Period (5000-3000 B.C.). On the walls of the tombs of Beni-Hassan, a series of pictures portraying Egyptian potters modelling vases and firing them in ovens were discovered in the Thebian Period (3000-1700 B.C.). It was also at this time that the forerunner of the modern glaze was discovered from the first pieces of earthenware found in the Pyramid of Saggarah. Ceramic art developed considerably following this discovery, as is evident from the innumerable figures and figurines in blue and green as well as from the numerous decorations found in the temple of "Tell-et-Yadouni" built by Rameses III. The Chaldeans and Assyrians, after using crude bricks in their buildings for a long time, developed a new process for the manufacture of red bricks and erected the Palaces of Crossus at Sardis and of Attalus at Tralles in red fired bricks of very fine manufacture. The ruins of Nineveh and Babylon consist of accumulations of bricks low fired of a yellowish white, sometimes covered with blue, bluish grey, or yellow white glazes.

Tombs made of a body fired in a single piece or formed by two pieces cemented together bear out the dexterity and artistic skill already reached by the Chaldean and Assyrian potters at this remote period. But the most curious fired bodies that have come down to us are the unique clay plaques on which chronicles were written which, after having been fired, were preserved in the archives of the museum. The most ancient of such a plaque is the one that was discovered in Sargon and its age is put at 4000 years B.C.

Discovery in China

It is considered possible that Indians learnt the manufacture of fired bodies and glazed from the Assyrians. In the Vedas also, frequent mention of pottery is made. The Persians, successors of Assyrians, inherited their traditions and carried on the manufacture of earthenware to a very high degree of perfection, while the phœnicians and the Greeks settling in Asia Minor initiated themselves in the art of pottery and manufactured terracotta but neglected glazes. The Chinese discovered the alchemy of ceramics very early and developed the art rapidly and manufactured the first pieces of pottery during the reign of Emperor Hoang-Ti (2698-2599 B.C.). These were vases in excellent glaze and enamelledware. From an ancient period, the Chinese had used ceramicware in the construction and decoration of buildings in the form of bricks and enamelled tiles but their greatest discovery is impermeable pottery, stoneware and china, all of which are much more recent as the first mention of these was made in the work published by the Emperor Wan-Ti of the Han Dynasty (175-151 B.C.).

At the time of the discovery of America, the natives manufactured remarkable terra-cotta and archæological discoveries have confirmed that, in certain districts of Mexico and Central America, the origin of this manufacture has been dated as far back as 1000 years B.C. From such a glean into the womb of the distant past, it would appear that the manufacture of terra-cotta, the first halting place in the ceramic art, was invented by the Egyptians, the Chinese, and the Mexicans at the incipient stage of their respective civilisations, that is, at periods too remote for us to be able to assign a date.

Debut in India

We have thus seen that the origin of pottery lies in remote antiquity and we will now show how the art made its debut in India. Roman conquest destroyed the art of pottery in Egypt. The Persians maintained the tradition until they were conquered by the Arabs in the seventh century A.D. The contact of the Persians and Arabs with India around this period brought the art into India and it continues to be practised even today in some parts of this country on the same principles and methods as was practised by the Persians centuries ago. Tiles, vases and plates made in India were composed of soft bodies and fired at low temperatures. The glazes used were also soft and hence chip off after some time. But the shades of colours on these articles are extremely artistic and defy reproduction even with the aid of highly advanced scientific technique employed in the manufacture of pottery today. It is said that scientists have "killed" the shades by making the oxides purer.

It has been seen that the art of pottery has been in existence in India also from the very earliest times. The indigenous methods of manufacture have also progressively developed in each century. As the art developed, the technique also developed and the modern pottery that exists today has very little in common with ancient pottery. Modern equipments and methods as were used in the West were introduced in the potteries in India only at the beginning of the turn of the present century and this pioneering phase was initiated by His Highness the Maharaja of Cassam Bazaar who started the Bengal Potteries and His Highness the Maharaja Scindia of Gwalior who started the Gwalior Potteries. Later, several potteries introduced modern equipments at varying stages of the manufacture and thus this modernisation trend spread continuously and very rapidly during the post-World War II period so much so the country has now potteries all over India well equipped with latest modern machinery.

The ceramic industry is a basic and key industry in every nation, particularly for us in India. Ceramic products have replaced metal in several fields and have become indispensable to some vital industries, such as electrical industries, building industry (for red bricks; roofing tiles, flooring tiles, glazed tiles for bathrooms, sanitaryware, etc.); furnaces for biscuit manufacture; furnaces for brass and iron smelting; refractories; chemical industries; cotton and silk mills; (household requirements in the form of crockery and cooking utensils; radio industry and electronic industry, to mention only a few. New fields of industrial application of ceramic products are being explored in the world's laboratories.

Some of the well-equipped pottery works are located in and around the mines where the absolutely essential chief raw materials are available. The chief raw materials required for pottery industry are: china-clay, plastic clay, fire-clay, quartz, felspar, etc. The success of a pottery works depends on the availability of raw materials in quality and quantity. In this respect, the Indian manufacturers are suffering from a serious handicap, for at no time could a standard quality be obtained continuously. This is mainly due to the utter lack of testing facilities at the mine-head or at least within easy reach from it. The Geological Department of the Government of India has done yeoman service, in that a country-wide survey has been conducted in regard to the various mineral deposits, but not from the angle of the ceramic industry. As a result, the pottery industry is not assured of uniform supply of basic raw materials. It will be agreed on all hands that the ultimate quality of the finished products will mainly depend upon the quality of raw materials used.

The manufacture of high tension and low tension insulators is the most important phase of the ceramic industry in the country and, in the scheme of things, this industry will have to be developed on a major scale. Hitherto, huge quantities of H.T. insulators have been imported, particularly from Communist countries, on rupee payment basis. But it is necessary to cry halt to this import business. Many units have been licensed for the manufacture of 11 kV, 22 kV, 33 kV, 66 kV and 110 kV insulators in this country, but, barring one or two units, no progress has been possible due to various causes. The most important unit is the Government Factory located at Bangalore, where H.T. insulators are being manufactured under licence from the well-known Japanese firm, N.G.K.

The future of this industry in this country is distinctly bright now more than ever before. The post-World War II period has ushered in an era of unprecedented industrial revolution in India and we are in the midst of the crucial third Plan. But the Chinese have drawn us out of our peaceful avocations and locked us in a hot border conflict, thereby compelling us to take to arms. It is imperative, therefore, that every ounce of metal should be saved to forge weapons of defence by depending more and more on ceramic articles for our daily use.

Our country is very rich in talent and in all the essential raw materials which have only to be assessed and exploited on a commercial scale in accordance with the need of the ceramic industry. What we lack is 'organisation,' without which no industry will flourish, more so an industry like ceramics.

Progress Under the Two Plans

Items	Units	Capacity (March 1962)	Production			
			1961	1960	1956	1951
Glazed tiles	Dozens	1,323,600	1,030,800	828,000	454,800	310,800

H.T. insulators	,,	5,208	2,999	2,334	347	651
L.T. insulators	,,	8,947	4,698	3,916	2,232	778

Tiles and Sanitarywares

An outline of how glazed tiles and sanitarywares are manufactured in a modern factory is given below for the information of readers.

The raw materials as received at the factory usually contain a lot of impurities and dirt. These have to be removed before they can be used. The clay which is the most important of all ingredients is soaked in pits with water for 2-3 days and then thoroughly beaten up into a slurry form in a special apparatus called "blunger" and then stored in a tank. Similarly, the flint and felspar stones are ground with water into a slurry of fine mesh (not less than 150 mesh) in an apparatus called "ball mill" and, like the clay, is stored in a storage tank. These ingredients in slurry form are well seasoned for periods varying according to the materials and then these various individual slurries are mixed together in definite proportions in a mixing tank and the mixture is agitated thoroughly to make it a homogeneous one called "body." This "body" is then passed through a "filter press" where the water is removed under great pressure and comes out of it in the form of "cakes."

These cakes that come out of the filter press form the basic finished raw material for further processing into sanitaryware, tiles and electric porcelain insulators.

The dried cakes are crushed and pulverised into the required mesh for being pressed into tiles in the "tile press." These tiles are then dried and given a coating of a special composition known as "glaze." After this operation, the tiles are "fired" in a furnace at cone 3 (1160° C).

The cakes from the filter press are charged in a "blunger." The required amount of water and electrolyte (soda and sodium silicate) are added to the cakes and thoroughly mixed. The mixture thus prepared is known in ceramic parlance as "slip" and is ready for "casting" into plaster-of-paris moulds to take different shapes like pans, wash-basins, closets, etc. After the liquid "slip" has set and dried leather-hard, they are hand-finished, checked for cracks, glazed, dried, and fired in the furnace or kiln at cone 8 (1200° C) at which temperature the glaze matures and the articles, when they come out of the furnace, have a glossy surface that we all know and see every day in our daily use.

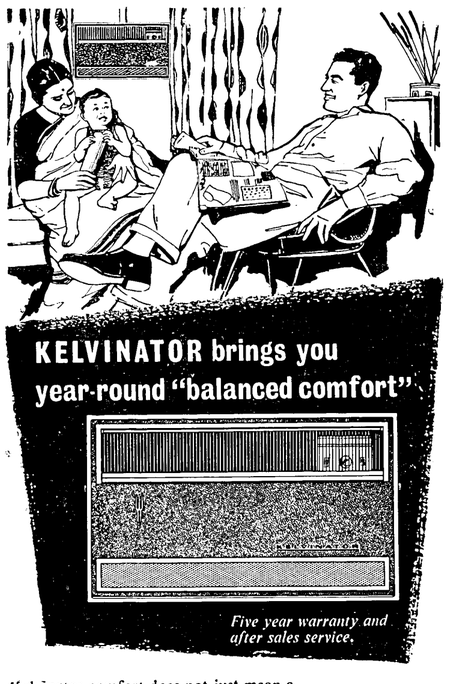
Strangely enough, the ceramic industry has not received from the planners the attention it deserves. The Geological Survey of India has set up a Ceramic Unit which receives technical advice from the Central Glass and Ceramic Research Institute.

Cost of Labour

Ceramic industry is one of those industries where the cost of labour is about three times the cost of raw materials. Yet the industry employs a large labour force. Transport of ceramic products is a very tricky problem. Products being bulky and fragile in nature, packing and transporting to the market in cities without breakages is a source of constant worry to the manufacturers.

There are over 100 potteries in this country and the accompanying table gives production statistics of various items from 1951 to March 1962.

The annual output of all ceramic products in India stands absolutely no comparison with the output in other countries, particularly Japan. Yet the Central Statistical Organisation has included the Indian production figures in their monthly statistics and assigned weights to the output of the industry in the compilation of the revised Index of Industrial Production. The weights have been assigned to different industrial products in proportion to the value added by manufacture. The weights for the entire "ceramic" range is 0.62. Excluding refractories, other items have assigned 0.35 which is a measure of their contribution to the overall industrial output of the country. The weight for sanitaryware is 0.01, stoneware 0.10, glazed tiles 0.02, whiteware 0.20 and insulators 0.02.



Kelvinator comfort does not just mean a way to keep cool when the weather is hot. It's a great deal more — a twelve month comfort that brings you

- **Extra cooling • Even comfortable circulation**
- **Freedom from humidity, dust, dirt, insects, driving rains and outside noises.**

Available in two models 1 H. P. and 1.5 H. P.

Development of Corrosion-resistant Alloys

Significant Research Achievements

By Dr. B. R. NIJHAWAN, Ph.D., F.I.M., F.N.I.

DIRECTOR, NATIONAL METALLURGICAL LABORATORY, JAMSHEDPUR

CHOICE of materials of construction for industrial applications is governed by several important factors, one of the most important being the ability of the materials to operate over requisite service life under specific corrosion environments and service conditions. With the growth of chemical, pharmaceutical, oil and fertiliser industries in India, the subject of making chemically corrosion-resistant materials for multitudinous applications is of paramount importance. Some views on typically corrosion-resistant alloys based on indigenous resources suitable for fast-expanding Indian industries have been expressed herein with the objective of focussing attention on some of the current development themes on the subject and highlighting projected fields in which such research and development work could be effectively channelised.

All materials of construction have to conform to certain well-established specifications both in terms of short-term acceptability tests and long-term rigid service criteria. In addition to the physical and mechanical test criteria, corrosion resistance to specific media under rigid service conditions over prolonged periods of exposure finally determines the acceptability and choice of materials. Materials of construction should additionally possess ease of fabrication and shaping to requisite shapes and sizes. The field of such corrosion-resistant alloys is vast indeed—comprehensive treatise and monographs have been published on the subject. It will be necessary only to indicate some current themes in the development of corrosion-resistant alloys for service under highly corrosive conditions in power, petroleum and chemical industries in the background of indigenous resources of minerals and metals.

High-tensile Low-alloy Steels

The high-strength low-alloy steels are tonnage grades of steel possessing superior properties by the additions of small amounts of various elements. The strength of these steels as measured by the yield point is about 50% higher than that of structural carbon steels. The resistance to atmospheric corrosion of some of these steels is four to six times that of carbon steel.

These low-alloy high-tensile steels comprise a specific group with chemical compositions specially adjusted to impart improved mechanical properties and greater resistance to atmospheric corrosion than are obtained from conventional carbon structural steels.

Among several types developed, two have generally established themselves; one in which, besides copper additions, a medium manganese content is coupled with a moderate chromium addition; and the other with higher manganese contents, without chromium additions. The manganese steels are considered to be better weldable. Attempts have been made to develop good welding steels to have still higher strengths of 38 tons per sq. in., by a slight increase in silicon and manganese contents together with additions of titanium or vanadium.* This development has not yet borne fruit and could be further explored along with the effect of copper additions in India.

In comparison with the good welding straight manganese steels, the manganese-copper steels offer for light-weight welded constructions the advantages of an improved corrosion resistance and weldability and, therefore, present a better solution for the light-weight coach construction. The structural steels produced at present (Tiscor and Tiscrom) by Tata Iron and Steel Company, Ltd., have a medium chromium and manganese content; the former has high yield ratio resulting from high phosphorus additions.

Broad-based investigations taken up at the National Metallurgical Laboratory have been aimed at developing low-alloy high-tensile steel utilising indigenous alloying elements possessing good weldability and corrosion resistance besides high strength-to-weight ratio. Investigations have related to steels containing varying percentage of Mn, Cr, Cu and, in a few cases, P, as well. Small percentages of V and Ti were further added to those basic heats to study their effects from the point of view of hardening the ferrite and producing smaller grain size, both of which are known to be conducive to higher strength. In a few cases, addition of Al and Zr were also made with the objective of getting finer grain size. Table I gives some of the heats which show promising results, in so far as these have got a tensile strength of 40 tons or above with yield point of about 30 tons and higher. Heats given Table I showed good weldability on the basis of standard weldability test. Standard electrodes used for welding of low-alloy high-tensile structural steels, were used for conducting weldability tests. Atmospheric corrosion tests for these heats are in progress covering a full year and more. It is expected that due to low carbon content and the presence of some Cr and Cu these low-alloy steels would have better corrosion resistance than normal plain carbon structural steels. In addition to these studies, long-range research and development programme of work on low-alloy steels is based on the following themes at the National Metallurgical Laboratory:—

(*a*) Studies on the melting practice to minimise the non-metallic inclusions in 1.5% Mn steel.

(*b*) To develop Mn-Mo steels with Mo from 0.2% to 0.4%. These steels will be similar to other standard steels but with lower Mo content, in which India is deficient.

(*c*) Cr and Cr-Mn steels with Cr from 0.5%-1.6% and Mn 0.3%-1.4%.

(*d*) Cr-V steels with Cr—0.6 to 1.8% and V—0.1-0.15%.

(*e*) Cr-Mo steels with Cr—0.9-6.0% and Mo—0.2-1.0%.

(*f*) Ni-Cr steels with Ni—0.7-3.0% and Cr—0.7-1.0%.

(*g*) Ni-Cr-Mo steels with Ni—1-3.0% and Cr—1-1.7% and Mo—0.1-0.6%.

(*h*) Effect of addition of boron to engineering steels.

Low-alloy Steels for Resistance to Sulphide Cracking

Cracking of oil well-tubing in deep-sour condensate wells due to the presence of hydrogen sulphide is a problem of extreme importance in oil and natural gas production. Conventional Mn/Mo or Cr/Mo type of high-strength steels are susceptible to cracking due to the diffusion of atomic hydrogen into the metal produced by the action of H_2S on steel. The problem of finding a suitable alloy for the above purpose was found to be elusive for a long time. Extensive investigations carried out in France have led to the development of Cr/Al/Mo and Cr/V/Mo type low-alloy steel which has a thermodynamically stable structure of carbon-free ferrite with highly dispersed fine carbides. The alloy† (C, 0.12%; Cr, 1-2%; Mo, 0.2-0.3%; Al, 0.3-1%) possesses in addition to good resistance to sulphide cracking excellent physical properties with yield strength of about 23-28 T/sq. in.

Stainless Steels

Stainless steel is one of the most popular, commonly used alloys under various corrosive conditions. A common variety of stainless steel is the 18/8 Cr-Ni austenitic stainless steel. However, this alloy is extensively used under mildly corrosive conditions even though less corrosion-resistant alloys may well be used in its stead. Such wholesale use of 18/8 Cr-Ni steels is not advisable. Considerable research and development work carried out during the last war in several countries showed the possibilities of partial substitution of nickel by manganese.

Some of the results of studies on the partial replacement of nickel by manganese carried out at the National Metallurgical Laboratory are given in Table II along with their corrosion resistanee data. From the results obtained, it may be summarised that Cr/Mn/Ni steels can be readily worked down with good mechanical properties upto 0.25% carbon and 0.1-0.2% N. When compared to 18/8 Cr/Ni steels, these steels possess higher yield and ultimate tensile strength without very marked decrease in ductility and compare well with 18/8 Cr : Ni steel in respect of resistance to scaling at high temperature and corrosion resistance in mildly corrosive conditions. The corrosion-resistance properties of these alloys can be further improved by the addition of about 2-3% Mo to the 13% Cr, 10-15% Ni alloy.‡ The corrosion resistance of this type of alloy has been well established both in laboratory and plant trials. This work was further extended at the National Metallurgical Laboratory to replace nickel completely by the addition of manganese along with nitrogen and copper as both of these are strong austenite stabilisers. Such chromium-manganese-nitrogen stainless steels are stronger than 18 : 8 type stainless steel and showed a tensile strength of over 60 tons/sq. in. The elongation values obtained on 1 inch gauge length ranged from 40-48% and the steels also showed adequate deep drawing properties.

Precipitation Hardening Stainless Steels

Stainless steels of the precipitation-hardenable type are finding increasing applications as material of construction for airframe components in high-speed aircraft; as these offer not only the desired property of high strength but also the advantages inherent in their 'stainlessness' and ease of fabrication. The well-known precipitation hardenable steels developed during the last decade are '17-4 PH', '17-7 PH' and 'PH 15-7 Mo'. The compositions of these steels are given in Table III.

So far the development of high strength stainless steels is based on the use of nickel as one of the constituents. Extensive work has been carried out in the National Metallurgical Laboratory in employing Mn to replace part of the nickel in the making of these steels. Use of interstitial elements like C and N and isothermal heat treatment were made to achieve extra high strengths. The steels investigated in this programme are:

1. 17-8—Cr-Mn-N steels and
2. 17-6—Cr-Mn-N steels with and without the additions of small percentage of nickel.

Further work in the series will include the study of the effects of phosphorus additions and precipitation hardening effects produced by carbon and nitrogen. It will be also interesting to observe the effect of aluminium, titanium, vanadium

BANKING BUSINESS OF EVERY DESCRIPTION TRANSACTED THROUGHOUT THE WORLD

BOMBAY: 14, Veer Nariman Road, CALCUTTA: 18A, Brabourne Road.

SOUTH INDIA VISCOSE LIMITED

COIMBATORE

Pioneers of Progress in
SOUTH INDIA.

First in India to Manufacture High Quality
STAPLE FIBRE & RAYON YARN
as a Joint Venture.

Promoted by Large-scale Investment by the Textile Industry of South India, especially Coimbatore District, to meet their requirements of Staple Fibre.

OUR RAYON YARN

Largely used in Hand-loom Industry and in Power-looms All Over India.

FACTORY:
SIRUMUGHAI
(Via) Mettupalayam,
Coimbatore District.
Phone: 142, Mettupalayam.

HEAD OFFICE:
Race Course,
Post Box 96,
COIMBATORE-1.
Phone: Office 3207, Secretary 3208

ASHER TEXTILES LIMITED

(Established in 1936)

POST BOX NO. 17 TIRUPUR (Coimbatore District)

Telegrams: "ASHERMILLS"

Telephones: 198 Managing Agents' Office
203 Managing Agents' Residence
65 Office
65A Secretary (Office)
312 Secretary (Residence)

REGISTERED OFFICE:
AVANASHI ROAD, TIRUPUR

Authorised Capital Rs. 14,00,000
Paid-up Capital - Rs. 11,98,600
Ring Spindles - - - - 24,800
Doubling Spindles - - - 2,424

MANUFACTURERS OF:
QUALITY YARN—SINGLE, DOUBLE, CONE, CARDED AND COMBED
Counts: 20s to 80s
(Tex Mark No. 602)
Quality Yarn under high standard of production
Indian Product with Indian Capital Under Indian Management

Managing Agents: MESSRS. SETNA & CO., TIRUPUR

and boron singly or in combination with Cr-Mn-N steels to achieve extra high tensile strength values.

Heat-resistant Alloys

All heat-resisting steels are desired to possess the following properties:

1. Ultimate strength and ductility.
2. Resistance to creep.
3. Resistance to corrosion and oxidation.
4. Resistance to thermal fatigue or shocks.
5. Weldability and machineability.

Creep may be defined as the time dependent deformation and accompanies the application of stress below its yield point. Creep is a high temperature phenomenon and so is of great importance due to use of higher temperatures and pressures in chemical and power plants and in gas turbine operation. Alloys are grouped accordingly to the temperature range for which they can be used. Table IV gives the various types of creep-resistant alloys that are commonly used in practice.

Table IV indicates that standard creep-resisting alloys vary from simple low-alloy steels to high-alloy steels and complex nickel and cobalt-based alloys. The usefulness of these alloys is limited by the service temperature and pressure conditions. In superheater tubes in medium pressure steam power plant for temperature upto 900° F., low-alloy steels of Mo or Cr-Mo type can be safely used as far as resistance to creep and oxidation is concerned. For temperature of 540° C. and higher, it however becomes necessary to use high-alloy steels and for temperatures of 700° C. and above nickel or cobalt-based alloys are used.

Development of High Temperature Alloys in India

Majority of high-temperature alloys are based on iron-chromium, cobalt-chromium or nickel-chromium groups. In each of these alloy groups, the alloying elements, for example, Cr, Mn, Fe, Co, Ni. etc., go in solution and thereby impart the necessary strength and oxidation resistance. However, in practice it is necessary to introduce substantial amounts of other elements, for example, Ti, V, Mo, Cu, W, Zr, etc., which form complex carbides. These complex carbides are known to increase creep-resistant properties by increasing the so-called complexity effect.

Development of heat-resisting alloys in India requires immediate attention as these constitute one of the most rapidly expanding sections of the alloy steel industry. For medium pressure boilers upto 900° F. the low-alloy steels containing Mo or Cr/Mo can be used safely. Further improvement in the properties of alloys can be brought about by the additions of other carbide-forming elements singly or in groups, for example, vanadium, titanium, niobium, etc.

Ferritic stainless steels containing 10-17% chromium possess excellent oxidation resistance properties but improvement in their creep-resisting properties by the addition of carbide-forming elements need special attention, as this will help in the conservation of nickel in relation to nickel-bearing 18/8 stainless steel. In this connection, the possible use of chromium-bearing ferritic stainless steel for resistance to high sulphur coal ash in boilers requires special studies as chromium steels appear to be more resistant than similar alloys containing nickel.

Another avenue of improved heat-resistant alloys for temperature range of 550-650° C. needs detailed investigation, for example, alloys containing silicon and aluminium. Silicon and aluminium improve the oxidation resistance considerably but, when added to steel singly in greater amounts, the working properties of the alloys deteriorate considerably. Further, the creep-resisting properties of the alloys containing silicon or aluminium are not good. The Fulmer Research Institute has developed some silicon-aluminium steels with a high resistance to oxidation. The silicon contents vary from about 1 to 4 per cent. In materials combining both aluminium and silicon, the proportions of aluminium ranged from virtually nothing to 3 per cent. Addition of 1 per cent chromium along with aluminium to high silicon-bearing alloys seems to increase the resistance to oxidation at higher temperatures.

Investigations have been carried out in the National Metallurgical Laboratory to study the effect of additions of Mn, Zr, V, Ti, B etc. on (*a*) low strength at high temperature, (*b*) brittleness due to grain growth, (*c*) poor creep properties and (*d*) poor workability of Fe-Cr-Al based heating elements (with Cr 10-25% and Al 3-8%). Addition of some of these elements to these alloys have been found to be beneficial with excellent properties for use as heating elements and these can successfully replace some imported heating element alloys such as 'nichrome' and 'kanthal' alloys.

Alloys for Gas Turbines

Nickel base alloys are the only group of alloys which have been standardised for use in gas turbines. In this group of alloys it is not possible to replace nickel completely but research work on the partial replacement of nickel can be carried out. Nickel base alloys of Nimonic group containing about 80% nickel have been one of the earliest alloys used in high temperature applications. But recent advance in the production of more complex alloys like Udimet 500, M-252 etc. containing only 50-50% nickel has helped in the conservation of nickel. Such substitution has been brought about by the additions of carbide and nitride forming elements like Mo, Ti, Al etc. in small amounts.

Cast Irons

Cast irons and alloyed cast irons can be used in various conditions involving concentrated caustic soda, sulphuric acid, nitric acid and chromic acid. Unalloyed cast iron is not resistant to dilute acids but when alloyed with nickel (Ni-resist) or silicon (Dur iron) or silicon molybdenum (Durichlor) then its resistance improves many-fold in weak and strong acids.

A great impact on engineering design in a number of industries has been made since the commercial introduction of S.G. iron. This alloy has found innumerable uses where strength and ductility need to be better than ordinary cast iron. Spheroidisation of graphite is brought about by treating the molten cast iron with Mg or other elements in small amounts. The success of the treatment depends on the composition of pig iron and so the possibilities of producing S.G. iron from Indian pig iron by inoculating it with different elements need careful studies. Trial heats have been carried out at the National Metallurgical Laboratory with a number of synthetic pig irons by inoculating the same with Ca, Zr, B, Zn, Na, and Mg. Only Mg gave 100% nodulisation while Ca, Zr, and B gave mixed nodules and flakes.

Complex high-tensile aluminium bronzes are established engineering materials. Recent developments have been made by the additions of manganese, nickel and small amounts of iron to aluminium bronzes. These alloys today find extensive use in propellers, pumps, valves and condenser components. However, aluminium bronzes are susceptible to stress corrosion cracking. It has been claimed that additions of Cd, Sn, or Ag have got a beneficial effect in imparting immunity to intergranular stress-corrosion cracking in steam or other oxidizing aqueous acid and caustic vapour.

Metallic Coatings

In most corrosion problems encountered, only one side of the surface comes into actual contact with the corroding medium. It is, therefore, clear that economically it would be advantageous to construct the strength portion of the vessel with less corrosion-resistant cheaper alloy, and then coating the corrosive surface with corrosion-resistant alloy. This type of sandwiched structure can be developed either by rolling or by diffusion treatment.

Cladding generally consists of hot rolling of the "sandwich block" prepared by edge welding of the assembly; the chief potentiality of this process lies in the production of clad steels where stainless steel or aluminium is clad over mild steel; while the former will be of importance to chemical industries, the latter can be used for structural purposes. Possibilities of using aluminium clad on creep-resisting superheater alloy steel (Mo or Cr/Mo) for resistance against sulphates in coal-fired boilers presents interesting possibilities.

Studies have been carried out in the National Metallurgical Laboratory for cladding stainless steel and aluminium on mild steel. By hot rolling a suitable 'sandwich' to the final required size it was possible to get a composite structure possessing good ductility and deep-drawing characteritics. Rolling temperature found suitable for stainless steel and aluminium were 1150° C. and 500-550° C., respectively.

In addition to cladding, improvement in the corrosion resistance of the surface exposed to corroding media may be accomplished by diffusion treatment. Processes like chromising, siliconising, calorising etc. present considerably attractive propositions. These processes are, however, limited by the size of material that can be treated. Alternative methods are, therefore, to be fully investigated. Increase in the aluminium content of the surface layer can be brought about by spraying or hot dip aluminising followed by high temperature diffusion treatment. Similarly, chromium, molybdenum etc., can be deposited on the surface at high temperatures under low pressure from their vaporised halides. Savings expected from the development of these processes are naturally expected to be considerable.

Alloys of Future Importance

After the Second World War, great advances have taken place in the production of newer metals, for example, titanium, zirconium, tantalum, niobium etc. Alloys of these metals have great potential applications in different fields. The main deterrent to their large use as material of construction is their high cost. However, India is favourably placed in respect of resources of titanium, zirconium etc. Titanium, the cheapest of the group, has the greatest potentiality, specially in the construction of equipments for missiles, jet engines, chemical plant equipment etc. While zirconium and niobium have potential fields of use in atomic energy applications, tantalum is expected to be economical

(*Continued on page 161*)

TREND OF WORLD COMMODITY PRICES

Excess Supplies, Despite Increase In Demand

WORLD commodity prices, which have been falling almost uninterruptedly since the end of the Korean boom, suffered a further distinct setback during 1962, thanks to persistent imbalance in the supply and demand position. On a preliminary assessment, it would appear that, generally speaking, the setback was induced mainly by the pressure of heavier supplies (following larger output and more releases from the U.S. stockpiles) rather than by any slack in demand. In fact, the overall demand for commodities tended to increase during the year. This was particularly so in the case of non-ferrous metals, industrial fibres, vegetable oils and silver, reflecting the distinct improvement of industrial production in the U.S. from the recessionary conditions of 1960-61, and the continuing expansion in Western Europe, albeit at a smaller pace. But for the improvement (though modest) in overall demand, prices of primary products entering into world trade would have gone down still further. It is, of course, too early to know the precise impact of decline in commodity prices on the economies of primary exporting countries during 1962. It is, however, only reasonable to assume that their terms of trade has continued to worsen during the year *vis-a-vis* manufactures, a feature that has been in evidence since the early fifties. To the extent that this trend adversely affects the tempo of development in underdeveloped countries through exhaustion of their capacity for importing capital goods, industrially advanced countries themselves stand to lose much from the weakness of commodity markets.

Most of the commodity markets began the year under review on a confident note. Values of a good many of them were well maintained during the first quarter. But this spell was rather short-lived and soon thereafter prices declined persistently to touch new low levels by August-September. The *Financial Times* (London) index of sensitive world commodity prices (base: 100=1952) which had improved from 78.29 during the turn of the year to 79.01 by the end of February, drifted gradually downwards to touch a new post-war low by the middle of September, when it stood at 74.61. The decline was accounted for mainly by the weakness in such commodities as lead, tin, rubber, coffee and soyabean oil. Some of the commodities of special interest to Indian exporters like tea, jute, and groundnut oil—which are not taken into account in calculating the *Financial Times* index—too were distinctly weak. It is no exaggeration to say that the *Financial Times* index at this stage would have slumped more sharply, but for some special factors, such as the producers support price for copper in the London market, strength in sisal, following floods in East Africa, and operators' hope of conclusion of a world coffee agreement and another for cocoa. Since September, the *Financial Times* index appeared to be on the way for a partial recovery, the latest available figure (end of November) being around 76.75, which, as compared with the beginning of the year, is still lower by well over a point. The recovery seems to have been induced to some extent by the Cuban crisis towards the end of October, which coincided with the beginning of the massive invasion of India's northern borders by China. The recovery has been somewhat marked in the case of some of the non-ferrous metals, coffee, cocoa and sugar.

U.S. Stockpile Surplus

Although imbalances in the supply and demand for commodities have been a persistent phenomenon for well over a decade, this problem was considerably aggravated this year because of the emergence of a new factor, namely, the apprehension about disposal of large surplus from U.S. strategic stockpiles. The U.S. Senate Sub-committee on Stockpiles, it may be noted, came to the conclusion by March last that all commodities held in the U.S. stockpiles were much in excess of their maximum objectives. The total market value of this surplus of seventy-four commodities was as much as $2,400 million. Indiscriminate disposal of these commodities, of course, would have led to an unprecedented depression in commodity markets. The U.S. Government, although anxious to dispose of the surpluses, has wisely refrained from inflicting any shock on primary producers. It has, on the contrary, taken into account the reactions of major producers and international commodity stabilisation organisations for ensuring orderly disposal of stocks. Thus, in consultations with the interests concerned, phased programmes for the disposal of stocks have been either undertaken in respect of some commodities or are being planned for others. Details about the stock position and disposable surplus of twelve major strategic materials, which account for about 75 per cent of the total stockpile by the U.S. (made public for the first time), are given in the following table:

(Quantity in '000 tons)

	Total stock	Surplus	Value of surplus ($ million)
Tin	340	164	442.1
Zinc	1,580	1,405	336.4
Aluminium ..	1,900	729	349.8
Chromite ..	5,200	2,530	219.7
Rubber ..	1,000	342	213.7
Lead	1,300	1,000	208.3
Manganese ..	9,100	2,300	174.5
Tungsten ..	72	50	159.0
Cobalt	43	35	117.0
Nickel	195	52	90.3
Copper	1,140	142	88.3
Molybdenum ..	38	11	35.4

Non-ferrous Metals

One of the commodities to suffer the worst setback during the year was lead. The setback has been the result of the pressure of large old stocks, and not of any imbalance in current production and consumption as such. Apart from the stocks of over one million tons with the U.S. stockpile, all the major producing countries have had large inventories with them. It is, however, a matter of some gratification that, during the year under review, stocks have tended to decline, unlike in 1961. It is estimated that producers' stocks, which stood at a very high level of 468,000 tons in January, moved down to 368,000 tons by September. The decline in stocks has been the result of increase in world consumption, which is said to have increased by 5 per cent in 1962 over the previous year to touch a record level. In fact, the Study Group estimates that world demand during this year has exceeded new supplies by 75,000 tons, in distinct contrast to the surplus of over 100,000 tons noted in each of the two previous years. This improvement, although small, has been accomplished by curtailment of output by producing countries at the instance of the U.N. Lead and Zinc Study Group. Thus, output in 1962 would be somewhat smaller than that in 1961 estimated at 2.31 million tons (primary metal).

It must be pointed out, however, that outlook for the commodity has turned better towards the close of 1962. This is reflected in the price movements in the London Metal Exchange, where the price of cash metal, which had gone down from over £61 per ton to touch the lowest post-war level of about £50 by August-September, has improved to around £55 by the end of November. The Study Group has, therefore, not recommended any curtailment of output for 1963.

Like lead, zinc also ruled distinctly easy during the year, thanks to pressure of surplus stocks. The output and consumption, in fact, are said to have touched record levels. But a small statistical surplus is expected during the year. Although consumption of Zinc has generally been going up, the rate of increase has slowed down. This is mainly because of the non-too-encouraging offtake by the motor industry in the U.S. and in Western Europe, aggravated to some extent by Russian sales in Western European countries. In the London market, the price of zinc (cash) fell from £71 per ton to £63-64 by August, though it recovered subsequently to about £68.

Tin

The slump in the tin market has come as an unpleasant surprise, for, unlike lead and zinc, tin had ruled distinctly firm in 1961 and had been well set for stable conditions a year ago. In fact, the demand for tin was running so much ahead of production that the Buffer Stock Manager of the International Tin Agreement had sold off all his stocks by the middle of 1961, in a bid to control prices. In contrast, the Manager has had to purchase about 2,000 tons of tin this year, to support prices under the new Agreement. Although consumption has been running high and output has only been just maintained, prices have moved down considerably. This was due largely to the fear of disposal of large U.S. stockpiles. This fear was removed only by September, when the U.S. decided to release tin stocks at the rate of only 200 tons per week. The U.S. has rejected the I.T.A.'s request for the fixation of a floor price for surplus disposal, but it has agreed to reduce or suspend sales, if they exert substantial depression in the market. World output of tin (excluding that of the Communist bloc) was about 70,000 tons during the first half of the year, which was higher by 4,500 tons than the output in the corresponding period of 1961, but still lower by 1,500 tons, as compared with the second half of 1961. Consumption of tin during the first six months of 1962 was 80,500 tons, as against 85,000 tons and 75,000 tons, in the first and the second half of 1961, respectively. The price of tin (cash) rose from £947 per ton in the beginning of the year to over £973 before declining to £847.75 at the end of the third quarter. At present, it is quoted at about £869 (end of November), which compares with £959 a year ago.

Silver

In refreshing contrast, silver and, to some extent, copper, fared well in world markets. The rise in the price of silver has, indeed, been phenomenal. This white precious metal continued to be in short supply, with the demand for industrial and artistic uses and coinage purposes outstripping output. While consumption has been around 300 million ounces annually since 1959, production has been around 235 million ounces. A rapid fall in the stocks of silver in the U.S., and also Mexico (which is the largest producer and exporter of silver) led to a boom in world silver prices. Ever since 28th November 1961, when the U.S. Government decided to suspend sales of silver to domestic industry, silver prices started its onward march. Then came the decision of the Mexican Government a few months back to suspend their sales, following the sharp decline in its stocks, too. The decline in Chinese exports of silver to the free world in 1962 further aggravated the scarcity conditions. From 88d. an ounce, the London market price of silver was skyrocketed to 104d. during the year, which is a record for several years.

A measure of stability has been attained in the copper market, largely as a result of concerted efforts, including cutback in production and extension of price support by producers themselves. Besides, labour strikes in copper mines in Peru, Chile and Rhodesia came as a blessing in disguise. Thus, the producers have been able to maintain the price at about £234 per ton for spot delivery in the London market. Futures prices have also been well maintained though there were modest two-way fluctuations during the year.

Industrial Fibres

Among fibres, jute has suffered a sharp setback. World cotton has also been ruling easy. But sisal has been firm, following crop failure in East Africa. The setback in jute has been

due mainly to the spectacular recovery in output in 1961-62 in both India and Pakistan from the abnormally low levels in the previous two seasons. India's jute output has gone up from a mere 3.98 million bales in 1960-61 to a record of 6.27 million bales in 1961-62 and that of Pakistan from 5.6 million bales to 6.97 million bales. Jute output is expected to be slightly smaller in India during the current season. In Pakistan and, to some extent, in Thailand too, output is estimated to be lower during the current season. But for this development and the price support schemes in India, raw jute prices would have gone down still further.

The weakness in raw cotton has been induced by larger supply and the somewhat uncertain prospects for cotton textiles industry in several countries. The cotton crop for 1962-63 is estimated at about 35 million bales (of which the U.S. share is 14.6 million bales), as compared with 33.6 million bales in 1961-62 (U.S. share 14.4 million bales) and 33.4 million bales in 1960-61.

Among the other industrial raw materials, rubber developed a sagging tendency since March, and a recovery was not in sight until the end of August. The earlier weakness was induced by the fear of low offtake by communist countries and continuing competition from synthetic rubber, besides large stocks in the U.S. Consumption trends in 1962, however, appeared to be quite satisfactory, especially in the closing months of the year. According to the latest estimates of the International Study Group, world production of natural rubber in 1962 is 2.11 million tons, besides stockpile releases amounting to 66,000 tons. Consumption of rubber has been running at a higher rate of 2.19 million tons. The recovery in the rubber market in the last quarter of 1962 has been due to large purchases of rubber from Malaya by Russia and the prospects of Chinese re-entry into that market, after a lapse of two years. The decline in overall stocks has also helped sustain the upward trend.

Coffee and Cocoa

There has been a marked downward trend in beverages as well. In respect of cocoa, comfortable supply position has pushed prices down. Prices would have gone down further, but for the hope of finding an agreed draft world agreement for stabilisation of prices, for which the Cocoa Study Group has been endeavouring for several months. The 1962-63 crop of cocoa beans is estimated at 1,139,000 metric tons. an increase of some 13,000 metric tons over 1961-62 crop (revised estimate). The grindings of cocoa beans for 1963 is placed higher at 1,148,000 metric tons, as compared with 1,103,000 metric tons for 1962. There has been a further increase in cocoa output in Ghana and Nigeria, which would offset any decline in Brazil and Ivory Coast. Tea and coffee prices too moved down during the major part of the year, but staged a slight recovery towards the close. The recovery in tea towards the close has been aided by lower output in North Indian estates, which was lower by 45 million lbs. at 511 million lbs. during January-October, as compared with the corresponding period last year. Pakistan's output was also lower. This is offset, to some extent, by the increase in South Indian production, as also that in Ceylon. The tea market has also been jubilant over the Common Market decision to introduce nil tariffs on Commonwealth tea, if the U.K. joins the Six.

An important factor that led to the recovery in the coffee market has been the prospect of stability in the market, when the World Coffee Agreement comes into effect. It must be noted, however, that despite the Agreement, which has laid down export quotas, and the expected decline in output in the 1962-63 season, there will be still large surpluses of coffee.

Oilseeds and Oils

Prices of oils and oilseeds continued to give way, particularly on account of the comfortable supply position of oils, both of vegetable and marine origin. An important bearish factor in this market has been the large output of soyabean in the U.S. The U.S. soyabean crop is estimated to have touched a record level of about 18.8 million tons in the 1962-63 season, that is, an increase of one per cent over 1961-62 and as much as 70 per cent over the 1950-60 annual average. Besides, the groundnut crop in India and most West African countries is also expected to be marginally higher. A further increase in U.S. output of cottonseed and linseed has also been predicted for the current season. These increases in supplies, however, will be partially offset by a decline in oilseeds production in Canada in particular.

Foodgrains

Prices of foodgrains have followed the general decline in commodity prices, though not to any significant extent. Wheat prices have tended to sag, after remaining steady during the major part of the year. A measure of strength had been in evidence in wheat as a result of the fall in output in 1961-62 to 209 million tons (from 219 million tons in 1960-61) and a small decline in stocks. It is against this background that maximum and minimum prices under the International Wheat Agreement were raised by 12.5 cents to $2.02½ and $1.62½ per bushel (basis being Manitoba wheat No. 1). According to the latest assessment, this declining trend in output has been reversed in the 1962-63 season, because of larger crop in Canada, Western Europe, Asia and Soviet Union. No increase in output, however, is envisaged in the U.S. mainly because of a reduction in acreage under the Wheat Stabilisation plan. It should not be forgotten, however, that the U.S. still continues to hold large stocks of wheat placed at over 36 million tons.

The decline in import demand for wheat from Western Europe (following a steady increase in its own production), is also a source of concern to wheat exporting countries, aggravated by the uncertainties regarding the impact of the Common Market's common agricultural policy which came into force in July. The steady import demand for wheat from India and Pakistan (which will be met largely under the U.S. P.L. 480 programme), and that from Communist China (being met under special agreements with Canada, Australia and France), however, are factors offsetting the possibility of any marked decline in wheat prices. As regards other foodgrains, including rice, barley and maize, output in the world as a whole is expected to continue its upward trend during the 1962-63 season, with the possibility of some decline in open market prices. According to the U.S. Department of Agriculture, output of rice (unmilled) will be about 153.2 million tons in 1962-63, as against 150.4 million tons in 1961-62.

The outlook for commodities in 1963 will depend largely on the trends of industrial expansion in the U.S., Western Europe and also Japan. On this question, there is no unanimity among economists. One only hopes that Dr. Per Jacobsson's fear of recession at any rate will be proved untrue. In fact, Dr. Jacobsson sees in the persistent weakness in commodity markets itself the genesis of deflation. Be that as it may, it is possible that the "miracle countries" such as West Germany and France may not be able to maintain the high tempo of economic activity, if current trends are any indication of coming events. Nor is it possible to assume that the pace of recovery in the U.S. output witnessed in 1962 will move up to any considerable extent next year. These factors, coupled with the growing competition from synthetic substitutes for a wide range of commodities, and the still uninterrupted increase in the output of these commodities, suggest that the imbalance in supply and demand position of commodities is not likely to be rectified to any perceptible extent in the foreseeable future. Much will, however, depend on actual trends in industrial production next year.

It is against this background of general uncertainty that producers and consumers have been making efforts on an increasing scale to promote international co-operation to stabilise commodity prices. International agreements on tin and wheat, for instance, have been renewed during the year, and a new long-term agreement is in the process of being signed for coffee. Besides, the U.N. Study Group on cocoa is now giving finishing touches to the draft on a similar agreement for that commodity. A similar attempt is also being made by the Lead and Zinc Study Group. Not always have the international commodity agreements been successful in stabilising price levels, especially as they do not involve provisions for effective control on production. For the time being, however, there seems to be no foolproof alternative to world commodity agreements as agencies for price stabilisation. They have to be welcomed in the spirit of something is better than nothing. Ultimately, they may yield place to something better.

COAL INDUSTRY'S PERFORMANCE IMPROVES

Expansion Plans Under Way, Despite Insufficient Incentives

IN an annual review, such as this, of the performance of coal industry, production trends in the relevant fiscal year (April to March) and calendar year alike have to be brought into focus. The present review, therefore, covers production trends in 1962-63 (based on the actuals of the first six months, April to September) and in 1962 (based on the actuals of the first nine months, January to September). Taking the *fiscal year* first, it is found that actual coal production in the private and public sectors together in the six-month period April-September 1962 has aggregated 29.9 million tonnes, representing a monthly average of 5.0 million tonnes. On the assumption that there will be no improvement on this average in the second six-month period, October 1962-March 1963, coal production in the whole of 1962-63 will be around 60 million tonnes only, as against 55.2 million tonnes in 1961-62 and 55.5 million tonnes in 1960-61. In other words, unless the spur of emergency created by China's aggression on Indian territory brings about—as it well may, thanks to the shift, with effect from mid-November 1962, to seven days' working and three shifts in the bigger collieries—a higher monthly rate of coal production in the second half of 1962-63, the estimated production in this the second year of the third Plan will be just 60-61 million tonnes, a level of output, which had been targeted for the last year of the second Plan (1960-61) but which, of course, was not attained then.

To examine the *calendar-year* trends next. Actual coal production in the private and public sectors together in the nine-month period January-September 1962, as will be seen from the table on this page, has aggregated 44.9 million tonnes, representing a monthly average of 5.0 million tonnes. If it is assumed that there will be no improvement on this average in the last three months of the current year, coal production in the whole of 1962 will be just around 60 million tonnes only, as against 56.1 million tonnes in 1961, 52.6 million tonnes in 1960 and 47.8 million tonnes in 1959. The calendar-year trends thus suggest that coal production in the country has maintained a steady, though slow, increase of about four million tonnes per annum since 1959. This, incidentally, is a measure of the achievement in the vital sector of coal industry on which the railways, iron and steel plants, thermal power stations and several other industries depend for their fuel supplies.

That this relatively modest achievement has fallen very much short of the needs of consuming industries in the last two years could be inferred from the critical shortages of coal in

Progress at a Glance

(In thousand tonnes)

most parts of the country. The rate of annual increase in coal production in the next three years (broadly corresponding to the remaining three years of the third Plan) would have to increase threefold, as compared with the rate in the last three years, if there is to be no serious shortfall in the achievement of even the originally-proposed target of 97 million tonnes for the end-year 1965-66. On this reckoning, even if the exigencies of the Sino-Indian war were not there, the level of output in 1963 would have to be not less than 72 million tonnes. Whether or not that much production in the next year can be, or will be, achieved may be broadly inferred from the review, in the following paragraphs, of official measures taken so far during the current year for removing bottlenecks on the production and transport sides of the coal industry.

Utilisation of I.B.R.D. Loan

On the production side, by far the most important development during the early part of the current year was the finalisation of projects involving the expenditure of the first loan of $35 million sanctioned by the World Bank in August 1961 for the exclusive use of the private sector in coal industry to cover orders for mining machinery and equipment during 1962-63. It may be recalled, in this connection, that the private sector's third Plan programme, designed for an additional annual production potential of about 17 million tonnes (from 45 million tonnes in 1960-61 to about 62 million tonnes in 1965-66) would call for a fresh capital investment of Rs. 60 crores with a foreign exchange component of Rs. 28 crores ($60 million). As many as 184 projects of individual collieries were scrutinised and approved by the technical and financial screening committees which had been set up by the Joint Working Committee of the industry with the approval of the Government of India. The approved projects became eligible for imports of machinery and equipment, including spares, within the framework of the World Bank loan which, it was laid down, was to be allocated in the following manner:

	$ million
For expansion of existing mines ..	14
For replacement for existing mines ..	14
For spares for existing equipment ..	2
For development of new mines ..	5
Total ..	35

The pace of utilisation of this loan seems to have been quickened during the year, with import licences for the aggregate value of Rs. 15 crores having been issued by August last. So, the first phase of the private sector's expansion programme may well be completed by the end of the current fiscal year 1962-63. Its effects, in terms of additional production, are, however, likely to be significant only from 1963-64 onwards. As the balance ($25 million) of the private sector's foreign exchange requirements is also most likely to be financed by a second loan of $25 million from the World Bank which has already given an indication to that effect, the chances are that this sector will achieve its third Plan target, even as it achieved its second Plan target, provided, of course, its other requirements are also satisfactorily met. These other requirements pertain to imports of spares, supply of explosives, availability of power, construction of ropeways for carrying sand for stowing, allotment of railway wagons and, above all, coal prices.

Spares and Explosives

To take these requirements one by one. First, imports of spares for existing equipment have not been adequately covered by licences. As much as 20 per cent of the equipment owned by private collieries is stated to have been idle during the year under review for lack of spares. Since the allocation ($2 million) for this item from the World Bank loan is patently insufficient, the licensing authorities would have to permit further imports within the limits set by foreign exchange availability. As for supplies of explosives, the situation has been pretty bad during the year, because 75 per cent of the output of the Imperial Chemical Industries (India) Private Ltd.—the sole manufacturer and distributor of explosives in the country—has been taken up by the Government. Only the balance (25 per cent) has been available to other consumers, including the coal industry. The supply situation is likely to become worse in the context of the Sino-Indian war emergency and the consequent additional defence requirements. Unless the Government takes steps to get more explosives imported or produced indigenously, the coal industry might continue to face difficulties in getting adequate quantities of this vital material.

Power and Stowing Sand

Thirdly, power supply for the coal industry has been insufficient during the year, and this has affected mechanical mining. The shortfall in power supply for the West Bengal and Bihar coalfields alone in the current year has been estimated at about 60 M.V.A. The official study team set up during the year to assess the additional power requirements of the coal industry in both the private and public sectors for the whole of the third Plan period has recently estimated them at 143 M.W. The team has also recommended some steps for improving power supply to the Bihar-Bengal coalfields. One of the steps recommended is that the Damodar Valley Corporation should review all the existing demands for power and allocate the maximum possible supply to the coal industry. Another recommendation is that the U.P. Government should be persuaded to release 30,000 kw. power at 50 per cent load factor from the Rihand Project for utilisation in the coalfields in the Bihar-Bengal area. The team has further suggested that six 1,500 kw. package generating sets be earmarked for supply to the coal industry in the area served by the Associated Power Company and the Dishergarh Power Supply Company in West Bengal. If these recommendations are acted upon, there will be an end to the present power shortage which has slowed down the rate of coal production. But there is some uncertainty here, for the extent to which Rihand power can supplement D.V.C. power is yet to be settled with the U.P. Government. Pending this, at the time of writing (that is, end of November 1962) the West Bengal State Electricity Board has agreed to supply an additional 20 M.W. of power to collieries and the U.P. Government has begun to supply some quantity of Rihand power to the D.V.C. grid.

Fourthly, in regard to supplies of sand for stowing purposes, the larger collieries, which have their own arrangements for gathering and transporting such sand, seem to have benefited during the year from the liberalised pattern of stowing subsidy. But the smaller collieries, which do not have their own arrangements for gathering and transporting sand, have continued to be at a serious disadvantage, for the Coal Board's ropeways programme, covering the Jharia and Raniganj coalfields and involving an outlay of Rs. 16 crores, has not progressed fast enough to be completed, as scheduled, within the first two years of the current Plan. Although it has been recognised that stowing as a measure of conservation would need to be intensified during the third Plan period since a part of the additional production is to come from existing mines by depillaring operations, a sufficiently high priority has not been assigned to the ropeways programme in the matter of foreign exchange allocation.

Transport Plans

As for transport bottlenecks which caused pithead stocks to accumulate during 1961 and thereby slowed down production, the current year has witnessed some progress in overcoming them. Thanks to considerable improvement in rail transport there has been practically no accumulation of pithead stocks in the Bihar-Bengal area. But over the country as a whole, the coal supply situation has continued to be difficult for all consuming industries, apparently because of expansion in industrial capacity in many parts of the country. For instance, as against the assessed

Annual Trends

(In thousand tonnes)

	Raisings	Despatches
Estimate for the whole of 1962	60,000	53,000
Whole of 1961	56,102	50,277
,, 1960	52,913	46,327
,, 1959	47,786	42,269
,, 1958	46,047	40,988
,, 1957	44,202	38,289
,, 1956	40,066	35,518
,, 1955	38,829	33,468

requirements of 8,127 wagons per day in respect of all the coalfields in the first half of the year under review, the railways were actually able to load only 6,049 wagons per day. The daily number of wagons actually loaded fell short of the railways' own target of 6,925 wagons per day. Coal supplies to industries did not, therefore, increase substantially during the period. The latest available figures show, in this connection, that the 36 priority classes of industries had an aggregate stock of 2.4 million tonnes of coal on 1st July 1962, as against 2.1 million tonnes on 1st July 1961. The aggregate consumption of these industries was 3.7 million tonnes in June 1962, as against 3.4 million tonnes in June 1961. The improvement that had taken place in coal consumption and stocks was thus only marginal and hence inadequate. The very fact that industry after industry has been complaining about inadequate coal supplies and uncertain and delayed deliveries proves that coal movement has not greatly improved during the year. The Government has, of course, been aware of the acute need for improving coal transport. It has, therefore, been seeking to finalise a scheme for the creation of coal dumps in different parts of the country for catering to strategic industries and power houses. But it would appear that this scheme, though ready for implementation from next year, may not have smooth sailing for all the interests concerned— coal industry, coal merchants and consuming industries—have criticised it on some ground or other.

The Government's new scheme, finalised during the year, for improving roads in the Bihar-Bengal area at an aggregate cost of about Rs. 15 crores is, by and large, sound. One part of this scheme envisages improvements to the Grand Trunk Road, over a stretch of 250 miles between Calcutta and Topchanchi, for facilitating coal haulage by heavy trucks. If this scheme is implemented and the required heavy trucks become available, the expectation is that anything upto 10 million tonnes of coal, as against the actual three million tonnes in 1961-62, can be moved by road annually in the latter half of the third Plan period. But the problem of higher cost of haulage by road will be there. This will have to be solved, in terms of the assurance given by the Union Minister for Mines and Fuel, through the grant of a subsidy like the one now being given for moving about two million tonnes of coal by the sea route to southern and western India. The other part of the scheme envisages improvements to feeder roads now looked after by State Governments or district boards in the Bengal-Bihar region and also to roads linking coal areas with riverside jetties from which more coal could be carried by boats and barges upto Allahabad. The idea here is to break the bottlenecks caused by congestion in the Moghulserai railway yard. But its potentialities are stated to be very much exaggerated, for haulage of some three to four million tonnes of coal per annum, as proposed, by river and through the D.V.C. canal will be a formidable task in the present undeveloped state of inland navigation and in view of the practical difficulties in the way of early manufacture of power tugs for country craft. So the only programme that is deemed immediately feasible is the one covering the Grand Trunk Road to Calcutta and its feeder roads. For the rest, consuming industries in different parts of the country could hope for relief, if at all, only from greater efficiency in the operations of railways in terms of improved wagon turnround, increased speed of goods trains, quicker loading and unloading, further rationalisation of block rakes and half-rakes and, above all, increased wagon availability in the light of requirements as assessed by the Coal Controller.

Coal Price Increase

Another important development during the year under review was on the production side of the industry. This pertained to the increases, announced in mid-June 1962, in the prices of various grades of coal. The sanctioned increases, as will be seen from the details given below, range from Re. 0.38 per ton to Re. 1.50 per ton:

	Rs. per ton
Non-coking coal :	
Grade II	0.38
Grade I	0.75
Selected B	1.00
Selected A	1.50
Coking coal :	
Grades HH, J, K and L ..	0.38
Grades F, G and H	0.75
Grades D and E	1.00
Grades A, B and C	1.50

The coal industry was frankly disappointed over these price increases, for it had cogently pleaded for a flat increase of Rs. 5.43 per ton to compensate it for the higher cost of production, the cost of servicing its capital investment programme in the third Plan period, etc. The industry was also surprised at the Government's decision to fix a celling on the prices of coking coal of HH to L grades (converted into one grade HH) and non-coking coal of Grade II at Rs. 20.50 per ton. This price celling, it was contended on behalf of Industry, would discourage the raising of the particular grades of coal from deeper seams in the Jharia-Raniganj fields. The marginal price increases, coupled with the ceiling price for certain grades, were, therefore, not such as to enthuse the industry which had established a sound case for a more economic price of coal in the context of cost increases and third Plan's expansion requirements alike.

In the Public Sector

No outstanding developments took place during the year in the public sector of coal industry. This sector's contribution to aggregate coal production in the period January-September 1962 has come to 7.6 million tonnes. The production programme of the public sector has been revised upwards during the year with the objective of reaching a target of about 40 million tonnes in 1965-66, made up of 34 million tonnes by the National Coal Development Corporation and 6 million tonnes by the Singareni Collieries. Its expansion plans, which will involve an aggregate capital outlay of about Rs. 105 crores (with a foreign exchange component of Rs. 50 crores), have been taken on hand. While no internationally available funds, such as those of the World Bank, have so far been allocated for this development programme, the Russian, Polish and Czechoslovak Governments and the United States, France and the U.K. have already provided or are likely to provide bilateral assistance therefor. As things stand at present, the public-sector coal programme would be generally financed from tied purchases from Western and East European countries to the extent that free foreign exchange is not available.

It is well known that the coal mined in India has a large ash content—about 16 to 18 per cent—even after washing. A team of foreign experts has, therefore, recommended recently that some superior grade coal be imported from abroad to blend it with the indigenously available varieties. The Government of India is now considering this recommendation, according to Mr. C. Subramaniam who addressed the Congress Parliamentary Party's Committee on public undertakings on 12th December 1962. The high ash content in coking coal and some aluminium content in iron ore are stated to be responsible for considerable wastage in blast furnace operation in the country's iron and steel plants.

CORROSION-RESISTANT ALLOYS

(*Concluded from page* 152)

for use under high-temperature corrosive chemical environments.

A recent field of research in high-temperature materials is the development of cermet materials. These materials are compounds between metals and non-metals, for example, boron, carbon, oxygen or nitrogen, with the addition of some lower-melting binder materials. Cermets used for high-temperature service should have resistance to oxidation and, from this point, metal-bonded titanium carbide group of alloys is one of the most important. However, considerable research work is required to assess quantitatively the effects of factors, such as shape and size of distribution of hard phase and the type of binder material on strength and hardness. Similarly research on new high temperature alloys based on intermetallic compounds is gaining prominence. Some of the possible compounds worth investigating are silicides like chromium silicide, molybdenum silicide, aluminides like nickel aluminide, titanium aluminide etc. Also of interest will be intermetallic compounds between transition metals, e.g. Zn, Cr_2, Cr_3 Ti etc.

Note: This article is based on the paper presented by the author at the Symposium on "Corrosion of Metals" held at Kanpur on 8th November 1962 under the joint auspices of the Defence Research and Development Organisation and the Council of Scientific and Industrial Research.

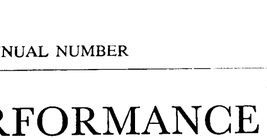
HOW TO GET THE BEST OUT OF YOUR AIR-CONDITIONER



THE AIR-CONDITIONING IN THIS BUILDING IS NOT VERY EFFECTIVE. MUCH OF THE COOLNESS PRODUCED BY THE AIR-CONDITIONER IS LOST ON ACCOUNT OF THE EXTERNAL HEAT PENETRATING THROUGH THE WALLS AND CEILING. FOR EFFECTIVE AIR-CONDITIONING THE COOLNESS PRODUCED INSIDE THE ROOM SHOULD BE PRESERVED AND EXTERNAL HEAT BLOCKED OUT. THIS COULD BE ACHIEVED BY INSULATING THE WALLS AND CEILING WITH JOLLY INSULEX THE FINEST FORM OF INTERIOR THERMAL INSULATION OBTAINABLE TODAY—THE EFFECTIVE INSULATION THAT ONLY INSULEX CANE FIBRE CAN ENSURE.

THREE DIFFERENT TYPES: NATURAL, WHITE-FACE AND FLAME RETARDANT SURFACES. WALL PANELS AND CEILING TILES ARE AVAILABLE IN SEVERAL DECORATIVE PATTERNS. ALSO PERFORATED ACOUSTIC TILES FOR SOUND CONTROL.

JOLLY INSULEX THE CANE FIBRE INSULATING BOARD MANUFACTURED BY ANIL HARDBOARDS LIMITED, THE PIONEERS OF FIBRE BOARD INDUSTRY IN INDIA. SOLE DISTRIBUTORS: VOLTAS

JUTE INDUSTRY TURNS THE CORNER

Both Production and Offtake Higher—Rise in Sacking Stocks, However, Causes Concern

IF 1961 was one of the darkest years for the Indian jute industry, the year 1962 was an exceptionally good one, thanks to a bumper jute crop and excellent demand for manufactured goods. Indeed, during 1962, almost the entire installed capacity of the industry consisting of about 73,000 looms was utilised to the maximum extent possible. In the previous year, it will be recalled, quite a bit of the mills' loomage remained sealed for want of raw jute supply (12 per cent for eight months and three weeks, 26 per cent for eight weeks, and 9½ per cent for eleven weeks). The raw jute supply position was so critical that the mills were forced to cut working hours and there was even compulsory block closure of mills for one week each in June and July. All these cutbacks disappeared towards the close of 1961 and the year 1962 began with distinctly encouraging prospects for the industry. A clear indication of full utilisation of capacity during the year under review is provided by the marked rise in the average of loom-hours actually worked; in the first three quarters of 1962, these were 2,016, as against 1,713 in the corresponding period of 1961. The average might have been higher still but for shortage of spinning capacity and restrictions on supply of power.

Record Output

Following the intensive utilisation of capacity, the aggregate output of jute goods in 1962, estimated on the basis of the figures for the first ten months, touched the all-time peak of 1.18 million metric tons, as against the actual output of 970,300 tons in 1961, 1.09 million tons in 1960 and 1.07 million tons in 1959. The mills were able to produce more chiefly because of plentiful supplies of raw jute and mesta at reasonable prices and good demand for hessian and other manufactures. The combined yield of these fibres during the 1961-62 jute season (July-June) was 7.97 million bales of 400 lbs. each, as against 5.11 million bales in 1960-61. Such a substantial rise in the output of raw material more than made good the poor opening stocks and reduced imports, so that the total available supply was as much as 9.24 million bales, as compared with 7.18 million bales in 1960-61 (*vide* Table A). The prices of raw jute were also relatively low, the average index number of wholesale prices (Base: 1952-53=100) for the first nine months of 1962 being 157, as against 227 in the corresponding period of 1961. The actual prices were fluctuating around Rs. 30 per maund, the floor level, as against Rs. 54.50 prevailing in the middle of June 1961. By itself, the large jute crop would not have been of much avail. There was also a significant expansion in the offtake of goods for both domestic consumption and export. The strong demand for jute goods arose partly from the need for rebuilding stocks in overseas markets following the heavy depletion on account of the "famine" conditions that prevailed in 1961 and partly from the increased world consumption of hessian fabrics. The total despatches of jute goods from mills during the ten months ended October 1962 were larger at 946,243 metric tons, as against 804,700 tons in the same period last year.

Since the peak of improvement in jute goods offtake was less than that in production (*vide* Table B), the *unsold stocks which mills increased*; the total of these stocks as on 31st October 1962 stood at 90,800 tons—it was higher still at 92,800 tons a month earlier—as against 55,500 tons a year before. This quantity may not be considered unduly excessive, inasmuch as it represents less than a month's offtake. But the steady increase in sacking stocks—from just 29,100 metric tons at the end of 1961 to more than 54,100 tons on 30th October 1962—is causing much concern to the jute industry and the outlook for late 1963 and 1964 is said to be obscure. In fact, many consider it to be gloomy. Here is what Mr. D. C. B. Pilkington, a former Chairman of the Indian Jute Mills Association and Chairman of the Kinnisson Jute Mills, stated in his annual statement circulated to shareholders early in September 1962:

"For sometime past, India has only succeeded in obtaining such overseas business as is available after Pakistan has sold her full production. The first half of 1962 has seen both India and Pakistan disposing of their full sacking production due to the rebuilding of stocks overseas. The indications today are, however, somewhat ominous—India's sacking stocks are already rising, while month-by-month Pakistan's production of sacking is increasing. India's monthly exports of sacking amount to between 30 and 32 thousand tons per month and this is approximately the extra monthly production of sacking that will come off the additional looms that will be installed in Pakistan by the end of 1964. Unless, therefore, there is a rapid rise in world demand for sacking—and this is unlikely due to the number of sacking mills being installed in other countries—India stands to lose the 55 crores of rupee per annum earned from sacking exports, unless some effective action is taken. A switch to hessian may be a partial solution, but the possibilities in this direction are limited both by demand and by the availability of the quality jute required.

"It is not my intention to propound here a solution to this problem—the Government of India is well aware of the importance of the issue and the Indian industry is confident that it will be dealt with realistically and as soon as the necessity arises. It is, however, desirable to summarise briefly just what the Indian industry is faced with in endeavouring to compete with its counterpart in Pakistan. The export subsidy bonus gives Pakistan a competitive advantage of around Rs. 150 per ton—the lower price of jute in Pakistan gives a further advantage of around Rs. 280 per ton. Factors in India's favour total a net amount of around Rs. 30 per ton. With Rs. 400 per ton to play with—Rs. 40 per 100 'B' twills—Pakistan has only to decide by how much to underquote Calcutta prices to obtain all the world's sacking business as soon as her production permits.

"The Indian jute mill industry, while having no feeling of hostility towards its Pakistan counterpart, is quite prepared to compete for its share of world sacking markets given the opportunity to do so—and has considerable confidence in its technical ability and dynamism. At the moment, however, it is in the position of a boxer with not one but both hands tied behind his back."

Despite the upward trend of offtake, the price of jute goods drifted downward during 1962, owing to the highly encouraging supply position, decline in raw jute prices and stiff competition from Pakistan in export markets. This was not an unhealthy downward trend, for, in the previous year, prices had gone up to such high levels as to cause a deleterious effect on the long-trend of consumption. The average wholesale price index of jute manufactures for the January-September 1962 period was 115, as against 139 in the same period of 1961. Sacking B. twills in the Calcutta market were quoted towards the close of November 1962 at Rs. 116 per 100 bags, as against Rs. 139 a year before, and hessian (40" x 10 oz.) at Rs. 56 per 100 yards, as against Rs. 58.

The quantity of jute goods actually produced during the first ten months of 1962 was 981,343 metric tons, as compared with 781,932 tons a year before, representing a rise of 199,411 tons. The rise was accounted for by both hessian and sacking. The actual output of hessian was higher by 108,897 tons at 391,539 tons and that of sacking by 71,580 tons at 459,894 tons. The production of other jute manufactures was also higher by 18,969 tons at 129,910 tons. The trend of output, together with the equivalent of raw jute consumption, during the first ten months of 1962 and 1961, as well as in the whole of 1961 and six years preceding it, is shown in Table C.

More Despatched

Despatches of jute goods during 1962 were well above those in 1961, the total during the nine months ended September being 845,500 tons, as against 725,400 tons in the corresponding period of 1961. The improvement in despatches was on account of both domestic consumption and export, the former rising by 101,100 tons to 623,200 tons and the latter by 19,000 tons to 222,300 tons. Details are given in Table D.

With the exception of Argentina, the U.K., New Zealand and some countries in the Far East, exports of jute goods from India to all other destinations registered an improvement during 1962. The actual shipment to the U.S., India's biggest customer, in the first half was 125,400 tons, as against 98,000 tons in the corresponding half of 1961. Canada, Australia, Africa and several European countries also bought more jute goods from India. The destination-wise shipments are indicated in Table E.

Modernisation

The jute goods exported abroad earned for the country foreign exchange amounting to Rs. 113.26 crores during the first nine months of 1962, as against Rs. 118.55 crores in the same period last year and Rs. 153.78 crores in the whole of 1961. This sum represents about one-fourth of the aggregate exports of all goods and commodities valued at Rs. 491 crores, so that the jute industry continues to rank as India's largest earner of foreign exchange. The industry can certainly contribute more significantly if earnest attempts are made to augment productivity in all the sectors and reduce costs. Considerable progress was made in the modernisation of the industry during the first and second Plan periods. By the end of March 1961, modernisation upto the spinning stage had been virtually completed, the total investment being Rs. 30 crores. The third Plan envisages the modernisation of jute mills' equipment for the post-spinning stage. The old winding equipment is expected to be largely replaced by new high-speed machines and additional prebeaming equipment will be installed to augment productive efficiency. For the modernisation of weaving process, the choice is said to be between (*a*) rendering the existing flat-bed looms semi-automatic by the use of cop-changers and warp-stop motions, (*b*) replacement by automatic circular looms, and (*c*) replacement by automatic shuttleless looms. The leading mill groups have been experimenting with these three methods of loom automatisation for some time now. By early 1962, they were expected to be in a position to draw up their modernisation programmes. It is not known whether this has been done. The phasing of the

COTTON MILL INDUSTRY BADLY SQUEEZED

Output Lower—Costs Higher—Stocks Mount Up

THE developments in the mill sector of cotton textile industry during the calendar year 1962 were by no means encouraging to investors. Indeed, it will be no exaggeration to say that the picture is depressing, because the industry was badly caught between lower output on an inflated cost base, on the one side, and decline in sales realisations, on the other. The estimated output of yarn and cloth in 1962 is about 1,863 million lbs. and 4,990 million yards, as against the actual production of 1,901 million lbs. and 5,142 million yards, respectively, in 1961. Sales realisations tended to decline, following reduced offtake and larger stocks. As compared with the position in 1961, the estimated despatches of cloth for domestic consumption were lower by 160 million yards at 4,435 million yards and those for export by 80 million yards at 492 million yards. It must be noted here that 1961 was by no means a good year for exports, having fared worse than in 1960. Consequently, the stocks of cloth lying with mills rose considerably, from less than 600 million yards at the end of 1961 to over 800 million yards towards the close of 1962. The impact of heavy accumulations of stocks on mills was all the more severe because of the difficulty in getting requisite credit facilities from commercial banks and the high cost of such credits. Many units were compelled to take recourse to borrowings from other sources at even higher rates of interest. Taking the average price of cloth as Rs. 75 per 100 yards, the total amount of money locked up in stocks aggregating 800 million yards comes to as much as Rs. 60 crores. Indeed, 1962 may be described as a critical year for the cotton mill industry. When the statement of accounts for the year come to be published, the vast majority of units will show a distinct setback in their financial results.

Production Cost Rises

That the cotton mill industry was in the grip of a persistent cost inflation during 1962 will be evident from the latest available data relating to the sixty mills in Bombay City which together account for almost one-fourth of the aggregate spinning capacity and one-third of the weaving capacity. These mills paid an average dearness allowance of Rs. 95.48 per worker per month during the first three quarters of 1962, as against Rs. 91.28 paid in the corresponding period last year. Taking the average number of 200,733 operatives at work, the total amount actually paid as dearness allowance in the entire nine-month period was markedly higher at Rs. 17.25 crores, as compared with the sum of Rs. 16.48 crores paid for 200,590 operatives a year before, or an addition of Rs. 77 lakhs to the wage bill of the industry for nine months. Besides higher dearness allowance, the Bombay mills had to pay enhanced prices for raw cotton, coal, chemicals, and fuel. The all-India average wholesale price index (base: 1952-53=100) of raw cotton, for instance, was 113, that for January-September 1961 being 109. The index of coal and chemicals was also higher at 159 and 114, as against 141 and 108, respectively. The index of fuel, power, light and lubricants stood at 123.4, as against 122.

While the manufacturing cost of the mill sector continued to rise, sales realisations were comparatively less, as there was a reduction in both production and offtake and the selling prices of textiles could not be raised to levels that covered the higher output cost in full. The quantity of cloth actually produced in the first ten months of 1962 was no more than 4,158 million yards, as against 4,290 million yards in the same period of 1961, and the output of yarn was 1,569 million lbs., as against 1,572 million lbs. The total offtake of cloth for domestic consumption and exports was also lower, as Table A shows.

Prices

Although the offtake of cloth was markedly lower and the Indian Cotton Mills Federation had enforced the scheme of voluntary regulation of prices, the average all India index of wholesale prices of cotton manufactures (base: 1952-53=100) for the first nine months of 1962 was higher at 129, as against 127 for the same period in 1961. Evidently, this modest rise in the index number reflects the higher excise duty on certain varieties of cloth imposed in the 1962-63 budget of the Central Government. The actual price paid by the consumer must have been much higher. The index number, it is common knowledge, does not fully reflect the prices paid by consumers for the following two reasons:

One, the cloth produced by power-looms and handlooms accounts for nearly a third of the cloth consumed in the country, and the prices of these varieties are not comprehensively taken into account in the calculation of the index number. In computing this number, the authorities take into account 12 items of mill-made cloth, four items of handloom cloth and some items of hosiery goods. The entire range of powerloom goods which constitute the major portion of production in the decentralised sector is not represented in the index number.

Two, in many centres, the retail prices of mill-made cloth are higher than the stamped prices, as both wholesalers and retailers have been exploiting the scarcity of popular varieties.

The drop in yarn and cloth output in 1962 occurred despite the more intensive utilisation of mill industry's capacity. The average spindle activity (representing the percentage of the spindles actually utilised to the total installed capacity) during the first nine months of the year was 89.2 in the first shift, as against 88.1 in the corresponding period of the previous year, 88.0 in the second shift (86.4 in January-September 1961) and 64.9 in the third shift (51.9). Similarly, loom activity was higher at 91.6, 90.0 and 27.3, respectively, the corresponding figures for 1961 being 91.2, 88.4 and 25.2.

Utilisation of Capacity

In view of the more intensive utilisation of the cotton mills' installed capacity, there was an addition to the labour force employed in the mills. The average number of persons on the books of mills (including general staff and *badlis*) in June 1962 was 934,000, as against 926,000 in the same month last year. The number of workers actually employed in all the three shifts was also higher at 796,000, as against 795,000. Since the yarn and cloth output suffered a setback despite greater utilisation of capacity and larger employment of labour force, it is clearly apparent that the productivity of the cotton mill sector went down during 1962. Table B gives the machine activity in cotton mills during the first nine months of 1962 and 1961, as well as in the whole of 1961.

While the number of purely spinning mills in existence rose from 193 in June 1961 to 197 in June 1962, the number remaining closed declined from 18 to 12. In the case of composite mills, the number in existence receded from 287 to 285 and the number of units remaining closed also receded from 15 to 10. Towards the close of July 1962, five spinning mills and six composite mills remained closed, together involving 126,372 spindles, 2,012 looms and 3,930 workers.

The trend of mill cloth and yarn output month by month is indicated in Table C.

There was a distinct change in the pattern of mill cloth output during 1962. Thus, the production of coarse and medium varieties declined, that of fine and superfine counts registered a rise. The improvement in the average counts of cloth is a natural phenomenon, being due to three important factors. First, the production of short-staple cotton from which course yarn of 1 to 20 counts is spun has gone down, while that of medium and long-medium staple cotton has risen markedly. Secondly, due to shortage of Indian cotton and scarcity of foreign exchange, mills had to use more U.S. cotton, suitable mostly for fine counts and higher medium counts, which was available under P.L. 480 without involving any payment in dollars. Thirdly, consumer taste has shifted towards cloth made from higher counts and that too for bleached, dyed, mercerised and printed cloth. Consumer preference for counts better than coarse is due not only to higher purchasing power but also to their longer durability. The actual output of the different categories is shown in Table D.

An idea of the different varieties of wearable and non-wearable mill piecegoods packed during 1962 can be had from Table E.

Exports Poor

The offtake of cotton piecegoods for exports, as already noted, suffered a further setback during 1962, as is borne out by the latest available data furnished in Tables F, G and H. The actual shipments in the first ten months of the year aggregated no more than 410 million years, as against 486 million yards in the same period last year. On this basis, the total exports for the whole of 1962 come to less than 500 million yards, as compared with the 572 million yards exported in 1961 and 690 million yards in 1960. The performance on the export front might have been even more disquieting but for the scheme of compulsory textile exports enforced by the Indian Cotton Mills Federation. The salient features of the scheme, which was announced in June 1962, are as follows:

The annual export obligation of every mill is fixed at 12½ per cent of the turnover of cloth and 3 per cent of the turnover of yarn, with reference to the balance-sheet of any year which ended on a date between 30th

SIZE OF PAPER MILLS

Case For Small Units

By I. J. CHOULS

THE suitability and the economy of small paper mills has been a leading question in India for many years. The theorists are inclined to say that the 5 and 10 tons per day paper mills cannot be as economical as the mills of 50 to 100 tons a day. In countries where large mills are necessary to their economy, even a 100-ton-a-day mill is considered a small unit, particularly so in the U.S.A. and in Scandinavia where mills with a capacity of 500 to 1,000 tons per day are quite common. It would, therefore, appears that mills of 50 and 100 tons per day which are under erection in India at present may also be considered as uneconomic units.

On the other hand, in Japan, Britain and on the Continent of Europe, the whole of the paper industry has been built up based on small units. The finest quality of paper produced in the world today is produced on small machines of 5, 10 and 15 tons per day capacity. Similarly, the majority of specialised papers are also made on such small machines. It would appear that the size of an economic unit cannot be decided on the basis of what has gone on in the past or on the developments in other countries. In the case of this particular industry, the capacity of mills will have to be decided, taking into consideration India's own particular problems. We in this country have three major problems in the development of the paper industry. These are:

First, the shortage of skilled personnel for running a large and highly mechanised unit;

Secondly, the shortage of any one raw material concentrated in an area; and

Thirdly, the heavy demand which is being made on our developing transport facilities in the country.

Dealing with the question of technical personnel, we have, over the years, not taken sufficient care to ensure that sufficient training facilities were available for technical personnel in the various sections of a paper mill. Secondly, many mills, until very recently, were very prejudiced against permitting the staff of other mills visiting them and gaining knowledge of their process and passing on useful information to their competitors thereby enabling them to learn something of the practical side of running a paper mill. Consequently today, when the paper industry is endeavouring to expand, we in India have very few personnel who could, with any confidence, take over and run a mill of 25 tons per day capacity or more, and run it with full knowledge of the various sections. This means that, for many years to come, the large paper units will be constantly bidding for these few people to move from one mill to another, thereby disrupting the running of the mill from which the technician is taken. These highly skilled technicians are also not permitted, due to this movement, to stay at one mill long enough to train any one individual to take his place. It can, therefore, be seen that, for many years, the industry will have to rely on technicians from abroad.

In countries such as the U.S.A., Canada and Scandinavia where large mills are being developed, the problem of raw material does not arise as forests are in abundance and as soon as they are cut, afforestation is immediate, whereas, in India, for many years the bamboo forests have been indiscriminately cut without any thought of afforestation or the development of bamboo forests. Consequently, the large units have to haul their bamboo from increasing distances year after year. Some of the existing paper mills are hauling their bamboo as far as 300 to 500 miles.

Every endeavour is being made to improve the transport facilities, but it will be many years before rolling stock will be easily available and can move quickly from one point to another. In a mill of 100 tons a day capacity the average requirements of rolling stock for raw material alone is approximately 900 tons per day and as some of the raw materials are bulky and take a long time for loading and unloading, rolling stock is being held up for a number of days to facilitate the handling of the raw material. Consequently, although the estimate is 900 tons per day of rolling stock, it would not be unrealistic to say that, in view of the delay in handling, the lock-up of rolling stock could be very much greater and, as it is expected that, by the end of the present Plan, India will have 15 such mills, the requirement of rolling stock will be of the order of almost 30,000 tons per day to service our paper mills.

In view of this prospect, the Government's suggestion to develop small 5- and 10-ton paper mills located in areas where grass, rice straw and bagasse become annually available is undoubtedly very sound. In view of the country's policy to increase the output of food, more straw will become available. Accordingly, these small paper mills should be located nearer to consumer points for the finished product. If this is done, the major portion of the transport problem will be overcome. It is visualised that the majority of the straw would be delivered to the mills by the local farmers in bullock carts and the finished paper distributed to the local markets by road transport.

With a small unit of fairly simple design, the question of a highly trained technician to run these mills does not arise. Any reasonably well-trained chemical engineer, with four or five years' training in a paper mill, can, with a little further training by the builders of these small units, very well handle a 10-ton mill. The suppliers of the plant are prepared to commission these small plants and run them until the mill manager is able to take charge.

These small 5- and 10-ton units, which are now being built in India, cost approximately 25 per cent of that of a large unit. The generous depreciation permitted by the Government will have a very large bearing on the cost of the finished paper. The saving of high transport costs and the saving in the high overheads required to employ the skilled technicians required for large mills and in the distribution of finished products will make these small units economical from the point of view of profitability to investors and of foreign exchange to the country.

Undue Optimism About Cotton Supplies Unwarranted

Shadow Of Uncertainty Still Lingers

COMMENTING on the cotton supply prospects for the 1961-62 season, which ended on 31st August 1962, we pointed out, in our last annual Number, that the country should consider itself lucky if the bitter experience of the 1959-60 season, when the crop was hardly 3.8 million bales, were not repeated in 1961-62. It is a matter for some consolation that, though the season has turned out to be less favourable than the preceding one, namely 1960-61, from the point of view of availability of cotton it was better than the 1959-60 season. Nevertheless, the record mill consumption of Indian cotton during the season which, by a strange coincidence, exactly matched domestic production, and higher exports cut into the carryover stocks (of Indian cotton) which declined from the somewhat comfortable figure of 1.8 million bales at the beginning of the season to the precariously low level of 1.4 million bales at the end of it. The surplus accruing from the good crop of 5.4 million bales in 1960-61 was thus wiped out and the new (1962-63) season has had to start again with very low stocks.

The following table summarises the supply and distribution of cotton during the 1961-62 season, as compared with the previous season:

TABLE I: *Balance-sheet of Cotton*
(In thousand bales of 400 lbs. each)

	1961-62	1960-61
Supply:		
Stock (beginning of season):		
Indian cotton	1,809	980
Foreign cotton	335	430
Commercial production ..	4,700	5,408
Imports	855	1,000
Total supply ..	7,699	7,818
Distribution:		
Indian cotton:		
Estimated exports	357	295
Mill consumption	4,700	4,250
Foreign cotton consumption ..	1,010	1,100
	6,067	5,645
Stocks:		
Indian	1,452	1,814
Foreign	180	359
Total stocks ..	1,632	2,173
Total distribution ..	7,699	7,818

The above table indicates that the decline in production during 1961-62 as compared with the previous season and reduced imports were balanced by the higher carryover at the beginning of the season. Even so, the total supply was somewhat lower at 7.69 million bales, as against 7.8 million bales in the previous season. On the other hand, higher mill consumption and exports accounted for a larger disappearance (consumption+exports) namely, 6.06 million bales, as compared with 5.6 million bales in the previous season. Carryover stocks at the end of 1961-62 were, consequently, depleted from 2.1 million bales at the beginning of the season to 1.63 million bales.

The crop during 1961-62, as noted above, was a poor one, aggregating 4.7 million bales. The rain-fed tracts of the Omras in Madhya Pradesh and Maharashtra turned out a below-normal crop, thanks to untimely rains in October 1961 and cold waves in January 1962. In the South, the crop got off to a very late start and suffered a setback on account of unfavourable weather conditions in January and February 1962. The Western/Comptah crop, in particular, was below average. The only area that produced a fairly good crop was the Northern region, consisting of the Punjab, U.P. and Rajasthan. Quality-wise, practically all areas produced sub-normal crops. Quality was poorest in Madhya Pradesh (197/3 and Buris) and Western/Comptah region (Laxmi, Jayadhar and Farun). Only Saurashtra produced a good crop, Kalagin, Wagad and Co2 produced in the region being of excellent quality.

The following table gives a region-wise breakdown of the 1961-62 crop with comparisons for the previous two years:

TABLE II: *Area-wise Production*
(In thousand bales)

Areas	1961-62	1960-61	1959-60
Punjab, U.P., Rajasthan	1,042	762	885
Oomras	1,488	2,271	1,170
Gujerat/Saurashtra ..	1,388	1,484	927
Western/Comptah/ Southern	766	871	816
Assam/Comilla ..	16	20	12
Total ..	4,700	5,408	3,810

Actual availability of cotton for mill consumption during the season was less than what the production figure indicate. This is because a good portion of the crop consisted of Bengal *Deshi*, only a limited quantity of which can be used locally. Production of this type of cotton in 1961-62 was a record high of 564,000 bales, as compared with the normal production of 300,000-350,000 bales.

Target and Performance

The third Plan target for cotton for the 1961-62 season was 5.42 million bales. Production fell short of this target by over 900,000 bales, if the official estimate of production of 4.5 million bales is taken into account and by 700,000 bales if the trade estimate is taken into account. The year's experience once again demonstrated the vulnerability of the crop to weather conditions. It is so because only 13 per cent of the total area under cotton is at present irrigated. Every effort should, therefore be made to bring more land under irrigation so as to impart an element of stability to cotton production which at present fluctuates widely from year to year. This, however, is a long-term solution. In the meantime, as Dr. A. D. Pandit, President of the Indian Central Committee suggested, attention should be concentrated on ways and means of securing an average crop even under unfavourable weather conditions. It should not be beyond the ability of research and development workers and the Government to minimise the effects of adverse seasonal conditions.

The sharp swings in output and the unpredictable nature of production has induced the Planning Commission and the Union Ministry of Agriculture to devote special and increasing attention to bring about an increase in cotton production. Two measures taken in this regard may be mentioned. One is the inclusion of cotton in the package programme and the other the offer of Government assistance for a wider adoption of plant protection measures. How far, and to what extent, these will help to increase production on a permanent basis remains to be seen.

In the field of cotton research, the trend of late has been to devote more attention to the problem of raising the yield per acre of cotton. Although encouraging results have been obtained in experimental and demonstration farms, they are yet to be reflected in actual commercial production. Recently, model agronomic schemes have been sanctioned for all the major cotton-growing States. These schemes envisage the conduct of comprehensive agronomic experiments to ascertain all the factors conducive to higher yield.

Research and Extension

The main problem, however, is not acquisition of new knowledge about increasing yield but dissemination of that already accumulated. There is a good deal of knowledge available with

TABLE III: *Progress in Quality*
(In thousand bales of 400 lbs.)

Season	A	B	C	Total
1955-56 ..	1,577 (39)	1,781 (44)	662 (17)	4,020 (100)
1956-57 ..	2,018 (42.50)	1,950 (41.25)	767 (16.25)	4,735 (100)
1957-58 ..	1,760 (37.00)	2,122 (45.00)	857 (18.00)	4,739 (100)
1958-59 ..	1,637 (35.00)	2,293 (49.00)	775 (16.00)	4,705 (100)
1959-60 ..	1,858 (50.50)	1,231 (33.40)	589 (16.10)	3,678 (100)
1960-61 ..	2,442 (45.3)	2,180 (40.4)	768 (14.3)	5,390 (100)
1961-62 ..	1,873 (41.6)	1,784 (39.6)	843 (18.8)	4,500 (100)

Note:—Figures in brackets are percentages to total.
A—Long staple (⅞" and above).
B—*Medium staple* (below ⅞" and above 11/16").
C—Short staple (11/16" and below).
N.B.—Figures of production given in the above table are official estimates.

research scientists in this country which, if applied in practice, can contribute significantly in the form of better yields. For instance, it has been found that, in the Vidarbha region of Maharashtra alone, where American cotton is grown under rain-fed conditions over some 1.5 million acres, an increase of 60 lbs. of *kapas* per acre could be obtained by applying 20 lbs. of nitrogen per acre. This means that, merely by fertilising the crop in this area, it would be possible to secure an additional output of 75,000 bales. Similar results could be obtained through the adoption of plant protection measures. At present, there is a wide gap between applied research and extension to fields: unless this gap is bridged and the results of research percolate to the level of the ordinary farmer, no perceptible improvement in output and yield of cotton can be expected. Efforts in this direction have so far been tardy, half-hearted and unaccompanied by ways and means of providing farmers with the necessary financial resources. Hence the woefully low yield per acre in this country even after eleven years of planning.

The position in respect of staple length and quality has, however, been encouraging as Table III indicates. It is evident from the above table that barring the last season, when the quality of the crop suffered a setback due to adverse weather conditions, the improvement has been quite substantial during the second Plan period.

The reduced crop and higher mill consumption necessitated imports almost on the same high level as in the previous two seasons. Import quotas announced during the season aggregated 1,066,330 bales of 400 lbs. each, as compared with 1,112,500 bales of 400 lbs. each in the previous season. Actual arrivals were, however, less at 864,706 bales of 180 kilograms, as compared with 949,148 bales of 180 kilograms each in the previous season.

In spite of the lower overall crop, the record production of Bengal *Deshi* permitted larger exports. Total shipments during the season were of the order of 323,665 bales (of 180 kilograms), as against 290,020 bales in the previous season. The destination-wise breakdown of exports is as follows:

Mill consumption of cotton, as noted above, reached a record figure of 5.70 million bales of 180 kilograms each during the season, as compared with 5.37 million bales in the previous season. The monthly trend of consumption of Indian and foreign cotton is given in Table VI.

It is noteworthy that, while consumption of Indian cotton had increased by about 500,000 bales over the previous year's figure, that of foreign cotton has declined from 1.127 million bales in 1960-61 to 978,021 bales during 1961-62. The fear that the serious foreign exchange situation would render imports of cotton extremely difficult and the delay in getting P.L. 480 allocation resulted in mills using more Indian cotton. An increase in third-shift working of mills also contributed to higher consumption of Indian cotton.

Controls Ineffective

The small crop and the rising trend of mill consumption had a bullish effect on prices during the season. Prices of all varieties of cotton started rising steadily right from the beginning of the season. Consequently, the control measures were tightened further. Compulsory quality survey, which was reintroduced after it had been prematurely lifted early in the season, was sought to be made more effective by stipulating that every single lot of Indian cotton should be classified quality-wise at the ginning and pressing stage and that maximum prices permissible under the ceiling price schedule be fixed for each and every lot of Indian cotton in the respective survey certificates. As in the previous season, freedom of mills to buy

TABLE IV: *Imports of Foreign Cotton*
(In bales of 180 kilograms)

Other sorts	29,313	37,372
Total ..	864,706	949,148

cotton continued to be restricted by quotas issued to them by the Textile Commissioner. A further modification was made in the quota system, whereby the qualities, which mills were allowed to buy were also specified. Mills were also prohibited from holding stocks in excess of five months' average consumption. The Textile Commissioner continued to be empowered to requisition cotton at his discretion whenever mills found it impossible to obtain cotton at the ceiling prices.

These controls, however, were not of much avail in arresting the upward trend of prices. The following observation of a leading firm of cotton traders is an eloquent commentary on the efficiency of these controls:

"In spite of all the controls the bullish sentiment reasserted itself through the medium of increasingly more lenient quality surveys. In other words, cotton was valued to fit the price which the mills were prepared to pay. Towards the end of the season, the quality survey certificates no longer bore any relation to the actual quality of the cotton thus certified. Qualities, where the ceiling price was comparatively low,

were elevated and marketed under the name and descriptions qualifying for higher prices."

The closing months of the season witnessed a prolonged agitation for decontrol of cotton. Mill interests on the one hand and traders and a section of growers on the other found themselves ranged on opposite sides, the former opposing decontrol and the latter two in favour of it. The Government wisely decided on a policy of the golden mean. Although the plea for decontrol was rejected, ceiling prices of all varieties of cotton were raised by Rs. 35 per quintal or Rs. 125 per candy with effect from 1st September 1962, that is, the beginning of the current season. The floor levels, however, were left unaltered, so that the range between the two limits widened considerably. Certain modifications were also made in the system of compulsory survey. Accordingly, instead of compulsory survey at the ginning and pressing stage, it was stipulated that compulsory survey must take place prior to the delivery of cotton to a mill. The number of regional survey committees acting on behalf of the E.I.C.A. was drastically reduced, while, in addition to the E.I.C.A., six

more zonal committees, one each at Ahmedabad, Akola, Ujjain, Bhatinda, Hubli and Tirupur were authorised to conduct quality surveys.

Supervisory Scheme

As the new season started with a small carryover of stocks, it was felt that the initial bulk-buying by mills would tend to keep prices above the ceilings, if no further step were taken to regulate the marketing of the new crop. Representatives of the mill industry, the trade and the Government discussed various schemes whereby mills could be assured of adequate supplies within the ceilings. These discussions resulted in the supervisory scheme which was devised by the Textile Commissioner in consultation with the mill industry and the trade. The function of a supervisor, stated simply, is twofold: first, to ascertain that the surveyor draws samples in the correct manner prescribed and, secondly, to tally invoice prices with the legal ceiling prices based on the survey certificates of the specific lots sold. In addition, he is empowered to check physical weights of bales and ensure that mills bought only such quantities of cotton as are permissible under the quotas allotted to them. The supervisory scheme has attracted a good deal of criticism. In fact, two writ petitions have been filed at the Bombay High Court by two cotton merchants from Tirupur challenging the constitutional validity of the scheme. The traders, as well as

MORE FOREIGN EXCHANGE FOR THE NATIONAL PLAN

Extensive international trade is essential for the development of national economy. A country's foreign trade largely depends on efficient banking service.
With a network of correspondents at all important trade centres of the world the United Bank is equipped to render adequate service and give expert guidance in matters of foreign trade.

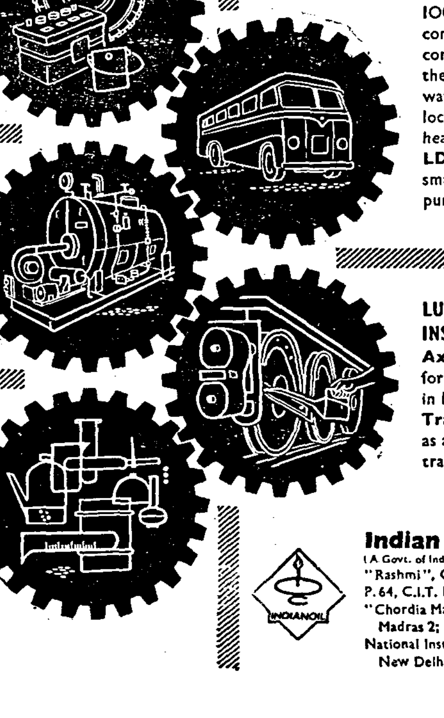
INDIAN OIL CO.

A NATIONAL UNDERTAKING, DISTRIBUTING PETROLEUM PRODUCTS FOR INDUSTRY.

All India is now served by the Indian Oil Company (IOC), the new State-owned petroleum distribution organisation, and most of the requirements for Industrial and Automotive fuels and Special Products, including Lubricants, can speedily be met.



AROMEX: for manufacturing carbon black, varnishes and paints, wood preservatives, wire enamels, rust-proof coatings and as solvent for insecticides

FUEL OILS: to help conserve coal. IOC's low-sulphur content **Furnace Oil** is ideal for a wide range of industries. **Tea Drier Oil** is fast replacing coal on tea and coffee plantations

NAPHTHA: for petrochemicals, fertilizer projects and town gas

DIESEL OILS: IOC's low-sulphur content **HSD** prevents acid corrosion and increases the life of all road and waterway transport, railway locomotives and of other heavy-duty equipment. **LDO** for power stations, small workshops and pumping engines

LUBRICANTS/INSULATORS: **Axle Oil** for railways and for other fast-moving axles in heavy machinery. **Transformer Oil** for use as an insulating medium in transformers and switchgear

mills, are awaiting the outcome of the petitions.

The Tide Turns ?

Although, as noted above, stocks of cotton with mills were considerably depleted at the beginning of the current season, cotton prices have tended to decline. Expectations of a good crop of 5.4 million bales—some estimate the crop even higher at 5.6 million bales—the heavy accumulation of cloth with mills and the hope that, in view of the emergency caused by the Chinese aggression, more P.L. 480 cotton would be made available by the U.S., have imparted weakness to both the futures and spot markets. In a bid to arrest the falling trend of futures prices the Forward Markets Commission fixed, on 10th December, the limit of the fall in futures price at Rs. 10 a week when the price of the futures contract, namely, Moglai Jarilla March 1963, ruled below Rs. 675 per three quintals. The Textile Commissioner simultaneously announced the second instalment of quota of Indian cotton to mills with a view to enabling them to support the spot market. The restrictions on the movement of the crop imposed at the beginning of the season have also been removed.

Following the decline in cotton prices the demand for a further upward revision of the floor prices has been revived by a section of farmers. The Government has promised to consider the question. It may be noted here that it was only during the last season that the floor price was raised from Rs. 139 per quintal to Rs. 168.75 per quintal (that is, Rs. 495 to Rs. 600 per candy).

Outlook

If one were to take an overall view of the prospective supply of and demand for cotton, one would find that the present easiness in cotton prices cannot persist for long. The estimated requirements of cotton during the current season is 8.4 million bales, comprising 5.9 million bales for consumption by mills, 300,000 bales for export and 2.2 million bales for stocks. As against this, indigenous supply is currently estimated at 7 million bales made up of a carryover stock of 1.6 million bales and an expected crop of 5.4 million bales. The gap to be filled by imports is, therefore, 1.4 million bales. Import quotas already released, amounting to 555,000 bales, and cotton expected to arrive against last season's quota, aggregating 250,000 bales, add up to only 800,000 bales, leaving a gap of about 600,000 bales still uncovered. How are we to get this additional supply in view of the tight foreign exchange position ? Will the U.S. agree to oblige this country by giving more cotton under the P.L. 480 ? Time alone can tell. Meanwhile, the calculations made here will all be upset, if the crop, which is not yet out of danger, turns out to be smaller than expected or the expectations regarding the imports of cotton do not materialise. Caution should, therefore, be the keynote of the raw cotton policy in the coming months of the current season.

COTTON MILL INDUSTRY

(*Concluded from page 164*)

June 1961 and 29th June 1962. The export obligation for the six months ending 31st December 1962 will be half of this.

The obligation can be fulfilled by a mill by exporting its own products in full or by exporting its own goods in part and by arranging with another mill to export the balance on its behalf.

Those mills which fail to fulfil their full obligation should contribute to the export effort by paying to the export promotion fund of the Federation a sum equal to one-eighth of the value by which their export performance falls short of their obligation.

It was estimated that the total export obligation of mills in a full year under the scheme now accepted by the Federation would be around Rs. 65 crores. The export earning of the textile industry during the calendar year 1961 through exports of cloth and yarn was Rs. 49.6 crores.

Left to themselves, the millowners might not have imposed upon themselves compulsion in textile exports. They were actually goaded by the powers-that-be to implement the scheme. The idea of compulsory exports no doubt reflects the seriousness of the foreign exchange position and the imperative need for expanding exports at any cost. But one wonders whether exports could be promoted this way, when, on the one side, the conditions obtaining in the industry are disquieting to a degree and, on the other, there is fierce competition in world textile markets. At any rate, the scheme of compulsory textile exports during the second half of 1962 does not seem to have been much of a success. It is, however, too early to pronounce any definite opinion on this point.

The estimated shipment of 500 million yards in 1962 falls considerably short of the third Plan target of 800 million yards and the peak level of exports amounting to 1,120 million yards touched in 1950. The foreign exchange earned from cotton textiles has steadily declined from Rs. 64.27 crores in 1959-60 to Rs. 57.55 crores in 1960-61 and Rs. 48.40 crores in 1961-62. The persistently downward trend of cloth exports has been due to stiffer competition offered by other countries, particularly Japan, Hong Kong, Pakistan, Communist China and Spain. Indian textiles are rapidly getting priced out in world markets.

CLOTH PRICES

Apropos statements appearing in the Press to the effect that one of the reasons for the accumulation of cloth in some of the textile mills is the uncertainty attending on the Tariff Commission's recommendations on prices and Government's decisions thereon, the Government of India has stated that, while the Tariff Commission's report on cloth and yarn has been received, the examination of the recommendations by Government is expected to take some time. The decisions of the Government on the recommendations of the Tariff Commission, we are told, will come up for implementation only after April 1963. No revision in prices of cloth or yarn based on the Tariff Commission's report need, therefore, be expected before the examination is completed, that is, after April 1963. In the meantime, the textile industry has been asked to continue to offer such reductions in prices as may be possible so that the trade may be induced to resume normal offtake of goods. The stamped prices, it is pointed out, are only the ceiling prices and all sales at prices lower than stamped prices are perfectly legal.

JUTE

(*Concluded from page 163*)

whole programme, to be determined in consultation with the Government, will depend on the availability of foreign exchange, the indigenous output of modern jute mill machinery and the probable impact of loom automatisation on employment. The requirement of foreign exchange for machinery imports till a complete range and adequate level of indigenous production is attained, as well as for imports of spare parts and stores the manufacture of which in India is not considered to be economic, is estimated at Rs. 6.5 crores only for the third Plan period. The estimated total investment in the industry in the same period is expected to be Rs. 12 crores.

Raw Jute

In the context of enhancing the competitive capacity of Indian jute goods in world markets *vis-a-vis* not merely Pakistan jute goods but also other substitute packing materials such as paper, cotton and plastic bags, the need for reducing the cost of raw jute by raising the per-acre yields assumes special importance. The average yield of raw jute per hectare during 1961-62, though it was higher than in 1960-61 and 1959-60 (6.88 bales, as against 6.51 bales and 6.75 bales, respectively), is less than that, namely, 8.36 bales obtained in East Pakistan which is as backward as, if not more backward than, India in the matter of agricultural productivity. Incidentally, to the extent productivity of jute lands is stepped up, a large part of acreage can be released for the cultivation of rice, the production of which is lagging behind the country's growing needs.

More of raw jute can be produced in a given plot of land provided multiplication of improved seeds, supply of more fertilisers preceded by intensive soil testing surveys, adoption of other improved cultural practices are given real top priority. It is only through a rise in productivity that jute growers can be ensured a decent return and not through fixation of a high minimum price. In considering the price aspect, it must always be borne in mind that the jute industry is an export industry, with 75 per cent of its production being sold abroad.

SUGAR AVAILABLE FREELY EVERYWHERE

Cane Price Linked to Both Quantity and Sucrose Content

PLENTIFUL supplies of sugar were available in every nook and corner of the country throughout the past season (November 1961-October 1962) and prices were comparatively stable. This was so, despite the substantial fall of 280,000 tons in output which aggregated 2.70 million tons, as against the record production of 2.98 million tons in 1960-61. For the season had begun with a huge carryover stock of over 1.18 million tons, so that the actual aggregate supply of sugar was markedly higher at 3.88 million tons, as compared with 3.58 million tons. And the commodity was freely available in any part of the country because there were no controls either on distribution or on prices, though the Government of India continued its policy of monthly releases. What was more, the sugar mills endeavoured their best to see that there was no undue rise in prices, as they were anxious to avoid consumer resistance to high prices, leading to the previous year's repetition of the disquieting problem of heavy accumulations. The ready availability of sugar and the comparatively stable prices, together with the shift in consumer preference from *gur-khandsari* to white sugar (in view of the high prices commanded by the former) and the addition of 8 to 9 million to the country's population, gave a significant boost to consumption. The quantity of sugar believed to have been actually consumed in the 1961-62 season was 2.54 million tons, as against 2.09 million tons in 1960-61. The rise in consumption would doubtless have been much more but for the continued heavy incidence of excise duty—Rs. 28.55 nP per kg. of sugar out of 119 nP per kg. paid by the consumer.

Sugar Balance-sheet

The statistical position of white sugar in the 1961-62 sugar season (1st November to 31st October) as compared with that in the two seasons preceding it is indicated below:

Sugar Balance-sheet
(In thousand tons)

	1961-62	1960-61	1959-60
Opening stocks ..	1,185	595	173
Production	2,700	2,981	2,443
Total supply ..	3,885	3,576	2,616
Exports	330*	300	Nil
Supply available for domestic consumption..	3,555	3,276	2,616
Consumption	2,545	2,091	2,021
Closing stocks as on 31st October ..	1,010	1,185	595

* Commitments to export aggregate 500,000 tons.

The decline in sugar production was not due to any shortage of cane supplies. It is true that the 1961-62 season witnessed a distinct setback to the crop, the total yield being no more than 96.03 million tons, as against over 102.48 million tons harvested in 1960-61. It is also true that the prices of *gur* and *khandsari*, the two substitutes for white sugar, were pretty high, so that the growers found it more profitable to utilise the cane themselves for making *gur* and *khandsari*, instead of selling to sugar mills. But these were not the factors which affected the crushing operations of mills. Even with a reduced crop and larger diversion of cane supplies to the manufacture of brown sugars, the sugar mills could have definitely produced more, but they could not, thanks to the ten per cent cut in output enforced by the Central Government, except in the case of the newly established factories, mills with rather low level of production and units having licences for effecting substantial expansion of their working capacity. The Government had fixed output quotas for individual sugar mills and, if any unit were to produce in excess of its quota, it had to pay on such excess output a special excise duty equal to the duty (Rs. 14.56 per cwt.) chargeable on sugar under the Central Excise Act. The penal levy was very high and acted as a strong deterrent to mills that desired, and were in a position, to produce sugar in excess of their quotas.

Sugar production in the State of Maharashtra, which had gone up from 392,097 tons in 1959-60 to 514,672 tons in 1960-61, declined to about 500,000 tons in the season under review, the number of factories working being no more than 27. Not only is the State today self-sufficient in sugar but actually there is a surplus.

As against the fall of 280,000 tons in sugar production (corresponding almost to the 10 per cent cut) in 1961-62, offtake of sugar rose by 560,000 tons to 2.95 million tons—domestic consumption by 454,000 tons to 2.54 million tons and exports (on the basis of commitments made) by 200,000 tons to 500,000 tons. The pace of sugar despatches from mills was, therefore, faster than in 1960-61 as is shown in the following table:

Production and Despatches
(In tons)

Month	Production		Despatches	
	1961-62	1960-61	1961-62	1960-61
November ..	117,057	232,908	202,162	150,413
December ..	416,588	479,985	202,971	163,489
January ..	546,587	530,098	184,417	164,175
February ..	510,253	491,302	182,143	175,923
March ..	508,222	502,312	223,195	224,790
April ..	353,567	409,962	267,487	179,210
May ..	159,730	206,000	264,701	176,000
June ..	42,071	43,000	243,969	189,000
July ..	3,939	4,646	260,507	200,471
August ..	4,991	15,000	232,473	234,000
September ..	9,000	16,000	254,000	238,000
October ..	27,995	49,787	306,975	295,529
Total ..	2,700,000	2,981,000	2,875,000	2,391,000

Since the improvement in sugar offtake was more marked than the rise in supply, the season 1961-62 ended (on 31st October 1962) with a closing stock of 1,010,000 tons, as against 1,185,000 tons a year before. Ordinarily, this quantity will have been considered as quite high, but not so now, apparently because production prospects for the current (November 1962-October 1963) season are not promising as will be discussed later in the review. Besides, in view of the state of emergency created by China's undeclared war on India, it has become imperative to keep a large stockpile of sugar.

Prices Decline

The surfeit of sugar supplies during the season under review exerted a downward pressure on prices. The average ruling prices of white sugar were much lower than the controlled prices in force prior to the abolition of controls on 27th September 1961, whereas the *gur* and *khandsari* prices registered a sharp rise, though a downtrend was discernible even in them towards the close of the season. The trend of sugar, *gur* and *khandsari* prices is indicated in the statement given below:

Trend of Prices
(In rupees per quintal)

	15th Nov. 1962	End of July 1962	A year before 15-11-61
Sugar—			
Bombay (D29) ..	109.37 (113.00)	113.06	113.06
Muzaffarnagar (Crystal) ..	104.75 (108.25)	107.62	106.00
Hapur (Crystal) ..	105.75 (108.25)	106.00	107.00
Meerut (D29) ..	103.50 (105.37)	107.37	104.37
Gur—			
Kolhapur (Special) ..	90.00	72.50	70.50
Hapur (Pausara Superior) ..	48.56	77.35*	44.24
Muzaffarnagar (Chaku dry) ..	62.50	63.62*	42.56
Khandsari—			
Hapur (Superior) ..	95.78	96.45*	91.89
Hapur (Crystal) ..	98.46	99.47*	96.24

Note :—Only average prices are taken into account. Figures in brackets relate to the previously controlled prices.
* Middle of October 1962.

If sugar prices did not fall steeply despite the abundance of supply, it was because of (*a*) controlled releases of sugar to the market in order to prevent unhealthy inter-mill competition and (*b*) the rigid cost structure of mills, the cane price alone accounting for three-fourths of the cost of making sugar. Nor was there any scope for a reduction in retail price, in view of the heavy incidence of taxation, the share of excise duty in the price being as much as 30 per cent. The Minister for Food and Agriculture himself admitted in Parliament on 13th November that there was no possibility of a reduction in sugar prices in the immediate future, as the margin of profit for the sugar trade was only about 20 per cent, the rest of the price went to make up production cost and taxes.

Considering the heavy incidence of cane cost, the problem of bringing down the cost has naturally to be tackled in the primary stage of sugar industry. Conditions in the cane economy did register an improvement during the second Plan period, thanks to the intensified development schemes, as witness the rise in the average per-acre yield from 12.98 tons (in 1955-56) to 17.72 tons (in 1960-61). These figures, incidentally, have been arrived at on the basis of revised official estimates for the period chosen for comparison. The revised estimate for 1960-61 shows a marked increase of 20 per cent in cane yield as compared with the final estimate for that season published earlier. Be that as it may, the position seems to have deteriorated in the 1961-62 season. According to final estimates (preliminary), the area sown to the crop was substantially larger at 5,942,000 acres, as against 5,789,000 acres in 1960-61, the actual yield of cane was smaller, being 96.02 million tons, as against 102.48 million tons. In other words, the average per-acre yield was considerably less, being 16.16 tons.

Price-linking Formula

On 22nd August 1962, the Government of India released the Tariff Commission's report (submitted as far back as in June 1961) on the revision of the price-linking formula for sharing the price of sugar between factories and cane growers together with its resolution thereon. The resolution stated that the Government had decided to retain, in respect of the four seasons 1958-59 to 1961-62, the formula notified in September 1958 in the Sugarcane (Control) Order, after making suitable changes. Since the proposed changes had to be given retrospective effect, Parliament passed the necessary legislation (on 16th September 1962), namely, the Sugarcane Control (Additional Powers) Act, 1962, authorising the Central Government to amend the provisions of the Sugarcane (Control) Order relating to additional payments either prospectively or retrospectively. The changes made by the Government in the formula for making additional payments to cane growers for the aforesaid four seasons were actually notified in a *Gazette Extraordinary*, vide the one dated 1st November 1962. The three principal changes effected were:

1. The schedule of costs given by the Tariff Commission in its report of 1959 has been used for purposes of determining the ratio which the cost of sugarcane bears to the cost of sugar (excluding taxes). There is a provision for the costs to be brought up-to-date.

2. Three-fourths of the amount earned by sugar mills by way of rebate of excise duty for their production during the 1959-60 and 1960-61 seasons will be taken into account for determining the additional price to be paid to cane growers. This amount will, however, be shareable in the same manner as other receipts.

3. An allowance for the purposes of rehabilitation has been made admissible to such factories as may have actually spent a certain amount on rehabilitation or transferred such amounts as reserve to a special rehabilitation account during the year.

The *Gazette* notification did not contain any reference to the machinery required to determine the amount which might become due to cane growers from the sugar mills in the various parts of the country. The Government said that such a machinery would be set up shortly. It was intended to complete this process as soon as possible, though it would involve the scrutiny of accounts and other data pertaining to the period of four years, of all factories.

New Cane Price Formula

The sugar price linking formula has ceased to be in operation since the commencement of the current (1962-63) season on 1st November 1962. The cane prices are now linked to both the recovery per cent of sugar contained in cane and the quantity of cane as such in accordance with a new formula announced, whereas the system hitherto in vogue had as the basis only the quantity of cane delivered to a factory irrespective of quality considerations. The salient features of the new formula, an-

CONDENSED MILK TO COSMETICS

Milk products or cosmetics, lubricants or vanaspati, paints or pharmaceuticals, processed food or printing inks, wide is the range of industries served by tin containers manufactured by Poysha. Though young in years, they are already one of the leading tin container manufacturers in the country. Over the last four years their turnover has increased by about 70%, annually ■ A great deal has been achieved in such a short time because at Poysha the emphasis is always on quality and service. At every stage of manufacture quality control is exercised by technicians, working with modern equipment. Service begins even before the order is placed and ends only when canning is completed.

GROWING WITH THE TIMES...

This tree is a symbol of BATLIBOIS' development. It's been growing now for 70 years. In 1892, Batliboi & Company first began their service of machinery supply. Since then, Indian industry has developed from a handful of isolated textile mills, ginning factories, and workshops, to a vast complex of enterprises...some huge, some small, producing on a large or modest scale...but nearly all relying on machinery. And BATLIBOIS have helped to fulfil that need. ■ For 70 years BATLIBOIS have sustained a continuous tradition of usefulness—supplying essential machinery, imported and indigenous, to the countless industries that needed it. ■ Today, a chain of BATLIBOI offices extends its services all over India...upholds a lively tradition that makes BATLIBOI a leading name in the field of industrial supply.

RPC/248/62

nounced on 3rd July 1962, are as follows:

The minimum price of cane with a recovery of 9.8 per cent is maintained at Re. 1.62 per maund. A discount or premium, as the case may be, shall be allowed on this price at the rate of 1.5 nP for every 0.1 per cent fall or rise in the average certified recovery below or above 9.8 per cent. There will be no discount if the recovery falls below 9 per cent. In other words, Re. 1.50 per maund of cane delivered at the gate of factory shall be the irreducible minimum price. The price for delivery at purchasing centres connected by rail shall be 12 nP less than the price paid at the factory gate. The usual transport rebate will be admissible in case cane is transported by road.

So far as the maximum is concerned, no premium will be paid on sucrose-content in excess of 10.14 per cent.

Accordingly, the price per maund of cane varies from a minimum of Re. 1.50 for cane with sucrose-content of 9 per cent and a maximum of Rs. 2.13 for cane with sucrose-content of 10.14 per cent and above.

While the new scheme is a welcome departure from the principle followed so far, its application in actual practice suffers from two disquieting features. First, the minimum price of Re. 1.62 per maund of cane (as against the old price of Re. 1.44 applicable for the seasons from 1953-54 to 1958-59), which was itself high in all conscience, has been continued and, second, the recovery per cent of 9.8 per cent taken as the average basis is very low. In other words, the sugar mills are made to pay the enhanced price of Re. 1.62 per maund for cane with a recovery of just 9.8 per cent and not the usual basis of 10 per cent that had been regarded as the norm all these years. In effect, therefore, the minimum price for cane with 10 per cent recovery is higher than before—Re. 1.62.2/5 per maund, a rise of another 2.4 nP, though there is one consolation and that is that, as a result of the new scheme, the sugar mills are no longer liable to pay to cane growers a share in the price of sugar realised by them in excess of what is regarded by the Government as the fair ex-mill prices.

The Government, as we have pointed out on more than one occasion, ought to have fixed the minimum price as the maximum to be paid for cane with the highest sucrose-content, say, 11 per cent if not 12 per cent. Alternatively, the Government should have at least continued the premium for the increase in sucrose-content upto 12 per cent instead of stopping at, as it has done now, 10.14 per cent. There are areas and farmers with records well in excess of the ceiling. It is obvious that such good lands and efficient growers should receive a better reward than those whose performance is below the mark. Such a policy would certainly augment the productivity of cane lands both quantitatively and qualitatively. This is necessary for two reasons: (1) The area currently being devoted to sugarcane needs to be reduced substantially, so that more land can be devoted to foodgrains and/or other cash crops. And (2), the cost of sugar has to be brought down significantly; otherwise, sugar exports will continue to be at a heavy sacrifice, not to speak of the plight of the domestic consumer. It may be noted here that the export of 400,000 tons of sugar in 1962, which at best could fetch a foreign exchange of Rs. 16 crores, entailed a subsidy of as much as Rs. 17 crores which was mostly met by the Government.

Exports

In assessing the prospects for Indian sugar exports, one has to bear in mind the trend in the world sugar market. The International Sugar Council is of the view that there may be a close statistical balance between world sugar supply and demand during the calendar year 1963. The world free market's sugar requirements are estimated at 11.5 million metric tons and the U.S. imports at 3.6 million tons, bringing the total world market requirements to just over 15 million tens. The current (September 1962-August 1963) season's sugar output is expected to be higher than the 1961-62 production of 52.22 million tons. The anticipated rise in output is likely to make up for the reduced carryover stock of 16.19 million tons, as against 18.76 million tons a year before. Incidentally, the aggregate world sugar consumption is estimated at 56.79 million tons, as against 55 million tons in 1961-62 and 52.80 million tons in 1960-61.

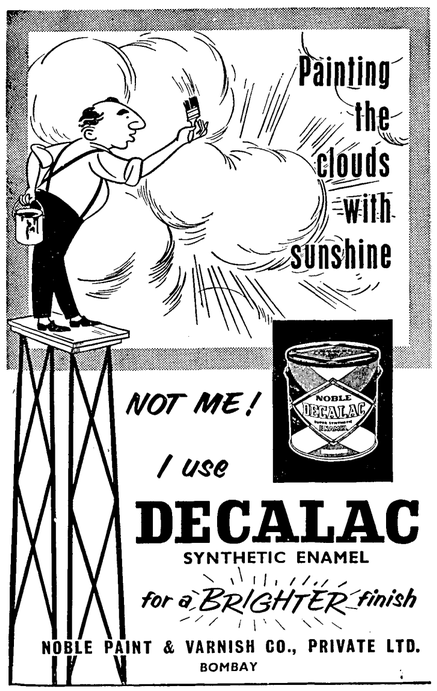
Whatever be the statistical position of world sugar, there is no denying that India can export sizable quantities of sugar only at a heavy sacrifice. It is reported that, early in November 1962, the State Trading Corporation sold 10,000 tons of sugar to Ceylon at Rs. 320 per ton, as against the f.o.b. cost of Rs. 800 after allowing for drawback of excise duty and cane cess. With a view to reducing the heavy loss and to meeting the demand for raw sugar, several factories have taken to the manufacture of raw sugar for export. While the move is good, it is pointed out by some sugar circles that the saving in production cost as a result of raw sugar manufacture is not much. Meanwhile, the Government of India has decided to stop further exports of sugar from the production of the 1962-63 season other than those required to meet the firm commitments already made by India with other countries for shipment in 1963. The total of these commitments is 400,000 tons, of which 200,000 tons will be exported to Japan, 100,000 tons to Canada, 70,000 tons to Malaya, 20,000 tons to the U.S. and 10,000 tons to Ceylon.

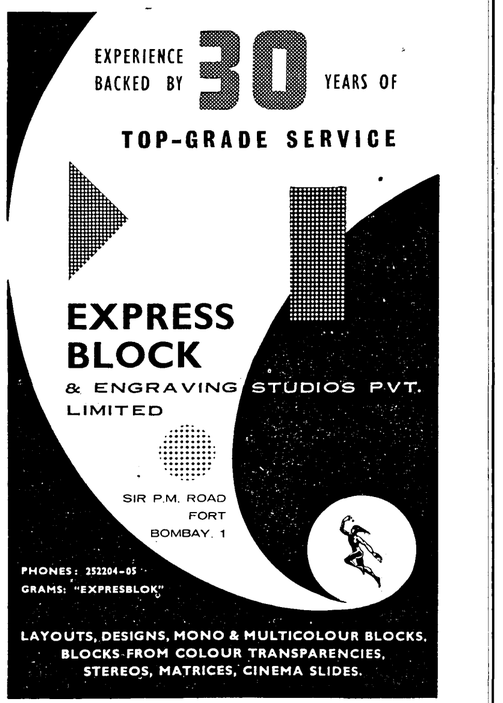
What of 1962-63?

The sugar production prospects in so far as the current (1962-63) season is concerned are, as already stated, not quite encouraging. The Government of India has, of course, removed the restrictions on output and the sugar mills are free to produce as much sugar as they can. The President of the Indian Sugar Mills Association, too, has appealed to all the mills to do their utmost to maximise production in response to the general call issued by the Prime Minister to the industries in view of the exigency of Indo-Chinese war. But it is highly doubtful whether the sugar industry would, in fact, be able to maintain even the 1961-62 season's level of 2.70 million tons; a section of sugar interests estimates the actual output at no more than 2.4 million tons. This estimate does not seem to be wide of the mark. For the cane crop has suffered a distinct setback again, owing to floods in the Punjab, premature dry weather in Uttar Pradesh and Bihar, and pest attack in the Deccan. The actual reduction in cane yield is put at 25 per cent in Bihar, 15 per cent in Maharashtra and 12 per cent in Uttar Pradesh. Considering the reduction in cane production and in view of the possible large-scale diversion of supplies to the manufacture of *gur* and *khandsari* which are commanding very high prices, the sugar mills are finding it difficult to obtain regular and adequate supplies of cane. The new sugarcane price formula linking the price of cane to both quality and quantity may not, therefore, be of much avail, though, under the formula, the cane growers get a higher price than what they would have received otherwise, if the quality of their cane is on the higher side. The proposal to manufacture raw sugar for export may also result in the dislocation in the normal production operations of mills.

It is thus clearly evident that, in the current season, the sugar industry will have the problem of underutilisation of capacity. Since the estimated output is only 2.4 million tons, as against the production capacity of 3.1 million tons, the capacity lying idle will be as much as 700,000 tons or 22.6 per cent. Can the country afford to suffer such a waste of capital resources? Certainly not, especially in the context of war with the Chinese and the exigency of exports. Whatever capacity that has been created in the sugar industry must be utilised fully. The Government, for instance, may take steps to restrict the flow of sugarcane to *gur* and *khandsari* manufacture. The State Governments must fully co-operate with the Centre in this direction. In view of the national emergency that has arisen, it is reported that the Maharashtra Government has decided to postpone the date of applying the ceiling legislation to the cane farms attached to the joint-stock sugar mills. The decision is realistic.

To sum up this review. The estimated sugar production of 2.4 million tons and the opening stock of 935,000 tons give a total available supply of about 3.34 million tons. Excluding the export commitment of 400,000 tons, the balance of supply available will be approximately 2.94 million tons. Assuming that the domestic consumption of sugar will be higher as compared with 1961-62 by another, say, 200,000 tons at 2.65 million tons, the season will end with a closing stock of no more than 290,000 tons which represent just five to six weeks' consumption. Of special significance, therefore, is the I.S.M.A. President's appeal to the sugar mills to endeavour their utmost to maximise production so as to cater to the increased civilian and defence requirements of this essential commodity.





LARGE DROP IN TEA AND COFFEE CROPS

Quality Of Coffee Needs Improvement

WHEN the Indian tea crop of 1961 touched the high level of 760 million pounds, representing an increase of 66 million pounds over the previous year's crop, there were many optimists, including some officials of the Government, who predicted a similar 'new high' for 1962 and hoped that the Plan target of 900 million pounds for 1965 would be overreached. Towards the end of June this year, however, it became quite apparent that the year's crop would not only not exceed last year's but would in all probability be several million pounds short of that level. Adverse weather in North-East India had affected production right from the beginning of the season in April, and continued almost to the end of the year. The crop for the ten months ended October had only totalled 510.6 million pounds, as compared with 535.7 million pounds for the same period of 1961, resulting in a shortfall of 25.1 million pounds. Towards the close of November, it was feared that the Chinese incursion would cause some further damage to production, but, fortunately, nothing happened and it is, therefore, hoped that the year's shortfall will remain at around 25 million pounds only.

The position of the South Indian tea crop was, on the contrary, very encouraging and production for the ten months ended October totalled 150.0 million pounds, as compared with 143.5 million pounds for the same period of 1961. Figures for September/October however showed a reduction by comparison with last year and it is probable that, when the final 1962 figures are announced, the excess of 6.5 million pounds would have been reduced by a million pounds. This would still leave an excess of 5.5 million pounds for South India and reduce the overall deficit to 20 million pounds. If these estimates prove true, the total Indian tea crop of 1962 would be about 740 million pounds, as compared with 760 million pounds of 1961.

World Production of Tea

It is also worthy of note that the world production of tea this year has not been above that of last year. While South India, Ceylon and some of the African countries have recorded an increase, North-East India and Pakistan have recorded a decrease, while Indonesia has kept level with 1961. The figures just released by the International Tea Committee bear out this fact.

Crop (in million lbs.)

	January-October	
	1962	1961
North-East India ..	510.6	535.7
South India	150.0	143.5
Kenya	29.2	21.3
Uganda	11.4	9.1
Tanganyika	7.8	7.5
Nyasaland	24.4	25.9
Mozambique	16.7	18.3
Ceylon (9 months) ..	349.0	341.0
Pakistan (9 months) ..	34.9	42.0
Indonesia (7 months) ..	58.4	58.1
Total ..	1,192.4	1,202.4

In the light of these figures, it seems that the F.A.O. forecast of a world surplus of 100 million lbs. of tea occurring by 1965 should now be regarded with reserve, even though at the time this estimate was made the trend of world production was certainly in the direction of a surplus. Much will depend on the extent to which this year's low production will be made up in the coming year and the increase that would occur during the next two years.

Notwithstanding the setback in production, the export of Indian tea this year has shown a distinct advance over last year. Total exports for the nine months ended September were of the order of 300.0 million pounds, as compared with 283.5 million pounds for the same period of 1961. This includes an increase of 5.2 million pounds in the export to the United Kingdom, our largest buyer. Ceylon also has stepped up its exports from 289.7 million pounds during the first eight months of 1961 to 309.5 million pounds during the same period this year. The increase includes additional exports to the United Kingdom of 12.9 million pounds. From this it is evident that our biggest competitor, Ceylon, is still ahead of India in the matter of exports to the United Kingdom. The African countries also have achieved larger exports to the U.K., but Indonesia and Pakistan have suffered a small diminution.

Relief to Exports

Although one cannot say it with any finality, it is generally believed that the improvement in our export performance this year has been largely due to the substantial reduction in the export duty announced early in the year. By reducing this duty from 44 nP to 25 nP per kilo and by providing for a refund of excise duty on tea exported at the rate of 15 nP per kilo, the tea industry did obtain a substantial concession which it has used with advantage for export promotion. Before the concession was announced, Government had stated that relief in export duty would only be granted if Government was fully convinced that relief would result in a greater volume of exports. Now that a significant increase in the export level has been achieved after the relief was announced, one may hope that Government would find it possible to allow some further concession in this levy in the knowledge that the revenue loss thus sustained will be compensated for by increased earnings in foreign exchange.

Domestic Consumption

The Government of India, however, persists in its belief that internal consumption should be artificially restricted in order to allow for more exports of tea. In consequence, it has enhanced the rates of excise duty on tea, and, while doing so, it has overlooked the fact that not only will a neglected internal market be difficult to revive, but that this market is always a safeguard against violent fluctuations in world demand. The policy of the Government not to propagate the consumption of tea within the country is, for similar reasons, a short-sighted one. If impediments in the way of greater production are removed and incentives are given, there would be no need for any sort of artificial regulation of internal consumption.

It is encouraging to see that the Government has this year bestowed greater attention to propaganda abroad. Concerned about the steady diminution in the export of tea to India's second and third largest markets, namely, the U.S.A. and Canada, the Government allowed the Tea Board to send a delegation to these countries, and more recently another to Australia and New Zealand. The report of the delegation which toured the U.S.A. and Canada has recommended the continuance of the Tea Council and India's participation therein. It did not recommend any uninational campaign by India, but felt that closer touch with the Tea Council and greater efforts through the Council would promote the consumption of Indian tea in both the countries. It has also drawn attention to the fact that, in the sphere of common and low medium teas, India has lost substantial ground in favour of other producing countries, owing to the comparably high prices, and urged that prices should be made more competitive.

Tea Prices Fall

Average prices realised for Indian tea so far both in London and in the Calcutta and Cochin auctions have been generally below last year's prices. At the end of November, North-East Indian tea fetched in London 5s. 2.60d. and South Indian tea 3s. 9.29d. per pound, while Ceylon teas realised 4s. 9.60d. In both North-East and South India, the price of common teas fell sharply during the first six months of this year and in many districts the price was below the cost of production. The increase in excise duty at this stage proved to be a heavy burden on low quality and medium teas which had to be sold internally. In some cases, the duty worked out to as much as 15 or 16 per cent of the price.

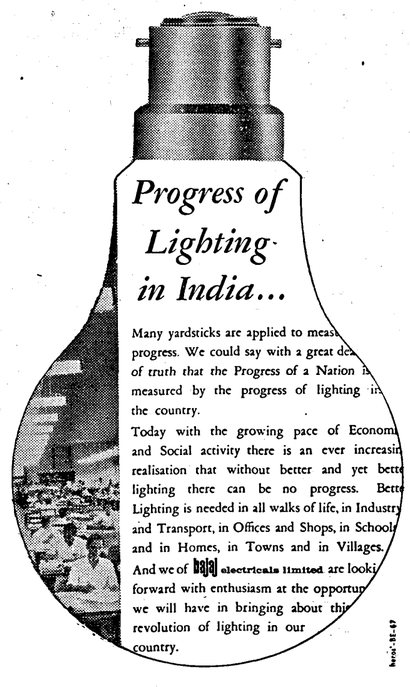
Realising the need to raise the export level the Government of India, through the newly set up Board of Trade, has been trying to remove some of the impediments in the way of export promotion in tea. The Tea Board also has announced several schemes for financial assistance to the tea gardens for working capital, purchase of machinery, irrigation equipment, etc. Although the industry still needs Government assistance in many matters there is a realisation that Government is trying to do as much as it can for the industry under present circumstances. If helpful official policy continues, one may hope that the tea industry will be able to prepare itself adequately for meeting the challenge of world competition in the coming years.

Coffee Crop Smaller

The Indian coffee crop for the 1961-62 season amounted to 45,653 tonnes at the end of November 1962. This was made up of 22,482 tonnes of Plantation, 6,620 tonnes of Arabica Cherry and 16,551 tonnes of Robusta. Last season's crop, which was an all-time record, was 67,587 tonnes, consisting of 28,968 tonnes of Plantation, 10,278 tonnes of Arabica Cherry and 28,341 tonnes of Robusta. Although this year's total crop is 30 per cent below last year's, it is good to know that the percentage of Plantation in the total is well above the percentage of last season.

Up to the end of November, 18,600 tonnes of coffee have been sold for export out of the current season's crop. The quantity consists of 11,249 tonnes of Plantation, 3,022 tonnes of Arabica Cherry and 4,329 tonnes of Robusta. A further 361 tonnes have been reserved for export auction at the end of December, making a total of 18,961 tonnes.

The internal market has taken in all 31,454 tonnes of coffee out of this season's crop. This is 242 tonnes more than the quantity taken out



of last season's crop. The offtake consists of 11,235 tonnes of Plantation, 3,756 tonnes of Arabica Cherry and 16,463 tonnes of Robusta.

Fortunately, due to a combination of favourable circumstances, the prices realised this year have been well above last year's and it is hoped that the return to the grower will be around Rs. 2.50 per point, as against Rs. 1.97 only paid last season. The payment made to date comes to Re. 1.80 per point only. In view of the high cost of production and the need for sufficient working funds, the coffee growers have been asking the Board to expedite the payments, if necessary, by resorting to more borrowing.

Loss of Quality

With a view to exploring the prospects of increased sales of Indian coffee, a two-man delegation from the Coffee Board toured the United Kingdom towards the end of 1961. The delegation's report stated that there was a general feeling abroad that the quality of Indian coffee had gone down. Before the war, Indian plantation coffee was stated to be comparable with Kenya's, but now it had not only gone below Kenya's but also below Columbia's. According to a leading roaster, the Indian mild coffees had of late developed a harsh taste like Brazil's and immediate steps should be taken to improve the taste.

One of the reasons for the loss of quality is stated to be the insufficient drying and defective curing of coffee. Drying the coffee to the requisite standard is sometimes rendered difficult by long periods of misty and cloudy weather in the plantations. The inadequate care taken by the pool agents in bulking coffees was also brought to the notice of the delegation. Since the Continent is the best and the largest customer of Indian coffee, it is essential that we should leave no room for complaints of poor quality from this market. This could be achieved if the growers, curers and others concerned were to give a little more care and attention to the proper drying, curing and bulking of coffee. No doubt the Quality Committee of the Coffee Board will be going into the complaints and applying the necessary correctives.

It has been pointed out that the lack of an assurance of continuity of supplies is a further handicap in the sale of Indian coffee abroad. It is alleged that supplies released for sale from year to year and the quotas earmarked for export are not uniformly available, month to month, whereas other countries are able to regulate the supplies more evenly.

The appearance of a new disease in coffee on an extensive scale this year has been causing a great deal of anxiety to the growers. It is not known whether this disease which resembles "die-back" will affect the production only, but quality as well. The Board's Research Department is making a full investigation into this matter.

World Agreement

After prolonged discussion and study, the Government of India agreed to become a signatory to the International Coffee Agreement with effect from the 1st October 1962. India's main objection to participation in the Agreement was the comparatively low export quota allotted to it. Out of a total basic quota of 45,587,183 bags for all the signatory countries together, India's share has been fixed at 360,000 bags, which is the equivalent of about 21,600 tons. Considering the large increase in production anticipated during the next three years, which is the period of the Agreement, and India's own need for export promotion and foreign-exchange earnings, it was felt that this quota was far too small. India's acceptance, however, takes into consideration other advantages which would accrue from participation along with other major producers and exporters. The Agreement excludes exports to "new markets" and countries with a low *per capita* consumption such as Ceylon, Iraq, Iran, Japan, Philippines and the U.S.S.R.

Notwithstanding the low export quota allotted to India, it is felt that India's participation in the Agreement will improve Indian coffee prospects in many countries of the world. It may be noted that consuming countries are also associated in the Agreement. The East European countries, which are outside the Agreement, can take a large quantity of Indian coffee, and these markets should be fully explored. If steps are taken to improve the quality and to promote measures for greater consumption in the traditional as well as new markets, Indian coffee should have a bright future.

Rubber

Up to the end of September this year, India produced 20,846 tonnes of raw rubber, compared to 20,315 tonnes and 19,041 tonnes in the corresponding periods of 1961 and 1960, respectively. While the production thus shows an upward trend, it is not at all in proportion to actual needs. Production has to be stepped up to a much larger scale, if imports are to be reduced and the demands of the rubber goods manufacturing industry are to be met in full. Much emphasis has, therefore, been placed on the need for a vigorous replanting programme which, in the course of a few years, will raise the yield of rubber a hundred per cent or more. The Rubber Board's replanting scheme includes a subsidy of Rs. 1,000 per acre as well as a replanting allowance of Rs. 9 per 100 lbs. in the price of rubber. But the area replanted by the end of 1961 was only 20,000 acres. The Chairman of the Rubber Board has stated recently that at least another 80,000 acres require to be replanted by 1970, if not earlier. The Rubber Board delegation, which recently toured Malaya, has drawn attention to the considerable progress achieved by that country in the matter of replantation and better yields, and stressed the need for India also taking immediate steps to achieve similar results.

Cardamom

Cardamom growers in India are passing through a period of poor yields and low prices. Average prices realised in the Cochin auctions so far this year have been around Rs. 11.74 per kilo as against Rs. 14.83 last year. At current prices, the growers are not able to make a reasonable profit and provide funds for replantation and development.

Welcome Change

It is heartening to note a welcome change in the attitude of the Government towards the plantation industry in general. Many helpful measures have been announced to assist the industry to improve its competitive position in foreign markets as well as for its internal development. There have been few, if any, new taxes, while concessions in existing taxation have been announced. Legislation affecting labour appears to have been suspended temporarily. While this policy may have been dictated primarily to suit Government's own prevailing need for export promotion, the industry is glad that Government is at last beginning to see the facts clearly and adjust its policy accordingly.

SUGAR

FOR HOME CONSUMPTION AND FOR EXPORT

As the country's leading producers in terms of yield of cane per acre, and in the recovery of sugar per acre, we are proud of our contribution to national progress and prosperity.

Progress in Agriculture Disquietingly Poor

Dependence On Imports To Increase?

[Crop estimates are given in this country for the agricultural crop year ending June. The result is that, by the time the review for a calendar year is written, the data pertaining to the crop year falling within the calendar year under reference are only of historical importance. The latest official final estimates are for the crop season July 1961-June 1962, made up of the second half of the previous calendar year and the first half of the current calendar year under review. Although movements of crops of 1962-63 are well under way at the time of writing (second week of December), reliable estimates of production are not available. There are, of course, unofficial reports and trade estimates, but they are sometimes conflicting. One must, therefore, keep in mind these limitations while reading the review on this page.—Ed.]

THERE are unmistakable signs that India is faltering on the agricultural front. Unless this trend is rectified in good time, the apple-cart of planned economic development will topple down. This is no exaggeration, particularly in view of the emergency created by the Chinese aggression on Indian soil. It is a matter for grave concern that performance on the agricultural front should continue to fall far short of the targets laid down in the third Plan. There is no doubt that India has the capacity and the means for producing more, but if still the results are unsatisfactory, it is mostly because of the defects in Administration. This is true of both foodgrains and cash crops. But for large imports, particularly of foodgrains and raw cotton, the overall price situation would have turned adversely against consumers this year. Unless internal production of these commodities is substantially raised, and the growing gap between demand and supply is plugged, dependence on imports is bound to increase in the coming years. Since India's exports are stagnating and foreign aid is available only on a hand-to-mouth basis, such a necessity would have a deleterious effect on the plans for both defence and development.

Foodgrains

During the crop year ended June 1962—the latest period for which official (final) estimates are available—the total output of foodgrains fell by about 1.1 million tons to 78.5 million tons, as compared with the previous year (1960-61). Both cereals (particularly rice and *jowar*) and pulses (*gram* and *tur*) shared the decline. According to trade estimates available at the time of writing for the crop year 1962-63, the foodgrains production in the current year, which is roughly equal to the second year of the third Plan, may be no more than 80 million tons, that is a small increase over 1961-62 and almost the same as that for 1960-61. If this estimate turns out to be correct, it will mean that foodgrains output has been stagnant during the first two years of the third Plan, while the population has gone up inexorably by 16,000,000 people. In fine, no increase in foodgrains production while the mouths to be fed have shot up by 16 million: this is, indeed, a very depressing performance by the country. It becomes even more so when it is remembered that the additional production of 20 million tons envisaged in the third Plan (or an aggregate output of 100 million tons by 1965-66) will have to be achieved in the course of the next three crop years beginning from 1963-64, that is, the annual average increase in production has to be as much as seven million tons. At the present rate of growth it will be an uphill task for India to reach this goal.

Trends in the production of cash crops have also been generally unsatisfactory. Raw cotton suffered a severe setback in 1961-62, its output having gone down by about 17 per cent to 4.5 million bales over the year. The production of sugarcane was also smaller. On the contrary, the output of raw jute and mesta (as well as tobacco exceeded their targets for 1965-66; these increases, however, have not been unmixed blessings. For the output has been achieved largely by an increase in acreage with little or no increase in productivity (per acre yield). In the case of jute, for instance, the area under its cultivation rose over the year by as much as about 50 per cent as against the 57 per cent increase in output. The larger area brought under jute cultivation was at the expense of rice and wheat in West Bengal and Bihar, where foodgrains output consequently suffered a setback. In respect of cultivation of tobacco, the third Plan itself envisages only a modest increase, since what is required at present is not larger production but development of superior varieties like *virginia*. Larger production of inferior varieties only depresses prices. The output of oilseeds rose by just 5 per cent in 1961-62, despite an increase of one million acres in area under cultivation.

Table I on this page shows the trend in production, and changes in area under cultivation, of major agricultural commodities in 1961-62, as compared with the previous year. In view of the changes that have taken place in the estimation and coverage of crops, the aggregate production figures do not serve as a correct guide to long-term trends. The indices of agricultural production, prepared by the Union Ministry of Food and Agriculture, is, however, a better indicator of long-term trends, as they are adjusted to the changes in coverage and methods of estimation. Indices of agricultural production are given in Table II covering the period since 1950-51. The setback in foodgrains (which still contributes, along with other agricultural commodities, half of the total national income), is one of the major reasons why the rate of growth of national income (at constant, 1948-49, prices) has gone down from 7.1 per cent in 1960-61 to 2.2 per cent in 1961-62 (as disclosed by the quick estimates of the Central Statistical Organisation).

Rice and Wheat

All the foodgrains, however, did not fare the same way in the 1961-62 crop year. In fact, the main *rabi* cereals, namely wheat and barley, made good progress. But the increase in their production was more than offset by the fall in the output of principal *kharif* cereals, particularly rice and *jowar*, and also pulses. The setback in production is attributed to unfavourable weather conditions. In respect of rice, for instance, output in 1961-62 was lower by about 50,000 tons at 33.61 million tons, despite a small increase in the acreage under its cultivation.

The decrease in rice production has been accounted for mainly by Bihar, West Bengal and Kerala due partly to the decrease in acreage in these States and partly to unfavourable climatic conditions during the period of growth. In West Bengal, it is said, conditions of drought delayed transplantation and irregular and scanty showers at early stages of the growth of the rice crop. In that State (as also in Bihar), large rice-cultivating areas were diverted to the production of jute, prompted by the high prices prevailing last year for this cash crop. These factors alone do not fully explain the setback in rice production. In fact, very favourable conditions were in evidence in Andhra Pradesh, Gujarat, Maharashtra and U.P. These States have been able to increase moderately their output over the previous year. Even this modest increase has been the result of larger area brought under cultivation, rather than any perceptible increase in the yield per acre. This only shows that the State Governments have been taking little interest in implementing the various schemes chalked out for promoting intensive cultivation.

The output of *jowar* fell sharply, that is, by about 17 per cent, to 7.66 million tons in 1961-62. The decline is attributed to excessive rains during October-September 1961 in Madhya Pradesh, U.P. and certain parts of Maharashtra. A severe cold wave in the North last year and locust attacks in certain parts of the Punjab, Maharashtra, U.P. and M.P. also damaged *jowar* and other foodgrain crops.

In refreshing contrast, the output of wheat touched a new record. The increase in production was reported by all wheat-growing States (except Bihar and Mysore) and this was achieved, despite the severe cold spell in December and January in parts of Bihar, U.P., Punjab and Rajasthan. It may, however, be noted that all wheat-growing States had larger area under wheat during the year. Here again, the per-acre yield continued to remain stagnant at deplorably low levels in comparison with foreign countries.

Fertilisers and Irrigation

The lack of progress in agricultural productivity (in respect of both foodgrains and cash crops) is largely due to the inadequate progress in implementing development programmes, seeking to provide more irrigation facilities, fertilisers, better seeds, etc. There is no doubt that the supply of fertilisers has been grossly insufficient. Even on Government's own reckoning, only 53 per cent of the demand for nitrogenous fertilisers could be met in 1961-62, owing to inadequate internal production and import restrictions. Now, minor irrigation projects, which have been assigned a key role in promoting production, have also fallen behind schedule. As against the third Plan programme seeking to bring 12.8 million acres under minor irrigation, the area actually covered in 1961-62 (according to official estimates) was only 1.7 million acres.

The tube-well programmes have the same story to tell. As against the

TABLE I: *All-India Final Estimates of Principal Crops*

Crop	Area (thousand acres)			Production (thousand tons)		
	1961-62	1960-61	Percentage increase or decrease	1961-62	1960-61	Percentage increase or decrease
FOODGRAINS:						
Kharif cereals:						
Rice	33,669	32,947	+ 0.9	33,610	33,658	— 0.1
Jowar	43,074	42,683	+ 0.9	7,664	9,215	— 16.8

* Based on provisional estimates.

Note:—The indices for 1959-60 and 1960-61 are generally based on partially revised estimates while those for 1961-62 are generally based on final estimates. The indices for these years are, therefore, subject to revision.

target of drilling 739 tube-wells in 1961-62, only 482 tube-wells were completed with pump sets (upto March 1962). This pace is too slow, considering the third Plan target for construction of 2,400 tube-wells; this target itself is a modest figure, particularly in view of the fact that the Exploratory Tube-wells Organisation has established potentialities for the construction of 6,550 tube-wells. As for the provision of improved seeds, the Plan is to cover an additional area of 148 million acres of cultivated land during 1961-62—1965-66. But, here again, according to official estimates, the area being brought under the scheme is no more than 33 million acres during the first two years (1961-62 and 1962-63) of the Plan. The same story will naturally be repeated in the case of other programmes such as soil conservation, land reclamation and plant protection. Will the Central and State Governments see the writing on the wall and get busy?

Price Situation

The decline in the production of foodgrains adversely affected the price situation, which would have got out of control but for continued imports mainly from the U.S. under P.L. 480, and also the improvement in the distributive machinery. Prices of foodgrains were rather stable during the first three quarters of 1961-62 crop year, continuing the trend of the previous year, but the last quarter (April to June 1962) saw a smart spurt in prices. The index number of cereal prices (base 1952-53=100), which stood at 102 in June 1961 (after an initial rise) fell to 101 by December 1961, but moved up thereafter to touch 105 in June 1962, representing an increase of about 3 per cent over a year. The index for rice was higher at 110 in June 1962, as compared with 101 in June 1962, as compared with 101 in January 1962 and 106 in June 1961. The price index of wheat jumped up from 86 in June 1961 to 100 by February, but moved down subsequently to 88, which was still two points higher than that a year before. The prices of *jowar* went up markedly, the index touching 131 in June 1962, an increase of 15 per cent over the year. But the index for *bajra*, however, declined by 10 per cent to 128, reflecting an increase of 10 per cent in output. Prices of pulses also moved up, with the index having gone up by about 15 per cent over the year to 103 in June 1962.

Although the prices of most of the foodgrains tended to go up, cash crops depicted a mixed trend. While raw cotton, *gur* and sugar ruled firm, jute and, to some extent, oilseeds were easy. The price index for cotton rose from 110 to 113 over a year. Cotton prices would have gone up still further, but for imports of 860,000 bales during the 1961-62 season, more or less the same as in the previous season. The price of *gur* skyrocketed during the year, the index having spurted from 122 to 144 by June 1962. The index for sugar was marginally higher at 130. Under the pressure of a record crop, the index of raw jute slumped from 208 to 139 before closing in June 1962 at 144, or a fall of 30 per cent over a year. The price of oilseeds and edible oils also moved down by about 5 per cent during the year from the high levels reached in the course of the previous few years.

Imports

The foodgrains prices were held in check by imports of cereals, largely from the U.S. under the P.L. 480 agreement. During the first six months of 1962, imports of wheat amounted to 1.32 million tonnes, as compared with 1.56 million tonnes during the corresponding period last year and 3.09 million tonnes during the whole of 1961. Imports of rice during the first half of 1962 were 328,000 tonnes, as compared with only 294,000 tonnes and 384,000 tonnes, respectively.

Internal purchases by Governments were considerably reduced in 1961-62. The procurement of rice and paddy remained suspended in most of the deficit and marginally-placed States and also in the surplus State of Andhra Pradesh. Only in the surplus States of Punjab and M.P. were there purchases on behalf of the Central Government. Some of the State Governments also bought rice and paddy on their account. In U.P., where a system of levy is in force, the rate of levy was reduced from 50 per cent to 25 per cent in the case of superior rice and to 35 per cent in the case of common rice from November 1961. Total purchases of rice by Central and State Governments were lower at 436,000 tonnes in 1961-62 (November 1961 to June 1962), as compared with 506,000 tonnes during the previous year. As regards wheat, Government purchases continued to remain suspended in 1961-62.

Government stocks were released during the year to meet the needs of deficit areas. During the first half of 1962, a total quantity of 1.92 million tonnes of foodgrains were released from Government stocks; this was 370,000 tons higher than the releases during the corresponding period of 1961. The releases during the whole of 1961 were, however, lower at 3.38 million tonnes, as compared with 4.47 million tonnes in 1960. It may be noted here that, as at the close of 1961, there were as many as 49,000 fair price shops throughout the country.

The current crop year, which began in July 1962, witnessed a further rise in the prices of foodgrains and cash crops which lasted upto the end of October; thereafter, the trend was downward, following the arrival of new crops into the market, the feeling of uneasiness among stockists in North India on account of the border war with China, credit stringency, some official measures to control prices, including larger imports, and voluntary restraint by the trade. Even so, the latest price levels are higher by about five per cent over those a year ago.

1962-63 Crop Position

The 1962-63 crop position is none too encouraging in respect of a number of commodities, having regard to the growing needs of the country. Traders feel that the overall foodgrains crop may show a modest recovery from the setback suffered in 1961-62, but the total may not be far above that witnessed in 1960-61.

Kharif cereals, which have already started moving into terminal markets, have fared better, except rice which has been adversely affected by floods in Assam and Punjab, irregular rains in West Bengal and Madhya Pradesh and widespread drought in Orissa. The production of *jowar* and *bajra* (coarse grains) is expected to be excellent. As a result of favourable weather conditions at sowing time, *rabi* cereals (wheat and barley) are also expected to put on a better performance than that in the last year. The output of pulses is also expected to stage a recovery, particularly in Maharashtra, U.P. and M.P. To sum up, the aggregate foodgrains production is expected to rise from 78.5 million tons in 1961-62 to about 80 million tons in 1962-63.

Among cash crops, raw cotton is expected to stage a smart recovery during the year. The crop is expected to be higher by about a million bales at 5.4 million bales, thanks to better crop in Gujarat, Maharashtra and Madras. The improvement, however, will not be adequate to make good the heavy inroads made into the stocks during the past two seasons. Oilseeds crop would be marginally higher, with groundnuts going up by about 100,000 tons to 4.8 million tons. The total output of five major oilseeds may be around seven million tons this year, a quantity totally insufficient to cover the fat requirements of our large, expanding population, let alone those of export trade.

In contrast, the production of sugarcane is said to be much lower than last year on account of smaller output in Maharashtra, U.P. and Bihar. But the acreage under this crop appears to have gone up, being higher by 1.6 per cent at 5.68 million acres in 1962-63. Jute crop may turn out to be slightly smaller than the last season's record owing to a decline in acreage in West Bengal, but will be more than sufficient to take care of the country's needs.

Fractional Improvement In Rate of Industrial Growth

Fuller Utilisation Of Capacity Necessary

INDUSTRIAL growth had distinctly slowed down in the first year (that is, 1961-62) of the third Plan. A broad indicator of this slow-down is to be found in the sectorwise contribution to national income as estimated by the Central Statistical Organisation. According to the relevant estimates at constant (1948-49) prices, the contribution (Rs. 1,236 crores) of the sector of "mining and factory establishments" to net national product in 1961-62 represented an increase of only 6.7 per cent over the corresponding contribution (Rs. 1,158 crores) in 1960-61, that is, the last year of the second Plan. That percentage increase was much less than the increase of 11.9 per cent which the 1960-61 contribution represented over the corresponding 1959-60 contribution of Rs. 1,035 crores. It would thus appear that industrial growth had received a setback in the current Plan's first year itself.

Another indicator, from which the trend of industrial production in the current calendar year can be known, is the Index Number of Industrial Production (Base 1951=100). The latest available figures under this index, which pertain to the first six months of 1962, show a monthly average of 193.5 points which represented an increase of 6.0 per cent over the monthly average in the corresponding first half-year of 1961. That percentage increase, again, was much less than the increase of 9.6 per cent which industrial production in the first half of 1961 represented over that in the corresponding period of 1960. These comparative figures thus indicate a marked decline in the rate of industrial growth in the immediate past. But it must be recognised, at the same time, that the trend of production in the first half of 1962 was a shade better than that in the second half of 1961 which, in turn, was higher than that in the first half of 1961. In other words, an increase of 7.7 per cent in industrial production in the first half of the current year over the second half of the previous year does represent a heartening trend which has probably resulted from the *ad hoc* remedial measures adopted for improving the availability of coal, power, raw materials and transport facilities.

Uneven Performance

The overall modest increase in growth of the industrial sector as a whole in the first half of 1962, as compared with the corresponding period of 1961, conceals the highly uneven performance of different industries. An industrywise picture of absolute production in the two comparable periods, along with percentage increases or decreases in production, is, therefore, given in Table I. A perusal of this table will enable one to get some idea of the extent of individual variations. It will be seen therefrom that in coal, power generation, jute manufacture, sulphuric acid, soda ash, bichromates, industrial alcohol, steel, aluminium, copper, ball bearings, machine tools and railway wagons, the percentage increase in production in the first half of 1962, as compared with the first half of 1961, had ranged from 13 per cent to 49 per cent. These are some of the industries, the production of which is crucial to the level of production in a number of other industries. While the extent of increase in such crucial industries was pretty substantial, it was, in most cases, well below the country's requirements and, therefore, inadequate. Further, the improvement in the output of these industries was partly or largely cancelled out by decreases or relatively very small increases in the production of other equally crucial industries like caustic soda, bleaching powder, cement, diesel engines and automobiles. The net result has been a modest overall rate of industrial growth in the first half of the current year—a rate which has probably not been bettered significantly in the second half, judging broadly by the trend of production in several industries in July 1962. The stimulus to higher industrial production provided by the Sino-Indian war emergency since November last may not have made much difference to the trend of production in the current year taken as a whole. But it may also be noted that, in industries like coal and steel, the process of gearing production to the additional requirements arising from the emergency is already in evidence.

It may be useful to review here briefly production trends in some important individual industries other than coal, textile, sugar and plantation industries covered elsewhere in this Annual. To take the iron and steel industry first. The latest available figures pertaining to this industry show that 3.8 million tonnes of pig iron and 3.3 million tonnes of ingot steel were produced in the eight-month period, January-August 1962. Pig iron production during the period worked out to an annual rate of 5.7 million tonnes, representing 86 per cent of the rated capacity of 6.6 million tonnes. Ingot steel production, on the other hand, worked out to an annual rate of 4.9 million tonnes, representing only 80 per cent of the relevant rated capacity of 6.1 million tonnes. This figure of 80 per cent utilisation of steel-making capacity, however, conceals some pronounced variations as between individual units. For instance, the Indian Iron and Steel Company in the private sector has already attained a level of production representing 97 per cent of its rated capacity in ingot steel. Likewise, the Bhilai plant in the public sector has attained a level of 97 per cent utilisation of steel-making capacity. The Tata Iron and Steel Company in the private sector, however, has reached a level of only 88-90 per cent utilisation of capacity. The Rourkela plant in the public sector has recently overcome its production difficulties and produced, as of September last, ingot steel at a rate representing 65 per cent of its capacity. The tempo of production in the Government-owned Durgapur plant, too, has gone up in recent months, thanks to the commissioning of its third blast furnace. But it is not known what its current level of capacity utilisation is. All in all, however, the iron and steel industry as a whole seems, at the moment, to be well poised for achieving full capacity production in the next six to twelve months.

Other Important Industries

In the cement industry which, too, is of basic importance, the trend of production in the first half of this year was very disappointing, for the increase in output was only two per cent over that in the corresponding period of 1961. The latest available production figures, those for July and August 1962, bring down the monthly average to 694,000 tonnes in the January-August 1962 period from the monthly average of 698,000 tonnes in the first half of the current year. This means that the trend of production in this crucial industry has not been quite encouraging.

In the non-ferrous metals group, while aluminium and copper fared reasonably well with production increases of 36 per cent and 16 per cent, as compared with the first half of 1961, the output of lead had come down by 29 per cent. Some of the engineering industries, too, performed rather poorly during the January-June 1962 period. For instance, diesel engines production actually decreased by 10 to 25 per cent, while the automobile industry was able to increase its production by just one per cent. In the chemicals group, too, production increases were relatively modest, except in the case of soda ash and bichromates. As far as the paper and paperboard industry is concerned, an increase of only 5.0 per cent in its production during the period was positively disappointing. The performance of some electrical industries during the period under review was, on the other hand, distinctly better. For instance, production of electric motors increased by 22 per cent, and that of power transformers by 55 per cent, as compared with the first half of the 1961. In respect of several other industries which are not specifically included in this analysis, the variations have been small, as the reader will note from the accompanying comparative table. Most of them have recorded modest increases over the previous year, while the number of industries that have registered a fall is relatively few.

Marginal Rise

The improvement effected in the supply of such crucial elements as coal, power, transport and raw materials seems to have been only marginal, for otherwise it is difficult to explain why a substantial part of industrial capacity remains unutilised at the present time. The Union Government's recent survey of under-utilisation of industrial capacity is an eye-opener in this connection. The results of the survey, which are brought together under different groups of industries, show that, in as many as 74 industries, the capacity at present utilised is below 63 per cent, while in 29 industries the range of utilisation is between 65 and 75 per cent:

Industry or group of industries	Number of industries	Range of utilised capacity (Per cent.)
Food processing industries	3	39 to 60
Woollen fabrics	1	60
Cotton and hair belting	1	56
Cork sheet	1	52
Leather and leather products, except footwear	4	32 to 61
Rubber products	4	10 to 56
Chemicals and chemical products	23	10 to 57
Non-metallic mineral products except products of petroleum and coal	9	40 to 60
Basic metal industries	12	2 to 60
Metal products, except machinery and transport equipment	6	15 to 51
Machinery, except electrical machines	3	18 to 50
Bare copper conductors	1	42
Railway wagons	1	50
Trailers	1	27
Motor cycles	1	20
Miscellaneous	3	39 to 63
Leather belting	1	75
Chemicals and chemical products	11	65 to 75
Non-metallic mineral products, except those of petroleum and coal	3	72 to 74
Basic metal industries	3	66 to 73
Metal products, except machinery and transport equipment	4	66 to 75
Machinery, except electrical machines	4	68 to 72
Electrical appliances	2	66 to 72
Power alcohol	1	72

This official estimate of overall unutilised industrial capacity in the country as a whole suggests that such unutilised capacity probably represents an aggregate capital outlay of the order of Rs. 300-400 crores and a production potential of about Rs. 100 crores per annum. The undoubtedly depressing situation revealed by the present survey seems to be even worse than what was revealed by the British economist, Sir Donald MacDougall's survey, of underutilised manufacturing capacity in India in 1959-60. In that year, it may be recalled, out of the 121 industries surveyed by Sir Donald, 40 had capacity utilisation of less than 60 per cent and 25 others between 60 and 80 per cent. While further additions to capacity have taken place since that year in many industries, the increases in coal, power, transport and raw material supplies have been relatively inadequate to handle all or most of the additional capacity. Hence the deterioration in the last two years in the process of utilisation of installed capacity and its sequel in a reduced rate of industrial growth itself. This situation calls for energetic measures aimed at maximisation of industrial output through fuller utilisation of existing capacity rather than for substantial expansion of capacity, except, perhaps, in some sectors, namely, alloy and special steels, petroleum refining, petro-chemicals, non-ferrous metals, machine tools, etc.

Current Official Thinking

In the context of the Sino-Indian war emergency which is bound to make heavy demands on the nation's resources and in view of the continuing foreign exchange stringency, large-scale development imports for expansion of capacity seem to be out of question except in a few sectors crucial to defence, unless, of course, the amount of foreign aid is expanded. It may also be recalled, in this connection, that at the meeting of the Central Advisory Council of Industries on 29th September 1962 it was firmly announced on behalf of the Government that in future any additional capacity would be allowed to be established only when the required production could not be secured from full-capacity working of the existing units. If more untied credits become available for financing maintenance imports and if further improvement is effected, under the spur of the emergency, in the basic sectors of coal, power and transport, the substantial unutilised potential can be harnessed in the coming year for additional industrial output for both defence and civilian needs. It is on these lines that the authorities seem to be seriously thinking now, judged by some recent ministerial pronouncements. But, unless the time lag and the physical gap between current thinking and potential performance are greatly reduced by quicker administrative procedures and more effective economic co-ordination at Ministerial level, the industrial sector's progress towards production targets, under the third Plan will continue to be halting and uneven.

TABLE I—Production in Selected Industries

Industry	Unit	Production in January-June 1962	Production in January-June 1961	Percentage increase (+) or decrease (—) in (3) over (4)	Production in July 1962
(1)	(2)	(3)	(4)	(5)	(6)

* Relates to January-August period.

FOREIGN TRADE ANALYSED

Reappraisal Of Export Policy Needed

EVER since the new Government was ushered in soon after the second General Elections in India, several measures have been announced in the direction of export promotion. A new department of International Trade has come into existence under the Ministry of Commerce and Industry. In order to review all aspects of trade and commerce and to advise and make recommendations to the new department on policy matters, a Board of Trade, more or less on the British model, was constituted in May last under the chairmanship of the Minister of International Trade. The Board has been entrusted with the functions of rationalisation of imports, increasing of exports, forging suitable import-export relationships and improving conditions in general for internal trade and foreign trade, particularly in regard to increase in production, improvement and enforcement of quality standards, development of sound traditions of commerce and trading ethics. Several changes were made in the export promotion schemes to simplify procedures and help exporters get the benefit of incentive schemes without delay. Licensing restrictions on the export of most of the items were recently removed. Export promotion councils on regional basis have been proposed to be set up so as to cover the entire international trade area.

The organisational changes brought about in the Government set-up have become all the more significant in the context of the possibility of the United Kingdom joining the European Common Market, which has posed a new problem to the Indian economy in that the new tariff barriers that may be raised by the enlarged European Economic Community are likely to affect 90 per cent of India's sales to the U.K. or as much as a quarter of India's total overseas sales. Further, the Chinese aggression and the consequent outbreak of hostilities during the last quarter of this year have put out of gear India's commercial policy oriented to meet the needs of a planned developing economy. Only the passage of time will reveal the effects of the Chinese aggression on India's foreign trade. The increasing defence requirements will, however, lead to larger imports from abroad and at the same time tell heavily on the tempo of export promotions. Looking at the present trend of exports and also in the context of defence requirements in the coming months, it is doubtful if the export target of Rs. 3,700-3,800 crores fixed for the third Plan period will ever be realised.

Position At A Glance

At the time of writing, complete foreign trade statistics are available for nine months, January-September 1962. Taking into account the preliminary figures for October 1962, one finds that total imports into India stood at Rs. 884.52 crores and exports at Rs. 543.98 crores during January-October 1962, as compared with Rs. 897.38 crores and Rs. 543.23 crores, respectively, during the corresponding months of 1961. The comparative trade statistics are shown in Table 1.

Although the overall trade in the current year remained more or less at the previous year's level, the pattern of trade underwent some changes this year. While food and raw material items recorded larger arrivals, capital goods and manufactured articles declined in imports in January-September 1962. A similar trend was witnessed on the export front also. The exports of food and raw material groups showed a rise and shipments of manufactured items declined. The shares of various groups in India's foreign trade during January-September 1962 and 1961 work out as in Table 2.

Food Imports

The rise in the imports of the food, drink and tobacco group was mainly accounted for by larger arrivals of dairy products and rice. Dairy products were imported to the extent of Rs. 8.2 crores in January-September 1962, as compared with Rs. 7.1 crores in the same period last year. Imports of cereals advanced from Rs. 99.6 crores to Rs. 106.7 crores during the same period, of which rice imports recorded Rs. 23.24 crores in the current year as against Rs. 14.30 crores in the nine months of the preceding year. There was a decline in the arrivals of wheat and spelt from Rs. 98.80 crores in January-September 1961 to Rs. 80.50 crores in the same months of the current year. Cashewnuts which are imported for processing and re-export were also lower at 0.9 lakh tonnes worth Rs. 2.98 crores as against 1.0 lakh tonnes worth Rs. 6 crores during the first three quarters of 1961.

Raw Material Imports

The relatively larger imports of raw materials and semi-manufactured articles in the current year were in keeping with India's commercial policy that the rising level of industrial production should result in the pattern of trade changing to greater imports of industrial raw materials and components than those of finished goods. The value of principal items of raw materials and semi-manufactured articles imported in January-September 1962, together with the imports during the nine months of 1961 in brackets, is as follows: oilseeds and kernels Rs. 7 crores (Rs. 6.4 crores), crude rubber Rs. 7.7 crores (Rs. 6.5 crores), pulp and waste paper Rs. 6.8 crores (Rs. 5.1 crores), wool and animal hair Rs. 9.5 crores (Rs. 8.5 crores), chemical and chemical components Rs. 28.0 crores (Rs. 26.1 crores), paper and pasteboard Rs. 10.5 crores (Rs. 9.7 crores), crude petroleum Rs. 34.5 crores (Rs. 16.2 crores), petroleum products Rs. 38 crores (Rs. 33.3 crores) and textile yarn and thread Rs. 9.8 crores (Rs. 8.6 crores). Imports of raw cotton decreased to Rs. 49.4 crores in the current year from Rs. 61.6 crores in January-September 1961. Likewise, imports of dyes and chemicals contracted to Rs. 9.2 crores from Rs. 10.1 crores. Arrivals of base metals were also lower at Rs. 105.4 crores (Rs. 118.8 crores), of which iron and steel amounted to Rs. 63.7 crores (Rs. 83.8 crores), nickel Rs. 0.9 crore (Rs. 1.23 crore) and zinc Rs. 5.7 crores (Rs. 6.5 crores). There were, however, increases in the imports of copper at Rs. 19.3 crores (Rs. 14.5 crores), aluminium Rs. 8.4 crores (Rs. 6 crores), lead Rs. 2.1 crores (Rs. 1.8 crore) and tin Rs. 4.4 crores (Rs. 4.0 crores).

Capital Goods Imports

Imports of capital goods registered a decline from Rs. 274 crores in the nine months ended September 1961 to Rs. 265 crores in the same period of 1962. Although import of machinery (other than electrical) advanced from Rs. 174 crores to Rs. 184 crores, the rise was more than offset by the fall in the import of electrical machinery and transport equipments from Rs. 47.6 crores to Rs. 40.0 crores and from Rs. 46.2 crores to Rs. 42.2 crores, respectively, in the above periods.

Tea Exports

During January-September 1962, exports of tea, by far the most important item in the group "food, drink and tobacco," were maintained at the past year's level of Rs. 80 crores, although the quantum was higher at 139 million kg. as compared with 130 million kg. in January-September 1961. The earnings would have been still larger but for the decline in the unit value of tea per kg. from Rs. 6.13 to Rs. 5.75 in the current year. There has been a gradual decline in the offtake of Indian tea by the United Kingdom. In fact, the total arrivals of tea in the U.K. were at a lower level in the current year. Ceylon, Pakistan and East African countries however, stepped up their shipments to the U.K. The figures of imports of tea into the U.K. from principal sources given in Table 3 illustrate the position.

Similar declining trends have been noticed in some other markets also. The Indian Tea Delegation which visited the U.S.A. and Canada have stated that, in the sphere of common and low medium teas, India has lost substantial ground in favour of other producing countries owing to the comparably high prices which have ruled for some years for Indian teas. The ground lost by India has been gained less by Ceylon than by other producers like Indonesia, Formosa and East Africa. In fact, a marketing and distribution team, sponsored by the National Productivity Team, recently noted that "Made in India" is a label yet to be invested with the prestige and stature needed to win sales in the U.S. market. The Indian tea industry has made a number of suggestions to make Indian blacks really competitive in the world markets. It has asked for the abolition of the West Bengal entry tax (6.25 nP per lb.) on teas sold through Calcutta auctions and the exemption of teas sold through Cochin auctions from the Kerala sales tax of 5 per cent *ad valorem*. It has also asked for a reduction in the price of sulphate of ammonia from Rs. 407.30 per tonne to Rs. 360 at which price it is sold to other agriculturists.

Spices

The value of exports of spices was slightly higher at Rs. 12.63 crores in January-September 1962, as compared with Rs. 12.26 crores in the same period last year. But for the decline in the prices, the total sales realisation from spices would have been much larger. Pepper, the most important foreign exchange earner in the spices group, went up in exports from 13.8 million kg. valued at Rs. 5.9 crores to 19.9 million kg. valued at Rs. 6.7 crores. The per unit sales realisation, however, declined from Rs. 4.30 to Rs. 3.34 per kg. in the above periods. The export of cardamom went up by volume from 1.4 million kg. to 1.5 million kg. but declined in value from Rs. 2.13 crores to Rs. 2.00 crores. Gautemala and Ceylon are reported to be offering cardamom at cheaper prices and, unless favourable factors such as stable and competitive prices coupled with regularity of supply are ensured, India may have to lose further ground in this item. Export of chillies declined both in quantity and value from

Godrej Typewriter

The Godrej Typewriter embodies the refinements of today's advanced precision engineering techniques. Vigorous tests to which each machine is subjected, combined with guaranteed services after sales, make the Godrej Typewriter a sound investment for years to come.

RS. 760/-
Brief Size
Service after sale guaranteed
Free for one year

Our friendly sales representatives will be happy to demonstrate, at your address, without any obligation.

Godrej Reg. the finest value in Typewriters

Offices: Bombay - Calcutta - Delhi - Madras - Kanpur - Hyderabad.

8.4 million kg. worth Rs. 1.6 crore to 6.4 million kg. worth Rs. 1.17 crore.

Tobacco

Indian flue cured virginia tobacco has a name in the international market and this variety accounts for the bulk of India's exports. India ranks third, next only to the U.S.A. and Rhodesia in the matter of exports of this variety. Its popularity in the world markets clearly suggests that its production should be stepped up if increased demands are to be met and the target under the third Plan fulfilled. The Union Government has already accepted the Tobacco Export Promotion Council's suggestion for a special allocation of 4,000 tons of ammonium sulphate for 1962-63 for growing this variety in Andhra Pradesh. During the first three quarters of 1962, exports of unmanufactured tobacco were maintained at a higher level of 53.2 million kg. valued at Rs. 16.8 crores as compared with 38.8 million kg. valued at Rs. 13.5 crores in the same period of 1961. There would have been larger foreign exchange earnings from unmanufactured tobacco but for a decline in the unit value of sales from Rs. 3.48 per kg. to Rs. 3.16.

Coffee had suffered considerably, shipments having declined from 27.6 million kg. worth Rs. 7.8 crores to 14.0 million kg. worth Rs. 5.3 crores. Although the volume of exports of cashew kernels went up from 32 million kg. to 34.3 million kg., the earnings declined from Rs. 15.1 crores to Rs. 13.7 crores. There was a setback in the offtake of cashew kernels by West Germany. The delegation to Europe sponsored by the Cashewnut Export Promotion Council has suggested possibilities for further exploitation of the European markets for Indian cashewnuts and has recommended, in this context, intensive propaganda and publicity to boost the sales of cashewnuts in these markets.

Sugar

The Board of Trade in its meeting in September last had suggested that sugar should figure prominently in India's export programme and recommended to Government to extend the required facilities to the industry for achieving this objective. The major sugar purchasing countries like the U.S.A., Canada, the U.K. and Japan prefer to import raw sugar in order to maintain their refining industries. Malaya is also reported to be planning to set up sugar refineries. India will no doubt benefit by producing raw sugar, as its manufacture is more economical. The State Trading Organisation concluded recently barter deals with Malaya and Canada for the sale of 55,000 tons of sugar worth Rs. 2 crores in exchange for fertilisers. The U.S.A., under the new Sugar Act, has allocated India an annual quota at 0.71 per cent of the total quotas assigned to foreign countries which works out to 20.084 short tons raw value. During the period under review, exports of Indian sugar increased from 1.95 lakh tonnes worth Rs. 9.9 crores in January-September 1961 to 2.47 lakh tonnes worth Rs. 10.29 crores. The S.T.C. deal and the U.S. quota will lead to larger exports of sugar in the next few months.

Exports of Raw Materials

The principal raw materials traditionally exported from India are mica, lac, manganese ore, iron ore and concentrates, vegetable non-essential oils, raw cotton and raw wool. Analysing their export performance during the period January-September 1962 as compared with the same period last year, it is found that there was a decline in shipments of the following items:

Lac from 16.5 million kg. worth Rs. 3.7 crores to 15.6 million kg. worth Rs. 3.6 crores, manganese ore from 7.16 lakh tonnes worth Rs. 7.8 crores to 5.4 lakh tonnes worth Rs. 6.6 crores, raw cotton from 0.45 lakh tonnes worth Rs. 11.3 crores to 0.44 lakh tonnes worth Rs. 10.7 crores and raw wool from 11 million kg. worth Rs. 5.88 crores to 8 million kg. worth Rs. 4.4 crores.

While India had yielded ground to Thailand in the U.S. market for lac, the decline in manganese ore exports was partly due to extraneous factors like competition from Brazil, Argentina, and Russia where operations are highly mechanised with the resultant reduction in costs and partly due to Government's policy. Several duties have been levied and port charges increased in India on manganese ore. Government has no doubt reduced the railway freight by about 50 per cent. Further, to encourage mechanisation, it has allowed exporters of manganese ore to import mining equipment and machinery to the extent of 5 per cent of their foreign exchange earnings. The decline in lac and manganese ore has, however, been offset by the rise in the despatches of mica from 20.4 million kg. worth Rs. 7.4 crores to 24.4 million kg. worth Rs. 8.08 crores, iron ore and concentrates from 21.1 million tonnes worth Rs. 12.7 crores to 36.3 million tonnes worth Rs. 12.9 crores, groundnut oil from 0.3 million kg. worth Rs. 7.5 lakhs to 22.7 kg. worth Rs. 3.08 crores and castor oil from 0.5 million kg. worth Rs. 12 lakhs to 0.8 million kg. worth Rs. 13 lakhs. Exports of leather and leather manufactures, including tanned hides and skins, were less by Rs. 3 crores at Rs. 16.95 crores this year (January-September), as compared with Rs. 20.15 crores during the same period last year.

Jute and Textiles

During the current year, the jute industry continued to face difficulties. There was keen competition from Pakistan in sacking goods. Hessians had, however, good inquiries partly for replenishing stocks and partly because of reduced activity in the European jute industry. Total jute manufactures recorded increases in exports by volume from 5.63 lakh tonnes in January-September 1961 to 6.35 lakh tonnes during the three quarters of this year, although the value declined from Rs. 110.65 crores to Rs. 107.22 crores. Sacking bags went up in quantity from 1.50 lakh tonnes to 1.61 lakh tonnes, despite a fall in earnings from Rs. 26.7 crores to Rs. 21.1 crores. The exports of gunny cloth advanced substantially from 2.59 lakh tonnes worth Rs. 55.4 crores to 3.44 lakh tonnes worth Rs. 65.25 crores. There was a general drop in the per unit sales realisation of all jute goods.

Cotton piecegoods exports amounted to 334 million metres valued at Rs. 33.52 crores in January-September 1962, as compared with 395 million metres valued at Rs. 38.66 crores in the corresponding months of 1961. The mill-made piecegoods totalled 314 million metres worth Rs. 29.72 crores in the nine months ended September 1962, as against 377 million metres worth Rs. 35.48 crores in the same period last year. In the context of a fall in the shipments of mill-made cloth, the performance of the handloom sector was satisfactory, the exports registering 20 million metres worth Rs. 3.79 crores in the current year as compared to 18 million metres worth Rs. 3.54 crores during the nine-month period of 1961. Under the scheme of compulsory exports introduced by the India Cotton Mills Federation from 1st July 1962, each mill is under an obligation to earmark 12.5 per cent of its cloth production for export purposes. On this basis, exports are to reach Rs. 65 crores. However, in view of the conditions in the international market being "worse than ever" and the margins of domestic sales higher than in the world markets, it is feared that exports may not reach the anticipated levels.

Items of machinery exports were valued at Rs. 2.71 crores this year (January-September), as against Rs. 2.32 crores in the corresponding months of last year. While shipments of machinery other than electrical increased by 30 per cent to Rs. 1.86 crore in the current year, exports of electrical machinery had a slight setback, accounted chiefly by electric fans.

Area-wise Trade

An analysis of India's foreign trade according to areas shows that India was running an adverse balance with all the principal trading areas. Except for the East European rupee payment countries, Indian trade was at a lower level with other areas in the current year. There is a growing apprehension that the European Common Market's commercial policies have already started hitting India's trade. This trend is causing widespread concern, because it runs counter to the promise of expansionary markets for India and other developing countries made by the E.E.C. countries in support of their grouping. While Table 4 indicates the trend of India's trade with principal trading areas, Table 5 carries the list of fourteen countries which accounted for over 80 per cent of imports into India and 70 per cent of exports from India during the current year.

It is to be hoped that the Board of Trade will take note of the present unsatisfactory trend of India's export trade and give serious thought to the problem of the almost inelastic nature of India's exports. In the light of the possibility of increased imports to meet the growing needs of the country's defence and of the prospects of the United Kingdom joining the E.C.M., it is imperative that a complete reappraisal of India's export trade is undertaken immediately and future course of action chalked out so as to give an impetus to the tempo of activity on the export front.

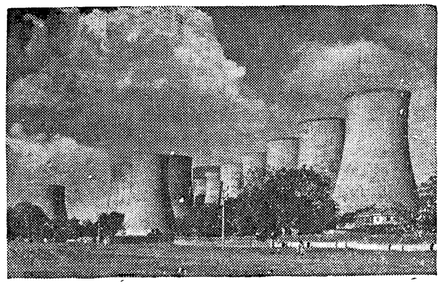
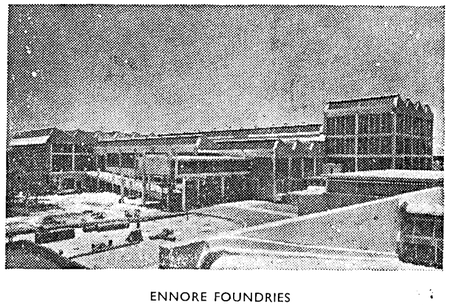
SYMBOLS OF PROGRESS



COOLING TOWERS AT SABARMATI

Fourteen of these Hyperbolic Natural Draught Cooling Towers, which serve the Ahmedabad Electricity Company's Power Station, have been constructed to-date at Sabarmati since 1934. Some 40 towers have so far been constructed in India by the pioneers of this facility in Asia.



ENNORE FOUNDRIES

Modern precast reinforced concrete north-light building for the foundry and pattern shops, along with machine foundations, has been constructed to provide 18.29 metre bays with 24.38 metre clear span.

★

Progress takes different shapes at different times. These shapes keep on constantly changing in the minds of planners who design and build the symbols by which progress can be perceived.

For nearly fifty years, engineers at Gammon India Limited have actively engaged themselves in building large numbers of these symbols—bridges, harbour works, aircraft hangars, industrial cooling towers, water storage tanks, factory sites, materials storage facilities etc.—which serve as massive milestones in concrete along India's road to progress, contributing in a large measure to the country's industrial advance and economic well-being.

"We believe...

that Free Enterprise is your enterprise and contributes to your prosperity. It is the lifebreath of a free society. It is not a creed; it is a way of life which all who cherish freedom must safeguard.

"WE BELIEVE that democracy is an essential element in the Indian way of life. Free Enterprise is an integral part of it and as such it should be permitted to play its legitimate role in our national life.

"WE BELIEVE that the beginning of intelligent living is the beginning of Free Enterprise. It is not something new: it is as old as man. The man who first discovered fire was a Free Enterpriser as also the man who invented the locomotive. Today, the man who builds up industries is a Free Enterpriser; so also is the small trader.

"WE BELIEVE that in the circumstances prevailing in our country today, there is ample room for State enterprise to function alongside of Free Enterprise in the service of the people. Monopoly of any kind, whether State or Private, is undesirable.

"WE BELIEVE that Free Enterprise must have clean hands. We realise that within its fold, as in that of every system, there are black sheep, and it will be our constant endeavour to develop and foster healthy traditions within Free Enterprise."

Extracts from the Manifesto of the Forum of Free Enterprise.

FORUM OF FREE ENTERPRISE
"Sohrab House," 235, Dr. Dadabhai Naoroji Road, Bombay-1.

The Forum of Free Enterprise is a non-political and non-partisan organisation. The Forum disseminates authoritative information to educate public opinion. It brings to public notice the achievements of Free Enterprise in this country, and the manner in which it can make its contribution to the economic development of India in order to raise the standard of living. All those who believe in the values of voluntary enterprise and democracy, whether they be in service, profession, agriculture, trade or industry, are invited to become members. Annual Membership is Rs. 10; Associate Membership is Rs. 5; Student Associateship is Rs. 2.

"Free Enterprise was born with man and shall survive as long as man survives"
—A. D. SHROFF,
President
Forum of Free Enterprise.

BANKING AND MONETARY TRENDS

Deposits Rise More Markedly Than Bank Credit

THE banking sector in India has completed one more year of vital contribution to the economic development of the country. Increasingly larger and larger credit facilities are being made available by the banks to their clients who represent wide and varied industrial and business interests. Between 1st December 1961 and 30th November 1962, scheduled bank credit spurted by Rs. 142.82 crores to Rs. 1,229.79 crores, as against the actual rise of Rs. 118.99 crores (to Rs. 1,118.80 crores) in the corresponding period of 1960-61, the rate of credit expansion being higher at 11.6 per cent, as against 10.7 per cent. Despite such a significant rise in credit, the liquidity position of the banking system was not subjected to any strain, for, alongside credit expansion, there was a sizable fresh accretion of Rs. 212.70 crores to the deposit liabilities of scheduled banks, the total of outstanding deposits (inclusive of P.L. 480 deposits with the State Bank of India of the order of Rs. 146 crores) as on 30th November 1962 standing at Rs. 2,102.55 crores, as against Rs. 1,889.85 crores. Since there was a transfer of Rs. 10 crores of P.L. 480 funds by the State Bank to the Reserve Bank in November 1962, the net increase in deposits was about Rs. 223 crores. In the same period last year, it will be recalled, deposits had risen by Rs. 134 crores, after taking into account the withdrawal of Rs. 72 crores of P.L. 480 funds from the State Bank of India in the first half of 1961. Although the pace of increase in deposits was thus much greater than that of increase in bank credit, the credit ratio (that is, the ratio of bank credit to total deposit liabilities) continued to remain at a pretty high level of 60 per cent. The ratio is bound to rise further and further, what with the persistently growing pressure of demand for bank credit. It is this factor which invests the need for banks to augment their resources with urgency.

Thanks to the markedly larger turnover of bank credit, coupled with the increase in the average lending rate and the interest earned on larger investments in Government securities (*plus* Rs. 75.53 crores in 1962 as against *minus* Rs. 61.00 crores in the previous year), the gross earnings of all scheduled banks must have registered a notable rise during the year 1962. As in the past years, a large part of the rise must have been neutralised by the increase in (*a*) total amount of interest paid on the substantially higher deposits, (*b*) cost of administration and (*c*) staff expenses. Even so, the working results of the majority of banks for the year 1962 may be expected to reveal a handsome improvement in profit. It may be noted here that, in view of the high cost of Central bank credit following the continuance of the three-tier bank rate system throughout the 1961-62 busy season, the banks relied on borrowings from the Reserve Bank to a smaller extent during 1962 than they did in 1961. The sharp rise in deposits also helped them to minimise reliance on such credit. The outstanding borrowings from the Reserve Bank touched a high of only Rs. 66.40 crores (as on 16th March 1962) in the 1961-62 busy season, as compared with Rs. 94.53 crores (as on 31st March 1961) in the 1960-61 busy season.

The consolidated position of all scheduled banks (including the State Bank of India) in the years 1962 and 1961 is presented in Tables I and II accompanying this article.

Reflecting the increase in deficit financing, the pace of monetary expansion was much larger in 1962 than in 1961. Money supply (currency and demand deposits of banks) during the first ten months of the year spurted by Rs. 200.27 crores or over 7 per cent (to Rs. 3,040.77 crores), as against the rise of only Rs. 44.10 crores or 1.6 per cent (to Rs. 2,781.38 crores) in the corresponding period of 1961. The improvement was accounted for largely by the significant rise of Rs. 124.56 crores to Rs. 2,184.18 crores in currency with the public. Deposit money, too, rose by Rs. 75.71 crores to Rs. 856.57 crores. In the January-October 1961 period, the currency with the public had risen by Rs. 98.01 crores, whereas deposit money had declined by as much as Rs. 53.92 crores. Since the expansion effect of scheduled bank credit (+Rs. 142.82 crores) between 1st December 1961 and 30th November 1962 was more than counteracted by the sharp rise (+Rs. 145.27 crores) in time deposits of banks, there was a decline in the net indebtedness of the public to scheduled banks. Besides, a partial offset to the expansion of money supply was provided by the deficit in the balance of payments as reflected in the movement of foreign assets which declined by as much as Rs. 53.54 crores during 1962 (up to 7th December 1962), as against only Rs. 4.94 crores in the same period last year.

The growth of monetary resources (money supply plus quasi-money, that is, time deposits of banks) during the year under review was reflected in a more rapid rise in deposits with banks than in currency in circulation. This factor, which reflects to some extent the restoration of confidence in the banking system following the implementation of the deposit insurance scheme with effect from 1st January 1962, enabled the banks to strengthen their resources through a wider network of branches.

Of the total rise of Rs. 212.70 crores in the deposit liabilities of scheduled banks between 1st December 1961 and 30th November 1962, those with the State Bank accounted for Rs. 42.91 crores. If the transfer of Rs. 10 crores P.L. 480 deposits to the Reserve Bank, effected on 1st November 1962—this was the first transfer to be made after 1st July 1961, when they were believed to have been of the order of Rs. 156 crores—is also taken into account, the increase in deposits of all scheduled banks comes to about Rs. 223 crores, that in the case of the State Bank alone being Rs. 53 crores. The net increase in State Bank's deposits in the corresponding period of the previous year (that is, after taking into account the Rs. 72 crores of P.L. 480 transferred during the first six months of 1961) was about Rs. 32 crores. It may be noted in passing that, under a revised agreement, the State Bank of India has to transfer Rs. 50 crores of P.L. 480 funds in six monthly instalments of Rs. 10 crores beginning from 1st November 1962. A broad position of P.L. 480 deposits with the State Bank is as follows:

(In crores of rupees)

1st July 1960 .. .. .. about	300
Transfer between 1st July 1960 and 1st December 1960	72
Balance as on 2nd December 1960	228
Transfer between 1st January 1961 and 1st June 1961	72
Balance as on 1st July 1961 (when transfer was stopped)	156
Balance as on 1st December 1961	156
Transfer on 1st November 1962 (transfer resumed)	10
Balance as on 30th November 1962	146

In the light of the foregoing details, the deposits position of the State Bank of India is as follows:

(In crores of rupees)

	Total deposits	P.L. 480 deposits	Dep. ... other than P.L. 480
2nd December 1960..	571.86	228.00	343.86
1st December 1961..	532.05	156.00	376.05
30th November 1962.	574.96	146.00	428.96

Now to resume the discussion of monetary position. The monetary authorities continued to lay stress on dear money. With effect from 2nd July 1962, the three-tier system of lending rates in force from October 1960 was substituted by a four-tier system, with smaller quotas of lending at the lower rates. Thus, the basic quota for borrowing at the Bank rate (4 per cent) was reduced by one half to 25 per cent of the average statutory reserves of each scheduled bank for the preceding quarter, the rate in respect of borrowings in excess of the quota being 5 per cent for upto 200 per cent, 6 per cent for over 200 but up to 400 per cent and 6½ per cent for borrowings exceeding 400 per cent. The new lending rate structure, in effect, meant a raising of the average lending rate of the Reserve Bank by about ½ per cent or more. The terms of the new Central Government loans, announced on 2nd July 1962, were also so fixed as to raise their yields perceptibly above the existing yields on securities of comparable maturity. The terms of the State loans, too, were ¼ per cent more favourable to the lenders. These measures, it is claimed, "represent substantial steps towards adjusting the pattern of rates in the organised money and capital markets to levels commensurate with the basic scarcity of savings in the economy in relation to investment needs."

Many in market circles wondered as to why the Reserve Bank altered the three-tier bank rate system into a four-tier one in July when the slack season was in full swing and the outstanding debt of commercial banks to the Reserve Bank was almost negligible. The idea, of course, was to give advance notice to scheduled banks that, in the ensuing busy season, they should rely less and less on central bank credit and go all out for the savings of the people to increase their lendable resources. But, as we shall

show later, this policy was amended and made more onerous on the eve of the commencement of the busy season.

While the overall stress was on dearer credit, the Reserve Bank's policy in regard to selective credit controls was one of progressive relaxation and withdrawal. This was only as it should be, in view of the improvement in the supply and prices of different commodities.

Effect of Emergency

Towards the close of October 1962 the Reserve Bank, announced the following changes in the system of quotas and lending rates, for both bills and Government securities, regarding the borrowings of banks from it:

A bank will be able to borrow upto 100 per cent of its basic statutory reserve at different rates upto 6 per cent as follows:

Rate	*Quota for borrowing*
4 per cent ...	25% of statutory reserve
5 per cent ...	Another 25% of statutory reserve
6 per cent ...	Another 50% of statutory reserve

But the Reserve Bank will not permit any borrowing beyond this limit, namely, 100 per cent of a bank's statutory reserve normally. Should any bank find itself in a special situation requiring further assistance over and above its ceiling limit, the Reserve Bank will consider the grant of such assistance only after making a detailed assessment of the bank's overall position and satisfying itself that the additional accommodation is justified. A penal rate of interest will also be charged by the Bank for such special accommodation.

The Bank has been granting additions to basic quotas of individual banks (namely, 25 per cent of statutory reserve which is permitted to be borrowed at Bank rate) equivalent to the excess of a bank's lending to small industries and co-operatives during each half-year over the corresponding half-year of the previous year. This facility is intended to stimulate the supply of credit to this sector, based on current performance of banks in improving the flow of credit to small industries and co-operatives. While making the above changes, the Reserve Bank made it clear that the overall ceiling set by the Bank on banks' borrowing from the Reserve Bank is not extended, owing to operation of this scheme of additions to basic quotas. Arrangement was, therefore, made to offset the addition to basic quota of bank by adjustment in its borrowing quota at the higher slab rates (namely, at 5 and 6 per cent).

The above measures were justified as being necessary in the context of the development and defence effort to prevent any excessive impact of money supply on the economy. Nevertheless, the Reserve Bank assured the banks that the ceiling for their access to it could be relaxed, if necessary, on a detailed assessment of the operations and credit requirements in any particular case. The banks, however, made a representation to the Reserve Bank to the effect that the aforesaid fresh credit curbs would cause much difficulty to them in meeting the normal demands for expansion of credit during the busy season. As a sequel to this representation, the Reserve Bank announced a slight relaxation of restriction on accommodation to scheduled banks. As a result of this relaxation, each scheduled bank is now permitted to obtain from the Reserve Bank, in addition to the basic quota under the three-tier system, an additional quota, at 6.3 per cent per annum for a period of six weeks beginning from the 10th November 1962. The additional quota that may be obtained is however, limited to the amount equal to the difference between a bank's quota based on its statutory balance and the maximum amount actually borrowed by it during the 1961-62 busy season. Besides, the Reserve Bank has assured the banks that it will sanction appropriate excess quotas for the remaining period of the busy season (on the basis of estimates of requirements submitted by them before 8th December 1962). The banks have been asked (*a*) to refuse advances for hoarding and speculation, (*b*) to refuse and recall, in suitable cases, unsecured advances as well as advances against gold and shares, and (*c*) to channelise credit for promotion of essential productive effort, that is, for defence, civil consumption and export.

Call Money Rate

Thanks to the improvement in the liquidity of banks reflected mostly in the form of lower level of borrowings from the central banking institution as compared with the position that had existed in the previous year and to some extent in a rise in investments in the Gilt-edged securities, conditions in the short-term money market were relatively comfortable practically throughout the year 1962. Consequently, during most part of the year, inter-bank money rates tended to be lower than in the preceding year. The actual inter-bank call money rate in Bombay, which had stood at 4½ per cent towards the end of December 1961, rose to the busy season peak of 5½ per cent in March, but, with the onset of the slack season, it retreated to reach a low of ½ per cent in July 1962—the lowest level since November 1952—which was 1½ per cent below that a year earlier. During the major part of the 1962-63 busy season falling in the last quarter of the closing year, the short-term money market was easy with inter-bank call rate coming down from 3½ to 2 per cent, but, after the beginning of December, there was a quick spurt in the rate, with the rate rapidly advancing to as high as 5½ per cent in Bombay and 6 per cent in Calcutta. After mid-December, however, the rate sobered down a little and came back to the more tolerable rate of 4½ per cent. The earlier easiness of the market was due chiefly to delayed movement of crops and the recall of advances by banks under the Reserve Bank's directive. The subsequent spurt reflected the accumulation of stocks of manufactured goods, especially cotton textiles and sugar, and the gathering momentum of the normal busy season. The trend of inter-bank call rate is indicated in Table III.

Inter-Bank Agreement

Term deposit rates of larger banks, however, continued to be quoted at the ceilings fixed under the All-India Inter-Bank Agreement on maximum deposit rates. In view of the growing need for more deposit resources, no bank was willing to pay anything below the maximum rates even during the slack season. Indeed, some of them wanted to pay more and the Inter-bank Agreement had to be revised. The revision was not done before much agitation for and against revision. At one time, it seemed as though the Agreement would break down. Ultimately good sense prevailed among the big banks and they decided to concede the demand, albeit half-way, of the medium-sized banks. Under the new agreement which became effective from 1st June 1962, while the standard rates for term deposits of various durations remained unchanged at levels fixed in March 1961 (namely, from 3 per cent for 3 to 30 days, 3½ per cent for 31 to 60 days, 3¾ per cent for 61 to 90 days, 3½ per cent for 91 days to less than 12 months, 4 per cent for one year, etc.), the medium banks (those with deposits over Rs. 25 crores but less than Rs. 50 crores) were given a concession to quote ¼ per cent more than the standard rates. Particularly, the small banks (with deposits of over Rs. 10 crores but less than Rs. 25 crores) were allowed to quote ¼ per cent over the standard rates. Banks with deposits of less than Rs. 10 crores were designated as smaller banks and given freedom from the restrictions under the Agreement.

The year 1962 was notable for the accord among banks in regard to their lending rates also. Under the Agreement (effective from 1st January 1963), the minimum rate of interest on advances made available by banks is fixed at 6 per cent per annum, calculated on daily balances and applied at least once every three months. The advances made to certain institutions such as public sector corporations and co-operatives, as well as advances granted against Gilt-edged securities or under Government guarantee and against deposits, are exempt from this minimum rate.

The long-term capital market also was well supplied with funds during the first ten months of the year. The Central and State Governments, as well as Local Bodies and State Electricity Boards, were able to put through their borrowing programmes without much difficulty, albeit at a higher rate of interest. The increase in rates was generally about ½ per cent point. So far as the private sector was concerned, there was, however, a fall in the number of new issues of both new companies and existing companies. Several of them were, of course, able to get heavily oversubscribed, but they were fewer than in 1961. There were actually quite a few issues that were not fully taken up and the underwriters were left with a substantial portion of the risk underwritten by them. The black Monday (28th May 1962) in Wall Street and the subsequent collapse of stock exchanges all over the world alerted the investors and cautioned them against attaching too much importance to equities as a hedge against inflation. The mania for capital appreciation began to wane and the value of buying scrips with good yield came to be appreciated. After the Wall Street crash, there were very few new issues of any great significance, first because of the precedence given to the borrowings by the public sector and secondly because a number of entrepreneurs with big projects on hand were hoping that, after the season for the public sector issues were over, the position of the capital market would improve. Little did they expect that their hopes would be dashed by the Chinese. The short-lived war on the Northern borders and the keen sense of uncertainty about the future have shattered the confidence of investors to such an ex-

TREND OF MARKETS IN 1962

EQUITIES BOOM AND COLLAPSE

Investors' Confidence At Nadir

BOMBAY, 19*th December*

THE calendar year 1962 has the distinction of having witnessed both the height of the preceding four-year boom in equities and its unmistakable collapse. It is an ironical coincidence that the start of the boom in 1958 as also its apparent end during the year under review came about while Mr. Morarji Desai occupied the office of Union Finance Minister. This remark would be unnecessary but for the fact that the pragmatic and practical approach of Mr. Desai to economic matters, in sharp and welcome contrast to the ideologically inhibited policy of his predecessor, Mr. T. T. Krishnamachari, had initiated a bull market and gone a long way to sustain the confidence of investors in equities. That it should reach its nadir while Mr. Desai continued to be Finance Minister was unthinkable for at least all marketmen and a great majority of investors. But the burst of the boom is no slur upon Mr. Desai. For it occurred fundamentally because of the Chinese felony culminating in an all-out aggression in Ladakh and N.E.F.A. on 20th October.

Cracks in the boom were, however, noticed soon after it reached its height in mid-May because of the serious infra-structural shortages in the economy unbalancing programmes of industrial development and leading to uncertainties about the attainment of production targets. The foreign exchange stringency, which led to the drawing of priority list of industries for import entitlements for the second half-year from October to March, created grave doubts about the maintenance of industrial progress at a satisfactory level. The arbitrary manner in which the Government tampered with the recommendations of the Tariff Commission on retention prices for steel companies and cut their profit-margin gave a serious jolt to the share markets, in that it gave rise to the impression that a fair deal to investors, especially in basic industries, would be hard to come by.

Nonetheless, it was the Chinese aggression that dealt a definite blow to the stock markets, as it undermined confidence in political stability —the very first prerequisite for industrial progress—in the country. As it mounted day by day until it was unilaterally called off by the Chinese on 21st November, sentiment on the stock markets went from bad to worse and ultimately to the worst. Frightened by the unexpected easy success of the enemy against our Forces, operators and investors sold in a panicky way and lost heavily in a market where values fell in chunks. A complete crisis of confidence enveloped the market. The Chinese aggression, leading to emergency at all levels, created one in the share markets also to get over which extreme measures, including ban on forward trading, were adopted. Even after the cease-fire, confidence was at a low ebb. What next in the border situation? This was the question uppermost in the minds of all. It remains unanswered while this is written. Will diplomacy save the country from a total war? Nothing is definite. The Colombo meet of the six "non-aligned" nations does not appear to have cleared the picture much.

* Basic industrial.

Two Clear Phases

The year's trend in equities had two clear phases; an upward move upto the middle of May, followed by a distinctly downward movement, moderate at first but sharp and steep from mid-October to mid-November. The two phases are best indicated by quoting the Reserve Bank's All-India Index for Variable Dividend Industrial Securities (base: 1952-53=100).

The index, which had recovered to 184.8 by the end of December 1961 after having declined from 187.6 to 182.4 by the middle of that month, rose further to 187 by the week ended 6th January 1962 and to 188.3 by 20th January, but turned slightly lower thereafter to close the month at 186.7—a level which was lower by only 1.3 per cent than the then all-time peak of 189.1 reached in mid-November 1961. The small reaction was owing to profit-taking and some precautionary selling induced by grave forecasts about the *Ashtagraha* in early February. In the subsequent months, the index generally maintained its upward march and struck a new all-time peak of 195.6 in the week ended 19th May, exceeding the previous peak by 6.5 points. Monthwise, during the period from January to mid-May, the index appreciated by a maximum of six points in February, when it rose from 186.7 to 192.8 on sizable support and short-covering following the failure of the worst predictions made by the astrologers. The recovery was also aided by favourable corporate news, particularly the announcement of rights and bonus issues by a number of companies.

Sentiment during the five-month bullish phase of 1962 was influenced by (i) the purchase of some blue chips by the L.I.C. during the fall in December 1961 on imminence of Army action in Goa and the consequent shrinkage in floating stocks, (ii) the remarkable success of the operation "Vijay" in Goa, (iii) the reduction by the Reserve Bank on 13th January of the minimum margin on banks' advances against shares from 50 per cent to 40 per cent, (iv) the *Ashtagraha* passing off without any of the predicted malefic effects, (v) the announcement of higher coastal freight rates, (vi) the expectations of an early announcement of increases in (*a*) steel retention prices and (b) coal prices, (vii) the news of an agreement to import 1.80 lakh bales of American cotton under P.L.480 as a step to relieve shortage of raw material for cotton mill industry and (viii) the reports that T.I.S.Co. was contemplating modernisation of its sheet mills as part of a larger project to augment production of tinplates.

The upward march during the period was, however, corrected in March, when business shrank considerably owing to uncertainties regarding the composition of the new Cabinet and especially about the continuance of Mr. Morarji Desai as Finance Minister, as his predecessor, Mr. T. T. Krishnamachari, had been elected unopposed to the Lok Sabha long before the elections were held. A steady tendency during the early part of March gave way to a mild recession in the middle of the month, particularly after the presentation of the interim budget on 14th March. The budget, with the revenue deficit of Rs. 63.46 crores and the big overall deficit of Rs. 147 crores, gave rise to serious fears of heavy taxation up to Rs. 100 crores. The index, after remaining steady around 192.8 between 24th February and 10th March, moved down to 191.2 during the week ended 31st March.

Budget, And A New Peak!

The tax fears were, however, quickly forgotten, as the proposals were to be announced only on 23rd April. Reflecting renewed buying support stemming from Mr. Morarji Desai's appointment as Finance Minister in the post-election Cabinet, the index surged forward to a new high of 194.1 by the week ended 17th April. But for a week after that prices eased on scattered selling, in view of the proximity of the announcement of tax proposals. Sentiment was affected by the anticipated rise in the revenue deficit to Rs. 91 crores and in the overall deficit to Rs. 175 crores following the Government's decision to raise the D.A. for Government servants retrospectively from November 1961 and the report of the Mudaliar Committee on export promotion containing proposals for tax relief for exports.

But the day (23rd April) when the tax proposals were made known it was found that the revenue deficit at Rs. 60.78 crores was even lower than what had been estimated. Further, out of a total tax effort of Rs. 71.70 crores in a full year (Rs. 68.08 crores for 1962-63), direct taxes aggregated Rs. 27.20 crores or 37.5 per cent of the total burden. Notwithstanding the five-point increase to 50 per cent in income taxation for companies, imposition of fresh excise levy on cloth and the tightening of the screw on the rich, the market reacted bullishly to the tax proposals in contrast with the pessimistic reactions of spokesmen of trade and industry. This curious behaviour showed that the market had lost its sense of reasoning and become a victim of bullish madness. The Re-

Reserve Bank's index advanced to a new all-time peak and the year's best level of 195.6 which was registered in the week ended 19th May.

Downward Drift

From the end of the third week of May, however, the madness began to subside and the market tended to change its course and prices began to drift lower. The decline was almost continuous till 21st July. This roughly two-and-a-half-month downward drift was caused by bull liquidation and selling pressure following mainly (1) the postponement of the Aid India Club meeting scheduled for 28th May as a result of which anxiety over aid prospects for the second year of the third Plan grew, (2) the sudden and sharp break in prices on Wall Street on 28th May and the resultant widespread declines in share values in the London and Continental exchanges, (3) the announcement on 8th July of a cut in import licences leading to apprehensions of a fall in production in some industries, (4) the renewed trouble in July on the Sino-Indian border in Ladakh, (5) the trend towards further dear money as indicated by the introduction of the four-tier system in place of the three-tier system of lending rates and the announcement of new loans by the Central Government offering higher yields, and (6) the power cut in Madras State due to the belated start of the monsoon and the threat of a similar cut in Bombay and Calcutta.

The announcement on 12th June of some concessions in the taxation measures proposed in the Central budget and the modest increases in coal and paper prices did not leave much impression on the market sentiment, as they fell far short of market expectations. The month of July saw, however, some redeeming features such as the non-materialisation of the power cut in the Bombay-Poona region and the restoration of the cut in Madras State, the announcement of a standby credit of 100 million dollars by the I.M.F. and the purchases of selected scrips by the L.I.C. But these factors failed to lift the market. Between 21st July and 1st September, however, a technical rally forced its way following the Finance Minister's satisfaction (expressed in July) with his discussions abroad on safeguards for Indian exports to the E.C.M. countries and prospects of larger aid from the Aid India Club. The aid prospects very largely materialised in August, when sentiment was also influenced by the expectations of an early announcement of increased steel retention prices. The Reserve Bank's index advanced from 183.3 during the week ended 28th July to 186.7 by 4th August and further to 188 by 1st September.

Short-lived Rally

The rally proved, however, a short-lived affair, as September saw a heavy shake-out engineered by the Government's disappointing announcement on 7th September of an increase of only Rs. 10.50 per tonne in steel retention prices instead of Rs. 38 per tonne as recommended by the Tariff Commission. As the month progressed, sentiment was dampened by fears of a cut in the T.I.S.Co. dividend, reports that the Government might resort to more stringent measures to hold the price line, fears of further curbs on imports of raw materials, components and spares in view of the serious foreign exchange situation and reports of renewed tension on the Northern border. The index dropped during the month from 188 to 180.4, at which level it was down by 7.8 per cent from the all-time peak of 195.6 reached in mid-May. The maintenance of the T.I.S.Co. dividend produced a small rally in the first week of October and the index edged forward to 181.2 during the week ended 6th October. Thereafter, it drifted lower to stand at 179.7 in the week ended 20th October.

The Chinese aggression brought the index reeling down to 168.8—the lowest level for the year—by the week ended 10th November. At that level, the index was down by 13.7 per cent from the all-time peak and the year's highest level of 195.6. After the steep fall following the Chinese offensive, the index moved narrowly between 170.8 and 170.3 and closed the week ended 8th December at 170.6 as against 183 for the week ended 9th December 1961. Since then, there has been a slight recovery in some of the popular counters thanks to L.I.C.'s purchase of a large block of Tata Ordinaries, some selective buying of blue chips by investors and fractional bear-covering. Behind this is the feeling—wishful thinking would be more appropriate—that there would be no recurrence of the shooting war on the Northern borders.

The heavy toll taken by the China war in terms of equity values created an emergency on all the stock markets of the country. The market authorities announced heavy anti-bear margins and prohibited fresh sales. Despite this, prices continued to fall. On 5th November, therefore, the market authorities in Bombay and Ahmedabad suspended trading for an indefinite period which later, however, turned out to be roughly a week. On that date, the authorities of the Delhi Stock Exchange suspended business for a day. Thanks to timely measures such as heavy margins on sellers, stoppage of fresh short sales, fixation of minimum prices, compulsory carry-over of outstanding business at fixed making-up prices and *budla* charges, the Calcutta Stock Exchange survived the crisis without recourse to suspension of trading. The special measures taken in Calcutta were followed later by all the other stock exchanges, and the situation was brought under control. The L.I.C. extended a helpful hand by making bulk purchases, particularly of ordinary shares of Tata Steel in Bombay and Ahmedabad and of Calico in Ahmedabad. Nonetheless, to prevent the recurrence of a similar crisis on stock exchanges, the Government banned forward trading in shares on all the stock markets from 30th November. However, from 10th December, the Bombay Stock Exchange was permitted to allow forward purchases up to a very restricted limit and subject to a margin.

The table showing the trend of equities—Table I—published on page 186 gives an idea of the extent of the rise and fall in equities on an industrywise basis. It will be clear from the table that Textiles, which had boomed sharply from January to May, were the worst sufferers in the fall mainly because they were boosted too high earlier. Although the trend of production in the industry continued to be encouraging, not many mills fared well last year. Besides, the feeling was that due to higher cotton prices and labour charges the profit-margin of the industry might decline further during the current year. The silk and woollen group in textiles also suffered heavily for identical reasons. Jutes were, however, relatively less affected mainly because of better availability of raw jute at reasonable prices.

Steels presented a steady front well up to September on hopes of a fair deal in regard to steel retention prices, but suffered heavily when the hopes were dashed, as already described. Engineering shares were in for a bad time during the greater part of the year following difficulties in getting adequate supply of raw materials and power. Sugar shares weakened further because of the lower profit due to cut in production and larger exports at a heavy loss. Plantations were affected mainly by the fall in tea prices and coffee crop. Otherwise boosted due to restrictions on imports, Chemicals caved in mainly because of the general fall following the Chinese aggression.

Thanks to greater attention paid by the authorities to movement and production of coal, coal shares made a steady show. Likewise, Cements seemed to be getting out of the wood. Electricity shares were a notable exception to the general trend, as they recorded a net rise over the year due to expectations (yet to be fulfilled) of a higher return to electricity companies on their employed capital.

These in brief are the main trends on the Bombay Stock Exchange and a scrip-wise picture is presented in the table on this page giving the movements during the year of some selected 50 equities.

Outlook

The year 1962 has, on the whole, proved to be a bad year for investors. If it started under the shadow of the border war with the Chinese, it had taste of one before it was out. Needless to say the taste was quite bitter. What is still worse is that the taste is still in the mouth and the fears are that another bitter pill may be administered any time. One would be unwise to hazard a short-term view of the outlook for equities, in view of the extremely unpredictable political situation. Besides, whatever turn the political situation may take now, it is already clear that the economic implications of the Chinese felony will be serious and far-reaching. Defence needs have assumed all priority over everything else. And the burden of such defence expenditure will have to be doubled, that is to a level equal to 5 per cent of the national income. The 1963-64 budget will be not a peacetime but a war-time budget. Not until it is out can the stock markets hope to regain their equipoise.

MADRAS STOCK EXCHANGE

From Boom To Gloom

By Messrs. Maconochie & Co.

1962 is truly a memorable year in the history of our nation. For the first time since independence, we came face to face with the realities of war—a war which has given us many shocks and for which we were totally unprepared. Like the nation, our stock markets too were taken by surprise by fast developing events, and flung mercilessly into a vortex of confusion and despair. In Bombay, trading had to be suspended for a week, minimum prices have been clamped down and forward trading suspended in all centres. Delivery rules for cash sales have been tightened up and the market situation is fluid. Thanks however to timely official action, the rot has been contained and the market health restored, at least partially.

The events of the first nine months of the year pale into insignificance before the cataclysm of the last quarter and seem of little value even for purposes of recording. Nevertheless, it is necessary to view them in proper perspective in order to understand the basic factors that influenced market movements during a good part of the year. The dominant factors influencing our national affairs as well as stock market fluctuations were: the much debated entry of Britain into the E.C.M., our deteriorating balance of payments situation, with its logical impact on our development plans and the fluctuating prospects of foreign aid. On the domestic front, we were concerned with the General Elections during February which, as expected, passed off peacefully and returned the Congress Party to the saddle in the Centre and all the States. The composition of the new Central Cabinet satisfied market circles and the country settled itself to a five-year period of peaceful development. But other problems reared their heads—notably the shortage of raw materials, coal, transport and power, whose solution has to be tackled on a long-term footing. The mid-year drastic cut in maintenance imports was a stern reminder, as much of our deteriorating foreign balances as of the feeble success of our export promotion efforts. The capital market was in fine fettle up to the middle of the year and several new companies were successful in getting the required capital. Conditions changed after July and thanks to the moratorium or large capital issues during the July-September period, many new companies have been shut out indefinitely from the capital market. By the beginning of the last quarter, a slackening of the market tempo was perceptible and, by November, the debacle set in, engulfing all markets in deep gloom, from which they are yet to recover.

In January, share markets opened buoyant in the wake of the success of the Goa action and prices moved forward briskly. However, the rise was halted during February which was the election month and it was not until March that the uptrend was renewed after the results of the election were known and the composition of the Central Cabinet had been announced. By the beginning of April, markets were again clouded because of the proximity of the Budget. The Budget proposals, despite the increase in the corporation tax of 5 nP per rupee, raising the total tax on companies to 50 per cent were received with relief and share prices started looking up again. The revenue deficit of Rs. 60.78 crores was more than covered by fresh taxes which were computed to yield Rs. 68.88 crores during the fiscal year 1962-63 and in a full year Rs. 71.70 crores. The increase in excise duty on yarn and cloth, expected to yield as much as Rs. 12.10 crores, was not taken serious note of at that time, as also the withdrawal of the exemption of wealth tax on new company's shares. As usual, the relief felt after the proposals were known, provided the momentum and share prices started climbing higher daily, mostly on growth prospects and in utter disregard of yield considerations.

The first major jolt was felt immediately after the unexpected Wall Street crash of 28th May. The announcement of the adjournment of the Aid India Club meeting which coincided with this, caused the first major break of the year and might be said to be the starting point of the slump which was to manifest itself latterly. The month of June passed with no major change and, in July, we had the news of the power cut in the Madras State, which fortunately lasted for 10 days only. About this time, the Aid India Club had sanctioned an immediate release of $1.070 million for the second year of the Plan. The Central Government loan to the tune of Rs. 250 crores was announced during that month. In August, the State loans were announced. September was the silver jubilee month of the Madras Stock Exchange which occasion was celebrated with justifiable eclat. Share Markets all over the country continued to be active and, though the market trend was latterly two-sided, there was really no sign of a major downtrend until the decision of the Government on the question of steel retention prices was made known during that month. The Tariff Commission's recommendation of an increase of Rs. 38 per tonne was pruned down to a mere Rs. 10.50 per tonne by the Central Government and this shocked market circles and raised grave apprehensions about the reasons which prompted the Government to effect such a drastic cut. Stock markets naturally reacted quickly to this piece of bad news and the downtrend which started in September continued unchecked, despite the Tata Iron and Steel Company maintaining the dividend at Rs. 7.25 per share, which included the bonus element, and gave the impression that the future of the steel companies need not be viewed with alarm. There was, however, an undercurrent of anxious concern, which developed into panic after the 20th of October when the news of massive Chinese aggression burst out openly for the first time. The Calcutta Stock Market authorities acted with alacrity by announcing minimum prices on the 24th of that month, whereas Bombay took no immediate action. However, on 5th November, trading was suspended in Bombay and minimum prices were fixed. It was not until 12th of November that the Bombay market resumed business. In Madras, minimum prices were fixed on 5th November and continue to be in force. On 29th November, the Government issued a notification suspending forward trading in all stock markets.

Sugars

The most important item of news in this section was the decision of the Government to link the payment to growers to the quality of the cane tendered by them. The industry is in a better state of health, thanks to better local offtake and the vigorous export drive. However, the difficulties experienced during 1961 were reflected in the dividends announced by sugar companies during this year. Several of them had to prune their dividends, notably Deccan Sugars which paid 18 per cent against 21 per cent last year, Cauverys 6 per cent against 8 per cent, India Sugars 10 per cent against 14 per cent and Travancore Sugars 5 per cent against 7½ per cent. E.I.Ds maintained the dividend at 21.3/7 per cent and the shares proved most attractive to investors by virtue of the high yield and the prospects of growth after the establishment of the composite fertiliser unit, now in production. From a low of Rs. 35.50 the shares registered a high of Rs. 44.50 but closed lower around Rs. 40. The highest in Deccan Sugars was Rs. 11.20 compared to the previous year's highest of Rs. 15.15 and of Cauverys Rs. 117.50 against Rs. 147. The highest for India Sugars was only Rs. 11 against Rs. 14 during 1961.

Rubber

The price of the commodity continued to be controlled throughout the year and the shares of rubber companies remained popular with investors. The demand for the commodity has exceeded supply and this trend is bound to continue for the next few years, so that the production of synthetic rubber on a larger scale than envisaged at present, has become a dire necessity. Despite the price of the commodity remaining unchanged, profit-margins were lower. The pattern of dividend payment was somewhat mixed. Malankaras paid 14 per cent, as against 16 per cent last year, while Kailas paid 30 per cent against 25 per cent. Mercaras paid 5 per cent lower, while Rajagiris maintained the dividend at 20 per cent. Thirumbadis paid 12 per cent against 7 per cent for 1960, while Travancore Rubbers paid 12 per cent against 13 per cent. Cochin-Malabars maintained the dividend at 20 per cent. There was not much variation in the prices of rubber scrips, and, if anything, most shares drifted lower. The highest for Cochin Malabars during 1961 was Rs. 8.05, while the highest during 1962 was Rs. 7.38 only. The fluctuation in other shares was even more insignificant.

Tea

At long last, the travails of this industry have attracted the Government's recognition and the Finance Minister announced valuable tax concessions in the Budget. He has reduced the Export duty from 44 to 25 nP per kg. and, lately, there are rumours that this duty may be abolished altogether. Tea accounts for one of our largest export earnings, Britain being our largest customer. Unlike the case of Textiles, which will suffer in the event of Britain joining the E.C.M., this industry will benefit because Indian tea will enter the E.C.M. countries duty-free. Home consumption has also risen steadily and, therefore, the industry is on fairly sound ground. The United Kingdom stock of tea as at 23rd November 1962 was 151.9 million lbs., as compared with 137.6 million lbs. a year ago. Offtake from Cochin was quite heartening, namely, 75.23 million lbs. upto 31st October, 1962, as compared with 53.38 million lbs. for the corresponding period of 1961. The sale average, however, was somewhat lower, the figure being Rs. 4.53 per kg. upto 13th November 1962, as compared with Rs. 4.76 per kg. as at 14th November 1961. A study of the break-up figures of the various grades is, indeed, interesting. Low mediums, which had fetched Rs. 3.40 to Rs. 3.70 per kg. at the beginning of the year, earned as much as Rs. 4.50 to Rs. 5 per kg. in the 27th November auction. Medium grades improved from about Rs. 3.85 per kg. to Rs. 5 per kg., and good medium from about Rs. 5 to Rs. 6 per kg. and Nilgiri B.O.P. from Rs. 5.40 to anything between Rs. 5.75 and Rs. 7.50 per kg. The general pattern was that, during 1962, the industry showed recovery from the slump of the previous year. The presence of Russia at these auctions and the general expansion of domestic consumption might account for this changed trend.

In view of the fall in the price of the commodity during 1961, most Tea companies had to prune their dividends for that period. Haileyburias paid 12½ per cent against 15 per cent, Parksides 22½ per cent against 27½ per cent, Peermades 25 per cent against 22½ per cent, Twyfords 6 per cent against 10 per cent and United Nilgiri Teas 22 per cent against 21 per cent. The June year-ending companies have announced better dividend for 1961-62, notably Parksides which raised the dividend to 27½ per cent while Nonsuch maintained it at 20 per cent throughout. The trend of share prices was, however, lower. Haileyburias dropping to a low of Rs. 11.75 compared with the highest of Rs. 14. Highlands Rs. 12.30 against Rs. 14.10, Kalasas Rs. 3.10 against Rs. 3.62, Nonsuch Rs. 21.62 against Rs. 25.50, Parksides Rs. 21.62 against Rs. 25.95, Twyfords Rs. 8.96 against Rs. 11.85 and United Nilgiri Teas Rs. 19.35 against Rs. 23.50.

Coffee

The year 1962 was definitely more favourable to the coffee industry and, thanks to the judicious marketing policy and a lower crop, the price for the commodity has shown a healthy improvement. The 1960-61 crop was 67,794 tonnes while the 1961-62 crop is expected to be about 44,858 tonnes. The total Pool return for 1960-61 is expected to be Rs. 2.10 per point only against an estimate of Rs. 2.45 per point for 1961-62 and Rs. 2.30 for the current season. The pattern of dividend payment by coffee companies in the last three years ending with the 1961-62 coffee season clearly shows that increases in taxation and costs of production are telling upon the profitability of the industry and that the higher crops, secured by the better strains introduced and improved cultivation methods, do not adequately cover the increase. The commitments for wages, bonus, etc. of the major coffee producing companies has risen to alarming figures in the past few years. In addition, coffee, being a fruit crop, is noted for its extreme fluctuation, with the result that, even a few bad crop years drain away the slender resources accumulated during the good ones. If this process continues, the desired expansion of this vital industry is not likely to materialise. To turn to dividends. For the year ended June 1962, Consolidated Coffee have declared a dividend of 15 per cent (20 per cent for the previous year) and Coffee Lands 9 per cent (12 per cent). Badra pruned the dividend from 15 per cent to 7½ per cent. Kumargodes declared 17½ per cent against 20 per cent. Lingapurs maintained 25 per cent as also Mysore Amalgamated 10 per cent and Oosoors and Wartyhullys 15 per cent. Rajendra paid 5 per cent less and Sheveroys paid 6¼ per cent against 7½ per cent in 1961. The trend of coffee prices again emphasise the market assessment of coffee prospects. Consolidated Coffee shed Rs. 4 over the year and over Rs. 8 compared to the highest in 1961. Similarly Coffee Lands have shed Rs. 3.25 over the year and Rs. 9 over the past two years. Cowcoodys have shed Re. 1.50 over the past two years and Lingapurs Rs. 2.50 over this period.

Textiles

Share prices during 1962 reflected the good working and higher dividends of the previous year which in several cases were considerably higher as compared with a year ago. 1961 was a year of prosperity for the textile industry. Unfortunately, conditions seem to be changing and the entry of Great Britain into the E.C.M. is viewed with apprehension by the Indian textile industry. Britain is one of our largest consumers and, if as a result of her entry into the E.C.M. she had to levy corresponding duty it is apprehended that our sales to the United Kingdom will diminish. Of late, there have been reports of heavy accumulation of yarn and cloth due to the credit curbs and the general unsettlement of the market since the beginning of the emergency. In addition, the textile industry is facing cotton shortage and the recent agreement with the United States for the import of 375,000 bales of PL. 480 cotton has relieved the position to some extent.

Textile scrips recorded the highest levels during the first half of the year and, since then, there has been a general decline, the worst to suffer being rayon shares. Bangalore and Buckinghams recorded a high of Rs. 267 and Rs. 290, respectively. Metturs touched Rs. 400, Radhakrishnas Rs. 40 and Rajalakshmis Rs. 120. The highest for Travancore Rayons during 1962 was Rs. 44.80 compared with Rs. 47.50 for 1961, while the highest for South India Viscose was Rs. 196 compared with Rs. 198 for 1961. Currently these shares are quoted Rs. 28.60 and Rs. 141.50 respectively.

Miscellaneous

Cement shares were throughout well supported and proved popular with investors because of the good yield obtainable. Chemicals also continued to be popular while paper shares lost much of their attraction after the reduction in the selling price, effected about a year ago. Engineering scrips were fancied for their growth prospects. All the cement companies maintained the dividend at the previous levels, the most active amongst them was India Cement which was consistently absorbed on investment account. The highest price recorded by this scrip was Rs. 6.45 against Rs. 6.72 for the year 1961. This company maintained the dividend at 12 per cent and made a right issue of 5 for 9 shares at par to holders as on the 28th February 1962. Dalmia Cements maintained the dividend at 12 per cent and the highest recorded was Rs. 14 against Rs. 12.85 for 1961. Orissa Cements maintained the dividend at 15 per cent and Travancore Cements at 6 per cent. In November, the Mysore Cement factory went into production. Amongst Chemical issues, FACTS declined steadily to close at Rs. 6.85. This company maintained the dividend at 6 per cent. Mysore Chemicals and Fertilisers reduced the dividend to 5 per cent. Mysore Chemical Manufacturers maintained the 20 per cent while Travancore Chemical Manufacturers stepped it upto 22½ per cent.

The two recently established paper mills in South India, namely, Mandya National Papers and Seshasayee Papers went into production during the year. Seshasayee Papers, recorded a high of Rs. 9.35 and are currently quoted at Rs. 8.10. Mysore Papers recorded a high of Rs. 15.12 XR during 1962 against a high of Rs. 27.25 CR during the year 1961, and are currently quoted at Rs. 13.90. This company has maintained the dividend at 15 per cent on the old capital.

Among the Engineering issues Binnys, being a Section 23(a) company, stepped up the dividend sharply from 12½ per cent to 22½ per cent and the shares recorded a high of Rs. 375 but are currently quoted at Rs. 329.40. Canara Workshops were popular. This company has paid a dividend of 20 per cent for the year ended March 1962 the shares are currently quoted at Rs. 30.50. Kirloskar Electric have announced a bonus issue in the ratio of 2 for 5 shares to holders on the 30th November 1962. These shares were very popular and are presently quoted at Rs. 23.62 *cum*-right, *cum*-dividend of 12 per cent. Madras Aluminiums have announced that the Company will be producing alumina by the middle of next year. The shares however declined steadily to Rs. 38.85. Madras Rubbers were most popular and at one time were wanted as high as Rs. 25 CD but receded gradually to fall to Rs. 19. This company has set up its tyre factory in record time and commercial production was started recently.

The Touchstone of Success

At the foot of the Himalayan ranges dwelt Suka the learned Rishi, and to him came from far and wide many seekers after knowledge.

To him there came, one day, a thoughtful man with a question in mind and he asked of the Rishi, "Of all things on this earth what takes the longest to grow?"

Suka mused awhile then answered: "Confidence. Whatever is tried and tested in the crucible of time and found to give complete satisfaction—only then does confidence come to be reposed in it! That is the touchstone of its success".

Manufacturers of ethical pharmaceuticals and fine chemicals since 1907

For any Service Involving Money—

THE

STATE BANK OF TRAVANCORE

(Subsidiary of the State Bank of India)

Head Office: TRIVANDRUM

●

With 94 Branches mostly spread all over Kerala and having agency and drawing arrangements with all the 1,413 Branches and Sub-Offices of the STATE BANK OF INDIA and its Subsidiaries the Bank offers complete Banking facilities. ACCEPTS GIFTS AND DONATIONS FOR THE NATIONAL DEFENCE FUND AT ALL OUR BRANCHES.

DEPOSITS

The Bank accepts all types of deposits, Current, Savings, Fixed and Call and Short-term Deposits.

Savings Bank Accounts opened and interest allowed at 3% upto a maximum of Rs. 50,000; maximum withdrawal Rs. 5,000 per week.

ADVANCES

The Bank grants all types of advances against Government Securities, Post Office Cash Certificates, Gold Ornaments, Shares, Life Insurance Policies, Foodgrains, Warehouse Receipts—in short, any standard commodity which is readily marketable.

Medium Term Finance and Financial assistance to Small Scale Industries and Co-operative Marketing and Processing Societies at specially reduced rates.

REMITTANCES

The Bank through its wide network of Branches of the STATE BANK OF INDIA and its Subsidiaries enables constituents to remit money to any part of the country.

FOREIGN EXCHANGE BUSINESS

The Bank undertakes all kinds of business connected with Foreign Exchange, including opening of Letters of Credit, Discounting of Foreign Bills, issue of Letters of Guarantee, Issue of Travellers' Cheques.

T. R. KRISHNASWAMI,
General Manager.

PRODUCTS that stand out from the Shelf—
that say
"COME, TAKE ME !"

★

It's the eye-appeal that makes for sales-appeal. To give your product a distinctive look, to make it stand out from the rest, almost say " Come, take me "—that is the supreme task that we fulfil, to your advantage. Whether collapsible tubes or tin containers, when you entrust your work to ZENITH, you can depend on our diverse resources....in men, machinery and techniques....and on our integrity and experience, above all. Amongst our patrons are the country's foremost manufacturers. So can you be !

Enhance the eye-appeal of your product.

SYMBOL OF QUALITY

Quality is the key to success and development of Industries. Use of quality products reduces cost of production, maintenance and overhead charges. That is why the demand for N.P.T. products are growing more and more every day. This increasing demand surely proves that N.P.T. stands as a symbol of quality.

RANGE OF PRODUCTS:

Bars—Rounds, Hexagonals, Squares & Flats. Sections, Pipes and Tubes of Brass & Copper including Arsenical Copper, Copper Bus Bars, Strips and various other non-ferrous Semis. N.P.T. also roll pure Lead and Electrolytic Zinc Sheets.

NATIONAL PIPES & TUBES CO. LIMITED

"NICCO HOUSE," 2, HARE STREET, CALCUTTA—1.

Calcutta Stock Exchange

Sentiment Gets A Rude Setback

CALCUTTA, 16th December

VIEWED in retrospect, stock markets in India led by Bombay passed through a critical period in 1962, which is closing after rudely shaking the confidence of investors and with no immediate hope of a return to normalcy. Although in the face of the Prime Minister's oft-repeated declaration that the emergency would not come in the way of the progress of the third Plan, there would be absolutely no justification whatsoever "to beat the gun," as the Americans so well express it, "to outwit the crowd, and to pass the bad, or depreciating, half-crown to the other fellow," that is what happens when sentiment gets a rude setback. This was only too clear towards the end of the year on the Calcutta Stock Exchange as well as other exchanges in India.

Up to the middle of May, equities at Calcutta recorded a slow but steady rise. The Reserve Bank's index of variable dividend industrial securities for the Calcutta region was 172.1 (base: 1952-53=100), for the week ended 31st December 1961. The index swiftly rose to 174.3 by 13th January, mainly because of the keen interest shown on the new shares (Birla Jute, Guest Keen Williams, Jaipur Udyog, J.K. Rayon, Kesoram Industries and Orissa Cement) included in the forward list on 1st February. Speculation on these shares was attributed to intelligent expectations of their imminent promotion. In the next two weeks the index gradually fell and stood at 173 in the week ended 27th January. Uncertainty about foreign aid, already highlighted in the shortage of imported raw materials and spare parts and preventing industries from realising their installed capacity, subdued sentiment. The Reserve Bank's decision to reduce the margin of share advances by banks, the likelihood of the imminent return to the Cabinet of the votary of heavy taxation, Mr. T. T. Krishnamachari, and shortage of power and transport added to the chill wave of January's cold weather.

In the next five weeks, the index gradually gained until it reached 179.5 by 3rd March. The passing away of the conjunction of the planets without giving birth to the apprehended Doomsday and Mr. Krishnamachari's belief of little justification to increase direct taxes further, the revival of demand for jute goods and the hope of mills to recover past losses, and the welcome news of a series of bonus and rights issues encouraged both the speculator and the genuine investor in entering into fresh commitments. In the next three weeks up to 24th March, however, activity cooled down following the view of Mr. Krishnamachari and Mr. Krishna Menon of the existence of scope for further nationalisation of industries, and the index moved down to 178.1. The recovery to 178.7 in the following week was due to the Prime Minister's declaration of the existence of considerable scope for the expansion of private sector. The announcement of good corporate results aided the view that, despite shortages of raw materials, power and transport, industries continued to work efficiently. Budget anxiety soon set in to force down the index to 177.2 by 21st April.

Most Hectic Days

The next four weeks ended 19th May were the most hectic days of the year, the index gradually rising and touching the year's high of 181.1. The initial healthy reaction of the market to the new taxation proposals was maintained for about four weeks, despite the possibility of a reduction in dividend in view of the increase in corporation tax. The next ten weeks up to 28th July witnessed a rapid fall of the index, from 181.0 to 169.7. The crash in world stock markets reminded many of a similar event in the U.S. on 29th October 1929 which served as the birth-pang of the most devastating depression the world had ever seen. Few could, however, remember that, since then, the U.S. has introduced many built-in stabilisers in its economy automatically to arrest any depression. However, depression in Wall Street was sufficient to justify a lowering of interest here, and the index began moving down. And, once sentiment gets affected, only unfavourable factors are given attention. The growing unfriendly behaviour and acts of intrusion by the Chinese, the aid-cut decision by the U.S., and the stiffening of the Government's dearer money policy as found in fresh restrictions on borrowing by commercial banks from the Reserve Bank, were factors which led to selling pressure.

With the passing off of the crash in New York and Continental markets, confidence was soon regained, and lower levels here attracted buying support which was mainly around speculative counters. The weekly index set on a recovery to reach 173.9 in the five weeks ended 1st September. From now on, the dull trend has continued and, by rapid recession, the index reached 163 on 24th November, that is, a loss of 10.9 points in the twelve weeks beginning from 1st September. The disappointment over the steel retention prices—the Government granted an increase of only Rs. 8.50 a tonne, as against the Tariff Commission's recommendation of Rs. 38—was the signal for the reverse trend early in September. This was followed in mid-September by anxiety on fresh aggression by the Chinese on the N.E.F.A. border, and on the accentuating foreign exchange shortage. The pre-*Pooja* lull, usually a normal feature, received significance and import in view of the continued setback. The reopening after the *Poojas* was a continuing phase of the lull, which was stimulated by nervous selling. News of heavy attacks by the Chinese followed by reverses for India served as the severest shock of the year and, in the complete absence of buying support, stock market activity came almost to a standstill from the end of October.

Restrictions on Sellers

Increased import of war equipment, it was thought, would lead to pacing down economic progress. Also, there was the apprehension that bottlenecks of transport, raw materials, power and personnel shortages would hamper progress. In order to stop the rot, the Calcutta Stock Exchange authorities imposed margins and restrictions on sellers in clearing shares. The collapse on Dalal Street served as foot-print for Lyons Range, where minimum prices for cleared and cash shares were fixed and selling in clearing shares was restricted excepting for squaring-up transactions. The increase in interest on overdrafts on stocks and shares and the Reserve Bank's decision to restrain credit fanned the chill wave, the pace of which was slowed down, however, by the timely measures taken by the C.S.E. authorities.

Early in November, the minimum levels for the oft-bought non-clearing shares numbering about twenty were reduced. This was followed by reduction of the minimum prices of five clearing shares.

The Reserve Bank's sub-group index of variable dividend industrial securities changed from time to time generally in consonance with the regional index, discussed above. All the same, a brief reference to the main causes for changes in the main sub-groups is attempted in the following paragraphs.

Jute Textiles

On 30th December 1961, the index was 91.2, which rose to 92.4 by 20th January. Investment buying received an impetus when, following increased demand for gunny, the I.J.M.A. removed all restrictions on output, hitherto in force. However, a dip to 91.6 by 3rd February followed, attributed to profit-taking and passing of the *Ashtagrahi* fears. The jump to 94 by 10th February and to 99.1 by the 24th was lively, as, with plentiful fibre supplies and increased demand for goods, mills were confident not only to erase the 1961 working losses but to improve profitability. Thereafter, the index rapidly improved until the year's high of 107.6 was reached on 28th April. The abrupt arrest of this upward trend and the loss of the index to 106.3 by 12th May were explained by the levy of excise duty on jute goods for internal consumption. In the following week, a small recovery to 106.4 took place on firm expectations of a bumper fibre crop. After remaining at 106.1 in the next two weeks to 2nd June, the index dropped sharply to 103.9 by 9th June, since the controversy over minimum prices for the new crop cautioned even the optimist. A mixed trend set in and the index, following a zigzag movement, fell from 104.3 on 16th June to 101.2 by 18th August, but recovered to 103.6 by 8th September. Since then, it has been a definite decline: the index for the week ended 24th November stood at 96.6. This is not to say that the mills are not working very satisfactorily, despite several difficulties; on the other hand, it is significant that, although the index of several Calcutta groups as well as the Calcutta regional index have fallen on balance in the year, the index for this section has gained by more than five points.

Tea

Closing at 155.4 for 1961, the index skidded to 153.2 by 20th January, attributed to discouraging marketing outlook, thanks to increased world supplies of tea. The next five weeks to 24th February saw a slow but rapid rise to push the index up to 155, as, contrary to expectations, auction prices hardened. At this stage, the general chill wave ran into teas also, for no reason other than psychological imitation, and that explained the dip to 154.3 by 24th March. However, the issue of bonus shares by some tea companies, coupled with the export tax concession, saw the index ascend since then; by 5th May, the year's high of 158.1 had been touched. This high was maintained in the following week. The next period of 20 weeks to 29th September was a recessionary phase, the index moving down from 157.8 to 144. The fall in the price of common teas and the slow support by overseas buyers underlined the uncertain outlook for marketing. However, when it was becoming clear that the North Indian crop would decline, overseas buyers began to take more interest in auctions, thereby leading to revival of interest in shares and to push up the index to 146.8 in the week to 6th October. The apprehension of financial worries for gardens as a result of accumulation of output, thanks to the strike by Pakistani crew in Assam-West Bengal river services, difficulties of working of gardens in the border areas, and the decline in crop making the dividend outlook uncertain, were all reflected in the shrinkage of interest in shares since 6th October. The index moved down to 141.1 by 24th November which is the year's lowest and which takes the total loss for the year to 14.3 points. With the resumption of work by the Pakistani crew, tea transport is fast returning to normalcy, but the general dullness has so far prevented an expansion of interest.

Coal

A gradual fall to 115.5 in the week ended 14th April from 121 on 30th December 1961 was recorded in the index for coal shares, as the growing shortage of explosives and transport were hampering coal output. Expectations that the Government would raise the price of the black fuel arrested the downtrend and the buying interest that was released pushed up the index week by week until it touched the year's high of 135.3 in the week to 26th May. In the next ten weeks up to 4th August, the index moved down to 122.8. The decline was in sympathy with the general trend of the market and also registered investors' disappointment at the small quantum of rise in coal prices. The subsequent recovery mainly as a result of the attractive low levels pushed up the index to 124.2, 123.3, 124.5, and 124.9, respectively, in the four weeks to 1st September. Since then, dullness has been a continuous affair to take down the index to 115.2 by 24th November. This is the year's low level, the total loss for the year being 5.80 points. So far in December, there has been no evidence of a recovery.

Paper Mills

The early rise in the group index to 214.2 by 13th January from 211.6 on 30th December 1961, fanned by hopes of a rise in the price of the commodity, was not maintained. A decline set in subsequently and, in the course of four weeks to 3rd February, the index lost to 210.7. The news of bonus issues by Bengal and more interest in Seshasayees arrested the decline and this forced up the index to 212.1 by 10th February. This was soon followed by the news of issue of rights and bonus shares for Titaghur, to raise the index to 219.3 by 24th February and to 223.7 in the next two weeks. Profit-taking reduced the index to 222 by 17th March, but, stimulated by expansion prospects in Orient and the plan, to increase pulp output in India Paper, the index rose to 223.6 by 24th March and to 227.9 by 31st March. In both April and May, the upward trend was fully maintained to push up the index to 235.9 (the year's high) by 26th May. In most of the nine weeks that followed, the index receded to touch a low of 217.6. A recovery was made possible with the announcement of increased prices for paper and paper board and, in the next two weeks to 11th August, the index regained to 221. From this time onwards, the index began to lose in line with the general dullness and, at 204.5 on 24th November, the year's low was touched to disclose the year's loss of 7.1 points.

Walchandnagar

a symbol of

Agrico-Industrial Revolution

From arid waste land to sugarcane growing: from cane growing to sugar machinery manufacture: and from sugar machinery to whole sugar manufacturing plants—that is the history of Walchandnagar within a short period of time! A vivid pointer to what mechanized agriculture and technology can achieve. Walchandnagar has made industrial history by recently completing the manufacture of India's first two sugar factories, in quick succession, one in Maharashtra and the other in Mysore. With the march of time Walchandnagar Industries continue to serve India's sugar industry—all parts, for three more sugar factories, will roll off their assembly lines by 1962, while special machinery and essential parts for sugar manufacture are being supplied throughout the country.

FURTHER RISE IN COTTON PRICES

Result Of Higher Ceilings

THE calendar year 1962, which covers the last eight months of 1961-62 cotton season and the first four months of the current season (1962-63), turned out to be yet another year of high prices, strict controls on distribution and large imports of cotton. It was clear as early as November 1961 that the 1961-62 crop was not only late but also smaller than the previous season's bumper crop. This consideration, coupled with the rising rate of mill consumption and the uncertain prospects for imports, left no one in doubt as to which way prices would move during the months that lay ahead. The bearish slant of the hedge contract and strict policing of the distribution of cotton by the Textile Commissioner did not succeed in bringing down spot prices which continued to rule well above the ceilings in the case of most varieties. The raising of the ceiling price by Rs. 35 per quintal or Rs. 125 per candy, for the 1962-63 crop, though it was ostensibly done to enable the farmer to realise a higher price for cotton, was described as "a feeble compromise to legalise what in fact had already been happening during the past season." The firmness of cotton prices, which was evident from the beginning of the season, reached a climax in July, though, since the commencement of the current season, prices have tended to look down for various reasons explained later. Reflecting this trend, the index number of wholesale prices of cotton, which was 104 in September 1961, rose to a peak of 115 in July 1962 and declined to 112 in September 1962, the latest month for which the index number is available. The following table indicates the trend of prices of ready cotton against the background of the futures contract during the year:

(In rupees per three quintals)

	Revised ceilings*	17-12-1962	End of August 1962	17-12-1961
Spot Rates :				
Moglai Jarilla 25/32"	798	770	693	693
Vidarbha Jarilla 26/32"	831	825	726	735
Khandesh 1973-26/32"	858	855	738	735
Buri American 29/32"	924	924	843	843
Bengal *Deshi* ..	690	577	585	585
Futures :				
Jarilla March 1963 ..	798	689	742	667

* With effect from 1-9-1962 only.

It will be noted that the spot prices as of August end 1962 are the same as those on 17th December 1961. They are so, because the transactions recorded were at the ceiling levels for the 1961-62 season. But this does not necessarily mean that the actual prices paid were the same; the premia above the ceilings were not officially disclosed. It is, however, common knowledge that spot cotton changed hands well above the ceiling prices. In contrast to this position, the present ruling prices of spot cotton, except Bengal *Deshi*, are only a few rupees below the enhanced ceilings. In other words, despite a substantial improvement in the production of cotton in the current (1962-63) season, much of the premium that ready cotton commanded last year still continues, albeit legally.

The sharp reduction in crop estimate from 4.8 million bales early in the season to 4.4 million bales in January 1962 and delayed arrival of crop imparted firmness to the futures market in January. The announcement of three import quotas during the month, comprising a global quota of 200,000 bales of cotton stapling 1.1/16" and above from any area, Rs. 1.50 crores worth of Pakistan cotton having a staple length of one inch and below and 33,330 bales of cotton of staple length 1.3/16" and above from any area, all in the short period of a fortnight, failed to influence the futures market. In fact, the Moglai Jarilla March 1962 contract, the only hedge contract of the 1961-62 season, firmed up from Rs. 673 per three quintals at the beginning of the month to Rs. 690, that is, Rs. 3 below the ceiling rate of Rs. 693, on 19th January, though it wound up a shade lower at Rs. 688.

Scarcity of Ready Cotton

In the spot market, scarcity of cotton was increasingly felt. With a view to distributing equitably the meagre supplies, mill quotas were made subject to both qualitative and quantitative restrictions. Accordingly, mills were given individual quotas for each and every description of cotton. It was also stipulated that no mill should hold stocks in each variety beyond five months' average consumption. These restrictions prevented cornering of cotton by powerful mills, but they were of no avail in arresting the rising trend of prices. In fact, the futures contract hit the ceiling of Rs. 693 by mid-February. There was hardly any tenderable cotton and long interests sat tight on their positions, preferring to pay the penalty for failure to tender. The Forward Markets Commission, however, belied their hopes by ruling that the ceiling price was inclusive of penalty. Nevertheless, the contract continued to be quoted at the ceiling and expired on 25th March at that rate with not a single bale having been tendered on the docket. The hedge contract having proved unworkable, it was decided not to have any more of futures market for the rest of the 1961-62 cotton season. Accordingly, dealings were not allowed in the August 1962 contract. The E.I.C.A., therefore, devised a new hedge contract for the 1962-63 season that would take care of a tight supply situation in cotton. The Forward Markets Commission approved of the changes made in the by-laws of the E.I.C.A. and allowed futures trading in the 1962-63 crop to begin as early as on 9th May 1962, that is, long before the sowings. The salient features of the new hedge contract were as follows:

(1) The basis of the hedge contract shall be Fine M.G. Moglai Jarilla staple 25/32" tenderable upto Good to Fully Good for grade (one and half class 'off') and upto 2/32" on and 2/32" off for staple. (2) All tenderable descriptions shall be tenderable upto 2/32" 'of', except Cambodia A for which tolerance will be 1/32". (3) Months of delivery will be March, May and August 1963. (4) The contract shall be subject to the ceiling and floor prices of the corresponding (1962-63) season.

Trading in New Crop

The new crop Jarilla March 1963 contract opened at Rs. 730.25 per three quintals. Early business in the contract was purely speculative, which was akin to gambling, as there was no cotton at all for hedging. The permission given by the Government for this business was an inexcusable lapse, considering that it was given by an authority which swears by socialism.

Meanwhile, activity in the spot market was next to nothing, especially as the Textile Commissioner had prohibited mills from holding stocks in excess of three months' consumption. Unsold stocks were small and selection became increasingly difficult and prices hardened further. The signing of the Indo-Pak Trade Agreement early in June, under which India was to import 100,000 bales of Pakistan cotton of staple length 1" and below, put an end to speculation in this regard. Even before the announcement of the quota, sales in Pakistan cotton had taken place to the extent of 40,000 to 50,000 bales. By the end of June, only about 25,0000 to 30,000 bales remained to be covered. American cotton also attracted the attention of mills which had received allocation out of the P.L. 480 quota announced in May. By the end of June, most of the prominent mills had covered their requirements of U.S. cotton. Some sales were also concluded in Sudans, A.R. Uganda and Egyptian cotton against the global allocation.

Demand for ready cotton was strong in July and a general wave of buying ensued. Prices of all varieties, particularly good quality cotton which was scarce, rose to a new high. In the futures market, however, the Jarilla March 1963 contract, after having shown some initial firmness, met with selling prompted by the favourable turn in weather conditions all over the cotton tracts and declined. But this proved temporary. The rising trend of mill consumption and firmness of the spot market had their impact felt on the futures market and the hedge contract recovered to close at Rs. 739 on 31st July.

August passed without any announcement of the cotton policy for the new season. The Government, however, announced an import quota for 185.000 bales (of 400 lbs. each) of cotton stapling 1.1/16" from any area. The shipment period for this cotton was from 1st January 1963 to 31st May 1963. Hence it was obvious that cotton under this quota would be available only after four months. It was clear by then that stocks at the beginning of the 1962-63 season would be very low and that, even if the crop turned out to be a good one, in view of the rising trend of mill consumption and uncertainty about imports, the supply position would be none too easy in 1962-63.

The cotton policy for the 1962-63 season was announced on 7th December. The most important feature of the policy was the raising of the ceiling price for all varieties, except a few, by Rs. 35 per quintal (Rs. 125 per candy). Reports of favourable weather and satisfactory crop progress, indicating an output of 5.4 million bales and the announcement of a fresh import quota for 55,000 bales (of 400 lbs. each) of U.S. cotton under a sugar/cotton barter deal bearishly affected the futures market. The Jarilla March contract receded from Rs. 742 at the beginning of September to Rs. 739 by the end of the month.

In spite of encouraging crop prospects prices of ready cotton ruled firm in September. This was due to the realisation that bulk arrival of new crop in upcountry markets would start only by the end of November and that supplies would be scarce in the intervening months. The announcement of the first export quota of the new season for 200,000 bales of Bengal *Deshi* and also a bullish effect on the market.

The meagre new crop arrival and low carryover made for a very bullish market for early deliveries in October. It was, therefore, felt by the textile industry and the Textile Commissioner that far more effective measures than quotas and compulsory survey should be introduced to prevent an undue rise in price. Accordingly, the supervisory scheme was introduced for ensuring stricter control over the price and distribution of cotton. The scheme came in for much criticism at the hands of the trade. Two writ petitions challenging the validity of the scheme was filed at the Bombay High Court by two cotton merchants from Tirupur, the outcome of which is eagerly awaited.

The futures market, far removed from the spot section, was featureless in October. Trading was thin and the trend of prices reflected more the sentiment of other commodity markets than cotton. The Jarilla March contract finished the month at Rs. 744 as against Rs. 737 at the beginning of the month. Export demand for Bengal *Deshi*, which was very slack in the first three months of the season, showed signs of revival towards the end of November. Export sales to Japan and the Continent considerably improved in the first two weeks of December. Total business concluded till 14th December against the quota of 200,000 bales released on 5th September was estimated at over 100,000 bales.

Sentiment Changes

November witnessed a remarkable change in market sentiment. Expectation of a bumper crop of over 5.4 million bales, nervousness caused by the Chinese invasion, reports of heavy accumulation of cloth stocks with mills and monetary stringency imparted considerable weakness to the futures market. The Jarilla March contract met with heavy speculative selling and slumped from Rs. 747 on 1st November to Rs. 687 at the end of the month, a decline of Rs. 60 in a month's time. The retreat continued, the rate having come down to Rs. 669.50 in the second week of December. Spot prices, too, tended to look down, thanks to increased arrival of new crop. In a bid to arrest the fall in futures, the Forward Markets Commission fixed the limit on the weekly price-fall at Rs. 10 when the price of the hedge contract was below Rs. 675 per three quintals. In order to support the spot market, the Textile Commissioner released the second instalment of Indian cotton quota for mills and removed restrictions on the movement of the crop imposed earlier in the season. These measures seem to have had a salutary effect on the futures market. The Jarilla March contract staged a recovery and at the time of writing (third week of December) is quoted at Rs. 688 per three quintals. The trend of the market in the coming months will be influenced mainly by two factors, namely, the size of the crop and the scale and timing of imports both of which are still uncertain.

Pakistan Cotton

Accumulated stocks, lack of mill offtake in the wake of large arrival of the market in the coming months weighed heavily on the Karachi cotton futures market during the major part of the first half of 1962. In June 1962, however, thanks to brisk demand from India following the signing of an Indo-Pak agreement, under which Pakistan agreed to supply 100,000 bales of cotton to India, futures prices firmed up. Good demand by local mills and renewed export interest imparted strength to the spot market also. Of the 1961-62 crop of 1.7 million bales, comprising 1.62 million bales of American-seed cotton and 156,000 bales of *Deshi* cotton, purchases of domestic mill till the end of August aggregated 1.35 million bales. Exports during the season were of the order of 405,000 bales. Total supply during the season amounted to 1.86 million bales. Carryover stock at the end of August 1962 aggregated 112,000 bales, as compared with 90,000 bales at the beginning of the season.

Export Duty

The Government of Pakistan announced the cotton policy for the 1962-63 season on 3rd September. The rate of export duty was kept unchanged at Rs. 75 per bale for American seed cotton (this was subsequently reduced to Rs. 25 per bale) and Rs. 25 per bale for *Deshi* cotton. Reflecting the trade's disappointment at this decision, the futures market turned easy. Bearish crop news and sluggish export demand imparted further weakness to the market. The new crop January contract, which was quoted at Rs. 74.55 at the beginning of September, declined to Rs. 67.70 at the end of the month. The entry of China in the market in the following month, that is, October, cried halt to the downward trend. China is estimated to have purchased 29,000 bales of N.T. cotton. But no sooner it withdrew from the market than prices receded, thanks to the pressure of new crop arrivals and limited export demand. The reduction in export duty on staple cotton from Rs. 75 to Rs. 25 per bale, with effect from 23rd November, gave a fresh stimulus to export demand. Nevertheless, export interest continued to be limited, in spite of the fact that the ruling prices were about 10 to 15 per cent below those prevailing at this time last year. The 1962-63 Pakistan cotton crop is estimated at 2.03 million bales. This, together with stocks of 112,000 bales as on 1st September 1962, indicates a total supply of 2.12 million bales, as against 1.86 million bales in the previous season.

U.S. Cotton

The main developments affecting business in cotton in New York and Liverpool and the trend of prices are reviewed by our Manchester Correspondent (vide page 122 of this issue). It is noteworthy that President Kennedy's decision to re-establish a one-price system for cotton, if translated into law, would have far-reaching effect on the price and pattern of trading in U.S. cotton. It will, on the one hand, enable U.S. mills to buy cotton at the same price as foreign mills and, on the other, make American cotton competitive in foreign markets without reducing the income of U.S. farmers. It is not possible to predict now as to how and, to what extent, it would affect the pattern of export of U.S. cotton but it is unlikely to influence exports of cotton under P.L. 480.

Another development affecting trading in U.S. cotton was the announcement by the Department of Agriculture on 26th June of a cotton export sales programme for the 1962-63 marketing year. A unique feature of this programme is that it would come into operation only when the domestic market price moves above a certain level set by the Commodity Credit Corporation. The announcement of this sale programme had little effect on domestic as well as export prices. Trading in the New York futures market was listless and price movements were narrow throughout the first half of 1962.

The new season (1962-63) began on 1st August 1962 with a carryover stock of 7.9 million bales (of 478 lbs. each), that is, 700,000 bales more than the previous season's opening stocks. Of this, C.C.C.-controlled stocks amounted to 4.8 million bales. Early estimates of 1962-63 crop placed it at 15 million bales but the final estimate turned out to be lower at 14.72 million bales, as compared with 14.40 million bales in the 1961-62 season, indicating a total supply of 22.9 million bales, as compared with 21.6 million bales in the previous season. The higher supplies coupled with sluggish export demand (export sales registered from 1st August till the end of October 1962, aggregated less than one million bales, as compared with 2.5 million bales at the same period of last season) made for a weak futures market for cotton. Current futures prices at New York are about 10 points lower than those prevailing at this time last year. Spot prices, however, are somewhat higher, thanks to the reduction in free stocks following the rise in C.C.C. stocks, in the context of fairly good domestic mill demand.

OILSEEDS PRICES MOVE DOWN

Production Picks Up A Little

BOMBAY, 18th December

AN outstanding feature of trading in the oilseeds market during the year under review was the prolonged pause in the almost continuous upward trend in prices of oilseeds and oils that had begun in 1958. In fact, the closing prices of almost all oils and oilseeds at the time of writing (18th December) are distinctly below those ruling a year ago. There were, of course, wide fluctuations both ways, but the undertone remained distinctly easy, especially in the closing months of the year. It will, however, be naive to assume that the overall weakness in oilseeds has been the result of any perceptible rectification of the persistent imbalance between supply and demand for oils and fats in the country. It is no doubt true to say that the increase in output during the 1961-62 season and expectations of a further modest improvement during the current crop year have somewhat eased the tight supply position. But one should not forget the fact that most of the losses occurred during the last quarter, due to a setback in confidence, following the Chinese aggression and the ban on forward trading in gold, shares and non-ferrous metals. If the bulls have been kept at bay, the credit is due no little to their fear that stringent restrictions, or even a ban, may be imposed, in case oilseeds prices moved up. The Government's decision to permit the vanaspati industry to import about 50,000 tons of soyabean oil from the U.S. and also the tight money conditions experienced by stockists in the local market have also been responsible for the weakness of oilseeds towards the close of the year.

Production and Exports

The trend of trading in the coming months will be determined largely by the current crop, for which reliable estimates are not available so far. The latest period for which official estimates have been published is the 1961-62 crop year. According to these estimates, the aggregate output of five major oilseeds rose by about 5 per cent to 6.83 million tons in 1961-62, as compared with the previous year. Groundnuts, sesamum and castorseed accounted for the major part of the increase in production.

In spite of some improvement in output during 1961-62 and general decline in prices, Indian vegetable oils and oilseeds continued to be out of parity with world prices. No wonder then that exports of castor oil, linseed oil, mustard oil and also hydrogenated groundnut oil should have declined during the year from the previous year's level. But there were some shipments of groundnut oil, following a quota granted to the State Trading Corporation during the year. There was also an increase in export of oils by soap manufacturers, who were allowed to import an equal quantity of less costly oils in replacement of groundnut oil. The S.T.C. also secured some business in linseed oil. But oilcakes, particularly defatted groundnut meal, fared well on the export front, as a result of better offtake by the U.K. and some East European countries. The following table shows the trend in exports of oils, oilcakes and H.P.S. groundnuts during the first ten months of 1962, as compared with the corresponding period in 1961:

(In lakhs of rupees)

	January-October	
	1962	1961
Vegetable oils :		
Groundnut oil	3.42	8
Castor oil	3.37	3.67
Linseed oil	14	5
Mustard oil	3	5
Hydrogenated groundnut oil ..	41	54
Oilseeds :		
Defatted groundnut meal ..	18.03	9.70
Groundnut cakes	90	100
Linseed cakes	74	37
Cottonseed cakes	72	66
Total oilcakes (including others). .	21.11	12.60
Oilseeds :		
H.P.S. groundnuts (both kernels and in shells)	3.47	3.31

Against the background of the introduction given above, we trace below the trend of oilseeds and oils in 1962.

Groundnuts

Groundnut ruled firm during the first two months, before a phase of gradual decline started which continued upto the end of May. The earlier firmness was induced mainly by the release of two quotas of 20,000 tons each for the export of H.P.S. groundnut kernels in quick succession, one in January and another in February. Besides, the relatively smaller arrivals of new crop from South India and Gujarat, in the face of steady offtake by vanaspati manufacturers and crushers, also led to a bullish fervour. At the same time, shippers were enthused by the Government's decision to permit industrial units consuming groundnut oil (soap industry) to export it in replacement of an equal quantity of less costly oils (like palm oil), the quota granted to them being 11,000 tons. The State Trading Corporation, in the meantime, secured permission from the Government for the export of 18,000 tons of groundnut oil, for the first time, which lent further support to the market. It may be recalled here that no export quota had been given in 1961.

In January, there was no official hedge trading in groundnuts, as the prevailing prices were about Rs. 3 to Rs. 4 above the ceiling of Rs. 215 per 250 kgs. By the end of the month, however, the Forward Markets Commission granted permission to operate May 1962 contract without any ceiling or special margins. But two conditions were imposed, namely, (1) trading would be closed when the rise in price during any week (between Monday and Saturday) exceeded Rs. 5, and (2) no member of the Exchange should keep net long or short positions in excess of 5,000 tonnes on behalf of their clients. Permission to commence hedge trading in groundnut oil May delivery was also given in February on condition that the maximum increase in price should not exceed 50 nP per 10 kgs. per week and that no member should have net long or short outstanding position of more than 1,200 tonnes at the end of any trading day. The relaxation of official restrictions on hedge trading enthused the bulls further, and prices were pushed up still further until the beginning of March.

From the month of March onwards, groundnuts tended to sag, under the pressure of large arrivals of summer crop from Andhra Pradesh and Madras. Reports of weakness in rapeseed in North Indian markets also acted as a damper. The announcement of an export quota in May (the third during the year) for 20,000 tons of H.P.S. groundnut kernels and another quota for 5,000 tons of H.P.S. in shells did not make any perceptible change in the sentiment. May 1962 contract, which opened the account at Rs. 229.50 in the beginning of February, rose to Rs. 245.50 by the end of that month, but gave way to touch Rs. 201.62 towards the end of May. July contract too fell from Rs. 231 (in the middle of April) to Rs. 201 by the end of May, the lowest level for groundnut futures in 1962. In the ready section, Nizam bold, which was quoted at Rs. 46.25 per 50 kgs. early in January, moved upto Rs. 48.50 (by the middle of February), before declining to Rs. 42.25 by the end of May. Oil ex-mill rose from Rs. 19 (in early January) to Rs. 22 by the end of March, but receded subsequently to Rs. 17.40 within a couple of months. Groundnut oil May 1962 contract eased from Rs. 20.50 to about Rs. 17 by the end of May.

An Exciting Phase

An exciting phase of trading in groundnuts commenced from June, characterised by wide two-way fluctuations. Prices were lifted to high levels of the year by September, but the gains were eroded completely within the next two months. The earlier firmness was the result of unfavourable weather conditions during the sowing time in Gujarat, as also in certain parts of Maharashtra and South India. The brisk offtake of groundnut expeller cake, the downward revision of trade estimates of current crop, reports of S.T.C.'s buying of oil for export and the large-scale purchases by vanaspati manufacturers induced further strength. The uptrend in prices was viewed with concern by the Forward Markets Commission particularly in view of the need for controlling prices in the context of Chinese aggression. Accordingly, the Commission reimposed ceilings on hedge contract in groundnut (Rs. 236 per 250 kgs.) and groundnut oil (Rs. 32 per 50 kgs.), in the middle of November. Thereafter, the market turned depressed and, within a week, a special clearing had to be ordered to stem the sharp fall in prices, consequent upon panicky and persistent bull liquidation.

Several factors were responsible for the somersault in market sentiment, not the least of which was the panic caused to the trade on the declaration of emergency. There was a general feeling of uncertainty about the continuance of groundnuts hedge contract itself, in view of the ban imposed on forward trading in gold, shares and non-ferrous metals. The Government's reported decision to grant a quota to vanaspati manufacturers for the import of about 50,000 tons of soyabean oils from the U.S. further depressed the market. Above all, arrivals of new crop, particularly from the South, had gathered momentum. On account of tight money conditions, stockists were also hesitant to extend their commitments to new crop supplies from upcountry centres. As a cumulative result of all these factors, prices of groundnut and groundnut oil tumbled down, with the spots touching the lowest levels of the year early this month. A quota for the export of 26,500 tons of expeller released last month also fell flat. There has, however, been a modest rally in groundnuts during the last week as a result of revival of sizable buying at lower levels. The supply position in the local market also turned somewhat tight, as arrivals fizzled out in view of the low level of prices prevailing here.

Groundnut September 1962 contract, which was quoted around Rs. 211 early in June, spurted subsequently to touch a peak of Rs. 254.50 (on 15th September), before going off the board at Rs. 246. January 1963 contract (which opened the account around Rs. 220.75 in the middle of July) rose to Rs. 235 by the middle of October, but moved down to Rs. 202.12 on 6th December, before recovering to close at Rs. 210.25 today. Bold ready (which was quoted at Rs. 42.25 in the beginning of June) rallied to Rs. 49.50 by the end of September. But it gave way to Rs. 39.75 by the 6th inst. Oil ex-mill closed on a steady note at Rs. 17.30, after fluctuating between Rs. 20.30 and Rs. 16.90 during the past seven months.

Castorseeds

The castorseed section ruled easy during most part of the year, barring a short spell of buoyancy early during the year. The initial buoyancy was inspired by reports of damage to standing crops in Gujarat and Bihar on account of a severe cold wave in the beginning of the year. Reports from Brazil also indicated the possibility of a decline in output in that country; this led the operators to believe that there would be a revival of U.S. buying of castor oil from India. Neither the fears of widespread damage to Indian castor crop nor hopes of a revival of U.S. buying, however, materialised. On the contrary, reports from the U.S. indicated that the U.S. was about to release a large amount of castor oil from its stockpiles. Heavy arrivals of new crop from Andhra Pradesh and other places also discounted the possibility of any setback in output. Consequently, prices of castorseeds and oils gradually receded till the middle of June, when a modest recovery set in. But the recovery, induced by overseas enquiries for castor oil from the U.K. and some of the East European countries, was rather shortlived. With the beginning of Chinese aggression, shippers turned doubtful about the prospects for continued export business in castor oil with the Communist bloc. They also noted that purchases by both Soviet Russia and the U.K., the two leading buyers, have been perceptibly lower this year than those in 1961. The fixation of ceiling for futures at the rate of Rs. 181 per 250 kgs. early in November also had a bearish effect. There was, under these conditions, persistent liquidation, which brought down values considerably.

Castorseed March 1962 contract spurted from Rs. 171.75 at the end of last year to Rs. 179.75 (this year's peak level) by the third week of January, but retreated later to Rs. 161. June 1962 contract, which had risen from Rs. 171 to Rs. 177 towards the end of January, fell to Rs. 155, before it expired at Rs. 155.75. September 1962 contract went off the board at Rs. 159.75, after moving both ways between Rs. 159.50 (5th June) and Rs. 172 (11th August). March 1963 contract, which commenced at Rs. 165.30 (in the middle of March), rose to Rs. 172.75 by early August, but eased to Rs. 157.50 early this month. It, however, recovered to Rs. 165.37 towards the close. Ready Madras closed 50 nP lower at Rs. 32.75 (as compared with a year ago), although it moved both ways between Rs. 38 (22nd January) and Rs. 30.25 (on 1st December). Oil commercial rose from Rs. 14.60 to Rs. 15.25, but lost ground to touch a low of Rs. 11.75 by the end of June, but recovered later to Rs. 13.42. The closing was well above the lowest level for the year.

Linseeds Easy

Except for periodical bouts of buying, linseed depicted a downward trend, thanks to the dull conditions for the export of linseed oil, the price of which continued to be out of parity with world prices. On fears of damage to linseed crop due to the cold waves in U.P. and the Punjab, the linseed market began the year on a firm note. But these fears were later proved to be unfounded, the actual damage being much less than expected. As arrivals of new crop gathered momentum, the market got into a subdued mood which lasted until March. The weakness in rapeseed and mustard also contributed to this state of affairs. Subsequently, there was some recovery, induced by better advices from North Indian sarson markets and on reports that the State Trading Corporation had concluded a deal with Australia for the export of 1,000 tons of linseed oil. There was also good offtake of linseed oil for being used as an adulterant with more costly oils like groundnut oil and mustard oil. This phase of cheerfulness ended in October and there was a landslide in values during the last quarter of the year, in sympathy with other major seeds and oils. Linseed futures contracts fluctuated between Rs. 35.75 (end of March) and Rs. 42.81 (beginning of August) over the year, before closing at Rs. 37.69. Bold ready improved from Rs. 43.50 to Rs. 44.50 by the middle of February, but, within about six weeks, prices tumbled down to Rs. 35.50 (third week of March). Thereafter, prices moved both ways, before closing at Rs. 38.62. Oil ready moved down over the year by Rs. 2.90 to Rs. 15.00, after fluctuating between Rs. 19.20 (middle of February) and Rs. 14.35 (middle of May).

Cottonseeds

Cottonseeds, which had ruled firm in the beginning of the year in sympathy with the raw cotton market, lost considerable ground subsequently. In view of reports of better cotton crop during the 1962-63 season, cottonseeds ruled distinctly easy during the latter half of the year, with occasional two-way movements inspired by hedge and speculative buying and selling by Akola and Ahmedabad interests. Cottonseed futures contract, which had risen from Rs. 102.25 to Rs. 111 by the first week of February, had slumped to Rs. 91.75 by the first week of this month. At the close, the contract was quoted at Rs. 96, which was lower by over Rs. 6.50, as compared with the quotation a year ago.

The following table shows the prices of seeds and oils as on 18th December 1962, as compared with a year ago and the high and low levels reached during the year:

	18th Dec., 1962	High	Low	18th Dec., 1961
	Rs. nP	Rs. nP	Rs. nP	Rs. nP
Groundnut :				
Futures contract ..	210.25	254.50	201.00	213.75
Nizam bold ready ..	41.50	49.50	39.75	44.50
Oil ex-mill	17.30	22.00	16.90	18.35
Castorseed :				
Futures contract ..	165.37	179.75	155.00	165.87
Ready Madras ..	33.00	38.00	30.25	33.50
Oil commercial ..	13.42	15.25	11.75	14.40
Linseed :				
Futures contract ..	37.69	42.81	35.75	38.50
Bold ready	38.62	44.50	35.50	43.50
Oil ready	15.00	19.20	14.35	17.90
Cotton seed :				
Futures	96.00	111.00	91.75	102.50

N.B.—All quotations for futures contracts are per 250 kilograms, except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

Outlook

As already stated, the price trends in the coming weeks will be conditioned by the size of the 1962-63 crop. According to private estimates, the aggregate output of groundnut would be about 4.8 million tons (in shell), or an increase of over 100,000 tons over the previous year. But for unfavourable weather conditions during sowing time in Gujarat, the output would have been still higher. The sowing of other seeds has already begun in several producing centres and it is expected that, unless the weather conditions change for the worse in the next few months, the aggregate seeds crop would be higher by about 200,000 tons at 7 million tons. This is still 600,000 tons below the second Plan target of 7.6 million tons. In view of this unsatisfactory trend in output, the Government's decision to revise upwards the third Plan target from 9.8 million tons to 10 million tons is quite unrealistic. What is needed is that the State Governments should expedite the implementation of the various development programmes for oilseeds already chalked out by the Planning Commission and the Central Oilseeds Committee.

WIDE MOVEMENTS IN BULLION

Gold Futures Closed—Government Intervenes

BOMBAY, 17th December

A STAGGERING fall in prices in a short span of three weeks from 3rd to 24th November was the most striking feature of trading in the bullion market during the calendar year 1962. The fall followed the further advance in prices earlier during the year to fresh all-time peak levels and marked, as it were, the end of the long saga of sustained buoyancy in the precious metals in this country. From the year's and the all-time peak level of Rs. 129.90 (per 10 grams) touched on 29th August, spot gold slumped to Rs. 86 on 24th November. Likewise, gold futures caved in from Rs. 128.85 on 29th August to Rs. 103.75 on 10th November and closed at Rs. 106.75 on 13th November—the day the Government imposed a ban on forward trading in gold in the country. Sovereign, which had touched a high of Rs. 99.25 on 9th June, retreated in sympathy with ready gold to register a low of Rs. 72 on 24th November. Ready silver scaled a new peak of Rs. 224.85 (per kilo) and forward of Rs. 225.55 on 1st November only to sink heavily to Rs. 187.80 and to Rs. 191.80, respectively, on 24th November. At the lowest level touched on 24th November, ready gold broke the record for the preceding five years and was in close range of the lowest level of Rs. 84.83 recorded in February 1956. As against this, ready silver fell only below the 1961 lowest level of Rs. 196.50 per kg., and, in terms of tolas, the rate at Rs. 220.50, was still Rs. 7.25 higher than the lowest level of Rs. 212.25 for 1960.

Although gold and sovereign recorded their highest levels for the year well before November, the prices as on 3rd November did not show a big fall from those levels. For instance, on that day, ready gold was quoted at Rs. 121.50 and forward at Rs. 120.75, while sovereign was quite steady at Rs. 96. Thus, as mentioned at the outset, the slump in prices was pronounced only in the three-week period ended 24th November.

Since then, however, prices have staged a brisk, though moderate, rally. By 4th December, ready gold had improved to Rs. 107, ready silver to Rs. 198.75 and forward to Rs. 199.25 and sovereign to Rs. 79. But, subsequently, there was a marked reaction. On 8th December, for instance, spot gold was lower at Rs. 98.25, ready silver at Rs. 195, silver futures at Rs. 194.90 and sovereign at Rs. 77. Thereafter, values rose again, with ready gold recovering much of the lost ground to stand at Rs. 116 on 17th December, sovereign at Rs. 85.75 and ready silver at Rs. 213.50. It will thus be noted that there have been wide fluctuations in the prices of precious metals in a short period of six weeks, an unprecedented trend in the bullion market's history of this generation.

Over the year, as of 17th December, gold has depreciated in value by Rs. 5.10 per 10 grams and sovereign by Rs. 13.25 per coin. Silver, however, has managed to show a small gain of Rs. 2.05 per kilogram.

The table below brings out the price movements during the year from the 1961 closing levels:

	Opening levels as on 2-1-1962	Highest	Lowest	Closing levels as on 17-12-1962	Closing levels as on 30-12-1961
Gold:					
Ready ..	119.45	129.90	86.00	114.75	119.50
Forward..	121.10	128.85	103.75	106.75*	120.90†
Silver:					
Ready ..	211.70	224.85	187.80	213.45	211.70
Forward	213.30	232.55	191.80	213.95†	213.30†
Sovereign .	97.25	99.25	72.00	85.75	97.75

* As on 13-11-1962. † *Pagun* Settlement.

This is the first time, in the past five years at any rate, that the price of gold has closed with losses over the year. Indeed, at one time the losses were incredibly heavy. This phenomenal fall was the result of the unswerving determination of the Government to coax and, if necessary, force the hoarders of gold bullion and coins to disgorge at least a part of the stocks held by them. Such determination of the Government was there even in the past. But it found a clear and unmistakable expression at the hands of Mr. Morarji Desai, Union Finance Minister, especially because of the national emergency arising from the unprovoked chinese aggression in Ladakh and the N.E.F.A.

Gold Bonds

On 3rd November, the Finance Minister broadcast that the Central Government had decided to issue special 15-year gold bonds bearing interest at the rate of 6.5 per cent per annum. Although the news came late in the evening at 8-30, it shook the market almost immediately and, in an orgy of selling, gold *Margashir* slumped in unofficial deals to Rs. 110 from the day's official closing level of Rs. 120.75 and silver receded to Rs. 224 from Rs. 224.85. By 6th November, gold futures fell further to Rs. 104.25 and silver futures to Rs. 218.75. Between the 3rd and the 6th of November, spot gold slumped from Rs. 121.65 to Rs. 102.50, sovereign from Rs. 96 to Rs. 80 and ready silver from Rs. 224.15 to Rs. 217.75. The setback was caused by panicky bull liquidation and considerable bear pressure in a market virtually devoid of support.

Readers are familiar with the details of the Gold Bonds. However, to briefly recall them. The subscription lists, which were opened on 12th November last, are due to close on 11th February next, or earlier without notice. Subscription is in the form of gold, gold coin or gold ornaments, and the Bonds are treated as issued on the date gold is tendered at the receiving office. The value of gold is calculated at the rate of Rs. 53.58 per 10 grams of .995 fineness, equivalent to Rs. 62.50 per tola of the same fineness. Interest on the Bonds, to be paid twice a year on 12 May and 12th November, is subject to deduction of tax. In the case of individuals, however, tax will not be deducted at source, if the holders declare that the total value of the Bonds held by them or on their behalf do not exceed Rs. 10,000. The Bonds are exempt from wealth tax and tax on capital gains from their sales, both at the hands of only the original owner of the bonds.

On 5th December, the Lok Sabha passed the Taxations Laws (Amendment) Bill, granting tax relief in respect of contributions to the National Defence Fund and investments in Gold Bonds. By suitably amending the Income-tax Act, 1961, and the Wealth Tax Act, 1957, the Bill provides for the exemption of the 6.5 per cent. Gold Bonds, 1977, from tax on capital gains and wealth tax and for tax rebate on contributions made to the N.D.F. It also seeks to relax the provisions regarding deduction of tax at source from the interest paid to individuals resident in India on the Defence Bonds and the Gold Bonds. Replying to the two-hour debate on the Bill, Mrs. Tarkeshwari Sinha, Deputy Finance Minister, disclosed that, up to the end of November, a total of 49.675 tolas of gold valued at Rs. 30 lakhs had been received under the Gold Bonds scheme. Apart from this, Mrs. Sinha stated, the Government had received 22.118 tolas of gold as donations to the N.D.F. up to 3rd December.

Ordinarily, market circles would not have been that ruffled by the issue of Gold Bonds as they were but for the fact that the Bonds were announced to meet the country's defence needs and had, therefore, to succeed. For the success of the Bonds a prerequisite was that the price of gold should decline to around the international level and remain steady thereafter for a sufficiently long-time, so that both hoarders and smugglers lose the incentive in their anti-social activities. Actually, it was not the announcement of Gold Bonds but the fear of quick Government action (which, subsequently, Mr. Morarji Desai did not conceal) to force down the price of gold that really scared marketmen.

Ban on Gold Futures

Such apprehension found meaning in no time. For on 13th November, that is, ten days after the Finance Minister's broadcast to the nation, the Government announced its decision to ban, with immediate effect, forward trading in gold throughout the country. Accordingly, it issued a notification, under Section 17 of the Forward Contracts Regulation Act, 1952, and ordered the closure, under Section 16 of the said Act, of all outstanding business at the closing prices on 13th November. The Government also rescinded the notification under Section 16 of the said Act, granting official permission to the Bombay Bullion Association Ltd. to conduct futures trading in gold within the limits of Greater Bombay. It may be noted here that, under the Act, only the Bombay market has been granted official recognition. Of course, forward trading in gold was being done in other centres like Delhi and Calcutta, but that was under voluntary regulations. Within two days of banning forward trading in gold, the Government stopped (on 15th November) trading in non-transferable specific delivery contracts as well, under the provisions of Section 18(3) of the Act.

These measures were designed to get rid of all speculative interest in gold. And Mr. Morarji Desai brooked no delay in striking the iron while it was hot. For on 20th November, he told the Consultative Committee of Parliament for his Ministry that the Government would take further steps in a month's time to bring down the price of gold very considerably and that he expected the price to fall consequently below Rs. 70 per tola at which rate it would be unprofitable for smugglers to bring gold into the country. Mr. Desai was said to have significantly added that, in regard to purchases of gold by the people, the ultimate aim of the Government was to fall in line with other countries where private possession of gold in large quantities was not allowed.

The aforesaid measures and the Finance Minister's statement led to a fresh wave of selling in the market and prices continued to decline up to 24th November, when, as noted at the

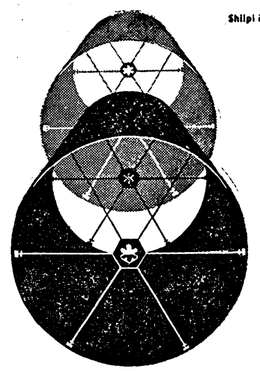
The Penstock Story...2 Shilpi ihp 246



PENSTOCKS COME FROM HADAPSAR

Just as "nuts come from Brazil", if you know the crack from "Charley's Aunt", that ageless farce.

However, there is no likelihood of either Charley or his make-believe aunt making, or for that matter believing in, Penstocks.

For several years now Indian Hume Pipe Co have been making PENSTOCKS; and, being made of the toughest steel, they are not so easy to crack as Brazil nuts or jokes about them!

Penstocks are tubular steel pipes which carry water from the reservoirs of hydro-electric projects to the turbines that generate electricity. As the water roars through the penstocks it gathers a terrific pressure, and you can imagine the sheer tensile strength required of the protective steel walls of the penstocks.

Penstocks manufactured by the Indian Hume Pipe Company have stood good stead in such major hydro-electric projects in the country as Papanasam (Madras), Mahatma Gandhi H. E. Project (Mysore), Moyar (Madras), Rihand (U.P.) and now Koyna (Maharashtra).

The choice of Hadapsar near Poona for the manufacture of these "vital nerves" of our river projects could not have been bettered from the point of view of transport to north, south, east or west.

PENSTOCKS—VITAL VEINS OF INDIA'S HYDRO-ELECTRIC PROJECTS
THE INDIAN HUME PIPE CO., LTD.,
A Walchand Group Industry, Construction House, Ballard Estate, Bombay 1

outset they were at the year's lowest levels. Sentiment was affected further by the Reserve Bank's informal request to banks to call back the advances against bullion. But, subsequently, the market stabilised and rallied on fair-sized short-covering and some renewed upcountry bull support in silver in the wake of a smart recovery in spot gold due to improved offtake and absence of sellers. The rally was impressive (its extent can be seen from the table given earlier) and continuing while this was written, with silver gradually stealing the show thanks to sustained speculative support from a prominent Calcutta operator. Sentiment was influenced by three factors. First, absence of new official measures to bring down gold price and also to mobilise idle gold. Second, fairly good offtake almost matching limited arrivals of gold. And third, the poor response to Gold Bonds.

Trend Before the Slump

The above account sums up the picture of the market at nearly the fag-end of the year—a period which will go down in the history of bullion trading in India as one of the greatly memorable ones. If towards the close of the year the market suffered heavily on almost panicky selling, at the start of the year also it displayed an easy tone as an extension of the weakness noticed near the closing months of 1961, which had gathered considerable momentum in December due to the Goa action leading to fears of large-scale inflow of smuggled gold piled up in the erstwhile Portuguese pocket. By 16th of January, ready gold had sagged from Rs. 119.45 to Rs. 115.85 and the futures (*Fagun*) contract from Rs. 121.10 to Rs. 116.20. But, by the close of January, spot gold rallied up to Rs. 120.30 and forward to Rs. 121. February saw some recovery, with ready rate closing at Rs. 121.75 and forward contract at Rs. 122.25. Thereafter, the tendency was quiet on reports of large arrivals, particularly from Goa. However, the month of May saw considerable activity in gold, and prices firmed up on rising demand in the wake of marriage season and reports of seizure of contraband gold valued at Rs. 3.5 lakhs. Ready gold touched on 22nd May a new all-time peak of Rs. 127.55, as against the previous high of Rs. 126 recorded on 27th September 1961.

The futures section gained strength only in June, when the maturing *Jeth* settlement advanced to Rs. 126.60 on the 15th and the new *Bhadrapad* contract, having commenced at Rs. 122.60 on the 4th, advanced to Rs. 124.10 on the 15th. But due to the seasonal slackening demand, ready gold eased in that month from Rs. 126.80 on the 15th, after having been done at Rs. 124.50 on the 5th, to Rs. 124.90 on the 25th. After presenting a steady front in July, ready gold scaled a new all-time peak of Rs. 129.90 (equivalent to Rs. 151.51 per tola) on 29th August. On that day, the futures section also recorded the year's peak level of Rs. 128.85. The rise in prices was attributed to renewed bull support and short-covering in the wake of the deteriorating situation in Ladakh.

But September saw the first signs of possible official measures against hoarders of gold. On 5th September, the Lok Sabha passed a Bill which brought bullion within the purview of the Industries (Development and Regulation) Act, 1951. Further, on 15th September, the Reserve Bank announced its decision to undertake a study of trading in bullion and of the inflow of contraband gold. These two developments imparted a bearish influence to the market. Ready gold, which had been done at Rs. 129.10 on 1st September, declined to Rs. 118.25 on 3rd October, but steadied up thereafter to Rs. 121.10 on 3rd November. The forward *Margashir* settlement, which had been done at Rs. 123.70 on 24th September after opening at Rs. 122 on 20th September, eased to Rs. 119.05 on 3rd October and further to Rs. 117.86 on 13th October to steady up later to Rs. 120.60 on 3rd November. The subsequent story of the gold market has already been told. It only remains to be recorded here, before we proceed to chronicle the trend of prices in the silver section in 1962, that an important change in the ownership of Kolar gold mines took place on 1st December 1962, when the Centre acquired it from the Government of Mysore by paying a compensation of Rs. 3.5 crores. It may be recalled here that the Mysore Government had nationalised these mines on 30th November 1956 by paying a compensation of Rs. 164 lakhs to Messrs. John Taylor and Company, Ltd., London, and other shareholders.

A feature of 1962 pertaining to the bullion market was the substantial increase in the seizure of contraband gold. The amount of smuggled gold caught by the authorities during the year is placed at 144,520 tolas, valued at Rs. 171.42 lakhs. Out of this quantity, 82,000 tolas, valued at Rs. 100 lakhs, were recovered in three raids by the authorities in Bombay in the second week of November, which was a record for any week.

Silver

Ready silver opened on 2nd January 1962 unchanged from the closing level of Rs. 211.70 on 30th December 1961. It then sagged gradually to Rs. 209.60 on 11th January, and likewise, silver, *Fagun* drifted lower from Rs. 213.30 to Rs. 211.10. From 12th January, silver tended to be steady and improved subsequently, with the ready rate touching a peak of Rs. 213.75 on the 27th January and the *Fagun* settlement recovering to Rs. 215.25. In February, silver moved within a narrow range. But March saw a hectic rise, with the ready rate establishing a new peak of Rs. 219.65 on the 29th. The futures *Jeth* contract, which had opened at Rs. 217.80 on 22nd March, edged forward to Rs. 218.65 on 29th March. Spot silver continued to forge ahead up to 3rd May, when it was done at a high level of Rs. 223.65. But the forward contract, after keeping firm around Rs. 220.30 till the close of third week of April, eased gradually to Rs. 218.15 on 3rd May. Thereafter, due to heavy arrivals, prices declined.

The downward trend continued well up to the close of July, when ready silver was done at Rs. 212 and the forward *Bhadrapad* contract at Rs. 213.05, as against its opening rate of Rs. 215.90 on 20th June. In August, prices improved smartly due to the strength of gold and also because of restricted arrivals. Rounding off the month at Rs. 219.50, silver *Bhadrapad* recorded a net rise of Rs. 6.65. Ready silver advanced by as much as Rs. 7.20 to Rs. 219.25. This spurt was also attributed to a sharp rise in New York silver to 109.25 cents per fine ounce by the middle of August, at which level it had appreciated by 6.50 cents in less than a month.

The upward movement in silver slackened a little in September because of the bearish trend in gold. But the tendency was steady. Following a spurt in New York silver from 113 cents to 120 cents between the second and fourth weeks of September, silver in the local market got fresh strength. From Rs. 217.40 on 3rd October, ready silver rose swiftly to a new all-time peak of Rs. 224.85 on 1st November. The *Margashir* contract likewise advanced from Rs. 218.40 to Rs. 225.55, which was the highest level in the futures section for the year. Prices thereafter slumped as explained at the outset.

Although trading in bullion futures continued to be in the three-monthly contracts introduced on 26th June 1961, the Forward Markets Commission decided to relax the special margins and the permissible free-limit with the start of the *Jeth* settlement on 7th March. The relaxations were: (i) Raising the levels at which margins become applicable from Rs. 115 to Rs. 120 in gold and from Rs. 195 to Rs. 215 in silver, and (ii) raising the exemption limit from 60 kgs. to 120 kgs. in gold and from 320 bars to 650 bars in silver. The rates of margins payable, however, were kept unchanged at Rs. 20 per 10 grams in gold and at Rs. 300 per bar in silver. After these relaxations were announced, there was no change in the margin system.

Silver in Limelight

Since the staggering fall from 3rd November to 24th November, both gold and silver have staged an impressive recovery for reasons already explained. To what extent this recovery will be sustained remains to be seen, for the Government has not abandoned its goal of bringing down the price of gold. However, one feature of the rally is worth noting; and it is that, in the past six weeks, silver has gradually been stealing the show for at least two reasons. First, while forward trading in gold has been abolished, it is being allowed in silver for reasons known only to the Government. Second, if the Government were to announce restrictions on purchases of gold (as is widely expected) and leave silver free from any control, buyers would gradually turn to the white metal. This apart, notwithstanding the fact that bullion prices in India have no relation to the world prices inasmuch as both import and export of precious metals have been banned, the trend in silver prices abroad has continued to influence the trend in India. Since 28th November 1961, when President Kennedy imposed the ban on the sale of "free silver" (that is, silver not required for purposes of backing currency) by the Treasury, silver in New York has advanced from 91.37 cents to 122 cents and in London from 80*d.* to 104*d.*

DEMAND FOR TEA IMPROVES

North Indian Output Falls

CALCUTTA, *7th December*

DECEMBER 1961 was the turning point for the Calcutta tea market. Sales during that month witnessed not only the arrest of the downward trend in prices which the market had been experiencing in the previous months, but there was also a revival in demand and prices actually began to rally and this trend, by and large, has been maintained to date.

Reports of record crop output in the various tea-producing countries had lulled the buyers into a state of complacency about future supplies, and it was only in December that it began to be realised that the anticipated surplus might, after all, be a fallacy. There were two reasons for this reappraisal; the increase in the number of gardens manufacturing C.T.C. teas had resulted in more dusts and less leaf teas being produced. Secondly, the Indian market appeared to have absorbed much more tea than ever before, and when these two factors were realised, there was a complete reversal of buying trend and the prices of most teas on offer started improving.

By the end of December, 65 per cent of the offerings for the season had been sold, but, because of the low price levels which prevailed before December, the export average was only Rs. 4.37 nP per kg., as compared with Rs. 5.40 nP per kg. in 1960. In January 1962 the quality of the offerings also began to improve, as is usual at that time of year, and this stimulated demand further, and the sale average for the month was Rs. 4.37, as compared with Rs. 3.90 in December.

Keen Inquiry

Demand was well sustained in the sales held in February and March and export sales for the season closed on a note of animation with keen inquiry for the exportable teas which was unusual for end-of-season sales.

A feature of the sales held in the 1961 season was the dominant role played by teas of C.T.C. manufacture, particularly in dust sales. The quantity of C.T.C. teas on offer showed a considerable increase, not only because of increased North Indian crop, but also due to the number of gardens going over to this, relatively more lucrative, type of manufacture. Many gardens had also been encouraged to increase the proportion of dust by the remunerative prices realised during the previous season. It was estimated that, as against a crop increase of 12.5 per cent over 1960, production of dust had increased by 32 per cent in 1961. Despite this considerable increase, there was no indication of any redundance of this type of tea in the market and offerings were readily absorbed. In fact, the best liquoring C.T.C. dusts often sold at higher prices than corresponding C.T.C. teas in export sales.

New Season's Sales

Sales of 1962 season production commenced in May with two auctions, comprising mainly offerings from Darjeeling. Inquiry was extremely selective and there were heavy withdrawals from offerings other than the most flavoury types. Teas from other districts met with good support and the plain teas were quoted between Rs. 4 and Rs. 4.30, which was slightly higher than in the closing sales of the 1961 season's teas in March. The season, however, did not quite come into full swing till July, and there were only two small sales in June when good liquoring teas and clean leaf descriptions were keenly competed for. Sales in July consisted of a significant proportion of second flush offerings and these came to a strong market. Some very high prices were paid for the tippiest varieties from Assam as well as stylish flavoury teas from Darjeeling, the highest price for the former being Rs. 7.20 per kg. and a record Rs. 9.40 per kg., for the latter. C.T.C. teas also sold well at prices up to Rs. 9.10 per kg. The plainer teas, however, were comparatively weak and, towards the end of the month, were being quoted below Rs. 4 per kg.

After July, a decline in market levels, commensurate with the decline in quality of offerings, is a usual feature of the Calcutta sales and, although this year the same trend was noticeable, the decline in prices was neither precipitate nor was it applicable to all descriptions. B.O.Ps and O.Fgs. with bright liquors, for instance, were strong features.

Russian Buying

Weekly leaf offerings in September were consistent at 70,000 packages and, although quality continued to show a progressive decline, bright liquoring teas sold readily, while tippy teas were keenly sought after by the Iranian buyers; support from the U.S.S.R. was also particularly active. The latter country has been a dominant buyer from the beginning of the season and its operations on the Calcutta market once again contributed, to no small extent, to the increase in offerings from Darjeeling, as well as orthodox descriptions from other districts.

C.T.C. offerings came in for keen competition throughout the month and plain orthodox descriptions were also a strong feature. Although prices tended to be easier during the latter half of the month, they were still above the closing levels of August.

The annual *Puja* break sale took place in the second week of October but, nevertheless, it was possible to hold four sales during the month. Demand which had slightly slackened during the latter half of September revived in October and there was strong and general inquiry and the majority of teas were readily absorbed. Out-markets operated actively and, in the last sale of the month, strong support was forthcoming from the U.A.R. for orange fannings and exportable fannings grades. C.T.C. descriptions also appreciated steadily and, at the end of September, prices were Re. 1.50 above corresponding rates a year ago.

Output Declines

During October, several significant factors made their mark on the tea market. First, production in North India has been lagging behind last year's figures and the crop to the end of September showed a shortfall of 9.2 million kg., while the world crop had shown only a negligible increase over last year. There were, therefore, indications that the world output was not keeping pace with the increasing world absorption. This was to have a bullish effect on the market. Secondly, the strike* by the crew of the Joint Steamer Companies in East Pakistan, which began during the second week of October not only resulted in about 100,000 chests being held up in Barisal in East Pakistan and 400,000 packages up-river at Dhubri in Assam, but also brought about a virtual stoppage in the arrivals of teas by river in Calcutta. The vital consequences of this stoppage stem from the fact that 60 per cent of the North Indian crop arriving in Calcutta is transported by river.*

Impact of Chinese Aggression

The strike inevitably caused shortage of spot teas in Calcutta and this had the effect of strengthening demand. This situation was aggravated by the exigencies created by the Chinese aggression. Although its total repercussions on the industry cannot be as-

ERIC HELPS TO EXPAND

EXPORT TRADE

Risks involved in exports on credit terms need not frighten or dishearten any exporter.

The Export Risks Insurance Corporation which has been set up by the Government of India with the sole object of helping the exporter offers to cover the following risks involved in exports on credit terms:—

(i) **Insolvency of the buyer;**
(ii) **Non-payment by the buyer;**
(iii) **Non-transfer of funds to India;**
(iv) **Loss due to sudden changes in import policy of buyer's country;**
(v) **Loss due to occurrence of war/civil war;**
(vi) **Additional expenses due to diversion of steamer;**
(vii) **Risks due to any other cause not being inherent in the nature of the goods and not being within the control of the exporter and/or buyer, etc., etc.;**

INSURANCE OF EXPORTS WITH THE CORPORATION

(i) is likely to make export finance facilities more readily available to the exporter while negotiating the documents,
(ii) will enable the exporter to secure valuable guidance as to the standing of the overseas buyers.

JUTE GOODS PRICES DECLINE

CALCUTTA, 10th December

A PARTICULARLY remarkable feature in jute goods during the year 1962 was the absence of wide fluctuations in prices, which not only led to greater demand for export and internal needs but also enabled mills to begin a phase of maximum production, thereby fully justifying the bumper fibre crop of the season. It was, however, unfortunate that the proportion of the higher grade crop declined, with the result that the mills could not produce hessian and specialities in the quantities desired. Against such a state of affairs, the monthly output of heavy goods was often more than demand, a trend which was conspicuously in evidence for four months from June to September. Stocks of heavy goods with mills, as a consequence, increased. There was, of course, a fall in stocks in October, but the fall was due to an impressive fall in output following shorter working month. In addition to buffer stocks, the mills always carried fibre for four to five months' consumption. They were, therefore, put to financial strain, besides storage difficulties. The prices of lower grade fibre declined by about three points below the I.J.M.A. minimum level of Rs. 30 a maund basis Assam bottoms. The decline was sharper in mofussil areas, despite continued purchases by mills.

The trade urged the Government to allow exports of lower qualities, but this was of no avail, as there was the apprehension that any such step would upset the market. It should also be pointed out that there has hardly been any demand overseas for such of the qualities India can spare. The small export quota for last year's lower grade fibre remained mostly unfulfilled. Both buffer stock purchases and mills' own offtake failed to arrest the falling price trend, but mills put it that, considering the handsome premium which the better grades were commanding, on an average, the lower as well as higher qualities realised minimum levels. The Government, however, was not impressed by this argument, and its anxiety to arrest the falling prices culminated in the Jute Commissioner's directive to mills to purchase at least a million bales in November. The mills protested against this order and stated that this kind of interference with their working was not desirable. They also pointed to the difficulties arising from shortage of transport facilities, made more acute as a result of the priority needs of Government. Before November ended, the mills' purchases far exceeded this quota. All the same, the declining price trend continued, as arrivals far exceeded demand. The State Trading Corporation stepped in and purchased about 40,000 maunds in the last week of November. It was announced that the S.T.C. would continue to buy in areas where prices had fallen, as it had secured storage space at Calcutta for about 500,000 bales. The Government also announced the proposal to set up a central warehousing corporation for the storage of jute and tea in an attempt, as claimed by the Union Deputy Food Minister, Mr. A. M. Thomas, to "revolutionise" the marketing of these commodities.

Quality of Fibre

Despite these measures, the prices of lower quality fibre continued to be below minimum levels, and the mills called for urgent measures to improve the quality of the next crop. Having regard to the fact that, in the not distant past, the problem for cultivators was to dispose of good quality fibre and increase the output of lower quality, the mills claimed that an improvement in quality was possible. It was apprehended that, if, in the face of several price support schemes, cultivators succeeded in getting a good profit in the disposal of the lower quality fibre, there would be little incentive for them to improve the strains for the next crop. The mills also emphasised that, in view of the higher crop, it was time to consider whether last year's minimum levels should remain unchanged.

The year began with good demand for jute goods, accelerated by Goan developments. Prices moved up to levels so satisfactory as to make simultaneous business in goods and fibre profitable after a lapse of several months. The mills celebrated this event by raising production with the unsealing of 2½ per cent of looms as from January. Already, 2½ per cent looms had been unsealed as from 13th November 1961. Now, there remained idle only 7 per cent looms which were also unsealed from 15th January, as the mills felt that demand could not be fully met without maximising production. Further, it was recognised that prices must be prevented from rising in order not to discourage the foreign consumer. Early in January, hessian 40" 10 oz. was fully firm at Rs. 60.50 and B. twills at Rs. 133.25. Fibre was also firm, as, with the decision of mills to raise output, it was apparent that the mills' input would increase. At the same time, anxious to maintain fibre prices at the I.J.M.A. minimum levels, the Government set up a buffer stock agency. The I.J.M.A. inaugurated a system of issue of weekly purchase quotas to mills, as it was realised that, with sowing time near at hand, prices must be kept firm.

With steady support from the U.S.A. and Argentina, the goods market was so poised that, as a step to check the upward trend, transactions in February 1962 futures contracts were prohibited from 20th February. This ban pushed down hessian 40" 10 oz. to Rs. 56.35 and B. twills to Rs. 125.50. There was anxiety among all concerned that, if prices did not decline, there might be diversion of overseas demand. In March, overseas demand for goods strengthened further, and the mills stated that their capacity for greater production was limited only by their restricted spinning capacity. It was also clear that the process of transfer of looms from sacking to hessian must stop. The loss of a Burmese tender for B. twills to Pakistan mills, whose quotation was Rs. 3 lower than the Indian offer, underlined the need for greater production of heavy goods in circumstances of declining marginal costs of production. The price support scheme introduced by the I.J.M.A. was quite satisfactory and it received the approbation of the Union Commerce Minister who was pleased to report to Parliament in mid-March that June-delivery of Assam bottoms was quoting at Rs. 32 a maund, that is, Rs. 2 higher than the minimum level.

Buffer Stock Purchases

In April, the first quota of 50,000 bales for buffer stock purchases was announced. Member-mills of the Buffer Stock Association were advised to purchase the lower grades at the minimum levels. In active support, B. twills were raised to Rs. 135.25, but the levy of excise duty at Rs. 250 a tonne on hessian and at Rs. 125 a tonne on other constructions for indigenous consumption, which work out to Rs. 6.50 per 100 yards and Rs. 13 per 100 bags, respectively, was a factor which imparted sobriety and pushed down B. twills to Rs. 123.80 and hessian 40" 10 oz. to Rs. 49.84 by the end of April. At this time, the B.S.A. met and announced the decision to buy a fresh quantity of 75,000 bales, thereby raising its stocks to 125.000 bales. The virtual closure of the Calcutta port as a result of the strike launched by the Hooghly pilots cooled down sentiment in goods in the beginning of May, but, after the strike was over, the revelation of depleted stocks with mills as at the end of April led to a rapid recovery and, by the end of May, hessian 40" 10 oz. had steadied up to Rs. 57, with B. twills being firmer at Rs. 125.50. The B.S.A. announced as fresh quota of 250.000 bales each twice in May, thus raising the buffer to 750.000 bales. At the same time, the Government of India doubled the export quota for low quality old fibre to 200,000 bales. The Government proposed that the minimum prices basis Rs. 30 a maund Assam bottoms should also be ensured to the new crop. The mills urged relief in this regard by pointing out that their cost of production was Rs. 300 a ton higher than in Pakistan and that cost of production of cultivation should be re-examined before fixing minimum prices for the new crop. This was in June, when, as a result of inactivity in the market fibre, prices had fallen below the minimum levels by 50 nP a maund. However, towards the end of June, reports of floods from Assam and West Bengal jute districts erased this decline. Demand for goods was maintained on an even keel and the news that the monthly average burlap consumption in the U.S. rose to 77 million lbs. in the first five months of 1962, from 57 million yards in the corresponding period last year and 65 million yards in the whole of 1961, was encouragingly noted.

News of foreign exchange difficulties in Argentina—that country is a good customer of hessian—and difficulties arising from customs formalities in regard to verifying rates in shipping bills reduced business during the major part of July, but, towards the end of the month, lower levels attracted buying support for hessian from the U.S. and sacking from Cuba. The recovery in prices of goods during August was maintained, hessian 40" 10 oz. rising gradually from Rs. 53.10 to Rs. 55. But sacking goods were dull, as higher stocks with mills caused anxiety. After the earlier reports of damage to crop on floods, arrivals of new crop were substantial, causing dullness to prices. The quality of the new crop showed a marked decline and, as this feature continued in September, it was clear that the crop fit for manufacture of hessian had declined to increase the harvest of the inferior fibre. In September, modest interest was maintained in goods and Government measures to stop delays in shipments as a result of time required for customs authorities to verify prices helped to revive confidence among foreign buyers, notably in the U.S.

Raw Jute Recovers

As a result of increased fibre arrivals, prices of inferior fibre declined further in October, and this caused anxiety to both Government and mills. However, the premium for only higher grades hardened. With a further increase in stocks of heavy goods, prices of these constructions had moved down below cost of production level; however, in the wake of open aggression by China on India, overseas interests resumed showing greater interest, and prices soon recovered to such levels as mills found simultaneous business in goods and fibre profitable after a lapse of a long period. At the same time, the U.S.A. increased its tempo of buying, which was attributed partly to replenishment needs and partly to stockpiling as a result of swift changes in the international political situation following developments in Cuba. The U.S.S.R. also turned out to be a substantial buyer. Hessian 40" 10 oz. gained from Rs. 54.75 to Rs. 57.60 and, in sympathy, B. twills also put on a better showing at Rs. 119, as against Rs. 115.75. This was towards the end of October. Conditions were steady during November, and the announcement of a decline in stocks of goods added to interest. However, foreign buyers were not inclined to follow the uptrend, and the trade realised that, in order to maintain a sustained level of business, prices should not move further. The Union International Trade Minister's indication that exports of jute goods and fibre were expected to yield a record sum of Rs. 150 crores this year was shared by the trade, inasmuch as there were reports that the Pakistan mills were unable to meet foreign demand in full, and the order books of Dundee mills were full up to the end of March 1963. Early in November, hessian 40" 10 oz. rose to as high as Rs. 59.10 and B. twills to Rs. 121.15; these rates could not be sustained, as follow-up support from overseas was lacking. Thus, by the beginning of December, B. twills had eased to Rs. 118.15 and hessian 40" 10 oz. to Rs. 56.75. Fibre prices, despite a series of price support schemes, including the release of a fresh quota of 250,000 bales for purchase by the Buffer Stock Association and the commencement of buying by the State Trading Corporation, continued to be below minimum levels in respect of the poorer quality. After completion of this quota, the total in buffer stock would stand at 875.000 bales. It was felt that, with mills having adequate stocks of inferior fibre and demand for sacking not showing any remarkable upward trend, it would be a problem for the buffer stock agency as well as the S.T.C. to dispose of their holdings in the future. In the circumstances the solution lay only in sustained attempts to improve the quality of the next crop. Early in December, fibre prices improved by Re. 1 a maund from from their lowest levels, following the decision of mills to purchase about 200,000 bales of Assam jute.

Jute and Jute Goods Prices

	Rate on 29-12-1961	Lowest rate	Highest rate	Rate on 8-12-1962	Net loss
Jute goods	Rs.	Rs.	Rs.	Rs.	Rs.
Hessian 40" 10 oz. (per 100 yards)	59.50	50.00	64.50	54.30	−5.20
B. Twills (per 100 bags) ..	135.25	113.85	137.25	118.80	−6.45
Raw jute (per maund):					
Northern bottoms	30.00	29.50	32.50	29.50	−0.50
Assam bottoms	30.00	30.00	33.00	30.00	Nil
Daisee bottoms	33.00	32.00	36.00	32.00	−1.00

DEVELOPMENT PLANNING IN LATIN AMERICA

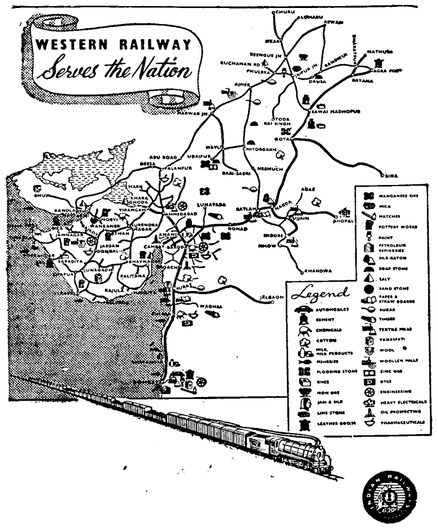
(*Concluded from page 52*)

and population. However, it is well to remember that South America is quite urbanised, so that it even now presents a market which is not too dissimilar from that of Europe and the United States. During the early stages of the Alliance, there will be heavy concentration, on the part of the Plans, to build industries which replace imports, with the result that it may be difficult to expand trade with Latin America. But, as the economies progress, there will be increasing attempts to expand international trade through the development of exports, first within the Latin American Free Trade Area, and then eventually to the entire world.

It would appear that India can contribute to the development of Latin America by trying to give technical assistance in the field of economic and social development, particularly with respect to national and regional planning and the institution building which must be associated with Plan implementation. At the present time, there is too much tendency to consider that a Plan is completed when it has been published in a book and it has been reviewed by an international finance agency or the Panel of the Nine. India has been building up the institutional framework to make the Plan operate. For example, the Latin American countries are struggling with the problem community development and bringing the benefits of economic growth to the rural sections of the country. Technical assistance from the Community Development programmes of India would be welcomed by many of the Latin American countries. Advice on how to strengthen the planning process with respect to the tools used by the Indian Planning Commission to enforce the Plan and to make it a living operation would be welcome.

The manner in which the planning system is co-ordinated at the national and State and local levels will be of particular help to Latin American political leaders and technical planners. Reviews of the substantive problems which were encountered during the course of each plan period would be extremely helpful. The method of progress reporting and control over the Plan implementation used in India will be of special interest to the planners of Latin America once they have their plans introduced as working guides for development and financing. Even the statistical system utilised by India which has been increasingly directed to assist economic development planning and decision-making should be studied by Latin Americans.

At the same time, one may expect the Latin American leaders and planners to develop ideas and institutions which will be of particular value to India. Thus, it is quite likely that the Colombian Institute for Agrarian Reform will develop programmes which will be of value to Indian agriculture. Even now, the initial steps being taken to mobilise private savings for housing through the establishment of Savings and Loan Associations in Latin America may be of help in India.



As a major means of transport, the Western Railway, extending over 6,000 miles, and covering wide areas of Maharashtra, Gujarat, Rajasthan and Madhya Pradesh States, serves some of the major ports, a host of important industries and a population of 40 millions.

Having fulfilled the target in the Second Five Year Plan the Western Railway has confidently embarked on a larger Third Five Year Plan. In the country's forward march to progress, the Western Railway pledges its continued services.

SHORTAGE OF BASE METALS PERSISTS

Copper, Tin And Lead Rise, While Zinc Falls

CALCUTTA, 10*th December*

A MARKED increase in demand under the impetus of greater needs of non-ferrous castings by machine-building industries, of semi-manufactures such as brass and copper rods, tubes, wires, sections, flats, sheets and plates by the engineering industry, and of electrical cables for various projects, including railway electrification and rural schemes, was the outstanding feature noted in the non-ferrous metals markets during 1962. However, pressed by the insufficiency of foreign exchange, the Government could not provide for increased imports of metals. Thanks to inadequacy of raw materials, manufacturers failed to raise output by utilising their capacity fully, and even one-shift working had on occasions to be restricted. Against this background, the issue of industrial licences to set up more plants based on non-ferrous metals was criticised by the industry. In accordance with the Government's desire, cable plants made a beginning to switch over to aluminium; but this did not lead to greater copper supplies to other plants. The Development Council for Non-ferrous Metals placed annual requirements of copper and zinc at 85,000 tons each, lead at 35,000 tons and tin at 7,000 tons. Although the availability of led is satisfactory, imports of copper, zinc and tin during the year were running 28,000, 14,000 and 2,000 tons, respectively, below the estimated requirements.

Import Policy

The import policy, announced on 31st March 1962, belied the earlier expectations of liberal metal quotas. The issue of import licences for the year as a whole was not of any practical value, inasmuch as only half of the licences was required to be used in the first six months. With the deterioration in foreign exchange position, the import policy for the October 1962-March 1963 period was postponed pending the Finance Minister's reassessment of the foreign exchange situation in the light of promises held out during his foreign tour. It was at this time that the Chinese began open hostilities against India, delaying further the formulation of import policy. However, with liberal U.S. assistance, India could get supplies of metals, and these contributed in no small measure to keep plants running.

Excise Duty

The imposition of excise duty on copper ingots and electric wires and cables was a feature of the April budget and this, coupled with administrative costs for submission of returns and maintenance of the stipulated excise records, raised the cost of production. The industry's plea for abolishing excise duty (imposed last year) on copper and copper alloys manufactures, which was based on the ground that the duty on an industry while it is receiving protection was against the recommendations of the former Tariff Board (1948), was rejected by the Government. Only recently, the Government announced the continuation of protection granted to copper pipes and tubes, brass pipes and tubes, extruded copper rods other than electrolytic copper rods and extruded brass rods. Extruded copper and brass sections and highly polished zinc sheets also benefit the extension of protection. The authorities also rejected the industry's earnest appeal to transform the *ad valorem* duty on tubes and pipes into a specific duty if only to reduce clerical work. The industry urged that ambiguity in excise rules should be removed and that duty should be imposed on primary metals or on manufactures, but not on both as at present. Effective from 29th November, the Government banned forward trading in copper, zinc, lead and tin. Non-transferable specific delivery contracts for the sale or purchase of these metals was excluded from this ban. The ban was aimed at reducing the volume of trading and thus preventing any rise in prices on this account. At the same time, the Government announced that it was proposed to set up a second State Trading Corporation to handle the exports of iron ore, manganese ore, non-ferrous metals, ilmenite and other metals.

The accompanying table briefly gives the course of price movements of the principal metals at Calcutta and other important trading centres.

Copper

The delay in the imports of virgin copper against permits and the possibility of a strike in U.S. mines which raised the London price from £229½ a ton to £234 despite comfortable warehouse stocks and reports of a 5 per cent rise to 1,136,000 tons in U.S. copper output in 1961, led to steady demand for copper scrap at Calcutta even early in January, when berry scrap gained from Rs. 522.50 per quintal to Rs. 549.25. In February, the price staged a decline to Rs. 544.25 on expectations of increased foreign aid facilitating more imports on non-ferrous metals, following the Washington meeting of the Aid India Club at the end of January, and due to satisfactory arrivals of virgin metals. The London price rose to £236½ early in February, as the situation in the Congo did not enhance the hope of an early return to normalcy, and there was the apprehension of a strike in Northern Rhodesia. The news of the sanction of a U.S. non-project loan of $100 million for import of industrial raw materials, including non-ferrous metals, and the Union Commerce Minister's indication of no reduction in essential imports subdued sentiment in March, when berry scrap sagged further to Rs. 541. Another factor was that the L.M.E. quotation eased to £234, due to subdued consumer demand. In April, after earlier weakness, berry scrap spurted to Rs. 572. It was clarified that the requirement of licence-holders to get their import licences endorsed after using the first half would not be applicable to D.L.F. licences. Conditions were mixed in May; while in London spot copper firmed up to £234½, in Calcutta berry scrap, after being higher at Rs. 576 stimulated by the strike of the Hooghly pilots, eased to Rs. 570.50 following the resumption of work by pilots, and accumulated arrivals awaiting at the Sandheads on the mouth of the Hooghly began reaching the port.

The Government's decision to cut imports by 20 per cent heightened activity in June and hardened the price trend, berry scrap rising to Rs. 589.50, but soon there was the announcement of another non-project U.S. loan of $200 million for importing raw materials including metals. In July, the price was fully firmed following the absence of any news with regard to actual user licences beyond September. In London, the price was unchanged at £234, despite clear indications of surplus production and the U.S. desire to release a substantial quantity from the strategic stockpiles. There were indications of success of India's efforts to get adequate foreign aid in August, but the Finance Minister soon declared that import relaxation, if any, would be only marginal. Berry scrap rose to Rs. 616.25. The Commerce Minister, however, indicated that the October 1962-March 1963 import policy would see more restrictions. There was also the bullish news that the cut in copper production in the U.S.A., Chile and Rhodesia had erased the world surplus. This led to the L.M.E. rate being firm at £234. The grave news over Cuba raised the London cash rate in October to £235¾. At Calcutta, the further postponement of the import policy and the increased import needs of the Army pushed up clean wire scrap to Rs. 604.75. With the staving off of an international crisis over Cuba, the L.M.E. quotation returned to £234 in November. As the month of November progressed, conditions at Calcutta eased and utensil scrap touched a low of Rs. 482 towards the end of the month. This reflected the anxiety arising from the border situation.

Tin

Tin was very often in the news. The U.S. decision to release 50,000 tons from its strategic stocks pushed down the London price of £946 to a low of £845. However, early in the year, apprehensions that output was falling much below demand pushed the L.M.E. rate to £940 and, in recognition of the representation from producing countries with regard to increased output costs and the provision of incentive to work abandoned and marginal mines, the International Tin Council raised the floor and ceiling prices from £730 and £880 a ton to £790 and £965, respectively. Soon, the Buffer Stock Manager exhausted his stocks and he could not prevent the price from rising further. The London rate swiftly moved up to touch a high of £970¼. The U.S. decision for weekly releases of 300 tons—later revised to 200 tons, of which 40 tons would be against Government needs and 160 tons against commercial needs—and Washington's rejection to accept the I.T.C's advice as to the price at which release bids should be accepted pushed down the rate rapidly to £845, that is, £35 below the floor. However, the Buffer Stock Manager made sizable purchases, as he was provided with £14 million to build up his stocks. This was in September. Since then, the London price has registered a rapid recovery and, by the end of November, it had gained to £871. In India, acute scarcity of tin led to a rapid rise in price, which reached a high of Rs. 2,660 a quintal, as against Rs. 1,570.75 early in the year.

Electrolytic Zinc and Lead

The price of zinc closely followed that of copper. However, there were occasions when the upward trend was arrested, as the alloy-makers, being unable to procure sufficient copper, were indifferent to the zinc market. In London, the price at one time was as low as £63¾ a ton, as against £71¾ early in the year, as it was becoming clear that world supplies were far in excess of demand and there was no prospect of any move for international control of production. Immediately thereafter, however, it was announced that the six European countries and Japan, Spain and the U.S.A. had decided on a cut in production and, following this, the price in London began to recover. It was also recognised that lead was in excess of demand and that explained why the L.M.E. rate could not move farther than £62½, as against 1961 closing of £60¼. A low of £50 was touched in the year, but, since then, a small recovery set in to improve the rate to £55⅞ by the end of November. At Calcutta, active demand pushed up both zinc and lead to Rs. 321 and Rs. 160, respectively, as against the 1961 closing of Rs. 200.75 and Rs. 123 per 100 kgs., but, since these levels could not be maintained for long, prices receded to Rs. 255 and Rs. 141, respectively.

Trend of Metal Prices

	Rates as on 29-12-1961	Lowest	Highest	Rates as on 7-12-1962	Net rise (+) or loss (—)
Calcutta (Rs. per quintal)					
Utensil copper scrap ..	471.50	482.00	568.00	509.00	+ 37.50
Malayan tin	1,570.75	1,561.00	2,660.00	2,660.00	+ 1,089.25
Electrolytic zinc	263.75	200.75	321.00	260.00	— 3.75
Lead	128.00	123.00	160.00	142.00	+ 14.00
Bombay (Rs. per quintal)					
Tin	1,630.00	1,580.00	2,800.00	2,650.00	+ 1,020.00

Lead	9.27	8.10	9.22	8.98	— 0.29

TEA MARKET

(*Concluded from page* 198)

sessed as yet, it has doubtless created a feeling of uncertainty about the regularity of future supplies. Apart from this, there have been reports of the early advent of cold weather in North India and production figures up to the 15th of November show a shortfall of 10.5 million kg., as compared with the same period last year.

The combination of these factors ensured a strong market during the first two weeks of November. In the third sale of the month, there were signs of resistance from out-markets for the better orthodox descriptions. Meanwhile, arrivals of teas by rail in Calcutta were surprisingly good and it has been possible to schedule regular auctions, although on a reduced scale, of 50,000 to 55,000 chests leaf (as against the normal 70,000 chests) during December. There is an adequate quantity of dust teas in Calcutta to have normal weekly dust sales of 30,000 chests till the middle of January. There are also reports of alternative arrangements being made and special wagons being allotted for the transport of teas held up in Assam. This helped to relieve the buyers of a great deal of anxiety, and, in the third week of November, demand for better orthodox descriptions (which had risen more than the other varieties) was weaker and withdrawals of medium B.O.Ps were heavy. This decline in prices extended to plain orthodox descriptions in the last week of the month, while in the first sale held in December, demand was palpably less and most descriptions eased by up to 40 nP, many of the more expensive teas from Darjeeling and orthodox Assam selling as much as 1 to 2 rupees below previous rates.

Given on page 198 is a table showing the price averages of leaf and dust teas from various districts at the beginning of December, as compared with the corresponding figures a year ago along with the quantities sold.

Taxes

With a view to encouraging export of tea, the Union Finance Minister announced the following changes in the taxation on tea when he presented the Budget for 1962-63 on 23rd April, 1962.

	Previous zones	New zones	Previous rates per kg.	New rates per kg.
Excise duty ..	I	I	10 nP.	15 nP.
	II	II	15 nP.	25 nP.
	III (N. India)	III	25 nP.	30 nP
	IIIA (S. India)	IV	25 nP	35 nP
	IIIB	V	35 nP	45 nP
Export duty..	..	..	44 nP	25 nP

The excise duty was also made refundable at the point of export to the extent of 15 nP per kg.

The other taxes and State Government levies which remain unchanged are:—

Package tea	40 nP per kg.
Tea cess	Rs. 4.40 per quintal.
West Bengal octroi ..	Rs. 6.25 per .4535924 kg. or per lb.
*Assam carriage tax ..	15 nP per kg.

*The Carriage Tax (Revalidation) Act expired on 31st March 1962.

Consequent on the abolishment of the export quota system in November 1961, teas are, from the beginning of the 1962 season, being catalogued in three different sections, namely leaf, dust and supplement, in place of the previous system of grouping offerings separately for export (covered with quota rights), internal consumption, dust and supplement.

Exports

The export position of North Indian tea has been particularly encouraging and 4.3 million kg. more tea have been shipped to the U.K. alone during the period January-October, while the other out-markets have absorbed 2.2 million kg. more than last year.

There are no indications at present of the world supply outstripping increasing world absorption of tea and demand in the coming months is expected to continue on an active note.

*It was reported on the 5th of December that the strike by the crew of the Joint Steamer Company in East Pakistan has been called off and this news has been received with a considerable amount of relief both by the producers and the buyers. Teas which were held up at Barisal in East Pakistan are expected to begin arriving in Calcutta during the second week of this month, while it may take further two weeks or more for those steamers which were held up at Dhubri in Assam to reach Calcutta.

HIDES AND SKINS EXPORTS FALL

Substitutes Make Heavy Inroads

MADRAS, *5th December*

THE spotlight in India for some time past has been particularly on the European Common Market and especially on the unprovoked Chinese aggression in the North and North-East. As our Prime Minister has put it, "we should build up our basic strength...and the third Five-year Plan is vital not only for the nation's economy but also for the war." Tanners and exporters of hides and skins in the country have not lagged behind in implementing this direction.

India abounds in the basic materials needed for the tanning industry. In the South, the industry has been developed on a large scale through cottage units which are dispersed over several districts and depend largely on manual labour. Tanners have, however, been slowly installing labour-saving machinery in their factories and keeping their production in step with the growing needs of the export market.

The tanned hides and skins industry has been an important earner of foreign exchange. In 1961, the export earnings from Madras port amounted to about Rs. 23.4 crores and were slightly higher than in 1960. There was a fall in exports of cow hides and sheep skins, which was offset by increases in those of cow calf, buff calf and goat skins. During 1962, there was a distinct setback in the volume of shipments in most of the sections of the trade, the only redeeming features being the export of cow calf and buff calf to the U.K., cow calf to the Continent and goat skins to the U.S.A. The larger trade in the calf section is attributable to the smaller offerings from other countries. Tanners have been able to interest importers in the East European countries and the U.S.S.R. in semi-tanned chrome and pickled goat skins, which no doubt can develop into regular trading merchandise, once the dressers overseas find their purchases profitable. India has reached a stage when it can ill afford to lose any export market in view of her balance of payments difficulties. The position has been further aggravated by the sudden Chinese aggression.

Britain and E.C.M.

In this context, it is unfortunate that since 1959 there has been a steady downward trend in the volume of exports to the United Kingdom, which is a dependable friend of India. The U.K. has been India's traditional export market and its preferential tariffs for the Commonwealth products have been greatly beneficial. The U.K.'s joining the European Common Market appears to be a certainty, as it will further her interest to a great extent. A small section in the U.K. is against this move because its repercussions can affect the solidarity of the Commonwealth. But the protagonists argue that Britain's entry into the Common Market will be beneficial to India as well because that country will exert a moderating influence on the other members and give liberal aid to India, as its export trade will increase substantially. It is a matter of gratification that the Lord Privy Seal told the House of Commons recently that individual arrangements were being negotiated with the E.C.M. countries for India, Pakistan and Ceylon which might be termed a package of comprehensive trade agreements to safeguard the trade of those three countries not only with the U.K. but also the whole enlarged Community. The countries of the E.C.C. are important as both importers and exporters of leather; and their total imports of raw hides and skins last year were estimated at £101 million.

Main Trends Same

The characteristics of India's hides and skins industry and trade remained unchanged this year. There was a steady demand for the recognised standards and superior tannages, but E.I. tanners were unable to take advantage of the call and did not make reasonable profits to compensate for the risks involved in the industry. The exceptional strength in the raw stock centres, transport bottlenecks, non-availability of sufficient raw goods of good quality at economic prices, and the keen competition of North Indian tanners prevented the Madras tanners from maintaining the 1961 volume of exports during the year under review. Rise in food prices led to wage increases which affected production charges and the competitiveness in the export market. Besides, in the U.K., bigger firms continued to give way slowly to smaller units, as the latter snatched away the available business from the curriers by cutting to the bone their remuneration in the transaction. This price-cutting was a regular feature during the year under review to the chagrin of the well-established old importing houses in the U.K. Leather dressers, on the other hand, found prices in Madras unremunerative and out of parity with world prices. Rubber, synthetics and leather substitutes made, therefore, serious inroads in the kips trade. All this resulted in restricted turnover for the E.I. tanners during 1962.

During the first half of 1962, shipments of tanned hides and calves were lower by 10 per cent than in January-June 1961. There was a decline of 25 per cent in the export of cow hides to the U.K. which was partly made up by increases of 40 per cent in cow calf and 70 per cent in buff calf to the U.K., and 35 per cent in cow hides and calf to the Continent. One of the factors affecting the export of kips was the growing demand for lower selections for footwear and for the manufacture of industrial leather for internal consumption. Tanners' output was less during the second half of 1962. There was a definite decrease in the volume of exports to all destinations, with the exceptions of tanned cow hides shipped to the U.K., sheep skins to the Continent and chrome tanned and pickled goat skins worth Rs. 50 lakhs to the U.S.S.R. and other East European countries.

The average monthly quantities shipped (in bales of 600 lbs. each) were:

	1959	1960	1961	1962*
Tanned hides and calves (cow and buff) to U.K. ..	3,697	3,061	2,992	2,773
Tanned cow hides and calves to Continent ..	188	179	120	184
Tanned buff calf to Continent ..	67	79	69	34
Tanned buff hides and calves to U.S.A. ..	299	129	263	176

* January-November.

Bark Tanned Cow Hides. Tanners have had a pretty difficult year. Demand for ordinary tannages was poor, and prices were on the decline, and tanners were not able to cover the replacement cost in view of the strength in the raw market. Preference for good tannages and marks from the U.K. showed no dimunition and importers' resistance to prices at origin was great but Madras tanners of superior standards were strong holders and held firm to their limits. During the first ten months of the year, prices fluctuated within a narrow compass and the superior tannages maintained the levels current during the second half of 1961. Only towards the close of the year, prices spurted over the January levels. British importers were mostly interested in light-weights, with emphasis on lower ends. They also took lower selections in medium-weights in F.A.Q. marks on account of favourable prices. Other weights in ordinary tannages were in disfavour; but fortunately, East European countries bought important quantities of light and heavy weights at full prices during the first half of 1962, and this helped the tanners to a great extent to clear their surplus stocks after meeting demand from the U.K. While about 300 bales were sold to East European countries in 1961, 700 bales were shipped to them during the first half of 1962. During November/December, there was good internal demand for heavy-weight kips for military purposes. Export of cow inferior fifths to the U.K. decreased appreciably because there was a good internal market in India at 5 to 10 per cent above importers' price ideas.

Cow Calf. There was steady trading all round the year at unchanged prices. Top marks and heavier averages were in good demand. Despite attractive prices being offered during November 1962, sellers were reserved, as the tanners had been making sales regularly without allowing stocks to accumulate. Shipments to the U.K. were 30 per cent higher and to the Continent 50 per cent higher than in 1961.

Tanned Buff Hides. Production was small and uneconomical for the tanners and was taken up mostly by inland trade. Demand from the U.K. was small, because the product could not be used profitably for the moulded shoe process. Export to the U.S.A. during the first half of 1962 was 45 per cent of what was shipped during the same period in 1961. Prices slowly declined month by month, and the November level showed a decline of 15 per cent over that in January.

Buff Calf. Production of buff calf was larger. Shipments to the U.K. during the first half of 1962 exceeded the total shipments during June-December 1961 and was 70 per cent more than in January-June 1961. The Continent took half the quantity of its imports during the same period in the previous year, while America's share was 90 per cent of the previous year. Top marks were in the limelight. Prices advanced 5 per cent during the middle of the year but sagged to the January levels during September-October to advance 10 per cent during November. Buyers in the U.S.A., who were generally taking 2/2½ lbs. average, preferred to purchase heavier averages during the year, probably due to their getting 2/2¼ lbs. average from Pakistan at lower levels. This accounts to some extent for the lower offtake on American account. Pakistan has been an active competitor in the U.K. market as well.

Tanned Skins. The variations in demand, especially in goat skins and top class sheep skins, depend largely on conditions in footwear and clothing trade. The fancy for suede garment leather, which was strong during 1961, wore off during the beginning of 1962. Stock-holders overseas who had expected the fashion to hold on were disappointed, and took lower prices to liquidate their stocks thereby precipitating the decline in prices.

Shipments

During the first half of 1962, there was about a 10 per cent fall in the volume of export of goat skins to the U.K. and of 20 per cent in that to the Continent from the 1961 average, while exports to the U.S.A. increased by 55 per cent. As regards sheep skins, the position was 25 per cent decrease to the U.K. and 30 per cent to the Continent, as against 25 per cent increase to Japan. During the second half of 1962, quantities shipped were less than in the earlier half. The average monthly quantities shipped (in bales of 560 lbs. each) were:

	1959	1960	1961	1962*
Tanned goat skins:				
U.K.	630	521	446	405
Continent	584	669	957	670
U.S.A.	160	178	173	262
Tanned sheep skins:				
U.K.	555	447	323	253
Continent	299	327	356	288
Japan	155	120	179	198

* January-November.

In the tanned goat section, the superior tannages were in good demand for regular average weights and selections throughout the year. Medium-weights were neglected and prices declined from 18s. 9d. in January to 16s. 6d. in August. In October, there was a revival of demand for "suedes" and prices improved. Importers in the Continent and the U.S.A. showed marked interest in heavy, extra heavy and lower selections in secondary tannages and prices were firm throughout the year. Continental buyers were also interested in the superior marks, and the E.I. tanners had profitable trading with the Continent throughout the year. Light-weights, which had been traditionally attracting higher prices than other weights all these years, were in the background and importers paid higher prices for the 11/12 lbs. average rather than for the 8/9 lbs. and the 5½/6 lbs.

In the tanned sheep skins section, prices of prime and semi-prime had been slowly declining since the beginning of 1961. During 1962, the price declined from 32s. in January to 26s. in July, but was steady at 27s. 6d. during November. Middle class sheep commanded a steady market during the year. Tanners in this section, would have noted that the Continental buyers react unfavourably to any drastic rise in price, as such fluctuations become uneconomical to them and shoemakers unhesitatingly decide to produce shoes without leather lining.

In the periodical tanned skins public sales held in London and Germany, good fresh lots attracted attention and poorer parcels remained uncleared or sold at bargain prices. Shippers were not happy over the results Trading with Japan in tanned sheep skins improved by 10 per cent during the year.

Inland demand for footwear and industrial leather was on the increase. About 102 million pairs of footwear were turned out at the end of the second Five-year Plan. The yearly production target for the third Plan is 140 million, including the export target of 4 to 5 million pairs.

Despite the challenge from leather substitutes, the E.I. tanned skins have held their own during 1962 and the industry has a good future. The American Medical Association has issued a warning against shoes made of substitute materials and exhorted the public to go in for leather. In the U.S.S.R., the Ministry of Health, it is reported, has prohibited the manufacture of shoes for children other than those with soles made of leather in order to protect children against foot diseases and rheumatism. The prospects for the trade during 1963 seem reasonably favourable, although political factors might upset the estimate of the position.

ECONOMIC TRENDS IN UNITED STATES

(*Concluded from page* 116)

too. Since the U.S. abandoned its fixed price a year or so ago, prices have been rising gradually, but continually. The underlying economic facts are that consumption for all purposes, particularly in 1962, has been far greater than production. The old law of supply and demand came into play.

The 1963 Outlook

Last year, forecasts spoke of glorious prospects which did not materialise. This year's prognostications for 1963 are very cautious. Perhaps, they will not come true either and things will be better than expected. Caution, based on the 1962 experience, is understandable, but nobody can jump at conclusions at this point. It is exhibited by many institutional investors who prefer an extremely liquid position. Some institutional investors have been selling more securities than they bought. But their prime considerations were earnings and prospects of earnings which again emphasises the psychological and real impetus a tax cut could have.

Agriculture in 1962 had a very good year. Crop yields were the third highest on record since figures were compiled by the Government in 1909. Reflecting the automation which has been going on in the farmlands and the more scientific use of fertilisers, the crop yields were obtained on an estimated acreage of 12,000 square less than in 1961. It is a trend which is likely to continue not only in 1963 but in the years to come.

This, of course, is true as well in industry where fewer number of people turn out more products by more and more efficient machines. It is part of the reason for the present strike waves in the U.S. Automation has caused the loss of jobs, temporarily. Eventually, everything will be all right, presumably, but, in the meantime, rent and food bills have to be paid by the workers. No reasonable formula has yet been found to reconcile the necessity of higher corporate earnings through automation by saving labour costs and the necessity of survival by the individual who has lost his job until he can be retrained or reorient him or herself.

These are not new problems. One blacksmith has been replaced by 20 automobile mechanics in due course, but it is the intermediate period which causes the trouble. Basically, that is what is going on in the U.S. today, what will continue to be a problem in 1963 and for years to come. The advance in science has been rapid. The person who loses his job fights for survival. He cannot help himself in a big city. He cannot grow his own food. He becomes a ward of the Government until he gets a break. This trend, naturally, will not destroy society or cause revolution, but it is a very serious problem facing Government, business and industry.

THE PRICE OF GOLD

(*Concluded from page 91*)

some years earlier—22 currencies, which account for 62 per cent of world trade, are fully convertible. Gold can now be bought by the smugglers almost at par—i.e., at less than one-half of the Indian prices, prior to the current price debacle—against any of these currencies. In the early post-war years, payments for smuggled gold had to be ultimately in U.S. dollars and the smugglers had to circumvent exchange control hurdles, which had been then operating in a number of important countries. The cost and the trouble of acquiring gold and reaching it to the Indian frontiers has been much less since the rapid spread of convertibility.

Surely, we cannot claim dispensation from the working of natural monetary laws because of a treacherous border war.

These reforms will, doubtless, pave the way for free subscriptions to the bonds, as, with the lifting up of the official price of gold to nearer the market price, the main hurdle of a heavy loss on capital account would, then, cease to be. But, as redemption of the bonds at maturity will be in rupees, not in gold, if, during the lifetime of the bonds, inflation should re-emerge, the price of gold will rise again and the subscribers to the bonds would lose on capital account to the extent of the price rise. This apprehension may be removed if the holders of the bonds are given the option of redemption in gold, or, in the alternative, the repayment is stepped up by the rise in the price of gold; this would also act as a check on inflationary policies. Given this additional arrangement, if the other features of the Gold Bond issue are retained, there is every prospect of a fair amount of subscription to the bonds. In the absence of these three measures—stopping further inflation, stepping up the official price of gold and the option to the bond holders of repayments in gold—the response to the issue, even including the subscriptions from temples governed by the Religious Endowment Acts and similar legislation, may not be substantial. When compared with the needs of war finance and Plan finance, the receipts may not be significant.

Store of Value

Capital invested in gold in August 1939 rose in money value over four times in August 1962. During the same interval, capital invested in Government debt and other fixed-interest yielding documents fell in value, in real terms, to one-fifth the original figure. Stated differently, Rs. 100 invested in gold in August 1939 yielded in August 1962 Rs. 401, or the original sum plus compound interest at 6.2 per cent. On the other hand, Rs. 100 invested in Government debt in August 1939 would bring in August 1962 Rs. 220, reckoning compound interest at 3.5 per cent.

This explains in large part the public's preference for gold. It is not due to the bullion market, the facility for forward transactions—India is the only country where futures trading in gold and silver exist—which it offers, the wickedness of the bullion speculators or the stupidity of the Indian people. It is part of the evil resulting from an unstable rupee, the latter being the inevitable outcome of statist policies. Fancy economic policies in peacetime, judging from our own experience, produce retarded production, sectoral stagnation, unemployment, anti-social income shifts and group tensions. Fancy economic policies in war-time might engender national insecurity, as they weaken the economy through resource wastages. We can ill afford a shooting war on the borders and a cold war on the bullion market and its customers, who comprise a very large population of the country, especially as the cold war has little chances of success.

Conclusion

We may briefly bring together the principal conclusions emerging from the foregoing discussion:

1. The experience of the past two decades has demonstrated that the price of gold, like the general index of commodity prices, moves up or down with the volume of money with the public. The price of gold reflects the prevailing state of inflation.

2. The gap between the internal and the external prices of gold emerged with the appearance of inflation in 1940-41. The gap widened with the progress of inflation.

3. The gap between the internal and the external prices, which had emerged in September 1931 with the abandonment of the gold standard, was eliminated when the rupee was devalued by 51 per cent on 14th September 1939. This resulted from a rise in the official price of gold to the market price.

4. The gap in the internal and the external prices of gold declined from Rs. 61 to Rs. 46 per 10 grammes with the devaluation of the rupee by 30.5 per cent on 21st September 1949. The diminution of the gap reflects the increase in the official price of gold from Rs. 37.22 to Rs. 53.58. As at 31st August 1962, the price gap was Rs. 76.32, an all-time record.

5. The current phenomenon of sagging gold prices is out of alignment with the basic economic logic of the situation. The prevailing fiscal and monetary situation does not warrant a fall in gold prices, as over-investment and inflation are continuing; and as there has now emerged an additional inflationary factor, namely, the border war with China.

6. The sagging prices of gold are, principally, the result of a succession of bad jolts that the bullion market has received from our unfolding gold policy. It is due to the fear that the Government might take some drastic action to mobilise the gold in private hands for finance of the Plan and finance of the war.

7. That, left to itself, the price of gold would recover and maybe continue to rise with commodity prices, is evidenced by the fact that, during the current price debacle, every fall has been followed by an uptrend. The price of gold fell to low levels principally because of a repetition of the blows the market received from the Government.

8. A part of the fall in prices, especially in September and October, may be also due to heavy arrivals of smuggled gold, a redoubling of the smuggling activity being induced by fears of devaluation of the rupee.

9. The crux of our gold problem is the gap between the internal and external prices of gold. This is causing the economy considerable damage. It involves exploitation of the Indian buyers of gold by the foreign smugglers to whom accrue the difference between the internal and the external prices. The magnitude of the gap has rendered futile all our attempts to prevent gold smuggling. The elimination of the gap is essential for the success of the issue of Gold Bonds.

10. Our gold problem is both desperate and intricate. The key to its solution lies in eliminating the price gap. To achieve this through using the sledge hammer on the bullion market is to attempt the impossible, though this may bring down prices temporarily. There is no device of keeping inflation from the bullion market when inflation pervades the rest of the economy.

11. It is also not possible to maintain an island, below sea level, of exchange control and import restrictions, which the present official price of gold calls for, in an ocean of freedom in gold transactions. The larger part of world trade, and as many as 22 currencies, being now free from exchange restrictions, the trouble and the cost of reaching gold to India's frontiers is very much less today than in the past.

12. Capital invested in gold in 1939 yielded, as at August 1962, compound interest of 6.2 per cent, which is vastly higher than the returns on investments in Government debt. This largely explains the public's preference for gold. The cause of this evil lies in policies which have rendered the rupee dishonest. We have been paying dearly for the fancy economic policies which we have pursued during the past two decades. The continuation of these policies in war-time might engender national insecurity, as they debilitate the economy through resource wastages and undermine social stability.

AHMEDABAD, *4th December*

MONEY AND BANKING

(*Concluded from page 185*)

tent that the long-term capital market has fallen into a state of coma. It may be noted here that even such well-known institutions like the Central Bank, the Central India Spinning and Weaving, and T.E.L.Co., which were to have issued new capital, preferred to defer their programmes to better days rather than risk the possibility of a lukewarm response. Again, the support for the debenture issue of the Central Government-backed Oil India Ltd. was less than normal, in spite of the attractive rate of interest carried by it. The disappearance of confidence in the capital market may be a temporary affair, but it is causing considerable concern among businessmen who need long-term capital for implementing their expansion programmes.

As already stated, the borrowing programmes of the Central and State Government were, however, a greater success than last year, as they were launched at a time when the banks were having plenty of floating funds. Further, the L.I.C.'s resources were larger owing to a substantial expansion in its growth. The total subscriptions to the three Central loans (July 1962) were Rs. 6.87 crores more than the target of Rs. 250 crores. Of this, conversion of maturing loans accounted for Rs. 153.67 crores, the balance of Rs. 103.20 crores being in cash. The response to the State loans was so good that the lists in respect of seven States were closed on the first day itself. The total subscriptions (Rs. 109.0 crores) to all State loans exceeded the amount (Rs. 93.5 crores) invited by 16.5 per cent as compared with 14 per cent last year.

Money Costs More

The year under review is notable for an increase in the cost of money to almost all borrowers in the public and the private sectors alike; only the banks were holding down their rates of interest on deposits through an agreement among themselves. The Central Government gave the signal in the first week of July by putting up its borrowing rate for a long-term loan from 4 to 4½ per cent. The Reserve Bank then revised in an upward direction the rates at which it would lend money to member-banks, that is, it raised the effective Bank rate. This development, coupled with the award for bank employees proposing higher emoluments, induced the banks to raise their rates of interest on loans and advances by ½ per cent, even though conditions in the money market were pretty easy. Then on 20th July, the Industrial Finance Corporation raised, with the prior approval of the Government of India and with effect from 19th July, its rate of interest on its loans and advances from 7 per cent to 7½ per cent, subject to the usual rebate at ½ per cent for punctual repayment of principal and payment of interest. A day later, the Government of India put up the rate of interest on Post Office Savings Bank accounts by ½ per cent. As a result, since 1st August, the Post Office pays 3 per cent on savings bank deposits upto Rs. 10,000 in individual accounts (and upto Rs. 20,000 in joint accounts) and 2½ per cent on the balance in excess of these amounts, as also on public accounts. Some of the State Financial Corporations, too, announced an increase of ½ per cent in their lending rates. The L.I.C. also soon came out with an increase in its minimum rate of interest on mortgage loans against immovable properties. On 30th July, it said that, with effect from 18th July, it had raised this rate from 7 per cent to 8 per cent. For those who repay promptly, the effective rate, however, would remain unchanged at 7 per cent, as the rebate for this purpose was raised from half to one per cent. If the Bank rate were to go up, the minimum rate would automatically rise, as it is fixed at 3 per cent above the Bank rate. A reference has already been made to the agreement among banks to charge a minimum rate of 6 per cent on their advances to trade and industry.

No review of banking and monetary trends in 1962 will be complete without a reference to the steps taken to strengthen the banking system. These had been initiated in 1961 itself, but came to fruition in 1962. The Deposit Insurance Corporation Act, placed on the Statute Book towards the close of 1961, came into force on 1st January 1962. A gentlemen's agreement was concluded with the Indian Banks' Association and the Reserve Bank for strengthening the capital base of banks through (*a*) transfer of a specified percentage of their declared profit to the reserve fund and (*b*) issue of fresh capital from time to time. The aim was that banks should have funds of their own (paid-up and reserves) equal to 6 per cent of their deposits. This understanding was also enforced from the beginning of the year and though no time limit was fixed for reaching the specified goal, several banks raised their paid-up capital by issuing new shares at attractive rates of premium. So far as conservation of the specified percentage (20 per cent) of the declared profits was concerned, almost all the banks, excepting one of the big banks, implemented the understanding notwithstanding the short notice given by the Reserve Bank. This, it may be noted, was only one of the two steps which the Reserve Bank had proposed as early as in June 1961. The other had sought to raise the ratio of liquid assets to deposit liabilities. A gentlemen's agreement on this proposal could not be arrived at because the banks' spokesmen complained that the ratio suggested, namely, 27½ per cent, was too high and put forward counter-proposals which failed to satisfy the Reserve Bank. But, as the year progressed, there was a change of Governor and the Reserve Bank, disappointed by the attitude taken by one of the banks to the gentlemen's agreement on strengthening the reserves through appropriation of profit, decided to give up the policy of gentlemen's agreement in favour of legislation for putting through its proposed reforms. Accordingly, during its monsoon session, Parliament amended the Reserve Bank of India Act and the Banking Companies Act and the amendments came into force on 15th and 16th September 1962. This opportunity was also availed of to amend the Acts to serve two more purposes? to enable the Reserve Bank to purchase or rediscount or lend against export bills with a duration of upto 180 days instead of upto 90 days as before, and to collect credit information from banks and financial institutions regularly and to provide such information in a suitable manner to member-banks, so that the risk of overtrading with any one borrower could be avoided.

As a result of the amendments mentioned above, the banks are now under an obligation to continue transferring to their statutory reserve fund 20 per cent of their declared profit even if their reserves have already equalled their paid-up capital. There is, however, no provision in the new legislation about the goal set for the banks under the gentlemen's agreement, namely, that the "own funds" should equal 6 per cent of deposits. But we are told that the Reserve Bank is of the view that banks should continue to have that goal before them and raise their paid-up capital from time to time. So far as liquidity ratio is concerned, they have to maintain statutory cash balances with the Reserve Bank at 3 per cent of their total demand and the time liabilities, instead of at 2 per cent of time liabilities and 5 per cent of demand liabilities. This ratio may be raised upto a maximum of 15 per cent, in special circumstances. The discretion for varying this reserve rests with the Reserve Bank. Besides, the banks should maintain liquid assets equal to 25 per cent of the total of demand and time liabilities. In other words, they will have to keep, including the statutory cash balances, a minimum of 28 per cent of their deposits in liquid assets, instead of 20 per cent at present. The banks, however, have been given a time limit of two years, that is, upto 16th September 1964, to fall in line with this requirement.

THE MORARJEE GOCULDAS SPG. AND WVG. CO. LTD.

CHAIRMAN, MR. GOPIKISAN PIRAMAL'S STATEMENT

IN the light of the Chinese invasion in the North and North-East, Mr. Gopikisan Piramal, Chairman of the Morarjee Goculdas Spinning and Weaving Company Ltd., outlined, in the course of his speech at the Ninety-first Annual General Meeting of the Company, held at Bombay on Friday, 14th December 1962, the efforts being made by the Company to meet the war needs. Mr. Piramal disclosed that, so far, 50 per cent of the Company's production had already been booked up to June 1963 exclusively for defence indents and more would go for defence requirements subsequently. The Company was turning out for defence navy blue drill, parachute cloth, olive green and mineral khaki drill and cellular shirting. In November last, the Company donated Rs. 2,56,690 to the National Defence Fund and the staff and workers voluntarily contributed their one day's earnings.

The following is the full text of Mr. Piramal's speech:

GENTLEMEN,

I am welcoming you all to the ninety-first annual general meeting of your Company under distressing circumstances. In referring to the Chinese invasion of our country, I do not intend to repeat the political and military facts of the case which are internationally known.

Implications of War

The economic implications and consequences of war are not the same as those which flow from a peace-time economy. And this is particularly so in our case where bullets and Bren guns had not so far ousted bread and butter from our national budget. But this is an age of crises, when the entire world has turned into an armed camp; and, it has taken the Chinese to shake us up and convince us that we cannot go about rationally in an irrational world.

The snap switch-over from a peace-time to a war economy is a stupendous job and one that requires a measure of co-ordination between the various sectors of the economy that only a national emergency can compel. At the same time, the all-out production of defence ware should not be allowed to scuttle our long-term development plans which have been accepted by us as the corner-stone of our national life.

Rising Prices

This brings me to the problem of the price-line which is the backbone of our economic planning. Unfortunately, the holding of the price-line has, in practice, come to mean its maintenance at successively higher levels. I have had much to say on this subject at our previous annual general meetings and I would only repeat today that the industrial cost-structure is still in jeopardy due to the steadily rising prices of all items that enter the manufacturing process.

You will naturally want to know what your Company has been doing to aid the national defence effort. So far, 50 per cent of your Company's production has already been booked up to June 1963 exclusively for defence indents and this is bound to go up in the coming months. Your Company is today turning out for defence, navy blue drill, parachute cloth, olive green and mineral khaki drill and cellular shirting. In November 1962, your Company donated Rs. 2,56,690 to the National Defence Fund and the staff and workers of the Company have also ungrudgingly contributed one day's earnings to the fund.

Modernisation

Apart from our defence commitments and normal activities, you will observe from the Directors' report that the mills' development and modernisation activities are in full swing. As a matter of fact, development has grown into a specialised and separate portfolio at the mills.

Apart from an increase in the complement of spindles and looms, your mills are due to receive shortly two Malimo machines. These novel machines, which have already been shipped, turn out a special cloth which is used for bath-robes, towels, backing material for leather-cloth, cheap dress material, T-shirts, etc. So far there is only one such machine of its kind in India.

I have to report to you, with some justifiable pride, a happy development in the career of your Company. Your Company no longer consists of just one mill but two. The second unit which has 49,312 spindles, 1,021 looms and a dye-house, has gone into full production since 22nd October 1962, and plans for its modernisation are on the tapis. I can assure you that the traditions of the first unit will be carried over into the second one.

Quite a few of you will be wondering how your Company has been able to disclose a higher profit this year in the face of lower sales and higher manufacturing expenses. I will attribute this jointly to our efforts at modernisation and to that intangible but important factor in industry, viz., the human element.

Further, you will be glad to know that your Directors have decided, in conformity with your longstanding wishes, to issue bonus shares, subject to the Central Government's sanction, in the ratio of one equity share for every three equity shares. Again, in order to maintain a balance between the Company's increasing gross block and the issued capital, your Board has also recommended the issue of right shares at par in the ratio of two equity shares for every three equity shares held by the existing shareholders.

Finally, it will be obvious to you that your Company has been endeavouring to consolidate and improve its past progress and to systematically modernise its works in spite of such unfavourable factors as the difficult position of cotton supplies and the current slackness in cloth deliveries. We expect, however, the cotton and trading position to improve during the ensuing year.

In conclusion, I thank you all, my colleagues on the Board, our staff and workers for their co-operation, and offer the services of our Company to the nation on your behalf.

Note: *This does not purport to be a record of the proceedings of the annual general meeting.*

Problems and Prospects of East India Leather

Organisational Changes Necessary to Solve the Growing Problems

By K. MURTI

THE East India leather tanning industry stands foremost among the export-oriented industries which are at the same time labour-intensive. This industry affording employment, direct and indirect, to over 15,000 workers who mostly belong to the lower strata of society and earning valuable foreign exchange to the tune of Rs. 25 crores annually, has been playing a significant part in the national economy of the country.

The leather tanning industry in India is divided into three sections, namely, vegetable or bark tanning, chrome tanning and miscellaneous tanning. From the point of view of production, bark tanning section producing East India leather, bag tanned leather and pit tanned heavy leathers and chrome tanning section producing box and willow sides, kips and calf and glazed kid, belong to the major types of production, while pit tanned dressing, patent and light leathers in the bark tanning section, chrome suede and imitation sambar, chrome lining, neobuck leather, chrome picking bands and miscellaneous tannages are relegated to the minor types of production. Again, from the point of view of foreign exchange earnings and employment, East India leather stands by far preeminent.

Feeder to U.K. Leather Dressing Industry

Although tanning industry is as old as the *Rig Veda*, it made very little progress for a number of centuries due to the twin reasons of religious sentiments of the people against the slaughter of animals and of the low status accorded to *chamars, mochis*, etc., the professional class of leather workers. The fact that the village tanner remains even today uninfluenced by modern methods of tanning indicates that indigenous tanning industry must have been in an extremely primitive condition in the past, engaged in making a good hide into a bad leather. About a century ago, European methods of tanning were introduced by the military authorities for meeting their requirements of superior leather suitable for harness and other military accessories. In the early forties of the last century, a French Eurasian of Pondicherry, by name D'Souza, visited the island of Mauritius and, having acquired a practical knowledge of the French process of tanning, introduced improvements in the native method of preparing skins in his tannery at Pondicherry and a little later in the several tanneries he set up in the vicinity of Madras City, the products being the harbinger of the export trade in the internationally well-known East India tanned kips and skins. Except for the fact that the lightly tanned hides and skins produced by the Madras tanneries and intended solely for export are referred to by the trade as E. I. kips and skins, the exact reason for so calling it is not known. However, the first consignments of tanned hides and skins must have been carried in the bottoms belonging to the East India Company who were having a share in fostering the export trade in Indian tanned kips "which represent an Imperial asset of very considerable value, thereby making an important contribution to Imperial industry and trade." The E. I. leather tanning industry was thus developed and expanded as a feeder industry. It has been instrumental in the growth and development of a very prosperous branch of leather industry in the United Kingdom, known as the leather dressing industry. During the First World War, according to the Controller of Hides, at least three-fourths of the upper leather used in the U.K. in the manufacture of boots and shoes for the British and allied armies alone were supplied from Indian tanned cow hides, almost all of which were tanned in Madras and Bombay presidencies. The quantum of East India tanned kips and skins used by the U.K. leather dressing industry is even now quite substantial.

For a long time, Muslim enterprise was responsible for the development of the industry, leading to its concentration in areas largely inhabited by Muslims. In recent years, entrepreneurs from other communities who were at one time or another connected with Muslim tanners as their employees or as suppliers of raw materials have entered this industry.

Raw Materials

The availability of raw materials and supply of abundant cheap labour have been factors favouring location of the industry in the South. Indian hides are smaller in size than those from other countries and are called kips which in Europe and America mean an animal above the size of a calf but not fully mature. About 7 million or nearly two-fifths of kips produced in India are locally available for tanneries engaged in E.I. tannage. Likewise, South India has about two-thirds of the total sheep population of the country and the E. I. tanneries utilise over ten million sheep skins annually. Most of the South Indian sheep belong to the red hair variety and yield excellent tight grained skins averaging 5-6 lbs. per 10 skins. In regard to goat skins, E. I. tanneries have a local availability of 8 million or 38 per cent of the Indian goat skins. The supply of raw hides and skins, after meeting the needs of the other users, has fallen short of E. I. tanning industry's requirements and a large quantity has, therefore, to be obtained from the North Indian markets and from abroad. The advantage derived from cheap labour, coupled with the availability of raw materials, outweigh transport costs incurred on the import of raw hides and skins.

Among the raw materials required for tanning, *avaram* bark (*Cassia Auriculata*) is the principal tanning agent, wattle bark and wattle extract supplementing it in recent years. The reputation attained by Madras in connection with the tanning industry is due to the fact that *avaram* bark is found chiefly in Madras, Andhra, Mysore and Maharashtra States. Its tannin penetrates the pelt quickly and, combining with fibres, loosely produces a soft leather of an agreeable light green colour. Further, for colour improvement after tanning, an immersion of tanned hides and skins is carried out in a bath of myrobalan (*Terminalia chebula*) solution. The variety available from Salem and adjoining areas has a higher tannin content and gives a lighter colour than those from other areas in the country.

The main force in the location of the industry in the South is the labour factor. The labour is mostly drawn from people belonging to the scheduled classes and, being hereditarily engaged in the avocation, has attained a high standard of skill. The labour hailing from Tirunelveli and North Arcot Districts of Madras State is endowed with a high technical proficiency which is the admiration and envy of the management of the E. I. tanning industry located outside the Madras State, which does not therefore mind incurring extra cost in importing and maintaining Madras labour and supervisors whose cheapness and skill override all other considerations.

Large Idle Capacity

It is a well-known fact that the E. I. tanning industry has been working much below capacity for a number of years and the number of idle tanneries has steadily been on the increase. It has been estimated that only about two-fifths of capacity are utilised. The unutilised capacity is considerable in Madras and Andhra States where there is a concentration of E. I. tanneries. The ever-widening idle capacity in the E.I. tanning industry has been brought about by various factors, principal among them being the shortage of raw hides of good quality, lack of finance and lack of organisation and proper management.

Problem of Raw Hides and Skins

The supply of suitable raw hides and skins is a problem of vital importance to the E. I. tanning industry. As a raw material, they account for a substantial portion of the cost of production of the tanner varying from 75 to 80 per cent. It is, therefore, clear that the availability of quality hides and skins at reasonable prices is a primary condition for the orderly development of the industry. Unfortunately, the principal criterion is far from being realised at present. There has been a dwindling in the number of cattle and buffaloes slaughtered and consequently in the supply of good hides. The drop in the supply has been brought about as a result of a reduction in the beef-eating population (Europeans and Muslims), a part of the livestock population going over to areas now comprising Pakistan and the complete or partial curtailment in many States of cow slaughter on religious and legal grounds. After taking into account these factors and also after allowing for the normal rise in the livestock population, the supply of raw hides and skins is expected to stand at 21.4 million and 47.2 million pieces, respectively, in the last year of the third Plan period.

The Development Council for Leather and Leather Goods Industries has estimated the total production of tanned hides and skins in the country at 19.5 million hides and 28.1 million skins in 1960-61. The Planning Commission has envisaged the demand in 1965-66, the last year of the third Plan period, at 22 million hides and 30 million skins, indicating an additional requirement of 2.5 million and 1.9 million, respectively. The Planning Commission has also envisaged the maintenance of the present quantum of export of tanned hides and skins during the third Plan period. Thus, the estimated requirement of hides and skins during the third Plan shows a deficit of 600,000 hides and a surplus of 17.2 million skins over the supply position. Taking into account the deficit of 600,000 hides and after allowing for the quantum of leather diverted to domestic uses, particularly for footwear, the net availability of hides for export works out to about 6 million pieces. In fact, the annual availability of raw hides at the end of the third Plan period is placed in some knowledgeable quarters even at as low a figure as 20 million pieces. As the policy of the Government is to extend all encouragement to the manufacture of leather footwear and finished leather, the reduced availability of 20 million hides will not be having any adverse effect on the supply of hides and skins to domestic industries engaged in footwear and finished leather production but will tell heavily on the E. I. production, resulting in a reduction in the quantum available for export at 3.5 million pieces, which works out to nearly a half of the present level of annual exports.

The Planning Commission expects to meet the additional requirements of raw hides through imports from neighbouring countries. It is well-known that the Pakistan hides alone are suitable for the production of E. I. leather. Since Pakistan is tanning more of her hides for domestic uses and also exporting larger quantity in pickled state to the United Kingdom and other countries, it is doubtful whether it will be possible for India even to maintain the present quantum of imports of 1.5 million hides a year from Pakistan. This points to the necessity for evolving an arrangement by which a part of the North Indian production of raw hides is earmarked exclusively for the E. I. tanning industry and the deficit in the hide requirement of the units producing leather and leather goods for domestic consumption met through imports from abroad. At the same time, it is essential to take measures for improved procurement and better utilisation of raw hides and skins, regulate their production, improve the quality of output and thereby widen the market abroad for E. I. leather. In this connection, it is of much interest to note that the Central Leather Research Institute has done some pioneering work in the uses of buffalo hides which can be utilised in the place of cow hides by splitting them into three layers, the grain layer being used as uppers, the middle layer as leather for luggage and cases and the bottom layer for the manufacture of chamois and lining leathers. Thus, the increased and better uses to which buffalo hides can be put will bring down the pressure of demand on cow hides for domestic consumption which will then be available in larger quantum for production into E. I. tanned kips for purposes of export.

Problem of Finance

On the basis of employment-investment ratio, the E.I. tanning industry is estimated to have a total investment of about Rs. 4.50 crores, comprising Rs. 1.60 crore of fixed assets and Rs. 2.90 crores of floating assets. This would mean that nearly 65 per cent of the investment is accounted for by floating assets. Inquiries at many tanning centres have revealed that the financial position of many small units is appalling. Many tannery premises are very old and dilapidated, requiring immediate repairs and renewals, but the problem of finding term finance makes the tanners postpone indefinitely undertaking repairs. In some places, sub-tanning, i.e., sharing of a tannery premises by many petty tanners, is so common that it has been brought

about by lack of finance as the tanners do not have necessary finance to take a full tannery and run it. Even the few lime pits taken on rent are not utilised to their capacity.

The working capital of the units in general is, indeed, very nebulous. In most cases, it is made up of borrowed capital from and advances given by the Madras Commission *mundis* and loans contracted from local moneylenders and credit from dealers in raw materials. The credit facilities available from Madras Commission *mundis* place the tanner under an obligation to send their tanned products to them. In times of slack season when loans are not forthcoming from the *mundis*, the tanners borrow from local moneylenders at exorbitant rates of interest. Banking facilities are available to a few leading tanners only. The limits upto which advances are given vary from tanner to tanner, depending on the status, integrity and financial worthiness of the borrower. While a few tanners who have bank facilities are those with personal securities getting loans or overdrafts against the value of their immovable property and/or on the hypothecation of goods, a large majority of E.I. tanners do not have any property worth mentioning. Further, the lack of knowledge about the tanning industry on the part of scheduled banks and the risks involved in the day-to-day operation of the industry are factors which seem to militate against their being allowed an active participation in the institutional finance. Thus, it is apparent that the financial requirements for capital expenditure as well as working expenses are real and quite large.

It has been recognised that one of the principal reasons for the slow development of small industries has been the inadequacy of finance and the provision of adequate institutional finance is considered the *sine qua non* for their speedy and orderly growth. With this end in view, both the Central and State Governments have adopted several measures during the last few years. Financial assistance is provided to small industries through various agencies like (i) State Governments under State Aid to Industries Acts/Rules, (ii) State Financial Corporations, (iii) Reserve Bank of India, and (iv) State Bank of India. Unfortunately complete ignorance prevails among a large number of E.I. tanners about the working of these agencies. It is, therefore, imperative that wide publicity should be given about the various schemes of the Government under which financial assistance is available to the tanning industry, with particular reference to the export-oriented units. It must, however, be conceded that a great impediment in the way of lending institutions in expanding their activity in financing the small tanner-entrepreneurs is not so much the inadequancy of resources, as the structural and financial weakness of the small borrower and the borrowing units themselves. The idea of co-operation has not taken root in the E. I. tanning industry, where individual rather than co-operative enterprise is the order of the day. Unless the entrepreneurs are imbued with a spirit of co-operation and form co-operative societies, it may not be possible for the Government agencies to pump in the much needed finance.

Lack of Organisation and Proper Management

The loose foundation on which the industry is based has been brought about by an organisation which is defective and a management which is generally far from enlightened. The core of the industry is made up of entrepreneurs who are sound and shrewd, being responsible for the development of the industry and trade during the last one century, but the outer sinews of the industry are loosely tied by a large number of adventurers who infest the industry at times of brisk business and give it up when market conditions are adverse. In a way, the unorganised nature of the industry has been responsible for its frequent vicissitudes. In order to escape from the operation of the Factories Act, the units are bifurcated and even fragmented, resulting in a number of petty and pigmy concerns operating independently in the same premises. Fragmentation leads to higher production costs, and lack of finance further complicates matters, with the result that the tanner brings to the market sub-standard products.

An Unorganised Industry

Although the leather and leather goods industries have been brought within the ambit of the Industries (Development and Regulation) Act, 1951, the majority of undertakings in the E. I. tanning industry falls outside the purview of the Act. Those units run without power form the bulk of the E. I. tanning industry and the employment of over hundred and more persons in any undertaking is an exception rather than the rule. While the *minimum* number of workers prescribed in the Industries (Development and Regulation) Act is not kept up in a large number of units, thereby precluding them from the necessary regulation and development which may be prescribed by Government both in their operational methods and managerial standards, the Factories Act has driven many of them into fragmentation, thereby freeing them from maintaining the elementary standard of amenities required by the workers. The net result is that the E.I. tanning industry remains, in the main, an unorganised industry.

Unlike many other small industries, the E.I. tanning industry has been long established and playing a vital role in the foreign trade of the country. On the eve of the Second World War, there was a great pressure of demand from overseas for stockpiling, leading to the highest recorded exports of 5.16 lakh cwts. equivalent of 8.3 million pieces of tanned hides in 1939-40. During the war period, production of tanned hides and skins suffered a considerable decline as a result of the acute transport difficulties from the North Indian sources of raw supplies and greater utilisation of raw stock by tanners engaged in other types of tannages. As a result of stockpiling on the eve of the Korean War, inquiries for E. I. tanned kips and skins increased, leading to a spurt in prices. The shipment of tanned kips and skins advanced from 1.88 lakh cwts. and 1.05 lakh cwts., respectively, in 1948-49 to 3.35 lakh cwts. and 1.22 lakh cwts. in 1951-52. The sudden stoppage of purchases when peace talks commenced in the Korean front gave a rude shock to the E.I. tanning industry. The recovery made by the industry thereafter was rather slow. The latest available statistics show that, in 1961-62, the exports stood at 2.09 lakh cwts. worth Rs. 7.03 crores of tanned hides and 1.71 lakh cwts. worth Rs. 16.26 crores of tanned skins.

Outlook

Since the advent of the export trade in E.I. tanned hides, the industry has been geared to meet chiefly the requirements of the U.K. curriers and dressers. Tanned skins are not exported to the U.K. to the same extent as tanned hides. Besides the U.K., other important customers of tanned skins are the U.S.A. and Japan. Great concern is being expressed by the tanning interests about the E.I. tanned kips being adversely affected by the U.K. joining the European Common Market. The countries in the E.C.M. have a varying duty on E.I. tanned kips whereas tanned skins will be admitted duty-free. No difficulty is thus expected in the export of tanned goat and sheep skins to the E.C.M., but, in regard to tanned hides, finished leather and leather goods, duties may be levied against their imports. As imports of tanned kips and finished leather by the countries of E.C.M. are negligible, the products will not get the advantage of averaging the tax structure. On the other hand, they will be placed at a disadvantage in the U.K. which is their traditional and almost the only market. Thus, the outlook for the E.I. tanned kips in the U.K market appears not very bright. This points to the necessity for diversifying the markets for E.I. leather as also for converting, in a phased programme, as much of E.I. tanned kips as possible into finished leather and leather goods.

The U.K. and other countries which import E.I. tanned leather retain and convert it into different types of manufactures. No doubt it would be of great advantage, if as much of E.I. tanned leather as possible is retained and turned into leather goods within the country. This question was examined time and again. Recently, the Madras State Industries Development Committee which went into this aspect seems to have suggested the conversion of 75 per cent of E.I. leather into finished leather in the course of the next fifteen years, and recommended various incentives to tanners for such a changeover. The existing high tariff in the importing countries against the import of finished leather and leather manufactures and the difficulty in obtaining the required machinery from abroad will, however, militate against the development of re-tanning and finishing industry on a large scale in India. So long as the foreign exchange position continues to be tight and so long as the U.K. continues to be the principal buyer of E.I. tanned kips and skins, our aim, albeit short-term, should be the maintenance of exports of E.I. tanned leather at the maximum possible level. At the same time, efforts should be taken, from the long-term point of view, to re-tan and finish a portion of E.I. leather for domestic and foreign consumption. Much thought and planning should, however, be given towards implementing these proposals without snapping the long-established business connections with the overseas markets, particularly the U.K. In this context, it is highly essential to set up a full-fledged statutory organisation on the lines of the existing Commodity Boards, for promoting, by such measures as the organisation thinks fit, the development of the nascent re-tanning and leather finishing industries and the maintenance to the maximum extent possible of E.I. leather exports of a high quality and for paving, at the same time, the way for the smooth changeover to the development and expansion of export markets in finished leather goods in the place of the present exports of raw and semi-tanned hides and skins. In the course of implementation of the measures, the Board will have to bring under its jurisdiction all the units engaged in the production of E.I. leather and leather goods, irrespective of their sizes. The great potentialities of the internal market for leather footwear are obvious and the Board will no doubt develop and expand the domestic market. Indeed, in the long run, the domestic market should become a stabilising factor for the changing fortunes of Indian leather in the overseas markets.

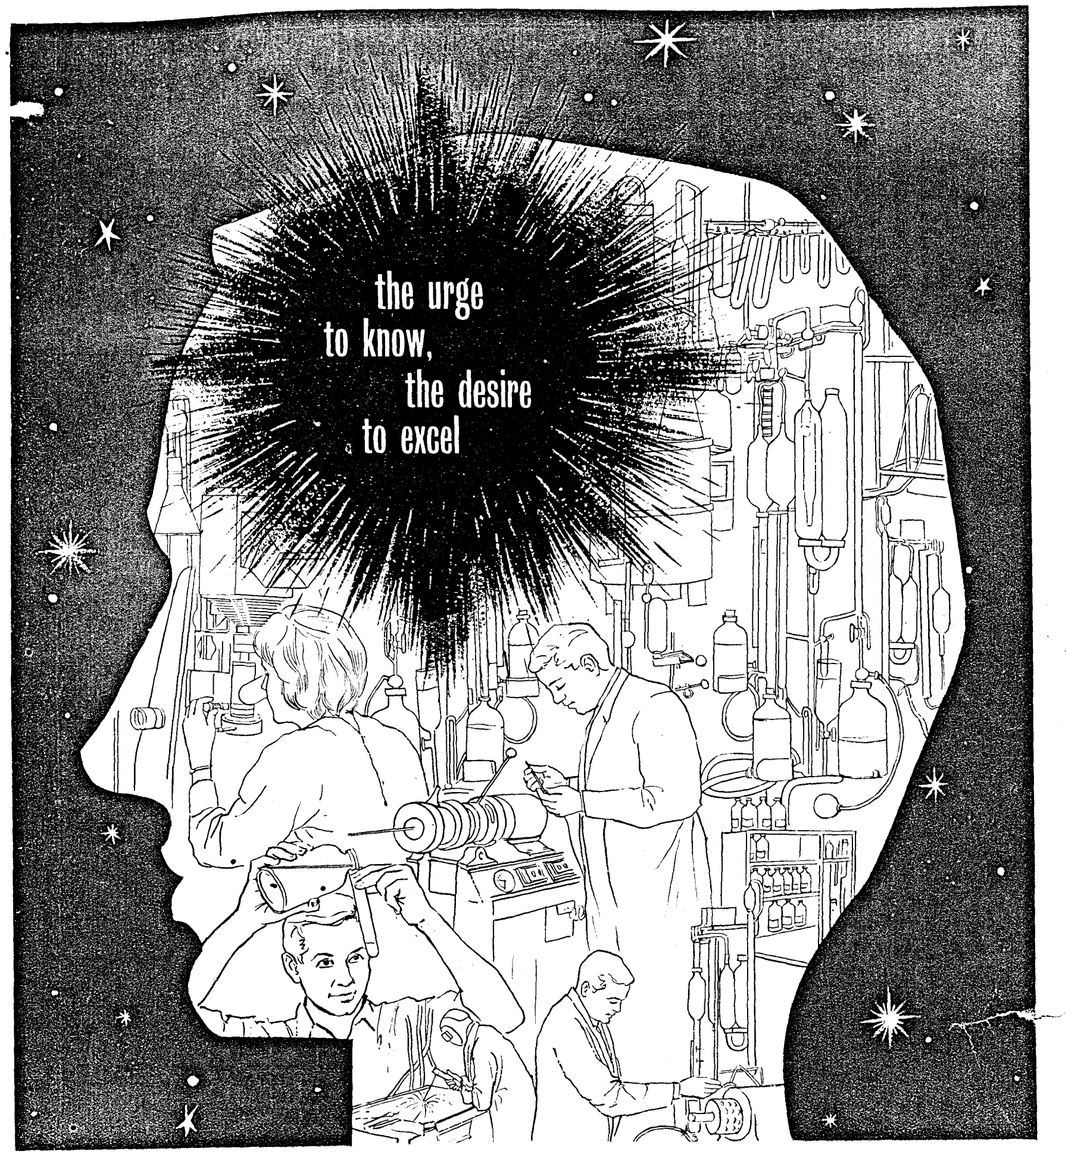
ajanta WHB/62-1



Huddled in a tiny capsule, hurtling through space . . .
braving the howling blizzards of the Antarctic . . .
exploring the depths of the mighty oceans . . .
probing the secrets of the atom . . . mankind is constantly
endeavouring to extend the frontiers of knowledge,
to make life more purposeful and rewarding.

At Advani-Oerlikon, scientists wrestle
with the secrets of metals,
lay bare the hidden components of weld deposits,
stress them and snap them, and
thereby evolve better welding techniques and electrodes . . .
motivated by the same urge to know and the desire to excel.
