THE world has not perished at the beginning of this month in spite of the astrologers' predictions. Nevertheless, West Germany has been overtaken by two major catastrophes, the mine-disaster in the Saarland with 299 miners killed, and the high tide calamity raised by a storm with a velocity of sometimes more than 200 kilometres per hour blowing along the northern coast of the German Ocean. While writing these lines the exact number of the dead is not yet known, but in Hamburg alone, a city of nearly 2 million people more than 265 persons died in the floods, some even in their sleep. Hamburg is not situated on the sea shore, in fact, far away by about 120 kilometeres. But it were the broken dikes of the Elbe river flowing into the German Ocean which brought the disaster to the city. The question now being discussed is whether the damaged dikes will stand the coming storms during spring time. Repairing actions have immediately started.

The mine disaster and the flood catastrophe have shown in the highly industrialised Federal Republic where prosperity prevails as never before (where the charwoman arrives in a Mercedes-car — no joke please) that there are higher powers before which man has to bow. Here in the Rhineland the carnival had been in full swing but now all the festivities have been cancelled including the traditional parades on the last Monday before lent. It should also be mentioned that 25,000 men of the German Army and Air Force, assisted by NATO units of USA, U.K. and Holland were at work from the very beginning of the disaster in Germany's North by rescuing stranded people and bringing food and drinking-water to them as well as by mending the dikes. After the Red Cross had asked for donations, within 24 hours more than one million German mark had been collected. It goes without saying that the Central Government and the governments of the Federal States have also sanctioned large amounts, especially for about 17,000 persons whose homes have been destroyed. To close this very sad subject, the reaction has to be mentioned it had on their side of the wall the Communists have built in Berlin. The official party newspaper "Das Neue Deutschland" (The New Germany) pointed out that showing on the West German television screen the salvage and rescue work of the soldiers was only done to make propaganda for the army. There is no need to comment on such wicked methods.

FORCIBLE COLLECTIVISATION IN EAST GERMANY

Let us remain for a while on this other side of the wall. Now, with the border to West Berlin and to the whole Federal Republic closed "watertight," the Communist rulers are quickly going ahead with another of their schemes, i.e. the forcible collectivisation of agriculture in East Germany is about to reach its final stage. The so-called "Seventh Farmers Congress" which will start in Magdeburg on 9th March is expected to be the stage where the Communist officials will announce the removal of the last remnants of independent farming and new drastic measures to increase the collectives' production.

The collectivisation of agriculture in 1960 has emerged as a major error of judgment of the East German authorities. The farmers who only three years ago were working all out to fulfil their stacked up quotas in order to stay independent, have resigned themselves. The result is an almost total apathy of the agricultural population and a corresponding languishing of the farm production. The inevitable consequence has been that East Germany has been tumbling from one food supply crisis to another. A constant series of shortages of potatoes, vegetables, dairy products and meat was reported. Frequently the state of emergency was declared by several districts, and groups of people were rounded up and put to work in the fields because of the non-fulfilment of collective farm plans. This in turn was the result of the fact that a large number of farmers—forced members of collective farms—had concentrated on cultivating the small plots they have so far been allowed to retain as personal property.

The reaction of the Communist authorities to the passive resistance of the farmers is already visible. A substantial cutting-down of the "inflated independent farming" (as they call it) will be announced at the Magdeburg Congress. A few figures will show the alleged "superiority" of the Communist system of collective farms. In 1960 the average yield per hectare was 3.6 tons of wheat in West Germany and 3.5 tons in East Germany. The corresponding figures for rye were 2.9 against 2.2 tons, those for potatoes were 23.6 against 19.2 tons and those for sugar beet 43.0 against 28.8 tons. As one can see from these comparative figures there is no superiority at all of the collective system and from 1961 onwards, as said before, the yields have tumbled considerably.

In 1950 still 617,900 independent farms were counted in East Germany. Their number declined steadily to about 340,000 in 1959. Only 30,200 privately-owned farms existed at the end of 1960 but all of them limited in size to not more than 0.5 hectare each. The number of collective farms, in turn, has now reached the approximate figure of 18,300.

THE SOVIETS LAY A TRAP

Meanwhile, all efforts have been and are being made to maintain independent farming in West Germany. New tasks are ahead in this respect as a result of the introduction of a harmonised farm policy within the European Common Market. Farmers in the Federal Republic will be caused by this move to revise their working and cultivation methods. But the Goverment has already announced that they will be given extensive support to maintain their competence and independence.

The German Ambassador Kroll has now delivered in Moscow's Foreign Office West Germany's reply to the aide-memoire he had received from the Soviet Government towards the end of last December. It seems to be worth while to look a bit closer into the contents of this Russian 22-page document. The Soviets have tended a bait to German business. This memorandum addressed, of course, to the Federal Government tried to appeal to the West German industry by offering an "ocean-like market" for all kind of goods and, in exchange, all the raw materials which German industry and agriculture may need. A closer look at the Soviet offer reveals the following principal reasons behind it: (i) It is the Soviet

Union's desire to expand foreign trade in order to offset failures in her own economy; (ii) Moscow needs increased reserves to help East Germany and Communist China to overcome their serious economic losses; (iii) The Soviet Union wants to make inroads in the world market in order to give economic support to her political actions; (iv) It is one of the lines of Soviet policy to point out that economic cooperation is an adequate means to ease political tensions.

West German trade figures and trade experience with the Soviet Union show that the new economic offer is not very substantial. The share of West Germany's trade with all Communist countries still amounts to only 4.7 p.c. of the total foreign trade of the Federal Republic. The Soviet Union provides herself an excellent example why this percentage is so low. Moscow strictly adheres to the bilateral character of commerce and subjects its foreign business to rigid quota restrictions. It sheds some light on the "ocean-like" Soviet market for German goods. The West German negotiators had to go through great efforts only to have the Russians agree to the inclusion of a few German export quotas for consumer goods into the latest German-Soviet trade agreement (8.5 million DM worth of woollen and cotton fabrics, 9 million DM worth of leather goods and the same amount worth of leather shoes, annually). Still, the Soviets bought nothing under these quotas between 1958 and 1960. In 1961 they purchased 4.3 million DM worth of leather shoes, a meagre 15,000 DM worth of textile fabrics and no leather at all.

NO CUT-THROAT COMPETITION

There is another important fact which the authors of the Soviet aide-memoire have neglected. They cling to the Communist thesis that economic competition in the Western world will lead to self-destruction. But instead of leading to the alleged "cut-throat competition," the new economic groupings of free democratic states within the Western alliance—primarily the establishment of the six-nation European Common Market—had had a definitely stimulating impact on the economies and living standards of the participating countries. Free competition in the Western World has not hampered economic growth but, on the contrary, has been and still is the main reason why the economic achievements of the free world are far ahead of those in the East Bloc.

The Soviet policy has often operated with economic baits in the past. The memorandum to the Federal Government is another example of this policy. Its primary aim is to sow distrust between West Germany and her friends within the free world.

Let us close by quoting from a radio interview with Prof. Erhard, Vice Chancellor and Minister of Economic Affairs, who had just celebrated his 65th birthday: "European economic integration takes its real meaning from the political integration that it is to bring about. A politically united Europe will be a very stable factor of the free world in the great controversy with Communism." He reiterated his opinion that closer links between the European Economic Community with the United States would really be a very good thing.

THE INDIA SUGARS & REFINERIES LIMITED

(Registered Office : Hospet — Bellary District)

Notice of Annual General Meeting

NOTICE is hereby given that the Twentyeighth Annual General Meeting of the Company will be held at the Registered Office of the Company at Hospet (Bellary Dist.) on Saturday, the 31st March, 1962, at 4 P.M. to transact the following business:

1. **To receive and adopt the Directors' Report and audited accounts for the year ended 30th September, 1961;**
2. **To declare a Dividend on Preference Shares;**
3. **To declare a Dividend on Ordinary Shares;**
4. **To elect a Director in place of Sri O. V. Alagesan, who retires by rotation and is eligible for re-election;**
5. **To elect a Director in place of Sri Rajeshwara Patel, M.P., who retires by rotation and is eligible for re-election;**
6. **To appoint Auditors for the year 1961-62 and fix their remuneration.**

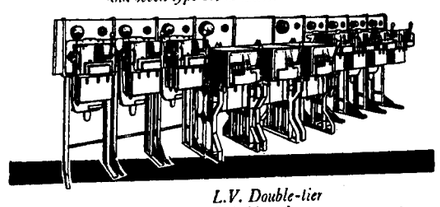
The Register of Members of the Company will be closed from March 16, 1962, to March 31, 1962, both days inclusive.

(By Order of the Board),
Per Pro THE INDIA SUGAR AGENCIES PRIVATE LTD.,

C. D. CHOUDHARY
MANAGING AGENTS.

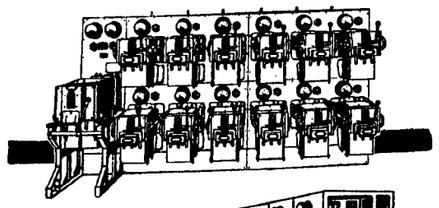
BOMBAY,
March 2, 1962.

Notes: 1. A member entitled to attend and vote at the Meeting is entitled to appoint a proxy to attend and, on a poll, to vote instead of himself and such proxy need not be a member of the Company. Proxies in order to be effective must be received by the Company not less than 48 hours before the Meeting.



2. The Dividends, when declared, will be payable on or after April 16, 1962, to those shareholders whose names are on the Register of Members on March 31, 1962, or to their mandatees.

3. Shareholders are requested to notify the Company of any change in address.



modern, robust, reliable H.V. & L.V.

JWT-BB 2003

Economic Report from the U.S.

EXTERNAL AID

By GUY SIMS FITCH

Washington, Feb. 27

IT has been the policy of the United States Government to help other nations modernize their societies and maintain their national integrity. In the process, Americans and other peoples have learned valuable lessons about social and economic development which are being applied with increasing effectiveness wherever free men have the will and the capacity to improve their conditions of life. These lessons have been spelled out in cogent form by a man whose background as a scholar and a diplomat lends important weight to his words. He is Dr. Walt Whitman Rostow, internationally respected economist and political scientist, who has been an adviser to President Kennedy and now occupies the post of Counsellor and Chief of the Policy Planning Council of the U.S. Department of State. In essence, as Dr. Rostow points out, development is a national undertaking. Each nation must bring to the effort its own resources—human and material. To the extent that this is done, outside assistance will be most effective. The effectiveness of this external aid is enhanced, moreover, as it is geared to national programmes on a long-term basis. This can enable developing lands to pursue their plans realistically, with reasonable assurance that they will have the external aid as well as the internal resources needed to complete important parts of their development programmes. U.S. foreign aid legislation now takes this long range requirement into account.

Effective national planning also is important because in many areas of socio-economic activity governments can help lay a solid foundation for modern growth. They can do this through educational systems geared to national needs; through social overhead projects in such fields as electric power, transport and land reform, upon which balanced industrial and agricultural development depend; through taxation and other elements of financial management which contribute to the stability of national and international accounts. Even in the United States, where the achievements and rewards of private enterprise are well demonstrated and appreciated, the Government has not hesitated to perform many functions essential to constructive development, leaving to the private sectors a wide and expanding range of fruitful activity. How wide that range should be is something each nation must decide for itself in the light of its own problems and its own potential. Thus, Dr. Rostow sees both Government and private enterprise capable of playing important roles in economic and social advancement, roles that are supplementary and mutually reinforcing. Finally, there is the recognition that free men have much to learn from one another, and that in the final analysis their methods are bound to prove more effective and more rewarding than those of totalitarian regimes. If there is one thing history makes profoundly clear, it is that a system of powerful State control, even apart from its inherent inhumanities, is an inadequate substitute for the commitment of free individuals to a common cause. And development, as Dr. Rostow observes, is a process that requires responsible action by millions of human beings operating individually and through organized groups. Long a student of both communist and free world developments, Dr. Rostow is well qualified in addressing himself to the essential differences between the two. Communist planning, he notes is a device for maximum political control over the individual; it thereby burdens the State with functions it cannot efficiently carry and destroys the individual incentives needed for a vital economy. Nowhere is this better seen, perhaps, than in the gigantic agricultural failures of communist planning, both in Europe and Asia. Free world planning, on the other hand, is a device for assuring balance in the growth process and for creating a framework within which individual freedom and initiative can flourish and can contribute effectively to the national purpose. The inescapable conclusion, in the words of Dr. Rostow, is that the United States and other free nations "are on the right track technically as well as morally." These words may border on the self-evident, but they have needed saying nonetheless.

CAPITAL FORMATION IN INDIA: 1948-49 TO 1960-61

"CAPITAL formation," according to Professor Simon Kuznets* of Harvard University, "is essential to economic productivity and economic growth." This sounds like a platitude but it is in fact a controversial statement in view of Colin Clark's thesis in "Growthmanship" . This is also the central doctrine of Indian planning. The thesis has been specifically accepted in the Third Five-Year Plan wherein net investment as a proportion of national income is anticipated to rise from about 11 per cent at the end of the Second Plan to 14-15 per cent at the end of the Third Plan. Precise estimates of the rate of capital formation were not available for a long time as the Central Statistical Organisation did not extend its old series beyond 1953-54. Happily, the gap has now been filled by the National Income Unit in the Central Statistical Organisation which has brought out two papers, one dealing with the estimates of gross capital formation for the 12-year period 1948-49 to 1960-61 and the other dealing with the financing of the gross capital formation. The following two tables give the central findings of the Central Statistical Organisation regarding the rate of capital formation in the Indian Union since independence. The most important conclusion which emerges from a study of the tables given below is that gross capital formation in the last three years of the Second Plan, namely, 1958-59 to 1960-61 was almost static around 19 per cent of the gross national product. This is a little disheartening because the promises made by the Government to the masses in regard to a steady rise in the level of living cannot be fulfilled if the rate of capital formation remains stay put, while the population continues to rise without any substantial control.

The gross capital formation has been defined as the sum total of fixed capital formation and changes in

TABLE I.

*Capital in the American Economy, Its Formation and Financing"—A Study by the National Bureau of Economic Research.

inventories. It covers the investments in all types of new capital goods such as buildings, plant and machinery and other equipment, and variations in inventories. Financial accumulations such as bank deposits, insurance funds etc., however, are excluded from this computation. Table II demonstrates that gross capital formation (at current prices) increased from Rs 1,080 crores in 1948-49 to Rs. 1,122 crores in 1950-51 and to Rs 1,721 crores in 1955-56, indicating that at the end of the First Plan the gross capital formation had risen by 53.4 per cent over 1950-51. During the Second Five-Year Plan the increase in capital formation was much larger. In percentage terms it was higher at 66.8 per cent of the level operating at the commencement of the Second Plan. This table also clearly shows that the major contribution to gross capital formation was through acquisition of capital goods. The inventories played only a minor role though the volume of inventories had been steadily rising with the expansion in the volume of gross national product. Before 1953-54 when the Indian Union faced food scarcity, widespread controls were applied and the stocks of foodgrains were very near the zero level. The good harvests from 1953-54 onwards coupled with rising imports of foodgrains swelled the inventories and in turn inflated the gross capital formation. However, the inventories have had no systematic and planned growth. Their behaviour has been highly erratic. At the present time inventories account for nearly 10 per cent of the gross capital formation.

An attempt was made earlier by the Reserve Bank of India and the National Council of Applied Economic Research to assess the rate of growth in net capital formation. The findings of these organisations are set out in Table III along with the estimates of the Central Statistical Organisation. It will be seen that whereas the Central Statistical Organisation has carried its series to 1960-61, the National Council of Applied Economic Research has stopped short at 1957-58 and the Reserve Bank series does not extend beyond 1958-59. The estimates of the National Council are higher than those of the Central Statistical Organisation, and the Reserve Bank for the First Five-Year Plan period. This, however, does not apply to 1956-57 and 1957-58. The deviation is particularly marked in these two years. From a study of the Central Statistical Organisation's analysis it appears that differences arise because of differences in the concepts and coverage. The National Council has restricted its coverage of inventories to sole proprietors and partnership firms (as obtained from the Census of Manufactures reports) and the balance sheets for corporate sector while the Central Statistical Organisation has covered inventories in all the sectors, including the largest sector i.e. agriculture. The Central Statistical Organisation has, however, indicated the inadequacy of the data in respect of "rural construction, trade and transport margins, production of capital goods in the small enterprises sector, stocks held in the private non-corporate sector and prices of machinery and building materials".

The level of net capital formation as shown in Table I according to the Central Statistical Organisation was around 14 per cent as against the estimate of 11 per cent assumed by the Planning Commission in the formulation of its Third Plan. It is highly probable that at the time of the finalisation of the Third Plan, estimates available were those of the Reserve Bank only which indicated a rate of domestic saving around 8-9 per cent. From this the Planning Commission obviously inferred that the total rate of savings after taking into consideration the net inflow of foreign capital, could not be beyond 11 per cent. In the light of the findings of the Central Statistical Organisation, it may be necessary to revise the estimates of the Planning Commission. In any case, there is a strong case for the experts of the three organisations to compare their estimates and evolve a uniform approach. The differences need to be ironed out by mutual consultation. They are currently a source of much confusion.

THE BUSINESS WORLD

A Great Industrialist

By CROESUS

THE unveiling of the bust of a great industrialist—the late Walchand Hirachand—by an equally great industrialist, Mr G. D. Birla, and that on the birthday of yet another great industrialist—the late Jamshedji Tata, whose lineal descendant (Mr. J. R. D. Tata) was also present, incidentally—was undoubtedly a great occasion. Occasional occasions such as these serve to remind one, in particular the younger generation, of the services of the stalwarts of private enterprise of this country which otherwise—and in the prevailing atmosphere where anything big is tending to become a taboo—might become a sealed book.

Great as was the occasion, it was also celebrated appropriately. The decision to instal the bust in the entrance hall of "Construction House" was, of course, as it should be, but the truly appropriate feature was the selection of the right person for the solemn duty of unveiling the bust. Who else could have filled this role more fittingly than one that "thought together, worked together, and struggled together for the cause of industry," with Walchand—Mr. G. D. Birla whom Mr Gulabchand Hirachand, Chairman of the Premier Construction Co. Ltd., described as "one of the greatest industrialists and patriots of our country." As Mr. M. R. Varadarajan, General Manager of the Company, who proposed the vote of thanks also pertinently observed, "it is in the fitness of things that the bust of Seth Walchand should be unveiled by Seth G. D. Birla whose contribution to the economic resurgence of this country is no less and whose part in the industrial development of this land is as great."

The time—notwithstanding the apology of those concerned for having had to postpone this function till last Saturday—too was appropriate. I have the authority of no less a person than Sir V. T. Krishnamachari, former Vice-Chairman of the Planning Commission, for averring so. Sir V. T. has said, in a message he sent on the occasion: "It is appropriate that, at a time when many of his ideas have been accepted by the country, all of us should recall the services rendered by Seth Walchand Hirachand to the cause of industrialisation in India and to his vigour and dynamism."

How did Walchand become a leader of industry? Only those who have been as successful as Walchand or those who know him intimately could provide the answer. Fulfilling both these roles, Mr. Birla did unfold the secret, when he recalled the vision, vigour, and dynamism of Walchand. Giving an intimate picture of his friend, he praised Walchand as a great pioneer in the industrial line whose craze for action was unbounded. He spoke of his ceaseless energy and added that Walchand was using his energy all the time. This characteristic of Walchand must have impressed Mr. Birla very much, for he felt impelled to relate an exhortation that the senior Kaiser is believed to have given to his son, Mr. Henry Kaiser once: "Man has got a vast reservoir of concentrated energy and if he decides to use it all there is nothing that he will not accomplish".

Mr. Birla almost caused a split-second stir when he referred to Walchand as a "crazy old man". That was how, he told later, he used to address Walchand whenever they met informally. Yes, Walchand was crazy if his craze for action could be described that way, Mr. Birla went on to say. In that sense, he said, he too could be deemed crazy. Walchand's craze for action was beautifully brought out by Mr. Birla's allusion to Walchand's criterion of greatness. If anybody was described as great, Mr. Birla revealed, Walchand would ask: "What has he created?"

Mr. Birla paid an unqualified tribute to Walchand for his uncanny knack of selecting good and able men and retaining their services—some of his selections are still serving the House of Doshis. The secret of this, according to him, was that, once Walchand selected a man, he trusted him, delegated powers to him, and worked with him, not as a superior but as a friend and colleague. The same has also been said in these words by Sir V.T.: "He was an ideal employer. He attracted to his service highly qualified technical men in various fields of activity—and also competent managers, paid them liberally, gave them full scope for initiative and resource and was generous in his appreciation of all they did."

In the course of his speech, Mr. Birla also recapitulated some of Walchand's outstanding traits. To him, Walchand was a man who did not fear anyone, who struggled hard, and who took bold decisions. Walchand hated undue delay in anything. Mr. Birla instanced the impatience of Walchand when, even after two years after Independence—that is in 1949—nothing much had happened to Indian shipping, and wondered what he (Walchand) would have said today when "nothing moves, not even a blade of grass grows, unless the Government decides." When dwelling on this point, Mr. Birla could not refarin from criticising the inaction and delay in Delhi, today. "There is," he said, "no sense of urgency in Delhi. There is no action. And, unless they buck up, the Third Plan cannot be implemented successfully. Already there is difficulty as regards power, coal, and transport, and administration is yet to be attuned to the changing times. Let us hope things will improve when the new Government takes over".

To Mr. Birla, apparently, the bust was but a feeble tribute. A bust may be all right, he said, but there are bigger monuments all round. Walchand has left plenty of living monuments—the construction companies, the sugar factories and farms at Walchandnagar and Ravalgaon, the engineering companies at Satara and elsewhere, the Scindia Steam Navigation Co., the Premier Automobiles, the Hindustan Aircraft and the Hindustan Shipbuilding Yard.

Maharashtra has special reasons to cherish the name and memory of Walchand. According to Mr. H. V. Pataskar, Governor of Madhya Pradesh, "it was he (Walchand) who first undertook the industrial development of Maharashtra. For many years, it was he who guided and developed the Maharashtra Chamber of Commerce" I feel, therefore, it was a fine gesture that the Governor of Maharashtra, Shri Sri Prakasa, showed by being present on the occasion.

Despite all the tall talk of socialism, India has a place for, and needs many more Walchands, from whose philosophy of action or penance ('tapasya') Indians need to draw inspiration. "His immortal spirit can guide the weak and the diffident. His memories can revive courage. In Walchand, we have lost what was dear to us. In his memory lives the entire enterprise, not in a pining mood, but with a vigorous spirit. If we lose any of his dynamism, we would betray his spirit." So runs a passage in the brochure that was distributed on the occasion. This, I am sure, applies a much to the entire business community as to the members of the Walchand family.

Business Notes

I.C.I.C.I.

ROLE IN DEVELOPMENT

THE PATTERN of industrial development perhaps taking place in this country for some years past is the same as what was witnessed in the industrially developed countries several decades ago. A large number of people engaged in trading and other occupations before are being drawn into the industrial sphere. The import cuts and the re-direction of channels of trade have closed traditional avenues of vocation for many business men; fortuitously sheltered market has made manufacturing activity definitely more lucrative. As Mr. G. L. Mehta, Chairman of the Industrial Credit and Investment Corporation of India, Ltd., (I.C.I.C.I.) put it, this change is "based on import substitution, where demand is assured".

In this year's statement to the shareholders Mr. Mehta has pointed out that at this crucial time, the functions of development banks, like the I.C.I.C.I., have become manifold. If quicker and more effective financing has become difficult, he says, it is because of certain shortcomings on the part of the promotors themselves. Many promoters who base their calculations on the prevalent shortages, Mr. Mehta has pointed out, should also take into account the likely growth in demand, the scope for further import restrictions and other relevant factors. The success of any new project, according to him, depends much on the correct assessment of the cost and the total financing arrangements of the project in advance. However, the I.C.I.C.I. Chief has appreciated the growing awareness to these porblems in the concerned quarters. Says Mr. Mehta: "This emphasis on the need to have a full and detailed appraisal of each project and on the desirability of having closer understanding at all stages among the different financing institutions participating in a project has been increasingly appreciated by the various agencies concerned." This is a healthy development in the sphere of industrial finance which should pave the way for financing large-sized projects which can only be carried out with the joint efforts of a number of financing institutions, including the Life Insurance Corporation, commercial banks and investment trusts as well as development banks.

As the activities of the I.C.I.C.I. have been on the increase, the corporation's profits too have increased considerably. Thus, before tax, the profits for last year have increased from Rs. 62.61 lakhs to Rs. 74.27 lakhs, enabling the directors to recommend a higher dividend at the rate of 6½ per cent, as against 5.75 per cent last year. Of the gross assistance of Rs. 13.76 crores sanctioned by the I.C.I.C.I. in 1961, Rs. 11.94 crores were in respect of new projects, the total cost of which is estimated at Rs. 65.49 crores, to be incurred over the next two or three years. When the units reach full production, the turn-over of these projects would be about Rs. 54 crores. The companies concerned are expected to finance the cost of the projects by raising ordinary share capital of Rs. 16.72 crores, preference share capital of Rs. 0.81 crores, loans of Rs. 23.07 crores, and bank borrowings and cash accruals of Rs. 24.89 crores. Of the foreign exchange cost of Rs. 10.53 crores for these projects, the I.C.I.C.I. has agreed to provide as much as Rs. 7.40 crores. All these, Mr. Mehta has reiterated, go to establish that the role of the I.C.I.C.I. is that of a catalyst. It was such a catalyst that industries in the private sector were sadly missing all these years. But for all the foreign exchange the I.C.I.C.I. has been managing to secure for our industries, it is doubtful if the tempo of industrialisation in the private sector could have been as sustained as it has been.

Pakistan

EXPORT POLICY

WITH A view to accelerating the industrial development of the country and to step up exports, the Government of Pakistan has started issuing advance import licences for raw materials to certain selected indusrties whose goods are to be exported. This policy of "earn and develop" having already shown encouraging results, is proposed to be pursued with renewed vigour now. Exporting industries, under this scheme, would receive foreign exchange for raw material imports not only on the basis of their past performance, but also on the basis of their future earnings and potential. The grant of licences is subject to the condition that the entire quantity of goods imported against them shall be used in the manufacture of goods for exports and that no part thereof shall be used within the country. The value of the licences shall not exceed 40 per cent of the f.o.b. value of the manufactured goods undertaken to be exported. The licences under this scheme are issued in addition to the normal licences admissible under the general import policy in force. The recipients of the 'advance licences' have to complete their export performance and bring in foreign exchange earned from their exports within nine months of the dates of the issue of licences for raw materials in their favour. After the exports have been effected, the recipients of the licences are entitled to receive bonus as admissible under the Export Bonus Scheme on the f.o.b. value of finished goods exported. The scheme does not, however, cover 38 industries which get their full allocations for the import of raw materials under the normal import policy.

With such concerted efforts being made by our neighbour to step up its exports, it is no wonder that Pakistan is emerging as a major competitor to some of our manufactured goods, particularly cotton textiles. This new threat from Pakistan obviously needs to be closely watched and effectively encountered if our export performance is to be commensurate with the needs of earning foreign exchange for the fulfilment of the Third Plan targets.

Engineering

A NEW FORGE AND FOUNDRY COMPANY

A NEW engineering company, called Wyman-Gorden India Limited, has been formed in Bombay as a consequence to an agreement having been reached between Almag Forge and Foundry, of Thana, and the Wyman Gorden Company, of Worcester, Mass., U.S.A., to undertake the manufacture of parts for the automative and aircraft industries and also to produce forgings for agricultural equipment, for diesel locomotive manufactures,

for machine tools industry and for other industrial consumers. The new company is setting up a most modern forge and foundry on a 30-acre site at Majwade, Thana.

The foreign firm owns plants at Worcester, Mass., and Harvey, Illinois, in the United States, and operates the U.S. Air Force Plant at North Grafton, Mass. It produces forging components for every major missile, rocket and space programme in the US in addition to aircraft, automative, farm equipment and other industrial forgings. It operates the world's largest closed-die forging press of 50,000 ton capacity, and was a pioneer in the forging of rail, automotive and aircraft components.

The machinery to be purchased by the Indian company from the United States includes hammers ranging from 2,500 lbs. to 12,000 lbs., 2-inch and 5-inch upsetters and other related components. The U.S. firm has undertaken to make arrangements for the supply of this machinery and equipment. It will also train the Indian personnel of the new company, whose management ultimately will be entirely in Indian hands.

In the initial stages, the company will be able to help in saving foreign exchange to the tune of Rs. 3.5 crores per annum. In course of time, it expects to exports a substantial portion of its products.

HANDY ANGLE PERFORATED SHEETS

HANDY Angle, a subsidiary of Wagon Repairers Limited, of Birmingham, is reported to have entered into a 10-year agreement with Harshavadan J. Shah, of Bombay, to undertake the manufacture of Handy Angle perforated sheets in India. The new company, called Handy Angle (India), is being formed for the purpose. The Indian group will be having a controlling interest in this venture.

The factory is planned to be put up in a 10,000 sq. ft. plot of land in Bombay during the current year itself. Within a period of three years, the capacity of the factory is envisaged to be doubled.

A spokesman of the Birmingham firm is reported to have disclosed in London recently that plans are already in hand for exporting slotted angle sheets to be manufactured at the Bombay factory, to Pakistan, Burma, Nepal and Thailand.

Sanitarywares

MORE MANUFACTURING UNITS IN THE OFFING

The Government of India, it is understood, is considering 10 schemes to license a further capacity to manufacture nearly 26,000 tons of sanitarywares per annum and six schemes to license an additional capacity of about 18,500 tons of glazed tiles a year. These additional capacities are likely to be licensed in view of the fact that out of the 43,473 tons per annum sanitarywares capacity licensed in 1960, nearly 21,000 tons capacity is not expected to materialise as no progress has been made towards its creation. In the case of glazed tiles, out of a capacity of 27,000 tons sanctioned in 1960, a capacity of slightly over 18,500 tons is not expected to materialise.

The sanitarywares manufacture schemes that are under the consideration of the Government are:

(1) Orissa Industries' plan to manufacture 3,720 tons of sanitarywares per annum and 480 tons of glazed tiles. The existing annual capacity of this company is 1,080 tons of sanitarywares per annum. The foreign exchange component of this expansion scheme is put at Rs. 9.5 lakhs.

(2) Neyveli Ceramics' proposal to expand its existing capacity of 1,200 tons of sanitarywares per annum to 1,800 tons in technical and financial collaboration with a West German firm. This expansion programme will cost Rs. 27.5 lakhs.

(3) The scheme of MacNeil and Barry, Calcutta, to set up a new plant to manufacture 5,400 tons of sanitarywares, 600 sets of toilet fittings, 324 tons of other fittings and 240 tons of insulators per annum. Fifty per cent of this output is envisaged to be exported every year.

(4) Laxman Engineering Company's proposal to set up a plant in Bombay to manufacture 2,500 tons of sanitarywares per annum in collaboration with a reputed foreign firm.

(5) Kiran Engineering Corporation's proposal to set up a plant at Bijapur to manufacture 900 tons of sanitarywares a year. Kiran Corporation is a Gujarat firm.

(6) The proposal of Herman Mohatta, another Gujarat firm, to manufacture 3,600 tons of sanitarywares per annum.

(7) The proposal of Mr. T. S. K. Iyer, of Bihar, to set up a plant to manufacture 2,400 tons of sanitarywares per annum.

(8) The proposal of Mr. R. D. Bansal to set up a plant at Calcutta to manufacture 1,596 tons of sanitarywares per annum.

(9) J. & K. Iron and Steel Company's scheme to set up a plant at Kanpur to manufacture 1,500 tons of sanitarywares per annum.

(10) The proposal of Mr. M. N. Ramakrishnan, of Kerala, to set up a plant in that State to manufacture 3,600 tons of sanitaryware per annum.

The six applicants whose proposals for manufacture of glazed tiles are under consideration of the Government are:

(1) Mr. Arvind Narottam who has sought Government's approval to set up a plant at Ahmedabad to manufacture 4,400 tons of glazed tiles per annum. The foreign exchange component of this scheme is estimated at Rs. 16 lakhs.

(2) Mr. G. U. Patil, who also wants to set up a plant at Ahmedabad, to manufacture 4,380 tons of glazed tiles per annum. The foreign exchange component of this scheme is about Rs. 7 lakhs.

(3) Mr. R. G. Patel who has applied for an industrial licence to set up a plant at either Baroda or Ahmedabad to manufacture 5,000 tons of glazed tiles per annum. The foreign exchange component of this venture will be about Rs. 12.5 lakhs.

(4) Mr. R. J. Chiani, of Bombay, who proposes to set up a plant at Thana, in the Kalyan district of Maharashtra, to manufacture annually 3,000 tons of glazed tiles. The foreign exchange component of this scheme is put at about Rs. 15 lakhs. The plant and equipment under this scheme is to be procured from rupee payment area.

(5) The Mahen Mercantile Corporation which has sought Government's permission to set up a plant at Bombay to manufacture 1,200 tons of glazed tiles per annum. Machinery worth Rs. 60 lakhs for this venture is also proposed to be imported from the rupee payment area.

(6) Orissa Industries whose proposal has been referred to above under sanitarywares.

Bombay Oxygen

PROMISE AND PERFORMANCE

FROM THE speech of Mr. Madanmohan R. Ruia, Chairman of Bombay Oxygen Corporation Ltd. delivered at the first annual general meeting of the company, it is clear that the performance of the company has been quite steady and satisfactory. Whatever difficulties there were have been successfully met and now the company is in a clear position to go ahead with its schemes. All the four Oxygen plants have been received from Ger-

many and it is expected that they would be moved to the site within a month. Supply of electric power has been secured and the fabrication of the steel gas holder has been entrusted to the requisite firm. It is expected, that circumstances being normal, the building will be ready by the end of August 1962. Erection of the plants is likely to be finished by the end of October 1962. Land near Mulund Railway Station measuring 21 acres is in the process of acquisition and acetylene plant on the advice of foreign technicians is likely to be set up at a distance from the Oxygen Plants. The acetylene plant with its accessories is ready for shipment and is likely to be received very shortly.

It needs to be made clear, Mr. Ruia emphasised, that new companies which are entering the field for producing oxygen and acetylene will not have any constrictive influence on the company's prospects. All said and done, it can be safely assumed that with streamlined production company's future prospects are quite good.

National-Grindlays

SATISFACTORY PROGRESS

FROM THE Statement of Mr. J. K. Michie, Chairman, National and Grindlays Bank Ltd. it is crystal clear that the bank is making satisfactory progress. The total of bank's consolidated balance-sheet at the close of 1961 was £251,284,590 or approximately £70 million more than at 31st December, 1960. Of this increase about £50 million is attributable to the additions of Lloyds branches leaving £20 million for growth. Although on account of the merger, figures of deposits and advances are not readily comparable, yet as a consequence of the continued pressure for financial accommodation bank's liquidity ratio has fallen slightly.

The expanded business in its wake has brought higher profits, the figure being £644,272 against £479,276 for 1960. This increase has enabled the bank after providing for a dividend of 14 per cent on the increased capital to place 150,000 to Premises Account and allot £100,000 to Reserve Fund. With a view to bringing the bank's reserve fund more into line with bank's increased capital, it has been decided to transfer a sum of £850,000 from bank's inner reserves.

The prospects for the bank are quite bright and at the extraordinary general meeting which will follow the annual general meeting, shareholders are likely to be asked to sanction an increase in the authorised capital of the bank from £5,702,925 to £9 million. In case this is agreed upon, there is every likelihood that a rights issue in the proportion of one share for every four held on 14th March, 1962 at a price of £1. 5s. per share may be made. The heartiest news is that the bank expects to maintain a dividend of 14 per cent on the increased capital.

In addition to presenting a sound picture of the bank, Mr. Michie also made a customary review of the the conditions prevailing in India, Pakistan, Ceylon, Burma, Eden, Somali Republic and East Africa. Conditions no doubt vary in all these countries but on the whole there is nothing very much alarming that would affect the direct working of the bank and its prospects. In India although external reserves have fallen by some Rs. 20 crores, yet this cannot be taken as an extraordinary sign of alarm. The Aid-India Club meeting which is likely to be held in May is expected to consider the country's needs. There is every likelihood that an additional aid of requisite amount might be forthcoming.

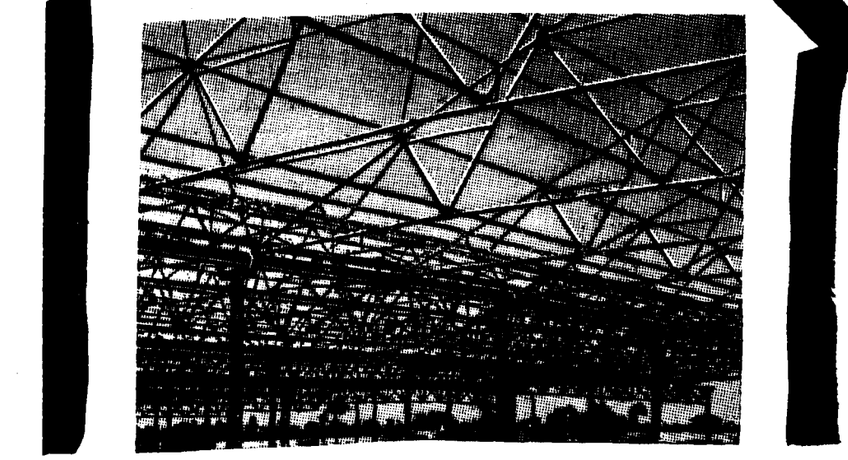
Tobacco

EXPORTS LOOK UP : NEW AREAS SOUGHT FOR

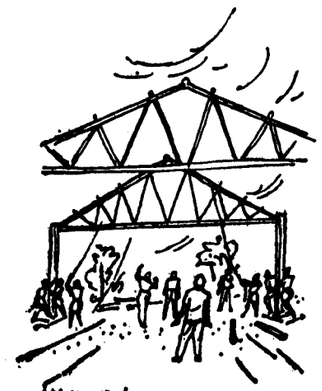
AT ITS annual meeting held in Bombay last week, the Indian Central Tobacco Committee decided to set up a Sub-Committee for studying the possibilities of growing tobacco in new areas and to organise co-operative marketing in the areas where tobacco had been recently introduced. The Committee noted that large-scale trials with the newly introduced cigarette tobacco 'Delcrest' have shown an increased return of Rs. 380 per hectare to the grower.

The production of tobacco, the Committee observed, totalled 229 million kg. during 1960-61 from an area of 3.9 lakh hectares, as compared to 286 million kg. from an area of 3.7 lakh hectares. There was, thus, an increase of 5.9 per cent in the acreage and 4.5 per cent in production during 1959-60. The exports moved up in 1960-61 to 47.5 million kg., valued at Rs. 15.7 crores, from 41.1 million kg., valued at Rs. 14.5 crores in the preceding year. The principal markets for Indian tobacco during 1960-61 were the U.K., the U.S.S.R., Aden, Belgium, Netherlands, French West Africa, Ceylon, Egypt and Singapore. A special Sub-Committee has also been constituted to consider the question of India's joining the International Standards Organisation in so far as tobacco standards were concerned.

Plastics



LIBERAL IMPORT POLICY URGED



OF THE many suggestions made by the All-India Plastics Manufacturers' Association, the fundamental one relates to the adoption of a fairly liberal policy in licensing plastic machinery and equipment during the April-September licensing period. The contention of the association is that if the local industry is to keep abreast of the developments in the foreign countries, then the import policy for raw materials not produced in the country must be liberalised. These raw materials are polyprophylene, poly-carbonate, polyurethane, polyester, cellulose propionate, ABS polymer, nylon, acrylic castors, ethyl cellulose, hydroxy ethyl cellulose.

The other suggestions of the association are that the system of the grant of licenses for raw materials on an annual basis should be revived. This will not only enable manufacturers to plan their production on a long-term basis but would also help to import more raw materials for the same value on the volume basis. The association considers that the question of granting block licences to small-scale units, which require more than one raw material, should be favourably considered as this will place the small-scale units on the same level with those firms registered with the Development Wing. The association has also recommended that import licences granted to small-scale units on the basis of essentiality certificates from the State Director of Industries should have the value as the limiting factor. At present actual users' licences are granted for the above items against S.N. 122(i) and 122(xxv) of Part V of the I.T.C. Schedule on an ad hoc basis in consultation with the Development Wings. Many of the industrial licences have been granted, and it seems reasonable to say that if the projects are not completed within the prescribed period, such licences should be withdrawn and granted next to those in the waiting list.

Since plastics play an important role in the industrial economy, it is fair that adequate facilities be pro-

PREFABRICATED TUBULAR ROOFING STRUCTURES

All S & L Prefabricated Tubular Roofing structures are designed to the requirement of I.S. 806: 1957 code of practice for the use of steel tubes in general building constructions.

Entirely self-supporting S & L structures of the following spans and bay lengths are available ex-stock.

Type	Nom. Single Span	Bay Lengths
SLS/20	20 ft.	10 ft.
SLS/30	30 ft.	10 ft and 13 ft. 4 in.
SLS/44	44 ft.	10 ft. 1.1/8 in. and 13 ft.4.1/8 in.

BANKING ADVICE FROM

MANU THE LAW GIVER

Deposit banking in some form or the other existed in India in the second century A.D.

Manu, the law-giver, enjoined people to make deposits with bankers of good repute. "A sensible person should make a deposit only with a person of family, of good conduct, well acquainted with the law, veracious, having many relatives, wealthy and honourable."

The Union Bank of India, established in 1919, has enjoyed the highest reputation in reliability, strength and friendly transactions. The Union Bank prides itself on its unique *personalised service*, under which every depositor is treated as a Very Important Person.

The Union Bank Helps People

SERVICES OFFERED: Current, Savings Bank and Cumulative Deposit Accounts; Fixed Deposits and Three-year Cash Certificates; Inland Bills, Demand Drafts and Telegraphic Transfers; Letters of Credit and Guarantees; Foreign Bills and Remittances; Loans, Overdrafts and Cash Credits; Sale and Purchase of Government Securities and Shares and Safe Custody; Standing Instructions accepted; Credit Reports and Trade Information, Safe Deposit Vaults; TELEX contact with countries all over the world.

THE UNION BANK OF INDIA LIMITED

Registered Office: Apollo Street, Fort, Bombay 1. 61 branches all over India

ASP/UBI-2

vided to the plastic manufacturers. The second Plan target of 11,500 tons for the production of plastics raw material has been achieved and keeping this progress in view a target of 74,000 tons by 1966 has been envisaged in the Third Plan.

Coffee

OUTPUT AND EXPORTS

IT WAS estimated that coffee production in the 1960-61 season would be around 66,030 tons. Actually 67,587 tons—28,968 tons of Plantation, 10,278 tons of Arabica Cherry and 28,341 tons of Robusta—had been received into the Coffee Pool upto the end of November, 1961. Out of an export allocation of 34,250 tons, 29,658 tons —17,921 tons of plantation, 3,737 tons of Arabica cherry and 8,000 tons of Robusta—had been released for export upto the end of November, 1961. The Marketing Committee of the Coffee Board, at its meeting sometime back had placed the estimated production of the 1961-62 coffee crop at 49,000 tons. Out of this, 20,000 tons—17,000 tons of Arabica (plantation and Arabica cherry) and 8,000 tons of Robusta — were proposed to be allocated for export. The Committee had further proposed that in view of the lean crop of Robusta expected during 1961-62—only about 17,000 tons as against 28,000 tons during 1960-61 season—the remaining 3,000 tons of Robusta out of the export allocation from 1960-61 crop might be ploughed back to internal market during 1961-62 season Thus a fair balance was proposed to be maintained. It was further indicated that from this year onwards, Coffee Board would be switching over to open auctions for the sale of Coffee for export. This would replace the existing method of sales through sealed tenders.

Coir

LESSER EXPORTS

THE COIR BOARD had proposed certain targets of exports for the year, 1961-62. These were:

	Quantity ('000 Quintals)	Value (Rs. lakhs)
Coir fibre	14.6	12.65
Coir Yarn	566.8	557.85
Mats, Mattings, Rugs and Carpets	180.0	276.71
Coir Rope	30.5	29.98

The actual exports of coir and coir products during the first six months (April-September) of 1961-62 were:

	Quantity ('000 Quintals)	Value (Rs. lakhs)
Coir fibre	6.0	7.01
Coir yarn	248.4	323.97
Mats, Mattings, Rugs and Carpets	77.0	141.28
Coir cordage and rope	10.2	11.37

It appeared that it would be difficult to achieve the targets proposed, if the present trend in exports continued. The reasons for decline in exports were varied. It was gathered that many European countries, particularly Holland and Germany, imported coir yarn from India in considerable quantities and manufactured mattings from that imported coir yarn. These countries had an advantage of employing modernised methods of production. In regard to coir mattings, India has lost markets not only in Holland and Germany but also in other countries chiefly because the demand of the consumers in these countries was for floor coverings of more sophisticated finish. It was a timely reminder for the producers in India that *quality* output was an essential element in the successful sale promotion abroad.

Wool

INTERNAL CONSUMPTION AND EXPORTS

INDIA'S WOOL output for the year 1961-62 was estimated at about 68 million lbs. This indigenously produced wool was mainly consumed by three sectors: Carpet Section, Organised Mill Sector and Cottage and Handloom sector. As a result of several export promotion measures, exports of Carpets requiring larger quantities of wool during the recent years has been increasing. Due to the shortage of foreign exchange as well as the rising demand for woollen cloth and fabrics in the country, the organised mill sector was also utilising more of indigenous wool. The consumption of Indian wool in this sector was naturally, therefore, expected to increase further because experiments made recently to utilise Indian wool for spinning worsted yarn had given good results.

Taking the overall requirements of these three sectors into consideration, it was estimated that India would have only about 30 million lbs. of wool available for export during the current year. A quantity to the extent of 15 million lbs. (or 68 lakh kgs.) had been released for export during October 1961-March 1962 licensing period. Out of this quantity, 13.2 million lbs. or 60 lakh kgs. had been reserved for export on contract basis and 1.8 million lbs. or 8 lakh kgs. for export on consignment basis. Exports were being licensed on the 'first-come-first served' basis. Individual exports on consignment basis had, however, been restricted to 100 bales, as in the past.

With the increasing consumption of Indian wool by the indigenous industry, the country would have a smaller quantity to spare for export in the coming year unless production of wool in the country increased substantially.

Arecanut

PRODUCTION TARGET FOR STATES

AT ITS 13th Annual General Meeting held in Bombay recently, Indian Central Arecanut Committee approved of the production target for each State during the Third Plan. The Committee also endorsed the existing policy of progressive reduction in the import of arecanuts into the country.

Reviewing the achievements under the Second Plan, the Committee decided that the Union Government might be moved to revive the central supervisory body for arecanut for scrutinising the annual State plans and examining the achievements of targets every year. The Committee also approved of a scheme for the investigation of a new 'yellow' leaf disease of areca palm in Mysore State at a cost of Rs. 61,757 during the Third Plan period.

FROM THE CAPITAL'S CORRIDORS

BOOSTING EXPORTS

In his concluding address to the Joint Import and Export Advisory Councils' meeting here on Tuesday, the Union Minister for Commerce and Industry, Mr. K. C. Reddy, disclosed that the Government decision on the Mudaliar Committee's recommendations would be taken before the end of the current month. He indicated that he entirely agreed with the recommendation of this Committee that income-tax relief on export earnings was one of the important ways by which India could push up her exports. Various other countries, he observed, had given this relief to promote their exports. Mr. Reddy, however, said that the incentive of income-tax relief on export earnings would have to be used with discrimination and expressed the hope that the loss accruing to the Central Exchequer because of this relief would be compensated by additional foreign exchange earnings.

Another important point made by Mr. Reddy in his speech was that the Government would endeavour to return to the issue of annual import licences as early as possible.

About the demand for reduction in or abolition of the export duty on tea, the Minister said that if the Government was assured that as a result of such a step the exports of tea would go up appreciably, it might consider the matter. Regarding validity of licences for import of capital goods, Mr. Reddy disclosed that despite difficulties, the Government would make these licences effective for two years.

The Commerce and Industry Minister expressed his appreciation of the work done by the State Trading Corporation in helping to increase the foreign exchange earnings of the country.

Earlier, the Secretary of the Commerce and Industry Ministry, Mr. S. Ranganathan, indicated that the Government might allot some more newsprint to new newspapers coming out from big cities.

It was also indicated by the official representatives that efforts would be made to streamline the import and export administration (to break the bottlenecks and avoid delays experienced at present in the issue of licences) and towards liberalisation of some of the incentives given to the industry to step up exports.

Informed circles opine that the Mudaliar Committee in its report has not favoured compulsory exports.

FOREIGN ASSISTANCE

The meeting of the Consortium of aid-giving countries to be held in May is not expected to be a money-raising meeting, according to indications available here. This meeting would be largely engaged in discussing the report of the World Bank's Economic Mission which is arriving here next week and those of the representatives of the member-countries to their principals. Another meeting of the Consortium is likely to be convened later in the year to determine the aid which the members of the Consortium would be extending for the remaining period of the Third Plan; firm commitments by these countries have, as yet, been made only for the first year of the Plan and partly for the second.

Meanwhile, Sweden has indicated its intention to finance the setting up of a technical training centre for paper-making industry. The Government of India, according to present indications, favours the location of the centre at Allahabad. But in certain circles, it is suggested that a more suitable site for this centre will be Saharanpur where there is already in existence a paper mill using wood as raw material.

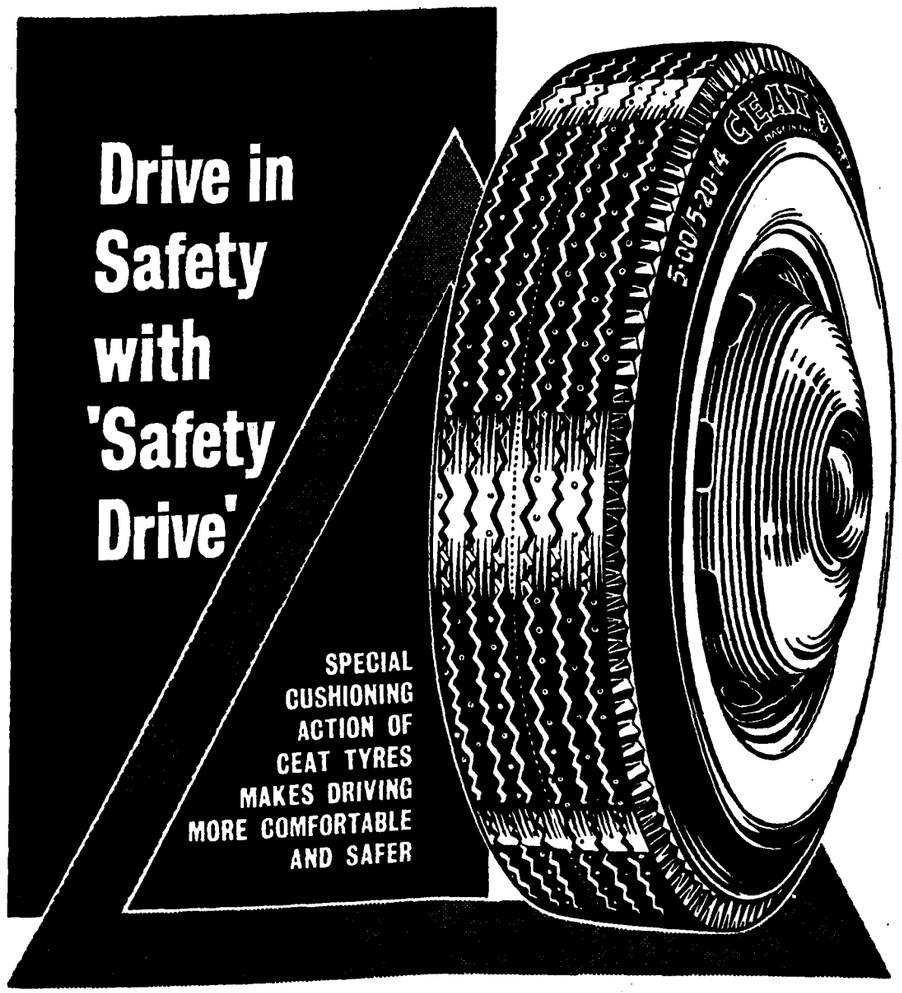
U.S. AID FOR MAINTENANCE IMPORTS

It has been officially stated here that a sum of $100 million would be available out of the credits to be provided by the U.S. Government under the Aid-India Club commitments, for maintenance imports ordered after April 25, 1962. The Commodities the import of which would be financed by this sum include synthetic rubber, tyre cord yarn, carbon black, wood pulp and spare parts, besides steel, non-ferrous metals, fertilizers, lubricants and chemicals. Within the broad categories, the Government will determine through the import licensing system what precisely will be purchased under this loan allocation and in what quantities. The loan agreement is expected to be signed shortly; negotiations have been completed.

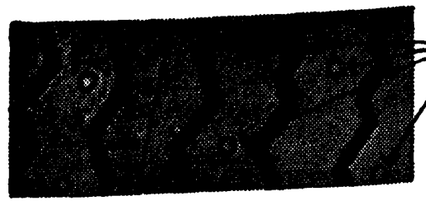
This loan of $100 million, it is learnt, will be repayable not in rupees as before but in dollars, over a period of 40 years, including a grace period of 10 years. The usual interest charges on this loan will be replaced by a "credit fee".

Two other U.S. aid allocations have also been announced this week—one for a credit of $33.6 million for financing the foreign exchange cost of the Cambay Thermal Power Project and the other for a credit of $3 million to the Premier Automobiles, of Bombay. The Cambay loan will be repayable in 40 years (including a 10-year period of grace) and will carry a credit fee of ¾ per cent per annum. The loan to the Premier Automobiles is to be repaid by the Company to the Government of India in a period of 15 years, with a service charge of 5¾ per cent. Under a special arrangement, it will be reimbursed to the U.S. Government over a period of 40 years, with a credit fee equivalent to ¾ of one per cent.

THIRD PLAN POWER SCHEMES



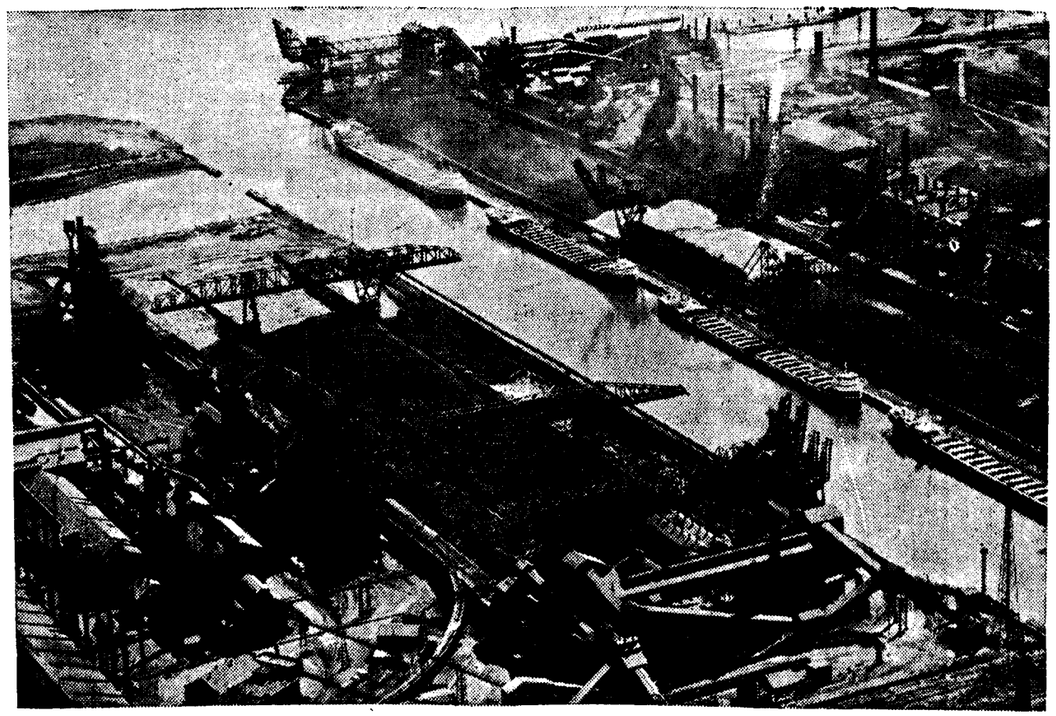
The three-member Team of high Government officials, consisting of Mr. P. P. Agarwal, Joint Secretary, Union Ministry of Irrigation and Power, Mr. K. P. S. Nair, Member (Hydro-electric), Central Water and Power Commission, and Mr. Balwant Singh Negi, Adviser (Irrigation), Planning Commission, has assessed that about 7.38 million kW of additional electric power—about 390,000 kW more than the Third Plan target—would be available by 1965-66, from the power schemes included in the Third Plan.



The Team was formed in August, 1961, to collect detailed information regarding the power projects and to suggest ways and means to break the bottlenecks that might be encountered in the fulfilment of the Third Plan targets.

The Team's appraisal of the benefits from power schemes during the Third Plan on an annual basis, along with the Third Plan targets (in million kW) is as follows :

Year	As in Third Plan Report	Appraisal by Team
1961-62	0.60	0.678
1962-63	0.73	0.711
1963-64	1.05	0.887
1964-65	2.07	1.989
1965-66	2.54	3.116



The Team has suggested that realistic schedules of all types of works for power projects included in the Third Plan should be drawn up by the States. Further, the States should undertake a periodical review of their progress, with a view to discovering and removing the

"SIPES"—the little ring knobs found in the tread give extra safety—hold the road better. These "safety rings" combined with CEAT's exclusive deep tread pattern give complete driving confidence.

Advanced ENGINEERING AND CONSTRUCTION FOR THE IRON AND STEEL INDUSTRY

The dictionary defines engineering "as the art and science by which the mechanical properties of matter are made useful to man in structures and machines." In the McKee Organization it is much more than that —it is a constant, unflagging effort toward advanced design, increased plant efficiency, improved construction and greater economy.

The results of that effort are readily apparent in the many contributions to the progress of steel-making made by the McKee Metals Division in more than half a century of specialized, world-wide engineering and construction for the steel industry.

Pioneering by McKee engineers in the fields of plant design, ore beneficiation, automation and production methods have been invaluable to the industry. Recent examples are McKee's work in pelletizing and in the first successful application of gas injection in blast furnaces.

McKee can deliver this kind of advanced engineering and construction to the steel industry in India and back it with an unmatched fund of practical experience and specialized knowledge.

Comprehensive engineering-contracting services, similar to those of the McKee Metals Division, are supplied by these specialized divisions of the McKee Organization:

PETROLEUM & CHEMICAL DIVISION
Complete Refineries and individual Processing Units for all modern petroleum and petrochemical processes and certain types of chemicals and chemical products.

WESTERN KNAPP ENGINEERING
Plants and facilities for production of Non-ferrous Metals, mining, preparation, handling, beneficiation and storage of Ores and Industrial Minerals.

THE McKEE ORGANIZATION
ARTHUR G. McKEE & COMPANY
WESTERN KNAPP ENGINEERING
Represented in India by
DR. B. S. GILANI

UNITED STATES: CLEVELAND • NEW YORK • WASHINGTON • CHICAGO • SAN FRANCISCO • UNION, N. J. HIBBING, MINNESOTA ABROAD: LONDON • TORONTO • MEXICO CITY • SAO PAULO • BUENOS AIRES

bottlenecks in implementing them. The States have also been requested to complete, as early as possible, detailed investigations of projects—hydro-electric and thermal—to be taken up in the Fourth Plan.

In view of the size of the power plan to be implemented and having regard to the dependence of project authorities on the Centre for co-ordination regarding supply of steel, cement, coal, foreign exchange and import licences, as well as for assistance and timely procurement of equipment from indigenous resources, it is proposed to undertake periodical reviews in future also.

The Team in its report has mentioned some of the important causes delaying the programme of power development, and has suggested how these could be removed. The details in this respect are not immediately available.

ISSUE OF INDUSTRIAL LICENCES

The Union Minister of Commerce and Industry, Mr K. C. Reddy, has issued a directive that every licence approved by the licensing committee should be submitted to him for his sanction before it is issued to the licencee. The terms of foreign collaboration and the decisions of the Capital Goods Committee are also to be made subject to his personal approval.

This directive probably has been issued as a consequences to the granting of industrial licences involving an expenditure in foreign exchange to the tune of about Rs. 400 crores during the first nine months of the Third Plan ending December, 1961, as against the total allocation of Rs. 450 crores for the whole of the Plan period. Licences involving Rs. 190 crores had been cleared by this time by the Capital Goods Committee. Of this sum, Rs. 50 to 60 crores were directly negotiated out of foreign credits such as DLF, Swiss credit etc. There has been some over-licencing in the case of such industries as chemicals including adhydride, forgings and castings and man-made fibres.

STRUCTURAL INDUSTRY

Structural Industry during the Third Five-Year Plan is likely to reach a target of 9 lakh tons. The present installed capacity is 4 lakh tons with an actual output of 1.5 lakh tons. Structural steelwork is broadly classified into three groups, namely, light, medium and heavy.

Light structural steelwork consists of tea garden factories, tank stagings, roof trusses, single beam columns, building steelworks. The material is usually manually handled. The factory building is light and the machinery items are few. The designs and fabrications are simple. This category of steelwork covers approximately 50 per cent of the total demand.

Medium structurals constitute factory buildings, rail and road bridges up to 100 ft. span, overhead travelling cranes, wharf cranes, sluice gates, transmission towers. The works are well equipped with overhead travelling cranes. Good design and fabrication is necessary. This category of steel work covers approximated 35 per cent of the total demand.

Heavy structurals are made up of large factory buildings, smelting and bessemer shops of steel plants large span road and rail bridges, large capacity cranes for workshops and cranes for steelworks. Works are well equipped with everhead travelling cranes and some special machinery. First class design and fabrication is necessary. This category of steelwork covers approximately 15 per cent of the total demand.

At present there are 154 firms licensed to fabricate steel structurals: Light steelwork 104, Medium steelwork 30 and Heavy steelwork 20. In addition to this, 72 more firms have been licensed but these have not yet gone into production. There is, therefore, licensed capacity available for the manufacture of Medium and Heavy Structurals, and to meet the target requirement of 9 lakh tons per annum (namely, Rs. 100 crores in terms of value approximately at the rate of Rs. 1,200/- per ton). The requirements of capital goods for the balance capacity of 5.00 lakh tons is to be installed during the Third Plan period. It will be at the rate of Rs. 40.00 lakhs for every 12,000 tons capacity: (1) Major machinery required during 5-year period to the extent of Rs. 16.00 crores. (2) Replacement/maintenance requirements of existing firms at the rate of Rs. 0.6 crores per annum to the extent of Rs. 3.00 crores.

There is, however, urgent need for the setting up of additional capacity for the fabrication of heavy steel work required for the extensions to the three Steel Plants at Rourkela, Bhillai and Durgapur, Foundry Forge at Ranchi, Railway Bridges etc., as the capacity of the existing firms that undertake such work is now fully booked for the next 18 to 20 months. The major problem in setting up new structural fabricated capacity will be the shortage of skilled workmen and technicians.

Cranes: At present there are 7 firms manufacturing workshop duty cranes, Goliath Cranes and dock-side cranes, in addition to the fabrication of structural steelwork. The total annual production of these firms is approximately 3,000 tons, valued at Rs. 1.5 crores at the rate of Rs. 5,000 per ton. The indigenous components in these cranes is approximately 70 to 90 per cent. Steelworks duty cranes of a capacity greater than 50 tons are not yet manufactured in the country, and hence there is plenty of scope for the manufacture of various types of cranes required for the steelworks.

Though the installed capacity is 12,000 tons per annum, the production is hardly 3,000 tons due to non-availability of requisite steel sections and imported components. The Third Plan target is 60,000 tons per annum, valued at Rs. 30 crores. The need for new units for manufacturing cranes coming into production at an early date is very great, as the demand greatly exceeds the capacity of the existing manufacturers.

Rolling Stock: This industry consists of Railway Coaches and Wagons, namely 4-wheeler and 8-wheeler. The manufacture of these could be in one of the 3 gauges, namely, (i) Broad Gauge, (ii) Meter Gauge and (iii) Narrow Gauge. Elaborate design, manufacturing and testing facilities are necessary for complete manufacture of all components required for Railway coaches and wagons in the private as well as public sectors. Enough capacity has already been licensed and no additional units are required for Rolling Stock manufacture. At present, the imported materials required for manufacture of Rolling Stock are (i) Ball or Roller Bearings; (ii) Wheel and Axles sets; (ii) Tool and Alloy steel; and (iv) Electrical equipment for Electric multiple unit coaches. Import of Rolling stock has been banned for the last few years.

The total installed capacity at present is 33,000 nos. per annum in terms of 4-wheelers, which comes to approximately 2.64 lakh tons per annum, and this is also the target capacity by 1965-66. The actual production is, however, low due to shortage of steel plates and sections. Annual maintenance machinery requirement of this industry is approximately Rs. 2.5 crores during the Third Plan period.

Coal Washeries: Most of the work for these coal washeries can be undertaken by the structural firms and hence separate capacity for this manufacture has not been indicated. The existing and projected structural manufactures within the overall capacity of 9.00 lakh tons per annum, will, it is expected, be able to meet the requirements for coal washeries in the country. The main items of coal washeries consist of different types and sizes of Conveyors, Bins and Bunkers, Classifying screens, Breakers and Crushers, Washing Jigs, Gravity Separation Apparatus, Filters, Pumps and Piping, Compressors and Vacuum Pumps, Electrical or other Power Units, Control Devices, Car Haul, Retarders and Tipplers.

At present, there are two firms which are licensed for the manufacture of coal washeries in collaboration with foreign manufacturers. There is therefore further scope for other structural manufacturers to come into the manufacture of this item, provided individual design is made available. To be able to achieve proper classification of coal, accurate analysis of the coal to be dealt with would be as much a necessity as a careful lay-out design to include the equipment for coal washeries mentioned in the preceding paragraph. Obviously, the lay-out design would require proper investigation and experience and if these were made available, the large number of mechanical and structural fabricators in the country could undertake to produce various standardised items of the equipment. Very considerable skill and capacity for the manufacture of varied types of industrial equipment are fortunately existent in the country and it would be to the benefit of the country and the coal mining industry if a suitable organisation be developed to design plant lay-out for coal washeries which may be considered suitable for coal mined from different areas. A central design organisation for Coal Washeries manufacture is suggested to be established under the National Coal Development Corporation, Ranchi and Fuel Research Institute, Dhanbad, along with leading Structural manufactures, in order to undertake the design and manufacturing work. Detailed drawings will of course be done by the leading structural manufacturers.

WORLD BANK LOAN FOR ICICI

The Industrial Investment and Credit Corporation of India has secured another loan of $20 million from the World Bank. This is the fourth loan to the ICICI from the World Bank. It brings the total assistance made available by the World Bank to the ICICI to $60 million. The ICICI last year started repaying the first World Bank loan.

The Industrial Credit and Investment Corporation has been acting as a catalytic agent by providing foreign exchange to Indian companies. It has financed uptil now 25 projects in collboration with the Industrial Finance Corporation of India and four projects in collaboration with the State Finance Corporations.

The ICICI is also planning to seek capital from the International Finance Corporation.

COLLABORATION WITH MONTICATINI

A three-man team from the industrial group Monticatini is arriving here next week to discuss the terms of collaboration with Indian firms for the manufacture of explosives, Polypropylene, and Polystyrene, and for the development of titanium industry in Travancore.

Sometime ago a well-known American firm Dupont had shown some interest in starting production of explosives and man-made fibres in this country. But nothing has as yet come out of this proposal.

WASTAGE OF WAGON CAPACITY

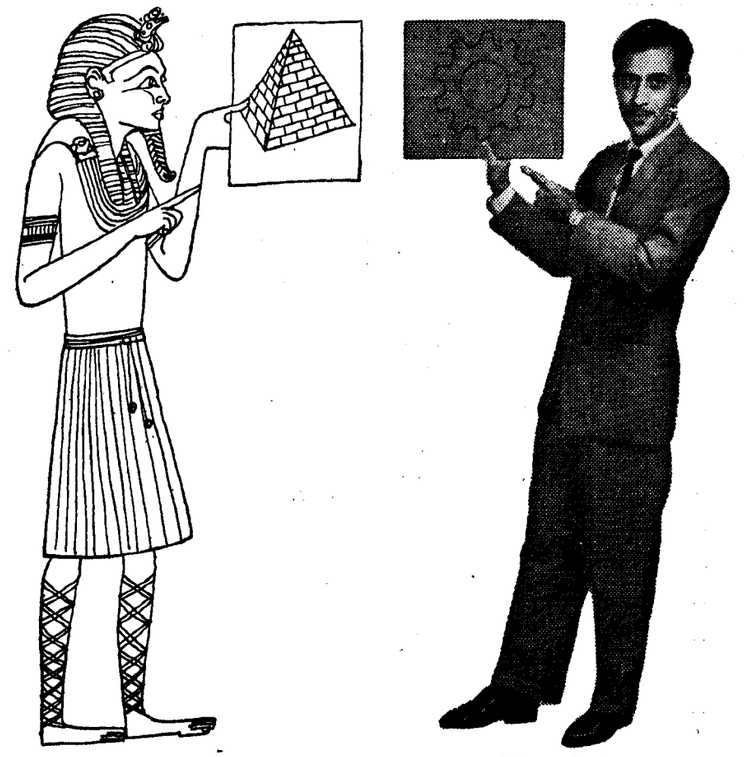
It is alleged that all the wagons supplied to collieries under the management of the National Coal Development Corporation were not properly utilised which resulted in the waste of public money. It is gathered from a reliable source that since its inception in 1956, over 48,000 wagons had been either detained, kept behind for loading etc. at the corporation's collieries for which it had to pay about Rs. 10 lakhs to the Railways in the shape of penalty detention charges etc. Although the Railways could not spare empties according to indents made by the corporation's seven collieries, yet they failed fully to utilise the allotted wagons for actual loading. In the month of June the indents were for 678 wagons against which the Railways could supply 579 wagons, but collieries were able to load only 483. The average comes to about 63 wagons detailed daily over the specified period. In July the position had not improved. Figures available up to July 26 show that 80 wagons on a daily average were not loaded in time and detained. It shows that indents were for 542 wagons against which 460 wagons were allotted but were not fully utilized. The source reveals that during the month of June alone Saunda Colliery detained 536 wagons, Giddi 448, Kathara 281, Saya 272, Bhurkunda 190, Bachhra 162 and Argada 5 wagons.

COTTON GOODS EXPORTS

The exports of millmade cotton piecegoods during the period January to September 1961, as compared with the corresponding period of 1960, have registered a steep fall. In million yards, the quantity exported was 423.07 and 518.70 respectively. Export of millmade cloth for the entire year 1961 from the Bombay Port amounted to 522.61 million yards. On this basis exports of millmade cotton piecegoods from all ports in India during the year 1961 may not exceed 574.87 million yards as against 694.83 million yards in 1960.

Export of cotton yarn also declined and was 10.52 m. lbs during January-September 1960 and 9.95 m. lbs during January-September 1961. Exports of Indian cotton yarn by value during the period January-November, 1961, aggregated to Rs. 28.78 million as compared to Rs. 33.71 million for the corresponding period 1960.

INDIAN TEXTILES FOR AUSTRIA



Austria has agreed to grant special quotas for the import of some Indian textiles, it is learnt here. The quotas are to be utilised before the current year is out. The varieties for which quotas have been established are: cotton fabrics (mill-made), cotton fabrics (handloom), silk handloom fabrics, miscellaneous hand-made woollen and silk textile articles, shawls, scarves, sarees, embroidered shoes, hand-made woollen carpets and hand-made Kashmir rugs (chain-stitched).

The agreement stipulates that the Indian handloom textiles imported into Austria must be confirmed as hand-woven by an authority designated by the Government of India. The Government has designated the General Inspecting Officer of the Cotton Textile Fund Committee, Bombay, as the authority for issuing quality marking certificates for handloom cotton textiles and the directors of the regional offices of the Textile Commissioner for handloom and silk fabrics. The procedure already laid down for the export of millmade cotton fabrics to the Continent is to be applied to the export of these fabrics to Austria.

EXPORTS OF VEGETABLE OILS

Exports of vegetable oils indicated a downward trend in the year 1961 as compared to the previous years. The value of exports in the 10 months January-October, 1961, amounted to Rs. 5.01 crores as compared to Rs. 10.69 crores in the corresponding period of 1960. Exports declined mainly on account of fall in exports of castor oil and linseed oil. No exports of groundnut oil were allowed by the trade in 1961, on account of wide disparity between the internal and international prices of groundnut oil. A small quantity of 329 tons of groundnut oil, valued at Rs. 8 lakhs, was exported in 1961 against tenders for 350 tons of groundnut oil accepted in November, 1961. Export of castor oil is not controlled. Its export in the 10 months January-October, 1961, was 22,473 tons valued at Rs. 3.7 crores. U.K. and U.S.A. are the principal buyers of castor oil from India, but the U.S.A. did not buy castor oil in 1961. India has to face severe competition from Brazilean castor oil in the U.S. and U.K. markets. Exports of linseed oil have also fallen because of the high internal prices and severe competition from Argentina. So long as the prices of linseed oil do not decline to a considerable extent, there is no possibility of increasing its exports. Exports of oilcakes also declined for January-October, 1961 as compared to the exports for the last year mainly on account of fall in the exports of groundnut expeller cake, linseed oilcake and coconut oilcake.

TELL US YOUR JOB—

AND WE'LL GIVE YOU THE TOOLS

The size, shape or complexity of a project doesn't overawe us. We have the tools to help build it with a minimum of time, labour and cost. For nearly 70 years, BATLIBOI have supplied Industry and Trade in India with goods ranging from complete power plants to hacksaw blades. We represent internationally known manufacturers from the United Kingdom, U.S.A. Czechoslovakia, France, Germany, Japan and many other countries. BATLIBOI also represent some of India's leading manufacturers of Machine Tools, Diesel Engines and various other types of machinery. Industry and Trade are vitally connected with the economic growth of any country, and BATLIBOI are vitally connected with Industry and Trade in India.

BATLIBOI participants in planned progress

BBY-97

The internal prices of linseed oilcake are out of parity with the world prices of linseed oilcakes as a result of which Indian exports have been poorer. In the oilseeds group H.P.S. groundnut is the main item of exports. Exports of H.P.S. groundnut improved in 1961 under the scheme of licensing by all shippers against registration of contracts backed by bank guarantees. 50,000 tons of H.P.S. groundnuts were released for export in 1961 and the entire quantity was taken up. A fresh quota of 20,000 tons of H.P.S. groundnut has been released early this year for shipment up to December, 1962. Export of nigarseeds, kardiseed, seasamseed is allowed freely, but exports have not materialised on account of very high internal prices.

HIGHER OUTPUT OF TEA IN 1961

The year 1961 saw the output of tea reaching an all time peak. Provisional estimates put the figure at 348.75 m.kgs. in 1961 against 320.40 m.kgs. in 1960 and 325.96 m.kgs. in 1959. Official figures of exports are available for the period of eleven months ending November 1961. They show, both in terms of quantum and value, a rise in exports, which increased from 168.08 m.kgs. valued at 104.40 crores in 1960 to 180.85 m.kgs. valued at Rs. 110.32 crores—an increase of 12.77 m.kgs. in volume and Rs. 5.92 crores in value—in 1961. The direction of trade was:

	1960	1961 (m.kgs.)
U.K.	103.56	108.19
Irish Republic ..	5.34	5.47
Netherlands	1.36	1.44
U.S.S.R.	9.02	10.68
Afghanistan	2.89	3.08
Iraq	1.98	1.99
Iran ..	3.13	3.60
Turkey	1.92	3.37
Egypt	12.79	13.04
Sudan	3.63	5.84
U.S.A.	7.66	9.27

Decline in exports has taken place in the case of Canada from 6.45 m.kgs. to 5.88 m.kgs., West Germany from 1.54 m.kgs. to 1.42 m.kgs., Australia from 2.28 m.kgs. to 1.50 m.kgs., and New Zealand from 0.56 m.kgs. to 0.49 m.kgs. According to British sources, import of tea during the calendar year of 1961 declined by £1,101,000 over 1960 imports. Exports during December 1961 are provisionally estimated at 22.68 m.kgs. valued at Rs. 13.30 crores. Thus, the final figure of tea exports during 1961 is likely to show an increase of 8.42 m.kgs., earning Rs. 2.5 crores more foreign exchange for the country.

With the increase in the volume of production in India and other tea producing countries, prices of tea at auctions in India and London registered some decline during the period under review. This has been reflected in the unit value of tea exports during the eleven months ending November 1961 which has declined from Rs. 6.21 per kg. in 1960 to Rs. 6.10 per kg. The unit value of exports during the months of October and November, 1961, were Rs. 5.95 and Rs. 5.86 per kg. respectively.

The Indian Tea Board launched in Edinburgh on March 1, a £100,000 campaign to promote the drinking of tea in Britain, with Scotland and the South of England as the main target areas. One of the biggest sales promotion programmes of its kind ever conducted by a Commonwealth country, it has been planned on behalf of the whole of the Indian tea industry.

BOC CHIEF IN DELHI

Mr. R. P. Smith, Managing Director of the Burmah Oil Company Limited, London, who is on a tour of the Group's offices and installations in the East, arrived in New Delhi on March 5 on a three-day visit. He called on the Union Finance Minister, Mr. Morarji Desai, the Union Minister for Steel, Mines and Fuel, Sardar Swaran Singh, and the Union Minister for Oil, Mr. K. D. Malaviya. Besides, he met Mr. S. Boothalingam, Secretary to the Ministry of Steel, Mines and Fuel, and Mr. S. S. Khera, Secretary to the Ministry of Oil. Mr. Smith had also talks with Mr. Khandubhai Desai, Chairman of the Oil India Ltd., a partnership concern of the Government of India and Burmah Oil Company.

Apart from the calls on the Ministers being courtesy ones, Mr. Smith is understood to have discussed with them the development of the oil industry in this country and the role that the Burmah Oil Company can play in fostering its development further. The Burmah Oil Company's partnership with the Government of India in Oil India Limited has proved quite succes ful. In view of this and the efficient operations of the venture, both in terms of time and cost of drilling, expansion of its activities inside as well as outside Assam is not ruled out. The success of Oil India Limited has also given rise to an opinion in knowledgeable circles that in future all oil prospecting in the Brahamputra valley will be brought under one agency, viz. Oil India Limited, leaving the ONGC to concentrate in the Gujarat area.

ANNOUNCEMENT

The following Annual Numbers of **THE EASTERN ECONOMIST** are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Rs. 50|-.

1. India & the World and India in 1950 — Rs. 5|-
2. A Social History of the Indian People & India in 1951 — Rs. 5|-
3. India & the Free World and India in 1952 — Rs. 5|-
4. India in Asia & India in 1953 — Rs. 5|-
5. India in South East Asia and India in 1954 — Rs. 5|-
6. India & the Communist World and India in 1955 — Rs. 5|-
7. India in 1975, A Study of the next Twenty Years & India in 1956 — Rs. 7.50
8. India & the Middle East and India in 1958 — Rs. 7.50
9. India and Europe & India in 1959 — Rs. 10|-
10. India & North America and India in 1960 — Rs. 10|-
11. India and Europe Divided — Rs. 10|-

Please take advantage of this offer and mail your enquiries to :

COMPANY AFFAIRS

ALKALI AND CHEMICAL CORPORATION

From the sale proceeds of the Alkali and Chemical Corporation Ltd. for the year to September 30, 1961 it appears that the company made significant progress. The year's sales were higher by nearly 25 per cent—from Rs. 5.40 crores during 1959-60 to Rs. 6.63 crores during the year under review. Naturally the net profit increased to 141.28 lakhs, nearly 10 per cent higher than the previous year's figure of Rs. 129.32 lakhs. The profit could have been still higher. The limiting factor was mainly the reduction in the selling prices for Polythene granules and the increased Excise Duty payable on a number of company's products. After providing for taxation, a sum of Rs. 2.5 lakhs was transferred to development rebate reserve. The allocation of Rs. 14 lakhs to the general reserve brings this reserve to Rs. 60 lakhs. A sum of Rs. 26.5 lakhs has been allocated to dividend acquisition reserve. The Board has recommended the payment of a dividend of Rs. 1.50 per share, subject to the deduction of tax, on both classes of ordinary shares of Rs. 10 each. This will absorb Rs. 46.5 lakhs.

The directors have reported that during the year the polythene unit operated substantially above the designed capacity. Turnover in the paints plant was maintained at a high level though it was hampered to some extent by the shortage of raw materials. Chlorine and caustic soda units also worked at optimum capacity but the profit margin continued to be restricted as a result of the price ceiling fixed by the Government.

The construction work for rubber chemicals was progressing. The company has also received a licence to increase production of polythene from 3,500 tons per annum to 8,500 tons per annum by the setting up of a new intermediate density polythene plant. A proposal for the expansion of the paints plant and the installation of a new resin plant has been submitted by the company to the Government. The company has also applied for the extension of the hydrochloric acid plant.

GLOBE MOTORS

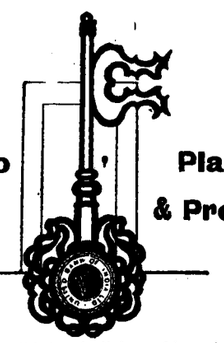
The sale proceeds of Globe Motors Ltd. for the year to July 31, 1961 amounted to Rs. 2.03 crores—nearly double the last year's figure. The increased sales were expected to continue further and the directors indicated that increased manufacture of Leyland vehicles by Messrs. Ashok Leyland Ltd. provided increased orders to the company for the supply of chassis. The profit for the year at Rs. 5.55 lakhs also was nearly double the previous year's figure of 2.82 lakhs. The directors have suggested the payment of dividend at the rate of 15 per cent on equity shares.

The directors have reported that the company's scheme for the establishment of a factory for the manufacture of alloy steel was progressing. The company had an industrial licence to produce 6000 tons of silico manganese spring steel per annum. They are also setting up a project for the production of 1200 tons of malleable castings. Plant and equipment from the United Kingdom and West Germany had arrived and the factory was likely to go into production towards the middle of 1962. With this the turnover was likely to improve considerably.

NEW ISSUES

Caltex (India) Ltd. has secured the Union Government's recognition to the additional issue of a capital of $6 million, allotted to the holding company, California Texas Corporation, New York. The formal recognition of the issue, which had so far been treated as a loan from the parent company, would now enable Caltex (India) to repatriate the dividend declared in full. Caltex (India) already has an issued capital of $ 4 million and is engaged in the distribution of petroleum products in India. With the additional issue its, total capital held wholly by California Texas Corporation amounts to $10 million.

SLM Maneklal Industries Ltd., Ahmedabad, will issue Rs. 80 lakhs in equity shares of Rs. 100 each, to be issued for cash at par. Of this, shares of the value of Rs. 10 lakhs will be issued to Swiss Locomotive and Machine Works, Switzerland. The amount will be used in meeting the foreign exchange cost of the machinery. The balance of the capital will be issued to Indian nationals. The proceeds will be used for financing the manufacture of Diesel engines of higher horse power and roots blowers and water ring pumps.



Orient Abrasives Ltd., Calcutta, a new company proposed to be incorporated, will issue capital of Rs. 25 lakhs divided into 2 lakhs equity share of Rs. 10 each and 5,000 preference shares of Rs. 100 each. The company will establish a factory in Maharashtra for the manufacture of alumina (used) abrasives.

The Shipping Corporation of India Ltd., Bombay, is raising fresh capital of Rs. 45 lakhs divided into 45,000 equity shares of Rs. 100 each for cash at par. The proceeds would be utilised for financing acquisition of additional tonnage. The paid-up capital of the corporation is Rs. 23 crores.

The Jehlum Spinning and Weaving Mills Ltd., proposed to be registered in Jammu and Kashmir, has been accorded consent to issue capital of Rs. 35 lakhs divided into 2,50,000 equity shares of Rs. 10 each and 10,000 cumulative redeemable preference shares of Rs. 100 each with interest at the rate of 9.3 per cent, taxable, for cash at par. The capital is intended to finance the setting up at Kathua, Jammu and Kashmir State, of a spinning unit with 12,000 spindles.

The Moraghat Tea Co Ltd., Calcutta, is issuing 88,000 bonus shares of Rs. 10 each on capitalisation of reserves to the extent of Rs. 8,80,000. The existing paid-up capital of the company is Rs. 11 lakhs.

The Parur Central Bank Ltd., Parur has been granted consent to the issue of capital of Rs. 50,000 divided into 5,000 shares of Rs. 10 each for cash at par. The paid-up capital of the bank is Rs. 1,50,000. **The Moolankuzhi Union Bank Ltd., Cochin,** has been granted consent to the issue of capital of Rs. 67,100 divided into 1,342 'B' class equity shares of Rs. 50 each, to be fully paid-up for cash at par. The paid-up capital of the bank is Rs. 71,299.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

with branches all over India and East Pakistan, and correspondents in all important trade centres the world over.

offers complete banking service

Company Meeting

NATIONAL AND GRINDLAYS BANK LTD.

PROPOSED RIGHTS ISSUE

Mr. J. K. Michie's Statement

The Annual General Meeting of National and Grindlays Bank, Ltd., will be held on April 3 at 26, Bishopsgate, London, E.C.

The following is the statement by the Chairman, Mr. J. K. Michie, which has been circulated with the report and accounts:

The Balance Sheet and Accounts of the Bank now before you reflect in figures 'inter alia' the outward results of the acquisition on 1st January, 1961, of the Eastern business and branches of Lloyds Bank Ltd. and these I am sure you will concur are encouraging. But what cannot be seen is the effort and co-operation by the staff throughout the combined business which has made the merger the success it undoubtedly is. The integration of staff, methods and systems which have grown up separately and independently is a task requiring patience, goodwill and broad-mindedness, and if in one year we have not achieved "optimum" results, we are well on the way to that desideratum.

The total of our consolidated balance sheet as at the close of 1961 was £251,284,590, or approximately £70 millions more than at 31st December, 1960. Of this increase about £50 million is attributable to the addition of Lloyds branches, leaving £20 millions for "growth." Because of the merger, figures of deposits and advances are not readily comparable, but as a consequence of the continued pressure for financial accommodation our liquidity ratio again fell slightly.

Naturally our expanded business brought higher profits, the figure being £644,273 against £479,276 for 1960. This increase has enabled us after providing for a dividend of 14 per cent on the increased capital to place £150,000 to Premises Account and allot £100,000 to Reserve Fund. Taxation I regret to say took an even higher percentage of our gross profits in 1961, otherwise our showing would have been somewhat better.

To bring our Reserve Fund more into line with our increased capital we decided to transfer a sum of £850,000 from our inner reserves, thereby bringing our published reserves to the round figure of £4 millions.

An expanding banking business carries with it the obligation to have its liabilities backed by a sufficiency of capital and reserves. At the Extraordinary General Meeting which will follow the Annual General Meeting shareholders will be asked to sanction an increase in the authorised capital of the Bank from £5,702,925 to £9,000,000. If this is agreed to it is then the intention to make a rights issue, in the proportion of one share for every four held on 14th March, 1962, at the price of £1.5s. 0d. per share.

Your board expects to maintain a dividend at the rate of 14 per cent on the increased capital.

NATIONAL & GRINDLAYS FINANCE AND DEVELOPMENT CORPORATION

The net profit for the year was £16,302. A dividend of £15,000 was declared and is included in our Consolidated Profit and Loss Account.

Old loans made at low rates of interest are gradually being reduced or revised and, if the Corporation can borrow at somewhat finer rates, results should steadily improve.

EXPORTERS' REFINANCE CORPORATION

During the year the Bank joined with the Hongkong and Shanghai Banking Corporation and S. Japhet and Company Limited in forming the Exporters' Refinance Corporation Limited for the purpose of providing credit finance for exporters on a short and medium-term basis. The authorised capital of the new Company which recently commenced operations is £1,000,000. The three participants have equally taken up shares of a nominal value of £750,000 of which £150,000 has been subscribed. Lord Aldington is Chairman of the Company and Mr. Owen and Mr. Cayley, Deputy General Manager of the Bank, are also on the Board.

INDIA

The results of the General Election, now being held and which has been rightly described as a massive exercise in democracy, will be known before this is in your hands.

The Reserve Bank rate remained unchanged at 4 per cent although throughout 1961 call-money often cost considerably more and at the end of the year 5½ per cent was being paid. This is a reflection of the continued steady pressure for Bank accommodation, principally by new and growing industries to which I drew your attention a year ago and there is no sign of a cessation. An illustration of this pressure is that during the eight months April 1st to November 30th, 1961, consent was given to the formation of 258 companies including 53 of foreign origin with a total authorised capital of Rs. 160.81 crores. Inevitably this puts the banking system under continued strain, a strain which, with the encouragement of the Reserve Bank, has been met very successfully.

The process of merging weaker with stronger banking units has continued, public confidence has revived and there has been an increase in deposits over the whole field of scheduled banking.

A scheme for compulsory insurance of small deposits came into effect on January 1st, 1962, and although the cost will fall largely on Banks whose depositors do not require this protection it is hoped that they too will gain from the confidence which the measure will engender in the minds of the small depositor.

The Reserve Bank has strongly advised indigenous Banks to increase their inner reserves; at the same time it has shown every disposition to assist banking through its Bill Market Scheme and by the encouragement it continues to give to the spread of the banking habit.

During the year we have been given licences to open 14 new branches of which 4 are already in operation. Arrangements for the others are in train.

In spite of very considerable foreign aid India's external reserves have fallen by some Rs. 20 crores and this cannot but cause some anxiety. Until India's economy becomes self-propelling the buttress for her balance of payments deficiency must come from outside and the consortium of western nations responsible for providing the bulk of the external wherewithal for India's latest five year plan known as the "Aid India Club" will be considering her needs. The total so far promised for the first two years is $2,225 millions but another meeting is to be held in May of this year to review the situation.

Agriculture must be regarded as the life blood of India and it is encouraging to see that the Planning Commission expect to see an increase in production of 24 million tons to a total of 100 million tons over the next five years. Sometimes it has been thought that agriculture ranked too low in the plans of a country much of whose population is so near the breadline but this would be a great step towards eliminating food shortages.

The jute industry had a much better year in 1961 as a result of increased export demand the number of looms sealed was reduced to 7 per cent in January of this year, the lowest for many years. Due to the competition of lower cost goods principally from Japan and Hong Kong, India's exports of cotton piece-goods were considerably reduced, particularly to Australia and East Africa.

Tea also had a difficult year and prices particularly for common teas fell to low and in some cases barely remunerative levels, a situation which still persists.

PAKISTAN

In October last the fine new headquarters of the State Bank were officially opened in Karachi and your Bank was represented by your Deputy Chairman.

The State Bank rate remained unchanged at 4 per cent, throughout 1961 and money continued to be tight.

The movement in the country's external assets during 1961 was an adverse one and strenuous efforts are being made to increase exports. However, during the year 1960-61 industrial production rose by 12.4 per cent which is a distinctly encouraging pointer and one which many older countries will envy. Agricultural production too was considerably increased.

Pakistan has been somewhat apprehensive about obtaining adequate aid for her current five-year plan but a recent decision made in Washington by the western consortium steps up their contributions covering the second and third years of the plan by $625,000,000. The Indus Basin Projects are now getting under way and a number of major contracts have recently been placed.

CEYLON,

I regret, has again had a troubled year. Balance of payment difficulties, illegal strikes and a very recent abortive attempt to overthrow the Government have all contributed to an unhappy situation which one feels in a country so well endowed with natural resources could somehow be avoided. The recent rise in rubber prices should help considerably. Apart from an unofficial strike by all Bank employees we along with other foreign banks are now under recently imposed disabilities which must have a restrictive effect on our business. Indeed that is the declared intention.

The most recent figures available show Ceylon's external resources as Rs. 476.4 millions in November, 1961, against Rs. 481.2 millions in December, 1960. The Central Bank rate has remained at 4 per cent since 1960.

BURMA

1961 was not a good year for exports, for due to an unusually short rainfall the rice crop which is Burma's economic backbone produced an exportable surplus of only 1,600,000 tons, a fall of 400,000 tons from the 1960 figure, representing a loss of over £12 million in foreign exchange. As this is under 50 per cent of the average pre-war exports obviously much remains to be done to encourage the cultivator and to give him a sense of security.

Early last year we decided that two offices in Rangoon were unnecessary and during the year we gradually transferred the business of Lloyds Branch to our main office. This operation has now been successfully completed and our surplus office has been sold.

ADEN

Business in Aden was well maintained in 1961 including her entrepot trade which had been showing some signs of declining. A minor building boom still persists but the prosperity of Aden depends rather too greatly on the refinery and her oil bunkering business, plus the considerable expenditure in connection with the British Forces in the area. The extension of cotton cultivation in Abyan and Lahej is therefore a welcome development.

We have recently extended our branch system in the area by opening sub-branches at Jaar, Lahej and Zingibar in the West Aden Protectorate, and in due course we shall open at Al-Ittihad.

SOMALI REPUBLIC

Rains were good and export business was active last year to the benefit of our branches. However, as a result of the union of the two territories we have ceased to be bankers to the Government and this cannot but reduce our business though we hope temporarily only.

EAST AFRICA

It is a most unfortunate concatenation of circumstances that a year of political destiny should also have had to bear visitations of nature which have struck grave blows at the economy of the whole area, first the severe drought followed at the end of the year by rains and floods unprecedented in this century. This combination has had disastrous effects on crops almost without exception—the Uganda cotton crop is now estimated at less than half of the first expectation—and has further lowered the morale of farmers and cultivators.

Schemes have been canvassed whereby there could be a willing transfer of land on reasonable terms from European to African ownership but the equivocal 'obiter dicta' of certain party politicians have not contributed to the task of achieving an early and reasonable settlement of this fundamental problem.

Meantime values of Government Securities, of commercial and industrial shares, and of land and properties have fallen steeply, and without a new spirit of accommodation this will have grave long-term effects on the economy of the country, and on the level of employment of the growing African urban population.

GENERAL

As you will have seen, we are by no means without our problems, but our overall chart shows we continue to grow. This also applies to our London business and I make no apology for drawing the attention of our shareholders and our overseas constituents to the various services which are available not only at Head Office but also at Parliament Street and St. James's Square.

As I have already indicated, I am highly satisfied with the calibre and 'esprit de corps' of our staff and I wish to thank them for another most excellent year's work.

The economy of this country continues to be balanced much too finely. The causes and problems involved have been fully commented on by other bankers whose institutions are affected more closely than is our own; but what does concern us are the possibilities of an economically unstable Britain and the repercussions on the countries in which we operate and on our own operations there. It is becoming increasingly evident that the countries more recently emerging into self-government tend to emphasise their independence not by stressing their association with Great Britain but rather by making other contacts, some regional, others geographically more widely spread. This is a natural and understandable phenomenon and how it affects Great Britain as a country and us as a Bank will depend largely on how much or how little we as a nation can give these countries in financial and other kinds of assistance to enable them to gain their economic and political feet. The question of our entry into the Common Market is a part of this issue, for many Commonwealth countries are a little apprehensive about not merely the economic but also the political consequences of our doing so. For that amongst other reasons it is important that we should know as soon as possible what are the terms on which it is open to Great Britain to join the European Common Market and so be able—I hope—to reassure doubting Commonwealth countries about their own future relations with us.

THIS IS AN ANNOUNCEMENT AND NOT A PROSPECTUS

Consent of the Central Government has been obtained to this issue by an order of which a complete copy is open to Public Inspection at the Registered Office of the Company. It must be distinctly understood that in giving this consent the Central Government do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinions expressed with regard to them. A licence has been obtained from the Central Government for the establishment of this new Industrial Undertaking of which a copy is open to public inspection at the Registered Office of the Company. It must be distinctly understood that in granting this Licence, the Government of India do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinions expressed in regard to them.

A copy of this prospectus, having attached to it the documents required by Section 60 of the Companies Act 1956, has been delivered for registration to the Registrar of Companies, Delhi.

Application will be made to the Stock Exchange at Bombay for permission to deal in and for an official quotation of the Equity Shares of the Company.

Application in the Company's Printed Form should be made for a minimum of 5 shares or multiples thereof on the basis of the Prospectus copies of which along with the application forms are available from the Brokers and the Bankers to this Issue.

The subscription list will open at the commencement of Banking hours on the 12th March, 1962, and will close at the discretion of the Directors but not earlier than the close of the Banking hours on the 14th March, 1962.

THE BARIUM CHEMICALS LIMITED

(Incorporated on 28th July, 1961, under the Companies Act, 1956)

SHARE CAPITAL

AUTHORIZED :

1,00,000 Shares of Rs. 100/- each.	Rs. 1,00,00,000

ISSUED :

50,000 Equity Shares of Rs. 100/- each	Rs. 50,00,000
Total :	Rs. 1,50,00,000

OUT OF THIS ISSUE :

The Promoters, Directors and their friends have subscribed for in cash, at par, and have been allotted:

7,532 Equity Shares of Rs. 100/- each	Rs. 7,53,200

Further, the Promoters, Directors and their friends have agreed to subscribe for in cash, at par:

2,468 Equity Shares of Rs. 100/- each	Rs. 2,46,800
Total:	Rs. 10,00,000

(No underwriting commission or brokerage is payable to the above 10,000 Equity Shares).

NOW OFFERED FOR PUBLIC SUBSCRIPTION :

The balance of 40,000 Equity Shares of Rs. 100/- each, at par, for cash in terms of this prospectus.	Rs. 40,00,000
Total:	Rs. 50,00,000

The entire issue now offered to the public is underwritten.

No Shares are issued or agreed to be issued for consideration other than cash.

TERMS OF PAYMENT :

The amount payable in respect of the present issue of Equity Shares to the public is as follows:

	Per Share
On application	Rs. 25/-
On allotment	Rs. 25/-
Balance	Rs. 50/-
	Rs. 100/-

The balance of Rs. 50/- per share, on call or calls to be made not earlier than three months after allotment.

Failure to pay any amount due on the shares allotted when due, will render previous payments and the shares liable to forfeiture.

DEBENTURES :

The Company has not issued any debentures or debenture stocks.

DIRECTORS :

Sri V. P. MENON, C.S.I., C.I.E., Chairman, Board of Directors, "Shelter," Cooke - Town, Bangalore - 5. Former Governor of Orissa & former Secretary to the Ministry of States, Government of India. BANGALORE: **M. Nanjappaiah Jahgirdar,** 181, Cavalry Road, Bangalore-1.

AHMEDABAD: **Chinubhai Chimanlal Dalal,** Maneckchowk, Ahmedabad.

HYDERABAD: **M. R. & Co.,** Singhee Bhuvan, Abid Road, Hyderabad, **P. B. Afzalpurkar,** 790, Sultan Bazar, Hyderabad.

LEGAL ADVISER :

Mr T. Raghavan, M.A., B.L., Advocate, 11-B, Mowbray's Road, Madras-18.

AUDITOR :

M/s. V. Sankar Aiyar & Company,
Chartered Accountants, 4, Scindia House, New Delhi-1.

REGISTERED OFFICE :

186, GOLF LINKS, NEW DELHI-3.

CONSENT :

The consents in writing of the abovenamed bankers, underwriters, brokers, auditors and legal advisers to act in their respective capacities have been obtained and filed with the Registrar of Companies, Delhi and none of the said consents has been withdrawn.

UNDERWRITING COMMISSION AND BROKERAGE:

In terms of the agreements arrived at between the Company on the one hand and the underwriters on the other the underwriters are entitled to an underwriting commission of 2-1/2% on the normal value of the capital underwritten by them.

Brokerage at the rate of Re. 1/- per Equity Share will be paid on all allotments made in respect of applications bearing the stamp of a Bank, a recognised broker, including the Brokers to the issue. Brokerage on the same basis is payable to the underwriters in addition to the underwriting commission on allotments in respect of applications made or procured by them and bearing their respective stamps.

OBJECTS OF THE COMPANY :

The Company has been formed generally for the purposes set out in the Memorandum of Association and, in particular to manufacture barium compounds and salts and the incidental by-products.

COMMENCEMENT OF BUSINESS :

The Company has obtained the Certificate dated 4-9-61 to commence business after filing a Statement in lieu of Prospectus

The Statutory Meeting of the Company is convened on the 2nd March, 1962.

IMPORT OF MACHINERY :

The Company is in possession of a Cash Sterling Import Licence of the value of £1.02,000 (Vide Import Licence No. 991626/61, dated the 27th November, 1961) for the Import of Machinery and other Capital Equipment.

Firm orders for plant and machinery required for the project have already been placed with the foreign technical collaborators and the necessary advances and letters of credit for full value both in Sterling and in Rupees, have been established in favour of the collaborators. It is expected that the complete delivery, erection and putting into operation of the plant and machinery will take place from nine to twelve months from now.

TECHNICAL COLLABORATION AGREEMENT AND PLANT & MACHINERY :

The Company has entered into a Technical Collaboration and Plant Supply Agreement with L. A. Mitchell Limited, Manchester (U.K.). Under this agreement they have inter alia:

Guaranteed capacity and performance of the plant and machinery.

Guaranteed the quality of the chemicals produced

to B.S.S. Standards.

Agreed to provide plant management and staff training for a period of 18 months.

LOCATION, SITE, POWER, WATER SUPPLY, RAW MATERIALS, AND TRANSPORT:

The factory will be located at Kothagudam (near Dornakal) in Andhra Pradesh. The Company is negotiating with the Government of Andhra Pradesh, for 50 acres of Government land selected for this purpose and the same is expected to be assigned shortly. Power and Water will be available at the site. The site has been selected having particular regard to an economic production of Barium Salts and Compounds. The essential raw materials are available at site and from nearby sources cheaply and in abundance. Kothagudam is connected by broad gauge to all points in India, and therefore suitably situated for procurement of raw materials and economic distribution of the products of the Company.

PROSPECTS

The Project is the first of its kind in India. The plant as envisaged is expected to produce 4,550 tons of Barium Salts & Compounds like Blanc Fixed (Pigment quality), Barium Chloride (Tech. quality), Barium Chloride (B.P. quality), Barium Sulphate (B.P. quality), Barium Nitrate, Barium Carbonate, Barium Hydroxide, etc. Further, for the first time in India 600 tons of superior grade Sulphur will be recovered annually as by-product. The plant has additional capacity for 1,800 tons of Barium Sulphide. Production cost of Barium Sulphide, Barium Carbonate and Sulphur is expected to be amongst the cheapest in the world. Consequently, the Company is expected to be in a position to compete in the world markets for the sale of Barium Sulphide and Barium Carbonate. These products are utilised in the manufacture of Caustic Soda, Paints, Glass & Ceramics, Pharmaceuticals, Chemical Industries and number of other industries and also in the manufacture of Ammunition and Explosives.

The production is expected to replace the present imports and the annual foreign exchange saving and earning of this project to the country will be about £3,00,000.

The Company will also enjoy the Tax benefits applicable to new industrial undertakings.

CAPITAL OUTLAY:

The capital required by the Company to reach the stage of production is estimated as follows:

	Rs.
Payment to L. A. Mitchell Limited, Manchester for supply of Plant, Equipment, Erection, Technical Know-how, Collaboration, Plant Management and Staff Training, etc., set out in the contract dated the 12th October, 1961	24,60,000
Land, Development of Land, Buildings, other Civil Engineering Works, etc., extra equipment and provision for increase in process, duty, transport, etc.	15,75,000
Pre-Incorporation and Preliminary expenses	1,50,000
EXPENSES OF THIS ISSUE:	
Underwriting Commission Rs. 1,00,000	
Brokerage Rs. 40,000	
Other expenses Rs. 35,000	1,75,000
Working Capital	10,00,000
Total	53,60,000

SOURCE OF FUNDS:

Equity Shares	50,00,000
Borrowing from Banks, other sources, etc	3,60,000
Total	53,60,000

MINIMUM SUBSCRIPTION:

The minimum subscription in respect of the present public issue on which the Directors will proceed to allot is Rs. 40,00,000. This is the total amount of the present issue offered to the public. Subscription of the amount is assured, as the entire public issue has been underwritten.

PRELIMINARY EXPENSES AND EXPENSES OF ISSUE:

The Preliminary Expenses incurred by the Promoter, Sri P. N. Balasubramanian, in respect of the procurement of the Industrial Licence, Import Licence, investigation of the project and registration of the Company, etc., amounted to Rs 1,50,000 which amount has been reimbursed to him by the Company.

The estimated amount of expenses of this issue including underwriting commission and brokerage is Rs. 1,75,000, the same are payable by the Company.

AUDITORS' REPORT:

The following is a copy of the Report of the Company's Auditors, V. Sankar Aiyar & Co., Chartered Accountants. They have given their consent to the issue of the Prospectus with the statement included in the form and in the context in which it is included. They have not withdrawn such consent before the delivery of the copy of the Prospectus for Registration.

V. SANKAR AIYAR & CO., Scindia House,
Chartered Accountants. New Delhi.

D/29th January, 1962.

The Barium Chemicals Limited,
186, Golf Links,
New Delhi-3.

Dear Sirs,

In accordance with the provisions of Clause 24 of Part II of Schedule II of the Companies Act, 1956, we report that no accounts of the Barium Chemicals Ltd., have been made up in respect of any period since the incorporation of the Company.

Yours faithfully,
Sd/-
(V. Sankar Aiyar & Co.).

MANAGING DIRECTOR:

Sri P. N. Balasubramanian has been appointed as the Managing Director of the Company under the Articles of Association. The appointment has been approved by the Central Government by its letter dated the 5th December, 1961. The Managing Director will be entitled to a remuneration of 5% of the net profits of the Company. The Central Government has stated that the proposal of paying a minimum remuneration of Rs. 50,000 per annum to him in the event of absence or inadequacy of profits, may be submitted to them after the present issue.

NATURE AND EXTENT OF DIRECTORS' INTEREST:

Sri P. N. Balasubramanian being a Promoter and Managing Director of the Company is interested in the reimbursement of preliminary expenses and remuneration and sitting fees payable to him as Managing Director.

The Directors other than the Managing Director are interested to the extent of the commission of 3% of the net profits of the Company, which will become payable to them on the special resolution being passed at the Extraordinary General Meeting and the same being approved by the Central Government. Each of the Directors is also interested to the extent of the Shares subscribed, allotted, or to be allotted to him in the Company as also in the sitting fees receivable for attending Board Meetings or Committee Meetings.

Sri S. B. Bilimoria, a Director, is a partner in the firm of Batlivala & Karani and is therefore interested in the underwriting commission and brokerage payable to them.

PAYMENT TO PROMOTERS:

No payment has been made or is proposed to be made to the promoters of the Company except reimbursement of the preliminary expenses incurred by Sri P. N. Balasubramanian. No profits or benefits have been given to any person or promoters of the Company.

The Lame Duck Budget: 1962-63

THE "Lame Duck" Budget for 1962-63 introduced in a Finance Bill by the Finance Minister, Mr. Morarji Desai, on Wednesday this week, has naturally awakened far less interest than a full-fledged Budget with taxation proposals and the vigorous full year's programme. It is now pretty clear that it is the taxation proposals that form the kernel of a Budget, and that the Indian public has failed to realise that taxation proposals represent only a marginal change in their tremendous revenue and expenditure accounts. The accounts themselves, and the Official Economic Survey which goes with them should, in fact, be more important than marginal changes. It is a sad commentary on the understanding of the economic framework of the country set out in the survey as well as in the draft estimates that the public galleries were practically empty and public interest was at a pitifully low ebb. The Finance Minister's concise and forceful speech deserved better of a country which is more than ever poised on the platform of economic growth. It should be clear at once that one of the great requisites of economic progress which is great public interest in the pattern of the nation's budgeting, is largely absent. Most Indians are still predominantly interested in merely that small area of economic change invested in the Budget which impinges on their own personal interests; uncharitably, self before the national conscience.

In more ways than one, there is cause for congratulation in the year that has ended. The revenue estimates have ended with a figure of Rs. 33.96 crores in surplus against a budget deficit of Rs. 5.57 crores. On the other hand, the overall deficit, both revenue and capital, accounted together, has increased from the original estimate of Rs. 70 crores to Rs. 121 crores, presumably the whole of this covered by deficit financing. In other words, instead of running well below the rated Plan figure of Rs. 550 crores over the five years, in the first year of the Third Plan deficit financing figure is significantly in excess of the annual average. This, notwithstanding the fact that conditions were favourable both in agriculture and industry and—as the Finance Minister said with justifiable pride—stability had been ensured in the price level. On the other hand, largely because we have increased our deficit financing in the first year of the Third Plan, it is desirable to seek for some reduction in the second year. It is almost certain that the deficit finance figure budgeted for in May will not exceed Rs. 70 crores so that to meet the overall deficit of Rs. 147 crores, at least Rs. 80 crores of additional taxation will need to be imposed by the new Parliament.

No one can look upon an increased burden of Rs. 80 crores in taxation without concern; but, equally, no one should be deceived into supposing that the Third Plan can be financed without a substantial sacrifice from all sections of the community. The idea that industrial development proceeds on the back of impoverished agriculture and, therefore, should not be given additional burdens, is too childish to be entertained. Undoubtedly, the socialist pattern of society implies that the rich will have to bear a larger burden than the poor. It is unlikely in the event, therefore, that more than Rs. 60 crores or three-fourths, will be raised by indirect taxation, which has hitherto been notoriously aggressive. If the figures recently published by the Finance Ministry are any guide, they imply that the extent of regression is even greater than anticipated in the Budget last year. One must, therefore, expect, however unhappy the prospect, that there will be a rise in the rate of corporate taxation on companies possibly from 45 per cent to 50 per cent, which would yield something between Rs. 12 and 15 crores.

It is likely that there will also be rises in wealth tax on persons, and perhaps even revised super-tax in limits which are very high. But there is no reason to assume that the volume of revenue which can thus be gained would be large; these are really token gestures to the unpraying new Goddess of the Socialist Pattern of Society. There is no need either to stress or exaggerate the hardships caused, since, in any case, they will not be significant so far as the country as a whole is concerned. But this is the more reason why moderation should be exercised in their use. The great body of middle class persons with incomes of less than Rs. 60,000 a year have a standard of living, wisely or unwisely, which can only be curtailed by significant hardship. It would be a pity if direct taxes were increased in this income range, which would affect all ranges of officials of the Government as well as Executives in industry, the men on whom the burden of economic development primarily rests.

There has been much talk of economy, but a cynic can refer to the passionate pleas made over the years and draw only one conclusion, which is that, however sincere the desire, the instruments employed are singularly ineffective for the purpose. Each year expenditure keeps on rising, partly because of the Plan, partly because of necessary administrative expenditure—as part of the welfare concept of development—and partly, to put it gently, by the operation of Parkinson's inescapable Law. In the current year, Revenue Expenditure is to rise from Rs. 1,045.15 crores to Rs. 1,179.46 crores. The increase in Defence of about a little over Rs. 38 crores is inevitable. How inevitable the remaining items are, one could well ask. But this is not, perhaps, the time to worry so much about detailed grants. By and large, the expenditure figure of Rs. 1,179.46 crores has to be accepted. As indeed is the need of additional taxation. Pleas should, however, be made that, while additional taxation is sought for to cover the deficit and in the case of the Railways, the cost of their services, one has the right to demand from both General Administration and from the Railways substantially improved efficiency in performing the services for which such heavy charges are being made. An atmosphere of deep complacency has entered into public administration; and the slow movements of files and the blocks in decision-making are now worse than they have ever been, which is saying a great deal. The Indian people have every right, when facing the exacting bills presented to them this week in the Railway and Finance Budgets, to demand that their servants in the Government should live up to higher standards than they have done in the last year.

Railway Finances: 1962-63

IN presenting the Railway Budget for 1962-63 to the Lok Sabha on Tuesday this week, Mr. Jagjivan Ram had in view the limited purpose of obtaining the vote of the House for funds sufficient to cover the expenditure for the first quarter of the budget year. If the estimates of revenue and expenditure are framed for the full year, it is merely to provide a rough basis to enable the House to grant proportionate amounts for three months. The budget, as presented, is purely provisional and assumes the rates, fares and costs at their existing levels. It will be for the new Parliament to readjust or retain these levels. And there can hardly be any doubt which way the House will make its decision. In reality there is no room for a choice. It will now be for the fourth year that the finances of the railways disclose a disconcerting imbalance, if their elementary obligation, conceived on the most modest scale, to contribute to the development outlay from their own resources, is to be honestly discharged.

Since 1958-59 a financial fiction has been created about these internal resources of the railways derived from the Development Fund. The fact of the situation is that a bulk of these so-called internal resources, however marginal they may look in the total picture of the railway development outlay, are provided by the Exchequer. Rather their marginal size and the prevalence of the imbalance on that margin for a prolonged period of three years spotlight how precariously the finances are poised. It is high time the fiction was ended and fresh blood was injected into Indian railway finances.

The fiction must be seen in its naked form, if only to appreciate why there is a compelling necessity for the Railway Minister to make a bold and forthright demand on the House for putting up freight rates and passenger fares to meet the ends of equity. The ends of equity ordain that the user of railway transport ought to be made to bear a fractional share of the outlay on development, which goes to provide him with the services for which he is making continuously increasing demands. The Development Fund of the railways exists precisely for the purpose which its name indicates. It is the source out of which the railways make their small extra contribution to the expenditure on expansion. The only source from which this fund receives accretions is the net or final surplus (revenue) of the railways. The net surplus in recent years has been rapidly shrinking to such an extent that the Revenue Reserve Fund is left high and dry. The entire net surplus is allocated to the Development Fund and, even so, it is too inadequate to enable the railways to meet their assigned obligation.

During the last three years of the Second Five-Year Plan, the Development Fund took a total loan of Rs. 29.40 crores from the General Revenues to fill the gap in the balances to its credit to meet its allocation for development. A fiction was created that these loans were purely "temporary" in character, but facts proved that they tended to become a chronic feature of the railways' "own" resources. When the present Railway Convention was introduced in the first year of the Third Plan, another fiction was created to give a semblance of discharge of these "temporary" loans by transferring a proportionate amount, partly by inflating the capital and partly by depleting the Revenue Reserve Fund. The purpose of this fiction was to enable the Development Fund to start with a clean slate in the Third Plan. The Budget Estimates for 1962-63 give an unequivocal indication that the fiction will have to be revived and a "temporary" loan of Rs. 10 crores will need to be written on the slate which has now been made clean, unless the net surplus is raised. The only way to raise it on a sustainable basis is to raise rates and fares.

The budget estimates for 1962-63 reveal that the gross traffic receipts will rise to Rs. 524.10 crores, showing an increase of Rs. 22.86 crores above the current year. But this increase will be wiped out to the extent of Rs. 18.03 crores by higher expenses and Rs. 2 crores on account of a larger allocation to the Depreciation Reserve Fund with the result that the net railway revenue will obtain an increase of a mere Rs. 2.83 crores at Rs. 95.01 crores. After payment of the dividend to the General Revenues of Rs. 65.35 crores and paying the State Governments Rs. 12.50 crores in lieu of the passenger fare tax (this represents no burden on the railway finances since the tax is merged for administrative purposes in the fares), the net and final surplus dwindles to Rs. 13.16 crores. This is to be compared with the net surplus of Rs. 16.46 crores in terms of the revised estimate for the current year when gross revenue is lower by Rs. 22.86 crores than in the budget year. It is no doubt true that higher traffic involves higher expenditure. But this is part of the explanation. Can it be denied that lower labour productivity and Parkinson's Law are defying control over expenditure?

The scheme of financial resources for the current railway development plan requires that the Development Fund should provide Rs. 115 crores or Rs. 23 crores per annum on the average. The opening balance in this fund at the beginning of the next year will be nominal—Rs. 13 lakhs. And the appropriation of the entire net surplus of Rs. 13.16 crores will still leave a gap of Rs. 10 crores. It is only just that there should be no resort to the financial fiction, but a straightforward revision of rates and fares to augment the revenues by Rs. 25 crores in the budget year. Economies in expenditure are by all means imperative. Unlike in the current year, there will be no shortfall in freight traffic below the estimated target, but an increase of 15 million originating tons. The Railway Board seems to be in error in assuming that passenger traffic, which showed an increase of 25 per cent as against the estimate of 15 per cent in the Second Plan, will not keep its upward trend in spite of rising incomes. Both the categories will give an expanding base of revenue. In the budget estimates freight earnings and passenger earnings are divided broadly in the ratios of 65 per cent and 35 per cent. The target of higher revenue of Rs. 25 crores here suggested should assume the same ratios.

A higher price for rail transport service now will provide a basis for a progressive increase in earnings along with the expanding volume of traffic during the rest of the period of the Third Plan. And there is no reason why industry should take fright at a moderate rise in the charges of services rendered by the railways. The railways, on the other hand, must acquire a new determination not to permit the inefficiency in traffic outturn which has disfigured their work this year.

Wheat Support Prices: A Welcome Step

AT long last, a beginning has been made to provide support for foodgrain prices. The Government of India has fixed a price of Rs. 13 per maund at which the State Governments will be purchasing from the farmers fair average quality white wheat, should its prices go down below this level at the next harvest which is to start around Baisakhi. *The Eastern Economist* warmly welcomes this step; it has during the past one year persistently called for this sort of measures with a view to giving a boost to agricultural output.

That the decision to support wheat prices has not come a day too soon should be evident from the fact that foodgrain prices in general and wheat prices in particular have shown a distinct downtrend since 1959. Not only the maximum prices recorded in the lean seasons have been successively lower, the prices at the harvest time have also been going down. The wholesale price index for wheat (base 1952-53=100), which rose to as high a level as 125 in January, 1959, fell to 97 in January, 1960, and further to 91 in January, 1961. The index for the whole of the lean period, January to March, during these three years declined from 121 in 1959 to 96 in 1960 and further to 91 in 1961. In the current lean months, the provisional index has been higher around 98, but the revised one is likely to be lower.

Although the decline in wheat prices at the harvest time has not been as spectacular, there has been witnessed a continuous fall in them during the past three seasons. The index went down from 100 in April, 1959, to 91 in April, 1960, and further to 88 in April last year. The average index for the harvest season as a whole (April to June) went down from 95 in 1959 to 88 in 1960 and 87 in 1961. Actual average wholesale prices recorded at the harvest time in the surplus wheat-producing areas of Punjab last year were around Rs. 13.50 nP. per maund. In 1960, they ranged around Rs. 14 per maund and in 1959 around Rs. 14.40 per maund. The prices received by the farmers must have been slightly lower.

Side by side with the fall in the all-India index number of wholesale wheat prices, the differentials in these prices as between various States have also tended to narrow down as a result of the removal of inter-State restrictions on movement of the commodity. While this has brought down the high prices that used to prevail in the deficit States, it has tended to uplift to some extent the prices obtainable in the surplus States. The downtrend in prices in surplus States, thus, has been arrested by the free movement of the commodity from there to the deficit areas. But this trend obviously can be expected to reverse in view of an all-time record crop expected this year; the new crop is anticipated to be over 11.5 million tons, as against 10.65 million tons in 1960-61 and 10.09 million tons in 1959-60. The Union Ministry of Food and Agriculture apparently has taken time by the forelock by fixing statutory minimum prices which should ensure an adequate return to the agriculturist in the surplus wheat-producing States.

It may be argued by some that this price support measure in the present context of India's wheat economy can only be a temporary expedient; there may not be any need for it in subsequent years. *The Eastern Economist*, however, does not share this view. The successive increases that have been recorded in wheat output over the past few years, especially during the last three years, have not been owing to any fortuitous circumstances like congenial weather. One of the primary factors that, in view of this journal, has helped in raising production is the massive investment that has gone into the agricultural economy under the first two Plans. With the completion of the Bhakra Dam, the whole picture on the wheat front is bound to change. Availability of water from this dam will virtually turn Punjab and Rajasthan into wheat graneries of India. To safeguard the interests of the farmers in these two States, as also elsewhere where prices should tend to fall as a consequence of increased production, support prices for wheat may become a permanent feature for some years to come. The present support price of Rs. 13 per maund may have to be slightly lowered in the light of the circumstances prevailing in future. For the next crop it appears to be quite appropriate. It is the same at which the Punjab Government has procured wheat in the last couple of years.

In the interest of raising agricultural output in general, support prices can play a very important role as has been the experience of almost all the countries of the European Continent where fostering of farm economies assumed new significance after the termination of World War II. This practice has been followed not only in the Western democracies, but also in Communist countries, not excluding the Soviet Union. The application of this lever over a wider field would, however, require detailed calculation of support prices for various agricultural products, taking into consideration such diverse and contending factors as the cost of production (including a fair return to the farmer as profit), cost of raising competitive crops, the prices that the consumer (or the industry in the case of commercial crops) should be expected to pay, and the prices of consumption goods which the farmer has to buy. Striking a balance between all these factors, no doubt, is not going to be an easy job. But the problem has to be faced. Through a process of trial and error this balance has to be struck, if the growth of the national economy is to be fostered at an accelerated pace and in a stable planned manner. Resort to this lever is as well imperative to raise the output of such commercial crops as cotton and oilseeds whose production has been lagging behind. Better specialisation in raising of various farm products amongst different States, which is a crying need of the day, can also be encouraged through use of this device.

A word may, in the end, be added on the importance of keeping a dynamic personality at the helm of affairs of the agricultural economy of the country in the office of the Union Minister for Food and Agriculture. The success achieved on the agricultural front during the past 2½ years is in no small measure due to the dynamism that Mr. S. K. Patil has brought to bear upon his onerous and exacting task. He has been able to ginger up the administrative machinery not only at the Centre, but also at the State levels, although he has not succeeded in making the State Governments feel the urgency of reclaiming culturable wastes which can play an important role in the realisation of the ambitious Third Plan targets. It is hoped he will continue to hold the present portfolio for at least some more time so that the recent gains recorded on the agricultural front are stabilised and the economy keyed up for a further leap forward. That should ensure stability in the cost of living and accelerated economic development without the agony of fluctuations operating pitilessly on the poorest in the land.

A DELHI DIARY

HEROINES ONLY

THEY used to tell us, a long time ago, that William Shakespeare had no heroes; he had only heroines. It would appear that Delhi this week has gone over completely into the Shakespearian mould. Almost all the great heroes have come under violent attack. The Prime Minister himself has been fiercely attacked by Master Tara Singh who has demanded his resignation. From far away Bombay Mr. Rajagopalachari, talking about corruption has demanded a caretaker government during the elections. The Press is angry with a particular proposal of the Prime Minister that only Opposition posters should be subject to an enquiry by the Home Ministry. How, it is asked, can the Prime Minister be so unfair? If impropriety is the subject for investigation, cannot the Congress impropriety, if not in posters, elsewhere be also a subject for investigation? And thus it would seem that we are left only with women in the field for honour this week. I give high place to Mrs. Indira Gandhi who has had the courage to resist the temptation of office as President of the Congress Party for another uncompleted term. She recognises — as I believe all sensible people do — that the daughter of the Prime Minister should not be the President of the Congress, however great her capabilities are. I do not know whether to pay a similar tribute to Smt. Vijayalakshmi whose name is still on a panel for consideration as Vice-President. It would be an excellent thing if following her niece's example, Smt. Vijayalakshmi announced that she would not stand as Vice-President of the Indian Union. The reason is simple: the Vice-President acts in the absence of the President, either abroad or during illness, and it is a totally wrong convention that the Prime Minister should submit his proposals to a President who is a close relative. I, therefore, whilst paying tribute to two women members of the Prime Minister's family, argue that their place in high offices in Delhi at this time is an error. But, of course, this observation was not really the one to which my argument was leading. It was in fact leading — as all roads in Delhi have led this week — to Mrs. Jacqueline Kennedy.

I am ashamed to say that I have not been able to see the heroine of the week face to face. I have had, however, detailed reports of numerous conversations in which she was involved, and have heard her voice over All-India Radio. The reception given to her has been enthusiastic everywhere and there is no doubt that Jackie has made a conquest of Delhi as I am told she has made of other capitals (whether Washington is one such, I cannot assert with certainty). But I have made a discovery while studying the January 1962 issue of a women's paper 'Journal' — which I recommend to my new friends — that Jackie formerly wrote a Washington newspaper column. We can, therefore, claim her as a colleague and friend of the journalistic profession. She apparently could even give an answer, seemingly cogent, to the searching question: "Can you give any reason why a contented bachelor should get married?" I am not quite clear who the contented bachelor in mind at that time was, but I suspect it was none other than the President of the United States. The argument seems to have had a happy ending but the most important reason was not in the argument but its maker. Of course no one has a real reason on marriage. The essence of a matrimonial decision is irrational or, should I say, super-rational! I look upon intuition as superior to reason. This accords well with my new conviction that the world has no heroes: only heroines!

HORSEMANSHIP — PLUS AND MINUS

I am no authority on the great issues of the feminine world. I am prepared to accept the view of the 'Ladies Home Journal' that Jackie's "fashion sense is flawless", but I can give an opinion, although second hand, on her great capacity as a horsewoman. For reasons which are not entirely clear to me, she was made to jump hurdles in the President's Bodyguard Parade Ground. I almost thought that VIPs were prevented from committing themselves to dangerous games of this kind. However, she sailed beautifully over all the hurdles she encountered and her skill was emphasized (most tactfully!) by the fall of a senior officer of the President's Bodyguard. How can one appreciate how difficult jumping of hurdles is unless a skilled horseman falls at a critical time? The papers were quick to notice the contrast, but I was wondering whether or not this was not a conspicuous example of Oriental hospitality, admittedly slightly overdone!

THE AZAD LECTURES

I must correct my view that Delhi has had no heroes this week. At least that small circle which deals with intellectual things has found a great hero in Dr. C. V. Raman, who has been delivering the three Azad Lectures at Sapru House. Those who have known Sir C. V. — as we will continue to call him — over the last thirty years always feel that he is one of those of whom it could be said that the passing years and custom cannot stale his infinite variety. A great mathematician and physicist, he has a superb sense of the manysidedness of cultural living. Anyone who listened to the first two lectures on the perception of light and of sound must have been amazed at the skill with which very involved scientific ideas were propelled into the minds of his hearers by the apt illustrations from everyday life which made even the waves of sound and quanta of light look as simple as seeing pictures in a book. On sound he was particularly good, though I must confess to having a quarrel with him on a particular remark which in Delhi is deemed to have some political significance. "The sound energy released in speaking", Sir C. V. said, "was so small that if thousands of people talked for hours the energy produced would not be enough to boil a cup of tea. It required an infinitesimally small effort to produce sound waves in the air". Those of us who see (mostly in Parliament) beautiful ineffectual angels beating their luminous wings in the void might wonder whether or not the sounds emitted did not cost their speakers a tremendous amount of energy. Now, according to the great principle of conservation of energy, it is unthinkable that the vast amount of energy expended by Members of Parliament should be reduced to the feeble quantum which Sir C. V. describes. It is a great pity that all the Members of Parliament put together are unable between them to boil a cup of tea. They have, however, succeeded in boiling up controversies on several problems and, in one particular case it boiled up so much that the aforesaid infinitesimal energy secured the dismissal of a Cabinet Minister. Let no one make the mistake of supposing that the energy content of sound is the end of its capacity to do damage to both personal reputation and impersonal institutions! The mighty atom now shakes the entire physical world since a single explosion can give rise to an almost endless chain reaction. Can it not be that a single speech, infinitesimal in its spoken energy, has the power of the aforesaid chain reaction to burn and destroy if not to create? I suggest, most respectfully, to Sir C. V. that quanta of energy are by no means the appropriate instruments of measurement of the sounds of raging political controversy!

THE WEEK'S NOTES

Rhodesia

BRINKMANSHIP

SIR ROY WELLENSKY is clearly set on the path of brinkmanship. Having failed to convince the British Government of his untenable case for the maintenance of the status quo, he hurried back home and made the peremptory announcement of dissolving the Federal Parliament in order to force a snap general election. It is to take place on April 27 as now announced in the official gazette. The Federal Prime Minister has stated that he is seeking a mandate from the electorate. But no one can be deceived about the nature of the sanction behind a "mandate", based on a franchise, where hardly one-hundredth of the population is entitled to cast the vote, and, then again, the overwhelming majority of African nationals is virtually debarred except for a tiny fraction. Mr. Kenneth Kaunda's United National Independent Party immediately retorted by declaring a boycott of the general election. In Nyasaland Dr. Hastings Banda has announced a similar decision. Sir Roy's precipitate and hazardous game to preserve the Central African Federation in its present form, with complete white domination, may or may not recoil on the solidarity of his United Federal Party (though some speculate on a likely crack within it), but the sham mandate cannot perpetuate the status quo.

This desperate dash for brinkmanship can hardly help the United Federal Party or the sympathetic Dominion Party in shutting out the forceful wind of change in the Federation comprising the three territories. Nyasaland, where the African population numbers over 99.5 per cent of the total, has now an African Government, but in so far as the electoral roll for the Central African Federation is concerned, it has hardly any locus standi and it cannot return even a single African to the Federal Parliament. The new constitution for Northern Rhodesia has disillusioned the African citizens, but it is being looked upon, in a mood of resignation, as a fait accompli. Even a constitution of such a variety is sought to be sabotaged by Sir Roy by his move for the mandate. The motive is quite obvious and it needs but elementary common sense to fathom it — Northern Rhodesia's rich copper belt must continue under the present control of those who govern Southern Rhodesia. Sir Roy Wellensky's Federal Government which has resigned will find no difficulty in being returned to power in the snap election, but it cannot resist constitutional progress. Resistance will only lead to the dissolution of the Federation.

Kerala's Finances

THE BUDGET FOR 1962-63

MR. R. SANKAR, Deputy Chief Minister and Finance Minister of Kerala, in presenting the State's budget for 1962-63 to the Legislative Assembly on March 9, has created the impression that there is to be a revenue surplus of Rs. 9 lakhs. Later on, when he goes into the details of the budget estimates and of the special features which are calculated to benefit the hard-pressed middle and lower income groups, he discloses that the cumulative effect of the concessions in pay and dearness allowance granted to government servants, private school teachers and the police force will be of the order of Rs. 38 lakhs per annum. This increase in expenditure, he goes on to explain, has not been taken into account in framing the budget estimates. The reasons for this novel course are not available in the press summary. In their absence it is safe to assume that the omission of the extra expenditure makes a substantial difference and the final result will be a revenue deficit of Rs. 29 lakhs.

It was in the fitness of things that the Third Finance Commission should take an equitable and sympathetic view of the requirements of the Kerala State and enhance its share of the Central taxes and grant-in-aid of revenue. Credit has been taken for this share at Rs. 15.11 crores which compares with the revised estimate of Rs. 6.22 crores for the current year. It was on the Central Government's advance intimation to the State Cabinet of the substantial increase in the share that the estimates in the budget were based, showing a surplus of Rs. 9 lakhs. While Kerala has received just treatment in this respect, the State cannot be absolved from its elementary obligation to step up the tax revenue to finance the outlay on the Third Plan out of its own resources, for taxation is an important resource. There are no proposals for fresh taxation in the budget year. On the contrary, the Finance Minister has been apologetic in advancing the explanation that the tax-collecting machinery would be sharpened to make it more efficient and effective in bringing larger collections.

The outlay included in the budget in respect of the schemes in the Third Plan in its second year is of the order of Rs. 34.01 crores out of which Rs. 3.02 crores is to be the Central share on schemes sponsored by the Centre. In the State sector the outlay of Rs. 30.99 crores reveals an excess of Rs. 73 lakhs above the ceiling fixed by the Planning Commission. This difference should not matter. Kerala's precarious position as a problem State must receive full understanding and appreciation. In the Third Plan power production is to be raised to 4 lakh kw. which would show a five-fold increase over the capacity at the end of the Second Plan. This augurs well for stimulating the development of small-scale and medium-scale industries which are the backbone of Kerala's economy, along with agriculture, which, too, is to receive adequate allocations.

Banking Companies

COMPULSORY WINDING UP

THE APPEAL of a director of the Palai Central Bank against the order of the Kerala High Court issuing the order of the winding up of the bank and appointing a liquidator at the instance of the Reserve Bank of India and a writ petition filed by a shareholder of the bank in the same matter were dismissed by a majority of the constitutional bench of the Supreme Court. In doing so the Court gave its ruling on the justification of the special power vested in the Reserve Bank for bringing about the compulsory liquidation of a bank under Section 38(1) of the Banking Companies Act.

The contentions raised in the appeal and the writ petition were that the various provisions of Section 38 of the Banking Companies Act violated Article 14 of the Constitution guaranteeing the fundamental right of equality before the law and also Article 19 guaranteeing the right to hold property and to carry on business. Section 38 was impunged on the ground that it made the Reserve Bank the sole and exclusive judge in the matter of winding-up and the High Court was left with no option but to order the winding-up, thereby reducing it to the position of an executive instrument. Banking companies, it was contended, could be wound up only under the same provisions as those contained in the Companies Act, since to uphold the validity of the provisions of the Section would be to violate the two fundamental rights under the Articles of the Constitution cited.

The minority of the two judges, in accepting the contention, looked at the issues from the angle of the deprivation of the constitutional functions of the High Court, taking away the fundamental rights of a banking company and of the negation of the judicial process involved in this procedure. The majority of the three judges, who refrained from taking a purely abstract view of the issues raised, based their decision on the point whether the distinction made and the restrictions placed were reasonable and as such sustainable. They pronounced the view that banking companies were rightly placed in a class quite distinct and apart from other companies and as such the provisions contained in Section 38 could not be impunged. The question for decision, therefore, boiled down to this — whether, in leaving the real decision on winding up to the Reserve Bank, the Act violated the principle of natural justice and placed an unreasonable restriction on the two fundamental rights in relation to banks. Examining closely the complex and sensitive structure of banking (which distinguishes it radically from that of other companies) and the position of the Reserve Bank as the nation's central bank, as well as its multifarious functions and responsibilities, the majority of the judges came to the considered view that the restrictions placed by Section 38 were not in the least against the public interest and the "momentous decision to wind up a tottering or unsafe banking company" was rightly placed with the Reserve Bank. The restrictions on the fundamental rights were upheld on the ground of reasonableness.

Industrial Relations

ONE SIDE OF THE MEDAL

MR. V. V. GIRI'S inaugural address at the last annual session of the Indian Institute of Personnel Management at Ernakulam was a praiseworthy attempt to give a correct lead to the deliberations at the session. The only reservation that could obviously be made is that it was an attempt to see one side of the medal only, without a look at the other, which, however, is inescapable. The Governor of Kerala placed the right accent on harmonious labour-management relations for greater production and a continuous rise in profits and wages. And to this end the adoption of enlightened and progressive personnel policy would be of great help. Scientific personnel management can prove of considerable value in providing a bridge between labour and management and help bring about rapprochement between the two, thereby averting occasions of friction resulting in strikes or lock-outs. The right type of personnel management constitutes that bridge and the Governor exhorted personnel managers to influence the managements to accept their unbiassed and non-partisan advice in management policies. It is no doubt true that personnel management has received scant attention in a majority of industrial establishments in this country. But there is the other side to the medal. The trade union leader who organizes and directs the collective activities of labour is much more a politician than a trade union worker, judged by the prevailing standards in the industrialised countries. Unless he sheds his political complex and works as a devoted and enlightened trade union organiser, the much-desired harmonious relations would be difficult to achieve.

Mr. Giri is ideological rather than objective in making an earnest advocacy for a two-day weekly holiday for workers every Saturday and Sunday. The reason behind this advocacy was to enable the worker to enjoy his leisure with a fullness of satisfaction by visiting his family in his village and returning with fresh vigour on Monday to his job at the factory. This is to presume that an overwhelming majority of industrial workers stay away from their families for employment within modest distances involving no strain on their purses from the week-end visits. This presumption will hardly be borne out by facts in a great number of the industrial centres in this country. Mr. Giri would have no objection to increasing the working day to 9 hours a day to compensate for the loss of work on Saturdays. This is not a question of the amount of time devoted, because a longer working day would result in a diminishing rate of output. The worker's separation from his family is without doubt an important reason of absenteeism, but it is not the exclusive reason. Any measures which aim at securing higher output, wages and profits as well as more leisure ought to be based on greater productivity. In the absence of a forthright approach to productivity, many of the well-intentioned measures of amelioration may bring disappointing results.

Disarmament

ECONOMIC AFTER EFFECTS

BY A queer coincidence the gist of the report of the 10-nation group of experts, appointed by the UN General Assembly to carry out an investigation into the economic and social consequences of disarmament, appears on the eve of the 18-nation (now reduced to 17 owing to the abstention of France) disarmament conference at Geneva which got off to a start on Wednesday this week. This session of the disarmament conference is expected to extend over a period of something like 8 to 10 weeks, but whether it will bring any tangible progress in these interminable rounds of discussions, it is hard to speculate. The available indications threaten to be forbidding. While such is the prospect for disarmament talks at the snail's pace, the 10-nation group of pundits proceeds on the assumption of complete and rapid disarmament for its assumptions and conclusions.

The main conclusion spotlighted by the experts is reassuring. It dispells any apprehensions on the score that disarmament would plunge the world, or at least the major armed powers, into economic chaos. There are many who, clinging to their preconceived prejudices, cherish the illusion that the major nations of the world would lose their greatest ally — armament production. These were the very persons who prophesied unthinkable upsets in the economies of the leading belligerents in the last war as a consequence of the loss of the support of armament output. It is heartening to note that the group is quite emphatic that the transition to disarmament would be much less painless than the transition for the transfer of resources from war production during World War II to peace production.

The group estimates the world's present armament bill at $120,000 million, roughly equivalent to something like 8 to 9 per cent of its output of goods and services. In such matters it would be naive to take the estimates at face value, but the margin of error is immaterial. Nearly 85 per cent of this outlay is incurred by the U.S.A., the U.S.S.R., the U.K., West Germany, France, Canada and China. The last one alone, among these, has a problem of population pressure. In the rest of the countries, it would be safe to accept the group's finding that manpower shortages would be reduced and civilian production would receive a boost. In the centrally planned economies, the transfer of resources can be managed efficiently by the perfected planning techniques, whereas in the other countries private enterprise, government spending and monetary and fiscal policies would do the job effectively. The under-developed countries would stand a far greater and assuring prospect of economic aid from the industrialised countries and the levelling up of economic activity would raise the demand for primary products. Peace would give a new acceleration to liberal outlays on welfare.

The World Abroad

THE TRUE GERMAN "MIRACLE"

By

ODYSSEUS

ENOUGH has been written about Germany's post-war economic "miracle" to sink a battleship, but I have yet to come across a study of Germany's post-war political "miracle."

The inauguration of a free market economy was in itself a political, not an economic, decision. It was taken by Professor Erhard, but he could not have enforced free enterprise against a hostile public opinion. Why were the people of Germany ready to accept the profit motive?

In 1945, opinion throughout the Western world had been conditioned, by six years of war, to state controls. The UK voted a Socialist Government into office. France set up a National Planning Commission. It is true that the USA favoured free enterprise but, as an Occupying Power, faced with a morally prostrate and physically devastated Germany, pullulating with millions of displaced and starving persons, even the Americans assumed that the economy would depend on centrally organised initiatives for years to come. Many authorities believed that the completeness of her defeat had condemned Germany to be a backward agricultural economy for at least a quarter of a century. The US Economic Co-operation Administration therefore drew up a Long Term Plan in 1948, which aimed at raising production to 110 per cent of 1936 by 1953. (In fact, of course, Erhard's free market economy had raised production to 150 per cent within those five years).

POST-WAR CONDITIONS FAVOURED SOCIALISTS

In 1946, the Social Democratic Party (SPD), which (outside the USSR) was the leading exponent of Marxism, was the only one of Germany's historic parties to have survived. For the two first post-war years, it was the only German party with an intact organisation. The Christian Democrats, and other parties, were incohesive groups, isolated in each occupied zone, searching for a programme, striving to build up from scratch non-existent political machines.

Since, moreover, many SPD members had magnificent anti-Nazi records, they were the obvious leaders for the renovation of democracy in Germany and, conscious of their mission, they threw themselves wholeheartedly into the work of political reconstruction. Many had been exiles in Britain or in the USA and it was not therefore surprising that the Occupation Powers picked out so many Social Democrats as "reliable" people for the first political posts created. In the House of Commons, Foreign Secretary Ernest Bevin in October, 1946, proclaimed British support for the socialisation of German industry and called on the Germans to take the necessary steps. General Brian Robertson, UK Occupation Commander, urged the Land (state) parliaments to nationalise heavy industry. The DGB (trades unions) also favoured this, and Dr. Schumacher, leader of the SPD, insisted on socialisation at the party conference in 1947. Even all the early CDU programmes assumed that recovery must be based on planning, supplemented by nationalisation of at least some basic industries. To the last, before the general election of 1949, most neutral observers were confident that the SPD would secure a sweeping victory.

In short, with all the dice loaded in favour of a Socialist State, why did the SPD not pull it off? I put this question to two cabinet ministers, to leaders of the CDU and SPD, to industrialists, and workers in overalls and white collars. What follows is a symposium of their views, with the caution that it would require a book to disentangle the many complete factors at work. All that I have space to offer here are some broad considerations, which, I readily concede, would require qualification to satisfy a scholarly mind.

One basic factor was that although by no means every German, any more than every European, is a practising Christian, every German shares with all Europeans the heritage of Christian human and social values, and the Graeco-Roman-Christian notions of the rule of law, respect for the rights of the individual and of his personality. For twelve years up to the desolating dusk 1945, the Germans had lived through the traumatic experience of the Hitler regime, which had enforced a brutally atheistic, indeed consciously pagan, dictatorship, setting human and Christian values at nought, regimenting the individual personality.

It follows that one of the forces at work in 1945-1949 was a profound anxiety to avoid any course which might lead to the return of a dictatorship, whether of the Right or of the Left. The Germans were, therefore, ready for a party of the Centre.

The SPD was not then such a party. It had inherited the political dogmas — class warfare, dictatorship of the proletariat, and scorn of religion — and the economic doctrines — state direction of the means of production, distribution, and exchange — of 1869, when Karl Marx won control of the German Social Democratic movement.

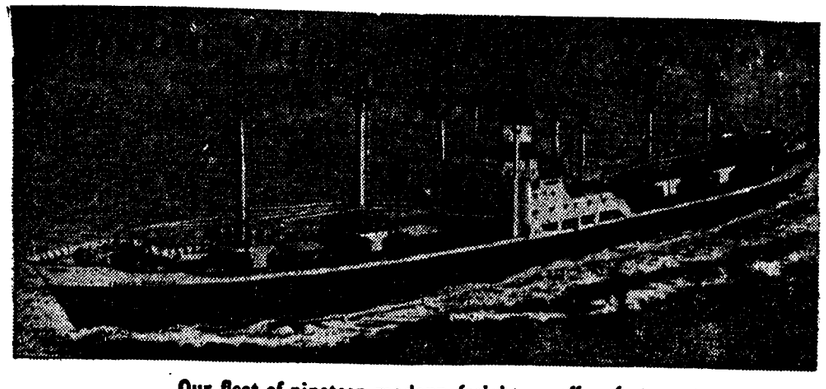
Although the trades unions are traditionally associated with Socialism in Europe, the DGB in post-war Germany tried from the first, and has on the whole succeeded, to be non-political. The DGB has about ten times the paid-up membership of any political party. Union officials are drawn indifferently from any political party. The DGB claims, with much justification, to be the strongest democratic influence in Germany. Their experience of the Nazis, and what they have seen in the Communist countries, convinced them that genuine trades unionism cannot survive totalitarianism whether of the Right or the Left. Moreover, the economic prostration of 1945, following the devastation of war, acted as a classical Toynbeean challenge not only to the trades unions but to all Germans — workers, employers, and middle classes — to close their ranks and to strive for material recovery and political stability. They sought national self-respect and unity, not the divisions of the class struggle.

ADENAUER'S GREAT CONTRIBUTION

Konrad Adenauer's great contribution to post-war Germany was to canalise this desire for national unity, recovery and, above all, for a stable society. He had the vision to see that the creation of political parties representing merely the sectional interests of Catholics, or Protestants, or middle classes, or employers, or workers, would consolidate Germany's divisions, and he had the statecraft to impose his vision.

Because Adenauer's CDU Government has directed a free competitive economy, foreign Leftist critics believe the CDU to be a party of reactionaries. It is not. In 1947, Dr. Adenauer sought neither Catholic, nor Protestant, nor working class support as such. His programme was the re-acknowledgement of the human and social values of Christianity after an atheistic interregnum. These values centre on the individual, on his spiritual, as well as his material well-being, and they imply a social and political programme which allows the individual to stand on his own feet, his head neither

bloodied nor bowed. The carefully thought out choice of the "Christian Democratic Union" as the name of the party proved to have the right combination of fixed meaning and flexibility needed by a party seeking to rally a broad following. To Catholics, the CDU was not an old-fashioned clerical party, but the protector of Catholic social and cultural interests. To Protestants, the name meant an alliance with the stronger Catholics to protect common values against the atheistic Left. Liberals accepted it as embodying liberal values within a non-sectarian interpretation of the Western cultural tradition. The middle classes responded to its rejection of Socialism. Those who sought social solidarity, whether Catholic or Protestant trades unionists, or Prussian conservatives, accepted the CDU as seeking to avoid a class war and to reconcile the claim of all classes.



No country can be governed, no industry run, no young people educated, without the aid of the middle classes. If you disenfranchise the middle classes, wholly or partially, by revolution or inflation, the community staggers along until you allow a new elite to emerge (as in the USSR). Konrad Adenauer had the imagination to realise that if Germany's recovery, moral and material, was to be speeded, he must have the support of substantial numbers of the middle classes. The CDU must appeal to the wide open spaces to the right of the class conscious SPD. These spaces included a substantial proportion of the workers and, to secure their equally important support, Adenauer said that the government would control the economy. Originally, he also foresaw a degree of state ownership, but Erhard's courageous inauguration of a competitive free market after the currency reform of June, 1948, introduced a wholly new and startling factor. Production soared. The free market triumphed over Socialist doctrines by practical demonstration.

Just as the political views of a business executive are his private affairs, having nothing to do with his firm, so DGB members may belong to any political party. Many are SPD supporters but the unions make no direct contribution to SPD funds. Although leading DGB officials have become politicians, even cabinet ministers, the best known have been members of the CDU, and their political activities have not involved their union. This means that the DGB, in its struggle to attract membership from the rising numbers of non-union minded, middle-class-orientated, workers of an affluent society, is unhampered by the conflict of loyalties that arises in the UK from the close link of the British unions to one political party, which at least 30 per cent of their members show by their votes that they do not want to see in office. My informants agreed that if the DGB were to tie up with any political party, its membership recruitment difficulties would be greatly increased.

It is nonsense to identify Germany's market economy with laisses faire. Government policy covers full employment, housing, anti-cartel legislation, and the world's most efficient system of social security.

Unlike the British Labour party, the SPD has digested the lesson. The key paragraph of its election manifesto says that "the free choice of consumer goods and services, free choice of a place to work, free initiative for employers (sic) are decisive foundations, and free competition an important element, of a free society. Totalitarian control of the economy destroys freedom... As much competition as possible — as much planning as necessary." Since Dr. Adenauer and Professor Erhard have been practising this SPD policy since 1948, I foresee shifts of emphasis but no drastic changes if the SPD wins the next election. In other words, all Germans are in broad agreement on their social policies. That is the true German "miracle".

(This is the final article in a set of three reporting the tour of Germany that Odysseus recently made on behalf of "The Eastern Economist" — Ed.).

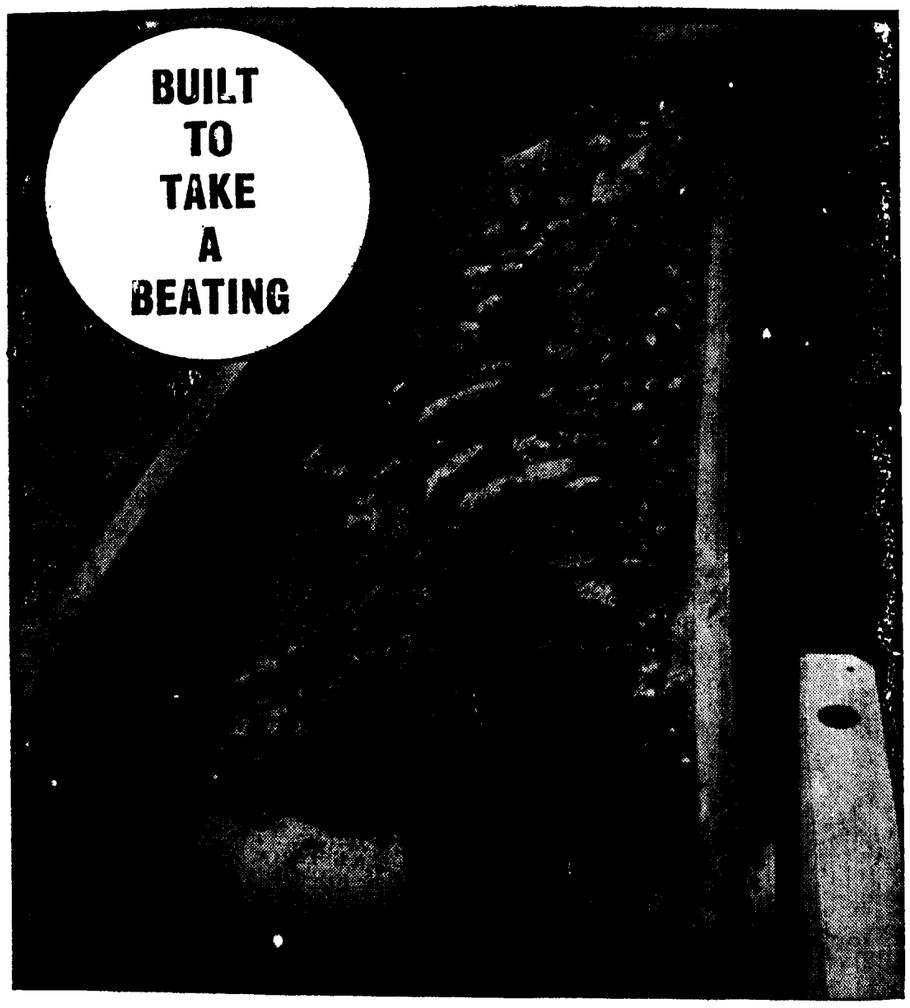
One who did not waver...



Jamshedpur's latest blast furnace needed a 'big bell'—a 20-ton component requiring highly skilled casting and machining. A difficult operation even if the right machine tools were available, but in 1958 they were not, and import seemed the only solution to all but one determined and resourceful young engineer, N. P. Naik.

Working on this problem in his leisure hours, Naik gradually crystallised his ideas into mathematical formulae and blue-prints. He developed, at the same time, a new machine tool to do the job by remodelling a small boring machine, stage by stage. Then started the casting and intricate machining, until, in a short time, Naik and his colleagues succeeded in producing a 'big bell', fully meeting the technical specifications to the last detail. As a tribute to Naik's fine endeavour, Tata Steel gave him an award of Rs. 10,000, the highest made under a ten-year old scheme to encourage initiative from the shop floor.

Men like Naik are carrying forward a fine Jamshedpur tradition, recalling Jamsetji Tata's exhortation: "Let the Indian learn to do things for himself."

The Tata Iron and Steel Company Limited

Hefty jagged lumps of iron ore, pounding down on this belt for sixteen hours a day, are carried from the primary to the secondary crusher at the Indian Iron & Steel Company's mine at Gua. Not just any belt will stand up to this tremendous punishment but Dunlop Super-A Grade conveyor belting made at Sahaganj can do it because it has been "built to take a beating". The requirements of industry vary considerably but Dunlop possess the specialised knowledge to offer you a tailor made belt. However exacting your particular needs we will supply conveyor belts that give the maximum life at the lowest cost.

The European Scene

BRITAIN IN EURATOM

From Our Special West European Correspondent

PARIS, March 10.

BRITAIN applied this week for membership of Euratom, the atomic research community of the Common Market. This was expected, for London announced her intention to join both Euratom and the Coal and Steel Community when she took the decision to seek entry to the Common Market, as a way of emphasising that Britain was genuinely interested in all aspects of West Europe's integration and not merely in the commercial arrangements between the Six. The application to Euratom has come earlier than some had expected; the negotiations about the Common Market will take many months yet (probably most of the rest of this year) while Britain's admission to Euratom will be speedily concluded, so this step could have waited. On the other hand, some very interesting plans are being laid inside Euratom between France and West Germany, and it may be thought that Britain wanted to be at least halfway in before matters went any further. This underscores the fact that entry into Euratom is not just a formality for Britain, a gesture of goodwill to this aspect of European integration; it has an importance of its own, for the atomic community will henceforth be undertaking work from which Britain could no more afford to be excluded than from the customs union.

At its birth, Euratom was the community to which Britain was least favourably disposed because, as defined in the Rome Treaty, it was the community with the most marked "supranational" aspect, the one that required evident surrender of national sovereignty. British reluctance to envisage abatement of sovereignty in a supranational organism is well known, but it was naturally most emphatic in regard to an organism concerned with atomic energy, because the impact on military independence is obvious. The charter of Euratom, for example, foresaw restrictions on national use of fissionable materials. However, in practice, Euratom's supranational powers have been very much reduced, thanks to the opposition of President de Gaulle, whose views on supranationality are precisely the same as London's. Since Paris has a dominant role in Euratom, being the only atomic power on the Continent, and since a Frenchman is automatically president of Euratom, General de Gaulle has been able to empty the organisation of all its supranational content; he is even recurrently suspected by his partners of wanting to emasculate it altogether.

Euratom has just come through a crisis on this subject. Paris sacked the president it had named because he began to develop a European patriotism and even opposed the actions of his own Government inside Euratom. This made him the hero of the One Europe clan, of the supernational bureaucracy of the European Communities and the Strasbourg Assembly, all of whom are committed to the singular faith that a European Nation can emerge in opposition to the Six existing Governments. The outcry notwithstanding, Paris replaced him with a loyal Gaullist minister who has no supranational inclinations and who obviously intends to act as his Government's delegate. One may suppose that London was very glad to see this change, and her application may even have been timed to mark her approval of it. Euratom as it now exists is a very different organisation from the one projected in Rome, and there is nothing in it that could embarrass in the least a member-nation that wished to dispose of its fissionable materials to make atomic weapons for its independent defence, i.e. specifically, nothing to hamstring France or, when she becomes a member, Britain.

One sees again here the vacuity of allegations that it is France that has been placing obstacles in the way of British membership of the European union. On the contrary, it is the Gaullist interpretation of the Rome Treaties in the sense of an international alliance rather than a supranational authority that has all along smoothed the way for Britain's reconciliation with the Continent. The One Europe imagined by the fanatics of integration, and vehemently supported by the pro-British small powers, could never have attracted Britain because it would have required abridgements of sovereignty to which British opinion will not consent. In contrast, the Gaullist vision of a "Europe of Homelands", which disgusts the Belgians and Dutch, is the only one acceptable to the British. In compensation, of course, Paris insists on a rigid implementation of the economic and commercial clauses of the Common Market treaty, because de Gaulle has been converted to the view that a unified economy is an absolute necessity but contains no threat to the persistence of sovereign nation-states provided they are bound together by alliance not different in nature from traditional multilateral treaties. He is probably wrong on this second point, but London shares his illusion and it is this that is making possible the construction of a Greater Europe. So when the French delegation in Brussels is obstinate about Britain paying the full economic price of entry into the Common Market, it needs to be remembered that it is France that has lowered the political price for Britain's entry into uniting Europe.

The point is noteworthy in connection with Euratom, because it is here that France enjoys that predominance over her Continental partners that de Gaulle is said to be reluctant to share with Britain. Being far in advance of the other five put together both in the industrial and military applications of atomic energy, possessed of nuclear weapons when West Germany is prohibited from making them and the others incapable of doing so, France was able to continue her independent atomic programme while sharing just what she chose with her partners. There was even a suspicion that Euratom's activities were being run as an annexe of French atomic policy, and that Euratom's laboratories were just branches or sub-contractors of the French research stations. None of this was ever literally true, but if French ambitions inclined that way they will be abandoned with the entry of Britain into the organisation. Britain's investment in and experience of atomic power is much greater than France's while in some research lines (but not in others) she is further advanced. The balance of power in Euratom will be revolutionised and the organism will virtually begin a new life; Britain's impact here will be greater than in the Common Market or Coal and Steel Community.

More important than these political considerations is the fact that Euratom will henceforth group two countries that have already reached the stage of industrial application of atomic energy. Their programmes have been following rather different lines, and it will be difficult to adjust them, but when the adjustment is made (and that is what Euratom exists for) West Europe will be well placed to claim a leading place in this field. The research programme that Euratom has worked out, although influenced mainly by French ideas, is perfectly capable of interesting the British. By participating in the common effort, the British will be able to compensate for some of the disappointments they have suffered in their excessively optimistic gamble on industrial atomic power.

Reactions from the USA will be significant. Britain and France had this in common that they both staked all on reactors using natural uranium whereas the minor European powers (minor as regards atomic research) were working with enriched uranium supplied, under rigorous conditions, by the USA. It would be normal if, after Britain's entry into Euratom, the balance of European interest shifted to natural uranium, which is the original European idea in atomic research, in contrast to the American effort to sell the Europeans an American idea, which inevitably tended to preserve US dominance over their atomic development. This was already one of the causes of friction inside Euratom. The smaller powers were willing to follow the American lead, because of short-term gains, leaving France to follow (like Britain) her own line of research although it was evident that, in the long run, to depend on US research meant accepting dependence on US suppliers of equipment later. If Britain and France now combine their activities, and make enough progress to secure the support of the other Europeans, the prospects for American exports of atomic generators will be altered.

Britain will be joining Euratom just when its first five-year plan is completed and a new five-year plan set on foot. The first plan covered principally the infrastructure for joint research, and it is only in the second plan that spectacular tasks will be attempted. The main one concerns the Orgel project, an atomic generator using heavy water and organic refrigerants, on which work is well advanced at Ispro, the Community's joint research station. Efforts will be concentrated on this because Euratom sees that the price differential per kilowatt-hour from nuclear sources and conventional sources is contracting rapidly, so that nuclear power will be competitive in the foreseeable future. A second project, run by the French and West Germans, concerns work on neutron acceleration reactors, which is expected to open up new uses for plutonium and to have the effect of reducing the cost of electric power produced from natural uranium. A third line of work is more technological than scientific, in that it consists in perfecting known types of reactors, and is thus a means of training the technicians who will be called upon to run tomorrow's nuclear power stations. Finally, Euratom has a programme for biological research, concerning the effect of radiation. This is not only of medical and social interest, but has a direct economic utility: protection against radiation risks is one of the causes of the present high cost of nuclear energy.

Though it was written before British membership was assured, this programme, it is believed here, will interest the new candidate. The extra financial resources Britain's entry will bring will enable work to be promoted more quickly, or extended to cover fresh fields of research. On either count, Euratom will become a better-balanced and more efficient centre of research. Operating as a community centre and undertaking research that is complementary to the independent activities of Britain and France (connected with their military interests), it should be able to leave behind it the quarrels about supranationality that have bedevilled its first years.

A PASSENGER FROM CALCUTTA WRITES:

. . . Just a line to thank you and KLM for looking after us so well prior to our departure from Dum Dum, and during the flight to London. The service on the plane was excellent and the hostesses charming . . .

This extract is from an unsolicited letter; a photocopy can be obtained from KLM, Calcutta.

For that extra personalised service, there's nothing like flying "the Golden Circle"

Economic Report from the U.S.

THE SMALL ENTERPRISES

By GUY SIMS FITCH

WASHINGTON, March 6.

WHEN U.S. astronaut John Glenn took off on his heralded flight into orbit, his safety and the success of his venture depended on the skill and technology of many hundreds of American business enterprises. The vast majority of these are small companies, suppliers of special equipment and services that have helped make the space age a reality. In a real sense, then, the Glenn achievement reflects the vital role of small business in the economic structure of the United States. Fully 95 per cent of all American businesses merit the designation of small by official definition. Not all of them work in fields as glamorous as space science and technology, but they all contribute in their ways to the healthy functioning of American society. At the last count, taken just about a year ago, there were 4.7 million business enterprises in operation in the United States. Of these, no fewer than 4.5 million were classified as small. The small enterprises represent every segment and every area of American life, from the family grocery store to the manufacture of intricate industrial equipment. They may employ a few people or a few dozen people, from unskilled clerks to highly skilled scientists and technicians. In the aggregate, they account for more than 40 per cent of the nation's total business activity and employ some 300 million persons — nearly half the nation's working force.

There is nothing static about this situation, of course. The number of business enterprises, both large and small, has grown with the economy. Only five years ago, for instance, the total was 4.25 million. Indicative of the opportunities that continue to abound in the expanding U.S. economy, projections place the number of small businesses at more than 5 million by the end of the 1960's — an anticipated increase of no less than 500,000 within the decade. This is in line with the prevailing view that the 1960's may well be the greatest period of economic expansion in the U.S. history. An expected population rise of 30 million, along with a 50 per cent gain in the total output of goods and services, should open the way for new business ventures of many different kinds. Not all new ventures succeed, of course. Some fall by the wayside, for various reasons — poor management, lack of money, shifts in demand, over-optimism, or any number of others, singly or in combination. The important point, however, is that millions have succeeded, and more are succeeding all the time. Let it not be forgotten, moreover, that there is hardly a big business in operation today which was not small when it started.

Not even the growth of automation, with its stress on costly and complex machinery, has stemmed the growth of the nation's business population. On the contrary, the development of new industries and new products based on new technology appears to be widening the prospects for small business. More than ever, brainpower and educational background are taking precedence over size and financial resources as criteria for excellence and efficiency in performance. There are jobs, of course, which are particularly suited to larger enterprises — automobile plants and steel mills, for instance. By the same token, small businesses have made and are making their contributions to the nation's progress and welfare, as in the supplying of special services and equipment. In addition, large companies often rely on smaller concerns to help in the manufacture, marketing and servicing of their products. Clearly, there is room in the multifarious U.S. society for all types and sizes of enterprise. Economic patterns and national requirements may change with the times. But United States will ever be a land of opportunity for those willing to pour their time and their effort, their dreams and their courage, into their self-advancement. The future of small business is as bright as that of the nation itself.

CONGRESS LOSSES IN UTTAR PRADESH

UTTAR PRADESH enjoys the unique distinction of sending the largest contingent of members to the Lok Sabha. Being the most populated State of the Indian Union, its legislature also has the largest number of members. The latest elections have indicated that even though the Congress Party succeeded in winning a majority, it suffered wounds which were far deeper than could be discerned by a cursory glance. Half a dozen Ministers of the State Cabinet have been defeated, and on top of that, the P.C.C. Chief, Mr. Ajit Prasad Jain, also failed to win his Lok Sabha seat.

The statistics of the election results show that the rightist parties, led by Jan Sangh, have thrown up a bitter challenge to the ruling party. In the 1957 elections, the Congress Party polled 46.3 per cent of the total valid votes for the Lok Sabha. In the current elections, the percentage dwindled to 39.1. The fall in the percentage of votes was not reflected to the same degree in the seats won for the Lok Sabha. Whereas the Congress Party had secured 70 seats in 1957, its strength was reduced to 62 in the present elections. Similar was the fate of the Congress Party in the State legislature. Out of a total of 430 seats, the Congress Party claimed only 248 seats‡‡ as against 286 members in the outgoing legislature. Thus the Congress Party in the Vidhan Sabha has yielded 38 seats. In certain instances, the Party has encountered defeat in areas which were its stronghold for more than a decade.

Table I below compares the election results for 1957 and 1962 in so far as the representatives of U.P. to the Lok Sabha are concerned. Here the most significant development is the increase in the strength of Jan Sangh from 2 to 7 seats and emergence of the Swatantra Party with 3 seats. The Congress Party has lost 8 seats which have gone either to Jan Sangh or to the Swatantra Party. The Communists have captured 2 seats instead of one in 1957. The independents and other splinter groups have improved their position from 9 to 10 seats. In addition to the Congress Party, the only other party to lose ground in U.P. is the P.S.P. which had 4 seats in the last House but has been able to retain only 2 seats in the new House. The Jan Sangh, therefore, has emerged as the strongest rival to the Congress in U.P. This conclusion is reinforced by the total valid votes polled (Table II) by the various parties in their Lok Sabha seats. Here the Jan Sangh has improved its vote from 14.8 per cent in 1957 to 17.5 per cent in 1962. The Communists have doubled their percentage votes from 1.7 to 3.6, while the P.S.P. has recorded a substantial fall from 15.3 per cent in 1957 to 10.4 per cent in 1962. The independents and other parties also improved their percentage share. This table also shows that in 1957 about 22.9 million voters made use of the franchise while the valid votes polled in the present elections were significantly lower at 17.8 million. This shift has been caused due to the elimination of the double member constituencies. In the 1957 elections each voter had two votes in each double member constituency. The comparison, thus, holds good in percentage terms but not in actual figures.

Table III on the next page shows the margin by which the Congress candidates have been able to win 62 seats to the Lok Sabha. Eight of these members had a very narrow win as their excess percentage margin over their nearest rivals was less than 5 per cent. Further analysis of these seats indicates that the victory in certain seats was extremely narrow. If the Congress Party had gained a one per cent smaller vote, it would have also lost its Gonda seat to the Swatantra Party. In Mainpuri, the difference with the nearest Communist rival was less than 2 per cent. In Domariaganj and Balrampur the difference between the winning Congress candidates and the defeated Jan Sangh candidates was less than 2.5 per cent. In Chandauli also the nearest Socialist rival to the successful Congress candidate had a difference of less than 2.5 per cent in votes. Again in Ramsanehighat, the Jan Sangh lost by a

AN ANALYSIS OF U.P. LOK SABHA SEATS

Name of the Party	1957 General Election			1962 General Election		
	Seats Contested	Seats Won	% to total of (2)	Seats Contested	Seats Won	% to total of (5)
	(1)	(2)	(3)	(4)	(5)	(6)
Congress	86	70	81.39	85(+1)	62*	72.09
Communist	7	1	1.16	18	2	2.33
P.S.P.	52	4	4.66	47	2	2.33
Jan Sangh	61	2	2.33	76	7	8.14
Swatantra	..	..	..	33	3	3.49
Other Parties and Independents	88	9†	10.46	182	10‡	11.62
TOTAL	294	86	100.00	441(+1)	86	100.00

*Including one unopposed return.
†Nine independents.
‡Three Republicans; One Socialist; One Hindu Maha Sabha; and five independents.
NOTE: The figures in brackets indicate unopposed return.
‡‡ Excluding the two constituencies where polling has been postponed.

margin of less than 3 per cent votes. Similar was the case of the Hindu Maha Sabha candidate from Gorakhpur. Thus, had the opposition succeeded in tilting the Congress vote by 5 per cent, the Congress Party would have lost another 8 seats, reducing its strength in the Lok Sabha to 54 out of a total of 86. The implications of such a shift would have been much more disastrous for the Vidhan Sabha where the Congress Party would have found it difficult to form its own Ministry. The Congress Party, thus, seems to have had a very narrow escape in U.P.

Table IV sets out the U.P. Assembly election results for 1957 and 1962. It follows roughly the pattern set in Table I regarding the Lok Sabha results. The losers are the Congress Party and the P.S.P. while substantial gains have been made by Jan Sangh, the Swatantra Party and the Communists. Strangely the independents and other parties have lost ground in the State Assembly while they were able to improve upon their Lok Sabha results. Much more impressive is the performance of the Jan Sangh which almost trebled its seats from 17 in 1957 to 48 in 1962. The P.S.P. has lost 6 seats while the Communists have gained five. Thus the losses of the Congress Party, the P.S.P. and the independents have been the gains of the Jan Sangh and the Swatantra and to a lesser extent the Communists. In other words the State election results are even more against the Congress Party than the Lok Sabha results. The figures suggest a period of instability in Uttar Pradesh after 1967.

THE BUSINESS WORLD

Birlas in Bombay

By CROESUS

THIS has been a veritable Birla Week in Bombay. It is as it should be, considering the valuable contribution that the Birla family has made to enrich the economic, political, educational, social, cultural and religious life of this country generally. Today, Birla's industrial or other activities may be more concentrated elsewhere than in Bombay, but it is Bombay that can rightly take pride in having given a start, as it were, to the great Birla enterprise exactly a hundred years ago, when the late Mr. Shivnarain Birla established his business house in Marwari Bazaar in this city. Indeed, Maharashtra's Chief Minister Chavan, who was the chief guest at the grand reception held in connection with the celebrations, in Bombay, last Saturday, claimed it without any mental reservation. "It is a matter of pride", he said, "for the city of Bombay to think in retrospect that the sapling taken from Rajasthan and planted in Bombay has become a big banyan tree giving shelter to many families, to thousands of employees working in their industries, and doing useful work in different fields — economic, social and educational."

As befitting an occasion such as this, divine services (puja), several meetings, receptions, luncheons and dinners were held and I made it a point to attend almost everyone of these functions with a view to assessing the popular reaction to the celebrations and to ascertaining, if possible, the secret of success of the Birlas. Particularly impressive were the reception held by the Birlas at the Cricket Club of India and the sharebrokers' reception at the Radio Club presided over by Mr. G. L. Mehta, our former ambassador to the U.S. If the large attendance—perhaps the largest at such a function I have so far seen of the elite in every walk of life of Bombay and outside—at the Cricket Club function was an indication of the esteem in which the Birlas are held in this country, the thousands of messages and telegrams wishing the function success from the highest placed in official life and business circles alike, from both within the country and abroad, provided an index of the reputation they enjoy all over the world.

How did the Birlas come to occupy this unique position? The clue is perhaps to be found from a careful sifting of all that was said at the several functions, by Mr. G. D. Birla himself and by others, in particular Mr. Chavan and Mr. Mehta. Mr. Chavan, I think, placed his finger on the pulse when he speculated that the success of the Birlas lay in their correctly responding to the changing urges of the times, be it in the political field or in the social field. According to Mr. Mehta, who endeavoured to find why there were hardly a few business houses that could boast of having completed a hundred years, the success of the Birlas is to be attributed to the disciplined lives of the members of the Birla family and the complete harmony prevailing among them. Both are right, but, if I may venture a third reason, it is the unflinching triple faith of the man at the helm of affairs, faith in himself, faith in the future of his country and faith in the Indian youth. It is faith and faith alone that sustains this Man of Faith —Mr. G. D. Birla. He is not content to say "I can do it", but he is catholic and generous enough to say "everyone can do it" and "India can do it". And, what is more, he has enabled many to do it by placing people in positions of responsibility and thereby providing an opportunity—the opportunity of their lives—to make or mar their future. This is how the Birlas have managed to carry on, incidentally disproving the theory that business acumen does not pass from father to son, a favourite argument of those who have successfully worked to do away with the system of managing agency, a unique feature of the business life of this country. I know how a member of the Birla family who is placed in charge of a given business or industry is expected to work, and, in fact, works. He works like any other employee, perhaps more than an employee. One must spend a day with a member of the Birla family, as I had occasion to do once, to be convinced of this. It is literally a question of 'seeing is believing'. But, before any member of the family is entrusted with responsibility, obviously, he is given a thorough training after years of good education and considerable travel abroad. Travelling abroad, it is noteworthy, is encouraged not for pleasure but for profiting from what there is to see in other countries and from observing how other countries are managing their business and industries. Surely such Spartan training does not happen to be the prerequisite of every young business man in India, but it ought to be so, if India is to industrialise on right lines. Productivity and profitability are the by-words of every Birla concern, as is amply borne out by the fact that, as against a total block of all their industrial undertakings, as on December 31, 1961, of about Rs. 150 crores, the total sales of these undertakings amounted to about Rs. 201 crores. This, it should be noted here, is not only highly commendable, but better than the performance of most industrial undertakings in our country.

Very soon in their business career, the Birlas must have discerned that, for the sound economic advancement of this country, what was needed was neither natural resources nor manpower, both of which we have fortunately been favoured in abundance, but skilled labour and technical know-how. Hence the bias towards technical education at all levels that one notices in the educational programme of the Birlas. It was only to be expected, therefore, that, to mark the Centenary of the House of Birlas, they would do something to promote technical education, in a big way, as, indeed, they have done. They now propose to start an Institute of Technology on the most modern lines, and they have been assured of the help and co-operation, for this purpose, of well-known institutions like the Massachussets Institute of Technology — M.I.T. It is understood that Prime Minister Nehru also has commended the proposal.

Although the Birlas have done so much—to quote Mr. Chavan, "the history of the Birla family is, in a sense, the history of the efforts and the progress of the country of the last century"—they have continued to retain their traditional humility. It was in a spirit of humility and a mood of prayerfulness that Mr. Birla

XM 2, NUGEE N62

spoke throughout on the centenary occasion. "I should like in all humility", he said, "to offer my thanks and the thanks and gratitude of my family to Almighty God, but for Whose will not a blade of grass can grow, nor a leaf move. If we have been successful in however humble a manner and kept ourselves on the right path and contributed our mite, it is because of divine blessings." It was, again, in a spirit of humility that he sought the blessings of Mr. Chavan for the future of the youth of this country "so that they may carry on the work which has been started by leaders in this country for the purpose of economic growth of the country, and so that India may became prosperous, happy and, really speaking, free."

At the Radio Club, Mr. Birla clarified an earlier statement of his in Bombay in which he seemed to take a rather gloomy view of the future. Emanating, as this happened to, from one known for his robust optimism at all times, it naturally provoked Mr. G. L. Mehta to make a pointed reference to it. With many others, he wondered what could have prompted Mr. Birla to take such a view. In reply, Mr. Birla said that he was not as gloomy as Mr. Mehta supposed, although he did take a somewhat pessimistic view of the outlook for the future because of the difficulties he visualised the Third Five-Year Plan would run into. As for the long-term outlook, however, Mr. Birla declared, he still felt quite optimistic and added that India would have a bright future and Indian youth great opportunities ahead. A financial journalist who was present pithily summed it up in stock market parlance—according to Mr. Birla, he said, "the short-term outlook is bearish and the long-term outlook bullish."

It was Mr. Mehta who rightly drew attention to the harmony and discipline among the members of the Birla family. One has to be present at any residence of the Birlas in the country when the family members happen to be together, as they do on rare occasions, to get a first-hand evidence of this harmony. No one can fail to notice the fraternal love of the elder brothers, Mr. J. K. Birla and Mr. R. D. Birla towards Mr. G. D. Birla, and the paternal feeling of the younger brother, Mr. B. M. Birla, towards the latter, on the one hand, and the awe in which the younger generation of the Birla family as a whole holds Mr. G. D. Birla, on the other. It could not be otherwise either, for it is Mr. G. D. Birla ("Great Democrat" is my extension of the two letters) that is the inspiring genius and the guiding star of the family. With the poet then, let me join and pray on this solemn occasion: "May his tribe increase".

Business Notes

Brick Kilns

CRISIS DEEPENS

"THE EASTERN ECONOMIST", two months ago, analysed the implications of the East Punjab Control of Brick Supplies Act, 1949 promulgated in the Capital whereby the price of first class bricks was fixed by the Chief Commissioner of Delhi at Rs. 30 per thousand. It was explained that the price fixed was uneconomic and was likely to result in the closure of some of the brick kilns. The forecast made by "The Eastern Economist" has come true and no less than 20 kilns have already closed down because of the non-availability of coal and the unremunerative price fixed by the Administration. This has also crippled the growth of 70 kilns which were expected to come into existence; the Control Order seems to have killed them before their birth.

When "The Eastern Economist" approached Mr. L. O. Joshi, Chief Secretary, Delhi Administration, for an elucidation of the steps being taken in order to arrest the deepening of the crisis, the plea was put forward that on the basis of the controlled price of coal the price fixed for bricks was adequate. This point of view has also been endorsed by the Brick Kilns Association but the Achilles heel is the non-availability of the needed supply of slack coal for the industry. The following figures compare the demand of 180 kilns for slack coal during the period October 1961 to February 1962 and the coal made available by the Administration. The figures make an immediate impression that the brick kiln industry is being starved of slack coal which is an essential component of this industry:

Month	Demand of coal for 180 kilns	Coal provided by Administration
October 1961	1,260 wagons	335 wagons
November 1961	1,260 wagons	124 wagons
December 1961	1,260 wagons	75 wagons
January 1962	1,260 wagons	225 wagons
February 1962	1,260 wagons	260 wagons

Those who have invested their capital in the brick kiln industry are forced by laws of economics to run them because otherwise they stand to lose heavily. They even go out and procure coal from whatever source they can by paying a premium over the prevailing controlled price. This they have to do because of the incapacity of the Administration to provide them sufficient coal and not due to any love for high-priced coal. The Administration seems to be sitting on its 'ethical' high horse, knowing fully well the difficulties in which the industry is enmeshed. Three months from now when really acute famine of bricks descends upon the Capital—in as much as it may put thousands of people out of work — the Administration may perhaps relax. But then it may be too late and the industry may have suffered so heavily that it may not be able to recover in the near future. Let the Administration take a positive action; either import more coal failing which it must move the price upward by at least Rs. 4 to 5 per thousand in order to meet the mounting cost. Unless this is done, the consumer of bricks will also be hard hit as he will not be able to adhere to the schedules which are being pressed upon him by the development authorities. The sands of time are running out; only 90 more days are left for "burning" bricks because the kilns will cease working with the commencement of the raining season. Any delay now may land the industry in irreparable loss.

Tea

PLEA FOR TAX CONCESSIONS

THE SPEECH of Mr. I. F. Morriss, Chairman, Indian Tea Association, delivered at the Association's annual general meeting, is to the point, logical and realistic. Besides, it has a lot of force in its arguments. While covering most of the problems pertaining to the tea industry, it makes a passionate plea for tax concessions. The complaint of the tea industry is that not only it pays excise duty but also an export duty which ultimately undermines its competitive strength abroad. His thesis is that if excise duty or export duty is reduced or abolished, an increase in the off-take of Indian tea by foreign buyers can be expected. The Chairman's view that such an increase can take place is based on many reasons. Firstly, there is at present no encouragement whatsoever to send out tea when each export is accompanied by the payment of an export duty over and above the excise duty already paid. Secondly, the producer who is asked to quote for his teas by foreign buyers is bound to quote a price which will at least cover his cost of production as well as internal taxes which he is to pay. The foreign buyer will naturally see to this price and will realise that in addition he will have to pay the export duty. Inevitably, quality for quality, the Indian producer must quote a higher price than producers who are not handicapped by the need to pay an excise duty and an export duty on teas which are exported.

The proposal which the Association has submitted to the Government is that internal duties, both Central and State, including tea cess, should be consolidated into one tax so that there is one set of tax gatherers to deal with, in place of four or five at present and that tax should be payable not ex-factory, as at present, but as near to the point of sale as possible. In the process of this consolidation, the Association's contention is, that it will save Government and the Association a lot of very costly and unprofitable accounting and a mass of reconciliation which is at present hindering the advancement of the industry. The other fiscal proposal is that when tea is exported there should be a refund on an excise duty it has paid or, alternatively, export duty should be abolished or reduced. In this context one is led to ask as to what is the consequence of imposing an export duty and an excise duty on exports. Needless to say that it results in discouragement of the consumption of Indian tea abroad—a consequence diametrically opposed both to Government's policy which is to export more and to the industry's chances of prosperity.

It may be borne in mind that FAO report on world supply and consumption predicts a substantial excess of production over consumption within the next three years. So, under the circumstances the plea of the Association's chairman seems to gather an added force. There is, however, only one heartening feature in the whole situation and that is that the Government might be prepared to consider a reduction in the export duty on tea. It was disclosed by Mr. K. C. Reddy, Minister for Commerce and Inustry at the recent Export-Import Advisory Council meeting. This incidentally is in line with the Mudaliar Committee report submitted to the Government, which has asked for a reduction in export duty. Now, it is only to be hoped that when the new Cabinet is formed the exhortation of the Minister will be carried into effect.

On the problem of industrial relations in the tea industry, the ITA Chairman, revealed that in the 800 separate units belonging to the membership of the ITA producing more than half of India's tea, there have been only 47 strikes of which 35 were settled on the day on which they started and only two lasted for more than four days. This not only is a tribute to the ITA's labour organisation, the local officials of the Government and the trade unions, but also to the plantation managers who have shown great sense of responsibility in dealing with the labour force. The improvement in relations can also be assigned to Mr. G. L. Nanda's labour policy and his Code of Discipline which has played an important role in curbing down the disputes.

An excellent suggestion was put forward in regard to bonus which states that in future agreements bonus should not go to the offending workmen but shou'd be placed in a cmmon fund belonging to the workers as a whole. The idea seems to be a good one for it can have a toning and an healthy effect. It is now only to be wished that it should be considered by the Bonus Commission.

New Issues

ASSAM HARDBOARDS

TWO COMPANIES will be raising capital from the public in the near future.

Assam Hardboards Limited is entering the capital market on March 22 with an offer to the public for subscription of 5,000 redeemable cumulative preference shares of Rs. 100 each and 2,46,000 equity shares of Rs. 10 each. The cumulative preference shares will carry dividend at the rate of 9.3 per cent, free of company's tax, but subject to deduction of tax at source at the prescribed rates. The list will close on March 31 or earlier at the discretion of the directors, but not before March 26.

The issue, if fully subscribed, will raise the issued and subscribed capital of the company to Rs. 60 lakhs. The company has an authorised capital of Rs. 100 lakhs, three-fourths of which is in equity shares and the remaining one-fourth in preference shares. Capital to the tune of Rs. 9 lakhs, all in equity shares, has already been subscribed by the directors of the company and their friends. They have further agreed to take up another 64,000 equity shares. The Assam Government has agreed to subscribe to 5,000 preference shares. The foreign collaborators will be allocated one lakh equity shares in part payment for the imports of machinery and equipment to be arranged by them.

The company has been established at Gauhati to undertake the manufacture and sale of hardboards and is setting up its plant at Panikhaiti, 12 miles from Gauhati, for the purpose. The plant will have a capacity of 50,000 tons hardboards output per annum. It is expected to be commissioned into production by the end of 1963.

Technical and financial collaboration has been arranged with Columbia Hardboard Co., Inc., Seattle, Washington, U.S.A. Wood raw material supplies are to be secured from the neighbouring forest ranges in Assam.

The total cost of the project is estimated at Rs. 1.40 crores. Since the share capital will be making available only Rs. 60 lakhs, a long-term loan of Rs. 60 lakhs has been arranged from the Industrial Finance Corporation of India. The remaining Rs. 20 lakhs will be procured through bank borrowings. The IFC loan will be in dollars to the extent of Rs. 51.74 lakhs. The company's Board of Directors includes Mr. G. D. Somani, a prominent industrialist of Bombay, Mr. Nagarmal Periwal and Mr. Benugopal Bangur.

ORIENTAL POWER CABLES LIMITED

ORIENTAL POWER CABLES LIMITED, Indore, is expected to enter the capital market early next month to raise from the public Rs. 36.5 lakhs in the form of 36,500 equity shares of Rs. 100 each. This issue, if fully subscribed, will raise the company's issued and subscribed capital to Rs. 105 lakhs.

The company is setting up a plant near Kotah, Rajasthan, for manufacturing wires, cables, lines, cords and conductors (paper insulated and plastic coated VIR description) of all categories, including belted type, H type, SL type, HSL type and PVC insulated types. In the initial stages, it will be producing about 600 miles of paper insulated power cables which are high tension cables suitable for use in the transmission of electricity at high voltage from 1,100 volts to 33,000 volts or more.

Technical collaboration for the project has been arranged with Sumitomo Electric Industries Ltd., Japan.

one of the leading cable manufacturers in the world.

The project is estimated to cost Rs. 250 lakhs. As the share capital will be making available only Rs. 105 lakhs, a loan of Rs. 85 lakhs has been negotiated with the Industrial Finance Corporation of India. The balance, Rs. 60 lakhs will be procured from other financing agencies.

The Rajasthan Government is collaborating in this venture. Production is expected to start by June 1963.

Nylon

MULTIFILAMENT YARN PLANT

WITH THE commissioning of the most modern, up-to-date and fully automatic nylon multifilament yarn plant at Pimpri, near Poona, Mr. B. D. Garware, of the Garware Group of Industries, may again be said to be the first man to open such an industry in the country. In 1958, it will be recalled, he successfully constructed the first nylon monofilament plant. Incidentally, both these plants are claimed to be the first of their kind not only in India, but in the entire ECAFE region save for Japan. Even so, this 1½-ton plant is but a part of the phased programme; very soon, there is going to be a polymerisation plant with a capacity of two tons which would produce raw materials that are needed for the nylon industry which are presently being imported. These two plants are estimated to cost about Rs. 1 crore and between them are expected to save foreign exchange to the tune of Rs. 50 lakhs annually.

On the occasion of the release, recently, of the first production of nylon yarn, Mr. Garware pointed out, that, while the monofilament plants had been producing nylon bristles that were more than sufficient for the entire brush industry in the country and fishing lines and guts to the sports goods industry, the multifilament plant had been designed to produce diverse products such as nylon fishing nets, ropes, hoses, tarpaulins, belts, spindle tapes, filter cloth, ribbons, sewing thread and tyre cords. The major part of the production would, however, be consumed by fisheries, the defence, and textile industry, he added.

As for the demand, Mr. Garware observed that, for obvious reasons, he was not able to give any assessment of the defence requirements. However, the total requirements of the Fisheries Departments alone has been estimated to amount to about a crore of rupees by the end of the Third Plan. With the development of nylon which is so vital to the industrial life of our country, one more step forward has been taken towards the take-off stage atleast in this field.

National Income

PATTERN OF GROWTH

THE NATIONAL income of India (at 1948-49 prices) was Rs. 12,690 crores in 1960-61 and Rs. 11,850 crores in 1959-60, compared to Rs. 10,480 crores in 1955-56. The per capita income at 1948-49 prices was Rs. 292.5, Rs. 279.0 and Rs. 267.8 in the three years 1960-61, 1959-60 and 1955-56 respectively. This is revealed by the ninth issue of the annual White Paper on national income just released by the Central Statistical Organisation.

The estimates for 1959-60 included in this paper are based on the detailed methods of estimation followed for the earlier years and show an upward revision over the preliminary estimates published last year. The estimates for 1960-61, though still preliminary and based on partial material, have also undergone upward revision as compared to the quick estimates released in August last year. These upward revisions, have inter alia been due to the incorporation, for the first time, of the results of random crop-cutting surveys in respect of rice in Orissa and maize in Bihar.

Unlike 1959-60 which, as a result of fall in agricultural output, recorded only a nominal increase in the total national income, the increase in total national income (at 1948-49 prices) during 1960-61 over the preceding year amounted to Rs. 840 crores, including an increase of Rs. 360 crores in agriculture alone. The increase registered by the non-agricultural sectors works out at Rs. 480 crores during 1960-61 over the preceding year, compared to an increase of Rs. 260 crores in 1959-60 over 1958-59. The total national income and the per capita income increased by 7.1 per cent and 4.8 per cent respectively in 1960-61 over 1959-60.

Columns 2 and 3 of the statement below indicate the trend in net national output at current and at 1948-49 prices respectively during the last 11 years (1950-51 to 1960-61). Columns 4 and 5 reveal the trend in per capita income based on population estimates worked out from the all-India census figures of 1941, 1951 and 1961 (provisional).

	Net National Output (in Rs. 100 crores)		Per capita net output (in Rs.)	
	at current prices	at 1948-49 prices	at current prices	at 1948-49 prices
(1)	(2)	(3)	(4)	(5)
1950-51	95.3	88.5	266.5	247.5
1951-52	99.7	91.0	274.2	250.3
1952-53	98.2	94.6	265.4	255.7
1953-54	104.8	100.3	278.1	266.2
1954-55	96.1	102.8	250.3	267.8
1955-56	99.8	104.8	255.0	267.8
1956-57	113.1	110.0	283.4	275.6
1957-58	113.9	108.9	279.6	267.4
1958-59	126.0	116.5	303.0	280.2
1959-60	129.4	118.5	304.7	279.0
1960-61 (preliminary)	142.0	126.9	327.3	292.5

After adjusting for purely statistical differences between the crop production estimates of 1955-56 and 1960-61, the increase in national income and per capita income in real terms amounts to 20.2 per cent and 8.4 per cent respectively during the Second Five-Year Plan period. Expressed at current prices, the national income was Rs. 14,200 crores and Rs. 12,940 crores in 1960-61 and 1959-60 respectively, as against Rs. 9,980 crores in 1955-56. The per capita income at current prices was Rs. 327.3, Rs. 304.7 and Rs. 255.0 in 1960-61, 1959-60 and 1955-56 respectively. The larger increase at current prices than at constant prices was due to increase in prices.

Iron Ore

EXPORTS FROM GOA

GOVERNMENT OF INDIA'S policy in respect of iron ore exports from Goa has been announced. Established shippers (in Goa) will be permitted to export iron ore generally under the previous system obtaining in this territory, which has also continued to be operative for the period ending March, 1962. As was the procedure hitherto followed, minimum prices will be fixed from time to time, operative normally for the period of one year at a time, by an agency or board to be constituted by the Military Governor (or Administrator) in Goa. There will be no restrictions on quantities which individual shippers contract to export to foreign buyers, but price stipulations in such contracts should be valid for one year at a time, that is, for the period for which the price fixed by the Administration in Goa is operative. Contracts should be for a period of one year. All existing contracts for the shipment of iron ore, irrespective of their duration, will be respected, provided they had received the approval of the former Administration, prior to December 18, 1961. Where

the price was to be determined from year to year, it will, in future, take into account the minimum price to be notified by the Administration in Goa.

Contracts which linked iron ore exports with the import of machinery may also generally be allowed to be fulfilled provided the commitments entered into can be considered as 'firm commitments'. Certain specific cases of such contracts which are concerned with the setting up of port installations and port development schemes are, however, being considered by Government separately, in relation to the policy to be pursued in regard to the maintenance and development of Marmugao harbour, and Government's views will be made known at a later date. Formulation of general policy for the exploitation of iron ore resources of Goa on a long-term basis is separately engaging the attention of Government.

Labour

JOINT CONSULTATION IN THE PUBLIC SECTOR

THERE HAS of late been evinced quite a keen interest by industrialists, planners, and labour leaders in the joint consultation scheme in the public sector. The 12th annual conference of the Indian Institute of Personnel Management which discussed at length the scheme of joint consultation and the recent talk of Mr. R. D. V. Roberts, Industrial Relations Adviser to Electricity Council in Britain, are in this context quite noteworthy. The Conference felt that the sine qua non of success of the scheme of joint management councils in industries was that its implementation should be voluntary. And so also runs the thesis of Mr. Roberts, who stressed that in fact this should be scrupulously adhered to. The conference was of the view that expressions "workers' participation in management" and "joint management councils" contributed materially to the difficulties of implementation and working of the scheme. It should, therefore, be substituted by the terms association of workers with management and joint consultative council.

Although the talk of Mr. Roberts pertained to joint consultation in the public sector in Britain, it definitely was of great interest to us here. Mr. Roberts is of the view that executive powers should not be entrusted to the workers and this should mostly remain in the hands of the management. Since the management itself is prepared to invite the workers and consult them on all matters, it can be taken for granted that "No" attitude generally would not be adopted by the management in the implementation of decisions. Mr. Roberts reiterated that these management councils have proved quite a success in the public sector in Britain. So it can be assumed that given reasonable conditions, there is no reason why they should not be a success in this country. Mr. Roberts feels that management at all levels must take an active interest in joint consultation and be prepared to initiate matters for discussion. The trade unions on their part must give active support and education and training schemes should be provided for committee members to enable them to appreciate the purpose of joint consultation and inform them on their duties, rights and responsibilities. There must also be a two-way communication and full exchange of information at all levels of the consultative machinery. Generally speaking consultation is easier in an expanding and prosperous industry with a few redundancy problems.

So far as difficulties in the way of effective consultation are concerned, they, of course, are many. There are, for instance, still some managers particularly at the local level who fear that joint consultation may undermine their status and authority. While they are prepared to allow committees to discuss some subjects such as welfare and accident prevention, they feel quite sore when the committee wishes to discuss other subjects which they consider should solely be under the jurisdiction of the management. Then again there are many foremen and frontline supervisors who are quite critical of joint consultative committees. However, one is not to be perturbed and these problems have to be met boldly and squarely.

All said and done, to quote the words of Mr. Roberts, "effective joint consultation cannot be achieved simply by imposing a committee or system of committees on an existing organisation and hoping for the best. It must be carefully integrated into the organisation of the industry or undertaking. Nor can it be assumed that those who participate in the work are expert at it or can become so in a short while. It requires training and experience and active measures to increase understanding". These words of Mr. Roberts sum up the situation very nicely and provide the golden mean to run the scheme on a successful basis.

Refractories

FIVE NEW UNITS

THE SOVIET TEAM invited by Hindustan Steel to do a techno-economic study of the Indian refractory industry has recommended the setting up of five new plants for the manufacture of steel plant refractories—all in the public sector. These five plants are to be built during the next ten years and are likely to take care of the requirements of the rising steel production which in terms of finished steel may be around 7 million tons by 1965-66 and 16 million tons by 1970-71. The Team has reported that only one of the five new plants will go into production before the end of the Third Plan. This will be located at Bhilai, the construction of which is stipulated in an agreement between the Government of India and the Soviet Union early in 1961. The Bhilai unit, according to the Team, would initially have a capacity of 125,000 tons of refractory products. Expansion in the second stage would be extended further so as to constitute a third of the total production volume.

The Team is of the opinion that all the five units should be located close to one or the other steelworks. This would reduce capital investment as well as production costs. One fact that substantiates this idea is that the most suitable fuel for the refractory industry is coke-oven gas which would be readily available near the steel plants. This proximity will also reduce freight costs on finished refractory products. Naturally, therefore, Durgapur and Bokaro have been suggested as sites for two other units. It is proposed that both these would produce 210,000 tons of refractory products by 1970-71. It is further added that the fourth unit is to be located either at Salem near Madras or at Almora in U.P. to produce 140,000 tons of magnasite refractory powder by 1970-71. Site for the fifth unit has not yet been determined, but the Team has expressed the opinion that it should be located as closely to some future steel works as possible.

As far as raw materials are concerned, the Team has emphasized that the present knowledge is highly unsatisfactory and has, therefore, recommended detailed surveys to be undertaken in selected zones where such possibilities are more promising. The Team recommends that raw materials for the plants will call for sources with reserves of at least 30 to 33 million tons of fireclay rocks, 8 to 9 million tons of magnasite, 15 to 20 million tons of silica rocks and similar quantities of other minerals. No firm estimates, of course, are available of the magnitude of investment.

The Team's estimate of total demand for refractories, from all industries, at 1.26 million tons by 1965-66 is slightly higher than the Development Wing's figures of 1.11 million tons. This difference in the possible demand is not very great considering the fact that only one refractory would go into production by the end of the Third Plan. Gradually when other refractories go into production, certain adjustments of output capacity can surely be made.

FROM THE CAPITAL'S CORRIDORS

THIRD FINANCE COMMISSION'S REPORT

STATES will be receiving an additional Rs. 35 crores from the Centre during 1962-63 as a result of the Government of India's decisions on the Third Finance Commission's Report. The report was presented to Parliament on Monday along with the Explanatory Memorandum explaining the Government's proposed action on the recommendations contained in it. Under the award of the Second Finance Commission, the States in 1962-63 would have got nearly Rs. 245 crores. In the light of the recommendations of the Third Finance Commission, this sum would be of the order of Rs. 280 crores.

The increased devolution of finances from the Centre to the States is the result of increases recommended by the Commission, and accepted by the Union Government, in the States' share in income-tax and union excises, stepping up of grants-in-aid and making available of special grants for improvement in road communications in some States.

With a sizeable amount flowing to the State Exchequers from the Central Exchequer, the Centre, it is learnt, will not in future encourage requests from S ate Governments for ways and means advances except in cases of extreme emergency, such as visiting of a natural calamity.

The Third Finance Commission, presided over by Mr. A. K. Chanda, former Comptroller and Auditor-General of India, it may be recalled, was set up under the Constitutional provision to make recommendations on the allocation of income-tax, sharing of basic Union excise duties and distribution of additional excise duties between the States and the Centre, payment of grants-in-aid to States under Article 275(I) of the Constitution, and on distribution amongst the States of estate duty on property other than agricultural land and of the grant of Rs. 12.5 crores payable to the States in lieu of the loss accruing to them on the abolition of tax on railway passenger fares.

The recommendations of the Commission are to cover a period of four years commencing from April, 1962, except in regard to the payment of the grant in view of the tax on railway fares which is to be effective for five years from April 1, 1961, the day on which the tax was abolished.

The report of the Commission is not unanimous and carries a minute of dissent from one Member, Mr. G. R. Kamat, on the payment of special purpose grant for improvement of road communications and inclusion of 75 per cent of the revenue component of the S ate Plans in the Commission's recommendation of assistance to the States. The Union Government has accepted all the unanimous recommendations of the Commission and its majority recommendation regarding the payment of a special purpose grant for improvement of road communications. Necessary action to implement these decisions is being taken and legislation for this purpose will be promoted in the current session of Parliament.

CHANGES EFFECTED

At present 60 per cent of the net proceeds of taxes on income other than Corporation Tax but excluding taxes on Central emoluments and those attributable to Union territories (assumed at 1 per cent of the net proceeds) are distributed amongst the States, the share of each State having been fixed 90 per cent on the basis of population and 10 per cent on the basis of collection. The Finance Commission has increased the percentage attributable to Union territories from 1 to 2½ per cent and raised the States' share of Income-tax from 60 to 66-2/3 per cent. The share of each State has been determined by the Commission on the basis of 80 per cent on population and 20 per cent on collection.

The States are at present entitled to 25 per cent of the net proceeds of Union Duties of Excise on 8 articles viz. matches, tobacco, sugar, vegetable produc s coffee, tea, paper and vegetable non-essential oils. The Commission, while reducing the percentage to 20, has increased the number of shareable excises from 8 to 35 by including all articles other than motor spirit on which such duties were collected in 1960-61 and excluding those (but not excluding silk fabrics) on which the yield was below Rs. 50 lakhs a year. In determining the share of each State, the Commission has, while continuing population as the major factor of distribution, taken also into account the relative financial weaknesses of the States, the disparity in the level of development reached, the percentage of Scheduled Castes and Tribes and Backward Classes etc.

The entire net proceeds of Additional Excise Duties on mill-made textiles, sugar and tobacco which were levied in replacement of States' Sales Tax accrue to the States other than those attributable to the Union territories. The States had also been guaranteed the income derived by them from the Sales Tax on these commodities in the financial year 1956-57. While retaining the share of Union territories at 1 per cent, the Commission has increased the share of Jammu and Kashmir State from 1½ per cent to 1½ per cent and suggested a small increase in the amount guaranteed to the States from the present level of Rs. 32.5 crores to Rs. 32.54 crores to account for the yield from silk fabrics which were subjected to the Additional Excise Duty in lieu of States' Sales Tax with effect from 1st April, 1961. The excess over the guaranteed amount has been recommended for distribution among t the rest of the States partly on the basis of population and partly on percentage increase in their Sales Tax revenue since 1957-58.

The Commission has not suggested any change in the principles governing the distribution of Estate Du'y. The percentages assigned to each State, however, have been revised on the basis of population figures as indicated in 1961 census.

The distribution of the annual grant of Rs. 12.5 crores payable to the States in lieu of their share of Tax on Railway Passenger Fares has been recommended on the principle of compensation to place the States broadly on the same footing as they were before the tax was abolished with effect from 1st April, 1961.

Of the two recommendations to which there is a minute of dissent from Mr. Kamat, the first relates to the payment of a special purpose grant for improvement of communications in certain States. Although for development of road communications there exi ts a provision of Rs. 324 crores in the Third Five-Year Plan, the Government has decided to accept the majority view of the Commission on this subject because it appreciates that the financial position of certain States is such that without special assistance of this kind it might be difficult for them to make adequate provision for this purpose. Accordingly, annual grants amounting in all to Rs. 9 crores will be made to ten States as recommended by the Commission.

GRANTS - IN - AID

At present 11 State Governments receive grants-in-aid of their revenues amounting in all to Rs. 39.5 crores annually; the individual shares being: Andhra Pradesh Rs. 4 crores, Assam Rs. 4.5 crores, Bihar Rs. 4 25 crores, Jammu & Kashmir Rs. 3 crores, Kerala Rs. 1.75 crores, Madhya Pradesh Rs. 3 crores, Mysore Rs. 6 crores, Orissa Rs. 3.5 crores, Punjab Rs. 2.25 crores, Rajasthan Rs. 2.5 crores and West Bengal Rs. 4.75 crores. The Third Finance Commission has recommended an annual payment of a total grant-in-aid of Rs. 110.25 crores to all the States other than Maharashtra, of which Rs. 52 crores are to fill the revenue gap in the budget of the State Governments and Rs. 58.25 crores towards 75 per cent of the revenue component of the State Plans. The Government proposes to accept the unanimous recommendation for the payment of the revenue gap grant of Rs. 52 crores. This would mean that Andhra Pradesh would get Rs. 9 crores, Assam Rs. 5.25 crores, Gujarat Rs. 4.25 crores, Jammu and Kashmir Rs. 1.5 crores, Kerala Rs. 5.5 crores, Madhya Pradesh Rs. 1.25 crores, Madras Rs. 3 crores, Mysore Rs. 6.25 crores, Orissa Rs. 11.5 crores and Rajasthan Rs. 4.5 crores.

PLAN ASSISTANCE

As regards the recommendation for including a part of the Plan assistance in the Commission's scheme of devolution, the Government of India, in consultation with the Planning Commission, has come to the conclusion that there would be no real advantage to the States in receiving assistance towards their Plan, partly by way of statutory grant-in-aid on the basis of Finance Commission's recommendations and partly on the basis of annual reviews made by the Planning Commission. The Central assistance is determined after a careful assessment of the overall financial and economic situation and after making such adjustments which changing situations would demand from year to year. It is, therefore, necessary not only to review the financial position of the Centre and the States annually but also to take an integrated view of the entire financial picture of each State, both on revenue and capital accounts, in relation to the State Plan as a whole. The non-acceptance of this recommendation of the Commission will not affect the total amount of Central assistance to the States. The Central assistance to the States, as envisaged in the Plan, will continue to be made available on the basis of annual reviews of the overall financial position and other relevant factors. The Union Government also considers that annual planning and reviews are an essential means of improving performance in all sectors ensuring the fullest effort to raise resources, maintaining a satisfactory balance between different types of projects and of observing priorities. These purposes will be better served through suitable changes in the existing procedures rather than by converti g any portion of Central assistance for the State plans into statutory grants which, by their very nature, would lack flexibility. The States already enjoy sufficient degree of freedom in the utilisation of the Central assistance made available to them. Steps will, however, be taken to further simplify the procedures for the release of Central assistance and to make them more flexible.

The recommendations of the Commission accepted by the Government would according to present indications involve an additional payment of the order of Rs. 35 crores to the States next year as compared with amount which they would have got under the present arrangements. As a result of the increase in the States' shares of Income-tax and the considerable widening of the number of shareable excises, the States' share in future years would be very much more .

The table below summarises the recommendations of the Commission accepted by Government.

GENERAL OBSERVATIONS

The Finance Commission has also made in its report some general observations. Action on these will be taken by the Government of India in course of time as some of them are of far-reaching character.

The Commission has suggested setting up of an independent body to assess the tax potential of each State and to review the tax structure in relation to the different heads of levies in the State list. This body may, it has further suggested, also study the widening gap between the resources and the functions of the States brought about mainly by the planning processes and consider adjustments necessary in the Union States financial relations.

Another important suggestion made by the Finance Commission is for solving the overlapping of functions between the Planning Commission and the Finance Commission. It has suggested that either the scope of the Finance Commissions, provided to be set up under the Constitution every five years, should be widened to

	Share of Income-tax†	Share of Union Excise Duties‡	Grant-in-aid under Article 275(1) (Substantive portion)	Special Purpose Grant for improvement of communications	Share of Estate Duty	Grant in lieu of tax on Railway fares	Additional Duties of Excise

†The net proceeds of Income-tax, except those attributable to Central emoluments and Union territories are divisible between the Centre and the States. The Commission has increased the share attributable to Union territories from 1 per cent to 2½ per cent of the net proceeds.

‡Representing net proceeds of Union Excise Duties on 35 articles recommended by the Commission.

*Applies only to tax allocated to other than immovable property.

**Jammu & Kashmir will receive no compensation but 1½ per cent of net proceeds.

embrace all assistance given by the Centre to the States or the Planning Commission should be transformed at the appropriate time into a Finance Commission.

The Commission has also commented on the wide disparities that exist in various States in the field of land revenue, sales-tax, motor vehicles tax, etc. In respect of land revenue, it has observed: "Though it is generally accepted that the rural sector could make a greater contribution to national economy, there is an understandable reluctance to revise even the rates of land revenue in operation, even when they have not been reviewed in the last 30 to 60 years."

The Commission has further urged the need for striking a balance between planned and non-planned outlays in States.

CHANGES IN LICENSING POLICY

The Union Ministry of Finance, it is learnt, has advised the Ministry of Commerce and Industry against issuance of any industrial licence automatically under the Free Licensing List if the foreign exchange requirements under it exceed Rs. 10 lakhs. All applications for the grant of industrial licences involving foreign exchange expenditure exceeding Rs. 10 lakhs, irrespective of their being on the Free List or not, shall, in future, have to be examined and approved by the Licensing Committee.

Simultaneously, the Licensing Committee has been advised to examine very carefully every new project in respect of its essentiality for the economic development of the country under the planned programme and the availability of power and transport, before approving them.

These procedural changes in the issue of industrial licences have been necessitated by the fact that licences involving a foreign exchange expenditure to the tune of Rs. 400 crores had been issued to the private sector by December 31, 1961, as against Rs. 450 crores earmarked for the purpose for the whole of the Third Plan period. Of the licences issued, licences involving foreign exchange expenditure to the extent of Rs. 190 crores had already been cleared by the Capital Goods Committee by December end. It is pointed out that in the last analysis, all the industrial licences are like post-dated cheques which the Government has responsibility to honour. Even if the "infant mortality" rate in this respect is assumed as 25 per cent, licences involving foreign exchange expenditure to the tune of Rs. 300 crores have been issued in the very first nine months of the Third Plan period. This should imply that the targetted capacity under the Plan for a number of items of production has already been exceeded. Some genuine entrepreneurs in some particular fields might, thus, be shut out for the Third Plan period.

With the Congress Party having been returned to power with an overwhelming majority at the Centre, the question of granting licences for setting up new units has assumed an added significance. The Planning Commission, it is understood, is demanding a careful scrutiny of the licensing system so that a policy should be evolved which may not only fit into the general pattern of industrial development but also achieve the main objective of planning, namely, the ushering in of a socialistic pattern of society.

The Government of India claims that through industrial licensing as practised under the first two Plans, the Government has been able to foster some healthy competition at least in consumer goods industries. With this aim in view, a fifth unit has been licensed to manufacture wrist watches, although there were already in existence four such units, including one in the public sector. Similarly, in the chemical industry some over-licensing has been done. In the case of certain other industries, however, this principle has been violated to some extent. A case in point is the manufacture of sewing machines. An application for the manufacture of industrial sewing machines was turned down recently although there does not exist adequate capacity for meeting the domestic demand for them. Similarly, at present there is a proposal to ban the import of eleven components needed for the manufacture of domestic sewing machines in the small-scale sector. Another instance of this lack of coherence in the industrial policy, as practised hitherto, has been the grant of a licence for a fourth unit to be set up to manufacture industrial laminates on the ground that the foreign collaborator, Formica International Limited, is a concern of international repute. During the Second Plan period, an application of a private concern seeking collaboration with an equally internationally reputed firm of sewing machines, Singers, had been turned down.

The present industrial policy may also need a review if not for any other reason than for avoiding concentration of wealth and means of production in fewer hands. The Mahalanobis Committee, which was set up towards the end of 1960 to enquire into concentration of wealth and means of production in a few hands, has yet to give its verdict on the issue. The Committee will, perhaps, enquire into the problem as to how far the licensing policy pursued during the last few years has had the effect of counteracting concentration of wealth and means of production or has it accentuated the trend.

IDA LOAN FOR DVC

The International Development Association has granted a loan of 18.5 million dollars (approximately Rs. 8.82 crores) to the Damodar Valley Corporation for raising the total installed capacity of its power system by 140,000 kW. and for expansion of its transmission network in West Bengal and Bihar. The agreement to this effect was signed last week.

The existing generating capacity of the DVC power system is 479,000 kW.: Tilaiya power station accounts for 4,000 kW., the Bokaro thermal power station for 225,000 kW., the Maithon hydel station for 60,000 kW., the Panchet hydel power station for 40,000 kW., and the Durgapur thermal power station for 150,000 kW. The new capacity to be generated (140,000 kW.) will be added to the Durgapur thermal station where another hydrogen-cooled toubro-generator is to be set up. The additional transmission lines to be erected with this fresh assistance from the International Development Association would cover about 17 miles—5 miles of 132 kV. double circuit line and about 12 miles of 33 kV. line.

Part of the loan will be utilized for modification and extension of the sub-stations at Durgapur, Bokaro, Chandrapura, Sindri, Kaliphari, Ramgarh, Luchipur, Ramkanali, Burdwan, Oyaria and Maithon. A central load dispatch and system control station will be constructed at Maithon.

POWER PROJECTS IN THE THIRD PLAN

The following is the list of the power projects included in the Third Plan. Foreign assistance for 38 of these has already been negotiated. Twelve projects are covered by bilateral trade agreements. Foreign assistance for 15 projects is under negotiation at present. There are 10 projects for which no aid has been arranged so far.

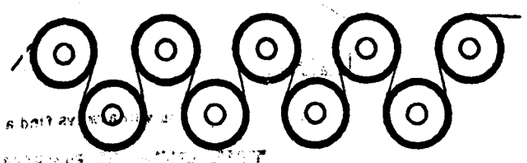
TATA-JOHNSON AND THE PAPER INDUSTRY

Although the pulp and paper industry is expanding rapidly, its output barely meets demand. Many new large-scale plants are therefore necessary. Importing machinery for these plants would be a heavy drain on foreign exchange reserves. A better plan: indigenous production of the machines.

Tata-Johnson's entry into the field is timely. Tata's, collaborating with A. Johnson & Co., a leading Swedish combine, have promoted Tata-Johnson Ltd. The company manufactures pulp and paper machinery with a high indigenous content and incorporating the latest developments in the field.



Technical know-how is provided by Sweden's AB Karlstads Mekaniska Werkstad (KMW), AB Kamyr and AB Rosenblads Patenter, as well as the Cellulose Development Corporation (Celdecor), pioneers in bagasse pulping.

Machinery designed by these leading organizations is manufactured at TELCO's well-equipped works with the close co-operation of Tata-Johnson specialists in Jamshedpur.

IRRIGATION AND POWER DEVELOPMENT IN NARMADA VALLEY

A conference of senior officers of Madhya Pradesh, Gujarat, Maharashtra and Rajasthan, held recently, has recommended that a central organisation, to be called the Narmada Valley Authority, should be formed on the pattern of the Tannesse Valley Authority, for the development of water resources of the entire Narmada Valley.

During the discussions, it was pointed out, that the Punasa project comprised four main power works: one at Punasa having a power potential of 400,000 kW., the second one at Burwaha having a power potential of 200,000 kW., the third one at Harinpal having a power potential of 370,000 kW., and the fourth one at Navgam having a power potential of 500,000 kW. Punasa, Burwaha and Harimphal are situated in Madhya Pradesh, while Navgam is in Gujarat.

The total estimated cost of the development of these sites is about Rs. 50 crores excluding the transmission system. All the development projects in the Narmada Valley may cost about Rs. 200 crores.

TRADE FOLLOWING AID

Considerable concern is being expressed amongst foreign interests, particularly the British, over the diversion of trade to the United States through the latter's aid programme. The U.S. Government has given some assistance to India, in the form of long-term loans, to enable the latter to import from the former certain industrial and agricultural raw material. Another similar loan is expected to be made available soon. India being in a tight corner in regard to foreign exchange, has to import some of the essential raw materials from the United States under the assistance programme; otherwise, the wheels of industry here are bound to slow down. As a consequence to this, the United Kingdom stands to lose in the Indian market because some of the goods imported from the United States are those that used to be the export items of the U.K. To avoid this complication, it is understood, efforts are being made to search for a via media.

TRADE ON RUPEE PAYMENT ACCOUNT

Some misunderstanding appears to exist in the minds of some persons regarding the implications of paying for imported goods and/or services in Indian rupees. All payments to foreigners and foreign concerns made in Indian rupees, it is explained, are, in the last analysis, payments in foreign exchange and the impression that such payments do not result in expenditure of foreign exchange is based on a misapprehension. Even when rupees are not converted into a foreign currency directly, they are utilised by the foreign party for financing exports from India or for the availing of services in India for both of which he would normally have remitted foreign exchange. In other words, in all such cases the foreign exchange that would have otherwise

been earned by exports or services is lost to the country. Thus, although at first the transaction takes place in terms of Indian rupees, the final result is that India pays for the goods and services supplied by the foreign party in foreign exchange. It may also be reiterated that under the Foreign Exchange Regulation Act and the rules made trereunder, it is obligatory to obtain necessary sanction from the Reserve Bank of India before any obligations are accepted or payments are made to or commitments to pay are entered into with a foreign party and this applies equally whether the payment is made in a foreign currency or in Indian rupees.

So far as transactions with the U.S.S.R., Poland, the German Democratic Republic, Czechoslovakia, Hungary, Yugoslavia, Rumania and Bulgaria are concerned, the Government of India have entered into agreements with these countries for all payments, on both sides, to be made in rupees only and the regulations require that all commercial contracts should be concluded on that basis. In accordance with Government of India's trade agreement with the Egyptian region of UAR and Afghanistan, trade with these countries should also be conducted in rupees. A limited payments arrangement on these lines also exists with Burma and Pakistan. The above trade agreements and special arrangements are intended to provide for trade between India and the country concerned on a balanced basis. As imports involve reciprocal export obligations, only essential imports can be permitted under the trade agreements and special arrangements. It may also be stressed that these countries cannot be used as intermediaries for importing goods from or exporting goods to a third country.

QUALITY CONTROL

The most important recommendations made by the ad hoc Committee on Quality Control and Preshipment Inspection relate to the enactment of legislation for empowering Government to impose quality control and pre-shipment inspection on export goods and the setting up of an Export Inspection Advisory Council for the formulation of guiding policies on matters concerning quality control. These two recommendations have been accepted by Government and steps are being taken to implement them.

The committee has also made a number of recommendations relating to the imposition of quality control on specific export commodities namely, vegetable oils, oilcakes, myrobalam, carpets, brassware, cashew kernals, pepper, cardamom, chillies and walnuts. These have also been accepted by the Government and action to implement them is in hand.

The other recommendations of the committee are of a general nature and are under examination.

WAGE BOARD FOR COLLIERY WORKERS

The Union Labour Ministry is understood to have conceded the demand of colliery workers for a wage board to review and re-examine the wage structure.

The Board is likely to be set up early next month under the chairmanship of an independent person. Besides having representatives of employers and workers as its members, it will include an economist as well, The move follows the strike notice given by the Colliery Mazdoor Sangh which has demanded that a miner's consolidated pay should be raised from the present Rs. 78.39 to Rs. 125 per month.

In view of the rigid control on the selling prices of coal, any increase in wages is bound to be reflected in a corresponding increase in prices, but the workers contend that there is a margin in the existing price structure which would absorb wage increases.

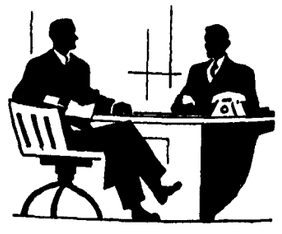
STABILIZING WORLD PRICES OF PEPPER

In order to stabilise world selling prices of pepper, exploratory talks have been held recently between the main pepper-producing countries — India, Indonesia, Sarawak — and the pepper marketing area in the East —Singapore—under the auspices of ECAFE. The trend of the talks has shown that there is a possibility of formation of an International Pepper Council for stabilising the prices at a higher level than at present with a view to maximizing the foreign exchange earnings of these countries from this commodity. The matter, it is stated, is being persued.

IN BRIEF.....

The U.K. - U.S.A. agreement for the reduction of tariffs, it is explained here, will be applicable to India as it has been reached under the Most Favoured Nation clause. India, along with the other Commonwealth countries, will be eligible to export on identical terms to the United Kingdom all those categories of goods which the U.S.A. will be allowed to export under the agreement.

*



The U.S. Government has granted a loan in dollars equivalent to Rs. 16.7 crores to the Indian Railways for the purchase of 125 diesel locomotives—100 2,600 H.P. broad gauge locomotives and 25 1,400 H.P. meter gauge locomotives—and some spare parts.

*

The Government of India has decided to give support to wheat prices at the next harvest by guaranteeing a price of Rs. 13 per maund for fair average varieties of white wheat when delivered at specified mandis. If need arises, the Government will make arrangments for the purchase of wheat tendered at this price.

*

The first petrol (motor gasoline) pump to be set up in India by the public sector will be commissioned in Assam within a week's time. The Government-owned Indian Oil Company (IOC) is installing it at Gauhati for the Assam State Transport Corporation's fleet. The IOC has already commissioned 62 High Speed Diesel fuel stations all over India which are now supplying "substantial quantities" of HSD imported from the Soviet Union, to Railways, State Transport Undertakings and to other major projects under the Third Five-Year Plan.

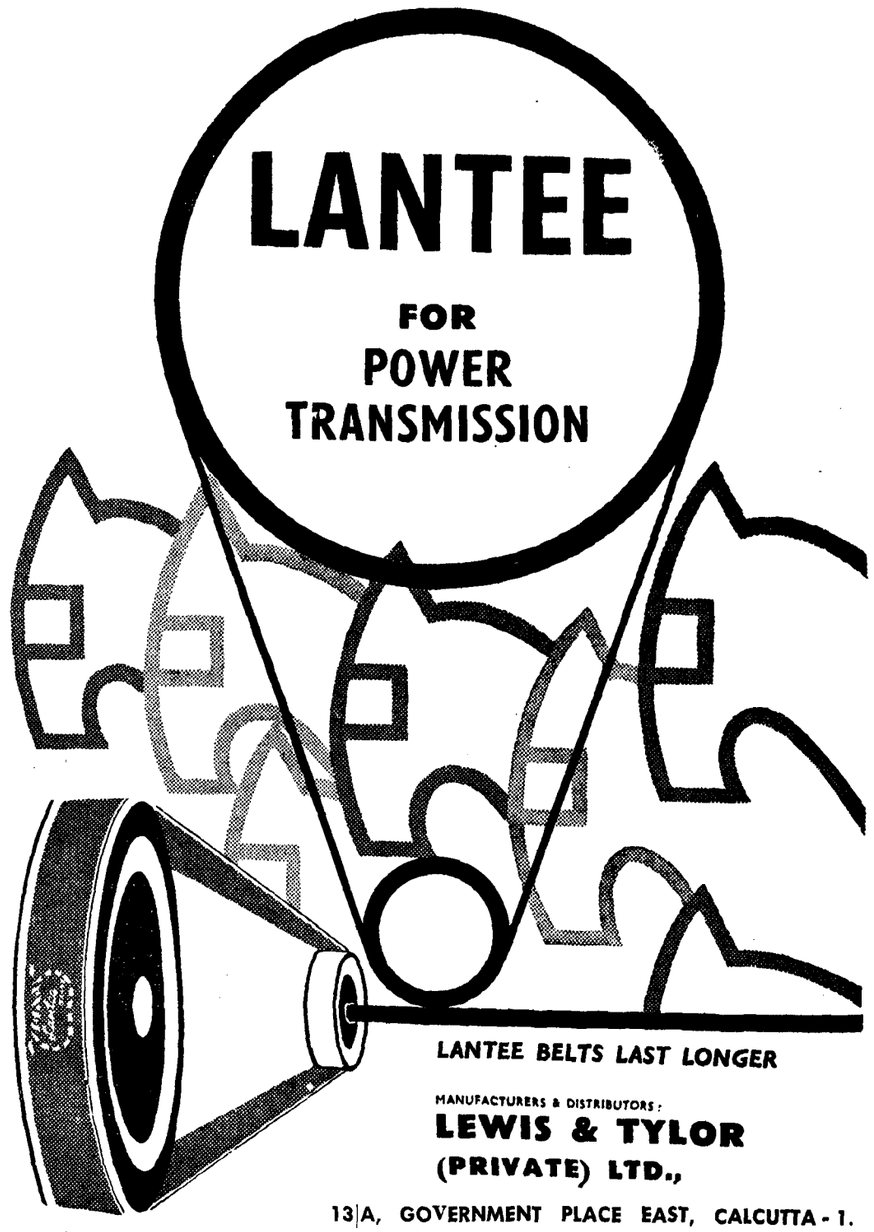
WHY TAKE CHANCES ?



In what you do every day, you are taking many chances. For example, take the things that you buy in the market. Are you always sure of their quality? Do you get good value for the money you spend?

And yet, you *can be sure* if you know that the goods you buy have been made to a given standard. Standardization benefits not only you, the consumer, but also the producer, the distributor and indeed, the country as a whole.

The Indian Standards Institution has prescribed standards for industrial as well as consumer goods. To manufacturers producing to relevant standards, ISI grants licences to apply on their goods its certification mark which is the guarantee of quality. The next time you buy anything, don't take a chance; look for the ISI mark.

COMPANY AFFAIRS

MAHINDRA & MAHINDRA LTD.

During the year to October 31, 1961 Messrs. Mahindra & Mahindra Ltd. recorded a profit of Rs. 110.58 lakhs—nearly 65 per cent higher than the previous year's profit of Rs. 66.76 lakhs. The sale proceeds during the year were recorded at Rs. 15.42 crores as against Rs. 13.63 crores during the previous year. After making provision for depreciation, development rebate reserve, payment of bonus to staff and provision for taxation, the directors separated Rs. 10 lakhs towards general reserve and Rs. 50,000 towards research and development fund. They recommended the payment of dividend on ordinary shares of Rs. 10 each at the rate of Rs. 1.25 which will absorb Rs. 16.50 lakhs. A bonus of 25 nP. per share is also proposed to be paid on ordinary shares of Rs. 10 each absorbing Rs. 3.30 lakhs.

The Directors have proposed that 6,60,000 ordinary shares of Rs. 10 each be issued for cash at a premium of Rs. 2.50 per share. Of these right shares, one new share will be offered to the existing shareholders as on 20th March, 1962 for every two shares held. The Board has reported that the Industrial Credit & Investment Corporation of India Limited and the Life Insurance Corporation of India had agreed to give the Company long-term loans of Rs. 1 crores and 35 lakhs inclusive of Rs. 35 lakhs in foreign currencies. These funds will be adequate for doubling the manufacturing capacity for Jeeps to 10,000 units per annum, and provide sufficient funds for investment in other projects presently under consideration. Thus the company shows a steady progress and promises good returns in the near future.

UNITED WIRE ROPES

United Wire Ropes Ltd. made considerable progress with its steel wire rope factory at Thana, near Bombay. After the suspension of acquisition proceedings in respect of lands for companies in general due to a recent Supreme Court judgment, the Company directly purchased about 75,000 square yards of land at Panchpakhadi, Thana, which was being acquired by the Government of Maharashtra for location of its factory. The Company has already obtained possession of the land and has completed contour survey etc. Preliminary building operations such as levelling, filling, etc. are in progress. Necessary building materials like cement, etc. have already been received. The Company obtained its import licence for a C.I.F. value Rs. 33,00,000 in October last year. The orders for plant and machinery required from abroad were placed with manufacturers in the United Kingdom, West Germany, France and Belgium and shipment of the machinery will start arriving in May 1962 and will be completed by August-September 1962. The orders for the indigenous machinery have also been finalised and the machinery will be delivered at the right time for erection. The construction of factory buildings is expected to be completed so as to start erection of plant and machinery in July 1962. The Company will, it seems, be able to maintain its original schedule of commencement of production by the end of 1962.

NEW ISSUES

The Automobile Products of India Ltd. Bombay, has been authorised to issue equity capital of Rs. 25 lakhs to finance the expansion for the manufacture of Lambretta scooters and autocycles. The new issue will be divided into 250,000 equity shares of Rs. 10 each for cash at par. The company has a subscribed and paid-up capital of Rs. 75 lakhs—Rs. 42 lakhs in equity and Rs. 33 lakhs in preference. Nine other companies have also been granted permission to issue capital. The consent is valid for 12 months in all cases.

The New Terai Association Limited, a company doing business as growers and exporters of tea, has been granted consent to the issue of capital of Rs. 2.70 lakhs on capitalisation of reserves. The existing paid-up capital of the company is Rs. 4.50 lakhs.

The Bhooteachang Tea Company Limited, Calcutta, is to issue 38,474 bonus shares of Rs. 10 each on capitalisation of its reserves to the extent of Rs. 3,84,740. The company's existing paid-up capital is Rs. 9,61,860.

The Pahargoomiah Tea Association Limited is issuing 58,500 bonus shares of Rs. 10 each on capitalisation of its reserves. The bonus shares will be issued in the ratio of one bonus share for every share now held.

The Baghjan Tea Company (1935) Limited, Calcutta, is also issuing 88,032 bonus shares of Rs. 10 each on capitalisation of its reserve to the extent of Rs. 8,80,320. The bonus shares will be issued in the ratio of one bonus share for every share held.

The Assam Forest Products Private Limited, Dibrugarh, has been allowed to capitalise reserves to the extent of Rs. 1,75,187 for issuing a bonus capital at the ratio of 50 per cent on the paid-up amount of the present paid-up capital of Rs. 3.50 lakhs, partly by crediting the existing partly paid shares and by the issue of 5,740 fully-paid shares of Rs. 10 each.

The Gujarat State Small Industries Corporation Limited, Ahmedabad, is raising Rs. 25 lakhs equity capital for cash at par. The proceeds will be utilised for helping the establishment of industrial estates and rendering assistance to small industries in the Gujarat State in the form of procurement of raw materials, machinery, equipment etc.

The Andhra Pradesh Mining Corporation Limited, Hyderabad, will issue capital of Rs. 10 lakhs in equity shares of Rs. 1,000 each for cash at par to the Andhra Pradesh Government. The proceeds will be utilised for the development of mineral rsources of the State. The present subscribed capital of Rs. 10 lakhs is also in equity shares of Rs. 1,000 each.

The Bihar State Small Industries Corporation Limited, Patna, a State Government concern incorporated on October 24, 1961, to establish industrial estates for executing the development work of the small-scale industries has been given consent to issue equity capital of Rs. 25 lakhs for cash at par.

The Hindustan Salt Company Limited, Jaipur, having a paid-up capital of Rs. 24.20 lakhs and engaged in the manufacture of salt and its bye-products is raising further capital of Rs. 175.80 lakhs in equity share of Rs. 1,000 each to be issued to the Central Government in consideration of transfer of assets of the three salt works, namely, Sambhar, Didwana and Khasaghoda.

AUSTRALIA'S LARGEST COMMERCIAL BANK CAN HELP YOU TO PROMOTE TWO-WAY
TRADE WITH AUSTRALIA, NEW ZEALAND, AND FIJI

Want to sell? Want to buy? Want market information? The international Division of the Bank of New South Wales can tell you about the opportunities for trade offering with these countries.

THE UNITED COMMERCIAL BANK, LIMITED

Registered Office: 2, India Exchange Place, Calcutta-1.

NOTICE

NOTICE IS HEREBY GIVEN that the NINETEENTH ANNUAL GENERAL MEETING of the Members of THE UNITED COMMERCIAL BANK, LIMITED, will be held at the Registered Office of the Bank at 2, India Exchange Place, Calcutta, on Wednesday, the 11th day of April, 1962, at 4 P.M. to transact the following business:-

1. To receive and adopt the Report of the Directors and the Audited Balance Sheet as on 31st December, 1961 and Profit and Loss Account for the year ended 31st December, 1961;
2. To declare a dividend;
3. To appoint two Directors in the place of Mr. A. C. Law and Mr. T. S. Rajam who retire under Article 92 of the Articles of Association of the Bank and, being eligible, offer themselves for re-appointment;
4. To appoint a Director in place of Mr. M. L. Dahanukar who retires under Article 92 of the Articles of Association of the Bank, and to consider and, if thought fit, to pass the following resolution, of which special notice, as required by Section 281 of the Companies Act, 1956, and in accordance with Section 190 thereof, has been received by the Bank:

   "Resolved that Mr. M. L. Dahanukar, who has attained the age of 72 years, be and is hereby re-appointed a Director of the Bank and that the age limit, prescribed under Section 280 of the Companies Act, 1956, shall not apply to him."

5. To appoint a director in place of Mr. P. D. Himatsingka who retires under Article 92 of the Articles of Association of the Bank, and to consider and, if thought fit, to pass the following resolution, of which special notice, as required by Section 281 of the Companies Act, 1956, and in accordance with Section 190 thereof, has been received by the Bank:

   "Resolved that Mr. P. D. Himatsingka, who has attained the age of 72 years, be and is hereby re-appointed a Director of the Bank and that the age limit, prescribed under Section 280 of the Companies Act, 1956, shall not apply to him".

6. To appoint Auditors for the current year and to fix their remuneration.

SPECIAL BUSINESS:

7. To consider and, if thought fit, to pass, with or without modification, the following resolutions which will be proposed as ordinary resolutions:

   a) That, subject to the consent of the Controller of the Capital Issues being received, 200,000 new ordinary shares of Rs. 100 each in the authorised capital of the company be issued at a premium of Rs. 25 per share on the footing that such new ordinary shares shall rank in all respects pari passu with the existing ordinary shares in the company save and except that they shall not participate in any dividend in respect of any period ended on or prior to 31st December, 1961; and that they shall be entitled in respect of the year ending 31st December, 1962 to half the rate of dividend that shall be payable on the existing shares;

   b) That the said 200,000 new ordinary shares be offered in the first instance, subject to the approval of the Reserve Bank of India wherever necessary, for subscription for cash to those members of the company whose names shall appear on the company's share register on the 11th day of April, 1962, in the proportion of one new ordinary share for every two existing ordinary shares then held by such members and so that half, namely Rs. 50, of the full nominal amount of each new share taken up together with the premium, viz. Rs. 25 in respect of each new ordinary share shall be paid to the company in cash with the acceptance of the offer and before allotment.

   c) That such offer be made by notice as hereinafter mentioned and that any member receiving such offer shall be entitled either to take up by paying therefor all or any of the New ordinary shares so offered to him or to renounce (upon signing a renunciation in such form as shall be prescribed by the Board of Directors) his right to all or any of such new ordinary shares in favour of a nominee or nominees; Provided that such nominee or nominees shall be a member or members of the Company or be approved of by the Board of Directors and that such nominee or nominees shall sign an acceptance of the shares so renounced in such form as shall be prescribed by the Board of Directors and that any such renunciation by a member and acceptance of such nominee or nominees shall be effective only if made upon forms to be supplied by the company and lodged duly completed with the company within the time specified together with the sum of Rs. 75 per share in cash (being the proportionate payment of Rs. 50 per share plus the premium of Rs. 25 per share).

   d) That subject to the approval of the Reserve Bank of India wherever necessary, the said offer be made to the said members by notice specifying the number of shares to which they are entitled and providing that the offer if not accepted within 30 days from the date of offer shall be deemed to have been declined and specifying that the payment for such shares at the rate of Rs. 75 for each new ordinary share so offered shall be made in full with the acceptance of this offer and before allotment.

   e) That any new ordinary shares not taken up by the said members in response to the above offer shall be available for sub cription by the members of the company who take up their rights in full and who desire to apply for additional shares but so that the right to apply for additional shares shall not be renounceable in favour of any other person and the allotment of any such additional shares shall be subject to any condition which may be imposed by the Controller of Capital Issues and, in the case of a non-resident member, further subject to the approval of the Reserve Bank of India.

Note: 1. A member entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and vote instead of himself and the proxy need not be a member:

2. (a) The transfer books of the Bank will be closed from Monday, the 26th March,

Why CIMMCO Sakamoto

BECAUSE

★ AUTOMATIC LOOM IS A MUST FOR QUALITY TEXTILES
★ 62% OF COUNTRY'S AUTOLOOMS ARE SAKAMOTO TYPE
★ 25% OF COUNTRY'S AUTOLOOMS ARE OTHER JAP. TYPE

ALSO

★ THESE ARE STURDY IN DESIGN
★ SIMPLE TO SET-UP AND OPERATE
★ TRIED IN COUNTRIES THE WORLD OVER

AND

TECHNICAL COLLABORATION **COMBINES** A **LOOM BUILDING EXPERIENCE** OF **18** YEARS AT CIMMCO WITH OVER **34** YEARS IN JAPAN.

Specially developed technique of boring frames on assembly ensures of perfect allignment. Improved temple cutter, end cutter and latest mechanised warp stop with efficient brake ensure faultless weaving continuously with minimum efforts.

BOOK REVIEWS

PROBLEMS OF GROWTH

Some Aspects of Indian Economic Development: Vol. I; By S. K. Bose, M.A., I.A.S.; published by Ranjit Printers and Publishers 4872, Chandni Chowk, Delhi; Pp. 508; Price Rs. 12.50.

A number of books have recently come into the market dealing with the current problems in economic development in the Indian Union but the volume under review by Mr. S. K. Bose (who has had the unique distinction of being associated with the Third Finance Commission, the Central Statistical Organisation and the Tariff Commission) provides a very thought-provoking analysis. The merit of this book lies in the fact that the author has spent considerable time in looking at the new and latest details—economic and statistical—made available by the various research agencies in order to throw light on the thorny economic problems facing this country. Because of his recent association with the Third Finance Commission, he seems to have delved deep into the regional demands, and the present volume does bear an impact of his keen interest in the regional picture. This is, perhaps, the only book produced recently which devotes substantial space to problems of regional growth and comes rightly to the conclusion that "if the rate of growth of a State is slower than that of the all India average, the State should be considered for preferential treatment provided it is not already having a per capita income above the all-India per capita income". The author has also made a special study of the level of living in the country in general and of special groups in particular.

The book is divided into a dozen chapters which discuss not only the problems of growth in terms of national and state income but also such issues as food supply, industrial development, Union and State Financial relations, revenue and expenditure of the Union Government, Revenue of State Governments, Planning in India and Foreign Assistance. Written primarily for the "intellectual elite" the book will be found extremely useful by students of economics as well as administrators who would like to have a dispassionate analysis of the current economic problems. It must be recorded here that the author has a definite bias in favour of statistical measurement. In order to describe a certain situation, he would rather struggle for a statistical figure than hanker after an idiom.

RAISING EMPLOYMENT

Employment Objectives in Economic Development: Published by International Labour Office, Geneva; Pp. 256; Price Rs. 11.

This is the report of a meeting of experts from five countries on a very important problem facing the developing countries all over the world. The experts have been picked from Brazil, Canada, Italy, Poland and India. Special studies on Japan, Brazil, India, Italy, the Philippines and Poland were contributed by experts while the ILO office prepared analysis for Ghana and the U.A.R.

The report comes round to the basic conclusion that processes of economic growth as well as employment can be hastened in the developing countries not only by raising the level of investment but also by changing the composition and the techniques of production. It is suggested that these developing countries should seek to produce those goods and services which embody "relatively little capital and relatively much labour". They should also seek to undertake the production of such goods and services by means of techniques that save capital and use much labour. The supporters of cottage and small industries believe that they answer these qualifications and therefore the area of unemployment can be reduced by extension of these industries. The experts have added another rider to this solution. They believe that the traditional industries will have to be transformed in the process of development if they wish to survive. Basically, output per man hour in these industries will need to be considerably increased by steadily increasing mechanisation. Their sizes also will have to be increased so that they should not be centred round a household as in the case of cottage industries. Modern management techniques as well as production processes will have to be pressed into service if handicrafts and small-scale undertakings are to move out of the traditional ways and come into the modern sector. In other words, the experts have advised selection of such industries which tend to raise employment but have also recommended the initiation of the small-scale and handicraft industries into the utilisation of modern techniques. The standard of living in any country can be raised only by raising the productivity of labour. The plea is made for modernized small-scale undertakings operating at an intermediate level of labour productivity, that is, productivity between the present-day large-scale sector and the present-day small-scale industries. Any diversion to small-scale industries without an eye on rising productivity will harm the objective of raising employment.

The report illustrates its thesis with reference to particular countries where the recommendations of their experts could be made use of with profit. Like all ILO reports, the present one also is very clearly laid out, without any confusion of thought.

THE PUBLIC SECTOR

The Structure of Public Enterprise in India: By Dr. V. V. Ramanadham; Asia Publishing House, Bombay; Pp. 267; Price Rs. 18.00.

It is perhaps most opportune at this moment, when the ideological speculations about the desirability of the public sector have been practically set at rest, to make an impartial and undogmatic assessment of its present structural and administrative aspects, and on the basis of past experience, focus attention on those aspects as are essential for its healthy development. Dr. V. V. Ramanadham has been, undoubtedly, successful in this almost pioneering effort to live up to his claims of presenting in this book what he describes "a scientific analysis of the important economic, organisational and managerial aspects of public enterprises in India", without digging into the evolutionary stages as also without indulging himself into the not-so-pleasant controversy between the two sectors. Beginning with the nature and extent of the public sector in this country, the author proceeds on to discuss the economic rationale with special reference to the needs of planning, the pricing and profits policy, the statutory structure of public corporations, followed by a case study of the relative merits of public corporations and the departmental organisations in the field of road transport, to end with a detailed analysis of the distinction between the approaches to the problem of public administration and those of public enterprise.

It is only in the chapter titled "Profits Policy of Public Enterprises" that he says his piece—with, of course, certain inhibitions. All through the chapter he has emphasized the desirability of profit motive in the public enterprises, for otherwise, apart from other things, it can create "institutional complications for the public exchequer", and the already low managerial efficiency cannot be put into gear; he, however, realises that profit maximisation always has a bad odour in the public sector. He has convincingly argued, though subjectively, that the public sector has many over-riding advantages over the private sector, e.g., easy access to the required capital, low rates of interest, favourable political environment, etc. With all these facilities at their disposal, the author admits that "the financial performance of the (public) enterprises is really poor". He has not come out openly, anywhere in the book, with objective criticism of the public sector; it is obvious, though, that he has been throughout bordering round it.

Dr. Ramanadham, who has done similar studies in respect of France and Sweden, has very deftly dealt with the present subject, avoiding all existing controversies between the public sector and the private sector. It is for this reason that this book will be read with interest by all those readers who wish to have an unbiassed insight into the subject.

ECONOMIC SURVEYS

Techno-Economic Survey of Tripura: National Council of Applied Economic Research, New Delhi; Pp. 163; Price Rs. 15.

Techno-Economic Survey of Himachal Pradesh: National Council of Applied Economic Research, New Delhi; Pp. 182; Price Rs. 15.

The techno-economic surveys for the Centrally administered areas of Tripura, Manipur and Himachal Pradesh were undertaken by the National Council of Applied Economic Research at the instance of the Ministry of Home Affairs. Two of these studies covering Tripura and Himachal Pradesh have been published recently while the one dealing with Manipur was released last year.

Although the areas are thinly populated, their strategic importance as frontier regions calls for special consideration in any approach to planning. According to the Survey of Tripura, agriculture is the most important sector of the territory which suffers from heavy population pressure. A large tribal population practises shifting cultivation known as 'jhuming', with no settled life. The problem is aggravated by the influx of refugees from East Pakistan. Food requirements outpace production and the gap continues to widen. The study recommends a land reclamation programme of 100,000 acres in the Third and the Fourth Plans, and a minimum of 6-acre holdings for a fair income to the family. It assumes that 50 per cent of the reclaimed area would be suited for field crops and the other 50 per cent for miscellaneous crops. The land can best be used for growing crops like cotton, groundnuts, pulses and maize.

The total outlay for irrigation during the period 1961-71, the Survey estimates, would come to about Rs. 3 crores on the basis of Rs. 300 per acre on an average for an area of 100,000 acres. Improvements suggested for tea industry are in respect of an infilling programme, shade trees to offset adverse effects of draughts, etc.

Among the other aspects on which recommendations have been made are forests which cover 60 per cent of the area, mineral resources, power, industry which is mainly rural, and above all transport and communications. Industries in which the survey sees possibilities of development are few, such as light engineering, wood working and leather industries.

The most important factor retarding development is lack of transport and communications and the Survey appropriately lays stress on their expansion and development.

The Survey estimates a total outlay of Rs. 65 crores over the next 10 years to build only a social and economic base for development later in a big way.

The key to the development of the resources of Himachal Pradesh, according to the elaborate survey of the NCAEF, lies in the building of a network of roads and communications to make the area accessible to the rest of the country.

Agriculture, as elsewhere in India, is the all-important occupation in Himachal Pradesh. The region being mountainous, cultivation is difficult. The slopy terrain lends itself to erosion which gives rise to grave consequences, like silting of rivers, gradual undermining of forests and loss of fertility. Since there is little scope for extending the area of cultivation the Survey lays stress on increasing productivity by intensive and better methods of cultivation and prohibition of grazing in the catchment areas for soil conservation. The Survey also recommends establishment of seed multiplication and demonstration farms. To eliminate silting it suggests afforestation in general and planting of river-fringe forests.

Apart from fruits and potatoes, Himachal Pradesh has ginger, sugarcane, vegetables and medicinal herbs as its cash crops. It is gratifying that the Survey notes an increase in the output of cash crops in recent years in spite of little increase in the area under these crops. The total output between 1951-57 has increased by 31 per cent in cash crops as against 18 per cent in food-grains. The crops whose output, according to the Survey, could further be increased are sugarcane, ginger, chillies, vegetables and vegetable seeds. It indicates that adequate afforestation programme and improved extraction techniques would strengthen the forest base of the territory.

In the light of the resources curently known, the NCAER emphasizes setting up of small industries and encouragement of handicrafts on co-operative basis. The possibility of setting up of a soda ash plant, cement, pig iron, and a fruit preservation plant, have been visualised. The Survey estimates an outlay of about Rs. 90 crores during the next decade to built an infrastructure for further development.

Reinforced by elaborate statistical data and a springling of maps, the two Surveys are all-comprehensive and of more than local interest. Almost all aspects of economic life in the areas studied have been probed and suggestions made should go a long way in directing planning effort on the right lines.

(Continued from page 718)

1962 to Wednesday, the 11th April, 1962, both days inclusive.

(b) The dividend, if sanctioned, will be payable on and after the 12th April, 1962, to those Members whose names appear on the Company's Register on the 11th April, 1962.

(c) Dividend Warrants will be posted to the Members at their registered addresses or in accordance with their mandates. Members are requested to advise change in their addresses, if any.

EXPLANATORY STATEMENT REQUIRED BY SECTION 173 OF THE COMPANIES ACT, 1956.

The item of Special Business to be transacted at the Annual General Meeting to be held on the 11th April, 1962 is to consider and pass Ordinary Resolutions for the issue of new ordinary shares.

With a view to further strengthen the capital resources of the Company and in order to increase the ratio of paid-up capital and reserves to total deposits, the Directors propose to raise the subscribed capital of the Company by the issue of 200,000 new ordinary shares of Rs. 100 each in the manner set out in the Resolution.

None of the Directors is interested in the aforesaid resolution except as shareholders of the Company. The General Manager is not in any way interested in the said resolution.

By Order of the Board,
S. T. SADASIVAN,
General Manager.

BOMBAY,
9th March, 1962.

*If the effect of the conversion of Rs. 50 crores is ignored, the net expansion of treasury bills during the year would amount to Rs. 126 crores. Of this Rs. 5 crores will be taken to increase the closing cash balance to the normal level of Rs. 50 crores. Thus the overall gap in the current year would amount to Rs. 121 crores.

INDUSTRIAL **IBCON** CONSULTANTS

in the expansion of
TEXTILE INDUSTRY

IBCON offers to intending promoters of textile industry, comprehensive consultancy services comprising:

- Project study and financial estimates.
- Project design including equipment, buildings, power, steam, water-supply, etc.
- Advice on purchase of equipment from India or abroad by tenders or negotiations.
- Supervision of construction of buildings and erection of equipment and services.
- Commissioning and operation.
- Senior and supervisory staff selection:
- Management organisation, clerical procedures, quality control, scientific cost and wage schemes.
- Technical assistance after commissioning to ensure successful and profitable operation.
- Also production planning, waste control, stores, dyes and fuel consumption.

IBCON PRIVATE LIMITED

Head Office: Adelphi, 119, Queen's Road, Bombay 1

Branches:
5, RUSSEL STREET, CALCUTTA 16.

THE EASTERN ECONOMIST

MARCH 23, 1962.

The Cease-Fire in Algeria

THE news from Evian on March 18 that French and Algerian negotiators had concluded a cease-fire agreement to end the seven-year war in Algeria has rightly received in all Indian newspapers banner headlines and continued prominence in comment. There are few international issues which so stir the Indian people as the departure of Colonialism after a long and, in this case, a bloody struggle. So far as combatants alone are concerned, Algeria has cost 141,000 Muslim nationals and 17,000 French troops in casualties up to the end of 1961, and it is believed that the equivalent of five billion sterling have been spent by France to maintain what has now been proved to be an untenable position in this, her key former colony. Apart from the O.A.S. which is attempting a last ditch stand under the direction of the notorious General Raoul Salan, the agreement has raised enthusiasm all the world over. President Kennedy and our own Prime Minister have, from different angles, expressed their admiration for General de Gaulle, whose great persistence and statesmanship alone has made this result possible. It is right, however, since this problem goes deep into the heart of France, that it should not look like the decision of one man, however acceptable he is to the French people. Therefore, President de Gaulle's decision to hold a referendum on his Algerian policy early next month will be warmly applauded. There is a corresponding referendum in Algeria to be held in July and with this it might be said that, in a short while, the firm stamp of popular approval will be placed upon an agreement which has been reached by the two negotiating parties after years of strife.

If this were the end of the matter one might well rejoice. But the power of the O.A.S. in Algeria is still great, and it is alarming to note that military operations have already been started in Oran in the form of a clash between French gendarmes and an O.A.S. commando group. The ultimate victory of France is certain as is the ultimate victory of the nationalist forces in Algeria. But it is still too early to say that the war in Algeria is over. It has ceased to be a war between France and the Algerian Nationalists and has now become in large measure a war between France and the recalcitrant O.A.S. All over the Indian Union, there will be a fervent prayer — somewhat unusual in the context of colonial battles — that metropolitan France will emerge triumphant in this display of strength over an area which it formerly controlled and which history rendered independent. In a sense, France has now changed sides; from supporting French settlers at the beginning in a futile war based on a miscalculation of nationalist forces in Algeria, she has now sought to throw her weight on the other side. It may be expected that the two sides of the triangle, France and Algerian nationalists, will be greater than the third. But this does not imply that victory is easy. Everyone in India will hope that, if victory cannot be complete, that the areas of resistance can be isolated and that the progress of Algeria hindered for several years by an insane conflict will not be impeded everywhere.

Largely because of the tremendous possibilities of Algeria and the Sahara oil fields, commanded from Algeria, it is likely that the new Algerian State will quickly ascend like other Middle-Eastern States gifted with oil resources, and establish a position of extraordinary economic viability which the years of attrition have so disastrously postponed. Algeria will now count anew in the counsels of the world. It is to be hoped that India will lose no time in sending suitable diplomatic and economic representation there so that our bonds both in friendship and in trade will rapidly grow. Indo-Algerian co-operation can be great and it is, undoubtedly, in our interests not to appear hesitant in providing any assistance of which we are currently capable. In particular, it is to be hoped that the Algerian nationalists who have obtained this triumph will help in securing that moderation in the settlement of colonial disputes which India for her part has often tried to advocate — sometimes, as at Belgrade, at some considerable peril to her anti-imperial image. It is right at this state in the world's affairs that the settlement that has been reached by the Algerian nationalists and French should be echoed in other portions of the world where, unfortunately, the gulf which separates metropolitan administrations from their colonies has tended constantly to widen. Portugal, in particular, should watch with interest, as well as with concern, events in Algeria. They have demonstrated finally that massive armies cannot subdue the free human spirit. A word might be added here that immitation of France would be the sincerest form of flattery.

The Disarmament Conference

FOR ten days now the representatives of seventeen nations have been engaged in a sincere endeavour to forge a formula for the first instalment in disarmament. If a tentative assessment could be ventured, it would not be wide of the mark to express hope for some measure of success in this problem which has consistently proved intractable for the last sixteen years. Taking the nuclear and conventional armaments together, the two premier powers are now very nearly evenly balanced in their defence as well as striking potential. But, unquestionably, considerations of superiority in nuclear weapons detract from this estimation and it is the decisive striking potential of nuclear arms which is withholding the appropriate psychology for mutual trust without which agreement is impracticable. For the first time, eight uncommitted nations are participating in these momentous talks, but, although their efforts must needs be confined to narrowing the differences between the viewpoints of the Big Three, they have chosen the right attitude to impress upon the nuclear powers the urgency to thrash out the issue in a spirit of informality among them, in the first instance.

This Conference starts with the positive advantage of the McCloy-Zorin joint statement of

principles announced in September last year, which inspires the hope that, given unreserved determination, a way out may be found for the initial phase in the process of disarmament. About the sincere desire of the two sides to rid the world of the curse of the nuclear threat, there need not be any doubt. A forthright approach, however, is hardly possible inasmuch as Mr. Kennedy is as much subject to the influence, as Mr. Khrushchev, from the domestic pressure of the orthodox school, which clings to the belief in deterrence and in negotiating from a position of strength. But this pressure need not be unduly overrated.

The Conference started with the two proposals from America and Russia which were reiterations of their familiar positions. The Russian proposal calls for general disarmament in four years phased over three stages, the first one in which is to cover nuclear weapons in particular. This proposal would have certainly commended itself to America and Britain, if only it had not left the serious gap of an acceptable system of control and inspection. It must be recalled in this context that the McCloy-Zorin Statement of Principles makes a positive commitment from the Soviet side of inspection and control, but the construction put by Russia on this crucial provision differs radically from the one put by America. There is no commitment, but on the other hand, unconcealed opposition, by Russia to control posts inside each country commanded by international teams of inspection and, further, Russia would be agreeable to inspection of actual disarmament but not of the other armaments left over. America, apart from asking for stationing of international teams, lays the right emphasis on the inspection of armaments still allowed to ascertain that they conform to the agreed residuary size and do not contain any element of concealed augmentation. Russia's objection to a full-fledged and internationally commanded system of inspectorate and stations inside her boundaries rests on the apprehension that it would amount to an open door for espionage.

The American proposal, based on a four-point programme, has certain basic essentials which form its core. The first stage envisages a cut of 30 per cent in nuclear delivery vehicles, along with the conventional armaments, and what is more significant, it calls for a ban on the production of fissionable material for nuclear weapons and, in addition, a transfer by the two nuclear leaders of 50,000 kgm. of uranium — 235 for other and peaceful purposes. This is to strike at the very root of nuclear weapons production.

The crux of the entire problem is an effective ban on nuclear tests. Of course, a phased reduction of the stockpiles is no less important, since relative superiority or inferiority for offence will be conditioned by the accumulation of weapons. But in the order of priorities the ban on tests naturally comes first. Mr. V. K. Krishna Menon's proposal on behalf of this country for setting up of control posts in the non-aligned countries to supervise the implementation of the ban on nuclear tests hardly suffices to improve the position as it obtained before the Conference. The intention behind ths proposal to meet the Russian objection of espionage is understandable, but its cardinal weakness is that it does not provide for any technique to verify the findings recorded by the supervisory teams in the outposts in the neutral countries. Mr. Menon had also proposed additional stations for monitoring of nuclear tests to be located in the uncommitted countries, to determine violations of the ban on tests. But monitoring is already available and effectively practised and this, too, fails to meet the basic requirement of verification.

To accept the deadlock in this situation is nothing short of a surrender to defeatism and the consequences of accepting defeat are quite obviously inconceivable. A compromise needs to be struck and, with a view to meeting the Russian objection over espionage, America has moved a decisive step forward. This is its proposal for the sampling technique of inspection. This technique requires a division of zones of the nuclear stockpiles and verifying the statements of a party as regards reduction to the agreed size by inspection of selected zones. It replaces total inspection of the entire stockpiles upon which Russia looks with distrust as a subtle device of espionage. As the sampling technique progressively confirms the claims of phased reduction, the process of inspiring greater confidence and dispelling distrust and apprehensions will move faster.

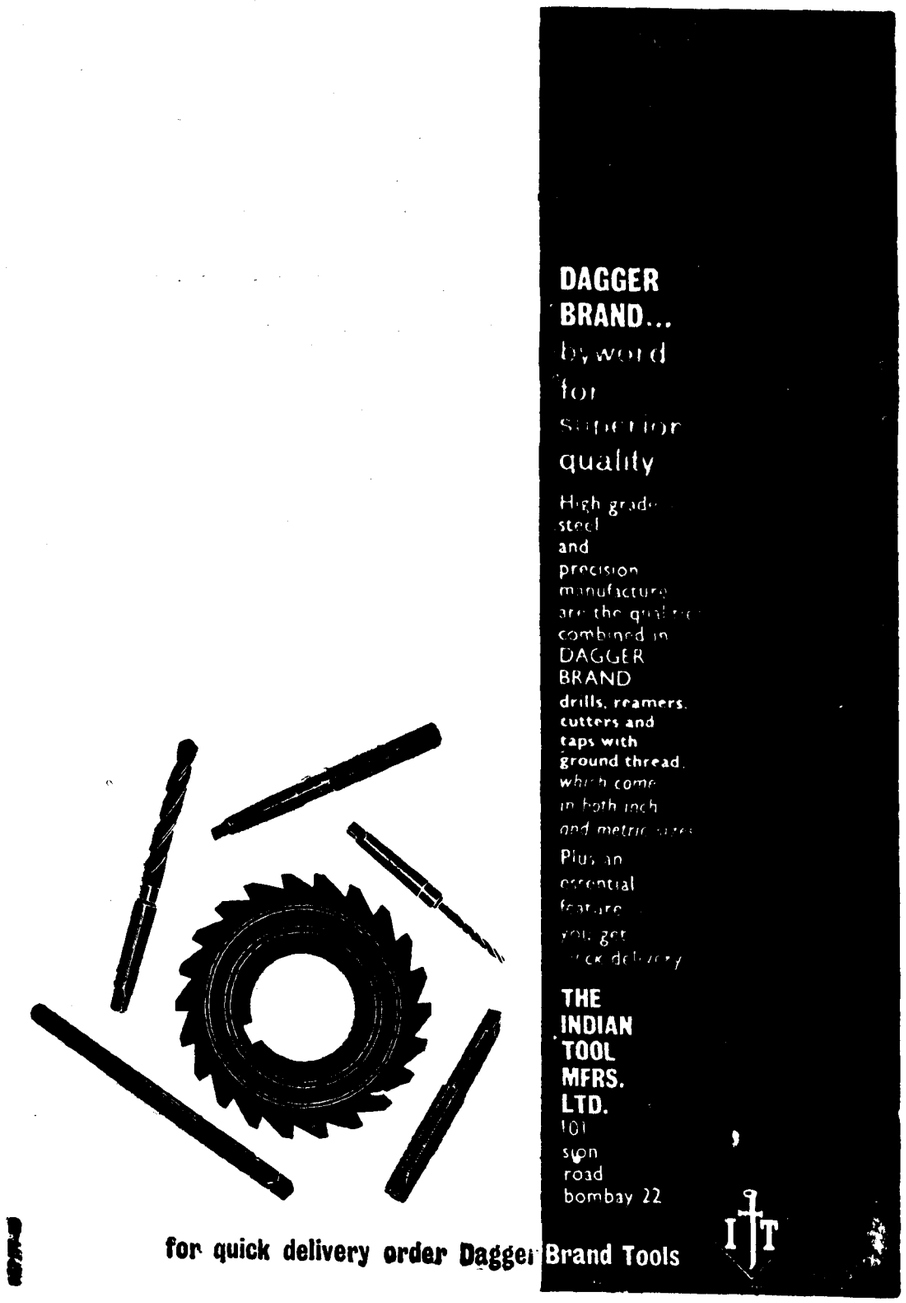
The most tangible and concrete achievement of the current session at Geneva is the appointment of a sub-committee, consisting of America, Russia and Britain to investigate the proposals made at the conference and to arrive at a compromise formula by the end of this week. This delicate task has been rightly placed on the parties whose attitudes matter first and last. The eyes of the entire world are now turned to this subcommittee. As we go to press, the sub-committee has announced a deadlock. But a renewed bid to resolve it must be made.

The Third Finance Commission

DEVOLUTION of finances from the Centre to the States by a Finance Commission, to be set up every five years under a provision in the Constitution, provides each Commission with an onerous and exacting task. The Third Finance Commission under the able stewardship of Mr. A. K. Chanda, former Comptroller and Auditor-General of India, has had the advantage of his manysided experience to help it to command respect. The report it has submitted to the Government is a concise and just document; it has been fair to the States. Besides recommendations on the re-allocation of States' share in the income-tax, Union excise levies and the estate duty, on grants-in-aid under Article 275 of the Constitution and on distribution of the additional excise duties levied in the place of States' sales tax on some commodities like cotton textiles, tobacco and sugar, and a fixed sum of Rs. 12.5 crores in lieu of the railway passenger tax, it contains some very pertinent general observations which should provide enough food for thought for any student of Indian finance.

It is not perhaps surprising that the report is not a unanimous one and contains a note of dissent by Mr. G. R. Kamat, the official Member-Secretary of the Commission. All the unanimous recommendations of this august body have been accepted by the Government along with the majority recommendation on one of the two issues, special grants for improvement of road communications, on which Mr. Kamat has appended a dissenting note. On the other controversial issue, Plan assistance grants, the Union Government has upheld Mr. Kamat's contention as against the majority verdict.

The Commission has done well in raising the States' share in the income-tax divisible pool from 60 per cent to 66-2/3 per cent and in gearing the allocation of different States on 80 per cent on the basis of population and 20 per cent on the basis of collection as against 90 per cent on population basis and 10 per cent on collection basis as recommended by the Second Finance Commission. There can be little objection to this formula, though it is likely to create some heart-burning amongst the States which are less developed industrially. The revision in the formula has been necessitated by the changes made in the Income-tax Act by the Finance Act of 1959, by virtue of which the entire income-tax paid by companies was classified as corporate tax and excluded from the divisible pool of income-tax. How far the share of State Governments in the income-tax proceeds will go up consequent upon this revised formula, it is difficult to envisage. The industrially advanced States like Maharashtra and West Bengal obviously stand to gain, while the not-so-favourably placed States, which form a majority in the Indian Union, may be losers to some extent.



Far more important recommendation of the Commission which goes to help in stepping up the devolution of finances from the Centre to the States is, however, the increase effected in the number of commodities (from 8 to 35) excise duty on which is to be shared by the States with the Centre. Alongwith this, of course, the percentage share of the States in this divisible pool has been reduced from 25 to 20. Even then the net share of States is substantially larger and will grow from year to year. The wisdom of not giving in the report the basis of the proportionate share of each State as recommended by the Commission may, however, be questioned. The Commission merely states in this regard that whereas population continues to be the major determining factor, such considerations as the relative financial weakness of a State, the disparity in the levels of development, the percentage of scheduled castes and tribes and backward classes in population have also to be taken note of. There can be a large element of arbitrariness in such a calculation in the absence of any correct index for assessing the relative backwardness of a State and its financial weakness on the basis of merely its tax effort in the past.

The changes effected by the Chanda Commission in the distribution of estate duty receipts, the revenue from additional excise duties and the allocation of Rs. 12.5 crores in lieu of the railway passenger tax are of minor consequence and need not be dwelt upon at any length. But a word would not be out of place in respect of the grants-in-aid recommended by the Commission for covering the revenue and State Plan resources gaps, as also for the purpose of improvement of road communications in the backward States. Consequent upon the relatively greater funds being available from the Centre to States like Maharashtra and West Bengal and the improved financial position of States like Punjab during the past five years, grants-in-aid on revenue account for such States have been, quite appropriately, discontinued. The grants-in-aid under this head in the case of Madhya Pradesh and Jammu and Kashmir have been slightly pruned and in the case of others stepped up in consideration of their financial vulnerability. The increase in the total of such grants-in-aid from Rs. 39.5 crores to Rs. 52 crores is justified owing to the rising tempo of developmental activity under heads financed from general revenues. The majority of the Commission members are as well right in their plea that some backward States would require special grants for maintenance and improvement of road communications in view of the terrible bottlenecks and strains experienced in the recent past on the railways in particular and the transport system in general. No doubt, roads development is a part and parcel of the Plan expenditure, the maintenance of the existing roads is a charge on the general revenue resources.

The net effect of all the above recommendations is transference of an additional Rs. 35 crores from the Centre to the States. Under the Second Finance Commission's award, the States would have got only Rs. 240 crores in 1962-63. Under the Third Finance Commission's recommendations, they will be entitled to nearly Rs. 280 crores. In the next three years (the Third Finance Commission's recommendations, except in regard to the share of States in the Rs. 12.5 crores available on account of merger of railway passenger tax with the railways fares, are to be operative for four years) they shall get something more, although the Commission has failed to give any tentative idea about this.

The anxiety of the Commission members, except Mr. Kamat, to what may be called restoring of financial autonomy of the States by virtue of making available to them by the Centre its assistance for State Plan outlays in the form of statutory grants-in-aid, though understandable, is however, not fully justified in the light of the past experience. *The Eastern Economist*, on the other hand, subscribes to Mr. Kamat's cogently-reasoned minute of dissent on this issue. The Plan itself being flexible and its fulfilment dependent on the availability of foreign exchange resources, it is just appropriate that the present procedure of providing Central assistance to the States to cover the gap in their resources should be continued. The Union Government's turning down of the majority recommendation of the Commission in this respect, thus, does not amount to any distrust of the States, especially when it has already undertaken to fill the gaps in the resources for and outlay on the State Plans. One great advantage resulting from this decision of the Central Government will be that the State Governments would be kept on their toes to fulfil their commitments in regard to tax effort promised by them and would have to take up the implementation of the Plan in a more earnest manner than would have been possible with the provision of statutory grants for this purpose.

The two pertinent observations of the Commission in respect of avoidance of overlapping of the functions of the Planning Commission and the Finance Commission by either enlarging the functions of the latter so as to bring in its ambit the entire financial assistance to be afforded to the States by the Centre or transformation of the former into a Finance Commission at an appropriate time, and setting up of an autonomous body to assess the tax potential of States require serious consideration by the Government. The spirit of the *Constitution* demands enlarging the functions of the Finance Commission. A close study of the tax structure and tax potential of each State would be useful in the interest of avoiding odium being incurred by the Union Government by its resort to heavy taxation, whereas the State Governments invariably evince reluctance to perform this unpleasant job, while sharing happily in its profits. Perhaps this is the price the Centre has to pay for its dubious monopoly on credit creation or deficit financing.

THE WEEK'S NOTES

Ministry Making

THE NEW INFLATION

IN SIX out of ten States the Congress Party has come out with reduced majorities in the general elections. A main reason of the substantial losses to the Congress Party is the virus of factionalism which has worked more to the detriment of the party than to the benefit of the Opposition parties. One should have expected the Congress High Command to call upon the State legislature parties and their leaderships to take the warning and act with a sense of discipline to bring cohesion within their ranks. But curiously enough, the High Command advised the leaders of the Congress legislature parties to make the Ministries broad-based. This was conveniently taken as a green signal for expansion on a fantastic scale in some States. The directive in respect of the broad base was misconstrued as a bait to placate militant factions without a reasonable assurance of producing harmony.

Punjab, U.P. and Bihar typify the harmful consequences of putting a premium on factionalism in the name of forming all-inclusive ministries. In Punjab, the ministry has been expanded from 18 to 30, raising the ratio of ministers to one for every three legislators. Assam has the next record of enlarging the ministry from 12 to 20. In U.P., where the ministry has been inflated to 43 members, the ratio is one minister for every five legislators. A ministry of 20 for Mysore was already too large, but the addition of 3 now is the price of the "unanimous" election of Mr. Kanthi as the leader. In Andhra Pradesh, the abstention of Mr. Sanjiviah from participation seems to be a tactic to exert pressure for the inclusion of his nominees at the appropriate time. In Maharashtra and Gujarat a different consideration was responsible for enlarging the size of the ministries — the urgency to give certain regions a sense of participation in running the government. Dr. B. C. Roy expanded his ministry by 3 without any similar considerations.

The size of the ministries has been increased in all the ten States without exception, but the worst and most disconcerting feature of this trend of inflation in some States is that it feeds on groupism and sectionalism. The extended cabinets are unlikely to achieve harmony and the team spirit. Their unwieldy size will reflect most of the weaknesses inherent in such bodies. Too many ministers will inevitably necessitate too many divisions of portfolios in hands, many of which will be too inexperienced and perhaps unsuitable. Guidance in policy matters and direction in normal affairs will tend to be conspicuous by their absence or effectiveness and eventually the administration may suffer. The real justification of the expansion of ministries is to be found in its modest scale and mainly for building a second or even a third line of leadership to take over in course of time. The right way to achieve this objective is to enlarge the opportunities to function as Parliamentary Secretaries and to learn the job the hard way. The mischief of ministerial inflation at all levels has been committed and once the stakes have been created it will be difficult to reverse the process after the next general elections. The High Command may find the same problem of maintaining a semblance of internal unity intractable except with the device of the 'broad-base'.

China

THE OVERTURES

THE LATEST correspondence between the Governments of China and India, which covers the period from December 3, 1961, to March 13 this year, does not disclose any improvement in the border dispute between the two countries. If anything, there is reason to believe that China has made further small incursions into the Indian territory on the Laddakh side. These pinpricks cannot but hinder reasonable hope of a real settlement. Ostensibly in making the recent overtures for resuming the negotiations for settlement, Mr. Chou En-lai has used the plea of the renewal of the Tibetan trade treaty which is due to expire on June 3 next. Having systematically uprooted the long standing institutions built up by the Government of India for trade with Tibet and given a twist to the direction of Tibet's trade away from India, China had left little for a substantial treaty to be negotiated.

The Prime Minister was right in reiterating before the Lok Sabha that the settlement of the border is a very complex and time-consuming problem. This is for the obvious reason that in the case of a border in a most difficult terrain and extending over hundreds of miles, history, tradition, custom and the natural demarcations ought to be respected as the bases for accepting the frontier. A frontier of such a highly complex character cannot be the subject of negotiation and delimitation, although there may be a marginal scope for adjustments at certain points. In insisting that negotiations should be resumed on the basis of the maintenance of the status quo, China has, unwittingly perhaps, let the cat out of the bag. The status quo is precisely the same thing as she deliberately chose to describe as "actuality" only a few months back. This is not the status quo which has the sanction of historical usage.

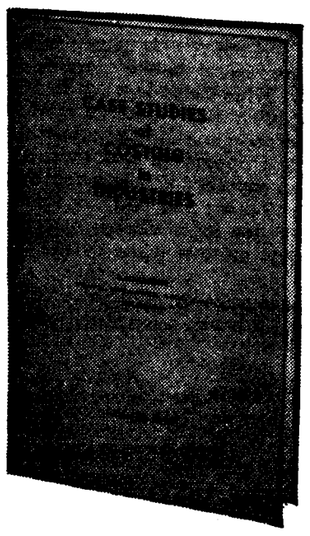
India has unequivocally defined in her reply what she understands by the status quo. She has asked for the peaceful withdrawal of China from the Indian territory which she has forcibly occupied in violation of the Panch Sheel treaty she has signed with India. This is a diplomatic and courteous way of asking her to vacate aggression which ought to be conceded as a condition precedent to the marginal adjustments of the border. What China in a subtle way means to assert is consolidation and perpetuation of the illegal gains of forcible occupation. She is totally mistaken if she is under the impression that India will be prepared for peace at any cost, if only a face-saving formula is devised. During the hustings the party in office was criticised for its vacillating policy on China, but the latest firm attitude taken by the Government of India should serve to restore confidence that there would be no appeasement or impatience for settling the border dispute. It is best allowed to lie as it is for the present.

West Irian

THE RENEWED ATTEMPT

AFTER THE dangerous drift towards an open war, followed by the offer of mediation made by the UN Acting Secretary-General U Thant, a stalemate began

to develop fast in the West Irian problem carrying with it the possibility of a sudden flare-up and threat to peace. Both the parties seem to be unrelenting apparently because the position taken up by each was hard to be modified in the short run. Indonesia's demand for a de facto transfer of West Irian and the Netherlands' insistence upon self-determination for the Papuans have throughout operated as great irritants and prevented a rapprochement.



But hopeful signs have now emerged, it would seem, as a result of patient and preservering diplomatic moves behind the scene. When U Thant's offer of mediation was not responded to the real possibility for negotiated settlement seemed to lie in the good offices which America was persuaded to extend. It is reassuring that the American help has now been accepted and secret talks between the representatives of the two Governments have been arranged. The venue of these talks, though not formally disclosed, has been fixed in the neighbourhood of Washington and the talks were scheduled to have got off to a start on Tuesday this week. On the Dutch side, the representatives nominated for the purpose are Mr. J. H. Van Roijen, the Netherlands Ambassador in Washington, and Mr. C. W. A. Schurmann, the Netherlands Parmanent Representative at the UN headquarters. Indonesia has nominated Mr. Sudjarow Tjondronegoro, Chief of the European Section of the Foreign Office and Acting Secretary-General at the Foreign Ministry, and Mr. Adam Malik, Ambassador in Moscow. It would appear from these nominations that the Netherland Government has chosen to utilise the services of its diplomatic representatives in America without deputing a special negotiator from The Hague with a newly defined brief. But the selection of the Indonesian representatives suggests that Indonesia still feels it necessary to be cautious and restrained in the negotiations and in fact her Foreign Minister Dr. Subandrio has expressly stated that Mr. Tjondronegoro is invested with a limited brief to which he has to conform strictly. This would suggest that Indonesia would press for de facto transfer as a major solution to the deadlock. Since the two parties have accepted the invitation to a secret conference, there is hope that reconciliation between the view-points of the two countries may be brought about and this tangled issue would be resolved.

U.P. Congress

BREACH UNHEALED

THE PRESTIGE of the U.P. Congress Party touched yet another low when an unseemly development took place at the last minute on the occasion of the swearing-in ceremony of Mr. C. B. Gupta's new Ministry on March 14. Among the eight members of the dissident group who were included in the Ministry, only Mr. Syed Ali Zaheer and two parliamentary secretaries turned up to take the oath, the remaining nominees headed by the dissident group's leader, Mr. Kamalapati Tripathi, abstained from the ceremony. Such an exhibition of internal conflict has no parallel.

It is most unfortunate that those who are responsible for guiding the affairs of the U.P. Congress Party have learnt nothing from their party's severe reverses in the general election for which responsibility must be put in a substantial measure on their shoulders. The High Command advised Mr. C. B. Gupta to give as broad a base as possible to his new Ministry to make it inclusive of all shades of opinion — a euphemism for conflicting groups. It would appear that the understanding was that the dissident group would be taken into confidence before the personnel of the Ministry was decided upon. What Mr. Gupta actually did was to disclose the names of all the members of the new Ministry only on the day previous to the day of the installation. The list provoked the dissidents into harbouring a deep-seated grievance that they were given a shabby deal and their strength in the legislature, which is estimated at something like 60, was completely disregarded. In fact the battle for candidatures for the election was so hard fought that ultimately Mr. Ajit Prasad ,Jain, the Chief of the Pradesh Congress Committee, perhaps with the implied consent of the High Command, made the selection on the basis of groups. The facade of unity which was attempted to be created by the selection of an all-inclusive Ministry was soon laid bare. The canker of groupism has gone deep in the U.P. Congress Party's organisation and the shock treatment which it received in the general election appears to have done little to produce any agonizing reappraisal, if only to re-unify and revitalise the Party. How long will instability be suffered to undermine the administration of this key State?

INDIA: A HOUSE DIVIDED?

By

ODYSSEUS

TODAY I want to talk about two new books, "India: A Modern History" (Cresset Press. London. 63sh.), by Percival Spear, who was on the faculty of Delhi University for no less than twentyeight years, and "Divide and Quit" (Chatto and Windus. London. 30sh.), by Penderel Moon who, after a distinguished career in the ICS, spent many years in the service of the independent government of India. The psychological questions raised by these two books are largely answered by "In The Minds of Men" (Basic Books. Inc., New York, 1953), by Gardner Murphy who, at the request of the Delhi Ministry of Education, carried out, with the aid of many leading Indian authorities, a survey of human behaviour and social tensions in India.

Why, as practical men, do we read history?

This question prompted me to look up an editorial entitled "India: A House Divided?" which appeared in "The Eastern Economist" of October 13, 1961, following distressing events in Aligarh University in the previous week. "The Eastern Economist" asked the National Integration Council if it could rise above paper resolutions and formulate a policy to "break down the barriers between man and man at those levels which have resulted in such terrible antagonism in this last unhappy week?" "The Eastern Economist" observed that the Aligarh incident displayed passions spread far and wide, in many non-university towns in the State, and it added: "Basically we are coming to the hard conclusion that the communal problem is something far deeper than we, in our national pride, often claimed it to be, namely, an off-shoot of British 'Divide and Rule' Imperial policy.... It is to be recognised that a major diagnosis and some deep surgery is required to deal with a deeply distressing malady in our body politic.... The Congress Party cannot pretend that it has ignored the advantages of putting up a candidate who would be backed by the religion or the caste of large groups of the electorate. It is, therefore, in no position to point to the mote in its political neighbour's eye, since it has a large beam in its own."

WHAT IS HISTORY?

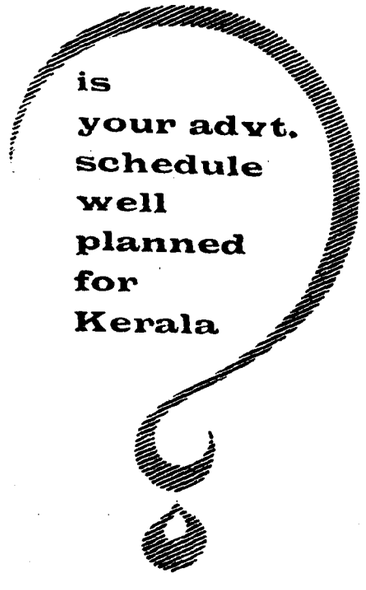
A policy for breaking down the barriers between man and man can only be formulated if their causes are studied. For these, we just turn to history. But here a warning is needed. As I said here in an article entitled "Question Marks of Indian History" (May 5, 1961): "An historian amasses vast arrays of facts in his researches. From these he selects what he regards as of interest to his readers, i.e., as relevant to the questions that press on us today. Each historian not only asks his own questions, but chooses which he will ask from a variety of possible questions. It is because men feel dissatisfied with the choice of questions and the explanations that satisfied their fathers, and seek to uncover new meanings for themselves, that history is subject to continuous reinterpretation, and that the history that we read in our school books is as dead as mutton."

The impact of the British on India gave rise to nationalism, which sent Indians in search of their own past to answer such questions as "Why did we fall victims to foreign conquest? What glories did the foreigner destroy?" and British historians to ask "What right have we to be in India?" It is a salutary warning to the guileless non-specialist reader, who believes whatever he reads because it has achieved print, to recall that the Indian answers were usually conditioned by the urge to compensate for the doubts and difficulties of their own era by conjuring up visions of past "golden ages", like that of Asoka (237-232 B.C.) and Chandra Gupta II (384-415 A.D.), in which land flowed with milk and honey, and that the British answers were usually conditioned by the thought "Will this make for easier and quieter government?"

Percival Spear, Penderel Moon, and Gardner Murphy, are all asking the contemporary questions for which "The Eastern Economist" called for answers on October 13, 1961.

The first reaction of the average man in all countries is to blame his misfortunes on anyone but himself, but as long as he refuses to ascertain, and to acknowledge, his own contribution, he cannot solve his new problems. It is, therefore, perhaps useful, before delving into the books quoted above, to follow up "The Eastern Economist's" suggestion that, whether or not during the course of the century in which the British effectively ruled India they periodically took advantage of communal antagonisms to divide and rule, they did not invent them.

The embryo of these antagonisms can be traced to the reversal of Akbar's policy of reconciliation by Jehangir, who ordered the execution of Jain priests in Gujarat, and showed his spite against the priests of Kangra temple by desecrating the precincts with the blood of cows; to Shah Jahan who prohibited the building of new temples throughout the empire; and to Aurangzebe who suppressed the Hindu theological schools at Banaras, and vigorously reimposed the Jizya tax. Skipping some centuries, we find that Dr. H. N. Sinha draws attention in his "Selections from the Nagpur Residency Records" (Government of Madhya Pradesh. 1952) to riots between the two communities in 1807 i.e., four years after the British occupation of Delhi—a period in which the British had every interest in peace between the communities in their newly established, and as yet unconsolidated, administration.



THE SIGNIFICANCE OF 1857 IN 1962

It is a mistake, however, to concentrate solely on communal tensions; other sources of conflict need to be recognised. Mr. Spear makes an important contribution to understanding modern India when he points out that the 1857 Mutiny was essentially the outbreak of all the pent-up dislike of the old traditional India against the innovations of the West. This traditional India was that to which the old Indian governing classes belonged, of which the Princes, and other leaders of the Mutiny, were the political expression. "The collapse of the revolt, Mr. Spear says, "meant for the Indian public the end of any reason for following these

old classes any longer." Educated Indians drew from 1857 the conclusion that traditional India could not oust the West by force, and that the only way to deal with the West was to meet it on its own terms, by education, by assimilating its political and economic techniques and using these techniques against it. The rising men of the new middle classes—lawyers, doctors, journalists, government officials, and business men—canalised in themselves the desire for an independent modern India. The descendents of these pioneers run India today. And I think that a first tension, that we have to recognise, springs from the struggle of millions of rural dwellers to adjust their traditional caste and family structure to the totally different structure implied by parliamentary democracy, the Five-Year Plan, and industrialisation. Even if the Socialist pattern does not imply a fully competitive economy, it does lead to a secular, non-caste, non-joint-family, non-regional system. There is no speedy solution for this conflict, but at least its frank recognition enables us to know what we are doing.

It was between 1830-80 that, under the leadership of such middle class intellectuals as Ram Mohan Roy, the modern outlook that conditions our present political and industrial leaders emerged. By accepting the dignity and equal status of all men, the pioneers of the 19th century began the erosion of caste. Gandhiji built on this foundation for social reform—from within the Hindu system—which his predecessors had created. Mr. Spear brings out, however, the important point that "Two generations later a work similar to Ram Mohan Roy's for the Hindus was accomplished by Sayyid Ahmad Khan for the Muslims. In the early years of the century the Muslims sank into a mood of depression for which there seemed to be no remedy. They had lost their empire; they regarded the Hindus as idolators and supplanters and the British as infidels. The first efforts at adaptation harked back to primitive Islam and led to a small militant movement mainly directed against the Sikhs. The Mutiny deepened the mood of pessimism. It was Sayyed Ahmad Khan who roused the Muslims by providing an ideological link with the West, much as Roy had done for the Hindus. Again the link was reason, which in the Sayyid's mind connected the science of the West with the Aristotelian element in Islamic thought." His monument was the College which became Aligarh University.

A point that India's ruling classes of today—the politicians, lawyers, doctors, journalists, business men etc.—often forget is that they are likely to be out of touch with the motives that activate the rural masses. Mr. Spear points out that the English language, Western social values, ideas of nationalism, and of practical democracy itself, became the perquisites of the new middle class, drawing them together from all over India and setting them apart from the masses. The new men increasingly met the British on an equal footing. They were prominent in all spheres of modern action. They monopolised the headlines. The old middle classes had been divided by language, by cultural and technical tradition, as well as by caste and distance. "They no common culture, no common status," says Mr. Spear—a view which may arouse emotional resistances in the Indian breast at first, but which is at least worth pondering when advanced by a dispassionate scholar whose writings reveal him as anything but anti-Indian. Mr. Spear reminds us that, for example, the Muslim hakim would not share his knowledge with the Hindu vaid. The old teachers and lawyers had been equally cut off from each other. The new middle classes, on the other hand, were linked by education, the English language, and by the very nature of their work, which all, whether in law, administration, teaching, medicine, journalism, or technical work, involved assimilating Western sciences and concepts. Thus the more the new classes grew in numbers the more emmeshed they became in the world of the West. That is why the take-over in 1947, far from heralding a return to the traditional past, far from creating a happy hunting ground for the Hindu Mahasabha and the Rashtriya Swayamsevak Sang, speeded up the rate of Westernisation, and in so doing so multiplied various social tensions at which we will take a closer look next week.

The European Scene

THE COMMON MARKET ACCELERATES

From Our Special West European Correspondent

PARIS, March 20.

THE Common Market Six are due to take a decision on March 21 about another acceleration of their internal tariff disarmament: a fresh cut of 10 per cent in the duties they impose on each other's manufactures, to take effect from July 1. It is just possible that their decision will be known as this appears in print. There is no danger in forecasting that it will be positive, or, at the most, delayed for a week or two to permit bargaining about trade in farm produce. For everybody is in agreement about the new reduction in duties on manufactures, which will bring tariffs inside the Common Market down to just half of what they were in 1958. The reason for delay has been that the Dutch have been making their assent conditional of a further reduction in the duties on farm produce too. One is by now familiar with this aspect of Common Market negotiations; whenever the stage is set for a new advance, one or two members put up last minute resistance and seek to sell their consent at the price of concessions in other fields. This is precisely as it should be, because the Common Market is not a simple customs union but an essay in economic integration, and it is proper that as trade becomes freer members should try to keeps progress in agriculture, social welfare, etc. in line with tariff disarmament. The rapid reduction of duties on industrial manufactures has been the motor of progress to date, because it is doing everybody good, so naturally various members try to link other reforms to duty-cuts. It is conceivable that in another economic context (e.g. a recession intervening before the customs union is complete) members might be more interested in harmonising welfare charges and conditions of competition, and then other members would sell their agreement to that at the price of fresh tariff reductions.

However, it seems at present that the move towards freer trade inside the region will continue to be the driving force of European integration, for there is no prospect of a recession. On the contrary, the trend is toward an expansion of world trade, both inside the Common Market and out, with a tendency to rising prices. So each nation finds tariff disarmament relatively easy, for it is simple to practise specialisation and find compensations in a period of expanding trade; and each nation finds freer imports useful in restraining price rises. Although the latest report of the ECM Commission shows that the pace of industrial growth has slowed down (because the booms in Italy, France and Belgium do not altogether outweigh the setback in West Germany and Holland), the outlook for the rest of this year is encouraging. The French Institute of Economic and Social Research has just forecast a 10 per cent increase in world trade in manufactures for this year, accompanied by a 5 to 6 per cent rise in industrial output (this being, substantially, the average of a recovery in West Europe and continued modest progress in the USA). Both these authorities agree that the rising tendency in prices will persist, because under it lies a shortage of manpower, and particularly of skilled labour and technicians, which cannot speedily be remedied.

In these circumstances, everyone is in favour of quicker reduction of duties—and not only inside the Common Market. It is also possible and desirable to practise freer trade with the outside world; hence such recent signs of liberalism as the success of the Dillon round in GATT which will gradually cut duties by 20 per cent or more, notably between the Common Market and the USA; also the freer import of Asian textiles, the concessions made to Japan and the project to cut the common external tariff on tropical produce by 50 per cent. All these measures serve, as well as duty cuts inside the region, to restrain price rises, promote specialisation and encourage firms to find more profitable uses for their capital under the comparatively painless conditions of general prosperity. But the more generous the Common Market shows itself to outsiders, the more it has to hasten its internal tariff reductions, in order to preserve its individuality from being lost in global trade liberalism. Indeed, the current burst of accelerated internal tariff disarmament would have been completed long before this (it was decided upon in May 1960) had it not been for the long delay required to harmonise agricultural policies. At all events, the point of 50 per cent reduction of mutual tariffs will be reached this July, and the point of 60 per cent reduction will be attained in July 1963—which will put the Common Market well ahead of the schedule set out in the Rome Treaty.

It is, no doubt, an exaggeration to say that "everybody" is in favour of accelerated duty reductions. By the time duties have been reduced by half, many individual firms (and some sectors of industry in certain countries) find that a critical point is being attained. Labour, as noted, is short and wage demands keen, so costs are rising. These rises cannot be passed on to selling prices, because as imports come in more freely price-competition becomes more acute. Firms have to absorb much of the increase in costs, at the expense of profit margins, and this can lead to a restriction of investment outlays. Thus some industrialists find the haste toward freer trade rather painful. However, this is simply an aspect of the specialisation of tasks in a widening market; far from being an argument against quicker integration, it is the reason the economic union was undertaken. Yet that depends on the wider market being a genuine economic union, where conditions of competition are harmonised. This reasoning could not justify an opening up of European markets to American goods, produced by well-protected giant corporations that are free of all the obligations of the Rome Treaty and which have large surpluses because of the mediocre state of their home market. Atlantic "liberalism" could be the cover for an American invasion of Europe, and there is little prospect that the Common Market will enter that path.

The 10 per cent reduction in internal tariffs that is projected for July will not have the immense significance of earlier cuts, because it is overshadowed by the January agreement on a joint agricultural policy, which was a much more serious guarantee of the progress of the Common Market. The Dutch, at the time of writing, do not quite agree because they are asking that the new cut be extended to certain farm products: they want 5 per cent off a limited range of commodities, which represent 17 per cent of total Common Market trade in agricultural goods. The West Germans reply that the joint agricultural policy, with its complex system of market control, price support and import levies, is the best way of expanding trade in farm products, so there is no need to apply the liberal formulae used for industrial manufactures. This little dispute has its importance, and not only for the Common Market. The Germans may make last-minute concessions and agree to reduce tariffs on some farm goods, but the general doctrine of the Six will henceforth be that wherever goods are submitted to international market management there is no call to apply liberal techniques of encouraging free trade by reducing tariffs.

In other words, the Six have reached the conclusion (which was not explicit in the Rome Treaty) that free-trade doctrines, even as modified by the conception of equality of conditions of competition, have relevance only to industrial manufactures and cannot be introduced into the field of trade in agricultural produce. This explicit limitation of free-trade theory to manufactures confirms the experience of GATT, which has shown that trade in industrial products can be promoted by mutual tariff concessions whereas all bilateral or multilateral efforts to promote trade in farm produce have failed in the absence of some super-national authority charged with organising and controlling the wider market. The reasons for this fundamental distinction between primary and secondary produce in trade theory are evident enough: capital is infinitely less mobile in rural uses than in industrial uses, and agriculture poses social problems much more acute than those of industry. The magnitude and complexity of agricultural problems are no excuse for giving up all hope of rationalising farming, organising a different distribution of functions between countries and in general expanding trade in primary produce. But to secure those objectives, it is quite inadequate to practise the modified free-trade theories that work in the case of manufactures; there must first be an international authority ready to organise the wider market. The appearance of this international authority (in the event, the Common Market's Council of Ministers) was the major result of the January agreement on agricultural policy. It was emphasised here at the time that this meant that market regulation for farm produce passed out of the hands of national parliaments (for, of course, there is no country that practises internal free trade in primary produce) into the hands of a super-national body sitting in Brussels. What the Germans have been arguing to the Dutch this month is that once this step is taken, one can forget free-trade doctrines in agriculture and limit them to trade in manufactures.

The importance of this dogma is in its international implications, that is, its relevance to trade in farm produce outside the Common Market. There are still exponents of free-trade theories for primary produce in Britain (for the special reason that British industry benefits from the competitive dumping of food by surplus producers on the limited cash market) and, to a lesser extent, in the USA. As the Six realise the implications of the method they are following in their internal affairs, they will defend a similar approach to world problems. Indeed, they have already done so in the recent Geneva discussions on world wheat trade, and they are working out a common doctrine for the Geneva talks on trade in tropical produce to be held next month. In all such cases they will tend to argue that the solution of international agricultural questions lies, not in price competition, tariff reductions or the removal of impediments to free trade, but in the establishment of a super-national authority representing both producers and consumers which will organise and regulate the market, fixing prices, governing production and distributing surpluses.

THE UNITED COMMERCIAL BANK, LIMITED

Registered Office: 2, India Exchange Place, Calcutta-1.

NOTICE

NOTICE IS HEREBY GIVEN that the NINETEENTH ANNUAL GENERAL MEETING of the Members of THE UNITED COMMERCIAL BANK, LIMITED, will be held at the Registered Office of the Bank at 2, India Exchange Place, Calcutta, on Wednesday, the 11th April, 1962 at 4 P.M. to transact the following business :—

1. To receive and adopt the Report of the Directors and the Audited Balance Sheet as on 31st December, 1961 and Profit & Loss Account for the year ended 31st December, 1961 ;
2. To declare a dividend ;
3. To appoint two Directors in the place of Mr. A. C. Law and Mr. T. S. Rajam who retire under Article 92 of the Articles of Association of the Bank and, being eligible, offer themselves for re-appointment ;
4. To appoint a Director in place of Mr. M. L. Dahanukar who retires under Article 92 of the Articles of Association of the Bank, and to consider and, if thought fit, to pass the following resolution, of which special notice, as required by Section 281 of the Companies Act, 1956, and in accordance with Section 190 thereof, has been received by the Bank :

   "Resolved that Mr. M. L. Dahanukar, who has attained the age of 72 years, be and is hereby re-appoined a Director of the Bank and that the age limit, prescribed under Section 280 of the Companies Act, 1956, shall not apply to him."

5. To appoint a Director in place of Mr. P. D. Himatsingka who retires under Article 92 of the Articles of Association of the Bank, and to consider and, if thought fit, to pass the following resolution, of which special notice, as required by Section 281 of the Companies Act, 1956, and in accordance with Section 190 thereof, has been received by the Bank :

   "Resolved that Mr. P. D. Himatsigka, who has attained the age of 72 years, be and is hereby re-appointed a Director of the Bank and that the age limit, prescribed under Section 280 of the Companies Act, 1956, shall not apply to him."

6. To appoint Auditors for the current year and to fix their remuneration.

Note: 1. A MEMBER ENTITLED TO ATTEND AND VOTE AT THE MEETING IS ENTITLED TO APPOINT A PROXY TO ATTEND AND VOTE INSTEAD OF HIMSELF AND THE PROXY NEED NOT BE A MEMBER.

2. (a) The transfer books of the Bank will be closed from Monday, the 26th March, 1962 to Wednesday, the 11th April, 1962, both days inclusive.

   (b) The dividend, if sanctioned, will be payable on and after the 12th April, 1962, to those Members whose names appear on the Company's Register on the 11th April, 1962.

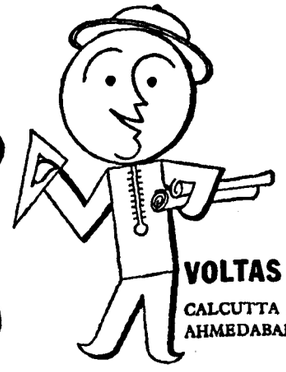
   (c) Dividend Warrants will be posted to the Members at their registered addresses or in accordance with their mandates. Members are requested to advise change in their addresses, if any.

By Order of the Board,
S. T. SADASIVAN
General Manager.

CALCUTTA,
17th March, 1962.

This Notice replaces the Notice published in our issue dated 16-3-1962.

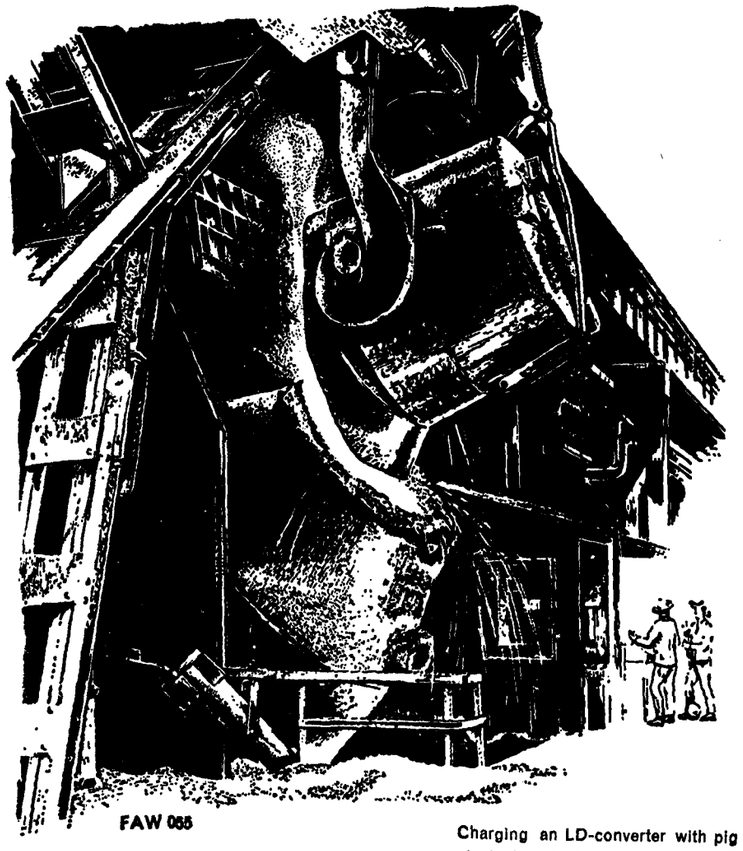
this is the time to think about air conditioning



and this is the time to think about Carrier and Voltas

—now, when there's just a signboard on the site that a new factory will soon occupy. Too early? Not at all. Before the architect prepares his design he must know what plans the company has for the building. Plans to air condition it, for instance—since this has so much bearing on the shape and design of a structure.

Why Carrier and Voltas?



Because they bring maximum engineering experience and skill to every air conditioning project. Carrier in the field of manufacture of equipment. Voltas in the field of engineering, installation and service.

Carrier
the people who know air conditioning and refrigeration best

Economic Report from the U.S.

ECONOMIC CONSEQUENCES OF WORLD DISARMAMENT

By GUY SIMS FITCH

WASHINGTON, March 13.

AN optimistic picture of the Economic consequences of world disarmament has come from the United Nations, in a report prepared and unanimously endorsed by experts from ten countries. Significantly, these experts are from both Communist and non-Communist lands the Soviet Union and the United States among them. They have put forward the common view that "all the problems and difficulties of transition connected with disarmament could be met by appropriate national and international measures." In effect, then, this report parallels the recent findings of a special U.S. panel of private and government experts, which reached much the same conclusion as far as the United States is concerned.

The two reports also agree that effective disarmament moves could open the way for new advances in living standards and welfare through the diversion to peaceful uses of resources now devoted to defence programmes. The fact that neither of the reports is unmindful of the economic difficulties entailed in defence cutbacks underscores the realism with which they approached this important subject. In its effort to delineate the magnitude and the nature of the basic problem, the U.N. report estimates world-wide military spending at about $120,000 million a year. Understandably, while virtually all nations contribute to this total, the bulk of the spending is concentrated among six or seven of the world's leading powers. In measuring the impact of this annual defence outlay, certain comparisons may prove instructive. It is, for instance, close to the value of the world's annual exports of all commodities, and it corresponds to about one-half of all the resources set aside each year for gross capital formation throughout the world. Put another way, it is equivalent to about eight or nine per cent of the world's total output of goods and services. It is interesting to note that the U.S. proportion is no higher than this, with some $50,000 million a year going into national defence out of a gross national product of more than $550,000 million. There is hardly a nation which would not agree — in principle, at least — on the desirability of diverting defence expenditures, and the human and material resources they employ, to productive peacetime pursuits.

The main problem would be to divert resources to non-military uses in such a way that no country would suffer a serious disruption to its economic life. To the U.N., this is a matter of international as well as national concern. A major problem, for instance, could be the decline in demand for some basic commodities as a result of defence cutbacks around the world. This could affect international trade in these commodities, with an appreciable impact on the economies of the countries producing them. In addition, there undoubtedly would be dislocations within the economies of the principal disarming countries, as resources would have to be reallocated, industrial patterns altered, regional effects eased, and workers retrained.

The important point about all this, however, is the confidence the experts have in the ability of nations, perhaps with international help in some instances, to make the necessary adjustments. In the long run, the U.N. report insists, there should be little difficulty in adapting resources to needs, to the benefit of all nations. Aid to less developed lands, raising of national living standards and furtherance of social and cultural aims are seen as alternative and desirable uses of resources now devoted to defence purposes. In the process, economic growth could be accelerated. Governments could give greater attention to education, health, welfare, social security, science and the arts. International co-operation could be stepped up not only in the realm of economic and social development, but also in such fields as atomic energy and space research.

MANAGERIAL ELITE AND THE POLITICAL PERSPECTIVE

By

DAYA KRISHNA

A TRAINED managerial class is the necessary condition for any successful business or industrial enterprise anywhere in the world. Whether the society be dictatorial or democratic in its political structure, its economic enterprises have to be run by persons who must share, to a very large extent, identical skills for the success of what they do. There is, however, one crucial difference and this concerns basically the relation between the economic and political considerations that weigh in the decisions made by the managerial elite in the two societies.

The political considerations are supposed to be overriding in the case of the managerial class of a country governed by a dictatorship bent on pursuing its own ends. On the other hand, they are regarded as completely irrelevant to the thinking of the managerial classes functioning in the framework of a polity which is essentially democratic in its structure. The political aspect is supposed to be taken care of by those who concern themselves with politics. The management of business and industrial enterprises is supposed to concern itself only with the maximization of profit.

The divorce between political and economic considerations in the thinking of the managerial elite of a democratic country is regarded not merely as a state of affairs that actually happens to obtain in fact but also as something which is desirable, as something which ought to obtain, if it is not already there as a matter of fact. It is argued that the essence of democracy is just this autonomy of different spheres which function in terms of their own criteria and each in independence of the other.

The Communist critics do not accept this description of the relations between the political and the economic sectors of a democratic society. In their view, the sectors are not merely not autonomous but it is the economic sector which controls, guides and overrides the political one. At a deeper level, however, these critics will deny the desirability of such an autonomy even if it existed. Their interpretations of the actual state of affairs prevalent in democratic societies is thus, to a great extent, irrelevant to their judgment of what ought to obtain in the relationship between these two sectors of any society. Equally, if someone were to urge that the actual decisions of the managerial elite in totalitarian economy are governed only by economic considerations and that the overriding political considerations are always brought to bear on them from the outside, it would not affect the issue in any relevant aspect of the matter I am trying to consider.

The central issue as I see it, in the context of societies committed to the maintenance and functioning of a political democratic system, is two-fold. First, what exactly ought to be the relations between the political and the economic sectors of the society? Second, what part should political considerations play in the economic decisions of the managerial elite of the society? The first is a large theoretical question which I do not exactly wish to consider. Only, that unless some sort of an autonomy between different areas is admitted, there can be little hope of an effective functioning of democratic institutions in any society. The autonomy, however, is not an anarchy and the exact balance between the two is a matter for political thought and practice to discuss and achieve.

However, what I am interested in here is the second question and I wish to consider it at some length as I think it important for the success of democracy in this country. There is little doubt in anybody's mind that maximization of profit ought not to be the sole consideration in the decisions of the management in business and industrial enterprises in a democracy. The considerations of labour-welfare and consumer-interest are already conceded as legitimate factors that ought to be taken into account in any decision taken by the managerial elite of a society. There could hardly be any leaders in corporate management in this country or elsewhere who dare not pay at least lip-service to these considerations as legitimate factors to be taken into account in their decisions. Not only this, it is today involved in the concept of enlightened management that

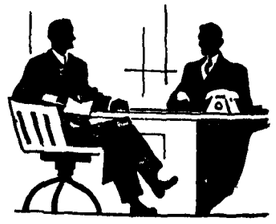
it takes into consideration these factors and strives for these ends besides the more obvious one of maximizing its profit.

In this connection, it would be well to distinguish between profit and the maximization of profit. Profit is a much maligned term in the socialist and marxist critique of capitalism. But everybody who inveighs against this seems to forget that it is only another name for the successful running of an enterprise. If there is no profit, there is not even the possibility of the development of the economy and if a concern is running at a loss, it obviously cannot run for long. But while profit is a necessity for any industrial or business concern for purposes of survival and growth, the maximization of profit is not. One may pursue it, but it is not a necessary condition without which the concerns will collapse and go into liquidation and the economic business of life run to a standstill.

The maximization of profit, thus, though a value arising immanently from the nature of the economic enterprise, can be tempered by other considerations which concern the welfare of man. This, today, is accepted by almost everybody and is an integral part of what is taught in the management courses anywhere. But there is a consideration which has never been regarded as very relevant to the decisions of the managerial elite of industrial and business concerns in a democracy. And this consideration relates to what may be called the political aspect of economic decisions. It is accepted as a matter of course that such a disregard is the essence of the divorce between the political and economic sectors which is the basic condition for any democracy to be a democracy.



The relative autonomy of different spheres of activity, each carried on for the realization of the purpose specific to that sphere and judged in terms of its own criteria, is in a sense the essence of democracy. But today the very existence of a democratic society is under attack from a determined group which has both power and resources at its command and is committed to the total eradication of this autonomy of every sphere and to making it subservient to the interests, purposes, ideals and values of its own and as conceived by itself. This subverting, attacking, undermining group is the Communist Party in every country which never conceals its proclaimed aim of doing away with democracy and burying the capitalistic form of industrial and business enterprise for ever.

It is in this background of a well-thought, well- planned, well-prepared attack on the very foundations of the socio-political structure which sustains each and every business and industrial enterprise in every country which has not yet succumbed to the Communist subversion and attack that the problem has to be thought anew. The insulation of the economic sphere from the political was *meaningful only till* no such threat was posed to the very foundations of both. Once such a threat begins to loom large, the presupposition on which the insulation rested holds no more. If the people at the crucial centres of decision-making continue to act on the old presupposition even in the changed circumstances, they would merely be paving the way to their own annihilation even though they may not be aware that this is so.

The managerial elite, therefore, has to become aware of the new danger to the very foundation on which the private and corporate forms of business and industrial enterprise rest. The awareness of the danger has to seep through their consciousness to permeate and affect every aspect of their thinking about any problem they have to confront in the course of their activity. "How to safeguard the democratic framework of political organisation against the openly proclaimed and practised subversion and attack of its enemies?" is, then, the question which has to be asked continuously by the managerial elite if their form of industrial and business organisation is to survive.

Along with the worker's welfare and the consumer's interest, another factor has to enter the thinking of this class. And that, I suggest, is the political factor. Unless the leadership in this class is trained to think that the consideration of this factor is as necessary to its survival as the consideration for profit, they might succumb to policies which may help in destroying the very foundations on which they exist. The relationship of the worker and the consumer and the pursuit of profit will be subtly changed and modified once this consideration is brought into play.

The problem, of course, is not confined to the managerial elite only. The autonomy of every field is endangered by the Communist challenge and all those who love the pursuit of their own field should, in order to safeguard that very autonomy, be aware of the political aspect of the problem. The safeguarding of democracy becomes, then, the task of everybody who wants to pursue his own activity unhampered by considerations alien to itself. The responsibility of the managerial elite is, however, both larger and immediate as they wield the most enormous influence after the political ones. It is their duty to themselves, their concerns and their country to become aware and act on this.

TRAVELLERS' CHEQUES

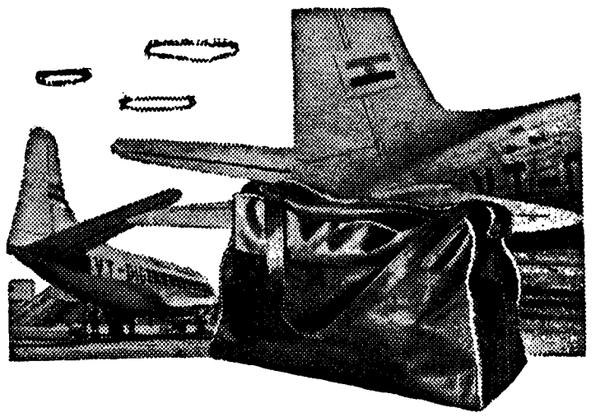
THE PUNJAB NATIONAL BANK LTD.

Established 1895
Head Office : New Delhi

Vintage 1900

One of the first typewriters ever sold in India the old Remington Standard No. 7 is now virtually a museum piece. Although a good efficient machine in its day, progress and 'Old Father Time' have passed it by.

Today at the Remington Rand factory at Howrah, (the largest in Asia), new sleek typewriters are rolling off the production line. Already over 1,00,000 machines have been manufactured in India by the Indian Company.



85% of the components of Remington typewriters are manufactured at this factory—with Indian raw materials—by Indian Staff.

Each part of each machine is made to exact universal specifications so that every part is interchangeable no matter where the machine was manufactured.

40 years ago the Remington organisation pioneered the adaptation of Indian languages to their typewriters and today Remington Rand produce typewriter keyboards in 8 regional languages. The blue prints for further languages are under preparation and these typewriters will go into production soon.

INT-BB-302

THE BUSINESS WORLD

Mixed Economy for Maharashtra?

By CROESUS

ALTHOUGH it was heartening to hear the Chief Minister of Maharashtra, Mr. Y. B. Chavan, declare that "Maharashtra State is wedded to industrialisation" and that "priorities are being given in all fields by Government agencies for the industries to develop so that there would be full employment with a rise in 'per capita' income of the State", one rather got the impression, at the last Annual General Meeting of the Bombay Chamber of Commerce and Industry (B.C.C.I.), that not all the points—even after excluding those that concern the Central Government—raised by the retiring President, Mr. N. M. Wagle, received adequate attention at the hands of the Chief Minister. To say this is not to doubt the earnestness of Mr. Chavan about industrialising the State to the maximum extent possible. Perhaps, like all cautious politicians, he did not want to commit himself too much or state anything categorically. Take, for instance, the answer he gave to Mr. Wagle about the need for a strong and adequately equipped central department "to deal with all the authorities under the State Government and present the 'entrepreneur' with a clear picture of what he can and cannot do, instead of making him go to each separate authority for land, for building permission, etc." It was obvious from the answer that Maharashtra's Chief Minister was merely content to observe that the Industrial Development Corporation of Maharashtra would enjoy preliminary powers very much similar to those that Mr. Wagle had in mind. More or less in the same strain were his replies to Mr. Wagle's references to power, communications and transport problems also. The only redeeming feature of Mr. Chavan's speech was the unmistakable impression it gave one that the Maharashtra Government is fully seized of all these problems and is doing its utmost to help new industries. Certain observations that Mr. Chavan made on the occasion in this context are relevant not to the State of Maharashtra alone, but to the country as a whole.

What he said, for instance, about the need for managers is very pertinent to the present situation in the country. He said: "industrial development both creates and depends on a new function, that of the manager. Everywhere in the world today, managers are the real scarce resource of economic development. Money, labour and raw material can be provided. Even the skills (including high professional skills and university-trained scientists) can be trained in an incredibly short time. But managers must be available and cannot be imported from abroad except in very small numbers and at the very beginning of the process". So saying, he exhorted the members of the Bombay Chamber to develop such managerial talents in order that they might be available not only for the proper functioning of their own concerns but also to help the State and the country at large. I cannot help inquiring whether this compelling necessity for managers has not been brought home to Mr. Chavan in the wake of the recent application of the Land Ceilings Act to sugar factories in Maharashtra.

Mr. Chavan's forthright call to industrialists to co-operate in setting up joint sector industries for the further industrialisation of the State, as also his praise of private investment as "one of the great engines of economic growth in this country", marks a refreshing departure from the parrot-like repetition by some Congressmen of the plea for a still stronger dose of socialism or a further shift to the left. His re-affirmation of the Industrial Policy Resolution of 1956 and the compliments he paid to the foreign-owned and managed businesses and the happy collaboration between foreign firms and Indian investors are a proof, I take it, of his abiding faith in a mixed economy. Anyway, the following observation of Mr. Chavan in this context must have particularly gratified his listners.

"Private investment, especially direct investment, has been one of the great engines of economic growth in this country. It has playd an important part in helping to develop a strong domestic private sector, in fostering local 'entrepreneurship', local skills and local sense of participation in a growing economic system. This joint venture should be relevant to businesses producing goods and services for local consumption. I would say that, with foreign collaboration, the technique of training and direct partnership can have a great effect in promoting rapid economic development."

What I failed to understand was the reluctance of Mr. Chavan to accept the suggestion of Mr. Wagle for the constitution of a central body on the lines indicated by him. Anyone who has had to do something with the starting of an industry is bound to endorse the latter's reactions to the inordinate delays in implementing a new project. It is not merely the resulting frustration of the individual concerned that matters but the enormous loss caused to the country's economy as a whole, which has been ably summed up thus by Mr. Wagle in his welcome speech:

"It is not sufficiently realised perhaps what the cost is of delays in implementing an approved project. Such delays are expensive not only to the 'entrepreneur' concerned but also to the nation, as imports have to be allowed until effective supplies materialise in India. Where imports cannot be allowed, several other industries, which might be relying on supplies from licensed production, are handicapped in their progress. The cost of servicing capital invested, but not effectively used in production, is passed on to the purchaser under present conditions of a closed economy. Finally, there is the loss of tax revenue to the State and Centre."

There would appear to be a good deal of confused thinking on the subject of small-scale 'versus' large-scale industries. Even to put it this way, I feel, is admittedly inappropriate, in that it brings to one's mind the existence of a seeming conflict between the two. In the present stage of our industrialisation, however, we have to think in terms of integrating or harnessing the

services of both. As the outgoing-President of the B.C.C.I. said, small-scale industries have certainly a very useful role to play, but this purpose cannot be achieved if they think in terms of direct competition with large-scale industries. It is also idle to think that subsidies or special allotments doled out by the Government will help small-scale industries. There is a specific field where small-scale industries can operate to their advantage as well as the advantage of the country and this is the sphere of ancillary production. It is only as satellites to large-scale industries that small-scale industries can hope to grow and prosper. It is only in this way again that they can really help to keep the cost of production down to the lowest level possible, "particularly now that we simply must export at a much higher level if the Third Plan is to survive".

One other observation of Mr. Wagle requires to be highlighted, namely that "the present approach to labour problems is a little out of tune with the realities of the situation". From this it does not follow that he is anti-labour, for he has himself stated: "No entrepreneur of any standing questions the moral as well as the political necessity of giving labour a fair deal, and of bringing about a real improvement in the worker's standard of living." But his thesis is—and rightly—that this cannot be secured merely by legislation, which hands out more and more benefits to the worker regardless of the profitability and competitive position of the industry. Hence his insistance that the present tendency to pick on the best run units for yet heavier burdens of wages and dearness allowance and fringe benefits like bonus, gratuity, provident fund, etc. must be controlled. More particularly, he has urged restraint with regard to increase in paid holidays which reduce productivity of labour without increasing the worker's earnings. This is especially appropriate at a time when even sober trade unionists like Mr. V. V. Giri have started proposing a further reduction in the weekly hours of work. Let me conclude the reference to this with the quotation from Mr. Krushchev which Mr. Wagle himself gave at the meeting in support of his statement that the question of labour productivity is one that agitates not merely the minds of private 'entrepreneurs' in this country but leaders even in Communist countries: "Labour productivity must be always one jump ahead of the growth of wages....it is clear that the correlation of wages as between truck drivers and tractor drivers is wrong, but we cannot now agree to an upward levelling of wages—first for truck drivers, then for tractor drivers, and then again for truck drivers. The question of wages is a big State question. Their level depends entirely on the output of produce, on the productivity of labour in a given society".

Business Notes

Jute Exports

GROWING THREAT FROM PAKISTAN

THE SPEECH of the I.J.M.A. Chairman, Mr. D. C. B. Pilkington, at the Association's annual general meeting in Calcutta last week, brings within focus once again the problems of the Indian jute mill industry. Primarily these problems emanate from the growing threat in the export market from Pakistan which is developing its industry at a rapid pace. As Mr. Pilkington has pointed out, the addition of another 6,000 looms to the present 8,000 looms in operation in Pakistan by 1965, will threaten ousting of India in sacking goods export trade unless steps are taken in advance to counter it. Pakistan's competitive position in this trade is better due to two factors: (1) the availability of raw material at cheaper rates and (ii) the most modern machinery that the industry there has set up. Of course, the bonus scheme gives an added advantage to the Pakistani exporter, but its growing impact on the country's finances can be expected to lead to some modifications in it at none-too-distant a day.

To meet this competition effectively, the Indian industry has obviously to be enabled to maintain its production costs at a reasonable level. It is, therefore, only in the fitness of things that steps are being taken to build buffer stocks of raw jute in years of bumper harvest, through the constitution of the Jute Buffer Stock Association. The assurance of a reasonable return to the agriculturist for his efforts to raise raw jute should play an important role in stepping up fibre output over a number of years so that the industry can be put on a stable and sound footing. It is indeed encouraging that side by side with the stepping up raw jute output, increasing attention is being paid to improve the quality of the fibre as well. The efforts of the Special Jute Development Section of the IJMA in this respect would be watched with interest. They need to be supplemented wholeheartedly by the State Governments concerned.

The growing competition in the world jute goods market also calls for concerted attempts at greater modernisation and rationalisation of the industry in this country. Although quite a lot has been done in this regard over the past few years, modernisation and rationalisation is a process that has no end. The IJMA Chief's plea for assistance from the N.I.D.C. in the task of incorporation in the Indian industry of the latest technological development in the weaving department deserves careful attention on the part of the authorities. It is hoped that the Union Finance Minister, Mr. Morarji Desai, who for the first time attended the Jute Mills Association's meeting, will be in a position to do something in this regard.

Along with the availability of adequate supplies of raw jute at reasonable prices and modernisation and rationalisation of the industry, another important point that deserves mention in the interest of reduction of costs of this industry is the raising productivity of labour. Whatever may be the justification of labour being paid on time basis, there is much to be said in favour of payment by results. That there is considerable scope for increasing productivity of labour in this industry has been eminently demonstrated by the fall in the consumption of raw jute last year to a lesser extent than was warranted by curtailment of working hours.

It is indeed gratifying that the Indian Jute Mills Association is appreciating more than ever before the necessity of keeping prices of jute goods at competitive levels. What it intends to do in respect of the notorious manipulation that is indulged in by some sections of the industry in periods of shortages is not yet clear. It is time that greater thought is paid to this aspect of the problem. The close co-ordination that had been witnessed amongst the various units of the industry over the past 1½years should augur well for the formulation of measures to eradicate this unhealthy practice of a minority amongst the jute manufacturers for whose misdoings the industry as a whole has sometimes to suffer.

Maharashtra

PRAKASA'S PARTING PLEA

REVIEWING THE past performance and underlining the basic policies and programmes of the State for the coming years, the Governor of Maharashtra, Mr. Sri Prakasa, in his inaugural address to the newly constituted Assembly—incidentally also his valedictory address to the Maharashtra Legislature—observed that the State had not only successfully completed the Second Plan, but had made considerable gains in the first year of the Third Plan too, despite the fact that the year was one of much strains and stresses because of natural calamities. In concrete terms, as per the address, during 1961-62, over Rs. 55 crores out of the States' total Third Plan outlay of Rs. 390.20 crores has been expended, and it is estimated that as much as Rs. 66 crores would be spent in the coming year. Mr. Sri Prakasa expressed the hope that the Maharashtra Legislature would continue to maintain its high traditions.

The Governor of Maharashtra made a fairly lengthy reference to the problems of land and agriculture and pointed out that, while waste lands would be allotted for the purpose of rehabilitating landless labour, the additional land accruing to the State as a result of the Ceiling on Holdings Act would be distributed on an equitable basis. An area of some 90,000 acres, it is estimated, would become available from the various sugar factories in the State, and the Governor said joint farming co-operatives would be formed from the ranks of workers of the aforesaid factories and tenants to manage the surplus lands. In the meanwhile, these farms are to be taken over by the Government itself and an autonomous State Corporation, to be formed for the purpose, is to manage them. This decision, in the face of the failure of co-operative farming even in Communist countries, is more a display of bravado than the sincere implementation of a practicable ideal. Evidently not even the recent pronouncements of the Soviet Premier Khrushchev on the debacle of the collective farms have had any effect on our leaders. Nearer home, Dr. C. D. Deshmukh, Vice-Chancellor of Delhi University, also made the disturbing disclosure that as many as 40 per cent of the 3,000 co-operative farms in the country were running at a loss and another 40 per cent. were making only a negligible profit. In other words, just about 20 per cent only of these farms are being run on proper lines.

The Governor of Maharashtra further observed that, with the increase in the production of electricity in the State, as many as 20,000 additional pumping sets would be run on electric power and 250 more villages would be electrified by the end of the current Plan Period. A notable disclosure in the Governor's address was that an area of over one lakh acres has been covered by cashewnut, a dollar-earner, by the grant of loans and free distribution of seeds in Ratnagiri, Kolaba and Kolhapur Districts The move is pregnant with potentialities.

Banking

WIDENING SCOPE

BANKS IN India have played increasingly important role in the general industrial expansion of the country. It is evident from the fact that during the decade 1951-1961 industrial credit provided by the banking system increased by Rs. 410 crores, which has also raised its share from 32 per cent of the total to 51 per cent. Advances of all scheduled banks in 1951 were Rs. 580 crores, of which 33.5 per cent were for industry. By 1956 the advances rose to Rs. 794 crores of which 38.5 per cent were for industry. In 1960 the advances touched the massive figure of 1,100 crores. Shri Lalitchandra C. D. Nanjee, Chairman of the Devkaran Nanjee Bank at its annual general meeting stressed the fact that the growing tempo of industrial activity in the country was assisted to a large extent by this increasing banking performance. The banking system had, therefore, risen to the occasion and made significant contribution. The Chairman further indicated that as compared to the rate of rising demand for bank credit the rate of growth in deposits was not adequate, especially in relation to the increasing pressure on the banking system from the industrial sector. This stagnation, however, disappeared in 1961 and there was a general improvement in the deposits of all scheduled banks.

The Chairman proposed that there was the need of a co-operative approach on the part of the banking system for a sustained drive for initiating banking habits among the people. It is true that in the face of the present backwardness and static habits of the people, it was not easy to penetrate into the countryside, but effort had to be made to break the barriers of habits. It is significant to note that the ratio of bank offices to population had not very much changed and remained at 1 to 88,000 in India. In this connection, Mr. Nanjee's suggestion, that smaller banks should be allowed to stay because only they could afford to function in smaller towns, was quite sound. It was of utmost importance, he said, because the requirements of different areas were fully known and local knowledge was easily available to smaller regional banks and they were in a better position to mobolise the deposits for the areas they served and could meet the credit requirements in an appropriate manner.

New Issues

LODNA COLLIERY

FOUR COMPANIES are approaching the public for subscription to their share capital in the next fortnight.

Lodna Colliery Company is entering the capital market on March 23 with an issue of 2,30,000 equity shares of Rs. 10 each for subscription at a premium of Rs. 7.50 nP. per share. The list closes on March 30 or earlier at the discretion of the directors, but not before March 26. The new shares will rank pari passu with the existing ordinary shares, except that they will not entitle the holders to any dividend that may be declared in respect of the year ending December 31, 1961.

The company was formed in 1920 and has since then been carrying on business as colliery proprietors. It is at present working five large collieries—two in the Jharia field and three in the Raniganje field. Ancillary to its Jharia collieries, it is operating a bye-products coke oven plant and a coal washing plant.

Proceeds of the issue are to be utilised for further developing the company's collieries. It is envisaged to increase the company's output to 24,00,000/25,00,000 metric tons of coal per annum by the end of 1965. The development programme is estimated to cost Rs. 1.26 crores. The new issue will be making available Rs. 40.25 lakhs. The balance of Rs. 85.75 lakhs is proposed to be raised by loans (Rs. 40 lakhs) available from the appropriate Government agency for aerial ropeways and stowing equipment the installation of which at two of the company's collieries is an integral part of the development plans, and by ploughing back Rs. 45.75 from the company's own resources.

The company made a net profit of Rs. 15.14 lakhs (unaudited) in the first half of 1961 (after allowing for taxation and depreciation), Rs. 18.25 lakhs in the whole of 1960, Rs. 23.13 lakhs in 1959, Rs. 31.84 lakhs in 1958, Rs. 23.78 lakhs in 1957 and Rs. 15.62 lakhs in 1956. The company has no mortgages, debentures or other loan capital outstanding, but has overdraft facilities with the National and Grindlays Bank. The amount owing to the bank on this account amounted to Rs. 25 lakhs on March 5, 1962.

The authorised capital of the company is Rs. 1.2 crores, of which the issued, subscribed and fully-paid capital amounts to Rs. 87 lakhs.

TAK MACHINERY

TAK MACHINERY, Bombay, is offering to the public capital worth Rs. 24.50 lakhs, all in the form of equity shares of Rs. 100 each, to be issued at par. The list opens

on March 29 and closes on April 4 or earlier at the discretion of the directors, but not before March 31. The authorised capital of the company is Rs. 1 crore, of which the issued capital, including the present offer, is Rs. 50 lakhs. The directors and their friends have already subscribed capital to the tune of Rs. 7.56 lakhs; they are further taking up shares worth Rs. 17.94 lakhs.

The company is setting a plant in Maharashtra State to undertake the manufacture of 24 electric overhead travelling cranes, 1,600 electric hoists blocks, 980 chain pully blocks, 600 portable floor cranes and conveyors (capacity yet to be determined) per annum. Electric hoists are not currently manufactured in India and the production of cranes, chain blocks and conveyors is said to be small. With imports restricted, there is, thus, a considerable blacklog of demand for this equipment. The company will also undertake structural fabrication work.

Technical collaboration for the project has been arranged with the U.K. from Fellow Brothers for the manufacture of electric cranes, hoists and chain blocks. Negotiations with well-known foreign firms for collaboration in the manufacture of conveying equipment are underway.

SARDESAI BROTHERS

Sardesai Brothers, Bombay, is offering to the public 17,500 equity shares of Rs. 100 each. The list opens on April 29. The authorised capital of the company is Rs. 100 lakhs, of which capital to the tune of Rs. 50 lakhs is issued. The directors and their friends have already taken up shares worth Rs. 10 lakhs; they are further subscribing to shares worth Rs. 22.50 lakhs.

The proceeds of the issue are to be utilised for raising the present capacity of the company for the manufacture of carboxy methyl cellulose (commonly known as C.M.C.) from 600 tons a year to 2,000 tons and that of various other items substantially. After the expansion has been completed, the company's present annual turnover of about Rs. 50 lakhs is expected to go up to Rs. 100 lakhs. The directors claim that they will be able to pay a reasonable dividend on the new shares from the very first year of entitlement because the company is already operating quite remuneratively.

For its products other than C.M.C., the company has entered into a technical assistance agreement with the U.S. firm NOPCO Chemical Company, which is well-known in the field of manufacture of chemical auxiliaries for rayon, leather, paper, paints, rubber, etc., industries. The agreement covers the progressive manufacture of NOPCO products in India for internal consumption as well as for exports to Burma and Ceylon.

HINDUSTAN KOKOKU WIRE LTD.

THE HINDUSTAN KOKOKU WIRE LIMITED is approaching the public on March 29, with an offer of 9,995 9.3 per cent (free of company's income-tax, but subject to deduction at source at the prescribed rates) redeemable preference shares of Rs. 100 each to be issued at par. The list closes on April 2. The issue, if fully subscribed, will raise the issued and paid up capital of the company to Rs. 30 lakhs; capital worth Rs. 20.015 lakhs (Rs. 18 lakhs in equity shares and Rs. 2.015 lakhs in preference shares) has already been subscribed by the directors, their friends and associates and the foreign collaborators. The authorised capital of the company is Rs. 50 lakhs, divided into 30,000 equity shares of Rs. 100 each and 20,000 preference shares also of Rs. 100 each.

The proceeds of the issue are to be utilised for meeting part of the expenses of the factory of the company that is being set up about 12 miles from Delhi to undertake the manufacture of all kinds and classes of wires, cables, ropes and cords, including high tensile galvanised steel wires, whether for use in ACSR cables wires, ropes, M.S. wires, P.C. wires or for any other purpose.

Technical collaboration has been arranged with two Japanese concerns—the Kokoku Iron and Steel Wire Manufacturing Company Limited and the Gosho Company Limited. The total cost of the project is estimated at Rs. 45 lakhs. Since the share capital will be making available only Rs. 30 lakhs, a medium-term loan of Rs. 18 lakhs has been secured from the Refinance Corporation of Private Industries Limited, through Devkaran Nanjee Banking Company.

•

The shares being offered shall rank for dividend from the date of allotment on the amount for the time being paid up thereon. They are redeemable at par at the expiry of 10 years from the date of issue or earlier at the discretion of the directors after giving due notice.

When this undertaking goes into full production, it is estimated that a sum of Rs. 30 lakhs in foreign exchange would be saved per year. Production is expected to start in another three months' time.

Ashok Leyland

IMPRESSIVE PROGRESS

FROM THE speech of the Chairman, Sir A Ramaswami Mudaliar, delivered at the thirteenth annual general meeting of the company, it is clear that the company has really made impressive progress. It may, for instance, be noted that the value of sales in nine months in 1961 nearly equalled to that of twelve months in 1960. And this was achieved mainly by increasing the output of comet chassis, the average output per month being 170 in 1960 as against 195 during the nine month period in 1961, an increase of nearly 15 per cent. Additional buildings to a value of approximately Rs. 40 lakhs have been erected and additional plant and machinery of a value exceeding Rs. 56 lakhs have been installed during the year under review. These additions represent partly the provision of plant and machinery to carry forward the phased manufacturing programme, and partly the building, plant, and machinery required for the expansion programme. The expansion programme is likely to be completed in 1963 and it is expected that then the output of comet chassis will be at the rate of 5,000 per annum with a 20 per cent excess capacity for the production of spare parts. Engine output will also increase to provide not only the comet engines, but also the heavier 600 and 680 types required for chassis and industrial applications.

Then again, it is no small satisfaction that with plant and machinery designed to produce 1,000 vehicles per annum with single-shift working, the factory was able to produce nearly 2,400 in 1961 and will probably produce over 3,000 in 1962 with double shift working. Ennore Foundaries Ltd. has also made good progress. It is expected that by the end of March, 1962, it will supply all the castings required by Ashoka Leyland Ltd. which would help from April to discontinue the import of castings including the cylinder blocks and heads. Progressively surplus capacity is also likely to be available for the supply of quality castings to users other than the company. Sponge raw materials may also be produced soon and this will be useful not only to iron foundries, but also to steel works. All this tends to show the rapid growth of the company which is expected to accelerate further in the years to come.

Sen Raleigh

SALES UP, PROFITS DOWN

IF OVERALL sales of Sen Raleigh have increased and profits have declined, there are various reasons for that. The entire situation was discussed at length by Mr. Abhijit Sen, Chairman of Sen-Raleigh Industries of India Ltd., at the 12th annual general meeting of the company. The reduction in profit was due to the failure of individual indigenous supplies to meet commitments, which resulted in an imbalance of stocks and in turn led to higher inventories with consequent higher financing charges, poor material utilisation, than had been anticipated as in many cases, as a result of changing import policies, materials had to be obtained from unknown and untested sources both within the country or abroad; high rectification costs where these non-standard materials had to be consumed, the higher cost of materials where indigenous or DLF buying from America replaced buying from usual sources in Europe and lastly, the impact of unabsorbed overheads on a turnover, much smaller than planned. The factors that affected bicycle production were a cut in import licence ceilings and the failure of some indigenous manufacturers to meet commitments for supply of semi-finished components that could no longer be imported. Since the promoters of this industry would like the industry to develop fast the attention of Mr. Abhijit Sen was obviously devoted to cut on import licence ceilings linked with export performance. He underlined that it was not understandable why the policy makers too readily agreed to deletion of items when indigenous manufacture was only in the air.

There is, however, one redeeming feature that inspite of the many bottlenecks, the future of bicycle industry appears to be assured. With rising income there was every likelihood of people buying more cycles. So far as expansion plans of the industry are concerned, they envisaged the expansion of bicycle and chain production and diversification into the manufacture of dynamo lamps and house service meters. A sanction has been received for a further issue of the capital. While all this is welcome, the success of the schemes can only take place on the availability of foreign exchange for the import of plant through further foreign participation in the capital of the company.

Flour Mills

PROBLEMS OF INDUSTRY

THE CHAIRMAN of Calcutta Flour Mills Association, at the annual general meeting, highlighted certain basic problems that the industry faced during 1961. Most glaring of these evidently was that of power shortage, which affected the industry considerably. The Chairman pointed out that the Calcutta Electric Supply Corporation wanted the consumers to reduce electricity load during peak period of the day. The flour industry could avoid this cut for some time on the basis that flour milling was a continuous process. Towards the middle of the year, however, the power position deteriorated further and flour mills had no alternative but to accept the cut in the supply of electricity. This naturally reduced the output considerably. Shortage of power supply in the Calcutta region has been chronic and many other areas too were not free from this problem. It would be advisable on the part of the Government, therefore, to face the problem of power shortage squarely and solve it in a composite manner.

Another problem faced by the industry was in respect of supply of wheat products in the Calcutta region. The import of flour which had to be executed as a stop-gap arrangement, continued even after the resumption of work by the five major mills in the region. These mills faced a challenge from their labour that refused to accept advances stipulated to be paid before Puja against bonus. This advance was subjected to adjustment after the publication of the Omnibus Tribunal's Award. The labour refused to accept the quantum of bonus and adopted go-slow tactics and the management was compelled to close the mills. Eventually an agreement was reached after the intervention of the Chief Minister. But flour was not stopped from being imported which was necessary only during the period of stoppages. This hit the sales of wheat products and the Association had to fight against a downward spiral in prices of flour in the market. It may be added that the Government of India has recently introduced statutorily fixed maximum prices of wheat products. Prices of suji, maida, wholemeal atta are uniform in all the mills in the country. In the case of atta, the products of mills in West Bengal, Assam, Orissa and Greater Bombay, are higher in prices by 25 nP. per maund than those of the mills in other parts of the country. This higher price has been found necessary because of local conditions in these areas.

Tourism

BETTER FACILITIES NEEDED

TOURIST TRAFFIC during the last few years has been on the increase. It is partly because of the concerted efforts of the Tourist Department and partly due to the publicity campaign that puts India in the eyes of the foreigner in a somewhat better perspective. The total number of arrivals into India in January and December 31, 1961 was 1,38,804 bettering the record for 1960 by 13.6 per cent. Those who came from Europe numbered 44,034 and from South and South-East Asia numbered 34,573. The number of tourists from U.S.A. and Canada was 38,268, from Africa 17,313, from West Asia, 5,880, from Oceania that in Australia, New Zealand and Fiji 2,903 and from Latin America and West Indies 1,833. The number of tourists from North America in 1960 had been up by 23.9 per cent over the previous year, while in 1961 the percentage of increase was 18 over 1960.

The increase in the number of tourists from U.S.A. alone was 15.3 per cent in 1961 while it had been 25.2 per cent in 1960. From the European countries there was a total increase of 18.7 per cent in 1961, improving the previous year's record of 12 per cent. Tourists from the United Kingdom alone increased by 18.4 per cent in 1961. Tourists from the Commonwealth countries in 1961 formed 47 per cent of the total. Tourists from neighbouring countries of Burma, Ceylon, Malaya, Singapore, together with African countries numbered 42,416 forming 30.3 per cent of the total. From Ceylon alone came 14,823 tourists making up 10.6 per cent of the total.

Various reasons can be assigned for the tourists coming over to this country. They may be classified as pleasure trips, business or study tours or just because they happened to pass through this country and chose to stay here a few days. So far as tourists' stay is involved they spent in all in 1961, 5.53 million days compared to 4.35 million in 1960. The average stay of tourist was 39.6 days in 1961.

Although Tourist Department deserves its due share of praise for attracting more tourists in this country, however, things have not reached a stage when they can be said to be completely satisfactory. Better facilities to attract more tourists is need of the hour and it is here that we must concentrate our attention. The building of more hotels and better service there perhaps might improve the situation to a certain degree.

Key to Planning & Prosperity

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

FROM THE CAPITAL'S CORRIDORS

MORE FROM FINANCE COMMISSION'S REPORT

THE Third Finance Commission has given some hard knocks to the administrative set-up in the States and their indifference to raising of additional revenues. It says:

"Secure in the knowledge that the annual budgetary gap would be fully covered by devolution of Union resources and grants-in-aid, the States are tending to develop an allergy to tap resources in the rural sector on many considerations and also a disinclination to make up the leeway in others. They do not also attach the same importance to a proper and adequate control on expenditure in the matter of services and supplies as before. Cadres expand, pay-scales get revised upwards, negligence develops in the procurement of supplies and execution of projects in the absence of proper cost control. While there is a close scrutiny of, and consultation on, the contents of the Plan, there is hardly any on the contents of the annual estimates; there is no counterpart at the national level in regard to non-Plan expenditure which is progressively increasing as a result of planning itself."

"A disturbing feature is not only the effect of unsound financial policies of a State on its own development, but its impact on neighbouring States also. We have noticed that in one State the pay-scales of one of the services were being substantially increased, backed by the recommendations of a high-powered commission, even when the scales were one of the highest in India. Sufficient thought does not seem to have been given to the effect of this pay revision on other departments of the State itself, much less on its impact on the neighbouring States."

"A similar situation obtains in the field of taxation and considerable disparities exist in the fields of land revenue, sales-tax, motor vehicles tax, etc. Though it is generally accepted that the rural sector could make a greater contribution to national economy, there is an understandable reluctance to revise even the rates of land revenue in operation, even when they have not been reviewed in the last 30 to 60 years. In one State, when a limited operation indicated that the rates could be raised considerably on old accepted and established principles of assessment, the Government considered it inadvisable to continue the settlement operations. In another State, in real need of resources, the collection of betterment levy already introduced had to be suspended just because the neighbouring State had done so in a more prosperous contiguous area. All these induce a chain reaction of enforced under-taxation on the one hand, and avoidable increase in public expenditure on the other."

"It is becoming increasingly evident that there should be arrangements for national or, at least, zonal economic co-ordination, both of tax levies and expenditure programmes, to introduce a measure of uniformity. It should ensure optimum mobilisation of resources and re-introduce a greater sense of responsibility in expenditure control. It is not our intention to suggest that absolute uniformity in various tax levies could be effected even on a zonal basis. The tax potential of even contiguous states is not always the same and their tax structure may need differing degrees of adjustments."

"We consider that a comprehensive examination should now be undertaken to assess the tax potential of each State, to review its tax structure and to recommend rates under different heads of levies in the State list. This examination should appropriately be entrusted to an independent Commission which would naturally take note of the widening gap between resources and functions of the State brought about mainly by the planning process and consider what adjustments, if any, should be made in Union-State financial relations which would add strength both to the Union and the States."

"Another important matter, which deserves a mention, is the need for overhauling the administrative, technical and executing agencies to make them more efficient, quick in movement and effective in execution. We have noticed that in their natural anxiety to obtain larger State plans, there is a tendency to overstate resources, current and additional, and promise economies which are not susceptible of realisation. We should like to stress the importance of 'non-Plan' expenditure pertaining, more particularly, to administration, even in a planned economy. Unless a balance is struck between Plan and non-Plan outlays and the need is recognised of refashioning the machinery of government, we fear that the Plan itself will be in jeopardy. In any event, it will be difficult to secure completion of projects to schedule or to obtain value for money expended."

The Finance Commission has also objected to large-scale grants now given under cover of the Article 282 of the Constitution. It observes: "It has also been urged that article 282 is outside the provisions of the Constitution governing 'Distribution of Revenues between the Union and the States', and is one of the several 'Miscellaneous Financial Provisions'; that it only a permissible provision to meet a possible contingency and is not intended to be used in the manner it is now being used." If this contention of the Commission were accepted, knowledgeable circles opine, all the Ministries trading in State subjects, such as Education, Health, Irrigation, Agriculture and Community Development, would have to be liquidated!

GRANTS TO STATES

A sum of Rs. 25 crores was provided in the Budget for granting ways and means advances to States. Several States faced acute ways and means difficulties during the year due to enhanced demands following increased tempo of developmental expenditure. It, therefore, became necessary to allow them larger short-term advances from time to time. These advances carry interest at 3 per cent per annum and are adjusted in the year itself against the amounts due to the States as their share of Central taxes, duties and statutory grants. The total requirements on this account are now estimated at Rs. 46.5 crores necessitating a supplementary appropriation of Rs. 21.5 crores. Despite these grants of substantial ways and means assistance, some of the State Governments have continued to face acute difficulties. The resources have not kept pace with the rising developmental demands. The States had, as a consequence, to run heavy overdrafts with the Reserve Bank.

The matter was considered in all its aspects in consultation with the State Governments and it was decided to grant 10-year loans to the States concerned to clear their overdrafts with the Reserve Bank at the end of the Second Plan period which would enable them to start the Third Plan with a clean balance. The total amount of these ad hoc loans granted during the year is Rs. 30 crores. Except during the first two years, when interest alone would be recovered, the loans are proposed to be repaid in annual equated instalments of principal and interest. No budget provision was made for this purpose as the decision to grant the special assistance was a post-budget development.

A provision of Rs. 258.62 crores was made in the Budget for payment of loans to State Governments for their Centrally aided Third Plan Schemes. Loans under specific heads of development amount to Rs. 173.57 crores and Loans for Miscellaneous Development schemes come to Rs. 85.05 crores.

As a result of the Planning Commission's discussions with the States in regard to their annual plans, the pattern of loan assistance in respect of the current year was further modified. Loans under specific heads of development are to be Rs. 165.77 crores and Loans for Miscellaneous Development schemes are to be Rs. 104.75 crores.

The latest assessment indicates that the provision for loans under specific heads of development is likely to show a further saving of Rs. 1.79 crores, and the provision for loans for Miscellaneous Development schemes is likely to exceed by Rs. 19.70 crores. In addition, a provision of Rs. 8.04 crores is required for making arrear payments to States for their Miscellaneous Development Schemes relating to the Second Plan period.

CENTRAL ASSISTANCE TO THE STATES

The provision of Rs. 405 crores, as assistance to the States, in the Budget for 1962-63 was made before the additional allocations, such as for power, were agreed to by the Planning Commission. This estimate at present is placed at Rs. 435 crores. This provision was also made before the Third Finance Commission had been made available. It also does not take into account the taxation effort the States have promised to make, and which, according to certain sources may be of the order of Rs. 70 crores during 1962-63. It has, therefore, been decided to make a fresh appraisal of the Central assistance to the States by May next and seek Parliament's vote for any additional amount so needed.

MANGALORE AND TUTICORIN PORTS

The experiments conducted by the Central Water and Power Research Station, Poona, have shown that Mangalore port can be developed to receive vessels of 34 feet draft. Detailed designs and estimates will be prepared on the completion of the investigations regarding borings and penetrometer tests and necessary surveys.

Tests for the purposes of providing silting embankments and evolving of designs for break-waters in connection with Tuticorin port are also being conducted. A Field Division is proposed to be established which could undertake local studies. On completion of these investigations, detailed designs and estimates for this port will be prepared.

Development of Mangalore and Tuticorin as major ports, it may be recalled, has been included in the Third Five-Year Plan and a sum of Rs. 10 crores has been allocated in the Central sector for the purpose. Mangalore is proposed to be developed primarily to handle about 2 million tons of iron ore expected to be available from Chitaldrug (Mysore) and other mining areas in the region. The development of an all-weather port at Tuticorin is also considered necessary in order to enable the port to handle the existing traffic efficiently and to provide capacity for increase in traffic, which at present consists mainly of commodities entering into the coastal trade.

The overall capital expenditure on the development of Mangalore and Tuticorin ports is estimated at Rs. 12.70 crores and Rs. 10.27 crores respectively.

SECOND SHIPYARD

Two British firms, Production Engineering Limited and Babtie Shaw and Morton of Glasgow, are interested in assisting India in building its second shipyard at Cochin. Their representatives are here at present, bidding against each other for a consultancy agreement. A meeting with the Government is scheduled for Monday next.

In case either of the firms get the contract, it will have the financial support of the British Government in building the shipyard.

MANY NEW LINES OF PRODUCTION IN 1961

Production of a number of new items commenced during 1961 for the first time in the country, according to the Report of the Ministry of Commerce and Industry for 1961-62. Among these were hydraulic presses, gas cutting machines, sintered bearings, time-pieces, watches, radio valves, compressors (sealed unit), field cameras, reduction gear units, potassium permangase, argon gas, ammonium phosphate and calcium ammonium nitrate fertilisers, butyl alcohol, butyl acetate, plasticisers, polyvinyl chloride, methyl violets, vitamin B6 and C and carboxy methyl cellulose.

The Report observes that, despite a sizeable fall in imports during the first eight months of 1961-62, necessitated by foreign exchange difficulties, industrial production recorded considerable increase. There is a general keenness to take advantage of the expanding opportunities for industrial growth and foreign collaboration, and to contribute to the building up of new industries. New items are being constantly added to the export list and new markets are being cultivated. The number of new enterprises and expansion of existing industrial units is continuously and rapidly increasing.

The average of the monthly indices of production for the first six months of 1961 was 181.4 as compared to 166.6 during the corresponding period of the previous year, showing an increase of 8.8 per cent. While nearly all industries recorded an increase, the improvement was particularly marked in the case of power transformers, power cables, machine tools, electric motors, grinding wheels, soda ash, caustic soda, sulphuric acid and oxygen gas. Cloth and yarn also shared in the buoyant trend, and tea, coffee, rubber and raw jute registered appreciable improvement.

The jute industry, however, had to go through a period of strain during the major portion of the year due to successive crop failures of raw jute during the previous two years, but signs of stabilization were apparent towards the end of the year.

PROJECT REPORT FOR KOYALI REFINERY

A team of nine Indian engineers has left for Moscow to participate in the preparation of the project report for the 2-million-ton refinery to be set up at Koyali near Baroda in Gujarat. A contract for the preparation of this project report and the working drawings for the Koyali refinery was signed here recently between the Oil and Natural Gas Commission and 'Tjazhpromexport', of the U.S.S.R.

This is for the first time that Indian engineers are actually participating in the preparation of a detailed project and design calculation. The project report will be signed both by the Soviet and Indian engineers.

The team, which is led by Mr. M. S. Pathak, Senior Electrical Engineer of the Indian Refineries Limited, will stay in Moscow for nearly 8 months. Other members of the team are: Mr. M. Gopal, Executive Engineer (Instruments); Mr. D. K. Palit, Executive Engineer (Chemical); Mr. S. K. N. S. Dikshit, Executive Engineer (Public Health); Mr. N. B. Sidhwa, Executive Engineer, (Civil); Mr. K. S. Raghvan, Executive Engineer (Mech.); Mr. C. Govinda, Assistant Engineer (Mech.) and Mr. L. K. Chandhok, Senior Design Engineer. The Koyali refinery will be built in two stages, each of one million tons capacity. The first stage is expected to be completed during the second half of 1964 and the second stage 6 to 9 months later. Equipment and material for the first stage will start coming from the Soviet Union next year.

Under the contract, the designing of a number of units within the refinery has been made the responsibility of the Indian side which will also, in due course,

—ALL 6,276 OF THEM

From the two full rated captains in every PIA jet cabin to the men that look after the 'planes with such loving attention to detail, they all believe in the job they are doing. The job is getting you there *comfortably—on schedule.*

PIA have marked up an unmatched record for punctuality, and people write nice letters about the service. That's why last year PIA carried more passengers (63% more) and showed a higher profit (41% higher) than ever before. Whether you want to fly to Rome or New York, London or Geneva, there are 6,276 people making sure that you get there *comfortably—on schedule.* They're great people to fly with.

be responsible for preparing the working drawings for some of the units initially designed by the Soviet organisation. Provision has also been made in the contract for the use of Indian equipment and material to the maximum possible extent to enable the Indian engineers to undertake increasing responsibility for the designing and execution of refinery projects in the future.

SMALL CAR

The plans to manufacture small car in India again figured in the Lok Sabha last week. The Union Minister for Industries, Mr. Manubhai Shah, disclosed that a firm decision in this respect was expected to be taken within the next four to six weeks.

The following questions put to the Minister and the replies he gave to them would be read with interest:

Mr. Tyagi: Have the present manufacturers of cars in India made any representation to the effect that if this car comes into the market, they will lose their business ?

Mr. Manubhai Shah: Not in those terms; but the Federation, as well as the automobile manufacturers, as the House is fully aware, have been protesting against this project for a long time. But we have taken all matters into consideration, and, as the House knows, Government have decided that the car project will be considered, if at all, in the public sector, that is, the project for the manufacture of a small car.

Mr. Joachim Alva: Is it the combination of the vested interests which has prevented this idea from being fulfilled at a very early stage ?

Mr. Manubhai Shah: It is not quite that. But there have been protests from all quarters. We have examined the project from all angles, and we hope that a decision will be taken very soon on this project. I shall only say that I am fully confident that a small car will be manufactured in this country in the public sector during the Third Five-Year Plan.

Mr. Joachim Alva: Small and cheap car ?

Mr. Manubhai Shah: We shall try to see that the decision is expedited. There is no reason to believe that this country can do without a small car of this size. The Hon. Member is right in his surmise that a country like ours does need a people's car of this size.

Mrs. Renuka Ray: May I know the reasons why the decision has been delayed ?

Mr. Manubhai Shah: The resources question is there. The foreign exchange question is there. Then, the technical feasibility of the car is there. Then there are all sorts of representations from different interests in this country. All these have combined to make the project a slow-moving one.

With the foreign exchange position continuing to be tight and the Government looking for more and more aid from friendly countries, it is a bit surprising that the Minister for Industries should still be toying with the idea of manufacturing the small car. This project, moreover, is not included in the Third Plan.

CREDIT FACILITIES FOR INDUSTRIAL CO-OPERATIVES

For making available adequate credit facilities to the industrial co-operative societies in areas where co-operative banks are unable to accommodate such societies, the Government of India has drawn up a scheme under societies, the Government of India has drawn up a scheme under which the State Bank of India will give advance working capital loans to industrial co-operatives. These advances would be normally against Government guarantee. The State Governments are accordingly being requested to extend to the State Bank and its subsidiaries the guarantee scheme.

The State Bank will charge the industrial co-operatives interest at the same rate as it charges for similar advances from small-scale units. The State Governments may have to subsidise the State Bank to some extent so as to bring its interest rate on these loans at

The scheme also envisages the offer by the State Bank of medium-term loan facilities and term advances of reasonable amount for purposes of expansion, renovation and modernisation of those industrial co-operatives which have borrowing arrangements with it.

EMPLOYEES' PROVIDENT FUND

The Government of India has taken a decision to aply from April 30, 1962, the Employees Provident Fund Act to trading and commercial establishment engaged in the purchase, sale or storage of any goods provided they employ 20 persons or more. These establishments include those of exporters, importers, advertisers, commission agents and brokers and commodity and stock exchanges. Banks or wherehouses established under a Central or State Act are excluded.

Interest on provident fund accounts for the next year is being increased to 4 per cent from the current level of 3¾ per cent.

CENTRAL ADVISORY COUNCIL FOR P & T

With a view to enabling the various interests directly connected with the functioning of the communication services to be associated with the policy direction, the Government of India has constituted a Central Advisory Council for the Posts and Telegraphs Department under the Chairmanship of the Minister of Transport and Communications.

The Council will deal with all-India matters, especially those pertaining to the development of postal, telegraph and telecommunication facilities in the interests of industry, commerce, transport, the Press and other services. Besides developmental matters, the Council will also review and discuss the functioning of the communication services.

Among others, 15 representatives of the State Governments, four Members of the Rajya Sabha and five Members of the Lok Sabha have been nominated to this Council. The Council will also have as its members a few representatives of the Central Ministries.

INDIA-DANISH COLLABORATION

Collaboration arrangements with the following Danish firms had been concluded for the manufacture of various industrial products upto December 31, 1961:

	Danish Firm	Products to be Manufactured
1)	Hydor Ltd., Haderslev.	Air Compressors.
2	Silkborg Maskinfabrik, A/S. Ltd., Silkeborg.	HTST Plate Pasturisers and other Dairy equipments.
3)	Laur, Knudsen Electrical Manufacturing Co., 53, Haraldskade, Copenhagen.	Low-tension switchgear, Motor Starters and Instrument and Control Panels.
4)	Nordisk Insulinlaboratrium, 2, Ved Station, Gentofte.	N. P. H. Insulin.
5)	Niro Atomiser Ltd., 12, Aurehojvej, Copenhagen — Hellerup.	Spray Drying Plants.
6)	Kosangas Ltd., 1, Vester Farimsgsgade Copenhagen V.	Filling of Bottle Gas Cylinders for distribution to households and industry.
7)	Kosangas Ltd., A. Jespersen and Sons A/S. Nyropsgade 18, Copenhagen. and	Bottle Gas Cylinders.
8)	J. Saabye & O. Lerche Ltd. 19, Nyropsgade, Copenhagen V.	Design and construction of wet dock at Madras Harbour.
9)	Hempel's Marine Paints, Copenhagen K.	Marine Paints.
10)	F. L. Smidth & Co. A/S., Copenhagen Valby.	Cement Machinery.

Collaboration arrangements with the following Danish firms are being negotiated for producing goods mentioned in the second column.

Danish Firm	Products to be Manufactured
1) Danfoss Manufacturing Co., Nordborg.	Evaporator Thermo. stats, Strainers and Dehyrators.
2) Roskilde Medical Co. Ltd., Roskilde.	Iron Dextron.
3) Danish Machine Co. Ltd., Aabyhoj.	Machine Tools.
4) Brdr. Simonsgaard, 155B, Jagtvej, Copenhagen N.	B. S. Lift Trucks.
5) Vilh, Pedersen Ltd., Hong.	Milling Machines.
6) Dansk Frugttorreri, Hjallese.	Fruit drying, Canning and Deep Freezing Equipments.
7) Atlas Ltd., Copenhagen.	Industrial Compressors.
8) A/S Teknova, Copenhagen.	Valves & Regulators.
9) Red Rotary International Corporation, Copenhagen.	Adding Machines.
10) Effort Maskinfabrik.	Whipping Machines.

INDIA'S TRADE WITH NEW ZEALAND

Mr. J. R. Marshall, Deputy Prime Minister of New Zealand, told newsman here on Monday that New Zealand did not favour formation of trade blocs which discriminate against countries that are not members of such blocs. New Zealand's basic trade policy, he said, was multilateral trade without discrimination.

Mr. Marshall was on a short visit to Delhi after attending the ECAFE session in Tokyo. During his stay here, he met the Prime Minister, Mr. Nehru, the Finance Minister, Mr. Morarji Desai, and the Commerce & Industry Minister, Mr. K. C. Reddy. Besides exchanging views on the impact of Britain's possible entry into the European Economic Community, he had discussions with Mr. Reddy on the possibility of increasing trade between India and New Zealand.

India at present imports from New Zealand goods worth about Rs. 1 crores, while she exports to New Zealand goods worth over Rs. 7 crores. New Zealand can supply India on competitive prices such goods and commodities as milk powder, wool, wood pulp, newsprint and mutton tallow. Mr. Marshall observed that India's requirements of milk powder were bound to increase. He added that New Zealand could well take a large share of it.

New Zealand offers good opportunities for stepping up exports of jute goods and tea from India, A significant observation made by Mr. Marshall in regard to India's trade with New Zealand was that India could import from New Zealand more mutton tallow and spare some of its vegetable fats, now used for domestic consumption, for export purposes.

Mr. Marshall also indicated that New Zealand could help India further in the development of dairy industry. She is already doing so under the Colombo Plan and is actively associated with the Delhi Milk Supply Scheme. New Zealand, he said, was not in competition with the Indian dairy industry and was assisting it to expand by supplying the supplementary quantities of skimmed milk powder which are essential for the development of public demand for milk.

MANGANESE EXPORTS

With a view to stepping up exports of manganese ore, the Union Government has decided to extend the incentive scheme meant for exporter-mine-owners to exports canalised through the State Trading Corporation. This will obviate the need for a mine-owner to export directly. He will now be ensured of the benefits of the incentive scheme even if he offers his ore for export through the STC. The step will also enable the STC to bargain for reasonable export prices in lieu of the incentives offered.

Under the incentive scheme which has been in operation since July last, exporters of manganese ore are permitted to import mining equipment and machinery, for the improvement of their mines, to the extent of 5 per cent of the foreign exchange earned by them, in case of straight exports against cash. Higher import entitlement not exceeding an additional 5 per cent, making a total of 10 per cent, will also be considered on merits in individual cases where the actual users establish the need for it.

In the case of exports under barter system, the import of machinery would be allowed to the extent possible under the scheme on the condition that the value of imports under the barter agreement is reduced to the extent of machinery entitlements.

IRON ORE EXPORTS

Japan continued to be the biggest importer of Indian Iron ore during 1961. Country-wise, exports of Indian iron ore during this year were as follows: Japan 16.33 lakh tons, Czechoslovakia 5.63 lakh tons, Italy 1.48 lakh tons, Poland 1.18 lakh tons, Hungary 86,000 tons, West Germany 58,000 tons, East Germany 24,000 tons, Austria 19,000 tons, Rumania 2.95 lakh tons and Yugoslavia 1.44 lakh tons. Total exports amounted to 30.88 lakh tons.

INDO-PAKISTAN TRADE

The Government of India has issued an Open General Licence, covering five items, for imports from Pakistan. The five items are: live tortoise; fish, not otherwise specified; fish salted and wet; hides and skins, raw or salted; and kapok.

Payments for two items, viz., live tortoise and kapok, under this Open General Licence will be made in non-convertible Indian rupees as provided for in protocol No. 1 between the Governments of India and Pakistan, signed on March 21, 1960.

The Open General Licence will be invalid until May 20, 1962.

IN BRIEF....

The second session of the Madhya Pradesh Organisation of Industrial Employers is scheduled to be held on April 1, 1962. It will be inaugurated by the Chief Minister of the State. Among the items on the agenda are a number of resolutions on the new industrial policy and various problems facing the industrial community.

•

Mr. A. R. Ramanathan, Chairman of the Travancore Rayon Ltd., has been re-nominated by the Union Government to serve as Chairman of the re-constituted Development Council for Art and Silk Industry. Mr. Ramanathan has also been elected as the President of the Association of Man-made Fibre Industry.

•

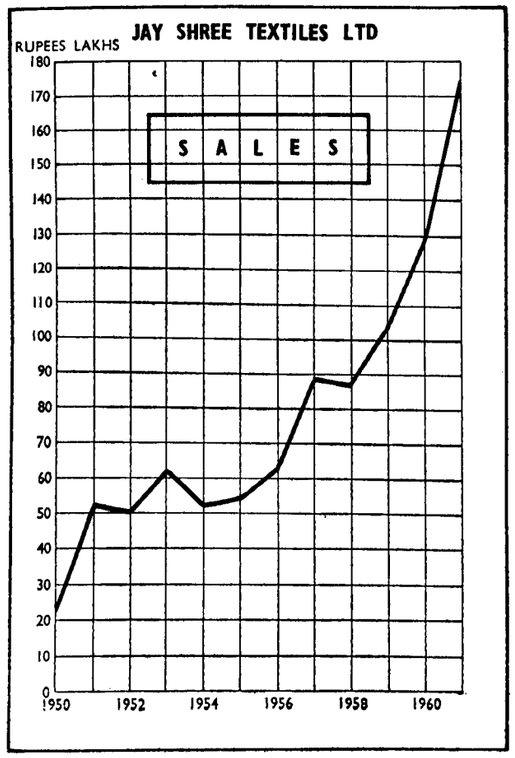
Bomas, the second largest advertising agency in India, has opened a new office at Calcutta. With the opening of this office, Bomas now offer an all-India network of national advertisers. Its service chain now includes Bombay, Calcutta, Delhi and Madras. S. H. Benson International Ltd., the parent company of Bomas, has on hand plans to expand its activities further by opening offices in many more countries. With its headquarters at London, it is already operating in Australia, Canada, Ghana, Nigeria, Kenya, Tanganyika, India, Singapore, Malaya, Hong Kong and Italy.

•

The Coal Industry has made a representation to the Union Government pointing out that the present price structure of coal is uneconomic and that a general increase in these prices is warranted. The matter, it is understood, is receiving the attention of the Government. Decision is expected to be taken soon.

•

The Bhilai Steel Plant fulfilled its target of 7½ lakh tons ingot steel output for the current financial year on March 16 — 15 days ahead of the scheduled time. The steel melting shop of this plant achieved its full rated production capacity in January last.



COMPANY AFFAIRS

JAY SHREE TEXTILES

As the graph below indicates, Jay Shree Textiles have recorded a continuous increase in their sales. During the last five years the sale proceeds more than doubled. During the year 1961, for which the report is now available, sale proceeds were around Rs. 173 lakhs—36 per cent higher than the previous year's sales of Rs. 128.4 lakhs. The gross profits too have increased in line with the sales. After providing for depreciation, the balance was Rs. 27.92 lakhs, which was comparatively higher than last year's figure of Rs. 18.64 lakhs. The Directors have proposed the transfer of Rs. 10 lakhs to Development Rebate Reserve. They have recommended the payment of dividend on old equity shares at the rate of Re. 1 per share of Rs. 10 each subject to deduction of tax which absorbs Rs. 4.92 lakhs.

The Directors believe that the results of the current year could have been still better but for certain serious handicaps, the most important being the inadequate import licences made available for raw materials especially wool tops and flax fibre and spare parts. Reduction and interruption in the power supply also hampered production. There was recorded an increase in wages and the prices of coal.

The Directors believe that the company can expand its activity and its cotton spinning plant of 15,200 spindles, a new scheme, is making progress. The erection of machinery has already started and production is likely to start during the third quarter of 1962. Provisional orders for the plant, that will manufacture high tension electric insulators, has also been placed. The company received permission for the issue of new equity capital to the extent of Rs. 24.59 lakhs. These shares have been offered to the existing shareholders on the basis of one right share for every two existing equity shares.

NEW ISSUES

Hindustan Lever Ltd., has been granted consent to the issue of Rs. 267.36 lakhs in bonus shares of Rs. 10 each on capitalisation of reserves to be offered in the ratio of 12 bonus shares for every 25 held.

The Nangdala Tea Company Ltd., will issue 24,000 bonus shares of Rs. 10 each on capitalisation of reserves. The existing paid-up capital of the company is Rs. 12 lakhs.

Hindustan Construction Co. Ltd., will issue bonus shares of the value of Rs. 36 lakhs divided into 36,000 equity shares of Rs. 100 each to be made in the ratio of one bonus share for every equity share held.

The New Monkhoosi Tea Co. Ltd., has obtained the CCI's permission to issue 72,000 bonus shares of Rs. 7.50 each on capitalisation of its reserves. The existing capital of the company is Rs. 9 lakhs.

The Binod Mills Co. Ltd., will raise further capital of Rs. 55 lakhs divided into equity of Rs. 40 lakhs to be issued as 'right' for cash at a premium of Rs. 10 per share and preference of Rs. 15 lakhs at par.

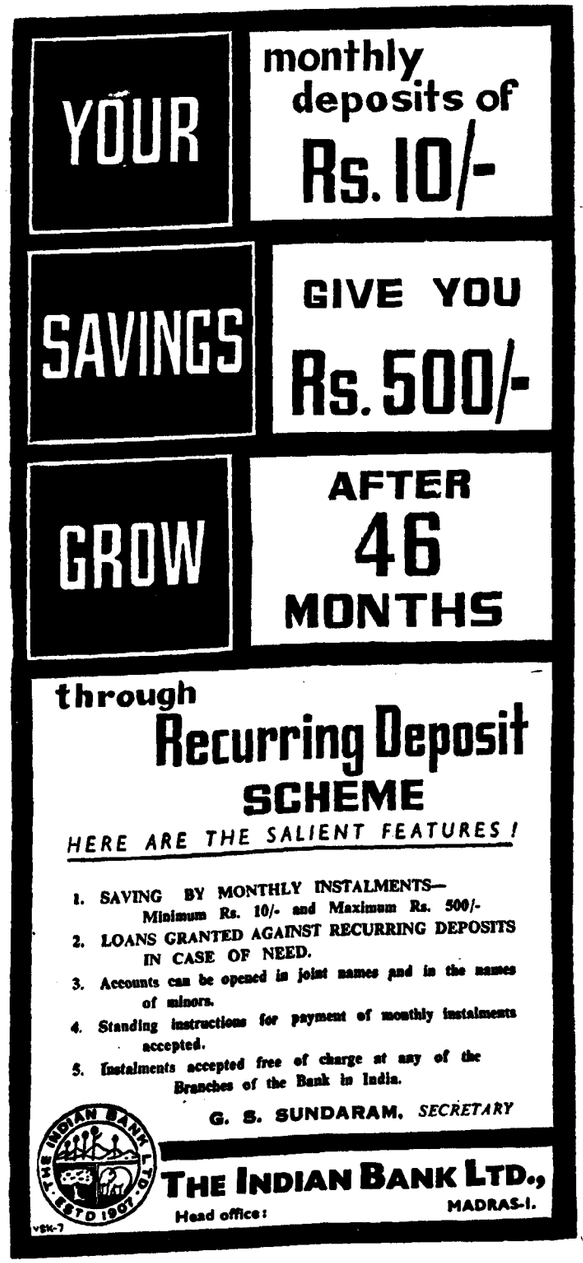
Dalhousie Hotels Ltd., a company proposed to be incorporated in West Bengal, has been allowed to issue capital of Rs. 1 crore divided into 8 lakh equity shares of Rs. 10 each and 20,000 cumulative redeemable preference shares of Rs. 100 each.

Particle Boards India Ltd., a new company, will issue capital of Rs. 40 lakhs divided into Rs. 32 lakhs in equity and Rs. 8 lakhs in preference. The firm plans to manufacture particle boards and by-products.

Modi Sugar Mills Ltd., has obtained Government approval to raise further capital of Rs. 73,38,960 divided into equity shares of Rs. 10 each at par.

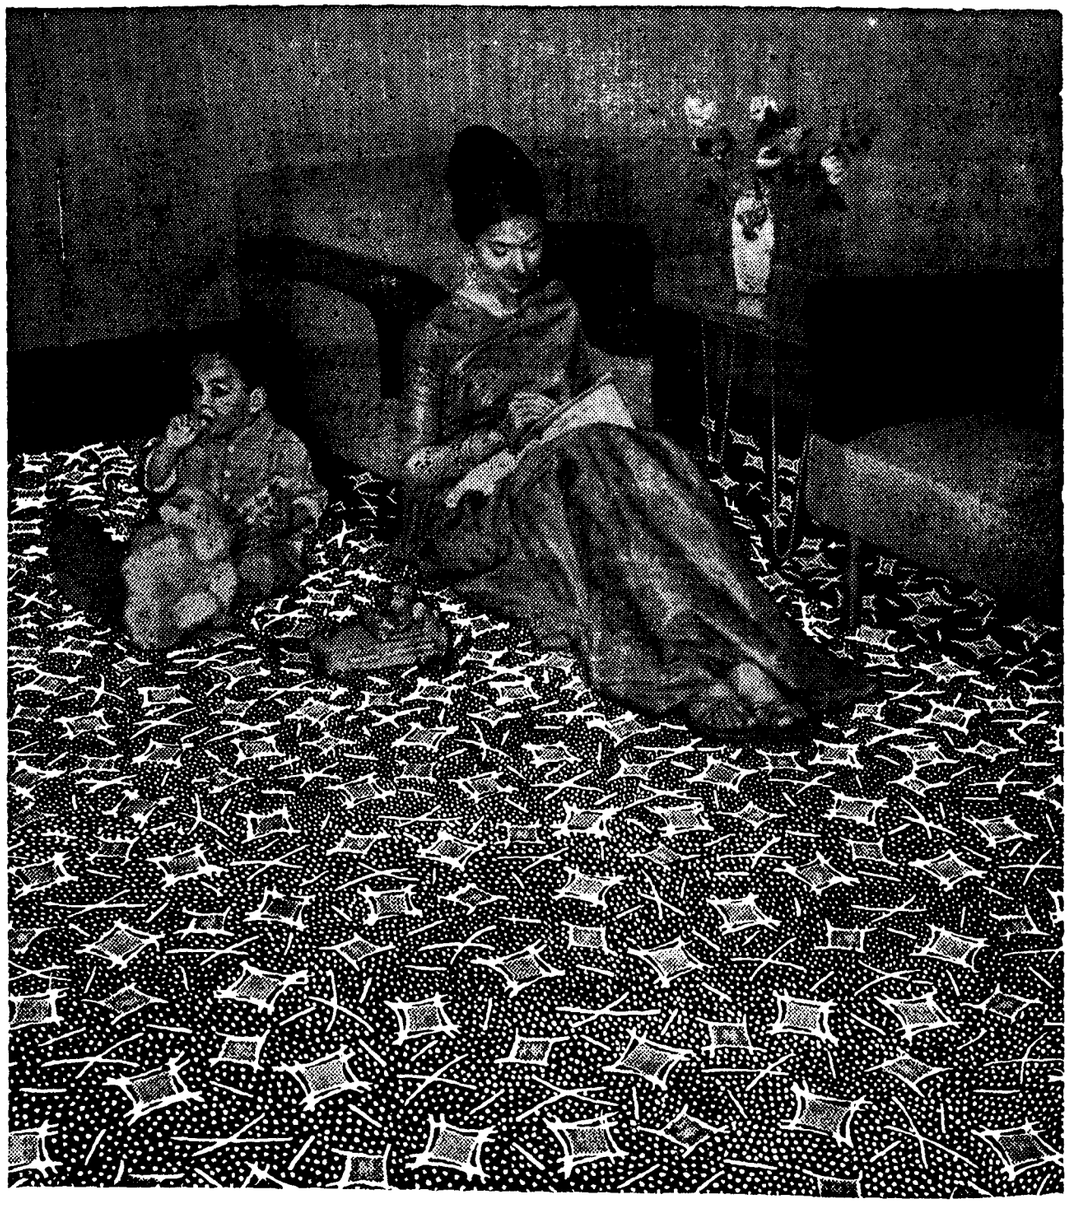
TAK Machinery Ltd. will raise fresh capital of Rs. 50 lakhs in equity shares of Rs. 100 each at par.

Hindustan Organic Chemicals Ltd., a Government company, will raise further capital of Rs. 45 lakhs divided into 4,500 equity shares of Rs. 1,000 each at par.



Nanubhai Industries (Private) Ltd. is to issue Rs. 29.12 lakhs capital divided into equity shares of Rs. 1,000 each at par.

Bharati Pulp and Paper Products Ltd., has been granted consent to issue capital of Rs. 22.88 lakhs in equity shares of Rs. 100 each at par.



Kothari and Co. (Private) Ltd. will issue 50,000 equity shares of Rs. 10 each for cash.

Swadeshi Ayat Niryat Ltd., Calcutta, has obtained the CCI's permission to issue five lakhs equity shares of Rs. 19 each at par for the establishment of a spinning mill in U.P.

The Woriur Commercial Bank Ltd., has been granted consent to the issue of capital of Rs. 20,500 divided into 2,050 shares of Rs. 10 each fully paid-up to be issued at par. The paid-up capital of the bank is Rs. 29,500.

Company Meetings

ASHOK LEYLAND LTD., MADRAS

Thirteenth Annual General Meeting

CHAIRMAN'S REVIEW

Speech delivered by Sir A. Ramaswami Mudaliar, K.C.S.I., D.C.L. (Oxon), Chairman, Ashok Leyland Limited, to the Shareholders at the Thirteenth Annual General Meeting of the Company held on 12th March, 1962, at Ennore, Madras.

Gentlemen,

I have great pleasure in extending to you a cordial welcome to the Thirteenth Annual General Meeting of your Company.

The Directors' Report, Audited Balance Sheet and Profit and Loss Account for the period from 1st January to 30th September 1961 have been circulated to you and with your permission I shall take them as read.

At the last Annual General Meeting I referred to the change in the financial year which the Directors decided to make. This is reflected in the Balance Sheet and Profit and Loss Account before you which cover a nine-month period only from 1st January to 30th September 1961 and the future financial years will run from 1st October to 30th September inclusive.

As the Profit and Loss Account shows, the sales for the nine-month period at Rs. 8,11,93,053 are a little less than the figure of Rs. 8,32,66,909 representing sales in the previous twelve months. It is gratifying to note that the value of sales in nine months this year has nearly equalled that in 12 months last year, a result which was achieved mainly by increasing the output of Comet Chassis, the average output per month being 170 in 1960 as against 195 during the nine-month period in 1961, an increase of nearly 15 per cent.

The continuous expansion of the Factory is the result of the investment of funds mainly raised by additional Share Capital and to some extent by external credit. There has been only a negligible contribution of funds from the profits of the Company. In an expanding industrial unit, where plant and machinery have been added and additional buildings have been constructed to accommodate the plant and machinery and the increased activities of the Company, it must be obvious that after providing for depreciation, development rebate and taxation reserve, there will be little left for ploughing profits into the concern. The small surplus remaining after these expenditures have been appropriated for a reasonable dividend. Your directors are considering ways and means by which there might be a reasonable amount of profit which could be ploughed back into the concern for further expansion.

The progress of your Company during the last five years must be recognised to have been impressive. The rapidly expanding assets have been appropriately depreciated so that the total depreciation up to 30th September, 1961, exceed Rs. 98 lakhs. The Development Rebate stands at Rs. 37.25 lakhs. With a Paid-up Capital of approximately Rs. 3.45 crores, the gross block on 30th September, 1961, was over Rs. 3.76 crores and the total assets on that date included stocks valued at Rs. 3.21 crores. I may mention here that the price charged by the Company for your Comets is the same today as it was in 1955, the difference in selling price being accounted for by the additional Customs or Excise Duties imposed in successive Finance Acts. I am not aware of any other Automobile Company which has maintained its price at the same level during the last seven years.

Additional buildings to a value of approximately Rs. 40 lakhs have been erected and additional plant and machinery of a value exceeding Rs. 56 lakhs have been installed during the year under review. These additions represent partly the provision of plant and machinery to carry forward the Phased Manufacturing Programme and partly the buildings, plant and machinery required for the expansion programme to which I referred last year. Buildings required for the expansion of production are nearing completion and the installation of plant and machinery has commenced. I hope that by the end of the current financial year, i.e., by 1st October, 1962, nearly all the machine tools will have been installed and most of the jigs and tooling required for the production of components in accordance with the phased planning will have been supplied. We look forward to the production and sales continuing to increase during 1962 and I trust that in 1963 the expansion programme having been completed, our output of Comet Chassis will be at the rate of 5,000 per annum with a 20 per cent excess capacity for the production of Spare Parts. In addition, Engine output will have been increased to provide not only the Comet Engines, but also the heavier '600' and '680' types required for Chassis and industrial applications.

It will not be inappropriate if at this stage of our development I attempt to review the task we have undertaken during the last few years. As I stated, its magnitude is impressive. In 1956, at the commencement of the phased Manufacturing Programme, it seemed an optimistic estimate that we might within five years reach an output of 1,000 Comets per annum; and with restrictions on gross laden weights in most States, preventing the operation of our Goods Vehicles, it appeared a most formidable task to sell 1,000 Vehicles per annum. However, by the end of 1957, it was clear that demands for our vehicles would exceed our ability to supply. Pending the practicability of a major expansion project, it was decided to introduce double-shift working with the object of increasing production to 2,000 vehicles per annum. It is no small satisfaction to the Board and myself that with plant and machinery designed to produce 1,000 vehicles per annum with single-shift working, the Factory was able to produce nearly 2,400 in 1961 and will probably produce over 3,000 in 1962 with double-shift working. Coincident with the task of increasing production with the plant and machinery currently available and with the progressive deletion of imported components, planning has been in progress since 1959 to give effect to the decision to increase production capacity to 6,000 'Comets' and in addition 1,200 Heavy Duty Engines per annum.

Ennore Foundries Ltd. has made good progress since your last Annual General Meeting. Production commenced in November 1961 and by the end of March, 1962, it will supply all the castings required by Ashok Leyland Ltd. which from April 1962 will discontinue the import of castings, including cylinder blocks and heads. From May 1962 progressively surplus capacity will be available for the supply of quality castings to users other than your Company. There are, nevertheless, certain difficulties which Ennore Foundries Ltd. have to face. Steel scrap is in short supply and is expensive, while pig iron available in the country has too high a phosphorous content. These difficulties may

be overcome in due course, but while they persist the price of high quality grey iron castings will remain higher than it might otherwise be. Until these difficulties are overcome, it is unlikely that it will be possible to produce iron castings appreciably more cheaply than the landed cost of imported castings. It is hoped that before too long there may be definite plans to produce "Sponge" iron in India as this would provide an ideal raw material, as an alternative to steel scrap, at an economic price. "Sponge" iron is obtained by the direct reduction of iron ore by suitable carbonaceous matter; and considerable progress has been made in this new technique, particularly in Germany. Madras has iron ore available at Salem and lignite at Neyveli, which could provide an ideal combination for the production of "Sponge" iron, which would be very useful not only to Iron Foundries but also to Steel Works.

There have been from time to time discussions about the competition of road transport with rail transport and opinions have been expressed in some quarters that the railway earnings must be protected and that they ought not to be eroded by road transport earnings. A review of present conditions of traffic on rail and road and a reasonable forecast for the future must leave one under no delusion about the necessity for road traffic developing and indeed side by side with the development of rail traffic. It must be clear in the light of recent experience that road and all other forms of transport must continue to expand and that in no other way can the success of India's agricultural and industrial development be assured. This expansion will during the next ten years not only result in the demand for Commercial Vehicles equalling the combined output of manufacturers but also in increased demand to a figure which may well be a 100 per cent more than the existing maximum production targets. The Board has, therefore, decided to go forward with the expansion project with confidence and be ready for such further developments as time and circumstance may demand.

You will be interested to know that, following requests received from a number of shareholders, we have come to an arrangement with our Bankers whereby they will charge us a concessional rate of 1/64 per cent on the total payments to shareholders who encash Dividend Warrants at any Branch of our Bank; and this charge will be paid by the Company. This will obviate shareholders having to pay bank charges of 65 nP. per warrant in order to encash them at outstations.

Since your last Annual General Meeting, we have had several visits from senior officials of Messrs. Leyland Motors Limited. Mr. West, Deputy Chairman of Leyland, accompanied by Mr. Grimshaw, Leyland's Engineering Consultant, came in November 1961; and Mr. Robinson, Leyland's Planning Controller in January 1962. In February 1962, we had the pleasure of welcoming Sir Henry Spurrier, Chairman of the Leyland Group, who visited us accompanied by Mr. West and Mr. Grimshaw. I must once more place on record not only our appreciation of the readiness with which our British Associates come to India to assist our efforts, but also of the invaluable advice which we receive from them. I am sure you will wish me to convey to them, and particularly to Sir Henry Spurrier, our thanks for all their assistance.

As Chairman I feel I must refer to one of my colleagues on the Board whose contribution to the progress of your Company has been outstanding. I refer to the Managing Director, Mr. Collins. His initiative and drive combined with his suavity — an invaluable asset to both in the Factory and in relations with Governments — has been a great factor in all our progress.

I must also record the enthusiastic help and cooperation which the Officers, Staff and Workers of your Factory have extended to your Directors. This cooperation has been readily given, indicating the interest of all employees in the development of the Factory and the cordial relations which exist. I should like to convey our thanks to them all.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

A SOLID "LIQUID" ASSET

Which never lets you down ... which you can keep indefinitely ... which you can cash anywhere — any time. AMERICAN EXPRESS TRAVELERS CHEQUES valid and payable all over the world

Never carry more cash than you can afford to lose

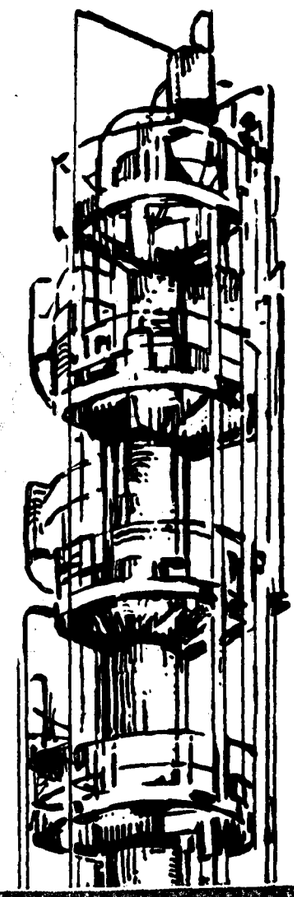
AMALGAMATIONS
AT WORK

Here is a vignette of the activities of Amalgamations and Associates.

Some of the Associates are acquired interests, while others have been promoted as part of a basic plan to augment the progress of automobile and transport industries.

Contributing in no small way to the national economy under the Five-Year Plans Amalgamations' sole aim is Service to the Country.

ENGINEERING GROUP



- **SIMPSON & CO. LTD.**
  MADRAS-2.
  Manufacturers of Perkins 'P' series Automotive, Agricultural, Industrial & Marine diesel engines in collaboration with F. Perkins Ltd, U.K.
- **ADDISON & CO. LTD.**
  MADRAS-2.
  Manufacturers of Engineers' Cutting Tools. Grey Iron Founders manufacturing high tensile castings for the Automobile & Machine Tool Industries.
- **ADDISONS PAINTS & CHEMICALS LTD.**
  MADRAS-11.
  Manufacturers of the full range of Spartan Paints in collaboration with Hardie Trading Ltd. Victoria, Australia.
- **AMCO BATTERIES LTD.**
  BANGALORE.
  Manufacturers of automotive, railway, telephone & Industrial batteries in collaboration with GOULD NATIONAL Batteries Inc. Saint Paul, Minnesota, U S.A.
- **INDIA PISTONS LTD.**
  MADRAS-11.°
  Manufacturers of Pistons, Rings, Liners & Gudgeon Pins in collaboration with Associated Engineering Ltd., England.
- **BIMETAL BEARINGS LIMITED**
  MADRAS-11
  Manufacturers of Shell Back Bearings in collaboration with Clevite Corporation, Cleveland, U.S.A.
- **GEORGE OAKES LTD.**
  MADRAS-2 & BOMBAY-4.
  Distributors in India for "FORD" Cars and Trucks and Ford Spares.
- **REICHHOLD CHEMICALS INDIA P. LTD.**
  MADRAS-2
  Manufacturers of synthetic Resins, Pigments etc.
- **SRI RAMA VILAS SERVICE LTD.**
  MADRAS-2 & KUMBAKONAM.
  Operators of a large fleet of local & long distance transport Lorries & Buses.
- **SHARDLOW INDIA LTD.**
  MADRAS-2.
  Manufacturers of forgings and stampings in collaboration with Ambrose Shardlow Ltd., Sheffield.
- **SPEED-A-WAY PRIVATE LTD.**
  MADRAS-2.
  Manufacturers of STEELCRAFT furniture, Distributors for BRICOVMO pistons, rings & liners, SYLVEX P.V.C. Auto cables, PAYEN TALBROS gaskets and Perkins spare parts.
- **STANES MOTORS (SOUTH INDIA) LTD.**
  COIMBATORE
  'Tyresoles'—Retreading of tyres, Distributors for Bedford., Ambassador and Standard Cars—Automobile servicing.
- **TRACTORS & FARM EQUIPMENT LTD.**
  MADRAS-34.
  Manufacturers of Massey-Ferguson Tractors and farm equipment in collaboration with the Massey-Ferguson Organisation of Toronto, Canada.
- **THE WHEEL & RIM CO. OF INDIA LTD.**
  MADRAS-11.
  Manufacturers of JUBILEE & RUBY Bicycle rims.

NON-ENGINEERING GROUP

- **ASSOCIATED PRINTERS (Madras) P. LTD.**
  MADRAS-2.
  Letter Press, Offset Printing, Book Binding, Die Stamping and Copper-plating.
- **ASSOCIATED PUBLISHERS (Madras) P. Ltd.**
  MADRAS-2.
  Proprietors of "The Mail", the leading evening newspaper in Madras.
- **HIGGINBOTHAMS PRIVATE LTD.**
  MADRAS-2.
  Leading publishers and booksellers in Madras.
- **SIMPSON & GENERAL FINANCE Co. Ltd.**
  MADRAS-2.
  Insurance & hire-purchase.
- **T. STANES & COMPANY LTD.**
  COIMBATORE-1.
  Fertiliser manufacturers, Tea Estates & Coffee curing.
- **THE UNITED COFFEE SUPPLY CO. LTD.**
  COIMBATORE-1
  Manufacturers of Stanes Instant Coffee and Stanes Tea.
- **WALLACE CARTWRIGHT & CO. LTD.**
  LONDON S.W. 1.
  Liaison buying and shipping agents in U.K. for the Amalgamations group.

AMALGAMATIONS PRIVATE LIMITED
202, MOUNT ROAD, MADRAS-2.

Advertising Consultants :

Specialized ENGINEERING AND CONSTRUCTION FOR THE IRON AND STEEL INDUSTRY

For more than half a century McKee engineers have specialized in the design, engineering and construction of steel-producing facilities. Our comprehensive mine-to-metal services include every phase of the work necessary for any steel-plant project, from preliminary studies to completed plant ready for initial operation.

The McKee Organization has executed contracts in 49 countries including India. Among these are some of the world's largest and most modern completely integrated steel plants and hundreds of individual units, including blast furnaces, open hearth shops, rolling mills, agglomerating, sintering and pelletizing plants. Most recent examples of large-scale integrated plants are the new Somisa plant at San Nicolas, Argentina and the C.S.N. plant at Volta Redonda, Brazil.

To the steel industry of India the McKee Metals Division offers the services of its large, well-qualified staff with a fund of sound, practical experience and specialized knowledge that is unmatched anywhere in the industry.

Comprehensive engineering-contracting services, similar to those of the McKee Metals Division, are supplied by these specialized divisions of the McKee Organization:

PETROLEUM & CHEMICAL DIVISION
Complete Refineries and individual Processing Units for all modern petroleum and petrochemical processes and certain types of chemicals and chemical products.

WESTERN KNAPP ENGINEERING
Plants and facilities for production of Non-ferrous Metals, mining, preparation, handling, beneficiation and storage of Ores and Industrial Minerals.

National Rayon
spins yarn from the bounty of nature

Fashionable fabrics at a low cost—that is the promise of Nature's bounty when spun into Rayon by NRC.

There is bounty of another sort as well: Rayon makes subsidiary chemicals which are vital to many diverse industries; it provides full-time employment to 500,000 workers; affords invaluable training and experience to chemical engineers and technicians, and conserves India's foreign exchange.

This bounty is truly a gift well-timed for this country.

Why CIMMCO Sakamoto

BECAUSE

★ AUTOMATIC LOOM IS A MUST FOR QUALITY TEXTILES
★ 62% OF COUNTRY'S AUTOLOOMS ARE SAKAMOTO TYPE
★ 25% OF COUNTRY'S AUTOLOOMS ARE OTHER JAP. TYPE

ALSO

★ THESE ARE STURDY IN DESIGN
★ SIMPLE TO SET-UP AND OPERATE
★ TRIED IN COUNTRIES THE WORLD OVER

AND

TECHNICAL COLLABORATION **COMBINES** A **LOOM BUILDING EXPERIENCE** OF **18** YEARS AT CIMMCO WITH OVER **34** YEARS IN JAPAN.

Specially developed technique of boring frames on assembly ensures of perfect allignment. Improved temple cutter, end cutter and latest mechanised warp stop with efficient brake ensure faultless weaving continuously with minimum efforts.

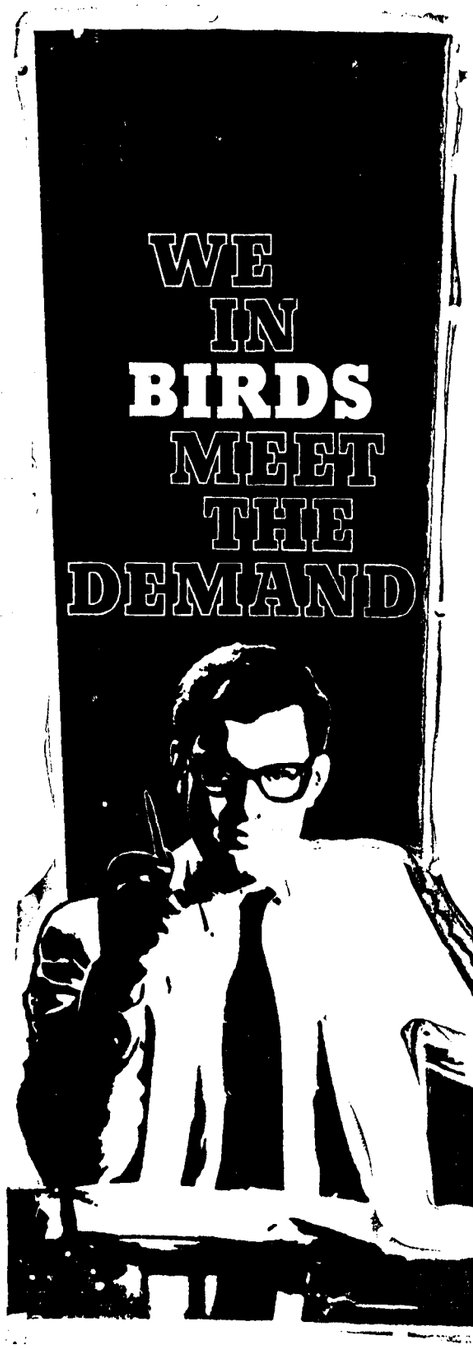
MANUFACTURERS OF:

Single Phase House Service Electricity meters. 230 Volts, Type I-IIR, Conforming to I.S.S. 722 (Parts 1 & 2) of 1955 in the Amperages of 5 (Max); 10 (Max); and 40 (Max).

Band Switches to meet the various requirements of Radio & Electronic Industries.

P.V.C. Insulated Cables & Wires etc. made strictly to B.S.S. & I.S. Specifications for Electrical purposes.

Water Meters, Half Inch size for Domestic Installations and Corporations.



THE BIG HURRY IN THE WORLD OF ASTRONOMY

Suddenly, a star exploded. ■ Turning within its spiderwork of iron and steel, the 200 ft. wide saucer-shaped 'eye' of the radio telescope at Jodrell Bank looked deep into black space and recorded: the star had exploded FIVE MILLION YEARS AGO! ■ Peering so deep into space as to question time itself such radio telescopes are revealing to us the breathtaking, even frightening, dimensions of space and time, gathering astronomical data that are making space travel a fast nearing reality. ■ Into the fashioning of the 2000 ton Jodrell giant went the most advanced technique and knowledge of welding and gas cutting. ■ It is this precise knowledge of industrial gas and its diverse applications that Indian Oxygen affords Indian industry.

INDIAN OXYGEN LIMITED

IOC-67

Rising steel production requires more and more vital raw material, iron and manganese ore, limestone, coal, dolomite, and refractories... New plants need essential water treatment processes... Agriculture requires tubewells in greater volume... the country's growing markets demand more jute products, paper, electricity, steel structurals and castings. And the Birds/Heilgers group is always there to spur their production... to meet these demands. But expansion doesn't stifle achievement. Nearly a hundred years of experience and research continues as Birds strive harder to bring you better products and better materials to keep pace with India's fast expanding economy.

Machines to produce wealth. But more important, men who can design and make machines and run factories. The production of skill. Dunlop have been doing this ever since they took on a batch of Calcutta University science graduates for their factory at Sahaganj, West Bengal, in 1936. At that time technicians from Birmingham supervised all operations. A different story in 1959, however, when Dunlop opened their second factory at Ambattur, near Madras. Skilled men from Sahaganj played the major part in getting Ambattur under way; in charge of production there is a man who began life as an operative at Sahaganj

Throwing aside the deadweight of habit. Striking out along new paths with confidence in the future. This is the substance behind the new Dunlop symbol.

FIREBRICKS, FIRE CLAY AND HIGH TEMPERATURE FIRE CEMENT

in the service of

the INDIA'S INDUSTRY

With half a century's experience at our back we serve our customer's individual requirements. REFRACTORIES OF HIGH QUALITY, for reliable service can now reach you swiftly from our Factories at Ishwarnagar, New Delhi & Niwar (Dist. Jabalpur).

We serve the Industry with fire Bricks of all types, sizes and grades, with Alumina ranging from 30% to 70%, Fire Clays High Temperature Fire Cements, 85% Magnesia Composition, etc., etc. We also manufacture complete requirements of Refractories for the Iron & Steel Industry, Railways, and Ordnance Factories.

THE ISHWAR INDUSTRIES LIMITED

FACTORIES AT:

ISHWARNAGAR, NEW DELHI • NIWAR DISTT. JABALPUR.

Preface

THE current issue of *The Eastern Economist* attempts to provide a benchmark from which the Indian people can look over the last decade — the Decade of Hope — and then forward to what is often believed to be a decade of fulfilment. It is appropriate that this month should be chosen for a review of this kind. The second Lok Sabha has just been adjourned *sine die*, and a new Lok Sabha will take charge of the governance of the people at the Centre, as new Legislatures have already taken charge in the States. The General Elections of 1962 present what might be described as the political reflection of the mind of the Indian people at this turning point in their long and arduous journey towards a better and a fuller life. They have expressed themselves somewhat ambiguously. It is, therefore, necessary to interpret their answer both in political and economic terms. Perhaps it is even more necessary to give form and expression to the unspoken discontent which is only partly reflected in the political vote which, in many States of the Indian Union, is certainly critical. Apart from the major decision in politics that the country has made, there are four pressing years of the Third Plan for which economic decisions have still to be formulated and much internal content given to the basic targets of the Third Plan. This is the appropriate time when one should ask where the country stands today; where it should stand, and where emphasis needs to be changed.

THE DECADE OF HOPE

The last two Plans, as well as the last two elections, have coincided with the fifties which all the world over has been a decade of remarkable change. In Europe this decade has seen the arrival of the European Common Market and the great strengthening of the Atlantic Alliance. In the Communist Bloc it has seen a new confidence in technical research and a military and industrial power which was wholly absent in 1950 before Russia had the atom bomb and before her economy had been proved in the hard struggle for international markets. In this same decade over most of Africa the lights of freedom have been going on one by one, culminating in this month with an agreement which concedes the substance of freedom to Algeria — France's most prized colony. All the world over, the currents of change, restless and unceasing, have been working at top speed exceeding that of any decade in world history. There have been shots at the moon and numerous satellites round the earth. Technology has found a new threshold of revolutionary activity based on atomic power. The future is unpredictable but the opportunities are certainly greater than ever before.

During this period, the Indian people have been largely absorbed in themselves. How in the ferment all the world over have they been affected? When the First Five-Year Plan first took form, the country was in a different and hesitant mood. In spite of the fact that the sterling balances were at the peak, the First Plan contained no steel plant, and it was believed that India could afford no more than a rate of rise of national income which, subsequent events have shown, because of population growth involved no real rise in the per capita standard of living. By contrast, the Third Five-Year Plan, on which we are now embarked, provides in absolute terms investment more than four times as large in spite of the absence of sterling balances and a foreign exchange gap nearly ten times the figure it was at that time. These are some small indications of the extent to which the diffidence at the threshold of the Third Plan has given rise to ambitious confidence in it. The face of the country has been changed in the interval, not merely by hundreds of factories and by thousands of new institutions multiplying everywhere under the impetus of planned development and much greater public initiative, but also by a cast of mind which is becoming increasingly adventurous and assured. Both in the short and in the long periods, this revolution in the Indian capacity for self-help and for an economic adventure will undoubtedly be ranked as the largest achievement of the decade that ended with the Second Five-Year Plan.

THE DECADE OF FULFILMENT

If the fifties were a decade of hope the next decade will need to provide at least some measure of fulfilment. This is largely because hope, although it is a condition of economic progress, cannot be self-sustaining. It must be reinforced from time to time at the fount of reality which is fulfilment. By and large, the First and the Second Plans contained a large element of statistical fulfilment. On the other hand, the price that was paid was rather greater than was expected and the material resources of this country were strained both by running down the rupee and foreign exchange resources and the rise of internal prices by about 25 per cent within the decade. Thus, fulfilment in an objective sense was qualified by subjective discontent, and over large areas of the country there has been undoubtedly a feeling of frustration either because hopes were unduly high or fulfilment unduly low. Where, indeed, should a true balance lie? The next two articles attempt to present a picture of the two decades in what might be described as appropriate perspective.

THE CHANGING INDIAN REVOLUTION

Although this was not expressed positively in these elections, it is clear that the legend of the Congress Party has itself undergone some considerable recession. The ideals of Mahatma Gandhi have become clouded with the years and even the glamour of India's great leader, Jawaharlal Nehru, is increasingly ineffective against the current restlessness and somewhat frustrated criticism. The need for fulfilment in the next decade is all the greater because the great elements which induced patience in the Indian people are beginning to wear down. There needs to be, therefore, both a new political as well as an economic approach to the challenges of the decade. The Third and Fourth Plans by themselves are not enough either to justify the Congress Government or to maintain stability in the body politic. Nor is the socialistic pattern of society a talisman or an enduring faith.

The articles which follow attempt to set a framework in which the pattern of change of the next ten years might be made more acceptable to the Indian people. It is as well that we should recognise now before it is too late that if the pattern of change is not made acceptable in this period, revolutionary movements, which have been splendidly stayed by the ascendency of the Congress Party, might sway an electorate out of the path of moderation into the path of extremism. Indeed, at this time there is nothing so disturbing as the emergence of militant extremism as a factor of great potential moment in Indian political life.

The Decade of Hope: Unhappy Ending?

WHY has the decade of hope, covered by the First and the Second Plans, ended in so much discontent? This surely should be one of the questions which the results of the General Elections pose. During this period, India has made, in terms of economics, greater progress than she made in the fifty years preceding. Agricultural production has been up by about 40 per cent and industry has more than doubled, if one employs a sound weighting of the new indices of industrial production. The national income has moved up at an average rate of nearly 4 per cent since 1952 and the country's industrial structure is now based on the heavy industries in a manner totally unknown ten years ago. These are substantial achievements for any country in the world. One might, therefore, have anticipated that, instead of a vote of limited confidence and even of some bitter opposition, there should have been clear and unambiguous verdict of approval. The economic answer to the problem of political discontent is reserved for the Blue Supplement in this issue. Here only some political reflections are presented.

There are some who would argue that it is a vote of supreme confidence in the Congress Party. *The Eastern Economist* does not entertain this view. It holds the view that the Congress Party has claimed a high percentage — 45 per cent in the Lok Sabha — of votes, largely on the face of no alternative government and on the magnificent organisation which still works miracles at election time. It is in the seats that the Congress Party has lost in the States that a vote of discontent, and even anger, expresses itself. In some respects, the discontent is not entirely economic. It is partly racial, as with the D.M.K. in Madras; partly religious, as with the Jan Sangh in the Hindi areas. But the source of militancy of these parties is the fundamental unrest which hopes to explain the new perspectives that these parties present. The character of economic discontent is widespread over a large portion of the Hindi area and Madhya Pradesh, Rajasthan, Punjab and Uttar Pradesh have borne ample evidence to the powerful force of the opposition at this time. It is significant that, while the overall vote of the Congress Party is 45 per cent in the Indian Union, it polled only 40 per cent votes in the States. In Uttar Pradesh, the vote in the State Assembly has dropped below 35 per cent, containing within itself a warning the significance of which cannot be lost on any tried political observer. A piece of supreme political good fortune has kept the Congress in power in Uttar Pradesh and has given it 63 seats in the Lok Sabha out of 86 with a vote of less than 40 per cent. Such good fortunes through the accidents of the electoral machinery cannot be repeated. Thus, in the decade which has commenced, undoubtedly the Congress Party faces four greater challenges than it has faced in the decade which has ended.

There can be little doubt that whatever the improvement of the economic conditions, the Indian people as a whole have not been stirred by the fruit of the first two Plans. An All-India Political Poll by the Indian Institute of (Gallup) Public Opinion shows only 26.1 per cent answered in the affirmative the question, "Has your economic condition improved or deteriorated since the 1952 General Election?" 26.3 per cent thought their situation had deteriorated; 36.5 per cent it was the same; 11.1 per cent could not judge. The corresponding figure in 1957 was: 'improved' 25.8 per cent, 'deteriorated,' 30.0 per cent and 'about the same' 34.0 per cent. The conditions are somewhat better in urban, as against rural, areas. But then urban population is only one-fifth of the rural population and this cannot change the general picture. Only about a fifth of the Indian people feel that their economic condition has improved. If this has happened in a period of such a remarkable development, one might ask the question how Indian Governments of future are to face the challenge involved in the critical electorate which they serve.

Nothwithstanding the fact that the electorate is very apt to blame Government for all shortages, the failures are primarily the consequences of 'external' pressures in India's economic problem. The first of these is certainly population which is rising at the rate of nearly 2 per cent per year and has eliminated substantial gains of real income expected when population rise was computed at only 1.25 per cent per year. The same growth in population has made the improvement in employment, which has been substantial both in agriculture and in industry, much less dramatic than it should have been. Finally, the rise in prices in the interval has eliminated at least, in the minds of a very large number of people, the feeling that their standard of living has improved. Of the 26.3 per cent who said their standard of living had deteriorated, 85 per cent said that prices had risen more than their income, which was the reason of the reverses they had suffered. To the question, 'Has your standard of living achieved your expectations or not?', only 17.2 per cent answered in the affirmative, 52.2 had a negative answer and 30.6 had no opinion. These are serious reflections on the capacity of the Indian administration to satisfy the Indian people. If after ten years of arduous work in the decade of hope less than 20 per cent of the people believe that their standard of living has achieved their expectations, it is obvious that something much more substantial has to be done in the following decade to provide a corrective to the disappointment of the majority with which the decade of hope has ended.

It is one of the arguments of the articles that follow that there is no easy correlation in India between economic discontent and political change. In some States notably in Kerala and Orissa, they were once closely correlated but there are others in which political, religious, moral, or factional forces are more powerful than economic fulfilment or economic discontent. Policies in the changing Indian revolution have thus to be many-pronged providing to the Indian people not merely political satisfaction and economic progress, but quite often a deep emotional satisfaction in the current democratic pattern and the individual freedom of expression and living which they are intended to perpetuate.

The Decade of Fulfilment: 1960-1970?

IT has been fashionable, particularly in official presentations of the Third and Fourth Plans, to argue that India will 'take off' in the next decade. This has been designed to impress students of economic history imbued by W. W. Rostow's 'Stages of Economic Growth'. The argument seems to be that it does not matter how much absolute progress you are making; it is of vital interest that you develop 'a self-generating economy', implying a stable balance of payments position and a capacity to advance henceforward predominantly on one's own resources. In other words, the promise of fulfilment in the Third and Fourth Plans is a promise of fulfilment to our foreign creditors that, after ten years, we shall no longer be a burden on them seeking assistance, particularly in the form of grants. This prospect of fulfilment is not by any means an answer to the feeling of political uncertainty in the Indian mind.

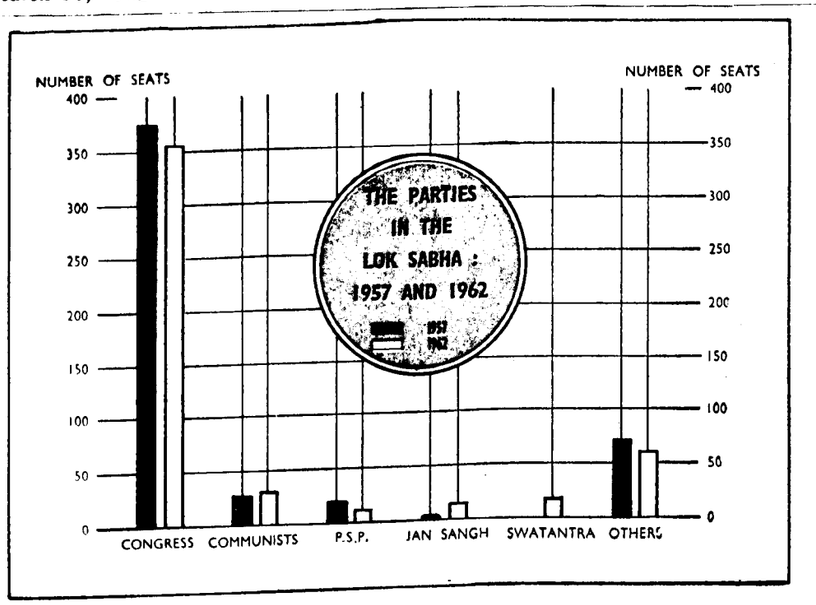
The doctrine that India is seeking an economic 'take off', like the doctrine of the continued rise of national income, may be satisfying to the pride of those who are building the economy as active agents and, indeed, by reflection to the nation as a whole, but it is no specific answer to the individuals visited by stress and strain to know that, while they endure burdens which, from time to time, look unbearable, the economy is achieving a position of steady flight. The metaphor of birds in flight might be satisfying to the birds themselves no less than to those who observe them from afar, but they are hardly convincing if flight is not a universal characteristic or can be seen as such in a comparatively short time. In other words, the doctrine of a 'take off' is primarily designed for fulfilment of those who are seeking to gear the economy at the higher level thus obtained. It is very necessary, therefore, to break down the problem of fulfilment in terms of individuals, and to describe it not in the economy as a whole, or of the components of payments, national income, industrial production, heavy industry and so forth. One of the great errors of the economists, shared considerably by politicians, is the attempt to describe achievements in terms of abstract or 'average' statistics. If the Indian problem, presented by the general elections recently concluded, has any immediate lesson, it is to be found in the fact that the subjective assessment of economic progress is very different from the recorded testimony of those operating the economic system whether here or abroad. In other words, there must be a subjective approach which can be translated into removal of political discontent if fulfilment is to arrive.

In the Third Five-Year Plan, more than in the First and Second combined, there will be a substantial improvement in the distribution of incomes and a much greater impact on unemployment. Nevertheless, as will be indicated in the Blue Supplement in this issue, there will be a residue of primary poverty both in particular States and at particular income levels in every State. Poverty and destitution will not be abolished and the discontents which arise from comparative inequalities will, between the States, hardly be less great at the end of the Third Plan than they are today. A uniform upward movement, if it applied to every income group, would still lead to economic discontent of a subjective kind. This is inevitable in any economic system and nothing can be done to abolish the pangs of relative inequality. But something can and should be done to abolish destitution which is still a terrible blot on the Indian economic system. If ten years from now people should continue to die of starvation and of cold as they did in Delhi last winter, one might argue that the 'take off' of the economy in a mechanical economic sense will be of no avail.

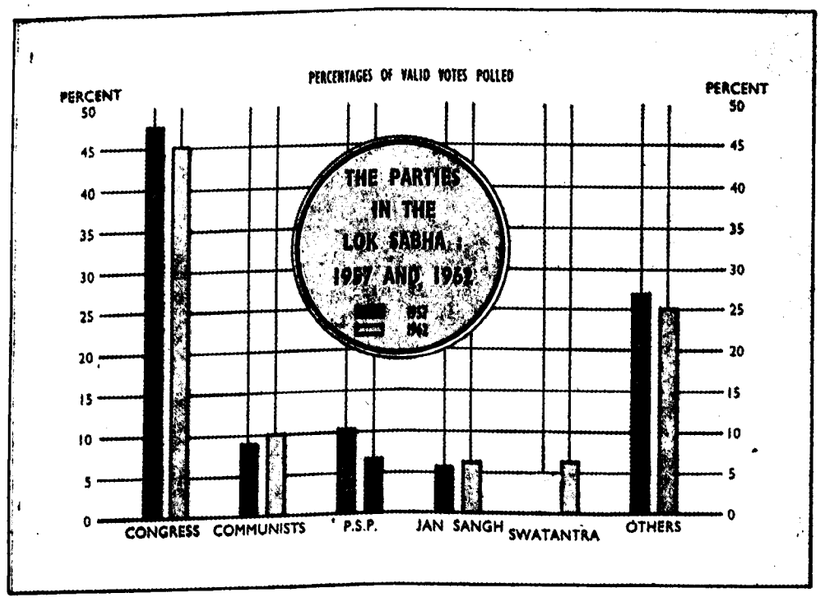
This suggests that fulfilment in the Third and Fourth Plans will need to be directed primarily to the weaker sections of the community. The argument that the waves of economic progress are certain to bring deliverance will not, in the next two elections, be decisive in retaining political stability. This would apply even if economics were the dominant element in producing the kind of fulfilment that the Indian people desire. There is, however, some evidence that in most States of the Indian Union this is not the case. In the current elections, the factors which influenced the vote away from the Congress Party have certainly not been economic only. In the State of Kerala, where standards of living are substantially above those in Maharashtra, the Communist vote continues to rise. In the State of Rajasthan, economic discontent is allied to a predilection in favour of former rulers of the State and takes on an emotional attachment to a bygone age rather than a relation to the capacity to improve economic conditions. The success of the Swatantra Party in Rajasthan is thus not an association with its effective economic policy. In the great State of Uttar Pradesh where the Jan Sangh has been markedly successful in making a dent in the Congress political power, the poll has some deep emotional quality in Hindu India, entrenched in the great spiritual centres of Hardwar, Prayag and Varanasi, all of which by a conspiracy of history, strengthen Hindu political influences in what might well come to be known as India's problem State. The sources of political fulfilment and the source of economic progress are now moving very differently in the States of the Indian Union. Undoubtedly, the factors which make for instability for the Punjab and Uttar Pradesh are different. So, indeed, are those which separate Rajasthan from Kerala. Therefore, the suggestion that the Third Plan contains fulfilment for all people in all States is an absurd over-simplification which it is hoped that the last general elections have finally dispelled. A great campaign of political persuasion needs to be allied in each particular State with a particular policy to suit the conditions of that State. All that can be said is that economic progress, if associated with a campaign of political persuasion, might be more effective than if the political persuasion is sought alone.

The danger in this situation is that the Congress Party, badly equipped in terms of experience to carry through a managerial revolution in the public sector which will generate income on a greatly increased scale, may be even more handicapped by the fact that it is in this process secular, socialist and committed to other policies of an unpopular kind. The Secular State has not been synonymous with national integration. There are large areas of Hindu India to which integration is only a word. There are some areas covered largely by minorities — the Punjab is notably one — in which the problem of integration is visited by an equal demand for separation. The D.M.K. probably stands betwixt and between, although it attempts in an extreme form to raise the cry of secession which cannot seriously be entertained by any thinking section of the Indian Union. But the answer to the problem of secession raised by the D.M.K. as well as the separate State raised by Punjabi Suba, cannot be effectively dealt with on the basis of current policies which are solely negative. It must be obvious that so far as both the Punjab and Madras are concerned, the policies of the last ten years have strengthened the Sikhs and strengthened the D.M.K. National integration under these circumstances calls for quite new and unfamiliar methods of political persuasion. The elections should prove that old wine cannot be put into these new bottles.

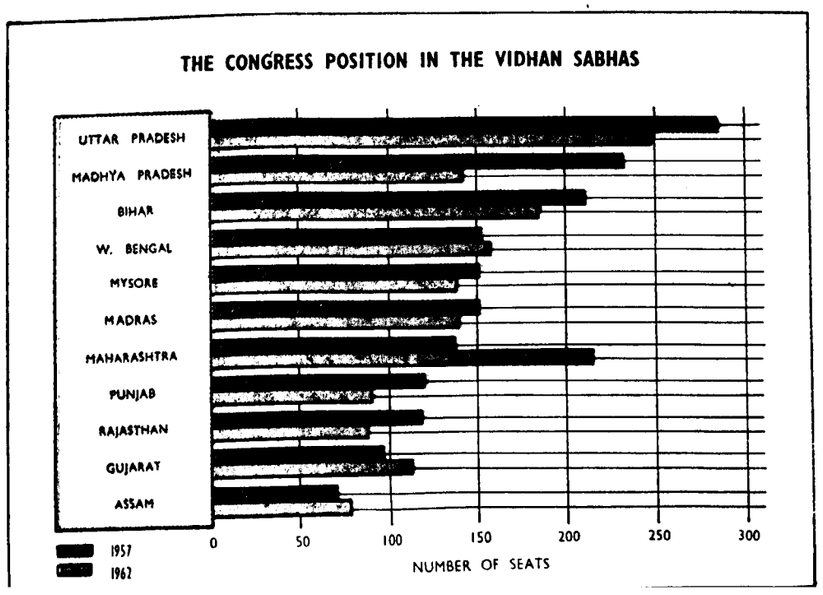
The Changing Indian Revolution



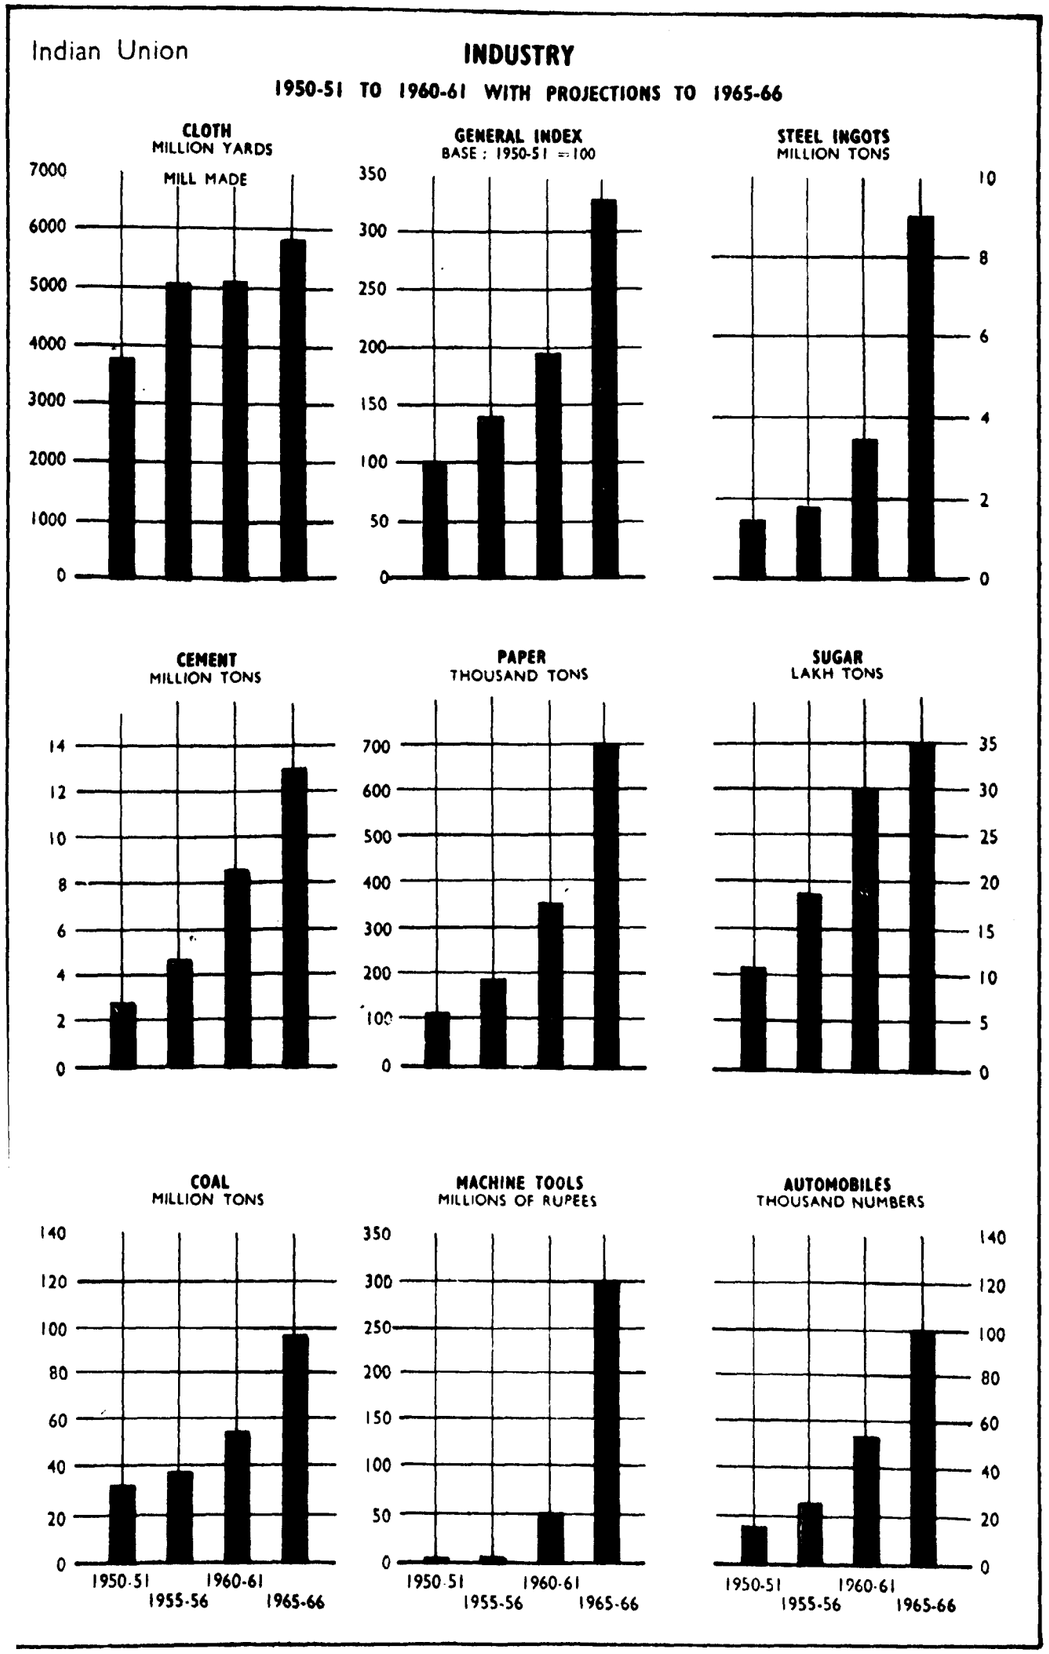
IT should be clear from these simple illustrations of the complexity of the Indian political problem, as revealed in these articles that the Third and Fourth Plans cannot be effective so far as changing the political opposition to the Party in power, unless some radical departure is made to meet the deep emotional opposition to certain elements in the Congress Party. Time itself will remove some of this opposition, but, unhappily time will even be more effective in removing Congress leadership. Most, of the Congress leaders — and this is particularly true of those at the Centre — are advanced in years, whereas the opposition leaders are substantially younger, except in respect of Mr. C. Rajagopalachari, who is the oldest campaigner of them all. By and large, age and time are on the side of the Opposition and against the Congress. This makes it all the more necessary that, while leaders of the Congress are still alive, some instrument by which their personal prestige can be passed on to an impersonal party, should be invented. Over the last ten years, nothing has been more disconcerting as the fact that, far from becoming more impersonal, Congress leadership attaches itself more and more around particular leaders in the Centre and in the States. The monolithic structure of the Congress Party is one of the factors which is leading to its decline. Once the present leadership of the Party is removed in particular States, there is no assurance that party loyalties will remain where they are today. It is vital, therefore, that the Congress Party should now drop its legend and woo the electorate on some different grounds than the leadership of Jawarharlal Nehru and the top circle of Congress politicians. It is difficult at this time to find out the base on which any personal structure can be raised. This, however, can be said that the promise of economic progress by itself will not be sufficient to stem the growing tide of political discontent. Therein lies the challenge as well as the opportunity of a younger group inside the Congress Party. The question is whether it will be equal in its response to the tremendous difficulties with which it is encompassed. The Ginger Group of the Congress does not contain much promise that, within the next ten years, great Congress leadership will arise to replace the generals who must necessarily fade away.



The elections of 1962 seem to suggest that the Congress is not the Party of the future. Its popular vote has not declined significantly at the Centre, but it has in the States, particularly Madhya Pradesh, Rajasthan, Uttar Pradesh and the Punjab. It is not, however, in the decline of the popular vote that the most serious challenge is presented. It is in the fact that, except in Uttar Pradesh where the Congress has received many more seats than on the basis of a proportional vote, the Opposition seems to be benefiting as much as the Congress by small majorities, increasing its seats without a very substantial improvement in its popular vote. The arithmetic of election varies from country to country. Until 1957 it looked as though the Congress Party which has never had a majority vote was always favoured in terms of seats, but, for the first time, in the general elections of 1962, the tide has moved away, and the character of the majorities that the Congress Party has received in the present elections suggests that there will be worse to come in 1967.



It would be a fair conclusion from the results of the elections that the legend that the Congress Party is the only party which can govern the country in the States, has already disappeared. Five States of the Indian Union may pass from the Congress in 1967. This could not have happened if the country as a whole was wedded to the Central doctrines of the Congress Party, namely Secularism, Socialism, and all that they connote. There is no justification for the assumption that the Indian people are largely socialist in their outlook. There is much more in the results of 1962 elections to suggest that there is a reaction from socialism, and particularly that variety which involves some considerable official machinery with the possible corruption that this entails. There is also evidence to show that had the Congress not been in the administration, its losses in some States, particularly, the Punjab and Uttar Pradesh, would have been more severe. The country is not, therefore, wedded to the Congress policies, and if it should happen that the tide should turn and other parties take charge of the administration, the decline might be swifter by reason of the fact that they may also use the official machinery as the Congress has sometimes done for its own purposes.



However this may be, the Congress Party itself will need new policies in order to carry added conviction in several States of the Indian Union. It is believed, it will also need new economic policies to buttress itself against the discontent in the lowest income groups and to distribute welfare more pointedly towards the economic base of the lowest income groups. The attempt to correct inequalities has been half-hearted, and, while this is to some extent inevitable in a free society, it is clear that the country as a whole will not be convinced about the effectiveness of the socialist policies of the Government unless something more tangible is produced in the direction of the raising of the lower income groups. Production is the great leveller, and it may well be that much the best course of action would be to promote production by every conceivable means rather than to develop the public sector even when it is inefficient.

The elections suggest that the Indian people are not primarily interested in ideologies, but are seeking a centre party which will accomplish a higher standard of living, less inequality and redress of the great grievances of the lowest income groups. A much more vigorous campaign in the villages is necessary to provide some of the defences that Wage Awards provide to industrial labour. It is difficult at this moment to see how this would be accomplished, but price supports may well be the only means of translating the policy of protection of the weakest income groups in the villages of the country. There would also have to be a rural bias where most of the lowest income groups still reside. Whether or not all this can be done without the erosion of income by a rising price level and by the stresses and strains seen in the Second Plan is a question which it is difficult now to answer. Much will depend on the course of the rains. If these are fairly good, as they were in the Second Five-Year Plan, perhaps the political crisis at the end of the Third Plan will be no greater than it is today. That in itself would be a substantial victory to the Congress. *The Eastern Economist* believes this unlikely and considers that the tide is moving away from the Party that gave us Independence. All this implies is that the Indian political system has moved away from its initial revolutionary objective. **The Indian Revolution is, in fact, moving in the direction of what might be called a normal balance between democratic parties in the Union.**

THE PARTYWISE PATTERN OF LOK SABHA VOTING

(Percentages of valid votes polled by the parties to total votes polled)

Total Number of seats: 494
Declared Results: 489

Economic Growth

RETROSPECT: 1951 - 1961

WHILE national income is the best index of the health and growth of an economy, the most helpful indicator for level of living is per capita income, though it must be supplemented by certain other information such as health (including demographic conditions), food and nutrition, education, conditions of work, employment situation, housing, clothing, recreation, social security, human freedom etc. It is to be conceded that a mere rise in per capita income does not imply a rise in level of living but if the rate of capital formation does not take a sharp rise or fall, the trend in consumer expenditure follows approximately the same path as traced by per capita income and, therefore, it does indicate, by and large, the manner of growth in the level of living.

The Central Statistical Organisation has published its estimates of national income at constant prices as well at as current prices after interpolating population for each year between 1951 and 1961 on the basis of the results of the latest census. Earlier estimates had underestimated the rate of rise in population as they were based on the 1941-51 periods and had therefore given a little distorted picture of the rise in per capita income. The table below shows in index numbers the growth in national income as well as per capita income, both at 1948-49 prices and at current prices. It will be seen that during the last decade national income rose by 43.4 per cent as compared to the earlier estimate by the Planning Commission at 42.0 per cent. At current prices, the rise was of the order of 49.0 per cent, the increase by 5.6 percentage points being due to the inflationary impact of rising prices. What is noteworthy is that national income (both at current and constant prices) received a greater raise in the Second Five-Year Plan than in the First. Whereas the overall increase in the two Plans was of the order of 43.4 per cent, the First Plan's contribution was not more than 18.4 per cent. In per capita terms, the growth over the decade was 18.2 per cent, indicating a simple rate of growth of 1.8 per cent per annum.

The rate of growth of the Indian economy indicated by these figures compares very unfavourable with the rates of growth in the advanced countries and even in some of the developing countries. Iran, for example, has recorded a rise of 9 per cent per annum; Burma, our neighbour, registered an increase double that of India and as the table below shows, there are many others which have had better experience in economic growth than the Indian Union. The only other areas which lie in the same group of slow economic growth are Ceylon, Egypt and Argentina.

All these facts lead one to the conclusion that the Indian economy has still to march to the "take-off" stage. Unless the economy attains the self-sustaining character so as to be able to propel itself through its own internal forces, it will continue to move at a sluggish rate. The next decade will surely lay down the foundations for speedy growth. The Third Five-Year Plan in financial terms is bigger than the first two Plans taken together. And the Fourth Plan will be much bigger than the Third Plan.

PROSPECTS: 1961-71

The tempo of growth will without doubt get accelerated during the next decade. The foundations of industrialisation were laid during the Second Five-Year Plan with the result that the Third and the Fourth Five-Year Plans will accelerate the pace of development in such a manner that the rate of growth of the Indian economy will compare favourably with the industrially advanced nations of the world. As against 43 per cent rise in national income during the last decade, the Third Five-Year Plan envisages an increase of about 34 per cent in national income. The growth is likely to be balanced though some sectors will, in percentage terms, grow faster than others. The mining and factory establishments sector will lead with a rise of about 82 per cent in five years or a little more than 16 per cent per annum. Agriculture is anticipated to increase by 25 per cent. The tertiary sector is likely to rise by 32 per cent. In per capita terms, the Third Five-Year Plan is likely to yield nearly 20 per cent increase or at least equivalent to 18 per cent — an increase which was achieved during the last decade.

It is pretty certain that the increase in national income in the Fourth Plan will be much larger than what is likely to be achieved during the Third Five-Year Plan. In other words, the growth in national income during the next decade will be around 65 to 70 per cent—more than 50 per cent above the level achieved during the first two Plans. The end of the Fourth Five-Year Plan will also witness a structural shift in the national income of the country. Hitherto the share of the agricultural sector has shown only a marginal fall from 49 per cent to 46 per cent. With the hastening of industrialisation, the share of industry and tertiary activities is likely to rise much ahead of agriculture with the result that the long-awaited shift in favour of industry will emerge around 1970-71. According to the indications available currently, it is expected that the share of agriculture in 1970-71 will be around 40 per cent of the national income. The agricultural sector, however, in absolute terms will continue to march in a progressive manner so as to satisfy the increasing demands of the agricultural as well as non-agricultural population. The new demands will emerge under the pressure of rising incomes all round. These forecasts assume that the capital output ratio which has been at a high level (3.29 : 1 in the Second Plan) would be reduced to a little above 2 as a result of larger increases in income through the primary sector. The investments made during the Second Five-Year Plan in the industrial sector failed to yield their complete results during the Plan period and their contribution will inflate output in the Third Five-Year Plan, and thus help in increasing the volume of national income without corresponding strain on financial resources.

While it is certain that the per capita income by 1970-71 will have increased beyond the 100 dollar mark (Rs. 500), the revolution of rising expectations will generate some other pressures. The basic necessities, of course, will have been provided. Vast sections of society which currently live below the poverty line will be able to rise above the level of subsistance and will obtain elementary necessities in terms of food and clothing which will be sufficient to keep body and soul together. The demand for comforts will increase. This aspect has been discussed in detail in the Blue Supplement.

The Population Mix

IN the United States and other industrially advanced countries the "baby booms" are welcome. The "Census Clock" of the Commerce Department of U.S. indicated early this year that its population had exceeded the level of 185 million, indicating a rise in population by one person every 11 seconds. The millions in the United States are arriving much faster, and this fact is deemed to be an asset for the economy. A rise of 30 millions in population in the U.S. took 29 years between 1857 and 1886. The span has been considerably reduced now. The corresponding increase of 30 millions in population in the United States is likely to emerge in 12 years between 1958 and 1970. It is estimated that this accelerated rate will take the population of the United States to 210 million in 1970.

The "baby booms" are not so welcome in the Indian Union, though they continue to arrive. The low standards of living which prevail in the country get pushed down further with the fresh arrivals of babies. The census of population taken last year recorded a rise in population beyond expectations during the last decade. As against a rise of 13.3 per cent in the decade 1941-51, the latest census indicated that the rise in population between 1951-61 was of the order of 21.5 per cent. Table I shows that every decade during the last sixty years brought accelerated millions.

Projections attempted for the next fifteen years indicate that India's population will reach 492 millions in 1966, 555 millions in 1971 and 625 millions in 1976. This explosive rate of rise in population has alarmed the planners; the financial allocation for popularising family planning techniques in the country has been enhanced in the Third Plan. In December last year Mr D. P. Karmarkar, Minister for Health indicated that the family planning programme had developed to such an extent that there was a feeling that a new Ministry of Population and Family Planning should be formed at the Centre. In urban areas as well as rural areas family planning clinics are being opened and even financial incentives are being offered in order to encourage people to avail of the facilities. The vast net work of clinics which has been

TABLE I

	Population Millions	Decennial growth Millions	%
1901	235.0	..	..
1911	250.7	14.3	5.7
1921	250.0	— 0.7	— 0.3
1931	277.4	27.4	11.0
1941	316.9	39.5	14.2
1951	359.2	42.3	13.3
1961	436.4	77.2	21.5

set-up in this country needs to be explained with facts and figures. The Second Plan started with only 20 clinics in rural areas. By the end of the last year there were 3,124 centres in rural areas. This includes 1260 regular clinics providing all family-planning services. Sterilization is slowly gaining ground and in some districts the response has been beyond expectations. However, old prejudices die hard; in view of the unmanagable size of the problem, it is feared that progress in this direction may be halting and hesitant.

The statistics in regard to the size and distribution of the working force in 1961 are not yet available and therefore, by way of illustration, only 1951 figures are given below (Table II). It will be seen that out of a population of 359 millions in 1951, the working force consisted of 143 millions constituting nearly 45 per cent of the total population. Agricultural classes predominated with a total of 100 millions; the earning dependents were also the largest in this class. Estimates have, however, been made in regard to the probable strength of the working force in 1961 and the table below (Table II) shows that the increase during 1951-61 in the working force was of the order of 28 millions as against a rise of 79 millions in population. The largest increase, in percentage terms, occurred in the case of the services, followed by industry and agriculture. It shows that during the last decade the strength of the blue collar workers rose by 3 million while that of the white collar workers increased by 9 millions. There is no element of surprise in this proportion between the increase in blue collar workers and the white collar workers. In other advanced countries also which have industrialised at a fast rate (such as Japan) the tertiary sector always scored over the secondary sector.

What is acting as a drag on the Indian economy is the addition to the working force in agriculture. Out of the total increment of 28 millions to the working force during the last decade; more than 50 per cent were added to agriculture. Living standards in agriculture are already very poor; falling death rates ne ped to swell the ranks of the poor classes in agriculture. The only solution lies in initiating new skills and tools in cultivation so as to raise productivity.

TABLE III

DISTRIBUTION OF THE ADDITIONS TO THE WORKING FORCE: 1951 AND 1961

Occupational activity	1951	1961	Percentage increase
	(Millions)		
Agriculture ..	100	116	16.0
Industry, mining etc.	17	20	17.6
Services	26	35	34.6
TOTAL	143	171	—

TABLE II.

SIZE AND DISTRIBUTION OF THE WORKING FORCE, 1951

(In million)

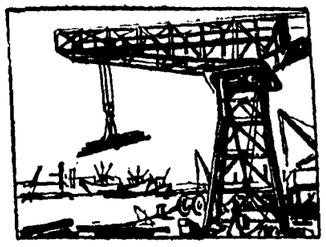
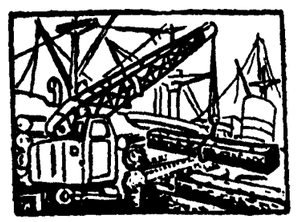
It takes the patience of untiring men to make the land yield a golden harvest. So with a nation.

And so with a company like HINDUSTAN LEVER.
Many heads, many hands work and plan...building up knowledge regarding modern marketing methods. Guiding the training of a body of technicians. Diversifying to meet changing consumer needs. Developing new consumer goods, new ideas in foods, like dehydrated vegetables, and constructing milk plants. Establishing research laboratories. Experimenting in ways and means of making use of neglected resources of the country. Increasing the utilisation of partially used resources, for example, by cottonseed oil extraction.
Working up new methods to help the national economy.



Work and patience. Work to educate for tomorrow. A tomorrow that will bring a little less of care, a little more of joy.

Today and tomorrow...Hindustan Lever serves the home with soaps, foods, toilet preparations



PR.33-K52

Planning TOWARDS A BETTER PORT

As the life-line of Eastern India's trade and commerce, the Calcutta Port faces recurring problems every year. The emphasis on industrial progress in the Second Five-Year Plan period has considerably changed the type of cargo to be handled. Steel and mechanical equipment, heavy machinery and huge plant form a considerable bulk of the import. On the export front it is coal or ore.

To-day's well-equipped Port needs be made into a better Port to-morrow. But this is possible not by more equipments alone. The Calcutta Port needs most the whole-hearted co-operaton from all fronts,—from those who use and also from those who serve it.

MEN & MACHINES MAKE A BETTER PORT

CALCUTTA PORT COMMISSIONERS

Issued by the Commissioners for the Port of Calcutta

The Challenges for the New Parliament

Transport

WITH his characteristic frankness, the Prime Minister forthright conceded at the inauguration of the recent annual session of the Federation of the Indian Chambers of Commerce and Industry that transport, coal and power have created serious crises and that the failures in this behalf represent failures on the part of the Government in planning and organisation. This outright admission of the triple failure sets at rest any possible controversy about them. But it is sad to reflect that the Railway Minister has not shown the candidness to admit the primary and fundamental failure in transport leading to serious difficulties in industry. The controversy between the Ministries of Railways and Fuel and Power over the failure of coal supplies, arising from the crisis of coal distribution, has not yet faded out of public memory. It is, of course, right that responsibility should be allocated where it rests in order to rectify the lapses, but where the failure is of the different Ministries concerned, a searching enquiry needs to be made why the basic failure of co-ordination has at all been allowed to occur.

In the recent coal crisis there is the irrebuttable evidence of mounting accumulations at the pitheads, which only means that transport is the villian of the piece. It is rather astonishing that in this situation Mr. Jagjivan Ram had not even a word to say about the transport crisis directly leading to the coal crisis in the course of his statement-cum-speech accompanying the presentation of the interim budget. This attitude of resentment at the exposure of the shortcomings of the Railway Ministry is not only not conducive to an attitude of open mind for correcting mistakes of omission and commission but it is definitely an impediment to a realistic solution. It is only to be hoped that the Railway Minister and the Railway Board will take criticism of the lapses in railway performance in the spirit in which it is made and examine the suggestions offered for overcoming the crisis as a helpful way out.

Sometimes there is a saving grace in our own failures. This has reference to certain noticeable shortfalls in the output of important industries. Finished steel lagged much behind expectations, fertilisers could not reach the production target, there were underfulfilments in the scheduled levels of the production of textiles, machinery, chemicals, newsprint, and cement which demand a heavy share of the available railway transport capacity — all this in the recent months. If these shortcomings had not occurred and production would have been carried to the anticipated levels, the crisis of transport, which was visibly in evidence in coal movements, would have manifested itself in respect of the movements of the carriage of these finished products. But the shortfalls in these important industries have only served to conceal the potential failures of the railways on a full scale.

Coal undoubtedly is the one single commodity which demands the maximum allocation of rail capacity for its transport and that too as a matter of priority. If there has been expansion in the despatches by rail of coal (which is not the same thing as expansion commensurate with the raisings of coal), it is only consistent with the minimum normal demands of a growing economy. The monthly despatches of coal by rail increased from 2.5 million tons in the first year of the Second Plan to 4 million tons as recently as June 1961. This performance cannot be held up as proof of the readiness of the railways to undertake greater loads of traffic. What precisely is expected of them is to respond to the demand for transport capacity at the time and in the direction in which that capacity is needed. This is the final test of the flexibility of the nation's premier transport organisation. At the end of the current Plan and again at the end of the Fourth Plan there will be significant increases in the volume of coal. The targets are pitched at a modest level to answer the requirements of industry for fuel and thermal energy. It is thus clear that the railways in the first instance and the other modes of transport as complementary agencies have to provide the carrying capacity.

The case of coal is in no sense an isolated or exceptional case. It ought to be taken as a test case. In the recent past the cotton textile mills in Ahmedabad had to scrape through with nominal stocks of coal hardly enough for consumption requirements of a day or two and it was only with the help of a few mills which could manage to have larger stocks in hand that an arrangement of mutual accommodation proved effective in averting the crisis of complete closures of mills.

As production gathers speed in the Third Plan, there will undoubtedly be continuous headaches for the railways to adjust and readjust allocation of wagon capacity between the competing demands in order to ensure that the wheels of industry are kept moving. It is easy to appreciate the difficulties of the Railway Board which is called upon to plan for a demand on a magnanimous scale with allocation of barely sufficient funds estimated on conservative calculations of demand. But provision of capacity is not entirely a matter of proportionately rising outlays. With rationalisation of the equipment, like the installation of bogie wagons in the coal-steel belt, this strategic area will be well supplied with wagon capacity. But obviously rationalisation has its practical limits. The alternative must be fully exploited in raising the wagon turn-round. It will be remembered that during the last war much of the railway rolling stock and equipment was in a dilapidated condition and even so the emergency requirements of military traffic (which were its normal requirements at that time) were not impeded and no one heard of serious bottlenecks. It is true that there is a positive element of the extraordinary in the war-time operation of the economy. But something of that dynamism and sense of urgency must be imparted to the railways, since on their functioning hinges the working of the other sectors.

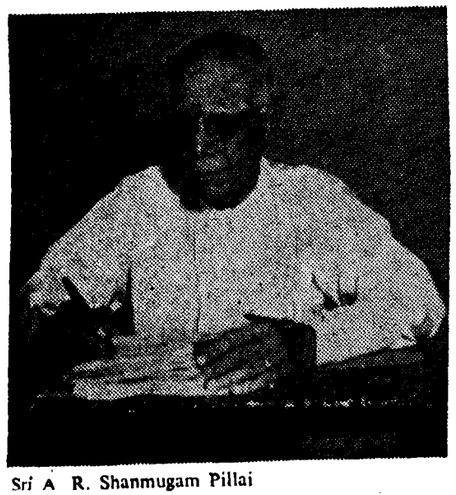
It is obvious that rail transport capacity can be stretched up to certain limits, but not beyond. That clearly means that the full magnitude of the transport requirements of the Third Plan period has not been properly assessed and some pressure demands are being made on the railways. But this sort of analysis does not help the situation. The apparent conclusion is that there has been a failure in realising the futility of suppressing the growth of road transport to its legitimate stature. In some measure the railways themselves are responsible for this wrong policy, because, only two years back, when there was some decline in their revenues as a consequence of the competition of the motor transport, they succeeded in securing the appointment of the Committee on Transport Policy and Co-ordination. The genesis of the appointment of this Committee will hardly be controverted. But with the first year of the Third Plan, it is becoming quite clearly evident that a quick decision must be made to ensure that the railways are not deprived of the essential high-

cost traffic and further strains are not produced on their finances. This is the type of co-ordination that is required.

But otherwise the manifold restrictions on the operation of road transport must be dismantled because road transport is the only potential mode which can effectively supplement rail transport. The Neogy Committee has, perhaps, consumed too long a time in preparing a well-drawn-out plan of transport co-ordination policy. That may be useful in the longer perspective, but the Third Plan cannot wait for it. It is of the utmost importance that pragmatic decisions should be made on the short-term transport policy up to 1966, as an interim policy, and the Neogy Committee should be asked to expedite its final report.

Power: The Engine of Industrialisation

OPINIONS may differ on the seriousness of the current power crisis in the country, but it is recognised in all quarters that power shortage is acting as a drag on India's industrial development at the present juncture. The issue is under constant review in the Planning Commission and speaker after speaker at the recent meetings of the Federation of Indian Chambers of Commerce and Industry and the Central Advisory Council for Industries dwelt at some length on the problems created by power shortages. Devising of measures to mitigate the rigors of power shortage in the immediate future and development of power resources over the long-term period pose a serious challenge for the ingenuity and resourcefulness of the new administration which is to take over the reins of Government next month.



It is not that power shortage has been a chronic malady of the Indian economic system. The genesis of the present-day power crisis are traceable not beyond 1957. Before that year, thanks to comfortable supply position of coal — one of the most important power-generating materials — power supply rarely posed any serious problem. Since then, however, it has been a recurrent phenomenon. The factors leading to this state of affairs have been: (1) the cuts necessitated in 1957 in the outlay on power schemes included in the Second Plan, consequent upon serious situation developing on the foreign exchange front; (2) the delay caused in the execution of some hydro-electric projects, notably the Bhakra-Nangal project, the Hirakud project and the Rihand project; (3) the lack of co-relation in the development of rail capacity for the movement of coal and the coal target which was revised sometimes downwards and sometimes upwards; (4) the delayed execution of National Coal Development Corporation's plans; and (5) continuance of licensing of new industrial units unabated even in the face of pruning of outlay on power development. The adverse effects of this imbalance brought about in 1957 in the implementation of the Second Plan were, of course, not descernible for some time; the shortfalls experienced being made good by over-exploitation of the existing power sources. But this over-utilisation of the power plants created its own problems about a year or so later. Their frequent break-downs aggravated the shortages. A case in point is the recent breakdowns in the power supply from D.V.C.

A vicious circle has come to operate in the recent past on the power front. Apart from adversely affecting the tempo of industrial activity in general, power shortage has hampered coal output. Slowing down of the coal development programme, especially in respect of raising of superior quality coal, in turn, has affected railways' efficiency to no small extent. In the reverse order, bottlenecks on rail transport have adversely affected raising of coal and this has, in turn, hampered

generation of power. Add to this the foreign exchange problem and the circle is complete in a wider sense — power shortages hampering full-utilisation of industrial capacity, leading to inflation in production costs which prices out Indian industrial goods in world markets. Foreign exchange earnings, thus, suffers. So does outlay on power development — foreign exchange expenditure on setting up of new power-generating units forms a substantial proportion of total outlay.

If somehow this vicious circle is broken, there is little doubt that India's industrial growth can be fostered at a much faster rate. How can this be done? This is the crucial problem.

It is indeed encouraging that this problem is getting its due share of attention in the highest quarters. An indication of this is available in the Planning Commission's stepping up the target for installed capacity for power generation under the Third Plan from 11.9 million kW originally contemplated to 12.7 million kW in the final draft of the Plan. It is now gathered that power projects included in the Third Plan will raise the capacity in 1965-66 to nearly 13 million kW from 5.7 million kW at the end of the Second Plan period.

Whether the 13 million kW installed capacity target fixed for 1965-66 is adequate or not, opinions on this differ. The industrial circles hold the view that on the basis of the industrial expansion envisaged in the Plan, power requirements in 1965-66 would be of the order of nearly 15 million kW. Their this estimate is based on the fact that for every 10 points increase in the index number of industrial output, power requirements on the current pattern of consumption go up by 23 to 25 points. This correlation between power requirements and industrial growth may not hold good if concerted efforts are made to check wastage of electricity in the course of transmission by locating new power plants and industrial units in each other's vicinity. But there can be little doubt that power shortages will continue even at the end of the Third Plan, if the present targets of industrial development and power generation are adhered to. The Plan being flexible, there is every hope that funds available on account of shortfalls in some developmental activities of ancilliary types will be diverted to fostering the development of power resources.

Though some solace can be derived from the announcement this week that the DVC power system has been put in order and no further breakdowns should be expected on it, relieving of power shortages in the immediate future poses a far greater challenge. The problem itself is far more complicated. There is no one simple solution for this. The problem has to be attacked from all the sides if some useful results are to be expected. The first shot to be fired from the armoury which suggests itself is to devise measures to curtail power consumption. Issue of licences for setting up new industrial units (licences involving foreign exchange outlay of nearly Rs. 734 crores have already been issued to the private sector; leaving only small funds available for the remaining four years of the Plan) may have to be deferred by a short period so that the new demands for power crop up only when some balance has been restored between the existing supply and demand. This is essential particularly in regard to areas where power shortage is acute. The contention that as a sequel to this step, industrialisation of the country will tend to stagnate hardly holds water. It is no use allowing setting up of new industrial units if they cannot be worked to their full capacity due to power shortage. This will only lead to higher production costs. On the other hand, much can be gained by ensuring full supplies of power to the existing units so that they may be able to function to their rated capacities.

The second measure that needs to be taken is the stepping of coal supplies and removal of bottlenecks on the transport system. This proposal is dealt at length in the succeeding article.

The third important step that suggests itself is the switch-over to furnace oil from coal by industrial units in West India. This measure has already been talked of so often, but unfortunately no concerted attempts have yet been made to put it into practice on any large scale. The usual difficulty that is pointed out in the way is that output of furnace oil in the country being only small, any large-scale switch-over to this will entail foreign exchange expenditure which the country can ill-afford at the moment. But it is not realised that

PATTERN OF POWER UTILISATION AS INDICATED IN THIRD PLAN

Categories	Anticipated consumption in 1965-66 (million kwh.)	Percent of total generation	
		1965-66	Range of Variation during 1951-61
Domestic or Residential Light and Small Power ..	3,400	7.6	7.5 to 8.0
Commercial Light and Small Power ..	1,900	4.2	4.2 to 4.8
Industrial Power	28,400	63.1	61.3 to 62.9
Traction	1,800	4.0	2.3 to 4.4
Public Lighting	400	0.9	0.9 to 1.0
Irrigation	1,900	4.2	2.4 to 4.2
Public Water Works and Sewage Pumping ..	900	2.0	2.3 to 2.8
Transmission Losses, Consumption in Auxiliaries etc.	6,300	14.0	14.4 to 16.3
Total	**45,000**	**100.0**	

this additional foreign exchange cost can be well made up by increased industrial output which will have wholesome effects not only on the availability of supplies of industrial goods in the domestic market but also for export. Further, it is not comprehensible why the Government should hesitate in removing the excise duty on this industrial raw material in the interest of fostering switch-over to it.

Allowing of setting up of their own power-generation units by industrial establishments can also relieve the situation on the power front to not an inconsiderable extent. It is just appropriate that the Government has assured the industry that it will give sympathetic consideration to all applications for setting up of such plants provided they fall within the four-corners of the Industrial Policy Resolution of 1956.

Some relief from power shortages can also be expected from the increasing use that is to be made of electricity capacitors manufactured by the Heavy Electricals Factory at Bhopal. These capacitors by evening cut fluctuations in power-loads, help in better utilisation of energy; excessive loads are stored for a few hours and this supplements the current when voltage falls. Greater self-discipline by the industry in matters of power consumption should also go some way in relieving the shortages of power.

				13.08

* On the basis of estimates of the Working Group on Power Schemes.

In the long run, of course, recourse has got to be taken to make use of nuclear energy for industrial purposes. It is gratifying that the first such power-generation station is being set up at Taraporewala to meet the requirements of industries in the Western region. Planning for a similar station to meet partly the power requirements of the Southern region also needs to be taken up at an early date. Prospects of utilising natural gas for generation of electricity in the Cambay - Ankleshwar area may as well be explored expeditiously. Oil exploration activity in this region has to be stepped up appreciably as a pre-requisite to this.

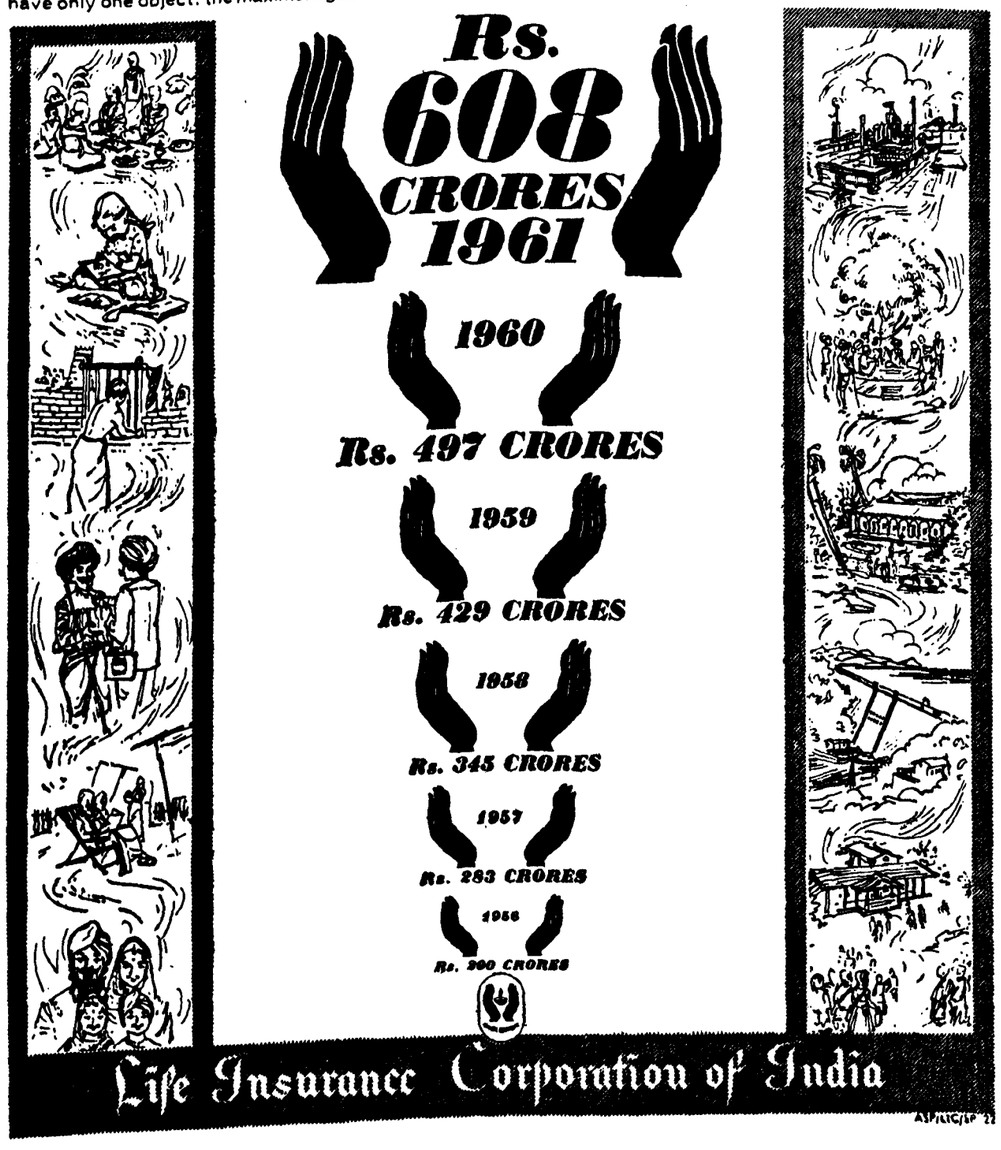
Coal Shortages

WHILE the various steps suggested in the previous article should go some way in relieving power shortages in the immediate future, the most important measure that has to be taken to ease the situation is augmenting the supplies of coal. This problem has three components: (1) raising of coal output as such; (2) reducing of ash content in coal; and (3) movement of coal from the collieries to the consuming centres. All these three issues are closely interconnected. High ash content raises the total requirements for coal and consequently puts forth greater demands on the transport system. With the superior-grade coal resources of the country none-too-plentiful and not-so-easily developed, any large increase in production is attended by comparatively greater raisings of inferior quality coal. Transport bottlenecks, whether they are due to shortage of wagons or owing to limited line capacity or are resultant from lower operational efficiency of the railways consequent upon supplies of inferior quality coal to them, hamper coal output because of accumulation of stocks at the pitheads with all the dangers of fires breaking out and difficulties experienced in raising of new coal.

The acute situation that had developed on the coal front towards the close of 1960 may be said to have eased to some extent in the subsequent months with the increase in coal output as a consequence to the National Coal Development Corporation attaining its target rate of production through some energetic action, the railways exerting themselves in a greater measure to move this vital energy-producing material and through some other measures such as creation of coal dumps and movement of coal by roads as well as



Rs. 608,00,00,000 L.I.C.'s 1961 New Business is better than ever before.
Good results were obtained despite adverse conditions for business. In vast areas, floods and other disasters made field operations almost impossible. But L.I.C.'s team of devoted men and women rose to the occasion. Result: record New Business of over Rs. 608 crores.

Here's the 1961 story in brief:

NEW BUSINESS: Rs.608 crores. An increase of Rs. 111 crores over the 1960 figure.

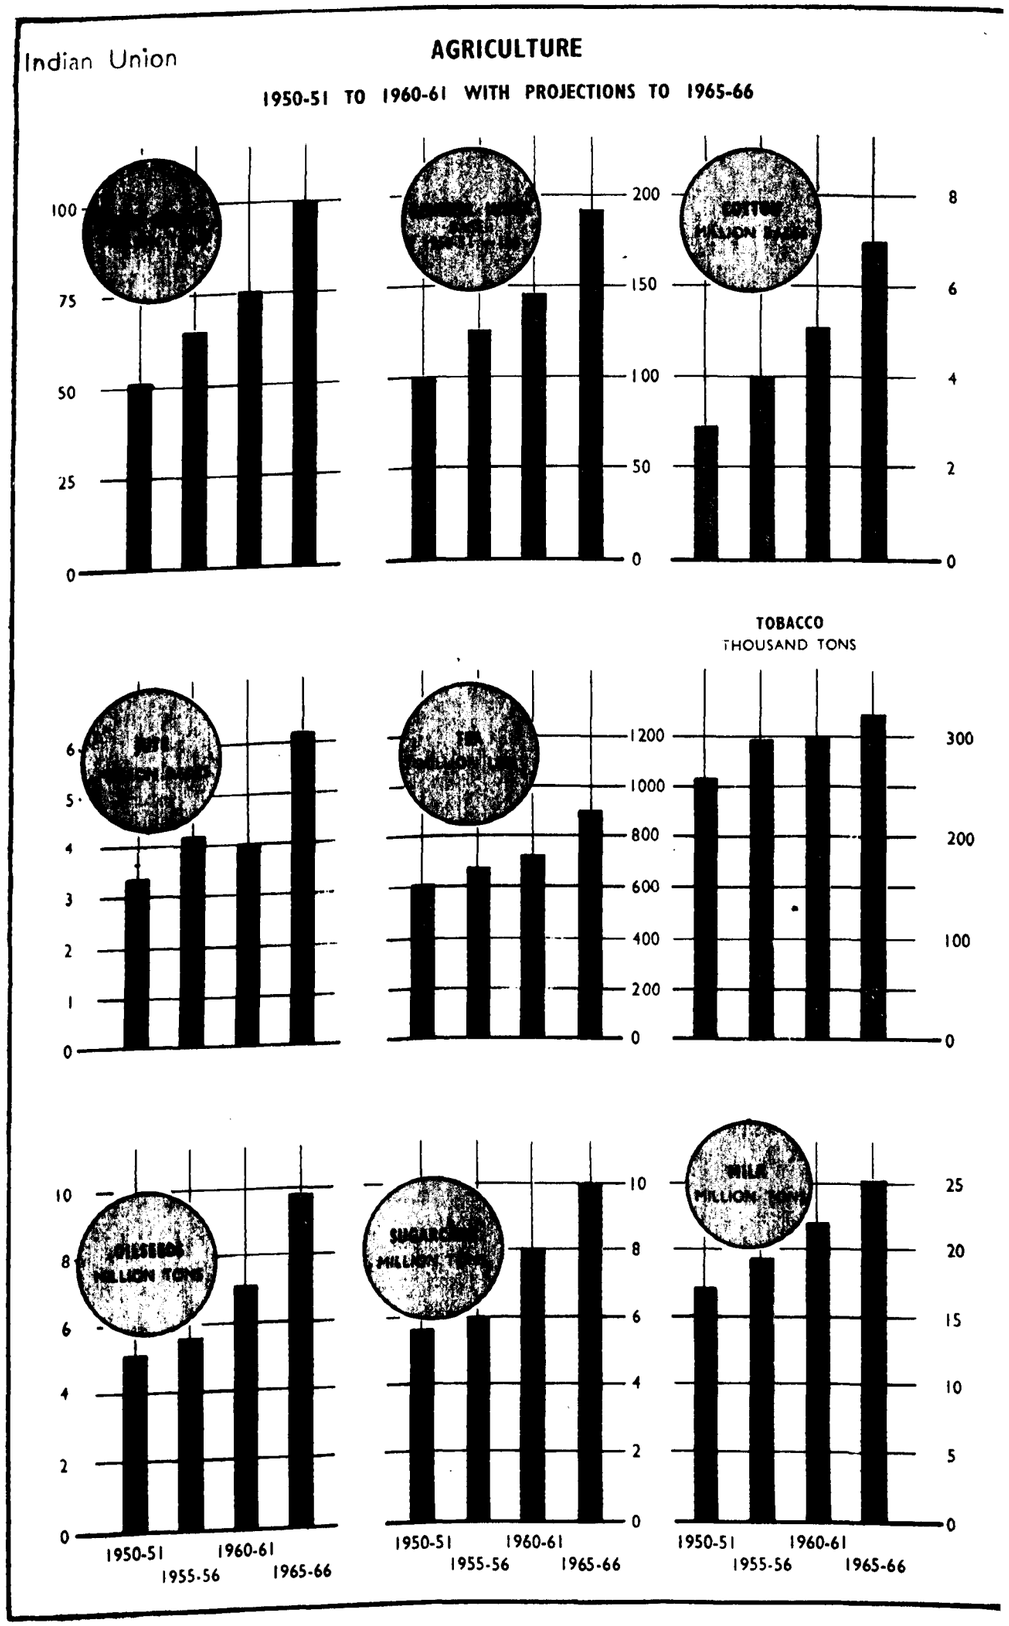
NUMBER OF NEW POLICIES: 14,67,000. An increase of 2,00,000 over 1960.

The benefits of L.I.C.'s successful performance are entirely yours, because L.I.C.'s business operations have only one object: the maximum gain to the policyholders, and contribution to the country's five-year plans.

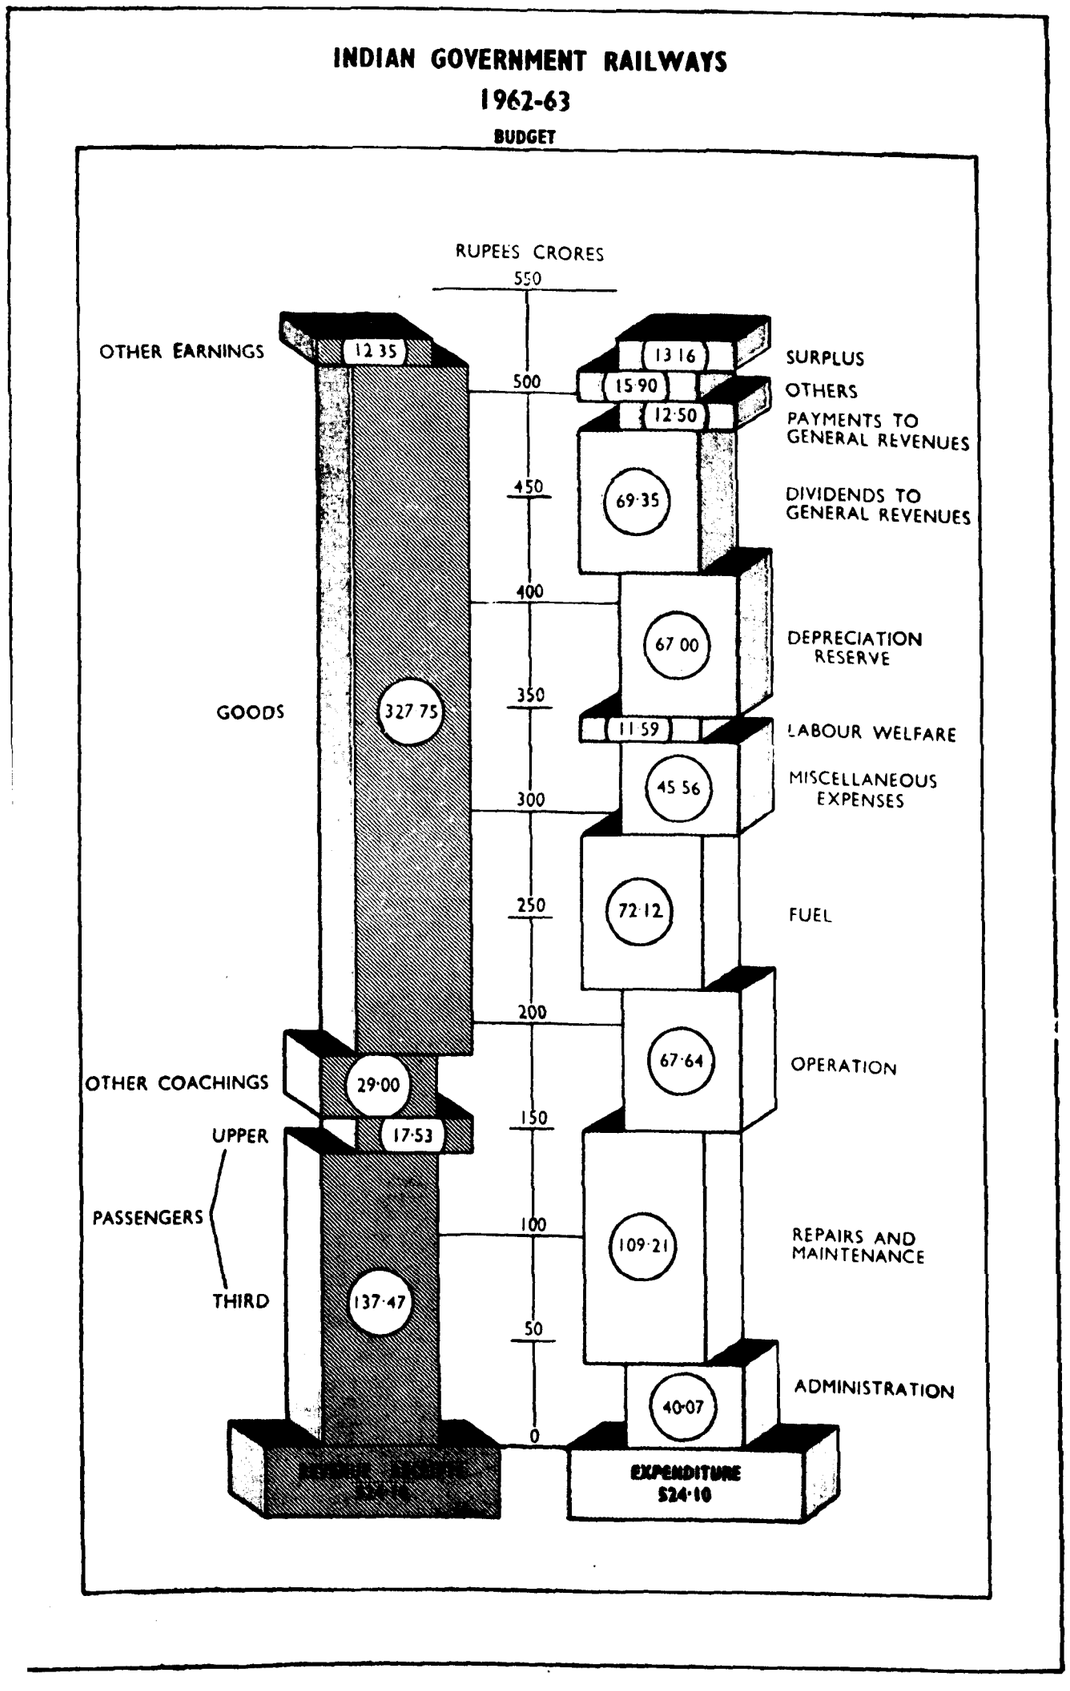
sea in larger quantities. But to say that the country has turned the corner in the matter is nothing short of traversity.

Output of coal which is 1960 amounted to nearly 52 million tons, as against the March 1961 target of 60 million tons, improved subsequently. The monthly rate of production in January, February and March, 1961, was slightly over 5 million tons, implying that the industry had attained its target rate of production. The monthly average during the last summer and the rainy season, however, went down to around 4.2 million tons, but since then it must have picked up (output of coal in 1962 amounted to 56.04 million metric tonnes). Wagon availability since the end of 1960 too went up somewhat with the result that the pithead stocks on December 31, 1961, were approximately 3.2 million tons, as against the irreducible average of 2.5 million tons on this day at any time in the last seven years. This was despite the emergency movement of traffic by railways in connection with the armed action in Goa. Some balance, it thus appears, had been restored in the output of coal and its movement in the second half of 1961. The position in regard to coal movement since December last, however, seems to have deteriorated. It might be due to the busy season, but the fact remains that railway bottlenecks have reappeared for movement of coal from the West Bengal-Bihar coalfields.

Supplies of coal during the current year, especially for consumers other than steelworks, are not likely to be commensurate with the needs. The railways, which on an average moved 186 wagons more per day in 1961-62 than what they moved in 1960-61 (3,584 wagons a day in 1961-62 as against 3,398 wagons a day in 1960-61) for these consumers, may be able to step up wagon supplies to some extent. But taking into consideration the overall target of loading — 6,925 wagons a day for all consumers of coal, including the steel plants — of coal set by them for themselves and allowing for movement of coal by sea and road to the tune of 2½ million tons and consumption at the collieries to the extent of 1½ million tons, it can safely be said that coal output during the current calendar year would be restricted to about 59 million tons as against the target of 68 million tons. And it is not certain that the railways will be able to achieve their loading targets. The 1962 target, for instance, is making available of 6,925 wagons per day for all consumers of coal, but in January the average worked out to only 5,842 wagons a day — a shortfall of nearly 1,100 wagons a day.



With rail transport falling short, leading to curtailment of coal output, during the current year, there is sure a case for redoubling of efforts to move coal in larger quantities both by road as well as by sea. The leeway left hitherto in the shipment of coal by sea has got to be made up; the Union Minister for Steel, Mines and Fuel openly expressed his displeasure at this week's meeting of the Central Advisory Committee for Industries at the pace of movement of coal by sea. Making it obligatory on the part of industrial units situated not more than 100 to 150 miles from the collieries to secure their supplies only by road and making available to them coal containing high ash content should also help in relieving the desparate situation to some extent. The latter suggestion will enable the railways to move larger quantities of coal with low ash content to the distant consumers in West, North and South India. The effect of the above two suggestions on the coal consumers in the vicinity of West Bengal-Bihar coalfields would undoubtedly be raising of their fuel costs, but they should not grudge this in the larger interests of the country. If need be, they may be given some compensation in the form of rebate on excise duties or subsidy to partly counterbalance the increased fuel expenses.



The policy of creation of coal dumps during the slack season, for the benefit of consumers in areas situated at a great distance from the coalfields, has perforce to be continued. So also encouraging loading on Sundays and all holidays. But another cruicial step that needs to be taken to relieve coal shortages during the current year and the next one is the allowing of particularly export industries in coastal areas to import high quality coal from rupee payment countries, say Poland. Aversion of the Union Ministry of Fuel to this proposal, put forth earlier in these columns, is ununderstandable. It probably is not recognised by it that this step can help quite substantially in our export effort. Lower fuel costs will undoubtedly help in reducing production costs, thereby making our industrial goods more competitive in world markets. And if our foreign exchange earnings can be stepped up at least to the extent of the cost of coal imports, why should we hesitate to take this calculated risk? Moreover, augmenting the supplies of coal through imports can help as a catalytic agent in breaking the vicious circle that has come to operate on the power and coal front. This injection appears to be absolutely necessary now if the health of the patient, the Indian economy, is to be restored at any early date. Recently import of coal from Pakistan to meet the requirements of the industries in North India has been frequently talked about in official circles. Why then there should be any aversion to imports of high-grade coal from rupee payment countries? And that too when our export effort is bound to get fillip as a sequel to it.

Now turning to the long-term problem, it must be recognised in the very first instance that the target of 97 million tons of coal output by 1965-66 is an underestimate by at least 8 to 10 million tons. This calculation is based on the fact that not only power target is rather low compared to the target fixed for industrial production, but more coal will be required by railways in view of the expansion already sanctioned or contemplated to be sanctioned in their development plans. The outlay on the development of railways under the Third Plan has already been stepped up by Rs. 120 crores over the Third Plan final draft figure, to enable them to raise their coal-moving capacity. Another allocation of Rs. 75 crores is understood to be under consideration in the Planning Commission to step up railways' capacity to move about 10 million tons more (than that contemplated in the final draft of the Plan) of general goods traffic.

While with the increased outlay on development of railways, either already sanctioned or contemplated to be sanctioned, with greater resort to dieselisation (the Railway Board has already been permitted to import a larger number of diesel engines than earlier authorised), and with encouraging the construction of bunkers and installation of tiplers (to enable bulk loading in box wagons) at the collieries having an output of 10,000 tons or more (suggestions to this effect have also been sent by the Railway Ministry to coal producers), railway bottlenecks in the movement of coal may be reduced to some extent, there is little doubt that the situation will ease only if roads and coastal shipping development is fostered in right earnest. The capacity of the road transport to carry more goods traffic should be augmented by building of causeways and even slightly revising upwards the maximum load a motor vehicle can safely carry. Encouraging coastal craft manufacturers to go in for building of light coastal ships will be a measure that should help in the development of coastal shipping.

To step up output of coal, whereas it is imperative that movement of the commodity from the pitheads should be accelerated, it is essential that adequate supplies of power, explosives and spare parts should be made available to the collieries. It is indeed encouraging that con-

certed steps are being taken in this direction. A note of caution, however, may be added in respect of raising of additional coal during the Third Plan period. If there is any likelihood of the National Coal Development Corporation's plans for development of new collieries lagging behind for some reason or the other, decision on allowing the private sector to expand more than it is envisaged now should be taken well in time.

There also appears to be a case to raise coal prices by a small margin so as to allow, at least partly, for the increases in the industry's costs on accounts other than labour wages. Admittedly, this will add to he fuel costs of the consumers. But to the extent increases in coal prices can be justified, they should be granted.

This leads us to the question of improvement of quality of coal. Any increase in coal price should be related to lowering of the ash content in coal. Augmenting the supplies of materials for stowing of coal should also help in more production of the commodity as well as improvement in its quality. Work on the establishment of coal washeries also has obviously to be accelerated.

Side by side with the taking of measures suggested above, an all-out effort needs to be made to explore sources of coal outside the West Bengal-Bihar Coal Belt, particularly in West India. That would go some way in reducing the dependence of Western region's industries on the distant collieries in East India.

Foreign Exchange

EASILY the one important component of the financial resources for the Third Five-Year Plan (and for that matter, for the Fourth Plan also) on which attention has been focused in public discussion is foreign exchange. The requirements of foreign exchange in the Third Plan are of a tall order because the tempo of the expansion of heavy industry in particular and the remaining segments of organised industry too is being accelerated by design. This is to complete the period of our economic take-off by the end of the Fourth Plan. The table attached to this section gives a comparative picture of India's balance of payments during the Second Plan. It will be seen from that table that the deficit on current account was the highest in 1957-58 at Rs. 501 crores and the lowest at Rs. 183 crores in 1959-60. Both were abnormal years, but it cannot be assumed that 1959-60 is a year of encouraging performance and a possible guide to the Third and Fourth Plans. It is patent on the face of this table that the low point of payments deficit on current account was rendered possible in 1959-60 because imports were held at a low figure and therefore the trade balance showed a relatively smaller deficit. This situation has no application to the high expansion which is assumed in the Third and Fourth Plans. The moral that emerges is that the critical nature of the foreign exchange requirements must be faced as an inescapable challenge by the new Parliament. It is not enough for Parliament to approve the Third Plan. It owes a duty to the nation to mobilise an intensive effort for raising these resources.

The two ways in which foreign exchange resources for the Third Plan are to be raised are a high level export drive and foreign assistance from co-operative countries — on a very liberal scale, if assistance in the Second Plan is taken as a criterion. The overall expectations of assistance from foreign governments and institutions are placed at Rs. 2,600 crores, but this figure excludes the P.L. 480 proceeds of the order of Rs. 600 crores which are now accounted for as a part of external aid. Will external assistance of this order materialise? Time was when some uncertainty, hesitation and reservations were expressed, in the course of the discussions on the preliminary estimates for the Third Plan and the fate of the Plan was presumed to hang in the balance. But this stage of uncertainty has been positively ruled out.

The manner in which different friendly governments came forward even during the latter part of the Second Plan to make commitments of assistance for the Third Plan began to regenerate strong optimism. Now it is unanimously agreed that external assistance on the scale which is assumed in the scheme of the resources for the Third Plan need not be held in doubt. At the end of this article is summarised the position of external assistance. It will be seen from this table that the aggregate balance available in October 1961 was of the order of Rs. 1,387 crores. But it includes the unutilised amounts of assistance left over from the Second Plan. Its importance lies in the fact that in the first years of the current Plan difficulties of financing development imports will not arise because these aid amounts will be with us in hand. But it ought not to be overlooked that a similar unutilised balance will be passed on at the end of the present Plan for utilisation during the Fourth Plan. But, all in all, the prospect of foreign assistance for the Third Plan projects should be taken as under-written and lifted from the realm of uncertainty.

During the Third Plan the average annual exports have been fixed at the target of Rs. 740 crores. One important aspect of the estimates about the foreign exchange requirements of the Third Plan that ought always to be borne in mind is that these estimates are rather too cautious and they appear to have been made in an anxiety not to create unwarranted concern about the magnitude of foreign currency expenditure. The trend of the criticism — whether made by our own or foreign analysts — of the scheme of the foreign exchange outlay goes to show that there is a good element of under-estimation in these calculations. This fact of under-estimation must be faced realistically. Its implication is that the drive for exports must be intensified. As it is, a liberal interpretation is being put on the concept of maintenance imports which should be financed by our own earnings of foreign exchange through exports. A certain element of what is conventionally considered as maintenance imports like those of machinery, equipment and intermediate products, is being taken out of this category on the ground that they go to augment the capacity for the production of capital goods. Some foreign aid is now avaliable to finance what is conventionally or strictly considered as maintenance imports This liberal interpretation makes it all the more necessary that the drive for export promotion must be intensified. In this context the target of exports in the Fourth Plan comes as a powerful reminder. At the end of the Fourth Plan it is presumed that our exports will be increased two-fold (as compared to exports at the end of the Third Plan) to the altitude of Rs. 1,400 crores.

The question may be posed: How is this a challenge to the new Parliament? Definitely, it is. The obvious facts are that a policy of compulsive restrictions on imports has created shortages inside the country and a sellers' domestic market. The range of profits earned in the domestic market, as the reality stands, operates as a disincentive to the hard effort to push up exports. Even when there are no impediments of such disincentives, it is the conventionally accepted policy on exports even in the industrialised countries to provide positive fiscal and other incentives to export traders in order to stabilise and expand the export drive. It is high time India aligned herself further with her competitors in the world export market.

The Ramaswami Mudaliar Committee has gone into a masterly analysis of this tough task of export promotion. The recommendations which it has made on providing incentives in the form of an import-export stabilisation fund, tax relief, freight concessions, foreign currency retention, and so forth are too fresh in the public mind to require even a brief repetition here. It is for Parliament to give the Government the necessary sanction for providing incentives. Failure on its part to discharge this obligation will mean direct evasion of its obligation to help make the export promotion campaign an effective success.

Education

PEOPLE'S reaction to educational progress in this country is a mixed one. While they are happy over the number of schools and colleges that have been opened for the education of their children, they are, at the same time, worried about the poor quality of education that is being imparted in most of the institutions. It is, however, not to deny that there are quite a number of progressive schools but they are only 'public schools' where the sons of poor cannot afford to get education. Whether the shortcomings in the field of education are due to the inadequacy of resources or due to wrong theories or perhaps to a lack of perspicacity or determination, the fact that they are there is in itself disheartening. The country is short of scientists, engineers, doctors, economists and other trained men and in spite of best efforts there still exists a wide gap between their demands and requirements. Indiscipline for the last few years has taken the worst form and even on the slightest provocation strikes are resorted to by the students. This certainly is not a trend towards the right direction.

The worst aspect is that the planners have not been able to achieve the goal of free and compulsory education for children up to the age of 14 years. The number of students in the age group 6-11 has only risen 43 per cent to 60 per cent in the beginning of the First Plan to the end of the Second Plan. Article 45 of the Constitution provides that "State shall endeavour to provide within a period of 10 years from the commencement of the Constitution free and compulsory education for all children until they complete the age of 14 years". This expectation is not likely to be fulfilled even in the Third Five-Year Plan and the estimates are that the percentage might rise only to 76 per cent. Government's contention in this regard is that the Constitution makers had under-estimated the immensity of the task but whatever that may be the fact remains that there is an urgent need to fulfil the task.

In the First Plan out of a total allotment of Rs. 153 crores for education, Rs. 85 crores were provided for elementary education and in the Second Plan out of a total allotment of Rs. 256 crores even if half the amount had been provided for enforcement of universal compulsory and free primary education, the possibility was that the directive might have been fulfilled. The planners were oblivious to it in the past and so do they now seem to be during the Third Five-Year Plan. It is not that sufficient resources are not there but the fact is that sufficient priority has not been given to enforcing compulsory and free primary education.

This is not the only flaw in primary education, but the basic education which incorporates the co-ordination of craft, music, teamwork, drill and other activities along with the teaching of the three R's, has also nothing to commend itself. It may be superior to the ordinary primary education, but the way it has been diluted, there is nothing much lustre left in it. It now merely means a few spinning wheels and some twisted cotton involving waste of time for the teacher as well as the taught. Secondary education is also meeting the same fate. Funds are being distributed in a multiplicity of schemes many of which are neither desirable nor urgent. While the development of junior schools for producing skilled artisans and mechanics is, of course, urgent and necessary, the large expenditure in the so-called multi-purpose schools is a needless distraction. It is just not possible to convert the high schools in the country into such schools within a reasonable time. Serious shortcomings of the secondary education system — apart from the inadequacy of the enrolment of girls — is that Indian students have to

carry a burden of language learning which their confrers in other countries are not required to do. With the surveying of the field of secondary education by an important commission a few years ago, the consolation now is that efforts are being directed towards its diversification and amplification. In the field of university education the fall in standards is an annoying factor. This is because of the shortage of qualified teachers who are not prepared to come to the teaching profession because the salary scales are so poor.

Admitted that there have been improvements in the salaries of teachers in the recent past, still a vast majority of them are paid less than Rs. 75 per month. The irony of the situation is that even where the quality of education can be improved without any additional outlay, the Government have been completely apathetic. Many of the text-books in the schools in the several States are now a crying scandal.

Technical education no doubt is taking a turn for the better. Rs. 140 crores are likely to be spent on schemes for technical training in the field of engineering and technology in the Third Five-Year Plan. In that very period, it is estimated that annual admission in the degree courses will be increased from 14,000 to about 19,000 and in respect of diploma courses from about 25,500 to 367,400. Here also the shortfall is in regard to the qualified teachers which the country has not been able to produce so far. Although there is no harm in bringing men of calibre from outside to impart education to our students, in the long run efforts must be devoted to train our own men to perform these functions. Since there exists in the world of today a practically perfect correlation between educational level and the economic development we must step up our investment in education. Our educational policy must be such that principles of democracy — fraternity, liberty and social justice—embodied in our Constitution are given a concrete shape. Education can become a blessing in disguise if we can bring about change in the outlook of the teachers and the taught. So far as bringing about quality in our education is concerned, perhaps there could be no better reform than the lengthening of the period of pre-university education so that no pupil is admitted to the university before he or she attains the age of 18 years.

Housing: Population Versus Resources?

INADEQUATE ALLOCATION

CONSTITUTING, as it does, in itself an important infra-structure of economic planning, housing contributes to the fulfilment of a primary necessity of the people. In the last decade of India's economic planning, public outlay in this important social overhead has risen progressively from Rs. 38.5 crores in actual figure in the First Five-Year Plan to Rs. 80.3 crores, against the respective allocations of Rs. 49 crores and Rs. 120 crores. Taken together, the actual amount spent in the past ten years was less by Rs. 50.2 crores or nearly one-third of the fund originally provided for. In the Third Plan programme allocation for housing and urban development has been made at Rs. 202 crores which, however, includes the unutilised amount of earlier two plans. This means to suggest that net allocation under this head in the Third Plan is not likely to be more than Rs. 152 crores. To put in a different way, the percentage rise of outlay in the Third Plan over the Second Plan is by 152 per cent approximately.

In physical terms, number of houses to be built during the Third Plan under housing schemes of various ministries is 900,000 as against 5,00,000 in the Second Plan. Private investment in urban house construction during the Third Plan has been placed at Rs. 1125 crores on 2.2 million houses as against Rs. 1000 crores in the Second Plan and Rs. 900 crores in the First Plan. A survey made by a research body shows that saving preference of the urban household in housing is second in order of importance. It is largely because of the sky-high rent the houses yield in the urban sector that the people tend to invest their saving in housing.

It would not perhaps be preposterous to indulge in a little mathematical exercise here. The number of urban houses increased from 6.5 million in 1931 to 10 million in 1951, the first year of the First Plan. The urban population in 1951 was estimated to be 62 millons, the shortage of houses being estimated at about 2.5 millions. The decade of planning that followed could not add more than 2.4 million houses in urban areas, while population during the same period increased at a rate of about 4 per cent per annum in towns with a population of 20,000 or more. The gap between the demand for and supply of houses is estimated to be around 5 million houses in 1961 and in 1966 the gap is likely to widen to 7.5 million on the present reckoning. The increasing pressure on urban houses will be apparent from the fact that while in 1951 there were 5.5 persons per household, in 1961 the number was estimated to be around 6.4 and if this rate of increase continues the projection for 1981 will be 9.6 or 10 persons per household. The rate of rise in urban population has already overtaken the rate of increase in houses and it is, therefore, not enough to reach for the target, since by the time the target is hit, population has outstripped it long back and the whole thing looks like will-o-the-wisp. To break away this rut, it behoves all the more imperative that master plans for urban areas should be immediately drawn up and undertaken. The adequacy of the allocation of funds is, therefore, open to serious doubt.

SUBSIDISED HOUSING SCHEME

The physical target under the subsidised industrial housing scheme in the Third Plan is 73,000 against the financial allocation of Rs. 29.8 crores. By the end of the Second Plan, about 100,000 tenements were completed and 20,000 were at different stages of construction. Under the present scheme the Central Government is to provide State Governments, statutory housing boards and the municipal bodies 50 per cent of the cost as loan and 50 per cent as subsidy. As far as co-operative housing societies for industrial workers are concerned, the Government is to subsidise the cost to the extent of 25 per cent and offer loan to 65 per cent. In the case of industrial employers the Government is to provide 50 per cent as loan and 25 per cent as subsidy. The scheme has not made much headway as the response received from employers and co-operatives has been poor. The obvious reason for this can be traced in the spiralling costs and scarcity of building materials. The actual cost turns out to be much higher than the estimated cost. With a view to making the scheme acceptable to the industrial employers, the Madras Government has made a new offer in that the share of 25 per cent of the estimated cost borne by the employers will remain constant in any event and that the task of building will be left to the Government. The change is, in fact, in conformity with the proposal of the Union Government and deserves to be followed by other States. There is no denying the fact that in the larger context of economic development and industrialisation, industrial undertakings will have to accept a larger share of responsibility for the housing of workers—a necessary condition for productivity and industrial efficiency.

Under the middle income group housing scheme of the Union Ministry of Works, Housing and Supply, the Government of India has already sanctioned loan assistance amounting to Rs. 4 crores for the year 1961-62

to 14 State Governments in order to assist persons in the income range of Rs. 6000 to Rs. 15000 a year, to build houses for themselves. The amount will be advanced by the Life Insurance Corporation of India direct to the State Governments. A person with a monthly income of Rs. 500 to 1000 cannot afford to pay 30 per cent of his income for rent, even a bare 20 per cent tells upon his purse considerably.

SLUM CLEARANCE AND IMPROVEMENT

The problem relating to slum clearance and improvement is perhaps the most baffling in view of the vast magnitude of the task and meagre resources available for the purpose. Following the reports of the Advisory Committee on Slum Clearance, the Slum clearance programme was extended to include slum improvement as a short-term objective and accordingly larger resources were provided as a matter of immediate priority for dealing with the slum problems of six major cities, Calcutta, Bombay, Madras, Delhi, Kanpur and Ahmedabad.

Viewed from the cost and the rate of return angle slum clearance and improvement problem would always appear to be chasing their own respective shadows. This is so because rate of return rises and so does the cost and they almost run against one another. The Government of India's latest measure proposing upward revision of ceiling cost and rent rates built under the Slum Clearance Scheme can not go a long way in bringing about any change, so long as land prices go on rising obstinately. Fixation of unit cost, rent rate and ratio of financial responsibility can by themselves do little. Slum clearance has indeed made little progress in checking land values which are running sky-high. The rapid rise in population has opened up a new dimension of the housing problem and by the end of the Third Plan more people will live in hutments than at present and more perhaps will sleep on pavements alone.

I.A.E.C.

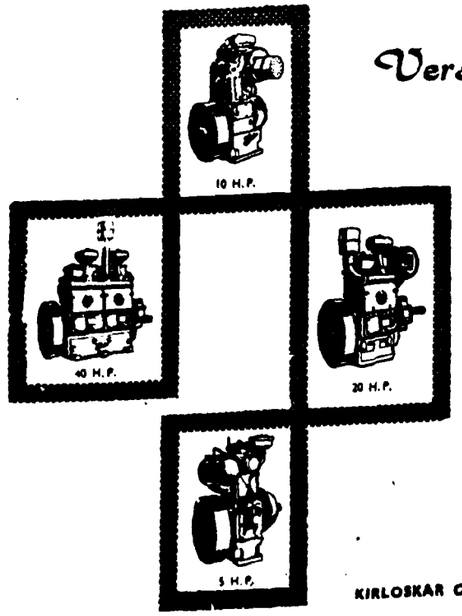
In the Service of Indian Industries

Design, Supply, Erection, Testing and Commissioning of :—

* Steam-raising equipment for power stations and industries.
* H. T. and L. T. Switch-gear for sub-stations.
* Water Treatment Plants.
* Humidification and ventilation Plants for the Textile and other industries.
* Solvent Extraction Plants.
* Electrical Installations or industries.
* Submersible Pumps.
* Fuel Injection Equipment.

Sales and Service of :—

Special Machine Tools, Material Testing Machines, Dynamic Balancing Machines, High Vacuum and special Furnaces for melting of metals and alloys including nuclear metals, and also for heat treatment and annealing, **Acid and Alkali resisting Stoneware, Plastic and Pure Graphite** for chemical, pharmaceutical and other allied industries; **Induced Draft Cooling Towers** for chemical industries and power houses; **Package Cooling Towers** for industrial air-conditioning; **Centrifugal Separators** for the chemical, pharmaceutical, antibiotics, fruit juice canning, oil refining, dairy, paint and rubber industries; **Milling and Grinding Equipment** for flour mills; **Vacuum Driers** for chemical, pharmaceutical, plastic and paper industries; **Industrial Dust Control and 'Air Filtration Equipment. Material Handling Equipment, Aerial Ropeways, Cableways and Conveyor Systems**



In short everything for Chemical, Electrical, Mechanical and Agricultural Industries of the Country.

Kundah hydro-electric project, the Nilgiris

Life-giving water, light and power to help transform our wastelands into smiling fields pour out from Bhakra-Nangal, Konar, Gandhisagar, Tungabhadra, Kundah and other projects. These great hydro-electric systems dramatise our progress and stress the fact that concrete is playing a vital part in our nation's growth and well-being.

The Third Plan has provided Rs. 1,712 crores for irrigation and power projects and huge quantities of cement will be required for their construction. In order that more cement may be available for the great projects and for the private consumer the Third Plan has set the cement industry a target of 15 million tonnes of cement a year by 1966. And the increasing output of ACC and India Cements factories will help to achieve this.

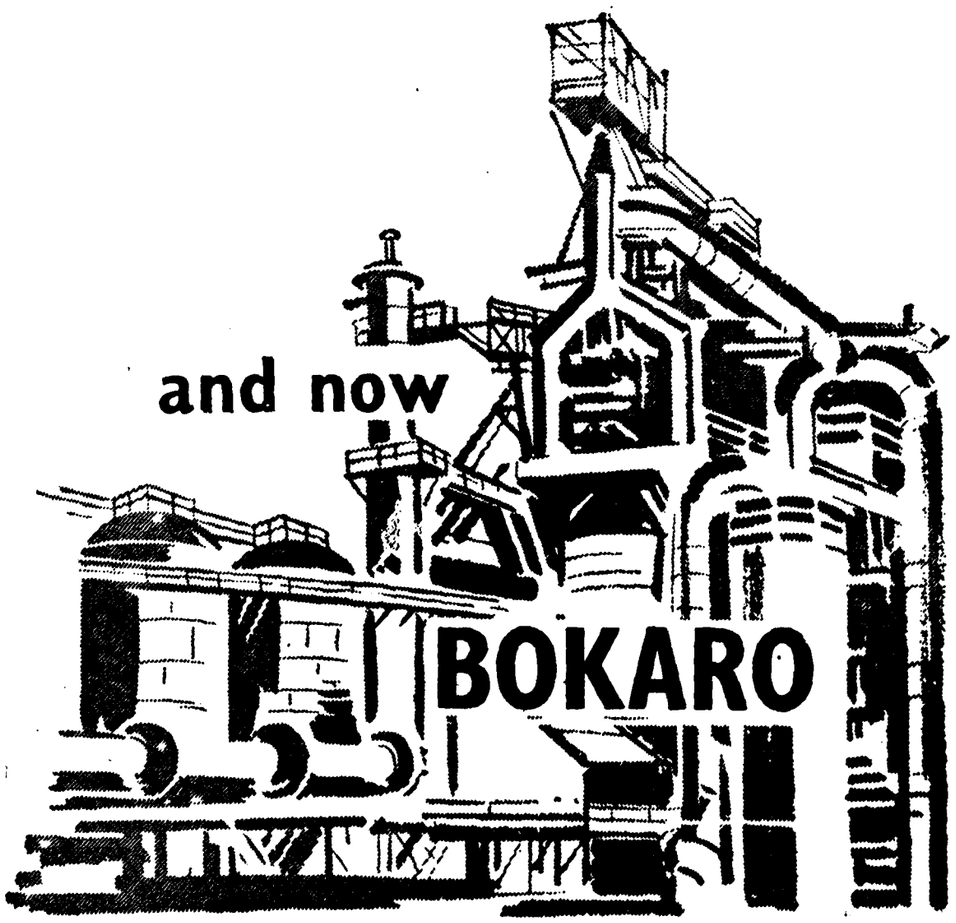
YOUR HOME NEEDS THE BEST

Usha fans are the choice of millions in 40 countries around the world for their quality and precision engineering.

Manufactured by the skilled craftsmen in the World's Largest single unit Fan Factory, Usha Fans enjoy the highest sale in India.

When you buy a fan you can confidently buy an Usha ... it is the most popular fan on sale to-day.



All ceiling fans are fitted with double ball bearings to ensure long trouble free service.

USHA FANS

The Private Sector in the Third Plan

By G. L. MEHTA

PRIVATE enterprise in India has now been working within a planned economic system for more than ten years. Although brief, this has been an eventful period in the history of the country and has also witnessed a remarkable development of the private sector. The period is sufficiently long to enable us to have a stock-taking of the past and draw lessons for the future. Such an exercise is essential because private enterprise is no longer taken for granted as in the last century. Besides, in a planned economy, the criteria by which private enterprise is judged are not the same as in a "free" economy.

Before the advent of planning, private enterprise had an almost unrestricted field in our country. Until World War II, such positive steps as were taken to assist industries were few and halting (the most important being the policy of discriminating protection) while Government attitude to economic development seemed largely negative. During the last war, certain industries did receive a fillip but this was largely without a consistent and long-term policy of industrial development.

After independence all this changed. The State has come to adopt a more positive attitude in regard to economic development and has endeavoured to lay down the broad framework of a plan within which such development is to be achieved. The Indian economy is frequently referred to as a "mixed" economy and cannot, perhaps, be easily defined — mixtures can be of several kinds and the economic formulae are no less varied than those made possible by advances in the medical field. If "mixed" economy is regarded as an "unmixed evil", all economies, except presumably some totalitarian ones, must be characterised as evil. Indeed, almost all economies are "mixed" in the sense that several functions in a community are performed by Government and others by individual citizens, corporate bodies and voluntary associations. It is the demarcation of responsibilities between the two sectors which distinguishes "mixed" economies. "Unmixed" concentration of both political and economic power in the same hands would be detrimental to democracy as well as genuine socialism. It would be a negation of liberty. As one of the outstanding economists of our day, Prof. Arthur Lewis, has observed, "Both sides can appeal to history but sensible people do not get involved in any arguments about whether economic progress is due to governmental activity or to individual initiative. They know that it is due to both and they concern themselves only with asking what is the proper contribution of each". If I were to specify the ingredients which go to constitute our economic system, I would mention three basic constituents, namely, planning, state-ownership of industry and controlled exercise of private enterprise.

Now, we need not be frightened of words any more than enamoured by them — whether it be planning, socialism, vested interests or nationalisation. The principal advantage of planning in developing countries has been, as recognised by international bodies and institutions, that it has helped to give a sense of direction to long-term policies and to enhance the flexibility of short-term programmes. Planning has also been instrumental in providing a general setting for expansion and in enabling various sectors of the economy to work towards a number of specific objectives. In the present-day world, we can no more condemn planning as such because of the risk that it might be carried to extremes any more than we can extol any kind of planning irrespective of its content and consequences. Our problem is not one of choosing between an ideal conception of individual freedom and some kind of collectivism but of finding in each case a proper balance between the two. For, the conflict is not so much between "individual freedom" and "collectivism" as between different forms of planning or collective action between different degrees of freedom, of open as well as concealed power.

Although the conception of a welfare state may be different in different countries and may also change from time to time, its fundamentals can no longer be disputed. The objectives embodied in the Directive Principles of the Constitution of India have to be achieved by democratic processes and without detriment to the national economy. Several years ago, Sir William Harcourt, then Chancellor of the Exchequer, observed in introducing the Death Duty Bill in Parliament, "We are all socialists now". No sensible person can support the unfettered exploitation of economic resources for private gain. No healthy adult citizen has a right to enjoy the fruits of other people's labour without contributing a fair quota of his own. In so far as socialism involves equality of social and educational opportunity, distributive justice, the supremacy of public interest above private gain and diffusion of economic power, few persons with a sense of responsibility and sensitivity would disagree with its basic principles. Priorities are essential to conserve and mobilise economic resources and see that necessities of life for the masses have a precedence over luxury for a few. We, with our cultural traditions, should surely be able to realise that mere pursuit of material gain by itself is empty and that the good society is one in which the human personality is developed to the full.

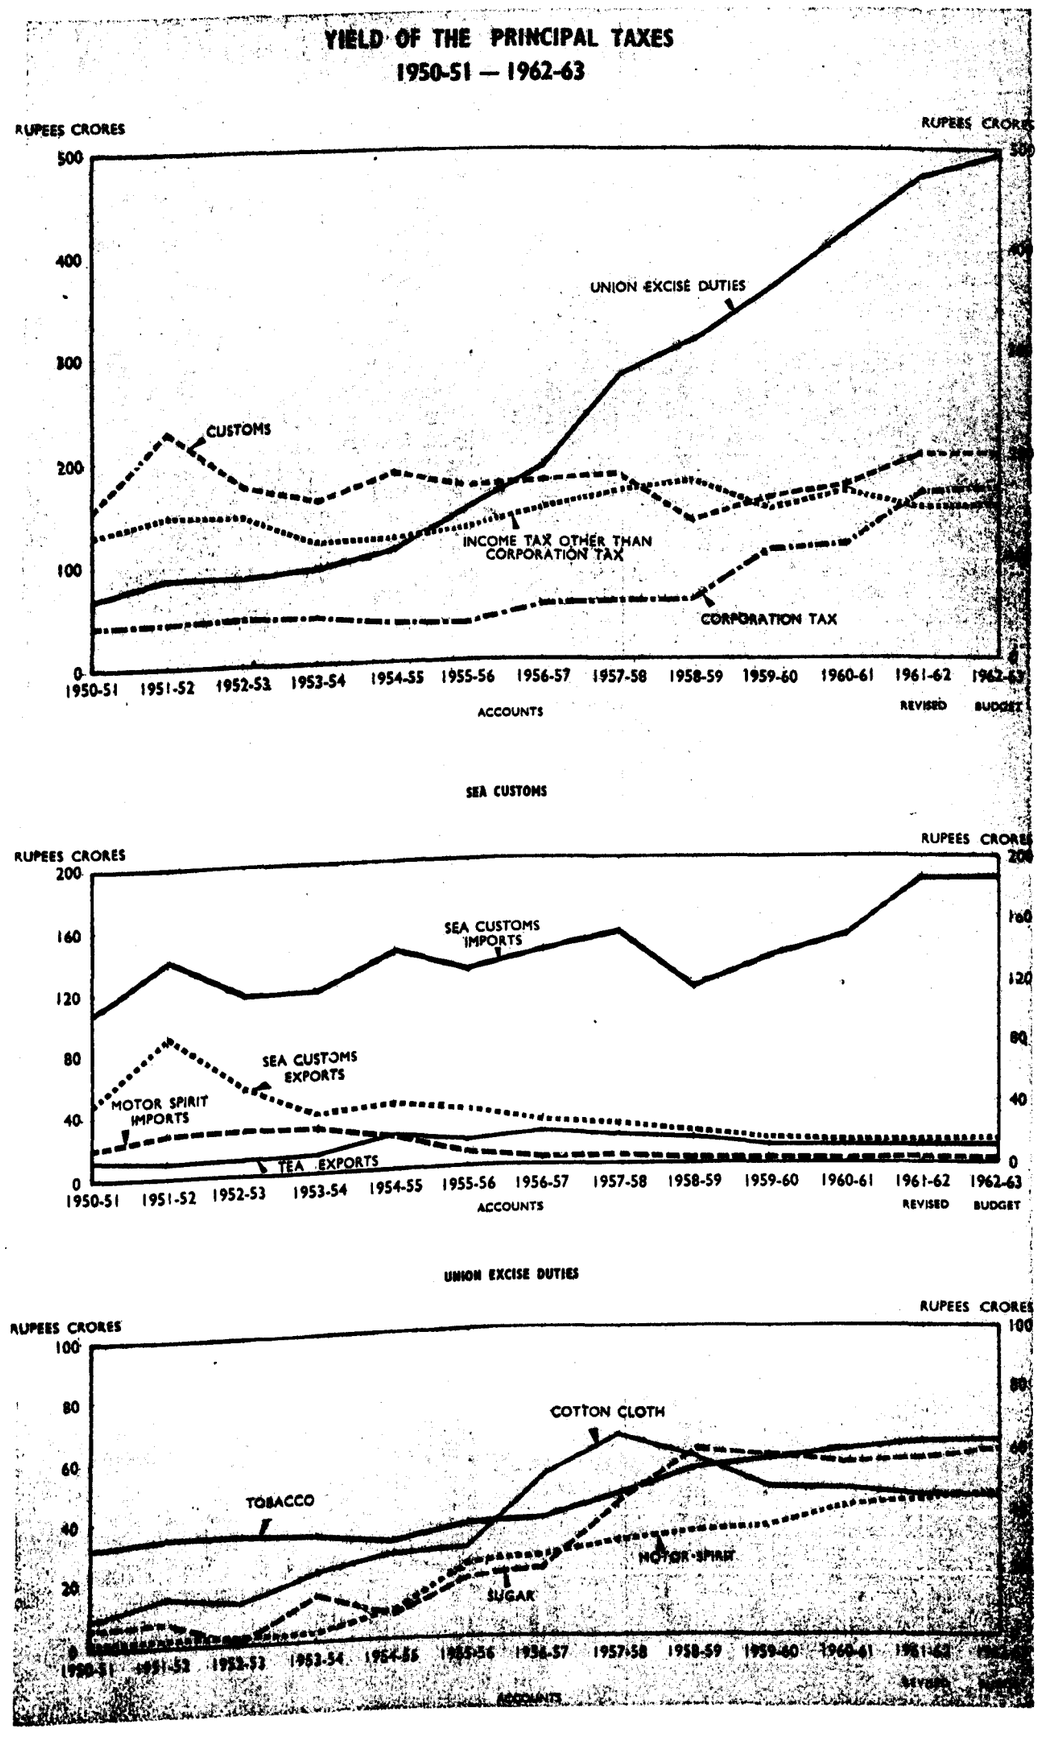
That the private sector is an integral part of national economy is widely recognised. In a book entitled "Twentieth Century Socialism" written by socialists and published a few years ago, the authors say: "The private sector of a socialist economy is not there merely on sufference to be tolerated on grounds of political expediency with the Sword of Damocles hanging over it in perpetual threats. On the contrary, it has a legitimate and, indeed, a necessary function to perform. Within the limits of equality, there must be opportunities for people to spend as they wish, to own, to initiate and experiment; they must be able to form associations to further their economic interests. In all these areas, the individual must have a chance to act without waiting for the approval of the State." And they go on to observe that "the reason why a socialist economy requires a private sector is because socialists place a value on individual freedom." The private sector in our country has made an important contribution to economic development and is, in fact, a dynamic element in the national economy. All but doctrinaire socialists and devout communists recognise that the criterion of profitability, the price system and the urge of self-enrichment if they are under effective social guidance and direction, can be effective means for attaining steadily rising standards of living.

The whole pattern of our economy is changing. Private enterprise is, however, no longer the private concern of the individual industrialist. It has a public character and a public image; it has to accept obligations and responsibilities both in law and in fact. Within the framework of the Plan, it has provided and

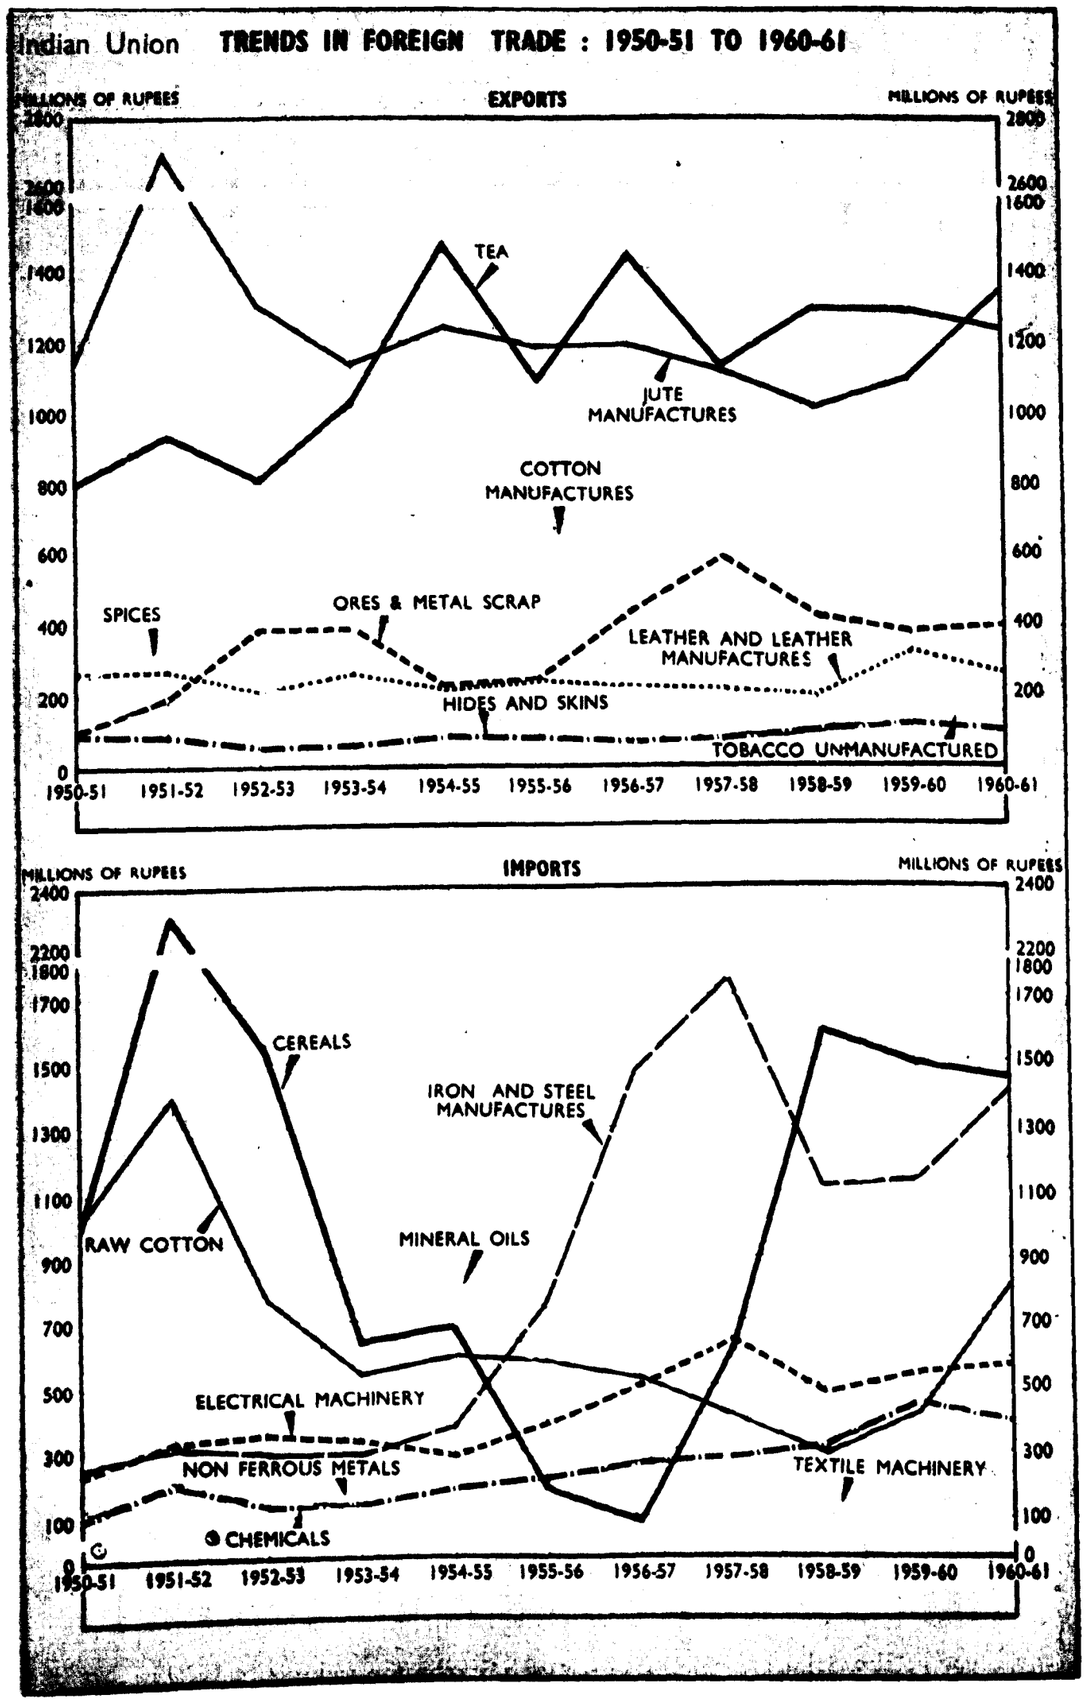
can continue to provide initiative and enterprise without which the economy is likely to be stagnant and undiversified. But it is not the profit motive alone that inspires the best of industrialists — it may be the will to power, the joy of creation, a desire for prestige, a sense of rivalry, even the sheer exhilaration of the race. As Keynes said, "If human nature felt no temptation to take a chance, no satisfaction (profit apart) in constructing a factory, a railway, a mine or a farm, there might not be much investment as a result of cold calculation."

So far as state-ownership of industry is concerned, the public sector still constitutes a small part of the organised sector of secondary industry while the private sector embraces a very large part of organised and unorganised industry as well as agriculture and trade and some forms of transport. The net output of Government enterprises and Government administration in national output was 10.3 per cent in 1957-58 which is the last year for which figures are available. It has, no doubt, gone up substantially since 1948-49 but the share of the private sector is still nearly 90 per cent. Moreover, the share of private enterprise in the total industrial production is very large. It was 87.5 per cent in 1957-58 as against 12.5 per cent of the public sector. The share of the private sector — 93.4 per cent in 1948-49 — has come down to 85.3 per cent in 1956-57. But it is undeniable that the development of the infrastructure has helped the economy and benefitted the private sector. We do not know many things about the dynamism of an expanding economy. What the business community is entitled to ask is that policies are adopted and measures are taken after careful consideration and full public debate and in consonance with our constitutional procedures. Also, the problem is not only of priorities but of allocation of resources. Here both kinds of enterprises — public and private — should have fair terms and no discrimination and in the sphere in which the private sector operates, it should not be "cramped, cribb'd and confined." Effective planning must seek to minimise interference and pin-pricks and devolve responsibility on industrial units and organisations, labour unions, local bodies and co-operative and voluntary organisations. The main requirement of the present situation is the maximum possible decentralisation and flexibility. Nationalisation is no longer regarded by socialists in the West as a panacea for economic ills; it is considered a means which might have to be adopted under certain conditions with proper safeguards for the consumer and the worker. The vicissitudes of democratic politics may impede the adoption of policies which are necessary. Industrialists and traders come more to rely on their capacity to influence some minister or official rather than on their ability to run their enterprise efficiently. The hierarchy of authorities and the complexity of regulations enhance the time-lag between consideration and decision as well as decision and action. The shortest distance in these circumstances is the circle where you go back to where you started! In his last testament, G. D. H. Cole, one of the most eminent socialist thinkers of our century, has observed, "I am neither a Communist nor a Social Democrat because I regard both as creeds of centralisation and bureaucracy, whereas I feel sure that a Socialist society that is to be true to its equalitarian principles of human brotherhood must rest on the widest possible diffusion of power and responsibility, so as to enlist the active participation of as many as possible of its citizens in the tasks of democratic self-government."

How has the business community in our country responded to conditions of a planned economy? Private enterprise is, if anything, adaptable and it has tried to adjust itself to the conditions in which it has to function. By now, it has acquired the necessary expertise to fill in the various forms which have become an essential part of a regulated economy, it has obtained the necessary knowledge of the ways and byways of New Delhi and the labyrinths of Government offices, and it has learnt patience to wait for official decisions. Setting up an industry in India is, in many respects, a time-consuming process but the rewards of enterprise have been generous and, notwithstanding impediments and irritants, the effort worthwhile. Despite the ups and downs, industrial production as measured by the official index has risen by 70 per cent during the last eleven years and in some industries like chemicals and general engineering, at even a faster rate. This is an achievement of which private enterprise can be reasonably proud.



The impact of a planned economy, however, is not so much on the operative aspects of setting up an enterprise as on its substantive aspects: the responsibilities cast on those operating private enterprise and the criteria by which private enterprise is judged. How has private enterprise functioned in these respects?



The balance sheet, I regret to have to say, is not without blemish. Let me first refer to one aspect of our economic situation: the present scarcity of many goods which seems to be a by-product of planning. Scarcities have arisen partly because of the acute shortage of foreign exchange and partly owing to the industrial licensing policy which until recently was restricted. The result is that the Indian entrepreneur has been protected not only from outside competition but also from internal competition.

I am sure you will agree that this situation is not a healthy one. On the one hand, prices have tended to rise and shoddy goods have not unoften been produced to take advantage of the scarcities, with the result that the Indian entrepreneur has not earned the consumer's goodwill. Moreover, the shortages have tended to induce a disregard of cost-consciousness in Indian enterprise.

Now this, I suggest, cuts at the very root of the private enterprise system. While maximisation of profits is often cited as the motive force of private enterprise, in the traditional theory this was to be the result of competition and continuous reduction in cost. Besides, the principal merit of private enterprise has been claimed to be its responsiveness to the consumer — what has come to be called "consumer sovereignty".

I cannot help feeling that the Indian consumer has not had a fair deal during the last twenty years. While at times and to some extent, the shortages may have been avoidable and have been due to factors beyond control, the Indian entrepreneur has not hesitated to take advantage of scarcity conditions in many industries. In many countries when the price of a commodity rises for any reason it is taken as a challenge to industry to meet it by increasing production and wiping out shortages. In our country, unfortunately, there has developed a tendency to make the most of such shortages and even try to make them permanent. There is no determined attempt to raise production by increasing efficiency or working more shifts or by exercising self-restraint in charging prices. It is not a question of working on a "loss motive" or of conducting business as a matter of philanthropy. But having worked so long in difficult times, the industry has become pathologically restriction-minded, seeking a large per-unit profit on a small output rather than a small per-unit profit on a large output. There is, I suggest, a need for an expansive mood in private enterprise, a keenness to create a market by reaching as large a number of consumers as possible rather than being satisfied with a limited market. It is true that industry itself has not only to put up with several restrictions and controls but has also to bear the burden of imposts and duties which go to enhance the cost of production. Nevertheless, Indian industry has to take a dynamic view of the market and evolve a far-sighted concept of profitability. The purchasing power being so low in

our country we have a large number of consumers with small means who have to be catered for. We cannot expect an oasis of prosperity in a vast desert of poverty. After all, private enterprise has, in order to justify its existence, to earn the goodwill of the consumer. Let us not forget that, in a planned economy, private enterprise tends to be judged by criteria different from those in a free enterprise economy.

While in the nineteenth century, private enterprise was accepted in Europe, America and elsewhere as the best possible form of the economic system, its premises have come to increasingly be questioned both on the ground of the rate of growth as well as its distributive justice. These are the questions which should not be glossed over but demand serious consideration in the interest of the commercial community itself. So far as the private enterprise system works by decentralising processes of industrialisation and helps to elicit the maximum effort from the people, it is capable of providing a rapid growth of the economy. Moreover, the fiscal system is now sufficiently developed to reduce disparties and inequalities not justified by contribution to the economic system.

We are living today at a time when we must be wary of "the political time-bomb deep in the rapidly changing social pattern" of our nation. If the prob em of social change is regarded primarily as a struggle between prosperity and poverty, we shall end up either by the establishment of a ruthless totalitarian system or a corrupt and decadent regime in which all moral values will perish. In few countries is the challenge of the "revolution of rising expectations" more serious than in ours where we have abysmal poverty and wide disparities of wealth and income, and where we are seeking to plan for social welfare through democratic means. The success of these endeavours rests not only on Government nor will it be achieved by foreign aid, essential as it is. No longer will the mass of people believe that economic disparities are divinely ordained or are the inescapable fruits of 'Karma'. Two great revolutions have taken place during the last fifty years in the Soviet Union and China, and today over 800 million people are living under Communist rule. In several countries including our own, Communist ideology is being vigorously preached. The scarcity of the bare necessities of life, the soaring cost of living and widespread unemployment all tend to create disaffection towards the established order of society. Who is responsible — Government or businessmen — for this juxtaposition of public penury and private ostentation is of less consequence for the masses than their own plight. The accusing finger is invariably directed towards those who have power and towards those who have the goods of the world.

Private enterprise is, therefore, on probation more than ever; how far and in what form it survives will depend mainly on how it acquits itself in changing conditions and serves the newer demands and finer needs of the people. It will no longer be judged merely by its capacity to earn large profits quickly. It will be judged by its utility in contributing to economic growth. It will have to accept social obligations involved in a planned economy and adapt itself to its environment. Industrial concerns will have to be institutional in structure and cannot continue to be simply proprietory and hereditary. Instead of notions of privacy and maximum profit, business will have to conform to standards of administration, organisation and technical proficiency; in other words, business will have to become a profession with all its implied responsibilities. It will have to consider production in terms related to consumption. It will have to recognise that only such income is legitimate profit as is earned in return for entrepreneurship, risk, organising capacity, savings and work. Gain must bear relation to service performed and responsibility undertaken. It will have to develop a sense of partnership with workers by hand and by brain. The American industrialist, Mr. Clarence B. Randall, once remarked that "the time is come for industry to make it clear that what is best for the country will be at the top of the agenda when a board of directors meets to make basic decisions even though that may cut earnings in the third quarter." No institution, no organisation, will survive if it is concerned only with self-preservation. Business has and should have goals beyond its own existence and material rewards. When we pursue only success and money for their sake, we lose the deeper reasons for living, we sacrifice the end for the means. Business interests have to exercise self restraint in taking advantage of a situation and come forward, where necessary, to prevent abuses. It is the lack of integrity and sense of social responsibility that damage private enterprise far more than occasional ministerial speeches and woolly 'obiter dicta' on matters of policy. Business ethic is part of social ethic, not independent of nor different from it. The private sector, in the final analysis will maintain and even improve its status and influence in so far as it shows the capacity to do a better job and conduct itself as a form of public service.

A planned economy demands adaptation and readjustment on the part of various sectors of the community. Violent upheavals are not prevented but hastened by selfishness, corruption and wilful obstruction. Democracy does not mean the acceptance of 'status quo'; it only demands that social and economic changes should be achieved by peaceful and constitutional means. A heavy responsibility rests on all those who believe in democracy to help in ensuring that democratic institutions achieve economic welfare. Private enterprise which is dynamic and resilient will, I trust, not be found wanting in the challenge it faces in our developing economy.

PATRONISE RAILWAYS—NATIONAL TRANSPORT

In the transport of goods, Railways cannot pick and choose. A cheap commodity like COAL, and an expensive commodity like PIECE GOODS are both accepted and carried. In the interest of all, do utilise to maximum extent the capacity available on Railways—which capacity is being rapidly increased, to enable Railways to serve the nation, better.

(ISSUED BY THE SOUTHERN RAILWAY)

*November figures have been taken for December also.
**Includes tyres and tubes of automobiles, bicycles and tractors.

Agricultural Development in 1950's and the Challenge Ahead

DESPITE occasional setbacks and at times serious ones as in 1957-58, owing to vagaries of weather, Indian agriculture during the past decade, covering the period of the first two Plans, has made quite rapid strides. The index number for agricultural output (base 1949-50=100) rose from 95.6 in 1950-51 to 116.8 in 1955-56 and further to 139.1 in 1960-61. The average growth in India's farm output during the fifties thus has been of the order 4.6 per cent (linear) per annum. During the current year the output is expected to rise substantially further; the index number may reach even 150.

This, however, does not imply that the growth has been evenly spread over the various farm products; in some cases such as rice, wheat, maize and sugarcane, the rate of increase in output has been substantially higher as compared to such crops as oilseeds, pulses and inferior foodgrains. The growth in cotton and jute cultivation also has been quite fast, though these two farm products have had a rather greater share of misfortune resulting from wheather adversities; the former in 1959-60 and to some extent in the current year and the latter in 1957-58 and 1960-61. Generally speaking, the pattern of growth has been such that there have become available increased quantities of most of the agricultural commodities, the occasional serious shortfalls being made good by imports to whatever extent possible. This is reflected in the containment of the price level, especially in the last year, on a fairly wide front in the agricultural sector. The index for food articles (base 1952-53=100) in 1960-61 stood at 120 as against 111 in 1950-51 and of industrial raw materials at 145.4 as against 141.5. There has, however, been witnessed an appreciable increase in prices, particularly of industrial raw materials, since 1955-56, partly as a reaction to the sharp fall in that year under conditions of bumper harvest and partly owing to inflationary tendencies consequent upon heavy doses of deficit financing. Tighter supplies of some commodities such as cotton in 1959-60 and jute in 1957-58 and 1960-61, have also led to their prices spiralling up rather unduly. On the whole, the picture has not been so bad. The index for industrial raw materials during the current year is expected to show a marked fall due to abundant supplies of raw jute and various other agricultural commodities.

The increase in farm output in the 1950's has resulted both from extension in cultivated area and greater application of scientifc and technological knowledge. Over 50 per cent of this increase appears to have been brought about by expansion in area under cultivation which went up from 325.9 million acres (gross) in 1950-51 to 374.4 million acres (gross) in 1958-59. There must have been some further additions to this during the last three years, but no reliable statistics are available for this period. Cultivated area has gone up as a sequel

*Provisional.

Notes: 1. Production figures to agricultural year, July-June; 1951 figures correspond to 1950-51, and so on for subsequent years. These estimates upto the year 1955-56 are adjusted with 1956-57 revised production as the base. Figures for 1957-58 are based on Revised Estimate, for 1958-59 and 1959-60 on Partially Revised Estimate and for 1960-61 on Final Estimate of production.

2. Net production has been taken as 87.5 per cent of the gross production, 12.5 per cent being provided for food, seed requirements, wastage and non-food purposes.

3. Population figures relate to mid-year estimates framed by the office of the Registrar General of India and exclude N.E.F.A. The estimates for years beyond 1951 are provisional.

27 factories

Twentyseven Factories in twentyseven Countries. Twentyseven Productive enterprises in which experience is gained. Twentyseven observation posts that watch each technical advance, investigate, develop and apply the same.

The fruit of all this immense amount of knowledge and experience is contained in just a small piece of carbon paper, in just one inked ribbon, and in that sheet of Stencil Paper, all products of the House of Kores.

If you buy equipment that is going to cost you a great deal of money, then the knowledge that you are buying from a firm with a world-wide reputation gives you that very comfortable feeling of safety. For just the same reason, it is preferable to choose "KORES" when you need Carbon Paper, Ribbons and Stencils.

In this way, you will preserve and add to the distinction of your organization by sending out letters that are clear and legible and which leave behind them as a fitting memorial copies which are clean and clear.

On behalf of twentysix Kores Companies.

KORES (INDIA) LTD.

KORES For your Kores pondence

to both increase in net area under cultivation and greater resort to multiple croping.

The increased application of science and technology to Indian agriculture has led to higher productivity of land which is reflected in increased yields of majority of agricultural crops. Significant increases have been recorded in the yields per acre of rice, jowar, gram, maize, tur and ragi. The increases in unit-area yields in the case of wheat, bajra, cotton and sugarcane, though less impressive, have also been fairly large. In the case of some oilseeds like linseeds and sesame and also in the case of tobacco, yields per acre, however, have slightly gone down.

The application of scientific knowledge and technology to Indian agriculture has taken various shapes. Due to particular conditions obtaining in this country, greater attention naturally has been paid to provision of irrigation facilities and fostering the use of chemical fertilizers. But the progress made in other fields such as provision of improved seeds, better farming implements, pesticides, etc., has also been quite appreciable. Net area under irrigation increased from 51.5 million acres in 1950-51 to about 70 million acres in 1960-61. The gross area irrigated during this period went up from 54 million acres to nearly 76 million acres. Owing to better utilisation of the irrigation potential created under the first two Plans, further addition to the gross area under irrigation during the current year is estimated at about 4 million acres. Thus, nearly 23 per cent of the total area cultivated at present has already been brought under irrigation, as against about 17 per cent in 1950-51.

Consumption of chemical fertilizers, which before the start of the First Plan, was mainly confined to aiding the production of such crops as tea, coffee, cotton and rice, has picked up appreciably during the last decade. The increase in demand for them, especially nitrogenous fertilizers, has been phenomenal during the past four years. In 1960-61 only 45 per cent of the estimated demand for nitrogenous fertilizers could be met because of the still low indigenous output and difficulties of importing them from abroad owing to tight foreign exchange situation. During the current year, the demand for this type of fertilizer is estimated to have gone up to about 26.7 lakh tons (in terms of ammonium sulphate), while the availability (both from internal sources and imports) has been about 15.1 lakh tons. Increased attention has also been paid in the recent past to production of urban compost which in 1960-61 went up to about 27 lakh tons. Green manuring during the current year is expected to cover about 150 lakhs acres.

The work on multiplication of improved seeds has also been accelerated especially under the Second Plan. The progress achieved during the five years to 1960-61 was quite appreciable though the target of setting up 4,328 new seed multiplication farms of about 25 acres each could not be achieved; about 4,000 such farms had been set up by March 1961. Nearly 55 million acres of agricultural land were estimated to have been brought under improved seeds by 1960-61. Another about 70 seed farms have been set up during the current year. To further increase the tempo in this respect, a National Seeds Corporation is being set up to undertake, on country-wide basis, production and distribution of seeds of high-yielding and disease-resistant varieties, in the first instance, of hybrid maize and hybrid jowar.

Concerted efforts have also been made during the fifties particularly towards their close, to make available to the agriculturist improved farm implements. But the progress made in this regard has not been very encouraging because of foreign exchange shortages hampering import of steel; mechanical cultivation could be extended to about 5 lakh acres of cultivated land by the end of 1960-61.

Along with making available to the farmer greater irrigation facilities, fertilizers and improved seeds and implements, some attention has also been paid to encouraging him to take to improved agricultural practices such as crop rotation, line sowing, proper spacing, eradication of weeds, plant protection and Japanese methods of paddy cultivation. The last practice has been of particular help in stepping up rice yields. Nearly 8.5 million acres of land under rice cultivation have already been brought under this method.

To make the agriculturist to go in for improved methods of cultivation, quite a useful role has been played by extension services provided under the Community Development Programme. By the end of 1960, about 3,07,000 villages, containing well over half of the country's rural population, had been brought under this programme. The programme is envisaged to be extended to the entire country by 1963.

Attempts have also been made in late fifties for land development and soil conservation. By the end of the current agricultural year, as many as 220 soil conservation programmes would be in operation in various States. Dry farming has also been practised on an increasing scale during the last two years. As many as 28 dry farming projects have been brought into operation during the current year, as against 19 in the previous year.

Two other measures have been taken during the past one and half years with a view to help the agriculturist to step up his output. The first one has been the introduction of what is known as the Package Programme for Agriculture. Under this programme, agriculturists in some selected districts are provided with all the aids to farm production in a co-ordinated manner and adequate measures. During the rabi season in in 1961-62, this programme covered 14.50 lakh acres in the first seven selected districts in Madras, Andhra Pradesh, Bihar, Rajasthan, Madhya Pradesh, Uttar Pradesh and Punjab—nearly 17 per cent of the total cultivated area in these districts. During the kharif season of 1961-62, 130,000 farm plans were prepared

PRODUCTION AND CONSUMPTION OF SUGAR IN INDIA

(Excluding Khandsari)

('000 Tons)

Year (Nov.-Oct.)	Production	Consumption

1955-56	1862	1940
1956-57	2025	1982
1957-58	1977	2042
1958-59	1918	2080
1959-60	2421	2020
1960-61	2981	2100*

*Estimate.

EXPORT OF INDIAN SUGAR

1958 = 44,000 metric tons	1959 = 16,000 metric tons.
1960 = 18,000 metric tons	1961 = 2,68,000 metric tons.
1962 = 76,000 metric tons	Upto middle of March, 1962.

in all these seven States, against 58,000 prepared in 1960-61, when the execution of programme was first taken up in right earnest. Measures are under way to extend this programme to eight more districts in the remaining States by the kharif of 1962. Meanwhile, to enable the agriculturist to have a better return for his efforts the system of co-operative marketing has been strengthened and the programme of building of warehouses accelerated.

The second device that has been taken resort to with a view to step up farm output is the extension of the price support schemes to wheat and raw jute alongwith sugarcane which was the only crop uptil now for which minimum prices had been fixed.

The pre-occupation with the stepping up of output from land, however, does not mean that no concerted attempts have been made for the development of animal husbandry, poultry, dairying, fisheries and forestry. The tempo of activity under these heads has picked up quite substantially under the Second Plan. Nearly 260 key village blocks were set up for cattle development during the five years ending 1960-61 as against a target of 275 blocks. As many as 72 extension centres for animal husbandry have also been set up. Over 31,000 superior calves were reared, 5.7 lakh scrub bulls castrated and 83.4 lakh inocculations given for prevention of cattle diseases during these five years. Under the scheme of better utilisation of superior calves from milk centres, over 800 calves were purchased from Aarey and Haringata and distributed free to bonafide breeders. Poultry population during the Second Plan period increased by about 20 per cent over the 1956 level. For the development of marine fisheries, greater resort has been taken to mechanisation of fishing crafts. At present there are over 18,700 mechanised boats in the country. To improve marketing of fish, refrigerated vans have been provided on three railway routes, namely Calcutta-Madras, Orissa-Calcutta and Ahmedabad-Delhi. Another such service is to be introduced soon on Agra-Calcutta route. Various schemes have been drawn up and executed for the development of dairy industry and forests.

While the record of achievement on the agricultural front under the first two Plans has been quite impressive, the future holds a big challenge that has to be met if the standard of living of a rapidly increasing population is to be raised steadily to anywhere near to that enjoyed in the advanced countries, and the rapidly growing industries are to be fed properly with agricultural raw materials. The fulfilment of Third Plan with its ambitious targets undoubtedly will be the first crucial milestone that would be reached in this uphill journey.

The Third Plan envisages increase (over the 1960-61 level) in foodgrains output by 31.6 per cent to 100 million tons, that of oilseeds by 38 per cent to 9.8 million tons, of sugarcane by 25 per cent to 10 million tons (in terms of gur), of cotton by 37.2 per cent to 7 million bales, of jute by 55 per cent to 6.2 million bales, of tobacco by 8.3 per cent to 32,500 tons, of tea by 34.1 per cent to 900 million pounds, of coffee by 67.7 per cent to 80,000 tons and of rubber by 70.5 per cent to 45,000 tons. Substantial increases are also envisaged to be made in respect of other agricultural commodities. Broadly speaking, the Third Plan assumes stepping up of the annual rate of growth in Indian agriculture to about 7.5 per cent per annum.

This rate of growth is deemed to be achieved by substantially stepping up application of technology to Indian farming. The gross area under irrigation is proposed to be increased by 25.6 million acres by 1965-66. Soil conservation measures are planned to be extended to 11 million acres and dry farming to 22 million acres. Nearly 3.8 million acres of waste, saline and alkaline lands are intended to be reclaimed. Total consumption of fertilizers is envisaged to be stepped up nearly five-fold; consumption of nitrogenous fertilizers (in terms of N) to 10,00,000 tons per annum, or phosphatic fertilizers (in terms of P2O5) to 4,00,000 tons, and of potash fertilizers (in terms of K2O) to 2,00,000 tons. Supply of urban compost is proposed to be stepped up to 5 million tons per annum and of rural compost to 150 million tons. Green manuring is envisaged to be extended to 41 million acres. Plant protection is to be extended to 50 million acres. All these steps, it is expected, will raise average yields per unit-area by 16.5 per cent over the average yields during the Second Plan period in the case of foodgrains (rice 27.5 per cent and wheat 20.1 per cent), by 10.9 per cent in the case of oilseeds, by 18.2 per cent in the case of sugarcane, by 13.7 per cent in the case of cotton and by 15.9 per cent in the case of jute. Similar increases in unit-area yields are anticipated to result in the case of other crops.

The task set forth in the Third Plan can be performed only by redoubling of efforts both on the part of the Government and the agriculturists. The targets under the Plan have been fixed with a view to attain a balanced development of agriculture during the 5-year period to 1965-66. How far this aim will be achieved depends on how judiciously the lever of price supports, which is envisaged to be extended to cover all the major crops produced in the country, is manipulated. As already stressed in these columns, this lever can be successfuly made use of for raising the output of such crops as oilseeds and cotton at the expense of say sugarcane, the abundant supply of which during the last two years has posed a serious problem. There is also need for building up buffer stocks of farm products like raw jute, cotton and foodgrains in years of bumper crops so that shortfalls in years of lean harvests can be successfully met. The maintenance, rather lowering gradually, of the present prices of essential agricultural raw materials and foodstuffs is a challenge that has to be taken up by the newly constituted Ministries in the States and the new administration that will take over at the Centre next month. The new Ministries at the State level will do well to undertake the work of reclaiming culturable wastes in a more earnest manner than their predecessors have done. Holding the price-line on the agricultural front, and this implies ironing out of excessive fluctuations in the prices of essential raw materials and foodstuffs, is the key to containment of the price-line in general. The success of the new Ministries will depend to a very large extent on their achievement of this crucial task.

PRODUCTION, CONSUMPTION AND IMPORTS OF JUTE IN INDIA

New avenues of progress

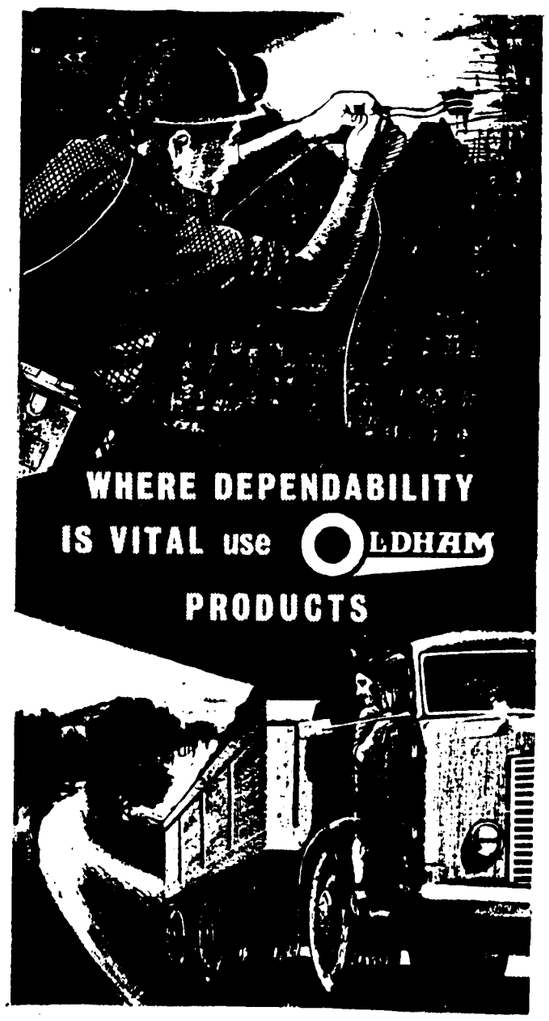
The rapid development of India's road transport has opened up new avenues of progress. Diesel trucks, lorries and buses now link every part of the country...carry goods and people to once-remote areas. With the growth of road transport has grown demand for High Speed Diesel Oil. Today over 1 million tons are consumed.

By the end of the Third Plan the country's needs will increase by 117.2%. There can be no question that the first priority should be the exploration and production of indigenous crude oil; the second priority must be to expand refining capacity in India. Oil is essential to economic growth, and Burmah-Shell believes that

for tomorrow's needs we must act today

on the move...

STANDARD HERALD cars, designed to give trouble-free motoring under any conditions.



Easy manoeuvrability, Control Tower visibility, 25 ft. turning circle,

TOWARDS A MODERNIZED SOCIETY

The Industrial picture of Madras State today presents a striking contrast to the picture of Madras, even as late as 1947, wherein one saw industrial activity confined only to a few centres like Madras, Madurai and Coimbatore.

Numerous big, medium, small and village industries have since appeared and are distributed all over the State. And they are thriving. The industrial estates and colonies at Guindy, Viruthu nagar, Madurai, Tiruchirapalli, Pettai, Erode, Thanjavur, Marthandam and elsewhere substantially augment production and contribute to the wide dispersal of prosperity.

While the power projects under the Plans have considerably accelerated industrial advancement, the bountiful benefits under the Neiveli Project when it starts functioning full steam, will transform the economy of the State into one predominantly industrial. Meanwhile industry in the State marches serenely ahead.

The Management of Coffee Estates in Coorg and Mysore is undertaken.

Inequalities of Personal Incomes in the Indian Union

WHEN the Mahalanobis Committee to enquire into the pattern of distribution of the increased national income generated by the two plans was announced, it was made very clear that its primary object was "to ascertain such statistical and economic data as may be gathered at present, to identify the gaps in the existing information and to suggest steps for removing these deficiencies." It was, therefore, quite plain that the absence of any evidence in respect of the extent of the existing inequalities of incomes in the Indian Union was not on account of any callousness on the part of the economists; it was more so on account of the non-availability of any precise data on which to construct sound conclusions. Any assessment of the existing inequalities of incomes has naturally to be based on data which evidently are only partly dependable. Nevertheless, certain surveys have been conducted during the last few years which do provide indirectly some sort of background to the magnitudes of the income inequalities.

One measure of the existing inequalities of incomes can be the extent of population living in each expenditure group. The thirteenth round of the National Sample Surveys gathered certain data in respect of households classified according to the various expenditure groups. Table I below has been processed from this data. It provides the distribution of rural as well as urban population in various expenditure brackets. Perhaps the most important revelation is that as much as 19 per cent of the Indian population constitutes the households spending below Rs. 50 every month. Evidently, as much as 19 per cent of the Indian population is living below what is commonly considered as the 'poverty line'. Then, the expenditure bracket of Rs. 51—100 per household constitutes as much as 37 per cent of the Indian population. In a way as much as 56 per cent of the Indian population is living below Rs. 100 monthly expenditure per household which is considered very low. It can nevertheless be stated that only 7 per cent of the population belongs to the Rs. 300 and above monthly expenditure group. This shows that the people in the higher income brackets are not far too many. In fact seen from another angle, as many as 75 per cent of the Indian population lives within the monthly expenditure group of Rs. 50—300, proving thereby that the major problem is not that of inequality but that of widespread poverty.

TABLE I.

PERCENTAGE DISTRIBUTION OF POPULATION—INCOME GROUPS

Income Group (Rs.)	Rural	Urban	Total
1 — 50	19.5	12.7	19.0
51 — 100	37.4	26.8	36.7
101 — 150	18.1	22.3	18.4
151 — 300	18.5	27.2	18.9
301 and above ..	6.5	11.0	7.0
TOTAL	100.0	100.0	100.0

An assessment of the inequality of incomes in terms of various regions in the Indian Union leads us to the conclusion that the population below the poverty line is not evenly spread all over the country. Table II gives the overall percentage of population below the poverty line in each State. It can be observed that in Madras and Orissa the population below the poverty line is more than 30 per cent which is a staggering volume. Similarly the States of Andhra, Bihar, Kerala, and Maharashtra are others where the poverty is quite above the average of all India level. On the other hand certain States like Assam, the Punjab and Kashmir are exceptionally favourably placed in the sense that the people below the poverty line are very few. The problem of inequalities of incomes is, therefore, to be observed from both these angles.

In Table III an effort has been made to assess the State-wise inequality of incomes by constructing various poverty lines. In column (A), (B), (C) and (D) poverty line has been supposed to be below Rs. 50, Rs. 100, Rs. 150 and Rs. 300 monthly household expenditure respectively. These indices have been constructed with Assam as base for easy comparison. It is clear that in column (B) where the poverty line is below Rs. 100, the inequality seems to be comparatively subdued. It is even more subdued in columns (C) and (D).

The most important aspect of the inequalities of incomes—the real context of the study of this problem—is to assess the fact that whether or not, as a result of income generation during the plan period, the inequalities have decreased. To measure such a change, income data around two different points of time had to be collected. In fact that Economic Intelligence Unit of the Indian Institute of Public Opinion processed data available in the above mentioned thirteenth round of the National Sample Survey, the Surveys conducted by the Tea Board as well as their own surveys. The table on pages viii and ix in the Blue Supplement, reproduced from the Quarterly Economic Report No. 31 indicates the extent of the shift of the income generated in various brackets. It may be noticed that in the Indian Union 11.3 per cent of income was earned in the income brackets below Rs. 50 during 1955-56. It was reduced to 5.83 per cent by 1960-61, indicating clearly that the poverty line in the latter year had tended to effect a smaller section of Indian people. Similar trend was noticed in respect of the next income group—Rs. 51—100, where in as much as 29.31 per cent of the income was generated during 1955-56. It may be observed that during 1960-61 this income group earned only 22.07 per cent of the total personal income. Thus there was a sure shift from the lower income groups towards the higher income groups. Against as many as 40 per cent of the personal incomes being generated within a monthly household income groups of below Rs. 100 in 1955-56, only 27.8 per cent of the personal incomes were being generated in this group during 1960-61. Therefore as many as 50 per cent of the incomes were shifted towards the higher income groups. It may be observed that in income groups of Rs. 100—200 the percentage improved from 28.27 per cent during 1955-56 to 32.94 per cent during 1960-61. Then again in the income brackets Rs. 200—300 there was an improvement from 1955-56 to 1960-61 to the extent that in the former years as much as 9.48 per cent of the income was generated from this group and in the latter year as much as 13.49 per cent of the income was being generated.

As far as the higher income groups are concerned there was a trend towards a declining percentage in the income bracket of Rs. 700 to 1000. While as many as 2.67 per cent of the income was generated in this group during 1955-56, only 2.58 per cent of the income was generated in this during 1960-61. Thus there was a fall though only marginal one. It may however be observed that in the income brackets above one thousand

the trend has not been towards equality. There has been an increase in percentage of income generated from 3.79 per cent to 4.60 per cent during the latter year. By and large, however, there has been a trend towards greater equality between 1955-56 and 1960-61. This trend was more certain in the urban than in the rural areas.

An estimate has been made in respect of 1965-66 trend. It may be observed that the incomes generated in the Rs. 50 or below group has declined further to 2.60 per cent, showing that the population below the poverty line is bound to be still lesser. In the urban areas this income group will only be to the extent of 0.54 per cent. Income generated from 51 — 100 group is also likely to be reduced to 5.15 per cent in urban areas while it was 9.86 per cent in 1960-61.

There is evident a clear trend towards increasing equality of incomes though it will be only a slow change. It may however be added that urban incomes are likely to be more equally distributed than rural ones. This perhaps is on account of the fact that the ceilings on large holdings which reduced inequality over the Second Plan period are not likely to be more extensive. Apart from this the incomes of more enterprising farmers who are likely to use fertilizers would improve their relative position.

A look at the table would reveal that the State where the reduction of income inequalities seems to be fastest is Kerala. The income generated from the income group Rs. 1—50 during 1955-56 was 13.56 per cent.

TABLE II.

PERCENTAGE OF POPULATION BELOW THE POVERTY LINE

State	Percentage of total population
1. Andhra	23.2
2. Assam	3.4
3. Bihar	19.0
4. Gujerat	19.0
5. Jammu & Kashmir	6.6
6. Kerala	20.0
7. Madhya Pradesh	19.4
8. Madras	31.7
9. Maharashtra	19.0
10. Mysore	14.9
11. Orissa	35.4
12. Punjab	7.4
13. Rajasthan	16.0
14. Uttar Pradesh	17.5
15. West Bengal	14.5
ALL INDIA	19.0

It dropped to 0.42 per cent in 1960-61 and is likely to further come down to 0.09 per cent during 1965-66. In 1960-61 the States with the greatest equality in total income distribution were the Punjab, Kerala and Orissa and in sharp contrast to this, total incomes in West Bengal and Gujerat were very unevenly distributed. Gujarat seems to be the State with the most unequal distribution with as much as 12.3 per cent of the total 1960-61 income concentrated in the monthly household income group of over 1,000. This study, therefore, leads us to the broad conclusion that equalities of incomes are being achieved, though very gradually. The real stress nevertheless, has to be in the raising of overall incomes.

TABLE III

STATEWISE RURAL DEGREE OF INCOME BACKWARDNESS

State	A	B	C	D
Andhra Pradesh	522	169	126	102
Assam	100	100	100	100
Bihar	469	150	120	100
Bombay	439	145	122	102
Jammu and Kashmir ..	180	120	106	99
Kerala	430	153	119	103
Madhya Pradesh ..	494	158	126	99
Madras	653	172	133	103
Mysore	377	148	121	100
Orissa	682	186	135	102
Punjab	236	95	92	102
Rajasthan	405	121	109	91
U.P.	410	150	124	94
West Bengal ..	390	144	120	102
Union Territories ..	184	99	95	101

Column A is obtained when we place the poverty level at below Rs. 50 which is the monthly household expenditure level in rural areas.

Column B is obtained when we place the poverty level at below Rs. 100, which is the monthly household expenditure level in rural areas and no weights are given.

Column C is obtained when the poverty level is placed at Rs. 150, the monthly household experditure level in rural areas, and no weights are given.

Column D is obtained when the poverty level is placed at Rs. 300, the monthly household experditure level in rural areas, and no weights are given.

Regional Distribution of National Income

DURING the last decade National Income of the Indian Union has continued to advance at the rate of nearly 5 per cent every year. It has become an interesting exercise to study whether this increase in income has been uniform all over the country or the increases have been unequal in various regions. The Indian Institute of Public Opinion has been able to present a State-wise break-up of National Income generated in agricultural, industrial and tertiary sectors during the last decade. This study is very significant for the simple reason that it tends to assess the translation in actual terms of planning efforts in various States.

Any attempt to compare the national income generated in various States has to be in terms of per capita income. A table in this section sets out the per capita incomes during the three Plans at 1955-56 prices. It may be observed that in 1950-51 when the all-India per capita income was Rs. 222, the States of Gujarat, Maharashtra, the Punjab, and West Bengal were those where the per capita income was much above the all-India level. These States in a way were 'richer' before the initiation of, what might be called, the years of planning in the Indian economy. It may be indicated that the First Plan generated increased per capita income to a rather modest extent. Certain interesting features of increase during this period were that Maharashtra which was already one of the 'richest' States grew richer by more than its normal share. The increase during the First Plan on all-India basis was to the extent of 6.27 per cent. Maharashtra on the other hand recorded an increase of 13.7 per cent. Three other States that recorded significant increases were Andhra, Rajasthan and Mysore. These States though comparatively 'backward' in 1950-51, improved their position in 1955-56.

Increase in per capita income during the Second Plan period was nearly double than that recorded during the First Plan period. The Punjab recorded maximum increase of 23.68 per cent which was more than double the all-India increase of 11.96 per cent. Other States which recorded sizeable improvements were Gujarat, Madras, Orissa and West Bengal. Apart from this, Delhi region also improved its position considerably. It might be observed here that the States which were 'rich' became comparatively richer. The Punjab, for instance, was fourth among the major States in terms of per capita incomes in 1950-51. Ten years later it was only second to West Bengal and their difference too had been considerably reduced .

When the probable increases in incomes in the States that were likely to be generated during the Third Plan period were taken into consideration, a picture of nearly 15 years was available, which made an interesting study. It confirmed the trend already observed that rates of growth in the different States of the Indian Union were markedly unequal and the disparities in overall rates of growth as well as per capita growth continued to stay. As an instance it might be indicated that while in Assam the per capita income generated during the Third Plan period was likely to be to the extent of 3.64 per cent, the increase in Orissa was likely to be of the order of 40.64 per cent. The Punjab which already was a leading State in respect of per capita income was likely to improve its position further by 23.7 per cent. This was an exceptionally high figure when compared to the all-India average of 16.92 per cent. Over the 15 years the advance would be greatest in the Punjab, at around 138 per cent in terms of incomes at 1955-56 prices. Income in Orissa would increase by nearly 115 per cent and in Gujarat it would increase nearly by 101 per cent. These three States, it seemed, were major beneficiaries. Comparatively slow movers would be Assam, Andhra Pradesh, Kerala and Madras. It might be observed that in Uttar Pradesh the rate of growth in income generation has been considerably below the all-India average. During the first two plans and during the Third Plan it would be 60 per cent which was about 30 per cent below the all-India figure of 86 per cent.

When seen in terms of various sectors, it might be observed that the States that were likely to register the greatest agricultural income increases over the entire period of three Plans were the Punjab with 170 per cent rise, Rajasthan with 139 per cent and Orissa with 96 per cent rise. The other important States in this respect would be Kerala, West Bengal and Mysore which would improve their positions by over 80 per cent. As far as industrial incomes were concerned, it would be Orissa and Bihar where the increases would be to the extent of nearly 230 per cent in each case. The Punjab and Bengal would also have recorded major increases—the Punjab was likely to increase income from industry to the extent of 190 per cent and West Bengal also to the same extent. The States that were likely to lag behind in terms of industrial incomes were Rajasthan with just 44 per cent, Assam with nearly 70 per cent and Kerala with nearly 60 per cent. This could definitely be considered on the lower side when compared to the all-India average of 120 per cent. In the field of tertiary incomes the rise during the fifteen years was likely to be highest in the case of Delhi with 161 per cent, while Assam, Bihar, Gujarat, Maharashtra, Orissa and the Punjab would also have shown major improvements. Particular slow movers would be Kerala, Andhra and Madras.

It might be observed that per capita income did not necessarily move in line with the general improvements in incomes because the pressure of population was not uniform all over the country During the decade 1951-61 the all-India annual growth was 2 per cent, as against this West Bengal recorded an increase of 2.9 per cent, Gujarat 2.4 per cent, Assam 2.7 per cent. Then, the States of Andhra Pradesh, Madras and Uttar Pradesh were comparatively fortunate. Their rates of population growth were lowest at 1.4 per cent, 1.2 per cent and 1.5 per cent respectively. Naturally, therefore, in terms of per capita incomes, Madras with an increase of 22 per cent in income during the Second Plan, recorded a per capita income increase of nearly 15 per cent. On the other hand West Bengal where the increase in income was to the extent of 32 per cent, recorded the per capita income which was less than half i.e. 14.7 per cent. In Assam 18 per cent increase in total incomes resulted in a mere 3 per cent increase in per capita income. Punjab recorded the growth in per capita income at 26.4 per cent though the growth in total incomes was as high as 42 per cent during the Second Plan period. The fact nevertheless remains that a wide difference between the 'prosperous' and the 'poor' States is still there and there was no likelihood of its reduction in the near future.

In terms of zones it might be observed that Northern Zone (Punjab, Rajasthan, Delhi and Himachal Pradesh) and Western Zone (Gujarat and Maharashtra) were the richest at the beginning of the Plan. During the 15 years of three Plans Northern Zone would have improved its position in terms of real incomes by 126 per cent and in per capita terms by nearly 57 per cent. The Western Zone also would have improved its position by 97 per cent in terms of incomes and 42 per cent in terms of per capita incomes. The other regions started with lower incomes as well as lower per capita incomes and they have recorded lower improvements. The only conclusion that could be drawn from this study was that fifteen years of planning was going to make 'rich' regions 'richer'. This did not mean that the 'poor' regions had become 'poorer'. It was only a bigger contrast: all the world resides in a world of relativity.

REGIONAL INCOME: 1955 - 56 — 1965 - 66

(At 1955-56 prices)

Profits

THE expressions "profit" and the "profit motive" are in disfavour with protagonists of the socialist pattern of society. "The Eastern Economist" suggests that the readers who hold an "anti-profit" viewpoint may read carefully the Special Article in "The Eastern Economist" published on pages 745-46 in the issue of March 23, 1962 wherein Mr. Daya Krishna explained that "it would be well to distinguish between profit and the maximization of profit. Profit is a much maligned term in the socialist and marxist critique of capitalism. But everybody who inveighs against this seems to forget that it is only another name for the successful running of an enterprise. If there is no profit, there is not even the possibility of the development of the economy and if a concern is running at a loss, it obviously cannot run for long". The enlightened people are veering around to the view that not only the private enterprises but also the public enterprises must earn profits because the expansion of the economy cannot be hastened without ploughing back profits. The Third Five-Year Plan takes a happy note of this new trend in thinking and has advocated the ploughing back of Rs. 450 crores from the surpluses — net profits plus depreciation reserves — to be obtained from the state enterprises. Unluckily, the overall picture of the public sector undertakings in terms of yield on capital employed is far from encouraging. Figures given in the Explanatory Memorandum on the Budget of the Central Government for 1962-63 (pages 197-200) show that the capital invested in the public sector enterprises upto 1961-62 was Rs. 709 crores while profit accruing to these enterprises was not more than Rs. 1.63 crores in 1961-62. This works out to not more than 0.3 per cent on the capital employed.

"The Eastern Economist" has no desire to run down these public sector enterprises simply because they have failed to show good working results during the short period for which they had been in operation. The gestation period for these enterprises has got rather prolonged but there is no doubt that after a couple of years, the giants in the public sector will also start running at a profit. All business ventures, whether in the public sector or the private sector, cannot help facing the teething troubles. Hindustan Steel has absorbed the largest share of the public sector investments and has not risen as yet to full capacity in production and that factor alone has been responsible for pulling down the performance of all the public sector enterprises jointly. If, however, some individual cases such as those of Hindustan Cables and Hindustan Machine Tools are studied it will be found that they are being run as efficiently as any private sector enterprise. This points to the growing awareness amongst the managers of these public sector units that they also are answerable to the nation for their activities and they should not use the resources of the nation in an unprofitable way.

The Reserve Bank of India has analysed from time to time the Balance Sheets of 1001 selected public limited companies which cover the bulk of the private sector enterprises. The results of these companies for the period 1955 to 1959 show that profits in the private sector have been uneven with a very bad experience in 1957. The drop in profits in 1957 was mainly due to the downturn in the performance of cotton textiles. The profits before tax, which were of the order of Rs. 118 crores in 1955 rose to Rs. 131 crores in 1956 but again fell to Rs. 108 crores in 1957. Since then they have been steadily improving and in 1959 they were at an all time peak at Rs. 161 crores. This resulted in raising the volume of profits distribution and profits retained. Whereas retained profits were of the order of only Rs. 14 crores in 1957 they rose to about Rs. 38 crores in 1959.

Profits after tax as a percentage of net worth ruled around 8.4 per cent on the average. In 1959, the average rate was a little higher at 10.5 per cent though the mineral and vegetable oil companies stood in the top group with profits at more than 15 per cent. Coal has consistently exhibited a poor yield at 6 to 7 per cent.

The development rebate and the tax-holiday provided to the new enterprises, are sufficient incentives for attracting private capital from abroad. There is, however, a long standing complaint from the business community that the depreciation allowed under the present rules is not sufficient to replace plant and equipment in case of complete breakdown. Depreciation should be allowed not on the depreciated capital cost of plant and machinery as indicated in the balance sheet but on the replacement value.

‡Figures for 1958 and 1959 are not strictly comparable with those for the earlier years owing to the changes in the system of company taxation introduced by the Finance Act, 1959.

The Pattern of Wages

SINCE the dawn of independence labour has been having a fair deal. And today there is hardly any section of the labour left which is not touched upon by labour legislation. Minimum wages, retrenchment benefits during lay off, provident fund, gratuity, employees insurance etc., in fact all these now form a regular feature of Government's labour policy. Wages are being governed by the Wage Boards which have been set up and are being set up for various industries. Mention may be made of the Wage Boards pertaining to the textile, jute, tea, coffee, rubber and iron and steel industries. The awards of these boards have gone a long way in giving a further boost to the rise in wages. By way of instance it may just be mentioned that in the textile industry, the Wage Board recommended an increase at the average rate of Rs. 8 per month to all workers in mills of category I from 1st January, 1960 and a further flat increase of Rs. 2 per worker from 1st January, 1962. Likewise, an increase at the average rate of Rs. 6 per month per worker was recommended to all the workers in mills of category II per month per worker from 1st January, 1962. Dearness allowance is to be linked with the cost of living index in all centres and if any centre has no such cost of living index, the index of the nearest centre is to be taken for that purpose. In fact linking wages with the cost of living index is taking quite a wide turn. Position being such, the question of real wages falling in industries where the above said formula is applicable does not arise. Even in industries where it does not apply, real wages have been rising either as a result of bipartite agreements or through the awards of industrial tribunals and courts. On the whole, real wages of a worker have risen by 27 per cent over the period 1947—1958. It may also be taken note of that there has been a sharp increase during the same period in non-wage benefits available to industrial labour. While the ratio of non-wage benefits to average earnings in percentage terms was only 1.6 in 1949, it was 6.0 in 1958.

Here it is relevant to ask whether the earnings of the industrial labour have kept pace with the increase in productivity. A careful analysis in the post-independence era would reveal that in many industries like jute textiles, matches, paints and varnishes, sugar, soap and ceramics, real earnings have outstripped the increase in productivity and in industries like distilleries and breweries, electric lamps, electric fans and cotton textile, real earnings have closely followed the increase in productivity. It is only in a few industries that real earnings have lagged behind productivity. Industries where the increase in real earnings has closely followed the increase in productivity accounts for 40 per cent of the organized labour, while the industries where real earnings have outstripped productivity account for 24.5 per cent of the organized labour. So far as money earnings are concerned, they have risen by 70 per cent during the period 1947 to 1958, whereas productivity has only increased by 50 per cent.

In this context it needs to be underlined that increase in productivity is not solely due to the efforts of labour, but also to efficient management, mechanisation and improved methods of production. Therefore, for the labour to claim the entire increase for themselves is totally untenable. If real wages have lagged behind productivity in certain industries, the fault is not that of the industry, but must be assigned to the government that has not been able to evolve a stable price policy so far. Table below pertaining to the trends in productivity and real earnings of labour in some of the major industries in India is self-explanatory.

THE TREND IN PRODUCTIVITY AND REAL EARNINGS OF LABOUR IN SOME MAJOR INDUSTRIES IN INDIA (1953 = 100)

	1947		1958		Percentage increase (+) or decrease (—) in 1958 over 1947	
	Index of Productivity	Index of real earnings	Index of Productivity	Index of real earnings	Productivity	Real Earnings
Jute Textiles ..	121.1	69.9	123.4	86.3	+1.8	+23.4
Matches	98.3	73.2	107.5	90.6	+9.3	+23.7
Paints and varnishes ..	105.4	74.4	152.4	121.7	+44.6	+63.6
Sugar	186.8	92.1	159.9	120.5	—14.4	+30.8
Soap	76.8	55.4	158.6	116.2	+105.7	+109.8
Ceramics	67.3	60.0	104.7	110.5	+55.6	+84.2
Distilleries and breweries	92.4	69.3	148.8	109.2	+61.0	+57.6
Electric lamps ..	72.5	66.6	122.6	107.3	+69.1	+61.1
Electric fans	66.7	64.9	142.6	114.3	+113.7	+75.9
Cotton Textiles ..	82.8	82.0	107.9	98.2	+30.3	+19.7

Note: The figures have been adjusted to 1953 prices. **Source:** Census of Indian Manufactures, 1958.

On the face of it, it would be erroneous to call that labour in the organised industry is worst off although many vested interests may claim it to be so. The organised labour engaged in manufacturing industries, mining and constructional activities constitutes only 5 per cent of the total labour force. An overwhelming proportion is in agriculture and the tertiary sector, and it is this section which is the worst off. Will it not be accentuating the already big disparities if wages of industrial labour are given increase after increase? The greatest argument that stands at the moment against rise in wages is that it would inflate further the industrial costs and thereby dim the chances of India's products in the foreign markets. It may be true that labour costs compared with the more developed countries are low, but when non-wage benefits are also included, they certainly become quite high. Industry on its part is justified in demanding that money wages should not rise faster than average increase in productivity. But the worker does not seem to be satisfied and continues to demand higher wages.

The position hence is of two extremes. To find a solution in this sphere is now the major worry. 'The Eastern Economist' is of the opinion that when every section of society is prepared to make sacrifices to fulfil the targets of the Third Five-Year Plan, there is no reason why labour also should not be prepared to do the same. But if it be must that an increase in wages be granted where it is reasonable, it should only be in the form of government bonds. This would be good not only for the economy as a whole but for the workers as well. This would help in putting an end to the wage-price inflation. At the same time there must also be an increased production of consumer goods for that would only offset the inflationary effects of the increased money supply.

THE BANK OF BARODA, LIMITED

(Registered Office: Mandvi, Baroda)

Directors' Report

The Directors have pleasure in submitting this Fifty-Third Annual Report together with the Audited Statement of Accounts for the year ended 31st December, 1961.

	This Year Rupees	Previous Year Rupees
The net profit for the year 1961, after providing for taxes, including Rs. 1,09,357.81 brought forward and after taking Rs. 8,80,143.87 towards depreciation on buildings and furniture amounts to	68 72,553.37	41,68 551 98
An ad-interim dividend at the rate of 14% per annum, subject to deduction of income-tax at the appropriate rates was paid for the half-year ended 30th June, 1961, which absorbed ..	10,50,000.00	8,75,000.00
Amount transferred to Reserve Fund	20,00,000.00	Nil
Provision for Bonus to Staff	20,20,000.00	17,10,000.00
	50,70,000.00	25,85,000.00
The Directors now recommend:-		
(a) payment of a final dividend at the rate of 20% per annum per equity share (i.e., Rs. 5 per share) subject to deduction of tax at the appropriate rates for the half-year ended 31st December, 1961, making in all 17% per annum for the year amounting to	15,00,000.00	14,74,194.17
(b) and carry forward to the next year's account of the balance amounting to	3,02,553.37	1,09,357.81
	68,72,553.37	41,68,551.98

2. The business of the Bank during the year under review continued to be satisfactory.

3. Under the Scheme of Amalgamation sanctioned by the Government of India, the New Citizen Bank of India Ltd. was amalgamated with our Bank with effect from 29th April, 1961. As a result, after due examination and valuation, our Bank took over the readily realisable assets of the New Citizen Bank of India Ltd., of the value of Rs. 1,69,19,139.11 nP. including immoveable properties situated at Palton Road, Crawford Market, Bombay, and at Kalyan (non-banking asset). As laid down in the Scheme, after providing in full for its outside liabilities, every depositor of that Bank was, in the first place given credit to the extent of Rs. 250 or the balance in the account whichever was less; and in the next place to those whose balances were above Rs. 250, the pro rata share calculated at Rs. 0.66 nP. in a rupee in respect of the balance of his account as diminished after the credit of Rs. 250 was given. The Board wishes to record its appreciation of the co-operation and assistance received from the Reserve Bank of India in connection with the amalgamation.

4. As a result of the amalgamation of the former New Citizen Bank of India Ltd., all its 44 offices started functioning as our branches. Of these, the branches at Bruce Street (Bombay), Jalgaon (Mahaji Bazar) and Nampur were closed down as they were found to be unremunerative.

5. Because of their nearness to each other, the Bank's branches in Calcutta at Pageyputty and Cross Street were amalgamated and shifted to new commodious premises at Mahatma Gandhi Road, Calcutta.

6. During the period under review, the Bank put up its own building in East Africa at Kampala (Uganda) at a cost of about Rs. 18,24,000 to house its branch office and a safe deposit vault. This is in addition to the Bank's own building at Nairobi (Kenya) which was put up earlier. The Bank has also started a mobile banking service under the control of its Kisumu (Kenya) branch for the benefit of six surrounding villages.

7. The Bank has applied for and has been granted an exemption from audit under Section 228 of the Companies Act, 1956, in respect of 104 branches in India for the year 1961 and the exemption orders in this regard will be read out to you hereafter. This number includes 13 branches audited by Chartered Accountants in the employ of the Bank who were entrusted with the audit work in consultation with the Bank's Statutory Auditors. The remaining branches in India have been either audited by the Bank's Statutory Auditors or by firms of Chartered Accountants entrusted with the audit in consultation with the Statutory Auditors. All the Bank's branches outside India have been audited by the Chartered Accountants who have been competent to act as Company Auditors under the Acts of the respective countries and who have been approved by the Bank's Statutory Auditors.

8. The Bank has opened branches during the year at Chandigarh, Indore (Siyagunj), Jullundur, Ahmedabad (Ellis Bridge), Bombay (Bandra), Calcutta (Bhowanipore), Delhi (Sadar Bazar), Baroda (Industrial Estate) and at Suva in Fiji Islands. A temporary branch was also opened on the grounds of the Indian Industries Fair held in New Delhi in November, 1961. Branches at Godhra, Dehgam and Bareilly will be opened shortly.

9. Shri Tulsidas Kilachand, the Chairman, was out of India for over three months from 16th May, 1961. In accordance with the Article 151 (1) of the Articles of Association, the Board had appointed Shri Ramdas Kilachand as an Alternate Director in place of Shri Tulsidas Kilachand. The Board appreciated and placed on record the valuable services rendered by Shri Ramdas Kilachand during the period in which he acted as an Alternate Director.

10. In accordance with Article 145, four Directors, Shri Tulsidas Kilachand, Lt. Col. H. H. The Maharaja Fatehsinh Gaekwad of Baroda, Shri K. P. Goenka, Shri Narsing Dass Bangur retire by rotation and being eligible, offer themselves for re-election.

11. Shareholders are requested to appoint Auditors to hold office from the conclusion of this Meeting until the conclusion of the next Annual General Meeting and to fix their remuneration.

For and on behalf of the Board,
LSIDAS KILACHAND Chairman

Bombay, 8th February, 1962.

Report of the Auditors to the Shareholders

We have audited the foregoing Balance Sheet of The BANK OF BARODA LTD., as at 31st December, 1961, and also the foregoing Profit and Loss Account of the Bank for the year ended upon that date, in which are incorporated the returns from 25 Branches audited by us, 25 Branches audited by Branch Auditors and unaudited returns from 104 Branches for which exemption from the provisions of Section 228 of Companies Act, 1956 has been obtained from the Central Government under Rule 4 clauses (a) and (b) of the Companies (Branch Audit Exemption) Rules, 1961.

We report that :

(a) We have obtained all the information and explanations which to the best of our knowledge and belief, were necessary for the purpose of our audit and have found them to be satisfactory;

(b) the transactions of the Bank which have come to our notice have been within the powers of the Bank;

(c) in our opinion, proper books of account as required by law have been kept by the Bank, so far as appears from our examination of those books and proper returns adequate for the purpose of our audit have been received from the Branches of the Bank not visited by us ;

(d) the Bank's Balance Sheet and Profit and Loss Account dealt with by this report are in agreement with the books of account and the returns ;

(e) the reports on the accounts of the Branches audited by Branch Auditors have been forwarded to us and the same have been considered by us in preparing our report ;

(f) in our opinion and to the best of our information and according to the explanations given to us, the said accounts, together with the notes thereon, give the information required by the Companies Act, 1956, in the manner so required for banking companies and on such basis the said Balance Sheet gives a true and fair view of the state of the affairs of the Bank as at 31st December, 1961, and, the Profit and Loss Account gives a true and fair view of the profit for the year ended upon that date.

UNITED BANK OF INDIA LTD.

Excerpts from the Speech delivered by Dr. N. N. Law, Chairman, United Bank of India Limited, at the Annual General Meeting of the share-holders of the Bank held on March 26, 1962.

BANK'S WORKING

"The results for the year 1961 speak for themselves. Deposits have grown by 13.8 per cent over the last year and compares favourably with the rise of 5.2 per cent for all scheduled banks and 10.7 per cent for scheduled banks excluding the State Bank of India. The rise has been well distributed throughout the year, enabling the Bank to add to its Investments port-folio and to meet the significant demand for advances without strain. In addition, as in the previous years, your Bank remained a free lender in the Call Money Market in Calcutta, almost throughout the year.

"The average ratio of advances to deposits was 68.6 per cent as against 65.9 per cent in 1960. Of the total advances 62 per cent was to industries and 28 per cent to Trade and Commerce; the comparative figures for 1960 were 66 per cent and 26 per cent re-pectively. Our advances to industries include those to the small scale industrial units, aggregating about Rs. 2 crores. You would recall that in 1960 I informed you about our decision to establish a special section for handling such proposals from small scale units as could not be entertained in the normal course by our Advances Department. I am glad to mention here that the section has since been organised and is doing good work in assisting such of the small scale industrial units as need special attention.

"You have, no doubt, been pleased to note the change in the Bank's dividend trend, made possible by the results of our past years' working. It is recognised that you had to wait for ten years before the turn could take place. But, I hope, you will appreciate that a period of ten years is rather short even in the life of an altogether new bank. This is more so in the matter of consolidating the amalgamation of rather old banks. Amongst various factors, the weight of large overheads, with all its complications, hung on us as a dead load. It was only through extraordinary efforts that the position could be stabilised, and the Bank is thankful to its patrons for enabling it to make these efforts, which, I am happy to say, have further strengthened the Bank's position.

RATE OF INTEREST ON DEPOSITS

"In the general sphere of banking business the obsession of banks with rate of interest on deposits has already raised complications. Higher rates are now being offered on deposits which more rightly should be classified as 'demand'. Facilities for withdrawal on demand (or at a very short notice) and a high rate of interest go ill together. There is an urgent need that the nomenclatures of different categories of deposits should be precise and adhered to.

"The unrealistic emphasis on rate of interest has brought about a situation in which the Inter-Bank Agreement, on the rate of interest on deposits, recently came under severe strain; some of the banks considered it to be inequitable for them to be bracketed with larger banks as far as the rate of interest is concerned. Fortunately, however, I am told, the impasse is now over and a settlement has been reached. What, however, is most important to remember in this connection, is that as long as the banks continue to over-emphasise the importance of the rate of interest, such situations are bound to occur now and again. It is time that we realised the danger of trying to perpetuate such an unrealistic approach towards developing deposits.

"There may be stray individual cases where growth of deposits might have followed a rise in interest rate but if the position is thoroughly analysed, it will, I am sure, be found that such growth has been by way of diversion from other banks rather than by attracting fresh deposits from outside the banking system. When every bank is in a position to compete with another, such gain for an individual bank will ultimately be found to be of only a temporary nature. In such a scramble, however, the net result is that an avoidable additional load is added to the already high operating costs of banks, with no corresponding benefit either to the banks themselves or to the economy at large. I would, therefore, urge on the experienced bankers of the country to give this matter a closer thought.

"Interest rate has only a limited significance in the overall growth of deposits in the banking system as a whole. More important are the quality and efficiency of service and availability of banking facilities. Bank deposit is not to be equated with investment. There is hardly any real outside competition for deposit money.

DEPOSIT INSURANCE

"During the past year, banking authorities have taken two very significant steps in the field of banking. A scheme for insuring bank deposits has been initiated and steps have been taken to strengthen the capital base of banks. Both these measures give us satisfaction inasmuch as the ideas were categorically sponsored and supported by us. I dealt at some length with Deposit Insurance in the past, and, you will recall, last year I also emphasised the need for strengthening the capital base of banks. The measures, however, have significant limitations calling for further study.

"When the Deposit Insurance Bill was introduced in Parliament, statements sponsorisg the bill seem to have visualised a scope much wider than what would actually result from the implementation of the Act. While the interest of the depositors has been safeguarded, no scheme appears to have been devised to ensure that the small banks in the country can develop and continue to render uninterrupted service. This is very important. Bank borrowers are engaged in genuine production of wealth in one form or another and create employment. It is thus essential in the interest of the economy that the business of these borrowers is not hampered on account of any strain that may be felt by their banks. Unless the smaller banks can be assisted to develop and to work effectively even in the days of strain, the economy will continue to suffer from uncertainty with which the borrowers of these banks will be faced.

CAPITAL STRUCTURE

"Coming to the convention that has been established with regard to the capital base of banks in relation to their individual deposits, I welcome the stand taken by the Reserve Bank in this matter. A target has been indicated and a minimum accretion to owned funds has been ensured. I, however, feel that the scheme has been rather inadequate, not to speak of its being self-sufficient.

LIQUIDITY

"Linked with the subject of capital structure of the banks is the question of liquidity. I raise the issue, as I did also last year, not so much to emphasise the formal liquidity as to draw attention to the need for an overall liquidity in the banking system, as well as the liquid character of the bank's assets. The need for maintaining a reasonable liquidity becomes particularly important in a developing economy, which inheres various contingencies, that cannot always be forecast with certainty.

"If the required liquidity has to be preserved, — his applies both to the individual banks and to the anking system as a whole, — it is necessary that the ncome differential of banks must go up without unduly naking bank money dearer to the producers of goods nd services. While maintaining a reasonab y liqu d osition the need for using the cushion available may rise either in consequence of depreciation of assets, viz: investments and advances, or owing to occasional sharp rises in banks' operating costs or as a result of changes in the Bank Rate. Further, banks are now required to explore in uncharted fields and are bound to be faced with higher overheads — all these, again, point to the need for raising the ability of banks to add to their internal strength.

BONDS MARKET

"Since the state of liquidity in the banks' assets, to a large measure, is dependent upon the state of the Bonds Market and the pattern of financial management in the corporate sector, a treatment of these two aspects is relevant at this stage. The market for Government Bonds still continues to be rather limited. On many occasions we have raised this point and a detailed discussion was made in our Banking Plan. We consider it necessary to formulate a scheme, under which banks could work as distributors of Government Bonds. As long as subscription to the Government Bonds by the public reduces bank deposits, the banks cannot be expected to take initiative in dispersing the loans far and wide. On the other hand, the object can be achieved by making specified commercial banks, (and such of the Co-operative banks as are not sustained by Treasury loans), the exclusive bankers to the Union and State Governments, with an arrangement that collection by way of sale of Bonds or of tax money through them will remain in deposit with the concerned banks.

CORPORATE FINANCING

"Shiftability, or extinguishment in due course, of a bank credit will depend on the overall effective liquidity in the economy. Such overall liquidity, again, is dependent, amongst others, on the cap tal base of the corporate enterprises and their profitab'e functioning. The capital base of these corporations thus need be adequately broadened.

"Last year I drew your attention to what was said by the Chairman of the ICICI and the then Governor of the Reserve Bank about the propensity to depend too much on borrowed capital right from the beginning of an industrial venture. Such an approach is fraught with grave dangers. Firstly, despite all plans and programmes many contingencies do remain unobserved when a project is launched. The capital base should be adequate to take care of such contingencies, as and when they occur, so that the technological and operational expectations can smoothly be fulfilled. Too much dependence on borrowed capital, at this stage, may put the entire project out of gear. In such a state the lender also gets involved and is put to severe strain.

"Secondly, in order to ensure profitable functioning, the industry must be able to modify or expand the project even at an early stage. Also, in view of the quick technological progress being achieved in different parts of the world, every industry must be prepared to be able to modernise their capital equipments at short intervals. With an adequate initial capital base, it should not be difficult for an industrial undertaking to seek credit facility at these stages of expansion or modernisation. But here also the approach should be to obtain credit as a bridge-over to serve the intermediate stage only, before further capital is raised from the market.

TERM FINANCING

"This brings me to the question of term lending by banks. It is a matter of satisfaction that the age old abhorrence to mixed banking is fast diminishing and that the banks are making a beginning in the matter of advancing loans to industries on 'term' basis. But in view of the present state of corporate financing, which I have just now discussed, I think a word of caution is necessary.

"A progressive outlook is required and is welcome. At the same time, it is also necessary that the limit is noted and the danger of overstepping the same is realised. I consider that in allowing term loans, the commercial banks must, first of all, satisfy themselves that the concerned industrial unit has an adequate capital base. Secondly, they must not try to provide more than medium term finance. It must be recognised that the longer term financing agencies and the Issue (or Investment) Houses must ultimately undertake to bear the long term risks. The basically short term agencies can come into the field only for tiding over the period of transition.

ASSOCIATION ACTIVITY

"I have always held the view that it is only through co-ordinated and concerted efforts on right lines that the banks can fulfil their obligations towards development of the economy. On the threshold of the Third Plan and with the complex problems before us, I consider that the need for such actions has never been more urgently felt as now. We are in need of a strong and progressive Banks' Association. Such an association is necessary both for a co-ordinated action on the part of the banks, and for generating and guiding a healthy competition amongst themselves. I, therefore, urge that the existing Association should consider formation of a strong Central Federation with residuary authority remaining with the local and sectional organisations of banks."

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Chairman's Speech

THE ALKALI & CHEMICAL CORPORATION OF INDIA LTD.

A YEAR OF ACHIEVEMENT

The Problem of Exports

Speech delivered by the Chairman, Mr. A. R. Foster, at the 25th Annual General Meeting held at Calcutta on Thursday the 22nd March, 1962.

Ladies and Gentlemen,

The audited accounts and Directors' Report have been in your hands for some time and with your permission I shall take them as read.

An examination of the accounts will show that the year just passed has been a record one for the Company. Compared to the previous year, there has been a further substantial improvement in turnover and profits, with important contributions from polythene and paints.

PRODUCTION

You may recall that in the previous year the polythene plant achieved a production of 4,000 tons against the designed capacity of 3,500 tons. The performance of the plant in the year under review was even better and a total of about 4,700 tons was produced, the increase being due largely to enthusiasm on the part of the technical staff at the plant and continued application of work study methods. Paints production also continued to rise, and would have been even higher, were not production hampered by a shortage of raw materials, which was aggravated by a reduction of import quotas. To overcome the problem, we are increasing our efforts to obtain raw materials from indigenous and rupee sources; whilst a measure of success has been achieved, supply difficulties still hamper production from time to time.

The other plants at Rishra have also contributed their share to the Company's prosperity and a reference to their performance has been made in the Directors' Report.

SALES

Our sales over the year have reached the record figure of Rs 6.6 crores as against Rs 5.4 crores in the previous year. This substantial increase in the volume of our sales would not have been possible without the strenuous efforts of our Selling Agents, Imperial Chemical Industries (India) Private Limited, and the technical services provided by them, and I wish to record our appreciation of their splendid achievement.

Wherever possible, although the cost of wages and raw materials has risen appreciably, we have reduced our prices in order to pass on the benefits flowing from the increased scale of manufacture to customers. As an example, we reduced the selling price of polythene three times in 1961, making a total of five reductions since the plant started production in 1959.

Our returns on caustic soda and chlorine, however, continue to be low, partly due to the price ceiling imposed by the Government and partly on account of the rise in the cost of salt, coal and power.

During the year, excise duties were levied for the first time on polythene and caustic soda and existing excise duties on most of our paint lines were increased. The excise bill for the year shows a rise of nearly 30 lacs over the previous year. It has not been possible for the Company to absorb all of this substantial increase in manufacturing expenses and a part has had to be passed on to customers.

EXPORTS

During the year goods worths several lacs of rupees were exported to neighbouring countries. This is a gleaming and we are hopeful of improving our exports performance. We are fully alive to the magnitude of the country's foreign exchange problem and of the urgent need for greater exports. It is your Company's intention to do its best to help in Government's export drive. I must point out, however, that the capacity of the relatively young and small chemical industry in this country to play a major part in exports is limited. The chemical industry is essentially one in which large units are needed to achieve low priced production. Our industry is developing well, but its units are still small by world standards, and we are a long way short of the size necessary to enable us to compete in world markets.

India must indeed increase her exports, and it is encouraging that Government are considering experimenting with various methods of providing incentives. But we must not overlook that other countries are doing likewise, and there is a danger of a race beginning as to who can provide the best incentives. Long term, I an convinced that it is in India's best interests to concentrate on increasing her exports of those products for which she has natural advantages, and these are the traditional ones supplemented to an increasing extent by iron ore, steel etc. These are the industries where the biggest expansion of exports can be expected, and they must be given every encouragement to operate at maximum efficiency and productivity.

MAJOR EXPANSION PLANS

As you will have seen from the Accounts our profit before tax has increased by Rs. 12 lacs to Rs. 141 lacs. Tax on the current year's profit is Rs. 52.5 lacs, a considerable increase over last year's figures because in that year the Company enjoyed substantial tax relief in respect of the Development Rebate allowances relating to the polythene plant.

The amount available for appropriation is Rs. 90 lacs and in the light of these satisfactory results, your Board considers it is justified in recommending that the Dividend on the Ordinary Shares be increased to Rs. 1.50 per share.

In its efforts to maintain a progressive but consistent Dividend policy, the Board has allocated Rs. 26.5 lacs to Dividend Equalisation Reserve, bringing the total on that Account to Rs. 46.5 lacs. I am sure you will agree that it is essential to safeguard in this manner the maintenance of your future Dividends.

Rs. 14 lacs has been transferred to General Reserve. This is a further provision towards retaining in the business funds with which to assist in financing the projected expansion programme of the Company, with which I shall now deal.

MAJOR EXPANSION PLANS

With the increasing demands for our products both in the industrial and consumer fields, we have been giving close attention to the question of securing a fair share of the growing markets by expanding output from existing units and establishing new ones.

Construction on the site for the Rubber Chemicals Project is proceeding at a satisfactory rate and it is expected that the plant will go into production within the next 12 months.

The Company's Paints Plant has for some time been operating at high capacity and an application is now pending with the Government for permission to expand capacity. In view of Government's desire that expansion be achieved without sterling finances, we are investigating the possibility of obtaining raw materials and machinery from rupee sources and of getting more plant fabricated in India.

Construction work in connection with the Intermediate Density Polythene Plant, which it is proposed to set up at Rishra to increase production of polythene has been held up due to delay in obtaining the Capital Goods Licence from the Government. I am glad to say this licence has now been received so that arrangements for design and procurement of plant can now proceed.

In all these projects and expansions, we are grateful for the encouragement and technical assistance provided by our associates in the U.K., Imperial Chemical Industries Limited.

STAFF AND WORKERS

In view of the rapid progress in technology in other developed countries, it is necessary that our technicians are up-to-date in their knowledge of skills and standards elsewhere. To achieve this, selected members of our staff have been sent overseas for training with our associated companies in the United Kingdom and Australia, whose help to us in this respect has been most valuable.

Throughout the year your Board's efforts were directed towards improving communication and consultation with our employees in order to maintain our good relations with them, and there now appears to be a greater awareness and appreciation amongst increasing numbers of our workmen that their prosperity is intimately tied up with that of the Company and that to achieve this, effective and willing co-operation is indispensable.

Following the expiry of the last long-term agreement we were able to reach, shortly after the end of the year under review, a 5-year Agreement with the recognised Employees' Union in conciliation proceedings before the Labour Commissioner, West Bengal. This is the first time that a 5-year Agreement has been reached in the area and your Board hopes that this will usher in an atmosphere of mutual confidence and understanding, which are so essential for the healthy growth of the Company.

We are supporting the Workers' Education Scheme organised by the Government of India and our workers have for some time past been receiving training under this Scheme.

We have also continued to promote the recreational activities of our workmen and to provide them with amenities for their welfare.

DIRECTORS

Before turning to the business on the agenda, I must refer to the sad death last year of Mr. J. M. Lall, the late Chairman of the Company. Mr. Lall had presided over the affairs of the Company for only 3 years, but in that short time he made his presence felt and played a commanding part in all the activities of the Company. With his untimely death, the Company, and indeed, the country sustained a very great loss.

Another loss suffered by the Company was in the death last November of Sir B. P. Singh Roy, who had been a Director since 1949. His guidance and wise counsel will be sorely missed by his colleagues on the Board.

Mr. F. G. Lamont, who retires by rotation at this meeting, is not seeking re-appointment. Throughout the period of five years that he has been a Director of the Company, his advice and assistance, particularly on technical matters, has been of very great value to his colleagues on the Board, and it is my pleasant duty to record our thanks for all that he has done.

Mr. C. E. J. Crawford resigned last year from the Board after having served as a Director for nearly 15 years, and I would like to express the Board's appreciation of the valuable services he rendered during that period.

Mr. B. R. Goodfellow and Dr. S. B. Cormack have also retired as Directors after many years on the Board and my colleagues and I wish to thank them for the great help they have given in dealing with the problems that have arisen over the years.

Mr. C. A. Pitts and Dr. E. C. Fairhead retire by rotation and their re-appointment is recommended.

AUDITORS

The Company's Auditors, Lovelock & Lewes, retire and have expressed their willingness to be re-appointed at the same remuneration as last year, namely, Rs. 16,000 plus out-of-pocket expenses.

SILVER JUBILEE

The Silver Jubilee of the Company's incorporation will take place on 8th December, 1962, and it is your Board's intention to celebrate the occasion in a fitting manner. It is interesting to recall that the Company commenced production on 4th April, 1940, when its Caustic Soda/Chlorine Plant went into operation, and our profit in the following year was just over Rs. 2 lacs.

We have come a long way since then and we look forward to the future with confidence and resolution.

And now, before I invite questions from you, I want to thank all of you who have found the time to be present here today.

Company Meetings

SEN-RALEIGH INDUSTRIES OF INDIA LTD.

CHAIRMAN'S REVIEW

The 12th Annual General Meeting of Sen-Raleigh Industries of India Ltd., was held in Calcutta on the 29th March, 1962. Below are extracts from the statement of Mr. Abhijit Sen, Chairman of the Company:

In the year under review the Company's overall sales increased by 11 per cent, but profits declined. Though bicycle sales dropped slightly owing to production bottle-necks, a greater production of components and accessories helped to realise the larger turnover. In the main, two factors affected bicycle production — a cut in import licence ceilings, and the failure of some indigenous manufacturers to meet commitments for supply of semi-finished components that could no longer be imported. The reduction in profit can be ascribed to:-

(a) The failure of individual indigenous suppliers to meet commitments, which resulted in a disbalance of stocks and in turn led to higher inventories with consequent higher financing charges,

(b) Poorer material utilisation, than had been anticipated, as, in many cases, as a result of changing import policies, materials had to be obtained from unknown and untested sources both within the country or abroad,

(c) High rectification costs where these non-standard materials had to be consumed,

(d) The higher cost of materials where indigenous or DLF buying from America replaced buying from usual sources in Europe,

(e) And lastly, the impact of unabsorbed overheads on a turnover, much smaller than planned.

Most of the factors which adversely affected our operating results in the past year were of a nature where solution was a matter of time and of adjustment to changing patterns of operation — as indeed our activities in the intervening period have tended to show. Indigenous supplies in general have improved remarkably both in respect of quality and in the honouring of commitments.

Import problems still remain a factor to contend with as the pace of development of ancillary and feeder industries has yet to catch up with the faster developing requirements of the consuming industries. The only predictable features of import policy would seem to be a reduction in ceilings from period to period and a change in sources from which the limited imports could take place, and all production planning now has to start from these premises.

Whilst we accept this situation as unavoidable, and have taken whatever steps are within our powers to meet it, there are two aspects of import licensing which we find it difficult to face with equanimity. The first is the fact that the bicycle industry appears to be the only one to have had cuts in import licence ceilings linked with export performance. We wonder why this industry should have been singled out for this distinction. The second is that in many cases the policy makers too readily agree to deletion of items from the import list even when indigenous manufacture is very much in the air, leading at a later stage to licensing policies having to be reversed, with its consequent delays, added paper work and very often production failures — when a more careful check on the progress of the industries could have made for smoother sailing all round.

A redeeming feature of the past few months has been the remarkable progress achieved by the steel producing industries and one can now safely assert that almost all categories of rolled or drawn steel required for the bicycle industry are being produced within the country. The bicycle industry is still however far from obtaining all its supplies of steels from local sources in such quantities as would allow utilisation of capacities to maximum advantage but the future of the bicycle industry appears to be more assured than in the immediate past.

The bicycle industry has now left the easy sellers market to enter an era of closer competition. Your Company has been lucky that there has been no slackening in demand for its products, and particularly in its major line — bicycles, it enjoys the reputation of marketing the fastest selling brands. In specific components, there is now a tapering off of sales which can be ascribed, in the main, to the unfortunate Government decision of allowing imports of friction parts in very large quantities for Small Scale assemblers.

A question that might arise in this context is why the Company should persist with a large production of components, when the same resources used for making more bicycles in preference to components would have fetched it better returns. The answer lies in the fact that releases of materials are very often earmarked for production of specific components, and so a smaller production of these would not necessarily lead to any increase in bicycle production. We have to accept the fact that in the larger interests of a planned economy operational decisions cannot always be taken on the basis of profitability alone.

A sanction has been received for a further issue of capital. The Company's future plans envisage expansion of bicycle and chain production, and diversification into the manufacture of Dynamo Lamps and House Service Meters. The successful implementation of these schemes depends largely on the availability of foreign exchange for import of plant through further foreign participation in the capital of the Company. Realising this, your Directors have been active in exploring the possibility of increased capital participation in the Company by Raleigh Industries Ltd.

At our invitation, a Raleigh Consultancy team visited our factories in November last — mainly for discussions on expansion schemes. Valuable contributions were made by it to our plans for the future. Raleigh have in the recent past developed new techniques and processes which would lead to more effective use of materials. As a result of the visit, it is proposed to incorporate a number of these new processes into our future scheme of operations.

For sometime, changes in the Company's methods of operation over the past few years had been highlighting the need for radical changes in the Company's organizational structure to improve efficiency and tighten controls. Very recently changes in the organizational set-up were introduced to meet these changing conditions and whilst it is too early yet to comment on the long-term benefits of this move, the working of the factories in the months following the change has certainly shown marked improvement.

If the operating results for the year have been disappointing to our shareholders, they have been disheartening for our staff and workers, whose sincere efforts have so often foundered on the rocks of frustration. I would close on a note of thanks to all staff and workers for the effort they have put in and the understanding they have extended to the Company in a year of difficult operations, and share with them the hope of better operations in the future.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

prefabricated tubular structures

All S & L Prefabricated Tubular Roofing structures are designed to the requirement of I.S. 806: 1957 code of practice for the use of steel tubes in general building constructions.

Entirely self-supporting S & L structures of the following spans and bay lengths are available ex-stock.

Type	Nom. Single Span	Bay Lengths
SLS/20	20 ft.	10 ft.
SLS/30	30 ft.	10 ft. and 13 ft. 4 in.
SLS/44	44 ft.	10 ft. 1 1/8 in. and 13 ft. 4 1/8 in.

THE EASTERN ECONOMIST

APRIL 6, 1962.

The Climate for Private Business

THE intervention of a Special Number, dealing with problems of political and economic stress and strain after the Elections, has prevented *The Eastern Economist* from expressing an opinion on the important meeting of the Federation of Indian Chambers of Commerce and Industry held on the 24th and 25th March. The meeting was particularly poignant as the President of the Federation, Mr. Karam Chand Thapar, was unable to attend owing to serious illness, and he expired shortly after the meeting was over. India has lost in Mr. Thapar a great exponent of self-help and of the power of single-mindedness to build great enterprises almost singly and against obstacles in ill health which would have certainly crushed a smaller man. It is likely that his great exertions in the year of office as President of the Federation hastened his untimely death. It is good, however, that there are examples of dedication of this kind, so as to remove the impression that the business world is not capable of looking at great national problems except in terms of its own small monetary interest. However mistaken some of the actions of particular businessmen might be, there is currently a desire to serve, as well as to benefit in the expansion of the national economy. It is necessary that the Indian public should recognize that dedication exists in the private sector of India just as it exists in the public sector. No one need claim that dedication is conterminous with either sector.

The Prime Minister was quick to catch the spirit of co-operation which informed the President's address and is increasingly informing the business community at this time. His address to the effect that, while the broad pattern of Indian economic policy would be what he has proclaimed, the concept of a mixed economy was a positive one and the private sector would not be unduly handicapped. This has done much to allev ate fears created of a possible swing to the Left following the return of the Congress in what, it seems, is likely to be the Prime Minister's last quinquennium of office. It is clear that nationalisation of private industry has no appeal to the Prime Minister as such. Great development will involve inevitably the public sector in important basic fields for which the private sector may not have adequate resources. In the belief that the emphasis was on co-operation and not competition, one might argue that it made a positive contribution to the understanding of the business community's positive role in Indian economic progress.

It is still true that the business community has to function under its own hard sanctions. It raises money not by taxation, but by offering inducements to investors and guarantees to financiers who lend resources. It is impossible, therefore, for business to be conducted without clear surpluses to finance the responsibilities which are written into private operations on the capital markets, both here and abroad. It was appropriate, therefore, that the Federation should deal, in an important resolution, with problems of pricing policy. Mr. Shanti Prasad Jain's exposition of the important part that must be played by the business community in recognising that, while the price line has to be held, the necessity is imperative for the private sector to service the capital which it employs deserves note. Both ends can be served if production is allowed to proceed up to full capacity and on a scale at which the law of increasing returns helps not merely to reduce prices but also to provision. One of the great difficulties of Indian industry is that, in some important basic fields, it is operating on too small a scale; the Tariff Commission's formula of a certain fixed percentage on the capital employed makes it impossible for adequate funds to be secured for a great expansion of Indian industry unless public funds are also heavily committed. There is a double danger in committing public funds to projects which should pay their way. In the first place, the funds are required elsewhere and a shortage, whether on loans or on tax account, will need to be redressed with consequences necessarily detrimental to the economy. Secondly, the more the private sector involves itself in public dependence, the less the theoretical justification for a system of free enterprise which justifies the rewards which managements and shareholders receive by way of capital appreciation and other benefits of successful operation. Price policy should be conceived to provide for efficient operation without public assistance. On the other hand, there should be no public hindrance in the form of price controls which are detrimental to production, and thereby to lower prices in the longer period. This resolution is well-conceived in terms of providing the essential inducements for production while, at the same time, recognising that those inducements must be contained within the political pressures to which both public and private sectors are necessarily subjected at this time.

One of the political pressures undoubtedly is the need as development proceeds for tax resources to be raised as required in the Plan. It would be physically, as well as politically, impossible for the Finance Minister in the Budget which is to be introduced this month to avoid some significant element of direct taxation. Indian business needs to recognise that if Government should succeed in transferring all tax measures on to the consumer in a notoriously regressive form of indirect taxation, it will merely be risking its long-period survival for a short-period gain. One of the most important elements to which reference has been made in the Special Number issued last week is this point that the private sector has now to operate in a political environment in which national policies must be reckoned as important as the pursuit of private profit. If there is no such balance between national income goals and private success, the chances of survival will be small when the political current becomes more restive.

It is difficult to be certain how restive the political current already is in respect of the present concentration of industry in the hands of the large managing agency houses. It is probable that the new Lok Sabha will be somewhat more radical than the last, and it is not unlikely that, as time advances, government itself will reflect a desire, by licensing and otherwise, to prevent the larger managing agency houses from growing at the expense of medium and small industries. The decision in the Small Industries Board this week to reserve certain chemical industries for the small-scale sector is in this respect an indication of the political current already in force. It is for the large-scale private sector to recognise that greater decentralisation of production and greater participation by small and medium industry is a necessary condition of the maintenance of the current pattern of harmonious economic development. There are good economic reasons for this

scale units. The more is the reason for large-scale managements not to impinge on the what is rightfully the province of medium and small entrepreneurs.

All in all, one might argue—as Mr. G. L. Mehta argued in his address to the Federation, which was reproduced in part in a Special Article last week—that the private sector in the Indian Union is on trial again for another period of five years. It is sincerely to be hoped that the political forces which have so often been ignored—because the stature of Jawaharlal Nehru has been great enough to induce indefinite patience—will not be overlooked. It is time for the business community to take a larger view of national policy and to provide a harmonious base inside itself for the distribution of the undoubted opportunities that the Third Plan provides.

Development Banks in Asia

IT was, indeed, a very happy thought on the part of the Industrial Credit and Investment Corporation of India to invite representatives of the Development Banks in other parts of Asia to the Regional Conference of such banks held in Bombay last week. Obviously, Mr. G. L. Mehta, who took the initiative in convening this Conference, was influenced by a similar conference which the International Bank for Reconstruction and Development had convened in Washington four years ago. Last week's Conference represented, therefore, a further step "in the process of facilitating mutual discussion of problems germane to Development Banks".

Considering the different environments in which Development Banks have to function, a separate Conference of Developmnt Banks in this region was particularly necessary. For, what Ambassador Galbraith of the U.S. told the Gujarat University in a different context, namely, that "we must now and promptly abandon the assumption that there is a single explanation with its fatal presumption that there is a single remedy" applies with equal force to the problems of Development Banks. The work of Development Banks, especially in the Asian region, must not get into a rut and there is always scope for revising procedures and policies, no less than for improving perspectives. It is only conferences such as the one held in Bombay last week that could provide an opportunity not only to have an exchange of views and form valuable contacts, but also to widen our horizon and make our own work more meaningful and significant.

Development Banks are of fairly recent growth, and it was not until the establishment of the Industrial Finance Corporation of India, followed by the establishment of its State counterparts, that we had anything resembling Development Banks in this country. But it was not until the advent of the I.C.I.C.I. in 1955 that we really began to have a Development Bank not only suited to the genius of this country, as it were, but also appropriate to the happily still current "Mixed Economy" concept of our Government. Indeed, in more ways—not only in some ways, as Mr. Mehta would have it—a Development Bank is an expression of a Mixed Economy. The I.C.I.C.I. Chief said: "It can combine—I would say it *must* combine—the best of both public and private sectors—a sense of service, an emphasis on public interest, along with initiative and enterprise: profitability harnessed to economic growth". In the nature of things, any institution claiming to perform such function or functions must be autonomous, free from Government interference as well as pressures of powerful private interests.

Since the common objective of all Development Banks is to foster healthy industrial development, it follows that the problems arising from the attempted implementation of this objective must also be common. But then there is also bound to be a great variety in regard to such common problems, depending upon the state of economic development, the availability of resources in material, men and money alike, and the technical know-how required at different levels. It was just proper, therefore, that the principal participants at the Conference dwelt on these points. They went further and dwelt quite at some length on some of the more important problems as well, such as the determination of viability of a given project, the terms on which finance should be made available to a project, and the conditions that ought to determine the profitability of operations of a Development Bank. The main interest of the Conference also seemed to lie in the discussion on identifying industries for development. The discussion on the technical appraisal of projects too was interesting.

As regards viability, Mr. Mehta was quite right in emphasising the point that "it is necessary to find this (viability) out not only from the narrow point of view of the security of the Bank's own investment, but also from the wider point of view of bringing about healthy economic development". Only the question of what "healthy economic development" is might present difficulties. Depending upon the ideals or ideology of the Government of a country at any given time, ideas on what constitutes "healthy economic development" also may differ. Even so, broadly speaking, there should be some common ground as to what "healthy economic development" means.

Be that as it may, in order to adjudge a project as viable, an appraisal of it is a necessary pre-condition. What kind of appraisal must it be? Technical appraisal of projects for rendering financial assistance figured prominently not only in the inaugural address of Mr. P. C. Bhattacharyya, but also in the discussion that followed. As though to give a start to the discussion, Mr. Bhattacharyya himself aired his views and said: "Appraisal of term loan applications has many facets: assessment of managerial competence, economic prospects of the borrower's products, technical feasibility of the project and financial appraisal. The relative weightage to be accorded to each of these elements is a matter for judgment of the lending institution. In a sense, financial appraisal is the most comprehensive of the lender's tasks. Generally, amongst under-developed countries, the tendency of Development Banks is to give greater emphasis to the types and values of security available for loans than to assessment of the earnings potential of a project".

One problem in regard to appraisal, thus, relates to the balance to be maintained between the development criterion, on the one hand, and the criterion of commercial profitability, on the other, in the selection of projects for receipt of financial assistance. This raises the vexed question of identification of projects for receiving financial assistance from among schemes which have been accorded priority. As industrialisation proceeds, this problem will come more to the fore.

On a unique characteristic of the Development Banks to which Mr. Mehta referred, one would have liked to know more from the participants, in particular, whether they endorse his view that "a Development Bank does not only provide finance, but also seeks to inculcate discipline in promoters and brings into being sound projects by insisting on standards." Although he described it as a bye-product of the operations of a Development Bank, it is very important, perhaps as important as the main product itself, if Development Banks, in a sense, ensure planning at the project level. What, one may ask, will happen if this planning at the project level by a Development Bank goes counter to the overall planning of the country concerned? The answer may be that the system of priorities followed by the Development Bank of a country will be—and cannot but be—within the framework of the overall planning of that country. The discussions, at any rate, would appear to have shown that the general trend was to accept that, in many countries, Government played an important role in laying down priorities and the Development Banks just conformed to these priorities.

Guest Editorial

A New Deal for Gold

By PAUL BAREAU, Editor, "The Statist"

IMPORTANT and fascinating initiatives have recently been taken by the leading central banks of the free world to stabilise the price of gold quoted in the free markets. These efforts go back to October 1960 and to the dollar crisis which then came to a head. That crisis caused the price of gold in the London market to rise to $40 per ounce or $5 above the parity. It was not immediately apparent to the American authorities that this was a grim danger signal. For a time they chose to regard the free gold market as a speculative bazaar fed only by hoarders and irresponsible operators. They were ultimately convinced, largely by good educational work put in by Bank of England representatives, that the London bullion market was the thermometer registering international confidence in currencies. They learned their lesson and, as a result of a co-operative effort between London and New York, the price of gold was brought down through heavy sales of the metal. The Bank of England was the seller but it did so as agent for the U.S. Treasury.

Soon after this, in March 1961, it was sterling, the other international reserve currency, which had to take the strain of another shift in international confidence. On this occasion, too, gold was involved but in a negative manner. The pressure on sterling was due to an enormous outflow of foreign money which left the London market. The immediate reason was the upvaluation of the German mark and the Dutch guilder which led to widspread expectations of a general readjustment in exchange values in which sterling would have been doomed to some devaluation. The pressure was met by arrangements between the principal European central banks which undertook to support one another's currencies by holding foreign currency balances acquired in repelling speculative attacks or abnormal movements of hot money. Gold entered into these operations because central banks agreed not to exercise their right to convert these balances into gold. These arrangements came massively to the rescue of sterling which at one time in June 1961 had received assistance from European central banks amounting to nearly £350 million. These debts have since been repaid largely out of the drawing which Britain made from the International Monetary Fund in July of last year.

Towards the end of 1961 pressure on sterling and the dollar began to build up again owing to the recognition that the two international reserve currencies were bearing responsibilities and accumulating the liabilities of large reserve balances owing to other countries in amounts disproportionate to the available gold reserves. The price of gold in the London market, which had fallen below $35.10, rose again to $35.21. In order to resist any further increase ten central banks, led by the U.S. Federal Reserve Bank, set up a pool of $250 million to intervene in the gold market. This was used to such good purpose that early in 1962 the dollar price of gold quoted in the London market had again fallen below $35.10 and was once more, therefore, safely within the margins of the normal gold points. During all these operations the central banks had undertaken not to buy gold in the free market, but to convert any currencies they might acquire through direct inter-central banking or inter-governmental transactions.

This pool operation proved so successful that it is being followed by another and more ambitious project. This is an attempt under official American auspices to stabilise the free market price of gold between the margins of $34.92 and $35.08. Ten countries have been invited to participate and although negotiations are still going on, it can be assumed that they will succeed. The intention is to constitute a collective pool, the exact amount of which is still undecided, but which will be operated in both directions, not only as a seller but also as a buyer of gold. In that respect it will differ from the pool that was worked towards the end of last year and was intended only to bring down the price of gold to the range of the gold points. That pool worked so satisfactorily that there are now fears that the free market price of gold would fall well below $35. If it did, considerable temptation would be placed on central banks to exchange into gold some of the gold or sterling which they now hold as part of their reserves. This could put pressure on the dollar and on sterling again, and it is to avoid this that the new project has been launched.

One further type of central banking operation involving gold should be mentioned. An interesting precedent was set recently by an agreement between the Federal Reserve Bank of New York and the Bank of France, by which the Bank of France account in New York was credited with $100 million and the New York Fed. account in Paris was credited with an equivalent amount of francs. This was pure creation of international reserves, conjured up out of nothing more substantial than an agreement between the two banks in question. It was a perfect illustration of the truth that in certain circumstances two multiplied by nought equals two. If this habit were to grow it could produce a solution of the world's international liquidity problem, which would relegate the role of gold to a secondary position.

These various examples of inter-central banking co-operation, past and prospective, are full of significance for the future of gold. In one respect they are reassuring. They show that gold is still regarded as the ultimate standard of value and means of international payment. It is still the touchstone by which the soundness of currencies is measured. The price of gold is the best indicator of the measure of confidence with which the future of currencies is regarded. Nonetheless, these collective measures by central banks also reflect the efforts that are being made to control and to some extent to neutralise gold as a judge and a recorder of economic behaviour, good and bad. These attempts will be watched with the keenest attention. What can be said of them as regards the immediately foreseeable future is that they put out of court any likelihood of an early increase in the price of gold.

A DELHI DIARY

THE THROES OF CABINET MAKING

AN absence from Delhi, and then a Special Number have kept me away from this column for two weeks. Almost throughout this time there has only been one subject in Delhi — Cabinet making! It is an extraordinary thing how everyone's interest concentrates on Cabinet making when it is pretty apparent that so little is gained by raising one's own house of cards. There have been literally hundreds of people bringing pressure of some kind or another on the Prime Minister of India, and I believe that the Prime Minister's indisposition cannot be entirely unrelated to the post-election strain that he has undergone. I see that everyone, from Mrs. Indira Gandhi to Dr. B. C. Roy, has put the main blame on the elections and, of course, as everyone knows, the Prime Minister in his whirlwind tour spared neither himself nor any of his colleagues. I have a private opinion that much of this whirlwindness was unnecessary, since the Prime Minister's physical presence is not really the maker of votes. His prestige and influence are so great that he could operate by a remote control in at least half the cases where he chose to be physically present. I think, however, anybody even if he had a constitution of steel — which the Prime Minister currently does not have — would have succumbed to the tremendous strain which people put while making claims on behalf of others and asking others to make claims on their behalf. It has been a truly humiliating experience to find how many people, whether in the new Parliament or outside it, have sought to influence a decision which should belong at this stage to the Prime Minister only. They talk about the loaves and fishes of office and I suppose, notwithstanding the high cost of living, a Minister's salary and perquisites are still much sought after. But everyone knows that the substance of power inside a Ministry is relatively small, partly because of the famous metaphor — wheels within wheels — and partly because of the Prime Minister's dominant position in the Central Cabinet. Cannot we have a convention that at the time of Cabinet making no Member of Parliament and, indeed, if possible, no one should speak to the Prime Minister of India or to the Chief Minister of a State on any individual claims? I think one consequence of this would be that the Prime Minister would be able to make a quick recovery after the elections, however strenuous they might be!

THE PRIME MINISTER

Next to Cabinet making much the most important subject for discussion has been the health of the Prime Minister. A week or ten days ago when he was without a temperature, it was still quite noticeable that he was under strain, and that his tiredness at times was something never seen before. It is absolutely true that so far as the doctors' reports are concerned, there is seemingly no cause for concern, though I do not like the word 'infection' undescribed. But there is, in fact, cause for the Prime Minister himself as well as the country to recognise that it cannot drive his physical frame in the next five years as it was driven in the last five years. This is in fact not surprising because almost nobody of any age should be driven as the Prime Minister has been driving himself. At the present time there are clear indications that nature is resisting the enormous burdens which he has taken for the last fifty years. An iron will and almost reckless disregard of minor ills, such as coughs and colds, have hitherto overcome all obstacles. Practically everyone in Delhi is now convinced that except in exceptional cases this cannot be done again.

Three prescriptions have been laid down, all of which I submit for universal consideration. Firstly, the Prime Minister must have a holiday at least twice a year. Secondly, he must have one day in the week off, except for very urgent and immediate work. Thirdly, and this is most important of all, he should gradually delegate authority in all the areas in which he remains in direct charge, namely External Affairs, Industrial and Scientific Research and, last but not least, all Congress offices which do not seem finally to go into swing without his approval. It is time that the Congress Party spared its great leader the terrible burden of rescuing it from its own decline. There are some who believe that it cannot be rescued even by the Prime Minister. But in any case, everyone is certain that the Prime Minister will not be there to rescue it indefinitely. It is, therefore, time to make a compromise with the imperatives of human capacity. The Prime Minister is far too great a national figure for him to be sacrified at the altar of Congress salvation.

The illness of the Prime Minister has had more than one clear indication of the point that the Prime Minister has become so central that almost nothing can proceed in his absence. There has been a visible slowing down in the Secretariat, partly because the outgoing Ministers were all awaiting in some animated suspense, partly because the Prime Minister's own minutes and files were standing by. This is an indication, if one were required, that even in administrative matters it is the Prime Minister who is making the tempo. Surely standing orders should now be revised so that all this is not necessary. And at the risk of raising new controversies I would have said that a small committee of the Cabinet should be constituted to operate for the Prime Minister during his period of leave just as a Regency Council operates for the sovereign in the United Kingdom. The old solution which was to have a Deputy Prime Minister is even more likely now that last year to raise internal jealousies inside the Cabinet and at the time when one needs harmony, the remedy would be worse than the disease. There are not wanting indications that the fires of that particular controversy have not died down. It is noticed that Mr. Jagjivan Ram's 55th birthday was celebrated with considerable enthusiasm and a public meeting with Mr. V. K. Krishna Menon in the chair!

In parting, may I extend my sympathy to those who have been kept in suspense during this exacting week when both physical and mental temperatures have tended to rise with the political uncertainty which is to be dispelled tomorrow. My cartoonist has very wisely presented his patient, with his back to the public so that he cannot now be recognised!

What a Life!

"Hmm! The PM's rest is greatly affecting your blood pressure!"

THE WEEK'S NOTES

China

THE TIGHT CURTAIN

A TIGHT curtain was pulled over the important deliberations which the National People's Congress—China's Parliament—was recently summoned to hold over urgent issues. It is intriguing that the NPC's session was postponed twice and this aspect appears all the more so, when it is recalled that the NPC was not convened at all during 1961 for the stipulated session—once in a year. Perhaps, the first postponement from March 5 to March 19 could be explained in the light of the fact that the Central Council of the Communist Party of the Soviet Union was scheduled to be held (by a subsequent coincidence) on March 5. Convenience lay in having Mr. Khrushchev's address and the version of the other proceedings for the benefit of the leaders of the Government and the NPC. But the explanation offered for the second postponement to March 25 seems plausible—that the formal session of the meeting on March 19 was devoted to preparatory work. The People's Political Consultative Council, a mammoth body of 800 members, was also subjected to postponement on March 5. Was it the embarrassment created by the internal economic crisis and the external crisis of the widening rift with Russia that caused hesitancy about a firm line to be prescribed for policy? Or is it a cleavage on basic issues inside the Communist Party of China.

When the NPC eventually met on March 27, a thick veil of secrecy was drawn round the conference. Official handouts of the proceedings were not doled out even to the Chinese press, not to speak of the withdrawal of permission to foreign press correspondents to attend. China's big leap forward—now bigger with the radical reform of the village communes—proved a great mis-adventure further aggravated by the set-back which the agricultural economy received as a consequence of the serious failure of three successive harvests; but the attempt to maintain a semblance of the communes has apparently made a complex situation more difficult. How far to demand greater sacrifice from the peasantry and the people at large was a real dilemma. The rift with Russia on the ideological plane has precipitated a gratuitous crisis, although it is too obvious that the present is not the time for China to aspire to the leadership of the Communist camp. The withdrawal of Russian technicians and stoppage of economic aid cannot fail to bring home to China the painful realisation of dependence on the Soviet Union, Mr. Chou En-lai's clarion call for self-help notwithstanding. But how far will Russia go to stretch non-collaboration, understimating the capacity of the Chinese masses for physical endurance and of their government to impose privations?

Madhya Pradesh

THE PERSONALITY CONFLICT

MR. TAKHATMAL JAIN has found it hard to reconcile himself with the choice of Mr. Mandloi as leader of the Madhya Pradesh State Legislature Congress Party and harder still to accept his discretion in deciding the distribution of the portfolios. It is asking too much to believe that Mr. Mandloi left the allocation of the key portfolio of Finance undecided, when no exceptional circumstances prevailed to warrant such a course. The Opposition had legitimate ground to raise a strong protest against the "absurd" situation created by Mr. Takhatmal Jain's disclaimer of having assumed charge of the portfolio and to demand an unequivocal explanation as to who was the actual incumbent. Mr. Mandloi's clarification that the responsibility finally rested on him could not escape the charge of equivocation and evasion. On the next day, when this ugly issue was again brought on the floor of the House, the Chief Minister was precise in stating that the portfolio was allotted to Mr. Takhatmal Jain on March 29. The latter, however, claimed the status of a Minister without portfolio. This polarisation of positions laid bare the personality conflict inside the cabinet and pushed its prestige to a pitiable point.

Dr. Katju, Chief Minister in the former Cabinet, is contesting the by-election in the Narsinghgarh constituency. Assuming that he is elected, apparently he will be elevated to the position he held before the general election. This prospect has helped to "resolve" the crisis and the claimant to the status of Minister without portfolio has been willing to discard it. Solutions of this kind cannot be available in every crisis and on the few occasions when they are available, they cannot eradicate the deeper disease of dissension.

The leaders of MPCC seem to be too obdurate to draw the plain moral from the electorate's verdict. In the State Legislative Assembly of 282 members, the Congress Party has a bare majority of 142. The real point, however, is that the loss of 90 seats in the last election has not opened the eyes of the factious leaders to the danger facing their own party and, more important, to the State. The Opposition parties and groups, although they have gained a considerable accession of strength from the Congress reverses, stand nowhere and are utterly unable to form a coalition. Blinded by aspiration, the local Congress leaders seem to bother little about the solidarity of their party and the stability of the State's administration. This biggest of the States (by area) in the Indian Union is fast deteriorating into a problem State for which responsibility must be borne by the Congress Party.

Syria

THE DRIFTING COUP

THE COUP staged by the military junta on March 28 seems to have ended inconclusively. It has only served to make a confused situation still more complicated. Three months of office was too short a span to judge the success or failure of Dr. Dawalibi's Government, but the few indications which are available go to confirm the belief that, given peace and time, his Government would have done better. It had already made a start with some ameliorative legislation in the industrial and agricultural spheres. The accusation of failure remains a mere allegation.

The picture is not yet finally clear and reports about the reinstallation of the civilian authority must be taken with reserve. The seven army officers who leapt into prominence have been exiled into Switzerland, but not before the mischief was done to the solidarity of the ranks of the army. The garrison in Aleppo rallied pro-Nasser forces, although finally it bowed before the obligation of allegiance to the army command. The one achievement of the coup was to halt the trend towards closer ties with Iraq. Nasserism without Nasser became a post-coup slogan for sometime. Whatever it may mean and however favourable some trends may be to reunion, President Nasser will keep aloof from intervention. If he bore the secession of September last with fortitude, he will betray no impatience in the new climate. The coup has shown once again that Syria would feel uneasy until she seeks security in alignment with a strong neighbour.

The World Abroad

INDIA WANTS NEW LIGHT ON OLD FACTS

By

ODYSSEUS

SOCIAL TENSIONS, whether between communities, castes, or different language groups, cannot be eased unless their historical origins are understood. In searching the pages of history for clues, it is important to study the most recent works available, for nothing dates so quickly as books on history. And this is especially true of India, because August 15, 1947, marks a dividing line in the questions that Indians asked of their historians. Before 1947, Indian historians were searching the records for evidence that would help India to free herself from foreign rule. Any evidence that suggested that the foreigners had no right to be in India, were acting unjustly towards Indians, were responsible for all India's discontents, was brought out for public ventilation. But those questions have (or should have) yielded place to new ones.

The problem today is not to get rid of foreign rule, but to promote the unity of India.

What causes the differences between ancient castes, suspicious communities, jealous linguists, and separatist regions? Unfortunately the answers that we get from pre-1947 histories do not answer these questions or answer them misleadingly. Let me explain why.

For many decades, the British, anxious to find answers in history that would justify the prolongation of their rule, emphasised the historical facts (for facts they were and are) that distinguished Hindus from Sikhs and Muslims, the Sanskritic North from the Dravidian South, and so on. Equally, the Congress Party sought to counter with the balancing historical facts (for equally facts they were) that virtually the whole sub-continent had been united under the Muslim Akbar's enlightened rule of tolerance and reconciliation, that Hindus, Sikhs, and Muslims were so intermingled as to be racially indistinguishable, that Bengali and Marathi were both Sanskritic languages, and that Hindi was spoken or understood by one fifth of the population (of undivided India), and so on. The fact was that both parties to the dispute were giving different interpretations and emphasis to the same facts in order to answer the particular problems of their epoch.

But these particular interpretations and emphases have no relevance to our present discontents.

That is why we need to consult such admirable new works as Percival Spear's "India: A Modern History" (Cresset Press. London. 1962. 63sh.), Penderel Moon's "Divide and Quit" (Chatto and Windus. London. 1961. 30sh.), and Gardner Murphy's "In The Minds of Men" (Basic Books Inc. New York. 1953), a study of human behaviour and social tensions in India, carried out under the auspices of the Delhi Ministry of Education.

EUROPE AND INDIA: SUB-CONTINENTS

From Spear, we can see that historically "India" is not a country but a sub-continent, in the same way that Europe is. If it is true that Bengalis and Marathas both speak languages of Sanskritic origin, they can no more discuss together the government's policy on coal or sugar than can Italians and French, both of whose languages are based on a common Latin ancestor. Again, to anyone who learned his Indian history from pre-1947 books, it must be emotionally disturbing to find Spear producing evidence to show that Madrassis, Rajputs, Muslims, and Bengalis had no common culture. But once the fact of "India" as a sub-continent rather than a country is digested, the fact of distinguishable sub-cultures follows. Take Europe; it is true that all Europeans share a common culture, the legacy of Greece, Rome, and Christianity, but the national sub-cultures of Germany, France, Britain, and Italy, are also plainly distinguishable. While, for example, many Frenchmen put Racine on a higher level than Shakespeare, only a minority of Englishmen enjoy him at all. Again, parliamentary democracy means something vastly different in Germany, France, Italy, Denmark, Holland, Belgium, Italy, and Britain.

Only when a Frenchman and an Italian are confronted by an Asian or an African do they become conscious of themselves as "Europeans," just as the Punjabi and the Madrassi became conscious of themselves as "Indians" when confronted by Europeans or Americans. The pressure exercised by the presence of th British led Sikhs and Ooryias to unite against it. Now that that pressure is removed the urge to unite is relaxed. The new problem is how to overcome separatist tendencies. Here, India can take heart from the contemporary European scene, where there exists, as yet, no common central government in charge of foreign affairs, defence, communications, a single currency, and so on, so that the valiant "European" patriots, who seek to foster the post-war move towards European unity, have a long hard struggle ahead of them. By contrast, in India, a high degree of unification already exists. But this will not be further promoted by those who persist in rejecting the facts of history. To insist, for instance, that India is as closely integrated as the UK, with its decimal minorities of Gaelic and Welsh speakers, and, on that analogy, to insist that all "Indians" must conduct their public affairs in Hindi is simply to promote resistance by flying in the face of the historical facts.

There is, alas, no quick easy solution to the problem of Indian unity. It will be solved in the generations, rather than in the decades, to come, through the leadership of "Indian" patriots who combine the necessary fervour for the cause with sympathy, understanding, and humility, towards the viewpoints of those who uphold (what you and I agree to be) obsolete ideas of nationalism or regionalism. I do not have time to read more than a handful of Indian newspapers, but I regret to report that I find more of antagonism, denunciation, and misunderstanding, based on obsolete interpretations of history, in the comments of one community upon another, than I do of sympathy and understanding.

At the time of the distressing events at Aligarh last October, the most common cry was for the punishment of those found guilty of violence. Now, I do not condone violence, and those guilty of it should be punished. But in addition to the cry for retribution, I should like to have seen the Indian press of all regions and shades of opinion calling for investigation into what caused the violence to break out at all. Why, in the first place, did certain ordinary people, like you and me, feel the urge to attack members of another community? Have they wrongs that need remedying? Have they been made to feel persecuted? Are they received on an equal footing in government, industry, commerce, in your home and mine? May their resentments not arise in part from their conditioning by history books that are answering pre-1947 questions?

Before you can build a bridge, you need to ascertain the local geographical facts. Where is the bridge most needed? On what soil must the foundations be laid? It is useless to insist that the bridge must be in modern steel if the soil will not take the necessary foundations. What volume of traffic will the bridge have to stand? To enlarge an old bridge to cope with modern traffic involves difficulties. If so, it does not help to blame your predecessor for weaknesses in an old structure intended for different traffic. Likewise, before you can build bridges between Ayrian and Dravidian, Sikh, Hindu, and Muslim, you need to ascertain the historical facts. And if the British are responsible for some of these facts, the problem is no longer theirs but yours—today—and it is as well to make sure that some aspects of today's problem is not of your creation as well, and that you are not continuing to create difficulties for yourself by failing to re-orientate your own ideas.

CHURCHILL AND INDIAN INDEPENDENCE

Here is a concrete example from current Indo-British relations of what I am getting at. It is commonly believed that India gained her independence in 1945-47 because a Labour government was in power, and, it is, of course, true that links between the Congress Party and the British socialists had been close for half a century. I detect the continuing influence of this belief on the Indian press in much of the reporting of, and editorial interpretation of, events in the UK. There is some bias towards Labour and against the Conservatives (usually called "Tories" in a slighting sense). But Mr. Spear calls attention to the historical fact that it was Winston Churchill's Conservative "Caretaker" government, which opened negotiations with the Congress within a few weeks of the German surrender. And as the Conservatives have been more consistently in office since 1886 than their opponents, it would be helpful for the smooth conduct of Indo-British relations not to develop a bias in their favour, but at least to discard a bias against them.

Are the British responsible for the creation of Pakistan? The Churchill government of May, 1945, regarded Pakistan as a counsel of despair. Under Attlee's Prime Ministership, Wavell refused to allow the Muslim League to take office in the interim government without the Congress. Alan Campbell-Johnson's "Mission With Mountbatten" (Robert Hale. London. 1951.) reveals how exasperated Mountbatten and his staff were with Mr. Jinnah's tactics and personality, whereas they formed warm friendship with the leaders of Congress.

How, then, did Pakistan come into existence? Mr. Spear says that while every credit must be given to Jinnah's leadership, one man could no more create Pakistan without a volume of popular support than Churchill could have saved the UK without popular backing in 1940.

We will consider these matters further next week.

[This is the second of a short series on the theme "India—A House Divided?", inspired by an editorial of that title in "The Eastern Economist" of October 13, 1961. While each article is complete in itself, Odysseus hopes that his friends will file their copies of "The Eastern Economist" for a collected reading, which will bring out the trend of the argument more clearly. Statements which may seem stark in one article may be elaborated or qualified in subsequent articles.—Ed.]

THE
UNITED COMMERCIAL BANK LTD.

Head Office:

2, India Exchange Place, CALCUTTA

AUTHORISED CAPITAL	..	Rs. 8,00,00,000
ISSUED & SUBSCRIBED CAPITAL	..	Rs. 4,00,00,000
PAID-UP CAPITAL	..	Rs. 2,00,00,000
RESERVE FUND	..	Rs. 2,35,00,000

With Branches in all important cities and towns of India, Pakistan, Burma, Malaya, Singapore, United Kingdom and Hong Kong and Agency Arrangements throughout the World, the Bank is fully equipped to give best service in India and abroad.

The European Scene

THE CONSUMERS' COMMON MARKET

From Our Special West European Correspondent

PARIS, March 23.

A PARISIAN department store this week opened a "Common Market Exhibition" where it displayed the 62 "price-cutting champions of Europe"—a series of commodities manufactured in France, West Germany, Italy and Benelux whose selling price has fallen notably since (and because of) the introduction of the Common Market. Naturally, this was a sale, a commercial stunt, but it was also extremely instructive. Having their eye on a selection of goods likely to sell well, the store's buyers were not pretending to give a complete picture of the economic consequences of the Common Market as seen from the ultimate consumers' standpoint. Nor could a display of this sort (or for that matter, accurate economic study) separate out what was really due to the Common Market and what was due to technical progress, long-term price trends and generally freer world trade, these being factors that would have made for price reductions even without the Common Market. One noticed, for example, that there were no leather shoes on display, because leather footwear (plastic is another matter) has jumped sharply in price all over the world in recent years; fundamental price trends here obliterate all the effects of industrial improvement and commercial liberation. Moreover, once one gets down to consumer goods like clothing and furniture, the influence of fashion is immense and confuses the picture: thus, the West was swept a few years ago by Italian pointed-toe shoes (this style is going out) and is still being so by Italian seamless stockings and Scandinavian furniture, so that one tends to ascribe these waves of international limitation to economic factors—until one sees how short-lived they can be.

Still, after making all these reservations the impact of the Common Market on the variety, quality and price of consumer goods is underable. Variety has of course increased, because of the abolition of quota restrictions; quality has almost universally improved; prices have generally fallen, and in some cases quite spectacularly; there are even signs (though here the influence of fashion is especially confusing) of a unification of taste throughout the region. To take the last point first, buyers in the furniture trade report that Germans are at last giving up the ghastly deep green and mustard yellow furnishing fabrics that disfigure their drawing rooms, in favour of the brighter floral designs of Mediterranean taste; thirty per cent of furniture sold in France is now "Swedish-style" teak (it is made in Belgium actually) against almost none three years ago; lampshades and table-lamps throughout the Common Market are increasingly of the Empire and "modern" styles to the exclusion of the baroque horrors that reigned in the generations between those two styles; and Dutchwomen, we are solemnly assured, are shortening their nightdresses to the length thought reasonable elsewhere. Some such unification of consumer standards is no doubt an inevitable result of freer trade and the wider scale of manufacture by the more efficient firms. The retail trade itself is organising its own Common Market, and the department stores have an international arrangement for joint buying. For example, a German store reveals its list of suppliers to French and Italian stores in the same club in return for equivalent help in procuring French and Italian goods. In buying from countries outside the region, they co-operate similarly: a French store will prepare the list of Spanish goods likely to sell in North Europe while a German firm surveys Scandinavian sources of supply. Thus a unification in the style of goods offered to the public is normal, even before consumers' choice begins to operate by encouraging manufacturers previously unknown outside their own country.

This encouragement has been considerable wherever consumers have discovered that articles of better quality and lower price are available from a neighbouring country. A Parisian department store, only 1 per cent of whose sales were imports in 1958, now sells 8 per cent foreign goods—and its total sales have risen about 50 per cent in the meantime. Taking 1958 as 100, it reports the following index numbers: 1961 sales volume 146, Belgian goods 290, Italian 350, German 380 and Dutch 1,160. Another store reports that its sales of Common Market goods have quadrupled in three years, the lion's share going to Italy. But these are far from telling the whole story of consumer benefits, for in numerous cases the local manufacturer, seeing the invasion of cheaper foreign goods, has cut his own prices and improved quality or style. The result has been a fall in prices of all the goods in that line, whether imported or local. At the risk of boring readers who never do their own shopping, I shall quote some of the more noteworthy illustrations. The prices given in rupees are accurate only to the nearest five per cent, but they will provide an interesting comparison with prices charged in India for similar goods.

Among the 62 "price-cutting champions" I noted a German camera that has dropped in price between 1958 and 1962 from Rs. 366 to Rs. 249; a German pocket alarm clock from Rs. 35 to Rs. 20; an Italian chair from Rs. 35 to Rs. 20; a German carpet from Rs. 90 to Rs. 65; five French saucepans from Rs. 120 to Rs. 70; six Belgian glasses from Rs. 12 to Rs. 10; a French vacuum cleaner from Rs. 230 to Rs. 109 (an Italian vacuum cleaner appeared this week at Rs. 59!); a natural silk dress from Rs. 130 to Rs. 65; a nightdress from Rs. 40 to Rs. 18 and a man's waterproof coat from Rs. 109 to Rs. 40. Among the 62 items claimed to have fallen most in price, 36 were French, 16 Italian, 7 German, 2 Belgian and 1 Dutch. I repeat that this was a commercial stunt, and one cannot conclude that the various nations of the Common Market have benefitted in just those proportions; but this order of magnitude seems reasonable, for the high-tariff countries would have been forced to make the sharpest price adjustments as trade became freer. To benefit from these price-falls the consumer did not have to start buying foreign goods; his local supplier matched the cuts where he could. The following items, turned out by the same French manufacturer in 1958 and in 1962 respectively, have fallen in price under the influence of foreign competition; a jersey dress from Rs. 70 to Rs. 50; a quilted windjacket from Rs. 75 to Rs. 47; a 125-litre refrigerator from Rs. 1,000 to Rs. 500; and transistors from Rs. 200 to Rs. 100.

These spectacular price reductions have been accompanied by improvements in quality. I find the case of a manufacturer of refrigerators who was making 15,000 a year in 1958 and who now turns out 200,000 a year, which he exports to 18 countries. He has increased his standard size from 100 to 125 litres, increased the thickness of the walls from 0.8 to 1.2 millimetres, mounted the doors on pivots and made various other improvements, while reducing the price from Rs. 600 to Rs. 500. While we are in the kitchen furniture department, note that the old wooden stool has virtually disappeared from commerce, being replaced by a chromium-plated tubular steel product with a plastic top and rubber feet, of which the price has dropped in three years from Rs. 12 to Rs. 9. Naturally, this combination of lower cost and better quality has everywhere stimulated sales. A store reports that woollen pullovers have fallen in price by 50 per cent while its sales of them have just doubled. The same has happened for other goods of which the price is half what it was three years ago: printed handkerchiefs and electric trains for boys.

This list may seem too detailed, but the point is that one has to come down to homely details to answer the general question, what has the ordinary European got out of the Common Market so far? Perhaps his main benefit has been sustained full employment, but you will never find anyone to be grateful for that: unemployment is a scandal but employment seems the most natural thing in the world when it is available. Worse, the full employment that now obtains all over the Common Market is accompanied by transitional pockets of unemployment as labour and capital are shifted to better uses, and both the immediate victims and the readers of popular newspapers are more sensitive to the temporary inconveniences this technological adjustment causes than to the blessing of overall full employment. There are well advertised cases at present in the coal industry, as various marginal mines have to be closed down, basically because of the shift to liquid fuels. Normally, this causes no trouble, for the mines are mostly in industrial areas where alternative and better jobs are readily available; but in a notorious recent instance the mine was a backwater region of central France, so that the men had to migrate to get work. They stayed down the mine on a hunger-strike until the Government made even more generous the already lavish terms of transfer. Now, a full month after this isolated incident, I find the French Communist Party describing the Common Market as a conspiracy of German-dominated monopolies which is ruining the French worker and holding up the case of this one mine as "proof". The readiest answer to that is the sort of price list I have cited, plus a recall of the benefits of full employment.

The complaint that the Common Market is "the bosses' Europe" (this is a pun in French: l'Europe des patrons, bosses' Europe, for l'Europe des parties, the Europe of nations), or that it is the private property of supranational technocrats headquartered in Brussels is heard well outside Communist circles. Inevitably, the big decisions that make the economic union are taken by capitalists and administrators, and in the former case, most of the immediate profits too. The gains of workers will show up only in sustained employment at constantly rising wages; and the gains of consumers in the evolution of prices that I have illustrated. If you do not count the first, or take it for granted, and are too impatient to read a list of prices in detail, you can pretend that "the ordinary man" is getting nothing out of the venture. Not for long however; the changes in variety, quality and price of consumer goods I have quoted result from only the first steps toward economic union, involving a reduction of only 40 per cent in tariffs. This will be carried to 50 per cent in July and 60 per cent next year, while the unification and perfection of European industry and commerce gather further momentum. The consequences, in the form of goods and their price tags, will then be too evident to be overlooked.

Our West German Letter

IN FAVOUR OF INDO-GERMAN CO-OPERATION

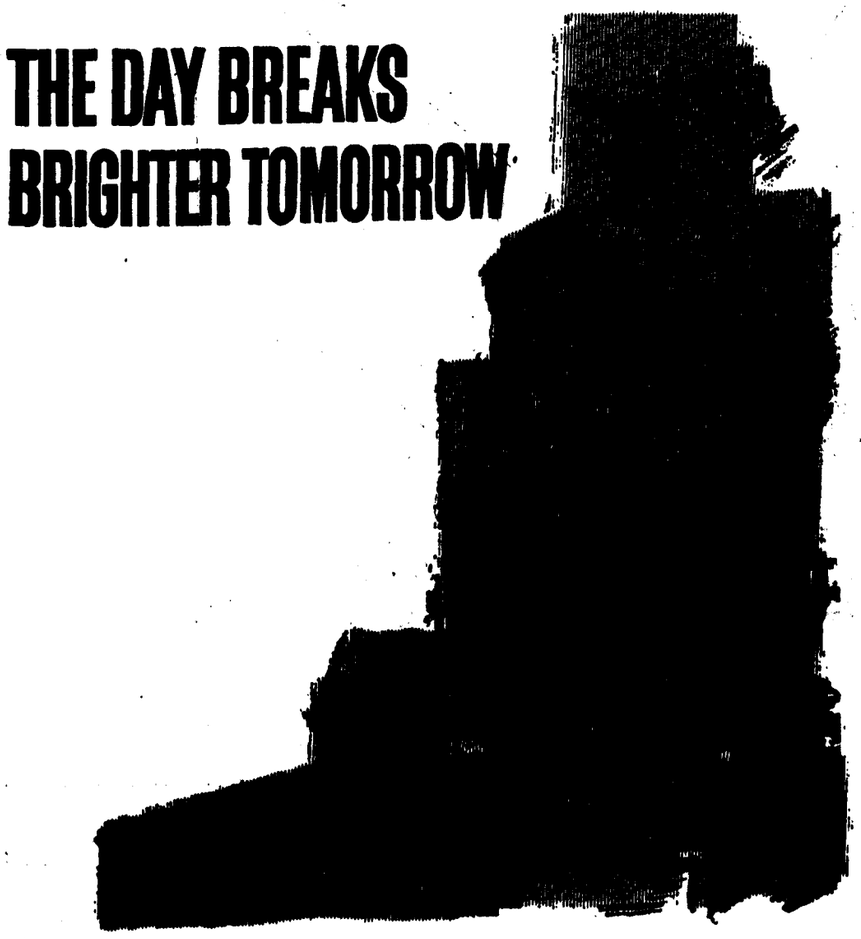
From Our West German Correspondent

BONN, March 25.

WHEN the Chamber of Commerce and Industry in Dusseldorf, the centre of the famous industrial Rhine-Ruhr district, invited its members to a lecture of Mr. A. B. Parakh, President of the Indo-German Chamber of Commerce of Bombay, one could be sure that a distinguished audience would be present. It goes without saying that the leading newspapers in the Federal Republic published extensive reports on this meeting. A similar convention with Mr. Parakh as speaker took place in Frankfurt, one of the main trade centres of West Germany, and we shall give our readers a condensed account of both these gatherings as we think it will interest them how India's present economic situation has been explained to European businessmen. Mr. Parakh started by asking his listeners whether their experience with India had been better or worse than with other countries. If European or American businessmen avoid in default of confidence in the political and economic ideas prevailing in India to take some risks and prefer to wait for a more favourable climate then the answer to it is that a grain of experience is weighing heavier than a ton of theory. The speaker asked for understanding of India's needs and drew the attention of the eagerly listening assemblies to the immense possibilities which offer themselves to the foreign partner. India is learning by experience and much that now is happening is depending on particular circumstances. In 1951 only 16.6 per cent of the population were able to read and write, now there are 24 per cent. Still, the standard of living is dangerously low and planning could under no circumstances ignore the crying needs of the huge masses of people. One has also to consider the religious, historical and provincial differences within the country which, to a certain extent, are decisive as to what sometimes could be done or had to be left off. Before this background one has to judge the present Indian politics. Taxes are considerable because the available means are very small but the need is very high. If the methods of taxing are not as good as they could be, India would be pleased to get the advice of her foreign friends, Mr. Parakh said. He also mentioned the extensive rate of the growth of the population which during the last decade amounted to 2 per cent a year.

The speaker then quoted a practical example of Indo-German co-operation. In 1953-54 when a co-operation with the German firm Mercedes-Benz was first planned by the Tatas, the demand for motor cars of all kinds was estimated at 12,000 per year. At first an annual production of 1500 trucks was intended. But the demand was rising to such an extent that it was raised to 12,000 and will now further extend to an output of 24,000 per year. During the past 7 years the Tata-Mercedes-Benz combine has sold 50,000 trucks. But, the speaker continued, this example is by no means a special case. There are, in fact, quite a number of similar projects, bigger and smaller ones, in various branches of industry. Further it has to be considered that such favourable results have been achieved within a relatively short time and that the annual income per head of the population still amounts to only Rs. 330. The industrial production rose from 1955 to 1960 in India by 6.5 per cent per year.

Mr. Parakh, who within the Tata group is also looking after TELCO (Tata Engineering and Locomotive Company) which co-operates with the German locomotive builders Krauss-Maffei in Munich, is at present, as he told a representative of the "Handelsblatt", Dusseldorf, negotiating with German firms which might grant licences for the manufacturing of accessories for motor vehicles. A contract has already been effected with the well-known firm Fichtel & Sachs in Schweinfurt (Bavaria).



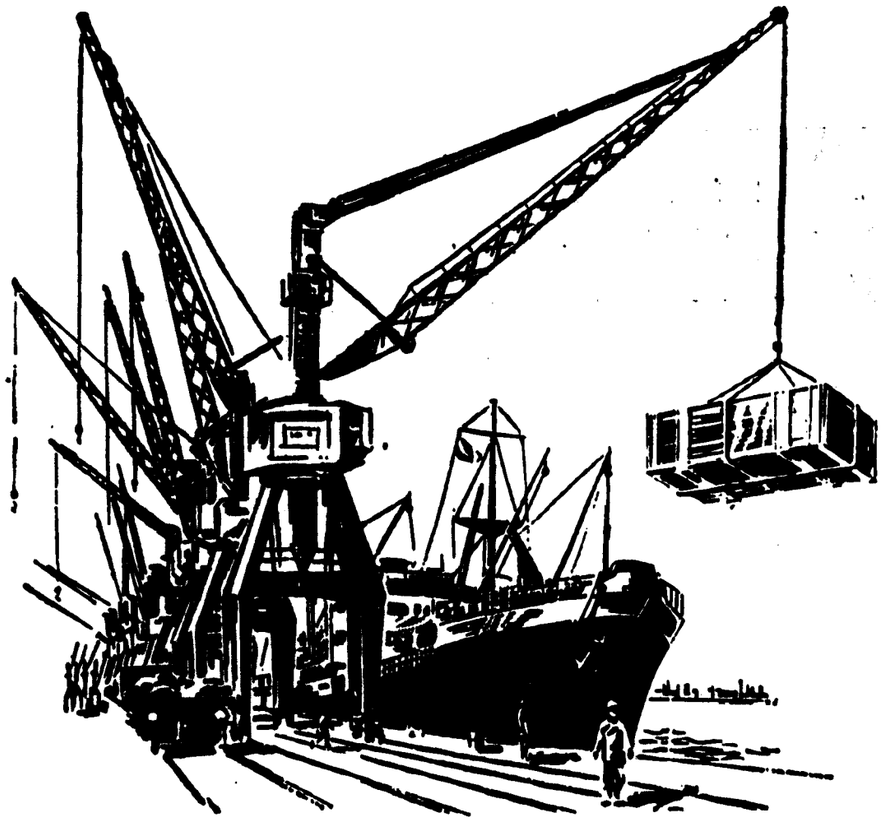
DATES ARE DIFFICULT TO SELL

Also Prof. Dr. Erhard, Minister for Economic Affairs, pleaded before the Marketing Club in Bonn for the establishment of productive undertakings on partnership basis in developing countries. The risk is not as big a sometimes assumed, he said, and the returns are often higher than in the case of investments in Europe. He mentioned especially French and Italian entrepreneurs who are very active in developing countries. If one leaves this kind of business to others it would not be feasible to make good later on because the then existing productions in these young nations will mostly be protected against competition.

Prof. Erhard's ministry is at present trying very hard to sell dates in the Federal Republic. This peculiar situation has arisen by an offer from the Iraq Government. Iraq produces annually 4.8 lakh tons of dates or 80 per cent of the world's output. Now the Government has suggested to West Germany a barter agreement by which it will exchange 10,000 tons of dates against various kinds of machinery. On a similar basis Iraq had already sold dates for the equivalent of 50 million DM to the Government of Bulgaria which now by way of barter is modernising the airport of the capital Bagdad. But unfortunately, nobody in West Germany seems to be prepared to buy dates at the price of 150 DM per 100 kilo which is far too high for producing alcohol or sugar or to use it even as forage.

We have to report about an interesting, newly established combine, the "Ruhr Consulting Gesellschaft mit beschraenkter Haftung" ("Ruhr Consulting Limited Liability Company"). The fact that the German name of the company contains the English word "Consulting" shows that an institution quite common in England and USA has now entered the Continent. There were already firms of consulting engineers in Germany but they were generally of a limited scope. In this particular case four of the largest heavy industrial groups of the "Rhine-Ruhr district" have joined forces and started the above company. They are: The August Thyssen Huette AG., the Hoesch AG., the Phoenix-Rheinrohr AG. and the Mannesmann AG. Actually, this is not a completely new foundation as these firms have taken over the shares of the "WEDEXRO, Westdeutsches Ingenieur-Buero Dr. Rohland". The capital of this company has now been raised to 4 million DM and the name was changed. One of the main aims of "Ruhr Consulting" will be to make available German technical know-how to developing countries. It is intended to form "task forces" who will not only supervise the execution of a project on the spot but they will also be responsible for the training of the staff recruited in the respective country. Engineers of the WEDEXRO have already experience in Asian, African and South American States, and the four founder firms are prepared to put at the disposal of "Ruhr Consulting" their own specialists whenever necessary. But otherwise they are not interested in executing projects themselves and, therefore, "Ruhr Consulting" will provide unbiassed expertise.

In the budget for the forthcoming financial year, at present being discussed in the Federal Parliament,



PLAY BECOMES HAPPY SERVICE.
Today's service. Today's effort. Continuous, successive.
Work-laden, face shining with a smile.
Tomorrow...a little less of care, a little more of joy.
And for HINDUSTAN LEVER, too, tomorrow begins today.
In the research laboratory, in the factory and office.
Work, patience, care
to serve tomorrow's homes and the nation's needs
with products that grow better and better.

TODAY AND TOMORROW...HINDUSTAN LEVER SERVES THE HOME
WITH SOAPS, FOODS, TOILET PREPARATIONS

PR. 37-X52

KRUPP

For 150 years, the name of Krupp has been identified with superb workmanship and enduring quality.

The name of Krupp is also linked with outstanding pioneer work, past and present, in many fields of industrial research, planning and manufacture.

The results achieved have caused the name of Krupp to be permanently associated with progress in engineering throughout the world. Illustrated on this page is one of the more than 3,000 items contained in our Catalogue "KRUPP PRODUCTS AND SERVICES": Full-portal level-luffing wharf cranes.

Products and Services:
Exploration of mineral deposits · Engineering of mining schemes · Design, layout, and supply of plant for the production and processing of ferrous and non-ferrous metals · Preparation and dressing plant for ore, coal, and other minerals · Chemical-process plant · Cement, lime, and gypsum plant · Bridges, hydraulic structures, and reinforced-concrete structures · Materials, pressure vessels, and tanks for nuclear reactors · Castings and forgings · Rolls · WIDIA-sintered carbide · Magnetic materials · Cable-making and stranding machines · Hydraulic extruders · Machinery for the rubber and plastics industries · Edible oil extraction plant · Sheet-metal working and can-making machinery · Mobile water purifiers · Plate and sheet-metal fabrications · Pneumatic tools · Motor trucks, buses, and special-purpose vehicles · Diesel and electric locomotives · Special-purpose freight cars · Ocean-going vessels and river craft · Diesel engines · Giant excavators and bulk-handling plant · Power shovels and cranes.

FRIED. KRUPP · ESSEN (GERMANY)

For particulars apply to:
Messrs. Protea Engineering Co. Private Ltd.,
173 Jamshedji Tata Road, Bombay
Branch Offices at Delhi, Calcutta and Madras

there is for the first time an item of 100 Mill. DM inserted to be given to Catholic and Protestant Missions which are to be spent exclusively in developing countries. This amount will be used for educational, social welfare and health institutions. But under no circumstances are these means to be utilized for pastoral purposes or the construction of churches. Furthermore, such projects will be especially supported which are recommended by missions on the spot, based on their long-time experiences, i.e. the final decision to start a planned project will be made by the mission concerned in collaboration with the cultural section of the Foreign Office in Bonn.

GENTLEMEN PREFER SCOTCH

High tide for Scotch Whisky and low tide for Cognac, this is the result of statistics for 1961. The rise of the "whisky wave" is proved by the following import figures: In 1958 West Germany imported 6.5 lakhs litre, the following year 9.6 lakhs litre, in 1960 already 18 and last year, without the month of December when the Christmas and New Year's business brings always a boom in sales of alcoholic drinks, even 23 lakhs litre. For the first time whisky was topping the list of all alcoholic drinks. While in 1959 Cognac was imported from France to the tune of 9.8 lakhs litre, i.e. 20,000 litre more than whisky, the import of Cognac went down during the first 9 months in 1961 (for the last quarter figures are not yet available) to 11 lakhs litre. The German connoisseur prefers Scotch to the American Bourbon and the Canadian whisky. Out of the 23 lakhs litre of foreign whisky, 21 were Scotch. The production of German whisky is negligible. According to the trade, there is more whisky drinking at home than in the pub. The reason is that drinks at the pub are too expensive and secondly television keeps people at home which they enjoy with a sip now and then. The retail price for Scotch is at present 24.00 DM but it is assumed that after Great Britain has joined the European Economic Community the price will come down to 20 DM.

Drinks play in the cold climate of Europe (where although according to the calendar springtime has already started, the thermometer is still below zero) an important part which is also proved by a protest of the Federal Government transmitted via the French Embassy in Bonn to the Government of France. The protest refers to a decree of the latter which permits the plantation of additional vineyards for the production of brandy with the protected brand "Cognac". During the question hour in the Federal Parliament the Minister for Agriculture, Mr. Werner Schwarz, said that this decree of the French Government is an offence against the treaty of the European Economic Community!

WHAT IS DE-MARXINATION?

According to an announcement of the Soviet Embassy in Bonn, after the de-Stalination has been carried out the name of "Stalin" will only remain in the official designation of "The battle of Stalingrad". At the same time the Municipal Council of Bonn has carried out, shall we call it a de-Marxination? At the famous university of Bonn there studied once upon a time a young fellow by the name of Karl Marx. Without being "Marxists", the city-fathers of Bonn some years ago thought that this man had become a person of world-wide fame and it would be proper to name a street after him. After all, he had acquired within the walls of the city on the Rhine his wisdom which was to shake the world. Now a new city-father has entered the council and when the majority of his fellow-councillors had left the meeting late in the evening and tired he suggested to change the name from Karl Marx to the plain and homely German first name of Max. The suggestion was happily agreed to. If one asks who is the "famous" Max one is informed that it was a rather obscure duke by this name. No further comment...

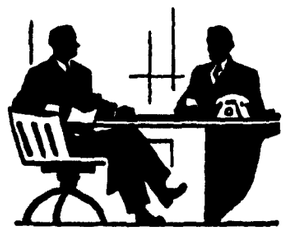
Economic Report from the U.S.

ECONOMIC AID PROGRAMME

By GUY SIMS FITCH

WASHINGTON.



ONE must go back more then ten years, to the days of the Marshall Plan, to find a U.S. economic aid outlay larger than the $3,400 million President Kennedy has requested for the 1963 fiscal year that begins July 1. It represents a substantial $1,000 million increase over the amount appropriated by Congress for the current 1962 fiscal year. A breakdown of this proposed economic aid programme reveals $1,250 million set aside for development loans and $335 million for development grants—both exclusive of alliance for progress operations in Latin America. In addition, there would be $482 million to help support the economies of countries carrying heavy defence burdens, $400 million to meet unforeseen contingencies that might arise during the year, $149 million for international organizations, $100 million for guarantees of private U.S. investment in developing countries, $5 million for investment surveys abroad, and some $60 million for administrative expenses.

There are some significant new departures in the President's aid proposals. One of these is the $100 million Investment Guarantee Fund, which it is hoped will help expand the flow of development capital to areas where it is most needed. The biggest new item, however, is a "$600 million fund for the Alliance for Progress, the co-operative Western Hemisphere venture designed to speed the economic and social progress of Latin America. This $600 million, of which $500 million would go into long-term loans and the rest into grants, represents but the first slice of a proposed four-year, $3,000 million special assistance programme for Latin America. It is evident that Mr. Kennedy is proposing not merely to continue, but to enlarge and to broaden, a long-standing U.S. programme of economic assistance to other nations. This $3,400 million would bring the total of economic aid given by the United States since World War II to no less than $51,000 million. With military assistance included, the total would rise to about $78,000 million. Two significant and related trends lie behind these huge sums. One concerns the relative stress on economic as against military assistance, the other the geographical distribution of the aid outlays.

In the early post-war years, with European economic reconstruction an urgent and recognized need, most of the U.S. assistance went for that purpose. With the Communist aggression in Korea in the early 1950's, however, and the acerbation of international tensions, military assistance began to rise markedly. At the same time, as Western European recovery progressed, the need for large-scale economic aid to that region declined sharply. For several years, therefore, the total of military assistance consistently exceeded that of economic assistance. Also, as European countries recovered to the point where they no longer needed large doses of reconstruction help, and as new countries with new economic problems began to emerge on the world scene, the regional distribution of U.S. assistance began to shift accordingly. This shift has become especially marked during the past decade, as developing lands in Asia, Africa and Latin America have been taking an increasing share of U.S. aid dollars.

With this growing emphasis on helping the less-developed nations accelerate their economic and social progress has come another reversal in U.S. aid programmes. In the past few years, economic outlays have again begun to exceed the military. As against the recommended $3,400 million in economic aid, for instance, the Kennedy administration is proposing $1,500 million in military assistance for the coming fiscal year. Today, moreover, hardly a penny of U.S. assistance goes to Western Europe; virtually all of it is earmarked for the less-developed areas. Whether or not Congress actually appropriates all the foreign aid money the President has requested for the coming fiscal year, a basic trend in U.S. policy is clearly established. Its emphasis is on large-scale and long-term economic assistance to developing lands.

The CALTEX "Stop-loss" Programme helps cut plant-wide maintenance costs as much as 15%

"Stop-loss" organises lubrication throughout the plant—from purchasing on through actual application. By specifying multi-purpose lubricants and by eliminating duplication, a "Stop-loss" Programme can reduce the number of lubricants needed by as much as 50%. By streamlining purchasing procedures the programme can cut the number of purchase orders.

Best of all—by assuring proper lubrication to every piece of equipment in the plant, a "Stop-loss" Programme helps extend equipment life. Result—plant-wide maintenance savings upto 15%. *Ask your Caltex Sales Engineer for information.*

Company executives can obtain a free copy of this booklet by writing on their official letter-head to their nearest Caltex office.

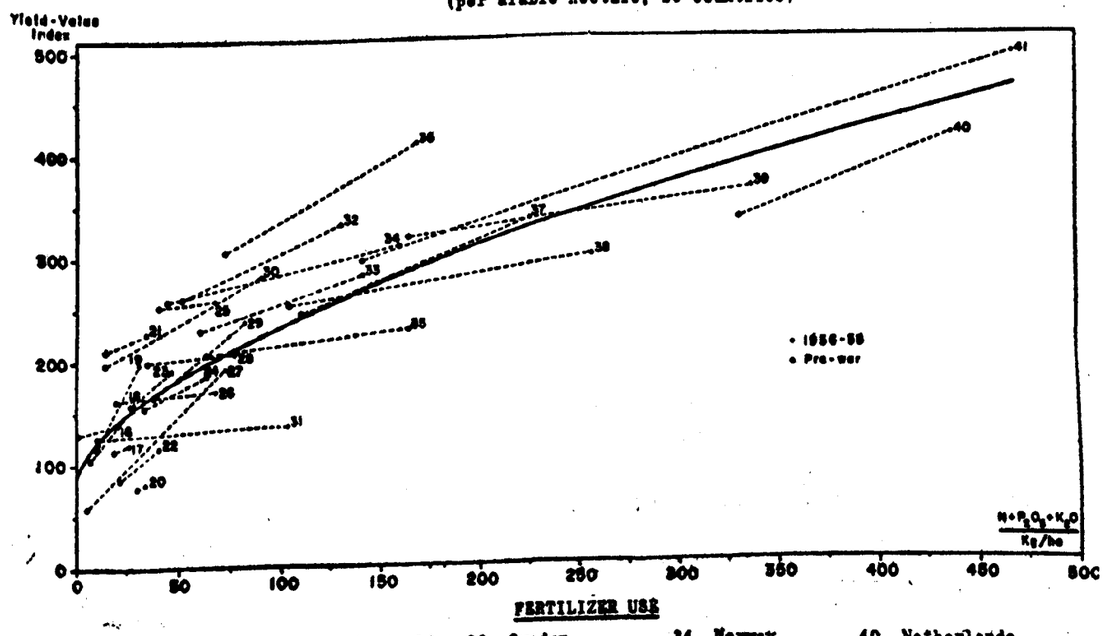
THE ROLE OF FERTILIZERS IN AGRICULTURAL PRODUCTIVITY



AT what stage does the extensive use of fertilizers become essential in any economy and how much can fertilizers contribute to agricultural and economic development? An answer to these questions has been attempted in a paper entitled "Fertilizers and Economic Development" by Mr. F. W. Parker, Assistant Director General, Technical Department, Food and Agriculture Organisation, Rome. Mr. Parker has arrived at the conclusion that economic development, specially in the countries approaching the "take off" stage, is dependent upon increased food and agricultural production. To achieve this objective, extensive use of chemical fertilizers is essential. He has estimated that the less developed regions of the world must increase their fertilizer consumption to about 30 million tons of plant nutrients by 1980 and for this purpose massive international assistance programmes need to be chalked out.

The basic premise of his thesis is that "people and crops are hungry because most of the soils of the world are of low fertility". In the more developed countries, substantial progress has been made in the use of fertilizers and enough literature exists to show the close relationship between fertilizer consumption and crop yield. In the table alongside are set out figures regarding grain yields and fertilizer consumption in France, the United Kingdom, Belgium and the Netherlands for pre-War and 1956-58 periods. All these countries have increased their yields substantially, the highest yield having been recorded in the Netherlands at 3310 kilos per hectare. Even though yield in France at 2280 kilos per hectare is the lowest for these countries, it must be remembered that the increase in percentage terms over the pre-War level is the highest in France.

GRAIN YIELDS AND FERTILIZER CONSUMPTION (PRE-WAR AND 1956-58)

	France	U.K.	Belgium	Netherlands
Grain Yield				
100 kilos per hectare				
Pre-war	14.9	21.1	24.1	27.2
1956-58	22.8	28.0	32.2	33.1
Fertilizer Use				
Kilos per hectare				
Pre-war	37.2	59.4	177.9	336.6
1956-58	80.9	141.2	349.3	438.6
Increases				
Yield	7.9	6.9	8.1	5.9
Fertilizer	43.7	81.8	171.4	102.0
Return				
Grain/unit Fertilizer	18.0	8.4	4.7	5.8

CURVE OF AVERAGE RELATIONSHIP BETWEEN FERTILIZER USE AND VALUE INDEX OF CROP PRODUCTION 1956-58, COMPARED WITH PRE-WAR
(per arable hectare, 26 countries)

40. Netherlands
41. New Zealand

Whereas the United Kingdom, Belgium and the Netherlands indicated more than 2000 kilos grain yield per hectare in the pre-War days, France could obtain only 1490 kilos per hectare. The use of fertilizer per hectare *in absolute terms* has increased the highest in Belgium, followed by the Netherlands, the United Kingdom and France. However, one fact which stands out very clearly from this analysis is that higher yields in these countries were obtained by employing substantially increased use of fertilisers.

A dramatic illustration cited by the author relates to Taiwan. The yield of paddy between 1936-38 and 1945-47 declined because the fertilizer used during the same period fell steadily and the fall in yield resulted directly from a drop in the consumption of fertilizers. After World War II, when the use of fertilizers was increased, the yield curve took a sympathetic upward course. After having established this close relationship between crop yield and fertilizer used, the author has evolved a method for forecasting the volume of fertilizer consumption necessary for taking agricultural production in any country to a specific level. This analysis based on 41 countries shows that not all the increase in productivity was due to fertilizers but it certainly showed that modern agricultural methods were highly influenced by the use of fertilizers.

The use of fertilizers becomes essential when an economy wishes to attain a level of agricultural production higher than 800-1200 kilos of grain per hectare. It was at the "take off" stage of economic development that crop output in Japan, the United States and most of the European countries ruled between 800 to 1200 kilos of grain per hectare. Since the economies of these countries demanded increased levels of production in agriculture, they resorted to increased use of fertilizers along with other improved agricultural practices. Like the Indian Union many other nations are currently at the "take off" stage of development and they will all find it essential to use fertilizers in increasing quantities for raising the level of production. Plans of economic development in the developing countries indicate that pressures of increase in population are demanding increase in agricultural production by 100 per cent in the next 15 to 25 years.

The graph on page 915 sets out the technique of determining the volume of fertilizer needed for achieving the targeted levels of production. Twenty-six countries have been considered and their pre-War and 1956-58 points have been correlated for increase in index of agricultural yield value per hectare with fertilizer used. Seventeen of these countries conform to the relationship exhibited by the slope of the curve i.e. the yields increased with the increased use of fertilizers. The relationship was not very close but was fair enough for five countries, but it was poor in the case of Finland, Sweden, South Korea and Taiwan.

The forecasts made by the author for the various regions have been summarised in the table below. It will be seen that by 1980, Asia and the Far East are estimated to require no less than 20 million tons of fertilizers in order to attain the nutritional goals. This also includes 5 million tons for Mainland China. The estimated requirements of fertilizers for the four less developed regions is placed at 39.5 million tons. If the area under cultivation could be increased, the estimate may be lowered to 30 million tons — nearly 7½ times the present level of consumption of four million tons.

Extending his forecasting technique to India's rate of growth and its probable implications in the future Mr. Parker has estimated that Indian fertilizer requirements would be 1.28 million tons of plant nutrients at the end of Third Plan. The Planning Commission has, however, estimated that the demand will be of the order of 1.60 million tons. The same method again yields a figure of 2.92 million tons for the Fourth Plan period as compared to the tentative estimate of 3.50 to 3.85 million tons for 1970-71 as estimated by the Planning Commission.

ESTIMATED FERTILIZER REQUIREMENTS FOR 1980 NUTRITIONAL GOALS

(Million tons plant nutrients)

Region	Food Supply Index	Fertilizer Consumption 1959-60	Fertilizer Consumption 1980
	(Base: 1960 = 100)		
Asia and Far East	219	2.53	20.0*
Near East	190	0.25	3.6
Africa	174	0.40	8.6
Latin America	194	0.82	7.3
		4.00	39.5 (30.0**)

* Includes 5.0 million tons for Mainland China.

** If allowance is made for expansion of the area under cultivation.

THE BUSINESS WORLD

Control on Cotton Prices: A Critical Appraisal

By CROESUS

IF there is something on which there is complete agreement today among the concerned interests—the grower, the trader, and the consumer as also the Government—it is in regard to the supply position of raw cotton. With the disappointing prospects of the current season's crop, estimated at no more than 43 lakh bales, and the increase in consumption by our cotton mills, on the one hand, and the sharp fall in imports of cotton, on the other, even official circles have conceded that there has been a dangerous deterioration in the raw cotton supply position. The stark reality is that the country will be faced at the end of the current season with a carry-over of just about half the size of the carry-over at the beginning of this season, that is only 11 lakh bales, as against 22 lakh bales. In other words, the carry-over at the end of the 1961-62 season will represent hardly 20 per cent of the country's annual requirements, a level to which the carry-over of cotton in this country had not deteriorated during any year in the post-Partition period. The following table represents the position very vividly:

SUPPLY POSITION OF INDIAN AND FOREIGN COTTON FOR THE COTTON SEASON 1961-62

(In lakh bales of 400 lbs. each)

	Indian	Foreign	Total
Opening stock as on 1-9-1961 with mills and trade ..	18.10	3.93	22.03
Estimated Production ..	43.00	—	43.00
Imports	—	6.79	6.79
TOTAL AVAILABILITY	61.10	10.72	71.82
Consumption by mills ..	47.17	10.00	57.17
Exports	3.00	—	3.00
Khadi & ex-factory consumption	0.55	—	0.55
TOTAL CONSUMPTION	50.72	10.00	60.72
Carry-over stocks at the end of the season	10.38	0.72	11.10

This, certainly, was not the expectation at the beginning of this season. At that time, it was estimated, in fact, that the crop would be of the order of about 53 lakh bales (more or less the anticipated consumption during the season). But, as a result of adverse weather conditions, the latest estimate is no more than 43 lakh bales. Normally, sufficiently large quantities of imports of foreign cotton would have saved the situation, but, as everyone knows, these are not normal times. Last season, i.e. during 1960-61, when the total Indian cotton production was 54 lakh bales, this country could import nearly 10.5 lakh bales. But, during the current season when the crop is expected to be lower by as much as 11 lakh bales, despite valiant efforts, it has not been possible so far to arrange for importing a sufficiently large quantity. What the authorities have allowed for import (5.10 lakh bales) plus the balance left over from the previous season is not expected to be more than 6.80 lakh bales. The total availability of cotton for the current season will, therefore, be less than 72 lakh bales. As against this, consumption by mills, exports, and extra factory consumption will together account for nearly 61 lakh bales to leave a balance of only about 11 lakh bales. This is, indeed, an alarming prospect for the coming season, and it is not surprising, therefore, that the authorities became panicky and set about taking a series of steps with the twin objective of ensuring (1) that the statutory ceiling prices fixed by the Textile Commissioner were respected, and (2) that the mills got their essential raw material within the prices fixed by the Government. The various methods adopted by the authorities for achieving these results include the scheme of requisitioning cotton right from the time the crop started moving, advice to trade and other cotton interests to keep all their purchases of 'Kapas' within the corresponding limits of the ceiling prices on the lint, provision for varietal distribution, compulsory survey, etc., not to speak of persistent efforts to import cotton from abroad. Theoretically, all these measures should have made it possible for the mills to obtain their requirements of cotton in sufficient quantities and at the statutory ceiling prices, but, as the authorities have themselves realised, this result could only have followed, provided everybody concerned played the game. There is official admission that one or the other of the concerned interests has always tried to evade his responsibility, so that prices have pierced the ceilings in respect of many varieties. May be, requisitioning of cotton at this stage helped some mills, but, by and large, it cannot be claimed that controls have served their purpose.

This ineffectiveness of controls, and that after giving the controls a fair trial for nearly two decades, has naturally prompted the question whether such controls should be allowed to continue indefinitely. Even the Indian Central Cotton Committee, which had all along been averse to the removal of floors and ceilings on cotton prices, recently passed a unanimous resolution recommending the removal of ceilings, in effect of controls. Although, unfortunately, the Cotton Advisory Board could not come to a similar decision unanimously, it is known that there was considerable support even among the members of that body for the view that the time has come for the removal of price controls on cotton. But this has not deterred the trade which continues to agitate for the removal of all controls on cotton.

The trade bases its demand for decontrol of the statutory ceiling prices on cotton on the following grounds:

(1) Price Control on cotton was introduced as early as in 1943 and there has been no material change in the ceiling prices fixed for the different varieties of cotton since 1951;

(2) Any further continuance of controls on cotton prices in the light of past experience would not only be unrealistic but also injurious to the interests of the country;

(3) There has been no such control on other commercial crops, with the result that the prices of the latter have risen in time with the general level of prices all round;

(4) if the present cotton prices are allowed to remain unchanged, there would be a diversion of the area under cotton to other commercial crops; and

(5) When control was first introduced on cotton prices in 1943, it was as a corollary to similar measures on cloth. Now that there is no overall control on cloth prices, there is no reason why only cotton prices should be controlled.

Although it would be too much to argue that decontrol of statutory ceiling prices on cotton would 'ipso facto' result in ensuring the target of 72 lakh bales as laid down in the Third Five-Year Plan, it would be equally wrong to maintain that the chances of the target being reached are any day better with the controls on. It is true that the ceiling prices today are not strictly the same as they were in 1950-51, but no one can dispute the fact that cotton prices today are more out of tune with the prices of other commodities than they were in 1950-51, which is the same as saying that, vis-a-vis his confreres, the grower of cotton has not had a fair deal.

Secondly, the statement of the official spokesman that the acreage under cotton is not governed, to any large extent, by considerations of price is as untenable as the argument of some cotton interests that de-control of cotton prices would automatically lead to the production of cotton touching the target. While it cannot be denied that there was a net increase in the acreage under cotton over the First Five-Year Plan period, it cannot also be denied that, over the Second period, there was a net reduction, as will be evident from the fact that the acerage under cotton in 1957-58 almost touched the 20-million acre level, whereas, in 1961-62, the area under cotton is expected to be no more than 19.5 million acres. As a matter of fact, the acreage had gone down much further i.e. to 18.8 million acres in 1959-60. Even though, for argument's sake, it may be broadly conceded that the area has remained more or less constant this is certainly not an achievement worth mentioning. Had there been no diversion of the area under cotton in favour of groundnut as in Gujarat and Maharashtra, the acreage under cotton would not have been static, but would have shown a sizable rise by reason of the special efforts made to augment the output of cotton in the country. To dismiss this trend as being of no consequence and to hope that the cultivator's conservatism will keep him tied down to the growing of particular commodities and he will be unwilling to switch over to any other crop is to shut one's eyes to realities. One could have afforded to take a complacent view of the "fairly constant acreage under cotton", had the position in regard to per acre yield shown a marked improvement. But what is the position? From an average of 97 lbs. per acre for the First Plan period, all the improvement that the country has registered is to raise this average to just 99 lbs. per acre for the Second Plan period (the estimated yield per acre for the current year is even lower at 91 lbs., compared to the highest yield during the past decade of 116 lbs. per acre in 1960-61). It is fortunate that the authorities realise that the per acre yield of cotton in India represents the lowest performance in the world and also that it is necessary to take immediate steps to increase the yield per acre, but to ask the farmer to wait until this is done in order to obtain better returns is unduly severely to tax his patience. This is all the more so, because as much as de-control or a higher price cannot be a sure guarantee for either increased acreage or increased yield, as maintained by the officials, the question of raising the yield per acre also does not follow the steps taken to increase the yield per acre, as a matter of course, thanks to seasonal variations.

When the advocates of de-control of cotton prices argue that the prices of cloth and yarn are not controlled, they cannot be said to be unaware of the existence of the voluntary control. At the same time, they cannot be debarred from having their own views on the effectiveness or otherwise of such voluntary control, notwithstanding the certificate of official spokesmen that this scheme has enabled the consumers to get cloth and yarn at reasonable prices. This apart, their experience of the adverse effects of the control on cotton prices on the quality of cotton in the country also has to be taken into account. If, as they allege, "due to price control on cotton, the superior varieties are generally mixed with inferior varieties, with the result that purity of seed has been lost and the work of the Indian Central Cotton Committee for the past so many years in that direction has been undone", the situation does warrant careful examination.

One has also got to take into account the possible effects of either a rise in the ceiling price of cotton or its de-control on cloth and yarn prices. For, being an important constituent in the cost of living index, cloth prices cannot be allowed to go up in the prevailing potentially inflationary context. But this fear according to cotton interests, is more imaginary than real. De-control of cotton prices, they say, need not necessarily mean a spurt in the price of cotton, although the initial reaction to de-control may be to take it up somewhat. If a multi-frontal approach is made to augment the output of cotton and the cotton production rises, it is quite conceivable that cotton prices may not only not remain high indefinitely, but actually come down, of course after a time lag. For this short interval, the mill industry must be prepared—and cotton circles feel the mills can afford to do so—to foot the higher cotton bill. Again, it should be borne in mind that the existence of the free and unfettered hedge market will take care of temporary dislocations.

In the same category as the fear of higher cloth prices if there is a de-control of cotton prices is the apprehension that removal of control on cotton prices will hit our exports, say the cotton circles. In any case, it would appear, too much is made of the advantage of the lower price of Indian cotton enjoyed by the Indian mills, as though this advantage has been exploited by them fully. While it is true that, 'vis-a-vis' countries such as the U.K. and Japan which are obliged to buy cotton at international prices, it is an advantage to India to get her cotton supplies at a lower cost, total cloth exports from this country over the past three years do not establish that the said advantage has been capitalised. Thus, against our cloth export target of 1,000 million yards, our actual exports were 814 million yards in 1959, 695 million yards in 1960 and 575 million yards in 1961! In other words, cotton circles contend, the great expectations entertained of the textile industry as a sizable foreign exchange earner has not at all been fulfilled. In the light of this allegation, it would be worthwhile for the Government to examine, the extent to which the cotton mill industry has contributed to the country's foreign exchange kit and also the extent to which it has drained it on account of imports of cotton, dyestuffs and other chemicals consumed by the industry.

But it is not for anyone to view this problem, which is fundamentally a national problem, either from the point of view of the cotton interests or from that of the mill industry. There are also so many aspects to this problem besides the price aspect which seem to warrant a thorough examination. If only for this reason, I feel bound to commend the suggestion made in cotton circles that the Government should appoint a high powered commission to deal with the cotton problem as a whole.

Business Notes

Banking

CREDIT INVESTIGATION NEEDED

THERE IS no gainsaying the fact that, during the last decade, the Indian scheduled banks have played a crucial and notable part in the development of the country's economy. The passing of the Banking Companies Act, 1949, which has imposed healthy restrictions on the working of banks and given larger powers to the Reserve Bank of India for helping, guiding, and controlling the banks, and also the sound and satisfactory manner in which the Indian scheduled banks themselves were managed, have led to the overall improvement in Indian Banking. Thus, between 1950 and 1960, the number of branches of scheduled banks in the country rose to 4,080 from 2,713, while their deposits increased from Rs. 754 crores to Rs. 1,714 crores. Again, while their advances moved up from Rs. 327 crores to Rs. 860 crores, their investments, chiefly in Government Securities, rose to Rs. 683 crores from Rs. 361 crores. On the other hand, the advances of all scheduled banks increased from Rs. 475 crores to Rs. 1,010 crores; in particular, advances to industry increased from Rs. 152 crores to Rs. 562 crores and those to commerce from Rs. 246 crores to Rs. 295 crores.

Reviewing the past ten years of progress in banking and highlighting some of the important developments during this period, Mr. Tulsidas Kilachand, Chairman, Indian Banks' Association, (I.B.A.), told that body's 15th annual general meeting, recently, in Bombay, that some of the policies and precedents, pursued and established by Mr. H. V. R. Iengar, the former Governor of the Reserve Bank, had found their full fruition in the past five years. Firstly Mr. Kilachand pointed out, a happy precedent had been established by Mr. Iengar, whereby, instead of issuing directives to banks, voluntary agreements were reached with them through discussions, which helped banks to understand better policies of the Reserve Bank; secondly there was the introduction of the practice of the Governor explaining to the public financial policies of the Government and the role of the Reserve Bank vis-a-vis the Ministry of Finance; thirdly, the introduction of the ingenious three-tier system of interest rates for scheduled banks' loans from the Reserve Bank provided a welcome relief; and, finally, a new dynamism was introduced into the State Financial Corporations by streamlining their procedure. However, while accepting the three-tier system of interest rates as a unique and ingenious system meant to secure the advantages of an increase in the bank rate without its drawbacks, on the one hand, and as an anti-inflationary measure for securing an abatement of the pressure of monetary demand (which is a contributory factor to rising prices of commodities) on the other, Mr. Kilachand felt that this system was not without its drawbacks since an increase in the bank rate would principally, "depress the market prices of shares and securities, in the latter of which banks and other institutions have had to invest large amounts and increase the cost of borrowing by Government." Further, the I.B.A. Chief observed: "The three-tier system has created distortion in the economy by making the cost of borrowing in the private sector almost double that of borrowing in the private sector and by preventing banks and other institutions, which are compelled to invest large amounts in Government securities, from obtaining a just and proper return on their fresh investments." In other words, Mr. Kilachand, stressed although not in so many words, the urgent need for the modification of this system in a manner that would serve the better interests of the banks in particular and the country in general.

Mr. Kilachand also referred to the problem of credit investigation. In this connection, he noted that, for quite sometime, the Reserve Bank had been wanting to set up a Credit Information Bureau which would collect information, every quarter, from banks regarding credit granted by them to their customers, pool the information and supply the consolidated data to the banks so as to enable the latter in time to detect excessive borrowing, if any, by their customers. Obviously, this scheme does not envisage the collection of information regarding the financial standing and creditworthiness of the borrowers, which the banks would have to find out. Accordingly Mr. Kilachand called for the establishment of private credit agencies such as those that exist in the U.S.A. and the U.K. Needless to say, as the I.B.A. Chief remarked, the need for such agencies is all the more imperative in the case of our country, where rapid industrial development has been taking place.

TOWARDS AN ASIAN CO-OPERATION

IN THE post-war era development banks have come to be accepted as instruments for initiating as well as providing capital and skill for development. In fact, beyond the centrally planned economies for a planned development, such institutions were essential. The banks, while providing finances for industrial projects sought to inculcate discipline in promoters and, by insisting on institutions, brought into being projects which were sound financially. Mr. G. L. Mehta, Chairman of the Industrial Credit and Investment Corporation of India, in his welcome speech at the Regional Conference for Development Banks in Asia held recently indicated that these banks carried out an independent examination of a project which assured the viability of an enterprise. "These are by-products of the operations of a development bank which are equally important to a developing economy. A development bank, in a sense, ensures planning at the project level". Mr. P. C. Bhattacharyya, Governor of the Reserve Bank of India, also stressed the same point when he referred to the technical appraisal of projects before rendering assistance. "Appraisal of term loan application has many facets: assessment of managerial competence, economic prospects of the borrower's products, technical feasibility of the project and financial appraisal". The development banks, therefore, have attained a unique position in the post-war economic development.

While it is true that each country has evolved its own pattern as far as development banks are concerned, it remains a fact that steps have to be evolved to facilitate mutual discussion of bankers associated with the development of banks. Several delegates at this conference felt that such institutions in their countries were hampered by shortage of funds and that of skilled personnel. This was natural because development banks were new to the Asian countries. As far as the finances were concerned, the gap in the resources was being bridged to some extent by government funds and funds from international agencies like the World Bank. Because of the lack of personnel in many development banks in Asia, top personnel had to be recruited from advanced countries. This conference naturally proved to be a fruitful effort.

Pharmaceuticals

AYURVEDA TOO CAN ADD TO OUR EXPORTS

THE INDIGENOUS system of medicine is still to develop and grow, and it has to do so in the face of considerable handicaps and prejudices. Even so, that Ayurveda is a scientific and rational system of medicine has ere now been thoroughly demonstrated by the pioneering efforts of enterprises like the Zandus. To many, the disclosure that 'Balshoolarka', an Ayurvedic drug manufactured by the Zandu Pharmaceutical Works Limited, is celebrating its Golden Jubilee, may come as a surprise. Started over fifty years ago, this firm of manufacturers of indigenous medicine, has so

far manufactured and put on the market some 1,500 different products. What is more — and this may not be known to many — the firm has also its own Allopathic Department which too has been manufacturing various medical preparations such as pills, tablets, as also biological preparations like liver extract, vitamins and protein Hydrolysate.

However, as Mr. G. M. Parikh, Director of Zandu Pharmaceutical Works Limited, pointed out at a recent Press Conference in Bombay, "in spite of our efforts to standardise our own products, we are aware that the industry in general, and this system of medicine, in particular, leaves much to be desired.....our progress and development depends on the progress of this system of medicine. The house of Zandu cannot prosper if Ayurveda itself is discredited". This concern for Ayurveda on the part of the Zandu Director is, indeed, commendable. If Ayurveda is to survive and thrive, it should get rid of some of the malpractices with which it is still associated. A very desirable move in this connection was made by the Government of Bombay when it appointed the Pharmacopoea Committee, under the Chairmanship of Pandit Shiv Sharma, to evaluate standards and to lay down standard procedures for the manufacture of Ayurvedic preparations. But as Mr. Parikh observed, unfortunately, nothing is as yet known about the findings of this Committee, even after the lapse of five years! It is just as well, therefore, that the Zandu spokesman called on the Maharashtra Government to expedite the publication of this report.

It is noteworthy that Ayurveda is not without its own modest contribution to this country's export trade. If Zandus have been able, as they claim, to export substantial quantities of their Ayurvedic preparations to Ceylon, Burma, the Fiji Islands, Middle East and East Africa, among other places, and if, as Mr. Parikh feels, the establishment of a separate wing or sub-committee for Ayurveda in the Export Promotion Council of Chemicals and Allied Products, would facilitate a further increase of these exports, there is no reason why the authorities should not act promptly and add to our export trade.

United Bank of India

INCREASE IN DEPOSITS

AT THE annual general meeting of the United Bank of India Ltd., Dr. N. N. Law, Chairman, dwelt at length on the bank's working and other problems connected with it. Dr. Law revealed that deposits have grown by 13.8 per cent over the last year and they compare favourably with the rise of 5.2 per cent for all scheduled banks and 10.7 per cent for scheduled banks excluding the State Bank of India. The rise has been well distributed throughout the year, enabling the bank to add to its investments portfolio and to meet the demand for advances without strain. The average ratio of advances to deposits was 68.6 per cent as against 65.9 per cent in 1960. Of the total advances 62 per cent was to industries and 28 per cent to trade and commerce; the comparative figures for 1960 were 66 per cent and 26 per cent respectively.

Dealing with the deposit insurance, Dr. Law pointed out that a scheme for insuring bank deposits has been initiated and steps have been taken to strengthen the capital base of banks. He, however, was of the opinion that the Deposit Insurance Corporation should so develop itself as to enable it not only to quickly spot the difficulties of the smaller banks, but also to provide suitable and timely assistance. Such assistance can be in the form of providing liquidity by way of providing redeemable capital, or by arranging amalgamation, where and when necessary, under its guarantee with regard to sticky assets enabling the bank taking over to assume 100 per cent liability to the depositors. Such a step would not only protect the depositor but would also ensure continuity of banking service to the borrowers and will, thus, have a stabilising effect on the economy.

Alkali and Chemical Corpn.

FROM PROGRESS TO PROGRESS

THAT THE Alkali and Chemical Corporation of India Ltd. is making an excellent progress is evident from the speech of Mr. A. R. Foster, Chairman of the Company, delivered at the 25th annual general meeting held at Calcutta recently. Sales and profits show a considerable increase over the previous year. Company's sales over the year have reached the record figure of Rs. 66 crores as against Rs. 5.4 crores in the previous year. Profits before tax have increased by Rs. 12 lakhs to Rs. 141 lakhs. Tax on current year's profit is Rs. 52.5 lakhs and the amount available for appropriation is Rs. 90 lakhs. In the light of these satisfactory results the Board feels justified in recommending that the dividend on the ordinary shares be increased to Rs. 1.50 per share. The Board has also allocated Rs. 20.5 lakhs to Dividend Equalisation Reserve, bringing the total on that account to Rs. 46.5 lakhs. Rs. 14 lakhs have been transferred to the General Reserve.

So far as production is concerned, it is interesting to observe that the polythene plant achieved a production of 4,000 tons in the previous year against the designed capacity of 3,500 tons. The performance of the plant in the year under review was even better and a total of about 4,700 tons was produced. Expansion plans are well on their way and construction on the site for the Rubber Chemical Project is proceeding at a satisfactory rate and it is expected that the plant will go into production within the next 12 months. Capital goods licence from the Government has been received and the construction work in connection with the Intermediate Density Polythene plant will be resumed soon.

East India Distilleries

ENCOURAGING RESULTS

AT THE 64th annual general meeting of the shareholders of the East India Distilleries and Sugar Factories Ltd., the Chairman, Mr. G. N. Noel-Tod while dealing with the problems of the sugar industry also dwelt at length on the progress of fertilizers. It is encouraging to find from the speech of the chairman that the construction of the compound fertilizer factory at Ennore is progressing satisfactorily and that it would contribute materially to the profits for 1962-63. There are even plans for doubling the capacity of this and an application has already been made to the Government for necessary permission. That the required permission will be forthcoming soon is now a foregone conclusion because the Government is encouraging the private sector to step up the output of fertilizers. So far as disposing of the output of compound fertilizers is concerned, there is not likely to be any difficulty as the company has already the necessary organisation.

The Visakhapatnam project is also making rapid progress. The contribution of the East India Distilleries' to this project is likely to be small because the American participants have taken the main responsibility. However the marketing of 350,000 tons of fertilizers annually would be undertaken by East India Distilleries and this is likely to contribute greatly to its earnings. When the doubling of the capacity of the Ennore factory is taken up, it will be necessary to find the additional resources and there may probably be an issue of equity capital at the appropriate stage. As regards ceramics, substantial progress has been made towards finalising a collaboration agreement with the well-known U.K. manufacturers' of Ceramic Ware, Messrs Doulton and Company Ltd. This agreement places at company's disposal technical advice of the highest quality and with this advice the company proposes to instal the third kiln plant at Ranipet and to improve the quality of output.

FROM THE CAPITAL'S CORRIDORS

NEW IMPORT POLICY

THE Government of India has announced its new import policy. A special feature of this policy is that for the financial year 1962-63, import licences in many cases will be issued on yearly basis, instead of for six months as has been the practice in the recent past. Reveral to annual licensing for some categories of imports follows the acceptance by the Government of Mudaliar Committee's recommendation in this respect.

Annual licensing will be done to the extent possible, subject to the availability of foreign exchange and will mainly cover the essential requirements of actual users both in the scheduled and non-scheduled sectors. Separate announcement will be made indicating the scope of annual licensing. Annual licences, where granted, will be subject to the condition that the first half of the annual licence can only be utilised within the first six months and the second half of the licence will, subject to such change in value and conditions as may be decided upon, be endorsed for utilisation in the second half of the validity of the licence. In other cases, licences will be issued for six-monthly entitlement/requirements as first instalment and supplementary licences covering next half-yearly entitlement/requirements will, subject to such cuts as may be decided upon having regard to the foreign exchange availability and other relevant factors, be issued in the next half year. (The system of annual licensing will provide relief to the importers inasmuch as they will, instead of making two half-yearly applications, submit the application for annual licence 'once'. This will also reduce the pressure of work on the staff of the I.T.C. Organisation to some extent and consequently lead to expeditious disposal of applications and other correspondence).

. .The initial period of validity of 12 months hitherto applicable to small value licences has now been extended to all import licences.

QUOTAS CUT

Having regard to the progress made by the indigenous industries, the stock position and other relevant factors, the import quotas have been reduced for items like oil line pipes and tubes; flexible pipes and tubes for passing gas or fluid; iron and steel screws; steel balls above 9/16" diameter; milling cutters; gear cutters etc.; electric insulation; thermocouples and pyrometers; electric motor starters; flexible metallic tubes; electric carbons; chemicals like hydrosulphite of soda; cation active finishing agents; textile preservatives; ultramarine blue and chemicals not otherwise specified; coal tar dyes; drugs and medicines also including Chloramphenicol, Oxytetracycline, Tetracycline, Glycero Phosphates excluding preparations thereof, and Vitamin C; printing material like brass rules and metal quoins etc.; radio parts; electric horns; fuel injection equipment and component parts thereof; piston rings and piston assemblies; fishing hooks; farinanceous and patent foods; parts of tape and wire recorders; roller composition; weighing machines; microscopes and accessories; laboratory balances and weights; electro-medical apparatus and vulcanised fibre in sheets; rods and tubes etc. The items like yeast, cartridges, Argon gas, Polyvinyl acetate resin powder, P.V.C. composition etc. have been banned.

A provision has been made, for the first time, to grant actual users' import licences for motor vehicle parts to co-operative societies with individual operators as members and having a fleet of 25 vehicles or above. Another new provision contained in the policy is that 'supplementary licences' will be granted to established importers of books for the import of books in sheet form only. (This provision will not only result in saving of foreign exchange, but will also provide additional

The basic period for certain items has been extended. The items for which the basic period has been extended are melleable iron pipe fittings, metal working saws, betelnuts, gum arabic, books and garage tools. Interchangeability of certain types of imports has also been provided in the new policy.

A provision has as well been made for allotment of newsprint to the extent possible to meet the requirements of additional circulation of existing newspapers and new newspapers.

With a view to helping the family planning programme, the quotas for rubber contraceptives and medicinal contraceptives namely Foam tablets have been liberalised.

The licensing work in respect of a number of items, which was hitherto centralised either at the Headquarters of the Chief Controller of Imports and Exports or at Port Offices, has now been mostly decentralised for the convenience of the trade.

Explaining the effects of the new policy, a spokesman of the Union Ministry of Commerce and Industry disclosed that a saving to the tune of Rs. 1 crore would be made owing to reduced quotas of established importers of various items. The policy by and large is rather more restrictive than during the past year. The spokesman also expressed the opinion that there is no justification for any increase in the prices of commodities for which import quotas have been reduced.

GOVERNMENT'S DECISION ON MUDALIAR COMMITTEE'S REPORT

Along with the announcement of the import policy for the next year, the Government has declared its decision on some of the recommendations of the Mudaliar Committee. The Government will bear in mind for the future the Committee's observations on "maintenance" versus "development" imports. Similarly, the Government has expressed its preparedness to entertain proposals for expansion of industrial capacity related to export targets and objectives and to provide assistance by way of advance allocation of foreign exchange to ensure that exports will take place.

Regarding the recommendations of the Committee on the issue of all import licences on an annual basis, the Government thinks that "as the foreign exchange position continues to be difficult and as percentage reduction of all imports would not permit of the available foreign exchange being utilised with due consideration for various items of priority, it would not be practicable to adopt annual licensing as envisaged by the Committee." The Government, however, has decided that all applications for licences should hereafter be on an annual basis. (This procedure is to be followed in the new import policy). But the import licences will be issued on an annual basis only to the extent possible. In respect of the rest of the categories of imports, the system of issuing half-yearly licence will continue.

Where annual licences are issued, these will be subject to the following conditions:

(i) Only 50 per cent of the face value of the licence can be utilised in the first half of the year.
(ii) The balance of the value will be utilisable only upon endorsement of the licence by the licensing authority with such change in value and other conditions as Government may decide.

PROCEDURAL MATTERS

The following recommendations of the Committee in regard to certain other procedural matters have all been accepted by the Government:

(i) The initial validity should be one year in the case of Actual Users' and Established Import- nd two years for CG/HEP licences

except CG/HEP licences issued against tied credits.

(ii) Except in the case of licences issued against tied credits, the power of revalidation should be delegated to the regional licensing authorities.

(iii) Normally, the validity of Established Importers' licences should not be extended, but in special circumstances such licences may be extended by three months.

(iv) Arrangements should be made for executing S.S.I. Committee's recommendations, as well as for attending to clarifications/appeals, at Headquarters.

(v) The C.C.I.'s Ad Hoc Committee should be more fully representative of the concerned technical officers of the Development Wing.

(vi) To expedite disposal of applications relating to scheduled industries, greater use should be made of inter-Directorate meetings.

(vii) Information regarding monetary ceilings for each licensing period should reach all the licensing authorities on the eve of the licensing period.

(viii) The application forms for the various categories of import licences should be examined with a view to simplifying them.

The Committee has also recommended that:-

(a) Actual Users' licences should be revalidated upto six months, and CG/HEP licences upto one year, upon request, without requiring the licence holder to produce evidence as to the unavailability of supplies.

(b) The IVC numbers should be valid for three annual licensing periods.

(c) As regards non-scheduled industries, the C.C.I. should evolve, on the eve of the licensing period, the general criteria for assessing essentiality, for the guidance of the Directors of Industries in issuing the Essentiality Certificates.

Recommendation (a) has been accepted so far as the period of revalidation is concerned, but the revalidation will be subject to the existing conditions and procedures. With regard to recommendation (b), the Government considers that I.V.C. period should be valid for two annual periods only. So far as recommendation (c) is concerned, the Chief Controller of Imports issues general instructions to the Directors of Industries at the beginning of every licensing period regarding the criteria for assessing essentiality, but it will be examined in consultation with the Directors of Industries, how the system could be made more effective.

DECENTRALISATION OF LICENSING WORK

The Government has also accepted the following recommendations of the Committee on the decentralisation of the licensing work:

(i) licensing of fresh fruits from Pakistan be decentralised, under a general policy laid down by the Chief Controller;

(ii) the requirements of the printing industry other than newsprint (e.g. printing machinery etc.) should be dealt with by the C.C.I's Ad Hoc Committee in the same way as for any other similar item;

(iii) all cases of investigation now dealt with by the 'newsprint cell', may in future, be handled by the Investigation Division, in consultation with the Registrar of Newspapers, whenever necessary.

As regards the licensing of newsprint, greases and lubricants, which the Committee would like to be decentralized, the Government proposes to maintain the existing system for the time being.

The Government agrees with the Committee that the entire TQR work (Transfer of Quota Rights i.e. recognition of new Established Importers and grant of quotas) should be decentralised. This recommendation will be fully implemented during the course of this year. The Government has also decided to appoint Public Relations Officers at the Headquarters and the regional offices of the C.C.I. & E., as recommended by the Committee.

The recommendations made by the Committee in regard to the publication by the Development Wing of an annual register indicating indigenous availability of raw materials, components and equipment, the Import Control Organisation's investigations into the import control cases and ICT and ITC classifications are still under the consideration of the Government. The Committee's view that ad hoc licensing should be minimised is acceptable to the Government in principal and efforts will be made to evolve procedures for dealing with items subject to ad hoc licensing. The Government has also accepted the Committee's recommendations for the creation of separate sections to deal with appeals at regional licensing offices and a legal cell at the headquarters.

The Committee's following recommendations in respect of aids and incentives to be provided to step up exports are receiving the attention of the Ministries concerned. Decisions on these will be announced in the near future:

(i) One of the most effective aids is to permit increased allocations of raw materials to industry, through additional imports. If internal allocations of foreign exchange do not allow of imports of marginally needed materials, components and equipment, certain case studies should be put to friendly countries to secure further assistance.

(ii) A revolving fund, to be called Import-Export Stabilisation Fund and administered by an autonomous body, should be set up to finance such additional imports.

(iii) Offers by foreign firms to finance imports of raw materials required by Indian export industries against rupee payment should be considered.

(iv) A three-fold system of income-tax remission should be introduced, viz,
(a) a tax remission on profits on basic exports,
(b) a tax rebate to enable the exporter to build an Export Development Reserve, and
(c) a special tax remission on additional exports.

(v) It is not necessary to resort to currency retention. Instead, the scope of the present Export Promotion Schemes should be widened to cover all exports. The exporter/manufacturer should be permitted to use the incentive licences to import a much wider range of raw materials, components and equipment for the manufacture of the export product and if the imported commodities are not required for a particular industry, they may be allowed to be sold to a sister industry. These concessions should be open to exporters as well as manufacturers, though the entitlement of the mere exporter (or the manufacturer who does not intend to use the store himself) may be only two-thirds of that of the manufacturer/exporter.

(iv) The Railways should grant a general rebate of 25 per cent on all goods put on board.

(vii) The special difficulties confronting certain export industries should be removed and in this connection the cases of tea, coffee and marine products have been mentioned.

(viii) A tariff of drawbacks should be drawn up for all, or at least the more important, items of export and the exporter claiming the drawback should be required merely to produce

hunger strikes
IN BANKING HISTORY

In the 3rd Century A. D. the 'hunger strike' was a weapon used in India for the recovery of loans. The method was called "dharna". The creditor posted himself outside the debtor's house and fasted till either the debt was paid or he (the creditor) died. The debtor usually paid up, for fear of being injured by the ghost of the man. Manu the Hindu lawgiver laid down five methods for the recovery of debt: "By moral suasion, by suit of law, by artful management or by customary proceedings a creditor may recover property lent; and fifthly by force."

Today friendliness and co-operation underscore banking transactions, especially when you deal with the Union Bank. The Union Bank has made a creed of *personalised service*, under which every depositor is treated as a Very Important Person. The Union Bank believes that a depositor's savings help not only himself and his family, but also the nation.

The Union Bank Helps People

SERVICES OFFERED: Current, Savings Bank and Cumulative Deposit Accounts; Fixed Deposits and Three-year Cash Certificates; Inland Bills, Demand Drafts and Telegraphic Transfers; Letters of Credit and Guarantees; Foreign Bills and Remittances; Loans, Overdrafts and Cash Credits; Sale and Purchase of Government Securities and Shares and Safe Custody; Standing Instructions accepted; Credit Reports and Trade Information; Safe Deposit vaults; TELEX contact with countries all over the world.

THE UNION BANK OF INDIA LIMITED
Registered Office: Apollo Street, Fort, Bombay 1. 61 Branches all over India

ASP/UBI-3

THE INDIAN BANK LTD.,

(Established in 1907)

REGD. OFFICE: INDIAN CHAMBER BUILDINGS, ESPLANADE, MADRAS-1

Offers complete Banking service of every description, backed by more than 54 years of sound experience

	Rs.
Authorised Capital	...1,00,00,000
Subscribed Capital	... 88,60,000
Called & Paid-up Capital	... 82,99,975
Reserve Fund	... 68,44,584

SISTA'S-18-2

evidence of export and receipt of the right amount of foreign exchange.

(ix) The Central Government should assume the responsibility for the remission of the sales tax entering into export costs; a uniform rebate of say 2 per cent should be granted.

(x) The drawback of import duties, excise duties and sales taxes should be given at one central point, e.g., the Collector of Customs.

(xi) Leaders of industry and trade should be induced to levy a small cess on products sold for domestic consumption, utilising the profits for subsidising exports. The Committee is not in favour of compulsory exports.

The Government has taken note of the Committee's suggestions and recommendations on participation in international trade fairs, forging of liaison with merchants abroad, the role of chambers of commerce, tourism, rupee payment arrangements, State trading, bartar trade and quality control in stepping up exports, publication of a directory of exporters, strengthening of India's commercial representat.on abroad, provision of export risk guarantees, making available of additional staff to the office of the C.C.I. & E., and desirabili y of inter-change of staff between that office and the Directorate of Export Promotion and C.B.R. Action will taken on these matters to the extent practicable in consultation with all concerned.

NEW INCOME-TAX RULES

Rules framed under the Income-Tax Act, 1961 came into force with effect from April 1, 1962, replacing the earlier rules. The new set consisting of 119 rules, one appendix and 51 forms, is self-contained for the purposes of implementing the new Act. The new rules consolidate, rationalise and simplify the old rules to a large extent. The old rules had been interspersed over six sets. They had been amended from time to time and, as a result, suffered from a comparative lack of coherence and logical arrangement. The new rules have been arranged and grouped together in 15 parts, each dealing with a particular subject. The forms drawn up under the new rules form a separate appendix to facilitate reference. The schedule showing rates of depreciation has been arranged alphabetically to ensure speedy reference to find out the rate of depreciation applicable to any item of machinery.

The substance of the rules has also been simplified and the language amended, wherever necessary, to bring it in line with the new Act. Some of the more important points relating to the new rules are briefly listed below:

Return of Income: A simplified return for persons whose income consists solely of salaries, interest on securities or income from other sources has been newly added.

Assessment Form: A single form showing details of income and tax liability has been devised which will be sent to the assessee and also used for departmental purposes. This eliminates duplication of work by the same data being compiled twice under the old rules.

Registration of Firms: So far, there had been a great deal of uncertainty regarding some aspects of the law relating to registration of firms. In order to reduce the field of uncertainty and avoidable litigation, the new rules set out comprehensively the requirements to be complied with by tax-payers under different circumstances. Separate forms have been provided for cases where there is no change in the constitution of the firm and where there is a change. It has been specified as to which instruments of partnership should be submitted along with the application for registration. Clarification has also been provided as to which instrument of partnership should be registered on whose basis registration will continue to be available in subsequent years.

Returns regarding Salaries paid and Tax deducted: The old rules required an employer to furnish, in addition to an annual return, a monthly return giving almost the same details as the annual return. The monthly return has now been greatly simplified and only broad information will have to be furnished. Full details have been left over for the annual return.

Appeals to Appellate Assistant Commissioners: The diversity of 14 forms which sometimes led to inconvenience for the appellants, has been replaced by a single form. This has been devised to meet the requirements of all circumstances.

Lump sum Royalties etc., for Literary or Artistic Work: It has been proposed that wherever the time taken for the completion of a literary work or an artistic work exceeds 12 months, receipts received by authors and artists should be spread over 3 years. This will increase the scope of the present concession by making the 3-year period of spread-over applicable also to cases where the time taken is more than 12 but less than 24 months. The new facility also reduces the difficulties expressed in ascertaining the exact time spent in the completion of the work. It has also been provided that in the first year, tax on two-thirds of the royalty etc. will be recovered at the rate applicable to one-third of such royalty. Credit for such tax will be given in the next two assessments.

Dividends paid by New Industrial Undertakings: A new rule has been made laying down the manner in which the exempt portion of a dividend paid by a new industrial undertaking to any shareholder should be determined. The dividend paid by a company will be regarded as having been paid in the first instance out of, and to the extent of, the profits which are exempt in the hands of the company under the scheme of tax holiday. The corresponding portion of dividend will be exempt from tax in the hands of shareholders.

Life Insurance Premia paid by Authors and Artists: Broadly speaking, it is proposed to increase the rebate on account of Life Insurance premia paid by authors, artists etc. to 33-1/3 per cent of the professional income or Rs. 12,000 whichever is less.

Income-tax Practitioners: Procedure to be followed by the Commissioner of Income-tax before disqualifying any Income-tax practitioner who is found guilty of misconduct in connection with any income-tax proceeding has been prescribed. Provision has also been made for the maintenance by each Commissioner of Income-tax of a register of Income-tax practitioners who have been practising in his area for more than a year. The scheme of registration is, however, optional.

Approved Superannuation Funds. The new Income-tax Act provides for rules to be made for various purposes connected with the approval of superannuation funds. Sixteen rules which deal with this subject are mostly based on the existing practice.

Approved Gratuity Funds: Fourteen rules deal with this subject and they follow broadly the same pattern as those relating to approved superannuation funds. It is pointed out that the contributions which an employer may make to such a fund are restricted to 8-1/3 per cent of the employee's salary for each year of service. In other words, the annual contribution should not exceed one month's pay.

COMMONWEALTH PRIME MINISTERS' CONFERENCE

The British Prime Minister has written personal letters to the Commonwealth Prime Ministers, enquiring from them whether September 10, 1962, would suit them for a conference in London to discuss the implications of Britain's entry into the European Common Market. It has been suggested that the Prime Ministers should bring with them their Finance Ministers. Suggestions have also been invited in regard to the consultation machinery to be set up during negotiations

of the United Kingdom with the European Common Market Organisation; whether the Commonwealth countries would prefer to send their own Ministers (as was done by Australia recently) or would they like a British Minister to visit them (as was done in the case of Canada).

ESSO STANDARD EASTERN

The Flying Red Horse has disappeared from all the petrol stations controlled by the Standard-Vacuum Oil Company in India and has been replaced by the word "Esso" enclosed in an oval. This change has come about as a consequence to the separation of the two partners in Stanvac — the Standard Oil Company (New Jersey) and Socony Mobil Oil Company. After reorganisation and renaming, Stanvac has become Esso Standard Eastern.

The assets of Stanvac have been divided between Jersey and Mobil largely on geographical basis. In a few areas, however, Jersey and Mobil will continue to share joint ownership of the property and operations of Stanvac.

As an integrated company, Esso Standard Eastern will be engaged in the search for oil and in the production, refining, manufacture, transportation and marketing of oil, petro-chemicals and other oil products in an area whose combined population of 800 million people represents more than a quarter of the world's population. It will operate in Japan, Korea, the Phillipines, Taiwan, Vietnam, Cambodia, Laos, Thailand, Malaya, Singapore, Borneo, Burma, India, Ceylon, Pakistan, East Africa, Madagascar, Australia and Indonesia. In Indonesia, Stanvac's producing, refining and marketing operations will continue to be under joint ownership, but Jersey will have the responsibility of management.

Both the former owners of Stanvac are free to enter any territory where they are currently not operating. Secony Mobil Oil Company, thus, is not debarred from trading in India provided the Government grants it permission to do so. It will have to build its organisation here from a scratch.

Esso Standard Eastern will fulfil all the contractual obligations that have been made by its predecessor — the Standard-Vacuum Oil Company — to customers, agents, dealers, suppliers, employees and Government. Esso Standard Eastern, thus, will now carry on with the Government of India negotiations for setting up a lubricating oil plant and a petro-chemicals plant in this country, which were started last year by Stanvac.

According to the proposal, the lubricating oil plant will be a Government of India-Esso joint venture, each party having equal share in the equity capital and management, more or less on the pattern of Oil India Limited. The petro-chemicals project will be a joint venture of Esso Standard Eastern and the Indian public and will be controlled by a rupee company. The Indian public is envisaged to have 40 per cent share in this Company. Esso will have the remaining 60 per cent share. Esso will be responsible for making available all the foreign exchange that will be required for the project, either through its contribution to its equity capital or through raising of loans from the U.S. banks and also from European banks if necessary.

The company desires to set up this petro-chemicals plant with a capacity of 2 lakh tons. The Government, however, has uptil now agreed to allow it to set up a plant with a capacity of one lakh tons — the original capacity that had been asked by the company.

Esso Standard Eastern is also likely to take up afresh the business of oil exploration in this country. Stanvac's negotiations with the Government of India for oil prospecting in Rajasthan area broke down last year. Esso will now look for oil in some other area. Its new set-up, it is hoped, will facilitate an agreement being reached between it and the Government as now there is only one share-holding company which has to be consulted, instead of two which owned its predecessor, the Standard-Vacuum Oil Company.

TWO NEW LOANS FROM U.S.A.

The U.S. Government has authorised a third loan of $100 million to the Government of India to finance imports of critically needed industrial and agricultural commodities.

The three loans, totalling $220 million, will be utilised by India to finance "maintenance imports," which will serve both to maintain and expand capacity of India's industrial sector, and to permit higher rates of utilisation of the present installed capacity.

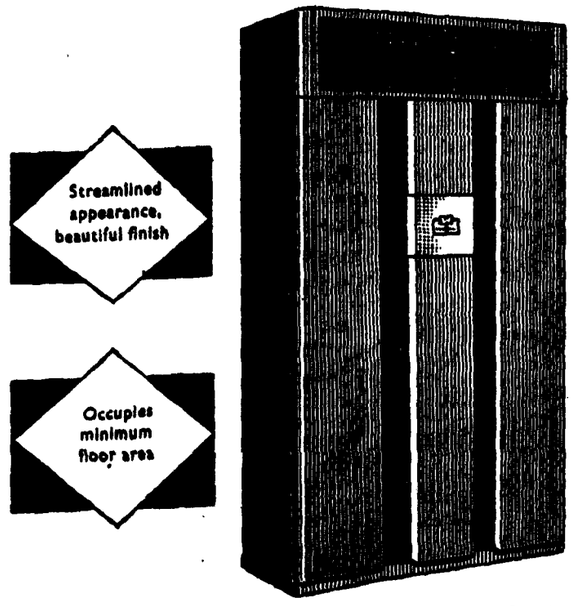
The first of these three non-project import loans was signed on October 26, 1961, and covered imports of non-ferrous metals worth $20 million.

The second non-project loan of $100 million was to finance imports of many raw materials, components and machinery including the following: non-ferrous metals, steel, fertilizers, synthetic tyre cord yarn, sulphur, carbon black, wood pulp, lubricants, synthetic rubber, other chemical materials, automobile components and spare parts, machine tools, rollers for steel plants, and other general purpose components.

Last week the governments of India and U.S.A. concluded an agreement covering a loan of Rs. 256.8 crores to India from the sale proceeds of agricultural commodities supplied to this country under the fifth U.S. Public Law 480 agreement which was concluded on May 4, 1960.

The loan of Rs. 256.8 crores will be utilised by India to meet the local currency costs of many economic development projects including hydro-electric and thermal power stations such as Sharavathi, Cambay, Bandel, Amlai and Talcher.

The fifth U.S. PL 480 agreement with India was the largest agricultural commodity agreement ever signed by the United States. Together with its supplements, the agreement provided for the sale of food and fibre valued at $1,370 million (Rs. 652 crores). The four previous U.S. PL. 480 agreements covered commodities worth $967.5 million (Rs. 461 crores). India pays for these supplies in rupees.



The United States will give India grants equivalent to 42½ per cent of the sale proceeds of commodities supplied under the fifth agreement to finance social, educational, health and other development projects. Five per cent of the sale proceeds is reserved for loans to private enterprises under the Cooley Fund and 10 per cent for the expenses of the U.S. Embassy in India. The 1960 agreement stipulated that a loan agreement, the one signed today, would be effected later covering the remaining 42½ per cent of the sale proceeds.

TARAPOREWALA NUCLEAR POWER STATION

Seven parties, belonging among other countries to the United Kingdom, the United States and France, have submitted tenders to the Government of India for setting up the nuclear station at Taraporewala, near Bombay, involving a capital outlay of Rs. 51 crores and having a capacity to produce 300 m.V. power. The real tussel for securing the contract appears to be between the French and the U.S. interests. India's reaction to the best British tender is that it is rather too high. Another comment heard in this connection is that Britain is interested in palming off to India its out-dated equipment. A third difficulty likely to be experienced in the case of British interests securing the contract is that financing of this nuclear power station would have to be outside of the assistance which Britain has promised to provide under the aegis of the Aid India Club. How far the British Government would be able to provide additional finances for this project it is difficult to say.

So far as the U.S. interests are concerned, they had

TELL US YOUR JOB—

AND WE'LL GIVE YOU THE TOOLS

The size, shape or complexity of a project doesn't overawe us. We have the tools to help build it with a minimum of time, labour and cost. For nearly 70 years, BATLIBOI have supplied Industry and Trade in India with goods ranging from complete power plants to hacksaw blades. We represent internationally known manufacturers from the United Kingdom, U.S.A. Czechoslovakia, France, Germany, Japan and many other countries. BATLIBOI also represent some of India's leading manufacturers of Machine Tools, Diesel Engines and various other types of machinery. Industry and Trade are vitally connected with the economic growth of any country, and BATLIBOI are vitally connected with Industry and Trade in India.

at one stage declined to finance this project, presumably following a report from the World Bank. Opinion now seems to have changed.

France appears to be interested in securing this contract primarily because it would like to claim having assisted India in setting up a specifically crucial project for this country's industrial development.

Negotiations are expected to start shortly both with the U.S. and French tenderers. The station is scheduled to be commissioned into operation by 1966.

NOTICE TO INDUSTRIAL LICENCEES

The Union Ministry of Commerce and Industry, it is understood, has decided to issue "show cause" notices to all holders of industrial licences who have not taken any tangible steps in the last twelve months towards commissioning the projects for which licences have been granted to them. It is felt that a number of persons have taken licences to set up industrial units for starting of which they have neither the means nor the requisite aptitude. They thus, it is construed, are blocking out genuine industrialists in some fields where the Third Plan capacity targets have already been reached by the issue of licences already granted. The replies to these "show cause" notices would reveal how far the licences already issued are likely to prove infructuous.

The licencees who have not yet made any concerted attempts to implement their projects may have to forego these licences, in order to enable the Government to consider further applications in these fields.

MANUFACTURE OF NEWSPRINT

The Chairman of the Anglo-Newfoundland Development Company, Mr. E. M. Little, has been here recently to study the Indian newsprint market with a view to exploring the possibilities of Canadian newsprint manufacturers setting up a newsprint mill or mills in this country. He expressed the hope that the Canadian newsprint industry could come out to India in a big way. The coming months should show how far he would be able to presuade his colleagues in Canada to invest in newsprint manufacture in this country.

SWITCH-OVER TO FURNACE OIL

The controversy over the switch-over from coal to furnace oil by industries in Gujarat and Maharashtra continues without any definite decision being taken. The industry would like to effect this switch-over at competitive fuel costs. The Government, on the other hand, would like to retain the existing excise dufy on furnace oil as also keep the foreign exchange expenditure on imports within bounds. Within these limits, all appear to be agreed that in the interests of stepping up industrial production, switch-over from coal to furnace oil for power generation is called for.

L.I.C. ADVANCES FOR SETTING UP INDUSTRIAL ESTATES BY CO-OPERATIVES

Industrial co-operatives and joint stock companies will now be able to obtain credit facilities from the Life Insurance Corporation of India for setting up industrial estates.

Under a new scheme, formulated by the Union Government, the L.I.C. will grant loans to industrial co-operatives and joint stock companies to the extent of 60 per cent of the total cost of the industrial estate. Before the loan from the Corporation is drawn, the co-operative or the company should have raised the balance of 40 per cent by way of capital, or partly by way of capital and partly by way of State Government loans.

In this respect, the Union Government has advised the State Governments on the desirability of advancing 15 to 20 years term loans to industrial estate co-operatives and companies to meet the gap between the amount raised by them and the minimum margin stipulated.

The State Government should also give 100 per cent guarantee for the loan advanced. The loan will be first instalment being payable at the end of the three years from the date of loan.

The establishment of industrial estates on co-operative basis has recently attracted small industrialists. It is expected that during the Third Plan period, one hundred such co-operative industrial estates would be set up all over the country.

MINING OF IRON ORE IN ORISSA

The Planning Commission has approved, in principle, the development of iron ore mines in Orissa to produce 2 million tons of iron ore per annum subject to (a) the State Government accommodating the scheme within its overall ceiling, (b) the railways being able to move the surplus production from this area — surplus to what can be handled through Paradip port — through Calcutta or Visakhapatnam as the case may be, and (c) the availability of foreign exchange of Rs. 1.376 crores required for the implementation of the mining project.

IRON ORE SALES TO JAPAN

The following iron ore sales contracts have been concluded with the Japanese steel mills.

Grade	Period of Supply	Quantity (In Tons)
65/62% Fe.	December 1960 — March 1962	17,50,000
	April 1962 — March 1963	20,00,000
	April 1963 — March 1964	22,50,000
	April 1964 — March 1968 at the rate of 22,50,000 tons per year.	90,00,000
62/60% Fe.	Sept. 1960 — 15 April 1964	4,50,000
65/65% Fe.	April 1961 — December 1962	3,00,000

These quantities are in addition to the quantities the Japanese steel mills will be purchasing from Rourkela and Bailadila under the long-term agreement concluded sometime ago. From Rourkela, Japan has agreed to take 2 million tons per year from 1964 for a period of ten years and from Bailadila project 4 million tons per year from 1966 for a period of 15 years.

IN BRIEF...

The Government of India has under consideration several proposals for import of cotton and staple-fibre in order to mitigate the shortages of these two raw materials during the current year. An announcement in this regard is expected to be made shortly—as soon as negotiations with various countries are completed.

*

Negotiations are in progress with the Soviet Union for the import of four units of 100 MG. generators. Three of these are to be installed at Pathratu,, in Bihar, and the fourth one at Neyvelli, in Madras. Discussions with the Russian authorities on the technical suitability and delivery of these units are being carried on.

*

The National Coal Development Corporation has decided to increase the output of coking coal from the Kathara colliery, in Bihar, to 3 million tons per annum. The present capacity of the colliery is 1.5 million tons per annum. The decision, it is learnt, has been necessitated by the input requirements of the washery being set up at Kathara with Soviet collaboration.

*

Letters have been exchanged between India and Greece by virtue of which the validity of the current trade arrangements between the two countries have been extended upto December 31, 1962. Three new items, namely alumunium and copper sheets, copper wires and exposed cinematograph films have been added to the list of commodities available for exports from Greece to India. The list of goods available for expor

COMPANY AFFAIRS

BANK OF BARODA

The Bank of Baroda during the year to December 31, 1961, made steady progress in terms of profits, deposits and advances. The net profit for the year, after providing for taxes and depreciation, amounted to Rs. 68.73 lakhs which was nearly 50 per cent more than last year's profit of Rs. 41.69 lakhs. Deposits towards the end of the year were at Rs. 95.46 crores which shows an advance of Rs. 10 crores during the year. Advances also increased by nearly Rs. 10 crores and were around Rs. 70 crores. The Bank has improved its position in respect of its ratio of advances to deposits which has been reflected in the profits. An interim dividend at the rate of 14 per cent per annum subject to taxation was paid for the half year to June 30, 1961, which absorbed Rs. 10.50 lakhs. The directors have now recommended the payment of dividend at the rate of 20 per cent per annum per equity share for the remaining half year to December 31, 1961, subject to deduction of tax, making in all 17 per cent for the whole year.

Under the scheme of amalgamation, the New Citizen Bank of India Ltd. was amalgamated with the Bank of Baroda with effect from April 29, 1961. The Bank took over the readily available assets of the New Citizen Bank of India of the value of Rs. 1.69 crores as laid down in the scheme after providing in full for outside liabilities. Every depositor of the Bank was in the first place given credit to the extent of Rs. 250 or for balance in the account whichever was less. In the next place balances above Rs. 250 were paid at the pro rata share calculated at 0.66 nP. in a rupee in respect of the balance of each account. As a result of the amalgamation of the former New Citizen Bank of India all its 44 branches started functioning as the branches of the Bank of Baroda. During the year the Bank put up its own building in East Africa at Campala, Uganda which was in addition to the Bank's building in Nairobi. The Bank has also started mobile banking service under the control of its Kisumu Kenya branch for the benefit of six surrounding villages. The Bank has opened new branches during the year at Chandigarh, Indore, Ahmedabad, Bombay, Calcutta, Delhi, Baroda and Suva in Fiji Islands. More branches are likely to be opened which naturally will lead to further expansion.

NEW ISSUES

Seven companies, including a new one, have been authorised to raise capital totalling over Rs. 2.14 crores.

The new company will offer part of its issue to its foreign collaborator. Another company is issuing part of its fresh capital to finance subsidiaries. The consents for six companies is valid for 12 months and for the seventh for two months. Following are the details:

Pyrotenax India Limited, Bombay, a new company, has been granted consent to issue a capital of Rs. 55 lakhs at par. Of this, shares of the value of Rs. 27.50 lakhs will be offered for subscription to Pyrotenax Limited, U.K. The proceeds of the issue will be utilised for the manufacture of pyrotenax mineral insulated copper covered.

Larsen and Toubro Limited is to raise Rs. 55 lakhs in equity shares of Rs. 10/- each, for cash, to be issued at a premium of Rs. 8/- per share. The money will be used for financing certain subsidiaries and providing for working capital. The consent is valid only upto May 31, 1962.

Bennet Coleman and Company Limited, Bombay is to issue debentures of Rs. 50 lakhs divided into five thousand 7 per cent redeemable mortgage debentures of Rs. 1,000/- each for cash at par. The capital is intended to finance the modernisation and expansion of the company's printing presses at Bombay and Delhi undertaken in 1961, and construction of the company's own building for housing the presses and offices of Delhi at Mathura Road.

U.P. State Industrial Corporation Ltd., Kanpur, is to issue further capital of Rs. 20 lakhs in equity shares of Rs. 100 each for cash at par. The Corporation has paid-up capital of Rs. 25 lakhs.

Indian Drugs and Pharmaceuticals Limited, Delhi, is raising further capital of Rs. 20 lakhs in equity shares of Rs. 1,000 each for cash at par. All the shares will be taken up by the Government. Indian Drugs has an issued paid up capital of Rs. 80 lakhs.

T. I. Diamond Chain Limited, Madras, is issuing further equity capital of Rs. 10 lakhs for cash at par privately. The proceeds of the issue will be utilised partly for the repayment of loan of the holding company and partly for the purchase of plant and machinery.

Tanjore Permanent Bank Limited, Tanjore, will raise further capital of Rs. 4,23,450 divided into 16,938 equity share of Rs. 25 each. Rs. 15 per share to be called up at par for cash. The proceeds will be used for strengthening the Company's capital base. The present paid up capital is Rs. 3,56,230.

Company Meetings

KAMANI ENGINEERING CORPORATION LTD.
BOMBAY

Summary of the speech of Shri R. H. Kamani, Chairman, Kamani Engineering Corpn. Ltd. at the 16th Annual Meeting of the Shareholders on 30th March, 1962 at the Office of the Company at Bombay.

Extending a cordial welcome to the Shareholders of the Company Shri R. H. Kamani, Chairman of Kamani Engineering Corporation Ltd., Bombay, presented the Directors' Report, Audited Profit & Loss Account and the Balance Sheet and proposed them adopted.

ACCOUNTS

Referring to the working of the Company as per the Balance Sheet and Profit & Loss Account, he said that the results for the year under review were good, with profits before providing for depreciation and Managing Agents' remuneration showing a substantial increase over the previous year. Sales increased to Rs. 2,68,68,131 from 2,36,89,673.

Enumerating the allocations Shri Kamani stated that the allocations included Rs. 1.60 lakhs for Managing Agents' remuneration as against previous year's figure of 1.62 lakhs and Rs. 5.85 lakhs for depreciation as against 4.89 lakhs for the previous. The provision for taxation had been increased from Rs. 6.70 lakhs to 9.25 lakhs and the development reserve from Rs. 0.23 lakh to Rs. 0.40 lakh. The general reserve and gratuity absorbed Rs. 1 lakh and Rs. 0.10 lakh against no absorption in the previous year.

He announced that the Directors have recommended a dividend of 9 per cent (subject to deduction of tax at source) on ordinary shares as against previous year's 8 per cent (subject to deduction at source). They had also recommended dividend on Preference Shares. After providing Rs. 4.78 lakhs for the proposed dividend a sum of Rs. 5,162 has been carried forward against Rs. 3,381 brought in.

PRODUCTION

The production tempo had further accelerated during the year under review, the production having registered a slight increase over previous year's production, he told the meeting. Remarking on the availability of Steel, Shri Kamani stated that although the position had somewhat eased, certain lighter sections required for Transmission Line Tower Industry continued to be difficult, in spite of which, however, the production reached an all time record of 2107 metric tons for December, 1961. The production level maintained at present was on an average 50 per cent higher over the year under review.

Shri Kamani observed that the requirements of Transmission Lines during the Third Five-Year Plan will be about 15,000 miles. This will require, according to Shri Kamani, about 200,000 tons of towers for the Third Plan period, during which the generation of electric power will be raised from 5.8 million kilo-watts to 11.6 million kilo-watts. To achieve these targets, it was absolutely essential that the lighter sections required by the Tower Industry be made easier, Shri Kamani added. He informed the Shareholders that the Government has already appointed a Study-Group to assess among other things, the capacity in the Transmission Line Tower Industry and their development programme and to examine the difficulties experienced by them and he hoped for a good outcome.

ERECTION

Referring to the Erection activities, Shri Kamani stated that the Erection Dept. had been further strengthened and expanded and now it was one of the largest units of its kind in the country. New tools and tackles have been designed, tested and put to operation to ensure greater efficiency. During the year under review, the Chairman said, the construction of land route of the 220 kV Koyna—Bombay Transmission Line was completed. This was the first 220 kV line in the country to use one of the largest size conductor ever used and the terrain namely Western Ghats was one of the most difficult ones. He also informed that at present construction work is going on in various parts of the country viz: Behrampur, Burdwan, Chakradharpur, Chittaranjan, Daltangunj, Jammu, Nadiad and Villupuram.

Shri Kamani was glad to inform the Shareholders that satisfactory progress was being maintained in the execution of this pioneering work and that the most complicated operation of wiring was being carried out to the satisfaction of the authorities without the help of any foreign experts. There were only ten firms in the world today who could undertaken such a complicated job and he was glad their firm was one of them.

"TRACTAMOUNT" ROAD ROLLER

Shri Kamani referred to the successful launching of the production of the completely new and improved Model MARK II "TRACTAMOUNT" ROLLER, as a result of experience gained on earlier models already in use in the country, with the active collaboration of M/s. E.V. Twose (Mfg.) Ltd., England.

EXPORT

It was a matter of gratification to note that the active efforts put in by the Company since about two years had started showing some good results. However the Company had to face severe competition in the export market from well established international manufacturers which was becoming increasingly difficult in the absence of adequate facilities and active support of the Government. Shri Kamani said that the measures suggested by the Mudaliar Committee are under active consideration of the Government. He felt that it was important that these recommendations and various other progressive measures are implemented by the Government at an early date in order to encourage additional exports of specialised engineering goods like Transmission Line Towers.

AGENCY BUSINESS

Shri Kamani referred to the Agency Business as satisfactory and found ample scope for business with the increased tempo of the Third Five-Year Plan, as was evident from the fact that the Company had recently secured business for Kandla Thermal Power Station in Gujarat valued above Rs. one crore. He thanked all the workers and the staff for their good efforts and co-operation and the Shareholders for the continued encouragement for the present achievements and bright future.

NOTE: This does not purport to be a report of the proceedings of the Annual General Meeting.

ASIAN CABLES CORPORATION LIMITED

Extract of the Speech of Shri G. B. Kotak, the Chairman of the Asian Cables Corporation Ltd., delivered at the Second Annual General Meeting of the Company.

Gentlemen,

I should not fail to express my happiness to have this opportunity to meet you all once again to review the progress of the Company and the prospects of the industry in which we all have a stake. I may assure you that your presence at this meeting, besides being an evidence of the keen interest that you all evince in the working of the Company, will certainly be a source of inspiration to the Management to work more arduously for better achievements. I am reminded here of the assurance that I gave you last year that your confidence in the Management will be fully justified by the sustained progress of the Company's undertaking which was soon expected to start yielding results. And I am very happy today to report that the optimism I expressed in the working of the Company at that time has been fully realised in the shape of solid results in as much as, firstly, the Company's first cable plant has gone into production according to schedule, and, secondly, the first cables that came out of the factory have turned out to be of very good quality as has been proved by the results of Alipore Test House. As stated by your Directors in their report which is with you, the Enfields' representatives who recently visited the factory were very much satisfied with the processing techniques and also with the quality of the products which according to them was as good as that of Enfield Cables in England.

More than a million and quarter core metres of cables have been manufactured uptil now and the production is progressively increasing as more and more skill is being acquired by the operative trainees working on the machines. At the present rate of progress, I expect a production of the value of Rs. 40-50 lakhs during the current year, which would be considered quite satisfactory in view of the fact that this will be the first year of production. Our present production schedule covers cables from the smallest size with 1/1.12 mm conductor to flexible cables of largest size with 37/2.12 mm. conductor. These popular sizes include (1) Braided and Compounded Cables, (2) Taped, Braided and Compounded Cables, (3) Tough Rubber Sheathed Cables, (4) Glaced Cotton Braided Flexible Cords and (5) Tough Rubber Sheathed Flexible Cords. We have also commenced production of special cables like Welding Cables and Trailing Cables.

I may say that this by itself constitutes a signal achievement in the first few months of production, a success which is rarely achieved by any industry in such a short span of time. If this progress is maintained, and I have no doubt about it, we should not be surprised if the Asian Cables very soon capture the confidence of the consuming public — individuals and institutions alike, — by their superior quality and perfect workmanship.

I had given to you a picture of the needs of the country for the electric power at the last Annual General Meeting. I had then told you that from 6 million kW target for the Second Five-Year Plan the Third Five-Year Plan was to generate about 13.5 million kW. But the Planning Commission looks much further ahead. In the Fourth Plan the target for the power generation is expected to be about 30 million kW and within 20 years the demand for power is expected to be near 400 million kW. All these will need enormous quantity of cables to conduct the power to the consumers. With QUALITY goods in our factory and tremendous demand outside, I feel confident of reasonably good returns on your investment in this Corporation.

In Project II of our Corporation, we shall be manufacturing about 1,000 miles of Power Cables and 360 tons of Enamelled Copper Wires (Magnet Wires). The most noteworthy feature of our expansion is that our programme covers the manufacture of power cables upto 33 KV, which no other Unit is manufacturing at present as this requires very high order of technique. At present the country has to depend for its requirements of 22 KV to 33 KV cables entirely on the imports from foreign countries.

In this Second Project to manufacture power cables we are being helped by two of the World's most well-known and reputed manufacturers viz. Messrs. Phelps Dodge Copper Products International Corporation of U.S.A. and Enfield Cables Limited of U.K., both of whom have long years of experience behind them to ensure our products a high quality.

The drawings, designs and layout for the Project II are now ready. The list of machinery has been received from the Collaborators and we are applying to the Government for import licences for the machinery both for Power Cables and Enamelled Wires.

Messrs. Kotak & Co., Promoters of Asian Cables Corporation Limited, had applied in the middle of 1960 for an Industrial Licence to start the Rod Rolling Mill, very necessary to a Cable Plant, with a capacity of rolling 20,000 tons per annum per shift. Two other manufacturers had also applied to the Government. Instead of granting licences to any one of the three applicants, the Government asked the three applicants to join together and start a joint Rod Rolling Mill and in that case the Government would grant a licence. A meeting of the Cable Manufacturers of this part of India (Western India) was called and all of them agreed to participate in the joint Rolling Mill and asked M/s. Kotak & Co. to proceed with the scheme. As a result, the licence to start the Rolling Mill has now been granted by the Government to M/s. Kotak & Co. for the joint venture.

During the course of the short period of the Company's existence, the Management did have its trials and tribulations, which it has successfully weathered. I am proud to tell you that with the steadfast devotion of a happy team of loyal staff who have stood to their post with determination, and with the undaunted energy and unwavering faith of your Managing Directors and the Technical and Commercial Manager, we are now not only in safe waters but are cruising along towards a brighter future. I, therefore, take this opportunity to express my thanks, on behalf of the Board and on my own behalf, to the two Managing Directors, the Technical and Commercial Manager, and the staff members who have all worked hard as an organised team in the best interests of the Company.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

THE EAST INDIA DISTILLERIES & SUGAR FACTORIES LTD.

SIXTY-FOURTH ANNUAL GENERAL MEETING

Mr. G. N. Noel-Tod's Review

Presiding over the Sixty-fourth Annual General Meeting of the Shareholders of the East India Distilleries and Sugar Factories Limited held at Madras on Wednesday, 28th March, 1962, Mr. G. N. Noel-Tod, Chairman, said:

"Gentlemen,

I extend to you a warm welcome to this, the sixty-fourth Annual General Meeting of the shareholders of this Company. The Accounts for the year ended 30th September, 1961, together with the Directors' Report thereon, have been in your hands for the statutory period and, with your permission, I will take them as read. The sad events which have led to my presiding at this Meeting have been recorded in the Directors' Report, and it only remains for me to place on record here our profound gratitude to the late Mr. Wonfor and the late Mr. Srinivasan for their outstanding services to the Group over a long period. Mr. Srinivasan in his speech at last year's Meeting covered extensively the development of the Group since the war, and I am indeed glad that there exists this record of the progress that was achieved under his Chairmanship and, before him, that of Mr. Wonfor.

You will have observed from the Accounts that the net profit before tax and the net profit after tax have declined slightly compared with the figures of the previous year. This largely comes about through a sharp increase in interest paid, by reason of the loans it has been necessary to raise to finance the construction of our Compound Fertiliser Factory at Ennore, which increase was forecast in last year's speech, and a decline in profits on sugar, on which I will comment later. On the other hand, I am glad to say that the profits from general merchandising have increased substantially. We are accordingly reaping the benefits not only of the reorganisation of our merchandising business, which has been effected over the past two years, but also of your Board's consistent policy of retaining diversification in our operations so that if circumstances are such that one particular side of our business is adversely affected, there remains the opportunity to make good a setback in one direction by an advance in another. You will also have noted that the ratio of total dividend paid to total net profits after tax is less favourable than it was last year, arising in part from the additional amount of dividend payable by reason of the increase in the equity capital which took place in 1960. Considering, however, that our Fertiliser factory at Ennore was under construction during the whole of the period under review and therefore no profits accrued therefrom, I do not think that there is any cause for apprehension over the long term prospects of the Group. In the shorter term, I expect the results for 1961-62 to be generally comparable with those of the year under review, even though little income may be expected during this year from our Ennore Fertiliser Factory. We are, however, confident that this factory will be contributing in full measure to the Group's profits in 1962-63, which means, in fact, that I have confidence that our contractors, Messrs. Simon-Carves, will "deliver the goods".

PROBLEMS OF SUGAR INDUSTRY

Let me now say something on the subject of sugar. The problems facing the sugar industry have received considerable prominence in the press for some time now and you must all be aware of the grave situation with which the industry is faced. For the past two years my predecessor has referred to the mounting surplus of stocks. The position today is that we are only now clearing stocks manufactured during the 1960-61 season which finished in June last year, despite having exported 9,000 tonnes to America in September last year. The whole of our production during the current season to date is lying unsold in our godowns, to a total value, at cost of Rs. 1.5 crores. You will appreciate what a heavy burden this means for the Company, especially at a time when we are engaged in commissioning our new fertiliser factory at Ennore.

Time and time again the attention of the authorities has been drawn to the fact, by official representations and in speeches of my predecessor, that cane is planted one year before it is crushed and it is more than desirable that both the grower and the factory should know at the time of planting what will be the amount of cane available and what price will have to be paid for it. For the current season the Government of India have imposed a 10 per cent cut on production throughout the country, but by reason of the exclusion of new factories and small factories from the scope of the Ordinance, only a few of the factories in Madras State will fully be affected during this sugar year. Nellikuppam's quota is 30,706 tonnes against 34,117 tonnes actually produced last year. We have pointed out clearly to the Government of India, with the support of the Government of Madras, that, as is our usual custom, we have entered into forward contracts with our growers. As things stand at the moment there may be 60,000 to 70,000 tonnes of cane left standing at the end of the season for which the growers will have no means of disposal, for the manufacture of jaggery is practically unknown in the Nellikuppam factory area. I am, however, hopeful that some way out of this impasse will be found, which will be fair both to the growers and to the factory. The Government of India are seized of the position and early orders are awaited.

Meanwhile, we still await an announcement of the cane prices for the 1962-63 season and also the quantity of sugar to be produced by individual factories. I fear that a further cut in production next year is inevitable.

As regards the All-India position, you know that the current sugar year started with stocks in hand at all factories in the country amounting to 12 lakh tonnes, rather more than half the normal yearly offtake. Despite the cut of 10 per cent, production this year is likely to amount to between 28 and 30 lakhs tonnes. Again, despite the relaxation of control on internal sales of sugar, it seems unlikely that internal consumption will rise to beyond 23 to 24 lakh tonnes, unless Government decide to slash the excise duty. The prospects of exporting more than 5 lakh tonnes of sugar this year are not good. Assuming, however, that 5 lakh tonnes are expected, still the surplus stocks of sugar at the beginning of the next sugar year will be not less than

they are at present, which justifies my apprehension of a further enforced cut in production.

To export the current surplus appears to be the only alternative to dumping the sugar in the sea. The type of sugar made in India is a factory white, as opposed to a refined sugar, and it will not keep indefinitely. In view of the high rate of loss per tonne of sugar exported I suggest that the long term future of this industry should not be linked with any idea of exports, unless and until there is a radical rise in world price. Until then, and for at least the next few years, there seems to be no alternative to Government facing up to a temporary loss of revenue by reducing the excise duty on sugar in order to stimulate internal consumption, and so use up the present unproductive excess stock, and by reason of the higher internal consumption gradually restore the quantum of revenue to something approaching its present figure. The present per capita annual consumption of sugar in India is 5.5 kilos, as compared with 55 kilos in the U.K. An increase of only 1.2 kilos per capita in India will represent an additional consumption of 5 lakh tonnes of sugar. My suggestion in this regard is that, at least as a first step, the basic excise duty may be restored to the pre 1957 level, i.e. Rs. 111 per tonne compared with the present rate of Rs. 222 per tonne.

There are other steps which should be taken to remedy the situation. These would involve a radical change in Government's attitude to the industry. One cannot escape from the fact that conditions for the manufacture of sugar at competitive rates are vastly different in different parts of the country, and the present policy of maintaining a high minimum price for sugarcane, this price being paid per tonne dead weight, without regard to quality, is subsidising uneconomic areas at the expense of those more fortunately placed.

Surely there can be no other agricultural commodity in the world which is paid for irrespective of quality. At last, however, there are indications that the Government of India is being converted to the view that we have propagated for so long that the cane price must be linked to quality. I hope they may go even further than this and appreciate that the best method of getting the right amount of cane grown to give the quantity of sugar the country needs, will be to remove controls both from cane price and from sugar price. Factories are dependent for their profit on having adequate supplies of cane and I suggest that their judgment can be relied upon to ensure that enough, but not too much, is paid to secure this end. A natural consequence would, of course, be that in some areas the cultivation of the cash crop of cane would give way to the cultivation of food crops, which would be most desirable. If Government cannot, for political reasons, go as far as this, at least the immediate introduction of a sliding scale price, according to quality, will go a long way towards achieving the desired end of lowering the cost of sugar and relating production more closely to consumption.

While Government have gone so far as to announce that no further licences will be granted for the establishment of new sugar factories or the extension of old ones, I would like to see this policy taken one step further forward, by the withdrawal of licences for new factories in respect of which active steps towards their establishment have not yet been taken. Even so, production in South India is likely to rise steeply in as much as six new factories will go into production in the 1962-63 season and at least an equal number appear to have taken active steps towards commissioning units within the next two years.

Although our relations with the Government of Madras have been generally most amicable, and we have received the fullest support from them in most of our difficulties, I must enter a protest against their refusing to refund the cane cess on sugar exported in the last three years. They have claimed that they see no necessity for this refund on the grounds that the Company has received a refund of excise duty. This is so, but, even so, the Company incurred a loss of Rs. 7,67,000 on sugar exported last year. Refund of cess would have amounted to Rs. 79,500. Further, there is an established precedent in that the Government of Madras did refund cane cess on sugar exported in the year 1958, and the Government of India has requested all State Governments to sanction this refund in the interests of helping to solve the superabundance of stocks with which the industry is at present burdened. I do hope, therefore, that our Government here will be able to fall in line with this policy and refund cane cess on exports, past and future.

PRICE LINKING FORMULA

Reference was made last year to a contingent liability for the Company to make some further payment on cane crushed since November, 1958 under the Price Linking Formula announced by Government, but not yet implemented. Since this Price Linking Formula was first announced, there has been a complete reversal in the fortunes of the industry, and I cannot see how the industry would find it possible to find the cash to pay anything extra in respect of past seasons. It is to be hoped that Government will soon clear the air by announcing what action, if any, they propose taking on the Price Linking Scheme.

We are still reasonably fortunately situated in the South in that we can sell whatever sugar is released without much difficulty within the period allowed for its sale. Prices, however, are still below those obtaining during the control period. Having regard to the smaller production allowed per factory and the probability that a certain part of the output will have to be exported, without any profit and possibly a loss, there can only be a contraction in the Company's profits arising from sugar. It would be wrong to gloss over the seriousness of the situation, and I can but hope that it will be possible to give you a more reassuring view of the outlook a year hence.

FERTILISERS — FURTHER EXPANSION

The picture as regards Fertilisers is more encouraging and the progress made during the year under review has been referred to in the Directors' Report. For the future, the addition of Ammonium Phosphate from our Ennore Factory to the range of fertilisers that we can market should result in a further substantial improvement. The confidence of your Board in the value of this side of our business is illustrated by the fact that we have already applied to the Government of India for permission to double, in due course, the capacity of our Ennore Factory. Assuming we obtain the necessary permission, the actual expansion will take place after we have gained some experience in manufacture and marketing of this fertiliser, and when that time comes, possibly in 1962-63, it will be necessary for your Board to give consideration to ways and means of raising the additional capital required.

Last year, reference was also made to the issue of a licence by the Government of India to a consortium of two well known American Companies and this Company to erect a fertiliser factory at Visakhapatnam to produce about 350,000 tons of fertilisers per year. Progress on this project has not been quite as much as might have been hoped for, the main stumbling block having been the finding of a suitable site at Visakhapatnam. I believe, however, that with the co-operation of the Government of India, this problem will soon be solved. The participation of this Company in the capital of the new Visakhapatnam Company will be small compared to the contribution of our two American partners, and it is they who have the major responsibility for the integration of the new factory, receiving of course from us all the assistance we can give by way of experience of local conditions, and contacts with the Governments concerned. I would like to take this opportunity of expressing my appreciation of the vigour which our American partners are displaying in overcoming initial difficulties, and I can assure them of our continued full support. When the Visakhapatnam factory comes into production, this Company will have an even more important part to play, namely in the distribution of the product. The distribution of fertilisers is a specialised trade, but I believe that we have the necessary organisation and experience to ensure that the very large production to be expected from Visakhapatnam moves without undue delay into the hands of farmers and so into the soil.

CERAMICS — FOREIGN COLLABORATION

As regards Ceramics, you will have noted from the report that last year, owing to the necessity to overhaul the Thrift Kiln, which occurs from time to time, production was reduced. We are still able to tell without any difficult our total output and during the year substantial progress has been made towards finalising a collaboration Agreement with the well known U.K. manufacturers of Ceramic ware, Messrs. Doulton & Co. Ltd. This Agreement places at our disposal technical advice of the highest quality from Daulton and with this advice we propose to instal a third kiln at Ranipet and to improve the quality of our output generally. There have been protracted negotiations with the Government of India as to the exact terms of this Agreement, but I am glad to say that these negotiations have now reached the final stage. I would also like to make a special reference to the fact that during the year under review, even though Government's final approval to the Agreement was still awaited, (and is still awaited), our friends, Messrs. Doulton, have without stint given us the most valuable expert advice on various problems.

I am glad to be able to report that labour relations have, in general, continued to be satisfactory during the year under review. The Sugar Wage Board recommendations have been the subject of detailed negotiations with staff and labour, and it is hoped that we shall shortly be able to conclude a satisfactory settlement with the Unions concerned. I am further glad to be able to record my sincere appreciation of the contribution to the maintenance and development of the Group's interests given by all members of the staff and the Directors of your Company. In particular, I should like to take this opportunity of placing on record your Board's gratitude to Mr. P. Hadfield, who relinquishes his appointment of Managing Director on the 31st of this month, for his services to the Group over more than 30 years. Mr. Hadfield recently left Madras to take up the appointment of Managing Director of our London subsidiary, Parry Murray & Co. Ltd. He remains a member of this Board, so that his vast experience and wise counsel will remain at our disposal.

Finally, you may have noticed in the announcement of my appointment as Chairman of this Company that I myself am nearing the end of my service in India. I am very happy to be able to tell you that Mr. H. V. R. Iengar, lately Governor of the Reserve Bank, has agreed to join the Board of this Company and, later in the year, to take up the appointment of Chairman and Managing Director. Your Directors will therefore co-opt him to the Board, and an announcement regarding the date of his becoming Chairman will be made in due course. On this coming about, it is the intention that I shall revert to my previous appointment of Vice-Chairman and Managing Director, until I leave India. Mr. Iengar needs no introduction to you and, for my part, I am very happy to feel that I shall be placing the direction of the Group affairs into such competent hands.

I would like to take this opportunity of announcing the following appointments which will be effective from 1st April, 1962:

(1) Mr. M. J. Edwards will retire from the Board of Parry & Co. Ltd., of which he is Chairman, to take up the appointment of Deputy Managing Director of this Company.

(2) Mr. John K. John, Vice-Chairman of Parry & Co. Ltd., will be appointed Chairman vice Mr. M. J. Edwards.

and 3) Mr. N. G. Bowen, Director of Parry & Co. Ltd., will be appointed Vice-Chairman vice Mr. John K. John.

I now formally move the adoption of the Directors' Report for the year ended 30th September 1961".

The Directors' Report and the Accounts for the year ended 30th September, 1961, were adopted and a final dividend on the ordinary share capital of the Company at the rate of 14-2/7 per cent subject to deduction of Indian Tax, was declared for the year ended 30th September, 1961, payable on 29th March, 1962.

Mr. V. Ramakrishna and Mr. R. Venkataswamy Naidu were re-elected to the Board and the Auditors, Messrs. Lovelock & Lewes, were re-appointed.

Note: This does not purport to be a report of the proceedings of the general meeting.

Advanced ENGINEERING AND CONSTRUCTION FOR THE IRON AND STEEL INDUSTRY

The dictionary defines engineering "as the art and science by which the mechanical properties of matter are made useful to man in structures and machines." In the McKee Organization it is much more than that —it is a constant, unflagging effort toward advanced design, increased plant efficiency, improved construction and greater economy.

The results of that effort are readily apparent in the many contributions to the progress of steel-making made by the McKee Metals Division in more than half a century of specialized, world-wide engineering and construction for the steel industry.

Pioneering by McKee engineers in the fields of plant design, ore beneficiation, automation and production methods have been invaluable to the industry. Recent examples are McKee's work in pelletizing and in the first successful application of gas injection in blast furnaces.

McKee can deliver this kind of advanced engineering and construction to the steel industry in India and back it with an unmatched fund of practical experience and specialized knowledge.

Comprehensive engineering-contracting services, similar to those of the McKee Metals Division, are supplied by these specialized divisions of the McKee Organization:

PETROLEUM & CHEMICAL DIVISION

Complete Refineries and individual Processing Units for all modern petroleum and petrochemical processes and certain types of chemicals and chemical products.

WESTERN KNAPP ENGINEERING

Plants and facilities for production of Non-ferrous Metals, mining, preparation, handling, beneficiation and storage of Ores and Industrial Minerals.

INDUSTRIAL **IBCON** CONSULTANTS

in the expansion of
TEXTILE INDUSTRY

IBCON offers to Intending promoters of textile industry, comprehensive consultancy services comprising:

- Project study and financial estimates.
- Project design including equipment, buildings, power, steam, water-supply, etc.
- Advice on purchase of equipment from India or abroad by tenders or negotiations.
- Supervision of construction of buildings and erection of equipment and services.
- Commissioning and operation.
- Senior and supervisory staff selection:
- Management organisation, clerical procedures, quality control, scientific cost and wage schemes.
- Technical assistance after commissioning to ensure successful and profitable operation.
- Also production planning, waste control, stores, dyes and fuel consumption.

IBCON PRIVATE LIMITED

Head Office: Adelphi, 119, Queen's Road, Bombay 1

Branches:
5, RUSSEL STREET, CALCUTTA 16.
BRADY'S BUILDING, MAHATMA GANDHI ROAD, KANPUR.
GEORGE OAKES BUILDING, SRI NARASIMHARAJA SQUARE, BANGALORE 2.
85, WARD PLACE, COLOMBO 7, CEYLON.

Also in: U.K., Pakistan, Burma, Iraq, Chile, Argentina, Brazil, Mexico and Hongkong

The New Union Cabinet

THE new Union Cabinet announced this week contains no surprises, unless it be the conspicuous absence of Mr. T. T. Krishnamachari who, immediately after his unopposed return, was universally expected to be a prominent member of the Cabinet. The promotion of as many as five Ministers of State to Cabinet rank has shown that the pressures of Cabinet making in the States are not wholly absent from the Central Cabinet. In the result, some injustice has been done to Mr. Manubhai Shah, on his performance as Minister for Industry in the Second Plan, and to Mr. S. K. Dey, Minister of Community Development, who were certainly entitled to equal recognition. The argument that the former would have given three Ministers to Gujarat might sound convincing but, in fact, is not. There was a time when there were seven Ministers from Uttar Pradesh in the Central Cabinet and even the present Cabinet has no less than four. The arguments in favour of regional representation are important, but they cannot be over-riding, unless talent is to be prejudiced by no greater argument than the inclusion of a distinguished set of predecessors. The claims of excessive regional representation can work to the detriment of the country if exaggerated. It was not unnatural that Mr. Manubhai Shah should feel keenly his initial exclusion and, while agreement has now been reached, there is still a grievance if the disqualification is not to be temporary and only until the Cabinet is reorganised. The view has been prominently presented that the Prime Minister intends such a reorganisation in July or August, when some Governorships fall vacant. If so, not much harm has been done in spite of the fact that an unprecedented situation occurred that a Minister appointed by the President was not present at the swearing-in ceremony.

These might be called the slings and arrows of political fortune. Of more importance is the distribution of duties in the Heavy Industries Ministry which falls to the able guidance of Mr. C. Subramaniam, fresh from his laurels as Finance Minister of Madras. The decision to throw all heavy industry into one group is a wise one, although it raises a difficult problem of servicing in the Development Wing which is now poised dangerously between two Ministers. The decision to place a woman in independent charge of public health is a good one, and Dr. Sushila Nayyar was a good choice in a Ministry which was originally born under the inspired direction of Rajkumari Amrit Kaur. Few people remember now what a tremendous debt Public Health owes to her untiring efforts. Most of them happily continued after she ceased to be member of the Central Cabinet.

The structure of the Cabinet is as much a reflection of the mind of the Prime Minister as it is of the political pressures to which he is subjected. His decision to raise Education and Scientific and Cultural Affairs to Cabinet rank is as much a mark of appreciation of the services of Dr. K. L. Shrimali and Prof. Humayun Kabir as it is of the importance in the new scheme of things in the Prime Minister's eyes of Education and Scientific Affairs. In both cases, these promotions were well deserved, and those who have murmured against them have failed to appreciate the substantial prestige and preparation which these Ministers have given to the educational component of India's technological and economic progress. It is sincerely to be hoped that they will have a long period of office in order to consolidate a policy which should provide the mainspring of higher manpower development in this generation.

Only a postscript needs to be added in regard to the Prime Minister himself. It has been a matter of bitter disappointment that his illness has handicapped him at a critical moment of Cabinet making, leading to a lapse here and there which might possibly have been avoided. But the structure of the whole Cabinet has shown that the Prime Minister is not to be driven to the Left by a refusal to support old colleagues or that he weighs performance by vague ideological norms. All the members of the Central Cabinet have done service to the country, and one should not be querulous in questioning the inclusion of any name. The Prime Minister himself has set the tone by recognising that Rightism and Leftism have lost their meaning in the present Indian context. What is important is achievement and performance in a framework which belongs neither to the Right nor Left, but has the positive strengths of the mixed economy in which the career is to the talent, irrespective of the philosophies which provide the springs of an individual's behaviour. Largely because the Prime Minister himself presides over this team with a calm impartiality, it can become as harmonious as any of the Cabinets in the world. This is as much as one can expect and it is not a detraction from its representative character that it is broadbased in both political and economic philosophy as well as well-conceived in terms of the rewarding of past services. The complaint that it has no new look would be worth entertaining, if there had been marked failures to replace. There is no point in making changes merely to provide a new look; one must test all things but hold fast to those which are good.

Noonmati: What's the Truth?

WITHIN three and a half months of its inauguration by the Prime Minister, the Noonmati Refinery—the first to be set up in the public sector—has run into difficulties. Attempts have been made—at least that is the impression one gets from the reports appearing in the Press—to put the responsibility for these troubles on the delayed completion of the pipeline through which crude supplies are to be effected to the refinery by Oil India from its oilfields in Nahorkatiya and Moran. But how flimsy this excuse is should be evident from the statement of General

Sardanand Singh, the General Manager of the refinery. His statement makes the significant revelation that the refinery has already in its storage tanks nearly 13,000 tons of crude. A press release issued by Oil India on its pipeline project goes a step further and states that not only the 16"-pipeline to Noonmati has been completed and tested, but crude has also been pumped into it and this can be supplied to the refinery at the rate of over 2,000 tonnes a day.

In the face of these facts, the political capital sought to be made out of the issue by some is ill-warranted. One has apparently to look elsewhere for the genesis of the present travails of this refinery. It is unfortunate that not much light has been thrown by the authorities on the real causes for the troubles of the refinery; even a joint statement prepared by the Oil India's General Manager and the Chief of the Indian Refineries Limited, which could have given some indication of the problems faced at Noonmati, is understood to have been withheld by the Mines and Fuel Ministry for reasons best known to itself.

It is a matter of elementary commonsense that teething troubles, which are not uncommon to any medium or large-scale industrial unit, are afflicting the Noonmati Refinery at the present time. Probably they have been aggravated by the commissioning of the distillation unit of the refinery somewhat in haste and the slightly delayed completion of the kerosene refining and the coke processing units. These two units, though ready now, are yet to be tested. This has led to the products storage capacity having been exhausted by filling these storage tanks by off-specification products and partly refined crude. Unless this semi-refined crude is processed further in the kerosene refining and the coke processing units, the refinery will be unable to receive more crude through the pipeline which, it is understood, has been plugged off at a distance of about 15 kilometers from the refinery.

The delay in the commissioning of the kerosene refining and the coke processing units is understood to be primarily due to the recent breakdown of the electricity generating plant of the refinery and the boiler trouble. Both these troubles, of course, have been overcome. But a new spoke has appeared in the wheel. The initial start-up power, which was to be had from the Assam State Electricity Board, is not immediately available because of draught conditions in the hill areas. A request has been made by the refinery authorities to the pipeline management as well as to the Army for making available on loan portable electric generation sets to get over this difficulty. Power supply, thus, is the villain of the piece; it has meddled with the satisfactory working of the Noonmati Refinery.

In the light of these facts, it would be imprudent—notwithstanding the difference of opinion on setting up of the 0.75 million tons refinery at Noonmati against the advice of an expert committee, which entailed inexcusable loss of time in exploitation of Nahorkatiya and Moran oil resources and resulted in high capital cost of the project—to underrate the difficult job that has been performed both by Oil India and the Indian Refineries Limited against heavy odds; the prolonged monsoon season last year upset the construction schedule of the pipeline to a great extent and hampered the work at the refinery site to a considerable degree. This, however, does not obviate the need to secure better co-ordination between the suppliers of crude and the refinery management, especially when one of the partners in Oil India has a long experience in the refining of the high-wax Assam crude. This co-ordination needs to be fostered by more frequent meetings between the two sides. Oil India, perhaps, is a classic example of both the private and the public sectors working hand-in-hand in a national enterprise. To make the Noonmati Refinery a success, despite its high capitalisation, if need be, one or two directors of Oil India may be co-opted to the refinery's Board of Directors. Meanwhile, it is to be trusted the refinery will overcome its teething troubles in another month's time. No efforts must be spared to that end.

Ancillary Industries

THE decentralised sector is steadily rising to assert its place in the industrial economy of the country. Few will find reason to quarrel with the claim advanced on behalf of the small-scale industries that their progress in the Second Five-Year Plan has been impressive. Some typical figures have been cited by the planners to substantiate this claim. Even a superficial examination of the proof offered would bring out in full relief the fact that the claim is sustained by the performance of the ancillary industries, primarily in the group of the mechanical engineering industries. This trend follows the emphasis on incorporating an increasing measure of modernisation in small-scale industries. Partly, the orientation is taking place without a deliberate direction of the pattern of development—as a part of the structural transformation of industry in general.

Ancillary industries are reaching the lower level too. A sub-committee recently appointed to review the definition of small-scale industries has recorded its finding that the existing definitions of ancillary industries having a capital base of Rs. 10 lakhs and the ordinary or non-ancillary industries having a capital base of Rs. 5 lakhs should be substituted by a uniform definition raising the capital base to Rs. 10 lakhs, but reserving certain benefits of aids and incentives for units upto a capital base of Rs. 5 lakhs, as a safeguard against their vulnerability to strains of various sorts. One important reason assigned for the modification by the sub-committee is that the demarcation between ancillary and non-ancillary industries even at the capital base of Rs. 5 lakhs is tending to become obscure.

It was the ancillary industries which attracted the major share of attention at the recent meeting of the All-India Small-Scale Industries Board. Two developments were prominently brought out in his inaugural address by Mr. Manubhai Shah. An International Perspective Planning Team for Small-Scale Industries, sponsored by the Ford Foundation, was arriving in this country in a short time. The new urge for perspective planning for this sector is inspired by the strides made by ancillary industries in particular. In the second place, the specific lines of expansion prescribed for the ancillary industries in the course of the last four years have been developed to the point of congestion. New outlets have become essential. Those selected for this purpose include light engineering industries in the mechanical segment, but the accent unquestionably is on chemicals. A number of facilities are to be provided to foster the growth in the chemical items, subject to the obligation that the participants must subscribe to the Indian Standards Institution's scheme of certification marks to conform to approved specification of quality of output.

In no industralised country even have small-scale industries progressed without the provision of aids and incentives. The report of the Committee on Dispersal of Industries, which was released at the session of the All-India Small-Scale Industries Board, gives copious details of the fiscal incentives as well as incentives and facilities of other types provided to small industries in the West European countries. Tax relief, subsidies in freight, electricity and water rates, credit provision on easy terms, housing accommodation, building sites on cheap rentals, availability of machinery on the hire-purchase basis are the major aids recommended for the promotion of the decentralised sector in this country. Many of them are being provided at present and the rest are certainly unexceptionable.

The basic question is: How should ancillary industries (as well as non-ancillary industries) be diffused in the semi-urban and rural regions? As an integral part of the problem of dispersal, backward regions have received a full share of attention at the hands of the committee. It has approved a few selected backward districts in some States. The major difficulty in prescribing an exhaustive list of backward regions is that of lack of basic statistics—per capita income and consumption, to take a crucial test. But dispersal in the backward regions is a strategic part of the general problem of the dispersal of these industries. The committee has pleaded for provision of social overheads as a matter of priority in an elaborate list of aids. But it has uttered two warnings which ought to be heeded. Ancillary industries can spring up only within reasonable proximity of large-scale units on which alone they subsist. In the last analysis, therefore, there can be no escape from the economic factors governing location. And the problem of ancillary industries cannot be treated on a sectoral basis, in isolation from the parent units in the corporate sector. If necessary, large-scale units, which will not arise automatically in the process of regional growth, should be offered the necessary incentives to stimulate, in turn, the growth of ancillary units.

Barriers to Birth Control

INAUGURATING a meeting of research workers in the field of family planning and fertility control in New Delhi on Wednesday, Dr. Sushila Nayar, the Union Minister of Health, is reported to have stated that "national awareness" had been created in the field of family planning during the last decade and that the idea had gripped the imagination of the people. While she immediately conceded that the results achieved so far were insignificant, it will be hard to substantiate even a modest claim regarding "awareness". The latest surveys conducted in Trivandrum, Quilon, Kottayam, and Alleppey by the Demographic Research Centre have indicated that nearly one-third of the urban population in Kerala was not favourably inclined to planned parenthood. The findings of the Centre have brought home the enormity of the problem in terms of mental and economic barriers to the spread of family planning techniques.

One of the revealing conclusions of these surveys is that only two-thirds of the respondents in the urban areas indicated preference for family planning while others either refused to comment or had very strong views against birth control. There was a sizeable proportion of respondents who did not employ any of the known methods of family planning even though they were "aware" of them, the most important reason advanced for not practising birth control methods being that they were not effective. Some even went to the length of stating tha these methods had a "deleterious effect on health or fecundity". Quite a large proportion even stated that they could not practise these methods because of financial handicaps.

What action has been taken by the official agencies to break these barriers? Before planning to set up clinics and health centres it is necessary to reach the people with printed literature or by means of lectures and other publicity media. The surveys in Kerala have indicated that the knowledge about family planning methods is usually disseminated through the male members who rely, by and large, on books and pamphlets for this purpose. Low levels of income still stand in the way of the vast masses of people in seeking advice from doctors. Kerala being one of the most literate States in the Indian Union, the people there can certainly be approached through free distribution of literature. The psychological opposition must be overcome before any tangible investments in the shape of hospitals and clinics can be planned.

Amongst those who were favourably inclined to family planning, the use of costly artificial contraceptives, such as the condom and the diaphragm, was restricted to one out of every six couples. It is amazing that about half of the respondents relied upon the "safe period" while nearly one-fourth observed the "elementary precautions". All this points to the impact of low levels of income in Kerala. The purchasing capacity of the people is extremely low and the income distribution data have lent support to this basic hindrance to a wider use of contraceptives. Nearly 95 per cent of the respondents belong to the income brackets below Rs. 100 per month and naturally the elementary needs of life take precedence over artificial contraceptives. Sterilization, whether of the male or the female member, is the least popular of the methods, having only 2 to 3 per cent support in most of these towns. It is certain that the results would be much more disheartening for rural areas, where incomes are still lower and literacy ratio pitifully small and prejudice strongly entrenched.

The upshot of this discussion is that the family planning methods in Kerala and other poor States of the Indian Union need far wider and sustained publicity than has been attempted hitherto. The income factor will continue to be a dominant factor which will stand in the way of wider propagation of birth control methods. Even before setting up a clinic it is necessary that "simple" contraceptives at subsidised rates should be made available to the most needy classes who lack financial resources. Though the barriers of ignorance may be broken earlier through a speedy rise in education, the income barrier is likely to prove a much prolonged hurdle.

The results of the 1961 census of population were received in this country with something of a shock because the net rise in population during the last decade turned to be very much beyond expectations. At all levels extreme concern was expressed about the alarming rate of rise in numbers and the family planning programme was urged to be put on a priority footing. The Planning Commission struck a hopeful note: "Given a sense of urgency and spirit of dedicated endeavour, it is fully within the capacity of the nation to achieve goals it has set for itself." Almost a year has passed, but no signs of urgency or dedication are in evidence. When will the country awake to the dangerous population explosion?

Why CIMMCO Sakamoto

BECAUSE

★ AUTOMATIC LOOM IS A MUST FOR QUALITY TEXTILES
★ 62% OF COUNTRY'S AUTOLOOMS ARE SAKAMOTO TYPE
★ 25% OF COUNTRY'S AUTOLOOMS ARE OTHER JAP. TYPE

ALSO

★ THESE ARE STURDY IN DESIGN
★ SIMPLE TO SET-UP AND OPERATE
★ TRIED IN COUNTRIES THE WORLD OVER

AND

TECHNICAL COLLABORATION **COMBINES A LOOM BUILDING EXPERIENCE** OF **18** YEARS AT CIMMCO WITH OVER **34** YEARS IN JAPAN.

Specially developed technique of boring frames on assembly ensures of perfect allignment. Improved temple cutter, end cutter and latest mechanised warp stop with efficient brake ensure faultless weaving continuously with minimum efforts.

THE WEEK'S NOTES

The French Referendum

AN OVERWHELMING VOTE

THE SEAL of approval has been put finally on the Avian agreement. The outcome of the French referendum on the Algerian settlement was never in doubt, but the overwhelming vote in the affirmative has surpassed all expectations. Out of the 27 million or so who were entitled to put into the box one of the two voting papers—"oui" or "non"—over three-fourths came to the booths to exercise their right and out of these a massive majority of over 90 per cent voted in favour. Thus ended the seven years' war of Algerian independence. But for President de Gaulle's assertive intervention the Algerian issue would have lingered on like a festering sore. In cutting the Gordian knot and wiping out the last ramnant of colonialism, President de Gaulle has raised the stature of his country as well as his own. France now acquires a new dignity and moral authority to use her good offices in European affairs in particular and world affairs in general.

This referendum was not a referendum pure and simple to endorse the agreement with the Algerian nationalist leaders. President de Gaulle also asked for full powers without reference to Parliament—powers to be exercised by means of presidential decrees—to take appropriate measures to implement the Avian agreement and also to sign a treaty of alliance with the Algerian Government should it decide to opt for a status on the basis of full separation. The referendum has been criticised by some as demanding a single and categorical "oui" or "non" to two questions and placing the voters in an embarrassing position. The Communists and socialists, who voted "yes", later explained that their vote signifies "yes" for the settlement, but not for the personal powers to the President in what they consider supersession of Parliament's sovereign authority. This is to take a legally puristic view. Once the settlement has been endorsed, it follows by sequence that it must be carried to its logical implications. It is hardly controvertible that if the firm hand of President de Gaulle is substituted by the Parliamentary process in this extraordinarily delicate issue, the chances of drift, indecision or equivocation may emerge as a stark reality. The powers asked for may have a semblance of authoritarianism, but ever since President de Gaulle was placed in office as such, he has refrained meticulously from conducting himself as an authoritarian.

The last of the tasks in Algeria cannot be taken to have been accomplished with the referendum in France. There is to be held the referendum in Algeria in July. And the OAS in its fanaticism may indulge in violence out of sheer desperation to subvert the Algerian referendum. The blunder which the OAS committed in attacking French servicemen made the operation clearance far more expeditious than would have been possible only with the President's iron determination to crush Salan's forces. The loyalty of the army was seldom in doubt, but the OAS completely alienated its emotional sympathy for the settlers by its outrageous conduct. The OAS is driven to fight the last ditch battle, but it may not necessarily be taken for granted that it will be a short-lived action for that reason. The situation may continue to demand swift decisions and swifter execution.

Rourkela

THE LOCK-OUT

THE LOCK-OUT, which the management of the Rourkela Steel Plant had to declare last week in the Blast Furnace Department, consequent on the illegal strike of the workers, is the latest in the series of the troubles which have occurred from time to time in this important works. It has involved total stoppage of two blast furnaces and 450 workers, but in their magnitude the effects of the lock-out threatened to be grave and far-reaching. The loss in the output of pig iron resulting from the closure of the furnaces amounted to some 1,700 tons per day, and in view of the most intimately integrated nature of the works in the different shops and departments, the shortage of pig iron would have been reflected in a paralysis of work throughout. This was not the end of the gravity of the consequences. Already, the Chittaranjan Locomotive Works began to feel the strain of the poor supply of steel. This is a state of affairs which calls for a patient and thorough reappraisal.

It would appear that there is considerable dissatisfaction about the withholding of promotion to upper posts in which technicians have officiated. Also, expectations of confirmation seem to be frustrated for a long time. Whether entertaining this sort of grievance by the workers is right or wrong is a matter for enquiry, a frank talk with them and firm decision on policy. The difficulty of the management at Rourkela is that there are as many as five trade unions, none of which is recognised. The question of recognition has been referred to the Bihar Government. This handicap notwithstanding, the management would do well to remove the misunderstanding or any feeling of injustice harboured by the workers on the score of promotion to higher posts or confirmation. There have been very frequent changes of the incumbent of the office of the General Manager and the absence of continuity for a long time is one of the serious handicaps in grasping the personnel problems and adapting policy to actual requirements. A full probe into the grievance in the Blast Furnace Department may very probably disclose that the workers' grievance is sentimental rather than substantial. But whatever it is, a frank probe and a right decision on the policy for promotions and other connected issues would certainly go to improve the labour-management relations.

A team of German experts in its report had a significant finding to record. It emphasises that indiscipline among the workers was one of the contributory causes of stagnation in the output of the rolling mills. Likewise, go-slow on the part of the staff running the factory railway is also a cause of reducing the rate of output on occasions. All these are pointers to a situation which calls for an early solution.

The lock-out has been withdrawn. The management has acted with magnanimity in admitting back workers who would tender a formal apology. Of course, an exception must be made, as has been made, in the case of some recalcitrant elements which were responsible for complicating and aggravating the situation. No break in service is to be imposed as a penalty and this is still another gesture of magnanimity. This is the proper psychological moment when the whole question of industrial relations inside the plant should be re-examined and a policy for better relations evolved. As we go to press, the management has been constrained to fix a deadline expiring today for resumption of work.

State Planning

REDUNDANT REPLICAS

IF THE report that the Planning Commission has strongly urged the State Governments to set up planning bodies is correct, the balance of convenience would hardly favour the proposal. It is quite obvious that

the Planning Commission has been impelled to make this suggestion because it finds the present condition of planning at the State level too inadequate to be of substantial assistance to it. What is, therefore, required is to remove the existing imperfections in the preparation of the State Plans. The Planning Commission obviously takes the view that the merit of its proposal lies in placing at the service of the State Governments planning bodies consisting of whole-time experts, who would take a technically more well-informed, as well as a more imaginative and longer, view of the developmental requirements of the States than is possible for the departmental officials to do.

On the face of it this suggestion to set up replicas of the Planning Commission at the State level appears sound. But a closer examination would hardly reveal strong merits to commend it. The planning bodies at the State level would develop into large organisations multiplying their personnel by the operation of Parkinson's Law and creating mountains of paper work, not to speak of the waste of time and superfluous procedural work involved in the red tape. The proposed State planning bodies must include certain ex-officio members. The Chief Minister would be the ex-officio chairman, the Finance Minister will be an inevitable ex-officio member and, if there is a separate Minister for Planning, he cannot be kept out. Correspondence for requisitioning the data for preparing the plans or evaluating their progress will produce inflation of routine work. The planning bodies will also be expected to prepare perspective plans. In certain spheres, where a State has indisputable resources and claims to undertake development programmes in the longer perspective, such plans would be of assistance in the overall national perspective plan. But in a majority of cases the plans of different States will overlap or clash and be definitely at variance with the Planning Commission's perspective plan, raising problems of ruthless pruning for co-ordination.

Planning, as it has been evolved in the last decade in this country, is not immune from political pressures. The National Development Council's revisional authority proceeds usually on this basis. With the Chief Ministers as ex-officio chairmen of the State planning bodies, the deliberations at the National Development Council would tend to become increasingly contentious. Effective reform in the present state of affairs is indicated in strengthening the existing planning cells in the State Finance Departments, removing the statistical gaps and improving the quality of work with the association of non-official experts, if necessary.

The Socialists

THE MERGER MOVE

THE PRAJA SOCIALIST PARTY, which conducted a post-mortem examination into its unexpected and crushing failure in the last general elections, has emerged wiser, if sadder. The other parties with a socialist brand have not fared a whit better than the PSP; mostly they have fared worse. This common factor has brought home to the PSP the realisation that the future of the democratic socialists would be quite bleak, unless they come on a common platform of unity and form integrated opposition groups or parties in the State legislatures and Parliament. With this appraisal it adopted a resolution at its Patna session to issue an appeal to the Socialist Party and other socialist groups for forming a united socialist party.

Whether the Swatantra Party or the democratic socialists will ultimately emerge as the main opposition, it is too much to forecast dogmatically. But it would appear that the Swatantra Party has got off to a good start. However, in an economically backward country the emotional appeal of Communism proves irresistible and it is for this reason that the socialists should bestir themselves and organize as a counterpoise against the Communist Party. From this angle, whether or not the socialist parties will emerge as the main opposition of the future, their unity would be desirable. But it will be recalled that in the past the PSP as well as the Socialist Party took postures which were anything but conducive to a merger. Dr. Lohia spurned the offer of merger except on the condition that his party's policies and programmes should be adopted without question by the PSP and the PSP at its convention of June 1961 made it clear that unity between the two could be possible only on the basis of the adoption of its own programmes by the merged party. Both feel—and they are under this genuine handicap—that the Congress Party's professions of the socialist pattern of society have taken much of the wind out of their sail and they can exist by holding up more extreme brands of socialism.

It is quite possible that the two parties now feel that it was a mistake initially to have fallen apart. The election reverses have undoubtedly produced a considerable sobering effect on them, but it is premature to say whether Dr. Lohia would be in a mood of reconciliation. It will not be a surprise if the socialist parties continue to function as groups regardless of their rapidly dwindling influence.

Britain

A SOBER BUDGET

THOSE WHO expected Mr. Selwyn Lloyd to make dramatic proposals in his budget will feel disappointed, but they had no reason to expect anything dramatic. Likewise, those, who characterise the budget as uninspiring and colourless, are hardly justified in making this appraisal on certain presumptions. The Chancellor, presenting the pre-election budget, has necessarily to steer a sober course and this is what Mr. Selwyn Lloyd has done. The tax proposals which he has made represent moderate changes either way. The 10 per cent surcharge on the purchase tax has been abolished apparently because the emergency which was the cause of this levy does not justify its continuance. On selected items of consumer goods the duties have been reduced. This is either to relieve the rigour of the austerity measures or to prepare the ground in anticipation of the adaptations which Britain will have to make on her entry into the European Common Market. But there has been a stepping up of the tax in some directions. On sweets, soft drinks and ice-cream, there has been an imposition of a 15 per cent tax. Betting has also come in for a higher levy. The proposal for taxation of capital gains is quite moderately conceived. The limit of the death duties has been raised by a modest margin. But some measures of extra taxation, which were hinted at in the pre-budget period, have not materialised and in this class come the absence of any changes in personal income-tax and the corporation tax.

The present was certainly not the time for the Chancellor to make any spectacular changes in the tax policies. After a hard struggle against the forces of stagnation in the economy, Britain is beginning to recover confidence in staging moderate progress. Exports in 1961 rose by £156 million above the level in 1960. Monetary policy could be modified as the pressures of inflation have eased and this is reflected in the two cuts recently announced in the Bank Rate. Sterling is acquiring stability. In fact, a note of hope to consolidate stability in the economy runs through the budget proposals.

The World Abroad

CONGRESS AND LEAGUE

By

ODYSSEUS

THE PARTITION of India in August, 1947, created a mythology which needs to be dispersed if the problems of India's unity are to be tackled realistically today.

In his newly published "India: A Modern History" (Cresset Press. London. 63sh.), Percival Spear, the distinguished scholar who was for 28 years at Delhi University, shows that Churchill's "Caretaker" government of May, 1945, initiated negotiations for Indian independence within weeks of Germany's collapse. The war against Japan was expected to last at least another year, and the Conservatives thought that they would be negotiating with India from a position of power, with the British armies still intact, and the people braced for further difficulties. The Conservatives, on the one hand, refused to ignore Muslim minority rights and, on the other, rejected Pakistan as a counsel of despair. They sought to hand over an India united in some form of federation.

But the collapse of Japan on August 14, 1945, understandably made the British realise that they were war-weary, and created a mood in which, now that there was no international reason for keeping large forces in India they were not prepared for further sacrifices. The rapid reduction in those forces meant that the UK no longer had the physical means of control in India. Likewise, the end of the war and the withdrawal of British troops removed two restraints on the Indian parties. From being an umpire with power to enforce rules, the Viceroy shrank to a go-between trying to reconcile two independent parties.

The first step of the Labour Government, voted into office in July, 1945, was, by holding a general election, to ascertain the degree of support that the Congress and the Muslim League enjoyed among India's electorate, which at that time (it is often forgotten) numbered as many as 30,000,000. The results revealed that the League dominated India's Muslim areas and the Congress the Hindu areas. In the Central Assembly the League won all the Muslim seats. In the Provinces (except for the NWFP) it won 446 out of 495 seats. The League's failure in the NWFP, says Penderel Moon, in his dramatic eyewitness book "Divide and Quit" (Chatto & Windus. London. 1961. 30sh.), was of small significance compared with its smashing success in the Punjab, where it had utterly failed in 1937 when it secured only one Muslim seat and the Unionists (Muslim-Hindu-Sikh coalition) won the rest. In 1947, however, the League won 79 seats and Khizar Hayat Tiwana and the Muslim Unionists were reduced to ten. Moon says that Baldev Singh made a cardinal error when, in the face of the verdict of the electors, he induced Khizar to head a coalition of Congress Hindus, Akali Sikhs, and his nine Muslim followers. Moon notes that the mere existence of the Coalition made reconciliation impossible. If the Coalition had not been formed and the League had had the prospect of office, they would have been compelled, simply in order to gain office, to conciliate the Hindu and Sikh minorities, and once in office, responsible for the peace and prosperity of the Punjab, they would have had no inducement to stir up communal strife. As it was, they had no inducement to conciliate the minority parties, which, they felt, had combined to defraud them of the electors' verdict. Moon and Spear agree that this explains the mounting tension throughout the Punjab in 1946 and the explosion which followed in 1947.

CULTURAL AND RELIGIOUS FORCES

It was India's misfortune that the Congress and the League were not just office-seeking organisations, like Labour and Tories in the UK, but were bodies supported by cultural and religious forces. There is no question that the Congress leaders stood sincerely for a united India and believed in the secular aims which they proclaimed, but in 1945-47, the weight of Hindu feeling behind them was too great for them to be able to convince the Muslims that reason would prevail. Anyone who doubts this must admit that even in independent India, the secular leaders of the Congress have encountered substantial resistances to policies or legislation distasteful to Hindu religious or social feeling.

Since the League's accession to power was blocked in the Punjab, tension, with neither war to inhibit it nor large determined British forces to control it, mounted. "The British could only argue and persuade; they could no longer command," says Spear. I support this from personal experience. In the service of the Government of India, I watched events from the inside up to the end of 1945, and as a newspaper correspondent I watched them from the outside till 1948.

It is a human weakness to refuse to acknowledge those facts of history which impede policies that we cherish. Fortunately, human beings can learn from experience. I recall these incidents of an unhappy period solely in the hope that reflection over them may throw light on present discontents. Both Spear and Moon agree with the late Maulana Kalam Azad—an Indian patriot if ever there was one—that the Congress did more than anyone else to build up mass Muslim support for the League by their refusal to acknowledge the weight of feeling behind the League. In his autobiography, "India Wins Freedom", the Maulana recalls that when in 1937 he was negotiating, on behalf of the Congress High Command, the formation of the UP Congress Ministry, he went out of his way to secure, in writing, the League's agreement to nominate two members as coalition Ministers in the Congress Ministry. The Maulana characterises Mr. Nehru's subsequent failure to include League nominees in the Ministry as "a great mistake....Jawaharlal's action gave the League in the UP a new lease of life...."

Secondly, the Maulana reveals that the 1946 Cabinet Mission's plan for a federation was based on his own scheme, substantially accepted by the Congress (a) as drafted by him and (b) as eventually published by the Cabient Mission. After Congress had accepted, Mr. Nehru (in a speech described by his biographer and admirer, Michael Brecher, as "one of the most fiery and provocative statements in his forty years of public life") declared that the "Congress was committed to participate in the Constituent Assembly, but to nothing else." Dr. Brecher says that this speech "sparked the collapse of the Cabinet Mission" and "was a serious tactical error," a view which the Maulana sorrowfully elaborates over several pages, pointing out that it led to Jinnah's proclamation of "direct action." The Maulana's criticisms should carry weight because he is not "anti-

Nehru", to whom, indeed, "as friend and comrade", he dedicated his book.

Was partition "inevitable"? Since I believe in free will and oppose the Marxist determinist view of history, I reply "No", with the qualification that partition gradually became "inevitable" as one human decision after another deepened the channel towards it. What, then, was the final decision that opened the flood gates? Moon, Spear, and the Maulana, agree that it was the refusal of Congress to declare unequivocally their acceptance of the 1946 Cabinet Mission's proposals for a federation in the sense that the League understood them and the Cabinet Mission had intended them (See Moon pp. 42/64. Spear pp. 407/418. Azad p. 155.)

WAS PARTITION AN EVIL?

Was partition an evil? Spear has a point when he says (p. 417) that the loose federation that would have emerged, if the plans discussed in 1945-46 had been accepted, so limited the central government that it is doubtful if the great developments of Nehru's India would have been possible under them. Even in today's India, much political energy is dissipated by factions in jostling for position instead of concentrating on giving real life to the concept of "India". Partitioned India has, at least got rid of the powerful faction that the Muslim League, and its millions of supporters, would have added to an undivided India with a weak centre. Industrial development today is handicapped by competition from factions to secure favour for their particular regions. What would be the position if the areas covered by Pakistan had been added to the competitors? Would not development have been retarded by party tactics and the Five Year Plans have foundered in party polemics? Only a joint directorate of the Congress and the League, ready to co-operate without reserve, could have achieved the development which has actually occurred. The feelings created in both Congress and League by the successive decisions of each, that followed the rejection of the Maulana's scheme for a UP coalition in 1937, rendered it "inevitable" that a joint directorate would have failed. Moon (whose devotion to India is proved beyond question by the manner of his resignation from the ICS and by his subsequent years of service to independent India in positions of high trust) goes further than Spear. It was, indeed, fortunate, he says, that the final attempt to retain political unity failed, for, in the state of feeling reached by 1946, an Indian union would have been at sixes and sevens and "the end would have been a civil war far more devastating in its effects than the severe, but short-lived, blood-letting in the Punjab. The whole sub-continent....would probably have foundered in Chinese chaos."

Can further partitions be avoided today? To prevent this, I suggest, in the first place, that India's Prime Minister and Pakistan's President should pursue policies that strengthen and consolidate the other state, and that avoid the nursing of resentments in their respective minorities. One weak neighbour means trouble for the stronger. Two weak neighbours mean trouble for each other.

Henry Havelock (1795-1857) said that in any regiment there were 10 per cent goondas, 10 per cent men who would lead anywhere and do anything, and 80 per cent who would go anywhere and do anything if properly led. In a democracy, elected leaders tend to follow the 80 per cent rather than to give them forthright leadership. This leaves the masses at the mercy of goondas. Now, you can't lead men without understanding, and I wonder if "The Eastern Economist" did not lay its finger on the truth when, referring on October 13, 1961, to the complacency of the National Integration Conference, it asked if these eminent people were not blind to realities, or "are they basically, in their passion for reason and intellect, removed from the masses in which these powerful political currents" (communalism, casteism, and regionalism) "are at work? If they are in fact blind, can the blind lead the blind....?"

Is the campaign for Hindi not an example of blind leaders leading astray the 80 per cent ordinary, decent, muddle-headed average men? Is it not true that, as Spear points out, the drive to make Hindi the national language not merely offended the non-Hindi speaking areas, but promoted separatism by strengthening the demand for local units of administration where a local language could be used for state business? If you force Hindi on a non-Hindi speaker for national purposes, it is only logical and human nature that he should insist that he be allowed his own language for local purposes.

BARRIERS BETWEEN COMMUNITIES

BUSY PEOPLE in industry, education, government, and the diplomatic service, have little leisure for reading. They want to be sure, therefore, that the subject of a particular book is one that concerns them and that the book itself is authoritative and worth while. One of the aims of this column is to draw attention to some of the more important books as they come out. But here we come up against a difficulty. If a book is worth reading, a columnist who creates the impression that he has summarised its essentials may do potential readers a disservice by leaving them with the illusion that they have read it.

Now, for all those concerned with the problems of social tensions and political integration in India, I believe that the three books which I have mentioned in the prvious articles in this series: "India: A Modern History" (Cresset Press. London. 1962, 63sh.), by Percival Spear, "Divide and Quit" (Chatto & Windus. London. 1961. 30sh.), by Penderel Moon, and "In The Minds of Men: a Study of Human Behaviour and Social Tensions in India" (Basic Books. Inc. New York. 1953), should be compulsory reading. I have indicated various points that these distinguished authorities have made, but you will be making a big mistake if you now sit comfortably back in the fond belief that you have read them through this column. My home-work consists in picking them out from the unending flow of new books, mulling over and assessing them, and drawing your attention to them. Your home-work consists in borrowing them, (or, better still, buying them because they will remain the standard works on their subjects for years to come).

Another important contribution to these problems was made by Dr. C. D. Deshmukh, now Vice-Chancellor of Delhi University, in a paper read before the conference on tensions in developing countries held last winter under the auspices of the Overseas Development Institute, 160 Piccadilly. London. W.1. (from whom copies of the text may be obtained). Dr. Deshmukh's paper is a symposium of views submitted by many leading authorities at the seminar on Tensions of Economic Development in South-East Asia, held under the auspices of Bombay University in 1961.

DR. C. D. DESHMUKH'S VIEWS

In the course of this paper, Dr. Deshmukh said that Indian observers of all shades of opinion felt that the functioning of the parliamentary system in India, although not perfect, would gradually improve in practice, particularly as a result of "prudently supervised democratic decentralisation. "However," he added, "it would be rash to indulge in prognostications....as the course of history is often influenced by powerful individuals or their absence." (This is the most discreet

formulation of the crude question "After Nehru who and what?" that I have yet come across). "Already in India," Dr. Deshmukh continued, "positions are being taken up against the possibility of the break-up of the existing ruling party....An asset in the bigger countries of Asia is that people are largely civilised, shrewd, and intelligent, even if unlettered, and they are willing to be educated and led. Essentially therefore the issue is good and enlightened leadership. We are too near the events which led to independence, and to the formal introduction of democracies into these countries, to be able to say whether a competent normal leadership will arise or not. There is no reason why it should not, given some imagination and rectitude on the part of the existing leaders, and an adequate measure of foreign assistance in their efforts to raise standards of living in the quickest possible time. It is particularly for the top leaders to give up the trade union sort of attitude, enlarge their ranks by talent from outside—which is available—and consciously to build up the echelons of second rank leaders. Particular care should be taken to give a sense of participation in the national effort to everybody, by encouraging the development of an effective opposition party. This necessarily means the abandonment of the many questionable devices now used for the prepetuation of power by a small group in power because of some historical circumstances."

"So far as India is concerned," Dr. Deshmukh went on, "I am convinced that Mahatma Gandhi was right in advising the dissolution of the Congress Party and the formation of more natural parties according to important social and economic principles. The present governmental struggles often range round persons, because there are hardly any principles round which they could range. One of the great weaknesses of the present situation is the absence of a real or effective parliamentary opposition. The internal party disputes are often necessary, nevertheless, in order to bring up leaders of the required calibre, and too much interference from the central party organisation in such processes seems authoritarian and anti-democratic. In the final analysis, the conduct of human affairs is conditioned by leadership at all levels, and that order of society will flourish in the long run which gives ample opportunities for the growth of leadership at every level."

Tension between social groups, it should not be forgotten, are not peculiar to India. They are characteristic of every dynamic society, undergoing change and growth. They are inevitable as new ways of producing goods displaced old ways, and inventions displace old-established goods. The difference, however between India and, say, Germany, is that the bulk of Germans do not live at subsistance level; they have a margin of income or savings to tide them over a period of adjustment, whereas the bulk of Indians do not. Hence the fierce resistance to change. It is all very well for intellectuals to criticise the caste and joint family systems, or communal exclusiveness, but, by and large, caste and community provide India's most effective and cheapest system of social security.

HOW TO REACH THE MASSES?

Social tensions can, nevertheless, be reduced if national leaders keep explaining the reasons for their development, social, and other policies, and the long-term benefits to be expected. Unfortunately, in India, the means of communication to the people open to the national leaders have their limitations. In the first instance, their messages reach the people through press and radio. But of India's 6,000 newpapers, the circulation of only some 3,000 is known, and is estimated at only 110 lakhs, and the number of radios licensed is only slightly more. It is true that several people read each copy and listen to each radio set, but even so the number reached direct is tiny. The masses get their information indirectly at second, third, or fourth hand, because the statements of the national leaders made in one language have to be translated into many others, and in so doing they may lose much of their force, or may be distorted in the filter of translation. Moreover, considerations of space rarely allow them to be more than summarised (and if given in full they are usually so verbose as to daunt the average reader). Next, all news is sub-edited in accordance with local interests. Local news normally takes precedence of national developments. Finally, how many people read their papers thoroughly? How many radio listeners remain switched in when popular music yields to news and serious talks? If these considerations apply to the first line recipients—those who can read and listen—how much news will reach the masses of non-readers and non-listeners, and how distorted will it be?

Gardner Murphy in his study "In The Minds of Men", made at the request of the Delhi Ministry of Education, points out that the channels by communication to the masses are inevitably and largely along the lines of language, community and caste. Since, also there is both a Muslim and a Hindu press, it is not surprising that news of communal disturbances takes on two essentially differing guises, one of which is circulated to Hindus through Hindi sources and the other to Muslims through Muslim sources. Supposedly authentic and factually well documented news therefore becomes accepted as such by all members of one community but not by the second. The basic facts and interpretations of one group are unknown to the second group, since each relies entirely on its own separate sources. In Europe, there are, of course, newspapers devoted to special interests of, for example, Roman Catholics and Jews, but these are normally small circulation weeklies, not dailies, and in a Protestant country, Roman Catholics and Jews normally rely on daily newspapers read primarily by Protestants; vice versa in a Catholic country; and even newspapers aimed at one religious group are likely to be restrained by the knowledge that any sectarian view will be seen and criticised in the non-sectarian press.

There is no quick and easy solution to this problem of communication in a vast multilingual, multicaste, and multi-regional country like India. But surely one of the biggest weapons for breaking down the barriers should be improved primary and secondary education. When I see that out of a total budget of Rs. 1023 crores, no less than Rs. 283 crores, or 27 per cent, are spent on armaments, I cannot help wondering whether the people of India would not be better defended if, say, three quarters of this sum were spent on Gandhiji's Basic Education schools. I wonder whether, if the suggestions were made to him, President Ayub would not hasten to agree to a similar proportionate cut in his own armaments expenditure for diversion to education. As far as China is concerned, India and Pakistan are not primarily defended by their armies, which could be swallowed up by China's hordes, but by China's knowledge that if she started up something serious against India or Pakistan, she would unite not only the whole free world against herself but the USSR as well.

I propose to discuss suggestions made for education in India by Gardner Murphy, and in the developing countries as a whole by Mr. Max F. Millikan, Director of the Centre of International Studies at the Massachusets Institute of Technology, in the final article of this series next week.

The European Scene

BELGIAN IDEAS ON WORLD TRADE

From Our Special West European Correspondent

BRUSSELS, March 31.

IT'S an ill wind that blows nobody any good. The vast industrial expansion that has taken place in the West in recent years, and which has widened the gap between the rich and poor nations, has not been long in producing signs of near-saturation in certain markets and of excess capacity in several industries, so that manufacturers realise that the only chance of sustaining their sales is to offer longer and easier credit to potential customers in the developing regions. It is a fair guess that the life of export credits will be lengthened until the present limit of five years, under the Berne convention, is honoured more often in the breach than in the observance. Switzerland has already extended export credits to as long as seven years, and in fact the regulations no longer specify any limit. Canada has gone further, and credits can be up to fifteen years long. Belgium this month joined the movement and created a fund for the re-financing of credits beyond the five-year limit so far observed. The State organisation charged with the matter is henceforth able to finance credits as well as insure them, though in theory its financing activities are to remain exceptional. Belgium (and hence Luxembourg, for this concerns the Belgo-Luxembourg customs union) is the first Common Market country to have an export credit mechanism as generous as Britain's. Since Holland has agreed this month to combine her export-market prospecting with Belgium, it is likely that easier terms will be available for all Benelux exports. In time, the other three members of the Common Market will probably bring their credit facilities into line with those of Benelux.

It is easy to understand why Belgium should be in the forefront, at least as regards the Common Market, in this affair: extraordinary as it may seem, this small industrialised nation exports 40 per cent of her gross national product, and between 65 and 70 per cent of all her industrial output. Indeed, one finds among the leading Belgian companies cases where the reliance on export markets is even greater than that. For example, Gevaert Photo Products, the star of the Brussels Bourse and the world's second in this line (after Eastman Kodak), exports no less than 94 per cent of its output! And its output last year, covering 13,000 different products, was worth the tidy sum of 5,000 million Belgian francs, or about Rs. 50 crores. These exports were genuine exports, and not just the addition of the output of foreign subsidiaries, for Gevaert does not believe in manufacturing abroad, claiming that quality control is too difficult in overseas plant. Furthermore, Gevaert is directly concerned with the purchasing power of the developing countries because they count among its main clients for medical and industrial photographic equipment (X-ray film for medicine and for material-testing in steel and other industries, quality control apparatus, photo-copy and sound-recording equipment for offices, etc.); the medical and industrial divisions of this gigantic firm far overshadow the division making material for amateur photographers.

Gevaert's 94 per cent is perhaps an extreme case even in Belgium, but firms selling 70 to 80 per cent abroad are far from rare here, and they include some heavy industries such as steel, mechanical construction and weapons. Whereas the French company Alsthom, maker of the record-holding electric locomotives, is regarded as a curiosity because it has been exporting 50 per cent of its output for the past ten years, and whereas French, German and British automobile companies are held to be in an unsound position when they have to rely on export markets for 40 to 50 per cent of their sales, in Belgium such situations are perfectly normal. A tiny country with nine million inhabitants, so heavily populated that it has more per square mile than any other in the West, with a negligible agriculture but a highly developed industry that is heavily biassed toward basic production (steel and metallurgy) and that gives it the highest revenue per head in the Common Market, Belgium is inevitably sensitive to the currents of international trade and feels, before her bigger partners, the need to keep export moving by subsidising the purchasing power of promising customers.

Of course, most of her exports go to other industrialised nations. About 76 per cent are absorbed by West Europe and 53 per cent by the rest of the Common Market alone. Yet far from making Belgian industry complacent about current trends in international trade, these facts make it aware, earlier than others, of the difficulties that are blowing up for Western industries that have installed excess capacity and done little to boost the buying power of the developing nations. The liberalisation of trade between industrialised economies (and Belgium has been at the front of this movement from the start, first in the Belgo-Luxembourg union, then in Benelux, then the Common Market, next as the advocate of British admission to the latter and lastly as favouring the US plan for freer trans-Atlantic trade) is not taken by these dynamic global merchants as the panacea; quite the contrary, it often serves to bring out the extent of over-investment in the West when it leads to competitive dumping. Going through Belgian company reports this week, one has seen literally dozens of warnings about the cut-throat competition that is developing between Western industrialists and complaints of dumping practised between rich nations that will not assist poor nations to buy their surplus goods.

The coal companies, still recovering from the crisis in the Borinage last year that led to a general strike and rioting, warn of the glut of solid fuels and the likelihood of a chaotic energy surplus unless West Europe rationalises its fuel policies, cuts back production, limits imports and prevents over-investment in new energy sources. The oil companies (the Belgian Petrofina belongs in the top bracket of this department) warn of excessive outlays in pipelines and tanker fleets; the recent discovery of a natural gas deposit in nearby Holland, the appearance of Russian oil and the invasion of German distributors into the Belgian market underscore their point. The shipbuilders (Cockerill-Ougree's yards rank among Europe's biggest and can launch vessels of 70,000 tons) refer, needless to say, to the current excess of world tonnage, which is being worsened by sustained investment in new vessels as owners seek to meet competition by modernising their fleets. Cockerill-Ougree, which is responsible for 32 per cent of this country's steel output, complains of the limitation that the Coal and Steel Pool has imposed on its production because of the recent steel glut; while other steelmakers denounce the plans of Cockerill-Ougree and Arbed (of Luxembourg) to build a big new mill at Ghent, which will exacerbate the surplus. Union Chimique Beldge, which has just emerged from the amalgamation of three of the country's biggest public chemicals companies, an amalgamation that was dictated by the increasing competition inside the Common Market, complain bitterly of American dumping of synthetics and basic chemicals on the European market. Belgium has no motor car manufacturing industry but it is a favourite site for the implantation of assembly plant; German Ford have just announced that they will follow the British and French firms that already assemble here, with a Rs. 35 crore investment at Genk to assemble the "Taunus"; so Belgians are well aware of the frantic competition in this industry too, which is leading manufacturers to build plant that cannot possibly all be working at full capacity in five years' time.

Moreover, Belgium finds itself right in the line of fire in the struggle between the USA and the Common Market, firstly because it is a haven for US firms seeking to get established on the right side of the common external tariff (Ford, Du Pont de Nemours, Parke Davis, Procter and Gamble, Outboard, Twin Disc Clutch and a score of others have rushed in these last few years); secondly because as a major exporter Belgium has run head-on into the difficult trading conditions now known inside the USA, and the protectionist measures being taken to relieve them. While Washington was publicising its grandiose schemes for freer trans-Atlantic trade, Belgian exporters encountered the hard realities of American trade practice. Washington announced last week that the import duty on glass was raised brutally from 1.3 to 3.5 cents per pound weight; it happens that Belgium is the USA's principal supplier, mainly because of the firm Glaverbel which makes 90 per cent of Belgian production and has the world's biggest capacity for plate glass: 60 million square metres. Simultaneously, the American duty on wool carpets was raised from 21 per cent to 40 per cent, a measure that will hit Japan first but will also stifle all Belgian sales and thereby reduce several thousand workers around Courtrai to idleness. The subsequent warning that the USA might impose special duties to prevent "dumping" of six makes of European cars could also affect Belgium, where certain of these brands are assembled for export. Petrofina's annual report contained the customary complaint about US restrictions on oil imports, for this firm's Canadian subsidiary, Canadian Petrofina, is thus prevented selling just over the border to the northern American states. Belgian shipowners, finally, joined their European colleagues in condemning the flag-discrimination introduced by the USA to assist its maritime industry.

In brief, Belgian industry is well placed to measure the extent of excess capacity that has appeared after the Western industrial boom, and the inability of freer trade within the Western world to relieve the situation —even where freer trade is sincerely practised, which it is not so far outside the Common Market because hampered by so many unavowed protectionist instincts. Perhaps Belgian apprehensions are exaggerated by the circumstance that this is a small nation, with a restricted home market, and with a living standard that is already the Common Market's highest in many respects. One finds here, therefore, none of the blissful confidence that an indefinite widening of the domestic market and the raising of living standards must surely absorb all increasing output; this being the mood that dominates in France and Italy in most, but not all, industries. No one here concludes that a classic over-production slump will develop, because everyone feels vaguely that it would be an impossible absurdity for the West to collapse under the weight of its own wealth and industrial power at a moment when its obligation to assist progress elsewhere is admitted by all. But for that, a vast and generous extension of the terms on which the industrial West trades with the developing nations will be necessary. Hence the support, which one hears expressed here more often than in other European business capitals, for measures to increase the earnings of raw-material producers (such as the fixing of higher world prices, suggested last year by M. Baumgartner) and to facilitate their purchase on credit of industrial goods.

A EUROPEAN ECONOMIC PLAN

PARIS, April 7.

HOW long will it be before there exists a European economic plan, in the sense that there already exist national plans in France and Holland? The question is a fair one, since it is sure that the Common Market (and even more, the enlarged Common Market) will have to have a plan eventually and it is only a question of how long recalcitrant members take to recognise the fact. Indeed, one may now say recalcitrant member in the singular, for it is only West Germany that maintains doctrinaire objections to the very principle of economic planning. France and Holland have plans, as noted, though of very different sorts. Italy was already coming round to admit the necessity of a national plan last year, and the "opening to the Left" constituted by Socialist support for the new Ministry has hastened the evolution. The present Government proposes to create soon a Plan Committee charged with preparing a general economic orientatoin plan (what is called here a "prospective") as well as detailed Five-Year Plans for all industries. It seems likely that as from next year Italy will have a national plan comparable with France's.

In Belgium, the evolution of opinion started earlier and dates in fact from the near-collapse of the Belgian economy in last year's general strike. A Bureau of Economic Programming (Belgium still bridles at the word "plan" but not at the reality) was set up last year under the professor Baron Kervyn de Lettenhove and, although its staff is small, it will have ready in three months or less a report on a Belgian national plan, on the relation between national planning and regional planning (this issue is live in Belgium because of the discrepancies between the Flemish and Walloon parts of the country), and on the sociological aspects of planning. Already the Bureau has published a target for the economy: an annual rate of expansion of 3.9 per cent up to 1965. Of course the mere publication of this figure (despite the bogus accuracy of saying 3.9 per cent instead of 4 per cent) does not constitute a plan, and one will want to know how the Belgian Government means to go about ensuring that rate of progress. Nevertheless, just by uttering the figure the authorities place a weapon in the hands of the opposition, which is henceforth entitled to ask the Finance Ministry to square its policies with this objective. (It will be remembered that it was the political exploitation of such target figures that was adduced by the Tory Cabinet some time ago as an argument against national planning.)

The Belgian plan, when it is available later this year, will be specially interesting from the point of view of a Common Market plan because, as mentioned in the previous article Belgium exports 40 per cent of her gross national product and 65-70 per cent of her industrial production—and more than half those exports are to present members of the Common Market and another quarter to candidates for membership or association. Thus the target of 3.9 per cent expansion yearly requires that Belgian exports in 1965 be 55.3 per cent higher than in 1959. Obviously, in planning their own expansion the Belgians are by implication planning (or making assumptions about) the expansion of the rest of West Europe. So they run into, earlier even than the French, the problem that brought up the discussion of a European plan: how to plan any nation's growth inside an economic union without general agreement about the rate of growth in the whole area? For the French this is already difficult; for the Belgians it is impossible.

With France, Italy and Benelux committed in principle or in practice to national planning, West Germany is in a minority of one. If the West German economy remained, as it was some years ago, the most prosperous of the six, it could be held up as a living

example of the beneficence of dogmatic liberalism. The example would be highly contestable, of course, for it would be easy to show that German expansion rested on accidental factors, such as the inflow of adult, trained labour, which no liberal theory can take for granted. But as long as the country boomed under the sign of Erhardian liberalism, Bonn could maintain that planning of any sort was a sugar-coated pill of Marxism. It happens, however, that the West German growth rate has fallen from 10 per cent to 3 per cent annually this year, whereas prices are 3.5 per cent higher than a year ago. Dr. Erhard warned last week about the deterioration of German competitiveness on world markets, the inflow of consumer imports, the excessive increase in wage-costs and even the danger of unemployment if present trends continued uncorrected. There is no need to dramatise West Germany's situation, or even to accept Dr. Erhard's interpretation of its troubles. The present point is not to argue that liberal Germany is doing worse than her planning neighbours (that would be hard to prove, and when proven would leave undemonstrated the assertion that it was planning that made the difference) but simply that as an object lesson of unplanned prosperity West Germany is less convincing a case than it was. The most one could say, at this moment, is (to quote a Parisian capitalist paper this week) "by dent of becoming more and more American, Germany runs the risk of encountering soon the same problems as America".

More important for Germany's opposition to a European plan is the approach of Great Britain to the Common Market, for London's conversion to the European ideal coincided with her conversion to the principle of national planning. If Britain becomes a member of the association just when she is making her first experiments in democratic planning, the camp of European planners will be considerably reinforced, and German aversion might be more readily overcome. Whatever the feelings about Britain's admission among other sectors of opinion, it is no secret that the French Plan Commission is an ardent supporter of London's application, for it sees in this the best hope of convincing the Germans that the enlarged association needs an overall economic plan. Needless to say, British backing is not expected for any essay in dictatorial planning of a socialist type, but then no one is suggesting that sort of plan. It is just to the extent that Britain, and under a Tory Government at that, agrees that there is value in French indicative planning, that Paris hopes to overcome German reticence.

In reality, piecemeal planning is implicit in the effort of economic unification. The Six have already discovered that the venture is impossible without a joint agriculture policy, an all-Europe fuel policy, and so on. Not that they have succeeded in elaborating all such sectional plans; they have for agriculture, but have not yet done so for fuel, transport and other matters. Yet everywhere that difficulties have blown up in a field where there was no general agreement on planned objectives, the work of integration has been undone. In coal for example, the Six waited passively until the overproduction crisis began, they made no attempt to co-ordinate their coal imports and they made no study beforehand of the likely effects of the relative fall in liquid fuel prices or of the transfer in industry from coal to oil. The upshot was an immense accumulation of coal at the pitheads, of course, but that is less my present point than that the slump inevitably hit one member worse than others and so that member had to be allowed to withdraw temporarily from the united coal market. It was Belgium, as it happened; that country is at present isolated from the rest of the coal pool, and its government has prepared a recovery plan that is a violation of the six-nation treaty. In other words, integration was undone by failure to work out a joint fuel policy. And how can one work out that without making projections of the role of each sort of fuel in industrial expansion and about the pace of expansion itself? Thus, the very attempt at integration implies a general plan for the whole region, unless one assumes that by a miracle all private investment programmes are going to fit together harmoniously without any danger of over-production.

Such an assumption might be more or less defensible within any one national economy, but it is absurd in an emerging economic union of many nations, because the prospect of a wider market stimulates all producers to invest more. Each government might see that its producers are overinvesting and, if the national market were still isolated, would promptly prevent them, e.g. by making credit dearer. But when it meets the argument that its producers must be allowed to invest more lest other producers in neighbouring countries conquer the wider market, it withdraws its objections. Taken individually, the Governments in Bonn, Paris and Rome all know, for example, that German, French and Italian automobile manufacturers are installing capacity that has no hope of being fully employed, especially in view of the expansion of U.S. implantations in Europe and of the mutual tariff reductions on car imports between the USA and Europe. But no one of them is willing to restrain its own nationals (indeed, often its own enterprises, since car factories are among State or semi-public concerns in each nation) for fear of advantaging competitors who achieve economies of scale.

It is because current investment programmes in Great Britain, West Germany, France and Italy forecast production of 9,300,000 cars in 1965 (against 5,861,000 in 1960), whereas likely demand is only for 8 million including exports, that France was able to persuade her partners to study the future of this industry. The word planning has nowhere been mentioned, but when the ECM Commission set up a committee in Brussels to study and make recommendations about the expansion of the European auto industry, it is in fact the first step toward a plan that is being taken — for one industry only, admittedly, but a vital one and one that has an evident impact on public expenditures on roads and on rail transport as well as on other equally vital industries like steel, rubber, textiles and oil refining. The report and the recommendations of this committee will be available shortly. No one expects that, on reading it, the Council of Ministers will issue orders to this firm and that to stop doing one thing and start doing another; if that is what German liberals understand by planning, then of couse there is no planning in France and Holland and none contemplated in Britain, Italy or Belgium. On the other hand, it is very likely that the Council or the Commission will advise producers to put their heads together, adjust each plan to the other's and to what is known of public policy over the next few years, to take account of the simultaneous forward programmes of other related industries and to see that their own programmes are well known to those who will have to supply them with materials and credit. By whatever name this process of adjustment must be called to spare German liberal sensibilities, it is what others call democratic planning, and it is to that that West Europe is tending increasingly.

Economic Report from the U.S.

ECONOMIC POLICY FACES A NEW CHALLENGE

By GUY SIMS FITCH

WASHINGTON, March 28.

IN agriculture, no less than in industry, economic policy faces the challenge of putting men and resources to productive use. This is a matter of pressing importance to the changing and growing U.S. economy, where developments in the farm and business sectors are inextricably linked. Agriculture's role in U.S. economic growth has changed sharply in recent years. It may seem strange in a country noted widely for its agricultural abundance, but as recently as the first two decades of this century there was serious public concern in the United States whether agriculture could continue to meet the food and fiber needs of the nation's expanding population. Public attention was focused on ways of improving agricultural technology.

By the 1950's, the full effects of agriculture's rapid technological progress were being felt, despite the disruption in the intervening years of the great depression of the 1930's and two international conflicts—world war two and the Korean hostilities. Between 1950 and 1961, labour use in agriculture declined by almost one-third, while output increased by more than one-quarter. As a result, the relationship of the farm sector to the rest of the economy was transformed. No longer was there any doubt about U.S. agriculture's ability to meet even the most strenuous demands for food and fiber. In 1910, it required 13.6 million farm workers to feed a nation of 92.4 million; in 1960, 7.1 million farm workers fed a nation of 180.7 million with greater abundance and variety than ever before. Today the nation's farms continue to produce in undiminished abundance, although farm workers now constitute less than 10 per cent of the total labour force, and in the face of farmers' voluntary acceptance of production controls under government programmes. On the average, the outmigration of workers from agriculture has run between 100,000 and 200,000 a year during the past decade, and the process still goes on. Policies designed to stimulate over-all economic growth can facilitate this outmigration and can help promote better use of the nation's resources. President Kennedy's comprehensive farm programme, which Congress now has begun to take up in detail, is one important element in this national effort. It is designed, in the main, to reduce the resources devoted to the production and storage of commodities in excess supply. In addition, the Department of Agriculture has plans to make effective use of land released from production. At the same time, policies to increase the mobility of labour generally and the flexibility of the entire economy also are required if workers from the farms are to find worthwhile jobs in industry. The Kennedy administration's stress on such programmes as area redevelopment, vocational guidance and job training, and enlarged employment information services are important steps in this direction as they contribute to the vitality of the economy as a whole.

Two new and significant steps to broaden business and employment opportunities have been launched within the past few weeks. A vast manpower retraining programme to fit up to one million workers for new jobs in the expanding U.S. economy has become law, and President Kennedy has just recommended to Congress a large public works programme to stimulate increased activity in those parts of the country which have been lagging behind the general economic advance. All these moves are directly related to the economic growth of the nation. For new industrial skills will do the newcomer from the farm little good if large numbers of experienced workers with the same or similar skills also are seeking employment. In this sense, the availability of the jobs that a fully employed economy offers is central to the solution of what has become known as the "farm problem" in the United States.

SETTLEMENT IN THE STEEL INDUSTRY

PITTSBURGH, April 4.

THE entire nation has won a major economic victory with the early and non-inflationary settlement of the labour-management negotiations in the steel industry. Here, in a capsule, is an example of the free collective bargaining process at its best. Neither side gained everything it sought. But what has emerged is a reasonable and highly acceptable compromise, with important advantages to both management and labour and to the economy as a whole. The settlement reflected the primary concern of the Union—the United Steelworkers of America (USW)—with employment and job security rather than wages at this time. Under their old three-year contract, which expires June 30, steelworkers received a wage increase as recently as last October. Their average earnings come to about $3.30 an hour, just above the highest for any major U.S. industry.

A significant achievement in the new contract is the introduction of new vacation and savings plans which could help spread the work load and open up thousands of jobs. The agreement also calls for increased pensions and broadened seniority rights. Another important provision would increase the supplemental unemployment benefits paid to laid-off and short-time workers. In addition, a joint union-industry committee will take up a number of problems of mutual concern, expanding the work begun by a human-relations committee set up under the expiring contract. Union officials credit that committee with contributing substantially to the new accord and to the creation of a bargaining atmosphere which has brought the first peaceful steel settlement since 1954. The administration of President Kennedy is elated with the steel settlement — both by the speed with which it was negotiated and by the moderation of its terms. The belief is that the steel companies will be able to absorb the additional costs without general price boosts. The reported settlement is well within the bounds of industrial productivity increases in the United States, which have been estimated by the President's Council of Economic Advisers at roughly three per cent a year.

The settlement has been approved by U.S.W. officials, but it still must go to the local unions of various plants for their ratification. Representatives of the eleven major companies which participated in the bargaining sessions have begun a series of meetings with local unions to hammer out these local agreements. If all goes well, formal signing of the new steel contracts could come by the end of this week or next. One of the side effects of the early settlement may be acceleration of the entire pace of labour-management bargaining, to the further advantage of the economy. Now that the basic agreement has been reached, the U.S.W., which represents all told nearly one million workers in steel and related industries, is beginning the process of reaching speedy accords with the smaller and speciality mills. Bargaining with major aluminium makers is expected to begin in about a month on a new contract to replace the one expiring July 31. Union spokesmen are confident that the new agreement will win ready support from the rank and file.

Special Article

MAN MADE FIBRES

By N. A. MOLLAH

THERE has been a quiet revolution in the world textile fibre industries during the last two decades or so. Artificially produced fibres, popularly known as man-made fibres or chemical fibres, now encroach on almost every use of natural fibres, such as cotton or wool.

There are two main groups of man-made fibres. The first group is derived from cellulose—the basic materials of which are wood and similar pulps and cotton linters; and the chief products of this group are rayon and acetate. The second group—the synthetic fibres are manufactured from various chemicals derived from coal and oil. There is also a third group—the protein fibres made from casein—a derivative of milk and oilseeds.

By far the greater proportion of cellulosic fibres consist of rayon (viscose); and acetate products have various trade names, such as Arnel, Triacetate, Triabene, Trilon and Tricel etc. The synthetic fibres and their different sub-groups offer a wide variety of products. Within the polyamide sub-groups there are three different types of nylon. Terylene is the product of the polyster sub-group and poly-acrilic fibres have trade names like Orlon, Acrilan, Darlon and Courtelle. Polyproplyne fibres and other forms of synthetic fibres (such as vinyon, Reevon, Drylene, Manryon, Wooion, Rhovyl, Zefton etc.,) are manufactured in some other countries.

The man-made fibres industry is still in its infancy and new fibres are appearing all the time on the market with attractive trade names. All these fibres are produced either as continuous filament yarn, that is, a thread consisting of one or more filaments ready for weaving or knitting; or as staple fibre—were filaments are cut into short lengths for spinning in the same way as natural fibres.

The production of textiles has increased steadily along with the rising standard of living in the world. The table below shows the production of cotton, wool and man-made fibres in some selected years since 1913.

TABLE I

WORLD PRODUCTION OF COTTON, WOOL AND MAN-MADE FIBRES
(In million pounds and in per cent)

Year	Rayon & Acoetate	Synthetics	Total	Per cent	Cotton	Per cent	Wool	Per cent	Total
1913 ..	24	—	24	—	10,950	86	1,730	14	12,704
1929 ..	444	—	444	3	12,600	82	2,250	15	15,294
1939 ..	2,243	—	2,243	12	13,060	74	2,460	14	17,763
1949 ..	2,743	104	2,847	15	14,312	74	2,238	11	19,397
1951 ..	4,008	228	4.236	17	17,534	73	2,356	10	24,126
1955 ..	5,035	582	5,617	19	20,917	71	2,780	10	29,314
1960 ..	5,748	1,564	7,312	22	22,514	68	3,184	10	33,010

Source: I.F.C.A.T.I. Annual Report 1960 and Quarterly Report, December, 1961.

The production of cotton and wool increased steadily throughout the period, but in terms of percentage the figures reveal a slower rate of growth compared to that of man-made fibres. Since 1949 the production of rayon and acetate has been more than doubled. Synthetic fibres became a commercial proposition in the beginning of the fifties and within the span of that decade production multiplied eight times. The progress of man-made fibres is also marked by the declining share of cotton and wool in the total textile fibre production.

The production and development of man-made fibres are growing at a rapid rate and they offer tremendous possibilities by virtue of their multifarious uses, strength of filaments and their "wash and wear" qualities. The consumption of these fibres has steadily increased since the war. But cotton has maintained an adequate share in terms of volume of total production and the present consumption levels are still more than twice the quantity of wool and man-made fibres taken together.

The table below gives the production figures of the leading man-made fibre producers in 1960.

TABLE II

(In million pounds)

	Rayon & Filament	Acetate Staple	Total	Non-Cellulosic Man-made Fibres	Total

Source: Cotton Year Book, 1961.

The United States is the largest manufacturer of man-made fibres, though before the war the development of the rayon industries in Germany and in Japan put these countries well ahead. Since the war, the development of the artificial fibre industries has been rapid. Rayon is now manufactured by almost every country, but synthetic fibres are produced mainly by the industrialised countries of the West—the major exception being Japan which ranks second in man-made fibres production. The Communist countries are still lagging behind some of the countries of the West in the production of synthetic fibres.

In many countries the man-made fibre industries are a highly protected sector of the economy, and the spectacular rise of these industries throughout Europe and in Japan could be accounted for by the assistance given by governments in many forms to these industries which, unlike cotton and wool, are not dependent on imported raw materials. Another feature of the man-made fibre industry is its oligopolistic character marked by a well pronounced tendency towards vertical and

horizontal integration. Vertically this industry embraces the manufacture of various chemicals and plastics for its raw materials while horizontally, the combination covers the production of different types of fibres.

Man-made fibres are being put to ever-increasing uses both for domestic and for industrial purposes. The table below indicates the main uses of the man-made fibres in the United States in 1959.

Source: Barclays Bank Review: August 1961

Rayon which was developed in the early part of this century as a substitute for silk, was mainly used for clothing particularly for women's stockings and under garments. Before the last war three fifths of the total United States' production of man-made fibres (mainly rayon viscose) went into clothing and only one twentieth for industrial uses. Now the clothing industries absorb less than one fourth of the rayon and acetate products, and of these a greater proportion of the latter goes to clothing. Industrial uses of rayon have increased steadily thus replacing traditional materials wherever possible.

Over one third of the synthetic fibre production finds an outlet in the clothing industries and this outlet is expanding at the cost of rayon and natural fibres. There is also heavy demand for these fibres for industrial uses. The tyre cord industry consumes about one fourth of the rayon fibre but the wider industrial uses of the synthetics counter-balance the large demand for rayon by the tyre cord manufacturers.

An increasing proportion of these fibres is absorbed into end-products that have been traditionally supplied by the natural fibres industries. Man-made fibres are popular for almost any kind of dress goods because of their crease resistance and "wash and wear" properties, their quick-drying qualities and, no less important, their durability. Nylon and Terylene are used for knitted goods which are now in direct competition with woven fabrics. The versatility of these new fibres is obvious when one considers the diverse products, such as fishing nets, ropes, fibre hoses, blankets, interior wall covering decoration, shoe fabrics, conveyor belting, which can be manufactured.

However, the artificial fibres are sometimes blended with the natural fibres to give better "touch" and texture. Terylene is mixed with wool for suits; nylon and terylene are mixed with cotton for shirts, sheets, rain coats, or with wool for knitting. There is ample scope in fibre blending.

Competition between the natural fibres and man-made fibres is ever increasing as the latter trespass into the end uses and industrial uses at a fast rate. In Western Europe the production of chemical fibres rose from a pre-war average of 707.8 million pounds annually to 2.8 billion pounds in 1960. As a result, cotton from all sources is supplying a declining percentage of the textile fibre requirement of Western Europe—the largest importer of cotton. Before the war, cotton represented 60 per cent of all fibres consumed domestically and this dropped to 54 per cent in 1957. On the other hand, man-made fibres increased their share from 19 per cent to 28 per cent in the same period. In the United States, cotton consumption did not keep up with the increase in total consumption expenditure. Per capita consumption of man-made fibre is growing steadily in the United States and in the industrialised countries of Western Europe.

Industrial uses of cotton and wool are giving ground to the high tenacity man-made fibres. Cotton received a heavy blow from the artificial fibres in one respect which is so spectacular that it over-shadowed the recent rising trends in cotton consumption. The tyre cord industries demand for cotton declined by 88 per cent between 1947 and 1957. Again, in the same period, for packing materials, cotton consumption fell by 56 per cent, part of the demand went to these new fibres.

However, there is no cause for pessimism. In the above mentioned period, cotton consumption for ladies' and teenagers' clothing rose by 52 per cent and 33 per cent respectively in the United States. Investigations also show that cotton consumption for clothing in the Western European countries might rise by about 30 per cent or more between 1955 and 1970. It is also expected that with the industrialization of many countries in Asia and Africa and the improved standards of living, per capita consumption of cotton will rise in these countries. This is particularly so with the cotton growing countries or with the countries having a domestic cotton textile industry. Apart from these prospects, a large amount of man-made fibres are utilized by the cotton textile industries for blending and there is ample scope for expansion in this direction.

Keen competition prevails within the whole range of man-made fibres. Nylon has replaced rayon in the manufacture of women's stockings and under-garments, but rayon made a return at the expense of cotton and wool and found new outlets in such products as motor tyres, tufted carpet and cigarette filter-tips. Synthetics invaded the motor tyre cord industry, the expansion of which is assured because of an expanding automobile industry throughout the world. Recently, to the dismay of the woollen industry, nylon, terylene and orlon have invaded the knitwear field and are keenly competing with each other as well as with wool.

Presently, with the major exception of Japan, a large proportion of these fibres is absorbed domestically. But there is growing competition for export markets as the break-neck growth in capacity of the man-made fibre industries in some countries (in many cases under government patronage), is in danger of outrunning demand. Fierce competition among the Common Market (E.E.C.) Countries will only be exacerbated by the entry of the United Kingdom. Du Pont of America—the largest organisation in man-made fibre production—is establishing factories in the Netherlands to compete in Europe. Japan has been carrying out a high-pressure export drive for her chemical fibres and no less than one third of the total Japanese textile export consists of man-made fibres.

The man-made fibre producing countries, sooner or later will look forward to the under-developed countries as a possible outlet. However, at present, the market is very narrow because of the limited purchasing power of the masses and of government policy in those countries to foster domestic cotton textile industries along with the general policy of economic self-sufficiency.

Man-made fibres are supplying a little less than one fourth of total textile fibres, and surely without their assistance the world will suffer from a shortage. But these man-made fibres are bound to go ahead at a faster rate both in volume and in terms of percentage of total fibre production. Competition with the natural fibres and within the whole range of man-made fibres can only be intensified.

THE BUSINESS WORLD

Rationale of Rayon

By CROESUS

BY and large, the Estimates Committee Reports presented to the Lok Sabha are known to be objective and accurate. This is not to say that the Esimates Committee is always infallible. One is driven to this seemingly rash conclusion after reading the Committee's Report on the Art Silk Industry in which it has made two observations which do not stand scrutiny. The first of these observations is that the prices fixed for indigenous art silk yarn are higher than the international prices; the second relates to the control on prices and distribution of art silk yarn and is to the effect that this control has not achieved the objective for which it was introduced.

Now, it may not be known to many that the control on prices and distribution of rayon yarn is a voluntary one, and, according to the officials concerned with this commodity, who ought to know, the control has been quite successful. There seems to be a complete agreement among the concerned interests, namely, the spinners and the weavers and, of course, the authorities also. Under the control as it obtains today, allocation or authorisation cards are issued by the Textile Commissioner or the Distribution Committee set up by the Textile Commissioner, and the yarn has to be distributed strictly according to these cards and at the prices fixed and approved by the Textile Commissioner. There is, thus, no scope for any doubt as to whether the rayon manufacturers charge higher prices or prices other than those fixed by the Textile Commissioner. Evidently, the Estimates Committee's conclusion is based on the open market prices where rayon yarn is said to be selling at a premium. It is unfortunate that a part of the yarn sold by the rayon manufacturers against allocation cards should find its way into the open market. But how can the rayon manufacturers be held to ransom for this? If, as the Estimates Committee has suggested to the Textile Commissioner, any corrective measures have to be taken to remove the alleged shortcomings of the present distribution scheme, the authorities must get at the holders of the authorisation cards who indulge in selling the yarn in the open market at a premium. Incidentally, this raises the question whether the basis on which the Textile Commissioner has issued the allocation cards is not faulty, in that it seems to offer scope for some holders of the allocation cards to receive more yarn than they can (or are entitled to) actually consume for their looms. In other words, it would be necessary to verify the accuracy of the number of looms with the holders of authorisation cards. Here, again, it is perhaps the powerlooms that pose the problem.

It is not clear as to how the Estimates Committee could venture a statement that the prices of indigenous rayon yarn are higher than the international prices. Apart from the fact that no one has cared to define the term "international prices of rayon", a comparison of prices of indigenous yarn with those of other countries is complicated because of a number of factors. In the first place, there are several countries producing art silk yarn of different deniers and of different qualities and shades; secondly, it is common knowledge that domestic prices of yarn, or, for that matter, of any commodity, are not necessarily the prices at which a user in the importing country can get it. For there is invariably a hidden element of subsidy in the prices quoted by yarn-exporting countries, for obvious reasons. For example, the domestic prices of 150 denier yarn in Italy is 139.33 d. per kg., whereas the price at which the same yarn is sold in India is 83.75 d. per kg. Notwithstanding this, it is noteworthy, if not surprising, that the price of indigenous yarn, even after adding the heavy excise duty imposed by the Government of India, compares favourably with the landed cost of imported yarn. The following table, showing the prices of Italian Art Silk Yarn (Snia-Cisa-Chatillion brand) of different deniers compared with the fixed selling prices of indigenous yarn, inclusive of excise duty, bears this out:

	100 Denier Cones	120 Denier Cones	150 Denier Cones
F.O.B Price per kg. in d. after adding one d. per lb. increase from 6-3-62 and deducting 1½ per cent L.C. discount on F.O.B. price	95.50	84.66	84.66
Nett F.O.B. Value in Rs. per kg.	5.35	4.74	4.74
Add Freight, Insurance, Clearing charges and import duty	5.96	4.81	4.81
Landed cost in India . Rs. per kg.	11.31	9.55	9.55
Fixed selling prices of indegenous Yarn (inclusive of Excise duty) (in rupees per kilogram)	10.51	9.14	8.44

It will be seen from the foregoing table that the fixed prices of indigenous yarn are lower than the landed cost of imported yarn. Even if we take the latest domestic prices of yarn in various foreign countries and compare them with the ex-factory selling prices of indigenous yarn, exclusive of excise duty (vide the January 1962 issue of "Skinners' Silk and Rayon Record"), the indigenous yarn prices are relatively lower. Perhaps the only country with a price lower than India's is Japan, but, if we take the average price of a number of countries including Japan, Indian rayon yarn prices are still found to be comparable, as can be verified from the following table:

	Selling price (ex-factory) of indigenous yarn (exclusive of excise duty)	Domestic prices of yarn in various countries of overseas manufacturers (including the increase of 1 d. per lb. recently announced effective from 6-3-1962.			
	Rs./kg.	Country	d/lb.	d/kg.	Rs./kg.
150 Denier on Cones (Bright) ..	6.94	Britain	67	147.71	8.27
		U.S.A.	71.3	157.19	8.79
		Japan	40.94	90.442	5.05
		France	63.0	138.89	7.76
		Italy	63.2	139.33	7.80
		Switzerland	73.5	162.04	9.08
		Sweden	63.2	139.33	7.80
		+12% Average	66.02	139.248	7.79
120 Denier	7.64	Britain	78	160.93	8.96
		U.S.A.	86	189.59	10.60
		Japan	40.94	90.244	5.05
		+7.46% Average	66.65	146.854	8.21
100 Denier	8.26	Britain	76.5	168.65	9.42
		U.S.A.	100.6	221.78	12.39
		Japan	45.86	101.079	5.66
		+19% Average	74.32	163.836	9.82

Committee had indicated the time or year of production of the rayon yarn the quality of which has been specifically commented upon. Surely this cannot apply to the quality of all indigenous rayon yarn today, certainly not to the first quality rayon yarn. One can say unhesitatingly, and without any mental reservations, that the first quality rayon yarn of indigenous manufacture of very good quality is comparable to those of Italian and any other foreign rayon yarn. Until recently, it is true some of our rayon manufacturers were finding some difficulty in manufacturing high quality yarn. This was because of the several difficulties that they had to contend with. There was, for instance, an inadequacy, not to speak of the inferior quality, of spares; secondly, power supply was not only inadequate but widely fluctuating; thirdly, the manufacturers had to reckon with the widely changing climate from season to season; fourthly, we didn't have a sufficient number of suitable and well qualified technical personnel for supervising the delicate processes of rayon manufacturing; and last, but not least, there was difficulty with regard to our labour which has yet to become as productive and careful as labour in the other rayon-manufacturing countries of the world. Fortunately, things have changed and the industry has overcome many of these difficulties, so that the quality of the outturn of the indigenous rayon manufacturers has vastly improved. Even so, at times, because of a technical flaw here or there, the quality of some batches of rayon yarn of indigenous manufacture may happen to be below par, but it must be said to the credit of the rayon manufacturers that such sub-standard rayon yarn is not palmed off as high quality yarn and charged as such. It is time, therefore, that these facts are made known to the members of the Estimates Committee and the authorities, in particular, and the public generally. The Association of man-made fibres owes it to itself and to the public at large to publicise these facts as widely as possible.

The Estimates Committee has also referred to the quality of indigenous yarn. Remarking that "the yarn produced in India barring a few exceptions is not up to the mark", the Committee has asked the Government to take energetic steps to improve the quality of art silk yarn. As in the case of prices of yarn, so also in respect of quality, the Estimates Committee's conclusions would seem to be based on, what has been described as "the consensus of non-official opinion before it." It would have been helpful if the Estimates

Business Notes

Textiles

MILL INDUSTRY'S PROBLEMS

THAT THE Cotton Textile Industry—one of the oldest industries in India—is confronted with a series of problems which have affected its production and that if the Government fails to remedy this situation, the industry will not realise its target under the Third Five-Year Plan, constituted the main theme of the Chairman's address at this year's annual meeting of the Mill Owners' Association, Bombay (M.A.O.) Mr. Pratap Bhogilal singled out cotton as the bugbear of the industry. As he pointed out, the shortage of raw cotton has been causing alarm. Domestic production has consistently lagged behind the Plan targets, while the rate of consumption by the mills has shown a marked increase. The output of cotton for 1961-62 is estimated at only 40 lakh bales—not even 43 lakhs as trade expected—in the first year of the Third Plan which provides for a production target of 70 lakh bales. This means that supply falls short of demand by about 18 lakh bales. Accordingly, the cotton situation calls for serious thinking. The area under cotton today is about 19 million acres, the highest in the world for any country, but the yield per acre is perhaps the lowest. Higher cotton production should, therefore, be sought through better yields per acre by means of a more extensive use of superior quality seeds, fertilisers and insecticides, and if necessary, but bringing under cotton cultivation more irrigated land. At the same time it is imperative that the farmer should have freedom to obtain the maximum return on cotton as in the case of other cash crops. Viewing in the broader perspective, the M.O.A. Chief was realistic enough to declare: "If it is generally felt that control of cotton prices is a

serious deterrent to the farmer for putting in his best efforts for maximising his return from cotton cultivation, I for one would not stand in the way of decontrol of the cotton ceiling prices."

In view of the shortage of raw cotton within the country, the industry has to lean heavily on imported cotton and the Cotton Advisory Board has recommended to the Government that the deficit of 18 lakhs should be urgently obtained from abroad. This is understandable because any serious shortfall in cotton supplies is apt to have repercussions on cotton prices, with the consequent distortion of the cost structure of the textile industry which is anomalous enough as it is.

Mr. Bhogilal pleaded for a large allocation of available foreign credits to the industry to meet its requirements of imported capital goods, on the ground that the Cotton Textile Industry is one of the largest earners of foreign exchange for the country and is expected to increase these earnings. But how far this contention will be accepted is doubtful in the light of the findings of a recent Reserve Bank study which shows that the industry has been spending more foreign exchange than it has been earning.

Modernisation and reduction of costs are indispensable if our textiles are to prevail in the overseas markets, as Mr. Bhogilal observed. If these twin objectives are to be achieved, his plea that the rates of depreciation allowances should be so fixed as to enable the mills to write off their assets within a period of 12 to 15 years as in other countries, deserves immediate consideration.

Listing the other problems facing the industry, Mr. Bhogilal urged that top priority should be given to ensure a steady and continuous flow of coal from collieries to the textile mills. He also expressed the hope that the State Government would hasten the completion of the Koyna Project in all its phases and thus meet the need for an ever-increasing supply of power.

Textile Interests are all agreed that on the export front intense efforts should be made to achieve the target of 850 million yards of cloth per annum during the present Plan period. The Mudaliar Committee also has devoted a good deal of expert study to the vital question of India's overseas trade. While agreeing with this view, Mr. Bhogilal felt that the industry should not indefinitely rely on artificial support in the shape of incentives for promoting exports, but should galvanise itself by its own strength and increase production sufficiently to meet the need of both the domestic and the foreign markets. This, coupled with the co-operation of Government in surmounting the obstacles in its path, should enable the industry to retain its prominent place in the Indian economy.

Plastics

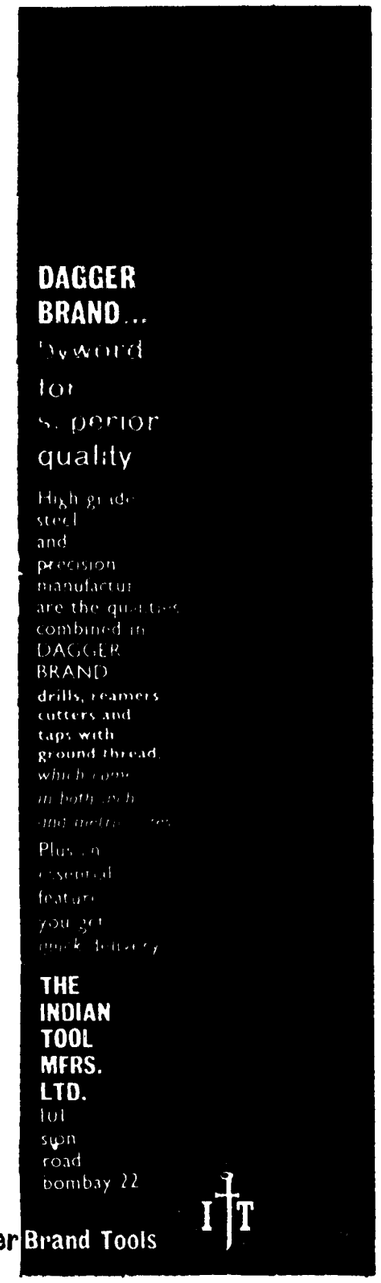
PHENOMENAL GROWTH

THERE COULD be no more vivid proof of the giant strides taken by the Indian Plastics Industry in recent years than the extensive range of plastic products one sees almost everywhere. Anything from polythene packaging film to umbrella handles or from automobile parts to radio cabinets one can have in plastics today. Displayed at the Seventh All-India Plastics Exhibition, declared open by the Governor of Maharashtra in Bombay, on April 4, 1962, there were also the numerous raw materials that are now being manufactured within the country. These include polystyrene, polythene, and polyvinyl chloride which are being developed as part of our growing chemical industry, to save lakhs of rupees of our valuable foreign exchange resources.

By virtue of its unique properties, such as lightness, toughness, transparency, translucency, flexibility, rigidity, corrosion resistance and insulation against heat and electricity, plastics have become a much-sought after material in every walk of life — industrial as well as domestic. A decided advantage enjoyed by plastics is that they are amenable to mass production methods which means that such a large number of items can be produced at a relatively low cost. Time was when plastics used to be considered only as a substitute for metal, glass, wood, procelain or rubber, but now they have come to be used in their own right as a basic material for industrial and constructional purposes.

Much encouragement has been accorded to this industry by the Union Government, as witnessed by the allocations made to this industry in the three Five-Year Plans. In the First Plan period, great attention was paid to the expansion and consolidation of the processing section of the plastics industry; during the Second Plan period, a firm foundation was laid for the production of various raw materials, and the target of 11,500 tons fixed for the production of plastics has since been achieved. According to Mr. Shadilal Jain, President, All India Plastics Manufacturers' Association, the target laid down by the Planning Commission for the production of plastics during the Third Plan period, that is to say, more than a six-fold expansion, amounting to 74,000 tons, should not be difficult to achieve, in view of the progress already made. In order to realise this target, however, emphasis must be laid on the manufacture of machinery and moulds, as also the development of technical know-how, the training of cadre, and research into the ever-widening application of plastics to industry. The importance of the industry can be guaged from the fact that approximately Rs. 25 crores are already invested in the industry, as also from the gainful employment to more than 30,000 workers that it has been providing.

As a foreign exchange earner, the Plastics Industry can make its valuable contribution, provided the raw materials are easily available and the licences are granted liberally. In this connection, Mr. Jain revealed that the All-India Plastics Manufacturers' Association, in co-operation with the Plastics and Linoleum Export Promotion Council, has been playing its part in increasing exports of plastics, which rose to Rs. 76.03 lakhs in 1960-61 from only Rs. 27.78 lakhs in 1958-59.



The Plastics Industry is playing a very important role in all the industrially advanced countries of the West, as also in Japan, by catering to various interests and supplying all manner of accessories and components. Although India is far behind these countries, there is no cause for alarm, judging from the phenomenal growth of the industry in the last few years.

Shipping

HINDUSTAN SHIPYARD'S DIFFICULTIES

WITH THE delivery — ahead of schedule for the first time — of MV "State of Punjab" — the biggest and the fastest cargo ship so far built by the Hindustan Shipyard — to the Shipping Corporation of India, yet another addition has been made to the number of vessels owned by the latter to make it the second largest shipping company in the country.

The picture of the Hindustan Shipyard has not been very bright, on the whole, although its performance during the past three or four years has been more or less satisfactory, thanks to Government assistance, as also to co-operation of Indian shipowners. However, several limitations still handicap the smooth working of the Shipyard, and Mr. G. L. Mehta (Chairman) drew attention to some of these, when formally handing over the ship to Mr. Srivastava, Managing Director of the Corporation. The absence of dry docking facilities at Visakhapatnam, about which so many distinguished persons, including the late Sir N. Gopalaswamy Ayyangar, have complained in the past, yet continue to be a serious bottleneck with the yard. It was for this reason that the delivery of the "State of Punjab" had to be made at Bombay and not at Visakhapatnam, as it should have been. This project — dry dock —

—THEY FLY NOTHING BUT THE BEST

You may not recognise all the 'planes in the PIA fleet. Some of them are used for the local air-bus services that make flying in Pakistan almost as cheap and simple as hopping on a bus. They were chosen because they were exactly right for just that kind of job. In the same way, only the great Boeings are sufficiently big, fast and comfortable for PIA's New York run. And PIA extend this thinking far beyond just choosing their 'planes. They maintain and fly them with loving care, and land them strictly on schedule. (PIA hold an unbroken record for punctuality.) This is what makes people say nice things about PIA. It brought the airline 63% more passengers last year, and 41% higher profits than ever before. The figures wouldn't go up if they weren't great people to fly with.

PIA

PAKISTAN INTERNATIONAL AIRLINES

(PIA. 1634A

are now told, has at last been included in the Third Plan, but it will take quite a few years more before the dry dock is completed.

A problem facing the shipping industry here, as almost everywhere, has been the dearth of trained men. Similarly, problems of procurement of materials have continued to present serious difficulties with the consequent delays both at the berths and at the fitting out jetties. Again, although the procedure for import of equipment and machinery from abroad has been simplified with the help of Government, according to the Chairman of the H.S.Y., delivery of material is frequently delayed, while negotiations between shipowners and the Shipyard in reaching agreement on specifications drag on unnecessarily, with the result that schedules of delivery are upset and the cost of structure is distorted in the result. Further, in view of the foreign exchange difficulties, it has become imperative to obtain suitable indigenous substitutes for imported materials. Mr. Mehta felt that the standing Advisory Committee on the Development of Ancillary Industries related to Shipbuilding and Ship-repairing, which has been set up and is doing useful work, ought to be helpful in this connection. But, as he added, indigenous manufacture involves several other problems, such as those in regard to standards, quality, prices, and delivery, which may not immediately conduce towards a reduction in the cost of ship construction.

Yet another matter which demands attention is the training of men to fill senior administrative posts. The Shipyard has only recently deputed an Officer-in-Charge of its Planning Office for special training in industrial engineering and production control and has also opened a Training School. The absence of a well-equipped Design Department is still another serious drawback. It is only when all these drawbacks are removed that the Hindustan Shipyard can hope to build many more ships of quality according to an agreed time schedule.

New Issues

ELECTRICAL INSTRUMENTS MANUFACTURING COMPANY

THREE COMPANIES will be entering the market in the near future to raise subscriptions from the public for their share capital.

Electrical Instruments Manufacturing Company Limited will be raising capital worth Rs. 20 lakhs, all in equity shares. The company has an authorised capital of Rs. 1,00,00,000, made up of 1,00,000 ordinary shares of Rs. 100 each. The shares being offered to public if fully subscribed will raise the issued capital of the company to Rs. 35,00,000; shares worth Rs. 15,00,000 have already been issued to the promoters and subscribers to the company's Memorandum and Articles of Association or their friends and associates. The list opens on April 16 and shall close on April 28 or earlier at the discretion of the directors, but not before April 20.

The company proposes to set up a factory at Naroda, near Ahmedabad, for the manufacture of house service meters (both single-phase and polyphase), electric switchgears, distribution boards and combined switch and fuse units. The project is estimated to cost Rs. 65 lakhs. As the share capital will be making available only Rs. 35 lakhs, two loans of Rs. 10 lakhs each are proposed to be obtained from the Industrial Credit and Investment Corporation of India and the Gujarat State Financial Corporation. The remaining sum of Rs. 10 lakhs is envisaged to be obtained through bank borrowings and cash accruals.

Technical collaboration has been arranged with Messrs. Valmet Oy, Helsinki, an undertaking of the Government of Finland. The products of the foreign collaborators, it is claimed, enjoy considerable reputation in the world market for their quality.

ASIAN REFRACTORIES

THE SECOND COMPANY which will be entering the capital market in the near future is Asian Refractories Limited. It proposes to offer for public subscription 3,30,000 equity shares of Rs. 10 each and 8,000 9.3 per cent preference shares of Rs. 100 each. The proceeds of the issue will be utilised for setting up a factory in the Hazaribagh District of Bihar to undertake, in the first instance, the manufacture of 24,000 tons firebricks and 6,000 tons silica bricks annually. At a later stage, it is proposed to go in for the production of magnesite bricks and chemical bonded bricks as well.

Technical collaboration for the project has been arranged with Messrs. CEKOP, a Polish State Foreign Trade enterprise. The foreign collaborators will not only supply the technical know-how, but also the plant and machinery required for the factory.

The Industrial Finance Corporation has sanctioned to the company a long-term loan of Rs. 35 lakhs and has also agreed to underwrite equity shares worth Rs. 5 lakhs.

BHARAT FORGE

THE THIRD COMPANY that shall be approaching the public for subscriptions for its capital some time in June is the Bharat Forge Company Ltd. It has plans to undertake the manufacture of heavy forgings upto 450 lbs. a piece at a factory to be set up near Poona. Preliminary work has already been taken in hand. The company has been licensed to produce 6,000 tons steel forgings per annum on a single-shift basis.

The authorised capital of the company will be Rs. 3 crores, consisting of Rs. 2 crores in equity shares and Rs. 1 crore in preference shares.

Technical collaboration is proposed to be secured from the Steel Improvement and Forge Company of Cleveland, Ohio, which is operating forge shops in several parts of the world such as the United States, Canada, Brazil, Argentina, the United Kingdom and Italy.

The company has been permitted by the Government to negotiate directly a DLF loan of about Rs. 1.5 crores to cover the foreign exchange component of the project.

Mr. S. L. Kriloskar will be the Chairman of the company's Board of Directors. Messrs. Kalyani Industries will act as Managing Agents for a period of ten years.

United Commercial Bank

ALL-ROUND PROGRESS

FROM THE statement of Mr. G. D. Birla, Chairman, circulated to the shareholders at the 19th annual general meeting of the United Commercial Bank, it is apparent that the Bank has made all-round progress during the year 1961. Deposits improved by Rs. 9.96 crores and stood at Rs. 98.90 crores on December 31, 1961. Profit increased from Rs. 67.43 lakhs to Rs. 72.61 lakhs. This increase probably could have been much greater if a lower liquidity ratio had been observed.

In disposing of the profit, the same pattern as followed last year has been followed and Rs. 30 lakhs have been transferred to the Reserve Fund, raising it to Rs. 2.35 crores. A sum of Rs. 4 lakhs has been added to the gratuity fund which was set up in 1960 with an initial contribution of Rs. 10,000. The most conspicuous feature is that after allocating Rs. 14 lakhs for bonus to the staff, a dividend of 12 per cent, less tax, has been repeated.

From the 10-year record of the Bank's progress it will be observed that the Reserve Fund has grown from Rs. 67.50 lakhs to Rs. 235 lakhs. But in spite of such substantial transfers to the reserve fund, the ratio of the paid-up capital and the reserve fund to deposits has declined from 9.04 per cent to 4.39 per cent owing to steep increase in deposits. It is now felt that the capital structure of the Bank needs to be strengthened. With this object in view, it is proposed to increase the paid-up capital by the issue of 2 lakh ordinary shares at a premium of Rs. 25 per share.

So far as the inter-bank agreement on rates of in-

terest on deposists is concerned, Mr. Birla specifically pointed out that it was not understandable how some banks could be given preferential treatment by allowing them to pay higher rates simply because their deposits for the time being were less than those of some other banks. He pointed out that a scramble for deposits through the offer of higher rates of interest would create stresses which might lead to the abondonment of the agreement and reduction in the profit margin to the point of imperilling the building up of capital funds of banks to anything like the extent to which banks are committed by the convention agreed to with the Reserve Bank of India. May it be stressed that it is only through competitive development and extension of banking services and in the environment of suitable interest rates and not in the atmosphere of a rate war that new deposits can be attracted!

Asian Cables

FAIR PROGRESS AND BRIGHT PROSPECT

IN HIS speech at the second Annual General Meeting of the Asian Cables Corporation Limited, Mr. G. B. Kotak, Chairman, said that the Company had picked up a fair rate of progress in a very short time in the production of quality cables. Mr. Kotak expects that at the present rate of production, the Company would manufacture cables worth Rs. 40 to 50 lakhs during the first year of production. The Company's production programme covers cables ranging from the smallest size with 1/1.12 mm. conductor to flexible cables of largest size with 37/2.12 mm. conductor. The Company has also commenced production of special cables like Welding Cables and Trailing Cables.

The Company's expansion project when completed will enable it to produce about 1,000 miles of power cables, the notable feature being the manufacture of cables upto 33 Kv. which demands a very high order of technique. This apart, the project will also be manufacturing 360 tons of enamelled copper magnet wires. Technical collaboration for this project has been obtained from Messrs. Phelps Dodge Copper Products International Corporation of the U.S.A. and Enfield Cables Ltd. of the U.K. both of whom have long experience at their credit. The drawings, designs and lay-out for the project having been ready, the company now awaits the import licences from the Government for the import of machinery.

In joint venture with other two manufacturers of cables, the promoters of Asian Cables and Corporation Ltd., Messrs. Kotak & Co. have been granted an industrial licence to start the Rod Rolling Mill, very necessary for cable plant, with a capacity of rolling 20,000 tons per annum per shift.

Within the short period of the company's existence, it has made a fair progress in its field of business and with the expansion schemes that are in hand, it now looks ahead to a period of more brisk progress.

Engineering

EXCELLENT RESULTS OF KAMANI

AT THE 16th annual meeting of Kamani Engineering Corporation Ltd., Mr. R. H. Kamani, Chairman, revealed that the Corporation was making excellent progress. If profits and sales are taken into account, they show an upward tendency over the previous year. Sales, for instance, have increased to Rs. 268,68,131 from Rs. 23,689,673. A dividend of 9 per cent subject to deduction of tax at source on ordinary shares as against previous year's 8 per cent subject to deduction at source depicts also an encouraging trend and the progress attained by the Corporation. Production record is no doubt to be commended. For instance, the production level maintained at present is on an average 50 per cent higher. Model MARK II "TRACTAMOUNT" Roller has been successfully launched.

It is equally encouraging that the Government has appointed a Study Group to assess among other things, the capacity in the Transmission Line Tower industry and their development programme and to examine the difficulties experienced so far. In connection with the requirements of transmission lines during the Third Five-Year Plan, Mr. Kamani specifically pointed out that to achieve the targets it was absolutely essential that the higher sections required by the tower industry be made easier.

So far as erection activities are concerned, it is by now well-known that they have been considerably strengthened and expanded. New tools and tackles have been designed, tested and put into operation to ensure greater efficiency. The construction of land route of 200 kV Koyna-Bombay transmission line has been completed. This is the first line in the country to use one of the largest sized conductors ever used. In the case of exports it is a matter of gratification that the active efforts put in by the Corporation have started showing good results. From the progress achieved there seems little doubt that Kamani Engineering Corporation Ltd. is bound to flourish year after year.

Technology

STIMULATING THE SCIENTISTS

THE PROBLEM of maintaining a fair standard of sound scientific and technological education claimed the attention of Mr. J. R. D. Tata while delivering his Presidential Address at the Indian Institute of Science, Bangalore.

It is quite imperative for a developing country like India to not only speed up education, but, at the same time, maintain its quality. In this fast-developing age, as Mr. Tata pointed out, we cannot afford to ignore the standards maintained elsewhere in scientific and technological education and research. While, in any case, our scientific education needed a thorough reorientation, he said, the fundamental objective in training science and engineering students should be to develop a grasp of basic concepts and a readiness to think for themselves and explore ideas. He regretted that there was too much formalized and wooden teaching of courses from text books too rigid and antiquated. According to Mr. Tata, merely to impart information is not to educate. Education should aim at encouraging and stimulating the curiosity of young minds. Young minds always yearn to know more. This is as it should be. Has not Charles Lamb observed: "Credulity is a child's weakness, but a man's strength"? Like the economists, the scientists also should make themselves heard and education should help them to do this. A scientist must transmit his faith and his vision in order that the Government and the people may appreciate the value of his work and the benefit it has to bring to all.

In view of the special place that the Indian Institute of Science occupies in the field of scientific and technological research, Mr. Tata pleaded for a greater recognition by the Central Government of its value and greater support to its work and efforts. For effectively carrying out its training and research programme, he emphasized the need to recruit additional staff and make the scales of pay commensurate with the kind and calibre of work done. He pleaded for an appreciable improvement in the resources of the Institute and for the provision and maintenance of increased facilities to keep pace with the rising tempo of work done there. With the help of the Government, Mr. Tata hoped, the Institute would be able to carry out successfully its objectives of disseminating knowledge, preparing men and women for the business of purposeful living, serving the community, fostering research and extending the frontiers of knowledge.

THE SASSOON SPG. & WVG. CO. LTD.

Registered Office :

Mafatlal House, Back Bay Reclamation,

BOMBAY - 1.

NOTICE

NOTICE is hereby given that the EIGHTY-NINTH Annual General Meeting of the Shareholders of the SASSOON SPG. & WVG. CO. LTD. will be held at the Registered Office of the Company, Mafatlal House, Back Bay Reclamation, Bombay-1, on Tuesday 24th April 1962 at 4-30 P.M. to transact the ordinary business as specified in items 1 to 6 and to consider and pass the Special Resolutions contained in item Nos. 7 and 8 of the Notice dated 3rd March, 1962 already posted to individual members at the registered address with the Company along with the explanatory Statement in respect of the Special Resolutions in items Nos. 7 and 8 of the Notice as required by Section 173 of the Companies Act, 1956.

By Order of the Board of Directors,
For M.G. Investment Corporation Ltd.,

K. K. MAHADEVIA
Director,
Managing Agents.

BOMBAY,
Dt: 3rd March, 1962.

N.B. : 1. A MEMBER ENTITLED TO ATTEND AND TO VOTE AT THE MEETING IS ENTITLED TO APPOINT A PROXY TO ATTEND AND TO VOTE INSTEAD OF HIMSELF AND A PROXY NEED NOT BE A MEMBER.

2. The register of Members and Transfer Books of the Company will remain closed from Monday, 2nd April, 1962 to Tuesday, 24th April, 1962 both days inclusive.

3. Dividend as recommended by the Directors, when declared at the Annual Meeting, will be paid from Wednesday, the 2nd May, 1962 to Tuesday, the 31st July 1962 at the United Commercial Bank Ltd., Reclamation Branch, Bombay 1, and thereafter at the Registered Office of the Company during office hours, excepting Saturdays, to those shareholders whose names are on the Register of Members of the Company on 24th April, 1962. Shareholders are requested to intimate the Company immediately any change in their registered address.

THE MAFATLAL FINE SPG. & MFG. CO. LIMITED

Registered Office :

Mafatlal House, Back Bay Reclamation,

BOMBAY - 1.

NOTICE

NOTICE is hereby given that the THIRTY-FIRST ANNUAL GENERAL MEETING of the Shareholders of THE MAFATLAL FINE SPINNING AND MANUFACTURING COMPANY LIMITED, will be held at the Registered Office of the Company at "Mafatlal House", Back Bay Reclamation, Bombay-1, on Tuesday, the 24th day of April 1962 at 4-00 P.M. (S.T.) or soon after the Extraordinary General Meeting of the Company is over to transact the business contained in the Notice dated 3rd March, 1962 already posted to the members individually at their Registered Addresses with the Company.

By Order of the Board of Directors,
NAVINCHANDRA PURSHOTAMDAS & CO. LTD.
H. B. MAFATLAL
Director,
MANAGING AGENTS

Bombay
Dated 3rd March, 1962.

N.B. : (a) A MEMBER ENTITLED TO ATTEND AND VOTE IS ENTITLED TO APPOINT A PROXY OR PROXIES TO ATTEND AND VOTE INSTEAD OF HIMSELF, AND A PROXY NEED NOT BE A MEMBER.

(b) The Register of Members and the Transfer Books of the Company will remain closed from Monday, the 2nd April, 1962 to Saturday, the 21st April, 1962—both days inclusive.

(c) The Dividends as recommended by the Directors when declared by the shareholders will be paid at The Bank of Baroda Ltd., Reclamation Branch, Bombay 1, from Wednesday, the 2nd May 1962 to Thursday, the 30th August, 1962 during business hours and thereafter at the Registered Office of the Company during Office hours, excepting Saturdays and holidays, to those shareholders whose names are on the Company's Register on 21st April, 1962. Shareholders are requested to intimate to the Company any change in their Registered address.

FROM THE CAPITAL'S CORRIDORS

THE NEW UNION CABINET

A 17-member Union Cabinet, the largest since Independence, was sworn in by the President on April 10. The new Cabinet consists of:

Minister	Portfolio
1. Jawahalal Nehru	Prime Minister. Incharge of External Affairs and Atomic Energy. Also will be Chairman of the Planning Commission.
2. Morarji Desai	Minister of Finance.
3. Jagjivan Ram	Minister of Transport & Communications.
4. Gulzarilal Nanda	Minister of Planning and Labour & Employment.
5. Lal Bahadur Shastri	Minister of Home Affairs.
6. Sardar Swaran Singh	Minister of Railways.
7. K. C. Reddy	Minister of Commerce and Industry.
8. V. K. Krishna Menon	Minister of Defence.
9. S. K. Patil	Minister of Food and Agriculture.
10. Hafiz M. Ibrahim	Minister of Irrigation and Power.
11. Asoke Kumar Sen	Minister of Law.
12. Keshava D. Malaviya	Minister of Mines & Fuel.
13. B. Gopala Reddi	Minister of Information & Broadcasting.
14. C. Subramaniam	Minister of Steel and Heavy Industries.
15. Dr. K. L. Shrimali	Minister of Education.
16. Humayun Kabir	Minister of Scientific Research & Cultural Affairs.
17. Satya Narayan Sinha	Minister of Parliamentary Affairs.

Alongwith the swearing-in of the 17 Cabinet Ministers, five Ministers of State were also be sworn in. They are:

Minister of State	Portfolio
1. Mehr Chand Khanna	Minister of Works, Housing and Supply.
2. Nityanand Kanungo	Minister of Industry in the Ministry of Commerce & Industry.
3. Raj Bahadur	Minister of Shipping in the Ministry of Transport & Communications.
4. S. K. Dey	Minister of Community Development, Panchayati Raj and Co-operation.
5. Dr. Sushila Nayyar	Minister of Health.

A few more Ministers of State, including one for Labour and Employment, and a number of Deputy Ministers and Parliamentary Secretaries are to be appointed in course of time.

Mr. Manubhai Shah who had been invited to take charge of international trade as a Minister of State in the Ministry of Commerce and Industry, declined the offer on the ground that within the present arrangements he would not be able to do justice to the portfolio. Mr. Shah, however, has since agreed to join the Ministry on understanding having been given to him that he will have a sufficiently free hand in his field of activity.

With the installation of the new Ministry at the Centre, certain amendments have been made in the Government of India (Allocation of Business) Rules, 1961. By virtue of these amendments, the Department of Mines and Fuel under the Ministry of Steel, Mines and Fuel has become a full Ministry of Mines and Fuel. Mr. K. D. Malaviya, who has been put in charge of this Ministry, will now not only deal with oil and development of certain minerals, but with all matter of oil and mineral development, including coal.

The Department of Iron and Steel has been placed under a new Ministry of Steel and Heavy Industries. A new Department of Heavy Industries has also been created under this Ministry. The Ministry of Steel, Mines and Fuel as such has ceased to exist.

The Department of Commerce under the Ministry of Commerce and Industry has been abolished and a new Department of International Trade has been created under the Ministry of Commerce and Industry.

The Ministry of Rehabilitation has been abolished. The work dealt with in that Ministry has been transferred to a new Department of Rehabilitation, which has been created under the Ministry of Works, Housing and Supply.

The following are the subjects which will be dealt with by the Department of International Trade and the Department of Industry in the Ministry of Commerce and Industry, and by the Department of Heavy Industries in the Ministry of Steel and Heavy Industries.

DEPARTMENT OF INTERNATIONAL TRADE

I. **Trade:** Foreign Trade; State Trading; Protection of interests of Indian traders abroad; Trade Missions and Delegations; International Commodity Agreement other than wheat; International Trade Agreements; Import Trade Control; Export Trade Control; Control of Prices of export goods; Trade Promotion (except promotion of exports of exposed cine films), Publicity and Research; ECAFE and its Committee on Industry and Trade; Export Credit Guarantee; Fairs and Exhibitions abroad and in India; Government showrooms and Trade Centres abroad.

II. **Commercial Intelligence, Statistics and Publications:** Commercial Intelligence and Statistics; Commercial publications including periodicals.

III. **Enemy Property:** Reparations (other than German Industrial Equipment; Control of trade with the enemy and enemy firms and custody of enemy property.

IV. **Plantation Industries:** Tea (The Tea Act, 1953); International Tea Regulation Scheme, Export Cess on Tea; Rubber (The Rubber Act, 1947); Coffee (The Coffee Act, 1942).

V. **Textiles:** Cotton Textiles (including); Raw Cotton; All questions connected with supply, prices and

distribution of Textiles; Co-ordination of the development of the Coir Industry; the Coir Industry Act, 1953.

VI. **Tariffs and Customs:** General Agreement on Tariffs and Trade; Tariff Policy (The Indian Tariff Act, 1934); Tariff Commission (The Tariff Commission Act, 1951); Tariff Valuation; Tariff Protection to Industries; International Customs Tariff Bureau; Commonwealth Tariff Preferences; Customs nomenclature and similar matters.

VII. **All matters relating to the following:**

(a) **Attached/Subordinate Offices and Semi-Government Organizations:** Chief Controller of Imports and Exports, New Delhi; Tariff Commission, Bombay; Textile Commissioner, Bombay; Jute Commissioner, Calcutta; Director General of Commercial Intelligence and Statistics, Calcutta; Controller of Enemy Trading and Enemy Firms and Custodian of Enemy Property; Cotton Textiles Fund Committee, Bombay; Rubber Board, Kottayam; Tea Board, Calcutta; Coffee Board, Bangalore; Coir Board, Ernakulam; Indian Trade Representatives Abroad.

(b) **State Undertakings and Government Corporations:** State Trading Corporation Ltd; Export Risks Insurance Corporation.

DEPARTMENT OF INDUSTRY

I. **Industrial Policy:** General Industrial Policy; The Administration of the Industries (Development and Regulation) Act, 1961; Industrial Management; Productivity in Industry.

II. **Industries and Industrial Development:** Planning, development and control of and assistance to all industries (with the exception of the Industries falling under the Ministry of Steel and Heavy Industries and Food and Agriculture); Cables; Light Engineering Industries (e.g. Sewing machines, type-writers, weighing machines, bicycles, etc.); Optical Glass Project; Light Industries (e.g. Plywood, stationery, matches, cigarettes, etc.); Light Electrical Engineering Industries.

III. **Chemicals and Drugs:** Chemical Industries (e.g. Caustic Soda, Soda Ash, Raw Films, Hardboard, Paper and Newsprint, Synthetic Rubber, Tyres and Tubes, Dyestuffs, Drugs and other fine chemicals, Plastics, Soap, etc.); Insecticides; Antibiotics; Salt; Power Alcohol (The Indian Power Alcohol Act, 1948).

IV. **Small Scale Industries:** Co-ordination of the development of small-scale industries — (i) Small Scale Industries Board; (ii) National Small Industries Corporation; (iii) Setting up of new industries in displaced persons townships and colonies and places where there are heavy concentrations of displaced persons for mitigating their unemployment in the Western Region, viz., Punjab, Uttar Pradesh, Maharashtra, Gujarat, Rajasthan, Madhya Pradesh and the Union Territory of Delhi.

V. **All matters relating to the following:**

(a) **Attached/Subordinate Offices:** The Development Wing (other than Directorates under the Department of Heavy Industries); The Development Commissioner, Small Scale Industries, New Delhi; The Salt Commissioner, Jaipur; Government Salt Works:

(b) **State Industrial Undertakings and Government Corporations:** The National Industrial Development Corporation Ltd.; The National Small Industries Corporation Ltd.; Hindustan Insecticides Ltd., Delhi and Alwaye (Kerala State); Hindustan Antibiotics Ltd., Pimpri; National Instruments Ltd., Calcutta; Hindustan Cables Ltd., Roopnarainpur, West Bengal; Hindustan Salt Company Ltd., Jaipur; Rehabilitation Industries Corporation Ltd.; Hindustan Photo Film Manufacturing Co. Ltd., Madras; Hindustan Organic Chemicals Ltd., Bombay; National Newsprint and Paper Mills, Ltd., Nepanagar; Indian Drugs & Pharmaceuticals Ltd., New Delhi

VI. **Trade:** Internal trade; Inter-State trade; the spirituous Preparation (Inter-State Trade and Commerce) Control Act, 1955; Control of Futures Trading; the Forward Contracts (Regulation Act, 1952); Essential Commodities Act (Supply, prices and distribution of essential commodities not dealt with specifically by any other Ministry).

VII. **Trade Marks, Patents and Designs:** The Trade and Merchandise Marks Act, 1958; Standards of Weights and Measures; Standardisation of international products and raw materials, the Indian Standards Institution (Certification Marks) Act, 1952; Patents and Designs (The Indian Patents and Designs Act, 1911).

VIII. **Village Industries:** Development of Handloom Industry (The Khadi and Other Handloom Industries Development — Additional Excise Duty on Cloth Act, 1953); Co-ordination and Development of village industries including Khadi and Handicrafts; Ambar Charkha; Sericulture; Development of Gur and Khandsari Industry.

IX. **All Matters relating to the following:**

Attached or Subordinate Offices and Semi-Government Organisations and Government Corporations: Economic Adviser to the Government of India, New Delhi; Forward Markets Commission, Bombay; Controller-General of Patents, Designs and Trade Marks, Bombay; Indian Standards Institution, New Delhi; Khadi and Village Industries Commission, Bombay; All-India Handloom Board, Bombay; Khadi and Village Industries Board; Central Silk Board, Bombay; Central Sericultural Research Station, Berhampur; All-India Handicrafts Board; Indian Handicrafts Development Corporation Ltd.

DEPARTMENT OF HEAVY INDUSTRIES:

The following matters will be dealt with by this Department:

Manufacture of heavy engineering equipment for all industries including coal mining equipment; Heavy Machinery Project; Foundry Forge Project; Coal Mining Equipment Project; Heavy Electrical Equipment Project; Machinery Industries including Machine Tools and Steel manufacture; Auto industries, including tractors, earth moving equipment and diesel engines; Heavy Electrical Engineering Industries; Cement; Fertilizers; Public Sector projects falling under the above mentioned subjects; The Directorates of the Development Wing dealing with the above subjects.

COAL MOVEMENT BY ROAD AND SEA

The Planning Commission's Working Group on Coal Production and Transport, in its draft report, has made some valuable suggestions for the movement of coal by road and sea and for the linking of industrialisation with coal production and transport. The report says :

"The Working Group has carefully considered the possibility of moving larger quantities of coal by road from the Bengal-Bihar coalfields with a view to relieving pressure on the Railways. The Coal Controller was requested in the first meeting of the Working Group, held on September 20, 1961, to give a list of the consumers located within 25, 50, 100 and 150 miles of coalfields. The Ministry of Transport and Communications (Roads Wing) later examined the possibility of supplying coal requirements of these consumers by road. The present annual requirements of the consumers within

distances up to 150 miles of the coalfields are estimated as below:

1.	0 to 25 miles	3 million tons.
2.	25 to 50 miles	4 million tons.
3.	50 to 100 miles	Negligible.
4.	100 to 150 miles	7 million tons.

"Of the total quantity of about 14 million tons of coal moving upto distances of 150 miles from Bengal-Bihar coalfields, about 3 million tons move by road—consisting of 2 million tons moving within 25 miles distance and 1 million tons moving between 100 to 150 miles, namely, from the coalfields to Calcutta. The remaining 11 million tons move by rail.

"The Working Group considers that, on the whole, after the necessary road capacity has been developed, it should be possible to move an additional about 2 million tons of coal by road from the Bengal-Bihar fields over and above the present road movement of 3 million tons. There may, in addition, be some possibility of road movement from the coalfields in the up direction of Uttar Pradesh but the Working Group has not been able to make any detailed study of it.

"The Working Group examined the relative economics of rail and road haulage of coal within short distances upto 150 miles. The actual freights charged by road and rail at present are reported to be as under:

Distance (Miles)	Rs. per ton Rail	Road
25	5.25	5.00
50	5.63	10.00
75	.07	15.00
100	7.11	20.00
150	9.63	30.00
Raniganj to Calcutta (120)	8.10	24.00

"The rail costs indicated above, however, do not indicate the terminal costs of loading and unloading and of local transport from railway stations to the sites etc. It is, therefore, felt that the factories which do not have railway sidings and the other small consumers may find it to their advantage to get coal by road within distances upto 50 or even 75 miles. Even as regards the movement to users in Calcutta city and suburbs the cost of transport by road could be reduced substantially if the movement took place by 11 ton truck trailer combinations. The cost of hauling coal per ton mile by such combinations is estimated at 8 nP. per ton mile for a 100 per cent load factor or 16 nP. per ton mile for a 50 per cent load factor in the event of no return traffic being available to them. Over a distance of 120 miles between Raniganj coalfield and Calcutta the cost of moving coal by road at 50 per cent load factor will come to Rs. 19.20 per ton. To the extent that return load to these trailors will be available, this figure will be reduced. The difference between the rail freight of Rs. 8 per ton and about Rs. 19 per ton by road will be reduced to the extent that rail movement would have to bear the additional cost of loading and unloading at terminal points and cost of local transport by road.

"While the Working Group has no doubt that with the improvements in the roads suggested above, the quantity of coal moving by road will increase, the Working Group has considered it advisable not to allow for this in assessing the requirements for rail transport of coal for the Third Plan period. This will avoid the risk of any under-planning of railway capacity, and the additional capacity that may be available in this region could, in any case, be used for other traffic.

"No detailed examination has been made so far about the possibility of road movement from the outlying fields. The total short distance movements from these fields for the last year of the Third Plan are estimated at 4.3 million tons. These include movement of coal by rail to the Power houses at Satpura, Obra, Talcher and Khaperkheda. In respect of Korba power house, coal is transported by rail but the rolling stock for the purpose is provided by the Madhya Pradesh Electricity Board. As regards coal requirements of the Satpura, Obra, Talcher and Khaperkheda power houses, the possibility of supplying them by road will need detailed examination.

"There is yet another field in which road transport will have an important part to play and that is in moving coal from the dumps to the ultimate points of destination. The entire scheme of rail movement of coal for State controlled priorities is based on movement of full rakes of BOX wagons from the collieries to the dumps to be located at appropriate places. The movement from these dumps to the ultimate points of destination will have to depend largely upon road transport. The actual quantum of road [redacted] may have thus to be organised will be [redacted] the results of the studies about the [redacted] were available.

"According to the decision of the Cabinet, 2 million tons of coal per year are required to be moved by sea from Calcutta to South India and West India ports. To move this quantity about 30 sailings per month are required of which 19 sailings are required for South India ports and 11 for West India ports. On this basis the minimum number of ships required as calculated by the Coastal Conference of Shipowners comes to 43. The Transport Ministry in fact thinks that the requirements, after allowing for such factors as delays in turn round of ships, detentions at ports etc., will be 50 ships.

"In regard to the purchase of ships, the main difficulty so far has been the non-availability of foreign exchange. The entire requirements of coastal ships are to be met by imports because the capacity of the Hindustan Shipyard is fully booked upto the end of the Third Five-Year Plan period for the vessels intended for overseas operations and the yard cannot easily undertake building of coastal vessels which will have a different design. The early completion of the second Shipyard at Cochin assumes added urgency in this context. Even if all the ships are to be acquired second hand, the requirements of foreign exchange for 22 ships at the rate of Rs. 60 lakhs per ship would be Rs. 13.2 crores. Although a sum of 10 million dollars from the Yugoslav credit has been allotted for the acquisition of ships, so far it has not been possible to utilise this sum except for one new construction. The reason for the non-utilisation of this credit is that suitable second hand ships are not available and as regards new construction the Indian Shipowners are reluctant to go to Yugoslavia because they have had no experience of that country's shipyards and secondly the prices quoted by the Yugoslav Shipyards are not competitive. The Working Group is therefore strongly of the view that the necessary foreign exchange required for the acquisition of additional tonnage of the order mentioned above should be released and if necessary, free foreign exchange should be made available for this purpose. It is very important to achieve the target of 2 million tons of

coastal movement of coal, if the industries in Western India particularly are not to be starved of coal and hence the additional ships should be acquired as early as possible.

"If the private shipping companies cannot be persuaded to purchase all the additional ships required on the coast, the Working Group would recommend that the Government Corporation should acquire coastal ships so as to make the total tonnage adequate for the movement of 2 million tons of coal per annum.

"The Working Group has also considered the possibility of coal movement in the Calcutta direction by the Durgapur Canal in the Third Plan period. At one stage, the Damodar Valley Corporation authorities had estimated that about 2 million tons of coal per annum could be moved by the canal. The arrangements for utilisation of the canal for movement of coal, however, have not so far been considered in detail. The Planning Commission is understood to have recently asked the Ministries of Transport and Communications and Irrigation and Power to consider these arrangements. One of the questions which requires to be considered in detail in this connection is by what arrangement and at what cost could coal be moved from the coalfield to canal head before it was transhipped to the barges in the canal. Until the results of this examination are available it will be difficult to suggest what quantities of coal could be expected to move by this route.

"Before concluding its report the Working Group wishes to draw attention to an important matter of policy, which has a bearing on the future pattern of [illegible] of coal in the country. This pertains to the [illegible]ustries based largely on coal. The Group [illegible]ous consideration should be given in decid- [illegible] industries to the requirements in regard [illegible] of coal involved. In formulating the fourth and the subsequent Plans it would be eminently desirable that industries which consume large quantities of coal grow up near the coalfields, while the industries which do not require much coal should be encouraged in places distant from the coalfields. Planning in this direction is essential so as to avoid undue strain on the transport system in the Fourth Plan period. In this context it will also be desirable to examine the feasibility of conversion of coal into gases which could be easily transported through pipelines and of increased generation of the thermal power in the coalfields and its transmission through inter-State grid. Moreover, a relatively higher priority may have to be given to production of hydro-electric or nuclear energy in the regions distant from the coalfields. It may also be necessary to revise the existing railway freight structure so as to discourage long distance uneconomic haulage of coal. Any such adjustments in railway rate structure could only be made over a period of time, in order to avoid dislocation to the existing industrial cost price structure. It will be an advantage, however, to consider the locations of new industries having regard to the true costs of hauling coal by rail and not merely the existing freight rates which are heavily subsidised. The general objective of these studies should be to minimise the haulage of coal over long distances which requires huge investments and yet to exploit the coal resources to the utmost. The Working Group has not given detailed thought to these issues but has considered it necessary to mention them in the hope that they will receive consideration by the appropriate agencies in due course.

"It would be desirable if the programmes in regard to the development of coal consuming industries and the transport requirements of coal is drawn up in two parts, namely (a) for the first two years of the Fourth Plan period and (b) for the end of the Fourth Plan period. In drawing up this programme the various considerations influencing the location of industries mentioned above and the desirability of avoiding needless transport strains should be borne in mind."

A FIVE-YEAR PLAN FOR DEVELOPMENT OF GOA

A high-level mission, representative of the Planning Commission and the Ministries of Finance, Commerce and Industry, Steel, Mines and Fuel and Transport, will shortly leave for Goa to prepare a Five-Year Plan for this recently acquired Union Territory. The Plan, when finalised, will form part of the country's Third Five-Year Plan.

Goa's so-called prosperity in the recent past was based on the import of consumer goods, which by and large were smuggled into India, and exports of iron and manganese ore to Japan, Germany and Italy. In 1961, for example, the Portuguese rulers of Goa earned 110 million D.M. from trade with Germany; exporting iron ore worth 130 million D.M. and importing largely consumer goods worth 20 million D.M. In 1960, Goa exported 5.5 million tons of iron ore — 2.6 million tons to Japan, 2.1 million tons to Germany and 0.5 million tons to Italy. In 1961, exports of this ore were of the order of 6.5 million tons — 3.5 million tons to Japan, 1.9 million tons to Germany and 0.7 million tons to Italy. The price realised in this year was 35 shillings per ton.

Apart from the planned exploitation of the mineral resources of Goa, the mission will also explore the possibilities of setting up a steel plant there. This steel plant is envisaged to be based on imported coal.

Goa has one of the best natural harbours on the Western Coast. Its development into a major port and its linking up by road transport with the hinterland are the other major problems, which would need attention.

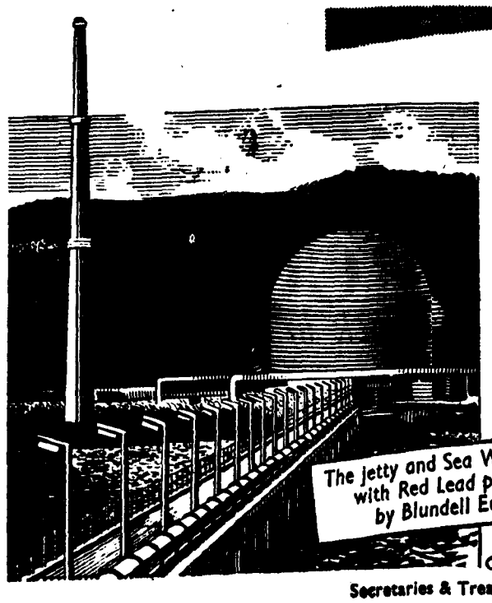
These developments are means to an end, which is to improve the economic condition of the people of Goa. Every effort shall have to be made to make the Goanese feel proud of India.

POWER SCHEMES SANCTIONED

Since the publication of the Third Plan, the Government of India has sanctioned three power schemes in the private sector with a total installed capacity of 180,000 kW.

These are for generation of 125,000 kW. of thermal power by Tatas at Bombay, 50,000 kW. by the Calcutta Electric Supply Corporation, and 5,000 kW. by the Dishergarh Electric Supply Company at Dishergarh in the coal-mining area in Bihar.

Six other power schemes have been added to the Third Plan in the public sector. These will generate 210,000 kW. of power.



In Bihar, the installed capacity of the two units under Barauni extensions, has been stepped up from 30,000 kW. to 50,000 kW. In Jammu and Kashmir, the Kalakote thermal station's capacity will be increased by 10,000 kW, making a total of 20,000 kW.

In Kanpur (Uttar Pradesh), the capacity of thermal station is to be stepped up by 60,000 kW., because it is felt that only two out of five units at the Singrauli thermal station could be commissioned by the end of Third Plan.

In West Bengal, a third 75,000 kW. unit has been accepted for the Durgapur coke oven power station. In addition, there will be six package power plants of 1,500 kW. each, to be installed at various places in West Bengal region.

A 15,000 kW. thermal plant has been accepted for installation at Delhi.

In Maharashtra, the Koyna Dam power house, with an installed capacity of 40,000 kW., has been included under the second stage of the Koyna Project. Two more schemes — Vaitrana and Sahashkund — with installed capacities of 40,000 kW. and 50,000 kW. respectively — have been included in the Maharashtra Plan.

PAINTED TO FIGHT CORROSION

For over a century Red Lead has been used as a priming paint on bridges, ships, wagons and structures and still continues to be the best protection against rust and corrosion.

The jetty and sea-water pipeline as well as other steel structures of the Atomic Power Plant at Trombay were primed with RED LEAD.

"Griffin" brand Red Lead pigment is manufactured in India by

AIRCON
Evaporative Climate Conditioners
FOR YOUR INDUSTRY

The initial cost of an AIRCON Evaporative Climate Conditioner is 1/3rd to 1/10th that of an equivalent refrigerant air-conditioner! And comparative running costs? Even less—1/6th the costs of a refrigerant air-conditioner!

And that's not the end of it: hundreds of industries have found that *productivity of workers increases substantially* with AIRCON climate conditioning. So much so that AIRCON installations have paid for themselves within a year!

It's AIRCON for *your* industry! No renovated construction needed, no impractical sealing of rooms needed. Please write to us for more information.

Mark XII 'Air Marshal' is specially designed for industrial sheds, big establishments, canteens and mines. All parts are triply protected against rust. 4-way, 180° directional control. Guaranteed for one year.

CLIMATE IS OUR BUSINESS

Aircon Industries Private Limited
Lakshmi Woollen Mills Estate
Off Haines Road, Bombay-11

Benefits from these schemes will, however, accrue during the Fourth Plan.

MANUFACTURE OF TRUCK CHASSIS

The Government of India has approved the expansion schemes of two motor vehicle manufacturers, namely, Hindustan Motors and Premier Automobiles. Hindustan Motors Limited has been permitted to raise its production of truck chassis from 6,000 to 15,000 units per annum. Premier Automobiles Limited has been allowed to increase its output in this line of manufacture from 7,000 to 12,250 units a year.

These expansion schemes have been approved to meet the growing demand for movement of goods by road.

Hindustan Motors, it may be recalled, manufactures Bedford trucks and Premier Automobiles Dodge/Fargo trucks.

MANUFACTURE OF ALUMINIUM

The Union Government has accepted in principle the Industrial Development Corporation's project to set up a plant for the manufacture, in the public sector, of 1,00,000 tons of alumina and 25,000 tons of aluminium ingots. The project is to be located in Madhya Pradesh and will be executed with Hungarian technical and financial collaboration. It will be based on the power to be produced at the thermal station proposed to be set up near Korba.

MANUFACTURE OF MANGANESE METAL AND MANGANESE DIOXIDE

A number of schemes have been approved by the Government for the manufacture of manganese metal and manganese dioxide. This follows the recommendation of the Committee set up recently by the Ministry of Commerce and Industry under the chairmanship of one of its Joint Secretaries, Mr. R. V. Raman. The Raman Commitee has pointed out that India is short of ore reserves for most of the non-ferrous metals. There are several large deposits of aluminium ore which can replace some scarce non-ferrous metals such as nickel. Electrolytic manganese is used for the manufacture of nickel-free stainless steel and headfield manganese steel and coinage.

The details about the schemes approved are not immediately available.

CHEMICAL FERTILIZERS

An additional chemical fertilizers plant is to be built in India by the Power-Gas Corporation, of Stockton-on-Tees, England.

Contracts worth between £1,000,000 and £1,500,000 have been awarded to the Corporation by Fertilizers and Chemicals Travancore Limited for major extensions to its factory at Alwaye, Kerala.

The contracts include the supply of a plant for producing synthesis gas from oil by partial oxidisation, an ammonia synthesis plant — the first in India of British design, with a capacity of 150 tons a day — and an ammonium sulphate plant which will use as its raw material gypsum produced as a by-product of phosphoric acid manufactured at Always.

The sulphate plant extensions will raise the factory's output of ammonium sulphate from 220 tons a day to 660 tons a day.

FRENCH ASSISTANCE FOR INDIAN INDUSTRIAL PROJECTS

M. Antoine Pinay, Chairman of the "Compagnie Francaise pour la Diffusion des Techniques" visited New Delhi last week. He was leading a Mission consisting of M. Krivitzky, Secretary-General, Sofremines (Railways); M. Gruot, Delegate of Sofrelec (Power); M. Amsler, Chief Engineer Sofregaz (Gas and Natural Gas) and Sofre Transport Urbain (Town Transport).

M. Pinay's company is a consortium of consulting firms. His visit to India was aimed at interesting Indian industrialists as also the public sector in securing his company's services for preparation of project reports, advice on the suitability of equipment required for an industrial unit etc. M. Pinay was hopeful of arranging credits if his company were entrusted with the preparation of any project report.

ASSISTANCE FROM DEVELOPMENT WING

A Public Relations Unit has been set up in the Union Ministry of Commerce and Industry in order to help the public seeking assistance from the Development Wing. It will supply all relevant information that may be required by those interested in the development and promotion of industries under the Industries (Development and Regulation) Act, 1951, and will assist them to see the concerned officers in the Development Wing, where further discussion may be necessary. Information on such matters as whether an industry is on the free licensing list or on the banned list, names of indigenous manufacturers and connected data etc. will also be available with this unit.

RECORD JUTE CROP

The Indian jute crop of 1961-62 has been the biggest ever since partition, it is learnt here. The final official estimate puts this year's output at 62.69 lakh bales, as against 39.82 lakh bales in 1960-61. The average annual production during the Second Plan period has been about 43.80 lakh bales.

The total area under jute cultivation, spread over West Bengal, Bihar, Assam, Orissa, Uttar Pradesh and Tripura, is understood to have gone up from 15.12 lakh acres in 1960-61 to 22.59 lakh acres in 1961-62.

Although the 1961-62 crop has been an all-time record, no marked surplus of jute is expected to remain at the end of the current consumption season because the mill consumption of jute has gone up and stocks with the trade and industry, which had touched a very low figure at the end of the 1960-61 season, had to be replenished.

The Government has taken a number of steps in the past few months to ensure that prices of raw jute do not decline to uneconomic levels following the bumper crop. An informal "floor" price of Rs. 30 per maund, basis Assam bottoms, has been fixed.

The Government has also approved licensing of over 250 broad looms for jute mills, provided the foreign exchange expenditure involved in the import of these looms is met from export earnings.

IN BRIEF....

The United States Government has increased by 1,49,000 tons the quantity of non-quota sugar authorised for purchase and importation during the first six months of 1962. Of this, India has been allotted a quantity of 50,000 tons. An additional 25,105 tons still remain to be allocated by U.S. Department of Agriculture. Efforts are being made to ship the total quantity of sugar allocated to India within the stipulated period.

*

India has signed an agreement with the Australian Wheat Board for the purchase of 270,000 tons of Australian wheat. These purchases form part of the commercial purchases of wheat India has to make during the current year.

*

Trans World Airlines flew in February last more revenue passenger miles, both domestically (297,903,000) and internationally (50,405,000) than during any previous February in the Airlines' history. The revenue passenger miles flown domesticcly represent an increase of 2 per cent over the previous record achieved in February, 1960. The revenue passenger miles flown internationally showed an increase of 33 per cent over the previous record also of February, 1960.

*

Mr. S. S. Khera, I.C.S., who is at present Secretary of the Ministry of Mines and Fuel, will take over as Secretary to the Cabinet and Secretary to the Planning Commission on the retirement of Mr. Vishnu Sahai, I.C.S., on the afternoon of April 15, 1962. Mr. Vishnu Sahai, will on that day, take over as Member of the Planning Commission.

BOOK REVIEWS

PLANNING

Democratic Planning: By K. Santhanam: Published by Asia Publishing House, Bombay: Pp. 201: Price Rs. 9.50.

Mr. K Santhanam, a member of the 'Old Guard', and a versatile journalist and scholar, through this book places at our disposal his philosophy of life. In fact, in only 43 of his articles he presents a digest of his considered views on a large variety of subjects, like politics, economics, constitution and education, in a most succinct manner. Each article has something definite to convey, and bespeaks of knack of the subject, clarity, veracity, precision and unusual elegance of the master mind.

The book is divided into three sections; whereas Parts I and II deal with political and economic problems, Part III is devoted to 'Congress Policies'. Not a single article is of ephemeral character, and will by itself give testimony of its readability over time. But one is tempted to feel that most of the articles would be relished more, if dates of their publication were given at the end.

One basic approach visible through the whole book, makes one fully appreciate the author's views — and more often than not, subscribe to them — about the problems that emerge in the transitional stages of a country's development, and agree with him that 'a hyper-critical attitude is likely to lead to pessimism and inaction'. So also, no one would differ with his contention that 'dogmatic faith in fanciful and hypothetical schemes and calculations will result in worse evils of wrong action and bitter disappointment.' Mr. Santhanam very rightly then beacons his readers to 'the middle path in which reason and faith combine.'

ILLUSTRATED GROWTH

"Towards 'Take Off'", an illustrated summary of India's Third Five-Year Plan: Prepared and Distributed by Esso Standard Eastern Inc.: Pp. 40.

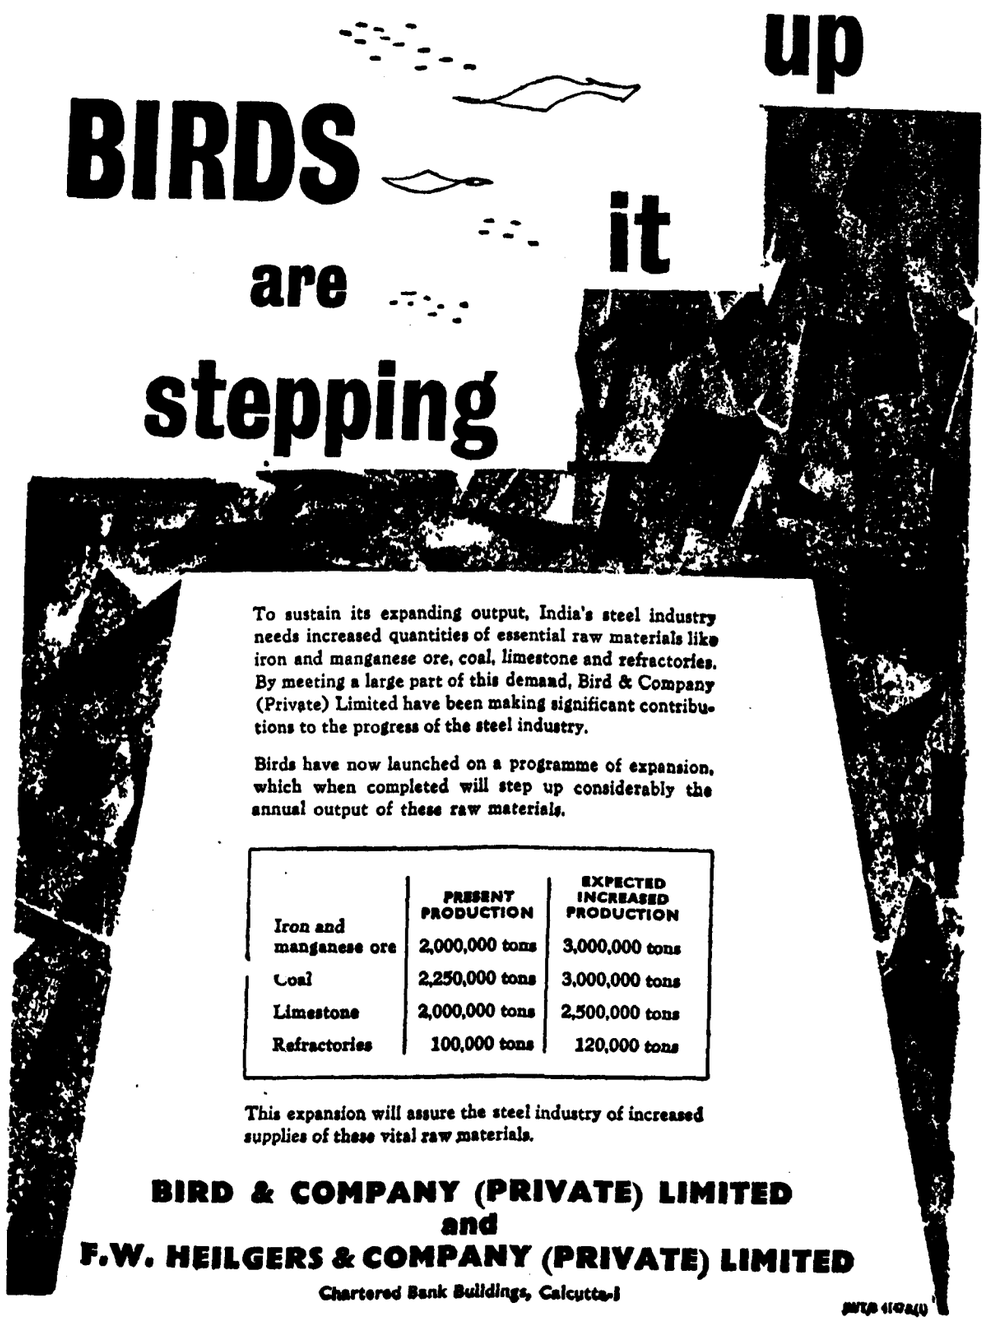
The Standard Vacuum Oil Company now known as Esso Standard Eastern Inc. has ventured to produce small pamphlets, very well illustrated and neatly laid out, on some important problems. "A Blueprint for Progress", a pictorial summary of the Second Five-Year Plan was issued five years ago. Before the elections, STANVAC also produced a small pamphlet entitled "You and the Ballot Box" primarily written for school students. The pamphlet under review attempts an illustration of the various economic developments which are likely to take place in the Indian economy so as to take it to the "Take-off" stage. Even though the aim is to present the outline of the Third Five-Year Plan in an easily understandable language, the task has been accomplished in a very competent manner. This little pamphlet should be in the hands of every high school boy and girl so that they may know and understand all about the Third Five-Year Plan especially how it is likely to help the Indian Union in raising the living standards all-round.

PATNA CONGRESS

Special Number of Economic Review: Published by the All India Congress Committee: 7, Jantar Mantar Road, New Delhi: Pages 224: Price Rs. 2.

The Special Number of the A.I.C.C. Economic Review brought out at the 67th Session of the Indian National Congress provides quite a variety of articles. The coverage is so wide that there is hardly any economic problem which has not been touched upon. The outstanding amongst these articles might be mentioned "The Location Problem" by J. B. Condliffe, "Savings and Capital Formation in the Indian Economy", by P. R. Brahmanand, "Problems and Prospects of Economic Growth in Kerala" by P. S. Lokanathan and "Increasing Production in Indian Agriculture" by W. Mellor.

While one may not agree with many of the articles written in this A.I.C.C. Economic Review, still it must be said that they provide a valuable information. Some, of course, are very short and provide only scanty information. It can well be due to lack of space that they have not been dealt with exhaustively. The main reference here is to the article "Role of Education in the Third Plan" where the problem of national integration is just dealt with in a passing manner. Certainly it demands a more comprehensive treatment than that.



The first leader in the Special Number as usual is a praise for the Congress Government and its policies. There is no doubt that significant achievements stand to the credit of the Congress Party, but there is still a tremendous amount of discontent in the country. A study in economic and political strain made by "The Eastern Economist" in its 'After the Elections' Number would bear ample testimony to that.

ANNUAL REVIEW

Major Industries of India Annual 1961, Editor M. P. Gandhi: Published by M. P. Gandhi & Co., Nanabhay Mansion, Sir P. Mehta Road, Fort, Bombay-1: Pp. 338: Price Rs. 15.

The tenth Annual dealing with the major industries of India published by Mr. M. P. Gandhi lives up to the high standards set by all his publications. It gives a series of authoritative articles on India's Third Plan and on the progress and problems of the leading industries.

Mr. Gandhi has analysed, in the leading article, the implications of the Third Plan and has rightly drawn attention to the need for efficient working of the Plan. Mr. Manubhai Shah, Union Minister for Industries in the last Cabinet, has explained the manner in which new units are being given preference for industrial ventures over established houses and how increased emphasis is being laid on building of machinery in the country. Mr. Shriman Narayan, Member, Planning Commission has discussed the problems of regional growth and employment in the Third Plan, while Dr. P. S. Lokanathan, Director-General National Council of Applied Economic Research has advocated new incentives for purposes of accelerating exports. An illuminating analysis has been presented for increasing India's foreign exchange earnings during the Third Five-Year Plan by Mr. L. K. Jha, Secretary, Union Ministry of Finance. Mr. K. B. Lall has discussed the problem of foreign investments in India. Authoritative reviews on cotton and cotton textiles, iron and steel, sugar, heavy chemicals, plantations, tobacco, oil and gas, railways, transport and foreign trade are also presented.

ANNOUNCEMENT

The following Annual Numbers of **THE EASTERN ECONOMIST** are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Rs. 50|-.

1.	India & the World and India in 1950	Rs. 5|-
2.	A Social History of the Indian People & India in 1951	Rs. 5|-
3.	India & the Free World and India in 1952	Rs. 5|-
4.	India in Asia & India in 1953	Rs. 5|-

COMPANY AFFAIRS

UNITED COMMERCIAL BANK

During the year to December 31, 1961, United commercial Bank recorded a net profit of Rs. 72.61 lakhs which was nearly 8 per cent more than the previous year's profit of Rs. 67.43 lakhs. The directors have transferred Rs. 30 lakhs to reserve fund, Rs. 4 lakhs to the newly constituted gratuity trust fund and have provided Rs. 14 lakhs for bonus to staff. They have recommended the payment of a dividend at the rate of Rs. 6 per share subject to deduction of tax which will absorb Rs. 24 lakhs.

During the year the deposits advanced to a figure of Rs. 98.90 crores and were more than 11 per cent higher than the previous year's figures of Rs. 88.84 crores. Advances also appreciated to a figure of Rs. 64.20 crores from Rs. 61.39 crores. The Bank opened a number of new branches during the year at Dhanbad, Khairthal, Kozhikode, Ghatkopar (Bombay), Dharamtala Street (Calcutta), Kamlanagar (Delhi), Raurkela Bazar and Vikram University (Ujjain).

The Directors have pointed out that on account of the "desirability of increasing the ratio of the paid-up capital and reserve fund to the deposits of the bank they have decided to offer to the shareholders 200,000 shares forming part of the unissued capital of the bank for subscription in cash at a premium of Rs. 25 per share and call up in the first instance half the nominal amount of these shares together with premium." The application to the Controller of Capital Issues for the sanction of these proposals has been submitted and the Bank after this proposition is likely to improve its performance further.

JAY SHREE TEA & INDUSTRIES LIMITED

The working results of Jay Shree Tea and Industries Limited for the year ended December 31, 1961 show a gross profit of Rs. 53.7 lakhs after meeting all the usual expenses. The management has set apart Rs. 10.8 lakhs or depreciation, Rs. 15.5 lakhs for taxation and Rs. 4.5 lakhs for Development Rebate Fund. The Managing Agents' commission and the Directors' commission add up to Rs. 3.8 lakhs. The net profit at Rs. 19.0 lakhs together with the previous year's balance of Rs. 88,479 comes to Rs. 19.9 lakhs. Special attention is invited to the appropriation of the profits. A dividend of Rs. 1.25 per equity share (12.5 per cent per annum) claimed Rs. 10.9 lakhs while the preference shares at 9 per cent per annum received Rs. 31,077. To general reserve a sum of Rs. 8.5 lakhs was transferred. No allocations were made for dividend equalisation fund because the transfer to general reserve was enhanced from Rs. 5 lakhs to Rs. 8.49 lakhs. All these indicators show that the company is steadily rising in stature and is improving upon its working results every year.

TRAVANCORE RAYONS

The working of the Travancore Rayons Ltd. during the year 1961 has resulted in a profit of Rs. 61.93 lakhs. The directors have indicated that the excise duty which was 66-2/3 per cent on rayon yarn in the Central Budget for the year 1961 has meant a heavy burden for the Company. The directors have indicated that the working results could have been even more encouraging if the Company did not have to bear this burden. The Company has maintained its selling prices too at the same previous levels despite the soaring cost of raw materials, cost of manufactures, and labour costs. Due to the slackness in demand for cellulose film, which still continues, the Company has not been able to work to its full increased capacity of 13 tons film per day.

The Company is going ahead with its ambitious expansion plans. It proposes to instal 6 more spinning machines and also put up a new rayon spinning unit, raising the installed capacity for rayon to 13.6 tons a day. The erection of the Cotton Linter Plant is well under way and production is expected to commence in August or September this year. The Travancore Rayons hopes to become the pioneers in this field also—in the manufacture of rayon grade pulp in India.

The liabilities to the Kerala Government have been completely wiped off. The gross block has gone up by Rs. 26 lakhs during 1961, and stands at Rs. 5.68 crores. The general and other reserves total about Rs. 1.13 crores. Against the paid-up capital of Rs. 1.50 crores an initial sum of Rs. 8 lakhs has been transferred to dividend equalisation reserve this year. The Directors have prudently maintained their recommendation of dividends at 20 per cent — the same level as last year.

NEW ISSUES

The Devkaran Nanjee Banking Company Ltd., has been accorded permission to issue one lakh equity shares of Rs. 50 each, to be issued for cash at a premium of Rs. 2 per share. The paid-up capital of the bank is Rs. 50 lakhs.

Capsulation Services Price Ltd., has been authorised by the Controller of Capital Issues to issue bonus shares of the value of Rs. 3,02,400 divided into 30,240 equity shares of Rs. 10 each to be made in the ratio of three bonus shares for every five shares held. The paid-up capital of the Company which is manufacturing one-piece soft gelatine capsules, is Rs. 5,04,000.

Jaipur Metals and Electrical Ltd., Jaipur, is to issue fresh capital of Rs. 25 lakhs, in equity shares of Rs. 100 each for cash at a premium of Rs. 15 per share. The proceeds will be utilised for the manufacture of copper conductors, electrical meters etc. Jaipur Metals has a paid-up capital of Rs. 35 lakhs.

West India Steel Company Private Ltd. Calcutta, is raising a capital of Rs. 10 lakhs, in equity shares of Rs. 1,000 each for cash at par. The proceeds will be utilised for rerolling billets into bars, rods, etc. The Company's present subscribed capital is Rs. 10 lakhs in equity shares of Rs. 1,000.

Company Meetings

THE INDIA SUGARS & REFINERIES LTD., HOSPET

Speech of the Chairman, Sri Rajeshwara Patel M.P.

Presiding over the Twentyeighth annual general meeting of the shareholders of the India Sugars and Refineries Ltd., held at the registered office of the Company at Hospet on Saturday the 31st March, 1962, Sri Rajeshwara Patel, M.P., Chairman said :

Gentlemen :

Before commencing the proceedings of the meeting it is my melancholy duty to convey to you the news of the sad demise of our Chairman, Rukn-ul-mulk, S. Abdul Wajid on the 27th November, 1961. He had been ailing for some considerable time and even last year his health did not allow him to participate in the Annual Meeting. As mentioned in the Directors' Report, he had been associated with your Company from its very inception and for the last 20 years had been the Chairman of the Board. *Personally*, I moved with him in close intimacy during the last five years and, with every passing year, our friendship found fresh points of contact and concord. In his death, the Company has lost the services and guidance of a mature intellect and mellowed wisdom. I would now request you all to stand up and observe two minutes' silence as a mark of respect to the deceased.

It gives me pleasure to welcome you to the Twenty-eighth Annual General Meeting of this Company. The Accounts for the year ended 30th September, 1961 and the report of the Directors thereon have been in your hands for the statutory period and, with your permission, I shall take them as read. The results contained therein reflect the position that was forecast in my statement at the last annual general meeting, namely, that stocks at our factory would mount up due to the increase in the all-India sugar production.

You will agree with me that our Company has done well during the year under review. The quantity of cane crushed and sugar produced during the year constitute a record for the factory. While the achievement, by itself, is gratifying, the immediate benefit was largely offset because of the smaller releases of sugar. Now that decontrol has come in the wake of overproduction, with very uncertain prospects as to the size of exports, we are entering a period marked by unstable prices and selling pressure. Already the prices have indicated a steep fall and unless they attain a stability the Sugar Industry would have to face very serious consequences.

Again, with the falling prices of sugar the industry has been asked to implement the recommendations of the Central Wage Board for Sugar Indu.try. Even so, your Company has been the first to adopt and give effect to the recommendations. Added to all these, with the increased cost on labour, stores and spares and also owing to the large carry-over of stocks, interest and insurance charges on the large quantity, the profits for the year under review could not be spectacular. It is feared, continuance of these difficult conditions would not permit any better results the next year either.

As I mentioned in my statement last year, the only solution of the surplus position of sugar in the Country lies in the rapid development of the export market. The little quantity of sugar we are exporting at the moment will not help the Country in clearing all the surplus stocks. An outlet for about six lakh tons of sugar at least in the export market would enable the industry to function satisfactorily with its present installed capacity. Along with this effort to export more, ways and means will have to be devised for a steady increase in internal consumption also.

It is a matter of some satisfaction that the Government, after all, have realised the dangers of overroduction and have decided upon certain measures to ombat it. They have, for the time being, stayed the licencees for new units to instal fresh capacities. They have also put a ceiling to the production of sugar for the season of the existing units. But as we all know, the prosperity of the Sugar Industry would ultimately depend upon the maximum utilisation of its various bye-products, your Directors' attention has been drawn to this aspect of the problem and they have taken concrete steps to increase the manufacture of bye-product like Spirit and explore the possibility of better utilisation of bagasse also.

The Government of India have issued a Licence to a Bangalore firm for putting up a paper mill unit in our area. We have already been approached by this firm for concluding an arrangement to supply bagasse to the proposed paper mills and the paper mills would be responsible for supplying our factory with the necessary oil-fired boilers and the requisite oil fuel. No capital expenditure will be incurred by the Company as a result of this change-over. This matter is still in the stage of negotiation and no final decision has been reached so far.

Although it was not entirely unexpected, the validation of the Sugarcane Cess Act with retrospective effect has deprived the Company of the anticipated reimbursement of a substantial sum of money consequent on the Supreme Court's declaring the imposition of cess Ultra Vires. However, as indicated in the Directors' Report the matter is now being examined by the Company's legal advisers and the Directors would certainly take appropriate steps according to such legal advice.

I am happy to inform you that the progress registered by your subsidiary Company, the Salar Jung Sugar Mills Ltd., is even more substantial than the previous year. The steady way in which this unit is marching, we feel confident of its furture financial stability. And this in turn would become a substantial source of revenue to your Company.

Two of your Directors, Sarvashri Rajeshwara Patel, M.P., and O. V. Alagesan, M.P. retire under rotation as per Article 105 of the Articles of Association of the Company.

I take this opportunity to thank my colleagues on the Board of Directors who have all along given me their guidance, advice and support. Finally, I desire to record our warm appreciation of the efficient and devoted work our Officers, Staff and Workers have given you during the last year.

I now formally move the adoption of the Directors' Report and the Audited Accounts for the year ended 30-9-1961.

The Directors' Report and the Accounts for the year ended 30th September, 1961 were adopted and a dividend on Preference Shares at 7½ per cent (subject to tax) as calculated in accordance with Preference Share (Regulation of Dividends) Act, 1960 and a dividend on the Ordinary Shares at 10 per cent subject to deduction of Income-tax, were declared for the year ended 30th September, 1961, payable on or after 16th April, 1962.

Sri O. V. Alagesan and Sri Rajeshwara Patel were re-elected to the Board and the Auditors Sarvashri R. Narasimhan of Bombay and M. S. Krishnaswami and Jagannathan of Madras were re-appointed.

N.B. : This does not purport to be a report of the proceedings of the General Meeting.

THE UNITED COMMERCIAL BANK LIMITED

Statement of Shri G. D. Birla, Ch airman, circulated to the Members at the Nineteenth Annual General Meeting held on Wednesday, the 11th April, 1962.

GENTLEMEN,

You will notice from the Directors' Report and the accounts of the Bank for the past year now before you that the all-round progress of the Bank has been maintained and our deposits have improved after the slight setback of the previous year.

DEPOSITS

The deposits at the end of 1961 stood at Rs. 98.90 crores and showed a rise of Rs. 9.96 crores on the previous year's figure of Rs. 88.94 crores. This increase of 11.2 per cent compares with 8.5 per cent by which, after making allowance for the transfer of Rs. 72 crores of PL 480 fund from the State Bank of India to the Reserve Bank of India, the deposits of the public with scheduled banks as a whole rose during the same period.

CASH & SECURITIES

Cash on hand and with banks and money at call and short notice were Rs. 8.66 crores and represented 8.8 per cent of the deposit liability. The additional deposit resources which accrued to the Bank during the year were utilised primarily to improve the liquid position of the Bank through a considerable reduction of the borrowings from the Reserve Bank of India and the addition of a little over Rs. 2 crores to our holdings of Government Securities and secondarily to increase our advances by the moderate amount of Rs. 2.82 crores. As a result of this policy our quick assets consisting of cash on hand and with bank, money at call and short notice and free government securities amounting to Rs. 43.31 crores formed 43.78 per cent of our total deposits. The corresponding figures for the previous year were Rs. 35 crores and 39.4 per cent.

PROFIT AND LOSS ACCOUNT

Though the profits for the year have risen from Rs. 67.43 lakhs to Rs. 72.61 lakhs the extent of the increase would have been greater if we had observ.d a lower liquidity ratio. In disposing of the profit the Board have followed the same pattern as last year and transferred Rs. 30 lakhs to the Reserve Fund, raising it to Rs. 2.35 crores, and added Rs. 4 lakhs to the Gratuity Trust Fund which was newly set up with an initial contribution of Rs. 10,000. After allocating Rs. 14 lakhs for bonus to staff the Directors have repeated the dividend of 12 per cent less tax.

CAPITAL DEPOSITS RATIO

The subject of the ratio of paid-up capital and reserves of the banks to their deposits received the attention of the Reserve Bank of India and a proposal was put forward that this ratio should be gradually increased to 7½ per cent and the views of banks were invited. After discussion with the Indian Banks' Association the Reserve Bank of India finally agreed that the matter should be regulated by a convention rather than by legislation and banks were required to transfer substantial amounts out of profits to published reserves and to supplement this action by increase of capital so as to bring the capital deposit ratio upto 6 per cent within a reasonable period of time.

Our Bank has transfered every year substantial amounts to the Reserve Fund and you will notice from the Ten-year record of the Bank's progress annexed to the balance-sheet that the Reserve Fund has grown from Rs. 67.50 lakhs to Rs. 235 lakhs over a period of ten years. But in spite of such substantial transfers to the Reserve Fund the ratio of paid-up capital and Reserve Fund, to deposits has declined from 9.04 per cent to 4.39 per cent by reason of the steep increase in deposits. It was in the year 1945 that the Bank increased its subscribed capital from Rs. 2 crores to Rs. 4 crores and paid-up capital from Rs. 1 crore to Rs. 2 crores and the Directors feel that it is now expedient further to strengthen the capital structure of the Bank. With this object in view the Directors propose to increase the paid-up capital by the issue of 200,000 ordinary shares at a premium of Rs. 25 per share and when the issue is completed the capital funds of the Bank will improve by Rs. 1½ crores. This proposal can be given effect to only after obtaining the consent of the Controller of Capital Issues for which an application has already been made. You will be advised as soon as possible after the sanction of the Controller is received of the steps which the Directors propose to take to implement the scheme.

It is a matter of gratification that deposits of the banking system have risen during the year under review in contrast with the stagnation which characterised the previous year. The rate of growth of 8.5 per cent was, however, not the same as in the first four years of the Second Plan period when deposits recorded a growth of 11.2 per cent. It is important that steps should be taken to attract more deposits to the banking system in order that the overlent position disclosed by the scheduled banks' return may be corrected and the banks may be enabled to meet the additional demands for finance that would inevitably arise with the progressive implementation of the Third Plan. The introduction of the Deposit Insurance Scheme, despite the fact that the amount of individual insured deposit is only Rs. 1500, has already infused confidence in the stability of the banking system in rural and non-metropolitan areas where it had received a setback sometime ago and the confidence will be reflected in due course in the speedy growth of deposits of individuals with the banks.

INTER-BANK AGREEMENT ON RATES OF INTEREST ON DEPOSITS

A stable structure of reasonable interest rates on deposits is worthy of defence against attacks. In my statements for the last two years I had referred to the healthy influence of the inter-bank agreement on deposit rates. It is a matter of regret that some banks gave notice last year to resile from the agreement. While there may be room for a modest revision, it would be undesirable to permit a material departure from the structure of interest rates and permit more and more banks to quote higher rates of interest. Almost all banks have a large network of branches operating all over India and they have attained more or less equal status because of the Deposit Insurance Scheme, the supervision of Reserve Bank of India and the proposed capital deposit ratio. It is not understandable how a few banks can be given a preferential treatment for the purpose of quoting higher rates of interest on deposits simply because their deposits are, for the time being, less than those of some other banks. It must be remembered that the history of Indian Banking is full of instances of small and medium sized banks which have grown into large banks without any weightage in preferential rates of interest inter-se. The proposed differentiation in rates of interest on deposits for three types of banks goes against the spirit and foundation of inter-bank agreement. A scramble for deposits through the offer of higher rates of interest would create stresses which might lead to the abandonment of the agreement and reduction in the profit margin to the point of imperilling the building up of capital funds of banks to anything like the extent to which the banks are committed by the convention agreed to with the Reserve Bank of India. It is only through competitive development and extension of banking services and in the environment of stable interest rates and not in the atmosphere of a rate war that new deposits can be attracted. The non-nationalised banking sector should conduct its affairs in such a manner as to leave no room for further official control and regulation over its basic function of inculcating and spreading the banking habit and gathering the surplus funds of the public.

MOBILISATION OF INTERNAL RESOURCES

The Third Five-Year Plan is a challenge to the banks to meet the demands for finance which its implementation would generate. The Plan envisages a bigger programme of industrial development than its predecessor. At the end of the Third Plan industrial production is expected to increase by about 70 per cent over the level at the end of the Second Plan. The general index of industrial production is expected to reach 329 (1950-51=100) in 1965-66 against 194 estimated for 1960-61. Estimates of the additional bank credit which industrial enterprises might require vary from Rs. 650 crores to Rs. 750 crores and the mean of the two figures may be taken as the probable requirement of industries in the private sector. Currency in circulation is also bound to expand during the Third Plan period and we may estimate the rise in circulation to be of the order of Rs. 1000 crores. As the level of bank deposits at present is on a par with currency in circulation it could be reasonably assumed that during the Third Plan period bank deposits would also increase by Rs. 1000 crores. In the United Kingdom the ratio of deposits to currency in circulation is 3.1.

To divert bank credit and currency in circulation into banking channels to an extent which would increase the proportion of bank deposits in relation to circulation should be the objective of banks so that the banks would not only be in a position to meet the demands of industry but also to play their traditional role of subscribing to Government borrowings in substantial manner. There must, therefore, be a drive to increase deposits by increasing banking service and branches of banks both in big cities and in rural areas. The recent trend in banking is to employ accretions to deposits in financing industry and trade partly because of the increasing demand from industry and trade and partly because of absence of ready market for Government securities. The banks have to build up the portfolio of Government securities so as to improve the liquidity of the banking system. In addition they are also nowadays called upon frequently to subscribe to capital and debenture issues of various financial institutions and providing long-term finance to industry.

The Third Five-Year Plan envisages more and more borrowing by Government and public bodies and to make these borrowings successful, attempts should be directed towards making Government securities freely marketable and the position of Reserve Bank and Life Insurance Corporation should be used more towards making securities market really active.

THIRD FIVE-YEAR PLAN

Turning to the prospective development in the Indian Economy, the Third Plan, which nominally at least has been launched, visualises an increase in the national income from Rs. 14,500 crores at the end of the Second Plan to Rs. 19,000 crores at the end of the Third Plan. For achieving this, the Plan visualises a total investment of Rs. 10,400 crores of which Rs. 6,300 crores is in the public sector and Rs. 4,100 crores in the private sector. The ratio of net investment to national income which is 11 per cent at present is proposed to be raised to 14 to 15 per cent at the end of the Third Plan. Though the Plan is a modest one I must confess to a feeling of diffidence about its successful fulfilment. The Plan itself appears from every test to be more like a list of programmes and projects than a properly laid out and cohesive chart for progress. What really matter, however, are the targets of agricultural and industrial production. It is not easy to make a correct estimate or, for that matter, any kind of estimate of total production, especially in the private sector. But it is possible to estimate production in some important fields and treat it as a yardstick to measure in a reasonable manner the economic credit of the nation as a whole. If, for instance, the targets for important items like food, agricultural raw materials, fertilisers, cloth, steel, petroleum, power, road and rail transport, coal and capital goods could be achieved at the end of the Plan and measured they would give a clear idea of the measure of the increased prosperity of the people.

PREPONDERANT RELIANCE ON FOREIGN AID

The circumstances in which the first year of the Third Plan has elapsed have been favourable enough, in that record agricultural production (buttressed by import of foodgrains from America under Public Law 480) and sustained increase in industrial production (though the rate of growth was somewhat lower than in the previous year) both ensured that the price situation was under control. But the Plan's reliance on foreign assistance is preponderant, and the experience in the first year has clearly been that the inflow has fallen short of both requirements and earlier assurances that we had obtained. We should be realistic enough to assume that we are unlikely to receive a blank foreign exchange cheque, and also that there will always be a gap between promises and performance in the matter of foreign aid. In the final analysis it is increased export earnings which will assure the country of continued progress achieved through planning. We cannot surely, for long, sustain increase in production, if our reserves do not even permit the import of industrial raw materials for feeding already existing and involuntarily idle units of production. Every incentive should be provided to the Indian entrepreneur to be a producer of industrial raw materials. Appropriate concessions will undoubtedly pay off in the form of enlarged exports.

NEED TO STEP UP EXPORTS

Foreign exchange plays an important role in the development plan because we have to import the "know-how" and equipment for many industries. A careful assessment of the prospects of securing foreign exchange is preliminary to a correct assessment of the success of the Plan targets. Laudable efforts are being made to earn foreign exchange by exports and although there has been some improvement in this regard the

expansion of our exports is not proceeding at such vigorous rate as to justify full reliance on them. Moreover, there is even a limit to what India can afford to export. To permit exports at the cost of the home market, i.e., by starving the Indian consumer, cannot improve the prosperity of the country or the standard of the people. Increase in the exports is, however, inescapable at present. More attention should, therefore, be directed towards finding out ways and means of reducing cost of production of exportable commodities to a competitive level and the factors that account for increase in the cost of such commodities should be investigated and remedied at an early date.

FOREIGN AID AND INVESTMENTS

The second source of foreign exchange is loans and aids which we were receiving from friendly countries during the Second Plan period and which we can hope to receive in an increasing measure for the Third Plan. The third source, and the most important and durable one, is foreign investments which are coming only in dribblets.

The total requirement of foreign exchange is likely to exceed the Plan figure and in my view might go up to Rs. 3700 crores in place of Rs. 3200 crores assumed in the Plan. This is a problem of the utmost gravity and should be solved. The answer is not to cut this or that item of the plan projects; that would cause the collapse of the Plan. In my view it is not impossible to earn foreign exchange to the extent I estimate provided we create an atmosphere to earn it. Aids and loans will be major contributory factors for a long time to come but we must make a special effort to attract private foreign investment and we should also try to raise loans not merely on Government to Government level but also in the financial markets of the World. At present the conditions are not favourable but an atmosphere must be created in which it would be possible to raise loans in the course of time.

PROBLEMS OF FUEL, POWER AND TRANSPORT

Apart from foreign exchange, there are other hurdles to the achievement of the targets. The chief of these are, coal, power and transport, all of which are in short supply thereby hindering the growth of the economy. I feel that there should be no ceiling for power production but that more power should be produced than is adequate to meet the existing demand completely so as to leave a great surplus of supply awaiting the growth of demands from potential consumers. Every concern that needs power for its own consumption should be freely allowed to set up its own plant without any restraint and if any party can arrange for foreign finance on suitable terms for production of power he should be allowed to do so. Transport bottlenecks are in a way responsible for fall in production and increased inventory resulting in lock up of funds, which we can ill-afford today. Railways are not able to cope with the increased demands for transport and as such the development of road transport should be encouraged to further supplement the transport needs of the industry at reasonable rates. This alone would give impetus to progress, production and prosperity.

Administrative delays should also be eliminated and lengthy procedures in granting industrial licences should be very much simplified.

My diffidence also slightly increases in the matter of internal resources for the Third Plan. It is no secret that the tax effort for the Second Plan, as originally estimated, was, in the end, far exceeded; but not all the projects could be put through, and one of the reasons was inadequacy of internal resources. The fact is that non-plan expenditure has been allowed steadily to rise. For obvious reasons, and in this case inevitably too, the cost of Defence Services rose to Rs. 302 crores in the Revised Estimates for 1961-62 as against the Budget expectation of Rs. 283 crores; and the figure for 1961-62, in the Budget, was itself some Rs. 35 crores more than the actuals for 1960-61. It is all very well to term such non-developmental expenditure as essential to the security of this country. We have, however, to recognise the possibility of further drafts on our Budgetary resources for "contingencies" and administration charges. What, then, is the solution?

Always, the easiest way for Government is to raise fresh taxes. But there is a limit to the forms of taxation that can be introduced and to the rates that can be fixed. As it is, there is an estimate that new taxes introduced in the first year of the Third Plan constitute fully one-third of the target for the quinquennium. The caretaker Budget for 1962-63 has made clear the prospect of additional imposts. No doubt, the tax targets for the Third Plan will be fulfilled. But there is considerable doubt whether additional resources raised by taxes will be available for developmental projects. I strongly suggest that tax enforcement laws are made stricter so that collections can be tightened up; and the addition to revenues should, I fancy, be surprisingly large. Secondly, greater care than ever before needs to be taken to ensure that there is strict control over non-developmental expenditure, whether it be costs of civil administration or even, if I may be permitted to suggest, defence.

Lest I be thought unduly pessimistic, let me add that the holding of the third general elections in this country is of portentious significance. The return of Congress to power will have assured our foreign friends that India has a political stability and maturity that is comparable to conditions in countries in which democratic practices have been prevalent much longer. It is, I may remark, stability, both political and economic, which is one of the pre-requisites for luring foreign participation in the industrialisation of this or any other country. At the same time the emergence of the Swatantra Party as the largest body of opposition in the country will have brought home the truth to our foreign friends that democracy is effectively at work in India, in that there is perceptible evidence of the growth of an Opposition. Thus, proof of Indian democracy as attested to by the third general elections may conceivably result in greater inflow of foreign assistance, not only on a governmental level, but I hope on the private sector level as well. The Plan must be fulfilled at all costs.

NOTE: This does not purport to be a record of the proceedings at the annual general meeting.

NATIONALISATION OF INDUSTRIES IN INDIA

ACADEMIC PUBLISHERS : : CALCUTTA-9

The United Commercial Bank Limited

Report of the Directors

The Directors have pleasure in submitting their Nineteenth Annual Report together with the Accounts of the Bank for the year ended 31st December, 1961.

The net profit for the year, after providing for taxes and for all known and anticipated charges, and including Rs. 1,46,870.98 brought forward from the previous account, amounts to .. .. Rs. 74,07,428.02

The Directors have transferred Rs. 30,00,000 to the Reserve Fund, Rs. 4,00,000 to the newly constituted Gratuity Trust Fund and provided Rs. 14,00,000 for bonus to staff. They now recommend the payment of a dividend at Rs. 6.00 per share, subject to deduction of tax, which will absorb Rs. 24,00,000, leaving an unappropriated balance of Rs. 2,07,428.02 to be carried forward.

The working of the Bank during the year was satisfactory with the deposits standing at a higher level than a year ago.

During the year branches of the Bank were opened at Dhanbad, Khairthal, Kozhikode, Ghatkopar (Bombay), Dharamtalla Street (Calcutta), Kamlanagar (Delhi), Rourkela Bazar and Vikram University (Ujjain).

Having regard to the desirability of increasing the ratio of the paid-up capital and reserve fund to the deposits of the bank the Directors have decided to offer to the shareholders 200,000 shares forming part of the unissued capital of the bank for subscription in cash at a premium of Rs. 25 per share and call up in the first instance half the nominal amount of these shares together with premium. An application has been made to the Controller of Capital Issues for sanction of these proposals and necessary resolutions for giving effect to them will be submitted for your approval after receipt of his consent.

The Directors are thankful to the Shareholders and the clients of the Bank for their continued support. They also express their gratitude to the Bank's Advisers and Advisory Committees for their able help and guidance.

The Directors place on record their appreciation of the services of the General Manager and the Officers and Staff of the Bank during the year.

The Directors retiring by rotation under Article 92 of the Bank's Articles of Association are Mr. M. L. Dahanukar, Mr. P. D. Himatsingka, Mr. A. C. Law and Mr. T. S Rajam, who offer themselves for re-appointment. Mr. M. L. Dahanukar and Mr. P. D. Himatsingka have both attained the age of 72 years and special notices of resolutions for their re-appointment have been given in terms of Section 190 and 281 of the Companies Act, 1956.

The Shareholders are requested to appoint auditors for the current year and to fix their remuneration.

On behalf of the Board,
G. D. BIRLA
Chairman.

BOMBAY,
17th March, 1962.

Report of the Auditors

TO THE MEMBERS OF THE UNITED COMMERCIAL BANK, LIMITED.

We have audited the attached Balance-sheet of The United Commercial Bank, Limited, as at 31st December, 1961, and the Profit and Loss Account of the Bank for the year ended upon that date, annexed thereto, in which are incorporated the Branch returns audited by the Statutory or other Auditors. The reports on the accounts of the Branches audited by other Auditors have been forwarded to us and dealt with in preparing our report in the manner considered necessary by us.

We report that:

(a) we have obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purpose of our audit and have found them to be satisfactory;

(b) the transactions of the Bank which have come to our notice have been within the powers of the Bank;

(c) in our opinion, proper books of account, as required by law, have been kept by the Bank so far as appears from our examination of those books, and proper returns adequate for the purpose of our audit have been received from the Branches of the Bank;

(d) the Bank's Balance-sheet and Profit and Loss Account, dealt with by this report, are in agreement with the books of account and the returns;

(e) in our opinion, and to the best of our information and according to the explanations given to us, the said accounts give the information required by the Companies Act, 1956, in the manner so required for banking companies and, on such basis, the said Balance-sheet gives a true and fair view of the state of the affairs of the Bank as at 31st December, 1961, and the Profit and Loss Account gives a true and fair view of the profit for the year ended upon that date.

Note: 1. Achievements actually refer to allotments of N by Fertiliser Pool and distribution of P_2O_5 by the manufacturers.
2. The Plan targets was for the States before reorganisation. The data for reorganised States have been calculated on the basis of the cultivated area that has gone from the original State into the reorganised State.
3. The figures of N used include quantity used in mixtures.
4. The Statewise targets and achievements of potash are not available. The All-India target for potash is 30,000 tons K_2O and the achievement is 28,000 tons K_2O. There was no allotment from the Pool, but some nitrogen may have been consumed from the carry-over stocks.

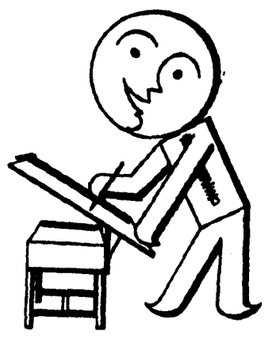
this is the time to think about air conditioning

and this is the time to think about Carrier and Voltas

—now, whi e a new building is in the blueprint stage. Too early? Not at all. It's a costly afterthought to plan air conditioning once construction has begun. Before designs are finalized, air conditioning engineers and architects work in close collaboration. Provision is made *from the beginning* for the installation of air conditioning plant, air ducts and cooling towers. This saves money on both equipment and installation costs. And air conditioning affords architects more freedom and flexibility to adopt new building concepts and designs for architectural beauty and maximum utilisation of the available space.

Why Carrier and Voltas?



Because they bring the maximum engineering experience and skill to every air conditioning project. Carrier in the field of manufacture of equipment. Voltas in the field of engineering, installation and service.

Air conditioning plant installed by Voltas is meticulously designed to suit a particular job. Every project is carried out by skilled engineers and technicians, and serviced with the expert care that guarantees efficient, economical operation.

Carrier

INDUSTRIAL **IBCON** CONSULTANTS

in the expansion of TEXTILE INDUSTRY

IBCON offers to intending promoters of textile industry, comprehensive consultancy services comprising:

- Project study and financial estimates.
- Project design including equipment, buildings, power, steam, water-supply, etc.
- Advice on purchase of equipment from India or abroad by tenders or negotiations.
- Supervision of construction of buildings and erection of equipment and services.
- Commissioning and operation.
- Senior and supervisory staff selection:
- Management organisation, clerical procedures, quality control, scientific cost and wage schemes.
- Technical assistance after commissioning to ensure successful and profitable operation.
- Also production planning, waste control, stores, dyes and fuel consumption.

THE EASTERN ECONOMIST

APRIL 27, 1962

The Price of the Plan

SLOWLY, all too slowly, the Indian people are beginning to discover the price of the Plan. The Third Plan documents have exhibited for the public view for well over a year the pattern of new taxation considered essential for the fulfilment of the spacious development programme of the next five years. Notwithstanding the fact that we have lived with this document for over a year we are still visited by extreme surprise, and even a curious sense of outrage, every time the Finance Minister imposes taxes of precisely the order written into the Plan. This is in some small measure of the extent to which the psychological obligations of the Plan have not been accepted by the Indian people. The figures are largely paper figures. Each time they are translated into the hard realities, with the burden placed squarely upon our unwilling shoulders, we utter cries of dismay. So it has been for almost every year in the last five; so, unfortunately, it continues today. And yet in our heart of hearts, we must know that the Finance Minister of India has no major choice in regard to the level of taxation which he is authorised to impose upon the country. The National Development Council, the country as a whole, and almost every important sector in it is supposed to be solidly behind the Plan. It is time that the Indian people realised that, growing to manhood in the planning age, they are partners of the Finance Minister to the enterprises to which we have jointly set out hands. It is their glory, as well as their duty, to accept with good grace what cannot now be evaded.

It is possible to differ only slightly in terms of the overall burden which has been imposed and to differ more markedly on the division between direct and indirect taxes. *The Eastern Economist* has already argued that the rise in the rate of corporate taxation by 5 per cent is justified. It has argued against the rise in the taxation of urban income groups at a time when the erosion of incomes continues to grow apace. A magnificent stability in the last year has surrounded the General Index of Wholesale Prices, but retail prices, for whatever reason, are by no means in the same happy position and, as the demands of middle class living widen in terms of 'nominal' luxuries, the cost of living continues to rise more rapidly than money income for the great majority of the urban population. Theoretically, the figure for urban taxes which is as high as 80 per cent of the total new taxes might be justified on the basis of the distribution of money incomes between town and country. In practice, however, with the different patterns of expenditure for town and country, an undue burden has been placed upon the urban middle classes. This is an issue more fully discussed in the Special Article in this issue. The Finance Minister errs in dealing with theoretical money incomes rather than with real margins of capacity. The real margin of capacity of the lowest urban middle class income groups is only a little higher than the average in the country. The reasons for this apparently paradoxical situation must be sought in the rigid character of expenditure demands in the towns, notably high rents in all the great cities, electricity, fuel and transport.

There is also an error in that portion of the Finance Minister's speech which deals more specifically with the incidence of indirect taxes. The Finance Minister has argued that the "view that the indirect taxes are regressive is not correct in our conditions. Whether indirect taxes hit the poor more than the rich or vice versa depends upon the kind of commodities that are subjected to indirect taxes and the rates at which they are taxed." The three instances given—automobiles, refrigerators and air conditioners—are surely far from representative. But if, as the Finance Minister contends, this whole question has been studied and his study proves that all the indirect taxes in India as a whole have been progressive in their incidence, it is doubtful if all the figures used in the Finance Ministry's study are acceptable.

It can still be argued that on this particular occasion, much more care than usual seems to have been taken to keep down the direct impact on prices of new excises on consumer goods. Whether or not the high hopes entertained will be fulfilled, it will certainly be agreed that the index of cost of living this year is substantially below what it was in the last. Since the total amount raised is even greater on both direct and indirect heads, one might leave the matter with the remark that this is the best of all possible worlds.

So far as the business community is concerned, it cannot be denied that incentives for production have been reduced. But on the other hand, it is arguable that the Plan gives to industry large assured markets and almost full order books even though profitability after tax per unit has been reduced. Again, the vital point that taxation at the moment is earmarked for expenditure which

in turn is translated into demand needs to be fully taken into account. Capital formation which ten years ago had to take place largely in the private sector is now translated into investment in the public sector before it works its way down as a stimulant for private sector production. The cart, in a sense, is thus placed before the horse; investment, proceeding on the base of capital formation with the Government, calling the pace. This is a basic change which has been accomplished in the late fifties and will probably gather strength in the sixties. Because of the fixed investment targets in the Plans which flow over into the private sector the disincentive of increased taxation is probably, on balance, far less than might otherwise be assumed.

Whether or not the Budget is the best that could have been attained will forever be a matter for debate. But it is not in doubt that the order of magnitude for taxation could not have been very significantly changed. It is far more important that the Indian people should concentrate on a total effort in mobilising resources required for the Plan than they should engage on controversies —largely political—on exactly where the burden of the new taxes lies. India still remains, by and large, a 'have not' society. The political complexion of this society would require some elements of socialist medicine, even if the country were not committed by the Congress Government to the socialist pattern of society. The political forces have, therefore, necessarily had—and will continue to have—much larger sway than a pure economic rendering might deem advisable. All in all, the Finance Minister has presented to the country a workmanlike document, some indications of the complexities of which will be found in the extremely able presentation of the results of his proposals in the Finance Bill which he introduced on Monday. The Finance Minister, as well as the officers who assisted him in this complicated exercise in fiscal legislation, ought to be congratulated on the remarkable response they have made to the challenge facing the country as a whole.

The Attack on Speculation

ONE of the most interesting, and perhaps drastic, features of the Budget is concealed innocently under the head "Capital Gains". The Finance Minister in his speech said, "I have proposed that gains which result from disposal of capital assets within a period of one year from the date of acquisition shall be made subject to income-tax and super-tax like other ordinary incomes. Capital gains for assessees other than companies from assets held over a period longer than one year will be subject to income-tax at the rate of 25 per cent or at the rate applicable as if they were short-term gains, whichever is less". In the Finance Bill there is a more complicated presentation of the changes in the income-tax consequences on Capital Gains. No doubt, this is a most skilful translation of the Finance Minister's intentions, but here for once the drafting of the Finance Bill might, perhaps, have been slightly improved upon. The net effect, however, seems to be that there is a steep rise in taxation of capital gains in the hands of large speculators, even if there appears to be, from the relevant clause (ii) in the Finance Bill, some assistance to those with an income of less than Rs. 10,000.

If short-term capital gains are to be taxed at the rate of income-tax and super-tax of the assessee "like their ordinary incomes" there would be a penal deterrent against increasing capital gains and obviously the inducement for the large speculator to trade on his own has been almost completely removed. He can, of course, continue to operate under the name of a company where the penal rate would appear not to apply, since, as far as can be determined at the moment, company short-term gains would enter into company income only. But it is doubtful if a great deal of speculation is advanced by benefits to a company rather than to an individual. The view is probably correct that a "bull" has been struck at, at least if the results of that speculation are honestly declared in income-tax returns. There is, however, one possibility and that is that 'bears' by receiving 'badla' on an open transaction for a whole year can escape profitably into the long-term rate. There is no escape possible for 'bulls' since the heavy 'badla' operating for a year would, in any case, convert in practically every conceivable case, their profits into losses. All in all, therefore, if speculation were conducted on honest lines, meaning that full declarations were made to the Income Tax authorities, a deep discouragement for 'bulls' is implicit in the Finance Minister's proposals. It is not equally clear that there is a deep discouragement for 'bears'.

The new provisions certainly help the small man who wishes to have a flutter on the Stock Exchanges. If he has an annual income of Rs. 10,000 he is saved one portion of the capital gains hurdle at once and, in any case, the income-tax rate at his level is not prohibitive to obtaining more income. But on the other hand, the dangers of losses make speculative buying and selling of the lower middle classes a dangerous pastime. It is a fact widely reported from Bombay, Calcutta and Delhi that the lower income groups are also interesting themselves in speculative transactions. It is not possible to determine exactly how much of this is true and whether the Finance Minister's proposals will keep speculative enquiries going on the basis of small investors. It is probable on balance that investment companies will be the only substantial beneficieries of the proposed pattern of capital gains taxation.

Only a postscript needs to be added to this comment. The figure given in the Finance Minister's speech of the yield of revenue from new capital gains taxation is only Rs. 50 lakhs, half of which is to be realised from companies. If the volume of speculation remains intact and it comes under the normal income tax and super tax rates payable by the assesses individually, surely the figure of Rs. 25 lakhs proposed for individuals must be a gross underestimate. It is extremely likely that the figure would be nearly ten times as large if speculative activity were anything like what it is at the present time. It can, however, be guessed that the penal rates of taxation now levied on short-term capital gains will greatly discourage large-scale individual speculation. This is not entirely to be regretted, but it is likely to affect the income of a very large number of people including the brokers concerned, and thus indirectly to bring about a reduction in income-tax and super-tax not presumably currently anticipated. There would appear to be some need for looking over the whole of the capital gains policy of the Government of India to leave some inducements for the rising entrepreneur to obtain "quick" resources to enter into industry on his own. There is no crime in playing on the Stock Exchanges sensibly. There is reason to believe that some of the younger men who have come into industry have made a considerable fraction of their money from capital gains; this is true of Europe and America. Is this source of revenue to be barred now for all individuals? It is not necessarily an advantage to the country that such avenues of gain of capital formation should be summarily abolished. It is difficult to see how injury is done to shareholders by the marginal transactions from which substantial capital gains are deemed to arise. The attack on speculation contained in the Finance Minister's proposals has probably been considerably overdone.

The Budget and Exports

ONE of the least satisfactory elements in the Budget for 1962-63 is the hesitant line taken on relief in tax on exports. The rebate on the rise in Corporation Taxes can only be called an inducement for exports in a Pickwickian sense. The removal of an additional hardship is not the same thing as an improvement in the current position. There is not much to be found in the Budget, except in the form of declaration of intentions which is enough to support the view that the Ramaswami Mudaliar Committee has made a major impact on the Finance Ministry's thinking. It is possible, however, if the Ramaswami Mudaliar Committee had not reported in terms of further income-tax relief, even the current rebate in terms of new corporation taxes on exports might not have been conceded. The Ministry of Finance is all too slow to take a major decision in regard to the need for powerful incentives to break the barrier in export promotion.

The relief on the export duty on tea and the decision to grant in one full sweep rebate on all the items of excise which enter into finished products as well as into intermediates might, however, be construed as the beginning of a turn of the tide which, under the dynamic influence of Mr. Manubhai Shah, Minister for International Trade, might conceivably swell to large proportions within the year. Even the decision to grant in one place all the rebates to which an exporter is entitled would be a great mercy. At the present time, for months together exporters are driven from door to door to obtain entitlements and rebates which, according to the rules, are due to them without a possible doubt of title. This is perhaps as much an administrative as well as a policy-making issue. If the Finance Minister and Mr. Manubhai Shah can quickly agree on the administrative handling of these matters, one might hope that a new outlook might be created in a very short time.

The Finance Bill has not been very specific on the changes in calculation proposed in regard to the reduction of corporation tax due on exports. Rules are to be framed in this behalf, and everyone who is acquainted with the rule-making difficulties will know that this cannot be too easy a matter. If the Finance Minister could arrange that, before the Finance Bill is passed into an Act, the necessary rules are duly framed and appended, he will have rendered a major service to the country at a time of great foreign exchange need. It will also be a major beginning from which Mr. Manubhai Shah, who, rumour has it, has already a major scheme in mind, can delve into these unknown waters which, for all too long, have surrounded export promotion. All that can be said now is that the climate looks like changing, and the Budget has given some little indication that rethinking is going on in the Ministry of Finance. It is still too hesitant; it needs to be swept into a tide of all-consuming power.

The Railway Budget

AS expected, Mr. Swaran Singh's budget speech was mainly devoted to the proposals for new taxation to cover the gap which was disclosed in the Interim Railway Budget presented by his predecessor before the General Elections. To outward appearances the estimates in the Interim Budget revealed a net surplus of Rs. 13.16 crores, but in the technical context of railway finances this was in fact a deficit because the appropriation of this amount to the Development Fund left a gap of about Rs. 10 crores in the resources available in this Fund to finance the development projects allocated to it. To borrow the amount of the deficit from the general revenues may be justifiable in terms of the prevailing Railway Convention, but such chronic reliance on this source would only go to perpetuate the instability and imbalance in railway finances. Subsequent to the presentation of the Interim Budget, the estimates made in it had to be varied substantially, the one solid item of increase in expenditure being the payment of a higher dearness allowance, adding up to Rs. 12.20 crores on account of the retrospective effect given to it from November 1, 1961. It will thus be seen that even the ostensible surplus which the Interim Budget showed was wiped out and a contingency was created in which the Development Fund would be constrained to borrow not Rs. 10 crores but something like Rs. 22 crores from the Central Exchequer in one year.

Mr. Swaran Singh's proposals aim at increasing the freight rates by a system of judicious discrimination according to the length of the haul over which freight traffic is carried. For the first 40 kilometres the increase works at 50 nP per tonne and for distances above 80 kilometres the increase is Re. 1 per tonne, with certain minor adjustments for haulage between 41 and 80 kilometres. The overall increase in freight rates, considered from the angle of high-rated and low-rated traffic, works out at a flat rate of 4 per cent. The purpose behind this scheme of revision is to reduce the impact of the increase on high-rated commodities. This is a sensible proceeding. Passenger fares have been increased

by 15 per cent for first class travel and by 10 per cent for travel by other classes. Suburban railway travel comes in for a much lighter levy of taxation. All in all, the scheme of revision of rates and fares is equitably conceived. It is made effective from July 1 and during the budget year it is expected to yield an additional revenue of Rs. 21.26 crores. In a full year the increase (at the assumed level of freight and passenger traffic in the budget year) would amount to over Rs. 28 crores. After meeting the obligations of higher expenditure on staff over which the Railway Ministry has no control due to the acceptance of the recommendations of the Second Pay Commission, the railway finances should now be in a position to earn a surplus enough, and perhaps more, for credit to the Development Fund to enable it to bear its obligation of financing development.

It is possible to argue that railway operational efficiency and financial management are not upto the expected standard now that so much ou lay has been made in the all-sided development of the railways, particularly since the beginning of the Second Plan. Parliament would be committing a lapse in its vigilance if it is not outspokenly critical of the shortcomings in railway efficiency and financial management. Such constructive criticism is necessary as a constant reminder to the Railway Board of the need for better operational and financial results. But the net effect of such better performance will be to improve the position of railway finances marginally in the overall context. There is no escape from an increase in rates and fares. The general debate on the Railway Budget in both the Houses was, curiously enough, extremely critical of the very justification of the increase in the price of railway transport services. This is absolutely un-understandable in the face of the admittedly precarious state in which railway finances find themselves placed. The least that was expected of Parliament was to endorse the tax proposals of the Railway Minister as reasonably justified. It is another thing to treat the railway authorities to criticism for their failures of which the recurring bottlenecks specifically in coal transport and in other industrial requirements are glaring illustrations.

But the main trend of the debate on the Railway Budget was to oppose the very proposals for rate and fare increase. There was the routine ventilation of the grievance against the neglect of provision of amenities to third class passengers. With congestion in the passenger sector, the hardship of third class travel cannot be denied. But it would be less than fair to the railways not to give them credit for a number of amenities provided to the majority class of travellers. During the course of the debate a demand was made for the appointment of a high powered committee for enquiry into the working of the railways. It is true that the Railway Board has shown some complacency. But the railways have certainly not sunk to a level of deterioration in efficiency which would urgently call for a high powered enquiry. The demand was rightly refused. In retrospect, it would appear that Mr. Swaran Singh was not wrong in anticipating likely opposition to the proposals for higher taxation of the railway transport user. This explains why he took all the trouble to clarify the historical background of the trends in the changes in the structure of railway rates and fares and devoted an unusually high proportion of his speech to this issue.

Barely one-seventh portion of the speech of the Minister deals with the performance of the railways in the freight sector. Most of it shows a pre-occupation with the difficulties of coal transport. If this issue would appear to have been excessively discussed in the recent past, the handicaps which the shortage of coal transport inflicted on industry are at the root of it. Time was when Mr. Swaran Singh blamed railway transport for shortages in the movements of iron and steel and ores. With the reshuffle in the portfolios he finds himself awkwardly confronted with a reshuffle in the brief which he has now to argue. The old debate may be forgotten. There is the assurance from the Railway Minister that the railways will not fail the coal industry now and this confidence seems to have been based on performance during the brief weeks in the recent past. The railways anticipate an additional load of 15 million originating tons worth of traffic during the budget year. The Railway Minister has been categorical in his promise that coal and the steel plants will find all their rail transport requirements fully met. There are apprehensions here for other users.

These apprehensions need not be treated as imaginary. An informative document on the performance of the railways, included among the budget papers in March last, sets out the various aspects of railway operations and the degree of efficiency disclosed by statistical evidence. Credit must be given to the railways for better performance in respect of engine usage, speed of railway trains, functioning of workshops, and so for h. But in two crucial tests the railways betray shortcomings which should cause real concern. In respect of commodities which lean very heavily on the railways, the rail transport co-efficient shows deterioration in 1960-61 as compared to the earlier part of the Second Plan period. As illustrative cases may be mentioned coal, cement, tea, raw cotton, cotton manufactures and oilseeds. But more important than that is the problem of wagon supply and the wagon turn-round. Mr. Swaran Singh has admitted that the production of wagons was handicapped during the last year owing to shortages of materials, but he has not mentioned the order of the shortfall in manufacture below the target. His hope about stepping up the rate of production in the current year may not inspire confidence or dispel likely doubts. The percentage of overaged rolling stock has increased in the recent past, but it is not clear to what extent overaged wagons have been retained in use. There is a substantial difference between retention of overaged locomotives and retention of overaged wagons in active service.

The official statistics furnished in the document referred to above show a deterioration in the wagon turn-round as computed in terms of days. Between 1955-56 and 1957-58 the turn-round varied between 10.4 days and 10.8 days, but during the next three years it deteriorated in a marked degree, exceeding the level of 1950-51 when the wagon supply position was most unsatisfactory. For 1960-61 the wagon turn round stands at 11.2 days which is in excess of that in 1950-51. This decline in efficiency seriously affects the current traffic demand. The transport user who will now bear a higher cost for the use of railway services is entitled to demand an explanation from time to time from the Railway Board how it is regaining the ground lost in operational efficiency.

THE WEEK'S NOTES

Algeria

AFTER SALAN'S ARREST

THE NEWS of the capture of ex-General Salan will be hailed as a major victory for the French Government in its arduous task against the OAS and as a crushing blow to the morale of this Organisation. Available reports give a clear indication that Salan's arrest was by no means a chance success. The movements and 'modus operandi' of Salan in directing the violent activities of the OAS were under very secret but close study for several days past. Nothing was left to chance when the ex-General was caught unawares. This fact, coupled with the earlier arrest of Salan's righthand man ex-General Jouhaud, gives an idea of the thoroughness and imagination with which the strategy to stamp out the activities of the OAS is being planned.

Salan is reported to have admitted after his arrest that his organisation was beginning to crumble rapidly. Nevertheless, it is plain that the French Government will allow no relaxation in its operations against the OAS. The French referendum should serve to open the eyes of the colons who still cherish the dream of their own rule in Algeria. Whatever little indirect sympathy might have been left for their cause among the microscopic section of the army and security forces is fast fading out since the wisdom of the Avian settlement is being solidly vindicated. However, the OAS, like any other armed extremist organisation fired with fanatic zeal, will continue to fight for what is apparently a lost cause. The referendum in Algeria is due to be held in July and it will not be a surprise if the OAS intensifies its murderous activities to thwart it. These exhibitions of its resistance, it is to be reasonably hoped, will be no more than attempts to fight with its back to the wall.

Ex-General Salan is already sentenced (though in absentia) to death. In the normal course what remains to be done is to execute that sentence. A fresh trial is redundant when the sentence of death stands unrevoked. But a fresh trial has been ordered apparently because the earlier trial was held in absentia. This is a time when President de Gaulle should act with unflinching firmness. Already the new Commander-in-Chief of the forces in Algeria has issued a stern warning to the rebels in Oran (the OAS stronghold) about the relentless action that is going to be launched by land and by air. The FLN, acting under the restraining influence of its leaders, has shown remarkable patience in refraining from any acts of revenge and retaliation against the OAS. But patience under these circlumstances may be stretched to the breaking point and it is precisely for this reason that the action to wipe out the resistance of the OAS ought to be not only firm but swift.

Transport

AD HOC POLICY IS URGENT

IF THERE were any doubts about the possibility of deriving any direct and immediate benefit from the valuable labours of the Committee on Transport Co-ordination and Policy for application during the Third Five-Year Plan period, they have been dispelled by the admission of the Chairman, Mr. K. C. Neogy, in his recent Press conference. Mr. Neogy has very frankly stated that there was little chance of the final report of the Committee being ready before the end of current plan. The Interim Report which the Committee has published, contrary to its character, has not proved to be of practical use in formulating an interim policy before the structure of the final policy is hammered out.

Transport co-ordination is a continuous process and even in the short run of a decade or two, it is very difficult to bring about a definite measure of stability in the policy for co-ordination. This has been the experience of other countries and India need not feel depressed if co-ordination proves an elusive goal. It would be an error to suppose that any high degree of finality can be given to co-ordination. Co-ordination must be adapted from time to time to the needs of the demand for transport capacity. It is a dictum of development planning that social overheads like transport have to be planned and provided ahead of the requirements for them, if deadlocks in the expansion of programmes in the other sectors of the economy are to be avoided. While this dictum is indisputable, in practice compliance with it is severely circumscribed in backward countries like India which have to use all ingenuity to get the maximum of development with inadequate resources. This handicap makes flexibility in co-ordination policy all the more important.

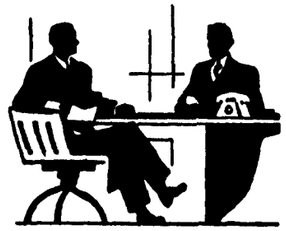
What is now needed is not waiting for the Neogy Report which may be useful for the Fourth Plan, if it is published sufficiently in advance. An ad hoc policy is very urgently required for transport during the Third Plan. There are no two opinions that transport is proving to be the Achilles heel and every effort must be made to repair this serious shortcoming. Precaution must be taken in selecting, by a pragmatic process, safeguards for the revenues of the railways in the freight sector. Allocation of traffic which bear high revenue between railways and roads and shipping (but roads in particular) must proceed on some rough estimates. What is definitely required is to follow a liberal policy of granting permits for the operations of truck transport services after ensuring the viability of the units. Conditions about maintaining large fleets of prescribed sizes and certain standards of operations will need to be imposed on the road services. Co-ordination will be relatively easy if road operations are placed on the basis of large-scale operations.

Parliamentary Privileges

CODIFICATION

IT IS not for the first time that the question of the codification of the privileges of Parliament and of the State Legislatures has been raised in public discussions on appropriate occasions. Each time refuge has been sought in the plea that the status quo could be maintained for some time without any serious encroachment on the right of expression of the Press and the like. The plea about no serious encroachment may be sustained by experience hitherto. But this observation could be modified, at least in some degree, in regard to the State legislatures some of which have tended to show a degree of super-sensitiveness to even unobjectionable exercise of freedom of critical expression of views. Mr. Hukam Singh recently expressed the view that the balance of convenience would lie in not codifying the privileges of Parliament for the present. The entire question is somewhat complex and to oversimplify it would be to take an extreme view.

The powers, privileges and immunities of Parliament and its members are dealt with in Article 105 of the Constitution and Article 194 makes identical provisions in respect of the State legislatures and their members. In both the Articles it is specifically stated that the privileges of the legislatures should be defined by law from time to time. Until so defined, the privileges obtaining in the House of Commons "at the commencement of this Constitution" should be adopted. In the absence of codification the privileges of the House of Commons prevail. This is only a tentative arrangement. Even so, it is subject to the qualification "at the commencement of this Constitution". Hypothetically, it



is arguable (although such a contingency is extremely improbable) that an earlier convention of the House of Commons relating to a privilege may be subsequently modified and what the Indian legislatures will follow is the superseded convention. The point of emphasis is that codification and not convention is unequivocally contemplated in the Constitution. The only question is of the time opportune for codification. Over thirteen years have elapsed since the Constitution was brought into force. It is high time at least to start preliminary work on making an intensive study of the privileges of the House of Commons and of the question of the privileges of Indian legislatures raised and settled since the introduction of Constitution in order to help expedite the process of the codification of parliamentary privileges. The code can be modified in the light of experience. This point is virtually ignored whenever the question is discussed.

Malaysia

SINGAPORE PREMIER'S VISIT

IF THE three-day visit of the Premier of Singapore, Mr. Lee Kuan Yew, to the capital city early this week has attracted much less attention than the visit of the King of Nepal, which could not be otherwise, its significance should not be missed. Malaysia is still a bold political plan of the integration of five small territories, which command geographically a strategic position in South-East Asia. Its significance arises also from another important factor, namely, that the population of these five states or territories has a strong proportion of people of Chinese origin. If the integration of Malaya, Singapore and the three non-self-governing territories, now under the colonial rule of Britain, finally matures into a sovereign State, an important nation will have emerged in this part of the world.

It is common knowledge that Tunku Abdul Rahman, Prime Minister of Malaya, is the sponsor and the source of inspiration behind the formation of the united state of Malaysia. His anti-Communist attitudes have never been concealed. It is for this important reason, among others, that Communist propaganda is trying to alienate the sympathies of the rest of South-East Asia from the ardent supporters of Malaysia by creating a strong impression that Malaysia will be a pseudo-sovereign state, functioning, in reality, as a non-self-governing bloc for all practical purposes. It is significant that the Singapore Premier is now on a tour of the non-aligned countries of South-East Asia. This choice is not without a definite purpose. It is to acquaint the governments of the non-aligned countries with the real forces behind the formation of the integrated state and to explain its determination to maintain an independent attitude, which, nevertheless, cannot be pro-communist. Mr. Lee Kuan Yew's People's Action Party suffered a serious defection last year of a solid pro-communist bloc on the very issue of Singapore's entry in the projected state of Malaysia. The party, thus purged of the communist element, cannot be considered as rightist, avowedly committed to an uncritical pro-Western attitude. It claims to be socialist. What is important, however, is that the five component units of the proposed State of Malaysia, with a strong complexion of Chinese population, seek to maintain their independence from Communist influence, which in the geographical context, means Chinese influence. It will be interesting to watch the progress of the people of Chinese origin asserting their nationality of Malaysia and the courage and determination they show in resisting the pressure from the land of their origin. These factors, and not the routine publicity given to the visit of the Singapore Premier, are what really matter in the context of China's aggressive ambition to dominate South-East Asia.

ANNOUNCEMENT

The following Annual Numbers of THE EASTERN ECONOMIST are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Rs. 50|-.

1.	India & the World and India in 1950	Rs. 5|-
2.	A Social History of the Indian People & India in 1951	Rs. 5|-
3.	India & the Free World and India in 1952	Rs. 5|-
4.	India in Asia & India in 1953	Rs. 5|-
5.	India in South East Asia and India in 1954	Rs. 5|-
6.	India & the Communist World and India in 1955	Rs. 5|-
7.	India in 1975, A Study of the next Twenty Years & India in 1956	Rs. 7.50
8.	India & the Middle East and India in 1958	Rs. 7.50
9.	India and Europe & India in 1959	Rs. 10|-
10.	India & North America and India in 1960	Rs. 10|-
11.	India and Europe Divided	Rs. 10|-

Please take advantage of this offer and mail your enquiries to :

The World Abroad

WHITE HOUSE VERSUS BIG BUSINESS

By PAUL BAREAU

LONDON, April 19.

ECHOES of Teddy Roosevelt's trust-busting campaign of sixty years ago and of Franklin D. Roosevelt's New Deal crusade against the "barons of Wall Street," are awakened by President Kennedy's vehement and successful attack on the American steel companies and their attempts to hoist the price of their products. If the mentle of the two Roosevelts is to fall on the young man now installed at the White House, a new and extremely interesting period in American economic and political history opens.

All kinds of related and important issues are involved in this incident. It is not only the relations between the Administration and the business community in the United States that is at stake; far more fundamental questions such as the balance of payments, the position of the dollar, the relative level of costs in the United States and competing countries, and last but not least, the more liberal trade policy to which the present Administration has set its hand, are also involved.

The facts are fairly self-evident and can be summarised without prejudice. The U.S. Steel Corporation, in common with other American steel companies, and with a large part of American industry, has in the last few years seen its profit margins seriously narrowed. These large corporations have had to withstand increased labour costs, they have found competition increasing in their own domestic market due partly to the healthy anti-monopoly climate that prevails in it, but also to the increasing inflow of imported manufactured products. The steel industry had recently negotiated a new wage agreement with its workers in which considerable concessions were made. Admittedly, the agreement when it was signed was said to be non-inflationary, but that was an apologetic rather than a truthfully factual description. Be that as it may, the U.S. Steel Corporation soon after announced a general increase of about $6 per ton in the price of steel and, though there is no price fixing arrangement between the steel producers in the United States, the lead of the biggest producer was automatically followed by most of the other companies.

The response from the White House was angry and explosive. President Kennedy openly condemned the decision as "irresponsible" and immediately proceeded to suit his actions to his words. First, he announced the setting up of a Federal Grand Jury to investigate monopolistic practices in the industry revealed by the evident unanimity with which the companies increased their prices. Secondly, he instructed all Government buying agencies to place their contracts for steel with those companies which had not raised their prices. In the face of this vigorous riposte the steel companies collapsed and countermanded the price increases.

No tears have been shed for the steel barons; on the contrary, a vast shout of approval has gone up for President Kennedy who by this one action seems to have regained with the American man in the street such popularity as he may have lost as a result of the Cuban fiasco. And yet, there is a good deal of justification on the steel industry's side. It is not generally realised that during the past five years, a period during which the national income in the United States has risen by 24 per cent, industrial production by 21 per cent and wages by 27 per cent., the profits of private corporations after payment of tax have remained virtually unchanged — and this despite the fact that over this period an average of $30 million of new capital a year has been invested in new plant and equipment for American industry. Wages and salaries have taken more than the lion's share of the growth in the American economy. The share of profits has fallen.

That share may fall further if in future the U.S. Administration is to extend to other industries the efforts it has just made so successfully to control prices in the steel industry. Those efforts will be justified provided the non-inflationary policy is maintained. But if budget deficits and further generous wage increases succeed in achieving a combined demand-pull and cost-push inflation, the policy of controlling prices will merely be an attempt to cure the fever by plugging the thermometer and could do the American economy a great deal of harm.

The vehemence with which President Kennedy reacted to the steel price decision is an indication of the concern with which he and his economic advisers view the U.S. balance of payments and the position of the dollar. A recent projection of the U.S. balance of payments for 1962 made by the National Foreign Trade Council suggests that there will be an overall deficit of some $3½ billion this year, after providing for foreign aid and capital exports amounting all told to $7½ billion. This indicates that the position of the dollar is likely to remain under strain and emphasises the need for expanding exports, meeting foreign competition in the domestic market, and therefore keeping down costs.

Labour costs look to be the Achilles heel of the American economy. American wages are still between 2½ and 3 times the figures that obtain in the industrialised countries of Europe. This difference could be justified as long as labour productivity in the United States had equal superiority. The superiority is diminishing — and it is diminishing partly because American capital has been exported to Europe and with it American knowhow and industrial techniques. The disparity between wage rates on each side of the Atlantic is becoming less justified than it was. Here lies the main long-term threat to the U.S. dollar, however well entrenched and securely buttressed by reserves and international co-operative arrangements it may be for the short run.

This situation also threatens the foreign trade policy of President Kennedy's Administration. He wants to liberalise trade and to negotiate further tariff reduction agreements with the European Common Market and through this with the other main industrial commercial countries of the world. He has asked Congress for bigger tariff cutting powers and the battle on this issue is likely to occupy a great deal of Congress's time this year. If, however, U.S. costs get out of line, as they have recently done in such industries as glass making and carpet manufacture, the President finds himself faced with almost irresistible pressure to invoke the escape clauses under the Trade Agreements Act, and to increase import duties on the goods in question. This is destroying with one hand the greater work that the other is trying to do.

For those who place their faith in freer, more multilateral trade, President Kennedy's attempt to control prices will be welcomed — but with the basic reservation that they will achieve nothing unless the fundamental economic policy of the United States is such as to justify the present exchange value of the dollar. On this some doubts must persist.

The European Scene

THE ROLE OF FOREIGN CAPITAL

From Our Special West European Correspondent

MADRID, April 21.

WHAT we call too loosely "foreign assistance" can have very different results depending on the form it takes and the channel by which it reaches a developing economy. The case of Spain illustrates this admirably. The general outlines of Spain's recent economic development are known: after suffering severely from the world-wide recession between 1929 and 1937, and then from the civil war, the world war and the period of boycott by the victors in the latter, between 1937 and 1952, Spain once again began to receive Western capital aid from 1952. Between 1952 and 1958 this aid was lavish; it came from the U.S. Government in return for the lease of Spanish strategic bases and took the form of direct military aid, paramilitary "support" assistance (designed to strengthen the economy of a strategic ally) and of PL 480 aid. In that period, the Spanish economy suffered violent inflation, and the more aid Madrid managed to extort from Washington, the worse her situation seemed to become — until bankruptcy. Incidentally, the Americans had not made themselves loved, and the Francoist regime emerged, if anything, weakened from this disastrous experience.

From 1959, Western aid took very different forms. Instead of pouring dollars into the country without caring what the recipient did with them (when aid is passed from government to government any enquiry about its use constitutes blatant interference), Western lenders asked Spain to join the international financial and economic institutions and abide by their rules. This entailed accepting the principles of an economic reform such as had been practised previously in West Germany and France, and then, if the reform worked, bringing Spanish economic management into line with that of her neighbours and backers. As for aid, the lenders offered merely stand-by credits, which were substantial but put up in the hope that they would not be used. Foreign aid at that point was designed merely to guarantee the success of the reform, to inspire confidence that the new value of the peseta would be defended, and to be available if the economy went into a "skid" such as is always possible in these operations. As hoped, the operation succeeded and Spain came through a difficult passage (rather more slowly than happened elsewhere, because of rigidities and distrust peculiar to a dictatorship) to find that her currency was firm, her exports increased, domestic inflation tamed and the stage set for a soundly based period of development. Note that during this crucial phase, foreign aid played a largely symbolic role; it was massed up behind the new peseta to ward off attack.

As for long-term aid, Spain's rescuers told Madrid that it would not begin to flow until the stabilisation operation was seen to have succeeded, and when it came it would come from private sources or through agencies like the Export-Import Bank which assist private enterprise. In other words, no cornocopia of shiney silver dollars was poured into Franco's lap. He was asked to face the truth about the economy he had ruined with inflation, to let the impartial experts of the OECD, the World Bank and so on study that economy, publish their results for all to reach and then make recommendations that Madrid was free to adopt or ignore. In the event that he chose to follow their advice, he was asked to use his authority (his dilapidated prestige would no longer suffice) to counsel patience to a people that would be sorely tried by the first painful phases of a deflationary reform. The shiney silver dollars would not come until Spain had won her own battle, and then they would not be provided on the strategic advice of the Pentagon but on the judgment of thousands of independent lenders and investors throughout the West who would be less concerned with Spain's dubious military might than with the honesty of her economic administration and her free markets.

The volume of this second sort of foreign assistance would no doubt be far inferior to the pipeline of credits that ran from the Pentagon, but it would be infinitely more efficacious. Madrid hesitated for over 18 months after initiating the economic reform before steeling itself to qualify for foreign private aid by adopting the policies that had worked elsewhere. The decision was taken when it was seen that, after a period of doubt in Franco's determination, foreign private aid was already beginning to flow into Spain, and the trickle seemed to swell every time Madrid liberalised its treatment of foreign and domestic capital. Finally, this month, the regime found the courage to go the whole hog, and after reforming the banking system on the lines recommended by the Americans and West Europeans and adopting a development plan approved by the World Bank, it threw the doors wide open to foreign enterprise.

Before the economic reform Spain was quite inhospitable to foreign aid (other than the dollars extracted directly from Washington), and the regulations were framed on the apparent assumption that predatory foreign bankers and cartels were anxious to dominate the country, exploit its people, ruin native enterprise and reduce Spanish independence. In fact, no one sought to invest in the country. With the reform, this exaggerated nationalism (a relic of the autarchic policy of fascism) was abated. Foreign enterprise was permitted to acquire a larger stake in Spanish firms (up to 50 per cent), which gave it confidence that it was worth while making technical co operation agreements with these latter, since the outsider would have a serious say in management. Then last year the peseta was made convertible for non-residents, which means that they could move funds into and out of Spain while getting the legal rate of exchange both times. These, and a number of minor adjustments were enough to attract the bigger foreign corporations, and Spanish industry has benefitted in the last year from a host of agreements and participations which are powerfully modernising its methods.

Numerous impediments remained, however. Dividends and interest could be repatriated up to 6 per cent only but, more serious, no capital gains or profits from the sale of shares, rights etc would be sent out of Spain. A special register had to be kept by each company showing, by name, its foreign shareholders, so as to be sure that foreigners never gained a controlling interest. Private foreign aid was being accepted, and in increasing amounts, but the official attitude was still distrust and anxiety. As from April 15, most of these remaining impediments have been swept away. Reassured by its $1,000 million reserves and encouraged by the excellent results so far obtained from foreign private capital imports, Madrid has decreed this month that there is henceforth no limitation on the acquisition and sale of Spanish shares and securities by foreigners. Dividends can be exported in any amount and capital gains can be transferred just as easily. Foreigners no longer have to be named on a special share register; it suffices for an intermediary to make a declaration that some anonymous foreigner holds so much stock — for the Government still wants to be assured that its approval is demanded before more than 50 per cent of shares pass into foreign hands. My information is that up to one-third of all the business currently being transacted in Spanish stock markets represents buying orders from foreigners. Foreign private capital is at last coming to the support of the Spanish economy on a scale comparable with that received (more quickly, because they were less distrustful) by West Germany and France after their stabilisation operations.

The benefits of this open-door policy to foreign capital will soon be evident, to judge from the stimulus the economy has received from the capital imports of the past two years. Making up for the slow rate of local capital formation and replacing the investments of the Spanish banking system (whose stranglehold over the nation's industry has at last been broken by the recent banking reform), foreign capital is bringing with it, not just money, but men and ideas — unlike the more massive governmental aid of the period 1952-58, which brought the inflationary impact of unearned dollars but left Spanish in a state of deplorable technological backwardness. Workers thrown out of employment by the deflationary reform of 1959 are already back at work, and an attack has begun on the chronic unemployment and under-employment typical of a country half of whose people are still peasants. Almost all the best known international corporations (except so far the oil cartels, regarded by the Spanish with an invincible suspicion) are co-operating with local enterprise in bringing new industries to Spain and in modernising and extending those that have subsisted since the last growth-period of Spanish capitalism at the beginning of the century.

The contrast between the benefits of governmental, cold-war aid and those of private capital are striking, but lest this be taken for a brief in favour of free enterprise alone, two facts must be noted. First, one of the conditions set by foreign private lenders before they invested in Spain was a nationalisation, an extension of governmental control: specifically, Madrid was asked to nationalise the Bank of Spain, which it did this month. Foreigners, that is, wanted the government to exercise some effective control over the supply of credit and to break the monopoly of private financial interests that were content for decades to restrain industry and make money out of inflation. Another condition, now in course of being met, was a "socialist" welfare measure: provision of State unemployment benefits, equal to three-quarters of a living wage, for men thrown out of work. The point of this was to restore some mobility of labour, in place of the fascist absurdity of prohibiting firms from dismissing labour at all. Secondly, the rush of private capital has brought with it new inter-governmental aid, of a more rational sort: West Germany, for example, has agreed to finance a multi-purpose project plus community development in the god-forsaken region behind Malaga, and France is putting up the money to pierce tunnels through the Pyrenees. Thus it is not that private and public foreign aid are exclusive, and one does not have to concur in the curious dogma of some U.S. Republicans, that governmental aid is always bad. But it is very little use in an economy that is not judged fit to invest in by private lenders.

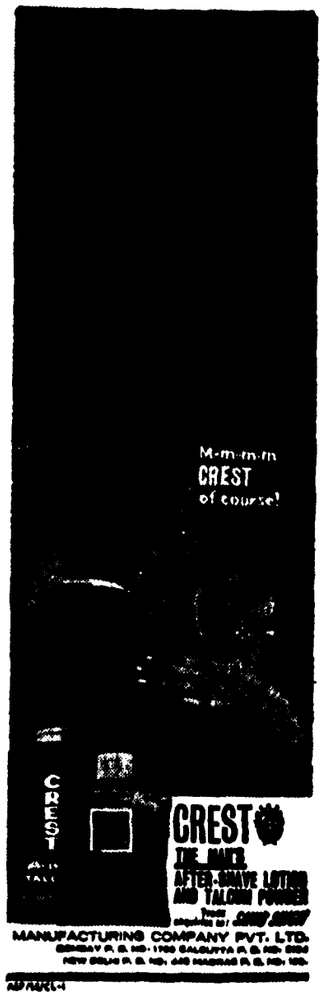
Economic Report from the U.S.

AID TO LATIN AMERICA



By GUY SIMS FITCH

WASHINGTON, April 17.

IMPATIENCE with existing conditions is an understandable human trait. It also can be a rewarding one, to the extent that it generates constructive efforts to accelerate social and economic progress. This thought comes to mind right now with particular reference to the Alliance for Progress, that co-operative Western Hemisphere venture to promote the development of Latin American nations. For hard on the heels of the annual U.S. observance of Pan-American Week has come an appearance before the U.S. Senate Foreign Relations Committee by Teodoro Moscoso, U.S. co-ordinator for the Alliance programme.

Admittedly, it has been difficult to get the Alliance moving as rapidly as the United States and its Latin American partners would like. But even the programme's severest critics concede that it is much too soon to expect definitive results from an undertaking as massive, as complex and as revolutionary as the Alliance. The programme was first proposed by President Kennedy little more than a year ago. Its charter was signed at Punta Del Este only eight months ago. And the job of organizing the U.S. assistance effort was begun by Mr. Moscoso only five months ago. Yet $1,000 million in U.S. aid has been committed to Latin America in the past year, of which more than one-fourth has been disbursed. And now President Kennedy has asked the U.S. Congress for another $600 million for the Alliance in the fiscal year beginning July 1, plus an authorization to commit an additional $3,000 million in loans and grants in the next four years. It was in support of this Presidential request that Mr. Moscoso made his Senate appearance. Even these large sums would cover only part of the Alliance's operation, which is envisaged in its entirety as a 10-year, $100,000 million programme of combined self-help and outside aid. Latin American countries would provide some $80,000 million of their own resources, while the United States has committed itself to supply about 60 per cent of the additional $20,000 million in external assistance. Emphasis is on government aid, although private U.S. capital, with its accompanying managerial and technical skills, also will contribute to the programme's effectiveness. But the significance of the Alliance is not to be measured by its size alone. The fact is that it represents a departure in economic policy. It seeks not only to build up Latin American economies, but also to modernize Latin American social and political structures. Alongside this effort, the highly successful Marshall Plan emerges as a comparatively simple operation, concerned as it was with rehabilitating an industrialised Europe within a framework of well-developed institutions. The Alliance represents another policy advance in its emphasis on large-scale government assistance for Latin America. This approach can be traced back to the creation in 1958 of the Inter-American Development Bank (IDB), to which the United States is the largest contributor.

Another important innovation is the Alliance's stress on internal fiscal and social reforms and other self-help efforts by the Latin American nations. These, including realistic and carefully formulated national development plans, are viewed as essential to the Alliance's effectiveness. If there are those in Latin America who are impatient with the apparent slowness of United States aid disbursements, there are those in the United States who are impatient with the apparent slowness of Latin American self-help and internal reform efforts. Nevertheless, there are encouraging signs of progress. In his Senate testimony, Mr. Moscoso conceded that self-help reforms can and should be accelerated in Latin America. But he also pointed to a number of important steps that have been taken, such as tax reform in Colombia, land reform in Venezuela, agrarian reform in Bolivia, development plans in Brazil, and a stabilization programme in Peru. Thus, while impatience may have its virtue, it should be tempered with a little patience and understanding in judging the Alliance's performance to date and its promise for the future. If all interested nations play their parts properly, as Mr. Moscoso told the Senate Committee, the year ahead should show "solid progress in building the Alliance."

THE PATTERN OF RISING PERSONAL TAXATION 1952-53—1962-63

THE latest Central Budget has revised upwards the schedule of rate of income-tax and super tax on individuals, Hindu undivided families and unregistered firms. The income-tax rates on incomes below Rs. 5,000 will remain unchanged, while those between Rs. 5,000 and Rs. 20,000 have been rated up. Again, incomes above Rs. 20,000 per annum have been left unchanged. The new tax rates on wholly earned incomes for salaries as well as "incomes other than salaries" are set out along with rates prevalent in 1957-58, 1955-56 and 1953-54 in Table I below. It illustrates the fact that individuals having an income of Rs. 20,000 per annum will pay according to the new schedule, the highest income-tax so far imposed in this country. According to 1953-54 rates, the income-tax on an income of Rs. 20,000 was around 10 per cent at Rs. 1,993. In the 1955-56 budget it was rated up to Rs. 2,132, while a slight relief followed in the 1957-58 budget reducing the tax to Rs. 2,058. According to the latest budget, the tax on "incomes other than salaries" will be Rs. 2,347, while for "salaries" only it would be Rs. 2,291.

When slight relaxation was provided in the 1957-58 budget, the then Finance Minister, Mr. T. T. Krishnamachari used the following argument for lowering the rates. He said: "Our present level of taxes are about the highest in the world and they no. only create a disincentive for earning but also encourage evasion". Mr. Morarji Desai has twisted the same argument to increase the income-tax rates. He said in his budget speech: "Rates of income-taxes on corresponding incomes in different countries are often compared. This is, however, not meaningful as conditions differ widely. In any case proper comparison can only be of the incidence of total tax burden on different groups with the same relative position in each society."

Table II (vide next page) gives figures in regard to taxes on incomes other than corporation tax for the last decade. It shows that the latest revision in the tax rates is likely to take the total tax realised to almost the peak levels registered earlier in 1958-59 and 1960-61. Even though these figures relate to collection of income-tax and in certain years include taxes on income of earlier years as well, yet these figures are a fair indicator of the rising burden on the individuals. The obvious conclusion which emerges from a study of these figures is that direct taxes in this country are becoming extremely oppressive and are likely to affect the potential for

savings. An analysis made last year by the Reserve Bank of India showed that 80 per cent of the savings came from urban households. It is this class of urban households which will be hit hard by the increased direct taxes. The additional sum of Rs. 15 crores realised by way of higher direct taxes will mean a lowering by the same amount of urban savings which have normally been channelled into the banking and other financial institutions.

The fresh dose of taxation has been applied at a time when considerable erosion in income has already taken place due to a steep rise in prices. The Finance Minister and the Planning Minister have both derived considerable satisfaction from the fact that the index of wholesale prices has remained steady in recent months. An analysis of the various components of the index shows that this relative steadiness in the general index has been brought about by the steep fall in jute prices; in the other groups of essential consumer goods, the prices continue to keep their upward march. An interesting exercise has been attempted in Table III in order to measure the combined impact of increased taxation and rise in prices. Incomes between Rs. 3,000 and Rs. 20,000 per annum have been considered. After deducting the annual income-tax for each income, the balance has been deflated so as to arrive at the real income at the pre-war and the 1952-53 level of prices. It will be seen that an income of Rs. 20,000 per annum of today reduces to Rs. 3,719 at pre-war prices. Similarly the same income of Rs. 20,000 reduces to Rs. 14,156 at 1952-53 prices. In other words, while the Finance Minister claimed an income-tax of Rs. 2,291 out of an income of Rs. 20,000, the erosion caused by inflation since 1952-53 was Rs. 3,553. The double edged sword of rising prices and rising taxation is reducing the standard of living of the middle classes which lie predominantly in income groups below Rs. 20,000 per annum. All the technicians and managers of industry belong to these income groups. It is these classes which will find increasingly difficult to honour all their obligations within the real incomes left in their hands. Education, housing, transport etc. are all becoming expensive in urban areas and are steadily reducing the level of living of these classes. Increase in taxation of these income groups is indeed tantamount to punishing the builders of society.

THE BUSINESS WORLD

The Central Budget: Bombay Reaction

By CROESUS

BUSINESS circles in Bombay have accepted Mr. Morarji Desai's Budget proposals for 1962-63 with considerable mental reservations, although the impression from the initial reactions of the stock market that one gathered seemed to suggest that they were generally welcomed. Of course, they concede that the proposals are practical and free from ideological predilection. But stock market reactions must have stemmed from the understandable feeling of relief that the actual extent of new taxation and of deficit financing in 1962-63 has not exceeded anticipations. Thus, as against market apprehensions of Rs. 80 crores additional taxation and Rs. 100 crores of deficit financing, the new tax proposals even for a full year amount to only Rs. 71.7 crores, while the deficit financing for the year has been limited to covering the net overall deficit of just Rs. 89 crores. In the words of the President of the Bombay Stock Exchange "the Finance Minister has struck the golden mean between too much taxation and too much deficit finance, both of which could be inflationary in the present circumstances." Similarly, Mr. K. R. P. Shroff has complimented the Finance Minister on having held the scales even as between direct and indirect taxes and as between the rich and the poor. Prima facie this may be so, and the fact that especially the highest income groups and the upper middle classes have been penalised most may even give the Budget a genuinely socialistic tinge. But political or ideological considerations apart, what the business world looks for are the implications on saving and investment after the new Budget proposals. It should be obvious to any one that the raising of the Corporation Tax by 5 per cent, the abolition of the exemption on shares held in new companies for the first 5 years as at present under the Wealth Tax Act, the revision of the structure of the rates of tax on registered firms and the increase in the Wealth Tax on the two highest slabs are all bound to reduce the quantum of funds that would otherwise have been available for investment.

Whatever justification the Finance Minister may have put forward in support of these additional burdens, it cannot be denied that the implementation of the proposals would amount to a going back on his solemn assurances, assurances actually inscribed earlier on the Statute Books. It will be recalled, for instance, that, when the new scheme of company taxation was introduced by Mr. Morarji Desai, he had stated that the change would not result in an increase in the overall income from corporate taxation. This statement has been grossly belied by actual receipts which have registered a sizeable rise in the incomes from this source. After having made this sacrifice, the shareholders in joint stock companies naturally feel that there can be no justification for the proposed increase in the Corporation Tax, however straight forward the proposal happens to be this time. The question also arises as to whether this additional tax burden will not adversely affect investment by companies. If it was the desire of the authorities that there should be no undue dissipation of distributable profits in the form of unduly inflated dividends to shareholders, they could very well have achieved the purpose by encouraging the ploughing back of profits with suitable incentives.

Investors are also keenly disappointed with the proposed abolition of the exemption from Wealth Tax on investments in new companies. They feel that this is going back on a solemn legislative assurance that the exemption would last for a five-year period. If only to be fair to those investors who put in their money on the strength of such an assurance, it is felt, the least that the authorities could and should do is to let the exemption run for the full term promised, viz., to let it continue to apply to investments made in all companies incorporated up to April 1, 1962. At any rate, there is a very strong feeling that investment in preference shares at least should be allowed to continue to enjoy the exemption. For, as is well known, investment in preference shares is not made with a view to deriving any benefit from capital appreciation. Actually, an investment in preference shares is not at all remunerative for the first four or five years. Investors in these shares, therefore, certainly deserve to be treated with greater consideration that has been shown to them.

Although the Finance Minister has paid lip sympathy to "the widespread desire, in this house and outside, that the imposition and enhancement of excise duties should not lead to a general increase in consumer prices", the cumulative effect of his tax proposals would surely be to raise the prices of quite a few items of consumer goods, including textiles. The proposed increase in the excise duty on cloth and yarn is admittedly very steep. May be, the marked victimisation of the fine and superfine varieties is partly pompted by the desire to discourage cotton imports and save foreign exchange. But one cannot help feeling that the Finance Minister could not resist the temptation to draw on this milch cow; otherwise one fails to appreciate the deliberate underestimate of the yield from this levy. As against Rs. 12.1 crores estimated by the authorities, the lowest estimate in textile circles is Rs. 25 crores and certain sections place it even as high as Rs. 40 crores! In view of this, there is a lurking suspicion in mill circles that some inaccuracy must have crept in somewhere. For instance, it would be interesting to know the basis of the Government's calculation of the yield from the duty on mercerised cloth. No seperate data would appear to be available anywhere for this category of cloth. Surely, this is not the way of achieving what Mr. Desai describes as "an equitable position" in justification of his proposals. It is even feared that the inordinately high levy on operations like mercerising might lead to a drastic reduction of this form of processing in order to save the prohibitive duty.

Another tax proposal which is likely to affect saving and investment is the proposed increase in the rates of Income Tax in respect of income slabs above Rs. 5,000. For, lately, it is this income group which has begun to take an interest in investing in stocks and shares and thereby contributing to the industrial progress of the country. While it is conceded that the rates of tax in the highest slabs of income are pretty stiff to allow of any further increase thereon and the income groups below Rs. 5,000 per year must be spared, and everyone is also aware that Income Tax cannot be a mass tax, it does not necessarily follow that the people in the intermediate income groups should be penalised to the extent that they have been penalised. Here, again, had it not been for the customary trait of Finance Ministers to underestimate revenue, the probability is that the extent of the increase in incidence might have been more moderate.

It may seem all right to accept the heavy doses of taxation and deficit financing every year as having been written into the (Third Five-Year) Plan, but may not one ask whether the emphasis all the time should be on indefinitely augmenting tax revenues thus, and not on preventing avoidable wastage, especially in the Government Sector? The usual excuse that tends to be trotted out by the authorities that, in the context of very heavy outlays on ambitious schemes of development, a degree of wastage is inevitable does not constitute a convincing answer. Moreover, it behoves the authorities to impress upon the public that they too are prepared to make sacrifices no less arduous than what they are asking the people to make.

There is one feature of the Budget Speech of Mr. Desai that deserves to be particularly highlighted. It is the feeling of concern expressed by him that progress in regard to additional taxation by the States has been woefully slow, as evidenced by the fact that the State Budgets in 1961-62 provided for additional taxation estimated to yield no more than Rs. 100 crores in five years, as against the Third Plan target of Rs. 610 crores in this behalf. The defence put forward by the Finance Minister in support of his Budget proposals, namely that, without the requisite tax effort, we cannot avoid stagnation must, therefore, be made to go home to the State Governments more than to the people at large, if they are really keen not to slow down the tempo of development and thereby prolong the poverty of the people, as they so vociferously profess.

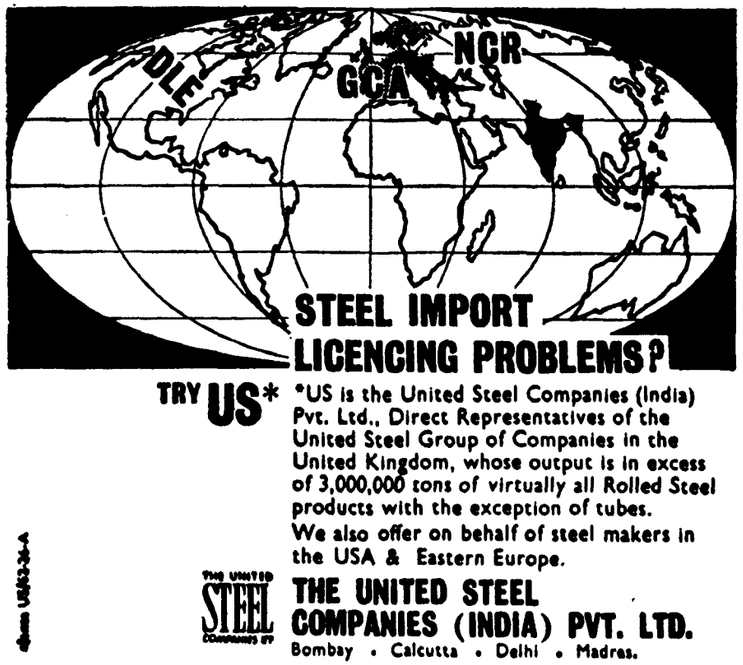
Two Brilliant Expositions

By CROESUS

TWO lectures which I heard during the past few days have impressed me very much. I cannot say whether I wholly endorse the points made by the two brilliant speakers, or, perhaps, I should say the two outstanding economists, namely the U.S. Ambassador Mr. J. K. Galbraith and the Director of the Institute of Economic Growth, Delhi, Dr. V. K. R. V. Rao, but I would not be true to myself if I did not admit that both the lectures were full of sincerity and conviction. Indeed, Mr. Galbraith's theme was the growing need for conviction, the conviction of accomplishment in particular.

No one who heard either Dr. Rao or Mr. Galbraith could have gone without being impressed about India's achievements. Addressing the Bombay branch of the Indian Council of World Affairs, Mr. Galbraith said that he was convinced that every problem would yield to a sufficient application of faith, energy and enthusiasm, but wondered whether there has not been some loss of momentum lately, either because the problems being tackled have been proving more intractable than was imagined a decade or two ago or because the people have become impatient. Dr. Rao, whose lecture was confined to India, opined that, while there has been some achievement, the achievement has not been according to our plans and expectations, and that there is need for a re-orientation if the results desired are to be realised. Although, as yet, the number of those who have begun to wonder if anything can really be done, or believe that nothing is possible, is not many, the very fact that there are even a few of them should be regarded as a danger signal, and something must be done before the number of such gloomy persons increases to compel us to give up the search for a solution in the belief that no solutions are possible. In so far as the U.S. is concerned, Mr. Galbraith assured his listners that America was determined to retain the conviction that things could be done, but he was not satisfied with quite that much. What we need, he went on to say, is "a new international organisation composed of the people who retain the conviction that progress is still possible, that problems can be solved". More, the U.S. Ambassador suggested that this conviction could even be a new unifying influence in the world.

In his illuminating lecture on "Some Reflections On the Industrial Revolution Now in Progress in India", under the Walchand Memorial Lecture Series arranged by the Maharashtra Chamber of Commerce, Bombay, Dr. Rao was not guilty of any lack of conviction of achievement, but he was certainly not content to leave it at that. While conceding that India has started on her industrial revolution, he was rightly of the view that "we have still a long way to go before we can call ourselves an industrialised country". It is to substantiate this that he posed a formidable list of questions covering the extent of our industrial growth, its salient features, the way it has been brought about, the extent to which it is linked up with the social and economic objectives of our planning, the mistakes that have been made, the lessons that can be learnt from past experience and the prospects for the future.



Examining the question of how far the industrial development during the two Plan periods has resulted in the implementation of the social and economic objectives set out by the Planning Commission and the various statements of Government policy, Dr. Rao stated inter alia:

(1) the employment objectives set out in the Plans have not been fulfilled and, to the extent that industrial development has formed the sheet-anchor of this policy, the industrial revolution has not succeeded in its objective;

(2) there has not been a sufficient increase in the volume of basic consumption goods to enable a rise in the common man's level of living;

(3) there has been some increase in the concentration of economic power alongside India's industrial growth. As regards inequality of incomes, India's industrial growth during the last ten years is being accompanied by the emergence of a mangerial and 'entrepreneurial' class that is comparatively well off.

Because of these features of our economic development Dr. Rao seemed to feel that it is not easy to go

in for industrial revolution and, at the same time, seek fulfilment of the social and economic objectives set out by the planners, at any rate within the short period. After pointing out the mistakes made and the lessons they hold out for the country in future, he remarked: "There is no doubt that advance is taking place in the industrial field, but it cannot be described as a planned advance either in the public or in the private sector, and the problems that this creates do no credit to the philosophy of planned development". He was, in fact, indignant that we have not yet learnt the lesson that our industrial experience of the last ten years contains in such rich abundance. He was sorry that we have not yet learnt either to assess the heavy price to be paid for industrialisation or to find remedies for reconciling it with our established social and value objectives. Hence his interesting speculation on what we can do to make our industrialisation more rapid and, at the same time, more suited to our social, economic and demographic circumstances. It was this process that prompted him to pose 'the haunting question': 'Can we find a way of reconciling material development with retention of human values and the creation of a classless and non-violent society"? In this context, he lamented the fact that "we do not yet have adequate public consciousness of the existence of these questions, let alone the heart-searching debate and public discussion that they require in a society that claims to be consciously setting out to plan its economic industrial development."

To pass on next to Dr. Rao's own contribution to a solution of these problems. Briefly, he made the following points: (1) the objective of industrial development needs formulation in terms of composition and volume of output more clearly and consistently with the broad social and value objectives of planning.

(2) There is need for improving the technique of planning; the planning must have a stronger technical base, a wider and more scientific and regional bias, and a more effective machinery of evaluation and implementation. There must also be public consciousness of the implications of frowning on individual and social behaviour, as well as the criteria of efficient performance. The country must go in for more well-informed and sustained debate on various technical aspects of development planning at all levels.

(3) The importance of investment in the human factor must be underlined; besides training in technical skills, this should induce work for the creation of a more scientific temper, a more rational approach, a sense of identification with the masses, a positive spirit of social justice and of human values, and an ultimate human motivation and action.

(4) There must be an employment orientation to our industrial development without either abandoning the criteria of efficiency or imparting the Gandhian views on technology.

Dr. Rao was not prepared to admit that all these would pre-suppose a volume of resources, which we do not just have, our resources being limited as they are and our capacity for mobilisation being even more so. According to him, what is necessary is a new outlook — a forward course without forsaking the original path, the path of spiritual tradition — in other words, material improvement combined with spiritual values. "The goal should be not just economic development but the creation of a good society." Stemming from this line of reasoning, Dr. Rao naturally wondered whether we have done the right thing in adopting for our ideal a phraseology that is foreign to the soil and has historical associations that link it with struggle, class war and material betterment". Would it not be better, he asked, if we gave a different name to our social ideology, so that, while it could retain its socialist context, it could also be conspicuously imbued with the spiritual values that constitute such a rich heritage from our Indian past? I do not know whether the learned lecturer was harking back to our "Sanathana Dharma", or thinking of the Swatantra Party's ideology, or merely was content to import the Gandhian values into the functioning and developing of our economic process. But, in any case, I wonder whether it has occurred to him that the inevitable corollary would have to be a minimum of interference by the State.

Business Notes

Coal

RELIEVING SHORTAGES

RELIEVING COAL shortages, particularly in western, northern and southern India, is undoubtedly going to prove a great headache for Mr. K. D. Malaviya, the new Union Minister for Mines and Fuel. It is proper, therefore, that immediately after taking up his new assignment, he should have turned his attention to this crucial task on the fulfilment of which depends not only the accelerated development of the industrial sector of the Indian economy, but also, to a fairly large extent, containment of the expanding spiral of prices. Indications are that Mr. Malaviya is feverishly thinking of measures to alleviate the distress caused by coal shortages and may come out very shortly with a well-thought out plan to solve the present industrial fuel crisis in the country.

The two-pronged attack which he intends to launch on this front consists of giving incentives in the form of small price increases for raising more coal, especially in what are called the outlying areas, and improving of the movement of coal from the collieries to the consuming centres. With Sardar Swaran Singh assuming the role of carrier of coal in place of producer of coal, after the recent Cabinet reshuffle, there may be some better co-ordination between the Ministries of Mines and Fuel and Railways. But how far Mr. Malaviya will be able to impress upon the Railway Board the pet thesis of his Ministry that it is not the production of coal that has caused the present crisis, but the bottlenecks on the railway system is yet to be seen. The Railway Board Chairman has been taking immense pains to bring home to all concerned that he has fulfilled the targets set for him for movement of coal and if he is called upon to exceed these targets, additional funds will have to be made available to him for augmenting the railways' capacity to move coal.

Whatever upward revision in the Plan target for coal movement capacity of railways takes place, it is clear without any doubt that it will help in relieving coal shortages only in the long run, say towards the end of the Third Plan period. In the short-term period, apparently, the solution to the acute bottlenecks in the way of coal movement lies in prevailing upon the coastal shippers and the road transport operators to undertake an additional burden of this traffic. Perhaps, this is the aspect of the coal transport problem that Mr. Malaviya is paying his attention to. It will be nothing short of a miracle if in the face of heavy odds, he is able to devise measures to improve coal move-

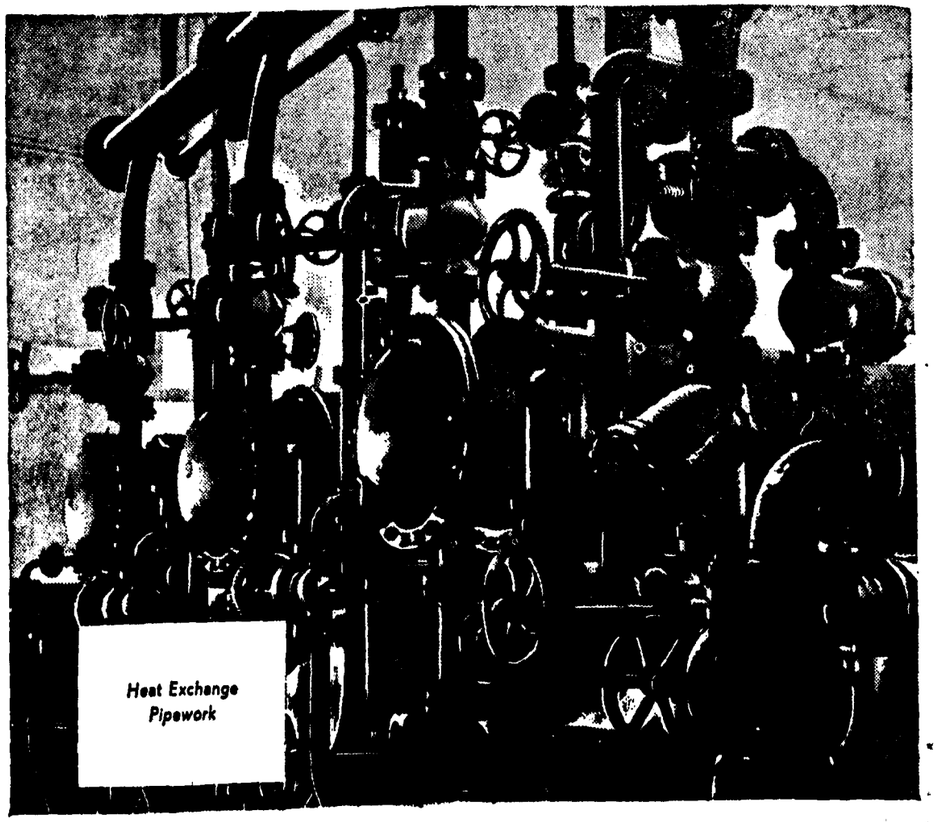
ment. One sure method of breaking the coal transport bottleneck, of course, is allowing, for a year or two, the export industries in western and southern India to import high-grade coal from the rupee payment countries. But this measure does not appear to have found favour with Mr. Malaviya, as with his predecessor Sardar Swaran Singh. No cogent reasons are put forth for the summary dismissal of this suggestion. Import of high-grade coal by export industries in western and southern India should not only help in allowing a breathing time for the railways to develop their capacity, but can also assist to no small extent in helping the cause of export promotion. The proposal requires to be given a serious thought, especially when a reorientation is evident in the policy of import of furnace oil as an alternative industrial fuel.

The contemplated increase in the Third Plan coal production target from 97 million tons to 104 million tons and allowing the private sector to have a greater share in this additional production (5.5 million tons, as against 1.5 million tons share of the public sector) is a welcome step. The private sector, with its long experience in the field, can be trusted to lend even a greater helping hand in the fulfilment of the task. It is appropriate that the National Coal Development Corporation's share in the Third Plan coal output target is being re-assessed to find out if any re-allocation of the targets between the private and the public sector is warranted. Mr. Malaviya should do well if he expedites the setting up of coal washeries as well. That will obviate the necessity of moving larger-than-warranted quantities of coal over long distances.

Engineering

INDUSTRY'S PROBLEMS AND REMEDIES

THE ENGINEERING industry in India has undoubtedly made remarkable progress during the last few years, considering, of course, the manifold problems it has had to contend with. It is to these problems and to their solutions that Mr. Deshpande, the Chairman of the Indian Engineering Association (Western Region), directed his address to the 13th Annual General Meeting of the I.E.A.



Mr. Deshpande first referred to the unfavourable balance of payments position which has been one of the basic problems of the country today. In this context, he pointed out how the high costs of engineering goods had been responsible for fewer exports. According to the I.E.A. Chairman, the second problem was the sacrifice of quality in order to have an increased production, to cope with the needs of an eager market. The industries were forced to relax their quality standards, he said, partly also because they had to depend on materials and components from the growing indigenous industry which was still passing through its teething troubles. He noted that it was not only the small-scale units in the private sector, but even the Government-owned steel plants had been relaxing their quality standards, with the result that there was an acute shortage of stocks of steel of particular qualities or types and specifications essential for the increasingly specialised work being undertaken by the engineering industry. Mr. Deshpande further referred to the uncertainties and shortages of supplies of foundry-grade pig iron and coke which aggravated the problems of the engineering industry throughout 1961. This had been a major cause for the loss in production, he observed. Transport shortage was another bugbear of the industry; this shortage had contributed to the disruption of operations in the industry by holding up for long and unpredictable periods supplies of raw materials and finished products at the point of production. To this long list, he had also to add the lack of adequate skilled and technical personnel which compelled the industry to make the maximum use of the limited technical manpower.

It is needless to say that all these factors had their impact on industrial costs, both direct and indirect. Direct costs increased due to high inventories, forcible use of expensive substitutes, both of materials and transport, high incidence of inspection and rejection of incoming supplies and frequently the compulsion to accept rework and upgrade inferior supplies or materials and components; indirect costs increased as a consequence of the wastage of production and distribution resources resulting from interrupted or inadequate material supplies, transport and power. The Chairman of I.E.A. was frank enough to admit that the problems besetting the industry arose out of the relatively poorly developed techniques of planning and administration, both in the private and in the public sector, vis-a-vis the conditions in the industrially advanced countries.

In order to combat these difficulties, the I.E.A. Committees of Calcutta and the Western Region advocated the greatest possible co-operation among all members of the Association throughout the country in particular and among all members of the engineering industry generally, as also the expansion and specialisation of services now available to members from the Association so as to make them avail themselves of expert advice and guidance in tackling the complex problems that they have been faced with. Mr. Deshpande claimed that these had already been tried out during the year in the Western Region and hoped that they would be developed further. Also he disclosed that the Association was considering the establishment of a Personnel Advisory Service for members on the lines of the Labour Advisory Service of the Association in Calcutta. Through this service and with the assistance of the Training Sub-Committee, the Association hopes to be able to achieve a measure of co-ordination of the extensive efforts of members as well as the Government and other public agencies.

PROBLEMS OF BOLT AND NUT MANUFACTURERS

AT THE second annual general meeting of the Indian Bolt and Nut Manufacturers' Association, Mr. K. L. Chowdhary, in his presidential address, dwelt at length on the various problems facing the bolt and nut industry. The grievance of the manufacturers is that the industry has not been taken proper care of in either of the two earlier Five-Year Plans and even in the Third Plan no schedule of regulated development has been drawn up. At present production of nuts and bolts in the country is approximately 60,000 tons from a capacity of over 1,50,000 tons. The Government estimates that the requirements of bolts and nuts in the country would be about 2,00,000 tons by the end of the Third Five-Year Plan and it is probably with this consideration in view that it has not restricted addition of further capacity in this highly congested industry which is at present having more than 60 per cent of its capacity lying idle. On the face of it, the Government's estimate of 2,00,000 tons of bolts and nuts by 1965-66 seems to be based on the requirements of the railway expansion and renovation programmes and other development activities that would be taken up in the Third Plan. Particularly when the demand in the Second Five-Year Plan did not rise beyond 70,000 tons although it was estimated to be 1,85,000, it seems difficult to understand on what basis the estimate of requirements of 2,00,000 tons of bolts and nuts has been arrived at. The plea of Mr. Chowdhary is that a permanent machinery be created to keep

This is an S & L pipework installation—
a part and parcel of the rapidly growing
Indian industry.

S & L undertake fabrication and installation
of the pipework, as well as the design
work entailed in the engineering of
piping systems. Our years of experience
gained on projects so far completed in India,
plus the extra attention that has
made S & L so well-known for quality and
dependability, assures you of complete
satisfaction.

ISSUE PRICE Rs. 99 PER CENT.

REDEEMABLE AT PAR ON THE 3RD MAY, 1972.

SUBSCRIPTIONS will be received in cash or by cheque. Applications will be received at the branches of the State Bank of India at Calcutta, Bombay, Madras, New Delhi, Patna, Lucknow, Hyderabad, Cuttack, Berhampur and Sambalpur from the 30th April, 1962 to 2nd May, 1962 both days inclusive.

ORISSA STATE ELECTRICITY BOARD BONDS, 1972

FOR Rs. 150 LAKHS

(PAYMENT OF INTEREST AND REPAYMENT OF PRINCIPAL GUARANTEED BY THE GOVERNMENT OF ORISSA)

The Bonds will be trustee securities under the Indian Trusts Act and also approved securities for the purposes of the Insurance Act and the Banking Companies Act.

Subscription may however, be closed earlier without notice if the total subscription is reached.

Copies of loan prospectus and application forms are available at all the offices of the State Bank of India mentioned above and at the office of the State Electricity Board, New Capital, Bhubaneswar.

watch over the development of industries like bolts and nuts whose growth in the previous years has been unfettered in the absence of some regulated policy. He also urged that there was an urgent need for a detailed survey of the industry from all angles.

In regard to production, the President was of the view that there are some sizes which are not being manufactured in sufficient qualities. Since there has been a changeover to metric system, Mr. Chowdhary underlined that bolts and nuts manufacturers should be supplied with inch sized limit bars so that the difficulties that come in the way to make inch sized bolts and nuts could be put an end to. The main difficulty in promoting modernisation/expansion has been the scarcity of foreign exchange. Keeping these things in view, the President has appealed that the Government should kindly give their favourable consideration to applications of some firms for import of new plants and machinery required for modernisation.

HIGHER OUTPUT OF MEDICAL APPLIANCES

THE MANUFACTURE of medical appliances and surgical instruments in the organised sector is likely to rise rapidly during the Third Five-Year Plan. It is envisaged that against an output of medical appliances and surgical instruments worth Rs. 14.7 lakhs during 1960-61, the output is likely to be worth Rs. 300 lakhs by 1965-66. Similarly, X-ray equipment output is also likely to expand from the production of Rs 10 lakhs in 1960-61 to nearly Rs. 200 lakhs by the end of the Third Plan. This increase in output has mostly been initiated for the reason that the country had so far been dependent on the imports of these items. Their requirements are now gradually to be met fully from indigenous sources and therefore their production capacity is being expanded in the public and private sectors during the Third Five-Year Plan.

At present there are six units in the organised sector for the manufacture of medical appliances and six additional units have been licensed. In addition to this, there are certain units operating in the small-scale sector too. It may, however, be added that the major contribution in this field is expected to be made by the Surgical Instrument Plant in the public sector proposed to be set up at Guindy near Madras. This plant will have a capacity of nearly 2.5 million pieces of various types of surgical instruments used for general surgery, ophthalmology, gynaecology and other branches of medicine. This project is being set up with assistance from the USSR Government and is expected to go into production during the period of the Plan. The cost is estimated to be around Rs. 2.7 crores.

As far as X-ray equipment is concerned, at present the requirements are met almost entirely by imports. The manufacture on organised scale is yet to be undertaken although some firms have been producing some types of X-ray equipment on small scale in smaller units. In view of the rising needs of electro-medical equipments, the manufacture of X-ray equipment is being planned and six units have been licensed which will have a capacity of nearly Rs. 30 lakhs worth of equipment every year. The range of equipment that will be produced is expected to cover almost all types of equipment required by hospitals and medical practitioners, though there still will remain certain specialised items which will have to be developed later. With the implementation of the new schemes, it is hoped that almost all the estimated requirements for X-ray and electro-medical equipment would be met. These schemes are likely to bring about a saving in terms of foreign exchange which will be quite substantial and gradually these items would be produced at competitive rates.

Tea

THE PLANTERS' VIEW

MR. P. B. SINHA, Chairman of the Indian Tea Planters' Association, at the annual general meeting held recently, outlined the strains borne by the industry in the foreign market. Undoubtedly, tea as the biggest earner of foreign exchange, has very important role to play in the country's economy. It is all the more necessary that sufficient attention is paid to the problems the industry faces in the foreign market. Mr. Guha indicated that the expanding output of tea was creating certain problems for the planters because they found it hard to dispose it of at competitive rates. Production of tea in India in 1961 rose to a record figure of 350 million kilograms against 320 million kilograms in 1960. This increased output, when seen in the context of world supply and absorption, gives the idea of the extent of over-production. The table below gives the figures for world supply and absorption and naturally the surplus of tea. It seems that in 1960 the surplus was nearly 37 million kilograms. The world output in 1961 was nearly 668 million kilograms — about 43 million kilograms more than in 1960. Mr. Guha pointed out that, considering the trend of absorption indicated in the previous years, it may be assumed that, after allowing for an increased absorption of 12 million kilograms of tea in 1961, the accumulated balance would be in the neighbourhood of 68 million kilograms which is rather too high. Perhaps, this has resulted in the downtrend in prices at Calcutta tea sales. It may, however, be added that in the world production in 1961, which was 43 million kilograms more than 1960, India's contribution was to the extent of 30 million kilograms. Naturally the Indian tea had to bear the brunt that acompanies over-production.

Mr. P. B. Guha indicated that Indian tea has to pay an export duty of 44 nP. per kilogram which yielded in 1959-60 an amount of Rs. 12.29 crores. This, he indicated, was more than 75 per cent of the total export duty earned by the exported goods. It is apparent that this export duty definitely is a handicap for a commodity which has to meet competition in the external market. It seems this burden on the tea industry was considered by the Finance Minister who has proposed a cut in the export duty from 44 nP. per kilogram to 25 nP. per kilogram. It is hoped the industry will be able to face the market from a competitive position of strength.

WORLD TEA STATISTICS

(Quantities in Million Kilograms)

Year	World Supply (Production and Export)	World Absorption	Excess Supply over Absorption	Cumulative Balance from 1946
1958	.. 692	694	—2	+30
1959	.. 700	694	+6	+36
1960	.. 720*	701	+1	+37

* Production 624.5 million Kgs. only.

Dunlop Rubber

CONTINUED PROGRESS AND STABLE CONDITIONS

IT SPEAKS well of the Dunlop Rubber Co. (India) Limited, that on account of its sound management, right plans and efficient working, net profit available for disposal this year was higher than last year by approximately Rs. 41 lakhs. Since compulsory transfer to Development Rebate Reserve has decreased by Rs. 9,50,000 this gives an overll increase of approximately Rs. 5,50,000 of profits for disposal. With all this additional amount, it is proposed that Rs. 25,50,000 be allocated to the shareholders, and the balance be retained as profits with the company. The dividend for 1961 is 20 per cent subject to tax on the ordinary share capital as increased by the recent Bonus Issue.

The demand for the Dunlop Rubber Company's goods has been at a high level and in the case of certain products it has continued to exceed company's manufacturing capacity. This has been particularly so in the case of Dunlopillo. Sale of cycles tyres and tubes has increased in the domestic market during the period under review. In the industrial rubber products field, company's conveyor belting expansion has been completed. The demand for industrial and other types of hoses has also been very satisfactory. All this was vividly revealed in the speech made at the 36th annual general meeting by Mr. M. L. Bexon, Managing Director of the company, who dwelt on various aspects of the company's activities.

So far as exports are concerned, it is heartening to note that company's cycle tyre exports in 1961 were 17 per cent higher than in 1960 and in the first quarter of this year overall exports were running at a level over 50 per cent higher than the same period in 1961. Expansion plans of course, are well under way. A licence to manufacture PVC belting has been obtained and small expansions at the factories are being carried out. This progress is visible all-round and further march has been made towards producing indigenously various raw materials used by the company as well. On the employer-employee relations front, things have been equally satisfactory and it is this sound base which has led the company to go ahead with its plans.

Keeping in view the previous progress, it can be safely concluded that the future prospects for the company are immensely bright. Rapid industrialisation and increasing demand is likely to give a further impetus to the company's production potentialities. No doubt the Dunlop Rubber Co. (India) Ltd. has contributed a good deal in the manufacturing processes of rubber products and is likely to play still an effective role in the years ahead.

Travancore Rayons

EXPANSION SCHEMES PROGRESSING WELL

THE PLEA made by Mr. A. R. Ramanathan at the sixteenth annual general meeting of the Travancore Rayons Limited for some relief on excise duty on rayon yarn seems to have had no hearing with the Ministry of Finance as in the Budget levy on unprocessed rayon has been raised. While Mr. Morarji Desai has his own reasons to advance for this rise in the levy, the Travancore Rayons certainly would not feel happy about it. Mr. Ramanathan had revealed in his speech that this rise in excise duty on rayon yarn in the 1961 budget was mainly responsible for not bringing about further increase in profits. If this would have been reduced, probably the profits of the Travancore Rayons Limited would have been much greater. The hope of obtaining now an increase in profits can certainly be laid to rest.

It, of course, is to be recognized that the rayon industry has achieved a notable success in the short span of a decade. Its annual output has increased from 5 million lbs. in 1950 to 45 million lbs. now and profit has been to the tune of Rs. 61.93 lakhs in 1961. As a result of this production, saving in foreign exchange has been to the tune of about Rs. 28 crores so far and this certainly is by no means a mean achievement. In regard to expansion schemes, Mr. Ramanathan pointed out that the company holds an industrial development licence for expansion of its rayon production capacity by another 5 tons per day which will raise the total rayon production to 13.6 tons per day. This expansion is expected to cost the company about Rs. 3.5 crores which will be met partly by issue of right shares and partly from long-term borrowings. The erection of cotton linter plant is going on according to schedule and it is heartening to note that the Travancore Rayons will be the first rayon plant to manufacture rayon graded pulp in India. The capacity will be 10 tons per day initially. The production is expected to start by October-November this year.

On the whole it can be said that the Travancore Rayons has so far had a fair career. Its management is trying its best to improve the factory efficiency, processes and technology and the quality of its products. Given a reasonable luck, it may make a good advance on the export front in the Far Eastern and the Middle Eastern markets.

AB-21

FROM THE CAPITAL'S CORRIDORS

NEW CENTRAL TAXES

PRESENTING the Union Government's Budget for 1962-63 in the Lok Sabha on April 23, the Finance Minister, Mr. Morarji Desai, estimated the revenue receipts at the existing level of taxation at Rs. 1,320.87 crores and expenditure at Rs. 1,381.65 crores. This shows a revenue deficit of Rs. 60.78 crores, as against a deficit of Rs. 63.46 crores estimated at the time of presenting of Interim Budget in February last. The deficit on revenue account would have gone up from the Rs. 63.46 crores estimate of last month to Rs. 75.78 crores owing to some new provisions made for expanditure (of Rs. 7.38 crores for meeting the increased burden of dearness allowance payable to the Union Government employees under the recent decision of the Government, of Rs. 1 crore for export promotion, of Rs. 25 lakhs for subsidy to the railways for transporting imported furnace oil from various ports to the consuming centres in South and West India, of Rs. 99 lakhs additional for the revised estimates for the purchase of stores and equipment required by the Survey of India and of Rs. 2.7 crores on account of the decision to revise the pay scales of the Services Officers with retrospective effect from April 1, 1960), but a transfer of Rs. 15 crores from the suspense head to revenue receipts counterbalances all this and brings down the revenue deficit estimated in February by Rs. 2.68 crores. The overall deficit (including the deficit on capital account) is now estimated at Rs. 150 crores, as against Rs. 147 crores anticipated on the basis of the last month's estimates.

To cover the deficit on revenue account fully, the Finance Minister proposed various new taxes, which after counterbalancing the loss to the Central Exchequer through some concessions in customs duties given for export promotion, will bring in a net sum of Rs. 68.88 crores during the remaining days of the current financial year and Rs. 71.7 crores in a full year. The revenue of the Central Government during the current year will go up by Rs. 60.80 crores, the remaining amount of Rs. 8.08 crores will go to the State Governments under the scheme of devolution of Central financial receipts.

The following are the taxation proposals put forth by Mr. Morarji Desai:

DIRECT TAXES

(1) The rate of tax on Indian Companies is proposed to be increased from 45 per cent to 50 per cent. The rate of tax on foreign companies will, however, continue at 63 per cent generally. For this purpose, the rate of income-tax applicable to all companies is to be raised from 20 to 25 per cent, the rates of super-tax being suitably adjusted. Earnings from exports will be excluded from this increase.

(2) With a view to avoid double taxation of profits of some companies which pay dividends to others, some reduction is to be made in inter-corporate taxation. In the case of Indian Companies, the rate, including super-tax, applicable to dividends received from Indian subsidiaries registered before April, 1961, will continue at 30 per cent, while that on dividends received from all other companies will be reduced to 35 per cent. Indian companies in which the public is substantially interested and whose income does not exceed Rs. 25,000, will continue to get a further concession of 5 per cent. In the case of foreign companies which have not made the prescribed arrangements for the declaration and payment of dividends within India, the rate applicable to dividends received from Indian subsidiaries will continue at 30 per cent. On dividends received from a non-subsidiary Indian company registered before April, 1959, it will be reduced from 63 per cent to 50 per cent, while on dividends received from other Indian companies, it will be reduced from 40 per cent to 35 per cent.

(3) The schedule of admissible entertainment expenses is to be tightened mainly as a measure of restraint.

(4) The schedule of rates of income-tax and super-tax on individuals, Hindu undivided families and registered firms is to be revised. The rate at the highest slab will be 72.5 per cent (exclusive of the surcharges), while rate on incomes below Rs. 5,000 per month will remain unchanged. The intermediate slabs are to be suitably adjusted to secure an even increase in rates.

(5) A reduction is proposed in the surcharge on income-tax on salaries including pensions. This will be from 5 per cent to 2.5 per cent. The other surcharges will remain unchanged. The rate at the highest slab inclusive of surcharges will be 87 per cent.

(6) The exemption limit for Provident Fund contributions and insurance premia is to be raised to Rs. 10,000.

(7) It is proposed to liberalise and widen the Cumulative Time Deposit Scheme with the benefit of income-tax exemption which can be taken advantage of by self-employed and uninsurable persons.

(8) It is also proposed to revise the structure of rates of tax on registered firms by reducing the limit for exemption, revising the number of slabs and the rates of tax and having higher rates for firms with five or more partners.

(9) With a view to secure broad equity in the treatment of different categories of Capital Gains Tax payers, it is proposed that gains which result from disposal of capital assets within a period of one year from the date of acquisition should be made subject to income-tax and super-tax like other ordinary incomes. Capital gains for assessees other than Companies from assets held over a period longer than one year will be subject to income-tax at the rate of 25 per cent or at the rate applicable as if they were short-term gains, whichever is less. Long-term capital gains of companies will continue to be taxed at 30 per cent.

(10) The five-year old Expenditure Tax is proposed to be suspended with effect from the current year.

(11) Wealth Tax rates are proposed to be raised by 0.25 per cent and 0.5 per cent on the two highest slabs. The slab structure is to be revised a little. Also, it is proposed to discontinue the exemption on shares held in new companies during the first five years allowed at present under the Act.

INDIRECT TAXES

(1) The rates of excise duty on unmanufactured tobacco and cigarettes are to be revised, yielding a revenue of Rs. 5.28 crores in a full year.

(2) It is also proposed to revise the general structure of duty on cotton cloth and yarn. The yarn rates will be so revised that there is a slight progression in the incidence of tax according to the quality of cloth, maintaining the present duty on coarse yarn. It is also proposed to step up the duty on processing of cloth, keeping in view the improvement in quality and price of cloth as a result of processing. To ensure that the common man has not to make anything more than a marginal adjustment in his cloth bill on coarse and medium varieties which he uses, it is proposed to reduce the duty on grey unbleached cotton fabrics. It is also proposed to place units with 50 or more powerlooms on the same footing as composite mills. Rates of compounded levy on powerloom units with looms from 5 to 49 will also be increased so as to graduate the increase in benefit with the reduction in size and to

reduce the incentive for splitting of units. Units employing 4 looms or less will be exempt.

(3) The duty on match boxes each containing 50 sticks has been revised in order to wipe out an unintended margin made by a retail dealer by selling a box at 6 nP.

(4) It is proposed to convert the duty on unprocessed woollen, rayon and art silk fabrics to a duty on yarn and processing so as to release the powerlooms from excise control. The loss in revenue will be made good partly by an increase in duty on yarn and partly by a duty on processed fabrics.

(5) With a widening of the definition of patent and proprietary medicines, it is proposed to reduce the incidence of tax on them from 10 to 7.5 per cent and also exempt totally certain highly essential drugs.

(6) Coal-tar burnt in furnaces of plants producing it will be exempt. It is proposed to revise some of the exemptions which have either outlived their utility or have been found to be open to abuse. The procedure for duty on copper and other alloys is to be simplified for the convenience of smaller manufacturers.

(7) The duty on aluminium foils is to be increased by Rs. 100 per tonne in order to discourage its internal consumption.

(8) In order to encourage the export of tea, the duty on loose tea is to be increased by 5 to 10 nP. per kilogram. A rebate of 15 nP. per kilogram will be given for its export.

(9) Excise duty is proposed to be levied on nine new items. These are jute manufactures (Rs. 250 per tonne duty on hessian and Rs. 125 per ton on all others), certain iron and steel products (ad valorem duty of 5 to 7.5 per cent), electric cables and wires (a duty of 5 to 15 per cent ad valorem), certain specific acids and gases (10 to 50 per cent ad valorem levy), plywood (10 to 15 per cent duty), asbestos cement products (10 per cent ad valorem duty), tread rubber and latex foam sponge (20 per cent ad valorem duty), gramophones, gramophone parts and accessories and gramophone records (15 to 30 per cent ad valorem duty) and mineral oils and mineral oil products not otherwise specified (5 per cent ad valorem levy).

(10) In the field of Customs, duty is proposed to be increased on six items. Import duties on certain iron and steel items and on art silk yarn will be increased by 5 per cent. A 25 per cent duty is to be levied on stainless steel plates and sheets and rods and bars. The notified rates on copra are to be increased to 25 and 15 per cent. (These will still be well within the ceilings). The duty on certain types of tools excluding machine tools and agricultural implements will be increased from 35 per cent to 50 per cent. Duties on a few other items will be rationalised.

(11) The rate of import duty on cars is to be raised from 100 to 150 per cent. The specific duty of Rs. 6,000 is, however, being done away with so as not to discourage the import of small or used cars in genuine cases.

EXPORT INCENTIVES

Export duty on tea is to be reduced from 44 nP. to 25 nP. per kilogram. Along with this a refund of 15 nP. per kilogram is to be given in the excise duty on tea (referred to above).

Direct tax proposed will yield a net additional revenue of Rs. 27.2 crores in a full year. The indirect taxes will yield a net amount of Rs. 44.5 crores in a full year. The effect of the new proposals during the current year will be to the extent of 93.7 per cent.

Union excise duties will not impinge on export costs since it is proposed to give a consolidated refund of excise duties paid on the material and intermediates used in the process of manufacture.

RAILWAY FARES AND FREIGHTS TO BE RAISED

Some increases in railway freights and fares have also been indicated in the Railway Budget for 1962-63 presented to Parliament by the Railway Minister, Sardar Swaran Singh, on April 19.

The proposal is to enhance the basic freight rate for all goods traffic, excepting railway materials, postal, military and export manganese ore traffic, by 50 nP. per tonne carried up to 40 kilometres and by rupee one per tonne beyond 80 kilometres, with suitable adjustments for intervening distances. For foodgrains, however, the increase of rupee one per tonne will apply only beyond 160 kilometres. The existing supplementary charge of 5 per cent would continue to be levied, in addition, as hitherto.

Passenger fares in the First Class are proposed to be increased approximately by 15 per cent and in Second and Third classes by a little below 10 per cent. For season ticket fares, the increase will be only five per cent. This lower rate of increase in designed to afford relief to a large section of office and industrial workers as much as possible.

The new rates and fares are proposed to be introduced from July 1, 1962.

LICENSING UNDER INDUSTRIES ACT: LISTS REVISED

The Union Ministry of Commerce and Industry has announced a revised list of 178 industries in respect of which applications for licences under the Industries (Development and Regulation) Act, 1951, will ordinarily be rejected without reference to the Licensing Committee.

Simultaneously, another list of 19 industries in respect of which licences under the Industries Act will ordinarily be granted without reference to the Licensing Committee has also been published.

Both the lists will be in force till September 30, 1962.

The list of industries where applications may be ordinarily rejected consists of 74 engineering and 104 non-engineering items. The engineering industries are: Agricultural Implements; Agricultural Tractors; Aluminium sheets, circles, extruded rods, sections, foils; Antimony; Automobile leaf-springs; Barbed wire; Bare copper conductors; Bare copper strips; Bicycles and bicycle parts except steel balls; Bifurcated rivets; Bolts, nuts and rivets; Brass and copper, extruded pipes, tubes, rods, sections, sheets and circles; Calculating machines; Car lifts; C.I. spun pipes; Chaff cutter blades; Circles, sheets, rods and utensils of stainless steel; Collapsible tubes and rigid containers; Commercial vehicles; Conduit pipes; Virgin copper and wire for non-electrical purposes; Cotton and hair belting; Crawler tractors; Domestic refrigerators; Domestic utensils; Drums and barrels and tin containers excepting those for manufacturers' own requirements; Dry batteries; Electric fans; Electric lamps—Photoflash bulbs; Expanded metal; Ferro-manganese; Flash light and Torch containers; Fluorescent tubes; Hurricane lanterns; Jeeps and station wagons; Kerbside petrol pumps; Virgin Lead; Mercury vapour and other gaseous discharge lamps; Meters—Single and Polyphase; Miniature lamps (excluding auto head lamps and sealed beam lamps); Motor cycles, scooters; Non-ferrous alloys; Paper capacitors—(a) for fans, fractional horse-power motors and lighting fittings and (b) for power factor correction; Paper insulated power cables; Paper making plants—large and small scale, including wirecloth for paper machinery; Passenger cars; Power driven pumps; Radio receivers and P.A. equipments (except components); Razor blades; Refrigeration plants for industrial use; Railway mechanical signalling equipment; Rolling shutters; Room air-conditioners; Rubber ply transmission belting;

—ALL 6,276 OF THEM

From the two full rated captains in every PIA jet cabin to the men that look after the 'planes with such loving attention to detail, they all believe in the job they are doing. The job is getting you there *comfortably—on schedule.*

PIA have marked up an unmatched record for punctuality, and people write nice letters about the service. That's why last year PIA carried more passengers (63% more) and showed a higher profit (41% higher) than ever before. Whether you want to fly to Rome or New York, London or Geneva, there are 6,276 people making sure that you get there *comfortably—on schedule.* They're great people to fly with.

Solvent extraction plant; Spark plugs; Saws of all types; Steel pipes and tubes; Steel doors and windows; Storage batteries; Stranded wire; Sugar machinery (except milling plant and centrifugals); Tea processing machinery; Tungsten carbide tips and intermediatories thereof; Valves—Tyre and tube; V.I.R. and P.V.C. Cables; Washing machines; Water coolers; Welded wire mesh; Wire nails; Wire ropes; Wood screws; Zinc; Zinc sheets and strips.

The non-engineering industries are: Abrasive grains; Acetic acid; Activated bleaching earth; Alcohol —Power and Industrial; Asbestos cement sheets and pipes; Azo dyes; Basic dyes; Beer; Beta-Naphthylamine; B.H.C.; Bichromates; Bottles and vials; Camphor; Calcium carbide except for captive use; Calcium Carbonate (Precipitated and activated); Carbon black; Caustic soda except for captive use; Carboxy Mithyle Cellulose; Cashew kernels; Cellulose film (Cellophane); Cholorine; Chip board; Citric acid; Copper sulphate; Cotton mesh fabrics; D.D.T.; Detonators; Dextrose powder; Drugs and pharmaceuticals, viz.: Antibiotics — Penicillin, streptomycin and tetracycline, Bismuth salts, Chloral hydrate, Cough Syrup, Derivatives of 8-Hydroxy Quinoline, Emptry hard celatine capsules, P.A.S. acid and salts, Salicylic acid—Sodium salicyclate, Acetyle, Salicylic acid, Sulpha drugs, Surgical adhesive Tapes, Synthetic hormones, Vitamin A and Vitamin C; East Indian Tanned (semi-tanned), Kips and Skins; Fast colour bases; Fibre board/hard board; Fire-works and paper caps; Formaldehyde; Gelatine; Glass, Mineral wool and allied products; Glass tubes (hand-made), sheet-glass, wire/figured other than rolled glass; Glazed tiles; Graphite electrodes; Hollow ware (semi-automatic) (Glass); Hydrogen Peroxide; Liquid glucose; Liquefied fractions by processing gas; Match; Menthol; Methanol; Myrobolan extract; Napthols; Newsprint; Nitric acid; Nitro compounds; Organic pigments; Paper and paper board (applications from small units will be considered on merits); Pesticidal formulations; P.F. Moulding powder; Phenol; Photographic raw film and paper; Phthalic Anhydride; Polystyrene; Polythelene; Polyvinyl acetate; Potassium chlorate; P.V.C. resins/composition; Pulp including rayon grade pulp; Rayon staple fibre; Rayon tyre cord; Reclaimed rubber; Rolled figured wired glass; Safety fuse; Sanitary-ware; Security paper; Shoddy yarn (woollen); Silicon carbide; Soap; Sulphuric acid; Sulphur black; Sulphur dioxide; Sulphur dyes—others; Super phosphate; Synthetic resins; Synthetic rubber (SBR Type); Table and Pressed ware (Glass); Titanium dioxide; Tyres and tubes—Automobile; U.F. Moulding powder; U.F. Resin adhesives; Vat dyes; Vegetable oil other than Cotton Seed Oil; Vanaspati; Vacuum flask; Zinc oxide; Woollen yarn; Worsted yarn; Woollen worsted cloth; Wool tops; Soda ash; Sodium Hydrosulphite derivatives; Sodium sulphite, bi-sulphite and sulphide; Sodium thiosulphate; Sodium aluminate; Textiles made of art silk; Vacuum brake hoses; Water proof hoses and Wide hessian gunny bags and webbing.

INDUSTRIES TO BE LICENSED

The second list, in respect of which licences may ordinarily be granted, includes 14 engineering and 5 non-engineering industries. Only letters of intent, and not actual licences, would be issued in those cases requiring foreign exchange in excess of Rs. 10 lakhs.

The engineering industries listed are: Boilers; Boats and crafts (fishing); Brazing tips; Conveyors; E.O.T. and Wharf Cranes; Fabricated Structures — Heavy; Gear Industry; Hand tools and small tools excluding twist drills, steel files and forged tools but including precision tools like plug-gauges, angle plates, etc.; Machine tools—all types; Structural ropeways; Sluice gates and gearings; Water meters; Winches; and Industrial machinery (not otherwise specified).

The non-engineering industries are: Cotton Seed Oil; Crockery (not requiring foreign exchange); Finished Leather; Stoneware Pipes (not requiring foreign exchange) and Solvent extraction of oil cakes and rice bran.

COCHIN SHIPYARD

A third British firm of consulting engineers, Sir Bruce White, Wolfe Barry and Partners (India) Limited, is tendering for the Second Shipyard, to be located at Cochin, it is learnt.

The economics of the second Ship-building Yard are being worked out to the extent possible with the available data from the existing shipyard. The economics will, however, have to be gone into more thoroughly when the technical consultants, who are expected to be appointed shortly, have submitted the detailed project report.

The technical consultants will also be asked to design the shipyard so as to incorporate the latest techniques and facilities for hull construction.

The technical consultants will in addition prepare an estimate of the requirements of the yard in regard to the training of supervisory personnel and will also advise on the steps to be taken for their training.

Steps are also being taken to train a certain number of skilled workers at the Training School at the Hindustan Shipyard, Visakhapatnam. A scheme to train some more persons coming out of the Industrial Technical Institutes in Kerala, in some industries similar to shipbuilding, is also receiving attention.

TARAPOREWALA ATOMIC POWER STATION

As already reported in this column, the American and the French interests are running neck to neck in their bid to secure the contract for setting up the atomic power station at Taraporewala to cater to the power requirements of industries on the west coast of India. The U.S. interests, it is learnt, have offered to supply the plant at the same price at which they would make available one to any authority in the United States. The U.S. price, thus, will include freight, insurance, landing charges etc.

While considering the proposal of the U.S. interests, the Government of India, however, has to take into consideration the recurring cost of the essential raw material required for such power stations, namely, uranium. Unlike the power station which can be set up with French collaboration, the American plant would require enriched uranium which is not produced in India and which will have to be imported for a considerably long time to come. Thus, as against the cheaper quotation for the U.S. equipment, the atomic power station if agreed to be set up with U.S. collaboration would entail a yearly drain on the foreign exchange resources of the country. The Government's decision, it is understood, will be taken only after examining all the relevant factors, including the above two, in detail.

MARINE DIESEL ENGINES

The Government of India proposes to import 250 to 300 marine diesel engines from Japan to meet the urgent requirements of various States for implementing their programmes of mechanisation of fishing craft. A sum of Rs. 30 lakhs has been allocated for this purpose out of the yen credit being made available by Japan as a member of the Aid-India Club. The imports will take place through the State Trading Corporation.

Meanwhile, the Union Ministry of Steel and Heavy Industries is processing a proposal to set up a marine diesel engine manufacturing factory in the country. A Committee has already examined what items are most suitable for indigenous production, having regard to the potential demand. The Government, it is stated, will encourage production of such items in the country.

NATIONALISATION OF PRIVATE-OWNED RAILWAYS

The Government of India does not propose to nationalise the Shahdara-Saharanpur Light Railway in the immediate future, it is learnt. The Government

policy regarding nationalisation of branch line railways still run by private firms is stated to be that in order to create additional rail transport capacity in the country, all available resources are to be concentrated on creating new assets under the Plan rather than on utilizing them for acquisition of the already existing assets; no light railway at present run by private firms is, thus, to be purchased unless it becomes absolutely necessary. Every individual case of nationalisation of a privately-owned branch line railway is considered carefully by the Government as and when the option in respect of its taking over by the State comes up.

The following are the nine branch line railways in the country still being operated by the private sector: (1) Bankura - Damodar River Railway; (2) Ahmedpur - Katwa Railway; (3) Burdwan - Katwa Railway; (4) Futwa - Islampur Light Railway; (5) Shahdara-Saharanpur Light Railway; (6) Arrah - Sasaram Light Railway; (7) Dehri - Rohtas Light Railway; (8) Howrah-Amta Light Railway and (9) Howrah - Sheakhala Light Railway.

MANUFACTURE OF TRACTORS

The collaboration arrangements between the French firm Renault and an Indian firm to set up near Delhi a plant to manufacture 3,500 tractors a year, using Perkins 35 H.P. diesel engines (already being produced in India) have been finalised. The French firm will not only provide the technical know-how, but shall also arrange for training of Indian engineers in France. Setting up of a training centre in India is also envisaged under the collaboration agreement understood to have been finalised.

In the initial stages, the Indian company has undertaken to export $2 million worth of goods from this country (included in them are jute, vegetable oils, sewing machines and bicycles) to meet its foreign exchange requirements. It is hoped that by the fourth year of its working, the new unit will be able to produce indigenously 90 per cent of the components required for its tractor manufacturing programme.

EXPORT OF HMT MACHINES TO SWITZERLAND

The Hindustan Machine Tools Limited has booked export orders from Switzerland for supplies of machines worth over a million Swiss francs. The booking has been made by Messrs. Oerlikons of Switzerland who collaborated with HMT in building the company's Bangalore factory. The orders consist of lathes of Oerlikon design built by HMT in India.

This booking is in addition to the export orders which HMT has been receiving from West Germany since last year for the supply of milling machines.

The Hindustan Machine Tools Limited, it may be recalled, had given an undertaking to the Government that it would be making good the entire foreign exchange required for its expansion programme, particularly in respect of setting up its third unit in Punjab, by way of exporting machines.

EXPORT OF ART SILK FABRICS

As a measure of export promotion, the Government of India has decided that art silk fabrics which are exported by post-parcels would also qualify for export incentives, subject to the condition that such exports are effected after complying with the existing pre-inspection procedure prescribed by the Textile Commissioner as well as the drawback procedure prescribed by the Central Board of Revenue for grant of rebate of customs duty on the imported yarn content in the fabrics and the excise duty on the indigenously manufactured fabrics. Exports made on or after April 1, 1962, will qualify for export incentives.

In order to assist the export of ready-made garments, it has been decided that the existing import entitlement of 15 per cent for dyes, chemicals etc., may be increased to 25 per cent. With the increase in the entitlement to 25 per cent, the raw cotton entitlement, which was previously in force, will be withdrawn. These changes will apply to all exports made on or after April 1, 1962.

RURAL INDUSTRIES PLANNING COMMITTEE

The Government of India has decided to constitute a Rural Industries Planning Committee which will review the progress of industries in rural areas, advise on problems of policy and planning relating to them and recommend programmes for the intensive development of village and small industries in the countryside, including co-ordinated area and regional plans of development and pilot projects.

The Committee will consist of Mr. G. L. Nanda, Deputy Chairman, Planning Commission; Mr. K. C. Reddy, Minister of Commerce and Industry; Mr. Nityanand Kanungo, Minister of Industry; Mr. S. K. Dey, Minister of Community Development, Panchayati Raj and Co-operation; Mr. Shriman Narayan, Member, Planning Commission; Mr. T. N. Singh, Member, Planning Commission; Mr. V. L. Mehta, Chairman, Khadi and Village Industries Commission; Mr. Shankarrao Deo; Mr. Jayaprakash Narayan; Prof. D. R. Gadgil, Director, Gokhale Institute of Politics and Economics, Poona; Mrs. Kamladevi Chattopadhyay, Chairman, All India Handicrafts Board; Mr. Dwaja Prasad; Mr. Krishnadas Gandhi and Dr. D. K. Malhotra (Member-Secretary).

SMALL-SCALE INDUSTRIES STUDY TEAM

The Union Ministry of Commerce and Industry has, through the courtesy of the Ford Foundation, invited an International Perspective Planning Study Team for Small-Scale Industries. It consists of the following six economists and planners from the United States and European countries: (1) Mr. Hans Gru dstroem, Sweden (Team Leader); (2) Mr. Morris Budin, Economist-Statistician, U.S.A.; (3) Mr. Anders Barfil Ejerhed, Engineer and Institute Head, Sweden; (4) Mr. Winfield B. Heinz, Engineer and Operations Research, U.S.A.; (5) Mr. H. Edwin Robinson, Economist, U.S.A.; (6) Mr. Morris J. Solomon, Economist and Statistician, U.S.A..

The Team began its work on April 16. It will stay in the country for a period of 4 to 6 weeks. Its study is expected to include a broad review of the existing programme of development of Small-Scale Industries and determination of some analytical, statistical and engineering approaches in regard to efficiencies of sale, management and engineering abilities in various small industries, as well as indication of new directions of development on a long-term basis, keeping in view the future planned economic growth in India.

RAISING PER CAPITA INCOME

The Seminar on "The Paths of Planned Economy in India" has set up a working group "to define the minimum level of income, and to fix a definite period within which every attempt should be made to secure this minimum income for all the households in the country." The Seminar considered it necessary that among the objectives of planning, the first priority should be given to the securing of a national minimum of basic consumption goods and social amenities for all the households in the country.

The Working Group consists of Prof. D. R. Gadgil, Prof. B. N. Ganguli, Prof. D. Ghosh, Prof. P. S. Lokanathan, Mr. M. R. Masani, Mr. Ashoka Mehta, Mr. Shriman Narayan, Mr. Pitambar Pant, and Prof. V.K.R.V. Rao.

Prof. V. K. R. V. Rao will be the convener of this Working Group. The Working Group has been request-

a helping hand...

As far back as 1921, Tata Steel established a Technical Institute in Jamshedpur to develop a cadre of fully qualified technical personnel to take up positions of responsibility in India's first steel works. Subsequently, the Company instituted training courses for skilled artisans and other categories of employees.

During the last four years, the Jamshedpur Technical Institute has planned and provided special training programmes to meet the urgent needs of Hindustan Steel. Over 1,800 technicians from the Government steel plants at Rourkela, Bhilai and Durgapur have availed themselves of the accumulated training experience and facilities placed at their disposal by Jamshedpur, where industry is not merely a source of livelihood but a way of life.

ed to complete its report by the end of September this year.

JAPANESE AID FOR AGRICULTURAL AND FISHERIES DEVELOPMENT

Two agreements have been signed between the Governments of India and Japan for the establishment of four Agricultural Demonstration Farms to be run on the Japanese methods of paddy cultivation and one Marine Products Processing Training Centre to introduce in India the technological advances made by the Japanese fish processing industry.

The four Agricultural Demonstration Farms are to be set up at Nadia (West Bengal) on an area of 25 acres, at Sambalpur (Orissa) on an area of 12 acres, at Shahbad (Bihar) on an area of 10 acres and at Surat (Gujarat) on an area of 12 acres. If they prove successful in stepping up rice yields in India, which are anticipated to go up to nearly four times the present average, a number of similar farms may be set up in the other rice-producing areas of the country.

Sixteen Japanese technicians to man these farms are expected to arrive here some time next month. The services of these farm technicians will be provided free of charge by the Japanese Government and they will bring with them Japanese agricultural machinery, equipment and tools of 90 different varieties for each farm. Besides machinery and equipment, the Japanese Government will be making available for the initial period of farming some other materials as well such as pesticides and fertilizers. Tools and implements for meteorological surveys and some vehicles are also proposed to be supplied by the Japanese Government under this aid programme. The Government of India on its part will provide the necessary land and buildings for the farms, accommodation for the Japanese technicians and the running expenses for the operation of these farms. This agreement will be valid for a period of three years. The Japanese technicians will be here for the whole of this period.

The setting up of the proposed farms in India will be the first experience of its kind for Japan, which during the post-war period has made rapid strides in her agricultural development programme under the stress of deficiency of indigenous food. Today Japan is nearly self-sufficient in its food supplies from indigenous sources. The Government of India, it appears, has been prompted to go in for this agreement, owing to the success achieved by four young Japanese farmers on a demonstration farm which they have been running at Saharanpur for the last few years. This year these farmers have been able to raise on this farm three rice crops instead of one as had been the case previously. The Japanese Government feels that it can make a significant contribution to the agricultural development of India through these demonstration farms.

The agreement on fisheries development envisages the setting up of a Marine Products Processing Training Centre at Mangalore, in Mysore State. The Government of Japan will make available under this agreement services of seven experts to man this centre and will also provide 90 different varieties of machinery, equipment and tools for operating it. The Government of India on its part will provide the necessary land and buildings for the centre, accommodation for the Japanese experts and the running expenses for the operation of the centre.

The seven Japanese experts who will be manning the centre include one co-director, two canning experts, two refrigerating experts, one fish pasting expert and one co-ordinator. The Indian counterparts of these experts will be sent to Japan for technical training. The centre will start functioning as soon as the necessary buildings are completed. Promising youngmen from different parts of the country will be sent to the centre for technical training. The details for the training programme are to be decided in consultation with the Indian authorities concerned when the Japanese experts arrive. This agreement is also to run for a period of three years.

The total aid that the Japanese Government will be making available under these two agreements, estimated at Rs. 40 lakhs for the whole of the period during which they will be in force, will be independent of the assistance promised by it as a member of the Aid-India Club and also under the Colombo Plan.

RICE OUTPUT OVER 33 MILLION TONS

India's rice production in 1961-62 has once again exceeded the 33 million-ton mark, reached for the first time last year. According to the latest estimates, the total output in 1961-62 is 33.61 million tons, and but for the diversion of considerable paddy area to jute in West Bengal and Bihar, this year's production would have been an all-time record. Last year's output was 33.66 million tons.

It is understood that while there was a fall of nearly 9 lakh tons in production in West Bengal and Bihar, there were significant increases in Uttar Pradesh, Gujarat, Andhra Pradesh, Maharashtra, Rajasthan, Punjab, Madras and Mysore.

Total rice production in India in 1957-58, 1958-59 and 1959-60 was 24.89, 30.35 and 30.95 million tons, respectively.

IN BRIEF.....

Textile Industries Machinery Corporation, of Dehra Dun, has been permitted by the Government to manufacture textile machinery in collaboration with the Soviet Union. This is first venture to go in for manufacture of textile machinery in collaboration with Russia.

•

There has been a general fall in the export of all textiles from India, particularly hosiery goods. The fall in exports of hosiery goods is attributed to (i) keen competition from the other exporting countries like Japan and Hong Kong, (ii) the higher prices of Indian goods and (iii) coming up of hosiery factories under protective measures in some of the traditional importing countries of Indian goods.

•

The Imperial Chemical Industries (India) Private Limited has been granted a licence for setting up a new industrial undertaking at Bombay, under the name Chemicals and Fibres Ltd., for producing polyester staple fibre (terylene) to the extent of 45,000 lbs. per annum.

•

The Union Government has agreed in principle to the Orissa Government's proposal to set up a 3,00,000 tons capacity cement manufacturing factory in Sambalpur district.

•

The Union Government has decided to increase the dearness allowance admissible to its employees drawing a basic salary of below Rs. 320 and to extend the benefit of this allowance to those drawing a basic pay between Rs. 320 and Rs. 399 per mensem, with effect from November 1, 1961. This has been done in pursuance of the Government's decision to accept the recommendations of the Pay Commission under which the dearness allowance was to be raised if for 12 consecutive months the Working Class Consumer Price Index on a average ranged 10 points above 115. Consequent upon the decision of the Government, which will benefit nearly 2 million Central Government employees, the Central Exchequer will have to bear an additional burden of Rs. 13 crores per annum.

COMPANY AFFAIRS

BUCKINGHAM CARNATIC AND BANGALORE WOOLLEN

During the year 1961 textile manufacturers seem to have done better than the previous year and this is confirmed by encouraging results for the year of the Backingham and Carnatic Company Limited and the Bangalore Woollen, Cotton and Silk Mills Co. Ltd.

The Buckingham & Carnatic recorded a profit of Rs. 1.07 crores which was nearly 9 per cent more than the previous year's profits. After providing for taxation to the extent of Rs. 46.6 lakhs, the Directors suggested the transfer of Rs. 6.50 lakhs towards Debenture Redumption Fund, Rs. 6.52 lakhs towards Development Rebate Reserve and Rs. 12.80 lakhs towards General Reserve. An interim dividend of Rs. 6 was paid on each ordinary share of Rs. 100 on September 30, 1961 which absorbed Rs. 10.71 lakhs. The Directors have now recommended a payment of final dividend of Rs. 12 per ordinary shares of Rs. 100 each, subject to deduction of tax, which would absorb another sum of Rs. 21.42 lakhs.

The Directors have reported that the Company maintained a satisfactory level of output. Sales at over Rs. 12.35 crores reached, for the fourth time in succession, a new record figure, and exceeded those of the previous year by 9.5 per cent. Exports totalling approximately Rs. 2.02 crores were also higher and again secured for the Company valuable benefits under the Export Incentives Scheme.

The Bangalore Woollen, Cotton & Silk Mills Company Limited recorded a profit of Rs. 59.0 lakhs which was over 30 per cent more than the previous year's profits. After providing for taxation to the extent of Rs. 27 lakhs, the Directors approved appropriation of Rs. 8 lakhs towards Workpeople's and Clerk's Gratuity and Rs. 1.90 lakhs towards Development Rebate Reserve. An interim dividend of Rs. 6 per share was paid on ordinary shares of Rs. 100 each subject to deduction of taxation on September 29, 1961, which absorbed Rs. 7.29 lakhs. The Directors have now recommended the payment of final dividend by Rs. 12 on each ordinary share of Rs. 100 each subject to deduction of tax. The appropriation will absorb Rs. 14.58 lakhs.

The Directors have reported that the production of cotton cloth continued at a high level and in the Silk Department, as larger supplies of raw material were available, output was greater. In the Union Section production of Cotswol and Angola was maintained. The Woollen Mill at Hebbal finally ceased working in June when stocks of raw material were exhausted. The demand for the Company's products exceeded output and closing stocks of finished goods represented considerably less than one month's production. Prices of raw materials, stores and machinery parts, many of which are obtained from indigenous sources, continued to rise, but a prudent purchasing policy contributed towards the improved results.

LYNX MACHINERY

Lynx Machinery Limited incorporated in November 1960 has vastly improved its production potentiality during the year to November 30, 1961 and has purchased additional machinery. The lay-out for the new factory at Calcutta has been worked out and negotiations for the construction of the building structures are being conducted. For the first year a loss of Rs. 1.56 lakhs is not discouraging, and it was after transferring an amount of Rs. 2.68 lakhs to expenditure on development account. Sale returns were to the extent of Rs. 17.4 lakhs.

The Company is in its stage of expansion. The complete set of drawing for the manufacture of LISTER petrol and kerosene engines was received by the Company from Messrs. R. A. Lister Co., Ltd., England. The Directors have reported that considerable progress has been made in planning and organising production of the components and assembly of the complete engines. The manufacture of Concrete Vibrators of ALLAM design has now been taken up and this will meet the long felt demand in the country for a dependable make of Concrete Vibrators of all types. The Company is also organising the engineering and the structural division. Industrial licence to manufacture flexible shaft grinders has also been secured by the Company though the collaboration agreement with Messrs. Flexible Drive & Tool Co., Ltd., of England has not been approved by the Government. The Company has also made an application for the issue of an industrial licence to manufacture Skoda diesel engines in collaboration with the well-known European manufacturers — Skoda, Czechoslovakia. The Company has secured an industrial licence for the manufacture of Hydraulic Tipping Equipment and Frames for Automobiles at Bombay. The Directors have reported that negotiations with foreign collaborators for technical and financial collaboration are being carried on. The Company, it seems, is set for a bright start.

Company Meeting

CENTRAL BANK OF INDIA LIMITED

Summary of the Speech delivered by the Chairman, Sir Homi Mody, at the 51st Annual General Meeting of the Shareholders of the Central Bank of India, Ltd., on Wednesday, the 25th April, 1962.

During his speech at the Annual General Meeting of the Shareholders of the Central Bank of India Limited on Wednesday the 25th April, 1962, Sir Homi Mody, Chairman, said that by and large, the year was one of general expansion of national output. He said that in regard to industrial production, though there was an increase of something like 8 per cent, the rate of growth was lower than in the previous year. Conditions of acute scarcity were allowed to develop in respect of coal, power and transport, in spite of repeated warnings of businessmen and industrialists. The failure in these all-important sectors together with an inadequacy of maintenance imports of items such as raw materials, spares and compenents have been chiefly responsible for the slackening in the pace of industrial production during the year.

TRANSPORT PROBLEM

"The Second Plan had sufficiently indicated", continued Sir Homi, "that the transport capacity was grossly inadequate for the needs of the country. The situation demanded drastic recasting of ideas with regard to targets of production and priorities ..... A position has now been reached in which not only the Plan estimates are likely to be confounded, but even the existing productive capacity in the country may be seriously affected."

Continuing, Sir Homi said that the transport bottleneck has been most seriously felt in the Coal industry. There was, as a result, growing shortage of coal in consuming centres, affecting all industries depending upon it for industrial or power production. He added that it was remarkable that when the country was desperately short of wagons, a large part of the rated capacity of the railway wagon industry should be lying idle. In the face of this situation, the targets of production set for the Coal industry during the Third Plan period would seem to be completely unrealistic. Sir Homi was of the opinion that the capital expenditure and foreign exchange involved in the projected expansion, and the time required for developing new mines, had apparently not been given adequate consideration. He went on to point out that even if we could raise all the coal estimated in the Third Plan, the problem of transport would remain.

Sir Homi observed that side by side with this imbalance in our economy was the acute power shortage that the country was experiencing. Under-estimation of the country's requirements, the failure of Public Sector undertakings to reach their targets and the disincentives to the Private Sector of the industry had resulted in a shortage which was being increasingly felt, particularly in regions which are far away from the coal fields.

NATIONAL PLANNING NEEDED

All this, argued Sir Homi, provided growing evidence of the imperfections of the Five-Year Plans. "Arguments about the Public and the Private Sector," continued Sir Homi, "and even about the size of the Plans, are becoming irrelevant in this context. What the country needs is national planning in every sense of the word, and the policy of keeping the Public and Private Sectors at arm's length, so to speak, from each other, needs to be revised."

"There ought to be a much closer relationship", Sir Homi said, "between the two than is now the case, and it is a thousand pities that the knowledge, experience and enterprise of those who have built up in the past, as they are building up in the present, an imposing structure of considerable dimensions, in the face of many difficulties, should not be more adequately utilised. There has recently been a welcome awareness on the part of Government of the importance of the Private Sector, but there is, as yet, an imperfect understanding of the role it can play in national development. While foreign experts are greatly in demand, there is still a barrier between the Government and the Indian industrialist, arising from a certain distrust and suspicion. I have been emphasising for some years that there has been a change in the outlook of the business community, and that there are many in its ranks who are not dominated by self-interest and are anxious to co-operate in the task of national development. I hope it may be found possible for their voice to be heard more effectively in the framing and implementation of our Plans for a rapid advance in the moral and material condition of our people."

FOREIGN EXCHANGE

Sir Homi expressed concern over the persistent erosion in the total foreign exchange reserves which had dropped from Rs. 825 crores at the beginning of the Second Plan period to Rs. 302 crores at the end of 1961, in spite of large drawings on the International Monetary Fund. He said, "In the year under review our adverse balance of trade amounted to Rs. 283 crores. This shows a welcome decline from the figure of the previous year, but this was more due to a decrease in imports than to an increase in exports". "The remedy", he continued, "lies in our ability to attract greater foreign investments and to promote larger exports". As regards the first, Sir Homi advocated that our Government should seriously consider ways and means of doing away with the harassing procedures, delays and stiff-necked attitudes which a number of foreign investors, anxious to participate in Indian undertakings, were experiencing. "As regards export promotion", said Sir Homi, "Government must realise that the measures so far undertaken have but a limited value, and that the basic fact is that our products have to be competitive in quality and price. In this connection, I would quote from a speech made by Mr. Alfred Hayes, President of the Federal Reserve Bank of New York, to the New York State Bankers' Association a few months ago, on the subject of export promotion. Whilst sounding a note of warning against the habit of looking upon import restrictions, higher tariffs and exchange controls as a panacea for their balance of payments difficulties, he said: "We must be willing not merely to recognise foreign competition as an economic fact, but also to make an aggressive effort to compete more effectively in all markets, both with new and important products and with lower costs ..... This is not the job of monetary policy alone, nor even of monetary policy primarily. Whole-hearted co-operation from Government, industry and labour is a necessity in this area." "I would add", Sir Homi continued, "that giving subsidies and inducements, on the one hand, and loading costs of production with all manner of burdens, on the other, is a self-defeating process."

PRESSURE ON BANKING SYSTEM

Sir Homi Mody then informed the shareholders that with a view to improving their position, Banks effected in March an upward revision in the rates laid down under the Inter-Bank Agreement. The pressure on the banking system, however, for additional credit continued to persist and the Advance-Deposit ratio rose in consequence from about 62 per cent in December 1960 to over 70 per cent in March 1961. The banks were therefore obliged, during the busy season, not only to liquidate a part of their investments in Government Securities, but to borrow on a larger scale from the Reserve Bank, even at penal rates of interest.

Sir Homi then went on to recapitulate the various measures taken by the Reserve Bank during the year to strengthen the banking system and revive public confidence, which had been somewhat shaken by bank failures in the preceding year. The policy of encouring a merger of the weaker banks with the stronger ones was vigorously pursued and resulted in the reduction in the total number of Scheduled Banks from 94 to 83. In conformity with this policy, the Central Bank took over the Jodhpur Commercial Bank.

By far the most important event that took place during the year was the passing of an Act for the establishment of a Deposit Insurance Corporation, which would fully cover about 75 per cent of the total number of deposit accounts in the country, and provide protection to all depositors to the extent of Rs. 1,500 per account.

"Towards the close of the year", continued Sir Homi, "the Reserve Bank also put forward a proposal for strengthening the equity base of the banking system and exhorted all the banks to observe a convention which would lead to their achieving a ratio of 6 per cent between their Paid-up Capital and Reserves and their Deposits. This is no doubt a sound move, but if the present pace in the growth of Bank Deposits is kept up, the attainment of the prescribed ratio may take a long time, even with the transfer of 20 per cent of declared profits to the published reserves of Banks."

Sir Homi then disclosed to the shareholders that as a step towards implementation of this proposal, the Directors had decided to increased the Authorised Capital of the Bank to Rs. 10 crores and to raise additional Capital by the issue of 6,30,000 new shares in ratio of one new share for every two existing shares. This would increase the Paid-up Capital to Rs. 4,72,50,000.

IMPRESSIVE INCREASE IN DEPOSITS

Turning to the affairs of the Central Bank itself, Sir Homi informed the shareholders that, for the second year in succession, the Bank's deposits registered an impressive increase of Rs. 20 crores the total moving up from Rs. 200 crores in 1960 to Rs. 220 crores in 1961, and that in the quinquennium 1957 to 1961, the growth of the Bank's Deposits had been of the order of 42 per cent.

Over the past 5 years, the improvement in gross earnings had been of the order of Rs. 4.43 crores, or 57 per cent. The increase, Sir Homi affirmed, had taken place under all heads, namely, Interest and Discount, Commission, Exchange and Brokerage.

The net profit during the year showed a substantial rise, and was indeed a happy culmination of the progress made by the Bank during the first half a century of its working. He, however, sounded a note of warning that while it would be their constant endeavour to keep up the rate of growth in profits, it must not be forgotten that the future would throw additional burden on the industry. As a corollary to the growth of Deposits, progressively larger amounts would be needed year after year for payment of premia to the Deposit Insurance Corporation. The implementation of the Tribunal's award was likely to impose a further burden. The Reserve Bank's proposal for strengthening the equity base and increasing the liquidity ratio of Banks would also have their effect on the availability of resources for employment in the Bank's business. It was, therefore, considered prudent and necessary to conserve the Bank's resources, and accordingly, out of this year's profit, Rs. 45 lakhs were transferred to Reserves, taking the total of the Bank's owned funds to Rs. 7.28 crores. This, however, was still short of the ratio between Capital and Deposits as envisaged by the Reserve Bank.

DIVIDEND

Referring to the dividend, Sir Homi stated that this year in view of the larger profits, it was proposed to pay a final dividend of Rs. 2.60 per share subject to tax, which together with the interim dividend of Rs. 2.40 would amount to a total dividend of Rs. 5 per share, subject to tax, or Rs. 3.50 net for the whole year, thus restoring the dividend to the level of 14 per cent net at which it had stood prior to the cut effected as a result of the changes in the taxation system.

In conclusion, Sir Homi made a reference to the Golden Jubilee of the Bank which was celebrated in a befitting manner all over the country, as well as in Pakistan, Rangoon and London. The great enthusiasm witnessed everywhere served to bring home vividly the abundance of goodwill and public confidence which the Bank enjoyed. Everyone connected with the Institution had derived fresh inspiration from those celebration. In commemoration of the occasion, it was decided, in collaboration with the Devkaran Nanjee Banking Corporation, to set up a Staff Training College, which would be named after the Founder of the Institution, Sir Sorabji Pochkhanawala. Sir Homi stated an announcement to that effect had been made at the time of the Golden Jubilee and the draft outlines of the Scheme were now being examined.

At the conclusion of his speech, Sir Homi, referring to the Budget proposals of the Finance Minister which were announced after his speech went to the Press, observed: "It is idle now-a-days to expect from a budget anything but heavy burdens. The reactions of the harassed tax-payer can, therefore, only be in the nature of either a groan or a sigh of relief that it has been no worse, depending on how much has been sought to be extracted from him. He can expect nothing better so long as our Government's planning continues to be what it is. All that can be said, accordingly, about the latest Budget is that the Finance Minister has done his best in the circumstances and is to be commended for his courage in doing away with the vexatious and unproductive Expenditure Tax. He must not forget, however, that the additional burden he has cast on the corporate sector is unjustified and is bound to affect the pace of industrial development."

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Company Meeting

THE NATIONAL RAYON CORPORATION LIMITED

The following is the speech delivered by Shri Kasturbhai Lalbhai, Chairman, at the Annual General Meeting of The National Rayon Corporation Limited held at Bombay on 26th April, 1962.

Gentlemen,

I have great pleasure in extending you a cordial welcome to this Fifteenth Annual General Meeting and placing before you for consideration the Directors' Report on the working of the Company for the year 1961 together with the Statements of Accounts for that period. These have been in your hands for some time now and with your permission I shall take them as read.

2. The production of the rayon yarn during the year under report has increased by Rs. 77 lakhs and that of chemical products by Rs. 17 lakhs compared to the year 1960. There has been an alround increase on the expense side due to increase in excise duty and increase in other items due to higher production, both of the rayon yarn and of chemical products. It is hoped that the turn over for the year 1962 will be higher as the Tyre Cord Plant has gone into production and the expanded rayon plant will be in production for the whole year as against only six months in the year under report.

3. No allocation has been made towards Gratuity Reserve this year as your Board has decided to pay the amount of gratuity if and when it arises and charge it to the accounts of the year in which it becomes payable.

4. There will be no further payment on account of Royalty to Skenandoa Rayon Corporation as our liability to pay it has ceased with the close of the report year.

5. We have now heard from the Government of India that they have approved of the Industrial Credit and Investment Corporation of India, granting our Company foreign exchange loan to the tune of Rs. 39 lakhs as applied for by us, for the expansion of the Caustic Soda Plant. The import licence permitting import of requisite machinery is expected any moment and it is hoped that the expanded capacity would be installed sometime early next year.

6. The Tyre Cord and fabric manufactured by the Company at its newly set up plant has been sent to leading manufacturers of tyres for tests. One of the manufacturers of tyres being satisfied has already placed a trial order for sizeable quantity and negotiations are afoot with a few other tyre manufacturers for supply of tyre cord.

7. The ensuring of adequate and uninterrupted supply of coal and electrical energy continues to be a headache to the Company. In case of Industries like ours who have a continuous manufacturing process, the problem becomes even more acute. I only hope that in due course of time the situation will improve.

8. For quite some time now rayon manufacturing industry is being criticised with regard to the selling prices of rayon yarn fixed by them under the plea that they are not comparable with the prices prevailing in other rayon producing countries in the world. This criticism is not only incorrect but the actual facts are entirely different from what they are represented to be. The ex-factory prices exclusive of excise duty permitted to be charged by the indigenous rayon manufacturing units are in fact substantially lower than the internal prices prevailing in all the other rayon yarn manufacturing countries excepting one; thereby you will appreciate our prices become second lowest in the whole world. I may also state that these prices are even lower than the landed cost of corresponding imported varieties. Such criticism, to say the least, is therefore unwarranted.

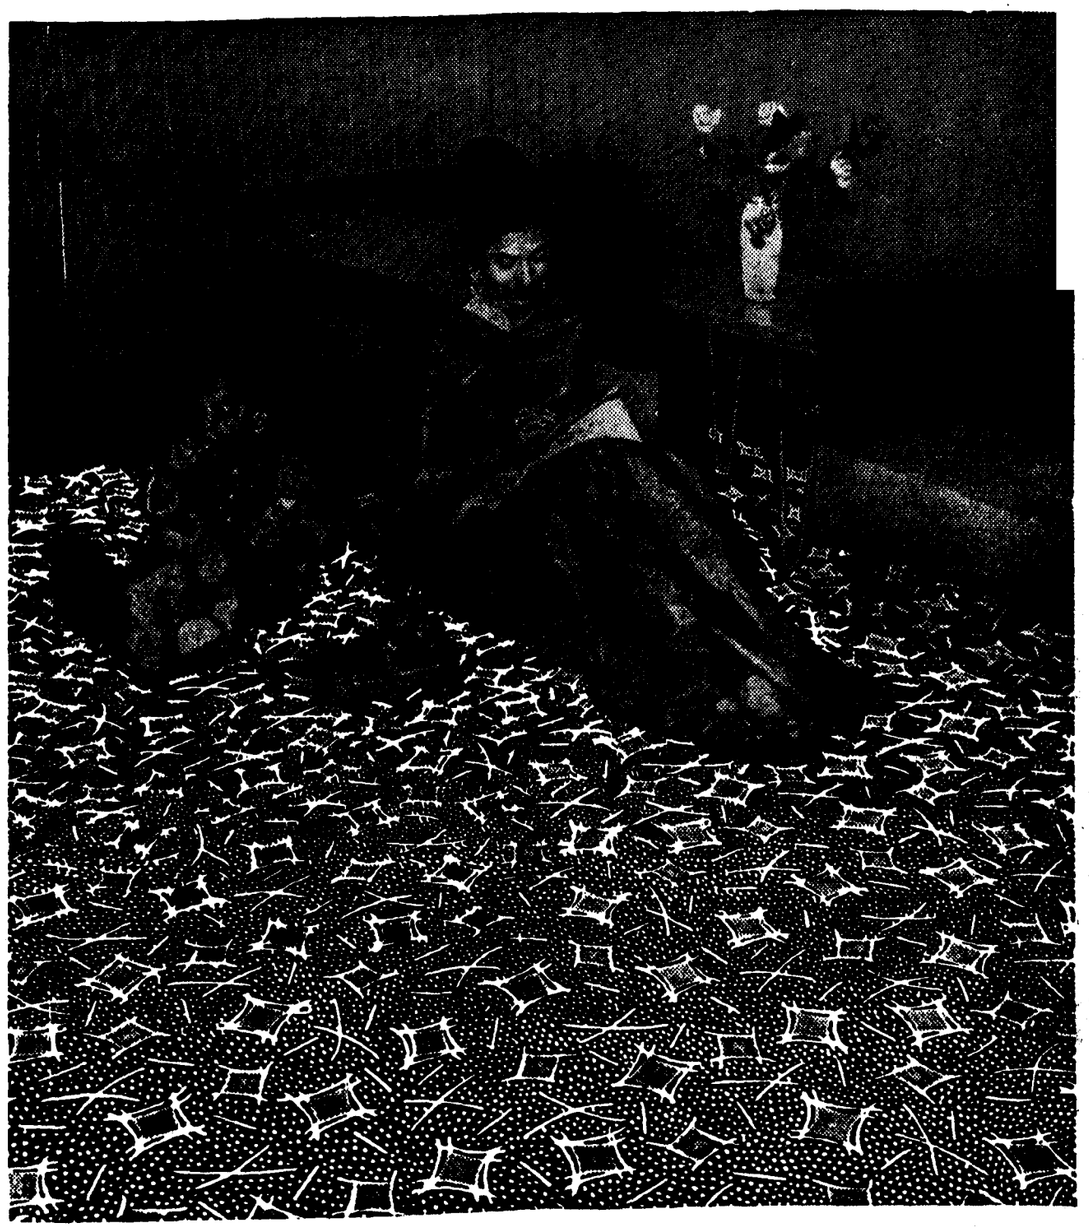
9. In this connection I may also mention that the manufacturers of rayon yarn as a whole agreed to the absorption of 60 per cent of the additional excise duty imposed last year on the specific understanding that the consuming units in their turn will not pass on the burden of this excise duty to their customers. We regret to find that this understanding has not been honoured. In the circumstances there does not appear to be any cogent reason for asking the manufacturers to continue the absorption of 60 per cent of the additional excise duty. Suitable representation is being made to the authorities concerned to reconsider this matter.

10. While the Company has been receiving licences for raw materials required for operating of our plant at its rated capacity, the position is somewhat different in case of licences for pulp. The Government appears to have fixed a certain quota of foreign exchange for import of rayon grade pulp into the country as a whole. This quota is not being increased in proportion to the increased capacity coming in operation. The available exchange is therefore being distributed pro rata amongst the operating units resulting in curtailment of the quota of existing units from time to time. We are thus compelled to purchase the balance of our requirement of pulp utilising the licences made available against the Export Promotion Scheme. These licences are made available, as you are aware, in consideration of certain quality of yarn being sold at substantially lower rates which in effect goes to increase the cost of pulp. The landed cost of sulphur has also increased consequent upon the shipping being restricted to US bottoms. These factors combined with the overall increase in the wage rate, transport, electricity etc. have contributed to the increase of the production cost.

11. I am glad to inform you that the Management's relation with the labour continued to be cordial during the report year. The dispute about the quantum of bonus paid for the year 1960 was referred by the Workers' Union to the Labour Commissioner on whose report the Government initially decided in Company's favour. However, a letter has been recently received from the Government informing that on reconsideration, the matter has been referred to Labour Court for adjudication.

12. A suggestion was made at the last Annual Meeting that a statement from the Chairman should be circulated to the shareholders along with the report and accounts of the Company. I regret this could not be done this year, but I may assure you that the suggestion will be implemented from ensuing year.

13. In conclusion, I must say a word about the workers and the staff, who, by their efficient work, have contributed in a large measure to the smooth running in the plant and the satisfactory working of the organization.



14. With these observations, I commend the Report and the Statements of Accounts for adoption and propose the following resolution —

RESOLUTION

THE FIFTEENTH ANNUAL REPORT AND THE STATEMENTS OF ACCOUNTS FOR THE YEAR ENDED 31ST DECEMBER, 1961, BE AND THEY ARE HEREBY ADOPTED.

Thank you, Gentlemen.

COSY COMFORT!

LINOLEUM *for better living!*

THE VERSATILE FLOORCOVERING

INDIA LINOLEUMS LTD. 14 Radhabazar Lane, Calcutta-1

Company Meeting

THE TRAVANCORE RAYONS LIMITED

Speech delivered by the Chairman, Shri A.R. Ramanathan, at the Sixteenth Annual General Meeting of the Company, held at Rayonpuram on April 25, 1962.

Dear Shareholders:

It gives me great pleasure to extend to you all a cordial welcome on the occasion of this Sixteenth Annual General Meeting of your Company. The Annual Report and Accounts for the year ended December 31, 1961, having been circulated to you in advance, I hope I have your kind permission to take them as read.

PROFIT AND APPROPRIATIONS:

The working for the year 1961 has resulted in a profit of Rs. 61.93 lakhs after providing Rs. 40.13 lakhs for depreciation, Rs. 2.75 lakhs for Development Rebate Reserve, Rs. 1.50 lakhs for Gratuity Reserve and after paying Rs. 32.80 lakhs towards Excise duty.

You will notice from the Balance Sheet that the provision for taxation is higher by Rs. 3.30 lakhs compared to 1960, and, with the profit for the year being more or less the same as that of 1960, your Directors have maintained the dividend recommendation on the equity shares, at the same rate of 20 per cent. They have considered it also prudent to create a new Reserve, known as "Dividend Equalisation Reserve". As the Directors have explained in their Report, the reason for this Reserve is this: When the huge expansion programmes of the Company are completed, a large amount of Development Rebate will be allowed to us by the Income Tax Authorities. In order to avail of this Rebate, a Development Rebate Reserve equivalent to 75 per cent of the Rebate will have to be set aside. The setting aside of such a Reserve will diminish the distributable profits. The object of the Dividend Equalisation Reserve is to help maintain dividend stability in such circumstances.

EXCISE DUTY — NEED FOR SOME RELIEF:

The increase in profits would have been greater but for the following reasons:

As I had mentioned in my last speech, the Central Government's 1961 budget raised the excise duty on rayon yarn steeply, by 66-2/3 per cent, and, what is more, the manufacturers were called upon to bear 60 per cent of the increase. This has meant a loss of profit of nearly Rs. 10 lakhs. Secondly, an equally high excise duty of 20 per cent ad valorem, on our Cellulose Film, was also levied, and, as anticipated, this proved to be a major cause of a fall in demand for the film in the latter part of 1961. Consequent upon this, the increased capacity of our Cellulose Film plants had to remain unutilised.

Even during last year, I had submitted that the Government of India should take a balanced and well considered view of the position and offer the industry the relief it deserves, by way of a reduction in the excise duties on rayon yarn and cellulose film. Alternatively, in the case of rayon yarn, the manufacturing units could be allowed to increase the selling prices to some extent. While on this subject, I wish to refer to another point also. In the case of both rayon yarn and cellulose film, there are a number of basic and intermediate raw materials such as caustic soda, soda ash, glycerine, zinc etc., which also bear excise duty in addition to the final products. This is, obviously, inequitable, and, in my opinion, a liberal approach to these aspects is likely to yield better results — both to Government and the Industry. I, for one, do agree that sacrinces are necessary on the part of everyone, in the interest of the Plans and the Nation.

ACHIEVEMENTS OF THE RAYON INDUSTRY:

The Indian Rayon Industry has achieved notable success in the short span of a decade. The annual output has increased from 5 million pounds in 1950 to 45 million pounds now. The saving in foreign exchange has been about Rs. 28 crores so far. The target for filament yarn under the Third Five-Year Plan has been fixed at 75 million pounds. Considering the substantial pace of progress of the economy, this target is easy of achievement, and may require an upward revision to cope up with the enormous expansion in demand, which the size of the plan is likely to generate.

PRODUCTION:

The production of rayon yarn suffered some shortfall, due mainly to lower output in the older machines which had been working since 1950. There have been many cases where our applications for imports had to be drastically cut due to acute foreign exchange shortage. While I fully appreciate the uncomfortable situation in which the Government is placed, I would plead for more scientific re-arrangement of priorities in such a way that raw materials and spare parts are allowed, in due measure, to existing industries, so that unutilised capacities may be minimised, in the overall national interest. The production of moisture proof cellulose film registered an increase of about 50 per cent over the 1960 production due to the commissioning of our Second MST Plant. When the market for the film improves, the increase in our MST production can also be maintained.

EXPORTS:

With the pressing necessity to increase the country's exports, your company is also making its contribution and striving to explore the export markets. In the case of rayon yarn, we are helping the fabric exporters by supplying them a quota of rayon yarn at subsidised prices. In the case of cellulose film, I am glad to tell you that a satisfactory beginning is being made. The quality of our film has met with good consumer acceptance. Besides the Far Eastern markets, it is also our desire to explore the Middle Eastern markets. Continuous efforts are being made to improve the factory efficiency, process and technology, and the quality of our products.

QUALITY CONTROL AND WORK STUDY:

The benefits of statistical-quality-control techniques are being availed of; and also the employees at various levels are being suitably educated and trained under courses conducted by the National Productivity Council. A work and job evaluation study is also being undertaken so that men, materials and machinery could be fully utilised.

EXPANSION SCHEMES:

As you are all aware, the Company holds an industrial development licence for expansion of its Rayon production capacity by another 5 tons per day which will raise up the total rayon production to 13.6 tons per day. This expansion is expected to cost the Company about 3.5 crores of rupees, which has to be met partly by issue of right shares and partly from long term borrowings. At the moment, I am unable to give you any indication as to the issue of capital etc. since the entire scheme depends upon the licence situation. Immediately the licence is received, your Directors expect to consider this question.

The erection of the Cotton Linter Plant is going on according to schedule. And, as your Directors have stated in their Report, in line with its traditional pioneering efforts, your Company will be the first Rayon Plant to manufacture Rayon Grade pulp in India. The capacity will be 10 tons per day, initially. The production is expected to start by October-November this year.

LABOUR:

The relations with labour were satisfactory, on the whole. The three-year agreement with the labour terminated on April 4, 1962. It is the desire of your company to renew it for a longer term in the interest of industrial peace and stable progress. I hope the employees will give their full co-operation.

I now propose that the Directors' Report, Balance Sheet and Profit and Loss Account for 1961 be approved and adopted.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Managing Director's Speech

THE DUNLOP RUBBER CO. (INDIA) LTD.,

The following is the speech delivered by Mr. M. L. Bexon, M.C., Managing Director of The Dunlop Rubber Co. (India) Ltd., at the 36th Annual General Meeting of the company held in Calcutta on the 24th April, 1962.

Ladies and Gentlemen,

I have much pleasure in welcoming you to the 36th Annual General Meeting of the Company. The Directors' Report and Accounts have been in your hands for some time, and with your permission I should like to take them as read. You will have noticed that we have this year for the first time incorporated some information and photographs of the activities of your Company, and I am sure you will agree that this is a worthwhile addition to your general knowledge of the Company's affairs.

THE YEAR'S TRADING

The year under review saw both our factories at Sahaganj and Ambattur working to full capacity, the notable feature being a general increase in productivity which was most encouraging.

During the early part of the year the Tyre Dealer Associations continued to play a worthy role in ensuring an equitable distribution of the sizes in short supply at list prices to consumers, but with the onset of the monsoon retail selling prices generally began to fall: by the end of the year the general shortage of tyres, except in a few sizes and types, was no longer felt and trading tended to return to normal.

Increased supplies of our Highway Truck and Bus tyre were made in the main sizes but the demand for this extremely popular pattern remained unsatisfied. Similarly, our Gold Seal car tyre continued to maintain its high level of acceptance with users and remained their first preference.

Throughout the many irrigation and industrial projects our Off-the-Road tyres continued to be in keen demand and particular mention may be made of the Dunlop "Powergrip" and "Earthmover EM.7" patterns which found ready acceptance for their high quality and durability.

Sales of Cycle tyres and tubes in the domestic market increased although our deliveries to the Bicycle Industry were below the level of 1960 as the activities of some of these concerns declined during the period. It is our view that the general trend in this Industry will improve before long and the signs today already confirm this view.

In the Industrial Rubber Products field our Conveyor belting expansion was completed during the period and field reports on the high quality of our product continued to be most encouraging.

The demand for Industrial and other types of hoses was also satisfactory and it is true to say, I think, that in every large project throughout the country Dunlop hoses are being used.

Dunlopillo sales remained at a high level and the demand for our range of products continued to exceed our manufacturing capacity. It is of interest that sales of Dunlopillo for industrial applications increased considerably.

During the year we were continually handicapped by the shortage of transport for the conveyance of finished products from our factory at Sahaganj to our various Sales Offices spread throughout the country, and this problem unfortunately still remains with us today. Increasing use of road transport where possible for long distance routes has proved very helpful and we would strongly urge that this medium be given every encouragement to develop to the full. Emphasis, we feel, should be placed on road building and maintenance as a positive contribution towards solving the existing transport difficulties.

EXPORTS

Your Company has responded to Government's call for exports and we are currently exporting all types of tyres, cycle rims and accessories. We are also seeking to widen the range of products we export and negotiations are in progress to this end.

However, I feel it would not be out of place to mention that export business is not only highly competitive but has its own special difficulties, and by its very nature cannot be built up over a short period of time.

Nevertheless, I am glad to be able to tell you that our Cycle tyre exports in 1961 were 17 per cent higher than in 1960, and in the quarter of this year our overall exports were running at a level over 50 per cent higher than the same period in 1961.

EXPANSION PLANS

I am sorry to report that there has been a delay in implementing our expansion plans, which were mentioned at this time last year. You will probably have seen press reports that Government are considering the question of raising the target for the automobile tyre manufacturing capacity to be established during the Third Five Year Plan. It is to be hoped that their decision will be announced soon and that we shall then be able to go ahead with our full plans because Am-

battur has been designed so that economical expansion can take place quickly and efficiently.

Meanwhile we are implementing some small expansions at both factories for which we have licences.

We also have a licence to manufacture P.V.C. belting, for which there is a good demand from the coal mines. Because of its fire-resistant properties, it is advantageous for use in underground gassy mines, and we are finalising plans to implement this project.

The Directors have constantly under review the possibilities and necessity for expanding existing capacity and introducing new products.

RAW MATERIALS

During 1961 the supply position of raw materials in general was reasonably satisfactory, although the foreign exchange situation and the consequent uncertainties and delays in the issue of import licences presented a constant problem. For some items, however, we had to abandon our established suppliers and find new sources in the U.S.A., with a consequent increase in our raw material bill. Despite these difficulties, production at both factories was maintained according to schedule.

On a number of items, import duties were further increased and resulted in a substantial addition to raw material costs, thus offsetting a number of economies which we had introduced.

Considerable progress has been made towards producing indigenously various raw materials we use, and we are already arranging comprehensive test programmes in order to ensure that these materials will be suitable for the very high quality products we make. It is gratifying to note that over half of our cycle rims are now manufactured from local rim strip, and as indigenous production increases, we are hopeful that during 1962 our entire output of rims will be made from Indian steel, with a consequent saving in foreign exchange.

PROFIT AND LOSS ACCOUNT

The profit for the year after providing for depreciation, interest and taxation was Rs. 1,64,75,494 as compared with Rs. 1,24,56,228 for 1960. The profit after tax expressed as a percentage to sales was 5 per cent, and, as you will have gathered from the Directors' Report, the improvement over last year's figure of 4.1 per cent arises mainly from the increased volume of business and increased efficiency.

Excise Duty now exceeds Rs. 6 crores and absorbs a substantial amount of working capital, a matter which your Directors continue to keep under constant consideration.

It will be observed that overall Salaries, Wages and Bonus show an increase of approximately Rs. 34 lakhs and Welfare Expenses are also up due mainly to improved canteen and catering expenditure at factories, depots and head office.

Advertising expenditure has been increased to meet the ever growing competition facing us now and in the future, and our participation in the Indian Industries Fair accounted for a substantial portion of the increase.

The amount of Bank Overdraft Interest has decreased as a direct result of our reduced borrowings.

As a result of the temporary lull in capital expenditure until our next planned expansion receives approval and gets under way, the amount transferred to Development Rebate this year is only Rs. 7,50,000.

The amount transferred to General Reserve is Rs. 62,50,000, this being considered prudent in the light of our forward expansion plans.

Our net profit available for disposal is higher than last year by approximately Rs. 41 lakhs. The compulsory transfer to Development Rebate Reserve has decreased by Rs. 9,50,000 and this gives an overall increase of approximately Rs. 50,50,000 of profits available for disposal. Out of this additional amount it is propo ed that Rs. 25,50,000 is allocated to you, the Shareholders, the balance of Rs. 25 lakhs remaining as retained profits within the Company.

The Directors recommend a dividend for 1961 of 20 per cent subject to tax on the ordinary share capital as increased by the recent Bonus Issue. In 1960 the dividend paid on the old capital was 21.5 per cent.

BALANCE SHEET

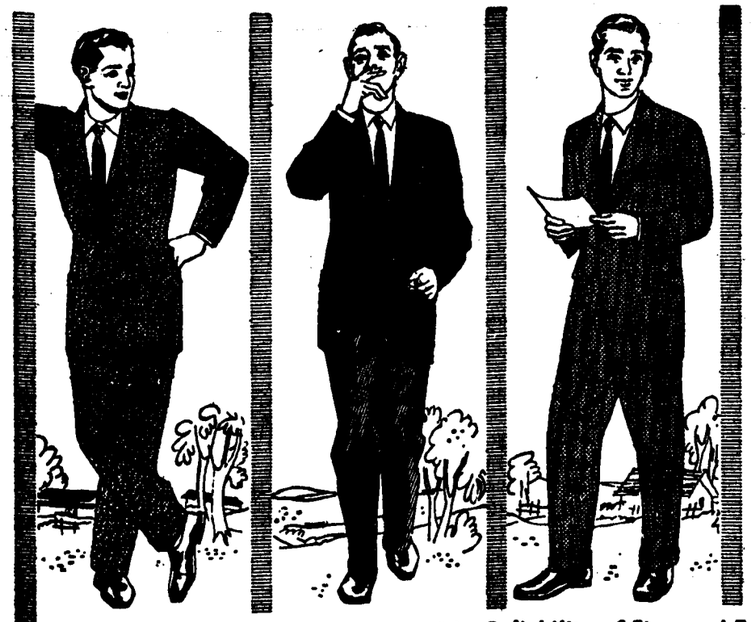
On the Assets side there have been no significant changes since last year. Inventories are higher in line with the higher level of output and sales.

The Share Capital as Issued and Subscribed has increased by Rs. 1.5 crores, which is, of course, the Bonus Issue, and Reserves have already been mentioned in the Directors' Report and need no further comment. Our overall borrowings through Bank Overdrafts, etc. are lower in-line with the increased profits and reduced capital expenditure. The Provision for Taxation is higher arising from the increased profits and the additional liability in respect of the Bonus Issue.

FUTURE PROSPECTS

There are now several manufacturers producing tyres in the country and others are expected to come into production during 1962. Competition will, therefore, be keen but your Company does not fear this and indeed welcomes it. We have the product, the sales organisation and the market acceptance to retain our share of the expanding market, but it is our earnest hope that if the total manufacturing capacity of the country is in excess of demand, then free competition and consumer preference will be allowed to decide sales levels.

EMPLOYEE RELATIONS



It is particularly gratifying to record a further improvement in labour relations at the Sahaganj factory during 1961. Increased productivity was obtained from both our factories with correspondingly greater rewards to our workers. I should like to mention that the workers also shared in the improved results of the Company, an annual bonus being paid at the rate of 3½ months basic salary as opposed to 3 months last year. The total bonus paid for the year exceeded Rs. 44 lakhs.

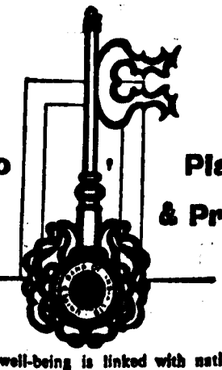
The Company entered into long-term agreements with Employees' Unions at Sahaganj and Ambattur factories, and at several of our depots throughout the country. These contain increasing benefits to the employees and reflect the success that has been achieved over the years in the field of industrial relations. At head office and the depots the service conditions continue to be improved.

You will, I am sure, wish to join the Directors in thanking the employees for the loyal service they have given and the hard work they have put in towards another year's successful results.

NOTE: THIS DOES NOT PURPORT TO BE A RECORD OF THE PROCEEDINGS OF THE ANNUAL GENERAL MEETING.

Men of discernment choose

DIGJAM WOOLLENS



DIGJAM Woollens have been the choice of discerning men for generations. Smart, beautifully textured, they come in a wide range of weights and weaves. And DIGJAM Woollens are so durable—the smartness is built-in *for life!*

Reputation earned by Reliability of Firm and Fabric

SHREE DIGVIJAYA WOOLLEN MILLS LTD. JAMNAGAR

Available at all leading stores and cloth dealers.

SISTA3-DWM-SA

Key to Planning & Prosperity

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

*If the effect of the conversion of Rs. 50 crores is ignored, the net expansion of treasury bills during the year would amount to Rs. 126 crores. Of this Rs. 5 crores will be taken to increase the closing cash balance to the normal level of Rs. 50 crores. Thus the overall gap in the current year would amount to Rs. 121 crores.

Why CIMMCO Sakamoto

BECAUSE

★ AUTOMATIC LOOM IS A MUST FOR QUALITY TEXTILES
★ 62% OF COUNTRY'S AUTOLOOMS ARE SAKAMOTO TYPE
★ 25% OF COUNTRY'S AUTOLOOMS ARE OTHER JAP. TYPE

ALSO

★ THESE ARE STURDY IN DESIGN
★ SIMPLE TO SET-UP AND OPERATE
★ TRIED IN COUNTRIES THE WORLD OVER

AND

TECHNICAL COLLABORATION **COMBINES A LOOM BUILDING EXPERIENCE** OF **18** YEARS AT CIMMCO WITH OVER **34** YEARS IN JAPAN.

Specially developed technique of boring frames on assembly ensures of perfect allignment. Improved temple cutter, end cutter and latest mechanised warp stop with efficient brake ensure faultless weaving continuously with minimum efforts.

Manufactured at Birlanagar, Gwalior

The Nuclear Cold War

THE appearance of the Budget last week, with its relentless demand for immediate comment, eliminated reference to a subject which, as events have shown, has deeply disturbed Indian public opinion. This is the new series of tests both at surface level and in the high atmosphere (and possibly beyond) contemplated by the United States. It is not necessary here to argue whether or not as a military deterrent these tests are likely to be effective on the Soviet Union. If the Soviet Union tests in the Arctic last year did not deter the United States, but merely encouraged them to proceed with a new series of tests, surely the tests done by the United States will have precisely the same effect now on the Soviet Union. The Soviet Union has already announced its intention of starting a new series of additional tests. Matters have now passed beyond the stage of contemplation. However equitable in theory the belief that nuclear balance must be maintained, in practice, the action only leads to more destructive nuclear power being released. The armed neutrality can, indeed, be preserved when the balance is close. But nobody need suggest that a particular test just restores the balance and a permanent equilibrium. Each test by itself is an invitation for others to commence new tests. *The Eastern Economist* believes that the Soviet Union erred deeply when it started its new series in the Arctic. It is equally of the opinion that the United States has erred deeply in committing itself to a new line of tests. The reason is not that defensive measures are not sometimes necessary; it is that this particular chain of defensive measures is an unending one in which equilibrium is never reached and the race for additional nuclear arms continues in an unending series.

Quite apart from the issue as to whether or not "testing" is a condition of nuclear balance, there is the question of public opinion in the neutral nations which has been deeply aroused by the USSR action in the first place and now by the United States. Friends of the United States in the Indian Union have been deeply disconcerted that neutral opinion has been treated with a little disrespect in this matter by the United States as it was by the Soviet Union. Indeed, it is not neutral opinion only. Reports from Europe suggest that even allies of the United States, such as Britain, have serious misgivings on the timing of tests or the physical results in the atmosphere even if they are tests at a high altitude or beyond or inside the Van Allen belt. So far as tests at high altitudes are concerned, we at this moment possess so little information on the effect of cosmic rays and the Van Allen radiation reflections that no one can say that the results will be salutary. It is certainly to be doubted whether a particular nation has the right to commit all mankind to these risks. In the Indian Union at least it is clear that opinion is coming round to the view that the United States cannot undertake its tests in waters which do not belong to it exclusively.

The net result of the tests in terms of the radiation component and the dangers to life and living are differently estimated by different scientists. There is a substantial margin of difference; it may well be that the additions of magnitudes fairly well tolerated in isolation, might pass a danger point when used cumulatively by the USSR and USA combined. It is not in any case as if the two nations are sufficient unto themselves for the responsibilities which they are taking blindly for the lives of millions of people who might be subjected to fall-out at a distant date. It is known that this fall-out has had, or can have, a very deleterious effect on the mutation of species. For all these purposes it is right that world opinion should be deeply exercised about

the decisions being taken in the Kremlin and the White House without any regard to the opinion of those who stand outside these tremendous symbols of monolithic power in the modern world.

The India Committee, which is collecting a million signatures for the banning of nuclear tests under the indefatigable enthusiasm of Mr. J. J. Singh, has already passed the half million mark and is now rapidly reaching its objective. It is said that there is little to be expected from signatures. Perhaps there would be more notice taken of Mr. Rajagopalachari's suggestion that we should support Earl Russell in entering the forbidden zone to register our protest in using the waters belonging to the whole world and now forbidden to it by the United States. These are merely tokens of protest. The question is whether or not the nuclear giants of this world still take notice of the multitudes of the human species over whom in this age and time they have command by a tremendous accident of science and nuclear technology. A deep distrust of nuclear powers who test in their absolute discretion must be extended by this indifference to the cries of those who beg for a hearing and receive no ear. It is extremely doubtful if the leaders in the Cold War gain anything from this massive and seemingly callous exhibition of their own terrible, yet unknown, might.

India's Relations with Nepal

KING MAHENDRA'S visit to India had to be deferred until after the general elections in this country, but it will be readily conceded that the delay has been conducive to a more agonizing reappraisal on both sides. Our relations with Nepal have been allowed to deteriorate fast, when, in fact, the deterioration could have been halted by a prudent display of restraint and moderation by some of our organs of public opinion, not excluding a section of our Press. This does not condone the virulent propaganda that is being carried on lately in the Nepali Press against India. But a greater responsibility rests on India than on Nepal to take timely precautions to prevent misunderstanding. When amity and not recrimination is sorely needed, it is useless to attempt to apportion liability for spreading misunderstanding. During the prolonged interval between the invitation to the King to visit this country and his arrival here, the Nepali attitude hardened due to a variety of factors, genuine as well as imaginary. This hardening, it cannot be denied, had a sobering effect on public opinion in India, which began to show a keen recognition of the sovereignty of Nepal as an effective force in our trans-frontier relations in the north.

Nepal's King, like India's Prime Minister, is a staunch optimist in upholding cordial and intimate relations between the two countries which are deeply grounded in history, religion, culture and no less important a cementing force—commerce. But in the recent past another dominating factor has emerged to underscore these relations and it is the stake in mutual security. It is this factor more than any other which has been a source of real concern to India. Geography has imposed a difficult and delicate position on Nepal as a buffer State between India and China. Like all buffer States which are small in size (and Nepal's embarrassment is heightened by her land-locked location), Nepal has to endeavour to hold the scale evenly between two great neighbours on her two sides. In this difficult game of diplomacy she has allowed the scale to be tipped in favour of China. It is anxiety over this excess that makes India unhappy because of its long-term repercussions.

Two major issues occupied the better part of the talks between King Mahendra and Mr. Nehru. The divergent positions taken by Nepal and India in respect of these issues made it inevitable that the discussion should be outspoken and, by available reports, it was so. Of immediate importance to Nepal was the upsetting problem of the activities of Nepali Congress leaders who took refuge in India after the dissolution of the parliamentary system of government. India looks with profound misgivings on the agreement which Nepal has entered into with China for the construction of the Kathmandu - Lhasa road, as it carries sinister potentialities directly affecting her security and the integrity of her frontier territory. The success of the talks must be judged by the extent to which the two countries have minimized the area of divergence and allayed each other's apprehensions.

Sensitivity is responsible for the misplaced and extreme interpretation the King and his advisers are putting on the Government of India's responsibility for the activities of the Nepali Congress leaders. But proof that subversion is being organised, directed and reinforced with arms from India has not been provided and its absence conveys its own implications. The Indian Government's assurance that it has not tolerated and will not tolerate abuse of asylum for violent activities ought to prevail. King Mahendra showed unremitting insistence in demanding the expulsion from India of the Nepali leaders, meaning their surrender to him for legal action. This is an unacceptable demand especially against India's firm commitment not to allow violent operations to be launched from her soil to disrupt Nepal's integrity. Points of ingress and egress on the mountainous frontier are limited in range. It is for Nepal's armed forces to control them. India's commitment of co-operation in this task stands. The joint communique issued after the close of the talks provides for consultation and appropriate preventive action by agreement.

The Kathmandu - Lhasa road is by no stretch of reasoning a local project and it requires little imagination to envisage its likely impact on India's security. King Mahendra was apparently unwilling to discuss the Sino-Nepalese agreement to build the road, but the issue could not be bypassed. The economic justification of its construction is patently unconvincing and so is the emphatic denial of its potential military significance. In such a hazardous matter escape cannot be sought under the plea that its remote consequences are of little significance in the immediate context. India's deep anxiety about buffer diplomacy having overshot the mark is intensified by the failure on the part of Nepal even to keep India informed of the negotiations and agreement with China on this hazardous line of communications in accordance with the treaty of friendship between our two countries.

It is idle to pretend that the two big issues have been resolved. The road pact is allowed to lie where it rests. It would be impolitic to press the issue at this stage. Time may prove to be a rectifier. Patience will eventually demonstrate that the Government of India will honour its obligation to prevent armed raids against Nepal's integrity. It is gratifying to find that personal contact is removing the cobweb of misunderstanding. The initial start has been made in direct consultation for agreed moves. It is primarily for India, as the big neighbour, to win confidence by the credentials of action, fortified by tactful respect for Nepal's sovereign status.

The Management Bottleneck

THE Sixth Annual General Meeting of the Delhi Management Association held on April 26 was a stimulating review of the major problem of creation of Indian managerial talent. Mr. G. D. Birla, who might be said to have delivered the "keynote" speech, pointed out that the problems of industrial management were becoming increasingly more complicated and there were two dimensions at least in which the current bottleneck displayed itself. One was that the quality of the individual manager had to be much higher because of the complexities of the responsibilities that he now bore, particularly in relation to employee management. But there was also the problem of numbers on which he felt that here very little had been done and, indeed, even expressed the opinion that there was "no serious intention" behind the vast literature growing on the subject to the creation of managerial talent, short both in quality and in quantity. He agreed that this applied to the private industry as well as to public undertakings.

It is right that one should recognise that this is not a stick with which to beat the public sector. It is, in fact, a general problem because of the enhanced growth rates fed into the economic system, whilst the training of managers, on whom the growth ultimately rests, has not been undertaken a decade previously. Napoleon is credited with the remark that the education of a child should begin twenty years before its birth with the education of the mother. In much the same way, it can be said that the good management of an industrial enterprise should begin twenty years before it is born by the adequate education of the potential top manager. Far too little was done twenty years ago to provide by actual experience at top levels the managerial skill required. The family system—which is a tremendous drag on the entrance of the talented professional manager at the topmost level—has done not a little to present the idea that the topmost management in many houses is a closed unit reserved for particular members of the family. Far too much still exists in Indian managing agency practice of family preference as a passport to management. The career is not nearly as open to the talents as it should be. This is one of the blots on some of our leading business houses. They talk about scientific management and opening of the career to the talents. In fact, the ring is often terribly, and quite unnecessarily, circumscribed.

Quite apart from the problem of the "general" education of a manager, there has been abroad in the last decade a vast accretion of strength in terms of tools for making managerial decisions. It now appears that a leading engineer of Dupont in the United States, Dr. Sigurd Anderson, has devised a computer system to present "venture analysis" using advanced mathematical techniques and high speed computers to consider alternative choices in decision-making. To quote Dr. Anderson: "The heart of venture analysis is a computer simulator—a framework developed by managers and expressed mathematically by us into it, like pieces of a jigsaw puzzle, go details supplied by research, production and marketing men. The simulator both holds these data and shows plainly what pieces are missing. Then it's ready for its second role—telling managers the financial implications of the information the computer has been given.

"In computer simulation, we try to programme the structure of the market, investment and costs of a new product venture in such a way that its future over ten to 12 years can be seen under a variety of possible forecasts and decisions....

"In other words, managers can accurately weigh the risks they face by having a large, idle plant in a slow market or by losing sales opportunities because a plant is too small to serve an expanding market."

It seems that computers are really great gifts to top management, but top management must be able to frame proper questions before the computer goes into its stride. Most Indian managers, and even our topmost businessmen, take decisions without a scientific study of the possible alternatives which might exist as possibles for consideration. This is even more true of the operation of the Indian Railways where a very large number of major decisions in regard to the length of a haul, the size of a train, the speed at which it will run are fixed by traffic personnel without any scientific calculation of the optimum turnround of their wagons or speed of movement in particular cases. Linear programming and operational research have found almost no takers in this country, whilst they have been practised on an ever-increasing scale in practically every country of Europe and the United States. In other words, tools of management are deficient in practically every area of the country. To name a few, operational research, linear programming, computer simulation and, of course, the basic background which is sound economic knowledge and marketing research. It is assumed that technicians will be able to supply technical information but the scale of operation on which depends the choice of technology to be used is obviously a matter of "outside" decision. It is, as Mr. Birla said, much more important to find the right type of top management than to get involved particularly in the shortage of technicians and accountants. There are signs that the new Institute of Management

at Calcutta will make its responsibility of perfecting the management tools which are not perfected in the country. That alone will justify the addition to management institutions which have produced literature; hardly any basic change in the character of the Indian management. In any case it is time for Management Institutions to do some work study on themselves. Is all this Management Talk, without basic change in capacity, worth the man-hours spent upon it ?

Guest Editorial

Automation—Changing the Mould of Society

By WILLIAM REES - MOGG

THE basic discovery of Marx was that societies tend to be shaped by the economic systems which support them. The England of the great landowners turned into the England of the small capitalist producer, and the England of the small capitalist producer changed in its turn into the England of the large industrial company. Each of these changes in the organisation of production produced a corresponding political and social change. So now the society of mass consumption, with its very high standard of living in terms of consumer durable goods, is breaking down Britain's familiar class and industrial structure.

The trouble with Marxism was that the more or less scientific analysis of the past was accompanied by quite unverifiable prophecies about the future, which have in fact turned out to be false. The capitalist system has not developed in the way that Marx forecast that it would develop, and the Russian and Chinese systems are also wholly unlike Marx own idea of socialism, let alone communism.

One must therefore be very careful about extending an analysis of existing economic and social patterns too far or too glibly in the future. It is clear however that a very great change is going to occur as a result of the development of automation, and that no country is fully prepared for its social consequences, and for the political decisions that will have to be taken.

At present, in all advanced countries economic life is based on what might be termed the primitive machine. Apart from those who work in agriculture, which varies from less than 10 per cent in Britain, to about 30 per cent in France, to about 50 per cent in Russia, people make their livings mainly through operating or organizing mechanical processes of quite limited complexity.

Most of these processes amount to the shaping and fitting together of pieces of metal. Whether the job is that of a man working a rolling mill or a turret lathe, this is the function he has to perform. Most of the machinery itself is quite simple in purpose, though refined in technology, and much the larger part of it is controlled by man, either directing it to bore or to cut or to carry.

This is accompanied by the organisational or office life of the society which is also relatively simple. The office machinery copies or sorts again normally under the direction of an individual. Large numbers of people are employed in offices as on the factory floor, in jobs which are essentially repetitive, supervising essentially repetitive machines.

It is only in industries concerned with liquids or gases, which can readily be carried about in systems of pipes, that the situation is different. Then the number of operatives is very much smaller, and their functions correspondingly broader. Whether one is dealing with chemicals, with oil, or even with water or milk, one finds that the system is wholly different. Contrast for instance the productive systems of an oil well with a coal mine, or a water works with cotton mill.

Obviously the economics of handling have helped what might be termed the 'flow' industries, which include electric power, to expand as against the 'solid state' industries. Yet now we are moving into the period when solid materials can be shaped and handled as automatically, though still at a higher capital cost, as the flowing materials.

Already, for instance, it is possible to build a factory to produce television sets which needs nobody inside it. Components are put in at one end—sets are taken out at the other. Already the British motor industry has been able to double its production without any increase in its labour force.

Yet we can envisage, and in thirty years will face, a society in which most of the repetitive jobs will have disappeared. There are great opportunites in this, but also great dangers. In the first place one can foresee a widening of the gap between the skilled and the unskilled members of society. The man who works a lathe will either have to upgrade his skill to the point at which he can supervise a battery of self operating lathes, or else he must leave the factory. One can put it this way. At present industry employs large numbers of people with say £2,000 to £3,000 of capital equipment to help them earn their livings. In thirty years' time it may be employing a tenth of the people with an average of £100,000 of equipment.

What will the others do? They cannot expect the same incomes as the highly trained industrial staff. They cannot expect to compete with the products of the automatic factories. They may still work the land—where mechanisation seems possible, but automation does not. Many of them will have to seek work in service and distributive industries.

Equally the gap between the rich and poor countries would widen. The great advantage of the rich countries is their capital investment capacity; the advantage of the poor countries is their low labour costs. One can assume that an Indian or Japanese textile mill can undercut in price a British or American because both have to face a similar labour requirement. But suppose automation became complete—and the new fibres might lend themselves to that—where would the advantage lie. The first stage of industrialisation has tended to equalise wealth and has produced relatively egalitarian societies—it is possible that the second stage may, unless we can foresee and solve its social problems, widen the gap again.

THE WEEK'S NOTES

Labour Legislation

SOBER ATTITUDE, BUT NOT ENOUGH

MR. GULZARI LAL NANDA'S inaugural speech at the recent annual session of the All-India Organisation of Industrial Employers in New Delhi gives a reassuring indication that the Government of India is now in a mood to adopt a sober attitude towards labour legislation. Since independence, and more specifically during Mr. Jagjivan Ram's term of office as Labour Minister, the country was flooded with labour legislation on a very wide range of subjects. Some of it could be easily defended as unexceptionable and perhaps overdue. But, by and large, much of it was the fruit of the first flush of enthusiasm for forcing the pace of the socialist policy in labour relations. In its wake it brought many obligations for industry which had no adequate justification under Indian economic conditions and, what is significant, which did not lay corresponding obligations on labour. After Mr. Jagjivan Ram gave up the labour portfolio the pace of labour legislation was slowed down.

We have now the assurance of Mr. Nanda that the Government would not indulge in enacting new labour legislation, but would, on the contrary, consolidate the position built up so far. This is to take a sober view of the priority for rushing with labour legislation in the name of the ideal of the socialist pattern of society. But a reservation ought to be entered. Mr. Nanda amplified his commitment on the consolidation of labour legislation by stating that amendments would be made to existing legislation whenever the Government deemed them essential. Looking to the pronounced bias of the Government for lopsided labour welfare, these amendments would inevitably mean additional social obligations on industry. But, in fairness, amendment ought to cover a revocation of a good part of labour legislation which is demonstrably premature and burdensome to industry. On this score there is no assurance from the Minister.

It would appear that not all the issues raised by the Organisation's President, Mr. Hutheesingh, in his speech were replied to by the Minister. To take some important ones. Mr. Hutheesingh specifically raised the issue that many of the obligations regarding fixation of wages had little relation to the financial capacity of the industry to pay and the emoluments granted to labour had no relation to productivity. In fact, productivity has remained much of a slogan. Likewise, rationalisation remains an intractable problem. The principle of rationalisation has been agreed to, but rationalisation as a means of modernising industrial production and raising the output as well as labour's real earnings has not been taken over in real earnest. Exceptions need not be denied. There is a good deal of emphasis on evolving an integrated scheme of social security. Whether integration would amount to consolidation of the present position with the necessary co-ordination or it would involve additional social obligations is left ambiguous. Mr Hutheesingh has tried to emphasize that integration should rest on the idea of consolidation and should not extend beyond the benefits which are granted to labour at the present time. Going beyond them will be to entail additional liabilities on industry whose validity may be open to serious question.

Sino-Indian Border

CHINA'S DISTORTED VERSION

THE REPORT of the official representatives of the Governments of India and China on the border dispute was tendered to the two Governments early in 1961 and a full text of the report was published in India in February last year. So far, the Chinese Government has not shown the integrity and forthrightness to release the full text of this document for the enlightenment of its own people. A summary of the report was furnished to the Members of the National People's Congress which was in session at Peking from March 27 to April 16. Thus it was that it took the Chinese Government fourteen months to make up its mind to publish a summary after the full text was made known in this country and abroad. The National People's Congress (the Chinese Parliament) was not convened at all during 1961, contrary to the constitutional obligation to hold a session at least once a year. This postponement certainly could not be utilised as a pretext for withholding the publication even of the summary of the report. Now, at long last, the summary has been published and also broadcast over the Peking Radio in a form which makes a total distortion of the facts contained in the full text. The decision of the Government of China to publish the summary and not the text itself conveys its unmistakable intention to keep the Chinese public in ignorance of the documented facts and of spoon-feeding the people with the interpretation which the Chinese Government arbitrarily wants to put on it. In the face of these plain facts, the claim made over the Peking radio to the effect that the officials' report vindicated the stand of the Chinese Government on the border issue can be taken for what it is really worth.

This attempt to present a distorted version apart, there are certain points which emerge from the radio broadcast of which India ought to take note. The McMahon Line has been condemned as an imposition of aggressive British imperialism on Tibet. But the time-honoured border between Tibet and India dates much anterior to the British rule and it has been firmly established by tradition, custom, usage, documentary evidence and it has been all along recognised as such. The manner in which the Government of China has shifted its positions about the border since 1959 shows that it will have no qualms of conscience in yielding to expediency and opportunism in pressing endless claims over Indian territory. The principle of 'actuality' being bolstered by military occupation has now become a practical technique with the Government of China. It would be a mistake for India to assume with any sense of complacency that new incursions will not be made by China into Indian territory. It is not necessary at the present moment to refer to the border between China and the Kashmir State lying to the west of the Kara Koram Pass, since this question can be taken up only after the issue of Pakistan's present forcible occupation of this territory is finally settled.

But in regard to Bhutan and Sikkim there are dangerous pointers about possible aggression by China. In his press conference held at New Delhi on April 25, 1960, Mr. Chou En-Lai stated clearly and unambiguously that China respected India's relationship with Bhutan and Sikkim. The meaning of this admission should be clear, when it is recalled that the Government of China had unequivocally recognised the validity of the Conven-

vention of 1890 expressly acknowledging India's responsibility for the external relations of Sikkim. The same applies to Bhutan. The determination of the boundary between Bhutan and Sikkim, on the one hand, and China, on the other, is therefore a responsibility of India in so far as the former are concerned. But the Chinese Government in its official version of Mr. Chou En-Lai's New Delhi Press Conference of April 25, 1960, interpolated the word "proper" before "relations" and now the position it has taken is that the Chinese Government recognises the "proper relationship" of India with Bhutan and Sikkim. Obviously, China is to be the judge of what is "proper" and how it should act to determine propriety. This interpolation and the twist it has given to Mr. Chou En-Lai's original commitment are completely contradicted by a tape record of the proceedings taken on that occasion. The settlement of the Sino-Indian border dispute is bound to be a protracted affair and it would not be a surprise if new dimensions are added to it in relation to Bhutan and Sikkim.

University Education

PANGS OF HIGH PRESSURE GROWTH

THE UNIVERSITY GRANTS COMMISSION'S report for 1960-61 contains a wealth of statistical data covering the period of the Second Five-Year Plan. It is possible to assess the speed and quality of the development of university education from different angles. But the conclusion cannot be escaped that speed rather than quality arrests attention. No reflection need be inferred from this observation on the manner in which the UGC has acquitted itself of its difficult task. Neglect of quality is inherent in the extraordinary acceleration of the speed of expansion at the level of higher education. Nevertheless, within the scanty resources and the grudging financial co-operation extended by the State Governments to secure individual benefits, the UGC has made the best job of its work. The dominant impression which the report creates is that of mitigating the pangs through which expansion of university education is passing under the high pressure of demand.

The total number of students in the colleges and universities increased during the five years by 32 per cent to reach the mark of one million. The UGC has to maintain a judicious attitude in allocating resources to 46 universities and colleges affiliated to them. It is none of its faults if in certain important sectors the progress had to be inevitably slow. At a time when the economy of the country is crying aloud for the assimilation of applied science and technology, hardly 6 per cent of the students are able to undertake post-graduate courses. The changing percentages of students opting for different courses reflect the changing trends in the economy. The percentage of arts graduates has declined by 6.4 to 44.9. So has law come down in the estimation of students. This is as it should be. But other trends need not necessarily be taken as an answer to the long-term requirements of the rapidly diversifying economy. The report discloses that agriculture, veterinary science and education are suffering a decline which is a matter for real concern. If education is being neglected as a subject of higher scientific study, the fast multiplying number of high schools and colleges will find themselves poorly staffed with the requisite talent. In consequence, the standard of education cannot but deteriorate. Engineering and commerce courses are the passion of the day with the student generation for the simple reason that an industrialising economy promises to open up gainful and promising careers in these specialised spheres. We will require increasing numbers of agricultural graduates, veterinary surgeons and the like, when the technological revolution makes its inescapable impact on agriculture. But the student or his guardian with whom investment for potential employment is the primary consideration, can be pardoned, if he does not respond to the appeal of this distant influence.

Finance has been a very severe handicap for higher education as for other essential and priority spheres of social welfare. The UGC can induce the State Governments to share the burden of better scales of salaries for teachers only to a limited extent. The principle of sharing the burden operates as an obstacle to the State Governments' enthusiasm to improve the terms of teachers' salaries. But how can they ignore the hard-fact that the UGC makes firm grants only for five years, while the future is uncertain? The array of percentage increases in the number of students taking courses in the different subjects may look imposing. But it could hardly be said that it is matched by balanced rates of growth in accordance with the relative importance of the subjects. Already science graduates are facing the same difficulties about employment as confront arts graduates in a much more acute degree. Here the UGC may plan imaginatively, but the provision of resources will hang like a big question mark.

C.P.I.

COMPROMISE, NOT CONCORD

THE WEEK-LONG deadlock over the election of the new Secretariat of the Communist Party of India was resolved at the last minute by means of a compromise under sheer pressure to avoid an open rift in the party. Neither the extreme group led by Mr. B. T. Ranadive nor the rightist group led by Mr. P. C. Joshi could muster sufficient support to assert itself. Eventually, the top leadership of the party was bifurcated by an amendment to the party's constitution and a Chairman and a General Secretary now head its National Council. The "unanimous" choice of Mr. Dange as Chairman and of Mr. Namboodiripad as General Secretary was secured by a heavy concession to the extremists in the form of no less than four new nominees from their group to the secretariat. The rightists got an accretion of three and the left-centrists one. But the Bengal and Andhra groups have not concealed their unhappiness at the election of Mr. Dange. They are known for their support of China's position on the border question and in the time to come they would undoubtedly grow restive and finally demonstrate that despite the compromise they are a powerful and irresistible element. For the time being, satisfaction may be derived from the fact that Mr. Dange, who has advocated a firm line of disapproval of China's frontier policy, is the Chairman of the party.

Groupism has no doubt come to stay in the CPI and this was not unexpected after the evidence of facts about the difficulty in finding a successor to Mr. Ajoy Ghosh. What is significant from the Indian national point of view is not the fact of the existence of groupism in the CPI (which may dissipate its strength and affect its solidarity for the time being) but the entrenchment of the pro-Chinese leadership of the CPI in its executive organization. The report of the delegates of the CPI on the 22nd Congress of the Soviet Communist Party was not presented to the Council but deferred for very obvious reasons. The four delegates who were deputed to Moscow were evenly divided according to their leftist and rightist leanings. The embarrassing question in presenting the report is the interpretation of the ideological cleavage between China and the Soviet Union as disclosed at the 22nd Congress. It remains to be seen how the delegation will manage to tide over this perplexing issue. The pulls inside the party towards the left threaten to grow. Nevertheless, the shift in policy in the direction of a more determined opposition to the Government by appealing to the public at emotional points is clear. Already a decision has been made by the Council to launch a nation-wide agitation against the new taxation proposals of the Finance Minister and the rising price line.

BUSINESS CONSORTIA FOR INDIA?

By

ODYSSEUS

THERE has come across my desk the first study ever to be published on the problems of forming and managing a business consortium.

Hitherto, India has been on the receiving end of foreign consortia, such as the group of British banks, engineers, and others, responsible for the Durgapur steel works. But one point which emerges from Mr. A. Harding Boulton's clearly and concisely written 120 page handbook "Business Consortia" (Sweet & Maxwell. London. 1961. Price 30sh.) is that a number of individual companies, in competition with each other at home, may find it convenient to join forces to form a consortium to do their overseas selling. Should not India's manufacturers of fans, diesel engines, bicycles, sewing machines, leather goods, and engineering products, etc. etc., read this book in order to size up the chances of collaborating in export markets?

Mr. Harding Boulton points out that we have lived through a revolution in the technology of manufacture as radical as the group of changes which we call the Industrial Revolution. It is this technological revolution rather than the actual size of projects, that has led the consortium idea to be developed. The great bridge built between 1882-90 over Scotland's Forth river remains a monument to the engineering skill of an era that found no need for consortia. Since then, however, what has become more and more evident is an increase not necessarily so much in mere size as in the integration, and interdependence, of many skills to give life to a project like the Durgapur works. The consortium is most often concerned with a productive unit marked by an integrated compexity, in which many techniques contribute to its design and creation, and are intricately bound together into an interdependent whole.

Another factor which has led to consortia is the emergence of governments of developing countries as buyers and sellers in industry. The developing countries can look for aid either to the free West or to the socialised countries, and since Western governments are not equipped to undertake development enterprises, the consortium is one way in which the West can offer aid.

Apart from consortia created to deal with one specific enterprise, such as a dam or a steel works, there are now consortia made up of groups of companies, which bring together complementary skills, in alliances intended to enable them to deal with an indefinite series of projects and actively to seek for business in their own separate names.

Mr. Harding Boulton instances a consortium of ten companies which do not necessarily co-operate in all contracts, but which, as a group, bring large-scale engineering projects to the notice of its members, and then encourage the formation of smaller consortia from those of its members interested in any project. In this case, the parent consortium of the ten companies provides an intelligence service and administrative facilities for the smaller groups whose formation it has facilitated.

OPPORTUNITY FOR INDIA

India is but one of many developing countries which has encouraged foreign companies to set up inside its borders by imposing tariffs on various imports. This may often create conditions in which a consortium has a role. Whereas a newly developing country may not provide a big enough market to justify each potential manufacturer in establishing his own factory in competition with others, it may be feasible for several companies, which are in competition in their homelands, to create a single jointly owned factory abroad. Should a joint enterprise not be considered by Indian companies anxious to increase India's earnings of foreign exchange?

Again, a group of companies, importing into a country ranges of products complementary to one another, may establish a consortium to market their products in a foreign country. There exists, for example, a UK consortium which markets small tools throughout the world on behalf of a number of companies. These companies maintain their own sales organisations in their home markets, but combine to exploit overseas territories, thus illustrating the possibility of co-operation between rivals when both face competition abroad.

In some circumstances the formation of a permanent consortium is inevitable. Thus, for the joint overseas factory a commonly owned consortium, as a coherent unit, is necessary. But in other instances, a newly formed company is not the only solution of the problem, especially when the problem is merely one of size or complexity. Before hastily adopting the new fashion and forming a consortium, it is sensible to consider whether the problem could not be solved more easily by one main contractor employing specialist subcontractors. Even when a number of companies have decided, in principle, to work as a group, it is well to consider whether it would not be better for one member to have the primary responsibility and initiative, with the protection and support of carefully thought out agreements. For, while a consortium solves some problems, it creates others, and the use of an experienced, existing organisation as the main contractor has advantages.

IL
Xm 21, N49 E2 N49.32

If, however, you plump for a consortium, you must distinguish between the "single purpose" consortium, intended to be dissolved after carrying out one big job, and the "continuing" consortium, intended for permanent existence, because there are wide differences in the practical methods of living together in a joint organisation if the alliance is to be short-lived or if it is to be permanent. Obviously, the establishment of a joint factory, or a joint selling organisation, requires a continuing consortium. This will avoid some of the difficulties inherent in consortium management. But the formation of a consortium to build a single big plant, dam, or power station, may well lead to a contract for another. Thus, a consortium intended, in the first place, as a temporary alliance may, to the surprise of its creators, turn out to be a continuing organisation. It then becomes important to recognise at once what is happening and to reshape the organisation to meet circumstances not envisaged at its formation.

If the consortium is set up in the form of a company, it is important that the drafting of proposals and

documents should not obscure the need for the promoters to grasp the underlying problems. Drafting is done by lawyers, accountants, secretaries, and administrators. Whether the framework that they devise is suitable depends, however, on how far they understand the technical and commercial requirements, the political backgrounds, any special local or other difficulties, the over-all problems of inter-company relations, and even the personal relations existing between the management of one company and another.

TOP MANAGEMENT'S ROLE

In every large company there is an inner circle which constitutes the "top management." Top management must leave to its legal, secretarial, and accounting experts, the work of drafting, but they must not expect these experts—outside the charmed circle of top management—to be able to read their thoughts. Draftsmen are concerned with forms and words, managers with substance and policy. Mr. Harding Boulton emphasises that success depends on the initial care taken to think out all the possible situations that could arise. A business leader worth his salt is a man of drive and enthusiasm, but he must not allow his enthusiasm to brush "details" aside. The project is attractive. He is sure that it is a money-maker. But, asks the accountant, supposing the consortium faces a loss, who is to pay? And how much each? Too often the business leader replies impatiently that in that case the parties will get together to decide what is to be done. The expert then dresses up this mental laziness in solemn, pseudo-legal language: "In the event that any party shall be of the opinion that the financial results are such as to indicate that any project, or projects, upon which the company shall be engaged will result in substantial loss, that party shall be entitled, by notice in writing to the others, to require that a special meeting be held at which each party shall be represented by a person, who shall be a director of that party, authorised to take decisions, and the meeting shall consider measures to be taken and the proportions in which any loss shall be borne."

It is easy to write such nonsense by the ream to disguise the mental laziness which prevents top management from thinking the project out properly.

It is worth remembering that the Latin word "consortium" means living together, and that family quarrels characteristically spring over trifles, become bitter, and are magnified from mole hills into mountains. It is therefore worth envisaging all possible situations before they arise, while the atmosphere is still cordial. If, later, a consortium runs into a crisis, the responsibility which each member ought to bear should be capable of exact definition.

The promoters should, from the first, clarify their thoughts about (a) the possibility of conflicts of interests between members, (b) the distinction between (1) conflicting and (2) basically different functions, (c) unequal need for, and loyalty to, the consortium on the part of its different members, (d) the effect of what Mr. Harding Boulton, in somewhat tight shorthand, calls the consortium's "severable" personality. By this he means the effect on each member company of creating a separate new legal entity, which will enter into contracts in its own right, in which its member companies will not only be shareholders, but may also be vendors to it or buyers from it, and with which their individual companies, separate from it, will have dealings. Remember that to start acrimonious argument with a consortium of which one is a member is to quarrel with oneself and with one's partners. When a consortium is formed by a group of manufacturers, to carry out a package deal, the temptation to regard it as one customer to whom it is unnecessary to be polite—a temptation most likely to emerge at the lower executive levels—must be consciously resisted.

The European Scene

SPAIN IN THE COMMON MARKET

From Our Special West European Correspondent

MADRID, April 29.

IN Brussels last month I found that Spain's application for association with, and eventually membership of, the Common Market was not being taken very seriously. The Six decided to reply to Madrid with a mere acknowledgement, without committing themselves to opening even exploratory negotiations. In Madrid, on the contrary, the prospect of Spain's entry into the European economic union is taken very seriously indeed; in fact, it is regarded as inevitable. The day the application became known the Madrid stock market took a dive, for speculators imagined that customs barriers at the Pyrenees were going to fall more or less overnight, exposing adolescent Spanish industry to the crushing competition of north European manufactures. This reaction was rather comical, since Madrid's application foresaw a long period of gradual adjustment before Spain would be asked to bear the impact of free competition, and in any case that application was received with scepticism if not indifference in Brussels. The share market has since then come back to its senses, but the impression remains: Spaniards now see their affairs in a new light, in the prospect of integration with the rest of West Europe.

The contradiction between opinion in Brussels and in Madrid on Spain's membership of the Common Market is less fundamental than might appear. Now that the Government's proposal is properly understood, Spaniards realise that there is no question of a sudden or even early entry, unarmed, into the arena dominated by the great West German, French and Italian corporations. In Brussels, too, it is not suggested that there is anything improbable about Spain's association with the European union. Unwillingness to take the matter further at this stage is due, firstly, to pre-occupation with Britain's case, which cuts out the work of the Six for many months to come; and secondly to fear of awakening political squabbles among the Six on the question of co-operation with the Francoist dictatorship. The Six are already engaged in a political dispute about the terms of their co-operation, and specifically about whether it is six sovereign governments that are to unite (this being de Gaulle's idea) or six peoples that are to unite under a new government (this being the vision of the integrationists). Obviously, any discussion of co-operation with Spain would bring this dispute to a paroxysm, because it is there that the distinction between government and people (which is rather sophistical when we are talking about Britain) becomes stark. A lot of people are ready to collaborate with the Spanish nation who will have nothing to do with the Francoist regime.

So the Six are wise to leave Spain's application pending until they have solved the British problem and, by the same stroke, settled their differences about supranationality and co-operation between sovereign states. When they have done so, the delicate issues posed by Madrid's request will have become much simpler. The economic question will be simpler, because it will be a matter of admitting Spain, with her big agricultural exports, to a larger union which will be deficit in food. The political problem will be simpler too because it will be a matter of digesting Spain into a unit where the powerful impact of Britain will have reduced that prominence of Catholic-conservative forces which today disturbs some Europeans in a union dominated by de Gaulle, Adenauer and the Italian Christian Democrats. (To put the matter more bluntly, the Six are now described by opponents as "the Vatican's Europe" and the entry of Spain into the association would deepen the purple tinge; on the contrary, a union that included Britain and was open on to the Commonwealth could consider association with Spain without complexes.) More important, when the Six, or the Seven or Ten as they will then be, attend to Spain's application they will see that it suggests a gradual association that might take 20 years—well beyond the tenure of 69-year-old Generalissimo Franco. The present colour of the regime, in other words, will be no pretext for refusing to co-operate with a Spanish nation that has at last decided to join Europe and the 20th century.

Formal negotiation about Spain's admission to the Common Market, then, lies some distance in the future, while her actual entry as a full member is remote. So it will seem paradoxical to report that, in a very important sense, Spain is already in the Common Market today! Yet this is the impression one forms in Madrid. The reason is that, despite legalistic preoccupation with the terms and technicalities of the Rome Treaty, people are in the Common Market once they adjust their economic actions to the prospect of serving a market that far transcends the national framework, a market of 200 million or so consumers, where goods, labour and capital will sooner or later circulate freely. The moment a majority of producers set themselves in that perspective, free themselves of the protectionist mentality, begin to think big and seek co-operation with other producers elsewhere in the wider market, then they are in the Common Market whether or not tariffs have yet fallen very far, or at all.

It is not the atmosphere of Cervantes' city that leads one to this Quixotic separation of vision and reality; it is the facts about recent European trade. We may leave it to United-Europe politicians to believe that the modest reductions of tariffs up to the end of last year explain the spectacular expansion of trade within the Common Market, the amalgamations and technical agreements, the modernisation and investment that have gone on in that region. Every business man knows that 30 per cent off tariffs could never produce such momentous consequences. What caused them was the knowledge that the reduction would one day be 100 per cent, so that, even if one did not know for sure when that day would be, one had to get ready now; this preparation for a bigger tomorrow, taking place in neighbouring economies that had been artificially separated by protectionism and which were enjoying a sustained industrial boom, explains the expansion of European trade, and not the tariff cuts. Now, once the Spaniards come to believe that their future lies with West Europe, so that all their economic plans have to be laid in view of that objective, they are as much in the Common Market as British firms who are not yet convinced that their Government is doing the right thing in preferring Europe to the Commonwealth.

Spanish business is in course of making this adjustment to the wider horizons of Europe, and the enthusiasm with which it is doing so suggests how stifled Spain has felt during the 20 years of isolation that followed the victory of Franco. It is not so long since students were arrested here for reading the pamphlets of the European unity movement, and since the regime banned the OECE report on the Spanish economy. Now there is a great opening of doors and shutters throughout the country; it is not only legal but approved to look toward

Europe—and of course Europe means all sorts of things besides economic integration: it means political democracy, free trade unions and independent criticism. For the first time, Franco has given the chronically divided Spanish people a vast objective about which they can almost all agree, and has assigned the nation a path of action that leads well beyond his own lifetime and even beyond the likely span of his aimless and sterile dictatorship. In no other country of Europe has the prospect of the Common Market brought such sentiment of release and widening horizons.

It is in adjusting its mentality to this sentiment that Spanish enterprise is, I suggest, already joining the Common Market. The instructive reaction of timid protectionism that caused the slump in the stock market is being belied by the string of company reports that appear in Spain each April. One after the other, company presidents are stressing the opportunities European integration presents to Spanish industry and the reasons why Spain need not fear the encounter with Europe, given facilities to make the transition at moderate pace. The president of a major chemicals firm, Union Espanola de Explosivos, has said this week, "Just as we believe that our traditional lines have nothing to fear from entry into the Common Market, provided we can rejuvenate them and increase productivity, so too we believe there exists a wide field for expansion of our activities inside an economically united Europe. I maintain that our entry into the Common Market is not prejudicial to, but essential for, our genuine and permanent economic development". That last assertion sums up the conclusions of a debate that has gone on in the economic Press here about the requirements of development and integration. Some had suggested that integration with Europe would be possible only after Spain had carried her development a certain way in isolation. The argument was illogical, for if the spell of development were to be really useful it would have to be development at a faster rate than that of the Six (so that Spain could catch up to some extent)—but if Spain were capable of the feat of developing faster than the Common Market she would have a secret denied most of the rest of the world (e.g. Britain), and would never need to join the Common Market at all. In reality, economists and business men have been able to show that the path to faster development lies through integration, because only that will provide the scale of operations, the capital, the cheaper raw materials, the technical help and the spur of competition which are all required for development.

This is not speculation, but something that is already happening, since Franco consented to put Spain back on the map of Europe by adopting the economic policies long pursued in West Europe while opening the country up to European capital. In the past year Spain has had a foretaste of the benefits of economic integration: her labour has been drawn out to France, Germany and elsewhere in North Europe at a rate never known before, to help relieve the acute manpower shortage there, while European capital has poured into the country to employ labour here and diversify the nation's industry. Incidentally, Spain has achieved an increase in trade with her immediate neighbours that exceeds anything known inside the Common Market itself: France's trade with this country increased last year by 42 per cent! As I wrote last week, the process is just beginning, for the benefits of the recent liberalisation of investment rules have yet to be seen. In short, Spain is being drawn into the orbit of the Common Market—physically, by the increase in trade and labour mobility, and mentally, in the transformation of entrepreneurs' attitudes—well before the formal negotiation of her admission has been taken up.

WILL THE BOOM CONTINUE?

From Our West German Correspondent

BONN, April 25.

AFTER Prof. Erhard's persistant and vehement attacks against trade unions and industrial managements blaming them for furthering the dangerous wage-price spiral, discussions are at present going on whether the boom will continue or whether symptoms of a declining tendency are already visible. Erhard himself said the other day in this connection that he is neither a pessimist nor an optimist but a realist and he just thought it proper to give a sound warning well in time.

Now the Economic Science Institute of the trade unions as well as its counterpart, the Institute of German Industry, have given their rather contradictory verdicts. Let us first see what the former has to say. It is of the opinion that the favourable business juncture in February indicates a further upward trend in the months to come. The report also states that one can observe a tendency of a growing demand for and an increasing production of consumer goods thanks to the successful wage policy of the trade unions. These facts are to be welcomed, the report says, because the particular branches of the industry till recently had booked comparatively small orders. As to the industry of capital goods, it has still to execute long outstanding orders but will finally also profit by the upward movement of the consumer goods industry. According to the economists of the trade unions, the growing integration of Europe will have favourable repercussions in the course of time.

Let us now turn to the opposite side and see what the Institute of German Industry has to say. In its survey it is pointed out that West Germany is not in a state of a depressed economy. But there are clear danger signals which indicate that the economic prosperity is jeopardized. Wages and salaries have increased by more than 12 per cent in each of the past two years and look like rising at about the same rate this year although productivity is likely to rise by only 3 to 4 per cent, following increases by 3.9 per cent in 1961 and 6.6 per cent in 1960. New orders for exports in the last quarter of 1961 were 5 per cent lower than in the same period a year earlier. The export surplus in the first two months of this year has fallen to 41 million DM against a surplus of 1.27 billion DM in the corresponding period in 1961. A recent survey of the European Economic Community — the EEC—authority showed that labour costs have risen faster in West Germany than in other major industrial centres in Europe while, at the same time, international competition has become fiercer.

The report goes on to say that the preservation of economic stability will depend to a very large extent on the attitude and actions of the two social partners, the employers and the trade unions. It can, therefore, be welcomed that both sides have agreed in principle to the establishment of a neutral committee of economic experts to act as advisory body on economic matters to the Government. Whatever the functions and the work of this future committee will be, it will relieve neither the employers nor the trade unions from their responsibility they have towards the German economy as a whole.

Prof. Erhard has actually suggested such an expert authoritative body and it was expected that the Cabinet would discuss it when Chancellor Adenauer did interrupt his holiday in Cadenabbia for five days and presided over the meeting of his Government in Bonn. But this question was obviously not taken up and rumours will have it that the Chancellor does not yet agree with the proposed functions of such a committee.

PROTECTION FOR INVESTMENTAL CAPITAL

As the endeavours to establish a multilateral convention for the protection of investment capital in foreign countries have up till now not proved successful the Federal Government has decided to propose bilateral agreements to developing countries which are interested in partnership contracts. The International Chamber of Commerce in Paris had already published some years ago a "Code of fair treatment" and therein suggested three main conditions for the protection of foreign capital: Foreign investments must be granted a fair and just treatment and there should not be any difference between indigenous and foreign capital. Expropriations should not be executed without proper legal procedures. An adequate compensation should be paid immediately after the expropriation and promises made to foreign capitalists are to be kept unconditionally. But as these conditions were considered too general two associations have gone more into details. In Geneva the "International Study Group for the Promotion and Protection of Private Foreign Investments" and in Cologne the "Society for the Protection of Investments in Foreign Countries" have worked out their schemes. On the basis of these schemes, the Federal Government is now encouraging investment activities by bilateral agreements. The first agreements of this kind have been concluded with Pakistan, the Federation of Malaya, with Togo and Morocco. Negotiations will be taken up shortly with Argentina, Thailand, Liberia, Turkey, Ghana, the Sudan and some other developing countries. The Federal Republic has also co-operated with economists in Switzerland, Holland and Great Britain who have worked out a sample treaty for partnership which has now been submitted to the OECD in Paris for further discussions.

In this context the speech of the Governor of the State Bank of Guinea, Minister Moussa Diakete, a member of a trade delegation at present visiting West Germany, is of special interest. At a press conference he called the capital protection law, issued on 5th April in Conakry as the "turning point in the economic policy" of his country. He explained that there are three groups which should enjoy the privilege of protected investments. The first group is the small-scale industry which will be granted a remission of taxes for five years. To the second group belong investments up to 2.5 million DM. Enterprises of this category will be granted tax remissions of seven to ten years. The continuance of remission is connected with the location of the factory concerned. Plants situated inside the country will enjoy greater concessions. The third category comprises investments up to 20 million DM. In this case the Government has drawn up a plan for remission for 25 years which gives the entrepreneurs the chance to calculate the tax payments at long sight. The Minister concluded his speech by emphasizing that Guinea has

opened the doors to the foreign investor and is aiming at granting him all possible facilities, f.i. to import duty-free the raw material he needs. The Federal Government has offered a long-term credit of 50 million DM to Guinea and the question of aid for the exploitation of the mineral resources in Guinea is at present being discussed.

NUCLEAR ENERGY FOR PEACEFUL USE

While West Germany's coal mining industry is fighting with its back to the wall against the "invading" oil which comes like an octopus in pipelines from the North Sea coast and from the Mediterranean over the Alps to the South of the country, the nuclear energy appears as a new competitor to the conventional fuels on the horizon. But the Minister for Nuclear Energy and Water Economy, Prof. Dr. S. Balke, said recently in a lecture that the decisive part will be played by nuclear energy only when its production will be able to compete. Under the prevailing circumstances one can well understand that the power industry shows a certain reluctance in building power reactors. It is, therefore, up to the Government to assist those firms which undertake the development of this new branch of energy production. The Ministry is already also aiding five projects for the development of ship reactors. They are being executed by Siemens-Schuckert A.G., Erlangen, the Allgemeine Eleltrizita - etsgesellschaft (AEG), Frankfurt, Deutsche Babcock & Wilcox AG., Oberhausen, the Brown-Boveri - Krupp Reaktorbau GmbH., Dusseldorf and the INTERATOM GmbH., Benberg, an affiliated company of the DEMAG, Duisburg. The latter firm will receive in addition a financial aid up to 18 million DM in repayable loans to assist in building a reactor of limited output. Total costs of the proj ct are estimated at 25 million DM. The development of this reactor is part of the programme for progress of medium and small reactors. Technical inspection of the development progress will be undertaken in agreement with INTERATOM by an independent committee of experts who are working at the Nuclear Research Institute at Juelich. The West German Atomic Energy Commission has given its support to the project. INTERATOM estimates that the construction of this reactor will take about three years.

BUSINESSMEN IN A MONASTRY

In Asia it is quite common that people retire temporarily to an ashram to listen to the wisdom of a sage. As far as we know a quite similar occurrence has for the first time happened in West Germany and it looks as if it will become a regular custom. At the suggestion of leading businessmen in Munich, a group of industrialists, university professors, judges and medical doctors entered for a fortnight the monastry of the Benedictine Order in Niederaltaich (Bavaria). Under the guidance of Abbot Immanuel Maria Heufelder these laymen went in for a seculsion according to the rules of the Order and participated in the monastic life of the abbey. This test has proved so successful that several hundred applications for temporary entry into the Benedictine Monastry have been registered. The movement also shows that in the "Country of Economic Miracle" (Wirtschaftswunderland) there is not always (and not only) a desire for the latest motor car model, television-set etc. or for good food and drinks but, as we have seen, there is also a longing for the spiritual matters of life.

Economic Report from the U.S.

HANDLING OF THE STEEL SITUATION

By

GUY SIMS FITCH

WASHINGTON, April 24.

PRESIDENT KENNEDY'S handling of the recent steel situation represents a major victory for his economic policies. Without exercising direct controls, the President was able to use the influence of his office to forestall a general price rise in this key industry, demonstrating dramatically the power of the federal government as an economic regulator and a protector of the public interest. The Kennedy policies are geared to the premise that continued price stability is essential to the attainment of U.S. economic goals. These include an acceleration of the domestic growth rate and a final solution of the nation's improving but still troublesome international balance of payments problem. These related objectives are tied to the ability of the U.S. economy to improve its efficiency at home and to compete effectively for export markets, abroad.

This helps explain the jubilation with which the Kennedy Administration greeted the moderate and evidently non-inflationary settlement of the labour-management contract talks in the steel industry. It also helps explain the sharp Administration reaction when the settlement was followed by an immediate and almost general increase of some 3.5 per cent in the price of steel. The price-raising action was initiated by the United States Steel Corporation, the nation's largest steel maker, and was soon joined by most of the other leading steel companies. The ostensible reason for the increase was to enable the industry to raise its earnings so as to invest more in the modernization of its facilities and hence make itself more competitive. Everyone agrees that modernization of facilities is a desirable goal. But to many economists in and out of the government, it was difficult to see how the industry could benefit from a price rise that would invite further market inroads from foreign producers and substitute materials—to both of which the American steel industry admittedly has been losing ground in recent years.

From the broad viewpoint of national interest, moreover, the Kennedy Administration could hardly countenance unprotested a move that ran the risk of pushing up prices for thousands of items in which steel is a major component. By endangering the price stability of the past year, such increases would tend to retard domestic economic expansion and to weaken the competitive position in world markets of a host of American products, with potential damage to the U.S. balance of payments. Also to be considered was the possibility that this might upset the apparently non-inflationary pattern of labour-management negotiations which the all-important steel settlement seemed to have signalled. Many economists, moreover, were ready to challenge the industry's claim that it needed a price rise because of insufficient earnings. This is reflected in President Kennedy's characterization of the abortive price increase as unjustified as well as harmful to the public interest. Estimates show that the labour cost of a ton of steel for the industry as a whole has not increased since the last general increase in steel prices in 1958. Nor, with productivity continuing to rise, is it likely to increase under the terms of the recent labour settlement. In addition, plant capacity is ample, and basic materials are in plentiful supply and relatively inexpensive compared to some past periods. Under these circumstances, as Administration officials have noted, the steel industry probably could realize better earnings from a higher operating rate than from higher prices. On the question of earnings, it is noteworthy that with the possible exception of United States Steel Corporation, the largest steel companies seem to have suffered no real deterioration in their profit positions in the past several years. Indeed, available reports show a marked rise in steel earnings in recent months, along with business earnings generally, under the impetus of rising demand and production. Not all elements in the business community are completely reconciled to this line of thought, and it is possible that some price increases in steel may be in order later on. It is to the credit of the steel industry, however, that the general price rise was rescinded only two days after it was announced. An important factor, in addition to the Administration's opposition, was the competitive position in the industry itself, as several important companies refused to go along with the price boost.

As for the acknowledged need to modernize plant and equipment, the Administration holds to the view that this can best be accomplished—in steel and other industries—through a basically non-inflationary approach. One way has been to keep interest rates and monetary conditions stable, so as to stimulate a flow of savings into investment. Of potentially more direct advantage are two pending actions which would offer important new incentives and sources of funds for the modernization of industry generally. One is proposed legislation, now being considered by Congress, to give a tax credit for investment in new equipment. The other, due to be announced by the U.S. Treasury soon, would take the form of liberalized depreciation allowances for writing off the costs of new facilities for tax purposes. Together, these measures could provide the steel industry, as one of the potential beneficiaries, with as much as $130 million of tax savings on new investments. The groundwork thus is laid for further and essentially non-inflationary advances in the U.S. economy. The Administration is pursuing its policies without recrimination and with an evident determination to improve further the climate for business cooperation with the government. But one thing has been made clear in this steel incident, the public interest is paramount. And in the long run price stability represents a genuine gain for the entire nation—consumers, workers, producers and investors alike.

Special Article

ADVERTISING AND THE SIGNIFICANCE OF THE BRAND IMAGE

(CONTRIBUTED)

TRADITIONAL advertising, by and large, attempts to make its concern known to the people in general. It is a medium indicating to look for the present wants or "playing up the old desires". It does not necessarily assure to foster and promote sales. Awareness or existence of a concern need not be tantamount to the acceptance of its goods and services. Therefore, the central aim of effective advertising should be to sustain a favourable image of a product and/or service and thereby stimulate the current demand and influence new wants. To create such an atmosphere, two hypotheses present themselves—how one perceives the world and what the world in turn expects from the perception. Such a study is commonly referred to as general semantics. In fact, this study helps to guide and promote advertising creativity and communication. In a word, Harry E. Maynard observes that "general semantics is the study of how we perceive or 'size up' the world and then symbolically relate to it; that is, talk about it, write about it, or mathematize about it."

An attempt is made here to present certain psychological and sociological influences which formulate an impressionable image of a particular concern.

If an advertisement strives to exhibit the physical attributes of a product or service of an outfit, it may lend itself to passive, pleasant or petulant association of ideas, depending upon the psychological set-up of the individuals. The latter is said to be influenced by external factors. The external factors are those which comprise social pressures such as suggestions, instruction, group influences or participation. Advertisements which involve repetition, size, novelty, intensity, contrast, and the like, are also taken to be external factors. While internal factors include personal interest, emotional or physical state, hunger or thirst, pride, prejudices, attitudes and other feelings towards individuals or groups.

The strategy of winning and influencing people to one's thought largely depends upon the favourable setting in which the technique is launched. The favourable environment can be thought of as one where the society experiences certain emotional disturbances which include:

"(1) Painful uneasiness or anxiety;

(2) a feeling of separation from the group or isolation from group standards; and

(3) a feeling of pointlessness or that no certain goals exist."

Such a disturbed and insecured feeling is believed by sociologists to exist in a fast moving, literate and industrialised society. It is held that a slow moving, non-literate and underdeveloped society develops resistance to change. Hence it is scarcely possible to replace the already formed images of that society to the changing new ones. In a word, the technique of image formation applies to a well-developed and standardised society. Another point as regards communication carriers deserves attention. The communication carriers, in fact, attempt to draw people and to get them together and influence them to an activity. But more often than not, they fail to accomplish their specific objective. As indicated earlier, they emphasise the existence or awareness of a certain product or service, but they do not, however, set forth the specific attribute which the image-maker endeavours to do. In other words, the repetition of message is not always as significant as the nature of the image that it attempts to soak and begins to germinate in one's mind. To assess the achievement of advertising, the entrepreneur has to pin down the specific aspect which he attempts to demonstrate through advertising. The distinction between the advertising goals and marketing objectives, though apparently similar in the ultimate analysis with respect to enhancing sales and repeating purchases, markedly differ from each other in individual performances. The former spell out as "a specific communication task, to be accomplished among a defined audience to a given period of time". While the latter include stepping up sales, assisting and aiding salesmen in opening new accounts in new territories and expanding the share of the markets.

One of the factors that could possibly make the potential clientele to form a favoured image of a particular concern is to hold forth the enamoured attribute of its product (if there is none, create one) in a well received setting. If necessary, lend the sought-after image a 'new look' "in the already accepted values of the people". The image should conform to the tastes, purses, purposes and similar other standards of the society. Consumer research seeks to demonstrate that many a new and exotic preference tends to alter according to the various educational and income frequencies. Hence it is up to the market researcher to bear in mind the nature of the image he has in mind to project it to his prospective clients. It is not the well publicized that merits the attention of the public that matters often, but most often the pleasant image that captivates the onlookers that really counts. Many a success of the "unknowns" and very many failures of the "knowns" in the recent General Elections drive home this incredible point. The reason seems to be obvious. The former, no doubt, were known to the public but somehow they failed to impress a favourable and vote-catching image in their constituencies. While the latter is believed to have imposed an influencial and promising image on their voters, despite their individual insignificance.

Another principle which advances the effective formation of image is to emphasise the already formed images in terms of their "reference points". Reference points are taken to be standards which are employed as basis for comparison. In a complex society, it is believed, people constantly and continuously make choices and as such standards are needed to judge the contrasts which are derived from various events in the competitive society. The standard of comparison may stem from the performances and accomplishments of people with respect to their finance, prestige, recognition, public goodwill, and such other human longings. The attitude of comparison may be directed either towards a positive stand or a negative approach. Human nature being what it is, it seeks to assess its attainment by comparing with other similar competitors' success or failure, profit or loss, goodwill or ill-will, assets or liabilities, and so on.

The next consideration is as to how could one determine the nature of the image of a particular concern which exists in the minds of a certain society or group. Unless it is appraised, one can scarcely proceed further to develop and deepen the image of one's choice. When once it is assessed, it is rather possible to develop the desired image through cautious, periodic systematic re-enforcement of messages or stimuli. To perform this course of findings, usually social psychologists are called into service. They evaluate the necessary particulars by means of projective tests and "depth interviews".

It is true that men are rational beings. As such, sale-stimulants should be designed and directed in such a way that they should appeal and impress the rational attitude of human beings. In a dynamic and standardized society, it is rather difficult to draw a line between the rational and the irrational. In a society where the majority has a say, it is immaterial to exert the rational attitude by the minority. The latters' views will lead them nowhere. In this context, it must be pointed out that the real reasoned people could even be dubbed as irrational by the majority!

It is argued that the consumer, as an individual, by and large, wants to buy the goods and services which are socially acceptable. The rational motive implies self-approval which is equally acceptable by the society. In fact, it reflects the customs and conventions of the society. Therefore, it is maintained that the society and the rational consumer have one and the same taste or desire about a consumer good in particular.

The irrational motive, on the contrary, can be taken to mean that it is not one of self-approval, but that which is appreciated by the society. What is good for the major population of the society need hardly be bad for all the individuals! This kind of argument perhaps has made the Chief Executive of the General Motors say: What is good for the G.M. is considered good for the Government of the U.S. It is no wonder that many individuals who when asked to give their opinion as regards certain item, they seldom give out the answers what they deem fit lest the society would brand them as irrational beings! Instead, they will offer "socially accepted answers or even completely erroneous answers concerning their behaviour". In a word, whatever motives the consumers may have, the former should be socially acceptable. What is socially accepted is constantly in a flux. That is why, the market researchers should be alert to keep in line with the changing consumer's preferences.

The consumers' behaviour in a standardised and imitative society, by and large, not only takes a shape with reason and knowledge, but more often falls a victim to feelings and unconscious drives. Hence an average individual is governed by both reason and emotion. In the light of these complex segments of individual behaviour, the image-maker has to take into account many a vital factor before he launches his campaign. The task of the image-maker is not an easy one. His primary concern should be with the individuals' longings and desires. If he ignores this aspect and attempts to coerce the psychological setting of the individuals by means of persuasive media, the success of his efforts would tend to be transient if not ineffective. Whenever an individual mental equilibrium is tilted or disturbed by persuasion, the mind, despite its coercion, attempts to seek ways and means to regain its equilibrium.

In conclusion, as indicated, advertising, by and large, is a communication between the respondent and the commercial. It was presumed once that the respondents were passive recipients devoid of emotions or outside stimuli and as such certain terms, viz., retention, memory, impact and the like indicated only a passive registration. But today modern psychology bears out that the above assumption is not only outdated and useless but also is misleading and incorrect. In fact an individual or group "talks back, restructures, identifies and distorts the relation between himself and the commercial". Hence an advertisement researcher has to take into consideration the dynamic inter-relationships between the consumers and the communication-carriers.

ANNOUNCEMENT

The following Annual Numbers of **THE EASTERN ECONOMIST** are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Rs. 50|-.

1.	India & the World and India in 1950	Rs. 5|-
2.	A Social History of the Indian People & India in 1951	Rs. 5|-
3.	India & the Free World and India in 1952	Rs. 5|-
4.	India in Asia & India in 1953	Rs. 5|-
5.	India in South East Asia and India in 1954	Rs. 5|-
6.	India & the Communist World and India in 1955	Rs. 5|-
7.	India in 1975, A Study of the next Twenty Years & India in 1956	Rs. 7.50
8.	India & the Middle East and India in 1958	Rs. 7.50
9.	India and Europe & India in 1959	Rs. 10|-
10.	India & North America and India in 1960	Rs. 10|-
11.	India and Europe Divided	Rs. 10|-

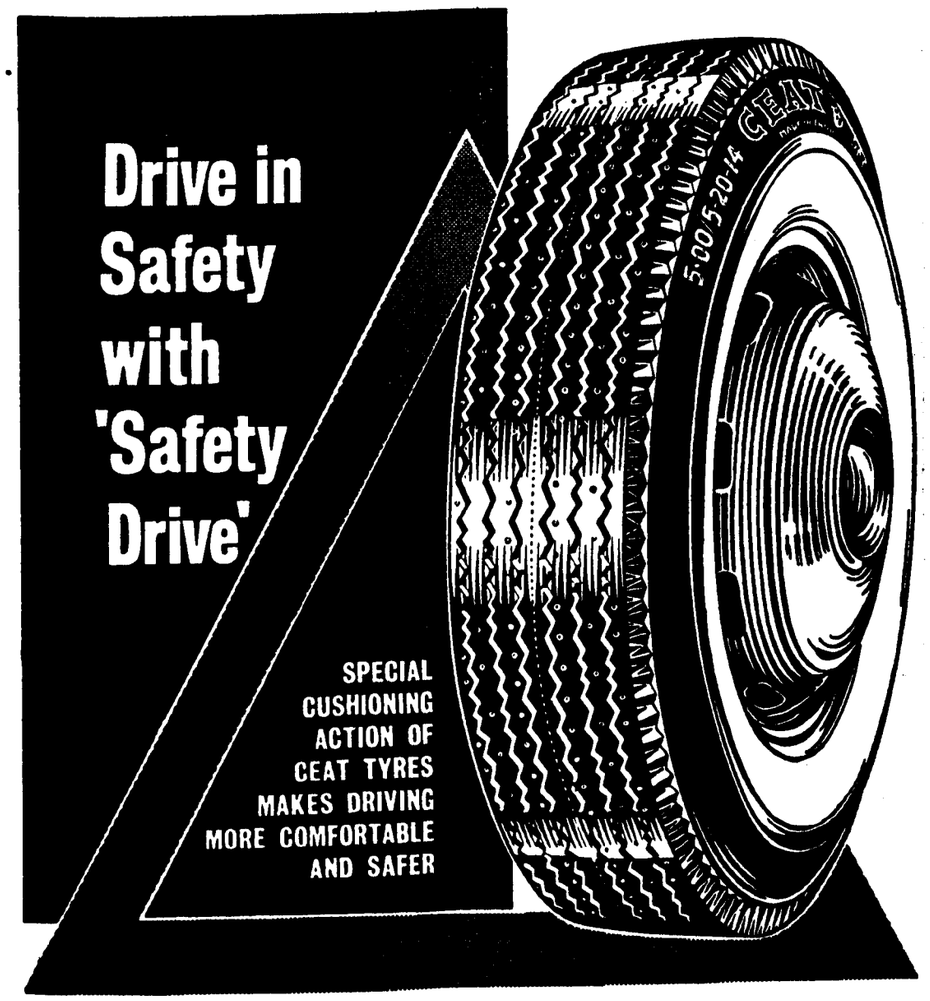
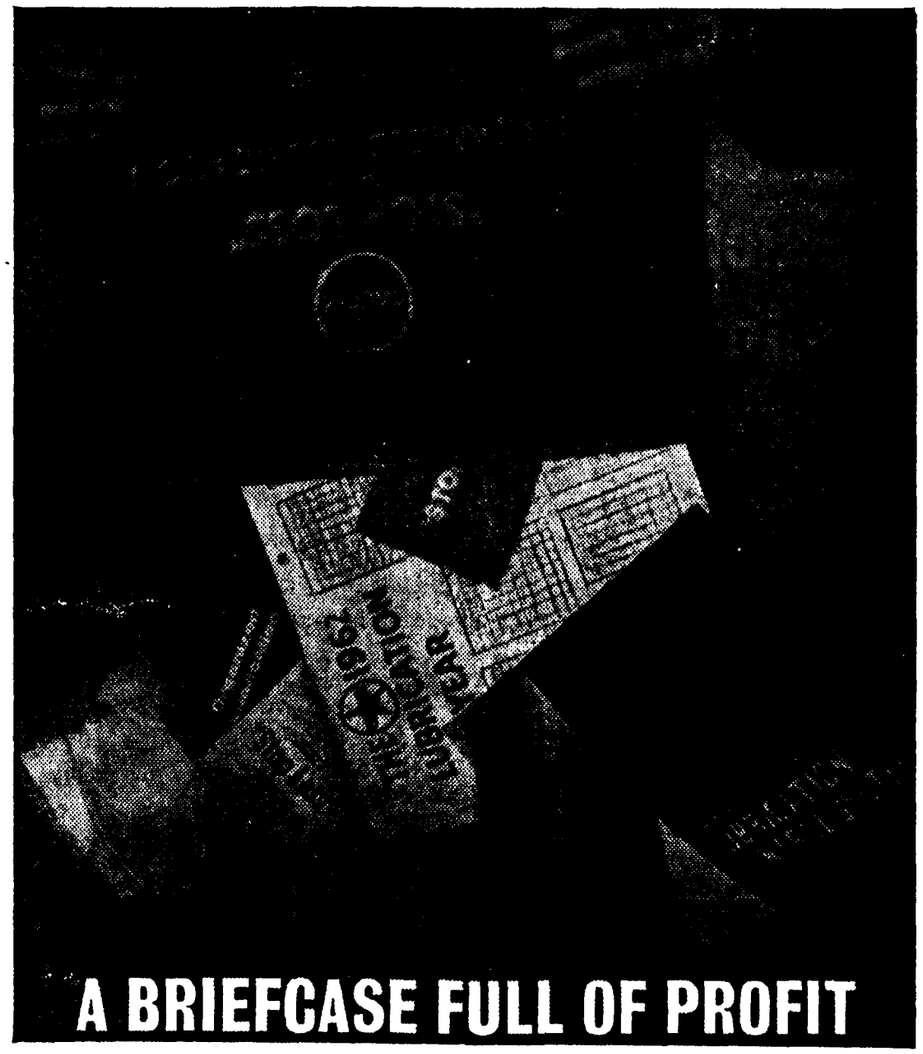
THE BUSINESS WORLD

Are We Doing Enough to Push Exports?



By CROESUS

ALTHOUGH the country may be said to have become export conscious, one cannot say as yet that this is matched by efforts commensurate with the needs of our ambitious development plans. "It is obvious," as Mr. G. L. Mehta, Chairman, of the Industrial Credit and Investment Corporation of India (I.C.I.C.I.) observed when he inaugurated the meeting of the Central Council of Foreign Trade, the other day, that "we cannot create an export market overnight; we have to start gradually building up an export market and nourish it for a long time before it is stabilised." This may sound like a cliche or truism but, if Mr. Mehta felt compelled to reiterate it, he must have had sound reasons for doing so. Even though it is generally agreed that exports are vital to our economy and an expansion of our exports directly concerns our development, judging by the actual performance, we cannot say that much has been done even at this stage sedulously to build up an export market, not to talk of nourishing or stabilising it. If we leave aside the export achievements of a section of the engineering industry and some marginal gains here and there due more to fortuitous circumstances than to deliberate effort—we have very little to feel elated about. On the contrary, the few figures that Mr. Mehta gave should convince everybody that there is no scope for any complacency. How many people are aware, we would like to know, that our exports, as estimated by the Planning Commission during the Third Five-Year Plan, do not at all help us to meet our needs for development imports? As against our maintenance imports of Rs. 3,650 crores or an average of Rs. 730 crores per year—even this is considered as an underestimate by Mr. Mehta—our total exports for the Third Five-Year Plan period have been put at no higher than Rs. 3,700 crores giving an annual average of only Rs. 740 crores. This means, as the I.C.I.C.I. Chairman did well to point out, that "we are meeting the whole of our import bill for Capital Goods by borrowing." This is hardly a satisfactory position for any country.



Let us look at it from another angle, also highlighted by Mr. Mehta. During the last ten years, our national income has increased at an annual rate of between 3 and 4 per cent, whereas our exports have risen, over the same period, at about just one per cent per annum! Thus, notwithstanding the fact that our production has increased, we have not been able to spare more for our exports. In other words, we have been using most of the production internally, which, of course, is a feature common to nearly all the developing countries where in the initial stages of progress at any rate, the propensity to consume is relatively greater than in the industrially advanced countries. Whatever the explanation, the net result remains that the level of our exports is not only not keeping pace with the level of our national income, but actually going down. About ten years ago, our exports were six per cent of our national income, but today, despite the two Plans, our exports are less than five per cent of our national income.

What is a matter for considerable concern is that, while we are not releasing any appreciable quantity of our increased production potential for exports, we are also impinging, to some extent, on imports, with the result that, quite often, there is not enough of these imports to go round to cater fully to the installed capacity of export industries in the country. The inevitable result has been, as Mr. Mehta has noted, that we have involved ourselves in a vicious circle, whereby import cuts are leading to high internal costs as a result of shortages of materials. This would not have mattered if the repercussions stopped there and did not extend further, but what has happened is that shortages of the essential imported raw materials have led to a curtailment of production even in export industries and, consequently, to a loss of competitiveness in the case of our exportable goods in foreign markets. This is by no means the only factor responsible for making our goods less competitive. The policies of the Government, on the one hand, and the unappreciative attitude of labour to the question of productivity, on the other, not to speak of the inadequate and often inefficient management, also go to render our goods in the world markets anything but competitive, price-wise or quality-wise. It is, therefore, necessary to forge a multi-frontal solution to the problem of exports.

Fortunately for us, the prevailing circumstances are reasonably propitious. Apart from the steadily growing export-consciousness of the public, to which reference has been made already, the authorities have also begun to bestir themselves. The acceptance of the recommendations of the Mudaliar Committee and the earmarking of a crore of rupees for export promotion constitute a good beginning. But there are a number of other important recommendations that require to be promptly implemented. There is, for example, the proposal for setting up a pool of revolving foreign exchange funds to be used to foster exports. As the Mudaliar Committee has observed, it should be possible to finance the import of the additional raw materials required to stimulate production for export progress through the medium of such a fund. It is the belief of this Committee that groups of international banks would be agreeable to supply credit for importing raw materials to be used by approved exporters who can be relied upon to fulfil undertakings on exports. If the foreign exchange so available is purposefully employed to ensure exports and earn more foreign exchange, such surplus could be put into a fund until it assumed a respectable size to be used, in turn, again, for imports of raw materials for export industries. The Committee has made further recommendation to make this effective, such as the setting up of an autonomous body, to be called the Export Stabilisation Board, and

"SIPES"—the little ring knobs found in the tread give extra safety—hold the road better. These "safety rings" combined with CEAT's exclusive deep tread pattern give complete driving confidence.

'For you...In the CALTEX "STOP-LOSS" Programme

Out of the Caltex Sales Engineer's briefcase comes a sheaf of ideas for cost control through organised lubrication—the Caltex "Stop-loss" Programme.

Start on the programme immediately. You will find that organised lubrication reduces losses in three important directions: production, maintenance and purchasing. The savings will go directly into profits —an average gain of upto 4% safely in the bag.

Ask your Caltex Sales Engineer for information

Company executives can obtain a free copy of this booklet by writing on their official letter-head to their nearest Caltex office.

it is to be hoped that effect would be given to these recommendations also without undue delay. The creation of a seperate Department of International Trade with such a dynamic Minister as Mr. Manubhai Shah as its head offers some hope that things will begin to move more brisky and systematically than hitherto. We may expect him to set, what the I.C.I.C.I. Chief has described as "meaningful targets for export for each industry, reconcile various programmes dealing with export, and co-ordinate several Government agencies concerned with them."

When once the Government is convinced — as one would like to hope it is—of the case for incentives to stimulate exports, it is not clear why it should be halting in providing as many as possible and practicable of such incentives as have been suggested by the concerned interests. As Mr. Murarji Vaidya, President of the I.C.O.F.T. urged, "we must take courage in both hands and announce and operate schemes of export promotion incntives which will make it worthwhile for every exporter to make long-term plans and set up the necessary organisation to develop the export trade of our country." Viewed in this context, it is debatable whether the relief on exports given by the Union Finance Minister last month is at all adequate. While the extent of relief given is welcome insofar as it goes and may even help improve our exports to some extent, the fact that the relief has been confined to a limited number of export commodities takes away much of the grace of this gesture. Further, the relief given in respect of corporate taxation is too meagre to prove an effective enough incentive for increased exports. The authorities could certainly afford to be more liberal when the stakes at issue are so vital to the economy of the country.

If the best results are to be obtained, tax reliefs and other official incentives alone will not do. They must be supplemented by the earnest contributions of both industry and labour; without that it would be impossible to strike at the root cause of the poor performance of our exports today. That our costs of production should be higher by nearly 100 to 200 per cent than those of many other countries, despite plentiful manpower and several other incidental advantages, is a commentary on the state of our preparedness in this sphere of economic activity. Something more effective than mere raising of eye-brows is called for, if we are not to continue to be priced out of the world markets not only in the new lines of our exports but even in some of our traditional ones. In short, to quote Mr. Mehta, "there is no basis for stable exports other than efficient production and steady reductions of cost."

Business Notes

Productivity

PLEA FOR RENEWED CONSCIOUSNESS

THE HIGH COST of production of our goods has placed us at a great disadvantage vis-a-vis those countries which can boast of a relatively much lower cost of production. This high production cost in our country is the result of a number of factors, but it is primarily a reflection of the low degree of productivity in the case of our industries. If productivity is reasonably high, the industry concerned will not at all mind a commensurately high wage bill. Now, wages constitute a large part of the cost of production, but the productivity of the workers concerned is lamentably low, and this is a serious hindrance to the country's export drive. At a time, when increased exports are so vital to the country's economy as it is today, the position requires to be looked into without delay. Indeed, this formed the main theme of the Presidential Address of Mr. Naval H. Tata at the annual general meeting of the Employers' Federation of India in Bombay.

"In the sphere of practical economics", declared Mr. Tata, "it is the wage cost per unit of production which matters". Despite the prevailing opinion to the contrary, ours is not a cheap wage-cost economy, although individual earnings of the worker in this country may not compare favourably with those in the more advanced countries of the West. Wages are directly related to productivity and they cannot outrun the industry's capacity to pay, nor can they be out of tune with productivity. In this context, Mr. Tata, referred to a recent survey which has shown that, between 1951 and 1957, the wage index in the organised sector has risen by 24 points, whereas the productivity index has moved up only by 8.6 points, thus revealing that there has been no relation between wages and productivity. The concept of wages, according to Mr. Tata, has a wider significance in this country and includes an element of what is popularly known as "Social Justice". But he noted that this yardstick of social justice was not being applied equally both to the organised and to the unorganised non-industrial workers of the country. In the result, there has been no reasonable parity as between the aggregate wages of the two categories, the unorganised sector having a distinct advantage over the organised. With the aid of statistics, Mr. Tata further revealed that agricultural labour, to which category the majority of the working population in India belonged, received only a fraction of what industrial labour earned, and remarked that it was unwise to accentuate the existing big disparities between the workers in different sectors thus, besides underscoring the point that any increase in the earnings of industrial labour must be preceded by a rise in productivity.

In view of the slender foreign exchange resources, Mr. Tata felt that exports must be increased and this could be achieved only if the two essential pre-requisites, namely, the maintenance of quality to satisfy the foreign consumer and the competitive cost of our products, were borne in mine. As regards quality, he said, it was the primary responsibility of the management, but the cost of production, he went on to say, depended on prices of raw materials, which were largely controlled by the Government, and labour cost over which also, as he averred, the employer had no control, thanks to the prevailing era of adjudicated awards. The primary responsibility for holding the price-line, therefore, lies more with the Government and the employer has practically no control over the wages, nor over the other items in the price structure which are now within the ambit of the Tariff Commission.

Chemicals

STEARIC AND OLEIC ACIDS

THE STEARIC AND Oleic acids industries have again come under the scrutiny of the Tariff Commission. The protection which these industries have been enjoying

for the last 14 years (it was in 1948 that the then existing revenue duty of 30 per cent ad valorem on Stearic and Oleic acids was converted into a protective duty) is due to expire next December. In 1954, the Tariff Commission brought in even derivatives of Stearic and Oleic acids within the scheme of protection, and the duty on these acids and their derivatives was fixed at a uniform rate of 31½ per cent ad valorem or 8 annas per lb., whichever was higher. Recalling all these, Mr. K. R. P. Aiyangar, Chairman, Tariff Commission, observed, whilst opening the public inquiry in this connection, that the industry had made considerable progress during the past 14 years; the production of stearic acid had increased from 69 tonnes in 1947-48 to 2,838 tonnes in 1961 and that of oleic acid from 8 tonnes to 392 tonnes. Even so, according to Mr. Aiyangar, there has been considerable under-utilisation of the existing capacity. Giving statistics to support this, the T.C. Chairman revealed that the present capacity of all the seven units engaged in the manufacture of these acids, as reported by the Development Wing, amounted to 6,949 tonnes for stearic acid and 1,768 tonnes for oleic acid; in the case of derivatives, which comprised stearates of aluminium, zinc, magnesium and lead, he said the total present capacity for manufacture amounted to 452 tonnes, while the total production of stearates increased from 113 tonnes in 1959 to 126 tonnes in 1960 and to 166 tonnes in 1961.

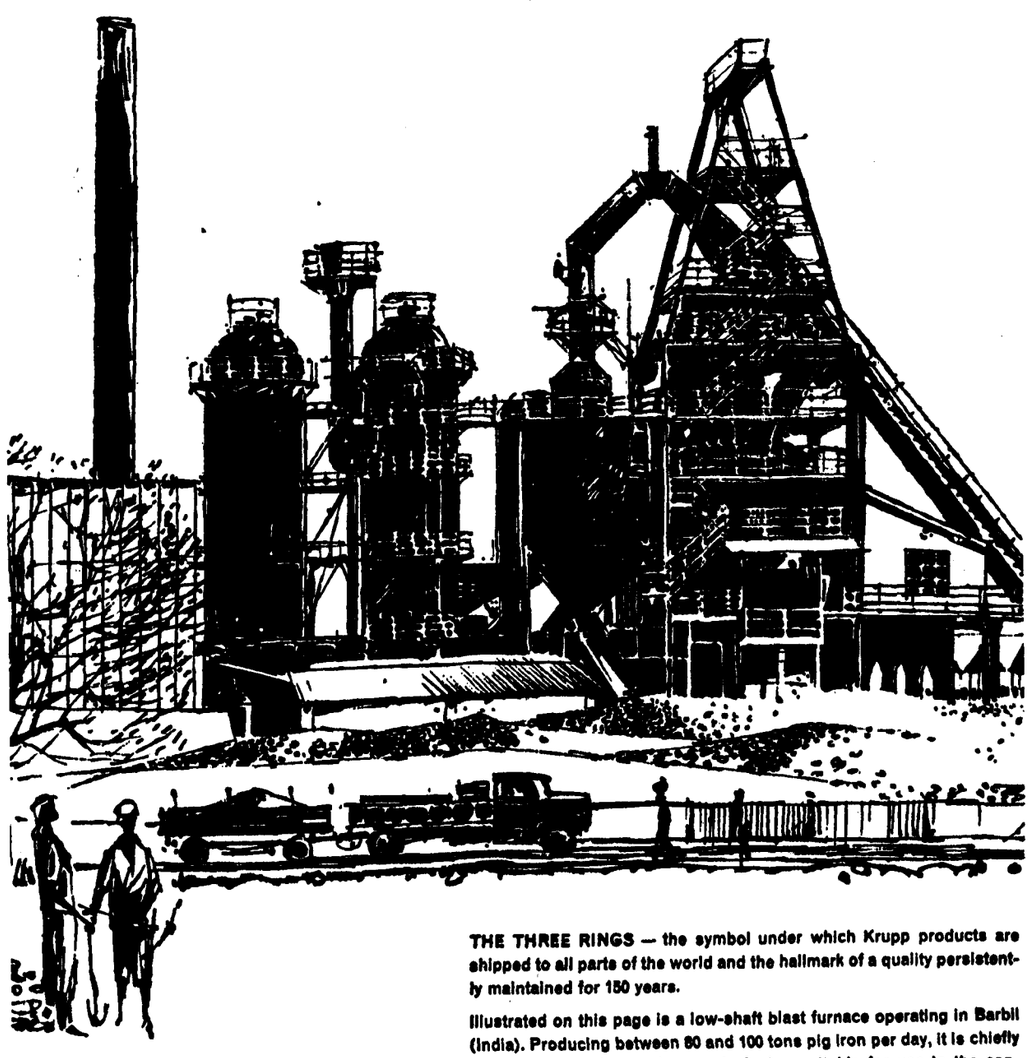
Mr. Aiyangar also disclosed that the consumption of stearic acid, on the basis of sales and imports, worked out to 2,410 tonnes for 1960 and to 2,716 tonnes for 1961, while the corresponding figures for oleic acid were 335 tonnes and 407 tonnes for 1960 and 1961, respectively.

The principal raw materials required for the manufacture of stearic and oleic acids are tallow, palm oil and groundnut oil. With the exception of palm oil and tallow, all other raw materials, according to Mr. Aiyangar, are available indigenously. The imports of palm oil and tallow are allowed to the existing manufacturers on the basis of their past consumption, claimed the T.C. Chairman. But the producers complain about the inadequancy of their quotas and they point out that it is this which has resulted the crippling under-utilisation of capacity. The indigenous supply of palm oil and tallow is very small and, even in the case of groundnut oil, the most important raw material in the manufacture of both these acids, the price has been steadily increasing.

Mr. Aiyangar drew attention to the fact that there were complaints from consumers about the higher prices of the indigenous products compared to the imported ones. There were also complaints he said, about the relatively lower quality of the acids manufactured indigenously. He did not, however, say to what extent the differences in quality of the finished products were the result of the inherent differences in the quality of the indigenous and the imported raw materials.

Paper Industry

HOW TO ACCELERATE DEVELOPMENT?



ALTHOUGH THE Third Plan envisages stepping up of paper and paper boards output from about 3.45 lakh tons in 1960 to 7 lakh tons by 1965-66, through doubling of the installed capacity from 4.1 lakh tons to 8.20 lakh tons, the progress made during the first year of the Plan appears to have been far from encouraging. During 1961, the increase in paper and paper boards production has been only of the order of 19,000 tons, as against an increase of 38,000 tons in 1958, 43,000 tons in 1959 and 51,000 tons in 1960. One explanation for this slow rate of progress in this industry in the last year can be that there is always a time-lag between the licensing of new units or expansion schemes and their implemetation. Thus, although licences for an additional capacity of 8.04 lakh tons have been issued, bringing the total licensed capacity to 12.14 lakh tons, no new paper plant has been added during the first year of the Third Plan. The 19,000 tons increase in output has resulted only through expansion of two of the existing units.

Three large and seven small units, out of the 22 large and 71 small units licensed to be set up during the five years to 1965-66, are expected to be commissioned during the current year. Some expansion programmes of the existing units may also materialise. But the growth of the industry is not likely to be commensurate with the growing needs of the country. No concrete steps appear to have been taken by licencees in the case of a number of schemes already sanctioned for implementation. This is evident from the fact that out of the additional capacity sanctioned to be installed, 32 licences (capacity 95,602 tons) has to be cancelled by March 31, 1962, under the "Show-Cause Notices" procedure. There are another 17 licencees who have also been served show-cause notices. The number of such cases may go up in the near future when the progress made by the licence-holders to implement their schemes comes up for further review. In the light of these facts, there is obviously a reason to look into the causes which stand in the way of setting up of the new units or even the expansion of some of the existing ones.

One reason for this slow progress in the matter of expansion of this industry is perhaps the low rate of return for capital employed in it. Mr. P. J. Egan, Chairman of the Indian Paper Makers' Association, has expressed the opinion that the rising cost of production has eaten up to a considerable extent the profit margin allowed to this industry after an enquiry by the Tariff Commission three years ago, which forms the basis of the present fixed selling prices of paper. The small profit margin that remains at present does not enable the companies to plough back any great profits for expansion and also does not make them sufficiently attractive for fresh investment by the public. Raw material, chemicals, power and fuel costs alone, according to him, have gone up by about Rs. 150 per metric ton since the Tariff Commission's enquiry. Production costs have also gone up owing to increased labour charges, repairs, establishment and the other overheads. The position has been explained recently to the Development Wing and an early decision in this regard in the form of some ad hoc increases in selling prices should help in accelerating the setting up of new paper factories in the country.

Some of the other difficulties faced by the industry are the non-availability of adequate quantities of raw materials due to transport bottlenecks and the anomalies created by lack of clear definitions of various types of paper for purposes of assessment of excise duty. Upgrading of the raw materials required by the paper industry into the category of preferential traffic schedule of the railways should indeed be of some help in expeditious movement of these materials from the assembling centres to the factory sites. But since the overall bottleneck on the railway system is going to

remain for some time to come, the industry will have to put up with it.

Mr. Egan's plea for the development of the forest resources of the country on the lines suggested by him deserves particular attention from the authorities. It is hoped that his plea for leasing out of forests for development and exploitation by the industry on long-term basis will be conceded by the Government. There is obviously a case for precise definitions of various types of paper being evolved for the purposes of excise duty and an expeditious disposal of the memorandum submitted by the IPMA to the Central Board of Revenue in this regard is warranted.

Kerala

INDUSTRIALISATION THE BASIC PROBLEM: NCAER SURVEY

AT THE instance of the Kerala Government, a techno-economic survey of the State was undertaken by the National Council of Applied Economic Research, the main object being to assess the industrial potential of the State during the coming decade vis-a-vis the growth potential in other sectors of its economy.

The Report spotlights the distinctive feature of Kerala's economy—the high level of labour productivity in the agricultural sector (Rs. 638 per worker as compared to the all-India average of Rs. 411 per worker) which is offset by the extremely low productivity in the industrial sector (Rs. 548 per worker as compared to the all-India average of Rs. 1,294 per worker). The high agricultural productivity in Kerala is occasioned by its pattern of commercial crops yielding a high value. Coconuts, for example, occupy 20.2 per cent of the gross cropped area in the State and this is closely followed by rubber plantations. Low productivity in the industrial sector is accounted for by the predominance of cottage industry using obsolete techniques.

Against this background, the pressure of population on land and the increasing unemployment in the State have resulted in the low per capita income. The Report, therefore, urges the need for increasing per capita and total income by providing more employment opportunities for the working force in the State. Since employment in the agricultural sector cannot be increased beyond certain limits, the Council emphatically advocates further industrialisation of the State.

Having thus diagnosed the malady that has hindered the progress of Kerala, the Report prescribes the remedy in terms of guiding factors in planning the strategy of growth of Kerala. Firstly, a proper system of crop priorities in the sphere of agricultural development is to be fixed, taking into account the special suitability of the State for growing valuable plantation and other cash crops. The Council discounts the present thinking in terms of achieving self-sufficiency in foodgrains within the State. Instead, the Council suggests that no change-over from cash crops to food crops should be allowed and the deficit within the State should be made up by Government from surpluses of other States. The Council details the following order of crop priorities for Kerala: (i) the crops constituting a raw material for the industry, specially those which are presently in short supply, e.g., rubber, cashew, coconuts; (ii) the crops making a substantial contribution to foreign exchange earnings, e.g., tea, coffee, lemongrass, cardamom etc.; (iii) crops which contribute towards the wiping out of food deficits.

Secondly the Report urges the need for technological improvements in the industrial sector. It analyses the industrial growth potential in terms of five factors which, among themselves, determine the possible rate and the lines of expansion. These include the existence of overhead facilities, availability of local raw material resources, the existing level of industrial technology, entrepreneurial skill and type of labour found in the State. One of the main reasons of industrial backwardness, the Report says, is the use of antiquated industrial techniques resulting in low productivity and small re-investible surpluses in the industries of Kerala.

Technology being the prime-mover of economic growth, the Report opines that the mainspring in the strategy of industrial growth must be technological advancement, both through the replacement of antiquated processes by more modern techniques in the existing industries, especially the small-scale sector, and through introduction of technologically advanced new industries.

The Report suggests that the State should aim at achieving a per capita income of Rs. 410 (at 1955-56 prices) by 1970-71 which will be a somewhat comparable level to that of all-India in that year. This would require an increase of 107.6 per cent in the State's income between 1961 and 1971, i.e. an annual average rate of increase of 10.7 per cent. "If this goal is to be achieved", the Report says, "total investment effort required during the coming decade will be around Rs. 1,000 crores; Rs. 400 crores during the Third Plan period and the balance of Rs. 600 crores during the Fourth Plan. Investment in the State sector will have to be of the order of Rs. 484 crores. The balance of investment will be in the Central Government and private sectors."

At the rate of growth suggested in this Report, the primary sector income would increase from Rs. 193.8 crores to Rs. 387.6 crores (100 per cent), secondary sector income will rise from Rs. 66.5 crores to Rs. 152.9 crores (130 per cent) and tertiary income will go up from Rs. 136.7 crores to 283.6 crores (107.5 per cent).

In an Appendix to the Report is set out a summary statement of the possible large-scale and medium-scale industries which can be fostered in the State on the basis of its agricultural, forestry and industrial raw material resources. Some of the more important of these are: Sugar, cashew shell oil processing, automobile tyre, rayon pulp, paper (panalur paper), industrial alcohol, essential oil, pharmaceuticals; chemical fertilisers, caustic soda, ship building, electrical instruments, agricultural implements, structural fabrication, high tension insulators.

Textiles

BANGALORE WOOLLEN, COTTON AND SILK MILLS

AT THE 79th annual general meeting of the Bangalore, Woollen, Cotton and Silk Mills Company Ltd., Mr. E. F. G. Hunter revealed that the company had a successful trading year in 1961, sales having reached a figure of over Rs. 6 crores for the first time in the history of the company. The higher profit resulted from the progress made to improve efficiency in the mill and also from the good conditions which prevailed for most of the year in the Indian markets. On account of the efficiency brought about, it has been possible for the directors to recommend an increase in the dividend

on the company's ordinary shares. The final dividend recommended will bring the total for the year to 18 per cent gross, equivalent to 12.6 per cent net, which compares with the dividend of 10 per cent net declared for each of the eight preceding years, during which period labour by way of wages, dearness allowance, gratuity and other benefits has annually taken an increasing share from the company's revenues. Sales of the company's popular union fabric Cotswol and the heavier cloth Angola increased during the year and a substantial target for the supply of both these fabrics to Soviet Russia was completed.

Mr. Hunter later on dealt with the new charges being imposed and over which the company has no control and as a result of which costs have gone up quite high. Increase in wages brought about as a result of the recommendations of the Wage Board and the Automatic Loom Cess can be said to be mainly responsible for this increase in costs. Coal supply difficulties were also experienced by the company in 1961 and recourse had to be made to the purchase of seaborne coal which costs nearly double that supplied by rail. Although all these difficulties have been raising their head from time to time and particularly last year, it can be said to the credit of the Bangalore Woollen, Cotton and Silk Mills Company Ltd. that it has weathered the storm very successfully.

BUCKINGHAM AND CARNATIC

AT THE forty-first annual general meeting of the Buckingham and Caranatic Company Limited, Mr. E. F. G. Hunter dwelt at length on the various problems facing the Company. Mr. E. F. G. Hunter revealed that for the first time since 1953 an increase in dividend on the company's ordinary shares has been recommended. The final dividend proposed will bring the total for the year to 18 per cent gross, equivalent to 12.6 per cent net which compares with the dividend of 10 per cent net declared for each of the eight preceding years. This increase in dividend is justifiable in the sense that while labour is demanding an increase in wages there must be equally a compensatory factor for the shareholders as well. The labour, and the shareholders have an equal right in the higher profits of the company.

Dealing with exports, Mr. Hunter underlined that an active export drive had been engaging the attention of the company. This is evidenced by the increase in company's export sales by 2½ per cent to approximately Rs. 2.02 crores which increase was once more against the trend of India's sales of textiles in overseas markets which last year fell by nearly 19 per cent. Since the textile industry is facing a severe competition in foreign markets, Mr. Hunter pleaded that there was a valid case for a reduction in the import duty on dyestuffs and chemicals. Quality has now become the key to success in overseas markets but this, of course, alone is not sufficient and it is essential that quality be backed by higher productivity to ensure a low cost production. In the final analysis Mr. Hunter pin-pointed towards the increase in costs that have hampered the speedy growth of the industry. First and foremost may be mentioned the increase in wages which have been brought about under the recommendations of the Wage Board and the second may be mentioned the absenteeism which has taken an increasing turn of late. If an onward march is to be secured and the target of cloth laid down for the Third Five-Year Plan is to be achieved, it is essential that absenteeism be put an end to and the rationalisation be brought about quickly. Labour will, of course, have to adjust to the rationalisation programme. Since management is prepared to look to their interests, it becomes the bounden duty of labour also to make some sacrifices for achieving the targets laid down in the Plan.

National Rayons

HIGHER COSTS

MR. KASTURBHAI LALBHAI, Chairman, The National Rayon Corporation Ltd. at the annual general meeting of the company revealed that there has been an alround increase on the expense side due to increase in excise duty and increase in other items due to higher production both of the rayon yarn and of chemical products. The chairman, however, was hopeful that the turnover for the year 1962 will be higher as the tyre cord plant has gone into production and the expanded rayon plant will be in production for the whole year as against only six months in the year 1961. Then again it is a comforting factor that the production of the rayon yarn during the year 1961 has increased by Rs. 77 lakhs and that of chemical products by Rs. 17 lakhs compared to the year 1960. Another encouraging development is that the company has been granted foreign exchange loan to the tune of Rs. 39 lakhs for the expansion of the caustic soda plant. The import licence permitting import of requisite machinery is expected and it is hoped that the expanded capacity will be installed early next year.

The criticism that the selling prices of rayon are higher as compared to the selling prices in other countries, was, refuted by the chairman in a dignified manner. In fact the position is that the ex-factory prices exclusive of excise duty permitted to be charged by the indigenous rayon manufacturing units are substantially lower than the internal prices prevailing in all the other rayon yarn manufacturing countries. These prices are even lower than the landed cost of corresponding imported varieties. Since the supply of imported pulp is not sufficient, the company is compelled to purchase the balance of its requirements of pulp utilising the licences made against the export promotion measures. Mr. Kasturbhai Lalbhai was sorry to find that while manufacturers of rayon yarn agreed to the absorption of 60 per cent of additional excise duty imposed last year, consuming units have not honoured the understanding and have tried to pass on the additional excise duty to consumers.

The Central Bank of India

ALL ROUND EXPANSION

FROM THE speech of Sir Homi Mody, Chairman, the Central Bank of India Limited, an all round expansion attained by the Bank in the year 1961 is visible. It may be in regard to working funds, deposits, advances, gross income or net profit, new records seem to have been established. Deposits, for instance, have registered an impressive increase of Rs. 20 crores, the total moving from Rs. 200 crores in 1960 to Rs. 220 crores in 1961. In the quinquennium 1957 to 1961 the growth in the Bank's deposits has been of the order of 42 per cent, time deposits having been doubled during the period.

Although there has been only a modest increase of Rs. 220 crores under investment, it is heartening to note that throughout the year 1961, Bank's resources were put to the maximum use and were profitably employed. At the end of 1961 advances reached as high a figures as Rs. 161 crores, showing an increase of Rs. 10 crores during the year. The growing tempo of economic and industrial development was reflected in an improvement not only in banks loans, overdrafts and cash deposits, but also in the portfolio of bills purchased and discounted, which is a true index of the part a bank plays in financing the movement and marketing of merchandise all over the country. As in the case of deposits, so also under advances there has taken place during the past five years a marked improvement to the tune of Rs. 60 crores, which is equivalent to an increase of about 60 per cent.

As far as gross earnings are concerned, they touched the highest level and amounted to Rs. 12.23 crores. Net profit also show a substantial rise and is an index of the bank's progress during the first half century of its working. The shareholders, though may not be very pleased with the dividend which is restored to the level of 14 per cent net probably because they expected a further increase on account of increase in profits, still it is a consoling factor that the level has been maintained. With the Bank continuing to make further progress in all directions, it is likely that the dividend of 14 per cent net might increase further in the years to come. Our economy is expanding at a rapid pace and the role of the Central Bank of India Ltd. has been quite substantial in it. Its management is in efficient hands and it can be expected that the Bank will continue to make progress year after year.

Indian Aluminium

SATISFACTORY PROGRESS

WHILE INDIAN ALUMINIUM COMPANY LIMITED has made an alround progress, its greatest achievement seems to be in completing its expansion plans much ahead of the schedule. This was pointed out by the Company's Chairman, Mr. K. C. Mahindra, at the twenty-fourth annual general meeting. It may for instance, be observed that at Hirakud, the expansion aimed at doubling the capacity of the plants to 20,000 tons per annum, was completed five months ahead of schedule. At Alupuram, the additional extrusion press was installed on time and started operating in October, 1961. The expansion of alumina producing facilities at Muri progressed satisfactorily and a portion of the new facilities was brought into operatoin in December, again ahead of schedule by approximately four months. In a few weeks' time, the company will have completed the integrated expansion programme undertaken during 1959. It, indeed, is a heartening factor that all the projects have been or will be completed within the capital expenditure figures originally budgeted. Expansion plans apart, the company is now taking such a turn that the expectations are that by 1966-67 it would achieve sufficient strength to stand on its own and generate technique, enough management and enough resources to follow through further expansions. Not only the Chairman has commended the working of the company but recently the National Plans Association, a non-profit-making research organisation in Washington, D.C., has made a case study of the Indian Aluminium Company as an example of Indian-Canadian Collaboration, and has recorded its judgment in very favourable terms.

Mr. Mahindra also dwelt at length on some of the difficulties faced by the industry. The first and foremost difficulty on which he focussed attention was in regard to transport for which he made the plea that transportation situation in the country be improved. On the bauxite problem, the ore from which aluminium is produced, Mr. Mahindra suggested that the State Government should from now on exercise care in issuing prospecting licences or giving leases for bauxite properties to persons or companies who are not directly engaged in the production of aluminium. This, in the view of the company's Chairman, would ensure more effective utilisation of reserves in the country and greatly contribute to the establishment of new economic production units.

British India Corporation

FROM STRENGTH TO STRENGTH

MR. H. S. CHATURVEDI, Chairman and the Managing Director of the British India Corporation Ltd., Kanpur, in his address at the 42nd annual general meeting of the Corporation revealed that after deducting all expenses the profit before taxation in the year 1961 amounted to Rs. 1,05,36,221 as compared with Rs. 90,93,242 in 1960. After providing for depreciation and taxation, the surplus available was over Rs. 61 lakhs as against Rs. 53 lakhs in 1960. The overall results have enabled the directors to recommend a dividend payment per ordinary share of 35 nP. less tax, which represents a gross return of 7 per cent per annum on capital invested by ordinary shareholders. The need to improve further and to build for the future, however, is obvious, and out of the available trading surplus, about Rs. 40 lakhs have been ploughed back into the business as against a corresponding figure of about Rs. 31 lakhs in 1960.

Production in the Corporation's woollen branches has been quite satisfactory. The demand for Lal-Imli and Dhariwal products continued to remain good and the branches were able to sell their entire production. Although the Cooper Allen and North West Tannery Branches continued to face serious operating difficulties during the year, the results of the Elgin Mills Company Ltd. and Cawnpore Textiles Ltd. for which the Corporation is now working as Secretaries and Treasurers were very satisfactory. Profits and sales were higher. In the sugar units record was created in the quantity of cane crushed and sugar produced during the season 1960-61 in all the six sugar units of the group. Industrial relations were also quite satisfactory in the various units. The main difficulty was of course of coal which led the Lal-Imli Mills to close down in January 1962 for some days. On the whole it may be said that the BIC has faced the difficulties quite admirably and it is expected that it will continue to grow from strength to strength.

FROM THE CAPITAL'S CORRIDORS

ABOUT OIL

THE General Managers of ESSO Standard Eastern and Burmah-Shell, Mr. J. W. Sinclair and Mr. H. A. Eccles, have been to their Head Offices in New York and London, respectively, for consultations.

Considerable importance is attached to their talks with their Boards of Management. It is a matter of common knowledge that neither the Government nor the oil companies have been happy over their continued strained relations, more particularly after the implementation of the Damle Committee's recommendations. The oil companies agreed to implement this Report under protest and have since submitted to the Government their considered opinion on the issue involved. There has also been a deadlock over the throughput of the two Trombay refineries. The Government has been insisting, through curtailment of foreign exchange allocation, on pegging this throughput at the 1960 level, irrespective of the capacity created since then. It has as well made it clear that no increase in the throughout of these refineries will be permitted unless the Refinery Agreements are revised.

So far as ESSO is concerned, it is also interested in setting up a lubricating plant, in equal partnership with the Government, and a naphtha cracker unit. The Government is inclined to grant it a licence for a 100,000 ton-capacity naphtha cracker plant, as against its demand for a unit of 200,000 tons capacity. ESSO had also shown interest in oil prospecting in areas other than West Bengal where its joint venture with the Government failed to discover any oil or gas.

It is presumed that it was to discuss some solutions to these issues that the two General Managers had gone to their Head Offices for consultation.

So far as the refinery agreements are concerned, a via media appears to be under discussion. The Government, it is suggested, should be satisfied if these agreements are replaced by licences under the Industries Act. This would place the oil industry on an equal footing with any other industry in India. It would also mean association of Indian capital in equity shares of the refineries. The prices of oil products could as well be determined by the Tariff Commission as is the case with cement, steel, rubber etc. The oil industry, on its side, would trust the Government that it will not be nationalised under normal circumstances. The Government would permit the oil companies to buy crude from their own sources, provided the price paid is competitive, and would allow them to maximise their refinery throughputs without involving any foreign exchange expenditure on capital equipment.

There appears to be a general agreement on ESSO's lubricating project. ESSO has agreed to go into fifty-fifty partnership with the Government, the management of the project being on commercial basis, largely on the model of Oil India Limited.

The Government will also like to enter into equal partnership with ESSO in the petro-chemical project. If ESSO agrees to this, it may be allowed to set up a petro-chemical plant of 200,000 ton-capacity, instead of 100,000 ton-capacity at present indicated to be licensed by the Government.

So far as oil prospecting is concerned, there appears to be no basis for an agreement. The Government has made it clear that it would either permit oil companies to prospect on contract basis (the companies working as contractors of the Oil and Natural Gas Commission) or as mere explorers (the companies undertaking to sell oil, if and when struck, to the Government at a determined price). These conditions have not yet attracted any international oil company except the Burmah Oil Company which is a partner in Oil India Limited.

AGREEMENT WITH ENI

The details of the agreement entered into between the Government of India and the E.N.I. of Italy were given by Mr. K. D. Malaviya, Union Minister for Mines and Fuel, in Lok Sabha last week. The agreement was signed on August 29, 1961.

In a statement which he placed on the Table of the House, Mr. Malaviya said: "The Agreement provides for a 100 million dollar credit being given by ENI for public sector petroleum projects in two categories; the first category includes projects for which the general provision has already been made in the Third Five-Year Plan, such as transport pipelines for petroleum products from Barauni to Delhi and Barauni to Calcutta, gas fractionation plant, liquid petroleum gas bottling plant and distribution facilities, lubricating oil plant, supply of crude oil production and also distribution equipment.

"Among the list of projects is also included contract drilling for any areas specified by the Oil & Natural Gas Commission. In the second category come additional projects like petro-chemicals and some others for which the Planning Commission and other Ministries have further to be consulted for concurrence and for which consultations have also to be made with E.N.I. in due course.

"Time schedule for projects under first category is such as to enable them to be executed within the Third Plan period.

"The estimated costs of the projects will be known after the project studies have been completed."

INVESTMENT AND INCOME-TAX REBATE

With a view to encourage savings, the Finance Minister, Mr Morarji Desai, in his Budget speech on April 23, announced a scheme by virtue of which moneys deposited in the 10 and 15-year accounts of the Cumulative Time Deposit Scheme run by post offices will also be allowed to earn a rebate of income-tax within certain prescribed limits. The benefits accruing from this have been explained in a Press note issued by the Union Ministry of Finance. The Press note says:

"At present, payments made as life insurance premia or contributions to recognized Provident Funds alone are reckoned towards earning a rebate of income-tax within the prescribed limits. Thus, persons who are not insurable or who cannot contribute to a Provident Fund are not in a position to earn the rebate. It has now been decided that the moneys deposited in the 10 and 15-year Accounts of the Cumulative Time Deposit Scheme run by post offices will also be allowed to earn a rebate of income-tax as in the case of life insurance premia and contributions to Provident Funds but within the same maximum limits. This concession will be specially attractive to self-employed persons like Doctors, Lawyers etc., or employees in commercial undertakings who are not eligible to contribute to any recognized Provident Funds.

"So far deposits under the C.T.D. Scheme can be made for a period of 5 or 10 years only with a maximum deposit limit of Rs. 200/- in the 5-Year Account and Rs. 100/- in the 10-Year Account. With the introduction of a new 15-Year Account with a maximum monthly deposit limit of Rs. 300, the limit for the 10-Year Account has been raised to Rs. 200 a month. As the return from the investments in the C.T.D. Scheme is free of income-tax, the new 15-Year Account would enable an individual to invest a total sum of Rs. 54,000 and earn a tax-free return of about 4.3 per cent compound per annum.

"Taking all the Small Savings schemes together, a single individual can at present invest upto a maximum limit of Rs. 1.05 lakhs the return on which is tax-free. With the opening of the new 15-Year C.T.D.

EXEMPTION FROM NEW EXCISE DUTY OF CERTAIN IRON AND STEEL PRODUCTS

With a view to making it convenient for the manufacturers of the end-products to pay the duty at one stage, the Government of India has decided to exempt blooms, billets and slabs from a part of new excise duty leviable on them in terms of the Second Finance Bill, introduced in Lok Sabha on April 24, 1962. Thus, if these products are made from duty paid pig iron or steel ingots, as the case may be, no further duty on ad valorem rates will be charged on them. If the duty had not been paid on them at the rates applicable to pig iron or steel ingots, it will have to be paid on such blooms, billets and slabs. When these blooms, billets or slabs are converted into other finished or semi-finished articles, which are subject to new excise duties, further duty at the appropriate ad valorem basis will have to be paid on them.

The Government has also exempted rails and sleeper bars from the duty in excess of that leviable on pig iron or steel. In the case of sleeper bars, the exemption will be applicable only when these are used for making sleepers for a railway track.

All these exemptions have been made effective from April 24, 1962.

EXCISE DUTY ON SUGAR

The Indian Sugar Mill Industry has been disappointed by the absence of any relief in excise duty on sugar in the recent Budget proposals of the Union Finance Minister, Mr. Morarji Desai.

The Committee of the Indian Sugar Mills Association has addressed a telegram to the Finance Minister urging him to reconsider the Association's request for reduction in this excise duty. In the telegram, the Committee has pointed out that the industry is facing a precarious situation due to the serious financial crisis caused by unprecedented burden of stocks, resulting from stagnant consumption, increasing production and difficulties in the way of exports. Further, it is stated, the production cut is undesirable in view of its adverse effects on cultivators. The Committee has pointed out that in view of these factors and owing to the licensing of additional capacity, a cut in excise duty is necessary for stimulating internal consumption which can provide a lasting solution to the present surplus problem facing the industry.

The Committee recalls that excise duty on sugar was enhanced by Rs. 4-2 per maund in 1957 with the specific objective of reducing internal consumption and for making available larger supplies for exports. The Committee considers that the continuance of this additional duty in the entirely changed circumstances, when the industry is burdened with surplus stocks, is absolutely unjustified and should be done away with. This reduction, the Committee opines, is not likely to seriously affect the Government revenue even initially. Over the period also, there may not be any loss in view of the expected increase in consumption.

Meanwhile, the Union Minister for Food and Agriculture, Mr. S. K. Patil, has assured the Lok Sabha that the entire standing sugarcane crop shall be crushed for sugar manufacture. The strategy adopted for alleviating the distress caused to the cultivators in areas where sugarcane output this year is in excess of requirements, after taking into consideration the 10 per cent cut in output stipulated in terms of the new sugar policy announced in November last, is the diversion of quotas for sugar manufacture from the mills whose production is likely to fall as a sequal to shortage of cane supplies, to mills which have in their areas more than the required amount of cane. To facilitate crushing of cane in Bihar and U.P., the State Governments are understood to be finalising their schemes to give some relief to the industry in the form of rebates on the purchase tax and the cane cess.

BOKARO STEEL PLANT

A fact-finding Mission, representative of the U.S. Steel interests, will shortly visit India, at the instance of the American Agency of International Development, to survey the availability, inter-alia, of ores, limestone, coal and transport for the purpose of financing the fourth one million ton capacity public sector steel plant proposed to be set up at Bokaro. Prima facie, this should mean that neither the U.S. Government nor the U.S. Steel industry are committed to finance the project till they are satisfied that the basic requirements for a Steel Plant are available at Bokaro. It should also be evident that the protracted India-U.S.A. discussions have already ruled out the possibility of any steel production from Bokaro during the Third Plan period, as envisaged in the Plan. The Indian authorities are, therefore, anxious that the proposed Survey should not be so prolonged as to rule out the project being materialised even in the early years of the Fourth Plan.

The U.S. Ambassador at one of his Press Conferences had indicated that his country's collaboration in setting up this project carried an obligation to work up the plant to its cheap and efficient production. This is all the more important in the face of the Russian claim that Bhilai Steel would be the best and the cheapest in the world. Bokaro will be the American answer to Bhilai, if the Americans were to take it up.

The coming out of the Survey Mission should mean that the basis of U.S. aid and collaboration in building the plant will follow its report. The Indian position seems to be abundantly clear, namely, that the plant will be in the public sector and India will use as much plant and equipment as are locally manufactured by the time the plant is being commissioned. Side by side, the Government has recognised that training is no substitute for the experience needed for running a first class steel plant. Within this framework, there is ample room for negotiations when the U.S. Government has decided to finance the Project.

ROURKELA & DURGAPUR PLANTS

Meanwhile, the Secretary of the Ministry of Steel, Mr. N. N. Wanchoo is leaving for Germany on May 1 to finalise the negotiations in regard to the expansion of German-built Rourkela Steel Plant by 0.8 million tons. The West German Government has already offered a credit to finance this project and tenders, on the basis of the project report, have already been invited.

Mr. Wanchoo, before returning to India, will also visit London to have further discussions in regard to the expansion by 0.6 million tons of the British-built Durgapur Steel Plant. The British Government has already offered to finance this expansion programme of the Plant.

KIRIBURU IRON ORE PROJECT

The work on the Kiriburu Iron Ore Project has made satisfactory progress. The project is expected to go into production, as scheduled, by the beginning of 1964, when ore exports to Japan from this mine are to commence.

Of the new railway links, the line between Sambalpur and Titlagarh is expected to be ready for goods traffic by December, 1962, and that from Bimlagarh to the loading point at Kiriburu by March, 1963. Work on improvement of facilities at Vishakhapatnam is expected to be completed by the target date.

The Japanese yen credit (equivalent to 8 million U.S. dollars) is for the purchase in Japan of machinery and equipment for only the mining project. Orders of a total value of Rs. 1.85 crores have been placed so far on various suppliers in Japan against the credit.

The U.S. credit was for the foreign exchange cost of the railway and port facilities. The railways have already entered into commitments worth $13 million;

drawals in respect of the port work will also commence soon as contracts have already been concluded for the additional berths and are about to be concluded for the ore loading plant.

PIG IRON PRODUCTION

With a view to encourage the dispersal and regional development of pig iron production and to achieve the target of about half a million tons output outside the integrated steelworks by the end of the Third Plan period, it is proposed to license shortly further capacity in the private sector.

Private parties so far approved for the manufacture of pig iron are:

Name of the Firm and its location	Annual capacity (Tons)
Messrs. Kalinga Industries, Orissa	15,000
Messrs. Kalinga Industries, Orissa (Expansion)	85,000
Messrs. Textool Co. Ltd., Madras	15,000
Acme Iron and Cetrifugal Pipe Works, Maharashtra	15,000
Acme Iron and Cetrifugal Pipe Works, Maharashtra (Expansion)	15,000
Sepulchre Bros. (India) Private Ltd., Bombay	15,000
Hind Traders, Bombay	96,000

KATHARA COAL WASHERY

An agreement has been signed recently between the National Coal Development Corporation and a Russian organisation for the preparation of the detailed project report and the working drawings for a 3,000,000 ton-capacity coal washery to be set up at Kathara. The project will be financed out of the 112.5 million rouble credit made available by the Soviet Union to India. The main terms of the agreement are:

1. The project report will be prepared within seven months from the date of receipt of all the initial data, which has since been supplied.
2. The report will include details of main technical and economic data for the Kathara washery as a whole and of its separate units.
3. The detailed project report will be prepared in conformity with the technical specifications, norms and standards in force in the U.S.S.R., taking into account the local conditions and regulations as obtaining in India.
4. The working drawings will be delivered within one year—beginning from March, 1963, to March, 1964.

SHOW-CAUSE NOTICES TO INDUSTRIAL LICENCEES

The Minister for Industries in the Union Ministry of Commerce and Industry, Mr. Nityanand Kanungo, told Lok Sabha last week that show-cause notices had been served on 817 licencees who had not taken effective steps to implement the licences granted to them under the Industries Act. During the last three years 1,474 licences had been granted out of which 88 had already been revoked, he added.

FURNACE OIL AS INDUSTRIAL FUEL

The Union Finance Minister's announcement on subsidy to railways for transport of furnace oil from the ports to consuming industries has created some difficulties.

It may be recalled that the Bombay textile mills, by and large, had switched on to furnace oil without demanding any relief. The Ahmedabad textile mills were having difficulties with their coal supplies. They wanted to switch on to crude from Cambay. The Minister for Oil, Mr. K. D. Malaviya, wanted better price for this crude and eventually got it from the oil companies rather than from selling it to the Ahmedabad mills.

Meanwhile, the Government, in its anxiety to step up cement production, had agreed to the proposal of certain cement factories in the South and on the West Coast to switch on to furnace oil on the basis of a price increase of Rs. 5 to Rs. 10 per ton of cement. This decision of the Government had been already communicated to the cement factories concerned prior to the Budget speech by the Finance Minister on April 23.

The Finance Minister in his Budget speech announced a rebate of 50 per cent in rail freight on furnace oil, the rebate to be paid by the Union Government. It will mean that no unit, textile or cement, at a port will get this concession. Ahmedabad is about 500 miles from Bombay and the Ahmedabad mills will be entitled to this concession which will be roughly Rs. 15 per ton or 2 nP. per metre of cloth. This should meet the fuel cost differential of switching on to furnace oil from coal.

Can the Government go back on its own decision, already communicated to cement factories, is the issue under discussion here.

REVERSIBLE POWER TURBINES

Our Madras correspondent writes:

At a Press Conference held here on April 28, Mr Paul Dietz, Associate Director of the well-known American firm Allis Chalmers, said that his firm had been able to perfect a reversible pump turbine unit which could work with thermal power to pump back the tail water into the catchment area so that the same water was available for use in a hydro-electric power station. Thermal power, he added, was available cheap during the idle hours of the night and this could be fully utilised for pumping back the water and enabling the hydro-electric power station to work fully in all seasons. He said his company had already commissioned such units in Japan and Italy after they had proved highly successful in the United States where several such units were operating. He hoped that the Government of India would also study the possibility of utilising these reversible pump turbines in many of the projects in this country.

Allis Chalmers, Mr. Dietz explained, had also been successful in their experiments in the field of power generation through the new and revolutionary "fuel cell" process. Their trials for commercial application of this process in a standard tractor had already proved very worthwhile and if their further experiments should also succeed, it should be a new achievement in the electricity field. He added that it was of the most exciting of all sources of energy that is being explored by world scientists.

Mr. Dietz also gave details of the first super-heated nuclear power plant now being built in the United States by his firm and seven others jointly. It was their hope that if the 66 mg plant should succeed, it would prove to be a big step forward in cheaper nuclear power. The process was, he said, that steam was passed twice into the reactor.

Mr. Dietz was told that Madras Government was considering a proposal to put up several 100 ton capacity cement plants in places where raw materials were available in small quantities. He said Allis Chalmers, who have specialised in cement machinery as well, were already manufacturing 100 ton capacity plants and that they would work economically in all places where biger cement plants were not nearby and where all the production of the smaller plants would be consumed within a radius of 100 miles. He commended the idea of locating 100 ton plants wherever possible.

IMPORT OF CAPITAL GOODS FROM JAPAN UNDER THE SECOND YEN CREDIT

An Import Trade Control notice concerning import of capital equipment from Japan under the Second Yen Credit, states that the contracts with Japanese suppliers can be either on c. & f. or c.i.f. basis as may be convenient. Any customary performance guarantee required may be settled by negotiation with the supplier.

The notice indicates that payment for the goods can be effected only under a confirmed irrevocable letter

'But can I sell my product there?'

Of course he can—with the help of Voltas! Whatever the size of his business, and wherever its site, the enterprising Indian manufacturer can depend on Voltas to distribute and sell his products efficiently, economically. For Voltas is everywhere in India! With its vast network of branches, agencies, sales depots and warehouses, Voltas touches every market in every part of this great country. The effective Voltas system of distribution is designed to answer fully the needs of both producer and consumer, and in the process to serve the larger interests of the nation.

Briefly, Voltas' activities comprise

- **Marketing and Distribution of goods.** Representing leading manufacturers, both foreign and Indian, Voltas supplies a wide range of goods—Electrical, Mechanical, Air Conditioning and Refrigeration, Textile and Paper Machinery, Agricultural and Construction Equipment, Machine Tools, Pharmaceuticals, Chemicals, Bulk Vitamins, Plastic Raw Materials, Processed Foods.
- **Manufacture and Development:** Air Conditioners, Water Coolers, Switchgear, Farm Implements, Drilling Machinery... and the list is growing!
- **Service:** Voltas after-sales service is a by-word in India. Voltas sales are fully backed by its nation-wide service and spare parts organisation.

For taking products to their markets VOLTAS IS THERE

VOLTAS VOLTAS LIMITED, Head Office: Bombay 1

JAMNAGAR

Available at all leading stores and cloth dealers.

SISTA'S-DWM-4A

of credit opened on a specified Japanese bank through the importer's bank in India.

The letter of credit which should be in the approved form would provide for payment by the Japanese bank against the Second Yen Credit. No foreign exchange remittance from India will be permitted.

As and when payments are made by the Japanese bank to the Japanese exporter, the Indian importer should deposit the rupee equivalent of the Yen payments calculated at the IMF parity rate on the date of Yen payments, to Government account through the State Bank of India, New Delhi.

The contract should normally provide for payment on cash basis i.e., on presentation of shipping documents. Customary performance required may be settled by negotiation with the exporter. Contracts on the basis of deferred payments can be considered only in exceptional cases, and if the value of equipment exceeds Rs. 1.5 crores. The foreign exchange remittance from India for payment of interest on such deferred payment contracts will be permitted. In no instance can payments after March 31, 1966, be allowed.

HINDUSTAN ANTIBIOTICS

The Hindustan Antibiotics Limited has tentatively fixed the following targets of production for 1962-63.

Commodity	Output
(i) Bulk Penicillin	50 million mega units.
(ii) Tetracyclines	1,000 kilogram
(iii) Streptomycin and Dihydro-streptomycin	20,000 kilogram

According to present indications, the expansion programme of the company is as follows:

Commodity	Output
(i) Tetracyclines	1,500 kilogram
(ii) Streptomycin and Dihydro-streptomycin	80,000 to 90,000 kilogram.
(iii) Hamycin (A new antifungul antibiotic)	15 kilogram
(iv) Vitamin 'C'	48 tons

MANUFACTURE OF FERTILIZERS

The capacity target for nitrogenous fertilizers envisaged in the Third Plan is one million tons (in terms of nitrogen), as against the existing installed capacity of 228,300 tons. In order to achieve this target, several projects have been licensed or approved in both the private and the public sector. Details of the existing capacity and of the licensed or approved schemes are as given in table below.

In addition, proposals for setting up fertiliser factories are being considered by the West Bengal and Gujarat Governments. The Jammu and Kashmir Government has also under consideration the setting up a fertiliser factory in this State. Details of these schemes are still to be worked out.

State	Location	Capacity		End - Product
		Existing (Tons of N)	Licensed/ Approved (Tons of N)	
Andhra Pradesh	Vishakapatnam	..	80,000	Ammonium phosphate; Urea.
Andhra Pradesh	Kothagudam	..	80,000	Urea.
Assam	Namrup	..	45,000	Urea and ammonium sulphate.
Bihar	Sindri	117,000	..	Ammonium Sulphate, Urea & double salt.
Maharashtra	Trombay	..	90,000	Urea and Nitrophosphate.
Kerala	Alwaye	20,000	50,000	Ammonium sulphate, ammonium phosphate, ammonium chloride.
Madhya Pradesh	Itarsi/Katni	..	50,000	Urea.
Madras	Ennore	..	8,250	Ammonium phosphate.
	Tuticorin	..	64,000	"
	Neiveli	..	70,000	Urea.
Mysore	Belagola	1,300	..	Ammonium sulphate.
	Mangalore	..	100,000	Urea, ammonium phosphate and ammonium sulphate.
Orissa	Rourkela		120,000	Calcium ammonium Nitrate.
Punjab	Nangal	80,000	..	"
Rajasthan	Hanumangarh	..	80,000	Ammonium sulphate.
Uttar Pradesh	Varanasi	10,000	10,000	Ammonium chloride.
	Gorakhpur	..	80,000	Urea.

In addition, proposals for setting up fertiliser factories are being considered by the West Bengal and Gujarat Governments. The Jammu and Kashmir Government has also under consideration the setting up a fertiliser factory in this State. Details of these schemes are still to be worked out.

I.W.S. OFFICIALS' VISIT

Sir William Gunn, Chairman, and Mr. W. J. Vines, Managing Director, International Wool Secretariat, completed their seven-day visit to India and left for Australia from Bombay last week. Sir William stated that the purpose of their visit was to study the long-term prospects of the Indian market for wools produced in Australia and New Zealand, and to obtain an understanding of the present problems of the industry with the view to providing whatever practical assistance their organization could.

They visited all the principal wool textile centres in this country and had conversations with industry and with Government authorities, including the Minister of International Trade, Mr. Manubhai Shah, and the Director-General of the Council of Scientific and Industrial Research, Dr. Thacker.

Sir William stated that he recognised the acute difficulties produced by India's balance of payment problem, and the proposals which he hoped the IWS would develop, would recognise this situation in a practical way. The IWS was prepared to take a long range view of the Indian market and was not looking for immediate results from its efforts, he added.

Sir William and Mr. Vines discussed with Mr. Manubhai Shah a number of possible ways in which the IWS could assist the Indian wool industry to improve the quality of its production and to increase its consumption of wool. These plans would need further consideration by the Ministry of International Trade and would require to be agreed to by the Board of the IWS, which would be meeting shortly in Australia. Possible methods discussed included assistance by IWS financially, supply of well-skilled technical personnel in the special research programme now being planned by the C.S.I.R. and the wool textile industry in India, and promotional support for wool carpets in world markets

which was already bringing increased demand for Indian as well as New Zealand type wools.

Mr. Vines stated that in recent months he and Sir William had visited every major wool consuming country in the world and were much encouraged by what they have seen. The development of modern easy-care process for wool products imparting permanent creasing, shrink resist qualities and moth-proofness, had done a great deal to make wool articles popular with all generations. Although the competition with man-made fibres was increasingly severe, there was an unmistakable swing throughout the Western World of the public towards pure wool articles. The Board of IWS and the grower countries had decided that they would considerably increase their expenditure on wool research product development and promotion.

It is learnt that a number of Australian technicians will shortly be arriving here to assist this country in every aspect of the wool industry—from sheep-breeding onwards. Special efforts will be made to improve the quality of carpet yarn for the purposes of export.

CENTRAL MACHINE TOOLS DESIGN INSTITUTE

The Government of India has decided to locate the Central Machine Tools Design Institute at Bangalore. The Government's decision follows the recommendation of a Technical Committee set up by the Ministry of Commerce and Industry to work out the details of location of an Institute and the type of work to be taken up there.

The main objectives of the Institute, which will be set up with Czechoslovak collaboration and assistance, will be to design and develop machine tools and to standardize machine tool elements, and to undertake the manufacture and testing of prototypes. It will train designers and design personnel for the machine tool industry, undertake research in methods of calculation in designs, in the behaviour of machine tools and hydraulic, electric and electronic control systems in relation to machine tools. Research in metal cutting, such as machineability, tool research, production processes, etc., will also be undertaken at the Institute. Information and documentation about the progress made on the technical aspects of the machine tool and cutting tool industry will as well form part of the Institute's work.

The project will cost over Rs. one crore. The Government of Czechoslovakia has offered, free of cost, the services of technicians, experts, machinery and equipment required for the Institute. The Czechoslovak assistance will be to the extent of Rs. 60 lakhs.

A formal agreement with the Czechoslovak Government in this regard will be concluded shortly.

ENHANCEMENT OF PROVIDENT FUND CONTRIBUTION

The Government of India has decided to increase, in four industries to begin with, the rate of provident fund contribution from 6¼ per cent to 8 per cent of basic wages, dearness allowance and retaining allowance, if any. These four industries are: (1) cigarettes; (2) electrical, mechanical and general engineering products; (3) iron and steel, and (4) paper. The decision, it is learnt, will be implemented in these industries step by step.

To give effect to this decision, a bill seeking to amend the Employees' Provident Fund Act, 1952, is likely to be introduced during the current session of Lok Sabha.

A Letter to the Editor

THE CONGRESS AND THE LEAGUE

Sir,

In his article on "The Congress and the League" in 'The Eastern Economist' of April 13, 1962, Odysseus reviewed the recent sequence of events that led to the partition of India. He said that while the war with Japan was on, the British Government had large British forces in India and were in a position of power to ensure an undivided federal Dominion of India. But when the war ended a year earlier than anticipated, the British became war-weary, reduced their forces in India considerably and in consequence, lost their power to enforce rules and were reduced to act as a go-between to reconcile two independent parties, the Congress and the Muslim League. According to Prof. Percival Spear, "the British could only argue and persuade; they could no longer command." Can it be that while the British were prosecuting the war against Japan, they were not aware that a communal civil war was threatening in India? If they were prepared to pursue the war against Japan for another year without wearing, did they suddenly weary of keeping the peace in India? Were they aware that Mr. Jinnah had proclaimed "direct action" which was not necessarily to be non-violent, like the non-co-operation of the Congress? Or, were they strong enough to defeat the direct action of the Congress because it was directed against the Government but was non-violent, and were not strong enough to nip in the bud the direct action by the League, though it threatened violence but was not directed against the Government? Had the Government already abdicated its responsibility to keep the peace and prevent civil war if only between communities?

Were the British Government in no position to command but only to argue and persuade when Bengal was partitioned in 1905 for communal ends, when Minto conceded a separate and superior status to Indian Muslims, when Chelmsford and Montagu condoned and sanctioned communal and excessive representation to them after denouncing it in strong terms, when the Round Table Conference met in 1930-31, and when the Government of India Act of 1935 forced communal representation on citizens who would have none of it? Pakistan is the end-result of a tendency which the British initiated in 1905, when they were not war-weary and when they were in a position, not only to argue and persuade, but to command and impose. If they were strong enough to impose communal and undemocratic representation against their own better judgment and over the opposition of the nationalist majority in India, were they not strong enough to impose, if necessary, joint electorates on the communal minority? Presently, the British and the French Governments are themselves practically imposing African majority rule over the white British and French minorities in Kenya and Algeria. The thesis that the British could only argue and persuade but not command is true after India attained independence, but not between 1905 and 1947.

Yours etc.,
P. KODANDA RAO

BANGALORE,
25-4-1962.

Company Meetings

THE BANGALORE WOOLLEN, COTTON & SILK MILLS CO. LTD.

Chairman's Speech

Presiding at the Seventy-ninth Annual General Meeting of the Shareholders held at the Company's Office, Agraharam Road, Bangalore City on Thursday, the 26th April, 1962, Mr. E. F. G. Hunter said:

Gentlemen,

I have pleasure in welcoming you to the Seventy-ninth Annual General Meeting of The Bangalore Woollen, Cotton and Silk Mills Co. Ltd. The Directors' Report and the Accounts for the year 1961 have been in your hands for the prescribed period, and with your permission, I propose to take them as read.

You will have seen from the Accounts that the Company had a successful trading year, sales having reached a figure of over Rs. 6 crores for the first time in the history of the Company. The higher profit resulted from the progress made to improve efficiency in the Mill and also from the good conditions which prevailed for most of the year in the Indian markets.

The better results have made it possible for your Directors to recommend an increase in the dividend on the Company's ordinary shares. The final dividend recommended will bring the total for the year to 18 per cent gross, equivalent to 12.6 per cent net, which compares with the dividend of 10 per cent net declared for each of the eight preceding years, during which period labour by way of wages, dearness allowance, bonus, gratuity and other benefits has annually taken an increasing share from the Company's revenues.

The closure of the Company's Hebbal Mill in June of last year saw the final conclusion of a battle which the Woollen Department of your Company has fought over a period of years against the tide of rising costs, which, together with the cess and excise duty, imposed on all but the coarser rugs in 1955, made the working of this Department uneconomic. Fortunately, by careful reorganisation and re-deployment of labour, the closure was effected without retrenchment. Negotiations for the sale of the woollen machinery and the machinery parts at satisfactory prices were concluded during the year, and formal sanction of Government to the transfer of the machinery to the buyer is awaited. It may be some time before the machinery is removed from the Mill but meantime consideration is being given to the future use of the Hebbal Mill premises.

Sales of the Company's popular Union fabric "Cotswol" and the heavier cloth "Angola" increased during the year and a substantial contract for the supply of both these fabrics to Soviet Russia was completed.

Your Directors continue their efforts to improve sales in overseas markets as they are most anxious to secure the valuable incentive benefits by way of licences for the import of cotton, dyestuffs and machinery.

Increased supplies of indigenous filature silk enabled the Company to increase the number of looms in use in its Silk Department for the manufacture of filature silk shirting and sarees, and I am pleased to say that this increased activity contributed to the improved results for the year. Recent developments in the production of spun silk in Mysore State are promising and there are prospects that during 1962 the Silk Department will once again work to full capacity.

The supply of Indian cotton during the 1960-61 season was favourable, both in respect of quality and quantity, but controls which had been introduced during the previous cotton season were continued. Although the Textile Industry had every reason at the beginning of the 1961-62 cotton year to expect a satisfactory Indian cotton crop, with the new crop estimated at around 50 lakh bales, during the last four months of 1961 growing conditions deteriorated rapidly and it became clear that once again Mills were faced with a cotton crisis. The cotton crop is now estimated at around 43 lakh bales, which is far below the annual requirements of the Textile Industry in India, and this represents a reduction of approximately 21 per cent on the 1960-61 Indian cotton crop. This obliged the Textile Commissioner to introduce variety-wise rationing of cotton several months after the start of the season. Apart from the fact that prices of all varieties of Indian cotton are now exceedingly high, it is clear that unless Government takes urgent measures to augment imports, including a proportion of suitable short staple cotton with which to supplement indigenous supplies, the Industry will very soon be faced with a serious shortage of its primary raw material. We know that negotiations are in progress with the U.S.A. and, we believe, with certain other countries.

The industry has not been faced with any serious shortage of long staple cotton so far, but with effect from January 1962, Government has increased the rate of premium payable on long staple imported varieties in order to finance the Export Incentive Scheme. The increase in the rate of premium varies from Rs. 20 to Rs. 30 per bale, depending on the staple length of the cotton, and this will necessitate increased expenditure by your Company of about Rs. 2,00,000 per annum.

Your Company has been carrying out experiments with the production of a terylene/Wool suiting and this fabric will be introduced to the market shortly.

The increase in costs recorded in the Profit and Loss Account is, in general, no more than proportionate to the increase in production and sales despite a tendency for all costs to rise, and reflects the energy with which measures of economy have been exercised by your Company.

Unfortunately your Company, in common with others in the Industry, is frequently faced with new charges and imposts over which it has no control and three of such additional increases in cost will have to be met this year. First, the wages of all workpeople were increased by a further Rs. 2 per month from the 1st January, 1962 in accordance with the terms of the Textile Wage Board recommendations made in 1960. Secondly, the Company's contribution to the Employees' State Insurance Scheme has been doubled from the 1st April, 1962. Still further to finance the Export Incentive Scheme, Government has imposed a special levy on all Indian cotton consumed from the 1st January, 1962 and it is estimated that this additional levy will

involve an increase in cost of about Rs. 85,000 per annum. It is hoped that labour will make some extra effort in return for the further increase in wages, otherwise the Company will have nothing to show for these specific increases in cost.

It will be noted that a new item of cost, namely, automatic loom cess, appears in the Profit and Loss Account. This new impost introduced by the Budget of 1961 is levied on 30 per cent of the production of automatic looms less the value of cloth exported. Had, therefore, the Company's export sales not improved, this levy would have been much heavier. While the Company will make every endeavour to increase exports, it is unlikely that it will be able altogether to avoid the payment of this additional levy.

You will observe from the Profit and Loss Account that charges in respect of management have undergone a change which is in consequence of the relinquishment of the Managing Agency from the 1st January, 1961.

The Company's appeal to the Supreme Court against the imposition of Octroi Duty by the Corporation of Banagalore on raw materials entering the city, was heard during the year and I regret to have to report was decided against the Company. As a result, a sum of over Rs. 8 lakhs, for which provision had been made, being the balance 50 per cent of the Octroi Duty levied since 1955 when the new duty was first introduced, was paid during the year to the Corporation of Bangalore.

Industrialisation in Bangalore has made considerable progress during the last ten years and one result is that during this period the population has almost doubled. Unfortunately, neither the supply of electric power, nor of water to the same area, has progressed at the same rapid pace. During the year it became necessary for the State Government to introduce staggered working days to reduce the daily electric power demand and the Mills now work on Sunday of each week and have Monday as the weekly holiday. Further, the Mills have been asked to reduce their demand during the evening peak load period which occurs between 6-30 and 9-30 p.m., and ways and means of meeting this request, without adversely affecting production, are being explored. No doubt as a further measure to reduce consumption, as well as a means of raising revenue, the Government of Mysore saw fit during 1961 to enhance the tax on electricity consumed. I regret to report that no improvement in the supply of water is in sight and it has been necessary to supplement the Corporation supplies by water from Bore Wells which your Company has sunk in recent years at considerable cost. The water thus secured is, however, initially unsuitable for production purposes, and to make it usable a Water Treatment Plant has been installed and is now in operation.

Coal supply difficulties were again experienced in 1961 and recourse had to be made to the purchase of sea-borne coal which costs nearly double that supplied by rail. Apart from a recurring difficulty in obtaining supplies, the use of coal has made it difficult to maintain cleanliness in the Mill and the storage of coal has taken up valuable space. Your Directors, therefore, decided to convert the Mill boilers from coal to oil firing and it is hoped that the conversion will be completed during 1962.

In addition to the space which will be gained by the release of the coal yard, the Company has obtained from the Corporation of Bangalore a promise to sell to the Company approximately six acres of the tank bed to the south of the Company's property. The Mill has for many years been severely handicapped by lack of space, and the additional area promised will prove invaluable in the Company's plans for reorganising and modernising the Mill.

I am sure you will wish to join with me in expressing thanks to all the Company's Officers, Staff and employees who have contributed to the satisfactory results.

Finally, I would like to express my very grateful thanks to my colleagues on the Board for their support and co-operation throughout the year.

NOTE: This document does not purport to be a report of the Proceedings of the General Meeting.

THE BUCKINGHAM & CARNATIC CO. LTD.

Chairman's Speech

Presiding at the Forty-first Annual General Meeting of the Shareholders held at the Company's Office at Madras on Friday, the 27th April, 1962, Mr. E. F. G. Hunter said :

GENTLEMEN,

It is my pleasure to welcome you to the Forty-first Annual General Meeting of The Buckingham & Carnatic Co. Ltd. You will have had an opportunity to study the Directors' Report and the Accounts for the year ended 31st December, 1961 and with your permission I propose to take them as read.

Trading conditions in India during 1961 were generally good but the improved results recorded in the accounts now before you are largely due to the maintenance of production at a satisfactory level throughout the year.

In the Directors' Report your attention has been drawn to the record sales figure achieved for the fourth year in succession. This fresh record is a credit to your Company's sales organisation and whilst I am hopeful that sales will continue to grow, other factors, particularly rising costs to which I will refer later, may make it difficult to maintain profits at the 1961 level.

For the first time since 1953, your Directors have recommended an increase in the dividend on the Company's Ordinary Shares. The final dividend proposed will bring the total for the year to 18 per cent gross, equivalent to 12.6 per cent net, which compares with the dividend of 10 per cent net declared for each of the eight preceding years. Your Directors feel fully justified in recommending the higher dividend which represents a modest 5 per cent return on the ordinary capital and reserves. Whilst it is of course essential in the interests of all concerned that a substantial share of the profits be retained to finance the heavy costs of modernisation, it is but equitable that shareholders should participate in the higher profits particularly as labour by way of wages, dearness allowance, bonus and other benefits, and Government by taxation, have annually secured an increasing share of the Company's revenues..

Your Company is at all times engaged in a drive to increase exports and 1961 was no exception. This is evidenced by the increase in your Company's export sales by 2½ per cent to approximately Rs. 2.02 crores, which increase was once more against the trend of India's sales of textiles in overseas markets which last year fell by nearly 19 per cent.

Many more countries have entered the field of cotton textile manufacture and this has resulted in keener competition for the narrowing fields open to exporters. India is at a disadvantage compared with many other producers due to the latter's superior equipment and higher productivity of labour. Quality has now become the key to success in overseas markets, but this alone is not sufficient and it is essential that quality is backed by higher productivity to ensure a low cost product.

Much has been said and written lately about incentives to export, and there is little I can add except to say that from your Company's point of view it is most important that these schemes continue thereby enabling your Company to obtain modern equipment from overseas, as well as cotton, dyestuffs and chemicals.

The indigenous dyestuff industry now provides your Company with a much larger proportion of its requirements and this trend will continue, but in my opinion unless imported dyestuffs are always available in reasonable quantities, the indigenous industry will suffer from lack of competition. Already most indigenous dyestuffs are more expensive than those imported, in spite of a heavy import duty, and if this duty is increased, as is rumoured, it will be still more difficult for Indian finished cloth to compete overseas. In fact now that India has increasingly to export finished goods, there is a case for a reduction in the import duty on dyestuffs and chemicals.

The restriction of production effected by the control of looms and spindles installed, to which I referred in my speech last year, has created a condition of shortage in the textile market in India. This is neither good for the consumer nor the industry and provides an unsatisfactory background for promoting sales in overseas markets where profits, due to intense competition, are negligible or non-existent.

The agitation for special incentives to export would lose much of its force if the industry could be carried on in a climate where the conduct of business was less subject to constant and disturbing alterations of policy, the most recent of which has affected the supply of cotton.

The 1960-61 Indian cotton crop was good and plentiful. Although the quota system introduced during the previous year was continued, Mills had no difficulty in securing their normal requirements of cotton. Unlike the cotton season ended August 1960 when the carry over was dangerously low, at the end of August 1961 the carry over of Indian cotton was around 18.5 lakhs bales, i.e. roughly 87 per cent more than the carry over of the previous year, and the Textile Industry had every reason to begin the 1961-62 season with confidence in so far as raw cotton was concerned, with the new crop estimated at around 50 lakhs bales. However, during the last four months of 1961, growing conditions deteriorated rapidly and it became clear that once again Mills would be faced with a cotton crisis. The 1961-62 crop is currently estimated at 43 lakhs bales, which is far below the annual requirements of the Textile Industry in India, and the Textile Commissioner introduced varietywise rationing with retrospective effect from 1st September, 1961. Apart from the fact that there is a serious shortage of most varieties of cotton, prices are now inordinately high and unless Government takes early action to import suitable short staple cotton with which to augment indigenous supplies, the Industry will later in the year be faced with an acute shortage of its primary raw material. All these factors cannot but have an adverse effect on the Textile trade, particularly on exports.

With a steadily rising Mill consumption, intensive efforts must be made, not only to increase acreage under cotton, but also to increase the yield of cotton per acre in this country, which unfortunately is the lowest in the world. I understand that the Indian Central Cotton Committee has made certain recommendations to Government in this respect and it is to be hoped that effective and prompt action will be taken. Unless this is done and a realistic approach to the problem is made, the country will have to grapple with cotton crises for years to come.

The increase by almost exactly Rs. 50 lakhs in the Company's overdraft loan from the Bank is mainly due to the increase in Stock-in-Trade, mostly raw materials and to the reduction in Creditors. Capital expenditure during the year amounted to nearly Rs. 56 lakhs and this was financed by the allocations to Depreciation and Reserves. The re-equipment, modernisation and rehabilitation of the Mills is a continuous process and an essential one if the Company is to maintain its trading position. The programme for the next three years, in pursuance of this policy, will involve further heavy capital expenditure and this, it is intended, will also be met from the Company's own resources.

As is noted in the Directors' Report, by the allocation of Rs. 6,50,281 to the Debenture Redemption Fund, there has now been provided for the redemption of the Debenture Stock Loan a total of Rs. 50 lakhs being 50 per cent of the original loan which still has half of its term to run to the latest redemption date, namely 1972.

I referred earlier to the record sales, but if you will turn to the other side of the Profit and Loss Account you will find that costs under almost every head of account are higher than for the previous year, many of the items of cost being unfortunately also record figures, despite every effort by the Management to economise and trim expenditure wherever possible. You will observe also from the Profit and Loss Account that charges in respect of Management have undergone a change in consequence of the relinquishment of the Managing Agency from the 1st January, 1961, and charges in respect of 'Managing Directors' Remuneration' and 'Directors' Commission' appear for the first time.

During 1962, there will certainly be further rises in costs as, apart from the general upward trend, which in January of this year was reflected in the highest monthly labour dearness allowance figure to date of Rs. 77.66 per head, the Company will be obliged to meet certain specific increases. The first of these is in respect of the increase of Rs. 2 per month in the wages of all workpeople from the 1st January, 1962 in accordance with the terms of the Textile Wage Board recommendations made in 1960 and this alone will cost over Rs. 3 lakhs per annum. Secondly, the Company's contribution to the Employees' State Insurance Scheme has been doubled from the 1st April, 1962 and this means a further increase of over Rs. 3 lakhs in a full year. Thirdly, in order to finance the Export Incentive Scheme, Government has imposed a special levy on all Indian cotton consumed from the 1st January, 1962, and it is estimated that this additional levy will also involve an increase in cost of over Rs. 3 lakhs per annum. Thus these three specific increases alone will cost your Company more than Rs. 10 lakhs a year and unless labour makes some extra effort in return for the further increase in wages, no compensating benefit will accrue to the Company. It is hoped shortly to initiate with the leaders of the recognised Unions, the questoin of greater productivity.

Towards the end of 1960 the Industry at the behest of Government entered into a voluntary price control agreement under which prices were fixed on the basis of those at which individual mills were selling their

cloth in August 1959. No provision was made in the agreement for the adjustment of prices to meet an increase in costs. It is obvious, therefore, that the pressure of rising costs will narrow margins and inevitably affect the industry's profit making capacity, unless a revision of the prices fixed can be agreed upon. The immediately future prospects of the Industry should, therefore, be viewed with the foregoing in mind. It is to be hoped that the report of the Tariff Commission appointed by Government to enquire into fair prices for cotton textiles and yarn will provide a satisfactory solution to the price question.

The Wage Board recommendations concerning rationalisation in respect of which substantial increases were awarded to labour, including the increase of Rs. 2 per month from 1st January, 1962 to which I have already referred, have yet to be implemented although the principles were settled by agreement between Management and labour in the previous year.

In the course of a speech I made last month as Chairman of the Employers' Federation of Southern India, I refered to the problem of absenteeism in industry in India which has increased in an alarming fashion in recent years and has resulted in expensive machines standing idle, due to workers helping themselves to leave to which they are not entitled. Unfortunately, your Mills have not proved immune to this new industrial disease which, experience shows, seems to thrive when higher wages and generous bonuses are paid. Your Mills, like many other factories, maintain a leave reserve of men but this reserve in recent months has frequently proved to be inadequate, as for example when on some working days total absence, including normal authorised leave, has exceeded 16 per cent. In case of your Mills an absentee figure of 16 per cent means that over 2,300 men are away from work.

The increase in absenteeism has to some extent been due to the manner in which the State Health Insurance Scheme, the Company's contribution to which as I have already mentioned has this year been doubled, is being implemented, and there is evidence that it is possible for fit men to obtain generous medical leave on proportionate wages. It will be apparent to you how this development, if allowed to continue, can result in a serious increase in costs, besides being a most disruptive element to production.

Industrial development during India's first two Five-Year Plans was marked by significant achievements, but the target for production of mill made cloth was set at a low figure by comparison with that fixed for other industries, and was exceeded without difficulty. The target of 5,800 million yards fixed for mill cloth in the Third Plan, which was launched during 1961, is also modest being only 13 per cent over the yardage achieved at the end of the Second Plan. This target, which I have no doubt will be reached provided adequate supplies of cotton are available, will barely keep pace with the anticipated population increase and will leave nothing for securing the progressive rise in living standards, one of the aims of the successive Five-Year Plans, and certainly no margin for increasing exports, so necessary if India is to reach the stage of self-developing growth. Perhaps this is why the limited scheme of expansion announced by Government last year has attached to it an obligation to export which if not met will involve heavy penalties. Such a condition is likely to inhibit growth rather than assist it, but growth and higher productivity are essential if India is to maintain its position in world markets.

The satisfactory results for 1961 could not have been achieved without the loyalty and sustained efforts of the Officers and Staff of your Company who continually have to face new problems, invariably accompanied by frustration and anxiety. I am sure you will wish to join with me in expressing sincere thanks to them for the devoted service they have rendered the Company throughout the year.

In the Directors' Report reference has been made to the resignation of Mr. Molyneaux who, for family reasons, has retired from India. Over the years, Mr. Molyneaux has rendered splendid service to your Company and it is hoped that we shall shortly be in a position to appoint Mr. Molyneaux as one of your Company's Technical Advisers and that he will make periodical visits to India.

Before concluding, I would like to record my very grateful thanks to my colleagues on the Board for their loyal support and co-operation throughout the year.

NOTE: This document does not purport to be a report of the Proceedings of the General Meeting.

THE BRITISH INDIA CORPORATION LIMITED, KANPUR

CHAIRMAN'S ADDRESS

Address by Shri H. S. Chaturvedi, Chairman and Managing Director, to the Shareholders of the British India Corporation Limited, at the Forty-second Annual General Meeting of the Corporation held in Kanpur on Saturday, 28th April, 1962.

GENTLEMEN,

I extend a cordial welcome to you on the occasion of the 42nd Annual General Meeting of the Corporation.

The Directors' Report, the Balance Sheet, and the Audited Accounts for the year ended 31st December, 1961 have been circulated as usual, and with your permission, I shall take them as read.

I am happy to report that 1961 was a good year for the B.I.C. Group as a whole. You will see from the Corporation's Profit and Loss Account that, after deducting all expenses, the profit before taxation amounts to Rs. 1,05,36,221 as compared with Rs. 90,93,242 for the previous year. After providing for depreciation and taxation, the surplus available is over Rs. 61 lakhs as against Rs. 53 lakhs last year.

The overall results have enabled your Directors to recommend a dividend payment per Ordinary Share, of 35 nP. less tax, which represents a gross return of 7 per cent per annum on capital invested by Ordinary Shareholders. The need to improve further and to build for the future, however, is obvious, and out of the available trading surplus, about 40 lakh rupees has been ploughed back into the business, as against a corresponding figure of about 31 lakh rupees last year.

I would like to draw your special attention to the increase in overdraft by over a crore of rupees during the year. This was partly on account of tax payments on the Corporation's income-tax assessments. The main factor however which necessitated higher borrowings in 1961 is reflected in our present production policy. The value of stocks to meet the requirements of work in progress has increased considerably, the stock-in-trade at December 31st, 1961 being Rs. 4.42 crores, showing an increase of Rs. 1.14 crores over Rs. 3.28 crores as at 31st December of the previous year. The current

year has started with a full order book for our Woollen Branches, and there is every indication that the high level of demand will continue.

WOOLLEN BRANCHES

Production, in our Woollen Branches has been satisfactory during the year. The market demand for our popular Lal-imli and Dhariwal products continues to be good, and the Branches were able to sell their entire production.

Import licences for raw materials were issued on the basis of 50 per cent of wool consumed during the period 1956-57. This amount is obviously quite inadequate for current requirements. A notable development in the Woollen Branches, however, has been the successful introduction, after considerable experimentation, of various blends of Indian and imported wools. I am glad to report that the market demand for these products has been favourable.

With regard to our programme for the rehabilitation and early modernisation of our plant and machinery, plans sub-divided into various phases and projects had been submitted to the Textile Commissioner, but no licences have yet been issued. We shall, however, continue to press this matter.

The problem of obtaining adequate spare parts to maintain our old machinery in running condition, still remains. In many cases we have been unable to execute urgent orders for the Defence Services, because machines have remained out of commission, due to the non-availability of spare parts. This is a situation which deserves special consideration by Government.

Our Woollen Mills have been recently called upon to divert substantial quantities of weaving yarn spun out of imported wool which is already in short supply, to small-scale weaving units in Amritsar. To do so is bound to effect seriously our pattern of production. It will also result in a number of weavers being thrown out of employment from the Lalimli and Dhariwal Mills, which have earned their high reputation as specialized manufacturers of cloth, blankets, hosiery goods and knitting wool, and not as wholesalers of spun yarn.

LEATHER BRANCHES

The Cooper Allen and North West Tannery Branches continued to face serious operating difficulties during the year. Until the plant and machinery of the Shoe Factory is modernized, it will remain a vexed problem to cater for modern markets in sufficient volume to produce profits. So far, unfortunately, it has not been possible to obtain the necessary import licences to take up any programme of rehabilitation.

The raw hide position remained substantially unchanged, the quality of hides having continuously deteriorated. Prices on the other hand have risen due to shortage of supplies.

Although the turnover increased during the year, it was not possible to realise the modest profit shown in 1960.

COTTON TEXTILE UNITS

The results of the Elgin Mills Co. Ltd., and Cawnpore Textiles Ltd., for which the Corporation is now working as Secretaries & Treasurers were very satisfactory. The sales and profits were substantially higher compared with previous years, due to better trading conditions, and the sustained efforts of the Management to achieve higher productivity. Bearing in mind market trends and consumer preferences, our production patterns were adjusted to ensure maximum results from the installed equipment.

I am also glad to report that rehabilitation and modernization programmes to replace old equipment and installation of up-to-date machines over the next five years, have been approved for both the Companies. During the past two years a sum of Rs. 26,50,000 has already been expended on other rehabilitation programmes at the Elgin Mills, and an approximate sum of Rs. 11 lakhs at Cawnpore Textiles.

SUGAR UNITS

A record was created in the quantity of cane crushed and sugar produced during the season 1960-61 in all the six sugar units of the Group. While this achievement may be considered satisfactory, it has been largely offset by losses suffered in respect of exports, increased wages imposed by the Sugar Wage Board, and high rates of interest paid on bank overdrafts necessitated by accumulations of sugar stocks. Other adverse factors were higher prices of consumable stores, and lower prices obtained for sugar as a result of price decontrol, in the wake of over-production and lower exports.

The machinery in most of our sugar factories is old, and requires rehabilitation and replacement. This is not yet possible chiefly for reasons of financial stringency and restrictions on large-scale expansion.

Another factor, which is causing considerable concern, is the deterioration of cane quality in East U.P. and North Bihar, where our Group factories have recorded a steep decline in recovery. The matter is receiving the attention of the Government authorities concerned, and it would appear that the only way to compensate factories for lower recovery, is to link the price of the sugarcane with the recovery.

LABOUR WELFARE

This year again, I am glad to report that our relations with labour continued to be quite satisfactory. The Board has recommended special payment of three annas in the rupee to all workers, on their basic earnings in 1961.

THE COAL POSITION

The coal situation, which has been very precarious during the past twelve months, still continues to be unsatisfactory. The Corporation's factories depend upon adequate supplies of coal to function effectively, and it is a matter of great concern that substantial cuts have been made in the basic allocations of railway wagons for transportation of coal. Production in the Lalimli Mills was stopped in January, 1962, when the factory had to close down for six days due to shortage of coal. We can only hope that the authorities concerned will not allow productivity to suffer through lack of co-ordination between coal suppliers and transport arrangements.

GENERAL

The total contribution of the B.I.C. Group of Companies to the Union and State Exchequers this year is 4.22 crores of rupees in various forms of taxation as against 3.73 crores last year. This increase by nearly half a crore of rupees is largely due to excise duty on woollen and cotton textiles to the tune of about 25 lakhs of rupees in excess of last year's figure. Cane Cess this year has also increased by about Rs. 7 lakhs, the other increases being in respect of income tax and sales tax.

Before I close, I would like to thank all my worthy colleagues on the Board for their invaluable support during the year under review. I would also like to express my appreciation of the harmonious working of the staff as a whole. The loyalty and enthusiasm of all categories of staff who have contributed so much to the year's achievements, deserves special mention, and I would like to place on record my thanks for the co-operation extended to me. If teamwork and efficiency are combined with courteous dealings in all contacts and circumstances, I have no doubt that the B.I.C. will continue to go from strength to strength.

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting.

Chairman's Speech

INDIAN ALUMINIUM COMPANY, LIMITED

The following is the address to the shareholders delivered by the Chairman, Mr. K. C. Mahindra, at the Twenty-fourth Annual General Meeting of Indian Aluminium Company, Limited held in Calcutta on Friday, April 27, 1962.

I have great pleasure in welcoming you to the Twenty-fourth Annual General Meeting of the Company.

The salient features of the Company's operations in 1961 are contained in the Directors' Report which has already been submitted to you along with the audited accounts for the year. You will no doubt have noticed that following the termination of the sole selling agency agreement with Venesta Foils Limited effective 30th June, 1961, sales of agency products for the year dropped to Rs. 17 million from Rs. 32 million in 1960. Production and sales of the Company's own products were however maintained at a satisfactory level during the year despite extensive dislocation by the construction work on the expansion programme at each of the plants.

The net profit for the year of Rs. 11.10 million shows an apparent decrease from the Rs. 11.98 million in 1960. During the year there were increased interest charges on borrowings, additional wage costs following new labour agreements, and exports, though small in quantum, at prices below total cost. But the major shift is due to the much larger allocation to Development Rebate Reserve (Rs. 4.55 million as against Rs. 263,000 in 1960).

During 1961 your Company entered the export sales market for the first time. Sheets and circles were sold to South Vietnam in the face of severe competitive conditions. Your Company's efforts in this direction are in conformity with the declared wishes of the Government of India and we will continue to search for overseas markets. Currently, your Company is looking into the possibilities of exporting aluminium extrusion and paste to South-East Asian countries.

In recommending a dividend of Rs. 1.50 to be paid on each ordinary share, your Directors proposed that to the extent as it may be possible, the dividend should be paid out of the Company's undistributed profits exempt from tax under Section 15C of the Indian Income-tax Act. It now gives me great pleasure to announce that the Income-tax Officer has certified that 78.1 per cent of the dividend on ordinary shares will be deemed to have come out from the undistributed profits of the Company exempt under Section 15C of the Indian Income-tax Act 1922. 78.1 per cent of the ordinary dividend will thus be exempt in the hands of the respective shareholders for payment of income-tax and super-tax. Dividends will be paid to the ordinary shareholders in accordance with the above instructions of the Income-tax Department.

The most satisfying aspect of your Company's activities during 1961 was the progress made in respect of the expansion programme. At Hirakud, the expansion aimed at doubling the capacity of the plant to 20,000 tonnes per annum, was completed five months ahead of schedule. At Alupuram, the additional extrusion press was installed on time and started operating in October 1961. The expansion of alumina producing facilities at Muri progressed satisfactorily and a portion of the new facilities was brought into operation in December, again ahead of schedule by approximately four months. In a few weeks' time the Company will have completed the integrated expansion programme undertaken during 1959. You will be glad to know that all the projects have been or will be completed within the capital expenditure figures originaly budgeted. This is specially heartening in view of, what appears to me, a chronic occurrence in inflationary conditions to exceed capital estimates. On behalf of all of you, may I take this opportunity of expressing our sincere appreciation of the efforts of all those within the Company who have made this remarkable achievement possible. I should mention at this stage that a few years back the Company commenced developing an engineering and design section, and the closeness between actuals and estimates are largely due to the meticulous preparatory exercises by our engineers. Our thanks are also due in very great measure to our technical consultants, Aluminium Laboratories Limited, under whose guidance and general supervision the expansion programme was conceived and carried out.

I have said it before, but it merits repetition, that your Directors are anxious that your Company continues to play its leading role in the development of aluminium industry in India. With this in view proposals consistent with sound business principles are constantly in review for further expansion of the Company's activities. In accordance with this policy plans were submitted in 1960 to the Government for the expansion of ingot capacity at Alupuram by 5,730 tonnes and for the establishment of a foil mill in Maharashtra State with an annual capacity of 2,500 tonnes of aluminium foil. Late in 1961 we received licences under the Industries (Development and Regulation) Act from the Government of India covering these projects, although financing terms still await Government's approval. While there have been unnecessary delays we hope we shall soon be able to start construction work which when completed will save the country approximately Rs. 8 million per annum in foreign exchange. Other forward-looking plans are also under study for further expansion of the Company's activities as and when market and other conditions justify.

Shareholders with a historic sense will have noticed that the Company has followed over the years a consistent and continuous policy of development; the thinking of your Board and the Management has no doubt been inspired by the philosophy of growth which Indian planners placed before us, but we have advisedly, and I am proud to say, deliberately planned to be a stage ahead of the targets and aims of the Planning Commission. The Third Five-Year Plan, which commenced last year, expressed a tentative but half-hearted hope that by the end of the Fourth Plan, i.e. 1971, India would reach the stage of a self-sustaining economy. In our own sphere of industrial operations, I make bold to state that the Indian Aluminium Company would reach this stage 5 years ahead; I mean that expectations are that your Company would by 1966-67 achieve sufficient strength to stand on its own and generate enough technique, enough management and enough resources to follow through further expansions.

Prof. J. K. Galbraith, the distinguished Harvard economist, and now the U.S. Ambassador to India, commenting on Indian planning in 1959, affirmed that:

> "In both capitalist and communist countries investment is in very large measure from the earnings of industrial enterprises. Something must happen in India like this. Industrial plants must take on their full job which is to be efficient producers and to accumulate surpluses which will provide for future expansion."

Your Company has taken on this full job.

Recently, the National Planning Association, a non-profit research organisation in Washington D.C., made a case study of the Indian Aluminium Company as an example of Indo-Canadian collaboration. Here is their recorded judgment:

> "...different aspects of the Company's growth reveal an underlying unity of approach, ...fitting current actions into a telescopic view of future objectives. This view encompasses an industrially developed economy in which aluminium will play an important role. It is enterprising business policy and enlightened self-interest to be in the vanguard of this development, which demands a many sided responsibility in investment, in technical and managerial efficiency and above all in willingness to share responsibility for the Indian community's development over and above the profit motive. Indispensable to this responsibility is a confidence in one's ability to assess and face the future. It is in this confidence in the future of the country, and in the rewards of doing progressive business there, that the basic motivation of Indian Aluminium Company's management philosophy may be discerned."

You will be interested to hear that after many years of benefiting through borrowing technicians and specialists from associate companies overseas, your Company was able in 1961 to make a small beginning in lending specialist Indian staff for overseas projects. I welcome this beginning and look forward to further opportunities for your Company to assist in the development of new projects overseas through the loan of Indian specialists, as such exchanges benefit not only the overseas porjects but also this Company and the men concerned through broadening of experience.

As we all know, aluminium industry is a major power consuming industry. About 2.5 KW/year of electric power is consumed in the production of every tonne of metal, the power cost forming approximately 20 per cent of the total cost of production. It therefore becomes necessary for all producers of aluminium to ensure a long-term supply at rates which are both economical and definite. Before setting up its Hirakud smelter and again, before its further expansion, your Company held protracted negotiations with the Government of Orissa to ensure long-term supply of power at fixed rates. These negotiations resulted in our entering into firm long-term contracts with the Government which formed the basis of our expansion.

In mid-October 1961 the Government of Orissa levied a 15 per cent 'ad valorem' duty on the consumption of electricity in the State. This levy of duty has considerably upset our future plans and put the Company to a serious competitive disadvantage through direct increase in the cost of metal produced at Hirakud. The Company does not claim that the imposition is 'ultra vires' the rights of the State, but submits that the levy will furnish a handicap to long-term planning, beside increasing the already high prices for aluminium products in the country. It is also a matter for consideration of the authorities that development in a comparatively underdeveloped country can proceed apace only if the contractual fundaments of industrial operations are not disturbed by the Government for the period of the contract. May I, in contrast, cite the case of Ghana where Volta River Authority has been set up for construction and operation of a dam and power generating plant and firm agreements have been signed with a consortium which proposes to set up an aluminium smelter. Guarantees have been given by Government of Ghana and that while the power contract is in existence, the Government will not impose any tax or other fiscal charge on the use of electric power by the Volta Aluminium Co. Ltd. The tenure of the contract is for 30 years, and rate for power is fixed 'firm' at 2.625 U.S. mills per Kilowatt-hour or Rs. 110 per KW/year (in contrast to Rs. 190 per KW/year at Hirakud—Stage II). This constitutes the linchpin of the entire project as the power contract forms the foundation for financing the hydro dam and power plant. I have cited the Ghana example in the hope that the Government of Orissa will reconsider the matter and exempt the aluminium industry in the State from the duty.

Another interesting feature of the Ghana project may be mentioned: Government of Ghana has agreed that for the first 30 years the Volta Aluminium Company's income taxes will be based on the tax laws in effect on January 2, 1961, including receipt of benefit of Pioneer Company relief. There is also provision for exemption from customs duties of imported construction materials and exemption from minerals duties in connection with the mining or processing of Ghanian bauxite.

I would like to draw the attention of the Government from this forum to another matter which is of some concern to both the present and the potential producers of aluminium in this country. It has often been said that India has plentiful supply of bauxite, the ore from which aluminium is produced. This is, perhaps, true but it is equally true that the deposits of bauxite ore throughout India have not yet been thoroughly field-tested for quality or reserves. Aluminium producers in India naturally desire to make geological surveys of areas known to possess bauxite and your Company has applied for prospecting licences for several of such areas. One difficulty which is being experienced in this exploratory effort is that a lot of bauxite-bearing areas are under the mining lease of persons whom I would venture to call "intermediates", i.e. persons who have no direct interest in the utilisation of ore for producing aluminium. Large areas are thus closed for any prospecting or exploratory effort and sometimes there is a scramble for obtaining mining leases by private negotiations for areas which are yet unproven. Whatever has been done over the past years probably cannot be undone; but I venture to suggest that State Governments should from now on exercise care in issuing prospecting licences or giving mining leases for bauxite properties to persons or companies who are not directly engaged in the production of aluminium. This would ensure more effective utilisation of the bauxite reserves in the country and greatly contribute to the establishment of new economic production units.

Speaking on this occasion last year, I had mentioned to you the transportation difficulties which the Company was experiencing on account of uncertainty of railway wagon availability. This difficulty continues, and representations made to the Railway Board have proved of little avail. The Company has been forced to use road transport in several instances, which has proved costly as well as unsatisfactory in other respects. But it would appear that we have no alternative until such time as the transportation situation in the country improves.

I had also spoken to you last year about the way in which excise duty regulations were being enforced resulting in serious disadvantage to your Company. Our application to the Central Board of Revenue for permission to move aluminium ingot in bond from the smelters at Alumpuram and Hirakud to the rolling mill at Belur has as yet produced no relief. This matter was also taken up with the Central Excise Re-organisation Committee. In the meantime, our losses on account

of blockage of working capital on metal in pipline and excise duty on melt loss are multiplying. This is an unfair burden which the rigidity of regulations has imposed on the Company.

Several years ago speaking from this forum I attempted a comparison between two kinds of growth—that in population and in productivity. Since then we in India have learnt in the bitter context of a population explosion that most of our efforts at 'national growth' have proved inadequate. We have still to comprehend the true meaning of productivity, its nature and content, for otherwise our development plans for growth would not so fumble and confound. Despite a plethora of productivity associations, seminars, numerous delegations abroad and published records of these trips, I remain skeptical in that the true measure and content of this co-ordinate of industrial activity is little understood. There is a personal factor which appears to be missing in such reportings—a factor of personal judicious assessment of the extent of application of a particular analysis in a selected industry. Is productivity a mere co-efficient of labour, of work done by the individual artisan? Does automation qualify the conclusions? Does the emergence of a professional managerial class, as distinct from financiers or even technocrats have any bearing on the classical concept of productivity as output per man-hour? This is a puzzling thesis.

The popular measuring rod for productivity is output per man-hour. But the President of U.S. Steel Corporation—the largest steel complex in the world—has recently raised a few broad queries:

> "What about the capital invested in more efficient equipment? What about the research which produced better production processes and the know-how which made available higher quality materials? What about the input of man-management, when directed and contributed to this effort?"

These are pertinent questions; practical difficulties emerge as one begins to frame an equitable distribution of gains in productivity over the various sectors—labour, management, machines, research, technology, capital employed, etc.

Searching for an appropriate definition of productivity, I have not come across anything better than:

> "an attempt to anticipate and solve man's major problems on earth by providing through the highest technology more and more of everything, for everybody, from less and less resources."

This does not however provide either a measure for gauging the actual quantum of increase in productivity, nor provide the base for any rational system of distribution.

But no matter what economic and industrial philosophy inspires national efforts, productivity increment is essential for growth and productivity is largely the result of social attitudes of the labour force—their attitudes to technology, to professional management, to work discipline. In our country under the stress of circumstances, over-burdened by extreme poverty, many of these attitudes have got perverted and frequently one witnesses drop in productivity with inexorable increase in wage costs. This is a spectacle which one should deplore and not applaud—as many of our labour and even political leaders do, without reason and without understanding. Whatsoever the measure of productivity one may adopt, no one will deny that it is the key as well as the handmaiden of prosperity. Witness Japan: her astounding industrial recovery is explained in large part by productivity-wages-prices relationship. Over the six years, 1955-60 productivity increased by 47 per cent, wages by 34.3 per cent and prices only by 2.8 per cent. As a recent survey in the London 'Economist' indicated, "the margin between productivity and wages makes possible a high rate of capital accumulation by companies, and thus a high rate of investment. In addition, personal savings are exceedingly high....these are probably the most important determinants of economic growth in Japan." There is a deep lesson to be learnt here.

An odd feature in the Indian planning firmament has been the comparative play-down of productivity in the agricultural sector—a field which contributes to more than 53 per cent of the gross national income of the country. An understanding of the perspective relationship between agriculture and industry, of the true meaning and content of productivity, of the measures which will quickly fructify and yield tangible results—these are essential virtues which we must cultivate along with discipline of mind and of habit. The latter is most needed in the context of our present development.

Goverment quite rightly has concerned itself over the last decade with a fair deal for industrial workers but, perhaps unwillingly, has created a climate of unenforceable and irrational demands which halt and do serious damage to the productive machine. With a larger and larger portion of the cake, the industrial worker, by and large, recognises no discipline and little responsibility for growth in results.

It may interest you, as it intrigued me, to know that a keen foreign observer mentioned to me the other day that perhaps what India needs is compulsory military training—to impart amongst the young a sense of discipline during the formative stages of one's character. A country need not become war-minded if there is compulsory military training—witness Switzerland; nor need it possess arms—as was successfully done in Germany a few years after the war ended. This is a commendable counsel coming from a friend of our country.

In the person of Mr. A. J. Zullig, the new Managing Director of the Company, you see a very wise and experienced head. It is fortunate that the Company has been able to secure the services of a man who has lived his life with aluminium and at the same time is conversant with social and industrial conditions in diverse climes and places. It is my hope that he will stay with the Company for many years and continue the tradition of sound business and forward look for which the Company has already made a name.

To the staff and workers I give our thanks on your behalf for their loyal and steady work throughout the year.

Perhaps you will allow me to conclude on a personal note. This will be the last occasion I will be addressing the Shareholders at their Annual General Meeting. I am aware of the calendar but indifferent health also has compelled me to seek retirement from active work. Let me say that I am deeply grateful to the Shareholders for their indulgence, to the members of the Board and the Staff for their confidence and to everyone connected with this great Company for the trust and loyalty they gave me throughout my 14 years' association with them. I have relished with them the dignity of shared confidence for I believe that faith and work alone do not always yield results: work is merely an expression of what man believes and does. To be enduring other men must feel and believe and work the same way. These years have been personally of great satisfaction to me. I feel happy that the Company is in good shape and that I will be entrusting the charge in the next few months into younger and abler hands.

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting.

*Includes miscellaneous social service organisations; Community Development, National Extension Service and Local Development Works (for the years 1961-62 and 1962-63); capital outlay on industrial development (met from revenue) etc.

Note: 1. Figures in brackets indicate percentages to total.

2. Till 1960-61 expenditure on community development, National Extension Service, etc. was included under "Extraordinary items." As no separate figures are available, expenditure under this item is, however, being excluded from 1951-52 to 1960-61.

3. From 1961-62 all grants to States for Social and Developmental services are being booked under the head "Grants in aid to States".

The President

THIS week Dr. Rajendra Prasad has said goodbye to New Delhi and, with the deep affection of all the people of India, has entered on his retirement appropriately in an Ashram in his beloved State of Bihar. It is difficult at this moment to evaluate the place that Dr. Rajendra Prasad will occupy when the story of India's first Presidency is being written. The biographies of him that have appeared have been fulsome and, in many cases, quite uncritical. This is hardly the way in which history will look upon the office in which he may be said to have built the first conventions. Dr. Rajendra Prasad no less than the Constitution built the Presidency of the Indian Union into a constitutional monarchy. Whether or not he was entirely wise to do this, seeing the possible need for India to use President's Rule as a guard against instability is questionable, but, all in all, the verdict of the country has been one of approval. During these twelve searching years in which he exercised the office of the Head of the State, he has been, so to speak, in the background of power. Jawaharlal Nehru with his central place in the political life of the country was naturally able to subtract from the Presidency some of the powers which otherwise the office might have assimilated. It is extremely unlikely that the future Presidents of the Indian Union will ever, falling away from Dr. Rajendra Prasad's example, attempt to capture power in any form in that office. Dr. Rajendra Prasad was a hero of the Revolution. His distinguished successor, Dr. Sarvapalli Radhakrishnan, is, perhaps, the first amongst India's scholars but still lacks the political stature to claim on party grounds any portion of the power of the Indian Union. Dr. Zakir Hussain, the Vice-President, also a scholar, has stepped appropriately into a tradition set by Dr. Radhakrishnan with the outlook of the campus rather than the hurly-burly of the political arena.

To argue that scholarship is a great virtue in both offices is by no means to fall into the confusion which some papers have already done by attempting to argue that the Indian succession is now literally in the line of the recommendations of Plato's philosopher-king. It is wholly wrong to equate the power of Plato's philosopher-king with the power of a constitutional monarchy in any country in the world. Philosophy was designed as an element in the restraint of individual ambition when power was uncontrolled. Since the office of the President of the Indian Union is not the residue of power, obviously his philosophy is not designed to produce self-content. India's President can never exercise substantial power unless he is raised to that office on the basis of a coup d'etat. This, it is fervently hoped, will never happen in India. Perhaps it is some guarantee with philosophers in that high office that they will never be tempted to employ crude military means for the wresting of the power which the Constitution has denied to the office.

While the country rejoices at the eminence which has now been placed at the head of the State, and the recognition given to the high scholarship of its present incumbent, it must also take note of the fact that opportunity for now creating conventions in which the influence of the President can be dominant in the political decisions of the Cabinet is relatively small. This is largely because the President is no longer a Congressman, at least in the old tradition of the Gandhian Age. But he has other virtues which come from the accidents of birth. As a Southerner and one widely travelled abroad, Dr. Radhakrishnan opens his account as an elder statesman of the highest rank. Everyone will wish that his talents will find opportunities in the highest of all offices in the country.

The Kashmir Debate

THE Security Council has adjourned the debate on Kashmir *sine die*. It is not very difficult to guess why Pakistan insisted upon the debate. Political expediency seems to have made it necessary for her to keep the Kashmir issue keenly alive. In the absence of really weighty developments holding a threat to peace, Mr. Sanjeeva Reddy's speech, asserting India's determination to liberate the Pakistan-occupied territory, was picked up as one convenient justification. An immediate debate was sought in January last, but it was postponed until after the general elections in India. The postponement was an indication of the significance attached to the strength of the plea. Many things are said in the heat of the hustings and if wild statements are made they need to be discounted on that score.

Sir Mohammed Zafrullah Khan had to labour hard in this situation to make out a case for the immediate intervention of the Security Council. Nevertheless, it was of little use to rake up the dead past by invoking memories of the atrocities committed in the immediate wake of the partition of the Indian sub-continent. Members of the Security Council knew too well that these atrocities, committed in a mood of frenzy, were not perpetrated unilaterally. Mr. Krishna Menon, on the other hand, expounded India's case in a manner which does credit not only to its merits but to his

talents as a skilful advocate. He refrained from indulging in acrimony and was quite brief and precise. He could bring force and lucidity to bear on his exposition just because he wisely practised the virtue of moderation. So persuasive was his advocacy that Mr. Adlai Stevenson could not resist the spontaneous urge to offer him warm congratulations. How far the purpose in convening the Security Council was achieved is best epitomized in the meaningful observation of Sir Patrick Dean: "Time had made the dispute no larger."

This debate is to be judged not merely by the points scored or the manner in which the representatives of the two countries argued their briefs. The implications of the speeches made on behalf of the big powers are more important than what the spokesmen of the two countries urged. One of the major issues which has been invariably thrashed out before the Security Council is India's obligation to hold a plebiscite in Kashmir. This obligation is contained in the UN Resolution of June 5, 1949. Convenience may seek to blur the genuine character of the resolution as an integrated whole and manoeuvres may be employed to focus attention on the plebiscite. But the fact cannot be obliterated that the earlier three parts of this resolution lay down positive conditions. Among them, a major condition precedent is the vacation by Pakistan of the territory she has occupied in Kashmir. The plebiscite clause can hardly be detached from the rest of the resolution and an impression created that the holding of the plebiscite is an unqualified and absolute stipulation.

More significant than this inherent spirit of the resolution is the fact that over the past twelve years material changes have occurred and the point has been reached when the question could be posed whether it is practicable to cling to a solution which was conceived in a situation that has ceased to exist. A constituent assembly has framed the constitution for Kashmir and two general elections have been held, based on direct vote. It is in the interest neither of India nor of Pakistan to cause any upsets now to the stability that has been achieved after the partition. India will not be a party to reversing the position only to plunge both the countries into a holocaust, which it would be extremely difficult to avoid, in a repetition of territorial division on the principle of religious alignments. Pakistan, too, can hardly envisage this prospect.

Basically India and Pakistan are fully conscious that their final interests lie in peaceful and friendly relations as good neighbours. Both the countries are aware that a settlement imposed by a resort to war or violence cannot succeed in establishing stability. India gave an unequivocal expression at the Council's meeting to her pledge not to take the initiative in using violence in the settlement of the dispute. A similar statement has been made on behalf of Pakistan and it would have strengthened the confidence of the friends of both the countries had it been unqualified. Unhappily it was not so. Sir Mohammed Zafrullah Khan warned the Council that the tribesmen were threatening to get out of hand and the citizens of Pakistan, too, were growing more and more restive over this issue. The reference to the tribesmen was nothing but a veiled threat of war. In 1948 the alleged religious zeal of the tribesmen was used to explain the attack on Kashmir. This is familiar history. The warning, therefore, could not fail to detract from value of the declaration of no resort to war or violence made by Pakistan's able delegate. In fact, Mr. Platon Morozov was quick to highlight the fact that the only new development in the Kashmir issue was this threat of war.

Pakistan's agreement with China to negotiate a settlement of the boundary between Kashmir and Sinkiang was presumably a diplomatic move to cause serious embarrassment to India and perhaps to exert pressure on her Western allies. This diplomacy was, however, ill-timed and it would appear that it was also ill-conceived. China played her cards shrewdly in making it clear that the agreement on the border, if reached, would be provisional and the final agreement would have to be concluded with the sovereign power. The implication of this condition is clear. But it revealed the extent to which Pakistan chose to proceed in an unexpected direction in an effort to influence her friends and to scare away India. The real repercussions of this agreement, however, do not appear to have been properly weighed by her.

If anything, this new move has gratuitously disturbed America and Britain. It is likely to be construed as a calculated thrust at her Western allies for what she considers as their default in not extending full support to her in this issue. Mr. Menon, though perturbed by this fresh development carrying the sinister potentiality of further strains and complications for India, would have committed a serious lapse of duty if he had omitted to lay bare the duplicity involved in this diplomatic game. While Pakistan chose Western alliance for military and economic aid, she had no hesitation to court China for political gain. This agreement may have been conceived in a spirit of expediency, but it is the kind of expediency which is bound to cause some serious heart-searching on the part of America in particular. Undoubtedly, this agreement weighed with Britain and America in agreeing to an adjournment of the debate. Pakistan's contemplated move to seek reference of this question to the General Assembly was thus foiled by her own action.

An essential lesson of this debate is the recognition of the fact that the complexion of the Kashmir issue has changed. This is not the same thing as to maintain that the controversy may be taken as set at rest. A solution to that end will have to be devised. If contingent plebiscite has now become obsolete and the Security Council finds itself in no confident position to take the initiative, it is in the interest of both the countries to hold direct bilateral talks. Mr. Manzur Qadir, Pakistan's Foreign Minister, has hinted that a third party acceptable to both the sides should be present at the talks—when they are held. But the presence of the third party is more likely to prejudice a frank exchange than to facilitate the course of the bilateral talks. It should be obvious that third party presence offends against mutual trust which is the basis of bilateral negotiations. The third party's good offices would certainly be useful in exploring the ground for agreement and attempting to enlarge it to the maximum possible extent. But the stage has been reached when both the parties should sit side by side and evolve a mutually acceptable solution. That appears to be the only way to establish permanent harmony between the two.

Burmah-Shell's Offer

WITH the announcement by Burmah-Shell of its readiness to abrogate voluntarily the controversial Refinery Agreement entered into by it with the Government of India in 1951, getting registered Burmah-Shell Refineries Limited under the Industries Act and its decision to offer to the Indian public "substantial and widespread" equity participation in both its marketing and refining enterprises, the momentous developments on the oil front have started unfolding themselves. If this move of Burmah-Shell speaks volumes for the progressive outlook of this company and a commendable grasp on its part of the "wind of change" that has been blowing in India in respect of foreign investments in oil, it also does great credit to the Union Minister for Mines and Oil, Mr. K. D. Malaviya, who has been the principal architect of the oil policy of this country, which, according to discerning observers, paved the way for his elevation from the status of a Minister of State to that of a full Cabinet Minister in the Union Government after this year's General Election. The harmonious and successful operations of Oil India Limited in which the Burmah Oil Company, one of the two partners in Burmah-Shell, and the Government are equal shareholders, appears to have played a great role in bringing about this healthy re-orientation in the Burmah-Shell management's policy of operations in India.

The offer naturally is subject to an understanding being reached between Burmah-Shell and the Government on "certain basic points". But what these basic points are has not been divulged in the statement issued by the company to the Press. Some of the issues on which an understanding will have to be reached prior to the implementation of these proposals probably are the pattern of management of the new rupee company to be formed, the percentage of its capital to be thrown open for Indian participation, expansion of Burmah-Shell's Trombay Refinery, the question of crude supplies and repatriation of the sterling capital which will become surplus as a consequence to Indian participation in the equity shares of the new company. Some of these issues are apparently such that an agreement on them can be reached without any difficulty. The effective control of the new company, for instance, will have to be allowed to remain in the hands of the present incumbents since they would be holding majority shares. Similarly, the surplus sterling capital will have to be allowed to be repatriated if it is not to be permitted to be invested in some new fields of activity. On more or less similar footing stands the issue of crude supplies. Any industrial unit has a right to secure its raw material supplies from any source it desires, but if imports are involved they can be effected only at competitive prices. Burmah-Shell would not be averse to securing its crude supplies indigenously if they are available, but if they are to be imported, it will naturally like to secure them from its own traditional sources instead of being forced to draw them from the Soviet Union, especially when its own suppliers would be able to meet its requirements at prices competitive with Russia.

The most intractable issues involved in the negotiations probably will be the pattern of Indian participation in the equity capital of the new company and the permitting of Burmah-Shell's Trombay Refinery's expansion at least to 3.5 million tons, which capacity it has attained through improvement in its operations and minor adjustments in its plant at a little or no extra expense in foreign exchange. According to the announcement, Burmah-Shell would like the Indian public to subscribe to the new company's capital in the proportion to be decided upon. But the present oil policy of the Government by its implications seems to rule this out. Any future refining capacity to be created, Mr. Malaviya has been emphasising, has to be in the public sector. This should imply that on behalf of Indians, it is only the Government that can undertake oil refining business and not the Indian public.

The Government's oil policy, however, does not preclude expansion of the existing private sector refineries, provided the controversial clauses of the Refinery Agreements are abrogated or suitably modified. Burmah-Shell's latest proposals should help in breaking this deadlock. And it is necessary too. The demand for petroleum products in this country, which is expanding at a very fast rate and is estimated to rise to 14 million tons according to the Planning Commission's estimates and about 16.2 million tons according to Burmah-Shell's estimates by 1965-66, would require the creation of additional refining capacity even after the contemplated expansion of the Noonmati and Barauni refineries to 1.25 million tons and 2.75 million tons and the setting up of a 2-million ton refinery at Koyali. The easiest and inexpensive way to do so is to allow the existing private sector refineries to increase their output through full utilization of their recently expanded capacity.

Expansion of the oil refining capacity in the country incidentally will help in solving the issue of the imported petroleum products prices which after the enforcement of the Damle Committee's report has created not a little estrangement between the Government and the oil companies. With augmented production here, the need to import middle distillates, which are in short supply, will be obviated to a considerable extent.

Given a pragmatic approach by the Union Ministry of Mines and Oil, it is hoped that an amicable settlement on all these issues will be arrived at at none-too-distant a day. The thoughtful and wise gesture on the part of the Burmah-Shell management needs reciprocation by Mr. Malaviya. If these negotiations prove successful, it can reasonably be expected that the Esso Standard Eastern and Caltex, as also the Assam Oil Company, will follow suit and form new companies under the Industries Act. Repatriation of foreign capital that becomes surplus as a sequel to Indian participation in the equity capital of these companies even to the extent of 20 to 25 per cent will undoubtedly put a great strain on our foreign exchange resources. But that can be avoided to a considerable degree by enabling its re-investment in new lines such as setting up of petro-chemical and lubricating oil projects.

THE WEEK'S NOTES

Laos

THE FALL OF NAM THA

THE REPORTS about the fall of Nam Tha, the capital of the north west province of the rightist Government in Laos, which first emanated from Peking, are no longer held in doubt. The Pathet Lao forces captured Nam Tha on May 6. Long before that the civilian population was practically evacuated as the fall of the city (which is of strategic importance to the defence of the province) became imminent. Earlier military engagements had made this fate of Nam Tha practically clear. It was certainly no casual coincidence that the Pathet Lao forces seized Muong Sing, which holds the key to the defence of the capital city of Nam Tha, on the first anniversary of the cease-fire in Laos. The day was purposely selected for the seizure since the Pathet Lao forces were quite confident of their victory with the massive support of the Chinese forces and the deployment of the 43rd division of the Chinese army on the Sino-Laotian border. China had two main objectives in precipitating this grave military engagement calculated to throw the cease-fire into jeopardy. In the first place, she wanted to send out a feeler how far America would be willing to get involved in a military action likely to be dragged on indefinitely. In the next place, knowing fully well that Russia is interested in the formation of the neutralist government, China took the opportunity to make an exhibition of her dominating influence in the South-East Asia in the present state of the rift between herself and Russia. But it must not be overlooked that the right wing General Nosavan Phouma's army light-heartedly indulged in provocative acts to foment a breach of the cease-fire. It looks at the moment as if the entire good work done after great patience and forebearance stands threatened to be undone. If the breach of the cease-fire is allowed to be completed the inescapable consequence will be to plunge the country into one of the bloodiest civil wars.

During the year that has passed, Pathet Lao has consolidated and strengthened its position. By contrast, Prince Boun Oum's rightist government is badly shaken by the withdrawal of American economic aid. America had no alternative but to apply this sanction as an instrument of pressure to give the strongly needed shake-up to Prince Boun Oum. It was his government which foiled all attempts to form a neutralist government in Laos with Prince Souvanna Phouma as the Premier in charge of the two key portfolios of Defence and the Interior. But Prince Boun Oum maintained his opposition to a coalition to which Prince Souphanouvang would be a party. A neutralist government in Laos, however, could not be neutralist unless it included Pathet Lao despite its red colour.

Prince Boun Oum has foolishly played with fire and has not cared to ponder over the consequences of his government's intransigent opposition to a coalition. The redeeming feature in the fast deteriorating situation is that Russia, Britain and America are interested in installing a neutralist government and holding aloof from a partisan attitude. But there is the counterbalancing factor that the new developments have given China and Pathet Lao an accretion of strength and to the latter greater negotiating power. The main hurdle seems to be how for Russia will go to induce Pathet Lao to agree to the restoration of the cease-fire in this complicated situation.

Hooghly Pilots

THE PARALYSIS OF STRIKE

THE STRIKE of the pilots of Calcutta Port had reached a highly critical point at which all activity has been paralysed. It is now over a week that 40 out of 46 Hooghly pilots resigned their offices. It is elementary commonsense that the port cannot function without the pilots and matters ought not to have been allowed to reach such an extraordinary impasse. Not only have incoming ships been stranded, but there is now a mounting threat to the flow of essential goods in the Eastern region, where the Calcutta port holds a unique position as the heart of the line of communications for internal as well as external flow of freight traffic. Coastal traffic has also been practically brought to a standstill and this would immediately hit the movements of coal by shipping. The alternative is by no means easy and its feasibility is open to serious question. With their capacity already stretched, the railways can hardly take the extra load of freight traffic without striking at the urgent requirements of other users.

The pilots, as responsible officers, owe a duty as much to themselves as to the public undertaking of which they should be proud to be the members. Whatever the force of validity behind their grievances, it is their first duty to place their service to the community above the vindication of their personal rights. But the Port Commissioners of Calcutta are perhaps to be blamed more than the pilots for a grievous failure to tackle this delicate problem with at least some degree of humanitarian consideration. And it would appear that the position taken by the Port Commissioners is vulnerable. Their attitude towards the striking pilots is unrealistic and considerations of prestige appear to have pushed them into this position of unrealism. A blunt refusal to accept conditions for compromise, to withdraw recognition from the Association of Pilots and to secure the machinery of the Essential Services (Maintenance) Ordinance when resort to it could have been postponed tactfully — these are all among the outmoded techniques to deal with strikes which are not groundless.

The central grievance of the pilots is about the breach of an assurance alleged to have been given by the Port Commissioners in 1951 for the restoration of the status and conditions of service of the pilots to the 1948 situation. Whether such an assurance was given or not has become a matter of controversy. While the Port Commissioners have denied it, the new Chairman is inclined to lend his support to its truthfulness. It was in 1948 that the Hooghly pilots were removed from the administrative control of the Central Ministry of Transport and placed directly under the Port Trust Authority. This would mean their likely reduction to a position of parity with the Harbour Masters and other categories of the Marine Services. The pilots who enjoyed higher emoluments and superior conditions of service could not envisage the prospect of being pushed to such a parity. Their major demand is restoration of the Central control as before. This has now become an issue of prestige. The pilots are prepared to call off the strike if this condition is agreed to. This may seem to amount to giving way to tactics of coercion, but it is likewise true that notions of prestige ought not to be asserted at such a grave cost. Discretion would lie in making a concession which cannot be wholly regarded as made under duress.

Naga Hostiles

REFUGE ACROSS THE BORDER

WHERE THE border is infested with a thick jungle and the entire terrain is difficult for communications, it is easy for the Naga hostiles to retreat behind it for safety and respite to redouble their activities of violent attacks in Nagaland. The hostiles first sought refuge behind the Indo-Burmese frontier. But Burma acted with promptitude and a great sense of duty to her friendly neighbour in making the hostiles evacuate her territory. Now they have turned to the East Pakistan border, exploiting the possibility of the fact that the attitude displayed by the Burmese Government had no chance of being repeated there.

An intriguing point that has emerged in the course of information on this latest development relates to the extensive nature of the territory on the Indian side over which the Naga hostiles effected their escape. This would show that they made a surprise move. The Prime Minister has rightly stated that it would be difficult at the present stage to be positive that the arms and ammunition seized from the fleeing hostiles belonged to a particular source. But as the Press reports show the hostiles have been well received on the other side of the frontier. To extend asylum to people who are admittedly indulging in violent subversive activity against a neighbouring State is certainly highly objectionable. With what face can Pakistan assail Afghanistan's position of lending support to the Pakhtoons? It is for the Government of India to exercise the greatest vigilance at the border points. The fact that the core of the Naga hostiles has disintegrated and they are operating in an unorganized manner from widely dispersed points is an encouraging indication of their tottering position. To seek refuge across the border and to function from there by means of sporadic attacks is a sign of a last ditch battle, when the majority of the Nagas are in no mood to respond to them. Nevertheless, firm action must be taken against such attacks by plugging the points of entry into India. The difficulties that confront the security forces in this task cannot of course be underestimated.

The latest development is the release of the four Indian airmen by the Naga hostiles and their return to the Burmese military officials. The timing of this release with the adoption of the new tactics to operate from the Indo-Pakistan border is intriguing. While the release is to be welcomed, it would be unwise to read into it a desire on the part of the hostiles to come to a compromise. Maybe, it is a ruse to mislead the security forces into a sense of lull.

Public Administration

EXPANSION OF CADRES

THE PARADOX of the operation of Parkinson's Law in the public administration of India and the dearth of officials at several points in the administrative machinery is more apparent than real. The problem, seen in its proper setting, is one of orderly growth with speed where the complex and rising volume of work demands it, and a firm brake on expansion, where the temptation is great to multiply the administrative personnel under a false or exaggerated sense of growing loads of work. The demand for administrators at the higher executive level is difficult to satisfy for the obvious reason that the obligations imposed by the acceptance of the ideal of a welfare state, planned development of the economy and the fast expansion of the public sector are making incessant calls for personnel of the necessary calibre. This demand is mounting so rapidly that the painstaking and able reports prepared on this knotty problem by Mr. A. D. Gorwalla in 1951 and by Mr. Paul Appleby in 1953 do not provide straight solutions to current problems. Mr. V. T. Krishnamachari's report, a product of an industrious and exhaustive probe into the problem, is expected to be submitted to the Government and the Planning Commission this week. Speculation on the nature of his recommendations appears to be in vain. The release of the report must be awaited.

The numerical aspect of this problem — in particular the scale of recruitment to the IAS — is less material than the nature of the qualities expected in these administrators and the capacity for adaptation to new situations in which the officials have to function. This has a particular reference to the administration of the community development projects, the decentralisation of administrative responsibility at the levels of the Panchayat, the Panchayat Samitis and the Zila Parishads. Decentralisation may sometimes demonstrate the bitter results of haste or impatience, but by and large, the real problem is flexibility and readiness on the part of the higher officials for adopting changed attitudes before frictions are created. The expansion of the public sector of the economy at an admittedly rapid rate is bringing to the surface the inadequacies of the requisite talent for positions of higher responsibility. Frequent shifts and transfers of top officials have made the problem more acute. And no less an important factor is lowering or shaking the morale and decision-making capacity of official executives of public enterprises by criticism (not infrequently loose) in Parliament where they cannot explain the correct position or defend their actions. We have to imbibe that respect for the administrative services and to develop aloofness from intermeddling with matters on which information available to outsiders is generally insufficient or one-sided — qualities which are so abundantly displayed in mature countries.

NATO

EFFECTIVE NUCLEAR CONTROL

IT IS unquestionably a matter for gratification in the present strained international situation, created by the positions taken up by the nuclear powers on the ban on tests, that the Ministerial Council of NATO did not make a complicated situation more complex. One of the major subjects on the agenda at the Council's meeting was about effecting a radical change in the policy of control over the use of NATO's nuclear arms. NATO has already a good stock of nuclear weapons, supplied by America as a reserve solely confined to use for retaliation. But these nuclear arms are strictly under American control and the power to authorise their use is vested in the American President. This is just in consonance with the American law which does not entrust the authority to any other agency. It was least expected that America would yield to the pressures of some of her NATO allies to deviate from it.

The argument put forth for transfer of effective control was that in case there was a near certainty of a nuclear attack by Russia on Europe, no time would be left for consultation with Washington to invoke the authority for a counter attack. It was, so the argument ran, vitally essential that the power to sanction use of atomic weapons should be delegated to the authority on the spot. Superficially this argument has a semblance of validity. But in reality its potential consequences would have been quite dangerous. No one can conceal the fact that complete unanimity on nuclear defence is lacking among the NATO members. The European members have diverse interests which deeply touch their national security. Precisely for this reason it would have been a serious error to transfer the control under auspices which might exercise the power under mistaken notions. The status quo has been maintained rightly. But it does not remove the tensions created by the nuclear race. The right course is to negotiate with Russia with a determination to reach a reasonable agreement.

The World Abroad

PROBLEMS OF FORMING A CONSORTIUM

By

ODYSSEUS

I WAS SAYING here last week that Indian industry might be well advised to look into the possibilities of forming consortia for the joint selling of exports, because it may be feasible for several companies, which are in competition in their homeland, to create either a joint overseas selling organisation, or even to set up a single jointly owned factory abroad. I draw your attention to a clearly and concisely written new book "Business Consortia" (Sweet and Maxwell. London. 30sh.) by Mr. A. Harding Boulton. This is the first book ever published on this new development in industry.

This week we will take a closer look at the underlying problems of forming a consortium. These are: (1) the possibilities of conflicts of interest between the member companies of a consortium, (2) the need to distinguish between conflicting and basically separate functions of the different members, (3) the unequal need for, and loyalty to, the consortium, and (4) the effect of the consortium's "severable" personality.

That two or more companies have decided to form a consortium implies that they have some community of interest. In some circumstances, it is, however, simpler for one company to act as main contractor and for the others to be sub-contractors. One of the advantages of this is that a main contractor constitutes an authority when there is a conflict of interest between himself and a subcontractor, or between two subcontractors. A consortium is, on the other hand, the answer when no company is able to act as main contractor. Its success depends on reasonable confidence that there will be no conflict of interest inside the consortium. Mr. Harding Boulton insists, therefore, that it is vital that any possible conflict of interest should be recognised and resolved at the time that a consortium is in course of formation.

Although, for example, a hydro-electric scheme is divisible into civil, hydraulic, and electrical engineering, there may be demarcation disputes between constituents. The manufacturing range of two constituents may overlap, so that they are competitors for parts of the work. Again, in a large project there may be fringe items, which are barely remunerative and something of a nuisance. Who is to be responsible? In relation to the customer, the consortium itself has accepted the responsibility. If the members quarrel, all will suffer.

There are friendships and antipathies between companies as there are between individuals. It is important that if the customary friendship and co-operation with a dominant member of a consortium brings two antipathetic members into the new organisation, this should be faced and understanding reached. It is at the consortium's board table that the business of living together begins. It is important, therefore, that the representatives who meet there should be given a considerable degree of freedom. They must not be given by their own managements directives which will disrupt the consortium. They must be able to take a decision. Nothing provokes conflict more than when one representative has to refer back for instructions while all the others are able to take decisions.

CONTRASTING AIMS

Discussing the need to distinguish between different functions, Mr. Harding Boulton points out the difference between the way an ordinary industrial company works, and that in which a consortium works.

An industrial company manufacturing and selling a product buys from its outside suppliers and sells to its outside customers. A company which buys components wishes to buy at the best possible price. The members of the board may disagree about the merits of alternative sources, but their disagreement is concerned with means, not ends. Similarly, in selling, board members may disagree about price advances or reductions, but their common aim is to sell the maximum quantity at the best price. The other party to any contract is in the outside world, whether he is a supplier or a customer.

The position in a consortium is different. The chief purposes for which consortia are useful are those in which the consortium buys from its constituent members for resale to a single customer (as in a construction consortium), or to the world at large (as in a selling consortium), or in which it manufactures for sale to, or through, its constituent members (as in the case of joint factory).

In each of these examples the constituent members are either sellers to, or buyers from, the consortium.

It follows that the director who represents one constituent on the board of a consortium is so placed that, while he sits as a member of a board which, as a board, is concerned with consortium affairs, half of his mind is occupied with the interest of the member company which has appointed him, whose concerns retain his long-term loyalties. While that member company is interested in the success of the consortium as a whole, it is even more interested in its own relations with the consortium, since in participating in the consortium at all it has done so in its interests. The directors of the consortium are there as representatives of their own companies who are buyers from, or sellers to, the consortium. Each will be anxious to influence the consortium so as to secure the best for the company that he represents. If some concession is made to one, the adverse effect will be borne by other members in their capacity as shareholders. The only solution is to recognise these facts before forming the consortium and to uphold fairness and equality of dealing and to lay it down that concessions must not be made in favour of one company save only with the understanding and approval of all.

A consortium is most likely to work satisfactorily if the member companies are of approximately the same size and are thus represented on the board by men of approximately equal status. It is, however, more likely that some members are much larger than others, and that the larger members may be much less vitally concerned with the success of the consortium than are the smaller members. If the consortium's project is likely to provide a substantial proportion of a member's turnover for a number of years, he will be enthusiastic. If the consortium provides a relatively small proportion of the member's business, his enthusiasm may be less. If the business is at unremunerative prices, enthusiasm may evaporate and the consortium come to be regarded as a nuisance.

PRICING PROBLEMS

Mr. Harding Boulton emphasises that it is essential to recognise that these differences in the relative importance of the consortium as between one member and another, and the different levels of profitability between different industries and, indeed, between sections of the same industry, constitute problems which must be thought out beforehand. He offers the following hypothetical example. The technically advanced, specialist manufacturer A, concerned with an individually engineered product, normally looks for a wider margin between costs and selling price than B, the manufacturer of a less specialised, more competitive and repetitive product, which has a recognised market price. A knows that he will incur severe loss if designs prove faulty, and he must allow a safety margin for the uncertainties of forward costing. B looks for a continuous turnover in which he can calculate costs narrowly in order to maintain his global profits.

Suppose manufacturer A produces a specialist product, and expects a profit of 15 per cent on cost, whereas manufacturer B's product is a competitive one with a recognisable price level which normally yields 7½ per cent. Suppose they are members of a consortium. Manufacturer A expects the project to fill his factory with important orders for a long time. Manufacturer B, however, may in any event be sure of a steady flow of business. To him, therefore, the consortium business, while welcome, is not vital. The first estimates are prepared:

	Cost	Profit	Quoted Price
A ..	100	15	115
B ..	100	7½	107½

The price quoted is 222.5, but owing to severe competition it is recognised that this must be reduced by, say, 5 per cent. It will seem common sense to A, who in any case knows nothing of B's costing, to press for the reduction and to think that it should be made by each party. The price becomes 211.375 and B, under pressure, agrees. But B's profit has now become a mere 2.125 per cent while A's is still nearly 10 per cent, and as the work goes on B will increasingly resent the occupation of his factory time in unremunerative work, especially if, when the consortium job is passing through his factory, he has to refuse other business because of the consortium's claims on his capacity.

There is no quick solution to such problems, but half the battle is won if they are squarely faced and discussed with mutual understanding before the consortium is finally formed.

Discussing what he calls the "severable personality" of the consortium, Mr. Harding Boulton stresses that the consortium's separate existence, its severable identity, has been created to further the common interests of its members. While for contractual purposes, and for convenience of accounting, it is a separate entity, it has no real existence apart from that of its members. It should therefore be remembered that to enter into acrimonious argument with a consortium, of which one is a member, is to quarrel with oneself and with one's colleagues and partners. The special relationship created by the consortium must be recognised at every executive level.

This is the second and final article on the problems of forming a consortium.—ED.).

THE EASTERN PURCHASING JOURNAL

Official Journal of the National Association of Purchasing Executives

THIRD YEAR OF PUBLICATION

Of practical interest to all who are concerned with :

The European Scene

COMMON MARKET AND POLITICAL UNION

From Our Special West European Correspondent

PARIS, May 5.

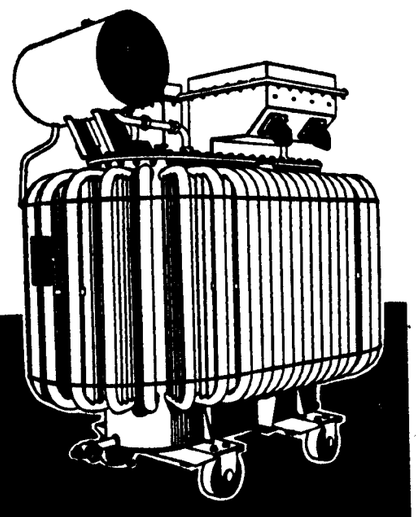
THE failure of the Six of the Common Market to reach agreement on a treaty of political union might seem to indicate that the movement of European integration has run into serious difficulties. Indeed, it has arrived at a crossroads, and at the present moment it is not clear which course it will take. But it needs to be emphasised that this uncertainty concerns solely Europe's political future, as distinct from the process of economic integration. That is, it relates to the institutions the union should have, the connection between them and national governments, and the degree of independence a united Europe should show in matters of defence and foreign policy. It is perfectly possible for economic unification to continue without such issues being settled and in fact it is continuing during the period of disagreement and uncertainty. Of course, economic unification poses political problems; some central organism will have to take important decisions on economic matters with far-reaching political implications. Yet such decisions could be taken now by the Council of Ministers, now by the supranational administrations in Brussels, or even on occasion by the European Parliament. In other words, Europe could resolve pragmatically all the political problems posed by economic unification without settling on a doctrine about permanent central institutions. One could go further, and guess that it would make very little difference to the form of the economic union whether Europe were an alliance of states or the embryo of a unitary nation. For the time being, at least, the quarrel about Europe's political institutions is irrelevant to the progress of the Common Market—and it is this that most interests and affects outsiders.

Nor was the political crisis something brought on inevitably by the success of the economic union to date. On the contrary, most consider that it was brought on artificially by President de Gaulle's impatience to give political shape to a union that was still engrossed with the first steps toward economic unity. France's five partners, and for that matter a majority of politicians in France, would have been content to let this process take its course without anticipating on the political issues, because it is their comfortable belief that suitable political institutions will grow up naturally out of the Common Market. Not sharing that belief, President de Gaulle asked them to settle on Europe's political constitution right now and he put forward a plan which, when modified by their criticisms, seemed a practical and realistic way of promoting European unity. However, several capitals are suspicious of de Gaulle's nationalism and his too great independence of Washington, and thought they found sinister intentions behind his haste to give Europe a political constitution; so they have insisted that nothing further be done until Britain's voice be heard, after she has become a member of the Common Market.

These facts are recalled to show that the political crisis may have its interest and importance but it is no symptom of a breakdown in the process of economic unification. Those of us who are primarily concerned with the growth of the Common Market and its impact on world trade and investment will attach little importance to the negotiations about a political treaty of union, and will continue to keep our eye on Brussels, where the association's economic future is being determined. The terms of an arrangement with Britain, the concessions the Six consent to make to Commonwealth exports toward Europe, the trading arrangements they make with the European neutrals, the exchange of tariff reductions with the USA and their own efforts toward harmonisation of economic policies—these are the vital questions for foreign economies like India, and it does not appear that the answers they will receive will depend on which political doctrine the Six choose for their central institutions. For example, the Parliamentary Assembly in Strasbourg (which has just changed its name, portentously it hopes, to The European Parliament) is at the centre of the debate between Gaullists and supranationalists, but its status is of less concern to outsiders than the proposal it made the other day for a European central bank holding gold and foreign exchange reserves in a common pool. That the idea should be launched in the midst of the political crisis shows that the drive toward economic unification continues unabated, and some progress could be made toward its implementation quite independently of the solution to the political debate.

Some suspect that the price Britain is asked to pay for admission to the Common Market will depend on her attitude to de Gaulle's plan for a political union. If this were true, then the wrangling about Europe's institutions would be of concern to us all since it would have an influence on the reorganisation of Commonwealth trade with Europe that must follow Britain's entry into the Common Market. But it needs to be noticed that London supports de Gaulle's proposal, which coincides with British ideas about the most suitable form of European co-operation; so there is no question of Paris raising the economic price of Britain's entry. On the contrary, it is the small powers, Belgium and Holland, who have very different notions of European integration, that have insisted that nothing be done until Britain is a member. There is no evidence that the negotiations in Brussels have been affected by the political crisis, or will be in the future. Sinister hints appear frequently in the Press about behind-the-scenes bargaining between Paris and London which will mightily affect the outcome of the negotiations, but they are contradictory and unsubstantiated. As far as one can know, those complicated talks are progressing purely in terms of the commercial and economic issues involved. It may well be that de Gaulle is prepared to make certain concessions in exchange for an agreement between France and Britain about nuclear weapons, but nothing sure can be learned on that subject.

Besides, there has to date been no dissension between the Six on the question of the economic arrangement with Britain and the Commonwealth; in other words, the negotiations are being handled from the Continental side by the Common Market Commission jointly on behalf of the six capitals, and that fact is proof that political issues are not causing complications at this stage. Similarly, the Six have found in the Commission an excellent spokesman on the question of President Kennedy's proposal for freer trade across the Atlantic. M. Walter Hallstein, president of the Commission, was able to speak on behalf of them all in the U.S.A. lately on the Kennedy plan, and it was notable that his open criticism of it echoed precisely the earlier remarks of the French Finance Minister. If the political disagreements that led last month to the suspension of talks on a treaty of union were having an effect on the economic enterprise represented by the Common Market, this unity of views would not occur. Everything indicates that steady advance is being maintained at the economic level, unperturbed by the controversy about political institutions—which is just what one would expect if, as suggested, the political trouble started when de Gaulle raised issues that were not yet ripe in the minds of his partners.



One of his reasons for asking the Europeans to think about their political constitution, instead of waiting for it to grow "naturally" out of the Common Market, was that he felt that a strong executive was needed to prevent Europe evolving into a ward or dependent of the USA. If the only representatives of united Europe were the bureaucrats of Brussels, de Gaulle said, they would tend to leave basic decisions to Washington, because administrators with no popular support shrink from independent action; united Europe would thus become a sort of headless giant, as powerful economically as the USA but subservient to Washington under the pretext of loyalty to NATO. So he considered that heads of the six States should take over the active political direction of united Europe, for they would have the courage to give European policy an independent colour. The argument has its force, especially in matters of defence and foreign policy; it is not a question of being loyal or disloyal to the Atlantic alliance, but simply that Europe must have political thinking at the top proportional to its re-found vitality, and supranational bureaucrats would seem less fitted to provide such leadership than a council of elected national leaders. However, recent events indicate that the argument does not obtain in the economic sphere: the staunchest defenders of Europe's economic interests have been the ECM Commission and they have not hesitated to be independent and critical in the face of American and British demands.

Whatever one may think of the line the Commission has taken on British requests for favoured treatment of Commonwealth trade, it surely does not suffer from the weakness or lack of decision that the Gaullists ascribe to supranational bureaucrats as against politicians. Similarly, I refer again to M. Hallstein's highly significant comments on the Kennedy plan—which amount to its rejection on the grounds that there can be no free trade without equality of conditions of competition. On both these points (as well as on the subject of concessions to the European neutrals, who want the benefits of the Common Market without any of its political responsibilities), the Common Market administration has shown vigour and frankness that would not be exceeded by a political directorate such as de Gaulle has demanded. It might well be different in questions of defence and foreign policy, where two decades of dependence on US might have bred a mentality of docility and subservience toward Washington which it would be ridiculous, degrading and dangerous to carry over to the emerging European Union. But that only proves, once again, that the process of Europe's economic integration has a logic and a mometum of its own which place it beyond the effect of acute disagreements about how to integrate defence and foreign policy. So, however grave or dramatic these disagreements may become in the months ahead, one should not make the mistake of thinking that the Common Market is encountering serious difficulties.

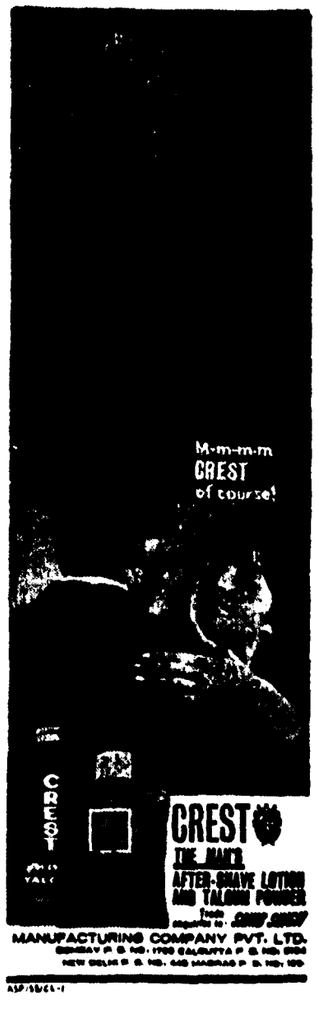
Economic Report from the U.S.

BUSINESSMEN MEET

By



GUY SIMS FITCH

WASHINGTON, May 1.

PRESIDENT KENNEDY took the occasion of a major meeting of businessmen here this week to propound his economic policies. It was only fitting that he should use this forum — the 50th anniversary meeting of the U.S. Chamber of Commerce, the largest business organization in the country. It is in the ranks of business that his policies seem to have met their most determined domestic criticism — a criticism that appears to have become particularly outspoken in the past few weeks, since the Kennedy Administration registered its strong dissatisfaction with a rise in steel prices, and through its influence was instrumental in having the price increase rescinded.

In effect, the President was assuring the 4,000 Chamber of Commerce delegates, and through them all American businessmen, that his administration is not anti-business, but is as much concerned with the welfare of the business community as with that of any other economic group. To this extent, his speech can be described as conciliatory. At the same time, his tone was far from appeasing. His offer of heightened government-business understanding and co-operation was accompanied by a firm and consistent insistence on policies designed to promote the public interest — an interest he promised his administration would continue to "invoke whenever it believes it to be threatened". Pursuit of the national welfare, in its totality, he stressed, will best contribute to the welfare of each national element. In speaking to his business audience, Mr. Kennedy stressed the proposition that adequate business profits are essential to the effective functioning of "a free enterprise system," and that a growing and fully employed national economy is the best road to profitable business. In an apt metaphor, he pointed out that "our primary challenge is not how to divide the pie but how to enlarge it." This reflects the conviction that when an economy grows and its resources are fully utilized, every segment of the population shares the benefits — in higher profits and wages, increased job opportunities, bigger government revenues. In this kind of an economic climate, business should be able to modernize its facilities without major price increases, just as labour should be able to enjoy better wages and other benefits without exceeding the bounds of rising productivity. A stable price level and modernized plants can help the nation expand its foreign markets and cope with its international balance of payments problem — a problem which Mr. Kennedy described as at the "heart of the issue," for on its ultimate solution depends the ability of the United States to maintain unimpaired its international economic and security commitments.

Mr. Kennedy reminded his audience that his administration will soon authorise faster tax write-offs on machinery to spur investment, and has proposed giving business an eight per cent tax credit on modernisation outlays — citing these as evidence of administration's concern with business problems. This incentives, he noted, are limited at present primarily by the nation's fiscal requirements, with a balanced Federal Budget a principal administration goal. Even vigorous prosecution of the nation's anti-trust laws was defended as a form of business assistance, in that it makes sure that "the realities of competition exist." This is not to be regarded as an attack on bigness in enterprise as such, but rather as a recognition that competition is a traditional and time-tested spur to industrial efficiency. In a further explanation of his attitude, the President pointed out that his administration has expected no more from business than it has from labour. This includes co-operation in moderating wage demands, eliminating waste in the use of manpower, and supporting cost-cutting technological advances. To the extent that labour and management conduct their affairs with appropriate regard for the national interest, there would be no occasion for the kind of White House intervention that caused such a stir in the steel situation. This is a point the President emphasised in noting that his administration does not want the task of setting prices — a task which is regarded as best handled by private enterprise and the competitive process in a free society.

STATE BANK OF INDIA'S

RUPEE TRAVELLERS

CHEQUES FOR

CARE-FREE TRAVEL

You can travel anywhere in India and outside without having to carry a large amount of cash, without being in fear of theft or of running short of money.

The State Bank's travellers cheques, issued in denominations of Rs. 100/- and Rs. 50/-, represent the ideal travel funds. They are as safe as a bank draft and are encashable anywhere, anytime.

This is one more of the services the Bank has provided from January 1958. For complete information, please ask for a copy of our illustrated booklet from the branch nearest to you, or consult your travel agent.

SOME QUESTIONS OF FOREIGN POLICY OF THE SOVIET UNION

BY HIS EXCELLENCY, I. A. BENEDIKTOV, AMBASSADOR OF THE USSR IN INDIA

THE basic principles, purposes and aims of Soviet foreign policy have long been settled; on that basis the key and fundamental tasks of the foreign policy that face the Soviet Union in the present phase have been determined and worked out in detail. They have been approved by the peoples of the USSR, by the highest organs of Soviet power and are being implemented by the Soviet Government.

The fixed, unswerving and main aim of ensuring peaceful conditions for a further rapid and untrammelled development of its national economy guides the Soviet Union in all its activities in the international sphere. It is indeed the main aim, the central purpose, of Soviet foreign policy. We want not only to avert a world war, but also to save the mankind for ever from a destructive world war. In its striving to preserve peace on earth, Soviet foreign policy expresses the supreme and the most solemn desire of millions and millions of people all over the world. It expresses the belief of the Soviet people, as of people everywhere, that if mankind is to progress and world civilization to develop, a nuclear war must be prevented.

The Soviet Union believes that it is not only desirable but also possible to prevent another war. Soviet foreign policy proceeds from the premise that there already exist and grow further forces in the world today which are capable of maintaining and consolidating peace. Gone are the days when only the voice of the Soviet Union alone was heard at the League of Nations, calling for peace and an end to the armaments race. The Soviet Union is no longer alone. Shoulder-to-shoulder with it stand the other socialist countries which together form a mighty bulwark of peace. The newly independent countries of Asia and Africa are likewise in most cases following a policy of peace, friendship and co-operation among nations. Their refusal to participate in military blocs, their determination to follow a neutral and non-aligned policy have helped immeasurably the cause of peace. The emergence of these countries has in fact changed the correlation of forces in favour of peace.

A vast zone of peace has thus taken shape. It comprises the Soviet Union and other socialist countries together with many other states which are basically opposed to war. And as the number of countries, which shake off foreign bondage or tutelage and lingering foreign influence over their policies, increases the peace zone too expands and develops; it begins to embrace new territories and new peoples.

Even in those countries of the world which are not yet part of the peace zone, the people are exercising a more and more active influence on basic policy issues affecting peace. Now-a-days politicians alone could not decide the question of war and peace without taking into account the will of the people. Today all over the world there is a vast movement uniting people from all starta in the single cause of preserving peace. Mass demonstrations in favour of peace and nuclear disarmament have taken place even in the citadels of militarism. All this is evidence of the fact that in the world of today it has become possible for people to actively and decisively intervene in international affairs. This is another factor vital to the cause of peace.

In view of these factors — the existence of a powerful camp of socialism and peace, the growing role of the newly independent countries and the growth over the years of an organised peace movement capable of exerting a powerful influence on the governments — it has become possible today to check the drift towards war. The combined forces of socialist and neutral countries and progressive people all over the world are strong enough to avert a world war. But for this purpose it is necessary to intensify the struggle for peace and for the prevention of war. We consider that one of the most important features of the present epoch consists in the fact that it has become possible for the first time to banish war from the life of society.

The radical way to maintain a lasting peace is general and complete disarmament under the strictest international control. The fact is undeniable that disarmament is the most pressing and urgent task of the day; it is the key to stable peace on earth. It is for this reason that the Soviet Union has worked patiently and indefatigably for an international agreement on general and complete disarmament, under the most rigid international control.

Our government openly declared that we were prepared in advance to accept any proposals of our partners at the disarmament negotiations for the most rigid international control, provided they accepted our proposals for general and complete disarmament. The basic difference in approach to this problem lies in the fact that while the Soviet Union is firmly for the strictest international control over disarmament, the other side is still insisting on control over armaments. The latter's approach cannot be judged otherwise than as a manoeuvre aimed at establishing an espionage network on our territory and on the territories of other countries. This in turn will understandably lead to the apprehension that information thus collected can increase the possibility of a sudden attack by a potential aggressor. In any case this will not lead to the cessation of the arms race.

On the contrary the Soviet proposals provide for the control over the disarmament measures, actually carried out according to the mutually agreed treaty. Besides no side will be put in an advantageous position over the other one.

The purpose of strengthening world peace will help such steps and measures as, liquidation of colonial yoke in all forms, effective help to countries which have won their independence, removal of the remnants of the World War II, settlement of the German problem, restoration of the rights of the People's Republic of China in the UNO, betterment of the UNO mechanism, and development of business international relations between all countries. Foreign policy of the Soviet Union is aimed first of all at carrying out these tasks.

War cannot and must not serve as a means of settling international disputes — this has been the keynote of Soviet foreign policy. The Soviet Union has declared again and again that instead of threat of war, pressure, blackmail and incitement of tension — weapons which have been far too often used against it and its allies — the nations of the world should base

their mutual relations on the principle of peaceful co-existence, namely rejection of war as a means of settling controversial questions between states, strict regard for the sovereignty and territorial integrity of a country, non-interference in its internal affairs and economic and cultural co-operation on the basis of equality and mutual benefit. All the controversial world problems must be settled only through negotiations.

The Soviet Union has consistently stood by this principle—the principle of peaceful co-existence of states with different social systems which was and remains the general line in Soviet foreign policy. The concept of peaceful co-existence of states with different social systems lies at the very foundation of the foreign policy of the Soviet Union.

In our time with the growth of nuclear weapons, with two opposite systems confronting each other, this concept has acquired added significance and urgency. Peaceful co-existence is no tactics or manoeuvre but a basic tenet of Soviet foreign policy.

In its relations with countries with different social and political systems, countries like India for example, the Soviet Union has set an example of peaceful co-existence. It is a new type of international relationship, based on friendship, mutual understanding and co-operation, which offers a contrast to the methods of domination, subordination and intimidation, of oppression of the weak by the strong, methods which have been followed for centuries by the imperialist countries in relation to weak and backward nations.

With the growing strength of the Soviet Union and other socialist countries and the growing influence of the newly independent countries, the new type of international relations is increasingly gaining sway and is superseding and supplanting the colonial and semi-colonial patterns of international behaviour. In fact in the new situation, with the new correlation of forces that has been established, it has become possible for even the small and backward states, which would have been in an earlier era at the mercy of the imperialist powers, to resist effectively all pressure and blackmail and successfully pursue an independent foreign policy. So far as the Soviet Union is concerned, it is one of the cardinal principles of its foreign policy to help and support these countries to strengthen friendly relations and close co-operation with countries of Asia, Africa and Latin America, who are struggling for maintaining and consolidating their political and economic independence. At the same time the Soviet Union is in favour of establishing better relations with all capitalist countries.

The Soviet Union has always, from the very day it came into being, held aloft the banner of peace and friendship among nations. Today, when the question of war and peace has become the main question affecting the fate of every country and every individual, overriding every other question, it is making every effort at ensuring a stable peace, so that every people on earth should have an opportunity to develop freely, according to its own genius, without the threat of war suddenly engulfing it and interrupting the peaceful course of its development.

Indeed, the foreign policy of the Soviet Government, approved by the entire Soviet people, is aimed at implementing these goals.

THE BUSINESS WORLD

A Constructive Criticism

By CROESUS

THE economic progress of any country makes fascinating study, more so the economic progress of a developing country, and especially so if it relates to the progress of a country that has become independent only lately. Perhaps this explains the interest of so many people in our plans for economic development. As Mr. G. D. Birla, India's leading industrialist, remarked, when addressing a meeting of the Commerce Graduates' Association, last week, the people of this country have never been more conscious of their economic conditions than they are today. Almost every one has become Plan-conscious although, as he significantly added, the man in the street seems to have hardly any responsibility, except it be to pay taxes, and more and more taxes every year. While the authorities lose no occasion to make the claim that the Plan is the people's Plan—and it suits them to do so if only as a pretext to to levy more taxes—they do not seem to be equally concerned about assessing the achievements of the Plan or telling the people about how the money to finance the Plan has been raised and how it has all been spent. It is this lapse on the part of the authorities that necessitates free thinking and free speaking on the subject. In a democracy particularly, the need to think aloud and to speak and act with courage is at once the right and the responsibility of every citizen. What a thinking citizen in a democracy says may not always be palatable to the powers-that-be, but it would be to the peril of the latter to ignore these warnings or remain complacent.

> **When necessary, and only to the extent necessary, they (the Americans) favour restrictions upon the individual in his economic behaviour in the interest of achieving two important goals: a greater equality of opportunity for all citizens, and a more productive economy for the benefit of society as a whole. In this enterprise, the role of the Government is that of a traffic policeman, directing and guiding, but not trying to drive everybody's car.**
>
> **— Leon Herman**

Now, the authorities get the reactions to the plans and the results of the plans from different sources both from within the country and abroad. These reactions cannot be expected to be and, indeed, are not always as objective as they should be, for obvious reasons. The reactions of a foreigner who visits this country as the guest of our Government, for example, cannot be anything but appreciative, call it a sign of culture or sophistication. On the other hand, the reactions of political parties within the country are bound to be tinged with their own pet ideological predilictions and prejudices. Fortunately, however, there is a third category of critics who may not be opposed to the party in power or to the Plans or to the ideology underlying the plans being pursued by the powers-that-be, but whose only object is to ensure that the country should derive the maximum benefit from all the outlays that go in the name of planning. It is when such people speak out that the authorities must not only shake off their complacency but be alert and take prompt note of the criticisms and suitably re-orientate their approach to, and implementation of, the Plan. This is precisely how Mr. Birla prefaced his observations on the Third Five-Year Plan in the light of the present fiscal policies of the Government. At the outset, it must be pointed out that he took care to make it very clear that he had nothing against the Government, nor against the socialistic policies of the Government; indeed, he went so far as to say that, in the twentieth century no one could afford to ignore socialism or social justice. But what is socialism, as he asked, without production? Nor can there be social justice without production; socialism without production would only be the "socialisation of poverty". The whole of Mr. Birla's speech, therefore, was a plea for more production and still more production.

In order to bring home his thesis, Mr. Birla did a sort of rapid stock-taking of the progress since Independence, that is the progress made under the first two Plans. There has, of course, been tremendous progress after Independence, he said, and pointed in support, to such visual evidences as more food, more cloth, more houses, more cycles, more cars and more facilities for education and health. There have also been remarkable increases in steel (2½ times), machinery (5 times), Chemicals, electricity and cement (3 times), diesel engines (8 times), and coal (75 per cent). To the naked eye, undoubtedly, these are impressive, but the crucial test lies in: how far these have contributed to the consumption of the average man? Or what dent they have made in his standard of living? Viewed thus the net effect, viz. the increase in the 'per capita' income over the past ten years, from Rs. 250 to Rs. 292 or a bare 17 per cent, cannot be considered to be satisfactory at all. Mr. Birla described this as hardly any improvement when 'per capita' income has nearly doubled in Germany and Japan and has gone up by 75 per cent in Italy since 1951. In other words, our performance compares very unfavourably with those of Germany, Japan or Italy or even with those of most developing countries in Asia. According to a recent United Nation's study, Mr. Birla recalled, the name of India stands as the 28th country in the matter of economic progress. Clearly then, there can be no room for complacency.

If this is the position, how can it be improved? What are the causes of the slow progress? According to Mr. Birla, the two main contributory factors to the present state of affairs are administrative inefficiency and unhelpful fiscal policies. He was extremely critical of a policy which has resulted in imposing the twin burdens of high prices and heavy taxation, thereby leaving the middle classes, who constitute the backbone of the country, with little to save and much less to invest. Accordingly, he characterised the fiscal policies of the Government as "anti-saving, anti-investment, anti-production and consumption, and, therefore, anti-progress."

Elaborating these remarks, Mr. Birla referred to some of the investments of the Government. Saying that he was neither against the public sector nor against more production in steel, he instanced the investment of Rs. 1000 crores on steel plants by the Government and draw attention to the loss of about Rs. 60 crores on this investment, after providing depreciation and interest on loans. This is by no means a solitary instance. According to the Explanatory Memorandum

itself, the Government does not expect a net return on its investments of more than 0.4 per cent in 1962-63! Contrast this with the provision in the Third Plan of Rs. 450 crores which the Government proposes to raise from public undertakings during the Third Plan period. No further comment is called for to confirm the point made by Mr. Birla that some of the country's investments have turned out to be unremunerative. It is such wrong-investment policy, coupled with inefficient administration, that hindered both sound investment and striking progress.

It is difficult to make an estimate of the real investment, although the Planning Commission has given certain figures. Mr. Birla, therefore, chose to rely on the investment in the organised industries to give an idea of the effect of the Government's wrong investment policy. He mentioned the following figures of capital raised in the form of equity capital, preference shares and debentures during the years 1959, 1960 and 1961:

(Rs. in crores)

	New Capital	Total, including profit ploughed back
1959	43	137
1960	63	165
1961	36	144

It is thus seen that the peak was reached in 1960 and that a downward trend had already set in even in 1961. The position has become worse since. In other words, by giving these figures, Mr. Birla exploded the myth of the general impression in certain official circles that there is plenty of money about. Actually, he declared, if anybody wants to raise a capital of Rs. 5 crores, he would find it extremely difficult.

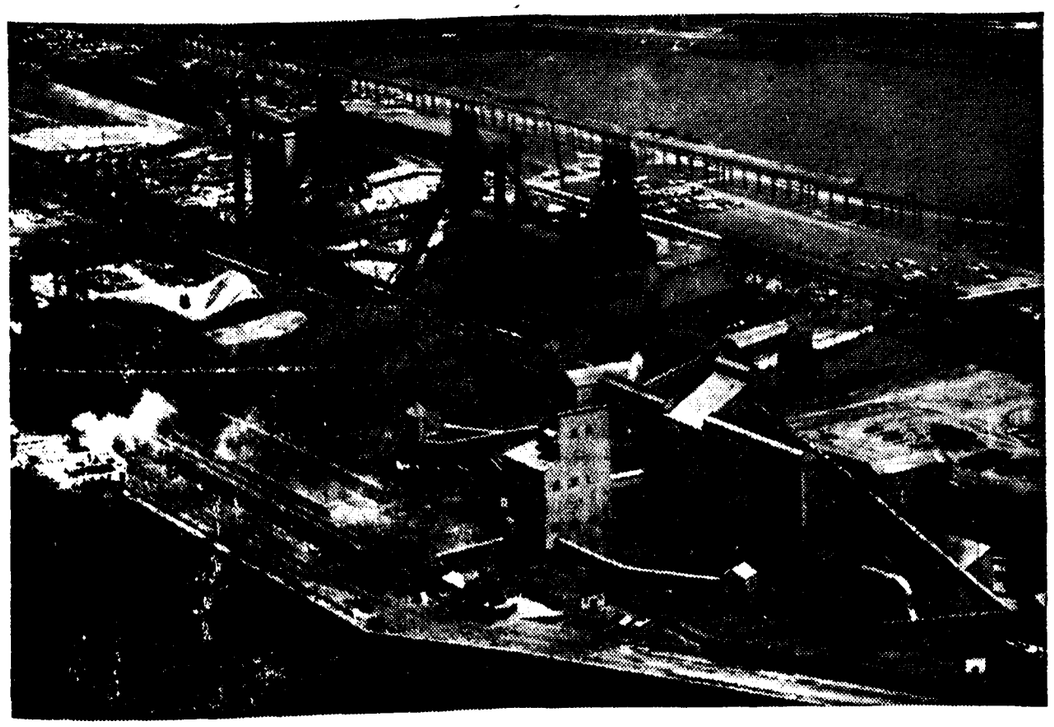
In order to encourage investment, Mr. Birla suggested that proper incentives should be given. The term "incentive" may be unpopular with some, he said, and wanted such people to remember that even Russia was now for providing incentives for more production. In this connection, he appealed for a progressive approach by employment of scientific methods as was urged the other day by the Prime Minister. He whole-heartedly endorsed Mr. Nehru's condemnation of anything that threw a premium on idleness and stupidity. His quarrel was not with the Government, but with bad and inefficient administration; not with planning, but with lack of adequate decentralisation in planning. In fact, he said, the greatest enemies of socialism and planning were inefficiency and overcentralisation. Averring that planning was necessary, he asserted that it should not be a property of a few, as it has now become. The Planning Commission has become a temple and its members the high priests and, as such, it has failed to create the urge required on the part of the people. Planning should be shared by the people; it must be simple and appealing to the man-in-the-street and release his pent-up energy. In short, he wanted scope for the free play of the energy of the millions, not of a few only at the top; in the hands of a few, planning has degenerated into a negative and preventive instrument.

From the remarks of Mr. Birla as above, one should not assume that he has become a pessimist. Far from it. He continues to have the same robust faith in the inherent strength of this country, and in its inevitable bright future. Reaffirming this faith, as also his unfailing belief that the future of the country is safe in the hands of the younger generation, he concluded with an appeal to everyone to work hard and march ahead. He exhorted the business community, in particular, not to be unnerved by the teething troubles but to expand.

As expected, Mr. G. L. Mehta, who presided on the occasion, struck the right note by reiterating the suggestion that he had made earlier that the Government should publish a balance-sheet of the achievements and failures of the Plans. This was necessary, he said, not so much to blame anybody as to profit by past experience which would be helpful in eliminating the shortcomings and plugging the loopholes. He also made the pertinent point that any failure, be it in the public sector or in the private sector, would be a national failure and, as such, had to be guarded against.

Business Notes

Taxation



NEW I.T. RULES GO BEYOND I.T. ACT

THE UNDULY belated publication of the Income-Tax Rules, 1962, and the Income-Tax (Certificate Proceedings) Rules, 1962, has, not unnaturally, evoked strong criticism from the Indian Merchants' Chamber, Bombay, for the Chamber feels that, in respect of a number of rules, the provisions go beyond the ambit of the Income-Tax Act itself. In other words, it is afraid that the Government has expanded the scope of the Act by making provisions of an over-riding character through these rules.

One of the rules that is outside the ambit of the Income-Tax Act, according to the Chamber, for example, is Rule 7, which artificially defines agricultural and nor-agricultural income, thereby offending the substantive provisions of section 10(1), and so this should be deleted. Also offending the fundamental provisions of the Act, according to the Chamber, are rules 10 and 11 relating to the determination of income of non-residents and from transactions with non-residents. These rules also give arbitrary power to the assessing Income-Tax Officer, inasmuch as they lay down that the Income-Tax Officer may determine the income in the case of non-residents "in such other manner as he may deem suitable". Similarly, arbitrary powers are given to the Income-Tax Officer to determine profits and gains in respect of activities laid down in Section 92. Accordingly the I.M.C. Committee has requested the Government to delete all these rules.

Among others, the I.M.C. has particularly objected to Sub-rule (5) of Rule 12 relating to the giving of a certificate by an authorised representative. Here, it feels the rule goes beyond the provisions of the Act; indeed, the Act makes no reference to any such certificate being granted by an authorised representative. It notes, in this connection, that the rule has been inserted without a basic legal justification and despite the positive decision taken by the Government not to introduce a scheme of compulsory audit. As the Chamber opines, the requirement concerning audit by Chartered Accountants is prescribed by law for certain definite purposes and the Rules should not seek to make the audit of accounts obligatory on a wider scale. The Chamber feels—and it is right—that a Chartered Accountant cannot give a certificate of the nature visualised, since his duty is 'only to audit the accounts and not to investigate the affairs of an assessee.' Besides, it would be difficult for any representative to assess the real position of an assessee where an assessee chooses not to disclose all the material particulars to the representative. Furthermore, the suggestion about the granting of a certificate by an authorised representative had been linked up with the provisions for compulsory audit and, in the absence of a compulsory audit provision under the Income-Tax Act, the case for the provision of a certificate by an authorised representative does not hold good. The Chamber has therefore objected to this Rule; it also objects to it on the ground that it would involve additional expense.

In the same way, the I.M.C. has protested against Rule 62 of the Income-Tax (Certificate Proceedings)

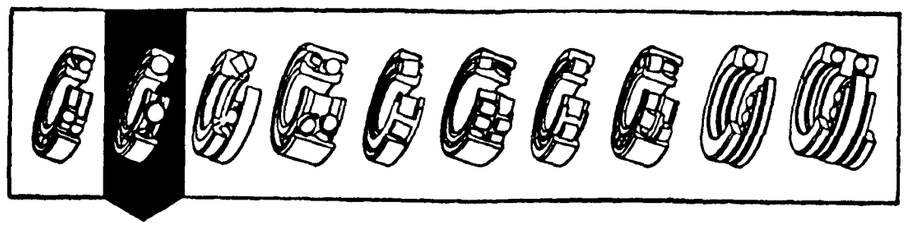
Specialized ENGINEERING AND CONSTRUCTION FOR THE IRON AND STEEL INDUSTRY

For more than half a century McKee engineers have specialized in the design, engineering and construction of steel-producing facilities. Our comprehensive mine-to-metal services include every phase of the work necessary for any steel-plant project, from preliminary studies to completed plant ready for initial operation.

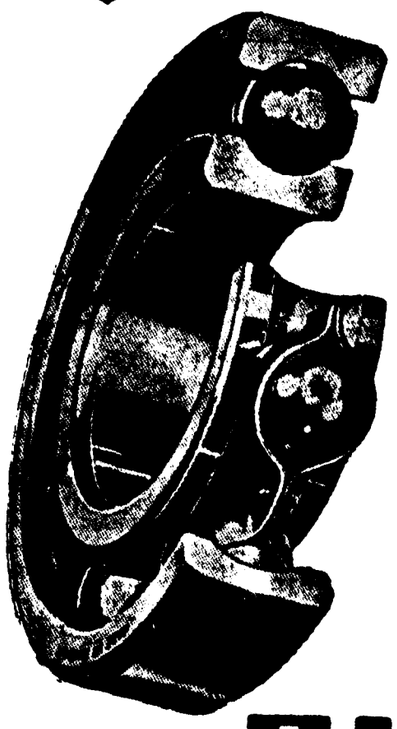
The McKee Organization has executed contracts in 49 countries including India. Among these are some of the world's largest and most modern completely integrated steel plants and hundreds of individual units, including blast furnaces, open hearth shops, rolling mills, agglomerating, sintering and pelletizing plants. Most recent examples of large-scale integrated plants are the new Somisa plant at San Nicolas, Argentina and the C.S.N. plant at Volta Redonda, Brazil.

To the steel industry of India the McKee Metals Division offers the services of its large, well-qualified staff with a fund of sound, practical experience and specialized knowledge that is unmatched anywhere in the industry.

Comprehensive engineering-contracting services, similar to those of the McKee Metals Division, are supplied by these specialized divisions of the McKee Organization:



PETROLEUM & CHEMICAL DIVISION
Complete Refineries and individual Processing Units for all modern petroleum and petrochemical processes and certain types of chemicals and chemical products.



WESTERN KNAPP ENGINEERING
Plants and facilities for production of Non-ferrous Metals, mining, preparation, handling, beneficiation and storage of Ores and Industrial Minerals.

P.O. Box 71, Sir Pherozeshah Mehta Road, Bombay. P.O. Box 588, Netaji Subhas Road, Calcutta.

Rules which disentitle authorised representatives, other than a legal practitioner, from appearing before the Recovery Officers, although each of the authorised representative is so entitled under the Act itself and has a right of practising before any Income-Tax Authority. It has been pointed out by the Chamber that the Recovery Officer is clearly defined as an authority under the Income-Tax Act, and that as recognition has been given to each such category to appear before any Income-Tax Authority, it follows that every such authorised representative or employee can appear even before the Recovery Officers. The I.M.C. Committee has accordingly urged the deletion of this Rule or, alternatively, the extension of the provision entitling Chartered Accountants and Income-Tax Practitioners, as also the employees of assessees, to appear before the Recovery Officers for all purposes.

Finally, the Chamber has requested the Government to afford it an opportunity to comment on the draft and the suggested rules before these are put before Parliament, if only to ensure that the views expressed by it are taken note of in good time.

Industrial Licensing

AMENDMENT OF RULES

THE FEDERATION of Indian Chambers of Commerce and Industry has communicated to the Ministry of Commerce and Industry its views regarding the proposed amendments to the registration and licensing of industrial undertaking rules. It is now an established fact that the licensing procedures are cumberous and various types of delays are written into them. It is beyond doubt, therefore, that the need today is that of a simplification of these rules. It appears, on the other hand, that the draft proposes to extend in one of the rules the period for grant or rejection of licence from three months to four. It may be observed that even now the period of three months is not being strictly observed and considering that it is sufficient period for the officials to weigh the case from all angles, there is hardly any justification for extending the period to four months. The Committee that considered the subject on behalf of the Federation of Indian Chambers of Commerce and Industry is strongly of the view that while retaining the period of three months, the officials should call for any additional information required within a period of one month from the date of receipt of the application. This would leave sufficient time for them to consider the case. Moreover the information should not be called for in a piecemeal manner. This proposal seems to be very sound in view of the fact that time-saving devices have to be developed so as to gear up the administration in the licensing bodies.

The Committee has raised objection to the unreasonable restrictions imposed on the applicants about the location of units in particular States or areas which could upset the calculations of the entrepreneurs. Broadly speaking wherever the needs for location are considered very essential the applicant should have the freedom to establish the undertaking in any place within that particular State. There is also the provision of housing and other amenities to workers which have to be fulfilled by the applicants. The Committee indicates that these are the subjects usually decided by the State Governments. It would be advisable therefore, that the final grants of applicants are not delayed on grounds which are properly checked up by the State Governments.

Another rule demands complete information about certain facts which are not likely to be decided before the actual launching of the unit. For instance, the foreign collaborators would not feel committed unless the Indian party had obtained industrial licence. It therefore becomes quite difficult for the applicants to give complete details about the foreign collaborators. Moreover, it may not be possible for the applicant to specifically mention at the time of the application the nature of his interest in the industrial undertaking such as that of a promotor, managing agent, major shareholder etc. The exact nature of shareholders can be determined only when the company has entered the market for raising capital. It would therefore be advisable on the part of the government to simplify the rules as far as possible and eliminate such clauses which might cause confusion and consequent delays.

Woollen Industry

MODERNISATION NEEDED

THE IMPROVEMENTS made in the woollen industry, thanks to the adoption of the latest techniques, have made the products of this industry very popular in the West. If Indian woollen goods are to compete with these foreign products in the world markets and to hold their own in the domestic market as well, it is necessary to effect a number of improvements in the industry, and it is just as well that, bearing this in mind, several recommendations were made by Mr. R. K. Birla, Chairman of the Development Council, at its meeting held recently in Bombay.

The Indian woollen industry today has an outmoded machinery which has seriously impaired its export chances and the first pre-requisite therefore is to modernise the machinery. For this purpose, Mr. Birla recommended that individual mills be asked to submit plans for the rehabilitation and modernisation of their units. As regards exports, he had a number of suggestions to offer. First, he urged a suitable revision of the incentives available under the Export Promotion Scheme for Woollen Goods. He wanted that the exporters of these products be allowed incentives similar to those available to the manufacturer exporters. According to him, at least 10 per cent of the incentives should be compulsorily earmarked for the import of machinery. Urging that the stepping up of exports should be the objective of the industry, Mr. Birla recommended to the authorities that there should be no quota restrictions for exports of raw wool to various countries; nor should there be any ceiling on exports of individual exports, he added.

A further recommendation made by Mr. Birla was that the allocations of import quotas for raw material should in future be made on the basis of the number of spindles installed, subject to some adjustment in respect of worsted spindles producing a larger percentage of hosiery and knitting yarn or weaving yarn, and, in this connection, he also pleaded for a revision of the pattern of production of different kinds of worsted yarns so as to ensure an adequate production of all weaving yarn, hosiery yarn and knitting yarn out of imported raw material. He further, recommended that a limited number of woollen spindles be allowed to spin shoddy yarn, provided the units concerned had the necessary equipment for doing so and no imports of additional machinery, accessories, etc. were involved.

Jute Industry

ADDITIONAL BROAD LOOMS

AFTER A considerably long time, the jute mill industry is being allowed to expand its installed capacity. The expansion, of course, is not to be in the traditional lines of manufacture, but in the new fields— the manufacture of carpet-backing cloth and similar other products—in which demand is growing in the world. Jute mills have already been permitted to install about 1,500 broad looms. The Union Ministry of Commerce and Industry, however, considers that it can allow installation upto 9,000 such looms in view of the expected increase in demand for carpet-backing cloth. An indication to this effect has been given by Mr. K. C. Reddy at the first meeting of the Informal Consultative Committee of Parliament for the Ministry of Commerce and Industry, held in New Delhi on Monday. Since the manufacture of these looms, which, of course, has begun in the coun-

try, is not likely to meet the requirements fully, some broad looms may even be allowed to be imported.

The step is obviously in the right direction and should help in boosting exports of jute goods which have assumed a new significance owing to our difficult foreign exchange situation as also due to abundant supplies of raw jute, some of which may even have to be exported after about a decade's time. But more important steps to help fostering jute goods exports are maintenance of raw jute prices at a reasonably low level (in the interest of keeping cost of jute manufactures at a competitive level) and enforcement of quality control by the mills. The Buffer Stock Scheme recently drawn up by the Indian Jute Mills' Association, in consultation with the Government, should help in ironing out wide fluctuations in raw jute prices both to the benefit of the jute-grower, who has been ensured a minimum price for his product, and the industry. The minimum price of raw jute may have to be lowered gradually, but a prerequisite to that is helping the grower to produce more per acre through making available to him adequate quantities of improved seeds and chemical fertilizers. The implementation of the measures designed to this end would be watched with interest.

New Issues

PAPER PRODUCTS LTD. TO RAISE RS. 16 LAKHS

THE PAPER PRODUCTS LIMITED, a joint stock company incorporated in Delhi in 1950, is entering the capital market on May 14, with an offer of 16,000 equity shares of Rs. 100 each to be subscribed for cash at par. The list closes on May 22 or earlier at the discretion of the directors, but not before May 17. The issue, if fully subscribed, will raise the issued and subscribed capital of the company to the full amount of its authorised capital of Rs. 50 lakhs.

The proceeds of the issue are to be utilised for financing the import and setting up of a plant by the company for the manufacture of rotogravure printing cylinders and also for making available more funds for working capital which is warranted by the expansion in the company's activities and its enhanced turnover.

The company is engaged in the manufacture of flexible packaging from printed and unprinted paper, cellulose film and boards. It also provides, amongst numerous other things, cellulose film heatseal strip packaging for various tablets, transparent cellulose film and waxed paper for the twist-wrapping of confectionery and sweets, waxed paper packaging for bread, biscuits and other articles, paper and cellulose bags, pouches and wrappings for all types of goods, including textiles, ready-made clothes, hosiery, food articles, tobacco, soaps, umbrellas, razor blades, etc., and is producing drinking straws, paper bags, cartons and various other packagings for commercial and retail trades.

During the past five years, its turnover and profits have gradually increased and sizeable dividends (26 per cent, free of company's tax but subject to tax at source, in 1959 and 1960 and 24 per cent, also free of company's tax but subject to tax at source, in 1961) have been declared. The slight fall in the dividend in 1961 was accounted for by the increase in the paid-up capital of the company from Rs. 9,38,500 to Rs. 16,00,000. The company raised its paid-up capital further from Rs. 16 lakhs to Rs. 34 lakhs last year by means of issuing 8,000 bonus shares by capitalising the General Reserve and through issue of another 10,000 equity shares for open subscription. The General Reserve of the company after the issue of bonus shares now stands at Rs. 4.80 lakhs. There is also a sum of Rs. 2,06,925.43 in the Development Reserve Fund. The company's turnover in the first eight months of its current financial year amounted to Rs. 1,00,37,223.13 nP. (subject to audit), as against Rs. 72,34,119.60 nP. during the corresponding period of last year and Rs. 1,18,71,558.46 nP. for the whole year 1960-61. In view of the rising tempo of industrial activity in the country and gradually improving standard of living of the people, the demand for the company's products is bound to increase.

The company has entered into technical consultation arrangements with Messrs. Milprint Overseas Corporation Milwaukee, Wisconsin, U.S.A., one of the leading producers of flexible packaging in the United States, having associates in almost all parts of the world.

GLOBE MOTORS TO RAISE RS. 12.5 LAKHS

GLOBE MOTORS, a private limited company converted into a public limited one in November last, is offering for public subscription, at par, 12,250 shares of Rs. 100 each. The list opens on May 9 and will close on May 12 or earlier at the discretion of the directors, but not before May 11. This issue, if fully subscribed, will raise the issued capital of the company to Rs. 50 lakhs, out of an authorised capital of Rs. 100 lakhs, consisting wholly of equity shares of Rs. 100 each.

The proceeds of the issue are to be utilised for setting up a factory at Ballabhgarh, Punjab, for the manufacture of alloy steel for Silco manganese spring steel flats (capacity 6,000 tons per annum on single-shift basis) and malleable castings of various categories (capacity 1,200 tons per annum on single-shift basis) for which the company has secured licences from the Government. A third unit to manufacture laminated springs for automobile industry (capacity 1,200 tons a year on single-shift basis) will be added to this factory when the requisite licence for it is received. The company has also plans to go in for the manufacture of 5,000 tons of steel castings and 5,000 tons of railway laminated and helical springs per annum. Applications for the grant of these licences have been made to the Government.

The total capital outlay on the projects for which the company has already received licences is estimated to be around Rs. 75 lakhs. The share capital will be making available Rs. 40 lakhs. Two loans of Rs. 10 lakhs each have been secured from the Punjab Financial Corporation and the National & Grindlays Bank. The remaining sum of Rs. 15 lakhs and any additional amounts required are envisaged to be raised through loans from the company's bankers, the Punjab Financial Corporation and other sources.

In view of the increasing demand for the products to be manufactured by Globe Motors, the company is likely to encounter little difficulty in marketing its manufactures; the present production of Silco manganese steel and malleable castings in the country only meets about 25 per cent of the total demand. Production by Globe Motors Ltd. is expected to start during the current year.

Globe Motors has also made an application to the Controller of Capital Issues, seeking permission to issue more capital to enable it to have controlling share in Messrs. Luk Auto Ancillary (India) Private Limited which has got a licence for the manufacture of clutch plates, pressure plates, clutch cover assemblies and clutch thrust bearings. The Luk Auto Ancillary (India) Private Limited has entered into collaboration arrangements with Messrs. Luk Lamellen and Kupplungsbau August Haussermann, Stuttgart, West Germany, for the establishment of the first factory in Northern India to produce all types of automobile clutches as well as clutches for scooters, motor bicycles, three-wheelers, tractors and industrial machinery.

Kohinoor Mills

INCREASED EFFICIENCY AND NEWER PRODUCTION

PARTLY BECAUSE of the increased efficiency and partly because of fuller utilisation of machine capacity run on a rationalised basis, and the change in the pattern of production, the Kohinoor Mills Company Limited seems to have attained a tremendous increase of 130 per cent in profits. This was revealed by Mr. A. N. Haksar at the 67th annual general meeting of the company. While there has been only a modest rise in the gross turnover by about Rs. 45 lakhs in 1961 as compared with the previous year, the net profit, after depreciation, development rebate and taxation, increased by over Rs. 10 lakhs. It is not only on the profit front, but in producing newer and better varieties of cloth that the Kohinoor Mills Company has been earnestly endeavouring to meet with the ever-changing pattern of consumer demand and has recently introduced terylene shirting, terylene suitings and full-voile shirtings and ladies' blouse material known as Rubayat. A comprehensive programme of rationalisation and modernisation has also been undertaken during 1961 and machinery to the value of Rs. 33,21,647 was erected during the year under review. Side by side with the programme of rehabilitation and modernisation the company has also been able to take further steps towards rationalisation and fuller utilisation of main capacity.

So far as exports are concerned, the company has spared no efforts towards trying to push its goods in the world markets. Its own deliveries in exports of cloth were higher by 24.93 per cent in 1961 as compared to 1960. This increase in exports is all the more creditable as far as the company is concerned in view of the total of Indian cloth exports having come down from 692 million yards to about 600 million yards showing a drop of 10.5 per cent on last year's performance. The principal reasons for this fall in Indian exports has been increased demand for processed cloth and the Indian mills' inability to meet the world demand at competitive basis, the setting up of textile mills in the under-developed countries in the East and West Africa, Burma, South Vietnam and intensive competition from Hong Kong, China, Japan and Pakistan.

There is no doubt that the company has been faced with many difficulties in regard to certain raw materials and availability of electric power at higher charges, still it must be said to the credit of the Kohinoor Mills that it has all along faced the difficulties with courage and confidence. The result is that it has been making a steady progress and is likely to continue making this progress in the years ahead.

Madras Rubber

UNIQUE PROFITS AND TREMENDOUS PROGRESS

FROM THE speech of Mr. K. M. Cherian, the Chairman, Madras Rubber Factory, it is evident that the company has made unique profits and the Indian rubber industry in general has made tremendous progress. As to when the Madras Rubber Factory Ltd. would commission its entire plant for the manufacture of Mansfield car and truck tyres is also now made clear and we know that it will be commissioned within three months.

It is a matter of pride that the profits for the year 1961 were Rs. 23,51,764.94 before depreciation and Managing Agents' commission. After adjusting these it is found that there is a net profit of Rs. 18,30 487.37. This entire amount was earned from the existing business of the Madras Rubber Factory's Tread Division. Sales in general have also fared better and came to Rs.. 1,64,47,976.30. The greatest satisfaction is that the products of the company continue to enjoy the confidence of the public and this is simply because of the good quality of its products.

Foreign collaborators are Messrs. Mansfield Tire and Rubber Company, U.S.A., a very well-known and reputed firm throughout the world. This company has placed the best technical know-how at the disposal of the Madras Rubber Factory. The result is that it has helped the company to lay firm roots and thereby come out as the foremost company in the commercial production of tyres. The expansion plans of the company are also well laid-down and erection of the machinery and building has been so well taken care of that the factory can be expanded by several times its present size without interrupting production. Besides, there is sufficient land for its expansion. The company has applied to the Government of India for an early consideration of their request for the increase of the capacity and it is hoped that this will be granted as there is likely to be increased demand for tyres during the Third Five-Year Plan.

On the growth of the Indian rubber industry in general, Mr. Cherian made the remarks that the production of natural rubber be encouraged for which a bolder policy was required. Mr. Cherian was of the view that the exisung low yielding plantations should be replanted and a directive be issued to the State Governments to release suitable areas for rubber planting so that such areas may be cultivated according to latest scientific methods. Finally, he urged that immediate steps be taken to open up the Nicobar and parts of Andaman islands for rubber cultivation. Regarding the other important raw materials, it, of course, goes without saying that we still will have to depend on imports and there is a feeling that by the end of 1963 or 1964, we might become self-sufficient as several new factories have been licensed for manufacturing the articles like carbon black, rubber chemicals, rayon cord and tyre valve tubes etc. That the Indian rubber industry has a bright future in the years ahead need not be stressed as it is obvious that the demand for tyres is likely to grow in the years to come.

Co-operation

STEADY PROGRESS IN 1961 - 62

THAT THE co-operative movement in India in general is making a steady progress is evident from the 1961-62 report of the Department of Co - operation in the Ministry of Community Development and Co - operation.

The number of primary agricultural credit societies and service co-operatives, which had increased from 2.03 lakhs on June 30, 1960, to 2.13 lakhs on June 30, 1961, is expected to go up to 2.21 lakhs by June-end this year. Short-term and medium-term loans advanced by these societies during 1960-61 increased from Rs. 169 crores to Rs. 208 crores. During the current year they are estimated to go up to Rs. 240 crores.

As a sequel to liberalisation of rules by the Reserve Bank of India regarding the credit limits of co-operative banks, medium-term loans upto Rs. 500 may now be available without obtaining mortgage of land as security and loans between Rs. 501 and Rs. 1000 may be granted on the borrower creating a charge on his land. With a view to giving adequate finance to the weaker units of primary societies and Central Co - operative Banks, provision has also been made in the State Plans for 1962-63 for direct grants to them.

The value of agricultural produce marketed by co-operatives during the year ending June 30, 1960, was estimated at Rs. 153 crores. The distribution of chemical fertilizers has been entirely taken over by co-operatives in almost all the States and distribution of improved seeds, agricultural implements, pesticides and spraying equipment and also sugar, kerosene and the agricultural quotas of iron and steel, is being progressively taken over.

Co - operative processing units continued to make further progress. The number of co-operative sugar factories in production increased from 24 in 1959-60 to 30 in 1960-61; total sugar produced by them rose from 2.86 lakh tons in 1959-60 to 4.42 lakh tons, increasing the share of co-operatives in the all-India production from 11.5 per cent to 14.7 per cent. As against 378 co-operative processing units established under the Second Plan, 109 units are expected to be set up in 1961-62.

Co-operative movement has yet to go a long way in India and whatever little progress it has made with the help of the Government demonstrates that its role is by no means insignificant. One would wish the spirit of co-operation did not wane.

HINDUSTAN ALUMINIUM CORPORATION LIMITED

Registered Office:

'Industry House', 159, Churchgate Reclamation, Bombay-1.

NOTICE OF MEETING

NOTICE is hereby given that the Third Annual General Meeting of the Shareholders will be held at the Registered Office of the Company, on Friday the 15th June, 1962, at 3-30 P.M. to transact the following business:

(1) To consider and adopt the Directors' Report, the Audited Balance Sheet and the Profit and Loss Account for the year ended 31st December, 1961.

(2) To appoint a Director in place of Shri M. P. Birla who is an 'Associate of the Managing Agents' and who retires from office by rotation, but being eligible, offers himself for re-election, and to consider and if thought fit to pass the following resolution as a Special Resolution of which special notice has been received by the Company.

As a Special Resolution:

"RESOLVED that pursuant to the provisions of Section 261 and relevant provisions, if any, of the Companies Act, 1956, Shri M. P. Birla, who is an 'Associate of the Managing Agents' be and is hereby re-elected a Director of the Company."

(3) To appoint a Director in place of H.H. Maharaja Jam Shree Digvijaysinghji Ranjitsinghji of Navanagar who has attained the age of 66 years, and who retires from office by rotation, but being otherwise eligible, offers himself for re-election, and to consider and if thought fit to pass the following resolution of which Special notice under Section 281 of the Companies Act, 1956 has been received by the Company.

"RESOLVED that pursuant to the provisions of Section 281 and other relevant provisions, if any, of the Companies Act, H. H. Maharaja Jam Shree Digvijaysinghji Ranjitsinghji of Navanagar who has attained the age of 66 years be and is hereby re-elected a Director of the Company and that the age limit prescribed in Section 280 of the Companies Act, 1956, shall not apply to him."

(4) To appoint a Director in place of Mr. A. N. Mafatlal who retires from office by rotation in accordance with Article 146 of the Articles of Association of the Company, but being eligible, offers himself for re-election.

(5) To appoint Auditors in place of Messrs. Singhi & Co., Chartered Accountants, who being eligible, offer themselves for re-appointment, to hold office from the conclusion of this meeting until the conclusion of next Annual General Meeting and to fix their remuneration.

By Order of the Board
K. N. SRIVASTAVA
Secretary

Dated the 16th April, 1962.

N.B. A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and the proxy need not be a member.

Notice is also given that the Register of Members and Transfer Books of both Equity and Preference Shares of the Company will be closed from 28th May, 1962 to 15 June, 1962, both days inclusive.

The relevant explanatory statement pursuant to Section 173 of the Companies Act 1956 is being posted to all the shareholders individually along with the notice of the aforesaid meeting.

K. N. SRIVASTAVA
Secretary.

FROM THE CAPITAL'S CORRIDORS

PETRO-CHEMICALS

THE Committee, set up last year to prepare a plan for the development of petro-chemicals in India during the Third and the Fourth Five-Year Plans has recommended the setting up of a refinery in South India and four steam cracking units in the country to meet the requirements of ethylene, propylene, butylenes, butadiene, benzene, tail gases etc.

It adds that from economic consideration it is essential to establish steam-cracking units near a refinery. This is so because such a step would avoid the need for transport of naphtha over long distances. Secondly, some of the uncracked liquids from the steam-cracker as well as certain other products, which cannot be utilised for production of chemicals, could be returned with advantage to the refinery for proper utilisation. It is considered necessary that steam-cracking units be set-up in the Western, Eastern and Southern zones of the country in order to meet the requirements of organic chemicals and finished products in these regions.

A steam-cracked, it is proposed, should be established near the refineries in Bombay. Similar consideration would hold good with regard to a second steam-cracker to be established in conjunction with the Barauni refinery in the eastern region. A third steam-cracking unit could be established in Gujarat when the refinery is set up there. A fourth steam-cracker would have to be set up somewhere in South India in conjunction with a refinery in that region.

It is explained that by the end of the Third Plan period while there would be a surplus of motor gasoline, there would be heavy deficit in respect of middle distillates such as kerosene, high-speed diesel oil, light diesel oil, fuel oil etc., and also of other products. This deficit could be met by undertaking additional refining of indigenous or imported crudes in South India. It would make available motor gasoline and surplus naphtha for the Petro-chemicals Industry. It is recommended that a refinery of economic size in South India be planned from now and based on imported crudes. The refinery could switch over to the use of indigenous crudes if additional quantities of oil were found in South India.

A steam-cracker would provide essentiallity olefine and a certain quantity of aromatics. Utilising these starting materials it should be the endeavour to build up a petro-chemical complex involving the manufacture of diverse products keeping in view the estimated demands indicated by the end of the Third and the Fourth Plan periods.

The estimated surplus naphtha likely to be available each year from 1960 to 1966 is as under:

Year		Surplus Naphtha
1960	..	209,000 tons
1961	..	152,000 tons
1962	..	270,000 tons
1963	..	503,000 tons
1964	..	553,000 tons
1965	..	973,000 tons
1966	..	899,000 tons
1. Surplus at the end of the Third Plan		899,000 tons
2. Additional surplus which would result during the Fourth Plan. (2.00 m. tons — 0.74 m. tons)		1,260,000 tons
Total		**2,159,000 tons**

The demand for naphtha by the end of the Fourth Plan for manufacture of chemicals might be of the order of 2.15 million tons:

	Tons.
1. Naphtha required for the manufacture of nitrogenous fertilizers in factories already licensed/approved as well as under consideration	396,000
2. For production of town gas for the city of Bombay (approved projects)	95,000
3. For captive steam-cracker of M/s. Union Carbide (licensed)	60,000
4. For four steam-crackers each having a capacity of the order of 200,000 tons naphtha through-put	800,000
5. Special naphtha-cracking unit for production of C4s.	300,000
6. For production of nitrogenous fertilizers during the Fourth Plan	500,000
	2,151,000

The Committee adds that the demand and supply of naphtha by the end of Fourth Plan appears to be very close to each other. If the rate of increase in motor gasoline consumption increases at a faster rate than 10 per cent per annum assumed during the Fourth Plan and more than 50 per cent of additional production of nitrogenous fertilizers during the Fourth Plan is based on naphtha, there would be a deficit and this would have to be bridged by either imports of naphtha or by increasing the refining capacity in the country beyond 20 million tons.

BURMAH-SHELL: A NEW BASIS

The Chief Representative in India of Burmah-Shell, Mr. H. A. Eccles, outlined to the Union Minister for Oil, Mr. K. D. Malaviya, his Company's broad proposals and intentions. He added that following discussions with the Government, Burmah-Shell are planning to put their marketing activities in India also into a rupee company, to offer substantial and widespread equity participation in both their marketing and refining enterprises to the Indian public, and to discuss with the Government immediate termination of the current Refinery Agreement and the basis of operation in future under an Industrial Licence similar to that for other Industries subject to an undertanding on certain

basic points. After discussions with various government departments, the final shape to these proposals willl be given.

The lead given by Burmah-Shell, it is expected, may be followed by the other two Oil Companies. Provided there was equal response from the Government, the Western Oil Companies have opened a new chapter in their trade relations with India. Burmah-Shell Company, it may be added, has a large investment of sterling in its two enterprises. There never has been any intention to take any part of this investment out of India. The only point for discussion could be the taking out of India profits earned on this investment. It may be added that such outgoings of foreign exchange are normally permitted by the Government. Another issue could be to import crude from Burmah Shell's normal sources. As indicated sometime back the Government does not seem to have any objection to this scheme, provided the price of crude was competitive.

The third point could relate to the expansion of Refineries. The Government's stand, so far has been not to permit any expansion of refinery capacity or even the utilization of the expanded capacity under the existing refinery agreement. So long as it did not involve any additional outlay in foreign exchange, the Government may not have any such objection.

Lastly, some understanding shall have to be reached on the pattern of distribution. As the Indian Oil Company, a Government of India Undertaking, is extending its field of operations, understanding should have to be reached to avoid any rate war.

Then again, there is the question of profits. The Damle Report, it may be added, had considered that a return of 12 per cent on the capital employed in the marketing organisations of the three oil companies should be regarded adequate. This 12 per cent profit recommended by Damle Committee is gross suject to 63 per cent income tax and minus bonus paid to the employees. This was on the basis of estimated capital requirements of ESSO and Burmah. Shell for the increased volume of business for the future, after taking into account the discount on the posted prices at Rs. 7,536 lakhs or Rs. 106.36 per kilolitre.

EXPANDED CABINET

The appointment of two more Ministers of State and 10 Deputy Ministers was announced on May 6, 1962. Mr. O. V. Alagesan and Dr. Ram Subhag Singh are two Ministers of State who will be attached respectively to the Ministry of Irrigation and Power and the Ministry of Food and Agriculture.

The 10 Deputy Ministers and the Ministry to which they are attached are as follows:

Mr. D. R. Chavan—Deputy Minister in the Ministry of Defence;

Mr. C. R. Pattabhiraman—Deputy Minister for Planning;
Mrs. Maragatham Chandrasekhar—Deputy Minister in the Ministry of Home Affairs;

Mr. Jagannath Rao—Deputy Minister in the Ministry of Works Housing and Supply;

Mr. Sham Nath—Deputy Minister in the Ministry of Information and Broadcasting;

Dr. D. S. Raju—Deputy Minister in the Ministry of Health;

Mr. Dinesh Singh—Deputy Minister in the Ministry of External Affairs.

Mr. Bibhudendra Mishra — Deputy Minister in the Ministry of Law.

Mr. B. Bhagwati—Deputy Minister in the Ministry of Transport and Communications;

Mr. Shyam Dhar Misra—Deputy Minister in the Ministry of Community Development, Panchayat Raj and Co-operation.

The total number of Ministers, after these appointments, in the Central Government is: 17 Cabinet Ministers, 12 Ministers of State and 21 Deputy Ministers.

ASSISTANCE FROM THE AID - INDIA CLUB

An important meeting is scheduled to be held in Washington on May 28, where the consortium of the aid-to-India countries is meeting. The principal item for discussion is the raising of more finances for the second year of the Third Five-Year Plan and to ensure continuity of financial support for the remaining years of the Plan. The United States, it may be recalled, offered one billion dollars to India during the first two years of the Plan provided the other aid-giving countries, excluding World Bank, promised to raise a matching amount. It may however be added that at India's request aid amounting to $45 million each already committed by the U.S.A. and W. Germany was excluded from the offer. For the first year of the Plan Canada offered to advance $28 million, France $15 million, W. Germany $225 million, Japan $50 million and United Kingdom $182 million. This makes a total of 500 million dollars: an equivalent amount of $500 million offered by the United States. The World Bank offered $250 million.

For the second year the commitments so far are Canada $28 million, France $15 million, Germany $139 million, Japan $30 million and United Kingdom 68 million dollars. These put together make a total of $280 million. World Bank has already offered $150 million and U.S. $500 million. The U.S. offer, it may be added, is subject to the approval of the Congress and also is subject to the matching offer by other countries. It is quite likely that United Kingdom would be prepared to come forward with a little more assistance. Some other European countries like Belgium may join the consortium at its next meeting and Australia may also join. It is gathered that Norway, Denmark and Italy not likely to come forward. Sweden and Switzerland too are planning to give assistance to the under-developed countries through the IDA, and a part of this assistance might be earmarked for India.

FOREIGN COLLABORATIONS

As many as one hundred and twenty-three cases involving foreign collaboration were approved during the quarter, ending March 31, 1962. These included thirty instances of British collaboration, thirty-one of the U.S.A., fifteen of West Germany, three of East Germany, eight each of Japan and Switzerland, seven of France, five of Holland, three each of Italy and Austria, two of Sweden, and one each of Denmark, Australia, Canada, Czechoslovakia, Finland and Hungry. Some of these are a newsprint project (Canadian), a project for sanitaryware (French), making timepieces (Japanese), Polyethylene, Polystyrene aircraft parts and ball bearings (U.S.A.), frozen foods and ice cream (British).

INDIA TO SIGN WHEAT AGREEMENT

India being a member of all International Wheat Agreements since 1949, is likely to sign a new agreement in Washington by May 15, 1962. This agreement was drawn up at the United Nations Wheat Conference in Geneva early this year. The agreement follows the pattern of the existing (1959) agreement except that the maximum and minimum prices have undergone a change. The maximum price for the basic quality of wheat (No. 1 Manitoba Northern Wheat) under the 1959 agreement was $1.90 per bushel; under the new agreement this has been raised to $2.02½. Likewise the minimum price has been raised from $1.50 to $1.62½. The increase is of the order of 12½ cents, per bushel.

India's imports of wheat are mainly from the United States under the P.L. 480 agreement of May 1960, for which the payments are made in rupees. Under that agreement, India has to import every year 4 lakh tons of wheat commercially. These commercial imports would be governed by the International Wheat Agreement. About 3.2 million metric tons of foodgrains costing about Rs. 120 crores were imported during 1961-62 including about 324 thousand metric tons of rice costing about Rs. 15.61 crores. 2.86 million metric tons of wheat, 686 thousand metric tons of rice and 34 thousand metric tons of other foodgrains were issued from Central stocks during the financial year 1961-62. The value of the quantity of wheat issued was approximately Rs. 107 crores and that of Milo issued about Rs. 1 crore. The Government of India held a reserve stock of about 2.1 million metric tons of foodgrains at the end of March, 1962. Imports during the financial year 1962-63 are expected to be about 4 million metric tons.

INDO-U.S. AGREEMENT UNDER PL 480

The Governments of India and the United States concluded recently an agreement providing for the sale to India of tobacco and yellow corn (maize) valued at $11.1 million (Rs. 5.3 crores) under U.S. Public Law 480. India will pay in terms of rupees. The United States will make available to the Government of India 85 per cent of the sales proceeds to be utilized in economic development projects.

The United States will supply 2.8 million pounds (1.27 million kilograms) of high quality leaf tobacco which will be used as a constituent of the blend mixture in the manufacture of top quality Indian cigarettes. The agreement will also make available to the Indian starch industry 125,900 metric tons of yellow corn (maize). This agreement brings the total of commitments under the six U.S.-PL 480 agreements between the two countries to $2,348.4 million (Rs. 1,118.3 crores).

SUGAR OUTPUT

Sugar output during the season 1961-62 (for the period November 1, 1961 to April 15, 1962) was to the extent of 22.6 lakh tons, out of which 10.96 lakh tons was sold and despatched and 0.89 lakh tons was exported. Off-take of sugar for internal consumption was to the extent of 10.30 lakh tons. The closing stocks of sugar with factories on April 15, 1962 were 23.53 lakh tons. Sugar exports were directed mainly to U.S.A., Canada, Malaya and Middle Eastern countries. It may be added that the loss on exports of sugar could be estimated from the fact that every maund exported to U.S.A. carried a loss of nearly Rs. 8.87. The loss was Rs. 15.80 per maund on exports to other markets.

IRON AND STEEL OUTPUT

Against the target for output of 4.8 million tons of steel ingots in the first year of the Third Five-Year Plan, the actual output for 1961-62 was of the order of 4.19 million tons. The table below gives the details in respect of various steel plants:

	Pig iron for sale	Steel ingots
Bhilai Steel Project	446,000	789,000
Rourkela Steel Project	117,000	354,000
Durgapur Steel Project	290,000	463,000
TISCO	—	1,650,000
IISCO	240,000	930,000
TOTAL	**1,093,000**	**4,186,000**

IMPORT OF OIL

In terms of an agreement made on 11th November, 1961 by the Indian Oil Company Ltd. with the USSR Export Organisation named SOJUZNEFTEEXPORT, a consignment of about 11,000 tons of furnace oil arrived in Cochin on March 16 this year. This oil will be utilized by industries and other bulk purchasers in the region. The oil is of high quality and its power point and viscosity are better than the Indian Standard specification.

IOC'S INCREASED STORAGE CAPACITY

The State-owned Indian Oil Company (IOC) now has a total storage capacity of 98,000 tons (over 100 million litres) at main ports and in the hinterland for storing and distributing all types of refined oil products throughout the country. It is stated that IOC started its nation-wide operations a year ago with only 45,000 tons of storage capacity at Bombay, Cochin and Vishakhapatnam which was leased to it by the Union Ministry of Defence. Within a year, IOC has increased its capacity by over 100 per cent. IOC has designed, constructed and is operating all its facilities without any kind or foreign technical assistance. IOC is now working on plans to increase its storage capacity to over 135,000 tons within the next six months. According to an IOC spokesman, IOC is now constructing new port storage installations at Okha, Calcutta and Madras and at sixty other inland cities also, in addition to further expanding the five main port installations and 22 inland relay depots already commissioned.

TRANSPORT FOR COAL

Mr. K. D. Malaviya, Union Minister for Mines and Fuel, today emphasised the urgency of the development of alternative modes of transport, including inland waterways, for moving coal to various regions in the interest of the speedy industrial advancement of the country. Mr. Malaviya told the members of the Informal Consultative Committee of Parliament for the Ministry of Mines and Fuel that the Government had already taken some steps towards solving the complicated problem of coal transport by way of importing additional quantities of furnace oil to meet the energy requirements of industries in the western region of the country. The area-wise allocation of wagons in specific regions of coal production was also being made in addition to movement of coal by road wherever it was possible in those areas. A decision to move 2 million tons of coal by sea had already been taken. The Minister added that the Government were reviewing the order of priorities fixed for the allocation of coal in order to meet the demands of industries such as brick kilns which were now low in order of priority. The Minister felt that the scheme, when implemented, was likely to satisfy a larger section of consumers in the country.

Some members referred to the reported intention of the Government to increase the price of coal and felt that such a step was not in the interest of the consumers. The Minister agreed that the mere increase in the price of coal, without taking into account other factors, was not going to solve the problem. Reference was made to the expansion of the Singareni collieries in Andhra Pradesh at the meeting and it was explained that an allocation of Rs. 20 crores had already been made for the Snngareni Collieries Company for its coal production programme during the Third Five-Year Plan. The expansion programme of the collieries envisaged the production of 6 million tons per annum at the end of the Third Plan period.

COTTON TO COST MORE

The Government has decided to raise the ceiling prices for the basic quality Mugllai Jarilla 25/32" staple length by Rs. 35 per quintal or Rs. 125 per candy according to the old description of weight units. The

floor prices which were raised last year by Rs. 106 per candy remained unchanged. Corresponding to the rise in the ceilings for the basic quality there would be increases in prices for other varieties of cotton too.

HIGHER OUTPUT OF MESTA

The production of mesta in the country touched a record figure in 1961-62. Production during the year is estimated at 1,705,000 bales of 400 lbs. each as against 1,131,000 bales in 1960-61. The acreage under mesta this year is estimated at 951,000 acres as against 689,000 acres in 1960-61. The increase in production is thus estimated at 50.8 per cent as compared to an increase of 38 per cent in the area under mesta. The yield per acre in the current year works out to 717 lbs. as against 657 lbs. for the last year.

IN BRIEF...

Hindustan Machine Tools Ltd., Bangalore, proposes to set up two new machine tool plants in the public sector during the course of the Third Five-Year Plan. One of these will be located in Pinjore in the Punjab. Orders for plant and equipment have been placed.

*

Mr. Posthuma's recommendations on the Dock Modernisation Scheme have been broadly accepted by the Bombay Port Trust. Based on his recommendations, the Port Trust has prepared a revised scheme. This scheme was approved in principle by the Trustees of the Bombay Port. The International Development Association has been approached for a loan for the foreign exchange required for executing this scheme and other Bombay Port Trust schemes covered by the Third Five-Year Plan.

The amount earmarked in the Third Five-Year Plan for the development of Paradip Port in Orissa is Rs. 1.54 crores to cover the first and second priority works recommended by the Intermediate Ports Development Committee. This is intended to enable Paradip to handle a tarffic of 5.5 lakh tons per annum, consisting of 5 lakh tons of iron ore and 0.5 lakh tons of other cargo. No further sums have been earmarked for the development of Paradip to handle larger quanties of iron ore, pending the results of the studies which the Planning Commission had considered necessary.

*

With the recent merger of Goa with Indian territory and the consequent resumption of the steamer service to Goa, a new factor has been introduced which necessitates a review of the recommendations of the Konkan Coastal Shipping Services Committee for increase in fares and subsidy to the Company. One of the important reasons given by the Company for its losses was the suspension of the service to Goa in 1955.

*

There is a scheme to produce two prototype motor coaches. Each coach is estimated to cost Rs. 9 lakhs. The prototype electrical equipments will be fully imported at a cost of Rs. 6 lakhs of which Rs. 5 lakhs would be the element of foreign exchange. The cost of imported components for the vehicle portion may be about 40 to 45 per cent.

SISTA'S-IB-2

COMPANY AFFAIRS

BRITISH INDIA CORPORATION

The British India Corporation Ltd. during the year to December 31, 1961 recorded a profit of Rs. 1.05 crores which was over 15 per cent more than the previous year's profit. The sale proceeds during the year, however remained nearly the same as last year's — Rs. 7.82 crores during the year under review as against Rs. 7.86 crores a year before. The Directors have approved the appropriation a sum of Rs. 8.50 lakhs towards depreciation, Rs. 1.29 lakhs towards development rebate reserve and Rs. 48 lakhs as provision for income-tax. The Directors have further recommended the transfer of Rs. 26 lakhs towards rehabilitation reserve. They have recommended the payment of a dividend on ordinary shares at the rate of 35 nP. per ordinary share of Rs. 5 each, which will absorb Rs. 52.75 lakhs.

The Directors have reported that the working of woollen branches of the Company was satisfactory. The total value of production during the year was greater than in 1960 and the Directors have pointed out that licences for the import of wool were not issued promptly which resulted in considerable dislocation of the factories. The Directors further pointed out that the two woollen mills after expensive experiments had succeeded in introducing various blends made of Indian and imported wools which were popular in the market. The Directors had under consideration a scheme for the rehabilitation and modernisation of two branches. Unfortunately due to shortage of foreign exchange it was not possible for the Government of India to grant import licences. The matter, however, was being pursued because the installation of modern machinery was considered vitally necessary for the efficient working of the mills.

The working of the Cooper Allen branch of the Company did not show the desired improvement. This the Directors pointed out was largely due to numerous uncertain factors on which the organised leather industry was still compelled to be heavily dependent. The operational efficiency of the branch continued to receive the active consideration of the Directors.

SEN RALEIGH

The sale proceeds of Sen-Raleigh Industries of India Limited for the year to September 30, 1961, improved by Rs. 39.85 lakhs to Rs. 3.98 crores as compared to the previous year. A large production of components helped to achieve this result. The Directors indicated that anticipated levels of production could not be reached because of shortfalls in semi-finished components occasioned partly by cuts in import licences ceilings and partly by failure of indigenous supplies to meet commitments. The profit during the year was Rs. 21.56 lakhs. The Directors recommended the transfer of Rs. 1.28 lakhs towards development rebate reserve, Rs. 3.75 lakhs towards payment of loan and Rs. 10.08 lakhs towards the provision for taxation. The Directors recommended the payment of a dividend at the rate of 6.5 per cent on cumulative preference shares. They also recommended the payment of a dividend at the rate of 8 per cent on ordinary shares which will absorb Rs. 5.60 lakhs.

The Company applied for and obtained permission to issue 6,50,000 Ordinary Shares. The issue was sanctioned at a premium of Rs. 4 per share. The Company's plans for expansion of bicycle production and diversification call for large foreign exchange resources and it is proposed that part of this new issue be offered to Raleigh Industries Ltd. to finance the foreign exchange component of these schemes.

SIMCO

Mr. S. Narayanaswamy, Chairman of a newly established Company, SIMCO METERS LIMITED, explained recently at Madras, the scope of the new venture. Some of the saliant features of this new venture are that all the meters produced by the new factory will be automatically absorbed by the South Madras Electric Supply Corporation who are an electricity distributing company of the Seshasayee Group in Madras; there are very good export possibilities for the polyphase meters to be produced and under their collaboration agreement, there are no restrictions over export to any country in the world. The collaborating firm are the well-known Denish Ferranti Meters Ltd. of U.K. and have themselves agreed to purchase 5,000 meters annually from the Indian company. The Indian factory will, to start with, produce 60,000 single-phase and 20,000 polyphase meters annually. This will be the first factory for electric meters in Madras State and they also hope to be the first to make polyphase meters in India though many others have also been licensed for their manufacture. The Maharaja of Mysore is one of the sponsors of this issue and has subscribed Rs. 2 lakhs towards equity shares; L.I.C. has agreed to purchase Rs. 3.5 lakhs worth equity shares, Managing Agents and their friends take Rs. 5 lakhs. A new managing agency organisation in the name of South Madras Industrial Development Co. (Private) Ltd., will be incharge of this venture and this managing agency house will function under the guidance of Seshasayee Bros.

PHILIPS INDIA LIMITED

At a meeting of the Board of Directors of Philips India Limited held in Calcutta on May 2, 1962, it was decided to recommend to the shareholders at the Annual General Meeting fixed for June 14, 1962, a dividend of 12 per cent subject to tax, for the year ended December 31, 1961.

GOODYEAR

Goodyear announced recently that its newly-built Rs. 6 crores tyre plant near Delhi is to be expanded immediately from the present capacity of 213,000 tyres to 513,000 tyres a year. Plans for expansion are well in hand, and it should be possible to complete installation of additional facilities within 12 months. The announcement was made by Mr. R. E. O. Carey, Managing Director at the annual generol meeting held recently. The new plant, which started trial production in August 1961 was still handicapped by an uncertain power supply, but the position had lately improved. The number of outages had come down from 110 a month to about 25 because of the "effective measures" taken by the Punjab State Electricity Board. Daily production was now approaching the current licensed capacity. He welcomed the official policy of keeping licensed capacity in the tyre industry ahead of demand to encourage competition. He felt sure that the demand would rapidly increase with the additions planned to India's fleet of trucks, buses, cars and jeeps, and also as a result of the new road mileage to be added under the Third Plan.

Commenting on the passing over the dividend this year, Mr. Carey hoped that shareholders would agree that this was a prudent decision because of the requirements of expansion immediately ahead. The larger scale of production would help the plant to achieve economies, he expected. The Company's sales were 4 per cent higher in 1961 than in the previous years. Rs. 100 lakhs were being set aside from the year's profits into a general reserve to take care of working capital requirements and other contingencies.

THE GANESH FLOUR MILLS COMPANY LIMITED, DELHI

REGISTERED OFFICE, SUBZIMANDI, DELHI

NOTICE

NOTICE is hereby given that the 70th Annual General Meeting of the Shareholders of the Ganesh Flour Mills Co. Ltd., Delhi, will be held at the Company's premises at 64-65, Najafgarh Road (Industrial Area) New Delhi, on Wednesday the 30th May, 1962, at 10.30 A.M. or soon after the separate meetings of different classes of Shareholders are over to transact the following business:

Forms not properly signed and/or completed or received less than forty-eight hours before the meeting wil be treated as invalid;

(c) A member entitled to vote is entitled to appoint a Proxy to attend and vote instead of himself and that a Proxy need not be a member of the Company;

(d) A copy of the existing Memorandum and Articles of Association of the Company as well as copies of the proposed amendments to the Memorandum and Articles of Association of the Company, duly signed by the Chairman, for purposes of identification shall also be available for inspection of members during business hours at the Registered Office of the Company on all working days from 17-5-1962 to 30-5-1962;

(e) The terms of appointment of Dealers as mentioned in item 10 above will be open for inspection of the members at the Registered Office of the Company on any working day between 17-5-1962 to 30-5-1962, during working hours.

(f) Explanatory statements as required under Section 173 of the Companies Act are being sent to the Shareholders alongwith the Balance Sheet by post.

(g) All Shareholders of the Company are also requested to send their present addresses to the Company before that date of the Meeting so that Dividend Warrants for the year ending 30-9-1961 may reach them at their correct address.

AUSTRALIA'S LARGEST COMMERCIAL BANK CAN HELP YOU TO PROMOTE TWO-WAY

TRADE WITH AUSTRALIA, NEW ZEALAND, AND FIJI

Want to sell? Want to buy? Want market information? The International Division of the Bank of New South Wales can tell you about the opportunities for trade offering with these countries.

The Bank's complete banking service includes such specialized facilities as trade introductions to buyers and sellers, industrial enquiries, economic and market information, and a complete travel service. The Bank is closely and constantly in touch with industry, business, and agriculture in the areas it serves through more than 1,100 branches and agencies.

● Enquiries may be made through your own bankers or direct to

Company Meetings

THE KOHINOOR MILLS COMPANY, LIMITED

Chairman's Speech by Mr. A. N. Haksar

Ladies & Gentlemen,

It gives me great pleasure in welcoming you to this Sixty-seventh Annual General Meeting of the Company.

As the working results of the year, which are already with you, show, the year 1961 has been a successful one for the Company. Whereas there has been a modest rise in the gross turnover by about Rs. 46 lacs as compared with the previous year, the net profit after depreciation, development rebate and taxation has increased by over Rs. 10 lacs, i.e. an increase of about 130 per cent over the previous year. Those of you here, who might have been present at the last Annual General Meeting, will perhaps recollect the indulgence I had sought from you in permitting the management just two years more to restore the Company to the same position of prosperity it had previously enjoyed, and you will perhaps agree with me that the working results of the year have justified the forecast made last year.

The principal reasons for the increase in profits are overall increased efficiencies, fuller utilisation of machine capacity run on a rationalised basis, and the change in the pattern of production to suit consumer demand. With regard to the last factor, the Company is earnestly endeavouring to put on the market newer and better varieties of cloth in order to meet with the ever changing pattern of consumer demand and has recently introduced in the market Terylene Suitings, Terylene Shirtings, Full Voile Shirtings and Ladies' Blouse material known as "Rubaiyat" all of which have become very popular.

A comprehensive programme of rehabilitation and modernisation as undertaken in the last year was further implemented during the year. Machinery to the value of Rs. 33,21,647 was erected during the year. Machinery worth about Rs. 43 lacs was on order as at the close of the year. By installing the various machines on order it is anticipated that the Company will be able to effect further rationalisation and also further improvement in the quality of its products.

Side by side with the programme of rehabilitation and modernisation, your Company has taken further steps towards rationalisation and fuller utilisation of machine capacity by working the Spinning Section of No. 2 Mill all three shifts on a rationalised basis. Cloth production has also been stepped up by running a section of the weaving shed in No. 2 and No 3 Mill for the third shift on a 4-looms-to-a-weaver basis.

The cotton position was easier during the early part of 1961 and almost all varieties were available at or below the statutory ceiling prices but the position was completely reversed during the latter part of the year.

The cotton season 1961-62 started with a carry over of about 22 lacs bales and the position was then considered to be comfortable in view of the anticipated production of 53 lacs bales. Unfortunately these expectations were not fulfilled because of adverse weather conditions in the cotton growing centres and the estimate has now been reduced to not more than 40 lacs bales. In order to improve upon the cotton supply position, the Government of India has been negotiating with several cotton producing countries and has also requested the U.S.A. Government to render some assistance under PL. 480. Although vigorous efforts are being made in this direction, the prospects of obtaining the Industry's full requirements of cotton appear to be bleak in view of the country's tight foreign exchange position.

To rectify the imbalance between the supply and demand position of cotton, the Textile Commissioner devised an elaborate system of quality and quantity controls to ensure equitable allotment of available supplies of cotton at ceiling prices. These measures, however, fell short of achieving their desired effect, with the result that cotton prices have shot up, and it is difficult to obtain the requisite cotton within the limits of ceiling prices. It appears that a section of the community has suggested a decontrol of cotton prices. It will be very difficult to foresee the effects of decontrol of cotton on the prices of cloth and yarn, both for the local and for the export market. In order to ensure adequate supplies of cotton to maintain the present level of production and also to meet rising demand, I am of the view that it is imperative to increase the cotton yield per acre substantially and also to raise the statutory ceiling prices so that the prices of local cotton are more in parity with prices prevailing in other cotton growing countries.

As already mentioned in the Directors' Report, cloth stocks during the first half of the year were higher than usual on account of the confusion created by the price stamping scheme and the increased incidence of excise duty on all fabrics. As the year progressed, the movement of cloth stocks improved and at the close of the year stocks were lower than in the previous year.

The stocks of yarn were also higher during the early part of the year. The budget for the financial year 1961-62 for the first time introduced an excise duty on cotton yarn excepting certain counts in hank form. The levy and its assessment at first created some difficulty and also met with some resistance from the consumers. Matters, however, smoothened out later, and the yarn started moving gradually. At the close of the year, yarn stocks were also lower as compared with the previous year.

In its endeavour to earn as much foreign exchange as possible for the country as well as to secure the maximum benefits for the Company by way of import of long staple cotton, terylene, dyes, chemicals, machinery etc., your Company has spared no efforts towards trying to push its goods in the world markets. Our own deliveries for export of cloth were higher by 24.93 per cent as compared to 1960. This increase in exports is all the more creditable as far as your Company is concerned in view of total Indian cloth exports having come down from 692 million yards to about 600 million yards, a drop of 10.5 per cent on last year's performance. The principal reason for this fall in Indian exports has been increased demand for processed cloth, the Indian Mills' inability to meet the world demand at competitive prices, the setting up of textile Mills in the under developed countries in East and West Africa, Ethiopia, Burma, South Viet-Nam and the intensive competition from Hong Kong, China, Japan and Pakistan. Your Company hopes to continue and if possible to increase its exports during the current year also.

You will have observed from the Profit and Loss Account that the value of stores consumption has increased by about 6.53 per cent over 1960. The principal reasons for this increase have been the non-availability of caustic soda at the prices fixed by the Government of India in view of the limited indigenous production and the inadequate supply of hydrosulphite of soda, both of which are consumed in large quantities. These

chemicals are mainly imported by the State Trading Corporation, and had the imports of these Chemicals been regulated by a consistant rather than a haphazard policy, periodic shortages would have been much obviated. There was also an upward revision of import duties on other chemicals, dyes and machinery spare parts.

Electric power and fuel charges were also higher than last year. This was principally due to more machinery having been worked during the year as also the inevitable conversion of boilers from coal to oil-firing on account of the stringent and uncertain coal supply position.

As already mentioned in the Directors' Report, Nahalchand Laloochand Private Ltd., and V. S. Apte & Son, the Company's Yarn and Cloth Selling Agents respectively, relinquished their selling agencies on terms mutually agreeable to themselves and the Board of Directors of the Company. They have been of great assistance to the Company especially in tiding over difficult times, and I am sure you will join with me in placing on record our appreciation for their long and faithful services to the Company for over 58 and 50 years respectively.

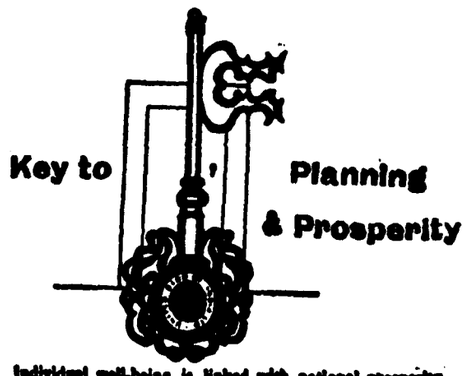
In accordance with the Central Wage Board's recommendations, a wage increase of Rs. 8 per worker per month and the merger of 75 per cent D.A. with the basic pay were also implemented during the year. A further increase of Rs. 2 per month per worker is being paid from 1st January, 1962 and this will cost your Company about Rs. 2½ lakhs more each year.

With regard to bonus for the year 1959, 1960 and 1961, negotiations between the Millowners' Association, Bombay, and the Rashtriya Mill Mazdoor Sangh having failed, the Sangh has filed its demand for the year 1959 with the Industrial Court, Maharashtra, before whom the matter is pending.

In order to achieve peaceful working conditions for the Industry, the Government of India have appointed a Bonus Commission to go into this vexed problem of the concept of bonus, the limits of the minimum and maximum amounts payable and the mode of payment and to make suitable recommendations to Government. Whatever their recommendations may be, I feel that bonus should essentially be linked with productivity.

During the year 166 employees were retrenched by paying them retrenchment compensation and gratuity amounting to Rs. 5,62,000. While retrenching, advantage was also taken of the natural separation of workers wherever possible.

In this regard I would like to state that before effecting retrenchment, your Company made all possible efforts to absorb displaced labour consequent upon introduction of rationalised processes by starting additional shifts and only those workers who were unwilling to accept alternative employment were paid compensation as required by law. I must mention that the introduction of rationalized processes could not have been possible but for the excellent co-operation extended by the R.M.M.S.



During the year Mill workers gladly responded to the call of the Chief Minister of Maharashtra, Shri Y. B. Chavan, for voluntary donations in order to give relief to the flood affected people in the city of Poona and other parts of the State of Maharashtra. About 90 per cent of our employees worked on 20th August, 1961, although it was a holiday, and the total contribution from their earnings was Rs. 39,914 which was the second highest contribution amongst all the Textile Mills in Bombay.

You will observe from the Profit and Loss Account that your Company donated a sum of Rs. 45,470. The principal donations were for the relief of people affected by cyclone in Ratnagiri District and by the floods in Poona and Bihar.

What does the future hold for us? We had every hope that, other things being equal, the current year would prove to be even better than the year 1961, as the results of the first three months have shown a definite improvement over the corresponding period of 1961. However, as you know, only a few days ago the budget has been announced, and once again the powers that be have thought fit further to increase the imposts levied on your Industry. Although as stated, it is the intention of the Government to recover Rs. 12.1 crores from the Textile Industry—which in itself is a very high figure—in actual fact on a very conservative estimate it is felt by the industry that the recovery which will be made by Government by these imposts will not be less than Rs. 25 crores and may even be as high as Rs. 30 crores. This latest burden, together with the scarcity of cotton this season and the difficulty of making up this shortfall by imports from other cotton growing areas not to mention the overall rising costs, are all bound to make a serious inroad into the profits of your industry. Furthermore, as far as the shareholder is concerned, although the Finance Act 1962 had given the corporate sector relief in Income Tax and Super Tax by a reduction from 51.5 per cent to 45 per cent, this tax levy has again been increased by 5 per cent (making it 50 per cent) and this will mean that your Company's tax liability for the year 1961 will be increased by about Rs. 1,75,000. Strong representations are being made by the Industry to try and persuade Government to reduce these imposts, particularly the excise duties. I sincerely hope that something substantial will come out of these representations.

As far as your Company is concerned, your management will make every effort to try and neutralise the extra expenditure to which I have referred above, by further economies and improvement in efficiency. I started saying that we had hoped the current year would be much better than the last. I am afraid the original hopes may not, in view of what I have said before, be fulfilled but I think I can say with reasonable confidence that comparatively speaking your Mill will do equally well again if not better this year.

N.B.: This does not purport to be the report of the proceedings of the General Meeting.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

C.I. PRESSURE PIPES BY IISCO

IISCO-STANTON *Cast Iron Spun Pipes Made to BSS 1211 of 1958 and Vertically Cast Pipes to BSS 78 of 1938*

Our pipes are being utilised all over the country from Kashmir to Kerala and from Assam to Gujarat. A few of the largest schemes being supplied today from Kulti at the present moment are—

Ernakulam — Mattanchery and other Schemes under the Third Five-Year Plan, Kerala		
3" dia. to 24" dia. Spun Pipes	—	8,62,000 Rft.
Trivandrum Water Supply Augmentation Scheme		
48" dia. Vertically Cast Pipes	—	42,240 Rft.
Madras State Third Five-Year Plan Water Supply and Drainage Scheme, Madras		
3" dia. to 24" dia. Spun Pipes	—	48,02,000 Rft.
Thippegondanahalli Water Supply Scheme, Bangalore		
36" dia. Vertically Cast Pipes	—	89,760 Rft.
Ajmer Water Supply Scheme, Rajasthan		
21" dia. Spun Pipes	—	3,69,000 Rft.
Manjira Water Supply Scheme, Hyderabad		
16" dia. to 24" dia. Spun Pipes	—	8,760 Rft.
36", 40", 42" & 45" dia. Vertically Cast Pipes	—	53,585 Rft.

LOOK FOR THIS
'Mark of Quality'

It is your Assurance of Extra Safety and Dependability and only Firestone Tyres have it

Whether you own a Motor Scooter, a Car, a Tractor, a Truck or whether you control a fleet of giant Earth-moving units; there is a Firestone tyre to suit your needs. Every single one bears "The Mark of Quality" — the long-established Firestone symbol of Extra Safety and Dependability.

Specify Firestone and you get—

- **SAFETY** The exclusive Firestone tread design and tyre construction will give you MAXIMUM STOPPING POWER and resistance to road hazards.
- **ECONOMY** The longest-wearing tread specially compounded by Firestone for Indian service conditions ensures MORE KILOMETRES PER RUPEE from the original tread.
- **RETREADABILITY** Look after your Firestone tyres — don't overload them or otherwise maltreat them—and they will remain suitable for RETREADING OVER AND OVER AGAIN.

Firestone BEST TODAY—STILL BETTER TOMORROW

Commercial Production of Tyres to Start in Three Months

MADRAS RUBBER FACTORY CHAIRMAN EXPLAINS EXPANSION PLANS

The Madras Rubber Factory Ltd. hopes to commission its entire plant for the manufacture of Mansfield car and truck tyres within three months, according to Mr. K. M. Cherian, the Chairman.

Addressing the shareholders at the first annual general meeting of the company held in Madras on May 4, he informed that the erection of the tyre factory was proceeding according to schedule. The entire building of the new factory was complete and the major part of the machinery had arrived, he said.

During the course of his speech, Mr. Cherian said:

I do hope, you have had an opportunity to study the Balance Sheet and the Directors' Report and, therefore, I do not propose to go into its details except to draw your attention to certain salient features of the company.

As you are all aware, the private firm of Madras Rubber Factory was acquired by your company for a total consideration of Rs. 25 lakhs. The public company was floated in 1961 and shares worth Rs. 75 lakhs were allotted on June 6. The first and second calls were made during August and October 1961 and these shares became fully paid up a few weeks before the close of books on December 31, 1961.

UNIQUE PROFITS

The profits of the year were Rs. 23,51,764.94 before depreciation and Managing Agents' commission. After adjusting these, we have a nett profit of Rs. 18,30,487.37 and this entire amount was earned solely from the existing business of the Madras Rubber Factory Tread Division. The total sales come to Rs. 1,64,47,976.30. The products of the company continue to enjoy the confidence of the public and there is every reason to believe that the sales and profits in the existing lines of business will continue to grow.

I am sure, you will like to jo'n me in paying tributes to the management for these excellent resul's and to the previous owners of the concern for their magnificent contribution to the growth of this undertaking.

FINE GESTURE

It may be pointed out here, that no payments were to be made to the promoters or to the Managing Agents for expenses incurred or for their services in the promotion of the company. The entire expenses thereof had been met by the promoters. Up to March 31, 1961, this was a private company in the sole ownership of the Managing Agents and when the company was converted into a public company on April 1, 1961, the accrued profits of the private company, which came to Rs. 5.31 lakhs, were also given away to the public company.

I have no doubt you will appreciate this fine gesture from the Managing Agents as an expression of their abundant confidence in the future of this new enterprise.

I am also happy to report to you today that the erection of the tyre factory is proceeding according to schedule. Orders for the entire machinery required for the tyre factory were placed with our collaborators in October 1961, barely 45 days after the receipt of the necessary import licence and the foreign exchange sanction. The construction of the factory building was also started in October after getting the plans approved by our collaborators.

The pilot plant machinery was shipped at the same time and, as you all know, it commenced trial production of tyres on November 16, 1961. The entire building for the main factory is now complete. Major part of the machinery has arrived in Madras and the balance is expected shortly.

The erection work is going on round the clock and our foreign technicians are hopeful of commissioning the entire plant within three months.

EXPANSION PLANS

The plans of the building and erection of the machinery etc. have been drawn up in such a way that the factory can be expanded several times its present size without interrupting production. We have also sufficient land for this expansion. We have also applied to the Government of India for their early consideration of our request for the increase of the capacity and we are hopeful that this will be granted as there will be need for increased production of tyres even during the Third Five-Year Plan.

FOREIGN LINK-UP

The company is extremely fortunate in having the unstinted co-operation of our collaborators Messrs. Mansfield Tire and Rubber Co. of U.S.A. They are as keen as your management in the early commissioning of the Indian plant and have spared no money or personnel for the realisation of this goal. We are fortunate to have with us Mr. M. L. Bayer, Technical Assistant to Mr. James H. Hoffman, President of the Mansfield Tire Co. and he has with him in Madras a team of very senior rubber technicians and engineers. Their devotion to duty, their keenness and eagerness for work and their extremely friendly attitude to people around them, have set a very fine example to our staff and workers.

We are proud of these eminent friends from abroad and I have no doubt, that you will all agree with me that our company owes a great debt of gratitude and thankfulness to our collaborators, the Mansfield Tire & Rubber Co. and to its able and outstanding President, Mr. James H. Hoffman.

I do not want to say anything more about Mr. Hoffman at present, as I am hopeful that he will be in India very shortly for the formal opening of the tyre factory.

PHENOMENAL GROWTH

Before I conclude, may I take a few moments of your valuable time, to say a few words about the Indian rubber industry.

The Indian rubber industry, which took firm root in the country immediately after Independence, has witnessed a phenomenal growth in recent years. The consumption of rubber by all factories in India in 1951 was only 22,786 tons. In a short period of ten years, it has increased to 63,848 tons (1961), and the estimated consumption for the current year is 71,917 tons consisting of 47,448 tons natural, 18,000 tons synthetic and 6,469 tons reclaimed rubber.

As against this, the internal production is only 30,785 tons and we have to rely on imports to the extent

of about 48,000 tons natural and synthetic, and 5,000 tons reclaimed rubber during this year. The position will considerably improve next year when we can expect about 30,000 tons of G.R.S. rubber from the Bareilly plant and 5,000 tons of reclaimed rubber from indigenous production.

PLAN ESTIMATES

The revised estimates for consumption of rubber for the Third Plan period are being compiled and it seems to be fairly certain that the original estimate of 93,500 tons consumption for 1965-66 will have to be radically modified as the figure may be nearer 1,40,000 tons. In spite of the expected indigenous production of 40,000 tons of natural, 30,000 tons of synthetic and 10,000 tons of reclaimed rubber, the country may have to depend on imports to the extent of about 60,000 tons even in 1965-66.

I dare not predict the possible requirements of rubber for the Fourth Plan, but I feel it is high time that the Government and industry studied the situation so that they are at least armed with the knowledge of the future trend.

BOLD POLICY

I would, in this connection, suggest to the Government and the Planning Commission to enquire fully about the possibilities of the production of additional quantities of natural rubber in India. A bold policy regarding the replanting of the existing low yielding plantations, a directive to State Governments to release for rubber planting all suitable areas and to see that such areas are cultivated according to the latest scientific methods and finally to take immediate steps to open up the Nicobar and parts of the Andaman Islands for rubber cultivation, are some of the suggestions I submit for the consideration of the Government.

Regarding the other principal raw materials required for the industry such as carbon black, rubber chemicals, rayon cord, tyre valve tubes, etc., though we have to rely on imports for the current year, we will be entirely self-sufficient by 1963 or the latest by 1964, as several new factories have been licensed for manufacturing the above articles.

EXISTING PLANTS

We have had only two tyre factories in India for nearly 25 years. Though over these years these factories have expanded their production considerably, the consumption of tyres in the country exceeded the production, and for the last two years, we have had to depend on large imports. The Government has, therefore, licensed seven more factories of which so far only three have commenced production. It is hoped that before the end of this Plan, all the remaining four will also have come into production, thereby increasing the output to about 3.8 million tyres and tubes as against the present production of about 2 million.

The Government now favours an upward revision of the target of production of tyres to about 5.2 million as against the Planning Commission's original estimate of 3.7 million. It is likely that all the existing factories who have the resources and who can arrange the necessary foreign exchange will be given preference in this expansion programme. It also seems to be the Government's policy to license a capacity of up to a million tyres for all existing units before new applications are considered.

EQUAL SHARE

In this way, all the tyre factories established in India will be more or less of the same size and they will also be of sufficiently large capacity with a cost of production comparable to their counterparts elsewhere in the world. Moreover, the Government believes that the cost of expansion of the existing units will be far cheaper, as far as foreign exchange is concerned than the licensing of new units at the present time.

I am glad to inform you that we have submitted our application for a substantial expansion and that we will be in a position to implement the setting up of this additional capacity without any loss of time, immediately the licence is issued to us.

TREMENDOUS PROGRESS

The Indian rubber industry has achieved tremendous progress in recent years. Already its production value has exceeded Rs. 80 crores and the total labour employed, over 30,000. It is fairly certain that production may reach nearly Rs. 200 crores by the end of the Third Plan period, with a corresponding increase in the labour employed. Your directors have full confidence in the future of your company and with the untiring efforts of the management, staff and labour, we look forward to better and better results in the years to come.

NOTE: This does not purport to be a record of the proceedings of the annual general meeting.

Brokerage at Re. 1/- per share will be payable to the recognised Brokers whose rubber stamp appears on the Application forms. However no brokerage shall be paid on shares taken up by the Directors and existing shareholders.

OBJECTS : The Company was incorporated on 30th August, 1955 as a Private Limited Company for carrying out the several objects set out in its Memorandum of Association. It was converted into public limited company on 8th November, 1961.

PRESENT BUSINESS SET-UP & OBJECT OF THIS ISSUE

1. The Company with its branches at Jullundur & Jaipur is Main Dealer of M/s. Ashok Leyland Ltd., Madras, with the sole right of selling Leyland products within the territory of Delhi, Punjab, Himachal Pradesh and Rajasthan.
2. The Company is the main agents of Messrs. Chloride & Exide Batteries (Eastern) Ltd., Calcutta for the territories of Punjab, Himachal Pradesh and Jammu & Kashmir.
3. The Company is the Sole distributors of M/s. Steelage Industries Private Limited, for the whole of Jammu & Kashmir, Punjab, Delhi, Rajasthan and U.P.
4. The Company is the authorised dealers for the distribution of Ceat Tyres in Jullundur.
5. Besides the present business given above, the Company has got three industrial licences, from the Ministry of Commerce, Government of India, New Delhi.
   (a) Industrial Licence No. L/IA(6)N-4/59 dated 9th December, 1959 for the manufacture of Alloy Steel for silico manganese spring steel flats to the capacity of 6000 tons per annum on Single Shift per day basis. The major part of the machinery has already arrived. The plant is expected to go into production by middle of year 1962.
   (b) Industrial Licence No. L/IA(3)N-54/59 dated 15th October, 1959 for the manufacture of Malleable Castings of various categories to the capacity of 1200 tons per annum on Single Shift per day basis. The major part of the machinery has already arrived and the project is expected to go into production by middle of the year 1962.
   (c) Industrial Licence No. L/7(5)|51/61-A.E.I. dated 10th February, 1961 for the manufacture of Laminated Springs for Automobile Industry to the capacity of 1200 tons a year on single shift per day basis. Company's application for the import of plant and machinery is under consideration with the Government of India.
6. Besides the above Industrial Licences the Company has also applied for industrial licences for the manufacture of 5,000 tons of steel castings yearly and also for the manufacture of 5,000 tons of Railways laminated and helical springs yearly. The applications are pending consideration with the Government of India.

7. **M/s. LUK AUTO ANCILLARY (INDIA) PRIVATE LIMITED:** Another company incorporated under the Companies Act, 1956, is holding Industrial Licence No. L/7(5)56/61-A.E.I. dated 11th April, 1961 for the manufacture of Clutch Plates, Pressure Plates, Clutch Cover Assemblies and Clutch Thrust Bearings. This Company will be a subsidiary company of Globe Motors Limited and has entered into collaboration with world famous clutch manufacturers Messrs. Luk Lamellen and Kupplungsbau August Haussermann, Stuttgart, West Germany, for establishment of the factory first of its kind in Northern India for manufacture of all types of automobiles clutches as well as clutches for scooters, motor bicycles, three wheelers, tractors and industrial machinery. The collaboration is not only technical but also financial one as the collaborators have agreed to contribute 49 per cent and Messrs. Globe Motors Limited have agreed to contribute 51 per cent of the share capital for this joint venture. The factory will go into production sometime by the end of this year. The collaboration has been already sanctioned by the Government of India and also agreed to by the Reserve Bank of India.

Messrs. Luk Auto Ancillary (India) Private Limited have applied to the Controller of Capital Issues for sanction of capital to the tune of Rs. 20,00,000 out of which capital for the value of Rs. 9,80,000 will be taken up by the foreign collaborators and capital for the value of Rs. 10,20,000 by this Company. This Company has also made an application to The Controller of Capital Issues, New Delhi for issue of fresh capital (beyond the already sanctioned capital which is now being issued to the public for subscription) so as to enable this Company to purchase the above shares in the capital of Luk Auto Ancillary (India) Private Limited.

CAPITAL OUTLAY AND FINANCIAL RESOURCES

The industrial projects covered by the industrial licences already secured is likely to cost the company as follows :

Land	Rs. 4,20,000-00
Office & Factory Building	Rs. 14,00,000-00
Other civil works, sewer works, railway siding etc.	Rs. 3,00,000-00
Machinery :	
a) Imported	Rs. 14,80,000-00
b) Indigenous	Rs. 18,00,000-00
c) Import duty, freight & Insurance	Rs. 3,00,000-00
d) Erection charges	Rs. 3,00,000-00
e) Spares & Stores, working capital and expenses of this issue	Rs. 15,00,000-00
	Rs. 75,00,000-00

The above cost of the project is intended to be met as under :

1) Share Capital specified for these projects. Already subscribed and now being issued ..	Rs. 40,00,000-00
2) Loans already obtained from Punjab Financial Corporation ..	Rs. 10,00,000-00
3) National & Grindlays Bank Ltd.	Rs. 10,00,000-00
	Rs. 60,00,000-00

It is intended that the balance of Rs. 15,00,000 and any increase in the actual cost over estimated cost, including provision for working capital will be raised by loans from the Company's bankers, Punjab Financial Corporation (which has been authorised by a recent legislation to advance loans up to Rs. 20 lakhs to any one Company) or other sources.

IMPORT LICENCES

To execute the projects covered under the above industrial licences, import licences for aggregate value of Rs. 11,76,084 (C.I.F.) for import of machinery and raw material have been procured.

The order for the entire imported machinery has already been placed with the various manufacturers and over 90 per cent of the machinery has already been shipped. Over 75 per cent of the imported plant and machinery has already arrived at site. Orders for the indigenous machinery have also been placed with indigenous manufacturers. Installation of machinery has since been started and it is hoped that by middle of year 1962 Malleable Castings and the Alloy Steel Plants will start functioning.

ELECTRIC POWER

Punjab Electricity Board has sanctioned a 3000 K.W. load with immediate effect and has promised to give another 1500 K.W. by the middle of 1963.

PLANT SITE

In order to reduce the cost of overhead, tools, technical know-how and administration, the company has decided to install all these three units at one and the same place and has procured about 75,000 sq. yards of land at a favourable price at Ballabgarh, Distt. Gurgaon in the State of Punjab on the Main Delhi-Agra Road. The construction of the building for factory and office etc. started in April 1961 and is nearing completion.

PROSPECTS OF THE BUSINESS AND PROFITS

India is hardly producing Silico Manganese Steel and Malleable Castings to 25 per cent of its present requirements and according to the programme outlined in the Third Five-Year Plan the demand of these items is likely to increase to 3 to 5 folds. Due to the declared policy of the Government of India to encourage capital equipment and basic machinery in India, these items are expected to remain in short supply for a long time. Moreover these items are in great demand abroad at a favourable price and as such the industry can be a source of foreign exchange earner which is very vital to the interest of the nation.

The progress made by the Automobile manufacturers has been tremendous during the last few years and all of them have already embarked on programme for increased production during the third Five-Year Plan with the result that the Laminated Springs are expected to be in great demand.

The Company has thus embarked on a major programme of industrial establishment so as to keep pace with the general industrial development of the country.

The Company is likely to handle a sizeable units of Ashok Leyland vehicles in 1962, and thereafter, since the production of these vehicles is to increase in the years to come, per manufacturing programme sanctioned by the Government of India, this Company is likely to handle larger number of sales in view of the potential territory they hold and the ready demand for such vehicles in its territory.

There is a tremendous demand for the products which the Company is going to manufacture. The construction of building and installation of machinery etc. have already reached at an advanced stage and the factory is likely to go into production by middle of year 1962.

It is anticipated that the future business will produce a reasonable return on the capital employed.

TAX BENEFITS

The Company will get the benefit of the Development Rebate and exemption from Tax under the relevant provisions of the Income Tax Act, 1961.

DIVIDEND AND CAPITAL

The Company in General Meeting, may declare dividends to be paid to Members, according to their respective rights but no dividend, shall exceed the amount recommended by the Board of Directors. Holders of the shares out of the present issue shall, however, not be entitled in the profits of the Company for the financial year ending 31st July, 1962.

MINIMUM SUBSCRIPTION

The minimum amount which in the opinion of the Directors, must be raised by the issue of these shares and upon which the Directors will proceed to allot the shares is Rs. 12,25,000.

PAYMENT TO DIRECTORS & OFFICERS

No amount or benefit has been paid or given at any time preceding the date hereof or is intended to be paid or given to any director or to any officer of the Company apart from normal remuneration and reimbursement paid to such officers.

KRUPP

4 man-trolley bridges, each capable of lifting 16 tons at a speed of 90 m/minute Span 65 m. Apron 48 m. These bridges were built by Krupp-Ardelt, Wilhelmshaven.

For 150 years, the name of Krupp has been identified with superb workmanship and enduring quality.

The name of Krupp is also linked with outstanding pioneer work, past and present, in many fields of industrial research, planning and manufacture

The results achieved have caused the name of Krupp to be permanently associated with progress in engineering throughout the world.

Products and Services:

Exploration of mineral deposits · Engineering of mining schemes · Design, layout, and supply of plant for the production and processing of ferrous and non-ferrous metals · Preparation and dressing plant for ore, coal, and other minerals · Chemical-process plant · Cement, lime, and gypsum plant · Bridges, hydraulic structures, and reinforced-concrete structures · Materials, pressure vessels, and tanks for nuclear reactors · Castings and forgings · Rolls · WIDIA-sintered carbide · Magnetic materials · Cable-making and stranding machines · Hydraulic extruders Machinery for the rubber and plastics industries · Edible oil extraction plant Sheet-metal working and can-making machinery · Mobile water purifiers Plate and sheet-metal fabrications · Pneumatic tools · Motor trucks, buses, and special-purpose vehicles · Diesel and electric locomotives Special-purpose freight cars · Ocean-going vessels and river craft Diesel engines · Giant excavators and bulk-handling plant · Power shovels and cranes.

The Board of Trade

THE Board of Trade, whose composition, functions and powers were announced on May 11, is being brought into existence at an opportune time in the wake of the formation of the Department of International Trade as a key portfolio inside the Ministry of Commerce and Industry. The creation of the Department of International Trade marks a considerable advance over the original idea, mooted last year, to set up a department inside the Ministry only for export promotion. And now the definition of the functional jurisdiction of the Board of Trade gives the new portfolio a more comprehensive base, covering internal trade and the two components of external trade. The intimate inter-dependence of the three facets of the nation's trade is self-evident, but our legitimate pre-occupation with the challenging problems of export promotion had tended to cause a loss of proper perspective of the integrated nature of the three facets.

The problems of export promotion could not be considered and tackled in isolation for any length of time, but a realisation of this obvious fact is painfully coming to us at this stage, when the domestic market, insulated from external competition, is offering tempting rewards that raise new hurdles against an intensified export drive. The integrated character of a dynamic policy for trade had never become so urgent as now. It would be an error to suppose that the essential purpose of the Board of Trade is to sustain export promotion alone. The Government Resolution announcing the structure and responsibilities of the Board makes it plain that the Board will be true to its name only if it functions on this comprehensive basis.

The functions prescribed for the Board make an imposing array of obligations which are likely to put a considerable strain on its talents. The enumeration which extends over twelve groups is exhaustive enough to admit of no ambiguity about its responsibilities. The fact that many of the functions with which it is charged have now become familiar as well accepted remedies to stimulate trade, as a consequence of enquiries at the hands of several official and non-official committees, does not alter the reality of the wide range of tasks which the Board will have to pursue. Policy for trade must always be flexible and it will be for the Board to advise when periodical shifts are necessary in respect of specific commodities or trading partners or to obtain new footholds. This function of the Board will not be so onerous as its wide responsibilities to evolve an elaborate follow-up technique to watch the progress or retreat in different markets, to analyse their causes and to suggest workable measures to stimulate or rectify the trends noticed. This is undoubtedly the most important function of the Board and one which does not appear to have received hitherto the close and sustained attention it deserves.

The Board has been called upon to undertake studies and research in trade in individual commodities. It is a continuous process which can never come to an end and, in fact, in the present crisis of our foreign currency earnings, it ought to be regarded as one of first priority. An overall plan for expansion of exports, with a brief description of the staple items, is all that our five-year plans have hitherto conceived as the shape of the export plans. If the technique of planning in thorough detail for every commodity in relation to each country-destination is adopted and targets are fixed on this pattern, the larger export plan will take care of itself. The Board can conduct a scrupulous follow-up procedure to reach objective conclusions and produce a wealth of data for the formulation of commodity-wise and destination-wise targets. Shortfalls will need vigilance at its hands to ascertain whether they lend themselves to elimination or are beyond our control. There should be no hesitation in placing a large secretariat, drawn from the personnel of the Department of International Trade, at the disposal of the Board for this purpose.

Quality and price have always remained the Achilles heel in our export trade, and the same conclusion applies to our domestic trade, although the neglect in this behalf in the latter sphere does not invite a set-back. It is one of the priority assignments of the Board to uphold quality, standardisation and quality control as also to bring progressive improvement in them. Pre-shipment inspection, as a final check, is part of quality control. Two senior officers of the Department of International Trade, who will enjoy the status as Members of the Board, will be switched on to this work, among other assignments, included in its functional jurisdiction. This is primarily a task to be achieved on the basis of voluntary effort based on self-discipline. Compulsory enforcement will create many problems of administrative difficulties, but, where necessary, obligatory quality control will need to be imposed on a selective basis in pursuance of the present policy.

One great virtue of the composition of the membership of the Board is that an equilibrium has been wisely maintained between the official and non-official members. Not more than eight out of the total strength of fifteen of the membership of the Board are to be drawn from the non-official sector. They would represent a cross-section of interests, ranging from Chiefs of the two all-India business and industrial organisations, business leaders, economists and 'others'. The benefit of their mature judgment, based on inside experience of trade and industry over long years, will be available to the Board in its deliberations.

The monthly meetings of the Board, with overloaded agendas, are bound to demand exacting work from the members. But once the responsibility is accepted with a sense of devotion to duty, its burden will be a matter of no consequence.

The structure of the Board as it has now emerged is in no sense final. It is conceived as an experimental pattern, to be tested by experience over a period of two years. There can be no doubt that by that time the Board will earn for itself a firm position as an inseparable adjunct to the Department of International Trade and qualify itself for more effective powers, which alone can enable it to shoulder greater responsibilities in a wide range of matters, which are vitally connected with trade, though they do not come within its immediate perview. This would refer primarily to industrial as well as agricultural policy in respect of products which prominently enter into the export trade — and in the domestic trade, too.

For the present, the Board has been enjoined to make appropriate recommendations for the expansion of production, obviously to ensure that the Ministries in charge of them may give earnest thought to them to create larger exportable surpluses or larger volumes for internal consumption to reduce imports. An attitude of full collaboration and a readiness to make co-ordination of policies between the Board and the Ministries really effective are vitally necessary for the expansion of trade. This point bears emphasis, since it cannot be claimed with any degree of confidence, that the Government is attempting to create a healthy convention to accept, as binding upon itself, the recommendations of high level advisory bodies as expert opinion, unless, of course, there are extraordinary reasons to depart from them.

The Budget Debate
